name has been unanimously consigned to perpetual infamy. This judge was sent down with a special commission, in the exercise of which he displayed the most brutal and unrelenting rigour, and filled the towns of the western parts of our island with mourning and consternation. James declared his approbation of Jefferies' proceedings, by raising him on his return to the peerage and the chancellorship. (See *JEFFERIES*.) These measures struck the nation with terror, and the king was allowed to follow his own course without opposition from the people or parliament. All idea of resistance to arbitrary power might have been lost, had not James pursued with impolitic haste his designs of introducing popery, which excited all the religious zeal of the general body of Protestants, and brought their united force into action. He hoped to lull their apprehensions by a declaration in favour of liberty of conscience, but they soon saw that this was intended ultimately for the benefit of the Catholics only. He attacked the established church, and appointed a commission, which cited before it all clergymen who had done any thing to displease the court. The rights of the universities were invaded, and in particular, a mandate was issued to Magdalen college, Oxford, commanding the election of a man as president, who had shewn a disposition to become a Catholic. The king next published a declaration of indulgence in matters of religion, which was ordered to be read by the clergy in all the churches in the kingdom. Seven bishops met and drew up a humble and very loyal petition against this ordinance. For this act they were committed to the Tower, prosecuted for sedition, and brought to a solemn trial, but no efforts of the court could procure a verdict against them; they were acquitted, and the jury who pronounced them "Not Guilty," were hailed as the saviours of the country. The general rejoicing on this occasion extended to the regiments encamped at Hounslow, and indeed to almost the whole of the army. James had already sent an embassy to Rome, in order to reconcile his kingdom to the holy see, and the birth of a son and heir at this time supported his confidence, but so unpopular was he become, that a general persuasion prevailed that a supposititious child was obtruded on the nation. The dangers which now threatened the liberties and religion of the country produced an union of parties, and many of the nobility and gentry concurred in an application to the prince of Orange, stadtholder of the United Provinces, and the king's son-in-law for assistance. William listened to the prayer of their petitions, and prepared with great secrecy a fleet and an army for the invasion of the country. James was now sensible of his errors, and would gladly have retraced his steps, but it was too late. All confidence between him and the people was at an end, and his concessions were regarded as tokens of fear, not as evidences of contrition. The prince arrived in safety at Torbay, and landed on the 4th of November, 1688. The royal army began to desert by whole companies and even regiments; and the king, deserted by his subjects, and having for his opponent his own son-in-law, found it advisable to retire. His best friends, as he thought them, abandoned his cause; and his daughter Anne, married to prince George of Denmark, put herself into the hands of the insurgents. When news of this fact was brought to him, he exclaimed in an agony of grief, "God help me! my own children have forsaken me." He now sought for safety in a foreign country, leaving the public affairs in the greatest confusion. He repaired to St. Germain, where he was received with the greatest kindness and hospitality by the French king Louis XIV. (See *WILLIAM*.) In the following year, James was enabled by the monarch of France to make a trial for the recovery of Ireland, where the Catholics possessed the

the chief power. He soon became master of the whole island, excepting part of the north. He failed in the siege of Londonderry, and returning to Dublin held a parliament. He soon renewed the most violent measures against the Protestants, which shewed that his disposition, and the principles on which he meant to govern, had undergone no radical change. At length William, who had been appointed his successor, landed with an army in Ireland, and the decisive battle of Boyne was fought in June 1690. In this action, so important to his interest, James kept aloof, and when the fortune of the day went against him, he returned to France. All his other attempts at restoration to the crown of these realms were futile, and he spent the latter years of his life in the practice of devotion. He died at St. Germain in September 1701. His son James, commonly known under the title of "The Pretender," died at Rome in 1766; his son Charles Edward, who invaded Scotland in 1745, died in 1788, and Henry Benedict, cardinal of York, who for some years was supported by this country, is now dead, and he was the last surviving branch of this unfortunate race. Hume. Rapin.

James was too gloomy and bigotted a prince, during the latter part of his life, to have spirit or leisure for cultivating or encouraging the liberal arts; nor, indeed, does he seem to have revolved any other idea in his mind, than the romantic or impracticable plan of converting his three kingdoms to the Catholic faith. And his subjects seem to have been in such a ferment during his short reign, that nothing, which deserves to be recorded, was achieved by any of them, except the wresting from him that power he abused. This remark is not made without recollecting that Newton published his Principia, and Locke finished his "Essay on Human Understanding," while this prince sat on the throne; but it can never be imagined that during so short and turbulent a reign, two works which exalt human nature more perhaps than any which the longest reigns upon record ever produced, could have been brought to maturity. Indeed, Purcell, who had so much distinguished himself in the former reign, does not appear by the date or occasion of his exertions, to have produced any particular anthem, ode, or drama, for the church, court, or stage, from the death of Charles II. his first royal master, till after the Revolution, except the anthem "Blessed are they that fear the Lord," which he composed by order of the court in 1687, as a thanksgiving for the queen's pregnancy.

JAMES I. king of Arragon, born about the year 1207, was son of Peter II. who was slain in 1213. On the death of his father James was solemnly proclaimed, but his country was for some years the prey of disturbances usually incident to a people governed by a regency. This youth shewed early signs of a great and heroic mind: at the age of twelve, he put himself at the head of a body of troops, in order to reduce a subject who had raised the standard of rebellion, and the young king returned successful from the expedition. In 1221 he was married to the infanta Leonora of Castile, but in a short time his uncle, Don Ferdinand, contrived to get the king and his wife into his possession. James made his escape, and a series of intestine disorders took place till he became master of his kingdom, when he was about twenty years of age. He now performed many exploits which proved his valour and wisdom, but his great object was to annex to his dominions the kingdom of Valencia, which was subject to the Moors, whom he had already driven from the island of Majorca. For this purpose he solicited a bull of crusade from the pope Gregory IX., which was granted, but as a condition he was obliged to permit severe canons against heresy and reading the scriptures to be enforced in

his dominions, and the Inquisition to be introduced into Arragon. He made himself master of Valencia, and expelled the Moors, who retired into the neighbouring kingdoms of Granada and Murcia, and into Africa. Though generally successful in his projects of ambition, he passed a troubled and agitated life. In 1268, as an atonement for his repeated failings, he took the cross and embarked for the Holy Land, but being driven by storm into a port of France, he returned without accomplishing his purpose. In 1276, the oppressed Moors broke out in open rebellion, and defeated an army sent out against them. This disaster, which he had not contemplated, had such an effect upon the mind of the king, that he fell sick, resigned his crown in favour of his son Pedro, and took the habit of a Cistercian monk. He died in the same year at the age of sixty-nine. To his second son James he left the kingdom of Majorca, and every thing which he possessed in France. Mod. Univ. Hist.

JAMES II. king of Arragon, surnamed the *Just*, son of Peter III., was born in 1261. He was king of Sicily in right of his mother, at the death of his elder brother Alphonso III. in 1291, whom he succeeded to the throne of Arragon. He was persuaded to renounce his rights on Sicily, but his mother and brother Ferdinand were resolved to hold the island by force. James set about reducing Alicant and Murcia, in which he succeeded, and afterwards visited Rome, where he was urged by the pope to make war upon his brother Ferdinand in order to expel him from Sicily. After a feeble attempt for this purpose he gave up the cause from an impression of its injustice. When the persecution broke out against the knights' templars, James, unlike the other sovereigns of Europe, refused to concur in severe measures against them, saying, "We must first be convinced of their guilt, and it will be then time enough to think of their punishment." He even protected and maintained those who had been driven from other countries. In conjunction with the king of Castile, he made an expedition in 1308 against the Moorish king of Granada, merely on account of their religious differences. This enterprize was unsuccessful, and both kings retreated to their own dominions. After this and another expedition against the pirates of Tunis, he turned his attention to improvements in his own country, and the aggrandizement of his family by matrimonial alliances. He compelled his eldest son to marry Eleonora of Castile. The prince, however, immediately quitted his wife, and desired at the same time to renounce all right and title to the succession of his father's kingdom, a favour which was granted him, and in the assembly of the states he took an oath of fealty to his next brother. At the same assembly, Arragon, Catalonia and Valencia were united, and the union declared inseparable. James died in the year 1326, greatly regretted by his subjects, to whom he was endeared by the equity and moderation of his measures. Mod. Univ. Hist.

JAMES DE VITRY, a celebrated French cardinal and historical writer, was born at a small town near Paris, whence he took his surname, towards the close of the 12th century. He was educated for the church, took orders, and obtained some preferment. This he resigned, and became a regular canon in the monastery of Oignes, in the diocese of Namur. Hence he went to Toulousain, where he preached a crusade against the Albigenes. After this, his zeal led him to preach up a crusade against the Saracens, to assume the cross, and to follow the crusaders into the East. Here he continued many years, and was made bishop of Ptolemais, or Acre. In 1228 pope Gregory IX., to recompense him for his services, invited him to Rome, and raised him to the purple, at the same time giving him the bishopric of Frefcati. He was now sent to France, in the capacity of papal legate, to preach up a new

crusade against the Albigenes, and he was afterwards sent in the same capacity into Brabant and the Holy Land. He died at Rome in the year 1244. Although he was author of many works, the most curious, and that by which he is chiefly known, is entitled "Historie Orientalis et Occidentalis, Libri 3." In the first book we have an account of the affairs of the East, civil and ecclesiastical, and the history of the country from the time of Mahomet to the year 1210. In the second a view of the state of ecclesiastical affairs in the West, during his own time; and in the third the history of the East to the year 1218. The cardinal was esteemed a man of talents adapted to the various concerns in which he engaged, and he was steadily devoted to the interests of the holy see.

JAMES, THOMAS, a learned English divine and critic, who flourished in the seventeenth century, was born at Newport, in the Isle of Wight, about the year 1571. He was initiated in grammar learning at Winchester school, and was thence sent to New college, Oxford, of which house he became a fellow in 1593. In 1599, having collected many MSS. he published "Philobibliæ Richardi Dunelmensis," with an appendix, "De Manuscriptis Oxoniensibus." This he dedicated to sir Thomas Bodley, who afterwards appointed him to the office of keeper of the library which he was then building. In 1600, Mr. James published "Eclogæ Oxonio-Cantabrigienses," containing a catalogue of all the MSS. in each college library at Oxford, but not those in the public library, and in each college library, as well as the public one, at Cambridge. In 1605, he printed "Catalogus Librorum in Bibliotheca Bodleiana," and shortly after he applied himself to examine the state of all the public libraries in England. In the year 1614 he obtained considerable promotions in the church without solicitation. In 1620 he resigned his office as keeper of the Bodleian library, in order that he might have less interruption in his studies, the chief object of which was the defence of the Protestant church against the Papists. He died at the early age of 51, leaving behind him the character of being the most industrious and indefatigable writer against the Papists of any who had been educated at Oxford since the Reformation. He was author of many other works besides those already mentioned; the titles of which may be found in Wood's Athen. Oxon. See also Biog. Brit. Supplement.

JAMES, RICHARD, nephew of the preceding, was also a native of Newport, in the Isle of Wight, brought up to the church, and entered into holy orders. About the year 1619 he travelled for improvement through Wales and Scotland, whence he proceeded to Shetland, Greenland, and Russia; on the last named country he wrote observations, as well as on the manners and customs of the inhabitants. On his return he assisted the celebrated Selden in the compilation of his work entitled "Marmora Arundeliana," which was published in 1628. He was also serviceable to sir Robert Cotton, and his son sir Thomas, in disposing and settling their noble library, and with the former of these he was committed close prisoner by order of the house of lords in 1629. During his confinement he composed some verses, which he prefixed to a copy of all his printed works, and presented it to the Bodleian library, a short time before his death. He died in December 1638, leaving behind him forty-five MSS. of his own composing or collecting, all in his own handwriting, which were afterwards placed in the Bodleian library. He was regarded by all who knew him to be a very good Grecian, poet, critic, antiquary, and divine; and admirably well skilled in the Saxon and Gothic languages. He was engaged by his uncle to assist in collating the MSS. of the fathers, with the Popish editions, in order to detect the

forges and omissions in these last. He seems never to have obtained any preferment in the church, though his uncle pleaded hard for him with the celebrated Usher. In a letter to this archbishop, having mentioned our author's engagement in writing the life of Becket, he recommends him to the prelate in these words: "This kinsman of mine, as well as myself, should be right glad to do any service to your lordship in this kind. He is of strength, and well both able and learned to execute somewhat in this kind, critically seen both in Hebrew, Greek, and Latin, knowing well the languages, both French, Spanish, and Italian; immense beyond all other men in reading of the MSS.; of an extraordinary stile in penning; such a one as I dare balance with any priell or Jesuit in the world of his age, and such a one as I could wish your lordship had about you, but "paupertas inimica bonis est moribus," and both fatherless and motherless, and almost, but for myself, I may say, (the more is his pity) friendless." Biog. Brit.

JAMES of the Sword, *St., San Jago del Espada*, a military order in Spain, the most honourable and opulent of the three Spanish orders, instituted in 1170, under the reign of Ferdinand II king of Leon and Galicia. The other two orders, viz. those of Calatrava and Alcantara, though inferior to that of St. Jago in power and wealth, were nevertheless very considerable.

Its end was, to put a stop to the incursions of the Moors; these knights obliging themselves by a vow to secure the roads, and to defend the pilgrims on their journey to visit the relics of St. James of Compostella.

An union was proposed and agreed to in 1170 between these and the canons of St. Eloy; and the order was confirmed by the pope in 1176. At that time a considerable part of Spain was subject to the Moors, and the whole country much exposed to the depredations not only of the enemy, but of banditti. It is no wonder then, that an institution, the object of which was to oppose the enemies of the Christian faith, and to restrain and punish those who disturbed the public peace, should be extremely popular, and meet with general encouragement.

The highest dignity in this order is that of grand-master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides; they must also make it appear, that their said ancestors have neither been Jews, Saracens, nor heretics; nor even to have been called in question by the inquisition.

The novices were obliged to serve six months in the galleys, and to live a month in a monastery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, since the year 1652, they have added that of defending the immaculate conception of the Holy Virgin. The badge of the order is a cross of gold, enamelled crimson, charged on the centre with an escallop shell argent, and worn round the neck pendant to a broad green ribband. Their habit is a white cloak, with a red cross on the breast. This is esteemed the most considerable of all the military orders in Spain: the king carefully preserves the office of grand-master in his own family; on account of the rich revenues and offices whereof it gives him the disposal. The number of knights is much greater now than formerly, all the grantees choosing rather to be received into this than into the order of the Golden Fleece; inasmuch as this puts them in a fair way of attaining to commands, and gives them many considerable privileges in all the provinces of Spain, but especially in Catalonia. The knights are most implicitly

implicitly to obey the commands of their grand master. The order could formerly bring into the field 1000 men at arms; and if they were accompanied as was usual in a former age, this was a formidable body of cavalry. To this order there belonged 84 commanderies and 200 priories, and other benefices.

There was an order of the same name and kind instituted in Portugal by king Don Denys, surnamed the Liberal, who, in the year 1288, obtained a bull from pope Nicholas IV. for the separation of the order from Spain; and in the year 1486, pope Alexander VI., at the solicitation of John II., revoked the vows of celibacy, and allowed all the knights of this order in Portugal to marry. The reigning king of Portugal is grand master of the order. The badge and ribband are nearly the same with those of the Spanish order.

Another order under the same denomination, being a religious order for ladies, was instituted at Salamanca, in Spain, in the year 1312. Their habit was black, their badge, which they wore on the left breast, was a cross fleury fitché embroidered on gules, charged on the centre with an escallop or.

JAMES, St., Order of, was instituted in Holland in the year 1290, by Florence V. count of Holland. The knights were 12 in number. The collar of the order was a chain of gold, in which, at equal distances, were placed six escallop shells; and pendant to this collar was a medal of gold with the image of St. James enamelled upon it.

JAMES'S Day, St., a festival in the calendar, observed on the 25th of July, in honour of St. James.

JAMES'S Bay, in *Geography*, the eastern part of the fourth division of Hudson's bay, with which it communicates, dividing New Britain from South Wales. It is about 150 miles wide. N. lat. $51^{\circ} 10'$ to $55^{\circ} 10'$. W. long. $58^{\circ} 30'$ to $82^{\circ} 45'$. See HUDSON'S Bay.

JAMES'S Cape, St., the southernmost extremity of Queen Charlotte's island, discovered by captain Dixon in 1787, on the 25th of July, whence its name. Captain Vancouver fixes its situation in N. lat. $51^{\circ} 58'$. E. long. $229^{\circ} 6'$.—Also, a cape on the coast of Chiampa, in the Chinese sea. N. lat. $10^{\circ} 32'$. E. long. $106^{\circ} 43'$.

JAMES City, a county of Virginia, in the United States, 30 miles long and 12 broad, lying between Chickahominy and James's rivers, containing 1542 free inhabitants, and 2318 slaves.

JAMES Fort, a fort of the island of Barbadoes, near Bridge-town.—Also, a fortress of Africa, in the kingdom of Acra, on the Gold coast.—Also, a fort on the N. side of Loblollo bay, in the island of Antigua, at the head of which is St. John's harbour.

JAMES Island, an island of America, situated in South Carolina, on the south side of Charlestown harbour, opposite to Charlestown, and containing about 50 families; separated from John's island on the westward by Stono river.—Also, an island of Africa, 30 miles up the river Gambia, where the English have a fort and factory.—Also, a small island near the coast of Maryland, in the Chesapeake. N. lat. $38^{\circ} 40'$. W. long. $76^{\circ} 25'$.

JAMES River, a navigable river of America, in Virginia, anciently called by the Indians "Powhatan," formed by the junction of Jackson's and Cowpasture rivers, which are nearly equal. At the place where it begins to break through the Blue ridge it receives the North river, and in its course between the Blue ridge and Richmond receives several other streams. At Richmond the navigation is interrupted by falls; but a canal serves for the passing of boats by these falls. Above these the river is navigable for batteaux and

canoes to within 10 miles of the Blue ridge. It is not improbable that its navigation may at some future period be made to interlock with that of the Potowmac, and thus to communicate by a short passage with the Ohio. James river, after a course of between 200 and 300 miles, falls into the mouth of the Chesapeake. N. lat. $37^{\circ} 2'$. W. long. $76^{\circ} 20'$.

JAMES, a creek in Delaware, which empties into Delaware bay, 11 miles below Hook island. Dover, the seat of government, stands on this creek, 5 miles from its mouth.

JAMES, St. a town of South Carolina; 15 miles N. of Charlestown. Also, a town of South Carolina, on the S. side of the Santée; 44 miles N. of Charlestown. N. lat. $33^{\circ} 29'$. W. $79^{\circ} 28'$.—Also, a town of the state of Maryland, in Kent county, 4 miles S.W. of Chester.—Also, a town of France, in the department of the Channel, and chief place of a canton in the district of Avranches; 9 miles S. of it. The place contains 2522, and the canton 12,459 inhabitants, on a territory of 155 kilometres, in 12 communes.

JAMES'S Islands, St., the greater and less, two of the smaller Virgin isles, situated in the King's channel E. of Tortola, and W. of St. Thomas; between which and there is St. James's passage.

JAMES'S River, St., a river of Canada, which runs into the river St. Lawrence, N. lat. $48^{\circ} 10'$. W. long. $69^{\circ} 10'$.

JAMES'S Powder, in the *Materia Medica*, a famous preparation of antimony, the receipt for which, as extracted from the records of chancery, is as follows: "Take antimony, calcine it with a continual protracted heat in a flat unglazed earthen vessel, adding to it from time to time a sufficient quantity of any animal oil and salt, well dephlogisticated; then boil it in melted nitre for a considerable time, and separate the powder from the nitre by dissolving it in water: Take quicksilver, make an amalgam with equal parts of the martial regulus of antimony and pure silver, adding a proportional quantity of sal ammoniac. Distil off the mercury by a retort into a glass receiver, then with the quicksilver make a fresh amalgam with the same ingredients; distil again, and repeat this operation nine or ten times; then dissolve this mercury in spirits of nitre, and put it into a glass retort and distil to dryness; calcine the caput mortuum till it becomes of a gold colour; burn spirits of wine upon it, and keep it for use. The dose of the powder is uncertain; in general, 30 grains of the antimonial powder and one grain of the mercurial is a moderate dose. Signed and sworn to by Robt. James." It is suggested, however, that James's real process was formed upon one previously brought from Italy, which had its run in the fashion of the day, and was called "Lise's powder," and the preparation of which was very analogous to the present "Pulvis antimonialis;" for an account of which, see ANTIMONY.

In the 2d part of the 81st volume of the Philosophical Transactions (for 1791) we have an elaborate paper, containing a great number and variety of "Experiments and Observations to investigate the Composition of James's Powder." These experiments and observations are the more important and useful, as they serve to explain the nature and manner of preparing this medicine, to which many physicians have recurred, and upon which they have principally depended for the cure of continued fevers; and more especially as this patent medicine cannot be prepared by following the directions of the specification in the court of Chancery. Our limits will not allow us to give a minute detail of the author's experiments; but we must content ourselves with extracting some of the general results, and refer the reader for further satisfaction to the valuable paper itself. From the above experiments it appeared probable

that such a substance as James's powder might be made by calcining together antimony and bone-ashes; which operation produces a powder called "Lisle's" and "Schawenberg's" fever powder; a preparation described by Schroder and other chemists above 150 years ago. The receipts for this preparation, says Dr. Pearson, differed in the proportion of the antimony to the bone-ashes, and in the state of the bone; some directing bone-shavings to be previously boiled in water; others ordered them to be burnt to ashes before calcining them with antimony; and in other prescriptions the bone-shavings were directed to be burnt with the antimony. According to the receipt in the possession of Mr. Bromfield, by which this powder was prepared above 60 years ago, and before any medicine was known by the name of James's powder, two pounds of hartshorn-shavings must be boiled to dissolve all the mucilage, and then being dried, be calcined with one pound of crude antimony, till the smell of sulphur ceases, and a light grey powder is produced. The same prescription was given to Mr. Wallis, about the same time, by Dr. John Eaton, of the College of Physicians, with the material addition, however, of ordering the calcined mixture to be exposed to a great heat in a close vessel to render it *white*. Mr. Turner made this powder, about 50 years ago, by calcining together equal weights of burnt hartshorn and antimony in an open vessel, till all the sulphur was driven off, and the mixture was of a light grey colour. He likewise was acquainted with the fact, that by a sufficient degree of fire in a close vessel this emetic powder turned white. Mr. Turner also prepared this powder with a pound and a half of hartshorn shavings and a pound of antimony, as well as with smaller proportions of bone. Schroder prescribes equal weights of antimony and calcined hartshorn; and Poterius and Michaelis, as quoted by Frederic Hoffman, merely order the calcination of these two substances together (assigning no proportion) in a reverberatory fire for several days. In the London Pharmacopoeia of 1788, this powder is called "Pulvis antimonialis," and it is directed to be prepared by calcining together equal weights of hartshorn shavings and antimony.

From the whole of his *analytical* experiments Dr. Pearson infers:

1. That JAMES's powder consists of phosphoric acid, lime, and antimonial calx, with a minute quantity of calx of iron, which is considered to be an accidental substance.

2. That either these three essential ingredients are united with each other, forming a triple compound, or, phosphorated lime is combined with the antimonial calx, composing a double compound in the proportion of about 57 parts of calx, and 43 parts of phosphorated lime.

3. That this antimonial calx is different from any other known calx of antimony in several of its chemical qualities. About three-fourths of it are soluble in marine acid, and afford Algaroth powder; and the remainder is not soluble in this menstruum, and is apparently vitrified.

From the author's *synthetic* experiments it appears, that by calcining together bone-ashes, that is, phosphorated lime, and antimony in a certain proportion, and afterwards exposing the mixture to a white heat, a compound was formed consisting of antimonial calx and phosphorated lime, in the same proportion, and possessing the same kind of chemical properties, as James's powder.

A powder, says Dr. Pearson, sold by F. Newbery under the title of "JAMES's powder for horses, horned cattle, hounds, &c." is a light clay-coloured, gritty, tasteless substance, in which are seen small *spicula*. He says, it appears to me to be nothing more than JAMES's powder for fevers, or LISLE's powder above-mentioned, made by calcining anti-

mony and bone-ashes together in open vessels; because, if, by exposure to a white heat in close vessels, it turns as white as JAMES's powder; 2dly, it dissolves partially in nitrous acid; and the remainder dissolves partially in marine acid. The nitrous solution contains phosphoric acid and calcareous earth; and the muriatic solution affords Algaroth powder.

JAMESPOUR, in *Geography*, a town of Hindoostan, in Balogistan; 25 miles S.W. of Dadari.

JAMESTOWN, a village of the county of Leitrim, province of Connaught, Ireland, which before the union returned two members to the house of commons. It is on the river Shannon, one mile from Drumsna, which is its post-town; three from Carrick on Shannon; and 73 N.W. from Dublin.—Also, a town of America, in Rhode island. See CANNONICAT.—Also, a post town, formerly the metropolis of Virginia, and now the capital of James city county. It is the oldest town settled by the English in America. It is situated on a peninsula, on the N. side of James river, at its mouth in Chesapeake bay, eight miles S.S.W. of Williamsburgh. N. lat. $37^{\circ} 9'$. W. long. $76^{\circ} 50'$.—Also, a town of Prince Edward county, in Virginia, situated on Appomattox river, 12 miles N.E. from the court-house.—Also, a town of the island of Barbadoes, founded in the latter end of the year 1624, being the first English settlement in the island; situated in St. James's parish, on the W. side of the island.

JAMEZ, or YAM, a town of Africa, in the kingdom of Fonia. N. lat. $12^{\circ} 30'$. W. long. $15^{\circ} 11'$.

JAMGONG, a town of Hindoostan, in Dowlatabad; 10 miles W. of Amednagar.—Also, a town in the circar of Aurungabad; 15 miles E.N.E. of Aurungabad.—Also, a town of Bengal; 58 miles N.W. of Burdwan.

JAMJA, a town of Sweden, in the province of Blekingen; nine miles E. of Carlscrona.

JAMLA, a town of Hindoostan, in the circar of Banfwalch; 18 miles E. of Tandla.

JAMMING, in general, denotes the act of enclosing any object between two bodies, so as to render it immovable.

In *Sea Language*, this expression is applied to the situation of some running rope, when it happens to be squeezed by the compression of the standing-rigging, &c. and consequently incapable of performing its office, by traversing in the blocks, till it is released. In this sense jamming is opposed to rendering.

JAMNEY, in *Geography*, a town of Bohemia, in the circle of Chrudim; 17 miles N.E. of Leutmischl.

JAMNIA, JAMNES, or JAFNA, in *Ancient Geography*, a maritime town of Palestine, between Azotus and Joppa, which belonged to the Philistines; but taken from them by Uzziah, king of Judah, 2 Chron. xxvi. 6. According to Josephus, it was given to the tribe of Dan. It was taken by Judas Maccabæus, who burnt its port and its vessels. In the 2d book of Maccabees, xii. 9. it is stated to be distant from Jerusalem 240 furlongs. Steph. Byz. assigns it to the Phœnicians. Augustus gave it to Herod, and this prince transferred it to his sister Salomé, who at her death bequeathed it to Livia, the wife of Augustus. Under the reign of Nero, it was taken by Vespasian, A.D. 67. After the conquest of Judea by Vespasian and Titus, an inconsiderable body of the Jews remained, when others withdrew; and collecting the scattered fragments of Jewish learning from the general wreck into a school at Jafna or Jamnia, revived in this place their forms of worship. The rabbi Jochanan was the founder of the school; and the good design which he began was completed, as far as the state of the times would allow, by the rabbi Gamaliel, called from this circumstance Gamaliel Jafniensis. The success which attended this

school induced many of the dispersed Jews to return to Palestine; and another school was formed at Tiberias.

JAMNITZ, or GEMNICE, in *Geography*, a town of Moravia, in the circle of Znaym; 22 miles N.W. of Znaym. N. lat. $48^{\circ} 59'$. E. long. $15^{\circ} 28'$.

JAMOORGONG, a town of Hindoostan, in the circar of Aurungabad; 20 miles E. of Jaffierabad.

JAMPNUM, in our *Old Writers*, furze, or gorse, and gorsy ground. This word is used in fines of lands, &c. and seems to come from the French *jaune*, i. e. *yellow*; because the blossoms of furze or gorse are of that colour. 1 Croke 179.

JAMPOLI, in *Ancient Geography*, a town of Greece, in Livadia.

JAMPOUR, in *Geography*, a town of Hindoostan, in Guzerat; 17 miles N. of Radunpour.

JAMPTPOUR, a town of Hindoostan, in Bahar; 25 miles N. of Hajypour.

JAMSA, a town of Sweden, in Tavastland; 56 miles N.N.E. of Tavasthus.

JAMSIO, a town of Sweden, in the province of Blekingen; 32 miles W. of Carlscrona.

JAMTLAND, a province of Sweden, bordering upon Norway, about 70 miles in length and 60 in breadth, annexed to the crown of Sweden by the treaty of Roschild, in the year 1658. It is generally mountainous; on the western part the rocks are craggy and the mountains high, having between them deep vallies and rapid torrents. The milk of the cows, bred in these pastures, and housed even in summer, furnishes excellent butter, but they are supplied with beef and tallow from Norway. The eastern part of the province is a champaign country, watered by lakes and rivers which abound with fish; and the neighbouring provinces are occasionally supplied with grain, chiefly barley, oats, and rye, and some wheat from the fertile spots in this district. The Jamlanders in severe seasons are reduced, by the scarcity of corn, to the necessity of preparing bread from the pulverized bark of trees. The iron ore of this province furnishes employment for many persons; and they have also alum quarries, slate, lead-ore, and other minerals, two copper-works of modern erection, and a place for making saltpetre. The population is inconsiderable, so that in most parts religious service is performed irregularly, and at distant intervals. The towns are few, and in the 11 parishes which Jamtland contains, 46 churches have been erected: the number of chimnies in all these parishes amounts to about 717. The inhabitants derive their subsistence from agriculture, grazing, hunting, and fishing. With the Norwegians they carry on a considerable trade, supplying them with salt-pans, steel, and iron-ware; and a kind of leather, impenetrable by water, of which are made shoes, boots, and even jackets. This country, by the contributions of the peasants, maintains a regiment of foot, or, as others say, of dragoons, and a troop of horse.

JANA, a town of Japan, in the island of Nippon; 25 miles N. of Seodar.

JANA, among the *Romans*, a name given to Diana, or the moon.

JANAGAVA, in *Geography*, a town of Japan, in the island of Ximo; 20 miles S.E. of Ikua.

JANAGUR, a town of Hindoostan, in Guzerat, on the right bank of the Puddar; 100 miles W. of Amedabad. N. lat. $23^{\circ} 30'$. E. long. $70^{\circ} 56'$.

JANAKA, a raja, according to Hindoo legends, who being childless, adopted a female infant found in a field by a ploughman. This child proved eventually to be an avatara, or incarnation of Lakshmi, consort of Vishnu, for the

purpose of accompanying her lord on earth in his manifestation in the person of Rama. As the daughter of Janaka she is sometimes called Janeki, but her most common name is Sita. See SITA.

JANAKALA, in *Geography*, a town of Sweden, in the province of Tavastland; 10 miles N.N.W. of Tavasthus.

JANALAX, a town of Sweden, in the province of Savolax; 35 miles N.N.W. of Nyflot.

JANEIRO, RIO. See RIO *Janeiro*.

JANEWAY, JAMES, in *Biography*, an English non-conformist divine, was educated at Christ-church college, Oxford. After the Restoration he was deprived of his living in the church, and gladly opened a meeting-house at Rotherhithe, when the act of indulgence was passed. He died in 1674. He was author of "Heaven upon Earth;" "The Saints Encouragement to Diligence;" and "A Token for Children," which has been exceedingly popular and gone through a multitude of editions. Calamy.

JANGAGUR, in *Geography*, a town of Hindoostan, on the Nerbuddah; 15 miles W. of Hurdah.

JANGARA, a town of Bengal; eight miles N.N.E. of Curruckpour.

JANGAS, a town of Peru, in the diocese of Guamanga; 15 miles E. of Lunaguana.

JANGEGUR, a town of Hindoostan, in the circar of Ruttunpour; 18 miles S. of Ruttunpour.

JANGIPOUR, a town of Bengal; 18 miles N.N.W. of Moorshedabad.

JANGOMA, or YANGOMA, a small kingdom of Asia, in the vicinity of the Birman empire, on the north of Siam. Its extent has been variable on account of its frequent revolutions. According to the Siamese reports, this country is governed by priests. The inhabitants are said to be tall and well proportioned; and in this hot climate their sole garment is a cincture of linen. The women are famed in the East for their gallantry and beauty, in which last quality they surpass those of Pegu; and voluptuous monarchs think their harems enriched and adorned by a concubine from Jangoma. The common food of the inhabitants is rice, and the country is also said to abound in musk, pepper, silk, gold, silver, copper, and gum-benzoic. Little that is certain, however, is known concerning this remote country.

JANGON, a town of Asiatic Turkey, in Caramania; 18 miles N. of Kaifarieh.

JANGUIRA, a town of Hindoostan; in Bahar; 13 miles W. of Boglipour.

JANGUIRABAD, a town of Hindoostan, in the circar of Sumbul; 10 miles S.W. of Anapsheer.

JANGUIRPOUR, a small circar of Bengal; W. of Dinagepour.

JANI, a town of Asiatic Turkey, in the government of Sivas; 60 miles S.S.W. of Sivas.

JANIACOPET, a town of Hindoostan, in Bednore; 20 miles W. of Simogu.

JANICULUS, or JANICULARIS *Mons*, in *Ancient Geography*, a mountain of Rome, having to the E. and S. the Tiber, to the W. the fields, to the N. the Vatican; and so much of it as stands within the city-walls is about five stadia in circuit. It was so called either from an old town of the same name, said to have been built by Janus, or because Janus dwelt and was buried there; or because it was a fort of gate (*janua*) to the Romans, whence they issued out upon the Tuscans. The sparkling fountains have at present given it the name of "Mons Aureus;" and by corruption "Montorius." This eminence afforded the best situation for a full prospect of the city; but it has been less inhabited than the other parts on account of the grossness of the air.

It is still famous for the sepulchres of Numa, and the poet Statius. Ancus Martius encompassed the Janiculum with a wall; and for a communication between this place and the city, he built over the river a timber-bridge, of an extraordinary structure, whose parts were held together without being linked with iron. The pontifices were appointed to keep up and repair the bridge.

JANIDUNI, in *Geography*, a town of European Turkey, in Bessarabia, situated on the Black sea; 40 miles W.S.W. of Otchakov.

JANIKAU, or JANKOW, a town of Bohemia, in the circle of Czaflau; six miles S S.E. of Czaflau.

JANISZKI, a town of Samogitia; 36 miles N.N.E. of Miedniki.

JANITORES, door-keepers among the Romans, the meanest of their slaves, who were commonly chained to their posts.

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior's foot-guards.

Vossius derives the word from *genizers*, which, in the Turkish language, signifies *novi homines*, or *militēs*. D'Herbelot tells us, that *jenitcheri* signifies a *new band* or *troop*; and that the name was originally given by Amurath I. called the Conqueror, who, choosing out one-fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektafche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops. Bektafche, after blessing them in his manner, cut off one of the sleeves of the fur gown which he had on, and put it on the head of the leader of this new militia; from which time, *viz.* the year of Christ 1361, they have still retained the name *jenitcheri*, and the fur cap. Others ascribe their origin to sultan Amurath II. in the year 1372, and others again to Orcan, the predecessor of Amurath I.

The janizaries are children of tribute, levied by the Turks among the Christians, and bred up to the military life. They are taken at the age of twelve years, to the end, that forgetting their country and religion, they may know no other parent but the sultan. However, generally speaking, they are not now a-days raised by way of tribute; for the carach, or tax, which the Turks impose on the Christians, for allowing them the liberty of their religion, is now paid in money; excepting in some places where money being scarce, the people are unable to pay in specie, as in Mingrelia, and other provinces near the Black sea. At present the Turks make no scruple of recruiting their janizaries with natives; and as there are some of these troops in the provinces as well as at Constantinople, it is not easy to ascertain their number. At first this military corps consisted of no more than 12,000 men, and they seemed to be particularly designed as a guard to the emperor's person; and it was afterwards augmented by the successors of the founder to 50,000. Selim, the son of Bajazet, reduced them; but since his reign their number has again so increased, that they have composed the principal force of the Turkish army.

As in the Turkish army, the European troops are distinguished from those of Asia, the janizaries are also distinguished from the janizaries of Constantinople, and of Damascus. At Constantinople Sultan Soliman built barracks for the janizaries, and bestowed a splendid gilding on the ceilings of the porticos, which his successors have always maintained, though they have entirely neglected the discipline which he established. This disregard of good order, by

totally destroying the spirit of the institution, has increased the number of those who receive pay.

Their pay is from two aspers to twelve per diem; for when they have a child, or do any signal piece of service, their pay is augmented. Baron de Tott says, that the pay of the janizaries is duly distributed every three months, and that it has a progressive increase from three aspers to ninety-nine.

Their dress consists of a dolyman, or long gown, with short sleeves, which is given them annually by the grand seignior, on the first day of Ramazan. They wear no turban, but in lieu of that a kind of cap which they call *zarcola*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case in the fore-part of the bonnet. On occasions of this kind the janizaries appear without arms, and with their hands crossed before them; and except the red shoes, great blue breeches and bonnet which they are obliged to wear, they dress themselves in what colour they please, and their uniform consists only in the cut of their clothes.

Their arms in Europe, in a time of war, are a sabre, a carabine, or musket, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they only carry a long staff in their hand. In Asia, where powder and fire-arms were more uncommon, they wore a bow and arrow, with a poignard, which they called *haniare*.

The officer who commands the whole body of janizaries is called the *janizar agasi*; in English, *aga* of the janizaries. He is one of the chief officers of the empire.

The corps of janizaries is divided into regiments, which are called "Baluck," and the commander of every regiment is denominated "Baluck-Aga:" these regiments are distributed into barracks, or "odas," the soldiers of which live together, when they are at Constantinople or in the provinces. M. de Peyssonel, in his "Structures on the Memoirs of Baron de Tott," mentions the division of them into "Ortas," "Buluks," and "Seymens," forming in all 196 companies, *i.e.* 101 ortas, 61 buluks, and 34 seymens. These companies are again subdivided. To this corps also belong the "Yerlis," or provincial militia of the janizaries, commanded by a "Serdar," in the cities which are not considered as places of strength, and where they have no janizary-aga; also the "Yamaks," or garrisoned invalids; and the "Otouraks," or invalids exempted from service. In the garrison and in the field they are divided into "Sag Kol," and "Sol Kol," or right wing and left wing, each of which has its separate standard and respective aga, one of whom is styled "Sag Kol Agassi," and the other "Sol Kol Agassi." There are also companies of volunteers, which are raised in time of war, and maintained by the officers at their own expence. To this class of military also belong gunners, bombardiers, pioneers, miners, &c. In the army the janizaries encamp together by tens; every ten having a horse to carry their small baggage and cloaks, with a servant to cook for them; and every twenty a camel to carry two tents, two large carpets on which to sleep, two kettles, and two leather vessels in which to carry water; when they cannot get camels, they make use of waggons furnished by the country through which they pass. With regard to their tactics, they form their battalions very deep, and their squadrons very large; they are exercised in the use of their arms, and to preserve their ranks and files; but with less order and exactness than the troops of the Christians. They never had pikes, but their favourite weapon has always been the scymetar. In former times they fought with darts, arrows, and hatchets; but, at present, the whole of their infantry

infantry is provided with firelocks. M. de Bonneval attempted to instruct them in handling the bayonet, and formed a small body to the use of that weapon; but it declined and dwindled away since his death. Their ordinary mode of fighting is to fire their pieces and then fall on the enemy, sabre in hand, with very loud shouts, but without any order, notwithstanding which their number, their impetuosity, and the weight of their shock, render them very formidable, particularly in the first onset; after one or two repulses their fury abates, and it is not easy to bring them again to the charge.

Though the janizaries are not prohibited marriage, yet they rarely marry, nor then, but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.

The janizaries were at first called *jinja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted mostly of cavalry.

Vigenere tells us, that the discipline observed among the janizaries is extremely conformable, in a great many things, to that used in the Roman legions.

The janizaries were heretofore a body formidable even to their masters, the grand seigniors. They deposed Bajazet II. in 1512; they procured the death of Amurath III. in 1595. Osman II. they first stripped of his empire, and afterwards of his life, in 1622; and in about two months dethroned Mustapha, whom they had made his successor; and in 1649 they deposed sultan Ibrahim, and at last strangled him in the castle of the Seven Towers; and in 1730 they obtained the sacrifice of the grand vizier, the reis effendi, and the captain bashaw, and deposed and imprisoned Achmet III. and advanced the sultan Mahomet, son of Mustapha II. from prison to the throne in his stead. The number of real janizaries has been variously estimated; but the privileges belonging to their order, such as exemption from taxes, and the performance of public duties, have induced many persons to bribe the officers, in order to their being admitted into the number of janizaries without pay.

Baron de Tott says that the number of those who receive pay amounts to 400,000, but that of those who are enrolled is unlimited. He allows, however, that 20,000 are scarcely ever collected at once, and that this number is principally composed of those who receive but little pay, or, perhaps, none; having only entered the service to obtain a right to it. The enrolled janizaries are so numerous, says M. de Peyssonel, as to amount, if their number could be ascertained, to several millions; nevertheless, they are only estimated at 40,000, on which account they are called "Kirk in Koul," or the forty thousand slaves; and though there may be 400,000 on the pay-list, it is certain the treasury does not issue pay for more than 40,000, that being only received by the janizaries of the "odas," or barracks, at Constantinople, and those who in the garrisons have followed their "kettle." All those who are not with the standard are called "Yamaks," and receive no emolument.

Although the janizaries were once the terror of the natives, and sometimes of the sultans themselves, whom they have by their insurrections and rebellions occasionally dethroned and murdered, their valour has declined, their discipline is relaxed, and their tumultuary array is incapable of contending with the order and weapons of modern tactics; but at the time of their institution, they possessed a decisive superiority in war; because a regular body of infantry, in constant exercise and pay, was not maintained by any of the princes of Christendom.

The janizaries of Syria are an enrolled national militia, consisting of a certain number in each pachalic, who must

hold themselves in readiness to march whenever they are required. As there are certain privileges and exemptions annexed to their body, there is a competition for obtaining admission into it. Formerly they were subject to regular exercise and discipline; but all regard to this has so declined, that within the last 60 or 80 years, says Volney (*Travels in Egypt and Syria*, vol. ii.), there no longer remains the slightest trace of their ancient good order. These pretended soldiers are only a crowd of artizans and peasants, as ignorant as the rest of that class, and infinitely less tractable. When a Pacha abuses his authority, they are always the first to erect the standard of sedition. They deposed and expelled Abdi Pacha from Aleppo, and compelled the Porte to send another in his stead. The Turkish government, it is true, avenges itself by ordering the most active mutineers to be strangled; but, at the first opportunity that occurs, the janizaries create other chiefs, and affairs return to their usual course. The Pachas, seeing themselves thwarted by this national militia, have had recourse to the expedient practised in similar cases; they have taken foreign soldiers into their service, who have neither friends nor families in the country. These are of two sorts, cavalry and infantry. The former are called *Delibaches* and *Leventi*, and the latter *Mograbians*, which see respectively.

In Egypt the janizaries, and also the Azabs, which two bodies of the military corps were formerly the terror of the Pacha, have been so degraded by the influence of the Mamlouks, that they are now as insignificant as himself. The cause of this has been the corrupt and wretched government of the Turks; for, previously to the insurrection of Ibrahim Kiaya, the number of Turkish troops, which should consist of 40,000 men, infantry and cavalry, had been reduced to less than half that number by the avarice of their officers, who diverted the pay to their own use. After Ibrahim, Ali Bey completely destroyed their consequence. He first displaced all the officers who gave him umbrage; left unfilled the places that became vacant; deprived the commanders of all influence; and so degraded all the Turkish troops, that at this day the janizaries, the Azabs, and the five other corps, are only a rabble of artizans and vagabonds, who guard the gates of those who pay them, and tremble in the presence of the Mamlouks, in whom the whole military force of Egypt consists. See MAMLOUKS.

JANIZARIES, at Rome, are officers or pensioners of the pope, called also *participantes*, on account of certain rites or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.

Most authors are mistaken in the nature of their office. The truth is, they are officers of the third bench, or college of the Roman chancery. The first bench consists of writers, the second of abbreviators, and the third of janizaries; who are a kind of correctors and revisors of the pope's bulls.

JANKOONIES TOWN, in *Geography*, a town of Africa, in Loango, on the coast. S. lat. 4° 30'.

JANMIER, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 38 miles S. of Gogo.

JANNA, or JANNINA, a considerable town of European Turkey, in the province of Thessaly, the see of a Greek bishop, situated on a lake which communicates with the river Peneus, and gives name to the province; 40 miles W. of Lariisa. N. lat. 40°. E. long. 21° 38'.

JANNANINS, in *Modern History*, the name which the negroes, in some of the interior parts of Africa, give to spirits which they apprehend to be the ghosts or souls of their ancestors, and which they go to the tombs to consult and worship. Every negro has his tutelary jannanin, and so has likewise every village, to whom private and public worship

is respectively addressed. The women, children, and slaves are forbid to attend their public worship.

JANNEQUIN, CLEMENT, in *Biography*, a French composer, who flourished early in the 16th century, during the most splendid period of the reign of Francis I. when, though we hear of but few great musicians at his capital, yet so many subsisted, particularly in the Low Countries, that music in parts became common from that school all over Europe; and Jannequin, though he is placed by Walther in the middle of the 16th century, must have flourished much earlier; as a curious composition by him, called "La Bataille," printed in the tenth book of "French Songs for four Voices or Instruments," is preserved in the British Museum, which, though it did not appear in this edition, by Tylman Sestato, of Antwerp, till 1545, must have been composed long before that time; for the song was written and set on occasion of the famous and obstinate battle of Marignan, which lasted two days, and was fought during the first year of Francis I. 1515, between the French and Swiss, who disputed their passage to the Milanese.

As this composer seems the first who tried to prove that music as well as painting and poetry was an imitative art, we shall give the whole title of the book of French songs for four voices or instruments preserved in the British Museum.

"Le Dixiesme livre des Chançons, contenant La Bataille à 4, de Clement Jannequin, avec la cinquiesme partie de Phillippe Verdelot, si placet, et deux Chasses du Lievre à 4 Parties, et le Chant des Oyseaux à 3, 1545.

"La Bataille, ou défaite des Suisses à la journée de Marignan; à 4 ou à 5, Clem. Jannequin.

"Le Chant des Oyseaux, à 3. Nic. Gombert.

"Le Chasse du Lievre, à 4. Incognito Authori.

"La Chasse du Lievre, à 4. Nic. Gombert."

In the Battle-piece, as well as in the other imitative pieces in the same collection, there are several long movements in the Bataille, in which the noise and din of war, during this memorable conflict, are imitated. In the song of birds, and in each composition called "The Chase," or hunting of the hare, the composers have severally tried to express the words with more exactness than we had seen attempted before. Indeed, the best counter-point and the most ingenious contrivances, with respect to musical composition, anterior to this period, are contained in the masses and motets of the church, where nothing like expression, or even the true accent of words is attempted. But here, though clumsily done, we have specimens of musical imitations, it should seem, for the first time.

The name and works of Jannequin had penetrated into Italy early in the 16th century, as we find by Zarlino, the elder Doni's catalogue of music, Pietro Pontio, and Zacconi. A work of his, entitled "Inventiones Musicales," in four and five parts, was published at Paris and Lyons, 1544.

JANNI, St., in *Geography*, a small island in the Mediterranean, near the coast of Naples. N. lat. 39° 59'. E. long. 13° 52'.

JANNOCK, a kind of oaten bread, much used in the northern parts of England, and made of four leaven.

JANOHAH, in *Scripture Geography*, a city of Ephraim, on the frontiers of the half tribe of Manasseh. Josh. xvi. 6. Eusebius places a town called "Jano," 12 miles from Schechem or Naplouse, in the Acrabatene, and another 3 miles from Legio, south.

JANOURA, in *Geography*, a town of Hindoostan, in Bahar; 16 miles S.W. of Bahar. N. lat. 25° 8'. E. long. 85° 34'.

JANOW, a town of Poland, in the palatinate of Ka-

miniec; 44 miles N.N.W. of Kaminiac.—Also, a town of Poland, in the palatinate of Lublin; 36 miles S. of Lublin.—Also, a town of Lithuania, in the palatinate of Brzesc; 24 miles S.W. of Pinsk.

JANOWIECZ, a town of Poland, in the palatinate of Sandomirz; 16 miles E. of Radom.

JANOWITZ, a town of Bohemia, in the circle of Kaurzin; 8 miles S. of Bentschow.—Also, a town of Bohemia, in the circle of Pilsen; 30 miles S.S.W. of Pilsen. N. lat. 49° 19'. E. long. 13° 8'.

JANOWITZKY, a town of Bohemia, in the circle of Czassau; 9 miles S.W. of Czassau.

JANOWKA, a town of Poland, in the palatinate of Volhynia; 40 miles N.E. of Zytomiers.

JANOWOW, a town of Aultrian Poland, in Galicia; 16 miles W.S.W. of Lemberg.

JANOZKI, JOHN DANIEL, in *Biography*, was born at Wiemar in 1720. He distinguished himself by his literary talents; and, by several useful works which he published, rendered great service to the literary history of Poland. His principal works are, 1. "Letters on Criticism," in two volumes; 2. "Account of rare Polish Books in the Zaluski library;" in this work he gives the titles of the books at full length, with an account of their contents; relates the history of them, makes known his opinion of their merits, and intersperses the whole with interesting anecdotes, respecting the lives, services, and characters of the authors; 3. "A Dictionary of living Authors in Poland;" and, 4. "Polonia Litterata nostri Temporis." In another work, entitled "Janociana, sive clarorum atque illustrium Virorum Poloniarum Auctorum, Mecenatumque Memoriarum miscellanæ," the author gives a further account of the Polish writers and their productions. His information, besides the authors, comprehends also friends and promoters of the sciences, whether Poles or foreigners, settled in that country. The two volumes comprize nearly 300 names in alphabetical order. Gen. Biog.

JANPOUR, in *Geography*, a town of Bengal; 20 miles S.W. of Midnapour. N. lat. 22° 15'. E. long. 87° 7'.

JAN-RAIA, in *Botany*, a name contrived by Plumier, in defiance of orthography, as usual with his countrymen, to perpetuate the memory of the great John Ray, the word *Raia* being already bestowed on a genus of fishes. Linnæus improved it to RAJANIA, to which article we refer our readers.

JANSAW, in *Geography*, a town of Prussia, in the province of Oberland; 24 miles E. of Marienwarder.

JANSENISM, in *Ecclesiastical History*, the doctrine of Cornelius Jansen, commonly called *Janfenius*, bishop of Ypres, in Flanders, chiefly with relation to grace and free-will.

Jansenius was born of Catholic parents in Holland, and studied at Utrecht, Louvain, and Paris.

Jansenism made no great noise in the world, till after the death of its author, in 1638, when Fromond and Calenus, his executors, published his book, entitled "Augustinus." This book had been the labour of 20 years, was just finished before the author's death, and published at Louvain in 1640. Jansenius was led to engage in this work by the controversy that was carried on, in the beginning of the 17th century, between the Jesuits and Dominicans, concerning the nature and necessity of divine grace; the decision of which had, towards the conclusion of the preceding century, been committed by Clement VIII. to a select assembly of learned divines. These arbiters, after much examination, delivered their opinion to the pontiff, that the sentiments of the Dominicans, concerning grace, predestination, human liberty, and original sin, were more conformable

conformable to the doctrine of scripture, and the decisions of the ancient fathers, than the opinions of Molina, which were patronised by the Jesuits. The former, they observed, inclined to the tenets of Augustine, and the latter bore a striking resemblance to the Pelagian heresy. In consequence of this declaration, Clement seemed resolved to condemn the Jesuits, and to determine the controversy in favour of the Dominicans. In 1602 the Jesuits prevailed on the old pontiff, by intreaties, menaces, arguments, and complaints, to re-examine this intricate controversy, and to undertake the office of principal arbitrator. For this purpose he chose a council, called the congregation *de auxiliis*, or the congregation of *aids*, composed of 15 cardinals, nine professors of divinity, and five bishops, which, in the space of three years, assembled 78 times. The death of Clement, in 1605, prevented his pronouncing a decisive sentence with regard to this controversy; nor are his sentiments certainly known, though the Jesuits and Dominicans contend, that his decision would have been favourable to their respective party. The proceedings of this congregation were resumed, in 1605, by order of Paul V. the successor of Clement. The result of many solemn deliberations was, that the whole controversy, instead of being decided, should be suppressed; and that each of the contending parties should have the liberty of following their respective opinions. Paul V. declined a public determination of the controversy, through apprehension of offending either the king of France, who protected the Jesuits, or the king of Spain, who warmly maintained the cause of the Dominicans. The flame of controversy broke out again with new violence in the year 1640, on the publication of Jansenius's book, which was divided into three parts: the first being historical, and containing a relation of the Pelagian controversy, which arose in the fifth century: in the second the author gives an accurate account and illustration of the doctrine of Augustine, relating to the constitution and powers of the human nature, in its original, fallen, and renewed state: and the third part contains his doctrine relating to the aid of sanctifying grace procured by Christ, and to the eternal predestination of men and angels. The design of Jansenius, in this work, was to shew in what manner the important points in debate had been understood and explained by Augustine, whose name and authority were universally revered in all parts of the Roman Catholic world. The Dominicans, who followed the sentiments of Thomas Aquinas concerning the nature and efficacy of divine grace, derived very considerable advantage from this publication; whilst the Jesuits considered it as not only a tacit but formidable refutation of their opinions concerning human liberty and divine grace. They therefore exerted their most zealous endeavours to obtain a public condemnation of it from Rome; and they succeeded so far as to procure a prohibition of the perusal of it, by the Roman inquisitors, in the year 1641; and in 1642 a solemn bull of Urban VIII. condemning it as fraught with several errors that had been long banished from the church. However, the decisions of the inquisition, and bull of the pontiff, were disregarded in many parts of the Roman church. The doctors of Louvain, the followers of Augustine in the Netherlands, and the abbot of St. Cyran, and other famous and learned men, known under the denomination of the Authors of Port-royal, in France, opposed the proceedings of the Jesuits, and strenuously supported the cause of Jansenism, though the greatest part of the French theologians engaged in behalf of the Jesuits. The dispute was now become very general and violent; and both parties exerted all their learning, art, interest, and power, to vindicate their respective cause. The Jansenists recurred to miracles in

confirmation of their doctrine; and the history of the controversy furnishes many legendary tales of miraculous cures wrought in its favour; the first of these miracles occurs in 1656, when a pretended thorn of that derisive crown that was put upon our Saviour's head by the Roman soldiers, is reported to have performed several wonderful cures in the convent of Port-royal: these were succeeded by other prodigies in the years 1661 and 1664. The same pious frauds were revived in 1725, 1727, and 1731, when the bones of the Abbé de Paris, which were interred at St. Medard, are said to have been instrumental in performing innumerable miracles. However, the opposers of the doctrines of St. Augustine selected five propositions out of Jansenius's book, which, by the interest and importunities of the Jesuits, were condemned by a public bull of Innocent X. in 1653. These propositions contained the following doctrines:

I. Some commands of God are impossible to righteous men, even though they endeavour, with all their powers, to accomplish them; the grace being wanting by which they should be enabled to perform them. II. In the state of corrupted nature, a man never resists inward grace. III. To merit and demerit in the present state of corrupt nature, it is not requisite a man should have that liberty which excludes necessity: that which excludes constraint is sufficient. IV. The Semipelagians admitted the necessity of inward preventing grace to each act in particular, and even to the beginning of faith; but they were heretics, in regard they asserted, that this grace was such as that the will of man might either resist or obey it. V. It is Semipelagianism to say, that Jesus Christ died, or shed his blood, for all men in general.

Of these propositions the pontiff declared the first four only heretical; but he pronounced the fifth rash, impious, and injurious to the Supreme Being.

The Jansenists, availing themselves of a subtle distinction invented by Arnaud, considered separately in this controversy the matter of doctrine, and the matter of fact, *i. e.* they acknowledged themselves bound to believe that the five propositions above mentioned were justly condemned by the Roman pontiff; but they maintained, that the pope had declared, and consequently, that they were not bound to believe, that these propositions were to be found in Jansenius's book, in the sense in which they had been condemned. But this artful distinction was of no long service to them; for Alexander VII. issued out a solemn bull in 1656, declaring, that the five propositions that had been condemned were the tenets of Jansenius, and were contained in his book; and in 1665 he sent into France the form of a declaration, that was to be subscribed by all who sought preferment in the church, affirming that the five propositions were to be found in the book of Jansenius, in the same sense in which they had been condemned by the church. This declaration produced the most deplorable tumults; the Jansenists maintained that the decisions of the pope, so far as they were not confirmed by a general council, with regard to matters of fact, were fallible; and the Jesuits, on the contrary, that unlimited confidence in the papal decisions, both with respect to matters of fact and of opinion, was an essential character of a well-grounded and divine faith. The Jesuits prevailed, and the Jansenists suffered exile, imprisonment, and various kinds of persecution. Clement IX. in consequence of the spirited remonstrance of several bishops, and the earnest application of Anne Genevieve de Bourbon, duchess of Longueville, accepted a conditional subscription to the declaration of his predecessor, allowing the Jansenists the privilege of interpreting it in their own sense. This indulgence restored tranquility, and produced a period in this controversy, commonly called the "Peace of Clement IX."

but it was soon disturbed again by a public edict of Lewis XIV. and totally abolished after the death of the dukes of Longueville, in the year 1679. The famous Arnaud retreated on this occasion into Holland, where he gained over the Romish congregations to the Jansenist party: and this party, secured under the protection of the Dutch government, has since prevailed in that country. The Jansenists were particularly offensive to the Jesuits, on account of the austerity of their party, and the severity that reigned in their system of moral discipline and practical religion: for they have exclaimed against the corruptions of the church of Rome, both with regard to its doctrines and morals; and urged the necessity of instructing the people in the doctrines and precepts of Christianity: with this view they have maintained that the holy scriptures and public liturgies should be perused by the people in their mother tongue; and taught, that true piety does not consist in the observance of pompous rites, or in the performance of external acts of devotion, but inward holiness and divine love. This apparent piety of the Jansenists has, however, been unhappily blended with superstition and fanaticism; and they have been branded, not altogether without reason, with the denomination of Mystics and Rigourists. (See QUIETISM.) The controversy relating to Jansenism, which was one of the principal sources of that division which reigned within the papal jurisdiction, has been carried on with great animosity in France and the Netherlands; and the Jansenists were for a considerable time much inferior to the Jesuits in number, power, and influence, though they equalled their adversaries in resolution, prudence, and learning, and surpass them in sanctity of manners and superstition, by which they excite the respect of the people. The United Provinces, particularly the Netherlands, have afforded them an asylum on many occasions: nevertheless the Jesuits, though they had no legal toleration in the republic, have gained ground among the Dutch papists. They had a flourishing chapel in the city of Utrecht, and places of worship in several other cities, and in a great number of villages. Towards the close of the 17th and the commencement of the 18th centuries, the cause of the Jansenists acquired reputation, by a French translation of the New Testament, made by the learned and pious Paschasius Quenel, a priest of the Oratory; in the annotations to which he has artfully blended the quintessence of Jansenism. This work, at the instigation of the Jesuits, and particular application of Lewis XIV. to the court of Rome, was condemned by Clement XI. who, in 1713, issued out the famous bull *Unigenitus*, in which Quenel's New Testament was condemned, and one hundred and one propositions contained in it pronounced heretical. The controversy relating to Jansenism was much heated and increased, instead of being mitigated or suspended, by this despotic and ill-judged edict. The Jansenists were again obliged to recur to writing, and even to miracles and visions, and pretended revelations for the support of their declining cause. However, the storm of resentment that afterwards arose against the Jesuits, and that has been attended with the extinction of their order in Portugal, France, and in all the Spanish dominions, has disarmed the most formidable adversaries of Jansenism, and must be considered as an event highly favourable to the Jansenists. Mosheim's *Ecl. Hist.* vols. v. and vi. Eng. ed.

JANSENIUS, CORNELIUS, in *Biography*, a learned Flemish prelate, born at Hullt in the year 1510, and educated at Ghent and Louvain, became a proficient in the Hebrew, as well as Greek and Latin languages, and devoted himself to the study of the scriptures. After occupying some subordinate stations in the exercise of his ministry, he was appointed professor of divinity at Louvain, and admitted

to the degree of doctor of divinity. In the famous council of Trent he commanded respect by his learning and modesty, and upon his return to Flanders in 1568, he was nominated the first bishop of Ghent, where he died in 1576. His works were "A Paraphrase on the Psalms," with copious notes, in Latin, printed at Louvain in 1569; "Notes on the Books of Proverbs, Ecclesiasticus, the Canticles, and the Book of Wisdom," printed in 1586: "Commentaries upon some Passages in the Old Testament," &c. His chief work, however, was the "*Concordia Evangelica*," first printed in 1549 and frequently reprinted. Of this work Dupin says, that it is the most perfect harmony of the four gospels which had till that time appeared. To the author he pays a very distinguished tribute of respect, as a very able expofitor of scripture, and eminently characterized by his learning, judgment and perspicuity. Dupin. *Gen. Biog.*

JANSENIUS, CORNELIUS, bishop of Ypres and founder of the Jansenists, was born at a village near Leerdam, in Holland, in the year 1585; and having commenced his studies at Utrecht, finished them at Louvain in 1602. Removing to Paris on account of the state of his health, which had been impaired by his assiduous application, he renewed his connexion with the abbot of St. Cyran, with whom he had commenced an acquaintance at Louvain. At Bayonne these two friends, after temporary separation, met again, and concurred for five or six years in the study of the fathers, and particularly of St. Augustine. The abbot Du Verger was here promoted to a canonry in the cathedral, and Jansenius was placed at the head of a college. Upon Du Verger's removal to Paris, Jansenius returned to Louvain, and was soon appointed principal of the college of St. Pulcheria. In 1617, he took his degree of doctor of divinity, and was admitted one of the professors of that faculty, in which office his talents and learning were conspicuously displayed. On occasion of the interference of the Jesuits with some privileges belonging to the university of Louvain, Jansenius was selected as a fit person to state and vindicate their rights in an embassy to the king of Spain. For this purpose he made two journeys into that country, viz. in 1624 and in 1625; and in the year 1630 he was appointed by the king professor of the holy scriptures in the university of Louvain. In this year he engaged in a controversy with the Protestants; and this controversy produced on his part a piece entitled "*Alexipharmacum*," printed in 1630; another under the title of "*Notarum Spongia*," &c. in 1631. Another controversy of a similar kind engaged his attention in 1634, in the conduct of which he had recourse, in a manner that reflects disgrace on his name and memory, to measures of persecution against his adversary, instead of contenting himself with the more appropriate weapons of argumentation. In the year 1635 he published a work, which, however acceptable to his patron, the Spanish monarch, conferred no honour on the spirit of the writer; it was entitled "*Alexandri Patricii Armacani, Theologi, Mars Gallicus, seu Justitiæ Armorum et Fœderum Regis Galliæ Libri duo*," and contains the most malignant and invidious exclamations against the services which were rendered by France to the Protestants of Holland and Germany, to the prejudice of the Romish religion. In consequence of this publication he was promoted to the bishopric of Ypres. His conduct on this occasion, and the publication of the above-mentioned book, are said to have first excited the enmity of cardinal Richelieu against the author and his followers, and the partiality of the court in favour of the Jesuits. Jansenius, however, sedulously engaged in the reform of his diocese; but was prevented from accomplishing the work which he had begun by his death, which happened in 1638, when he was about

53 years of age. He died highly respected for learning and other eminent qualifications, as well as for his piety and virtues. His works, besides those already mentioned, were "Tetrateuchus, five Commentarius in IV Evangelia," 4to. "Pentateuchus, five Commentarius in V libros Moysis," 4to. "Analecta in Proverbia, Ecclesiasten, Sapientiam, Habacuc, et Sophoniam," 4to.: "De Vi obligandi Conscientias quam habent Edicta regia super Re Monetaria:" "De Juramento quod publica Auctoritate Magistratui designato imponi solet;" "Oratio de interioris hominis Reformatione," and, more particularly deserving of mention, his "Augustinus, seu Doctrina Sti. Augustini de Humanæ Naturæ Sanctitate, Ægrotudine, Medicina, adversus Pelagianos et Massilienses," fol. This latter work occasioned the controversy, of which we have given an account under the article JANSENISM, to which the reader is referred. Dupin. Bayle. Mosheim.

JANSENS, JAMES, a learned theological professor at Louvain, was born of Catholic parents at Amsterdam in the year 1547, and completed his studies at Louvain, whither he was sent for this purpose in 1564. In 1575 he was admitted a licentiate in divinity, and was afterwards nominated first president of the new Augustine college. Having risen gradually to several offices of honour and duty in the church, he was at last, in 1614, appointed dean of the collegiate church of St. Peter's at Louvain; and died in 1625. Of his works, which have been held in high esteem, we shall enumerate "Expositio in Prophetam Job," folio; "Commentarius et Expositio in Psalmos Davidicos," 4to.; "Commentarius in Canticum Cantorum," 8vo.; "Expositio in Evang. Joann." 8vo.; "Instituto Catholici Ecclesiastæ;" "Liturgica;" "In sacrum Missæ Canonem;" "Enarratio Passionis," &c. &c. Moreri. Gen. Biog.

JANSI, in *Geography*, a town of Hindoostan, in the circar of Gohud; 110 miles S. of Agra. N. lat. 25° 32'. E. long. 78° 57'.

JANSONS, MESSRS. in *Biography*, two brothers, the most celebrated performers on the violoncello in France, at the time when M. Laborde published his "Essais sur la Musique," and consequently, according to that author, "the best in the universe." These were rivals of the two brothers; Dupont, whose performance gave equal delight. It was hardly possible to play an adagio with more delicacy, taste, and feeling than the eldest Janfon. The eldest Dupont's execution was truly astonishing; and it is among extraordinary circumstances, that four such performers on the same instrument should flourish at the same time in one city.

JANSENS, ABRAHAM, an historical painter, born at Antwerp in 1569. He possessed great powers in the practical parts of the arts, but, negligent and dissipated, he wasted those powers, and fell into indigence. Being contemporary with Rubens, he was mortified at the success of his younger rival, who drew from him the admiration of the public, and in a fit of ill humour challenged him to paint a picture for fame; desiring to submit their reputation to impartial judges. This proposal was rejected by Rubens, who answered in a mild and becoming manner, that he submitted to him; and the world would do justice to them both. The churches of the Low Countries possessed many excellent works of this master; but his chef-d'œuvre is the Resurrection of Lazarus in the gallery at Duffeldorf.

JANSENS, HONORIUS VICTOR, a painter, born at Brussels in 1664. Having applied sedulously to the practice of the art, and made much proficiency, he was employed by the duke of Holstein at a pension of 800 florins, and after-

wards enabled, by the same munificent patron, to pursue his studies in Italy.

In Rome he studied the works of Raphael, and became eminent in fame. He afterwards associated with Tempesta the landscape painter, and painted figures in his pictures.

In general his pictures are small in size, and have somewhat of the style of Albano. His invention was copious, and his works are very pleasing. He died in 1739, at the age of 75.

JANSENS, CORNELIUS, called also *Johnson*, a portrait painter of very extraordinary merit. He was born at Amsterdam; when, is not exactly ascertained. It appears that he painted in England as early as the year 1618, in the reign of James I. Here he continued to paint with very great and deserved success till the arrival of Vandyke, whose transcendent talents and taste Janflens was not quite equal to cope with. On the breaking out of the civil war he returned to his own country, in 1648; leaving behind him a number of excellent characteristic portraits in the great families of this island.

He retired first to Middleburg, and afterwards to Amsterdam, where he died in 1665.

His style of design was formal and void of taste, but his features are justly marked, and the faces of his portraits have great character, and an air of nature, possessing much sweetness of tone in the colouring, and finished very highly; too much so indeed. His pictures are generally on wood, and with black draperies; an arrangement adopted frequently by Rubens and Vandyke.

JANTECA, in *Geography*, a town of Hindoostan, in the circar of Adoni; 59 miles N.W. of Adoni.

JANUARIUS, ST., in *Biography*, bishop of Benevento, who was beheaded at Puzzuoli in the persecution of Diocletian. His body was brought to Naples, where a beautiful chapel is erected to his memory in the cathedral. What renders his name remarkable, is a pretended miracle exhibited yearly by the priests, who say they have the saint's real blood enclosed in a phial, which is either liquid or congealed at the pleasure of these devout gentlemen. This wretched mummery is always practised when Mount Vesuvius shews signs of a convulsion, and the people believe that the influence of Januarius will prevent an earthquake. This pious fraud will scarcely live beyond the changes which are now taking place in Italy. Moreri. Addison's Travels.

JANUARIUS, ST., *Order of*, was instituted July 2, 1738, by the Infant Don Carlos, then king of Jerusalem and the two Sicilies, and afterwards king of Spain, who was grand master of the order, and the honour of which devolved on the king of the two Sicilies. The ensign of the order is a star of eight points, enamelled white, edged with gold: in the centre is represented a bishop, with half his body in clouds: on the reverse is a book, on which are two vials red, surrounded with two palms, all enamelled in proper colours. The collar of the order is of gold, composed of castles, banners, mitres, roses, &c. The badge in ordinary days is worn pendant to a broad deep-blue ribband.

JANUARIUS'S BLOOD. See *Religious uses of BLOOD*. The head of this saint is occasionally carried in procession at Naples, in order to stave the eruption of Vesuvius.

JANUARY, the name of the first month of the year, according to the computation now used in the West.

The word is derived from the Latin Januarius, a name given it by the Romans, from Janus, one of their divinities, to whom they attributed two faces; because on the one side the first of January looked towards the new year; and, on the other, towards the old one. The word Janu-

arius may also be derived from *janua*, gate; in regard to this month being the first, which is, as it were, the gate of the year.

January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.

The Christians heretofore fasted on the first day of January, by way of opposition to the superstition of the heathens, who, in honour of Janus, observed this day with feastings, dancings, masquerades, &c.

JANUB, in *Geography*, a town of Persia, in the province of Kerman; 120 miles E. of Kabis.

JANVILLE, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Chartres, 21 miles S.E. of it. The place contains 1803, and the canton 10,368 inhabitants, on a territory of 290 kilometres in 23 communes.

JANUM, in *Scripture Geography*, a city of Judah, mentioned *Joth. xv. 53*.

JANUNA, in *Geography*, a town of Hindoostan, in Goondwanah; 20 miles N. of Chanda.

JANUS, in *Mythology*, a divinity of the Romans, who, as it is said, had the custody and care of their gates (*Janua*). As to the origin of this deity, ancient authors are not agreed; but the most general opinion is, that he was not a native of Italy, but that he came thither from Perrhebia in Thessaly, where, being a descendant from Deucalion by Ion his son, as fabulous history reports, he was originally settled. Ryckius dates the arrival of Janus with his colony in Italy in the 146th year before the taking of Troy; but as Theophilus of Antioch assures us, that Chronos, called by the Latins Saturn, and who was received by Janus into Italy, lived 321 years before the taking of Troy, there must have been more than an age and a half between him and Janus. Hence we should be led to conclude, either that Saturn never came into Italy, or that he arrived there long before the time of Janus. Antiquity, however, ascribes co-existence to these princes: therefore we must suppose that there was another Saturn, contemporary with Janus, whose original name was Stercus, the father of Picus; and that being deified by Janus, he was, after his apotheosis, denominated Saturn. To this purpose we learn from Aurelius Victor, that Janus, having landed in Italy, and made various conquests, took possession of a mountain, and there built a city which he called after his own name, "*Janiculum*." In the time of his reign, Saturn, banished from his own country, landed also in Italy; where Janus kindly received him, and made him his associate in the empire. Saturn built a fortress near Janiculum and called it "*Saturnia*." The part of the country which Janus first occupied was Latium; and it is said that the inhabitants, before the arrival of this prince, led a savage life, without laws and almost without religion; and that he softened the ferocity of their manners, brought them to live together in cities and villages, gave them laws, and caused his subjects to enjoy under his reign a happiness which they had never known before; accordingly this period was denominated the golden age. From this change of condition, produced by the counsels and influence of Janus, the inhabitants rendered him divine honours; and he has been regarded, not as one of the great gods, but as one of the *Indigetes*. To him also, as we learn from Macrobius, all the passages from or to the houses were consecrated; because, according to the Mythologists, every family in the time of Janus was distinguished by religion and sanctity. It is added, that he was the first who built temples, and instituted ceremonies of religion. Concerning the reason of his being represented with two faces, we have different accounts. Some say that

he was thus exhibited, because he commanded two nations; or because, upon his sharing the kingdom with Saturn, he caused medals to be struck, bearing on one side a head with two faces, to express that his power was divided between Saturn and himself, and that his dominions were to be governed by the counsels of both. Plutarch gives another account and says, that this representation was intended to intimate that this prince and his people had, by wise and salutary counsels, passed from a wild rustic life to a life of civilization and humanity. Others say this appearance, or "*bifrons*," *i. e.* double faced figure, denoted that Janus knew the past and foresaw the future. Others again, who are of opinion that Janus represented the sun, pretend that he is exhibited double, because he opens the day when he rises, and shuts it when he sets. From Athenæus we learn that Janus had two faces, one before, the other behind; and that he gave his name to a river and to a mountain on which he had settled. He is said to have been the first who invented crowns, ships, and barges, and who coined money of brass. Hence it happens, that several towns in Greece, Italy, and Sicily, coin money with a double head, with a barge on the reverse, or a crown, or a ship. Some authors say, that the two faces represent his presiding over *January* (which see); and others say that the two heads are those of Janus and Saturn. For an account of his temple; see the next article.

JANUS, *Temple of*, in *Ancient History*, a square building at Rome (as some say) of entire brass, erected by Romulus, after he had made peace with the Sabines, or, as Rollin says, by Numa, as an acknowledgment to the gods for the tranquillity Rome enjoyed at his accession to the throne; it was so large as to contain a statue of Janus five feet high, with two faces, intimating, that the Romans and Sabines were united into one people, and that the two kings, Romulus and Tatius, made but one head to govern them. It had brazen gates on each side, which were always kept open in time of war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was first shut during the long reign of Numa, who instituted this ceremony. 2. In the year of the city 519, B. C. 235, after the end of the first Punic war. 3. By Augustus, after the battle of Actium, in the year of Rome 723, B. C. 31. 4. On Augustus's return from the war which he had against the Cantabrians in Spain, A. U. C. 729. B. C. 25. 5. Under the same emperor, in the year of Rome 744, about ten years before the birth of Christ, when there was a general peace throughout the whole Roman empire, which lasted twelve years. 6. Under Nero, A. U. C. 811. A. D. 58. 7. Under Vespasian, A. U. C. 824. A. D. 71. 8. Under Constantius, when upon Magnentius's death he was left sole possessor of the empire, A. U. C. 1105. Some dispute the authority on which it is said to have been shut by Constantius, and say that the last time of its being shut was under Gordian, about the year of Rome 994, A. D. 241. Virgil gives us a noble description of this custom:

"Sunt geminæ Belli portæ, sic nomine dicunt, &c."

Æn. lib. vii. ver. 607, &c.

The origin of this custom is not certainly known. Accordingly when the consul, appointed to command the army, was ready to set out, he went to this temple, attended by the senate, the chief citizens, and his soldiers in their military dresses, and opened its gates. The new consuls took possession of their offices in this temple; whence they were said to open the year. See Macrobius *Saturn. lib. i. cap. 9.* and Virgil, *Æn. lib. vii. v. 601, 622.*

This

This temple was in the Roman forum, and Procopius says, that in his time the remains of it were still to be seen there over-against the capitol, with a little niche of brass, in which was his statue.

There was a second temple of Janus, built by Cn. Duilius, in the Forum Olitorium, or herb-market, after the first Carthaginian war; and this, being fallen into decay, was rebuilt by the emperor Tiberius, according to Tacitus, *Annal.* l. ii.

A third temple of Janus, called "Templum Jani Augusti," was situated in the Velabrum, a little valley, on one side of the Forum Boarium, or ox-market, between the capitol and mount Aventine. It was a square building of the Ionic order, and entirely of marble. Some say, that it was built by Numa, and repaired by Augustus; but others dispute its high antiquity. This was the temple of Janus quadrifrons, or the four-faced Janus; and owed its origin as well as its name, to the following accident, according to Servius. The Romans, he says, after the taking of Faleria in Tuscany, having met with a statue of Janus that had four faces, were desirous to have such a one at Rome; and to honour him the more, they built for him a temple with four fronts, each having twelve niches in it, with a great gate, which denoted the four seasons, and the twelve months of the year. Varro says there were also twelve altars in this temple, dedicated to Janus, each of which represented a month of the year.

JANYSUS, in *Ancient Geography*, a town of Syria, situated on the sea-coast, between Gath and the Sirbonide lakes, according to Herodotus, who adds, that it is at the distance of three days' journey from mount Calius.

JANZE', in *Geography*, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Rennes; 5 miles S. of Chateau-Girons. The place contains 3513, and the canton 12,815 inhabitants, on a territory of 172½ kilometres, in 6 communes.

JAO, a town of Japan, in the island of Nippon; 35 miles S. of Meaco.

JAOURHORISI, a town of Asiatic Turkey, in the province of Diarbekir; 65 miles W. of Nisibin.

JAP. Among Hindoo mystics great merit is ascribed to abstraction, or silent contemplation of the attributes of the deity. This is essayed by enthusiastic individuals most perseveringly; to the length, as is pretended, of complete absorption of all intellectual power, by a sort of spiritual union with the attribute or deity thus propitiated. Another species of abstract devotion is called *Tapas* (which see); but this includes also penance and austerities; whereas jap, we believe, is confined to abstraction, induced by silent and intense contemplation. To promote this, the aspirant sometimes continues with closed eyes, or with his eyes fixed on the tip of his nose. Rosaries are also used in the commencement of this species of devotion, or by those who intend only a short exercise of it. Such rosaries are called jap-mala.

JAPACANI, in *Ornithology*, a species of *Oriolus*; which see.

JAPAN, in *Geography*, a kingdom or empire, consisting of several islands, and situated near the eastern extremity of Asia, between the 30th and 41st degree of N. latitude, and the 131st and the 142d degree of E. longitude. The coast of Japan is, according to Kämpfer, the most dangerous in the whole world; and captain Gore found strong and rapid currents setting along the eastern coast, which he has particularly described. (See Cook's Third Voyage, vol. iii. p. 406.) This empire has been called by Marco Polo Zipangri, or Zipangu; by the inhabitants themselves, Nippon,

Nippon, or Nifon; and by the Chinese Sippon, and Jepuen. The principal islands of which it consists, omitting several of a smaller size, are, towards the S.W., *Kjusiu* (called also Ximo, Saikokf, or the western country), and Sikokf or Xicogo; N.E. of these Nippon or Nifon, the most important; and N. of Nippon, Jesso, Jedso, or Chicha. The Japanese islands probably derive their original population from the Chinese by way of Corea, though their languages are radically distinct. It appears from Kämpfer's account, that the Japanese themselves acknowledge their government and civilization to have been derived from China. This author distinguishes three epochs in their history; the fabulous, the doubtful, and the certain. The latter period commences with the hereditary succession of the ecclesiastical emperors, from the year 660 before the Christian era, and extends to the year of Christ 1585, during which 107 princes of the same lineage governed Japan. At the last period the secular princes assumed the supreme authority. The several reigns are generally pacific, though at distant intervals the Mandchurs and Coreans occasionally invaded Japan, but were always defeated by the valour of the Japanese. An attempt was made in the reign of Gouda by the Moguls, to make a grand invasion of Japan, after having conquered China about fourteen years before. But the formidable fleet, consisting, according to exaggerated report, of 4000 small vessels, which contained an army of 240,000 men, was dispersed by a furious tempest, which the Japanese devoutly ascribed to the gods, their protectors.

The religion of the Japanese is Polytheism, intermixed with an acknowledgment of a supreme creator. Their two principal sects are those of "Sinto" and of "Budso." The first acknowledges a supreme being, far superior to the worship of man, and they therefore adore the inferior deities as mediators. They believe that the souls of the virtuous have a place assigned them immediately under heaven, while those of the wicked wander in the air till they expiate their offences. They abstain from animal food, detest bloodshed, and will not touch any dead body. Thunberg further says, that though it is unnecessary on any occasion to pray to the gods, whom they call "Sin," or "Kami," because they know all things, they have both temples and certain stated holidays. These temples consist of several apartments and galleries, with windows and doors in front, which may be taken away and replaced at pleasure, according to the custom of the country. The floors are covered with straw mats, and the roofs overhang an elevated path, in which people walk around the temples. In these temples there is no visible idol or image for representing the supreme invisible being; but they sometimes keep a little image in a box, which represents some inferior divinity to whom the temple is consecrated. In the centre of the temple is often placed a large mirror of well polished metal, designed to remind those that come to worship, that in like manner as their personal blemishes are faithfully portrayed in the mirror, so do the secret blemishes and evil qualities of their hearts lie open and exposed to the all-searching eyes of the immortal gods. The priests are either secular or monastic. Their festivals and modes of worship are cheerful and gay, for they regard the gods as beings who solely delight in dispensing happiness. The first day of the month is always kept as a holiday; so is the first day of the year: and besides these they have three or four other grand festivals. There are also several orders of monks and nuns.

The sect of "Budso," which is the same with that of Budha, or *Boodh* (which see), was imported from Hindoostan; and passing through Chini and Corea, its tenets have been blended with foreign maxims; but the doctrine

of the metempsychosis remains; wicked souls being supposed to migrate into the bodies of animals, till they have undergone a due purgation.

The doctrine of their philosophers and moralists, called "Shuto," resembles the Epicurean, though it is blended with the tenet of Confucius, that the purest source of pleasure is a virtuous life. This sect admits a soul of the world; but does not allow infinite gods, temples, or religious forms.

Soon after this country was discovered by the Portuguese, missionaries from the Jesuits arrived in 1549, and they and their successors continued to diffuse their doctrine till 1638, when 37,000 Christians were massacred. Before this period various persecutions had occurred; and in 1590 upwards of 20,000 are said to have perished. The Christian faith has, indeed, been so perverted and disgraced by the pride and avarice of the Portuguese, and the vain ambition of the Jesuits, that since the above-mentioned memorable epoch, Christianity has been held in the greatest detestation; and the cross, with its other symbols, are annually trampled under foot; nevertheless, it is a fable that the Dutch are constrained to join in this ceremony.

As to the government of Japan, the "Kubo," or secular emperor, is now the sole monarch; but till near the close of the 17th century the "Dairis," pontiffs or spiritual monarchs, held the supreme authority. The secular prince, in concurrence with the Dairi, confers two honorary ranks, corresponding to those of our noblemen and knights. The Dairi resides at Miaco, and his court remains, though not in its former splendour. Each province is governed by a resident prince, who is responsible to the emperor for his administration. The emperor derives his chief revenue from his own estate, consisting of five inferior provinces and some detached towns. Each prince enjoys the revenues of his fief, with which he supports his court and military force, repairs the roads, and defrays every civil expence. The princes of the first dignity are styled "Daimio," and those of inferior rank "Siomio;" and they are generally hereditary. Upon the whole we may observe, that the constitution of Japan consists of an absolute hereditary monarchy, supported by a number of absolute hereditary princes; whose jealousy of each other's power conspires with domestic pledges to render them subservient to the supreme head. The laws, according to Thunberg, are few, but rigidly and impartially enforced. The code is written in large letters, and posted up in every town and village. Death is the common punishment of crimes, but sentence of death must be signed by the privy council at Jeddo. Parents and relations are answerable for the crimes of those whose moral education they ought to have superintended. The police is excellent; each town having a chief magistrate, and each street a commissary, elected by the inhabitants to guard property and tranquillity. Two inhabitants alternately patrol the streets by night to prevent fire.

The population of the Japanese empire, which is very considerable, is not easily ascertained. Its regular military force is estimated at about half a million, the infantry being 468,000, and the cavalry 58,000, and if the army be doubled, the population may be stated at a million: but it may be more exactly deduced from supposing that it is equal to that of China; and as the former country is only about one-tenth part of the size of the latter, the whole number of people will be about 30,000,000. The character of the people is singularly brave and resolute. The navy scarcely deserves notice. The Japanese vessels are open at the stern, so that they cannot bear a boisterous sea. Spanberg, however, describes two kinds of vessels, one answering to Kämpfer's, and another, which he calls buffes, and in

which, he says, they make their voyages to the neighbouring islands. As Japan consists of islands, and is destitute of a navy, it can have no external political importance; but it has little to apprehend from any neighbouring power. The revenues of the empire may be stated at 28,340,000*l.* sterling, besides the provinces and cities that are immediately subject to the emperor, who, besides these, has a considerable treasure in gold and silver, deposited in chests of 1000 taels, each being equal in value to a Dutch rix-dollar, or about 4*l.* 4*d.* English money.

The Japanese, with respect to their persons, are well made, active, easy in their motions, and having stout limbs, though less strong and athletic than the other northern inhabitants of Europe. The men are of a middling size, with yellowish complexions, though some few, especially the women, are almost white. Their narrow eyes, very much sunk in the head, and high eye-brows, resemble those of the Chinese and Tartars. The eyes incline to black, and the eye-lids form in the great angle of the eye a deep furrow, which discriminates them from other nations. Their heads are generally large, their noses, though not flat, rather thick and short; their hair black, thick, and shining in consequence of the use of oils. The mode of the men's head-dress is singular; the middle part of their heads, from the forehead very far back, is close shaven. The hair remaining round the temples and nape of the neck is turned up and tied on the top of the head into a kind of brush, which is lapped round with white thread and bent backwards. The women preserve all their hair, and, drawing it together on the top of the head, roll it round a loop, and fastening it down with pins, to which ornaments are fixed, draw out the sides till they appear like little wings, behind which they stick a curl. Physicians and priests shave the head entirely, and are thus distinguished from the rest of the people. The fashion of their clothes has undergone little alteration from remote antiquity. They consist of one or more loose gowns, tied about the middle with a sash; those of the women being much longer than the men's; in summer they are very thin, and in winter quilted with silk or cotten wadding. Persons of rank have them made of silk; and those of the lower class of cotton stuffs. Those of the women are ornamented with gold and silver flowers woven into the stuff. At the breast these gowns are open, and they have wide sleeves, which serve as pockets. Some use drawers; but their legs are naked. They wear sandals of rice-straw; in winter they have socks of linen, and in rainy or dirty weather wooden shoes. They never cover their heads except when they travel, and then use conical caps made of straw: for defending themselves against the rain or sun, they use fans or umbrellas. In their sash they fasten the sabre, fan, and tobacco-pipe. Their houses are built with upright posts, crossed and wattled with bamboo, plastered within and without, and white-washed. They are generally of two stories; the roofs are covered with large and heavy pantiles: the floors are covered with planks, on which they lay mats, filled with straw. The whole house consists of one large room, divided by wooden partitions; and their windows are frames of wood, separated into squares, filled up with thin white paper, and sufficiently transparent to answer the purpose of glass. In their rooms they have no kind of furniture; not even beds. Their custom is to lie down upon their heels on the mats, which are always soft and clean. Their victuals are served up on a low board, raised a few inches from the floor, and only one dish at a time. They have mirrors, made of a compound metal, which they use only at their toilets. In the severity of winter, they are obliged to warm their houses from November to March; but they have neither fire-places nor stoves;

JAPAN.

stoves; instead of these they use copper-pots standing upon legs; these are lined on the inside with loam, on which are laid ashes, and upon them lighted charcoal, so prepared as not to render its fumes dangerous. The use of tobacco, probably first introduced by the Portuguese, is very common among both sexes, both old and young; and the smoke is blown out through the nostrils. The first compliment offered to a stranger in their houses is a dish of tea and a pipe of tobacco. Their pipes have mouth-pieces and bowls of brass, or white copper. The hollow of the bowl is so small as scarcely to contain an ordinary pea; and the tobacco is cut as fine as a hair about a finger's length; and is rolled up in small balls like pills, to fit the small hollow in the bowl of the pipe. Every house has a bath, which, as the people are very cleanly, is daily used by the whole family. You seldom meet a man, who has not his distinguishing mark imprinted on the sleeves and back of his clothes, in the same colour in which the pattern is printed. Their usage of names differs from that of all other nations. The family name is never made use of, except in signing solemn contracts, and the particular names by which individuals are distinguished in conversation varies according to the age or situation of the person who makes use of it; so that in some cases, the same person, in his life-time, is known by five or six different names. They reckon their age by even years, not regarding whether they were born at the beginning or the end of a year. In general, the Japanese are a highly civilized people, displaying great diversity of character; but their virtues far outweigh their vices. Obedience to parents and respect to superiors form the characteristic of this nation. Their salutations, or mutual intercourse among equals, are distinguished by civility and politeness; and to these children are early accustomed by the example of their parents. Their pride is useful, as it prevents their stooping to the mean tricks of the maritime Chinese. Though polygamy be allowed, they acknowledge only one wife; the others being merely concubines. Marriages are conducted by the parents or relations; and domestic tranquility is insured by the wife's being under the absolute disposal of her husband, the laws allowing her no kind of claim if she incurs his displeasure. Examples of infidelity are rare. In case of separation, the wife is condemned to the ignominy of having her head always shaven. The marriage ceremony is always performed before an altar, by the bride's lighting a torch, from which the bridegroom kindles another. The bodies of the distinguished dead continue to be burned, while others are buried. Periodical visits are paid to the tombs, besides the festival of lanterns, held as in China, in honour of the departed. As to food and sauces those of the Japanese are very various. Their general drink is "Sarki," or beer made of rice, which last article supplies the place of bread. They use many kinds of vegetables and fruits. Tea is universally used; but wine and spirituous liquors are unknown. The Japanese festivals, games, and theatrical amusements, equal those of the most civilized nations. Dancing girls are common; and the introduction of boys indicates an abominable propensity here, as in China, neither reputed a crime nor a singularity.

The language of the Japanese, of which Thunberg has published a curious vocabulary, seems to have little connection with the monosyllabic speech of the Chinese. In sciences and literature the Japanese are not inferior to few of the oriental nations. In domestic economy, deemed here a science, and also in the history of his country, every person in Japan excels. Astronomy is cultivated, but to no very important and useful purpose. The art of printing is of ancient usage, but they use blocks and not moveable types; and

impress only one side of the paper. They are excellent workmen in iron and copper; and yield to none in manufactures of silk and cotton, and in the art of varnishing wood. Glass is common, and they make telescopes. The porcelain is deemed superior to that of China. Their celebrated varnish is obtained from the "rhus vernix." They have many varieties procured from the bark of a species of mulberry tree; and their woods display incomparable skill. They have many schools, in which the children are taught to read and write; and their education is accomplished without personal chastisement, while courage is instilled by the repetition of songs in praise of deceased heroes.

Although the mountains of Japan prevent the formation of canals, their roads are kept in excellent order, and the proximity of the sea renders inland navigation almost unnecessary. Their inland commerce, being free from imposts, is very considerable; and their external commerce, though confined to the Dutch and Chinese, is extensive. The harbours are crowded with large and small vessels; the high roads with various goods; and the shops are well replenished. Large fairs are held in different places, to which a great multitude of people resort. Their trade with China is the most important, and consists of raw silk, sugar, turpentine, drugs, &c. while the exports are copper in bars, lacquered ware, &c. The Dutch export copper and raw camphire, for which they give in return sugar, ripe cloves, Japan wood, ivory, tin, lead, tortoise-shell, chintzes, and a few other trifles. In their intercourse both with the Dutch and Chinese, they trade with companies of privileged merchants. As the Dutch company have not been accustomed to pay duty in Japan, either on their exports or imports, they used to send an annual present to the court, consisting of cloth, chintzes, succotas, cottons, stuffs, and trinkets. Thunberg represents the profits of the Dutch trade as very inconsiderable, so that the company employed only two ships. The Japanese coin is of a remarkable form: the gold being called "Kobango," the silver, called "Kodama," sometimes represents "Daikok," the god of riches, sitting upon two barrels of rice, with a hammer in his right hand, and a sack at his left. The "Seni" of copper or iron, are strung like the Chinese pieces of similar value.

The climate of Japan is variable. In summer the heat is violent, and if it were not moderated by sea-breezes, would be intolerable. The cold in winter is severe. The falls of rain commence at Midsummer, and to these Japan owes its fertility, and also its high state of population. Thunder is not unfrequent: tempests, hurricanes, and earthquakes, are very common. From Thunberg's thermometrical observations it appears that the greatest degree of heat at Nagasaki, was 98° in August, and the severest cold in January 35°. The face of the country presents, besides some extensive plains, more generally mountains, hills, and valleys; the coast being mostly rocky and precipitous, and invested with a turbulent sea. It is also diversified with rivers and rivulets, and many species of vegetation. The soil, though barren, is rendered productive by fertilizing showers and manure, and by the operations of agricultural industry. Agriculture, as Thunberg informs us, is here well understood, and the whole country, even to the tops of the hills, is cultivated. Free from all feudal and ecclesiastical impediments, the farmer applies himself to the culture of the soil with diligence and vigour. Here are no commons, and it is a singular circumstance, that if any portion be left uncultivated, it may be seized by a more industrious neighbour. The Japanese mode of manuring is to form a mixture of all kinds of excrements, with kitchen refuse, which is carried in pails into the field, and poured

poured with a ladle upon the plants, when they have attained the height of about six inches, so that they thus instantly receive the whole benefit. They are also very attentive to weeding. The sides of the hills are cultivated by means of stone walls, supporting broad plats sown with rice or esculent roots. Rice is the chief grain: buck-wheat, rye, barley, and wheat being little used. A kind of potatoe (*convolvulus edilis*) is abundant with several sorts of beans and peas, turnips, cabbages, &c. From the seed of a kind of cabbage lamp oil is expressed; and several plants are cultivated for dyeing; with the cotton shrubs, and mulberry trees for the food of silk-worms. The varnish and camphire trees, the vine, the cedar, the tea tree, and the bamboo reed, not only grow wild, but are planted for numerous uses.

The principal rivers of Japan are the Nogafa, Jedogawa, Ojingawa, Fusigawa, Sakgawa, Jodo or Yodo, Ujin or Ojin, Oomi, and Aska. One of the chief lakes is that of Oitz, said to be 50 Japanese leagues in length, each about an hour's journey on horseback, but of inconsiderable breadth. From it flows two rivers; and near it is the delightful mountain of Jesan, which is esteemed sacred, and is said to present not less than 3000 temples. The principal Japanese mountain is that of Fusi, covered with snow almost throughout the year. The Fakonie are in the same quarter, surrounding a small lake of the same name. Many of the mountains are covered with wood. There are several volcanoes; and they generally abound with evergreen trees, and crystalline springs. Near Firando there is a volcanic island; and in the province of Figo there is a volcano, which constantly emits flames, and another, which was formerly a coal-mine, in the province of Tfikuser.

In the whole empire of Japan there are neither sheep nor goats; and, in general, there are but few quadrupeds. The food of the Japanese consists almost entirely of fish and fowl, with vegetables. Some few dogs are kept from motives of superstition; and cats are favourites of the ladies. Hens and common ducks are domesticated for the sake of their eggs. The mineralogy of Japan has been particularly stated by Thunberg: from whom we learn, that gold and silver are to be found in abundance; copper is also quite common: but iron is scarcer than any other metal in this country. Of that which is found they manufacture scymitars, arms, scissors, knives, and other necessary implements. Amber, brimstone, pit-coal, agate, asbestos, porcelain clay, flesh-coloured steatite, pumice, and white marble are enumerated among the productions of Japan. Many small isles are dependents on this empire, particularly in the S. and E.; among which is Fatilio, the place of exile for the grandees. For other particulars we refer to Kämpfer, Thunberg, Phil. Transf. vol. lxx. and Pinkerton's Geography, vol. ii.

JAPAN Earth. (See **CATECHU.**) The extract prepared in the manner, stated under that article, is much used by the natives of Hindoostan in dyeing and painting chintz and other cloths: combined with the vitriolic salts, a black colour is produced: mixed with oil they paint the beams and walls of houses to preserve them, and to defend them from the destructive white ants; and it is sometimes mixed with their wall-plaster. The extract is used only medicinally as a cooling medicine, and when too profusely used, it is said to be a destroyer of venereal pleasures. It is also given at the rate of two ounces a day to tame vicious horses. This extract is likewise a principal ingredient in one of their ointments, of great repute, composed of blue vitriol, four drams; Japan earth, four ounces; alum, nine drams; white resin, four ounces; which are reduced to a fine powder, and

mixed with the hand, adding of olive oil ten ounces, and water sufficient to bring the mass to the proper consistence of an ointment: this ointment is used in every sore from a fresh wound to a venereal ulcer. Med. Obs. and Inq. vol. v. art. 16. The antiseptic quality of catechu appears from the experiments of sir John Pringle.

The London college formerly directed Japan earth to be made into troches by beating it with an equal weight of gum arabic, and four times the weight of both, of sugar of roses, and a sufficient quantity of water: but the college of Edinburgh ordered one part of the Japan earth, four of gum tragacanth, and twenty-four of fine sugar, with rose-water. The *tinctura Japonica*, or *tinctura Catechu*, is prepared by digesting, for fourteen days, three ounces of the extract of catechu, and two of cinnamon bark bruised, in a quart of proof spirit; and this tincture may be given in doses of two or three spoonfuls. The infusion of catechu is prepared by macerating for an hour in a covered vessel $2\frac{1}{2}$ drams of the extract, half a dram of bruised cinnamon bark, in half a pint of boiling water. This is one of the best forms in which catechu can be exhibited, as it is thus at once freed from its impurities, and improved by the addition of the aromatic. For the method of preparing Japonic confection, see **CONFECTION.** Japan earth dissolved in water is of a full brown colour, a little inclined to red. It is sometimes used in water-painting, where it has a good effect; but its gummy texture renders its use improper in oil.

JAPANNERS GILDING. See **GILDING.**

JAPANNING, the art of varnishing, and drawing figures on wood, &c. after the same manner as the workmen do who are natives of Japan.

The varnish made and used in China and Japan is composed of turpentine, and a curious sort of oil they have. This they mix and boil up to a proper consistence, and this never causes any swelling in the hands or face of the people who use it. The swellings in these parts, which often happen to those who work the lacquered ware, and sometimes to those who only pass by the shops of these people, is from the lack, and not the varnish. This lack is the sap or juice of a tree, which runs slowly out on cutting the lower part of the trunk of the tree, and is received in pots set on purpose under the incisions. The juice, as it flows from the tree, is of the colour and consistence of cream; and as it comes in contact with the external air, its surface becomes black. As they only use it when black, their method of preparing it is to set it out in the open air, in large flat bowls, in which it looks all surface; but that the whole may be of the same uniform colour, they continually stir it for twenty-four hours together, with a smooth piece of iron. By this means the whole becomes thicker than it was before, and of a fine deep black. When it is in this state, they powder some burnt boughs of trees, and mix them thoroughly with it; and then spreading it thin over any board which they intend to japan, it is soon dried in the sun, and is then absolutely harder than the board it is laid on. When this is thoroughly dry, they polish it over with a smooth stone and water, till it is as smooth as glass; and then wiping it very dry, they lay on the varnish, made of oil and turpentine, and boiled to a proper consistence for this kind of work.

If the work is to be of any other colour than black, that colour is to be mixed with the varnish, and then the whole spread on very thinly and evenly; for on this laying it on depends the principal art of varnishing. When there are to be figures in gold and silver, these must be traced out with a pencil in the varnish over the rest of the work; and when this varnish is almost dry, the leaf-gold or leaf-silver is

JAPANNING.

to be laid on, and polished afterwards with any smooth substance.

The substances which admit of being japanned are almost those of every kind that are dry, and not too flexible; as wood, metals, leather, and paper prepared. Wood and metals require no other preparation, except that of cleaning their surfaces, and rendering them perfectly even. But leather should be securely strained either on frames or on boards; and paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning, till it is converted into *papier maché*, or wrought, by other means, into an inflexible form. One principal variation in the manner of japanning is the using or omitting any priming or under-coat on the work to be japanned. In the older practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the *papier maché*. But in the Birmingham manufacture it has always been rejected. The advantages attending the use of such priming are, that it makes a saving in the quantity of varnish necessary to be used, and that it helps to form, by means of rubbing and water-polishing, an even surface for the varnish. However, when an under-coat of size is used, the japan coats of varnish and colour will be always liable to crack and peel off, and are less durable than those which are formed without such priming. This difference is observable in comparing the wear of the Paris and Birmingham snuff-boxes.

The laying in of the colours in varnish or oil instead of gum-water, is another variation from the method of japanning formerly practised. But if the colours are tempered with the strongest isinglass size and honey, instead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the common old japan work, the best kinds of the true japan excepted. The proper japan grounds are either such as are formed by the varnish and colour, where the whole is to remain of one simple colour; or by the varnish, either coloured, or without colour, on which some painting, or other decoration, is afterwards to be laid. The priming, or under-coat, which is sometimes used in japanning, is of the same nature with that called clear-coating, practised by the house-painters; and consists in laying on and drying in the most even manner a composition of size and whiting. The common size, (see *SIZE*,) has been generally used; but in nicer works, the gloves or the parchment size, improved by adding a third of isinglass, will be preferable. The work should be prepared for this priming, by being well smoothed with fish-skin, or the glass-shaver; and by being brushed over once or twice with hot size diluted, when it is of the common strength, with two-thirds of water. The priming, formed of a size whose consistence is between that of the common kind and glue, mixed with as much whiting as will give it a sufficient body of colour to hide the surface on which it is laid, should be laid on evenly with a brush. Two coats of this priming will generally be sufficient; but if, upon trial with a fine wet rag, it will not receive a proper water-polish, another coat or more must be given it. And after the last coat but one is dry, the work should be smoothed by rubbing it with the Dutch rushes. When the last coat is dry, the water-polish should be given, by passing over every part of it with a fine rag, a little moistened, till the whole appears perfectly plain and even. The work is then ready to receive the painting or coloured varnish.

When wood or leather is to be japanned, without priming, it may be prepared by laying on two or three coats of coarse

varnish, made by dissolving two ounces of feed-lac, and as much rosin, in one pint of rectified spirit of wine: and then the proper japan-ground must be laid on. As metals never require to be under-coated with whiting, they must generally be treated in the same manner as wood or leather.

For white japan grounds.—Prepare a white varnish, by working and grinding flake white, or white lead, with a sixth part of its weight of starch, and drying the mixture; then temper it into a consistence fit for spreading with mastic varnish, (see *VARNISH*,) or compound it with gum anime; lay this on the body to be japanned, previously prepared with or without the under-coat of whiting: and varnish it over with five or six coats of the following varnish, formed by dissolving two ounces of the clearest and whitest grains of feed-lac, and three ounces of gum anime, pulverized, in about a quart of spirit of wine, and straining off the clear varnish.

A very good varnish, free from brittleness, may be obtained by dissolving as much gum anime as the oil will take in old nut or poppy oil, boiled gently when the gum is put into it. The ground of white colour may be laid on in this varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentine when it is used.

Blue japan grounds may be formed of bright Prussian blue; or of verditer glazed over with Prussian blue, or smalt. The colour may be best mixed with shell-lac varnish, and brought to a polishing state by five or six coats of varnish of feed-lac. But when a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed, in the case of white grounds, must be pursued.

Red japan grounds.—For a scarlet ground, vermilion may be used: but this is less beautiful than the crimson produced by glazing it over with carmine or fine lake, or rose-pink. For a very bright crimson; instead of glazing with carmine, the Indian lake, called safflower, should be used, dissolved in the spirit of which the varnish is compounded. But in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used; which will render this a cheaper method than the using of carmine. If the highest degree of brightness be required, the white varnishes must be used.

Yellow japan grounds.—For bright yellow grounds, king's yellow, or turpeth mineral should be used, either by themselves, or mixed with fine Dutch pink. The effect may be still more heightened by dissolving powdered turmeric root in the spirit of wine, of which the upper or polishing coat is made; which spirit of wine must be strained off from the dregs, before the feed-lac be added to it for forming the varnish.

Yellow grounds may likewise be formed of the Dutch pink only.

Green japan grounds may be produced by mixing king's yellow and bright Prussian blue; or turpeth mineral and Prussian blue. A cheap, but fouler kind may be had from verdigris with a little of the fore-mentioned yellows, or Dutch pink. But if a very bright green be wanted, the crystals of verdigris, called distilled verdigris, should be used, and their effect will be heightened by laying them on a ground of leaf-gold. Any of these may be used with good feed-lac varnish, but will be brighter with the white varnish.

Orange-coloured japan grounds may be formed by mixing vermilion or red lead with king's yellow, or Dutch pink: or orange lake, or red orpiment will make a brighter orange ground than can be produced by any mixture.

Purple japan grounds may be produced by the mixture of lake

lake and Prussian blue; or a fouler kind, by vermilion and Prussian blue.

Black japan grounds may be formed, without heat, by either ivory-black, or lamp-black, which may be laid on with the shell-lac varnish: and the upper or polishing coat may be common feed-lac varnish.

For forming the common *black japan grounds* on iron or copper by means of heat, the work must be first painted over with drying oil, and a little lamp black; and when it is moderately dry, put into a stove of such a degree of heat, as will change the oil black, without burning it. The heat should be slowly augmented and continued for a long time, in order to harden the coat of japan. This kind of varnish requires no polish.

Tortoise-shell japan grounds.—The best is made by means of the following varnish; prepared by boiling together one gallon of good linseed oil and half a pound of umbre, till the oil becomes very brown and thick; by straining the mixture through a coarse cloth, and setting it again to boil, till it acquires the consistence of pitch. On the piece of work to be japanned, well-cleaned, let vermilion, tempered with shell-lac varnish, or with drying oil diluted with oil of turpentine, be laid thinly on the places designed to imitate the more transparent parts of the tortoise-shell.

When the vermilion is dry, brush over the whole with the black varnish, tempered to a due consistence with oil of turpentine; and when it is set and firm, put the work into a stove, where it may undergo a very strong heat, and be continued for a considerable time. This method, proposed in one of Kunkel's recipes, has been revived in the Birmingham manufactures, where it is pursued in forming the ground of snuff-boxes, dressing boxes, tea-waiters, &c. This ground may be decorated with painting and gilding in the same manner as any other varnished surface.

Japan-work ought properly to be painted with colours in varnish. (See *PAINTING in Varnish* and *VARNISH*.) The colours are now most frequently tempered in oil, having a fourth part of its weight of gum anime previously dissolved in it. This oil should be well diluted with spirit of turpentine when it is used, that the colours may be laid more evenly and thin, and thus fewer of the polishing coats of varnish will be necessary. When water-colours are laid on grounds of gold, so as to have the effect of embossed work, they are best prepared by means of isinglass size corrected with honey or sugar-candy. The body of which the embossed work is raised may be formed of a very strong gum-water, thickened to a proper consistence by bole armeniac and whiting, in equal parts, which being laid on in the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the isinglass size, or in the general way with shell-lac varnish.

The finishing part of japanning consists of laying on and polishing the outer coats of varnish. This is in general best done with common feed-lac varnish. (See *VARNISH*.) But where brightness is principally regarded, the feed-lac must give way to the whiter gums. When hardness, tenacity, and brightness are desired, the mixed varnish made of the picked feed-lac, already proposed under *white Japan grounds*, should be adopted. The pieces of work to be varnished should be placed near a fire, and made perfectly dry; the varnish should then be rubbed over them with proper brushes; first one coat, and when this is dry another should be laid over it; and this operation must be continued at least five or six times. When a sufficient number of coats is thus laid on, the work is fit to be polished, which must be done, in common cases, by rubbing it with a rag dipped in tripoli, commonly called rotten-stone, finely powdered;

but toward the end of the rubbing, a little oil of any kind should be used with the powder: and when the work appears sufficiently bright and glossy, the oil alone should be used to clear it from the powder, and to give it a brighter lustre. For white grounds, fine putty or whiting should be used instead of the tripoli. For gilding of Japan work, see *Japanners GILDING*. Handmaid to the Arts, vol. ii. p. 497, &c.

JAPARA, in *Geography*, a sea-port town of the island of Java, situated on a peninsula on the N. coast; the harbour is formed by a river of the same name, and is capable of receiving a great number of ships. The Dutch have a resident here for the purchase of timber, cotton, rice, and indigo. About four miles S. from this town is the ancient city of Japara, once the capital of a kingdom. Not far from this is an old and ruinous Moorish temple of stone, with beautiful sculpture of imagery and foliage: this temple is more than 300 years old. S. lat. 6° 28'. E. long. 110° 54'.

JAPENE, a town of Africa, in the kingdom of Jagra.

JAPHA, in *Ancient Geography*, a city of Galilee, near Jotapata, according to Josephus; probably the same with Japhia (Josh. xix. 12.) belonging to the tribe of Zebulun. It was strongly fortified; and was besieged and taken by Trajan, the father of the emperor of this name, who massacred all the inhabitants who were capable of bearing arms, and made slaves of the women and children, A. D. 67. See *JOPPA*.

JAPHETH, in *Scripture Biography*, the eldest son of Noah, who was born in the 500th year of this patriarch, and who had seven sons, *viz.* Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras, who "peopled the isles of the Gentiles, and settled in different countries, each according to his language, family, and people." (Gen. x. 5.) By the "isles of the Gentiles," the Hebrews understood the isles of the Mediterranean, and other countries whither they could go by sea only, as Spain, Gaul, Italy, Greece, and Asia Minor; and with respect to these seven sons of Japheth it is very generally supposed that Gomer was the father of the Cimbri, or Cimmerians; Magog of the Scythians; Madai of the Macedonians or Medes; Javan of the Ionians and Greeks; Tubal of the Tiburenians; Meshech of the Muscovites or Russians; and Tiras of the Thracians. From the LXX, Eusebius, the Alexandrian Chronicle, and Austin, we learn that Japheth had an eighth son called Eliza.

The portion of Japheth was Europe and part of Asia, whose descendants possessed all Europe, all the islands in the Mediterranean, the whole of Asia Minor, and the northern parts of Asia. Noah, in his benediction of Japheth, prophesies concerning him (Gen. ix. 27.), "God shall enlarge Japheth; and he shall dwell in the tents of Shem; and Canaan shall be his servant." This prediction was accomplished when the Greeks and Romans, who were descendants of Japheth, not only subdued Syria and Palestine, but also pursued and conquered such of the Canaanites as were any where remaining, as, *e. g.* the Tyrians and Carthaginians, the former of whom were received by Alexander and the Grecians, and the latter by Scipio and the Romans. In the original of the prediction, "God shall enlarge Japheth," there is a manifest allusion to his name, which signifies enlargement. This was fulfilled both with regard to the territory and children of Japheth. The territories of Japheth's posterity were very large; for besides all Europe, extensive as it is, they possessed the Lesser Asia, Media, part of Armenia, Iberia, Albania, and those vast regions towards the north, which anciently the Scythians inhabited, and which now the Tartars inhabit; and it is not improbable that the

new world was peopled by some of his northern descendants passing thither by the straits of Anian. The enlargement of Japheth also denoted a numerous progeny, as well as ample territory; for Japheth, as we have observed, had seven sons, whereas Ham had only four, and Shem only five.

In profane authors Japheth is known under the name of "Japetus," who is made by the poets father of heaven and earth; whose habitation was in Thessaly, where he became celebrated for his power and violence. Japetus married a nymph named Alia, by whom he had four sons, Hesperus, Atlas, Epimetheus, and Prometheus, who were all very famous among the ancients. Neptune is also, among ancient mythologists, a memorial of Japheth. As Noah divided the earth between Shem, Ham, and Japheth, Saturn divided the world between his three sons, Jupiter, Pluto, and Neptune.

JAPONIC CONFECTION. See CONFECTION.

JAPU, in *Ornithology*, the name of a Brazilian bird, of the woodpecker kind, called also *jupujuba*. See *ORIOBUS persicus*.

JAQUARIPE, in *Geography*, a river of Brasil, which runs into the Atlantic, S. lat. 4°.

JAQUE-LAHOU, a town of Africa, on the Ivory coast; 20 miles E. of cape Lahou.—Also, a river of Africa, which runs into the Atlantic, N. lat. 5° 20'. W. long. 5° 5'.

JAQUEJAG, a town of Africa, on the Ivory coast; 43 miles E. of cape Lahou.

JAQUEMEL, a town of Hispaniola, on the S. coast, in a bay to which it gives name. N. lat. 18° 17'.

JAQUEMEL, *Cape*, a cape on the S. coast of the island of Hispaniola. N. lat. 18° 14'. W. long. 73° 25'.

JAQUES, CAPE, a cape on the coast of Chiampa, at the mouth of the river Cambodia. N. lat. 10° 40'. E. long. 107° 30'.

JAQUES, or *Jask, Cape*, a cape at the western extremity of the gulf of Persia, at its entrance from the Arabian sea. This is known by a remarkable square rock, a few miles N. of it. It is a low sandy desert, with a few shrubs on it; and it is called by Le Brun cape St. James. N. lat. 25° 39'. E. long. 57° 20'.

JAQUES, *St.*, a town of Mexico, in the province of Vera Paz.

JAQUESY, a town on the N. coast of Hispaniola; 13 miles E.S.E. of cape François.

JAQUET, CAPE, a cape on the coast of Guzerat, in the gulf of Cutch. N. lat. 23°. E. long. 69'.

JAR, or JARR, from the Spanish, *jarra*, or *jarro*, which signify the same, an earthen pot or pitcher, with a big belly, and two handles.

JAR is used for a sort of measure, or fixed quantity of divers things.—The jar of oil is from 18 to 26 gallons: the jar of green-ginger is about 100 pounds weight, of wheat 52 pounds.

JAR, a measure of Lucca oil is 25 wine-gallons = 5775 cubic inches = 3.3420 cubic feet = .12378 cubic yards = 11.62456 cubic links.

JAR, or *Jiar*, in *Chronology*, one of the Hebrew months, answering to our April. It was the eighth month of the civil year, and the second of the sacred, and had only 29 days. On the 23d day of this month the Jews kept a festival in memory of the purification of the temple by Judas Macabæus. (2 Mac. xiii. 51.) On the 25th they mourn the death of Samuel.

JAR. *To jar* is a verb which implies to disagree, to sound harshly and untunably.

JAR, for measuring musical intervals by water. See *HYPPASUS*.

JARA, in *Geography*, a town of Syria, in the pachalic of Damascus; 15 miles E. of Safet.—Also, a town of Sweden, in the province of Smaland; 10 miles S.W. of Jonkioping.

JARAMEY, an inland town of Africa, in the kingdom of Yani.

JARAMOTH. See *RAMOTH*.

JARANI, a town of Dalmatia; 10 miles S.E. of Marcarfa.

JARARA-COAYPITINGA, in *Zoology*, the name of a species of serpent found in America, not much unlike the common viper, and equally venomous. Its tail is of a paler colour than the rest of the body, and thence it has its name; which, in the language of the natives, expresses this property.

JARARA-EPEBA, the name of a species of American serpent, of a brown colour, but variegated by a very beautiful undulated red line, running all along the back like a chain. Ray.

JARARACA, the name of a species of serpent, common in America. It is a very short serpent, seldom exceeding a foot and a half in length. It has some prominent veins on its head, and is of a dusky brownish colour, variegated with red and black spots. It is a very poisonous species. The natives use for a remedy the root of a plant called caatia, and by the Portuguese herva de cobros. Ray.

De Laet has described four different species of this serpent.

JARARACUCU, the name of an American species of serpent. It is of the viviparous kind, and produces a great number of young; thirteen having been found perfectly formed in the body of a female of this kind; it grows to between two and three feet long, and has, like the other poisonous serpents, very large and long teeth, which are hid in the gums, and contain a yellow poisonous liquor. These it only exerts at the time of biting, and its poison is so fatal that it will destroy a man within four and twenty hours. Ray.

JARBARRY, in *Geography*, a town of Hindooostan, in Bengal; 20 miles N. of Dinagepour. N. lat. 25° 58'. E. long. 88° 40'.

JARBO, a town of Sweden, in West Gothland; 25 miles N. of Uddevalla.

JARBOAS, a town of Sweden, in Westmanland; 45 miles W.N.W. of Stroemsholm.

JARCHI, SOLOMON BEN, in *Biography*, a famous rabbi, was born at Troyes, in Champagne, in the year 1104. He is known in history by the surnames of Ifaaki, Ifarchi, and Raschi, and was the son of a rich merchant and learned rabbi, named Ifaac, who was also at the head of a college founded at Troyes for the instruction of the Jews, in the languages, medicine, and theology. Solomon had the best education that could be given him, and when he had finished his studies he went on his travels for farther improvement. On his return, and when he had attained to his thirtieth year, he formed a plan, under the direction of his father, of writing a history of the Jews, from the period of the destruction of Jerusalem. With this view he left his native city in 1133, and spent seven years in travelling through Italy, Egypt, Greece, Asia Minor, Palestine, Armenia, and Persia, to collect materials among the Jews themselves, who had been dispersed in all parts of the globe. In Egypt he met with the celebrated Maimonides, who advised him to relinquish the undertaking, and to leave the execution of it to more favourable times. On his return to Troyes, finding that his father was dead, and, perhaps, aware of the difficulties

which he had to contend with, he followed the counsel of Maimonides, locked up his collections, and applied himself to give an illustration and commentary on the collections of Talmudical traditions. This work being received with great applause, he next published "Glosses on the Jerusalem and Babylonish Talmuds;" and finally he wrote moral illustrations of the bible, which were printed in the great bibles of Venice and Basil, and were inserted in De Lyra's great work on the sacred volume. Jarchi died at Troyes in 1180, in the 76th year of his age. He was buried with every mark of respect in the Jewish cemetery near that city, and when that nation was afterwards driven out of France, they carried his remains with them into Bohemia, and interred them at the Prague. He is mentioned by Reland as one of the best interpreters of scripture, who says, that when any difficulties occurred to him in the Hebrew text, the illustrations of rabbi Jarchi appeared more satisfactory to him than those of the greatest critic, or any other commentator. Moreri. Bayle..

JARDES, or **JARDONS**, in the *Manege*, are callous and hard swellings in the hinder legs of a horse, seated on the outside of the hough, as the spavin is on the inside. Jardons lame a horse, unless you give the fire dexterously and betimes.

JARDIN, **KAREL DU**, in *Biography*, an agreeable painter of scenes in common life, in a style partaking of Berchem's and Wouverman's manners united. He was born at Amsterdam in 1640, and was a disciple of N. Berchem; but finished his studies in Italy, where he spent the greater part of his life, and died at Venice in 1678.

The compositions of this master are simple. A few figures with a horse or cattle, and a small landscape back-ground, generally comprise the whole; and they are most usually on a small scale. His colour is rich and bright; and frequently very agreeable; expressing happily the glow and effect of sun-shine; or the duller light of a lowering day. The defect of his works is somewhat of hardness in the touch, which, however, is very delicate and neat; and has great spirit and brilliancy.

JARDINES, **Los**, in *Geography*, small islands and rocks near the south coast of Cuba. N. lat. 21° 18'. W. long. 81° 50'.

JARDINS, **MARY CATHERINE DES**, in *Biography*, a celebrated novel writer, was born at Alençon in 1640. An early adventure in gallantry having obliged her to quit her native town, she went to Paris in her twentieth year, where she soon became known as a dramatic writer and novelist. She also attracted the notice and engaged the affection of captain Villedieu, who was already married, but from whom she took the name of madame de Villedieu, by which she has been chiefly known. The sudden death of a friend inspired her with pious sentiments, which caused her to retreat to a convent; but when it was known that her conduct had not been of the most correct kind she was dismissed. On her return to the world she became acquainted with the marquis de la Chaffe, and married him. She died in 1683. Her works were printed in a collective form, in twelve volumes, in the year 1702. They contain a number of novels, or short romances, which were much read, and contributed to set aside the long serious romances at that time in fashion. She is one of those writers who, by ascribing fictitious adventures to known characters of antiquity, have so much contributed to confound truth and falsehood. Bayle.

JARECA, or **YARECA**, in *Geography*, a town of Syria, in the Desert; 18 miles N.N.E. of Palmyra.

JARFSO, a town of Sweden, in Helplingland; 36 miles N.W. of Soderhamn.

JARGEAU, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Orleans, situated on the Loire; 9 miles S.E. of Orleans. The place contains 2441, and the canton 7724 inhabitants, on a territory of 150 kilometres, in 10 communes.

JARGEPOUR, a town of Hindoostan, in the circar of Cuttack; 35 miles N.E. of Cuttack.

JARGON, in *Mineralogy*. See **ZIRCON** and **GEMS**.

JARGONG, in *Geography*, a town of Hindoostan, in Bengal; 18 miles S.W. of Midnapour.

JARGROD, a town of Poland, in the palatinate of Braclaw; 36 miles S.S.W. of Braclaw.

JARHISAR, a town of Asiatic Turkey, in Natolia; 40 miles N.W. of Kiutaja. N. lat. 39° 43'. E. long. 30° 3'.

JARJARIA, a town of the Arabian Irak, on the Tigris; 60 miles S.S.E. of Bagdad.

JARIBOLUS, *Ἰαριβόλος*, in *Antiquity*, one of the Palmyrenian gods. This deity, in all appearance, had the same attributes with the God Lunus; for *Jari* signifies the month over which the moon presides. Mem. Acad. Inscript. tom. iii. p. 177.

JARISZOW, in *Geography*, a town of Poland, in the palatinate of Braclaw; 56 miles S.W. of Braclaw.

JAR-KEVI, a town of Asiatic Turkey, in Natolia; 30 miles S.W. of Augura.

JARLSBERG, a town of Norway, capital of a district, abounding in mines, in the diocese of Aggerhuus; 5 miles N. of Tonsberg.

JARMAN, a town of Africa, in Sahara. N. lat. 18° 57'. E. long. 6° 26'.

JARNA, a town of Sweden, in Dalecarlia; 35 miles W.S.W. of Fahlun.

JARNAC-CHARENTE, a town of France, in the department of the Charente, and chief place of a canton, in the district of Cognac, situated on the Charente; 6 miles E. of Cognac. The place contains 1725, and the canton 10,420 inhabitants, on a territory of 162½ kilometres, in 14 communes.

JARNAGES, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Bouffac; 16 miles S. of Bouffac. The place contains 727, and the canton 6118 inhabitants, on a territory of 207½ kilometres, in 12 communes.

JARNOWICH, or **GIORNOVICH**, in *Biography*, one of the most agreeable performers on the violin of the present age, or perhaps of any age. He delighted, if not astonished more, the oftener he was heard. No one had more facility of execution, or executed with more grace the greatest difficulties. He composed concertos, which, without appearing learned, or dividing the attention by the contrivance of the inward parts, cherish the melody of the principal violin, and give a relief to the most rapid as well as the most pathetic periods of the cantilena. But such was the brilliancy of his bow, that he always seemed playing with his part. His slow movements never border on psalmodia, but have always a "unity of melody" of the most interesting and engaging kind, so complete in taste and variety, as to stand in no need of graces or embellishments to make it palatable. In his manner of playing, in the carriage of himself and his instrument, there was a something for which we have no elegant word; an ignorant and vulgar critic would perhaps call it a *flang*. If this performer, while in England, had been less capricious, and of a temper more practicable, he might have governed the musical world as despotically as Giardini had done before, and been a much richer man than caprice and extravagance

gance would ever allow him to be. Though the French, with their usual ingenuity of disguising names, call him Jarnowich, he wrote Giornovich, being by birth a Sicilian.

This admirable performer, after quitting England, resided a considerable time at Hamburgh, where he was no less remarkable for his performances on the violin, than as a sword's-man, a dancer, a billiard-player, and for feats of activity of all kinds. When in England, at the same time as the accomplished creole, St. George, he was a match for him with the foils, and more than a match for the fencing-masters. And being a man of a difficult commerce, and very sensible of his superiority in the use of arms, he was often captious and insolent in society, and wished for nothing more than opportunities of manifesting his talents. He had fought several duels in France and Russia before his arrival in England; and after quitting our island, he was wounded in the arm at Hamburgh, in an affair of honour, so severely, that it was thought both his bow-hand and sword-arm were so disabled, as never more to allow him either to fiddle or fight. And some years elapsed before he was again heard of as a musician. During which tranquil period he seems to have subsisted as a gambler, being dextrous at all kinds of games. But in 1804, going again to Russia, accounts came to this country that he died at a billiard table at Petersburg, the latter end of that year.

Though Jarnowich's taste, fancy, and performance on the violin were so excellent, as a composer, he seems to have been self-taught, and not a regular bred contrapuntist. It has been said, that in his early youth he had been an apprentice to a rope-dancer and tumbler; which will account for his extraordinary agility, feats of activity, and dancing talents. He danced a hornpipe, not only better than any of our sailors, but as well as Nancy Dawson, or Slingsby. The rest of his history is but little known. He arrived, at an early period of his life, at Paris, and delighted and astonished all hearers. In 1780 he had quitted that capital to visit other countries. M. Laborde, in his "Essais sur la Musique," tom. iii. published that year, gives him a great and just character for his captivating performance on the violin; but seems to over-rate his concertos, when he says they were as learned as agreeable.

JARNSKOG, in *Geography*, a town of Sweden, in W. r neland; 38 miles N.W. of Carlstadt.

JARNUS, a town of Egypt; 13 miles N. of Abu-Girgé.

JAROCZOW, a town of the duchy of Warsaw; 20 miles W.N.W. of Kalish.

JAROMIRZ, a town of Bohemia, in the circle of Konigingratz; nine miles N. of Konigingratz.

JARON, or JARRON, a town of Persia, in the province of Farsistan, on the road from Ispahan to Gamron. The houses are constructed of earth, and the mosques are mean. In the town and gardens are many palm-trees, highly esteemed by the Persians for their beauty and fruit, and furnishing a profitable article of trade; 80 miles S. of Schiras. N. lat. 28° 35'. E. long. 52 42'.

JAROS, a small island of the Mediterranean, near the coast of France. N. lat. 43° 12'. E. long. 6 25'.

JAROSLAVL, a city of Russia, and capital of a government, deriving its name from it; it is large, well built, and commercial, situated on the Volga; containing eighty churches, three convents, above 6000 houses of wood, and more than 20,000 inhabitants. It abounds with manufactures of Russia leather, in which 6000 artisans are employed; first established by Czar Peter I., and rendered very flourishing by Ernest John, duke of Courland, during

his exile in this place; 144 miles N.N.E. of Moscow. N. lat. 37 35'. E. long. 30 14'.

JAROSLAVSKOI, a government of Russia, bounded on the E. by the government of Kostrom, on the N. by those of Vologda and Novgorod, on the W. by Tverskoi, and on the S. by Vladimir; about 160 miles in length, and from 30 to 110 in breadth. The capital is Jaroslavl.

JAROSLAW, a town of Austrian Poland, in Galicia; 48 miles W.N.W. of Lemberg.

JAROSOT, a town of Poland, in the palatinate of Kiev; 36 miles W. of Bialacerkiev.

JAROTSIN, a town of the duchy of Warsaw; 14 miles W.N.W. of Kalish.

JAROU-SANPOO, a branch of the Sanpoo, or Burham-pooter river, which rises in Thibet; 30 miles E. of Darmadijira.

JARPOUR, a town of Hindoostan, in Bagiana; 24 miles E. of Bahbelgong.

JARRA, a town of Africa, in the Moorish kingdom of Ludamar; the town is extensive, the houses are built of clay and stone intermixed, the clay answering the purpose of mortar; the majority of the inhabitants is composed of Negroes, from the borders of the southern states, who prefer a precarious protection under the Moors, which they purchase by a tribute, to continuing exposed to their predatory hostilities. The tribute they pay is considerable; and though they manifest towards their Moorish superiors the most unlimited submission and obedience, they are treated by them with the utmost indignity and contempt. N. lat. 15° 5'. W. long. 7° 13'.

JARRAH, a town of Hindoostan, in Oude; 14 miles S. of Allahabad.—Also, a town of Hindoostan, in the circuit of Chandail; 30 miles W. of Saipour.

JARRETIER, in the *Manege*, an obsolete French word, signifying a horse whose houghs are too close together; which is now expressed in French by *crochu*, i. e. crooked or hooked.

JARRIE, LA, in *Geography*, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of La Rochelle; six miles S. E. of La Rochelle. The place contains 1163, and the canton 9729 inhabitants, on a territory of 157½ kilometres, in 14 communes.

JARS, GABRIEL, in *Biography*, was born at Lyons in 1732. His father was concerned in the mines of the Lyonnais, and as the son discovered an early attachment to the art of metallurgy, he was placed in the establishment for the construction of bridges and causeways, in order to obtain a practical knowledge of the business of a miner and civil engineer. He was soon fixed on as a fit person for introducing improvements into the art of working mines in France, and with this view he visited and strictly scrutinized most of the mines on the continent, and those in Scotland and England. On his return he set about arranging the observations which he had been able to make, when a sudden death in 1769 broke off his designs. His works were published by his brother at Lyons, entitled "Voyages Metallurgiques, ou Recherches et Observations sur les Mines et Forges de Fer, la Fabrication de l'Acier, celle du Fer-blanc, et plusieurs Mines de Charbon de Terre, &c." in three vols. 4to. They are said to form a complete collection of theoretical and practical metallurgy down to the time in which the observations were made. Gen. Biog.

JARUS, in *Botany*, a name by which some authors have called the *arum*, or *wake-robin*.

JASAD, in *Geography*, a town of Persia, in the province of Segestan; 50 miles S. of Zareng.

JASENITZ,

JASENITZ, a town of Pomerania, on the W. side of the Oder, near its mouth; 10 miles N. of Stettin.

JASIDÆANS, in the *History of Religion*. See JEZIDES.

JASINE, in *Botany*, a name used by the ancients to express a small kind of climbing plant, much resembling that from which they obtained the drug called *scammony*. They, therefore, called this sometimes the small *scammony*, or *scammonia parva*. It climbed upon trees, and had small ivy-like leaves. Pliny has described such a plant as this under the name of *langini*; and it seems very probable that this was only a corruption of the word *jafine*, that author having taken most of his accounts from the Greeks, and having frequently mistaken their names.

JASINGPOUR, in *Geography*, a town of Hindoostan, in Oude; 30 miles S. of Fyzabad.

JASIONE, in *Botany*, *αζιον*, the ancient Greek name of some wild pot-herb, according to the lexicographers, with which the genus in question has but little connection.—Linn. Gen. 455. Schreb. 596. Willd. Sp. Pl. v. 1. 888. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 241. Ait. Hort. Kew. ed. 2. v. 1. 343. Juss. 166. Lamarck. Illustr. t. 724. Gært. t. 30.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Campanulaceæ*, Juss.

Gen. Ch. *Cal.* Common Perianth, or rather Involucrum, of many alternate leaves, the inner ones narrowest, containing numerous flowers on short stalks, permanent; proper perianth superior, five-cleft, permanent. *Cor.* of each flower of one petal, regular, in five rather deep, lanceolate, spreading segments. *Stam.* Filaments five, short, awl-shaped; anthers oblong, connected at their base, their summits spreading. *Pist.* Germen inferior, roundish; style thread-shaped, the length of the corolla; stigma swelling, cloven. *Peric.* Capsule roundish, with five angles, crowned with the proper calyx, membranous, imperfectly two-celled, opening by a round orifice at the top. Partition divided from top to bottom. *Seeds* numerous, nearly ovate, affixed to a stalked, globular, unconnected receptacle, in the lower part of the capsule.

Eff. Ch. Corolla wheel-shaped, in five deep linear segments. Stigma club-shaped, cloven. Anthers connected at their base. Capsule inferior, imperfectly two-celled, opening at the top.

Obf. The central flowers are often abortive, their stigma being more tumid and undivided. Linnæus placed this genus in his *Syngenesia Monogamia*, an order now, by general consent, abolished.

1. *J. montana*. Linn. Sp. Pl. 1317. Curt. Lond. fasc. 4. t. 58. Engl. Bot. t. 882. A native of dry hillocks and fields throughout Europe. In England it is known by the name of Sheep's Scabious. The root is annual Herb roughish, pale, with several stems, and oblong, waved, narrow leaves. Flowers terminal, solitary, stalked, of a sky-blue, and very pretty. The genus is nearly allied to *Phyteuma* in habit and characters.

There is said to be a perennial variety, about which we have often enquired in vain.

JASK, in *Geography*, a town of Croatia; 14 miles N. of Carlstadt.

JASKAS, a town of Sweden, in the government of Abo; 14 miles N.W. of Abo.

JASLO, a town of Poland, in the palatinate of Sandomirz; 72 miles S.S.W. of Sandomirz.

JASLOWIECZ, a town of Poland, in the palatinate of Kaminiac; 41 miles W.N.W. of Kaminiac.

JASLOWITZ, a town of Moravia, in the circle of Znaym; 10 miles S.E. Znaym.

JASMELÆUM, a medicinal oil, called also by the Persians *jafme*; it is made by putting two ounces of the white flowers of violet into a pint of oil of fefamum. It is used to anoint the body after bathing, and is in great esteem among the Persians for its fragrancy, though it is a sort of smell which many would rather think offensive.

JASMINE, or JESSAMINE-Tree, in *Botany*. See JASMINUM.

JASMINE, *Arabian*. See NYCTANTHES.

JASMINE, *Bastard*. See CESTRUM. See also LYCIUM.

JASMINE, *Cape*. See GARDENIA.

JASMINE, *Fennel-leaved*. See IPOMOEÆ.

JASMINE, *Ilex-leaved*. See LANTANA.

JASMINE, *Persian*. See SYRINGA.

JASMINE, *Red*. See PLUMERIA.

JASMINE, *Scarlet and yellow*. See BIGNONIA.

JASMINEÆ, a natural order of plants, so called from *Jasminum*, which is one of them. This order is the 37th in Jussieu's system, or the fourth of his eighth class, and is equivalent to the 44th of Linnæus, or *Sepiariæ*. For the characters of Jussieu's eighth class, see GENTIANÆ. The order in question is thus characterized.

Calyx tubular. Corolla tubular, regular; (in *Fraxinus* either wanting, or of four petals.) Stamens mostly two. Style one; stigma two-lobed. Fruit either capsular (in the manner of the order of *Acanthi*), or pulpy; in some cases with two cells and two seeds; in others of one cell, with one, two, or four seeds. Embryo straight, flat, generally inclosed in a fleshy albumen. Stem shrubby, more rarely arboresecent, with opposite branches. Leaves for the most part opposite. Flowers either panicled in an opposite manner, or corymbose.

The sections are two.

1. With a capsular fruit. This contains *Maytenus* of Molina, with *Nyctanthes*, *Syringa*, *Hebe* (which is a *Veronica*), and *Fraxinus*.

2. With a pulpy fruit. This section consists of *Chionanthus*, *Olea*, *Phillyrea*, *Mogorium* (which is properly not distinct from *Jasminum*), *Jasminum* and *Ligustrum*.

The *Jasmineæ* form an elegant and distinct order, valuable for the elegance of their flowers, which, moreover, are usually very sweet-scented, though in some instances unpleasantly strong.

JASMINOIDES. See LYCIUM.

JASMINUM, in *Botany*, from *αζιον*, a *fragrant ointment*, or *perfume*, alluding to the sweet scent of the flowers. Linn. Gen. 9. Schreb. 12. Willd. Sp. Pl. v. 1. 35. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 15. Brown. Prodr. Nov. Holl. v. 1. 520. Juss. 106. Tourn. t. 368. Lamarck. Illustr. t. 7. Gært. t. 42. Class and order, *Diandria Monogynia*. Nat. Ord. *Sepiariæ*, Linn. *Jasmineæ*, Juss.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, oblong, permanent; its margin five-toothed and cleft. *Cor.* of one petal, falver-shaped; tube cylindrical, long; limb flat, in from five to eight deep, somewhat elliptical, lobes. *Stam.* Filaments two, short; anthers small, within the tube of the corolla. *Pist.* Germen superior, roundish; style thread-shaped, reaching as high as the anthers; stigma two-lobed. *Peric.* Berry double, smooth, each of one cell. *Seeds* solitary, large, ovate-oblong, convex on one side, flat on the other, coated with pulp.

Eff. Ch. Corolla falver-shaped; its segments from five to eight. Berry double. Seeds solitary, coated.

This delightful genus consists of 21 supposed species in Willdenow's Sp. Pl. Linnæus confined it to such as have a five-cleft corolla, he having referred those which have eight

JASMINUM.

eight segments in that part to *Nyctanthes*, for want of attention to the fruit. This in the *Arbor trifolia*, the only true *Nyctanthes*, is capsular, but in all his other species pulpy; for which reason sir J. Banks and Dr. Solander first properly removed all such to the genus before us, of which their manuscripts contain descriptions of many more, hitherto unpublished. Eleven of Willdenow's species have simple leaves, eight ternate, and two pinnate ones.

Among the former are *J. hirsutum* and *pubescens*, figured in Sm. Exot. Bot. v. 2. t. 118, and there shewn to be one and the same plant; in the same predicament are *angustifolium* and *vimineum*, of which a plate may be seen in Rheede Hort. Mal. v. 6. t. 53. So that the number of species in Willdenow's first section are diminished to nine, and his whole number to 19. One of the most interesting of this first section is the Arabian Jasmine, *J. Sambac*, *Nyctanthes Sambac* of Linnæus, a native of the East Indies, and very general in our stoves, where its elegant white blossoms, purplish in decay, are abundantly produced, and diffuse the sweetest possible fragrance. A double variety, sometimes seen, is highly valued; see Andr. Repof. t. 497. A still finer variety is the *Kudda Mulla* of Hort. Malab. v. 6. t. 51, figured also in Tilli, Hort. Pisan. t. 30. This last, though easily propagated, was confined to the gardens of the grand duke of Tuscany, and not given to any one. Such stupid illiberality met with its just reward after a time, in the loss of the plant, which, if dispersed, might have been preserved.

In the second section are, among others, *J. azoricum*, frequent in green-houses, valuable for its shining broad leaves, and sweet white flowers:

J. fruticans, Curt. Mag. t. 461, native of the south of Europe, hardy with us, bearing yellow but scentless flowers: and

J. odoratissimum, Curt. Mag. t. 285, found in Madeira, very commonly kept in green-houses, for the sake of its very sweet and handsome yellow blossoms.

J. officinale, Curt. Mag. t. 31, our common white jasmine, a native of the East, but so generally cultivated that it can hardly be found certainly wild; and the most showy Catalonian jasmine, *J. grandiflorum*, are the only ones known with pinnate leaves. This last is much more tender than the *officinale*, with larger flowers, elegantly tinged with red underneath. It grows in India, nor is there any good reason for the name of Catalonian jasmine.

JASMINUM, in *Gardening*, a genus containing plants of the hardy and tender, deciduous and evergreen, shrubby kinds; of which the species chiefly cultivated are the common white jasmine (*J. officinale*); the common yellow jasmine (*J. fruticans*); the Italian yellow jasmine (*J. humile*); yellow Indian jasmine (*J. odoratissimum*); the Spanish or Catalonian jasmine (*J. grandiflorum*); the Arabian jasmine (*J. Sambac*); and the Azorian jasmine (*J. Azoricum*.)

This sort has varieties with white striped leaves, and with yellow striped leaves.

The second sort is extremely productive in suckers from the roots.

Method of Culture —Of these plants the first sort is readily increased by layers or cuttings. The young branches should be laid down in the early autumn, and in the following autumn be taken off, and planted where they are to grow. The cuttings of the young shoots may be planted either at the same time or in the early spring, being protected in the first case, in severe weather, in the winter. When they are well rooted, they may be removed, with

balls of earth about their roots, to the places where they are to grow up and remain.

And the different varieties are increased by budding or grafting them upon stocks of the plain or common kind. See **Budding** and **Grafting**.

In respect to the common sorts, they must be planted against walls, pales, or other fences, that may serve as a support. When planted as a standard, it is difficult to train to a proper head, and keep in order, without destroying the flowering branches which are the extremities of the same year's shoots. On this account they should be permitted to take their natural growth in the summer, and not be pruned or nailed till towards the latter end of March, when the frosts are over, to prevent their being injured by them.

But the varieties should be planted in a southern aspect, and a warmer situation than the common sort, especially the first, which, in very severe winters, should be protected with mats or other means.

The second sort may be increased by layers, or planting the suckers taken from the roots, in the spring or autumn. The layers may be made as in the first sort.

The third sort is capable of being propagated either by budding or in-arch-grafting upon stocks of the second kind, or by layers of the young tender branches made in the autumn or early spring seasons; but the former is the better practice, as producing more hardy plants. It should have a rather warm aspect, as a south wall, and, in very severe winters, have the protection of mats. It requires the same sort of pruning as the first sort.

The four following sorts are more tender in their nature and habits.

The first of them may be increased by seeds or layers of the young shoots. The seeds should be sown in the early spring, in pots of fresh light earth, plunging them in a moderate hot-bed, and when the plants are up, removing them into a second hot-bed to forward them, giving them frequently slight refreshings of water and gradually hardening them to the full air. They should be occasionally watered in the winter, and in the spring following be removed into separate pots, the earth being carefully preserved about their roots. Their first growth may be promoted by placing them in a mild hot-bed. They afterwards require a pretty free air and slight protection from frost in winter. They should have the decayed branches pruned out in the spring, without the others being shortened, as the flowers are produced at the extremities of the branches.

In the latter method the young shoots should be laid down in the early spring, as about March, being slightly nicked underneath at a joint, and often slightly watered in dry weather. In the following spring they may be taken off, and planted out in pots filled with light earth, separately; being afterwards managed as the others.

They may likewise be raised by in-arch-grafting into stocks of the second species, but the plants produced in this way are not so strong as those upon their own stocks, and they are apt to send out too many suckers from the roots.

The second of these tender kinds may also be raised by budding or in-arch-grafting upon stocks of the first species, which renders it more hardy than its own; but the plants are mostly brought from Italy, in bunches of four together, and which, after having their roots moistened, and the shoots and dead parts pruned away, as well as the tops cut down to within a few inches of the grafted parts, may be planted in pots filled with light fresh earth, plunging them in a moderate bark hot-bed, shading them from the sun, and giving them water. When they begin to grow, all the shoots below
the

the grafts should be rubbed off, and the top shoots cut off, free air being admitted, so as to gradually harden them to be set out in a warm situation. They must have the protection of the green-house in winter, and be frequently sparingly watered, a free air being admitted in mild weather.

The third of these tender sorts may be raised by layers and cuttings; but the first is the best method, as the cuttings require much care to make them strike. The young branches should be laid down in the spring, in pots filled with soft loamy earth, plunging them in a tan hot-bed, and watering them occasionally. In the autumn, when they have stricken root, they should be taken off, and planted out in separate small pots, plunging them in a hot-bed, due shade being given. The cuttings may be planted in pots of the same sort of earth during the summer, plunging them in a tan hot-bed, and covering them close with a bell or hand glass, due shade being given, and occasional waterings. When they have taken good root, in the beginning of autumn, they may be removed into separate pots, and be managed as those from layers.

These plants succeed best when kept in the stove.

The last of these tender sorts may be increased in the same way as the fourth species, and requires the same management afterwards.

The three first species may be employed as plants of ornament for covering walls, palings, and other naked erections about houses, as well as occasionally introduced as standards in clumps, borders, and other parts of pleasure grounds.

The other sorts afford variety among other potted green-house and stove plants. Some may likewise be trained against warm walls or palings, especially the last kind which has a fine fragrance, and at the same time a good appearance.

JASMUND, in *Geography*, a peninsula of the island of Rugen, which forms, with another peninsula called "Witto," a large bay, fronting the north-east, which, in hazy weather, often proves destructive to vessels. The bay is called "Tromperwyck." N. lat. $54^{\circ} 35'$. E. long. $13^{\circ} 45'$.

JASOUN, a town of Asiatic Turkey, in the government of Sivas, on the Black sea; 75 miles N.E. of Samoun.

JASPACHATES, in the *Natural History of the Ancients*, a name given to some varieties of the agate-jasper, mentioned under No. 5. in the following article.

JASPER, *Jaspe*, Fr. *Jaspis*, in most other European languages; a mineral species belonging to the class of earthy fossils, and divided by Werner into six sub-species distinct from each other, both by their oryctognostic and geognostic characters; viz. 1. Egyptian jasper; 2. Ribbond jasper; 3. Porcelain jasper; 4. Common jasper; 5. Agate jasper, and 6. Opal jasper. They agree in their being opaque or slightly translucent at the edges, in hardly ever affecting vivid colours, in their always occurring massive and in common external shape (except the Egyptian jasper; in their hardness being rather inferior to that of common quartz. The remaining external, in conjunction with the geognostic characters have been thought sufficient by Werner to divide the jaspers into the above sub-species, which by some other writers are considered as varieties only. Some jaspers are nearly related to heliotrope, others approach the nature of indurated clay, argillaceous iron-stone, and lithomarge; the opal jasper passes into the opal.

Almost all coloured jaspers, according to Haüy, are conductors of electricity; a property observable by bringing

them into contact with an electrified conductor, when, on the approach of the finger, they emit sparks.

1. *Egyptian jasper*; *Egyptian pebble*. *Quartz jaspe panacé*, Haüy; *Caillou d'Egypte*, Fr.; *Egyptischer Kiesel*, Nilstein, Germ.; *Silex Ægyptiacus*, Niloticus, Lat.

Brown and yellow are the predominant colours of this jasper, and generally several shades of them occur together in the same piece. The brown is usually a deep chestnut or liver brown, sometimes approaching to blackish brown, and an admixture of red is likewise observable; at Baaden a variety is said to occur in which the red predominates. The yellow is mostly a deep isabel-yellow, also greyish yellow; it likewise passes into several shades of pale red. Two of these colours are generally mixed in such a manner that the one, particularly the brown, forms the ground, while the other represents a succession of variously contorted, concentric, irregular zones or bands, and spots which, in conjunction with black dendritical and other delineations, often produce representations of grottos, landscapes, human figures, and other objects.

It has hitherto been found only in rolled mostly oblong pieces, and in the form of balls, with uneven surface. These have also been found hollow, drilled with brown quartz crystals; but such specimens are very rare.

Both externally and internally it is moderately glistening; lustre more or less resinous. Fracture flat conchoidal. It is pretty easily frangible. Its hardness is rather less than that of quartz. Fragments indeterminately angular and very sharp-edged; perfectly opaque, and only slightly translucent at the edges. Specific gravity 2.564, Briffon; 2.600 Brünlich.

Before the *blow-pipe* the Egyptian jasper is infusible without addition. When ignited for a considerable length of time it loses its colour.

The proportion of the component parts of this substance must, of course, be subject to considerable variation, according as the brown or yellow mass predominates. A variety analyzed by Delametherie, yielded

Silica	54
Alumine	30
Oxyd of iron	16

This jasper is found pretty abundantly in Egypt, particularly in the neighbourhood of Cairo and Suez, on the borders of the Nile. According to Dr. Reufs, it occurs also, as rolled pieces, at Kofchatek, in the Bunzlau circle of Bohemia. It is also said to be found at Freife in Lotharingue.

Of its *geognostic* situation, no more is known than that it always occurs in rounded pieces, which appear not to owe their origin to rolling, but to be original, and produced by infiltration. It has been ingeniously remarked by Mr. Mohs, that the interior of those balls is generally found to agree exactly with their exterior form, in the same manner as in some hornstone-balls, in which the nucleus is separated from the surrounding coatings by a conformable coating of crystallized quartz, &c. If this be the case, neither the colour, nor the delineations in the Egyptian jasper, can be considered as derived from without, nor its form as a secondary one; and we may further infer from this, that the balls of this jasper, (at least those of the brown variety from Egypt,) are formed like agate balls in rocks belonging to the formation of the amygdaloid. Werner, as we are told by Mr. Jamefon, suspects that it occurs imbedded in a brown ochre of iron. Mr. Patrin is of opinion, that these rounded masses have originally been simple ferruginous geodes, formed in marly ferruginous soil, abounding with iron ochre, which has moulded itself into oval masses composed

posed of concentric layers. These layers, in the progress of time, will shrink both by desiccation and the effects of the mutual attraction of the ferruginous molecules, which have a perpetual tendency to enter into the closest possible combination. The layers of the geode, by their condensation, become more or less separated from one another, and its centre remains empty, in case the whole mass is composed of nothing but pure oxyd of iron; but when mixed with marle, this latter is continually pressed towards the centre, where it forms a nucleus more or less light coloured, in proportion as it has parted with the iron it contained, and which has united with that of the neighbouring layers. In the ordinary way of occurring, (Mr. Patrin observes,) it appears that these geodes remain nearly in the same state in which they were formed; but in Egypt some particular circumstance has made them undergo a new modification. Decomposition, or other circumstances that may have altered the nature of the soil that contained these geodes, must have caused the development of various fluids, which penetrating through the pores of the geode, and combining with the fluids it contained, have formed there the siliceous matter in the same manner in which water is formed by the combination of hydrogen and oxygen.

Cordier observed this jasper to enter into the composition of an Egyptian breccia, made up of a great variety of rounded stones; and it is supposed that those places where this breccia forms extensive beds, the greater part of the rolled pieces that are seen there, owe their present detached state to a disintegration of such masses.

The Egyptian jasper is much esteemed on account of its delineations, which are often very singular; and as it is susceptible of a very high polish it is cut by lapidaries into thin pieces for snuff-boxes, broaches, &c.

2. *Ribbond jasper, Striped jasper*, Kirw. James.; *Band jaspis, Band stein*, Germ.; *Quartz jaspé onyx*, Haüy. *Jaspé rubané, J. en ruban*, Broch, &c. *Jaspis vittata*, Forst.

It always exhibits two, three, or more colours together, which are disposed in alternating, straight, seldom waved, stripes or layers. The colours are yellowish, greenish, and pearl-grey, yellowish, and greenish-white, ochrey, and isabell-yellow, mountain and leek-green, flesh, cherry, and brownish-red.

It is always found massive, internally it is dull; the lustre it occasionally exhibits proceeding from admixed heterogeneous particles.

Its hardness is less than that of quartz. It is brittle and easily frangible; fracture conchoidal, but sometimes approaching to splintery or earthy; also a tendency to the slaty fracture has been observed in some varieties. Fragments indeterminately angular, sharp-edged. Specific gravity from 2.500 to 2.800.

The ribbond jasper is found in Siberia, particularly in the districts of Koliwan and Catherinebourg; in Sicily; Corsica; Switzerland; in Germany, at Gnadstein and Wolfstz near Frohburg, in the Leipzig district; at Ilmenau in Henneberg, at Falkenstein; on the Hartz, and in the Palatinate. It probably occurs also, according to Jameson, in the Pentland hills near Edinburgh.

The *geographic* relations of this jasper appear to be sufficiently distinct from that of the others, it forms considerable masses and beds, with whose connection, however, we are as yet unacquainted. The ribbond jasper of the Hartz, as connected with grauwacke on which it rests, cannot be doubted to be subordinate to the transition rocks. Mr. Patrin considers this jasper and all others that occur in beds,

and are entirely opaque, to be primitive; and most of the Siberian jaspers are in that predicament. He refers to the *secondary* jaspers, all those that have a vitreous fracture combined with a slight degree of translucidity. But several circumstances connected with the geognostic occurrence of the different jaspers, prevent us from admitting this distinction.

The finest Siberian ribbond jasper is found, together with other varieties, in the hills that border on the southern part of the Ural mountains, about 100 or 150 leagues northward of the Caspian sea, in the neighbourhood of the fortress of Orskaia. The red and green layers of this jasper being so well defined and regular, it is made use of for several purposes of ornament, particularly for cameos. It is not found in large masses. Patrin informs us, that when seen in its native place, it appears to admit of being quarried in blocks of several feet in size; but as soon as the rock is wrought, it separates into small pieces.

3. *Porcelain-jasper. Porcellanite*, Kirw. *Jaspé porcellaine*, Broch. *Jaspé porcellanite*, Brongn. *Thermantide porcellanite*, Haüy. *Diaspro porcellanico*, Nap. *Porzellan-jaspis, Porzellanstein*, Germ.

Its principal colour is a bluish-grey, of various intensity, generally intermediate between pearl-grey and lavender-blue. It is also found yellow, such as ochre and straw, and even pale orange-yellow, which passes into brick-red. Clove-brown and liver-brown are likewise mentioned among its colours; as also bluish-black and mountain-green. Sometimes several of these colours occur together in spots, and in flamed and clouded delineations. The bluish-grey varieties, however, exhibit generally but one colour, besides the red and yellowish-brown colour on the rifts, and the red or brown coloured impressions of various vegetables.

It occurs commonly massive, and sometimes in blunt-edged and rounded rolled pieces, which, in the rents they exhibit, bear evidently the marks of the action of fire.

Internally its lustre is inconsiderable; it seldom approaches to shining.

Its hardness is inferior to that of most other jaspers; it is very brittle: fracture imperfectly conchoidal, approaching to even: fragments indeterminately angular, pretty sharp-edged; perfectly opaque; specific gravity 2.330, Kirwan; 2.603, Wiedenmann.

By the continued application of intense heat, the porcelain-jasper, according to Wiedenmann, may be fused into a black scoria. But the yellow variety, operated upon by Klaproth, shewed no change either in the clay or charcoal crucible, except that in the former it was seen to contract, and its surface to become dark steel-grey and dull, while in the charcoal crucible a small piece became black and glistening, and acquired a yellowish-brown surface.

The constituent parts of the pearl-grey variety, from Stracke, in Bohemia, are stated as follows by the late Mr. Rose, by whose death the world has lost one of the most accurate analysts.

Samml. Pract. Chem. Ath.

This substance is found in Bohemia (at Schwintshitz, Stracke, near Carlsbad, &c.), in Saxony (at Planitz), in the Upper Palatinate, in Heflia (near Almerode), in Saarbruck (at Dutweiler), in Siberia (at Kufnezsk, in the district of Koliwan), Iceland, &c. It occurs in considerable masses, and obviously owes its origin to the action of subterraneous fire: Werner therefore ranks it with his pseudo-volcanic, or such fossils whose nature has been considerably altered by the proximity of that agent. That it has not been in a state of fusion is proved by the impressions of plants so frequently observed in it, and which bespeak the fossil to have originally been that variety of slate-clay which belongs to the coal formation. We accordingly find it in company with burnt clay, earth-slag, &c. in countries which have either formerly experienced the ravages of subterraneous fires, or where beds of coal are actually in a state of ignition. It is a fact worthy to be noticed, that at Dutweiler, in the county of Saarbruck, which not long ago experienced the spontaneous inflammation of a bed of coal, both porcelain-jasper, and other pseudo-volcanic substances, are seen as it were in a progressive state: they are more or less changed in proportion to their distance from the principal seat of the subterraneous fire; and the vegetable impressions which they exhibit are in every respect the same with those observed on the slate-clay.

The porcelain-jasper has obtained its name from its appearance, and the circumstances connected with its origin. It takes a moderate polish, but is not applied for ornamental purposes. Indeed, there are seldom any large pieces of it found without rifts and fissures.

4. *Common jasper. Gemeiner jaspis*, Germ. *Diaspro commune*, Nap. *Quartz jaspé*, Haüy. *Jaspé commun*, Broch. *Silex jaspis vulgaris*, Lat.

Its principal colours are brown, red, and yellow; the brown is yellowish, reddish, clove, liver, blackish-brown, approaching to black; the red is tile, and blood-red of various shades, seldom flesh-red; the yellow is mostly ochre-yellow, which passes into greenish-yellow; also various shades of green are observed among the colours of the common jasper, such as mountain, verdigris, and olive-green, but they are less frequently met with. Several of these colours are sometimes seen together in small irregularly striped, spotted, and clouded delineations.

It occurs commonly massive, but also alternating in thin layers with quartz, &c. and disseminated, as in the blood-stone; it is likewise found in blunt-edged rolled pieces.

Internally its lustre is intermediate between glistening and shining; it is rather vitreous.

It is nearly of the same hardness as the preceding species; it is brittle and easily frangible: fracture more or less perfectly conchoidal, approaching in some varieties to splintery, from which it passes into fine earthy. Fragments indeterminately angular, pretty sharp-edged: they are generally opaque, but now and then translucent at the edges. Specific gravity, 2.580 to 2.700, Kirwan; 2.652 to 2.663, Saussure; 2.666, Muschenbroek; 2.692, Blumenbach.

Common jasper is infusible without addition before the blow-pipe; it only loses its colour by the application of intense heat; with borax it is dissolved without ebullition, while soda and phosphoric acid combine with it in an imperfect manner only; when urged by oxygen gas it is converted before the blow-pipe into a white or dark grey globule.

According to Kirwan the common jasper consists of

Silica	-	-	-	75.00
Argil	-	-	-	20.00
Oxyd of iron	-	-	-	5.00

100

Mr. Lampadius thinks that he has found that the reddish-brown variety is generally coloured by the oxyd of uranium and some iron, the proportion of the uranium being about three per cent.

Among the localities of the common jasper are: Saxony (Altenberg, Geising, Freiberg, Seifersdorf, Schneeberg, Eibentock, &c.); Bohemia (Jeshkner mountains, &c.); Silesia (Bunzlau, Landshut, &c.); Salzburg; Steurmark; Hungary and Transylvania; Italy, particularly Sicily; France; Scotland (according to Jameson, in the transition rocks near Edinburgh), the Shetland islands, Norway, &c.

The common jasper is exclusively a production of veins: it occurs in such as are chiefly composed of iron ore, to which indeed it appears to bear great geognostic affinity. The substances with which it occurs together in these veins are red and brown iron-stone, iron-slint, quartz, opal, lithomarge, &c.; as also, sometimes, galena, pyrites, and vitreous silver. But common jasper is also found constituting veins for itself without any metallic ores, and only accompanied by some amethyst or common quartz, which in this case generally occupy the middle of the vein. It likewise occurs as a constituent part of agate balls in amygdaloid. At Salzburg it is said to have been found in calcareous and clay slate rocks, and at Offenbanya, to form the basis of a particular kind of porphyry; but this latter observation seems to be founded on error, since all the Transylvanian varieties of porphyry that have fallen under the observation of Werner, and other mineralogists well acquainted with the true characters of jasper, have pronounced them to belong to the clay, horn-stone, and pitch-stone porphyries.

Most varieties of the common jasper are susceptible of a tolerably good polish, whence they are frequently cut by the lapidaries, and formed into snuff-boxes, buttons, seal-stones, (see GEMS, engraved) &c.; some varieties that may be procured in voluminous blocks are wrought into tables, mantle-pieces, small pillars, and other objects of ornamental architecture. The following are most frequently seen in the hands of the lapidary:

The *red jasper*, on which we possess some very fine antique engravings. It is found at Giuliano, at San-Stefano, at Cornerata, and at Monte-Vago, in Sicily; and occurs also in the vicinity of Geneva, in the valley of Chamouni; at Grenoble, in the department of the Isère; and at Mont-More, in the department of the High Alps. Canavais, in Piedmont, is said likewise to furnish good red jasper. This should not be confounded with iron-slint and sinople, which is a variety of quartz.

The *yellow jasper*: it is seldom found in large pieces, and only used for inlaid work, mosaic, &c. The best is found at Giuliano, in Sicily; and it occurs also in the valley of Chamouni, and between Varet and Grenoble, in the department of the Isère. This variety is seldom found equally tinged, but often traversed by white and red veins.

Brown

Brown jasper of various shades. This is the most common, and most frequently seen converted into objects of ornament, vases, pedestals, &c. It takes a very fine polish.

What the Italians call *Paragone* is, properly speaking, the Lydian stone; but the name is now and then applied to a black variety of jasper, much esteemed by lapidaries for seal stones, &c. It is said to be found at Giuliano in Sicily. (Also a black marble is sometimes improperly called *Paragone*.)

The existence of a *snow white* variety of common jasper is doubted by some. What goes by this name is a white stone marked here and there with fine red lines; but as it has been seen cut and polished only, its nature is not determined with accuracy. Another white jasper is mentioned by Herrmann as occurring in more elevated parts of the Altaic mountains, near the source of the Korgoo; it is marked with black dendritæ. Specimens before us have the appearance of horn-stone.

The galactites of Pliny is, by some writers, considered as a white jasper.

5. *Agate Jasper; Jasp. agate; Agat Jaspis*, Germ.

Its colour is flesh-red, reddish-white, and brownish; also yellowish-white, which passes into isabell, straw, and greenish yellow. These colours form concentric rings, and figures resembling plans of fortifications, &c.

It occurs massive. Has scarcely any lustre. Is rather less hard than common jasper. Its fracture is small and flat conchoidal, approaching to even. The other external characters are those of the preceding species.

The agate-jasper is only found in agate veins, and in agate balls occurring in amygdaloid and porphyry rocks.

It is cut and polished.

6. *Opal Jasper, Quartz resinite commun*, Haiiy.

Its principal colours are shades of red; flesh-red, scarlet-red, brick-red, blood-red, cherry-red, brownish-red; it also occurs reddish and yellowish-brown, and seldom ochre-yellow; these colours exist variously mixed, as spots and veins in the same piece; sometimes they are uniform.

It occurs massive.

Internally its lustre is more or less shining, and intermediate between vitreous and resinous.

It is nearly of the same hardness as the preceding subspecies, brittle, and easily frangible. Fracture large or small flat-conchoidal. Fragments indeterminately angular, sharp-edged, scarcely translucent at the edges.

The preceding characters agree partly with those of the opal; and indeed the geognostic relation of the opal-jasper is perfectly the same as that of the opal. It is mostly found nidulating in porphyry, sometimes in veins, and in both cases it is constantly accompanied by common opal.

Its principal locality is Kaschau, Tockay, in Hungary, and it is also found near Constantinople, and in the mountains of Kolywan, in Siberia.

JASPONYX. See JASPER, No. 2.

JASQUE, in *Geography*, a town of Persia, in the province of Mecran, which gives name to a cape in the gulf of Ormuz. N. lat. $25^{\circ} 40'$. E. long. $59^{\circ} 4'$.

JASSARI, a town of Sweden, in the Lapmark of Kimi, in the gulf of Bothnia; 50 miles N.N.E. of Kimi.—Also, a river of Sweden, which runs into the gulf of Bothnia, at the above-named town.

JASSELMARE, a country of Hindoostan, bordering on the lower part of the course of the river Puddar, and on the sandy desert, which, as well as Nagore and Bickaneer, form a number of petty rajahships, and are understood to be mostly inhabited by Rajpoots.

JASSENES MARMOR. See MARMOR.

JASSI, in *Geography*, a town of Turkiitan, on the Surr; 140 miles W. of Taraz.

JASSINGPOUR, a town of Hindoostan, in Oude; nine miles E. of Sultanpour.

JASSUM-KALASI, a town of Asiatic Turkey, on the W. coast of Natolia; 40 miles W. of Moglah.

JASSY, a city and capital of Moldavia, supposed to have been garrisoned in the time of the Romans; having a citadel and some fortifications. It is the see of an archbishop, and the inhabitants are chiefly Greeks; 200 miles E. of Otchakov. N. lat. $47^{\circ} 10'$. E. long. $27^{\circ} 44'$.

JASTIAN, in the *Greek Music*, a name given by Aristoxenus to a mode more generally called by other authors *Tonian*. See *MODE and Music of the Ancients*.

JAT, in *Geography*, a town of Sweden, in the province of Smaland; 20 miles S. of Wexio.

JATOE, a town on the island of Borneo; 120 miles N. of Nagara.

JATRALIPTES, in *Ancient Medicine*, and the *Gymnasium*, derived from *ιατρος*, physician, and *αιλαιον*, I anoint, an appellation given to the persons who superintend the use of oils and unguents in the gymnasium, as well as to those who directed unctuous applications to the sick. Pliny inveighs against the luxurious extent to which the use of these perfumed ointments had been carried in his time, when the application of them employed as many people as the management of the baths. Under the jatrapietes were the *unctores*, who applied the ointment; the *fricatores*, who rubbed or curried the skin with the strigil, or other instruments of a similar kind; the *dropacista*, or *aliparii*, whose business it was to remove the hair, either by extraction or depilatory applications; and, lastly, the *trahatores*, who were employed in gently moving and squeezing, or kneading all the limbs, to render them supple, and at the same time to give a pleasing sensation. The jatrapietes was also called *alipies*; both which terms were sometimes also used to denote the masters of the exercise, such as the *gymnastes* and *padotriba*. The external application of oil, for the cure of diseases, became a distinct branch of the medical art, and was called

JATRALIPTIC MEDICINE. This was first introduced, according to Pliny, by Prodicus, a native of Selymbria, and a disciple of Hippocrates. The volumes, which treat expressly of its precepts, are lost; but we find the anointing of the body with oil recommended, among other remedies, in various diseases; as fevers, pustular eruptions, gout, palsy, lethargy, tetanus, hydrophobia, cholera, melancholy, dropsy, profuse sweating, and itch. In surgery, it was supposed to allay irritation in those who had undergone severe operations, to resolve indurations, and to remove the pain and swelling attending luxations. See Le Clerc, *Hist. de la Med.* part 3. lib. i.—Pliny Nat. Hist. lib. xiii. cap. 1. and 3. Lib. xv. cap. 4. &c. Celsus, *passim*. Prosp. Alpin. de Med. Ægyptorum, lib. iii. cap. 15.—Also, Mr Hunter's learned Essay on the External Use of Oil in the Edin. Med. and Surg. Journal, vol. ii. p. 185, for April, 1806.

JATROPHA, in *Botany*, apparently from *ιατρος*, a physician; the physic-nut. This is a virulent tribe of plants, whose oily seeds, at least their cotyledons, are either eatable and wholesome, or simply purgative, like those of its nearly the *Ricinus* or *Palma-Christi*.—Linn. Gen. 503. Schreb. 655. Willd. Sp. Pl. v. 4. 557. Mart. Mill. Dict. v. 2. Juss. 389. Lamarck. Illustr. t. 791. Gært. t. 108. (Manihot; Tourn. t. 438.)—Class and order, *Monoclea Monadelphica*. Nat. Ord. *Tricocce*, Linn. *Euphorbia*, Juss.

Gen. Ch. Male, *Cal.* Perianth scarcely manifest. *Cor.* of one petal, funnel-shaped; tube very short; limb in five deep,

deep, roundish, spreading, convex segments, concave underneath. *Stam.* Filaments ten, awl-shaped, approaching each other in the middle, the five alternate ones shorter, all erect, shorter than the corolla; anthers roundish, versatile. *Pist.* a slight rudiment in the bottom of the flower.

Female, *Cal.* none. *Cor.* roseaceous, of five petals. *Pist.* Germin superior, roundish, with three furrows; styles three, cloven; stigmas simple. *Peric.* Capsule roundish, three-lobed, three-celled; each cell with two valves. *Seeds* foliary, roundish, large.

Eff. Ch. Male, Calyx inconstant. Corolla of one petal, funnel-shaped. Stamens ten, alternately shorter and longer.

Female, Calyx none. Corolla of five petals, spreading. Styles three, cloven. Capsule of three cells. Seeds foliary.

Obf. *J. urans* is said to have but nine stamens. Willdenow reckons 17 species of this genus, of which about eight were known to Linnæus, though not very perfectly. For examples of *Jatropha* may serve

J. pandurifolia. Andr. Repof. t. 267. Curt. Mag. t. 604. (*J. acuminata*; Venten. Jard. de la Malmaif. t. 52) — A native of Cuba, remarkable for its saddle-shaped leaves, and beautiful deep scarlet flowers.

J. Curcas. Jacq. Hort. Vind. v. 3. t. 63; a native of South America, sometimes kept in the stoves of botanic gardens.

J. Manihot, whose root makes the Cassava bread in the West Indies, being, though a virulent poison, rendered sweet and harmless by washing its grated substance.

All these are shrubs. The leaves of the whole genus are stalked, alternate, generally lobed, and often palmate. *Flowers* corymbose.

JATS, JATES, or *Jetes*, a tribe of Hindoos, who long since the death of Aurungzebe erected a state in the provinces of Agra and Delhi. They appeared at first no otherwise than as banditti, but at last formed a regular state, and fixed their capital at the city of Agra, and appear to have possessed a tract of country, along both sides of the Jumnah river, from the neighbourhood of Gwalior to that of Delhi; in length about 160 miles and 50 broad. Col. Dow, in 1770, estimated their revenue (perhaps extravagantly) at 200 lacks of rupees, and their force at 60 or 70,000 men. This nation is traced by P. Wendell from the countries lying between the S.E. confines of Moulton and Gohud. Tamerlane, it is certain, made war on a people, called the "Getes," in his march from Batnir to Samanah. Nudjuff Cawn, at a late period, dispossessed the Jats of their whole country, except the confined territory of Bhartpour. Madajee Sindia has, in turn, stripped Nudjuff Cawn's successors of these conquests, which are now scarcely worth possessing, although a few years ago, under Soorage Mull, they ranked among the most flourishing provinces of Hindoostan. The Jats no longer exist as a nation: all that remains to Runjet Sing, the son of Soorage Mull, being the fort of Bhartpour, or Burratpour, situated about 45 miles on the west of Agra, with a small territory of four or five lacks of rupees. The rajah of Gohud is of the Jat tribe, but unconnected with Rumjet Sing. Rennell's Memoir.

JATTENDALS, a town of Sweden, in Helplingland; 16 miles N. of Hudwickswall.

JATTIR, in *Scripture Geography*, a city of Dan (Josh. xv. 48.), afterwards given to the Levites of Kohath's family. (Josh. xxi. 14.) Eusebius says, that it is situated in the district of Daroma, towards Malatha, about 20 miles from Eleutheropolis.

JATTRA, in *Geography*, a town of Bengal; 15 miles N. of Midnapour.

JATTS, a small island in the Atlantic, near the coast of Guinea. N. lat. $11^{\circ} 48'$. W. long. $15^{\circ} 50'$.

JAU DE ST. ELIAS, a town of Brazil, on the river Negro; 70 miles W. of Fort Rio Negro.

JAVA, one of the largest islands constituting the Archipelago in the East Indian sea, about 650 British miles in length, and in medial breadth about 100 miles, situated between $5^{\circ} 45'$ and $8^{\circ} 48'$ S. lat., and 105° and $114^{\circ} 40'$ E. long. This island lies nearly in the direction of E. and W. and to the S. and W. its shores are washed by the southern Indian ocean. On the N.W. lies the island of Sumatra, from which it is separated by the straits of Sunda; to the N. Borneo, from which it is separated by the Java sea; to the N.E. at a considerable distance, Celebes; to the E. Bali, divided from it by a narrow passage, called the straits of Bali. This island is the southernmost of those four large islands, the other three being Sumatra, Borneo, and Celebes, which were formerly known by the appellation of the Sunda islands; and when the Dutch company first established themselves here, Java was divided into three large empires, *viz.* Bantam, Jaccatra, and the empire of the Soefoeloenam, which last was the most extensive, and comprehended full two-thirds of the whole island, Cheribon being feudatory to it. But it is at present divided into five states or empires, *viz.* Bantam, Jaccatra, Cheribon, the empire of the Soefoeloenam, and that of the Sultan; which altogether contain 123 provinces, or governments, the kingdom of Bantam being considered only as one. The four first of these are so dependent on the Dutch, as to be under engagements to deliver their produce to the Dutch, and not to sell any of it to any other nation. Each province, or government, consists of a certain number of "tjatjars," or families, the number of which, throughout the whole of Java, including Bantam, amounted, in the year 1777, to 152,014. These families are estimated to consist of 912,084 persons; and if to these we add the inhabitants of the principality of Madura, which, though a separate island, is always considered as connected with Java, and contains 10,000 families, or 60,000 persons, the whole population of Java and Madura will amount to 972,084 persons. Huyfen, however, gives the population of Java, exclusive of Madura, as follows: *viz.* in the kingdom of Bantam, 5000 families, in Jaccatra 33,914, in Cheribon 15,000, in the Mataram, or empire of Java Proper, 94,200, making in all 148,114 families, which, allowing six individuals to each family, will give 888,684 for the whole number of inhabitants; but from more recent accounts he infers, that the population of Java is $1\frac{1}{2}$ or 2 millions of people. These statements do not include the inhabitants of *Batavia*; which see. A chain of high mountains, commencing to the E., in the province of Balambouang, and running through it to the W., but decreasing in height, divides Java, longitudinally, into two parts, of which the northern portion is the largest and the best. The north coast has every where a low and woody foreland, with some hills, particularly W. of Bantam, where the high land stretches down to the sea-coast. This island has several deep bays on the north side, as those of Bantam, Batavia, Cheribon, Samarang, Joana and Sourabay, which afford every where good anchorage. The south coasts are much less known than those on the north. In the good monsoons, the sky is almost always clear, except near the time of the breaking up of the monsoons, when many and violent thunder storms rapidly succeed each other. In the bad monsoons, the west winds, which then prevail, bring with them heavy rains and violent thunder-storms, without much alteration in the temperature; the thermometer, in the warmest part of the day, generally standing at between 82° and 88° . The effect of this de-

gree of heat is much moderated by the alternate land and sea breezes, which blow every day in regular rotation. The barometer seldom varies more than two or three lines. Thunberg mentions several volcanoes in this island, one of which had overwhelmed with ashes a great number of coffee plantations. Java is watered by a great number of rivers, which descend from the chain of mountains above-mentioned, but none of them are navigable for large vessels. The soil is every where a reddish granulated clay, which in the dry season is so hard, as to be incapable of cultivation without much moistening, but with little labour it is extremely fertile. Ploughing is performed with buffaloes, which abound in this island. In general agriculture no manure is used; but the gardens are moistened with water in which oil-cakes have been soaked, and which renders the soil rich and fat. The only method which the farmer takes with his land consists in burning upon it all the weeds and rubbish which it produces; and when one piece of ground ceases to yield sufficient crops, recourse is had to another; and the first is suffered to lie fallow for several years, after which it again recovers its fertility. The articles produced in this island are much more valuable than those of all the neighbouring countries; of these the first article is rice, which not only supplies the inhabitants but provides for the eastern provinces and the island of Ceylon: this rice is of two kinds, one sort being set nearly under water and another sort planted in the rainy season, on high ground and upon the mountains; the former, however, is the best, and bears the highest price. The pepper of Java is also a profitable article to the Dutch company, and so is the sugar, the best of which is from the province of *Jaccatra*, which see. Coffee is likewise a product very advantageous to the company, the greatest quantity being furnished by the provinces of *Jaccatra* and *Cheribon*. Cotton is also a production of Java of great value. Java also yields to its possessors the article of salt. The N. E. coast of the island, and part of the district of *Cheribon*, afford a very large quantity of timber, logs, beams, boards, &c. which not only supplies *Batavia* for various purposes, but admits of an annual exportation of a considerable quantity to several of the out-factories, and in particular to the Cape of Good Hope. Indigo, though it be not an original production of Java, has been cultivated with tolerable success since the Dutch company have been established here. Turmeric, long pepper, and cubebs, are also productions of this island. This island abounds with fruit-bearing trees, such as the cocoa-nut palm, the *Suri* tree, which yields the palm-wine or toddy, china-oranges of a larger and smaller size, the tamarind-tree, the shaddock, the durioon or derioon-tree, the fruit of which resembles the bread-fruit, and which is considered as diuretic, sudorific, and serviceable in expelling wind, the *Surfak*-tree, the mango-tree, the mangostan, lemon and lime-trees, pine-apples, and many others.

The native inhabitants, called *Javanese*, whether they belong to the kingdom of *Bantam*, or to any other part of Java, are of a middling size, generally well proportioned, of a light brown or yellow complexion, with a broad forehead, and flattish nose, curving downwards at the tip. The hair is black, and always kept smooth and shining by the use of cocoa-nut oil. They are in general proud and indolent, as well as cowardly. Their principal weapon is a kind of dagger, called a "*kris*," which is often poisoned, and causes immediate death. Arrogant towards their inferiors, they are no less cringing with respect to their superiors, from whom they expect any favour. Their dress consists in a piece of cotton, wrapped round the waist, and drawn between the legs, so as to be fastened behind. They are otherwise naked, except that they wear a small cap on the

head. Those of superior rank wear a wide Moorish coat of flowered cotton, or other stuff, and in general turbands. They suffer no hair but that of the head to grow. The dress of the women is little better than that of the men, except that it is more close and covers more of the body; the hair of the head, worn long, is turned up, and twisted round the head like a fillet, fastened with long bodkins of various materials, and adorned with flowers. Men and women are fond of bathing. Children of both sexes are entirely naked till about eight or nine years of age. Twelve or thirteen is their age of puberty. The *Javanese* are polygamists, and besides their wives, who are as many as they can maintain, they take their female slaves for concubines. The women are more comely than the men; they are extremely jealous; and punish those whom they suspect of inconstancy and infidelity by the administration of emaculating drugs. Their habitations, rather huts than houses, are constructed of split bamboo, interlaced or matted, plaited with clay, and covered with the leaves of the cocoa tree. The entrance is low, and they have neither door nor shutter. The whole house consists usually of one apartment, in which husband, wife, and children, and also their poultry, of which they keep a great number, lie together on the ground. Their chief food is boiled rice, with a little fish, and their drink is water. They take a little arrack when they can obtain it, and are almost always chewing betel or pinang; and likewise a sort of tobacco, produced here, and therefore denominated *Java tobacco*. This they smoke through pipes made of reed. They sometimes put opium into their pipes with the tobacco, in order to invigorate their spirits; but the continual use of it rather deadens them. They have neither tables nor chairs; but sit upon the ground, on mats, with their legs crossed under them. They make no use of knives, forks, or spoons, but eat with their fingers. They have a certain kind of musical instrument, called "*gonggome*," consisting in hollow iron bowls, of various sizes and tones, upon which a person strikes with an iron, or wooden stick, and which emit sounds like a set of bells. They are very fond of cock-fighting, for which they keep a peculiar breed. The tax upon their game-cocks forms part of the revenue of the province of *Jaccatra*. One of their favourite diversions, at which they are very dextrous, is a kind of tennis-play; in which they strike the ball, which is of the size of a man's head, hollow, and made of matted reeds, with their feet, knees, or elbows. Their manner of salutation consists in touching the forehead with the right hand, accompanied by a slight inclination of the body. The *Mahometan* religion, introduced into Java by the *Arabians*, is predominant over the whole island; though it is said, that far inland, over the mountains, towards the S. side of the island, there are still some of the aboriginal idolatrous natives. Mosques are erected all over the island, and there is a famous one near *Cheribon*. They are very particular and nice about the tombs of their saints, and will suffer nothing unbecoming to be done upon or near them. They do not bury their dead in coffins, but simply wrap them in a piece of white linen, and having deposited them in the grave, place two stones upon it, one at the head, and one at the feet. These stones, they believe, are to serve as seats for the two angels, who, after their death, examine into their conduct, while in this world. They have both male and female physicians, who are said to perform wonderful cures by means of their knowledge of the medicinal and vulnerary herbs. Much friction of the affected parts is one of their chief means of cure. This is done with two fingers of the right hand, which are pressed down by the left, and passed continually downwards, after having first anointed

anointed the part with water mixed with fine ground wood, or with oil. The coin of Java is of lead, like that of Sumatra and Borneo. The language of Java is the Malay, or a dialect somewhat akin to it. The original inhabitants of the country are not suffered to be made slaves, but are a free people, governed by their own emperors, kings, and governors. The capital of Java is *Batavia*; which see.

JAVA Head, the western point of the island of Java. S. lat. $6^{\circ} 47'$. E. long. $107^{\circ} 40'$.

JAVA, Little. See *BALI*.

JAVA Sea, that part of the East Indian sea, which lies between the island of Java to the south, Sumatra to the west, the islands of Banca, Billiton, and Borneo to the north, and the island of Celebes to the east.

JAVAT, or *Tschavat*, a town of Persia, in the province of Schirvan, at the union of the Aras and the Kur; 45 miles S. of Scamachie. N. lat. $39^{\circ} 55'$. E. long. $48^{\circ} 10'$.

JAVELIN, a kind of spear, or half-pike, used by the ancients both on horseback and on foot.

It was five feet and a half long; and the steel wherewith it was headed, had three sides, or faces, which all terminated in a point.

The javelin match was one of the Gymnastic exercises among the ancients, and consisted either in throwing a stone, or a dart, or something else, with the most address, and to the greatest distance. Plato (*De Leg. l. viii.*) admitted two sorts of "Jaculations," the first called *τοξόμαχος*, and the other *ακροβυστομαχος*; and Galen informs us, that Apollo and Esculapius were the inventors of them. The Latins translated the first by the word "Sagittatio," and the second by that of "Jaculatio." In those exercises they equally employed either a bow or a sling, or another instrument, which they made use of for hanging to the arrow a thong which they held in their hand, to take the more steady aim.

JAVENBY, in *Geography*, a town of Sweden, in West Bothnia; eight miles S. of Pitea.

JAUER, a principality of Silesia, bounded on the N. by the principalities of Glogau and Sagan, on the E. by Lignitz and Schweidnitz, on the S. by Bohemia, and on the W. by Bohemia and Lusatia. It is mountainous and covered with wood; and it yields pit-coal and mill-stone. The mountains contain various ores, with numerous mines of iron and copper. The warm baths of its mineral springs are much frequented. It has 12 towns, and several large villages, which contain 200 families and upwards; and among their inhabitants are artificers, particularly weavers, whose manufactures are purchased for exportation. Its earthenware is much esteemed. Jauer, its capital, is situated 16 miles N. of Schweidnitz. N. lat. 51° . E. long. $16^{\circ} 18'$. Its other principal towns are Hirschberg, Lowenberg, and Bunslau, which give names to districts.

JAVERDA, a town of Hindoostan, in Dowlatabad; 10 miles S. of Calberga.

JAUIA, a city of Peru, famous for its manufacture of woollen cloths, and mines of silver.

JAVIE, LA, a town of France, in the department of the Lower Alps, and chief place of a canton, in the district of Digne. The place contains 130, and the canton 2401 inhabitants, on a territory of 75 kilometres in 10 communes.

JAUESMOW, a town of Hindoostan, in Oude; 15 miles N. of Corah. N. lat. $26^{\circ} 25'$. E. long. $80^{\circ} 46'$.

JAULDOE, a town of Bengal; 142 miles N.W. of Calcutta. N. lat. $23^{\circ} 23'$. E. long. $86^{\circ} 7'$.

JAULNO, a town of Hindoostan, in the circar of Aurungabad; 28 miles N.E. of Aurungabad.

JAUMS, among *Carpenters*, denote the door-posts, as also upright posts at the end of window-frames.

JAUMS, among *Bricklayers*, &c. the upright sides of chimnies, from the earth to the mantle-tree.

JAUNDICE, in *Medicine*, from the French *jaunisse*, (which again is from *jaune*, yellow,) a disease which is principally characterized by a yellowness of the skin over the whole body, and of the coats of the eye.

The appellation of *Aurigo* has been also given to this disease, from *aurum*, gold, in allusion to the yellow colour of the skin. The Romans called it *morbus regius*, or the royal disease, and *morbus arcuatus*, or *arguatus*, the origin of which names has afforded matter of dispute to the etymologists, who have not come to any satisfactory conclusion on the subject. Celsus believes that it was called *regius*, because it requires rich or royal fare to cure it. And the term *arcuatus* is said to have originated from the various colours of the skin resembling those of the rainbow. By the Greeks it was denominated *ικτερος*, *icterus*; whence also *icteritia*. Sauvages has adopted this last as the title of the sixth order, of his tenth class of diseases, understanding by "icteritix" (*couleurs depravées*) morbid changes of the complexion, and denoting jaundice by the term *Aurigo*. See his *Nosol. Method.*—Also, Van Swieten Comment. Aph. 918.—And Celsus, lib. iii. cap. 24.

Jaundice is marked by a yellow colour of the whole surface of the body, which is first seen, and is most conspicuous, in the tunica conjunctiva, or white part of the eyes, and at the roots of the nails. The urine is thick, of a deep yellowish brown colour, and tinges linen and other white substances, immersed in it, of a yellow hue. The bowels are often costive, but sometimes loose; and the stools are commonly of a very pale and clay-like appearance both in consistence and colour, from the absence of bile, and have not the usual fæculent smell. This disease is accompanied with a sense of much lassitude and languor, and a great inaptitude to exertion; with lowness of spirits, and a feeling of pain and tension, or weight and oppression about the præcordia; there is also frequently much anxiety, and some degree of difficulty of breathing, as well as a troublesome sense of itching over the skin, unattended by any eruption. Many symptoms of indigestion are generally present; such as nausea, vomiting, flatulency, and eructations, and loss of appetite: solid food tastes bitter in the mouth of some patients; and in some states of the disease hiccup occurs, and occasional paroxysms of rigour or chilliness. The pain is sometimes extremely acute in the epigastrium, or pit of the stomach, or in the right hypochondrium, especially during the passage of a gall-stone. The state of the pulse varies much; in general it is somewhat quicker than natural; but in some cases, and particularly under the circumstance just mentioned, it is slower. There is a popular notion that all objects appear of a yellow colour to patients labouring under jaundice; and, indeed, Galen, Hoffmann, Boerhaave, and Sydenham, all assert that they have occasionally witnessed that circumstance. But, on the other hand, Dr. Heberden, and other physicians of much observation and experience, have never found such a change of vision in any patient, nor have we ever met with any living practitioner by whom it had been detected. It is not, indeed, an impossible case, particularly where the disease has been of very long continuance and great intensity, when, should the cornea or humours of the eye become impregnated with bile, the light would pass through a yellow medium, and objects thus be tinged of that colour. But these parts are not usually found impregnated with bile.

The symptoms of jaundice originate from the mixture of
bile

bile with the circulating blood. In its ordinary state the blood contains no bile, nor any other of the secretions, such as urine, saliva, &c.; but the bile is generated from the blood, by a different combination of its parts, which is produced by the action of the vessels of the liver. When thus generated or secreted, as the term is, the bile is conveyed to the intestines by a duct which opens into the *duodenum*, or upper part of the alimentary canal. Branching from the middle of this duct, however, is another duct, which leads to the gall-bladder, into which the bile regurgitates. This is called the *cystic duct*; and that part of the duct of the liver above the branching off of the cystic duct, is called simply the *hepatic duct*: but the part below, or between this and the intestine, being the common channel for the bile from the liver, and for that which had regurgitated into the gall-bladder, is called the "common biliary duct," or *ductus communis choledochus*. Thus much it seemed necessary to state, in order that our future observations may be understood. For a minute account of the structure of the parts, see LIVER.

Now, after the bile is secreted, if the hepatic, or the common duct be obstructed, so that the passage of the bile into the intestine be prevented, it is forced back into the liver, and is taken up by the absorbent vessels, and carried into the mass of the circulating blood, in the serum of which it is dissolved, and thus gives it its own yellow colour. The blood, thus tinged, carries the dye with it to every part of the body, and hence the general hue of jaundice is produced. It would seem, however, that the bile, in a liver distended by obstruction of the ducts, is not only taken up by absorption, but is also forced into the mouths of the hepatic veins, according to the observations of Dr. Saunders and Dr. Powell. For both these gentlemen have witnessed the presence of bile in the thoracic duct on dissection; and Dr. Saunders found the serum of the hepatic veins in a dog, in which jaundice had been a short time before produced by a ligature on the common biliary duct, evidently more loaded with the colouring part of bile, than that serum in the other veins of the body. (See Saunders's *Treatise on the Structure, Economy, and Diseases of the Liver*. Powell's *Obs. on the Bile and its Diseases*, &c. p. 56.) When the bile reaches the circulation, the intensity of tinge which different parts receive will be in proportion to their vascularity, and the quantity of colouring matter thus carried to them; or to the natural hue of the part being more or less calculated to shew it, as in the eye and white of the nails. All the solid parts of the body, except the medullary substance of the brain, as some have affirmed, even the bones themselves, the fat and the cartilages, have been observed to be deeply tinged of a yellow colour. The secreted fluids are generally also deeply tinged. In cases of some duration, the perspirable matter is coloured, so likewise is the saliva, which has a very bitter and bilious taste: but the urine is much more highly impregnated with bile, and more speedily than any other of the secretions. Indeed the milk is the only exception which is made by authors; for the affection is supposed to extend even to the semen. (Van Swieten.) As we have already stated, however, poetic licence seems to have got the start of observation, in affirming that the bilious tinge extends to the humours of the eye, which has not been detected by modern inquirers.

"Lurida præterea spectant quæcunque tuentur
Arquati,"

Lucret. lib. iv. v. 333.

is probably without any foundation, as well as Shakspeare's assertion to the same purport. (See Heberden, *Med. Transf.*

vol. ii. p. 132.) The fluids, which are often preternaturally collected in the cavities of the body, as in those which constitute the varieties of dropsy, and those which are accumulated in bladders upon the surface, in consequence of the application of blisters, or other acrid matters, to the skin, are also found tinged with bile; and so likewise is that fluid which, under some circumstances, is collected in the ventricles, and which, in other respects, differs materially from the effusions into other cavities. Powell, *loc. cit.*

It is generally stated that costiveness attends the jaundice, in consequence of the want of bile, which is believed to be the principal stimulus to the intestines. But Dr. Heberden justly remarked, that icteric patients are often disposed to have a purging, and that certainly neither of these states is peculiar to the disease: and Dr. Powell observes, that the greater number of patients, whom he has attended, have been rather purged than otherwise. He remarks, that the degree of the costiveness militates much against the notion, that it originates in a deficiency of bile in the intestines. "Supposing for a moment," he says, "that bile is the stimulus imagined, it acts with a definite force, exemplified in the daily occurrence of stools: now, under these circumstances, any common purgative stimulates the intestines still more, and produces more copious evacuations; but where bile is absent and there is costiveness, even the strongest purgatives fail of their effect, though, as far as their stimulating power goes, they must infinitely surpass any quantity of the bile itself. If, too, this deficiency was the sole occasion of so unpleasant a symptom, it might be thought that the bile of animals might be advantageously employed for its removal: but even this does not answer, nor has a scruple of inspissated ox-bile stimulated my own intestines to more frequent or copious discharges. Upon the whole, I think that costiveness ought not, in this case, to be attributed to absence of bile, and that bile is certainly not the stimulus which has been imagined." (P. 87.) This reasoning is by no means conclusive; but it puts the matter in a probable light.

Causes of Jaundice.—The causes which obstruct the passage of the bile out of the liver, are to be found in the various circumstances which can *obstruct, compress, or diminish the calibre* of the biliary ducts, particularly of the ductus communis. Under these three heads we shall treat of the individual causes of the disease for the sake of discrimination.

I. *Of Obstruction in the Biliary Ducts*, or of the causes which plug up those passages. The ductus communis is liable to obstruction from two causes, namely, from gall-stones, biliary calculi, or concretions, as they have been termed, and from a morbid inspissation or density of the bile.

1. *Gall-stones* are generally formed in the gall-bladder, and acquire their chief bulk there; but from what cause these crystallizations take place we are altogether unable to state. While they remain in the gall-bladder they are perfectly harmless; and when they are very small they readily pass with the cystic bile. The principal inconvenience, then, arises upon the accident of their being carried from the cyst into the narrow ducts. Biliary concretions are very frequently found in the gall-bladder, in the dissections of dead bodies, when no symptom has appeared during the life of the person to excite a suspicion of their existence.

When a gall-stone is impacted in the duct, a pain, which is often most acute and severe, so as to be hardly supportable, but sometimes moderate, is produced, and is often accompanied by shiverings, which afterwards occasionally recur. The pain is seated at the pit of the stomach, and seems generally to be confined to that point of the epigastric region which corresponds to the situation of the opening of the common

JAUNDICE.

common duct into the duodenum, and from this part it appears to dart through to the back: the pulse at the same time continues nearly as slow as is natural, and has none of the hardness attendant on inflammation. By an attention to the seat of the pain and this natural state of pulse, Dr. Heberden observes, that it is not difficult to foretel the outward yellowness in many cases, some days before it appears. The breath, during the continuance of the pain, becomes short and hurried; there is great general anxiety and restlessness, sometimes amounting to delirium, and at last great depression and fainting; the stomach is affected by nausea and reaching; and there are often irregular spasmodic twitches in various parts of the body. There are often profuse sweats, which are, however, sometimes absent; and they do not depend at all upon the shiverings, for they are sometimes present, when no shivering has occurred. These symptoms do not continue long in all their violence; for although the patient, during the passage of a gall-stone, is never free from some pain, yet it increases, by paroxysms, to a state of acute suffering, and subsides again into one of comparative ease, during which there is a sense of deep-seated soreness and fulness of the epigastric and right hypochondriac regions. The greatest relief from pain is experienced by bending the body forward upon the knees, in which position the relaxation of the abdominal muscles leaves the affected parts subjected to the least pressure. Another fit, perhaps of equal or greater violence than the first, then comes on, and alternates with another remission; this may occur several times in an hour; but sometimes the duration of the paroxysm is much longer.

At some early period of these attacks, the jaundice makes its appearance; and it continues for a considerable time after the violent symptoms have disappeared. When the concretion has passed, however, and the more urgent symptoms have ceased, the yellowness may soon be perceived to diminish in its intensity; but before it can entirely disappear, it requires that the whole quantity of the tinged serum be removed by a gradual operation of the excretory glands, and a fresh supply in a natural state be introduced.

The duration of the attack, including the whole time of the passage of the concretion, is as various as its intensity; sometimes a few hours, sometimes several days, or even weeks elapse, before it is expelled. In the former case, the passage is often so rapid as not to allow time for the jaundice to take place. The number and size of the concretions also vary much; sometimes the gall-bladder is filled with them; at other times there are not more than one or two: sometimes they are small and angular; at others large, and have a more regular surface. They have been sometimes seen nearly of the size and figure of the gall-bladder itself, so as almost to fill the whole cavity. These large concretions are less frequently the cause of jaundice than smaller ones; for, from their bulk, there is but little probability of their entering the *ductus cysticus*, and afterwards of obstructing the *ductus communis*: it is from calculi of smaller dimensions that such obstructions generally arise. It appears, however, that calculi of considerable bulk must have passed; for the *ductus communis* has been found, on dissection, enlarged to an inch in diameter; an instance of which was met with by Dr. Heberden. But concretions have passed during life of such a bulk as to occasion a doubt whether they escaped into the intestines by the natural canals, or made their way thither by a preternatural passage; as by the adhesion of the gall-bladder, in consequence of inflammation, to the duodenum or colon, after which ulceration had occurred, and opened a communication. Dr. Cheston, of Gloucester, some years

ago met with a case where a gall-stone of unusual magnitude passed during life, and the patient recovered. Some years afterwards she died of another complaint; and on examination, it appeared that this large gall-stone had made a preternatural passage through the gall-bladder into the intestine. Mr. Cline has an instance of the same kind in his collection of anatomical preparations, at St. Thomas's hospital.

It would be foreign to the purpose of this article to enter into a minute account of the varieties of appearance, and the chemical properties of the different biliary concretions. Upon these topics the reader will find some observations under the head of *BILIARY Calculi*; and he will find a most ample investigation of the whole subject, in Dr. Powell's "Observations on the Bile and its Diseases," from page 105 to 133.

The chief circumstance which seems to give rise to the formation of these concretions in the gall-bladder and bile ducts, is a life of indolence and inactivity; it matters not whether it may have been passed amid the luxuries of wealth, or the hardships of poverty; and if the disorder be more common in the former situation, it is perhaps because necessity compels the subjects of the latter to more personal exertion. Hence these concretions are comparatively more frequent in women than in men; those men who are engaged in literary pursuits are very liable to them; and in either sex they are most common after the active period of life is past. Haller noticed the frequency of their occurrence in criminals, whose death had been preceded by long confinement. (*Opuscula Patholog.*) They are often found in the gall-bladders of oxen, which have been stalled during the winter months; and Dr. Powell believes that they occur in a larger than common proportion of maniacs who have been long confined. Dr. Saunders explains this influence of a sedentary life on the bilious secretion, by observing that the excretory powers of the liver depend but little upon any action which the biliary ducts can perform, as they possess a very small degree of irritability; but are assisted principally by the agency of the diaphragm and abdominal muscles, and the peristaltic motion of the intestines; and more especially from the agitation which the hepatic system undergoes during bodily exercise. The want, therefore, of a degree of exercise, sufficient to assist the biliary ducts in their excretory function, must necessarily lay an ample foundation for morbid affections of the bile. And the necessity of this external aid to the perfect action of the liver, seems more obvious from the circumstances of its venous circulation, which is always more languid than in those secretory organs, where the fluids are kept in a state of more rapid motion by arterial impulse.

It is commonly supposed that the biliary concretions are protruded from the ducts by the contractile power of the ducts alone. The truth of this opinion, however, Dr. Pemberton has questioned; and he maintains, that the gall-stone is propelled by the accumulating bile behind it, which at the same time pushes it forward and distends the duct. For, in the first place, the duct, he affirms, is always found contracted before the gall-stone; whereas, if the concretion were protruded by the contractile power of the duct, it ought to be contracted *behind* it. In the second place, opium and blood-letting are employed as relaxants and antispasmodics, and successfully: but this relaxation would rather retard than expedite the passage of the calculus, if its protrusion were the result of the contractile power. The consideration is, therefore, of practical importance. See Pemberton on *Dis. of Abdominal Viscera*, p. 55, *et seq.*

It may be added, that excessive vomiting and violent exercise, which have given rise to jaundice, operated proba-
bly

JAUNDICE.

bly by forcing concretions from the gall-bladder into the ducts; and that there is an instance on record, in which jaundice arose from the seeds of gooseberries, which were found in the extremity of the common duct, as it enters the duodenum. Saunders.

2. The canal of the ductus communis choledochus may be obstructed or plugged up by the secretion of bile of a *morbid density* and tenacity, or by the *inspissation* of it in the gall-bladder. Dr. Saunders, speaking of the appearances that have been observed on dissection, says, "the bile has been found of a very viscid and pitchy consistence, especially in the gall-bladder; passing from the cystic to the common duct, and thereby perhaps resisting the passage of the more fluid hepatic bile, which would otherwise flow freely into the duodenum." The colour of this dense and inspissated bile is still yellow, according to Dr. Powell, who states, that it does not seem to block up the large ducts, nor their entrance into the duodenum, but rather accumulates in the liver itself, the deviation from a state of fluidity rendering its passage through the smaller canals difficult. He conceives that this state of the secretion is connected with the use of spirits. Loc. cit. p. 75 and 145.

II. *Compression of the Biliary Ducts.*—The passage of the bile into the intestines may be also impeded by the various circumstances under which the common duct, or the hepatic duct is placed in a state of compression; of these we may mention the following:

1. *Posture.*—All persons, who are engaged in sedentary occupations, yield very generally to a curved posture, which, independently of the more remote effects of such modes of life, has seemed sufficient to produce jaundice. It is a well known fact, at least, that under such circumstances the disease is particularly frequent. Dr. Powell remarks, that in the necessary attention to anatomical dissection, which is given by young men in their preparation for the profession of physic, it is by no means uncommon to find attacks of jaundice, and that too at so early a period of their confinement, as can scarcely admit of the supposition that this was the chief exciting cause; and in some cases of literary study the same fact is observed: now the only circumstance in common in these two situations, is the flexure of the body forwards. In such a posture, the gall-ducts are obviously liable to suffer constant compression between the liver and the intestines and other adjoining parts.

2. This compression may be also occasioned by the gravid uterus, in pregnancy, towards the latter periods of which jaundice occasionally occurs. Dr. Powell, however, is inclined to refer the jaundice, produced under such circumstances, to the plethoric state of the liver, in which the accumulation of blood in that viscus itself is the cause of the compression of the ducts; more especially because blood-letting, and other evacuations remove it.

3. *Tumours* of the liver and of the neighbouring viscera are among the common causes of the most permanent and severe jaundice. A mere congestion of blood or turgescence of the vessels throughout the liver, as just hinted, from whatever cause produced, may be easily supposed to press upon and block up the biliary ducts, and thus occasion the absorption of that bile, to the secretion of which it ministers. Thus *hepatitis*, or inflammation of the liver, is sometimes accompanied by jaundice; and would probably be more frequently so accompanied, were it not in general confined to a small part of the viscus, or to its investing membrane. Thus, after the intermittent fevers of this country, and the analogous remittents of warmer climates, a

jaundice often comes on towards the conclusion, which has been considered as forming no very unfavourable prognostic; for there does not generally appear to be any other disease of the liver, in such cases, than an increase of its size, with great accumulation of blood through its substance. Dr. Powell mentions the case of a woman who died of consumption, and whose lungs were found to be almost one mass of ulcerated tubercle; within the last three days of her life, jaundice had come on to a very intense degree. But, on dissection, the ducts were found free, and the gall-bladder empty, and no external tumour was discovered; but in the liver there seemed to be a great accumulation of blood; it was much increased in size, had a loose texture, and was in every part deeply tinged with bile. Loc. cit. p. 72-3.

Scirrhus tumours of the contiguous parts, as of the head of the pancreas, of the pylorus, and even of the liver itself, scrofulous enlargements of the lymphatic glands in the capsule of Glisson, and steatomatous swellings of the omentum, are often so situated as to obstruct mechanically the passage of the bile into the intestines; tubercles of the liver have sometimes also operated as extraneous causes, and, from their local situation, stopped the natural course of the bile. But the liver is often much enlarged by collections of large tubercles, which yet leave, in their interstices, a perfect freedom for the action of the vessels and the passage of the biliary ducts; and scirrhus of the liver is not usually a general disease, but is confined to particular spots, which are often out of the way of the biliary passages; so that it has often been found, on dissection, to have made considerable progress without inducing jaundice.

4. Distension of the large intestines by air, which constitutes the disease called *tympanites*, is often accompanied by jaundice. Such a distension, arising to a certain point, must impede the influx of the bile into the duodenum, both by its pressure upon this bowel itself, and upon the biliary ducts; and the jaundice seems to take place, under such circumstances, only when the distension is very considerable, and is therefore to be deemed a very unfavourable symptom. In a case, mentioned by Dr. Powell, the accumulation of air was so great, that, very speedily after the appearance of jaundice, the *cæcum* was burst by it, and the patient of course destroyed.

III. *The calibre of the biliary ducts being diminished*, independently of internal stoppage or external pressure, jaundice will equally ensue. Two causes of this kind are mentioned by medical writers; but it is probable that neither of them are of very common occurrence.

1. *Spasm* of the common duct, or a spasmodic constriction of the duodenum itself, and consequently a closing of the aperture of the duct, are particularly mentioned by Dr. Cullen among the causes of jaundice, and Dr. Powell deems the fact well established, although it has often been denied. In some way or other, however, jaundice frequently concurs with diseases that are called spasmodic. Thus it is said by Sydenham to come on occasionally during hysterics; and it has been observed to follow violent fits of anger, and other emotions of the mind. Dr. Heberden denies the accuracy of Sydenham's observation, in respect to hysteria, both from his own observation, and the authority of many other practitioners. With respect to the influence of the passions, Dr. Saunders remarks that anger not only augments the quantity of bile secreted very considerably, but likewise vitiates it: hence it is, that, being carried into the duodenum in large quantities, and regurgitated into the stomach, it produces the same effects as an emetic: and hence

JAUNDICE.

probably the term *choleric*, as applied to passionate people. If the *ductus communis* do not transmit it as fast as it is secreted, and the gall-bladder is so full that it cannot receive the excess; then it will be forcibly returned upon the hepatic system, and, by entering the blood-vessels, produce jaundice. (Saunders, p. 235.) Some have supposed that, during the general commotion of the passions, a gall-stone may have been pushed from the bladder into the duct, and thus produced jaundice; but the whole attack has often been too transitory, and too free from the general symptoms of the passage of a gall-stone, to allow of such a supposition. (Powell, p. 70.) The symptoms of spasm, affecting the parts in question, are, however, generally considered as being similar to those of the passage of a concretion. (Pemberton, loc. cit. p. 49.) So that, on the whole, the explanation which Dr. Saunders has given, of the influence of the passions in producing a temporary jaundice, appears to be the most probable.

2. *A thickening of the coats* of the biliary ducts, by which their calibre must be diminished, is mentioned among the less common causes of jaundice. (See Morgagni De Causis, et Sedibus Morborum, Epist. xxxvii. art. 10 who mentions an instance of the total obliteration of the common duct.) Dr. Saunders remarks that this contraction of the canal of the duct, is produced by the extension of diseased structure, originally produced in the stomach by the abuse of spirituous liquors, to the biliary ducts. "In the dissection of those who have been intemperate dram-drinkers, the diseased structure may be traced," he says, "from the stomach along the course of the ductus communis, and I have frequently seen these ducts so contracted and thickened, that they could not transmit bile." A similar effect, from inflammation of the liver extending to the gall-bladder and ducts, which often lays the foundation of an incurable jaundice, has been observed by Dr. Pemberton: the inflammation of the duct may be removed, he observes, but the thickening remains, a permanent evil. Dr. Darwin, however, imagines, that a temporary jaundice may be occasioned by an inflammatory thickening of the membrane lining the ducts, analogous in its kind to that of the membrane of the nose in catarrh, and which, like it, soon ceases; and the jaundice will go off. (Zoonomia, vol. ii. p. 138.) The truth or falsity of this opinion it is not in our power to ascertain.

In addition to the series of causes already detailed, arising from obstruction to the passage of the bile into the duodenum, it has farther been a question, whether any obstruction to its discharge from the bowels, after it has cleared its appropriate ducts, may not likewise occasion its absorption into the system, and therefore produce jaundice. It would appear, from an experiment of M. Portal, that this may happen. He passed a ligature round the intestine of dogs, a little below the opening of the ductus communis choledochus, and observed that, in five or six hours afterwards, their eyes acquired a yellow tinge; and upon examining the lacteals, he found them filled with bile. (Mem. de l'Acad. des Sciences, ann. 1777.) In some of the cases of obstinate costiveness accompanied by jaundice, that are on record, it is probable, therefore, that the jaundice was a symptom, rather than a cause, of the costiveness.

This seems to be the case, in the slight jaundice of infants, which speedily vanishes when the bowels are unloaded.

Dr. Powell mentions a paralysis of the gall-bladder as one of the causes of jaundice. In this case, as in the urinary bladder, the powers of contraction are lost from over-distension, and the accumulation of bile is said to have be-

come so great, as to produce a tumour externally, with an evident fluctuation, which has induced the surgeon to puncture it, under an idea that the collection was *pus*. It is not easy to conceive how jaundice should be induced, under these circumstances, except by absorption from the inner surface of the gall-bladder itself.

The prognosis, in jaundice, must be obviously very different in different instances, according to the nature of the obstruction upon which it depends. In jaundice arising from gall-stone, or spasm, the prognostic is favourable; for, in the latter case, the spasm will assuredly cease; and, in the former, if the stone is small enough to enter the duct, it is most likely that it will pass its whole length, inasmuch as the canal at the entrance is of less diameter, than when it unites with the hepatic duct to form the ductus communis choledochus. If, therefore, jaundice has arisen suddenly in young and vigorous habits (even though accompanied with much pain), and is unattended with fever, and other unfavourable circumstances to be mentioned, it is seldom of long duration, and may be effectually removed. The itching of the skin, which sometimes subsides after a few days, Dr. Pemberton observes, often returns a day, or even two days, before other evident proofs of the removal of the obstruction; so that he considers such a recurrence of the itching as a favourable symptom. A bilious diarrhoea coming on, implies the removal of the obstruction, and must therefore be regarded as conclusive with respect to the recovery of the patient. A small variation of the yellowness cannot be relied upon as a symptom of convalescence; since the colour of the eye and skin often undergoes slight changes, even during the time when the obstruction remains the same. Pemberton, loc. cit. p. 61.

Among the unfavourable symptoms may be reckoned a continuation of the intenseness of the yellow colour in the eye, the pain of the stomach remaining equally acute, and confined to the same spot, and an increase of nausea, while the stools and urine continue to retain the unnatural colours before-mentioned. The appearances are very unfavourable, if, with the violent pain, there is also a quick pulse, loss of flesh and strength, with occasional watchfulness and melancholy; under these circumstances, the patient becomes subject either to profuse sweating or hæmorrhagy. These symptoms generally mark the presence of some fixed disease in the viscera, and the disease frequently terminates in a confirmed dropsy of the belly.

It must not be omitted, that jaundice is a disease into which the patient is very liable to relapse, after every appearance of recovery.

Diagnosis.—It is extremely important, with a view to the proper treatment of jaundice, to distinguish from which of the causes of obstruction before-mentioned the biliary ducts are impeded. Our conclusions as to the event of the disease must also depend entirely upon our knowledge of the nature of the obstruction. We have in some measure anticipated the diagnostic symptoms, in treating of the causes; but it cannot be too carefully observed, that where gall-stone, or spasm of the ducts, is the cause of the jaundice, there is most acute pain in the pit of the stomach, attacking suddenly, commonly remitting and recurring in paroxysms, and often accompanied by vomiting; but at the same time the pulse continues in its natural state, both in respect to slowness and softness, which implies the absence of inflammation. When shiverings occur, it may be observed that they come on *after* the pain has continued some time, and do not precede the pain, as is the case with those shiverings which attend inflammation.

JAUNDICE.

Jaundice arising from compression of the biliary ducts, by tumours of the neighbouring organs, may be distinguished by the pain not having come on suddenly; by its being less acute and varying little in degree; by the circumstances of the general health, when the jaundice has been preceded by other diseases of long continuance, by wasting of the flesh and strength, and is accompanied by soreness or obvious hardness in the hepatic or epigastric region, and by an increased velocity of the pulse, and when it occurs in the middle or advanced period of life. Even when the jaundice has subsisted long without any intermission, (Dr. Cullen remarks,) and without any pain in the epigastrum, an external compression is to be suspected. When to these circumstances a disposition to dropsy is added, there can remain no doubt as to the existence of morbid enlargement of some of the viscera, and of the incurable nature of the disease.

The *chlorosis*, to which young women are extremely subject, puts on, to a superficial observer, the appearance of jaundice; and, indeed, the whole body assumes, in some cases of this disorder, so much of a yellow colour, as might lead a less careful observer to suspect the presence of bile. But in all such cases, the original whiteness of the eye remains, or is even increased to a pearly whiteness, and the urine remains of its natural colour, assuring us that the circulating fluids hold no bile in solution.

Cure of Jaundice.—As the cure of jaundice consists essentially in removing the obstruction to the free egress of bile from the liver, the treatment must vary according to the nature of the obstructing cause; and while measures are adopted, with a view to remove these causes, other collateral indications, such as the alleviation of pain, the diminution of inflammation, if any be present, and the support of the patient's strength, will require to be fulfilled.

When the symptoms lead us to infer, that the jaundice arises from the impaction of a gall-stone in the duct, the object of remedies will be to facilitate its passage into the intestinal canal. We know of no certain and immediate means of expediting the passage of biliary concretions, which is generally a work of time, depending upon the gradual dilatation of the biliary duct. It proceeds, however, faster or slower upon different occasions; and therefore the jaundice, after a various duration, often ceases suddenly and spontaneously. This circumstance has given rise to a belief in the efficacy of a number of remedies, many of which are perfectly inert, and others cannot be supposed to exert any effect upon the passage of a gall-stone. Some of these, indeed, seem to have been recommended for the cure of jaundice, in consequence of their *yellow* colour; such as saffron, the yolk of raw egg, &c.; in the same way as the root of madder, which is *red*, has been popularly used as an emmenagogue. Of such remedies it is unnecessary to give any farther account.

But although no immediate evacuation of the obstructing cause be within the power of medicine, yet that process may be facilitated by those means, which are known to abate increased action of muscular fibres, and to diminish irritability; *i. e.* by anti-spasmodic and narcotic medicines. Opium is one of the most effectual medicines of this class; and the benefit, resulting from its administration, seems to confirm the theory upon which it has been recommended. It fulfils the two-fold indication of relaxing the spasm of the ducts, and alleviating the urgent pain. It is not enough, however, to administer small or even ordinary doses of this medicine, which, in proportion to the severity of the pain, will produce the less effect. The quantity of opium, as Dr. Pemberton

enjoins, ought to have no limit but the absolute alleviation of the pain; and till that object is attained, the patient should take a grain of solid opium, or twenty-five drops of the tincture of it every hour. (Pemberton, *loc. cit.* p. 52.) Or, as is recommended by Dr. Powell, which we believe to be more efficient, he should take a large dose, say two or three grains, in the first instance, and follow this up by smaller doses, at short intervals, which will prolong the powers of the medicine, and sometimes the concretion will pass, while the patient is under its influence. (Powell, p. 155.) A dose of fifty drops or a drachm of tincture of opium, in a glyster, will frequently produce immediate relief.

The spasmodic constriction of the duct, and the excessive pain attendant upon it, may be also alleviated, and the passage of the concretion facilitated, by the use of warm fomentations, applied to the region of the stomach and liver, and still more effectually perhaps by immersion in a warm bath; the temperature of the bath should, however, be properly regulated, as well as the continuance of the immersion. As the object, in this case, is to obtain the soothing and relaxing effects, and not the corroborant operation, of the warm bath, its temperature should be from 100° to 110° of Fahrenheit's thermometer, either on the first immersion, or by the application of subsequent heat; and the immersion should be continued till an incipient faintness is produced, which, whether it take place after a longer or a shorter time, is the best criterion to regulate its duration; for where this has not ensued, the bath has not appeared to produce any beneficial effect. Powell.

Several physicians, and Dr. Cullen among the rest, have considered the action of vomiting as the most probable means of assisting the passage of a gall-stone through the biliary duct. This action, Dr. Cullen says, "by compressing the whole abdominal viscera, and particularly the full and distended gall-bladder and biliary vessels, may contribute, sometimes gently enough, to the dilatation of the biliary duct." (First Lines, § 1825.) Hence *emetics* have been frequently recommended for the cure of jaundice arising from gall-stones. Dr. Heberden, apparently by a dereliction of his usual rational caution, while he admits that vomiting is often an urgent symptom of jaundice, from biliary concretion obstructing the duct, and that the action may even be supposed to contribute to lacerate the duct, if the concretion be strongly impacted in it; yet he maintains that experience had taught him that vomiting, excited while the pain was intense, rather quieted than aggravated the pain, and never brought it on. (Medical Transact. of the Coll. p. 160.) He considers it, therefore, as a judicious practice, whether the patient have a vomiting or not, to order an emetic, either at first, or as soon as the intenseness of the pain has been alleviated, and occasionally to repeat it, watching at the same time its operation, and checking it by an opiate, if the straining continue too long, or be too violent. It is true, that no decided injury is stated to have been produced by such an exhibition of emetics; yet the theory of their operation, by mere mechanical concussion, seems very problematical, and experience, on the whole, does not attest any very clear proofs of their efficacy. Dr. Cullen admits that gentle emetics alone should be given; and suggests that, where, by the long continuance of the jaundice, it may be suspected that the size of the concretion then passing is large; or more especially when pain attending the disease gives apprehension of inflammation, it may be prudent to avoid vomiting altogether. On the whole, the practice must be deemed precarious where the disease

JAUNDICE.

is severe, and uncalled for where it is mild. When the obstruction is occasioned by inspissated bile or mucus about the mouth of the duct, vomiting might remove this, and thus cure the disease; but a purgative, which is less precarious in its operation, is perhaps equally efficacious.

The use of *purgatives*, indeed, has been recommended by some writers, with a view to aid the expulsion of gall-stones from the biliary duct; but the most experienced agree that little benefit can be expected to accrue from the use of cathartics (except when the bowels are very costive), until the concretion shall have escaped into the intestine. There cannot be a doubt, however, that slight cases of jaundice, depending perhaps upon the clogging of the aperture of the duct with inspissated bile, or a very small calculus, are speedily removed in many cases by cathartics. From the notion that congestion arose from a deficiency of bile in the intestines, the *bitter purgatives* were particularly recommended in jaundice; such as aloes, infusion of chamomile with tincture of aloes, or colomha with rhubarb and soap, &c. As soon as the pain is relieved by the remedies already enumerated, and more especially when the relief is complete and sudden, implying the escape of the concretion into the duodenum, it would seem to be advantageous to preserve an open state of the bowels for some days, not only for the purpose of carrying the concretion out of the body, but to assist in expediting the discharge of the bile tinging the serum of the blood, and the healthful renewal of the latter. The choice of the purgative for this purpose would seem to be not very material; castor oil, moderate doses of calomel succeeded by neutral salts or rhubarb, &c. repeated every third day, may answer the proposed end.

When there is complete evidence, from the colour of the stools, &c. that the obstruction is removed from the gall-duct, little farther aid from medicine, than the means just stated, would seem to be requisite. Perhaps, however, the restoration of the functions of the stomach and adjoining organs may be accelerated by the administration of some aromatic bitter, such as an infusion of cascarella or gentian; or of the absorbent or antacid medicines, when heart-burn or pain of stomach remains.

Such is the treatment to be adopted, whether the jaundice arise from spasm merely, or from gall-stone, or inspissated bile, stopping the duct. Except in the case of gall-stone, the disease will soon disappear. But in the latter instance, it often happens that the concretion, either from its magnitude or from its angular form, produces inflammation of the duct. It then becomes a more serious complaint, and requires the use of blood-letting, blisters, and purgatives, as in other visceral inflammations. The supervention of inflammation is principally marked by the increase in the velocity and hardness of the pulse. The tendency to inflammation, indeed, in strong and plethoric habits, from such an irritation in a membranous part as the passage of a biliary concretion excites, is so great, that experienced physicians recommend the employment of blood-letting, by way of precaution, in persons of moderate vigour, even before the pulse is quickened, or febrile symptoms have supervened; and deem it absolutely requisite, when the pain is severe and the slightest degree of feverishness is present. (Cullen, loc. cit. § 1824.) One full bleeding, produced from a large orifice in a vein, to the extent of 18 or 20 ounces, in a strong person, will be more efficacious than twice the quantity taken at repeated times.

It must here be observed, that various attempts have been made to discover medicines which might act upon the biliary concretions as solvents, while they remain in the gall-bladder or biliary ducts. Several substances have been found to

dissolve the most common ones when directly applied out of the body, especially ether, oil of turpentine, spirit of wine, and the alkalies; and the combination of the two former, as well as solutions of essential oils in alcohol, have been administered internally both in France and this country, and their efficacy strongly attested. (See two papers on this subject, by M.M. Durande and Maret, in *Les Nouveaux Mémoires de l'Acad. de Dijon*. tom. i. and iii. &c. White's *Essay on Diseases of the Bile*.) But it is to be recollected, that it is altogether impracticable to make a direct application of these substances to calculi in the biliary passage; and we have no facts to prove that they can be carried into the gall-bladder, through the medium of the circulating-blood, so little changed as to preserve any sensible degree of solvent power. Dr. Saunders, however, affirms that the alkalies have been found by experience, when taken for some continuance, to be successful against biliary concretions; and it has been generally stated, that stalled oxen get rid of their biliary calculi when turned out to graze in the spring, which, if it be true, implies the possibility of some change being effected upon calculi already formed. This statement induced some practitioners, who ascribed the effect to the new food which the cattle obtained, to give *grafs*, or the juice of it, to their human patients affected with jaundice. Van Swieten affirms that he cured a poor labourer by prescribing a decoction of grafs, sweetened with honey, for his common drink. (Comment ad *Apl.* 950.) But these practitioners did not recollect that a free muscular exercise in the open air was an important point in the alteration of the circumstances of the cattle just mentioned; and whether we look to the sedentary habits of those who are more particularly disposed to jaundice, or to the beneficial effects of exercise, especially on horseback, which experience has ascertained, in preventing the stagnation and viscidness of the bile (see Saunders, p. 255. Powell, p. 161.), we shall not be disposed to send our jaundiced brethren to graze for the recovery of their health.

Acids were long ago considered as beneficial in many cases of jaundice (Baglivi, *Prax. Med. lib. i. cap. 9.*); and the diluted *nitric acid* has recently been recommended in some diseases of the liver. Dr. Powell was hence induced to administer this acid to a patient who was subject to frequent attacks of jaundice from biliary concretions; and during the use of the acid for eight months he continued free from the disease. The writer of this article was induced to administer the nitric acid from the same considerations, and has witnessed the most decided efficacy of the remedy in several instances in which the disease speedily yielded to its influence again and again, after returning on desisting from its use. In one case, a young lady has experienced from it an invariable cure, and from the disposition to a recurrence of the jaundice has found it expedient to employ it almost constantly. It may be taken in the proportion of a drachm of the diluted nitric acid to a pint of distilled water, or of any vegetable infusion, daily.

In that state of the liver which produces jaundice towards the end of intermittent fevers, mercury is the best and only remedy; and calomel, in small doses, is the form under which, in this, and some other hepatic diseases, it seems to act most powerfully. Where scirrhus of the substance of the liver, or of the neighbouring organs, operates mechanically by its pressure upon the ducts, and occasions jaundice, it is more likely to prove the source of permanent mischief than any other cause, and our means of relieving it are less effectual. In the true tubercle of the liver, which begins with induration,

induration, and afterwards passes on to ulceration, the efficacy of any medicine is very doubtful; even mercurials, when given in large quantities, and under any form, have not seemed to produce any decided advantage. They are absolutely injurious, according to the observation of Dr. Saunders, when symptomatic fever takes place. The chalybeate waters are recommended by the last mentioned physician, as giving that tone and energy to the system so very defective in cases of jaundice.

When jaundice arises from a general congestion of the vessels of the liver, general blood-letting, or, if the circumstances of the constitution and strength of the patient forbid that, local bleeding by leeches, or cupping-glasses after scarification, or the application of blisters to the hypochondrium, will be useful, together with the exhibition of purgatives; and if it be admitted, that torpor of the intestinal canal, and a retention of bile or an accumulation of mucus in the duodenum can sufficiently obstruct the departure of the bile, and thus occasion jaundice, as it seems to do in young children, the employment of any active purgative will be adequate to its removal. Calomel and jalap are particularly well suited to this indication.

JAUNDICE, Black, was distinguished from the jaundice, properly so called, or *yellow jaundice*, by the ancients, when the skin of the patient became of a dark green hue. They conceived it to be occasioned by a mixture of melancholy, or black bile, with the blood, and to originate from disease in the spleen, which they conceived to be the organ in which the black bile was generated, or from corruption and putrefaction of the yellow bile. It appears to have been nothing more than an intense degree of the ordinary jaundice, when the skin becomes of a dark or bronze hue, to which this appellation was applied.

Horses are subject to jaundice as well as men. The farriers commonly call it the *yellow*, and divide it, as we do the jaundice, into two kinds, the yellow and the black. The yellow kind is known by the creature's white of his eyes turning to a yellowish colour, and his tongue and lips also partaking of the same tinge, but in a smaller degree. In the black kind all these parts are tinged with a dusky or blackish colour. The common cure among the farriers is by means of an ounce of mithridate dissolved in two quarts of strong-beer, and given to the horse warm; and repeating this dose once in twelve hours, as long as the distemper continues.

JAUNDICE-BIRD, *icterus*, in *Ornithology*, a name by which several of the old authors have called the galbula, a bird of the turdus kind, very beautifully coloured all over with a gold yellow, but with black wings. See **ORIOLE** *Galbula*.

JAW, in *Anatomy*, the bone in which the teeth are lodged: there are two, an upper and a lower one. These are described in **CRANIUM**. The joint and muscles of the lower jaw are considered under **DEGLUTITION**.

JAW, *Dislocations of*. See **LUXATION**.

JAW, *Fractions of*. See **FRACTURE**.

JAW, *Locked*. See **TRISMUS** and **TETANUS**.

JAWATA, in *Geography*, a town of Japan, in the island of Nippon; 90 miles W.N.W. of Meaco.

JAWBERRYA, a town of Bengal; 21 miles N.W. of Calcutta.

JAWOR, a town of Lithuania, in the palatinate of Novogrodek; 48 miles S.S.W. of Novogrodek.

JAWOROW, a town of Poland, in New Galicia, celebrated for its warm baths; 25 miles W. of Lemberg.

JAXARTES. See **SIHON**.

JAY, **GUY-MICHAEL LE**, in *Biography*, a learned ad-

vocate of the parliament of Paris, who flourished in the 17th century, was at an early age profoundly skilled in the Oriental languages, and formed, at that period, the noble design of publishing a polyglott at his own expence. He carried the plan into execution, but it was with the expenditure of all his property. He might have reimbursed himself, and have also received an ample compensation for his long and almost unremitting labours, if he would have accepted the patronage of cardinal Richlieu, who was ambitious of a similar reputation to that obtained by Ximenes, for patronizing the Spanish Polyglott, but M. le Jay chose to reserve to himself all the glory of the undertaking. On account of his poverty he embraced the ecclesiastical life, and obtained a small deanery, but his income was very inadequate to his wants, till cardinal Mazarin made him a magnificent present of nineteen thousand livres. The king likewise granted him letters of nobility, and a brevet of counsellor of state as rewards of his learning, zeal, and disinterestedness. He died in the year 1675. His Polyglott is in ten volumes, folio: it contains the Syriac and Arabic versions, with their Latin translations, and the Hebrew Samaritan text of the Pentateuch, with the Samaritan translation of the same in Samaritan characters. The high price at which this Polyglott was offered for sale in England, induced Walton to publish a similar work, which is more complete and commodious, though not so handsome, as M. le Jay's. Moreri.

JAY, in *Geography*, a township of Ameriea, in Kennebeck county, and state of Maine, thus named in honour of John Jay, governor of the state of New York. It lies on both sides of Great Amerefskoggen river, and includes the great bend which, from an easterly and westerly course, suddenly turns southerly in this township, and passes into Livermore, containing 430 inhabitants. The Indian name of this place was "Roehomekoe."

JAY, in *Ornithology*, is the English name of the *Corvus glandarius*; which see.

JAYA, in *Hindoo Mythological Romance*. Jaya and Vijaya were two of the daughters of Daksha, son of Brahma. When Rama went forth to the wars of Lanka, the gods and demigods endowed and armed him with their potencies and weapons. These two sisters "of slender waist," as they are described in the Ramayan, brought forth a hundred weapons "missive and manual," wherewith to arm Rama and his compeers in their arduous conflicts with Ravana, the tyrant of Lanka.

JAYADEVA, in *Biography*, a celebrated Hindoo poet, whose lyrics, entitled "Gita Govinda," introduced to the literature of Europe by the elegant pen of the lamented sir William Jones, seem to give him a claim to an elevated rank in that species of composition. The "Gita Govinda" is a pastoral drama, exhibiting the loves of Krishna (under the name of Govind) and his mistress Radha; and although apparently a mere voluptuous rhapsody of passion, and that not always devoid of grossness, embellished by exquisite touches of poetry, it is contemplated in a very different light by the enthusiasts of the Gokalaitha sect, or the exclusive adorers of Krishna. These persons can discover in the "Songs of Jayadeva," as the poem is called, a system of emblematical theology: the loves, apparently carnal, of Krishna and Radha, mean, they say, the reciprocal attraction between the divine goodness and the human soul; and in this manner the voluptuousness of the poem is explained and lost. Others of a more sober cast passionately admire the practical beauties of the Gita Govinda, without admitting it to be a composition exclusively spiritual. It is certain that a figurative mode of expressing the fervour of devotion obtained extensive prevalence in very early times. Among the Jews, Ma-

hometans, and Hindoos, striking examples can at once be pointed to; not to mention in this place the doctrines promulgated in the same glowing style by the illustrious Grecian travellers, Pythagoras and Plato, who, it may be safely asserted, derived many of their tenets, as well as peculiarity of expression, from the mystics of India and Persia. See *Mystical Poetry*.

Jayadeva is believed to have lived anterior to the Christian era, and to have been born at the town of Cenduli, in Kalinga; but as there is a town of a similar name in Berdwan, the natives of it claim the glory of citizenship with the finest lyric poet of India, and celebrate in his honour an annual jubilee, passing a whole night in representing his drama, and singing his beautiful songs.

JAYADEVI, the consort of Vishnu, in an equivocal incarnation under the form of Jina or Jaina, as appears in some Hindoo writings. She is represented preaching to the females of Kari or Benares, the Jaina doctrine, that "all true religion consisted in killing no creature that had life;" a heresy, according to Brahmanical authors, which gained so much ground, as to render an incarnation of Siva the avenger expedient to resist it. This incarnation, they say, accordingly took place, in the person of a learned bigot named *Sankara*, which see.

JAYES, in *Geography*, a town of Hindoostan, in Oude; 30 miles N. of Manickpour.

JAYGONG, a town of Bootan; 25 miles N. of Beyhar.

JAYNA, a canton, parish, and river on the S. side of the island of St. Domingo; between this river and the Nigua is enclosed an extensive and fertile plain, which was formerly an abundant source of riches to the colonists. The quantity of pure gold that was dug from its cavities, its sugar, cocoa, indigo, and other plantations, paid duties to a greater amount than those now paid by all the Spanish part of the island. The inhabitants are wholly employed in the breeding of cattle or the washing of gold sand. Indigo grows wild here. Towards the source of this river, which at 250 miles from its mouth is not fordable, but crossed in canoes and skins, were the celebrated gold mines of St. Christopher's, near which Columbus erected the fort of that name. On this river there are also rich silver mines. The establishments in the plain of St. Rose, and those on the Jayna, are reckoned to contain 2000 persons.

JAYNAGUR, a town of Bengal, six miles N.E. of Mahmudpour. N. lat. 23° 28'. E. long. 89° 46'.—Also, a town of Bengal; 42 miles N. of Rangur. N. lat. 24° 21'. E. long. 85° 53'.—Also, a town of Hindoostan, in Bahar; 15 miles N.N.E. of Durbungah. N. lat. 26° 33'. E. long. 86° 20'.

JAYPOUR, a town of Hindoostan, in the county of Orissa; 192 miles W.S.W. of Cattaek. N. lat. 19° 5'. E. long. 82° 48'.

JAYSPIZ, a town of Moravia, in the circle of Znaym; 10 miles N. of Znaym. N. lat. 48° 57'. E. long. 15° 53'.

JAZAR, or JAZER, in *Scripture Geography*, a city beyond Jordan, given to Gad, and afterwards to the Levites. (Josh. xxi. 36. xiii. 25.) It lay at the foot of the mountains of Gilead, near the brook Jazar, which discharges itself into the Jordan.

JAZIRA, *Desert of*, a tract of Asiatic Turkey, extending along the Euphrates from Balis to Anbar. See *GEZIRA*.

JAZYGES, in *Ancient Geography*, a people of Scythia, or Sarmatia. Of these there were the *Jazyges Mustæ* who occupied the northern coast of the Palus Martis, and were destroyed in the 13th century by the kings of Poland; and also the *Jazyges*

Metanastæ, who inhabited the angular territory formed by the Tibiscus with the Danube. They lived in the vicinity of Dacia, and are called by Pliny "Sarmates." The *Jazyges Bassi*, or royal, were people of Sarmatia, joined by Strabo to the Jazyges on the coast of the Euxine sea. These advanced in process of time to the banks of the Danube, and penetrated to the other side of the Sarmatian mountains. They have been sometimes confounded with the Getæ and Dacians, on account of the resemblance that subsisted between them in their manners and mode of government. Ptolemy speaks only of the Jazyges Metanastæ, who were probably more considerable than any of the other Jazyges; and whose country was bounded on the N. by European Sarmatia, S. E. by the Sarmatian mountains, as far as mount Carpathus, and W. and S. by that part of Germany which extends from the Sarmatian mountains to the Danube, near Carpis, and thence by a part of this river to the Tibiscus; and E. by Dacia, from which it is separated by the Tibiscus. Towards the decline of the empire, this country was occupied by the Vandals, and afterwards became a part of the empire of the Goths. About the year 350 they were expelled by the Huns. It has since formed part of Hungary and of Galicia, and probably also of Bannat-Temeswar.

IBAGUE, in *Geography*, a town of New Granada, in the province of San Juan de los Llanos; containing about 400 inhabitants, one half of them being Indians.

IBALI, a town of European Turkey, in Macedonia, situated near Drino Nero; 65 miles W.N.W. of Akrida.

IBAR, or HIBAR, a river of European Turkey, which runs into the Morava; 20 miles N. Precep.—Also, a town of Servia; 20 miles N. of Novi-Bafar.

IBARRA, JOACHIM, in *Biography*, born at Saragossa in 1725, became printer to the king of Spain, and died in 1785. He carried the typographic art to a degree of perfection which had been unknown in that country. He produced very fine editions of the bible, the Mozarabic Missal, Mariana's History of Spain, Don Quixotte, and Gabriel's Spanish Translation of Sallust.

IBARRA, in *Geography*, a town of South America, in the province of Quito; 45 miles N.N.E. of Quito. N. lat. 0° 25'. W. long. 77° 40'.

IBAROTI, a town of South America, in Paraguay; 130 miles E. of Aslumption.

IBAS, in *Biography*, bishop of Edessa, who flourished in the fifth century. He was a Syrian by nation, and appears to have been elected to the see of Edessa about the year 436. While he was a presbyter of that church, he wrote a letter concerning the council of Ephesus, and the condemnation of Nestorius, in which he was thought to favour the Nestorian doctrine. He was several times tried upon this charge, and obtained verdicts of acquittal. He was frequently harassed, and sent from one place of confinement to another, till, in the year 451, the council of Chalcedon pronounced his sentiments orthodox, and decreed that he should be restored to the dignity of which he had been deprived. Moreri.

IBBERVILLE, in *Geography*, a river, or a kind of natural canal of West Florida, which joins the Mississippi when it overflows, and forms a communication for vessels drawing three or four feet, from the Mississippi to the gulf of Mexico, eastward, through the lakes Maurepas and Pontchartrain. Its junction with the Mississippi is at the town of Manshack, in N. lat. 30° 17'.

IBBETSON, CAPE, a cape on the N.W. coast of Pitt's Archipelago. N. lat. 54° 4'. E. long. 229° 31'.

IBBETSONIA,

IBBETSONIA, in *Botany*, so named by Dr. Sims in Curtis's Magazine, p. 1259, after an ingenious writer on the structure and physiology of plants, in Nicholson's Journal, Mrs. Agnes Ibbetson. It is, however, the *Cyclopa* of Ventenat, a genus previously published by that author, and cited by Mr. Brown in the third volume of Mr. Aiton's Hortus Kewensis, not yet finished.—The plant in question is *Sophora genifloides* of Linnæus and Thunberg, *Podalyria genifloides* of Willdenow, Sp. Pl. v. 2. 502, and *Gompholobium maculatum* of Andr. Repof. t. 427.

IBBOT, BENJAMIN, in *Biography*, an English divine, was born at Beachamwell, in Norfolk, in 1680. After he had received the elements of a learned education he was entered of Clare-hall, Cambridge, where he took his degree of B. A. in 1699, and in the following year he removed to Corpus-Christi college, and was made a scholar of that house. He was, in 1707, taken into the family of archbishop Tennison as librarian, and soon after the prelate made him his chaplain. After this he obtained considerable preferment in the church, and in 1716 he was appointed one of the chaplains in ordinary to king George I., and when his majesty visited the university of Cambridge, in the following year, his chaplain was created doctor of divinity by the royal mandamus. Shortly after he was appointed assistant preacher to the celebrated Dr. Samuel Clarke, and presented to the rectory of St. Paul's, Shadwell. In 1724 he was presented to a prebend at Westminster, and died in the following year. Two volumes of his sermons were published for the benefit of his widow by Dr. Clarke in the year 1726: and soon after his "Course of Sermons preached at the Lecture founded by the Honourable Robert Boyle." These are regarded as masterly replies to Mr. Collins's "Discourse on Free-Thinking."

IBBIT, in *Geography*, a town of Africa, and capital of a district, in Kordofan; 140 miles W. of Sennaar. N. lat. 13° 20'. E. long. 31°.

IBEK, in *Biography*, the slave of Schehabeddin, sultan of India, usurped the throne on the death of his master, and added to his dominions many provinces of Hindoostan. An account of his conquests was written in a volume, entitled "Tage al Mather." D'Herbelot. Bibl. Orient.

IBERA, in *Ancient Geography*, a town of Spain, seated on the Iberus or Ebro, which is represented by Livy (l. xxiii. c. 28.) as a very rich city, when the Romans took it.

IBERIA, Ἰβηρία, a name given by the generality of Greek writers to Spain, either from a colony of Iberians, a people bordering on mount Caucasus, planted there; or from the river Iberus, the Ebro of the moderns, one of the most famous rivers of this country. However, the ancients, who lived before Polybius, by Iberia understood only that part of Spain extending from the Pyrenees to Calpé, or the straits of Gibraltar, and terminated by the Mediterranean; the other part being unknown to, and consequently having no name among the Greeks and Romans. The true and proper Iberia is supposed to have been originally that part of Spain called Celtiberia (wh. see), from a body of Celts who settled in it, bounded by the Iberus, the Pyrenees, and the Mediterranean. See HISPANIA.

IBERIA was also a country of Asia, between the Euxine and Caspian seas. According to Ptolemy, it was bounded on the N. by a part of Sarmatia, on the E. by Albania; on the S. by the Greater Armenia; and on the W. by the Colchide. See GEORGIA.

IBERIS, in *Botany*, Ἰβηρίς, a name in Dioscorides, for something of the crests kind, and therefore not unsuitably

retained for this genus.—Linn. Gen. 335. Schreb. 438. Willd. Sp. Pl. v. 3. 452. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 692. Just. 240. Lamarek. Illustr. t. 557. Gærtn. t. 141. Class and order. *Tetradynamia Siliculosa*. Nat. Ord. *Siliquosa*. Linn. *Crucifera*, Just.

Gen. Ch. Cal. Perianth inferior, of four obovate, concave, small, spreading, equal, deciduous leaves. **Cor.** Petals four, unequal, obovate, obtuse, spreading, with long upright claws; the two external ones much the largest, of equal size; the two inner very small and reflexed. **Stam.** Filaments six, awl-shaped, erect, the two lateral ones shortest; anthers roundish. **Pist.** Germen superior, roundish, compressed; style simple, short; stigma blunt. **Peric.** Pouch erect, nearly orbicular, compressed, notched, surrounded with an acute border, two-celled; partition lanceolate; valves boat-like, compressed, keeled. **Seeds** few, nearly ovate.

Ess. Ch. Corolla irregular; its two outermost petals largest. Pouch emarginate, with several seeds.

This genus is singular in its natural order for the unequal petals, constituting an irregular flower, and affording a most decisive essential character. Reichard observes that in *I. rotundifolia* the petals are nearly equal; but we find them by no means such as to invalidate this character.

The species are eighteen in Willdenow, mostly herbaceous, half of them annual or biennial, some few of the rest rather shrubby. We have two in England, *I. amara*, Engl. Bot. t. 52, found in chalky fields but rare, distinguished by its brilliant white flowers, which sometimes procure it a place in the flower-garden; and *I. nudicaulis*, Engl. Bot. t. 327. Curt. Lond. fasc. 6. t. 42, found here and there on gravelly ground in the spring. Both these are annual.

I. sempervirens and *I. umbellata* are very frequently cultivated for ornament. The former is perennial and rather shrubby, conspicuous for a profusion of white blossoms, and well calculated to adorn rock-work; the latter, figured in Curt. Mag. t. 106, is a hardy annual, with purple flowers of various dyes.

I. linifolia is very nearly allied to the latter, of which indeed Linnæus at one time reckoned it a variety.

IBERUS, in *Ancient Geography*. See EBRO.

IBETI, in *Geography*, a town of Turkish Armenia; 33 miles S.S.W. of Akalziké.

IBEX, in *Zoology*, the name of an animal of the goat kind. (See CAPRA *Ibex*, &c.) This name is also given to some species of *Antelope*; which see.

IBIBOCA, the name of a species of serpent called by the Portuguese *cobra de coral*. It is about two feet in length, and of the thickness of a man's thumb; and tapers off at the tail to a thinness, till at last it ends in a sharp point. Its belly is all over white, and very bright and glossy; and its head is covered with white scales of a cubic figure, and with some black ones towards the edges. Its body is variegated with black, white, and red. It is a very slow mover; but is of a very terrible and poisonous kind. Ray.

IBICARAM, a name given by Piso to a species of *Cecilia*; which see.

IBIJARA, the name of an American species of serpent, called also *body*, and by the Portuguese *cega*, *cobre veiga*, and *cobra de las cabeças*. It is of the amphisbena kind, and is generally said to have two heads, one at each end; but this is wholly erroneous. The head and tail are of the same shape, and of equal thickness, and the creature will strike equally with either; and, as it is said, its poison is equally contained at both. It is a snake of the smaller kind, being of about a foot long, and as thick as one's finger. It is white.

white in colour, and as shining and glossy as glass; and is very elegantly marked with rings and streaks of a brown or copper colour. Its eyes are small, and scarcely conspicuous, looking only like dots made by the point of a needle; it lives under ground, and feeds on ants and other small insects. It is often thrown up in digging; and the Portuguese say, it is a creature whose poison is beyond the reach of all the known remedies. Ray.

IBIFAU, in *Ornithology*. See *CAPRIMULGUS grandis*.

IBIPITANGA, in *Botany*. See *PLINIA*.

IBIRA, a name given by some authors to the tree which produces the cubebe, or cubebs of the shops.

IBIRACOA, in *Zoology*, the name of a species of serpent found in the West Indies; whose bite is always attended with very terrible effects. It is of a variegated colour, mottled with black, white, and red.

IBIS, in *Ornithology*, the name of an Egyptian bird, said by some to be a species of *Ardea* or *Heron*; by others of *Tantalus*; and by others of *Numenius*, or *Curlew*. See each of these articles, and also *HASSELIQUIST*. It is said to be peculiar to Egypt, and is there very serviceable in destroying the serpents, locusts, and other devouring insects; and hence it was, that, in early ages, they had divine honours paid them. Such is the account given by Herodotus, Diodorus Siculus, and Cicero.

It is remarkable with regard to this bird, that although it lives principally about the Nile, yet it never enters the water, nor can it swim. The use of glysters is said to have been learned from the ibis, and not from the stork. It generally builds its nests upon the palm-trees, to avoid the cats. Aldrovandus relates, that the flesh of the ibis is red, like a salmon's, that it is sweet, that its skin is very hard, and smells like wild fowl. This subject has been treated at large by M. Savigny, in his "Hist. Nat. et Myth. de l'Ibis," Paris 1805, 8vo. He first traces the description from the ancients, who mention the white ibis and the black, though the latter be not strictly black, but of a deep brown colour, with beautiful metallic reflections. But if the bitumen employed in embalming was too much heated, the feathers of the white ibis became black. That the ibis devoured serpents is a mere imagination of the ancients. Like the other birds of its kind, even the red curlew of Cayenne, and the white of Carolina, it could only have devoured worms, little fish, and aquatic insects. At present the white ibis is not regarded as resident in Egypt. According to the report of the inhabitants, these birds arrive when the Nile begins to increase, probably the real cause of the ancient veneration; their number augments as the river rises, and diminishes with its decrease, after which they return to Abyssinia. They would appear to reside in Egypt about seven months, at least in the Delta. The black, or rather brown ibis, arrives and returns later than the white. According to this account the ibis generally arrives in Egypt in June, and retreats in October, though some may linger till December.

IBITIN, in *Zoology*, the name of a very large and dangerous serpent in the Philippine isles. This animal twirls its tail round the trunk of a tree, and strikes its prey, as men, deer, &c. which it entirely devours, and then squeezes itself against the tree, in order to digest what it has eaten.

IBITUPOCA, in *Geography*, a town of Brazil, in the province of Minas Geraes; 32 miles S. of Villa Rica.

IBOPETUBA, a small island in the Atlantic, near the coast of Brazil. S. lat. 25° 33'.

IBRAHIM, in *Biography*, sultan of the Turks, succeeded his brother Amurath or Morad IV. in 1640, being then in his twenty-third year. He had been long a prisoner

at the instance of Morad, who would have put him to death had he not been prevented by his mother; and such was the state of his mind, that he refused admission to the great officers of the government when they came to announce his brother's death, and his own accession to the throne, nor could he be prevailed on to open the doors of his dungeon till the dead body of Morad was laid in his view. Ibrahim was ill fitted for the cares of a crown, and resigned the duties of his station to his ministers, contenting himself with trifling amusements and gross voluptuousness. One of the first events of his reign was the capture of Azof, the principal post of the Cossack pirates who infested the Black sea: by which measure their depredations were repressed, and the navigation rendered clear to Constantinople. An attempt was made upon the island of Candia, but it was not successful. The lascivious desires of Ibrahim were the cause of his death: he had violated the chastity of the beautiful daughter of the Mufti, who, resolved upon revenge, took such means as to effect the end. He ordered the sultan to appear before him, which he refused: he then declared him an infidel, and incapable of exercising the authority of government. The janizaries took the part of the head of the church, and he was almost immediately strangled. This was in the year 1649: he left several sons, of whom three successively filled the throne. Mod. Univer. Hist.

IBRAHIM AL-SHIRAZI, a celebrated Mussulman doctor, a native of Shiraz, the capital of Fars, or Persia properly so called. It is not known at what period he flourished, but he sustains a very high rank among the expounders of the law, and was author of many works in Arabic, very highly esteemed. The principal of these are "An Exhortation to the Study of Jurisprudence;" "The Exemplar," an illustration of the principal articles, or, as the Mahometans call them, the foundations of the law. He is supposed to have been the author of a work on the art of scholastic disputation, with the Arabic title, signifying "The Search after Truth."

IBRAHIM AL-MEROUZI, a celebrated Mussulman doctor, who derived his surname from the city of Merou, in the province of Korasan, where he was born. He wrote many pieces in the Arabic language, which are greatly valued; and among others a commentary on the "Mozni," consisting of an abridgment of Mussulman law. At Bagdat, where he resided, he was consulted as an oracle in all matters relating to jurisprudence. In advanced life he removed from Bagdat to Cairo in Egypt, where he died in the year of the hejira 340.

IBRAHIM BEN IBRAHIM MEHERAN, one of the celebrated doctors of the sect of Schafai, was author of many works of high reputation, of which the chief is a defence of the Mussulman law against the objections of those unbelievers and Atheists described under the Arabic title, signifying "Men without Religion." He died in the year 418 of the hejira. A more full account of the persons just mentioned may be found in Herbelot's *Bibl. Orient.*

IBRAHIM EFFENDI, a native of Poland, who was raised by his courage and talents to the principal dignities in the Ottoman empire. He established the first printing-press in Turkey. The earliest work which he produced was on the military; he afterwards published the "Account of an Expedition against the Afghans;" "A Turkish Grammar;" and "A History of Turkey."

IBRAHIM, in *Geography*, a mountain of Arabia, in Yemen; 40 miles S. of Chamir.

IBRAHIM *Bassa*, a river of Syria, anciently *Adonis*, (which see);

fees), that runs into the Mediterranean, about five miles S. of Gibelet.

IBRAHIM Lik, a town of the Arabian Irak, on the Tigris; 80 miles N. of Bagdad.

IBRAIM, a town of Hungary; 14 miles N.N.E. of Nanas—Also, a river of Persia, which runs into the Persian gulf, six miles S.W. of Mina.

IBRAS, a town of Lithuania, in the palatinate of Brzesc; 40 miles S.W. of Pinsk.

IBRIGI, a town of European Turkey, in Romania; 16 miles N.N.W. of Gallipoli.

IBRIM, a town of Africa, in the northern part of Nubia, subject to the Turks; 120 miles S. of Syene. N. lat. 22°. E. long. 32° 40'.

IBRIS, a small island of Scotland, in the Frith of Forth; three miles N.W. of North Berwick. N. lat. 56° 5'. W. long. 2° 51'.

IBUM. The rabbins give this name to the ceremony of a brother's marrying his sister-in-law, the widow of his brother, deceased without children, by virtue of the Mosaic law mentioned in Deut. xxv.

IBURAR, in *Geography*, a town of Asiatic Turkey, in Caramania; 16 miles N. of Alanieh.

IBURG, a town of Westphalia, in the bishopric of Osnabruck, having formerly a citadel, which was the episcopal palace; 10 miles S. of Osnabruck.

IBYCUS, in *Biography*, one of the nine celebrated Greek lyrics. Some say he was the son of a native of Reggio, but born in Messina. He was likewise a great musician, and inventor of the instrument called Sambuca, of four strings of acute sound; and according to Euphorion in Athenæus, of the Troglodites, from its resemblance to the sambuca, which was triangular. The military instrument mentioned by Polybius, lib. viii. was called *sambuca*.

Ibycus flourished in the 60th olympiad, and the 214th year of Rome. He was author of various works, of which Henry Stephens has collected fragments. The unfortunate Ibycus being attacked by thieves, and begging in vain that they would spare his life, when on the point of receiving the blow which left him for dead, he cried out to a flock of cranes that was hovering over him, to bear witness against his murderers. Some time after, these assassins being in a market, and having spied a flock of cranes, said to each other, laughing, there go the witnesses against us for the death of Ibycus. This speech being reported to the magistrates, the thieves were put to the torture, when they confessed the fact and were hung. Hence came the proverb *Ibyci Grues*, against villains whose crimes were accidentally discovered. The following verse of Ausonius on the subject is well known:

“Ibycus ut periit, vindex fuit altivolans Grus.”
Plato, Plutarch, Athenæus.

IBYNUS. Pere Parran speaks of Ibynus as one of the best writers on music among the ancients before Boethius, St. Basil, St. Hilary, St. Augustine, St. Ambrose, St. Gelasius, &c. Where the good father Parran found this author we know not, as we have never met with his book or his name in our researches after the *Materia Musica*.

IBYRIESKI, in *Geography*, a town of Lithuania; 32 miles E. of Koniecpole.

ICA, or **YCA**, or *Valverde*, a town of Peru, in the audience of Lima, and one of three towns, which give name to a province called “Ica Pisco and Nasca.” It is situated in a valley, and its principal commerce consists in glass, wine, brandy, &c.; it contains about 6000 souls; 140 miles E.S.E. of Lima. S. lat. 13 50'. W. long. 75° 28'.

Vol. XVIII.

ICA, *Pisco and Nasca, jurisdiction of*, a province of Peru, in the audience of Lima, comprehending about 140 miles along the coast of the Pacific ocean, interfectured with sandy deserts. The oil and wine yielded by this province are excellent, and supply the other provinces; and where the land is capable of being watered, it produces corn, maize, and a variety of excellent fruits. The inhabitants near the coast are employed in catching fish, which they cure and send in great quantities into the inland country.

ICACO, in *Botany*. See **CHRYSORALANUS**.

ICADES, the name of an ancient feast, celebrated every month by the Epicurean philosophers, in memory of their master Epicurus.

The day on which it was held was the twentieth day of the moon, or month, which was that whereon Epicurus was born, and hence came the name *icades*; from *icades*, of *icades*, twenty.

They adorned their chambers on this day, and bore his image in state about their houses, making sacrifices, &c.

ICARIA, in *Ancient Geography*, an island of the Ægean sea, situated W. of the isle of Samos, E. of that of Delos, and S.S.E. of that of Chios.

ICARIAN SEA, that part of the sea of the Archipelago into which Icarus fell. Thus Diodorus and Ovid deduce its name. “Icarus Icarias nomine fecit aquas.” But the learned Bochart says, that this part of the Ægean sea was so called upon account of the isle Icaria, or Icaure, which, in the Phœnician language, imports “fishy.”

ICARIUM, an island of the Persian gulf, over-against the mouth of the Euphrates. Here, according to Strabo, were a temple and oracle of Apollo. Arrian calls it Icaros, Pliny, Ichara, and Ptolemy, who places it on the coast of Arabia Felix, calls it Ichara and Icaros.

ICARUS, a river of Asia, in Scythia, which flowed into the Oxus, according to Pliny.

ICARUS, in *Fabulous History*, the son of Dedalus, who was shut up by the king of Crete, with his father, who had favoured the amours of the queen in the labyrinth. As Dedalus knew all its mazes, he found no great difficulty in extricating himself; and having gotten a ship which Pasiphæ had provided for him, he fixed sails to it, the use of which was not then known in Greece, and thus was able to outstrip Minos's galley which pursued him with oars. His son Icarus, having arrived in an island very remote from the continent, and endeavouring to land too precipitately, fell into the sea and was drowned; or, not having skill enough to manage his barge, as we learn from Pausanias (in *Bœot.*), perished near the island of Samos. The poets veiled this escape under the ingenious fiction of wings, the invention and use of which are ascribed to Dedalus; thus Horace, (*Od.* l. i.) speaks of them:

“Expertus vacuum Dædalus æra
Pennis non homini datis.”

The young and adventurous Icarus, it is said, disregarded the wise counsel of his father, who recommended him not to soar too high, lest the heat of the sun should melt the wax with which his wings were fastened, while he himself flew near the surface of the water, and even took care, as Diodorus Siculus remarks, to moisten his wings from time to time, lest they should be over-heated; and fell into the sea.

ICCIUS PORTUS, or **ITIVS Portus**, the harbour of Gaul, whence Cæsar embarked his troops for the invasion of England. Some have referred this harbour to Bologna, others to Witland, and others to Calais.

ICE, a brittle transparent body, formed of some fluid, frozen or fixed by cold.

The specific gravity of ice to water is as eight to nine; or the specific gravity of water being 1, that of ice is .93; hence, being lighter than water, it floats upon it. The specific gravity of ice was tried by Dr. Irving, in Phipps's voyage to the north pole; who found, that when a piece of the most dense ice which he could meet with was immersed in snow-water, the thermometer 34° , fourteen fifteenth parts sunk under the surface of the water: in brandy just proof, it barely floated; in rectified spirits of wine, it fell to the bottom at once and dissolved immediately. This rarefaction of ice has been supposed to be owing to the air-bubbles produced in ice while freezing; these, being considerably large in proportion to the water frozen, render the ice so much specifically lighter. Accordingly, it is said, that a considerable quantity of air is lodged in the interstices of water, though it has not there any elastic property, on account of the disunion of its particles; but these particles coming closer together, and uniting as the water freezes, light, expansive, and elastic air-bubbles are thus generated, and increase in bulk as the cold grows stronger; whence of course the ice grows lighter, and these air-bubbles acquiring an elastic force burst to pieces any vessel in which the water is closely contained. But snow-water, or any water long boiled over the fire, affords an ice more solid than ordinary, and with fewer bubbles. Pure water, long kept in vacuo, and frozen afterwards there, freezes much sooner, on being exposed to the same degree of cold, than water unpurged of its air and set in the open atmosphere. And the ice made of water thus divested of its air will expand in freezing; though it is much harder, more solid and transparent, and more ponderous than common ice.

But M. de Mairan, in a dissertation on ice, more justly attributes the increase of the bulk of the water under this form, principally to a different arrangement of its parts: the icy skin on water, being composed of filaments which are found to be joined constantly and regularly at an angle of 60° , and which, by this disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, and in different trials a 14th, an 18th, and a 19th; but when the water was previously purged of air, only a 22d part. Besides, ice, after its formation, continues to expand by cold; a piece of ice, which was at first only a fourth part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter; and thus he accounts for the burling of ice in ponds. See CONGELATION, FREEZING, and FREEZING Mixture.

To make the most perfect ice, we should take the purest water, and perfectly purge it of its air by the air-pump; then freeze it in the severest frost, by means of Mr. Fahrenheit's contrivance. Thus we obtain an ice of the greatest hardness, density, purity, transparency, and gravity.

It appears by an experiment of Dr. Hooke, in 1663, that ice refracts the light less than water; whence he infers, that the lightness of ice, which causes it to swim in water, is not produced merely by the small bubbles which are visible in it, but that it arises from the uniform constitution or general texture of the whole mass. This fact was afterwards confirmed by M. de la Hire. Hooke's Exper. by Derham, p. 26. Acad. Par. 1693. Mem. p. 25.

Dr. Wollaston has fully confirmed the observation of Dr. Hooke by means of an accurate instrument which he has contrived for determining the refraction of different substances; so that ice must be considered as the least refractive of any known substances that are not aeriform. The refrac-

tive power of ice is stated by Dr. Wollaston, and by Dr. Young, by calculation, from halos, at 1.31. (See REFRACTION.) The capacity for heat of water to ice is as 1.000 to .900; and the heat, in a given measure, is as 1.000 to .840.

Ice is known to evaporate as well as water, and some say in an equal, others, in a greater degree. See EVAPORATION.

In the mountains of Switzerland there are immense masses of ice, which, by the tradition and histories of the country, must have lain there many centuries. At certain times there happen cracks in these, and by these cracks the vast thickness of the masses may in some measure be guessed at; some of them being three or four hundred ells deep, and yet none of them ever having gone through the whole thickness.

The vast bodies of ice met with in the northern seas, near Hudson's bay, are surprising; some of them being immersed a hundred fathoms or more under the surface of the ocean, and a fifth or sixth part above, and three or four miles in circumference. See Phil. Trans. N. 465. sect. 2.

These floating mountains of ice owe their vast bulk and durable nature to a cause not considered by many; that is, to their not being common ice, but the ice of sea-water; many experiments proving, that in acid and spirituous liquors, when the frost has power over them, the watery parts only are affected, and the ice is tasteless, while the liquor remains concentrated, and much stronger than before at the bottom or in the centre. It was generally supposed that the saline liquors, and consequently sea-water, were affected by freezing in the same manner; that is, its watery part alone was frozen, and the salt separated from the part so congealed: but Dr. Lister alleges, that the ice formed of sea-water is really salt, and does contain sea-salt; and finally that it is, by means of this salt contained in it, rendered more durable than common ice. If a phial of salt-water be exposed to the air in frosty weather till flakes of ice are found in it, and then brought into a warm room, those flakes will remain even in that place a long time undissolved; and if they are taken out and exposed at a small distance to the fire, they will not run into water as common ice would, but they will by degrees evaporate, and there will be left only a little white salt.

Since sea-water, when frozen, thus forms a very durable ice, it appears easy to conceive, that the immense masses of such ice found in the northern seas should continue undissolved through the whole year, and at the return of the freezing season remaining of the same bigness as at first, they must of consequence then become much bigger by the freezing of more ice about them; and thus continuing to lose very little, and that only by accidents, and annually to increase a great deal, it is not wonderful that they become so large. Phil. Trans. N. 167. 836. See SEA-WATER.

But there have been different opinions with regard to the origin of those vast piles of ice, resembling whole islands, in the northern regions. Some ascribe them to snow, which falling in great abundance in these cold climates, and melting in the sea, accumulates gradually, till those huge heaps are at length formed: but the more common opinion is, that this ice is formed from the fresh waters which flow from the neighbouring lands. It is certain that great quantities of floating ice are discharged by the river Obi, and kept in a state of constant agitation by it. Bartoli has written an Italian treatise expressly on ice and coagulation. And the Acta Eruditorum furnish us with an account of a French author on the same subject. See COAGULATION, COLD, and CRYSTALLIZATION.

The formation or coagulation of ice-islands has not yet

been thoroughly investigated. Captain Cook (Second Voyage, vol. ii. p. 240.) objects to the opinion of those who ascribe them to the freezing of the water at the mouths of large rivers, or great cataracts, where they accumulate till they are broken off by their own weight. He says that no ice was found incorporated with earth, or any of its produce, which must have been the case, if it had been coagulated in land-waters. He doubts whether there be any rivers in the countries to which he refers: "it is certain," he says, "that we saw not a river or stream of water on all the coast of Georgia, nor on any of the southern lands. Nor did we ever see a stream of water run from any of the ice-islands. How are we then to suppose that there are large rivers? The vallies are covered, many fathoms deep, with everlasting snow; and, at the sea, they terminate in icy cliffs of vast height. It is here where the ice-islands are formed; not from streams of water, but from consolidated snow and sleet, which is, almost continually, falling or drifting down from the mountains, especially in the winter, when the frost must be intense. During that season, the ice-cliffs must so accumulate as to fill up all the bays, be they ever so large. This is a fact which cannot be doubted, as we have seen it so in summer. These cliffs accumulate by continual falls of snow, and what drifts from the mountains, till they are no longer able to support their own weight; and then large pieces break off, which we call "ice-islands." Such as have a flat even surface must be of the ice formed in the bays and before the flat vallies: the others, which have a tapering unequal surface, must be formed on, or under the side of a coast composed of pointed rocks or precipices, or some such uneven surface. For we cannot suppose that snow alone, as it falls, can form, on a plain surface, such as the sea, such a variety of high peaks and hills, as we see on many of the ice isles. It is certainly more reasonable to believe that they are formed on a coast whose surface is something similar to theirs. I have observed that all the ice-islands of any extent, and before they begin to break to pieces, are terminated by perpendicular cliffs of clear ice or frozen snow, always on one or more sides, but most generally all round. Many, and those of the largest size, which had a hilly and spiral surface, shewed a perpendicular cliff or side from the summit of the highest peak down to its base. This to me was a convincing proof that these, as well as the flat isles, must have broken off from substances like themselves; that is, from some large tract of ice."

"These ice cliffs," captain Cook apprehends, "extend a good way into the sea, in some parts, especially in such as are sheltered from the violence of the winds. It may even be doubted if ever the wind is violent in the very high latitudes. And that the sea will freeze over, or the snow that falls upon it, which amounts to the same thing, we have instances in the northern hemisphere. The Baltic, the gulf of St. Lawrence, the straits of Belle-Isle, and many other equally large bays, are frequently frozen over in winter. Nor is this at all extraordinary; for we have found the degree of cold at the surface of the sea, even in summer, to be two degrees below the freezing point; consequently, nothing kept it from freezing but the salt it contains, and the agitation of its surface. Whenever this last ceaseth in winter, when the frost is set in, and there comes a fall of snow, it will freeze on the surface as it falls, and in a few days, or perhaps in one night, form such a sheet of ice as will not be easily broken up. Thus a foundation will be laid for it to accumulate to any thickness by falls of snow, without it being at all necessary for the sea-water to freeze. It may be, by this means, these vast floats of low ice are,

in the spring of the year, formed, and which, after they break up, are carried by the currents to the north."

The northern ice extends about 9° from the pole; the southern 18° or 20° ; in some parts even 30° ; and floating ice has occasionally been found in both hemispheres as far as 40° from the poles, and sometimes, as it has been said, even in latitude 41 and 42° . Between 54 and 60 south latitude, the snow lies on the ground, at the sea side, throughout the summer. The line of perpetual congelation is three miles above the surface at the equator, where the mean heat is 84° ; at Teneriffe, in latitude 28 , two miles; in the latitude of London, a little more than a mile; and in latitude 80 north, only 1200 feet. At the pole, according to the analogy deduced by Mr. Kirwan, from a comparison of various observations, the mean temperature should be 31° . In London, the mean temperature is 50 ; at Rome and at Montpellier, a little more than 60 ; in the island of Madeira, 70 ; and in Jamaica, 80 . See CONGELATION, COOLING, and TEMPERATURE.

Sir Robert Barker has particularly described the process of making ice in the East Indies, where, during his time, he has never seen any natural ice. For this purpose they dig, on a large open plain, three or four pits, about thirty feet square, and two deep each; the bottoms of which they cover about eight inches or a foot thick with sugar-cane, or the stems of the large Indian corn, dried. On this bed are placed in rows a number of small shallow unglazed earthen pans, formed of a very porous earth, a quarter of an inch thick, and about an inch and a quarter deep; which, at the dusk of the evening, they fill with soft water that had been boiled. In the morning, before sun-rise, the ice-makers attend at the pits, and collect what was frozen in baskets, which they convey to the place of preservation. This is generally prepared on some high dry situation, by sinking a pit fourteen or fifteen feet deep, lining it first with straw, and then with a coarse kind of blanketing. The ice is deposited in this pit, and beat down with rammers, till at length its own accumulated cold again freezes it, and forms one solid mass. The mouth of the pit is well secured from the exterior air with straw and blankets, and a thatched roof is thrown over the whole. The quantity of ice formed by the method above described, depends on a light atmosphere, and clear serene weather. Phil. Trans. vol. lxxv. pt. ii. art. 22. See COOLING, and COOLING of Liquors.

ICE-bergs are large bodies of ice filling the vallies between the high mountains in northern latitudes; the face of which towards the sea is nearly perpendicular, and of a very lively light green colour. Some of these are at least three hundred feet high.

ICE, *Blink of the*. See BLINK of the Ice.

What is called the ice-blink in Greenland is an amazing congeries of ice, at the mouth of an inlet, the splendour of which is discerned at the distance of many leagues. It is said to extend in magnificent arches for about 24 miles.

ICE-boat, in *Nautical Affairs*, is a kind of barge, having a square and very sloping head, made very strong and shoed with iron, which is drawn along canals by several hories, during frosts, to break the ice, when it is not too thick to be thus broken, and there is a prospect of its not forming again. A light kind of flat-bottomed boat has sometimes been used on the ice, for the purpose of rescuing skaters and others, where the ice has broken in, and such are also called ice-boats, of which a model by count Berhtold is preserved in the Repository of the Society of Arts in the Adelphi. Clafs iv. N^o 134, which is described vol. x. p. 277 of the Society's Transactions.

ICE-berne, in *Geology*, is employed to describe the man-

ner in which large fragments of rocks have been transported, to places far distant from their native situations, on masses of ice, floating on the ocean, before it had been reduced to its present limits: according to the theory of Mr. Jameson, *Geognosy*, vol. iii. p. 33. Mr. Playfair supposes, in his illustration of the Huttonian theory, § 348, that glaciers or inclined planes of ice, existing on the surface of the earth, previous to the excavation of vallies, were the means of transporting many of such blocks, those of granite in particular; an opinion ably combated by M. De Luc, in his *Geology*, § 234: but whose explanation of this important and very common phenomenon, *viz.* that they were projected into the air, from chasms, or fissures in the earth, extending down to certain great subterranean caverns, by the force of vast currents of air and water issuing therefrom, seems (says Mr. Farey) less probable, than that recently offered by himself, *viz.* that the extraneous blocks of stone, and all other alluvial matters found on mountains and hills, were transported during the disturbed and reversed-action of gravity, occasioned by the perigeic visits of a former satellite. See *Philosophical Magazine*, vol. xxxvi. p. 6.

ICE-cream, Method of making. Take a sufficient quantity of cream, and, when it is to be mixed with raspberry, or currant, or pine, a quarter part as much of the juice or jam as of the cream; after beating and straining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter vessel, and varying in size and shape at pleasure; cover the mould, and place it in a pail about two-thirds full of ice, into which two handfuls of salt have been thrown; turn the mould by the hand-hold with a quick motion to and fro, in the manner used for milling chocolate, for eight or ten minutes; then let it rest as long and turn it again for the same time; and having let it to stand half an hour, it is fit to be turned out of the mould, and to be sent to table.

Lemon juice and sugar, and the juices of various kinds of fruits, are frozen without cream, and when cream is used, it should be well mixed.

ICE-house, in Gardening, a sort of building sunk in the ground for the purpose of preserving ice for use during the summer season, when the weather becomes hot.

Situation.—The proper situation for an ice-house, is that of a dry spot of ground; as wherever there is moisture the ice will be liable to dissolve; of course in all strong soils, which retain the wet, too much care cannot be taken to make drains all round the houses to carry off moisture; as when this is lodged near them, it will occasion a damp, which is always prejudicial to the keeping of ice in them.

The aspect of ice-houses should be towards the east or south-east, for the advantage of the morning sun to expel the damp air, as that is more pernicious than warmth; for which reason, trees in the vicinity of an ice-house tend to its disadvantage.

The best soil for an ice-house to be made in is chalk, as it conveys away the waste water without any artificial drain; next to that, loose stony earth, or gravelly soil.

The places should likewise be elevated, that there may be descent enough to convey off any wet that may happen near them, or from the ice melting; and also as much exposed to the sun and air as possible; not under the drip, or in the shade of trees, as is too often the practice, under the supposition, that if exposed to the sun, the ice will melt away in summer, which never can be the case where there is sufficient care taken to exclude the external air, as the heat of the sun can never penetrate through the double arches of the buildings, so as to add any warmth to the internal air;

while, when entirely open to the sun and wind, all damps and vapours are readily removed.

Shape.—The external form of the building may be according to the fancy of the owner; but for the well, into which the ice is put, a circular form is the most convenient; the depth and diameter of it being proportioned to the quantity of ice wanted; but it is always best to have sufficient room, as when the house is well built it will keep the ice two or three years: and there will be this advantage in having it large enough to contain ice for two years' consumption, that if a mild winter should happen, when there is no ice to be had, there will be a stock to supply the want in the house already.

Where the quantity wanted is not great, a well of six feet diameter, and eight feet deep, will be large enough, but for a large consumption, it should not be less than nine or ten feet diameter, and as many deep: where the situation is either of a dry chalky, gravelly, or sandy kind, the pit may be made entirely below the surface of the ground; but in strong loamy, clayey, or moist ground, it will be better to raise it so high above the surface, as that there may be no danger from the wetness of the soil about it.

At the bottom of the well there should be a space about two feet deep left, for receiving any moisture which may drain from the ice, and a small underground drain should be laid from this, to carry off the wet; over this space should be placed a strong grate of wood, to let the moisture fall down which may at any time happen, from the melting of the ice. The sides of the well must be walled up with brick or stone at least two feet thick; but if it be thicker it will be better, as the thicker the walls are made, the less danger there is of the well being affected by external causes. When the wall of the well is brought within three feet of the surface, there must be another outer arch or wall begun, which must be carried up to the height of the top of the intended arch of the well; and if there be a second arch turned over from this, it will add to the goodness of the house; but this must depend on the person who builds going to the expence. When not, the plate into which the roof is to be framed must be laid on this outer wall, which should be carried high enough above the inner arch to admit of a door way in, to get out the ice. Where the building is to be covered with slate or tiles, there should be a thickness of reeds, straw, or other similar materials laid under, to guard against the effects of the sun and external air; where they are laid two feet thick, and plastered over with lime and hair, there will be no danger of the heat penetrating in such a way as to prove injurious.

The external wall of the house need not be built circular, but of any other form, as square, hexangular, or octangular; and where it stands much in sight may be so contrived as to make it a pleasing object to the sight.

But ice-houses may be built in such a manner as to have alcove seats in the front, having passages to get out, and put in the ice behind them; or the entrance may be behind, to the north; small passages being left next the seats, through which to enter to take out the ice, a large door being contrived with a porch wide enough for a small cart to back in, to shoot down the ice upon the floor near the mouth of the well, where it may be well broken before it is put down. The aperture of this mouth of the well need not be more than two feet and a half in diameter, which will be large enough to put down the ice, a stone being left to stop it with, which must be closed up as securely as possible after the ice is put in, and all the vacant space above and between this and the outer door be filled close with barley straw, or other similar materials to exclude the external air from entering.

The door to enter by for taking out the ice should be no larger than is absolutely necessary for the coming at the ice, and must be strong and close to exclude the air, and at five or six feet distance from this another door should be contrived, which should be closely shut before the inner door is opened, whenever the ice is taken out of the house.

When the house is thus finished, it should have time to dry before the ice is put into it; as when the walls are green the damp of them frequently dissolves the ice. And at the bottom of the well, upon the wooden grate, some small fagots should be laid; and if upon these a layer of reeds be placed smooth for the ice to rest upon, it will be better than straw, which is commonly used.

Proper sort of Ice.—In the choice of the ice, the thinner it is the better it may be broken to powder; as the smaller it is broken the better it will unite when put into the well. In putting it in, it should be rammed close, and a space left between it and the wall of the well, by straw being placed for the purpose, so as to give passage to any moisture that may be collected by the dissolving of the ice on the top or otherwise.

In putting the ice into the house, some mix a little nitre with it, to make it congeal more fully; but this is not necessary.

As the ice becomes solid in the well, an iron crow is necessary to take it up with.

The ice-house is, as has been seen, capable of being made an ornamental building; but this is seldom done; it being generally placed in a sequestered spot, on the side of a hill or sloping ground, the base of which is lower than the bottom of the well, the outside being well banked up with earth, to keep out all external air and heat, and neatly covered with turf or thatch.

To construct an ice-house, first choose a proper place at a convenient distance from the dwelling-house or houses it is to serve: dig a cavity (if for one family, of the dimensions specified in the design) of the figure of an inverted cone, sinking the bottom, concave, to form a reservoir for the waste water till it can drain off; if the soil requires it, cut a drain to a considerable distance, or so far as will come out of the side of the hill, or into a well, to make it communicate with the springs, and in that drain form a *slink* or *air-trap*, marked *l* (*Plate XX. Miscellany, fig. 5.*) by sinking the drain so much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will constantly be in the trap, and will keep the well air-tight. Work up a sufficient number of brick piers to receive a cart-wheel, to be laid with its convex side upwards to receive the ice; lay hurdles and straw upon the wheel, which will let the melted ice drain through, and serve as a floor. The sides and dome of the cone are to be nine inches thick, the sides to be done in steened brickwork, *i. e.* without mortar, and wrought at right angles to the face of the work; the filling-in behind should be with gravel, loose stones, or brick-bats, that the water which drains through the sides may the more easily escape into the well. The doors of the ice-house should be made as close as possible, and bundles of straw placed always before the inner door to keep out the air.

Description of the parts referred to by the letters:

a The line first dug out.

b The brick circumference of the cell.

c The diminution of the cell downwards.

d The lesser diameter of the cell.

e The cart wheel, or joists and hurdles.

f The piers to receive the wheel or floor.

g The principal receptacle for straw.

- b* The inner passage, } each of these passages has a separate door.
i The first entrance, }
k The outer door, }
l An air-trap.
m The well.
n The profile of the piers.
o The ice filled in.
p The height of the cone.
q The dome worked in two half-brick arches.
r The arched passage.
s The door-ways inserted in the walls.
t The floor of the passage.
u An aperture through which the ice may be put into the cell; this must be covered next the crown of the dome, and then filled with earth.
x The sloping door, against which the straw should be laid.

The ice, when to be put in, should be collected during the frost, broken into small pieces, and rammed down hard in the strata of not more than a foot, in order to make it one complete body; the care in putting it in, and well ramming it, tends much to its preservation.

In a season when ice is not to be had in sufficient quantities, snow may be substituted.

Ice may be preserved in a dry place under ground, by covering it well with chaff, straw, or reeds. *Phil. Trans. N. 84. p. 140.* See *Snow*.

Great use is made of chaff in some places of Italy to preserve ice: the ice-house for this purpose need only be a deep hole dug in the ground on the side of a hill, from the bottom of which they can easily carry out a drain, to let out the water which is separated at any time from the ice, that it may not melt and spoil the rest. If the ground is tolerably dry, they do not line the sides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole; this pit they fill either with pure snow, or else with ice taken from the purest and clearest water; because they do not use it as we do in England, to set the bottles in, but really mix it with the wine. They first cover the bottom of the hole with chaff, and then lay in the ice, not letting it any where touch the sides, but ramming in a large bed of chaff all the way between: they thus carry on the filling to the top, and then cover the surface with chaff, and in this manner it will keep as long as they please.

When they take any of it out for use, they wrap the lump up in chaff, and it may then be carried to any distant place, without waste or running. *Phil. Trans. N. 8.* See *ICE*.

ICE, Palace of, a palace built of ice by the empress Anne of Russia, on the bank of the Neva in 1740, 52 feet long, which, when illuminated, had a surprising effect.

ICE-plant, in *Botany*. See *MESEMBRYANTHEMUM*.

ICELAND, in *Geography*, the largest island in Europe next to Great Britain, is surrounded by that part of the northern sea which geographers have called the Deucalidian ocean. Its length, from the most western cape to the most eastern, is about 260 British miles, and its breadth from north to south about 200 miles. Mallet indeed reckons its length from east to west at about 112 Danish miles (12 to a degree), and its mean breadth 50 of those miles. The number of its inhabitants is estimated at about 50,000, or one to the square mile. Nature herself hath marked out the division of this island. Two long chains of mountains run from the middle of the eastern and western coasts, rising by degrees till they meet in the centre of the island, from whence two other chains of smaller hills gradually descend till they reach

ICELAND.

reach the coasts that lie N. and S.; thus making a primary division of the country into four quarters (fierdingers), which are distinguished by the four points of the compass towards which they lie. The whole island can be considered only as one vast mountain, interspersed with long and deep vallies, concealing in its bosom heaps of minerals, of vitrified and bituminous substances, and rising on all sides out of the ocean in the form of a short blunted cone. Earthquakes and volcanoes have through all ages desolated this unhappy island, "while it abounds in sulphur and subterranean fires, and volcanoes appear in every quarter. It would be too bold a theory (says Pinkerton), to suppose that so wide an expanse was ejected from the sea; not to mention that the surlurband, or carbonated wood, found at a great depth, evinces a most remote vegetation. The highest mountains clothed with perpetual snow are styled "Yokuls;" and of these Snaefial, hanging over the sea in the S. W. part of the island, is esteemed the highest, being computed at 6860 feet. The mountains are said to be chiefly sand-stone, pudding-stone, with petro-silex, steatite, and argillaceous schistus. The calcareous spar of Iceland is celebrated since the days of Newton for its double refraction: calcedony, zeolite, lava, pumice, black obsidian, and malachite, or copper stalactites, are among its mineral productions." Of *Hecla* we have already given an account under that article. The mountains of Krabla, near Myvatn, in the N. W., and of Kattlegia, were more known than Hecla by their eruptions in the 18th century. The mountains of Iceland exhibit indications of their containing iron, copper, and silver ore. In this island there are no salt springs, but salt has been found at the foot of the volcanoes or burning mountains. Woods rarely occur, but many large trees are driven hither by the sea, especially on the N. coast, where, for want of shipping to export it for sale, it is suffered to lie and rot. Shrubs, on which grow all sorts of berries, as juniper-berries, black-berries, &c. are burnt in great abundance every year for charcoal, used by the natives in their forges. On some of the mountains, many of which, consisting merely of rocks and sand, are barren, there are plains of several miles in extent covered with verdure and producing fine grass; between other mountains dispersed over the island, there are vallies which afford plentiful nourishment for cattle. The finest pastures are in the northern parts of the island, where the grass springs rapidly and to a great height. The cattle are generally driven among the mountains to graze, where they find good pasture; but the grass that grows near the habitations of the Icelanders is reserved for winter fodder. Iceland, though a very mountainous country, is intersected with roads which are passable for horses; and carriages, which were formerly used, being now laid aside, some hundreds of pack-horses pass annually over the mountains from the north to the trading places in the south parts of the island; and these are loaded with butter, woollen manufactures, &c. which are bartered for other commodities. The boiling springs of Iceland present a singular phenomenon; that of Geyser to the N. of Skallholdt is the most remarkable, rising from an aperture 10 feet in diameter, and springing at intervals to the height of 50 or even 90 feet. The chief rivers of Iceland are in the east; the Skalfande, the Oxarhrd, and the Braa, all flowing from the S. to the N. some are white with lime, and others smell of sulphur. The common fuel of the country is turf, some of which emits a strong sulphureous smell; and even fish-bones are burnt in some parts of the island. Iceland affords a great variety of salsubrious and medicinal herbs; bread is little known among the common people, who cannot purchase that which is imported into the harbours;

but subsist chiefly on fresh and dried fish, and also on milk, oatmeal, and flesh. In times of scarcity they are constrained to prepare flour of various plants described by Von Troil; and their common drink is milk, and also a liquor called "Syra," which is four whey, kept in casks and left to ferment: beer being scarce. Bears are frequently driven to this island with the large flakes of ice from Greenland; but they are destroyed by the inhabitants; so that the only wild beasts to be seen in the island are brown and white foxes. The horses are small, but strong and mettlesome; and those that are broken for the saddle excepted, they lie in the open air through the year, and subsist in winter on the fodder which they can scrape from under the ice and snow. Sheep are numerous, so that a single person possesses a flock of three, four, or five hundred. In winter they are driven to shelter at night, and also in very severe weather during the day. Their large caves afford convenient places of resort. In winter the sheep are occasionally turned out, when the weather is fair and mild, to pick up what they can find under the snow; and if at such times they are surprized by a great fall of snow, they form themselves into a compact body, laying their heads together in the centre; and thus arranged they are covered with snow, and benumbed with cold, so as to be unable to extricate themselves without the assistance of their owner. In this season of hunger and distress, they have been sometimes known to eat one another's wool. Goats in this island are few. Some of the Iceland oxen and cows have no horns; and in the southern parts they are fed with fish bones, and the water in which the fish was boiled. Here are no hogs; few cats; but dogs are numerous. Poultry and tame fowl are scarce, the feeding of them being dear; swans, wild geese, and ducks are plentiful; and among the latter we may mention the eider, the eggs and feathers of which are so much valued. Snipes, woodcocks, &c. are also found in this island. The birds of prey are the eagle, hawk, raven, and falcon, the latter being reckoned the best in Europe. The rivers, lakes, and bays, with the other parts of the sea, supply the natives with various sorts of fish in great abundance. The cod-fishery near Iceland begins at the point of Brederwiek, and ends at that of Langerness, running by Cape North and the isle of Grims, and has occupied more than 200 Dutch vessels and about 80 French. The Icelanders are naturally robust and vigorous; but their strength is soon exhausted by the hardships they endure at sea in their fisheries; so that about the age of fifty years they are generally afflicted with disorders of the breast and lungs, and few attain to advanced age. In the middle of the 14th century this island was greatly depopulated by a pestilence called the "Black death," and in 1784 a dreadful mortality carried off 19,488 horses, 6800 beesves, 129,947 sheep, if the account given by Catteau (vol. i.) be not exaggerated. The exports from Iceland are principally dried fish, salted mutton, beef, butter, train-oil, tallow, coarse and fine jackets of wadmul, woollen stockings and gloves, red wool, sheep-skins, fox-tails of various colours, feathers, and particularly eider-down, quills, falcons, and hawks. The imports to Iceland are chiefly iron, horses' shoes, timber, meal, bread, brandy, wine, tobacco, coarse linen, a few silken stuffs, and domestic utensils. The first inhabitants of Iceland were a colony of Norwegians, who, to withdraw themselves from the tyranny of Harold Harfagre, retired thither in the year 874. The government was an aristocratic republic for about 387 years, till in 1261 it submitted to Norway. The present inhabitants, being of Norwegian extract, have few peculiar manners; but retain more of the ancient dress and customs of their

their ancestors. The Icelandic language is the most ancient and venerable, and of course the purest dialect of the Gothic. It has engaged the attention of many profound scholars, who have considered it as the parent of the Norwegian, Danish, and Swedish, and in a great degree of the English, though this last may probably be more connected with the Frisic, and other dialects of the north of Germany. In the ancient Icelandic Lord's prayer is as follows:

"Fader uor som est i Himlum. Helgad warde thitt nama. Tilkomme thitt Rikie. Skie thin vilie so fom i Himmalam fo och po ordauné. Wort dachlicka Brodh gif os i dagh. Ogh forlat os uora Skuldar fo fom ogh vi forlate them os Skildighe are. Ogh inled os ikkie i Frestalfan. Utan frels os ifra ondo. Amen."

In Iceland, extraordinary as it may seem, letters flourished in a very high degree from the 11th to the 14th century; and independent of the fabulous sagas, which were very numerous, the solid and valuable works then produced in that island might fill a considerable catalogue. From Iceland we derived the "Edda" (which see), and our knowledge of the ancient Gothic mythology. From Iceland the Swedes, Norwegians, Danes, and Orcadians, drew their chief intelligence concerning their ancient history: Snorro in particular being styled the Herodotus of the North: and the Landnama, or book of the origins of Iceland, is an unique work, displaying the names and property of all the original settlers, and the circumstances attending the distribution of a barbaric colony. There still exists in Iceland a bath, built by Snorro, in the 13th century; but the edifices being of timber, no remains of them exist.

In this island there are properly no towns; nevertheless the houses of the Iceland company, suppressed on account of its commercial monopoly in 1759, at the twenty-two ports or harbours, of which there are three or four at each harbour, have been dignified with the appellation of towns; though they are only trading places. We have already said that Iceland consists of four quarters, separated from one another by ridges of mountains. The north quarter constitutes the diocese of Holun, containing 140 churches. The other three quarters are included in the diocese of Skalholt, to which belong 163 churches. These two bishoprics are only valued at 150*l.* each. The religion of this island as well as of the Danish dominions to which it belongs, is the Lutheran. Iceland was converted to Christianity at the same period with Norway, in the reign of Olaf I. There are two Latin schools maintained at the royal expence in Iceland. The winter season in this island is unexpectedly moderate, so as generally to permit the natives to cut turf even in January. In this extensive island there is not much room for agriculture; which has however greatly declined since the period of the republic, when treatises were written on this interesting subject. N. lat. 63° 15' to 67° 15'. W. long. 10° to 25°.

ICELAND, or *Island Crystal*. See CRYSTAL of Iceland.

ICELE, in *Mythology*, the son of Sleep, according to the fable, and brother of Morpheus, who is said to have the power of changing himself into a variety of forms; "varias imitantia formas somnia, delusæ mentis imago." Ovid. Met. lib. ii. c. 630.

ICENI, in *Ancient Geography*, a British people, who were situated to the north of the Trinobantes, and inhabited that country, which is now divided into the counties of Suffolk, Norfolk, Cambridge, and Huntingdon. This nation is called by several different names by the Greek and Roman writers, as Simeni by Ptolemy, Cenimagni by Cæsar, &c. They do not seem to have made any opposition to the Romans at their first invasion under Cæsar,

but made their submission at the same time with several of the neighbouring states. (Cæf. Bell. Gal. l. v. c. 14.) At the next invasion in the reign of Claudius, the Iceni entered into a voluntary alliance with the Romans; but soon after, joining with some other British tribes in a revolt, they were defeated in a great battle by Ostorius Scapula, the second Roman governor of Britain, A. D. 50, and reduced to a state of subjection. For some time after this they were treated with much favour and indulgence by the Romans, and even allowed to live under the immediate government of Prasutagus, their own native sovereign. But after the death of that prince, the Iceni were so much enraged at some grievous insults which were offered to his widow and daughters, by the lust and avarice of certain powerful Romans, that they broke out into a second revolt, much more violent than the first. In this revolt they were commanded by the celebrated Boadicea, the brave and injured widow of their late king; and being joined by several other British states, they did many cruel injuries to the Romans and their allies. But being at length entirely defeated in battle, with prodigious slaughter, by Suetonius Paulinus, A. D. 61, they were reduced to a state of total and final subjection to the Roman government; and the Romans took great pains to keep them in this state of subjection, by building many strong forts, stations, and towns in their country. (Tacit. Annal. l. xiv. c. 40, 41, 42.) The capital of the Iceni, which is called by the Roman writers Venta Icenorum, was situated at Caister, on the banks of the river Wintfar, about three miles from Norwich, where some vestiges of its walls are still discernible. Several of the Roman stations in the country of the Iceni are mentioned in the fifth Iter of Antoninus; as Villa Faulini, Iciani, Camboricum, Durolipons, and Durobrivæ; *i. e.* St. Edmundsbury, Ickborough, Chesterford, Waltham, and Caister on the Nen. Some other places in the same country are mentioned in the ninth Iter, as Venta Icenorum, Sitomagus, and Combretonium, *i. e.* Caister, Wulpit, and Stretford. Two places on the sea-coast are mentioned in the Notitia Imperii, Branodunum and Garononum, *i. e.* Braucaster and Yarmouth, in which strong garrisons were kept by the Romans to protect the country from the depredations of the Saxon pirates. The territories of the Iceni made a part of the Roman province Britannia Prima. Henry's Hist. vol. i.

ICESIA, an island of the Mediterranean, in the Sicilian sea. Ptolemy.

ICH-DIEN, the motto of the arms of the prince of Wales, signifying in High Dutch, *I serve*.

Sir Henry Spelman judges it to be Saxon, *Ich thien*; the Saxon *d*, with a transverse stroke, being the same with *th*; and signifying, *I serve*, or *am a servant*, as the ministers of the Saxon kings were called *thiens* or *thanes*. See CROWNS of British Princes.

ICHNÆ, in *Ancient Geography*, a town of Greece, in Macedonia, placed by Pliny on the sea-coast near the Axis.—Also, a town of Asia, in Mesopotamia, on the banks of the river Billicha, N.W. of Nicephorium. This town took part with the Romans when Crassus was defeated by the Parthians.

ICHNEUMON, in *Zoology*, the trivial or specific name of a kind of weasel that inhabits Egypt, especially on the banks of the Nile, and which is considered particularly useful in diminishing the number of that formidable creature the crocodile, by insinuating itself into the banks of the rivers or the sands, and destroying the eggs; so that it was not without reason that it was ranked by the Egyptians in the class of their deities. It is a fierce and very crafty animal, about the size of the cat, and is distinguished from the rest

of the *viverra* tribe by having the great toes remote, and the tail, which is thickest at the base, tapering gradually to the tip, which is tufted. The ichneumon is a great enemy to serpents, lizards, reptiles, insects, and other noxious animals, and is sometimes tamed by the Egyptians, and kept in their houses to destroy mice. The people call it Pharaoh's rat, and the peasants frequently bring it young to market.

According to Sonnini, neither the name ichneumon, nor that of Pharaoh's rat, is now known in Egypt. The Arabic name of the ichneumon is "Nems:" and, without doubt, it was one of the sacred animals of ancient Egypt. Particular care was taken of it while alive, and honours were paid to it after its death: funds were set apart for its support; it was fed, like cats, with bread soaked in milk, or with the fish of the Nile cut in pieces; and it was every where forbidden to kill it. With great dispositions to familiarity, says Sonnini, the ichneumon is not now domestic in Egypt. The inhabitants do not now rear them in their houses, nor do they even remember their having been so brought up by their progenitors. This writer disputes the natural antipathy to crocodiles, attributed to the ichneumon. If some ichneumons, he says, have been seen flying with fury at the little crocodiles that have been offered them, it must have been the effect of their appetite for all sorts of reptiles, and not, as many persons have supposed, that of a particular enmity, or of a law of nature, which specially directed them to stop the multiplication of this amphibious species. It would at least, continues this writer, have been as reasonable to suppose, that nature created the ichneumon on purpose to prevent the too great propagation of poultry, which, in fact, they destroy in much greater proportion than they do crocodiles. Besides, in more than half the northern part of Egypt, that is, in the part comprehended between the Mediterranean sea and the town of Siout, they are very common, although there are here no crocodiles; while they are more scarce in Upper Egypt, where crocodiles are very numerous. The ichneumon is no where more multiplied than in Lower Egypt, which being better cultivated, more inhabited, more moist, and more shady, affords also a more abundant supply of prey and food; and yet crocodiles are there never seen. The antipathy to the crocodile, erroneously ascribed to the ichneumon, belongs to a species of tortoise of the Nile, who, as soon as the young crocodiles are hatched, and reach the river, attacks and devours them. This species of tortoise is only to be found in the upper parts of the Nile, to which crocodiles are confined. This tortoise is the "therse" of the Egyptians and Nubians, and, as Sonnini conceives, has a much better title than the ichneumon to the god of the ancient Egyptians, and the wonder of writers. Sonn Trav. in Egypt. See VIVERRA.

M. Sonnini mentions a beautiful species of ichneumon-fly, with a long and strong weapon at the extremity of the body, which sometimes enters the houses in Egypt; and which shines with the most lively colours: its head is of a beautiful emerald-green; the corselet and belly are of a glistening purple hue.

ICHNEUMON, in *Entomology*, a genus of the hymenopterous order. See WASP-ICHNEUMON Fly.

ICHOGRAPHY, in *Perspective*, the view of any thing cut off by a plane parallel to the horizon, just at the base or bottom of it.

The word is derived from the Greek *ιχνος*, *vestigium*, *foot-step*, and *γραφω*, *scribo*, *I describe*, as being a description of the footsteps or traces of a work.

Ichography is the same with what is otherwise called the *plan*, *geometrical plan*, or *ground plot*, of any thing, and is

opposed to orthography or elevation. See also SCENOGRAPHY and STEREOGRAPHY.

ICHOGRAPHY, in *Architecture*, is a transverse section of a building, exhibiting the circumference of the whole edifice, and of the several rooms and apartments in the given story; together with the thickness of the walls and partitions; the dimensions of the doors, windows, and chimneys; the projectures of the columns and piers, with every thing visible in such a section.

The drawing or designing of this is properly the work of the master-architect, or surveyor; it being, indeed, the most difficult of any.

ICHOGRAPHY, in *Fortification*, denotes the plan or representation of the length and breadth of a fortress; the distinct parts of which are marked out, either on the ground itself, or upon paper.

ICHOGLANS, the grand seignior's pages, serving in the seraglio.

The word, according to some authors, is composed of the Turkish words, *ich*, or *itch*, which signifies *within*, and *oglan*, *page*; in which sense ichoglan is a page serving within the palace, or seraglio. Others derive it from the barbarous Greek *ιγκολας*, or *ιγκολος*; which was formed from the Latin *incola*. These two etymologies give nearly the same sense to ichoglan, taking *incola* for *domus incola*.

These are the children of Christians, and bred up in an austerity scarcely to be conceived. The sultan prefers them to offices more or less considerable, as they appear more or less capable, and devoted to his service; but it is to be observed, they are incapable of offices till forty years of age, unless they have some particular dispensation from the grand seignior. They are educated with a great deal of care in the seraglios of Persia, Adrianople, and Constantinople. They are under the direction of a capi aga, who presides over their exercises, and treats them with great severity. They are divided into four odas, or chambers, where, according to their several talents or inclinations, they are instructed either in the languages, religion, or exercises of the body.

ICHOR, *Ιχρρ*, signifying any *humour* or *humidity*, properly denotes a thin, watery humour, like serum; but is sometimes also used for a thicker kind, flowing from ulcers; called also sanies.

ICHOR, in *Surgery*, signifies a thin, bloody, acrid discharge, which frequently takes place from unhealthy sores and wounds.

ICHTHYITES, in *Natural History*, is the name by which Dr. Grew denominated several fish-moulds, or impressions of fish preserved in the collection at Gresham college. "Rarities," p. 256.

ICHTHYOCOLLA, *Ιχθυοκολλα*, formed of *ιχθυς*, *fish*, and *κολλα*, *glue*, popularly called *isinglass*, or *fish-glue*, is a solid glutinous substance, prepared from a fish of the sturgeon kind, caught in the rivers of Russia and Hungary. The beluga affords the best; but the sounds of all fresh-water fish yield, more or less, fine isinglass; particularly the smaller sorts, found in prodigious quantities in the Caspian sea, and several hundred miles beyond Astracan, in the Wolga, Yaik, Don, and even as far as Siberia. It is also well known, that our lakes and rivers in North America are stocked with immense quantities of fish, said to be of the same species with those in Muscovy, and yielding the finest isinglass. The production of isinglass requires no artificial heat, neither is the matter dissolved for this purpose, as it has been generally imagined: for, as the continuity of its fibres would be destroyed by solution, the mass would become brittle in drying, and snap short asunder, which is always

always the case with glue, but never with isinglass. The latter, indeed, may be resolved into glue with boiling water, but its fibrous recombination would be found impracticable afterwards, and a fibrous texture is one of the most distinguishing characteristics of genuine isinglass. Isinglass is nothing more than certain membranous parts of fishes, divested of their native mucosity, rolled and twisted into different forms, and dried in the open air. The sounds or air-bladders of fresh-water fish, in general, are preferred for this purpose; as being the most transparent, delicate, flexible substances. These constitute the finest sorts of isinglass; those called book and ordinary staple are made of the intestines, and probably the peritonæum, of the fish. The sounds, which yield the finer isinglass, consist of parallel fibres, and are easily rent longitudinally: but the ordinary sorts are found composed of double membranes, whose fibres cross each other obliquely, resembling the coats of a bladder. Isinglass receives its different shapes in the following manner: the parts of which it is composed, particularly the sounds, are taken from the fish while sweet and fresh, slit open, washed from their slimy fordes, divested of every thin membrane which envelopes the sound, and then exposed to stiffen a little in the air. In this state they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple; a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. Having thus settled the proper dimensions, the two ends of what is called the short staple are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart, and thus it is laid on boards, or hung up in the air to dry. The sounds, which compose the long staple, are larger than the former; but the operator lengthens this sort at pleasure, by interfolding the ends of one or more pieces of the sound with each other. The extremities are fastened with a peg like the former; but the middle part of the roll is bent more considerably downwards; and, in order to preserve the shape of the three obtuse angles thus formed, a piece of round stick is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state it is permitted to dry long enough, to retain its form, when the pegs and sticks are taken out, and the drying completed. Lastly, the pieces of isinglass are joined together in rows, by running pack-thread through the peg-holes, for the convenience of package and exportation.

The membranes of the book sort being thick and refractory, will not admit the same formation; and, therefore, the pieces, after their sides are folded inwardly, are bent in the centre, in such manner, that the opposite sides resemble the cover of a book, whence its name; a peg, run across the middle, fastens the sides together, and thus it is dried like the former. The cake isinglass is formed of the bits and fragments of the staple sorts, put into a flat metal-line pan, with a very little water, and heated just enough to make the parts cohere like a pan-cake when it is dried; but this is of little value. Isinglass is best made in the summer, as frost gives it a disagreeable colour, deprives it of its weight, and impairs its gelatinous principle.

The sounds of cod and ling bear a general likeness to those of the sturgeon kind of Linnæus, and are used for the same purpose. The Newfoundland and Iceland fishermen split open the fish as soon as taken, and throw the back-bones, with the sounds annexed, in a heap; but previously to putrefaction, the sounds are cut out, washed from their slime, and salted for use. In cutting out the sounds,

the parts between the ribs are left behind, which are much the best; the Iceland fishermen are so sensible of this, that they beat the bones upon a block with a thick stick, till the *pockets*, as they term them, come out easily, and thus preserve the sound entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water, before they are prepared for isinglass. The fresh sound must then be laid on a block of wood, whose surface is a little elliptical, to the end of which a small hair brush is nailed, and with a saw-knife the membranes on each side of the sound must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with scissors, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water, in order to absorb their oily principle; and lastly, in clear water. They are then laid upon nets to dry in the air; but, if intended to resemble foreign isinglass, the sounds of cod will only admit of that called book; but those of ling of both shapes. The thicker the sounds are, the better the isinglass, excepting its colour; but that is immaterial to the brewer, who is its chief consumer. See Mr. Jackson's Account of the Discovery of the Manufacture of Isinglass, in Phil. Trans. vol. lxxiii. part i. p. 1, &c.

Ichthyocolla, or isinglass, is one of the purest and finest of the animal glues, of no particular smell or taste. Beaten into threads, it dissolves pretty readily in boiling water or milk, and forms a gelatinous substance, which yields a mild nutriment, and proves useful, medicinally, in some disorders arising from a sharpness and colligation of the humours. A solution of it in water, curiously spread, whilst hot, upon silk, affords an elegant sticking-plaster for slight injuries of the skin, not easily separable from the part by water, and scarcely inferior to the more compounded one sold under the name of the ladies black sticking-plaster, in which different balsams and resins are joined to the ichthyocolla. See *EMPLASTRUM adhaesivum*. Lewis's Mat. Med.

Isinglass is used in miniature painting, in the same manner as the gum Arabic or Senegal, for rendering water a proper vehicle, by giving it a due viscosity for spreading and binding the pigments of an earthy texture. But the greatest quantities of it are consumed by brewers, wine-coopers, &c. for fining their liquors. See *FINING*.

A size may be made of isinglass, by boiling half an ounce of the beaten isinglass in a pint and half of water, till the whole be dissolved, and then straining the hot fluid through a linen rag. The size may be reduced by taking half the above quantity, and adding to it an equal measure of hot water.

A very valuable glue is to be made of this drug. > See *GLUE*.

It is valuable, in that it will keep also, and is a very proper form to keep isinglass in, for readiness for the wine-cooper's use; besides this it serves also very elegantly for the taking off the impressions of medals, coins, &c. See *MEDAL*.

ICHTHYOCOLLA Piscis, in *Ichthyology*, the name of a large fish, of the sturgeon or acipenser kind; from which, as also from the *huso Germanorum*, the drug called isinglass or ichthyocolla is made. It is a fish of very great size, and is cartilaginous, having no bones or scales; its head is large and thick, and its mouth stands very forward; the upper jaw has four fleshy apophyses hanging from it; its eyes are small; its flesh is very well tasted, but glutinous; it is of a yellowish colour, and its tail is large and forked. See *BELLUGA-flores*.

ICHTHYODONTES, in *Natural History*, is a name by which some authors describe the glossopetra, or fossil teeth of fish.

ICHTHYOLITE, ICHTHYOLITHUS, in *Natural History*, a name given to the fossil remains of fishes, and also to the impressions of these animals or their skeletons in stone. Some authors, however, have applied that term to such specimens only as exhibit the fish itself, either petrified or in the state of a mummy; while the name of *Typolites* has been proposed for such stony substances as exhibit the mere impression of those animals. The number of species of which the fossil remains have been described by naturalists is comparatively small; nor can this be a matter of surprise if we consider the extreme tenderness of the substance, and the corruptible nature of most fishes, together with the many circumstances unfavourable to petrification under which they are generally found after their death. Even those few that, by being accidentally enveloped in mud and soft clayey sediment at the bottom of the water, are preserved from passing into immediate dissolution, or from becoming the food of the inhabitants of the waters, generally leave but faint traces of their original form. Sometimes, however, we see their external appearance completely preserved, as in those of Vestena in the Veronese territory, and those in the bituminous marle-slate of Oeningen; or they appear as solitary mummies, inclosed as it were in a coffin of a grey marle, in which state the Arctic trout (*Salmo arcticus*) is frequently seen, particularly at Zuckertop, on the west coast of Greenland.

Where petrified fishes or their impressions occur in considerable number, we may always be certain that they perished by some sudden revolution or catastrophe, by which they were overwhelmed in shoals on the very spots whose geological history they now contribute to elucidate. The most extensive depositary of fossil remains of fishes is that of

Monte Bolca, or rather of *Vestena Nova*, in the Veronese territory. Vestena Nova is a district separated from Monte Bolca by the river Scaranto Maggiore, which receives the rivulets that descend from the mountains on both its sides. Within the boundaries of this place, one thousand paces from the village Bolca, and about 242 paces lower than the summit of the mountain of that name, we find the fish-quarry called *Lastrara*, being a hill whose height above the level of the sea is about 38 French toises. The rock which predominates almost in the whole of the districts of Bolca and Vestena, is basalt, both massive and prismatic. The three places in which the latter appears particularly characteristic are the Valle dei Stanghellini, mount San G. Ilarione, and the upper part of Monte Bolca, called La Purga di Bolca. The basaltic columns are in general perpendicular to the axis of the mountain; but those of San Giovanni Ilarione are rather inclined to the horizontal line, and appear to have been forced out of their original position. Besides basalt there occur other rocks in these mountains that have the appearance of being volcanic productions; such as an ash-grey conglomerate, red cellular stones like scoriae, and a violet coloured indurated earth, not unlike the puzzolana of true volcanoes. Some of these masses are full of nodules of fibrous zeolite and calcareous spar; others contain fragments of feld spar and quartz, while still others exhibit an uniform solid mass without any imbedded substances. Only the first mentioned of these rocks have the appearance of productions of volcanoes; the others obviously belong to the porphyritic formation, and some of the last mentioned are hornstone. But of all the rocks just noticed, none are to be seen in the immediate neighbourhood of the immense quarries where the fishes are found. These consist chiefly of a more or less fossil marle disposed in layers which, observing

exactly the same succession in the different adjoining hills, appear to prove that these formerly constituted a continued ridge. One of the hills consists principally of a whitish, porous, friable tuff, resembling common cement; it is made up of particles of lime and sand, containing a vast number of fossil shells, particularly of *Murex aluco* and *Turbo uriscalpium*, natives of the Mediterranean, and here converted into a white marble; also of *Turbo unguinus*, *variegatus*, and *terebra* of Linnæus. In some places the tuff becomes much harder; it passes into a kind of common limestone, and is found to contain mummulariæ, and lids of shells belonging to the above species.

The *Lastrara*, or hill where the fishes are found in abundance, has for its uppermost stratum a kind of mould mixed with the detritus of basalt and other rocks. The interior consists of two distinct kinds of strata; the one called *Zengio* is a hard marle-like limestone, traversed by veins of calcareous spar: it is not divisible into thin layers, and seldom contains any petrifications. The other strata, called *Lastra*, consist of a schistose marle, divisible into very thin layers, giving out a fœtid odour when rubbed. The colour of this mass is whitish, yellowish, or blueish-grey. It varies with regard to hardness, but is in general easily scraped by the knife. In this alone the remains of fishes are found, which are sometimes seen accompanied by parts of maritime algæ; at other times the sea-weeds occur separate.

The fishes in question are mostly sea-fish, but there are also some of fresh water found among them. The originals of many, if we can trust the naturalists that appear to have examined them with great care, live now in regions most remote from each other; among them are the natives of Europe, the Indian ocean, Africa, and North and South America. The remains of the fishes thus imbedded are all of a dark-brown colour, and therefore appear very distinctly on the light ground of the stone; they lie flat among the laminæ, their profile and their several parts, little, if at all, distorted from their natural shape and dimensions, except that in some cases the stone inclosing them seems to have suffered some little disturbance after their inclosure, by which they are found at times somewhat fractured, and the parts a little disjointed. Their whole form is well defined, but the harder parts, such as the head, fins, spine, with the bones that branch from it on either side, and indeed all the bones in general, as well as in some the scales, are remarkably well expressed. The dark-brown matter composing these fishes remains distinct, and may be picked off from the stone; it projects in proportion to the thickness of each part in its natural state; it is hard, brittle, and rather glossy through its substance, except in some of the grosser bones, such as the joints of the vertebræ, which, though of this appearance externally, are found, when broken, to consist internally of laminar calcareous spar. On cleaving the matrix the forms are found equally announced on each of the opposite sides, the prominences on one side being exactly answered by corresponding hollows on the other.

We cannot be too careful in determining the species of the prototypes of fossil remains; in cases, therefore, where difficulties arise with regard to their diagnosis, it is much more advisable to abstain from pronouncing with confidence than to mislead the geologist by inaccurate determination. This is more particularly the case with fossil fishes; and it is owing to the difficulties which attend their diagnosis, that the opinions of different naturalists respecting the species, or even the genus to which specimens are to be referred, have been often so very contradictory. Upon the whole it may be said, that those of the Veronese territory are determined with greater care and exactness: and it is much to be wished that the

authors

ICHTHYOLITE.

authors of the "Ittiolitologia Veronese," which contains the descriptions and figures of no more than sixteen species, all of them preserved in the Bozza collection, might have been encouraged to proceed with this highly splendid and instructive work. The just mentioned sixteen species are, 1. The shark (*Squalus carcharias*, Linn.). It has all the characters of this species, but its length is only 26 inches. 2. The winged chætodon (*Chatodon pinnatus*, Linn.) first described and figured by Scheuchzer, under the name of "Piscis fossilis elegans," and conjectured by him to be the Brazilian Guaperu described by Marcgraf. 3. The trumpet fish (*Fistularia chinensis*, Linn.). 4. The sea-needle (*Efox Brasiliensis*), considered by Bloch as a variety of *E. belone*. 5. The swimming sea-horse (*Pegasus natans*, Linn.), unique, in the Bozza collection. 6. *Uranoscopus restrum*. It was first considered by Bozza as the unicorn fish (*Balistes monoceros*) of Catesby: but a more close examination renders it highly probable that it is an unknown or lost species of star-gazer, to which, on account of the long serrated dorsal fin, the above specific name has been given. 7. The bat chætodon (*Chatodon vespertilio*, Bloch.). 8. The *Portavela*, a fish not before described, belonging to the order jugulares of Linnaeus, and in all probability to the genus *Kurtus*, established by Bloch. It is here called *Kurtus velifer*; it approaches very near to *Acarauna* of Willughby, and the Spitsneus of Ruysch. 9. The arc fish (*Chatodon arcuatus*, Bloch), unique in Bozza's cabinet. 10. *Tetrodon Honckenii*, Bloch; a small species, which, in imperfect specimens, has formerly been mistaken by some for the impression of elliptic leaves, by others for tad-poles. Only a few specimens have been found in the Veronese hills. The bishop of Winchester is mentioned in the "Ittiolitologia," as having acquired at Verona a much larger and better preserved specimen than the one figured in that work. It is not found in the common grey-coloured layers of Bolca, but in the brown and ash-grey variety of marle-slate of that hill. 11. The globe-fish (*Tetrodon bispidus*, Linn.). The fossil remains of very small specimens of this fish are found only in the whitish and yellow coloured layers of marle-slate in the Lastrara. 12. A species of ray, denominated *Raja muricata* by Marcgraf, which name is here retained. The Portuguese, on account of its shape resembling that of a musical instrument, call it *Viola*: neither Linnaeus nor Bloch make mention of it; there can, however, be no doubt that it belonged to that tribe of rays which inhabit the Arabian seas, and is comprehended by Forskoal under the name of *Raja sephen*. 13. *Chatodon mesoleucus*. The prototype likewise described by Forskoal as a native of the Arabian sea, to which locality Bloch has added that of Japan; but Gmelin, considering both as distinct, calls that of Forskoal *Ch. mesoleucus*, distinguishing the Japanese fish by the specific name of *mesomelas*. 14. The argus (*Chatodon argus*, Linn.). Fortis has erroneously described this ichthyolite under the name of *Chatodon faber*. 15. *Gobius barbatus*, a new species, approaching the *G. ocellatus* of Broussonet, under which name this fossil fish has been before erroneously described by Bozza. 16. *Gobius Veronensis*. This has been considered by Fortis and Bozza as the *G. strigatus* of Broussonet: posterior observations have, however, proved it to be distinct from the last mentioned species.

To the species just enumerated, we subjoin the following systematic list of Bolea ichthyolites, in the famous collection of Signor Vincenzo Bozza, which, in 1791, was united with that of the marquis Gazola, and is now preserved in the Museum of Natural History of Paris: but whether they are as well determined as those in the "Ittiolitologia

Veronese" appear to be, remains to be ascertained by those who have made ichthyology the principal object of their researches.

1. *Fishes of European seas*.—The Rondeletian eel (*Murana myrus*, Linn.): the Roman murana (*Murana Helena*, L.): *M. ferpens*: *M. caca*: the bearded eel (*Ophidium barbatum*, L.): the coal-fish (*Gadus carbonarius*, L.): the green gadus (*G. virens*, L.): the hake (*G. merluccius*, L.): the Mediterranean gadus (*G. Mediterraneus*, L.): the butterfly fish (*Blennius ocellaris*, L.): the arcolated blenny (*Blennius lumpenus*, L.): the porcine scorpena (*Scorpena porcus*, L.): *Scorpena scorpius*, Will.: the rufous scorpena (*S. serosa*, L.): *Scorpena Salviani*, Will.: the common dory (*Zeus faber*, L.): the dab (*Pleuronectes limanda*, L.): the gilthead (*Sparus aurata*, L.): the fargy (*Sparus fargus*, L.): the pagre sparus (*Sp. pagrus*, L.): the maroon sparus (*Sp. chromis*, L.): the varying labrus (*Labrus turdus*, L.): *Scomber colias*, Will.: the common mackarel (*Scomber scomber*, L.): the bonito (*Scomber pelamis*, L.): the tunny (*Scomber thynnus*, L.): the cuckow gurnard (*Trigla cuculus*, L.): the sea-pike (*Efox sphyrona*, L.): the herring (*Clupea harengus*, L.): the common angler (*Lophius piscatorius*): the sting ray, (*Raja pastinaca*, L.)

2. *Of the Indian seas*.—The Indian dragonet (*Calyonimus indicus*, L.): the ciliated dory? (*Zeus ciliaris?* Bloch): *Zeus triurus* cui valde affinis *Z. faber*, L.: the striped chætodon (*Chatodon striatus*, L.): *Chatodon macro-lepidotus*, L.: *Chatodon*, Seba Mus. 3. t. 26. f. 23. *Chat. canescens*, L. *Chat. lineatus*, L.: *Chat. fuscus*, Seba 3. t. 26. f. 22. *Sparus argenteus*, Seba 3. t. 27. f. 13. *Labrus*, Seba 3. t. 31. f. 5, 6. *Perca*, Seba 3. t. 23. f. 3, 4. *Efox Amboinensis*, Ruysch Amb. t. 14. f. 2. The fish of Paradise (*Polynemus paradiseus*, L.): the thrissa herring (*Clupea thrissa*, L.): *Diodon*, Seba 3. t. 23. f. 3, 4.

3. *Of the African sea*.—The rough sparus (*Sparus dentex*, L.): *Ostracion turritus*, Linn.

4. *South American seas*.—The common coryphene (*Coryphæna hippurus*, L.): the Brazilian dory (*Zeus vomer*, L.): the arcuated chætodon (*Chatodon arcuatus*, L.): *Chatodon fasciatus*, L.: *Chatodon cornutus*, L.: the Curassao chætodon (*Ch. Curaçao*, L.): *Chatod. nigricans*, L.: *Chatod. triostegus*, L.: the silvery sparus (*Sparus argenteus*, L.): *Scomber cordyla*, Will. t. 5. 18. f. 1. *Scomber coorza pifonis*, Will. t. M. 5. f. 2. The bagre filurus (*S. bagre*, L.): *Loricaria plecostomus*, L.: The Seban polyneme (*Polynemus quinquirius*, L.): *Polynemus plebeius*, Brouff.: the round diodon (*Diodon orbicularis*.)

5. *North American seas*.—The toad gadus (*Gadus tau*) Will. t. N. f. 3.): *Chatodon chirurgus*, L.: the Carolina stickleback (*Gasterosteus Carolinus*, L.): the Canada stickleback (*G. Canadus*, L.): *Perca venenosa*, L.: *Perca trifurca*, L.: the tobacco-pipe fish (*Fistularia tabacaria*, L.): *Efox*, Catesb. t. 1. f. 1. *Elops saurus*, L.: the oceanic flying fish (*Exocoetus evolvans*, L.)

The above described place, where these remarkable petrifications are found in such abundance, has become the subject of much speculation with the naturalists of modern times. Arduino was one of the first writers who produced some very ingenious conjectures, to prove the volcanic origin of that hilly district; and his theory was afterwards supported by Ferber, Fortis, Strange, Dolomieu, Patrin, and others; the leading feature of whose system, with regard to the preservation of the fishes and other marine productions, was the supposition that the whole tract where they are found, anciently constituting the bottom of the

ICHTHYOLITE.

sea, was raised by the action of subterraneous fire. Notwithstanding the plausible reasons that have been given by those naturalists in favour of the volcanic origin of the Bolca fishes, there are several very respectable writers, and among them the author of the "Itritolitologia Veronese," who, after a minute examination into the nature of those hills, and the circumstances under which the fossil remains occur in them, have not hesitated to pronounce them of Neptunian origin. Their observations lead them to suppose, that the district of Vestena and Bolca is the result of a widely extended deluge, which collected the fishes, shells, and plants of distant parts of the globe into one common sea; and that successive partial inundations, together with the occasional ignition of the inflammable substances previously deposited, produced the volcanic appearance of the masses of rocks above those strata which contain the remains of fishes, and which are totally destitute of the characteristics of volcanic productions.

The ideas which Mr. Graydon has offered on this subject, in the Transactions of the Royal Irish Academy are, in substance, as follows. The very perfect preservation of the living form observable in the specimens from Vestena and Bolca, appears to prove that the fishes could not have been long dead, before they were enveloped by the calcareous marle, which must have been suspended in the water, and, on subsiding, have caught and enclosed the fish which probably derived their death from this very cause. The bodies of these animals did not undergo any simultaneous putrefaction, but their oily and other soft parts were absorbed by the enclosing mass. This stony substance being for the greatest part calcareous, Mr. Graydon supposes that a vast body of it, previously calcined or reduced into quick lime by the agency of subterraneous fire, again passed into the state of slacked lime, as soon as it came into contact with the waters, from which subsiding it gradually and successively concreted at the bottom, and assumed the structure of a schistose mass, which becoming afterwards impregnated with the oily parts of the fish, acquired the foetid smell which it is still found to emit on being scraped with a harder substance. It is highly probable to the same author, that these masses, in their original position, must have formed part of a continued and horizontal stratum of very considerable extent, of which the quarries of Bolca are evidently to be considered as no more than portions or fragments, now completely disjoined from all connection with their native bed. This separation must have happened after the consolidation of the original stratum; for it could not have taken place in the yet soft and yielding substance, without producing a considerable disturbance both in the laminar structure of the mass, and in the forms of the fishes. It would therefore seem, that, at some subsequent period, the whole of the stratum was violently broken up, and immense fragments of it heaved from their natural situation, and dispersed here and there as in the instance before us. The author considers the eruptive force of subterraneous fire fully adequate to producing these effects, though he allowed, that it must have operated in the present case with a force much exceeding whatever has been experienced in the known history of volcanoes.

In whatever manner we explain the phenomenon of the Bolca fishes, it will always be found extremely difficult to account for the collection, in one spot, of so many fishes from various parts of the globe most remote from each other, and among them some which live in fresh water. Indeed, this difficulty appears so great, that we are almost inclined to suspect the accuracy of the observations made to ascertain the originals of these fossil fishes, and

that many of them should be considered rather as approaching to, than as being the same with, the species to which they are referred by authors.

We subjoin, from Patrin's account, what relates to the ichthyolites of the gypsum quarries of Aix, in Provence, which are not less remarkable than those of Vestena and of Oeningen. The strata that are open to view in descending by 110 steps, into the interior of the mountain at Aix, are seven in number: 1. A kind of marle-slate, called *argile feuilletée* by the miners: it is of a brownish-yellow colour, and when immersed in water, separates into very delicate layers. 2. The white stone (*Pierre blanche*), a chalk like marle, which, when dissolved in acids, leaves a considerable quantity of a brownish-grey clay. 3. Hard clay (*argile dure*). 4. The black stone (*Pierre noire*), a variety of marle-slate, perfectly like that of N° 1, but full of rhomboidal selenite crystals. 5. The stratum containing the impressions of fishes; it is a schistose rock of a yellowish-grey colour, soft, rather soiling, divisible into thin layers, and giving out a slightly bituminous smell when scratched. 6. Bed of gypsum; and 7. A stratum of what is called by the quarriers *Pierre froide*, a substance which much resembles that of N° 3; both are of a greyish-white colour, have a nearly conchoidal fracture, adhere but little to the tongue, and feel cold; they both dissolve with effervescence, but leave a great proportion of clay. Lower down the same succession of strata is continued, but no impressions of fishes are found in any of them. The fishes buried in the stratum, below the gypsum, are, according to Darluc, the red surmullet (*Mullus barbatus*, L.); the lunated gilt head (*Sparus aurata*, L.); sea-wolves; the whiting (*Gadus merlangus*, L.); a guraard (*trigla*), which resembles, but still appears to be distinct from, the *Trigla cataphracta*, a native of the Mediterranean, on the coast of Provence. All these fishes lie flat on their sides, as a proof that they perished on the very spot they now occupy. Patrin is of opinion that these fishes have been suffocated by the sulphureous vapours which, by their combination with lime, have formed the upper stratum of gypsum; that, however, at the time when similar emanations formed the older strata of gypsum, the waters of the ocean still covered the high land which encompassed this tract, so that the fishes were enabled to escape, and that none were suffocated but at a period when, by the diminution of the sea, this same tract of country was become surrounded by coasts that checked the flight of the fishes.

A great number of impressions of fishes are found in the quarries of Oeningen on the right bank of the Rhine. The strata observed there below the vegetable mould, which is white and clayey, are, 1. A stratum, only one inch thick, of friable and fine-grained sand-stone, composed of transparent sharp-edged grains of quartz, cemented by a mixture of clay and lime. 2. A layer of a compact clay, four inches in thickness, effervescing with acids. 3. A layer, twenty-six inches thick, of a slaty clay mixed with lime, and some bitumen. 4. A layer of one foot in thickness, of a yellowish-grey calcareous schistus, intermixed with minute layers of clay, of a dark-grey colour, and containing a small portion of bitumen. 5. A bed, eight feet thick, composed of clay slate, divisible into fine laminæ, and alternating with soft clay, which has no slaty structure. 6. The slaty rock contains the impressions of fishes, and which is called *bonne Pierre* by the quarriers. It is composed of strata, which together form a thickness of twelve feet, and each of them is separated from the upper and lower by some earth, impregnated with bitumen. It is easily divisible into laminæ, on which are discovered the impressions of the fish. This
slaty

slaty stone is pretty soft, although it is as sonorous as a brick : it adheres to the tongue, and when dissolved in acids, leaves a considerable proportion of clay. Beneath these layers, of 12 feet in thickness, there are four inches of a similar slaty mass, which, however, contains no impressions. Dr. Lavater possessed a rich collection of ichthyolites of Oeningen, among which he has recognized the following species: the lesser lamprey (*Petromyzon fluviatilis*); the common eel (*Muræna anguilla*); the bull-head (*Cottus gobio*); the brill (*Pleuro-nebus rhombus*); the scad (*Scomber trachurus*); the mailed gurnard (*Trigla cataphracta*); the lucerna-gurnard (*T. lucerna*); the thorny leach (*Cobitis taenia*); the leach (*C. barbata*); the trout (*Salmo fario*); the pike (*Esox lucius*); the herring (*Clupea harengus*); the shad (*C. abasa*); the bream (*Cyprinus brama*); the minnow (*C. phoxinus*); the dobule (*C. dobula*); the crucian (*C. carassius*); the borderliere (*C. blica*); the dotted carp (*C. bipunctatus*); the bitterling (*C. amarus*); *Cyprinus hisella*; the round-tailed chub (*C. cephalus*); the loach (*C. rutilus*); grislæan carp (*C. grislægine*); the bleak (*C. alburnus*); the dace (*C. leuciscus*); the tench (*C. tinca*); the nase (*C. naseus*); the common carp (*C. carpio*); the gudgeon (*C. gobio*).

The Hessian ichthyolites, particularly those found at Riegelsdorf, in bituminous marle-slate, are more particularly remarkable on account of the distorted forms exhibited by the fishes, with whose impressions it abounds. This circumstance, and the great quantity of copper found in that rock, have induced a belief that the death of these fishes was occasioned by a sudden impregnation of the waters with a cupreous solution. It is worth observing that the more the impressions of fish abound in any particular part of the strata of marle-slate, the richer these are found to be in copper ores. Mr. Rieff has given an account of the succession of the stetz strata at Riegelsdorf, which are the following: N^o 1. Ferruginous clayey mould, from one to two fathoms. N^o 2. Greyish-white limestone from 6-8 fathoms. N^o 3. Blue clay, with imbedded fragments of selenite crystals; 8-10 fathoms. N^o 4. Blueish limestone, called *Raucl-wacke*; 8-9 fathoms. N^o 5. Grey compact gypsum, traversed by ferruginous loam; 7-8 fathoms. N^o 6. Black and grey itinkstone; 1-1½ fathom. N^o 7. Sand, sometimes loose, sometimes cemented; 1-1½ fathom. N^o 8. A kind of limestone called *Zech-stein*, of a greyish-brown colour, and soft above towards the sand, but blacker and more compact below; 3¼-3½ fathoms. N^o 9. A black slaty stratum, containing pyrites, and forming the roof of the bituminous marle-slate; 18-20 inches. N^o 10. Black cupiferous bituminous marle-slate; 3-8 inches: this is the principal depositary of the ichthyolites. N^o 11. Gneiss-like greyish-white rock, consisting of small rounded quartz pebbles, and sometimes of fragments of jasper and mica, cemented by indurated clay; 6-18 fathoms. N^o 12. Old red sandstone, or the dead rock, being the fundamental rock of these stetz strata. From the above it appears that the greater part of the impressions of fishes, plants, and other subjects (among which Mr. Rieff supposed to have found the skeleton of the hand of a child, but which Blumenbach considered as having belonged to a species of ape), are found in the depth of upwards of forty fathoms. Most of the fishes occurring there are carps, trouts, pikes, and other species similar to them, which are now and then accompanied by fishes supposed to be marine. In general the impressions are not indiscriminately mixed, as is the case in other places where ichthyolites occur, but each species is found in distinct shoals.

The opinion which Mr. Patrin, a celebrated volcanist, en-

tertains respecting the origin of those vast depositaries of the fossil remains of fishes, should not be left unnoticed in this place. According to him, all circumstances appear to prove that these fishes lived in bays and gulfs, at the entrance of which volcanoes were situated either in the points that formed the mouth, or in some island, similar to the volcanic island of Ischia, at the entrance of the gulf of Naples. Under such circumstances, the sulphureous and other deleterious vapours which were disengaged from the submarine bases of the volcano, at the time of an eruption, must have suffocated the fishes in the gulf, which were prevented from escaping through its entrance where those vapours were most abundant. The dead bodies of these fishes, therefore, floated on the surface of the water in the gulf, till, enveloped by those showers of ashes, so abundant at the beginning and termination of the eruptions, their specific gravity became greater than that of the water, and they sunk to the bottom, where they were ultimately buried under a stratum formed by the ashes or other substances ejected from the volcanoes. In cases where the gulf had but little depth, at the same time that the volcanic ejections were abundant, the fishes were enveloped at once, and formed but a single bed, such as may be seen in some places where ichthyolites occur. Under other circumstances the eruptions may be supposed to have been repeated for several times, in which case several beds containing bodies of fishes were deposited in succession, and separated from each other by layers destitute of such remains, but nevertheless owing their origin to the same eruption that caused the death of the fishes contained in the others.

These events, Mr. Patrin continues, could take place only at a period when the continents were already sufficiently raised or emerged to give existence to gulfs and bays, whose sides, elevated above the surface of the water, served as a barrier to the fishes; since it is evident that these, had the present shores been still covered by the sea, would have escaped in all directions from the effects of the suffocating vapours. This hypothesis, the same author thinks, is supported by the following circumstances: 1. It is only in a few places that we find beds filled with fossil fishes; and the appearance of such places bespeaks the former existence of volcanoes in them. 2. The bodies of these fishes are in perfect preservation, disposed with great regularity, often even united in tribes; which proves their having been suddenly destroyed and hurried under the stratum which now covers them. 3. They are not unfrequently seen in variously contorted shapes; as a proof that their death was attended with convulsive motions. 4. These fossil remains of fishes are found only in strata of very recent origin; whereas, had they been preserved under ordinary circumstances, like shells and zoophytes, they would be found in a variety of localities, and in strata of much less recent formation than those in which they now occur.

ICHTHYOLOGISTS, authors who have written concerning fishes. The authors who have left us treatises on this subject are very numerous; and are ranged by Artdi into their several proper classes, with great care and candour.

The systematical ichthyologists are Aristotle, Pliny, Isidore, Albertus Magnus, Gaza, the interpreter of Aristotle, Marschall, Wootton, Bellonius, Rondeletius, Salviati, Gesner, Aldrovand, Johnston, Charlton, Willughby, Ray, Artdi, and Linnæus.

The ichthyologists who have written of the fishes only of some particular places, are these: Ovid, of the fishes of the Euxine; Oppian, of those of the Adriatic; Ausonius, of those of the Moselle; Mangolt, of those of the Podamic lake; Paulus Jovius, of those of the Tyrrhene sea; Bened.

Jovius, of those of the lake Larius; Petrus Gillius, of those of the Massilian sea; Figulus, of those of the Moselle; Salvian, of those of the Tyrrhene sea; Schwenkfeldt, of those of Silesia; Schonefeldt, of those of Hamburg; Margrave, of the Brasilian fishes; Ruysel, of those of Amboyna; and Francis Valentine, of those of the same place. Of these authors, Ovid, Ausonius, Oppian, and Bened. Jovius, wrote in verse, the rest in prose.

The ichthyologists, who have copied all they have written from the works of other writers, and therefore least deserve the name, are the following: Pliny, Ælian, Athæneus, Isidore, the author of the "Libri De Natura Rerum," Albertus Magnus, Johannes Cuba, Marschall, Gesner, in great part, Aldrovand in great part, Johnston, Charlton, and perhaps some others.

In regard to method, some have written of fishes without any method at all; some have treated of them in the alphabetical order of their names, and some have followed a method more or less perfect throughout their works.

Those ichthyologists who have attended to no method at all, are Ovid, Ælian, Athæneus, Ausonius, Hildegard, De Pingua, Paulus, and Bened. Jovius, Figulus, Salvian in his "History of the Roman Fishes," and Ruysch.

Those who have written alphabetically, are Cuba, Marschall, Salvian in his "Tabula Piscatoria," Gesner, Schonefeldt, Johnston.

Among the authors who have used some sort of method, those come first who have treated of fishes according to the places where they are usually caught. Of these are Oppian, Rondeletius, Aldrovand, Johnston, and Charlton.

Those who have treated of fishes, according to the general division of them into cetaceous, spinose, and cartilaginous, are Aristotle, who was author of the method, Wootton, Willughby, Ray; the last two authors have added to this the numbering the rays of the fins on the back, which is one step towards the Artedian method.

The principal and best authors in this study, and who have reformed and amended it, are Aristotle, Bellonius, Rondeletius, Salvian, Gesner, Willughby, and Ray. To these are to be added such as have described only new or particular fishes, who have merited greatly of the world by the new lights they have thrown in upon this part of natural history. These are Paulus Jovius, Petrus Gillius, Schonefeldt, Sibbald, Marfigli, Hebenstreit, and our countryman Mark Catesby: all the rest, except Pliny, Athæneus, Aldrovand, and Johnston, are of no use or value. Willughby is allowed by Artedi to be by far the best author on the subject; but the world will now give that character to Artedi himself. Artedi, De Script. Ichthyol.

ICHTHYOLOGY, in *Natural History*, the science of fishes. See **PISCES**.

ICHTHYOMANTIA, *ἰχθυομαντεία*, in *Antiquity*, a species of divination by means of the entrails of fishes.

ICHTHYOMORPHUS, in *Natural History*, is the name which Aldrovandus gave to the flattened fossil fish, found at Isleb in Germany. Similar fossils are found at Osterode in Brunswick, near Eislebe, in Mansfield county, and other places in Germany. Jones's *Phys. Diss.* p. 410.

ICHTHYOPHAGI, *ἰχθυοφαγοί*, compounded of *ἰχθυός*, fish, and *φαγέω*, to eat, fish-eaters, a name given to a people, or rather to several different people, who lived wholly on fish.

The Ichthyophagi, spoken of by Ptolemy, are placed towards China. Agatharchides calls all the inhabitants between Carmania and Gedrosia by the name of Ichthyo-

phagi. Pausanias places them near the Red sea, and Pliny peoples several isles with them to the east of Arabia Felix.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears, indeed, that they had cattle, but that they made no use of them, excepting, as they say, to feed their fish. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors; and the mortars wherein they pounded their fish, and baked it in the sun, were nothing else but their vertebræ.

ICHTHYOPHTHALMITE; *Zeolite of Hellesta*, Rinmann; *Ichthyophthalmite*, d'Andrada; *Fischaugen-stein*, Wern.; *Apophyllite*, Häüy.

A rare mineral substance, which, on account of one of its chemical characters, has been considered as zeolite by some mineralogists; while one of its external characters, *viz.* the pearly lustre, has induced others to class it with adularia-feldspar. A closer examination has proved this mineral to constitute a distinct species.

D'Andrada has given the above appellation to this mineral, on account of its exhibiting a similar reflection to that of the adularia or moon-stone, sometimes called *œil de poisson*, of which the German *fischaugen-stein* is a translation. Häüy's name is derived from the property this substance has of exfoliating under certain circumstances.

The colour of the ichthyophthalmite is white, generally slightly tinged with red, grey, and blue, seldom with yellow and green.

It occurs massive and crystallized. The primitive form of its crystals is, according to Häüy, a four-sided prism with rectangular base. The simplest of the secondary forms is the primitive parallelepipedon, with its eight solid angles intercepted each by a triangular plane; the *Apophyllite épointé* of Häüy.

Another, but very complicated, variety of 48 planes, determined from an incomplete crystal of only ten remaining planes, is characterized and figured, (*Journ. des Min.* vol. 23, 5. f. 3, 4.) by Häüy, who calls it *Apophyllite sur-composée*.

None of the modifications of the crystals have hitherto been found in a complete state; most frequently they occur as thick tables, grown together in all directions, or intersecting each other, and resembling at first sight a variety of tabular barytes. They are splendid, and generally exhibit more or less the lustre of mother-of-pearl; in the manner of a variety of stibite.

The fracture, parallel to two of the planes of the primitive parallelepipedon, is foliated, with splendid often iridescent surface; cross-fracture uneven with vitreous lustre.

In small fragments it is generally perfectly transparent, but often rendered translucent only, and even nearly opaque, by a cloudy or milky suffusion. Refraction simple.

It is easily frangible. Its hardness is nearly that of fluor spar. A small fragment, when rubbed on a hard body, according to Häüy, separates into thin leaves; this property is, however, not observable in all specimens.

Its specific gravity, according to Vauquelin and Fourcroy, is 2.467.

Before the blow-pipe the ichthyophthalmite becomes at first opaque, and melts, without difficulty, into a very white opaque globule. With nitric or muriatic acid it becomes softened, and forms a jelly, like zeolite. This property appears to be owing to the presence of water, which facilitates the action of the acids on those constituent parts of the substance with which they can unite.

Analyses of the Ichthyophthalmite.

	Rimmann.	Fourcroy and Vauquelin.	Rose.
Silica	55.00	51.00	55.00
Lime	27.00	28.00	25.00
Magnesia	0.50		
Potassa		4.00	2.25
Alumine	2.50		
Water	17.00	17.00	15.00
Lofs			2.75
	<hr/>	<hr/>	<hr/>
	102.00	100.00	100.00

This substance, therefore, differs essentially from zeolite, in not containing the least portion of alumine; the variety from Hellesta has, indeed, afforded a small quantity to Mr. Rimmann, but this appears to be accidental. A small quantity of oxyd of iron found in this substance may likewise be considered as accidental.

This mineral is found in the iron-mines of Uto, in Sudermania, a province of Sweden.

ICHTHYOSIS, in *Medicine*, *fish-skin disease*, from $\iota\chi\theta\upsilon\varsigma$, a *fish*, a denomination appropriately used by Dr. Willan to designate "a permanently harsh, dry, scaly, and in some cases, almost horny texture of the integuments of the body, unconnected with internal disorder," bearing a considerable resemblance to the skin of the scaly fishes.

This rare species of cutaneous disease constitutes the fourth genus of the second Order, (or *scaly eruptions*), in Dr. Willan's arrangement, and is distinguished from the other eruptions, included in the same Order, the *Lepra* and *Pсориаз*, in being generally diffused over the limb affected, and in the permanency of its scales; for in the other scaly eruptions alluded to, the diffusion is partial, or in distinct patches, and the scales are deciduous. See LEPROSY and PSORIASIS.

The arrangement and distribution of the scales in ichthyosis are, indeed, peculiar. Above and below the *olecranon* on the arm, and in a similar situation with respect to the *patella* on the thigh and leg, they are small, rounded, prominent, or papillary, and of a black colour. Some of the scaly *papilla* have a short narrow neck, and broad irregular tops. On some parts of the extremities, and on the trunk of the body, the scales are flat and large, often placed like tiling, or in the same order as scales on the back of a fish; but in a few cases they have appeared separate, being intersected by whitish furrows. There is usually in this complaint a dryness and roughness of the soles of the feet; sometimes a thickened and brittle state of the skin in the palms of the hands, with large painful fissures, and on the face an appearance of scurf rather than of scales. The inner part of the wrists, the hams, the inside of the elbows, the furrow along the spine, the inner and upper parts of the thighs, are perhaps the only portions of the skin always exempt from scalliness. Patients affected with ichthyosis are occasionally much harassed with inflamed pustules, or with large painful bites on different parts of the body; it is also remarkable, that they never seem to have the least perspiration or moisture of the skin.

The *causes* of ichthyosis seem to be altogether unknown. The disease did not, in any case witnessed by Dr. Willan, appear to have been transmitted hereditarily; nor was more than one child from the same parents affected with it. In several instances it was said to have been connate, and in others to have occurred two or three months after birth; in one case it appeared soon after the small-pox, at the age

of two years, and had continued six or seven years, without alteration. A state of skin, similar to that in ichthyosis, takes place partially under a variety of circumstances. It occurs on the limbs of persons who, from long continued ill health, or a weakly constitution, are much emaciated, and have little perspiration. When inveterate ulcers on the lower extremities are at length healed, the common integuments are not replaced in their usual order: instead of cuticle, the legs are covered with thick, dry, shining scales, variously disposed. In cases of anasarca, likewise, the skin becomes scaly, rigid, and inelastic. This rugged coating prevents for a time any farther enlargement of the limbs; but the effused lymph, by its gradually increasing pressure, at last overcomes the resistance, and is discharged through innumerable crevices.

According to Buffon, the inhabitants of Paraguay are much affected with the ichthyosis, or a complaint much resembling it. "Il regne parmi eux une maladie extraordinaire; c'est une espèce de lèpre qui leur couvre tout le corps, et y forme une croûte semblable à des écailles de poisson; cette incommodité ne leur cause aucune douleur, ni même aucun autre dérangement dans la santé." (Hist. Naturelle, tom. iii. p. 507.) Some observations on a diseased state of the skin, analogous to the ichthyosis above described, appear in the Philosophical Transactions, vol. xiv. N^o 160; and a striking instance of the same, though somewhat differently modified, is inserted in the same collection, N 424, the sequel of which is given in vol. xlix. (part i. for the year 1755.) See also a case slightly detailed by Panarolus (Pentecôte, v. obs. 9.), and another related by Stalpart Vander Wiel, obs. 35. cent. ii.

With respect to the cure, little more seems to be known than of the causes of this eruption. Dr. Willan merely observes, that, when a portion of the hard scaly coating is removed, it is not soon produced again. The easiest mode, he says, of removing the scales, is to pick them off carefully, with the nails, from any part of the body while it is immersed in hot water. The layer of cuticle, which remains after this operation, is harsh and dry; and the skin did not, in the cases attended by him, recover its usual texture and softness; but the scales were prevented from forming afterwards, by the repeated use of the warm bath, along with moderate friction.

The disease above described is the *Ichthyosis simplex* in Dr. Willan's nomenclature; but he describes another species, which he terms *I. cornea*. This, which he has never seen, is mentioned by authors as "a horny rigidity of the integuments, impeding the motion of the muscles and joints;" and as affecting the lips, prepuce, toes, fingers, &c.; and sometimes as extended over the whole body. A singular case of the latter description is recorded in the Philos. Trans. vol. xlvi. part ii. p. 580. This form of ichthyosis, Dr. Willan remarks, is sometimes attended with the production of *horns*; a proof that those singular excrescences may be cutaneous, or perhaps cuticular, and generated in nearly the same manner as the nails from the human body, or the hoofs and claws of quadrupeds. An account of a girl, whose body was nearly covered with horny excrescences, is given in the Phil. Trans. N^o 176. And a horn, similar to those here described, together with a portrait of the woman on whom it grew, is preserved in the British Museum. See Willan on Cutan. Dif. order ii. p. 197, et seq.

ICHTHYOSPENDYLA, in *Natural History*, is the name by which Mr. Lhuys denominates the vertebrae, or joints of the back bones of fishes. Lithophyl. tab. 18.

ICHTHYPERIA, the name given by Dr. Hill to the bony palates of fishes, which are frequently found fossil at great

great depths in the earth, and usually immerfed in the strata of ftone; and in this ftate had been named by Mr. Lhuyd, from their refemblance in ftape to the pods of lupines, and fome of the other leguminous plants, *filiquoftra*.

Many from this name, and this cafual refemblance to the pods of plants, have been mifled into the believing them foftils of vegetable origin. But they have plainly all of them been the bony coverings of different parts of the mouths of certain fifh of the cartilaginous, and perhaps other kinds, whole principal food being fhell-fifh, thefe bony palates were neceffary to the eating of them. Many of the ichthyperia are found indeed plainly worn and rounded by ufe.

They are fometimes found in their foftil ftate joined to one another; but commonly in fingle pieces or joints, or in fragments of fuch. They are of the fame fubftance with the bufonitæ, and their ftape depends on the fpecies of fifh, or part of the mouth, to which they belonged. But their moft ufual figure is that of half the fhell of the pod of a lupine. Their fizes are various, from the tenth of an inch to two inches in length, and an inch in breadth. Their furface is fometimes fmooth and polished; fometimes finely ftriated or finuated, and fometimes wholly covered with tubercles. They are alfo found of very different colours; but moft frequently either black, or of a dark chefnut colour.

They are found lodged and bedded in the ftata of ftone, in Germany, Italy, and France, and in the iflands of the Archipelago, and in Syria among the fpines of the echini; but they are nowhere fo frequent as in England, there being with us very few quarries of ftone which do not afford more or lefs of them. Hill's *Hift. of Foftils*, p. 645.

ICHTHYS, ἰχθύς, in *Antiquity*, a famous acroftic of the Erythraean fibly, mentioned by Eufebius and St. Auftin; the firft words of every verfe of which made up Ἰησοῦς Χριστὸς Θεοῦ υἱὸς γεννητὸς, *Jefus Chriftus Dei filius, fervator*, the initial letters of which compofe the word ichthys, ἰχθύς.

ICHTHYS, in *Ancient Geography*, a promontory of the Peloponnefus. Ptolemy.

ICICA, in *Botany*, Aublet. Guian. t. 130—135. See AMYRIS.

ICICA, in the *Materia Medica*, a name given by fome to the gum elemi.

ICICARIBA, in *Botany*, a name ufed by fome authors for the tree which affords us the gum elemi, ufed in medicine.

ICOCA, the name of a genus of plants, defcribed by Plumier; fince called by Linnæus *chryfolbanus*.

ICOLM-KILL, in *Geography*. See IONA.

ICON, in *Natural Hiftory*, fignifies a figure, cut, or engraving, of any fubject in natural hiftory.

ICON, Εἰκων, in *Rhetoric*, the fame with image.

ICONIUM, in *Ancient Geography*, a town of Cappadocia, in the department of Lycaonia. In the time of Xenophon it belonged to Phrygia. This town ftill fubfifts under the name of Konieh, or Cogni.

ICONOCLASTS, or ICONOCLASTE, formed from εἰκων, *image*, and κλάω, *to break*, in *Ecclefiaftical Hiftory*, breakers of images; a name which the church of Rome gives to all who reject the ufe of images in religious matters.

In this fenfe, not only the reformed, but fome of the eastern churches, are called iconoclafts, and are all efteemed by them heretics, as oppofing the worfhip of the images of God, and the faints, and breaking their figures and representations in churches.

The oppofition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks

a little after the commencement of the eighth century when the worfhip of them became common. (See IMAGE.) But the tumults occafioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The difpute, however, broke out with redoubled fury under Leo the Ifaurian, who iffued an edict in the year 726, abrogating, as fome fay, the worfhip of images, and ordering all the images, except that of Chrift's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worfhip. This edict occafioned a civil war, which broke out in the iflands of the Archipelago, and, by the fuggeltions of the priefts and monks, ravaged a part of Asia, and afterwards reached Italy. The civil commotions and infurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his fubjects, in the Italian provinces, violated their allegiance, and rifing in arms, either maffacred or banifhed all the emperor's deputies and officers. In confequence of thefe proceedings, Leo affembled a council at Conftantinople in 730, which degraded Germanus, the bifhop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of fevere punifhments upon fuch as were attached to that idolatrous worfhip. Hence arofe two factions; one of which adopted the adoration and worfhip of images, and on that account called iconoduli or iconolatæ; and the other maintained that fuch worfhip was unlawful, and that nothing was more worthy the zeal of Chriftians than to demolifh and deftroy thofe ftatues and pictures, which were the occasions of this grofs idolatry; and hence they were diftinguifhed by the titles of *iconomachi*, from εἰκων, *image*, and μάχομαι, *I contend*, and *iconoclaftæ*. The zeal of Gregory II. in favour of image-worfhip, was not only imitated, but even furpaffed by his fucceffor Gregory III. in confequence of which the Italian provinces were torn from the Grecian empire.

Conftantine, called Copronymus, from κοπρός, *filercus*, and ονομα, *name*, becaufe he was faid to have defiled the facred font at his baptifm, fucceeded his father Leo in 741, and in 754 convened a council at Conftantinople, regarded by the Greeks as the feventh œcumenical council, which folemnly condemned the worfhip and ufe of images. Thofe who, notwithstanding this decree of the council, raifed commotions in the ftate, were feverely punifhed; and new laws were enacted, to fet bounds to the violence of monaftic rage. Leo IV. who was declared emperor in 775, purfued the fame meafures, and had recourfe to the coercive influence of penal laws, in order to extirpate idolatry out of the Chriftian church. Irene, the wife of Leo, poifoned her husband in 780; affumed the reigns of empire during the minority of her fon Conftantine, and in 786 fummoned a council at Nice in Bithynia, known by the name of the fecond Nicene council, which abrogated the laws and decrees againft the new idolatry, reftored the worfhip of images and of the crofs, and denounced fevere punifhment againft thofe who maintained that God was the only object of religious adoration. In this conteft, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they confidered the worfhip of them as highly injurious and offensive to the Supreme Being. Charlemagne diftinguifhed himfelf as a mediator in this controversy: he ordered four books concerning images to be compofed, refuting the reasons urged by the Nicene bifhops to juftify the worfhip of images, which he fent to Adrian, the Roman pontiff, in 790, in order to engage him to withdraw his approbation of the decrees of the laft council of Nice. Adrian wrote an
answer;

answer; and in 794, a council of three hundred bishops, assembled by Charlemagne at Francfort on the Main, confirmed the opinion contained in the four books, and solemnly condemned the worship of images. In the Greek church, after the banishment of Irene, the controversy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain success. The emperor Nicephorus appears, upon the whole, to have been an enemy to this idolatrous worship. His successor, Michael Curopalates, surnamed Rhangabe, patronized and encouraged it. But the scene changed on the accession of Leo the Arminian to the empire; who assembled a council at Constantinople in 814, that abolished the decrees of the Nicene council. His successor Michael, surnamed Balbus, disapproved the worship of images, and his son Theophilus treated them with great severity. However, the empress Theodora, after his death, and during the minority of her son, assembled a council at Constantinople in 842, which reinstated the decrees of the second Nicene council, and encouraged image worship by a law. The council held at the same place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a festival was instituted by the superstitious Greeks, called the Feast of Orthodoxy. The Latins were generally of opinion, that images might be suffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtuous actions of the persons whom they represented; but they detested all thoughts of paying them the least marks of religious homage or adoration. The council of Paris, assembled in 824 by Lewis the Meek, resolved to allow the use of images in the churches, but severely prohibited rendering them religious worship. Nevertheless, towards the conclusion of this century, the Gallican clergy began to pay a kind of religious homage to the images of saints, and their example was followed by the Germans, and other nations. However, the iconoclasts still had their adherents among the Latins; the most eminent of whom was Claudius, bishop of Turin, who, in 823, ordered all images, and even the crosses, to be cast out of the churches, and committed to the flames; and he wrote a treatise, in which he declared both against the use and worship of them. He condemned relics, pilgrimages to the Holy Land, and all voyages to the tombs of saints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much less infected with superstition than the other parts of Europe. The controversy concerning the sanctity of images was again revived by Leo, bishop of Chalcedon, in the eleventh century, on occasion of the emperor Alexius's converting the figures of silver, that adorned the portals of the churches, into money, in order to supply the exigencies of the state. The bishop obstinately maintained, that he had been guilty of sacrilege; and published a treatise, in which he affirmed, that in these images there resided an inherent sanctity, and that the adoration of Christians ought not to be confined to the persons represented by these images, but extended to the images themselves. The emperor assembled a council at Constantinople, which determined, that the images of Christ and of the saints were to be honoured only with a relative worship; and that invocation and worship were to be addressed to the saints only as the servants of Christ, and on account of their relation to him, as their master. Leo, dissatisfied even with these absurd and superstitious decisions, was sent into banishment. In the western church, the worship of images was disapproved and opposed by several considerable parties, as the

Petrobruffians, Albigenes, Waldenses, &c. till at length this idolatrous practice was entirely abolished in many parts of the Christian world by the Reformation. Mosheim's Eccl. Hist. vol. ii. See IMAGE.

ICONOGRAPHIA, *Εικονογραφία*, derived from *εικων*, *image*, and *γραφω*, *I describe*, the description of images, or ancient statues of marble and copper; also of busts and semi-busts, penates, paintings in fresco, mosaic works, and ancient pieces of miniature.

ICONOLATRÆ, or ICONOLATERS, from *εικων*, and *λατρευω*, *I worship*; or *Iconoduli*, from *εικων* and *δουλος*, *I serve*, those who worship images; a name which the iconoclasts give to those of the Romish communion on account of their adoring images, and of rendering to them the worship only due to God. See ICONOCLASTS, and IMAGE.

ICONOLOGIA, formed from *εικων* and *λογω*, *I speak*, the interpretation of ancient images, monuments, and emblems.

ICONOMACHI. See ICONOCLASTS.

ICOSAHEDRON, in *Geometry*, a regular body, or solid, terminated by twenty equilateral and equal angles.

The icosaedron may be considered as consisting of twenty triangular pyramids, whose vertices meet in the centre of a sphere, imagined to circumscribe it; and, therefore, they all have their heights and bases equal; wherefore the solidity of one of those pyramids, multiplied by 20, the number of bases, gives the solid content of the icosaedron. See REGULAR Body.

ICOSANDRIA, in *Botany*, from *εικοσι*, *twenty*, and *ανθρωπος*, *a man*, is the 12th class of the artificial system of Linnæus, distinguished by having numerous stamens, about 20, or more, inserted into the calyx, not into the receptacle. Such an insertion is justly pointed out by Linnæus as an infallible mark that the pulpy fruit of the flowers so constructed may always be eaten in safety. This rule holds good, whatever the number of the stamens may be; as in the fifth class, where, amongst many plants with poisonous or unwholesome berries, whose stamens are differently inserted, is found the *Ribes*, or Currant and Gooseberry, whose salutary fruit is indicated by the stamens growing out of the rim of the calyx, exactly as in the class *Icosandria*. At the same time, the foliage or herbage of such plants is always, more or less, to be mistrusted, being acrid, nauseous, or eminently dangerous; witness the *Prunus Lauro-cerasus*, or Cherry-laurel, whose essential oil, and even its distilled water, is one of the most potent of vegetable poisons. This dangerous quality resides in the oil of a bitter-almond flavour, observable in most of this tribe, which is rendered less injurious perhaps in the kernels of peaches and apricots, by the mild oil of their cotyledons, and always taken by us in too small a quantity to be materially hurtful. It is further remarkable, that as Icosandrous plants, when dried, are peculiarly subject to the depredations of insects, the same is the case with all the genus *Ribes*.

The orders of the *Icosandria* are distinguished by the number of their styles. The first, *Monogynia*, contains the valuable genus *Prunus*, and its near ally *Amygdalus*, composed of some of our sweet fruits; with *Myrtus*, &c. The *Digynia*, *Trigynia*, and *Pentagynia* of Linnæus are so nearly a-kin, and so inconstant in the same genus, if not species, that it is found most commodious to unite them under the last denomination, as the number five most prevails. *Polygynia*, whose styles are more than five, is a numerous and very natural order, containing *Rosa*, *Rubus*, *Fragaria*, *Potentilla*, &c. to which the *Sibbaldia* naturally belongs, though, having usually but five stamens, it is placed in the class *Pentandria*.

ICOSANDRIA is also the name of an order in the classes *Polyadelphia*, *Monocelia*, and *Dioecia*, whose character ought chiefly to depend on the insertion, rather than the precise number of its stamens. To this circumstance Linnæus did not sufficiently advert, when he referred *Citrus* to *Polyadelphia Icosandria*, instead of the orders *Dodecandria* or *Polyandria* of that class, and on the other hand, excluded *Melaleuca*, which is truly icosandrous, being of the natural family of *Myrti*. S.

ICOSIUM, ALGER, in *Ancient Geography*, a town of Africa, on the eastern part of Mauritania Cæsariensis. Ptolemy mentions it, and the Itinerary places it 47 miles E. of Tipasa. Pliny says that Vespasian gave it the title of a Latin city.

ICTERUS, ἰκτερός, in *Medicine*, also *icteritia*, words from the Greek, signifying *Jaundice*, which see. Whence also the adjective *icteric*: thus we say *icteric* symptoms, *icteric* medicines; meaning the symptoms of jaundice; medicines proper for the cure of jaundice, &c.

ICTERUS, in *Ornithology*, a species of *Oriolus*, which see. For other species see the same article. See also *TODUS paradiseus*, *STURNUS contra*, and *MUSCICAPA paradisi*.

ICTERUS Lapis, in *Natural History*, a name given by the ancients to a stone famous for the cure of the jaundice. Pliny describes four species of this stone. But these descriptions are so short, that we cannot determine from them which of the stones of those known at present were intended.

ICTIAR, in the *Eastern Military Orders*, an officer who has gone through all the degrees or poils in his respective body; and has a right to be a member of the divan.

ICUS, in *Ancient Geography, an island of the Archipelago, and one of the Cyclades, near Eubœa, over-against Magnesia.*

ICY CAPE, in *Geography*, a point of land on the N.W. coast of America, much incumbered with ice. N. lat. 70° 29'. W. long. 198° 20'.

IDA, in *Ancient Geography*, a common name of several mountains of considerable elevation, celebrated among the ancients. The name is derived from ἰδέω, *I see*, and applied to them on account of the extensive prospect they afforded. The principal are the two following, *viz.* Ida, mentioned by Homer, and said to be the mountain on which Paris decided the price of beauty between Juno, Minerva, and Venus. It was situated in Dardania, at some distance S.E. of Troy. Here were found the sources of the rivers Simois, Xanthe, &c. This mountain, however, is in reality a chain of mountains, of which the principal part lay to the E. and near the site of Troy. Thence it extended to the N.W., W., and S.W., as far as the sea, projecting on four promontories, towards Cyzicum, Antandros, the gulf of Adramyttium, and the promontory of Lectum. Homer, therefore, speaks of the Idæan mounts. This mountain in its whole extent is a great reservoir of water, and supplied the rivers Æfopus and Granicus, which discharged themselves into the Propontide; the Simois and Scamander, or Xanthus, which ran into the Hellespont; and the Samoies and Ciloe, which passed into the gulf of Adramyttium. The other Ida is a mountain of Crete, which still retains the name, though it is sometimes called Puloriti, and which has been much celebrated by the poets. It is much the highest mountain in the island, though in other respects inferior; it is for the greatest part of the year covered with snow, and so barren that it produces nothing but the tragacanth. Jupiter is said to have been secretly nursed on this mountain, and on this account called Idæus.

IDA, in *Geography*, a mountain of the island of Crete, which rises in the form of a pyramid S. W. of Candia, and

serves as a land-mark to navigators, who wish to anchor in the harbour of that town. This mountain is covered with snow almost all the year.

IDAAN. See **MAROOT**.

IDACIUS, in *Biography*, an ancient chronicler, was a native of Lamego, in Spain, and flourished in the fifth century. He wrote a chronicle commencing with the first year of the reign of Theodosius, and ending with the eleventh of that of Leo, A. D. 467. To him is attributed a table of *Fasti Consulares*, frequently published. The *Chronicle* and *Fasti* were published with notes by father Sirmond, at Paris, in 1619.

IDÆI DACTYLII, in *Ancient Geography*. See **DACTYLII**.

IDANHA a Velha, in *Geography*, a town of Portugal, in the province of Beira, near the Spanish Estremadura. N. lat. 39° 52'. W. long. 6° 48'.

IDEA, ἰδέα, the image or resemblance of a thing, which, though not seen, is conceived by the mind. See **IMAGE**.

The word is Greek; Cicero renders it into Latin by *exemplar*, and *exemplum*; and Plato himself, in some places by παρὰδράμα. Cicero, in his *Topics*, also expresses it by *forma* and *species*.

IDEA, in *Physiology*, denotes the immediate object of the mind about which we are employed, when we perceive or think of any thing; and this definition of Mr. Locke's is much less exceptionable than that of some other logicians, who define an idea to be a pattern or copy of a thing in the mind.

Thus, when we look at the sun, we do not see that luminary itself, but its image, or appearance conveyed to the soul by the organ of sight; and this image we call idea. See **IMPRESSION** and **PERCEPTION**.

The origin of ideas has been a long time disputed among philosophers. Aristotle and the Peripatetics maintained that external objects emit species, images, or forms, which resemble them all around; and that these species, striking on our senses, are by them transmitted to the understanding and impressed upon it; and that being material and sensible, they are rendered intelligible by the active intellect; and are at length received by the passive. The followers of Democritus and Epicurus held an opinion, with regard to slender films of subtle matter coming from external objects, similar to that of Aristotle with respect to his immaterial species or forms. Others are of opinion, that our souls have of themselves the power of producing ideas of things we would think upon; and that they are excited to produce them by the impressions which objects make on the body, though these impressions are not images in any respect like the objects that occasioned them. And in this, say they, it is, that man is made after the image of God, and that he partakes of his power; for as God made all things out of nothing, and can reduce them to nothing when he pleases, so man can create as many ideas as he pleases, and annihilate them when he has done.

Others maintain, that the mind has no occasion for any thing beside itself to perceive objects; and that, by considering itself, and its own perfections, it is able to discover all things that are without. Whilst Aristotle thought that every object of human understanding enters at first by the senses. Plato, on the other hand, had a very mean opinion of all the knowledge we acquire by the senses. According to him all science must be employed about these eternal and immutable ideas, which existed before the objects of sense, and are not liable to any change. In this respect these two philosophers essentially differed; the notion of eternal and immutable ideas, which Plato borrowed from the Pythagorean

gorean school, was totally rejected by Aristotle, who maintained it as a maxim, that there is nothing in the intellect, which was not at first in the senses. It seems, however, probable, that the Pythagoreans and Platonists agreed with the Peripatetics in their general theory of perception; *viz.* that the objects of sense are perceived only by certain images, or shadows of them, let into the mind, as into a "camera obscura." The notions of the ancients with regard to the seat of the soul were very various. But since it has been discovered by the improvements in anatomy, that the nerves are the instruments of perception, and of the sensations accompanying it, and that the nerves ultimately terminate in the brain, it has been the general opinion of philosophers that the brain is the seat of the soul, and that the soul perceives the images that are brought there, and external things only by means of them. (See SOUL.) Many philosophers, ancient and modern, have employed their invention to discover, how we are made to perceive external objects by our senses; and in their sentiments on this subject there seems to be a very general agreement. Plato conceived, that by our senses we perceived merely the shadows of things, and not things themselves; and his shadows may very well represent the species and phantasms of the Peripatetic school, and the ideas and impressions of modern philosophers. Since the time of Des Cartes, the shadows of external objects, called by the ancients species, forms, and phantasms, have been commonly denominated "ideas," and by Mr. Hume "impressions." But all philosophers, from Plato to Mr. Hume, agree in this, that we do not perceive external objects immediately, and that the immediate object of perception must be some image present to the mind.

The ideas by which we perceive external objects are said by some to be the ideas of the Deity; whilst it has been more generally thought that every man's ideas are proper to himself, and are either in his mind or in his "sensorium," where the mind is immediately present. The former is the theory of Malebranche. This theory seems to have some affinity with the Platonic notion of ideas, adopted with some modification by the philosophers of the Alexandrian school, commonly called the latter Platonists; but it is not the same. It does not appear that either Plato or the latter Platonists, or St. Augustine, or the Mystics, who seem to have inclined to the tenets of the Alexandrian school, thought that we perceive the objects of sense in the divine ideas. The theory, therefore, is properly the invention of Malebranche himself. According to his statement, the soul is united with a Being possessed of all perfection, who has in himself the ideas of all created beings. The Deity, then, being always present to our minds in a more intimate manner than any other being, may, upon occasion of the impressions made upon our bodies, discover to us, as far as he thinks proper, and according to fixed laws, his own ideas of the object; and thus we see all things in God, or in the divine ideas. Malebranche, however, distinguishes more accurately than any philosopher had done before, the objects which we perceive from the sensations in our own minds, which, by the laws of nature, always accompany the perception of the object. Although, he says, we see all sensible and material things in God, yet we have not our sensations in him when we perceive any sensible object; in our perception are included both a sensation and a pure idea. The sensation is a modification of the soul, and it is caused in us by God; but as to the idea, joined with sensation, it is in God, and it is in him that we see it. The system of Malebranche, it is plain, leaves no evidence of the existence of a material world, from what we perceive by our senses; for the divine ideas, which are the objects immediately per-

ceived, were the same before the world was created. He candidly admits this consequence of his opinion; and rests the complete evidence which we have of the existence of matter upon the authority of revelation.

Mr. Norris, an English divine, espoused the system of Malebranche, in his "Essay towards the Theory of the Ideal or Intellectual World," published in two volumes 8vo., 1701. This system was also adopted by many devout people of both sexes in France. It was opposed by S'Graveande in his "Introduction à la Philosophie," and particularly examined and refuted by Mr. Locke in a small tract which may be found in his "Posthumous Works." See also Berkeley's Dialogues, 2d edit. p. 257, &c. But the most formidable antagonist of Malebranche was his own countryman, Antony Arnauld, an acute writer in favour of the Jansemits. (See his article.) In the year 1683 he published his book of "True and False Ideas," in opposition to the system of Malebranche. Arnauld maintains, that ideas are modifications of our minds; and finding no other modification of the human mind which can be called the idea of an external object, he says it is only another word for perception. Ideas, considered as certain representative images, by which external objects are perceived existing either in the human or divine mind, are, according to Arnauld, mere chimeras, fictions of philosophers; there are no such beings in nature; and therefore, he says, it is to no purpose to inquire, whether they are in the divine or in the human mind. The only true and real ideas are our perceptions, which are acknowledged by all philosophers, and by Malebranche himself, to be acts or modifications of our own minds. Arnauld, however, did not totally deny the existence of ideas in the philosophical sense of that word, nor adopt the notion of the vulgar, who acknowledge no object of perception but the external object. He formally maintains, that the modes of expression common among philosophers, *viz.* "that we perceive not things immediately; that like ideas of them are the objects of our thoughts; and that it is in the idea of every thing that we perceive its properties," are not to be rejected, but are true when rightly understood. By endeavouring to reconcile these expressions to his own definition of ideas, he embarrassed himself and his subject.

The common theory of ideas is in general, as we have already stated, that we perceive external objects by certain images which are in our minds, or in the sensorium to which the mind is immediately present. These images have been variously denominated. Since the time of Des Cartes they have been called ideas. The Cartesians divided our ideas into three classes; those of sensation, of imagination, and of pure intellect. Of the objects of sensation and imagination, they thought the images are in the brain, but of objects that are incorporeal, the images are in the understanding, or pure intellect. Mr. Locke, taking the term idea in the same sense with Des Cartes, divides ideas into those of sensation and those of reflection; meaning, by the first, the ideas of all corporeal objects, whether perceived, remembered, or imagined; by the second, the ideas of the powers and operations of our own minds. What Mr. Locke calls ideas, Mr. Hume divides into two distinct kinds, "impressions" and "ideas." The difference between these, he says, consists in the degrees of force and liveliness with which they strike upon the mind. Under impressions he comprehends all our sensations, passions, and emotions, as they make their first appearance in the soul. By ideas he means the faint images of these in thinking and reasoning. Dr. Hartley gives the same meaning to ideas as Mr. Hume does, and what Mr. Hume calls impressions he calls

fenfations, conceiving our fenfations to be occafioned by vibrations of the infinitesimal particles of the brain, and ideas by miniature vibrations, or vibratuncles.

Des Cartes, who contributed to overturn the Peripatetic fyftem and the authority of Ariftotle, took it for granted, as other philofophers had done before him, that he did not perceive external objects themfelves, but certain images of them in his mind called ideas, and hence it is faid he was led to doubt the report of his fenfes without collateral proof of their veracity. The impreffions made upon our organs, nerves, and brain, could be nothing, according to his philofophy, but various modifications of extension, figure, and motion. There could be nothing in the brain like found or colour, tafte or fmell, heat or cold: thefe are fenfations in the mind, which, by the laws of the union of foul and body, are raifed on occafion of certain traces in the brain; and although he gives the name of ideas to thofe traces in the brain, he does not think it neceffary they fhould be perfectly like to the things which they represent, any more than that words or figns fhould refemble the things they fignify. But he adds, that we may follow the received opinion as far as poffible, and may allow a flight refemblance. As to the place of thofe ideas or images of external objects, which are the immediate objects of perception, he fometimes refers them to the brain, not only when they are perceived, but when they are remembered or imagined, and this has been held to be the Cartesian doctrine; yet he fometimes fays, that we are not to conceive the images or traces in the brain to be perceived, as if there were eyes in the brain; but thefe traces are only occafions on which, by the laws of the union of the foul and body, ideas are excited in the mind; and therefore it is not neceffary that there fhould be an exact refemblance between the traces and the things represented by them. Des Cartes, it is well known, made the effence of the foul to confift in thought: he would not allow it to be an unknown fomething that had the power of thinking; it cannot therefore be without thought: and as he conceived there can be no thought without ideas, the foul muft have had ideas in its firft formation, which, of confequence, are innate. See CARTESIAN *Philofophy*.

Mr. Locke produced a revolution in the modes of thinking among metaphyficians by his celebrated "Essay on the Human Underftanding," a work, which brought men to think with precision on the philofophy of the human mind, and which contributed at the fame time to infpire them with that candour and love of truth, which are the genuine fpirit of philofophy. Locke and Des Cartes differed concerning the origin of our ideas. Des Cartes thought that fome of them were innate; but he demonftrated that all our ideas are owing to our fenfes; and that all innate, created, and factitious ideas, are mere chimeras.

Our mind, he fhews, has not abfolutely any ideas befides thofe prefented to it by the fenfes, and thofe which it forms by its own operations on thofe others which the fenfes furnifh; fo that a man, deftitute of one of his fenfes, would never have any idea belonging to that fenfe; and, fuppoſing him deftitute of all the fenfes, he would never have any idea at all; external objects having no other way of producing ideas in him, but by means of fenfation, he would have no ideas, not even of reflection; becaufe, in wanting all fenfation, he wants that which would excite in him the operations of his mind, which are the objects of his reflection.

It is plain, therefore, there is no innate idea; no general truth, or firft principle, inherent in the foul, and created with it; no immediate object of the mind, before it had

perceived external objects by means of the fenfes, and reflected on that perception. Thofe ideas only feem to be innate, becaufe we find we have them as foon as we come to the ufe of reafon; but they are, in effect, what we formed from the ideas with which the mind was fenfibly filled by the fenfes. Thus, when the mind is employed about fenfible objects, it comes by the ideas of bitter, fweet, yellow, hard, &c. which we call *fenfation*; and, when employed about its own operations perceiving and reflecting on them, as employed about the ideas before got by fenfation, we get the ideas of perception, thinking, doubting, willing, &c. which are called *inward fenfation*, or *reflection*; and thefe two, *viz.* external material things, as the objects of fenfation, and the operations of our own minds, as the objects of reflection, are the only originals whence all our ideas have their rife. When we have confidered thefe, and their feveral modes and combinations, we fhall find, that they contain our whole flock of ideas, in fo much that the underftanding does not feem to have the leaft glimmering of any ideas, that it did not receive from one of thofe fources.

And thus far the mind appears merely paffive, as not having it in its power to choofe whether it will have thefe firft beginnings, or materials of knowledge, or not. For the objects of fenfe will obtrude their ideas upon the mind; and the operations of the mind will not let us be without fome (however obfcure) notion of them.

Mr. Locke afcribes likewife to the mind the power of compounding its fimple ideas into complex ones of various forms; of repeating them, and adding the repetitions together; of dividing and claffing them; of comparing them, and from that comparifon, of forming the ideas of their relation; nay, of forming a general idea of a fpecies or genus, by taking from the idea of an individual every thing by which it is diftinguifhed from other individuals of the kind, till at laft it becomes an abſtract general idea, common to all the individuals of the kind. (See ABSTRACTION.) For the ideas which we have of the different qualities of bodies, according to Locke, we refer to the article QUALITY.

From the fyftem of Mr. Locke and of other philofophers, who confidered ideas as the immediate objects of all thought, the ingenious bifhop Berkeley (fee his article) inferred, and undertook to demonftrate, that there is no fuch thing as matter in the univerfe, but that all which it contains may be reduced to mind, and ideas in the mind. "It is evident," fays he in the firft fentence of his "Principles of Knowledge, &c." "to any one who takes a furvey of the objects of human knowledge, that they are either ideas actually imprinted on the fenfes; or fuch as are perceived, by attending to the paffions and operations of the mind; or laftly, ideas formed by help of memory and imagination, either compounding, dividing, or barely representing thofe originally perceived in the forefaid ways." See EXISTENCE and MATTER.

Berkeley's fyftem was adopted by Mr. Arthur Collier, rector of Langford Magna, near Sarum in Wiltfhire, who publifhed a book in 1713, which he called "Clavis Universalis, or a New Enquiry after Truth; being a demonftration of the non-exiftence or impoffibility of an external world." Bifhop Berkeley has widely deviated from the common fyftem with regard to ideas, diftinguifhing between ideas and notions. He fpecifies two kinds of ideas, thofe of fenfe and thofe of imagination. "The ideas imprinted on the fenfes by the Author of Nature," he fays, "are called real things; and thofe excited in the imagination, being lefs regular, vivid, and conftant; are more properly termed ideas, or images of things, which they copy and represent. But then

then our sensations, be they never so vivid and distinct, are nevertheless ideas: that is, they exist in the mind, or are perceived by it as truly as the ideas of its own framing. The ideas of sense are allowed to have more reality in them; that is, to be more strong, orderly, and coherent, than the creatures of the mind. They are also less dependent on the spirit, or thinking substance which perceives them, in that they are excited by the will of another, and more powerful spirit; yet still they are ideas; and certainly no idea, whether faint or strong, can exist, otherwise than in a mind perceiving it." Princ. § 33.

By the ideas of sense, the author means the sensations we have by means of our senses; concerning which, see SENSATION. The ideas of imagination, according to Berkeley, are more properly termed ideas, or images of things; or in other words, the images of our sensations. With regard to these it is observed by Dr. Reid, that they are not sensations; and that there is no distinction between those ideas of imagination and notions, which Berkeley says are not ideas; but they seem to Dr. Reid perfectly to coincide. See NOTION.

The opinion of Leibnitz, concerning the origin of ideas, seems to have some affinity with innate ideas. He asserts the soul to be simple, and without parts or composition; hence he concludes that no created thing can act internally upon it, but that all the changes it undergoes depend upon some internal principle.

God has formed every soul, so as to have different perceptions; some distinct, many confused; and a great number so obscure, as hardly to be perceived. All these ideas together represent the universe; understanding by this term every thing that has been, is, or shall be. According to the different relations that each particular soul has with the universe, some of its ideas are distinct, and distinctly represent a certain part of the universe. The foundation of this opinion is, that as each part of the universe, distinctly represented, has a necessary relation with every thing that exists, with every thing that has been, or shall be, all things being connected, so that the one is the consequence of another; in like manner, the representation of a certain part of the universe has a necessary and inseparable relation to the representation of the whole.

From whence it follows, that all distinct perceptions of the soul being connected with the ideas of all other things, these must likewise be in the soul, though obscurely. In this sense Mr. Leibnitz asserted, that the soul is the mirror of the universe. Now all things that happen in the universe, succeed each other according to certain laws. In like manner in the soul, ideas become successively distinct according to other laws; which, though they have a relation to the former, are yet consistent with the nature of intelligence.

All human souls have the same ideas, taking the ideas of each individual collectively. But distinct ideas are not the same in each; these depending upon the relation which each soul has to the universe; and this relation is different, according to the station which God has pleased to assign to each. This seems a fair representation of Mr. Leibnitz's system relating to the origin of ideas; upon which we may remark, that the foundation of this system is, that all the parts of the universe have a necessary connection: but to make just conclusions from this proposition, the connection must be such, that things being considered in themselves, no one thing can be supposed, without all others being so necessary a consequence thereof, that the idea of another universe, in which there should be any thing belonging to our actual universe, must be contradictory.

If such a connection took place, what is supposed concerning obscure ideas would be true in a certain sense; to wit, that it might be said, that a man who has a distinct idea of a triangle, has thereby obscure ideas of all the properties of this figure, because of the necessary connection between these last ideas and the former.

But no such connection between ideas succeeding each other in the soul is perceivable. For if passing from a dark place to one that is enlightened, I thereby suddenly acquire the ideas of several objects, never before seen, it does not appear that the previous perception of darkness must necessarily lead me to these new ideas.

According to this system, all our perceptions of external objects would be the same, though external things had never existed; our perception of them would continue, although, by the power of God, they should be this moment annihilated. We do not perceive external things because they exist, but because the soul was originally so constituted as to produce in itself all its successive changes, and all its successive perceptions, independently of the external objects.

These and other difficulties may be urged against Mr. Leibnitz's system. See LEIBNITZIAN *Philosophy*.

The ingenious Mr. Harris seems to consider all our ideas as innate; originally impressed on our minds by the Deity, and only awakened or called forth by the presence of external objects. Ideas, he says, are of the essence of mind, and, therefore, having no relation to corporeal things, cannot be produced by them. But this takes for granted a principle which is contrary to all appearance; viz. that the mind is of such a nature as that it can have no possible connection with matter, or be properly affected by it. Whatever be the nature of the thinking principle, it seems agreeable to fact and universal experience to conclude, that it is capable of being affected, either by natural operation or in consequence of an established law, by external objects; and that its perceptions correspond to the state of the corporeal system. Besides, Mr. Harris allows that sensible objects have a natural power of awakening ideas; and why may they not have a natural power of originally exciting them in the same mind? Mr. Harris farther argues, that his hypothesis is necessary to account for the identity of the ideas of different minds, which could not be explained, if they were only generated from sensible objects, which are fluctuating and variable. But it may be replied, that there is an equal identity or diversity in external objects, as there is in our ideas of them; and the correspondence between both is so strict, as to afford a sufficient proof, that our ideas have this origin, and no other. This ingenious writer supposes also, that the mental origin of our ideas is necessary to account for the correspondence subsisting between the ideas of the divine mind and those of our's, and consequently to the communication between him and us. If sensation were the only source of our ideas, this argument would have considerable force; but the contrary appears to be the fact, even upon the system of Mr. Locke, and will be more particularly illustrated in the sequel of this article. See *Hermes*, p. 380. 394, &c. 399, &c. and Priestley's *Examination of Dr. Reid's Inquiry*, &c. p. 334, &c.

According to Mr. Hume's system, all perceptions are either impressions or ideas, comprehending under the first all our sensations, passions, and emotions, and under the second, the faint images of these, when we remember or imagine them; and it is not possible for us so much as to conceive any thing specifically different from ideas and impressions; and since all ideas are copied from impressions, we can therefore have no idea or conception of any thing of which we

have

have not received an impression. No man can have any idea of power or energy, because he has never received any impression of it; and for the same reason no man can have any idea of self. What we call a body is only a bundle of sensations; and what we call a mind, is nothing but a bundle or collection of different perceptions, or of thoughts, passions, and emotions, which succeed each other with inconceivable rapidity, and are in a perpetual flux and movement, without any subject. There is properly, says Mr. Hume, no simplicity in the mind at one time, nor identity at different times, whatever natural propensity we may have to imagine that simplicity and identity. They are the successive perceptions only that constitute the mind; so that there is nothing in the universe but impressions and ideas; all possible perceptions being comprehended in those two classes. Consequently, this philosophy, excluding body and mind, admits of no existence whatsoever, not even of a percipient being to be the subject of these perceptions.

Dr. Price, in his "Inquiry into the Original of our Ideas," has taken occasion to remark, that the system of Mr. Locke, which ascribes all our ideas to sensation and reflection, is materially defective; for, if by sensation we understand the effects arising from the impressions made on our minds by external objects, and by reflection the notice which the mind takes of its own operations, it will be impossible to derive some of the most important of our ideas from them. This excellent reasoner observes, that the power within us that understands, the intuition of the mind, or the faculty in it that discerns truth, that views, compares, and judges of all ideas and things, is a spring of new simple ideas, or original, primary, and uncompound perceptions of the mind. To this source he refers our ideas of the impenetrability and *vis inertiae* of matter, substance, duration, space, infinity, necessity, contingency, possibility, impossibility, power, causation, &c. all our abstract ideas (see ABSTRACTION), and also our ideas of moral right and wrong, and of moral obligation. It is, he says, of the essence of these ideas to imply something true or false of an object, and that they by no means denote the manner in which we are affected by it: so that they cannot, with any propriety, be referred to that part of our constitution, which has been distinguished by the appellation of sense. Accordingly, our ideas may be divided, first, into those implying nothing real without the mind, or nothing real and true, besides its own affections and passions; to which class we may refer the immediate effects of impressions on the bodily senses, without supposing any previous ideas, as all tastes, smells, colours, &c. and those that arise upon occasion only of other ideas; as the effects in us of considering order, happiness, the beauties of poetry, painting, &c. Secondly, into those which are images of something distinct from sensation, or which imply real, independent existence and truth; which may be subdivided into such as denote the real properties of external objects, and the actions and passions of the mind; and those which are derived immediately from intelligence. By the notices conveyed to the mind through the organs of the body, or its observation of the necessary attendants and concomitants of certain sensations and impressions, it perceives the figure, extension, motion, and other primary qualities of material substances; by contemplating itself, it perceives the properties of spiritual substances, volition, consciousness, memory, &c. To all these ideas it is essential that they have real, certain, invariable archetypes, actually existing, to which they are referred, and to which they are conformable. These ideas again become objects or archetypes to the intellectual faculty from whence arises a new set of ideas, which are the perceptions of this faculty, and represent not the mind's own

affections, but necessary truth. Antecedently to these, whatever other ideas we may be furnished with, nothing is understood; whatever seeds or subjects of knowledge may be in the mind, nothing is known. Price's Review, &c. of Morals, sect. 2 and 3.

The system of Mr. Locke, with regard to the origin of our ideas, has been lately attacked with considerable force of argument as well as confidence by Dr. Reid and others; and it has been charged with being the foundation of universal scepticism.

Dr. Reid suggests that Mr. Locke has been sometimes misled by the ambiguity of the word *idea*, which he often uses in different senses. In common use this word has two meanings, *viz.* a popular and a philosophical. In the popular meaning, to have an idea of any thing, signifies nothing more than to think of it. But philosophers, ancient and modern, have maintained, that the operations of the mind, like the tools of an artificer, can only be employed upon objects that are present, in the mind, or in the brain, where the mind is supposed to reside. Therefore, objects that are distant in time or place, must have a representative in the mind, or in the brain; some image or picture, which is the object contemplated by the mind. This of late has been called an *idea*, and every thought is conceived to have an idea of its object. Hence it has happened, that philosophers have been apt to confound the operation of the mind in thinking with the idea or object of thought, which is supposed to be its inseparable concomitant. Thought, and the object of thought, however, are different things, and ought to be distinguished.

Mr. Locke is charged with using the word *idea*, without any intimation of the ambiguity of the word, sometimes to signify thought, or the operation of the mind in thinking, and sometimes to signify those internal objects of thought which philosophers suppose; and this, it is apprehended, is the true source of several paradoxical opinions that occur in his excellent work. In explaining this word, Mr. Locke says that he uses it for whatever is meant by phantasm, notion, species; so that we have here three synonyms for the word *idea*. The first and last are very proper to express the philosophical meaning of the word, being terms of art in the Peripatetic philosophy, and signifying images of external things in the mind, which, according to that philosophy, are objects of thought. But the word *notion* is a word in common language, whose meaning agrees exactly with the popular, but not with the philosophical, meaning of the word *idea*. The frequent use of the word in these two senses is the cause of confusion and of misapprehension in the reader. Besides, there is a third sense in which he uses the word, and that is to denote objects of thought that are not in the mind, but external. Thus we see, that the word has three different meanings in the "Essay;" and the author seems to have used it sometimes in one, and sometimes in another, without being aware of any change in the meaning. The reader slides easily into the same fallacy.

Dr. Reid objects to every system which supposes that the mind receives images of things from without, by means of the senses, because sensations bear no resemblance to bodies or any of their qualities. With regard to extension, figure, motion, &c. he says, if they are not ideas of sensation, nor like to any sensation, then the ideal system is a rope of sand, and all the laboured arguments of the sceptical philosophy against a material world, and against the existence of every thing but impressions and ideas, proceed upon a false hypothesis. To this objection it has been replied, that ideas are only, in a figurative sense, the images of external things; that certain impressions are conveyed to the

the mind by means of the organs of sense, and their corresponding nerves, between which, and the sensations existing in the mind, there is a real and necessary, though at present an unknown connection; and that the same reasoning would lead him to deny, that sounds are produced by bodies striking against one another, because he can perceive no proper resemblance between the cause and the effect.

Dr. Reid farther objects to the notion generally received among philosophers, that the images of external objects are conveyed by the organs of sense to the brain, and there perceived by the mind. But from this objection it might be inferred, that the whole system of our senses, nerves, and brain, is of no real use whatever; because it is impossible to say how they act upon the mind, or the mind upon them.

It is also objected, that Mr. Locke's division of ideas into those of sensation, and those of reflection, is contrary to all the rules of logic; because the second member of the division includes the first. For can we, says he, form clear and just notions of our sensations any other way than by reflection? Sensation is an operation of the mind of which we are conscious, and we get the notion of it by reflecting upon that which we are conscious of. In like manner, doubting and believing are operations of the mind, whereof we are conscious, and we get the notion of them by reflecting upon what we are conscious of. The ideas of sensation, therefore, are ideas of reflection, as much as the ideas of doubting or believing, or any other idea whatsoever. But it has been alleged, that the author confounds the *ideas of sensation* with the *idea of sensation itself*, which is, without doubt, of the same class with the ideas of doubting, &c. as Mr. Locke would have allowed. But the ideas belonging to the class of sensation do not require any scientific knowledge of that power, or any reflection upon it. If this were the case, brute animals, having no proper ideas of reflection, could have no ideas of sensation; and the case would be the same with the bulk of mankind. In another place, Dr. Reid acknowledges, that human beings may have ideas of mere sensation some time before they discover any power of reflection, and that this power may discover itself, and come into exercise afterwards.

Against the philosophical opinion of the "Essay" and its advocates, Dr. Reid sums up his objections in the following reflections, which we shall briefly mention, without any further detail, which our limits will not allow. 1. This opinion is directly contrary to the universal sense of men who have not been instructed in philosophy. 2. The authors who have treated of ideas have generally taken their existence for granted, as a thing that could not be called in question; and such arguments as they have mentioned incidentally, in order to prove it, seem too weak to support the conclusion. 3. Philosophers, notwithstanding their unanimity as to the existence of ideas, hardly agree in any one thing else concerning them. If ideas be not a mere fiction, they must be, of all objects of human knowledge, the things we have best access to know, and to be acquainted with; yet there is nothing about which men differ so much. 4. Ideas do not make any of the operations of the mind to be better understood, although it was probably with that view that they have been first invented, and afterwards so generally received. 5. The natural and necessary consequences of this theory furnish a just prejudice against it to every man who pays a due regard to the common sense of mankind.

Reid farther observes, that, according to Mr. Locke's system, ideas being the only objects of thought, and having no existence but when we are conscious of them, it necessarily follows, that there is no object of our thought which can have a continued and permanent existence. Body and

spirit, cause and effect, time and space, to which we were wont to ascribe an existence independent of our thought, are all turned out of existence by this short dilemma. Either these things are ideas of sensation or reflection, or they are not: if they are ideas of sensation or reflection, they can have no existence but when we are conscious of them: if they are not ideas of sensation or reflection, they are words without any meaning. To which we shall only reply, that we have the same reason to believe, that mind exists as that body exists; since it is only by that name that we distinguish the subject of certain powers or properties of which we are conscious, as perception, memory, will, &c. and we have just the same reason to believe the identity of an idea as that of any external body, or that of our own minds.

Dr. Beattie, Dr. Oswald, and others, have pursued and extended the same kind of reasoning against the principles of Mr. Locke; and alleged, that Berkeley's reasoning against the existence of a material world, and Hume's reasoning against the existence both of soul and body, are deduced from Locke's Essay, and the Principia of Des Cartes. For an account of Berkeley's system, see ABSTRACTION, BODY, and EXISTENCE.

In opposition to this system, Dr. Reid, and those who have adopted his theory, have recurred to certain instinctive principles; alleging, that our perceptions necessarily imply the belief of the present existence of external objects; and that the real, separate, and independent existence of matter is believed, not because it can be proved by argument, but because the constitution of our nature is such, that we must believe it; and that we cannot in our own minds separate the belief of external objects from our sensations. However, it has been urged by an ingenious writer, that Mr. Locke's doctrine is not so favourable to Mr. Berkeley's theory as Dr. Reid's; and that a system which ascribes our primary mental operations to mere constitution and feeling, is more favourable to scepticism than that in the room of which it is substituted.

Those who wish to be farther acquainted with the controversy relating to the nature and origin of our ideas, must be referred to Hume's Treatise of Human Nature, vol. i. p. 123, &c. 282, &c. 434, &c. Reid's Inquiry into the Human Mind, passim. Essays on the Intellectual Powers of Man, Ess. ii. Beattie's Essay on Truth, part ii. chap. 2. Priestley's Examination of Reid, Beattie, &c. passim. See COMMON SENSE.

For an account of Dr. Hartley's system of the generation of our ideas, see ASSOCIATION, VIBRATION, and VIBRATION.

The term idea has, by Mr. Locke, been extended to every thing we know or have any notion of, any thing about which the mind is employed in thinking. But this extensive use of the term idea is thought improper by a very ingenious and acute writer, who observes, that we may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas. In like manner, we know and have a notion of relations between things or ideas, which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us, without our perceiving the former. The same author elsewhere observes, that by *mind*, *spirit*, *soul*, or *self*, he does not denote any one of his ideas, but a thing entirely distinct from them; wherein they exist, or, which is the same thing, whereby they are perceived; for the existence of an idea consists, as he says, in being perceived. He also observes, the word *thing*, or *being*, is the most general name of all, and comprehends under it two kinds entirely distinct and heterogeneous; having nothing common but the name,

to wit, *spirits* and *ideas*. And in another part of his treatise, he expressly affirms, there can be no idea formed of a soul or spirit. Berkeley's Princ. of Human Knowledge, § 2. 27. 89. 142.

Another author has also blamed Mr. Locke for confounding ideas and notions. He observes, that by idea, according to the common and most usual signification of the word, is meant the image, picture, or representation in the mind of a sensible appearance, or of an object which hath before been perceived by sense. To which sensible appearance therefore the idea necessarily refers, for whatever is in it, or upon any account can be ascribed to it; and it serves, or is made use of in its stead, for the mind to contemplate or employ itself about in thinking, at such time when the object it represents is not immediately perceived, as in the act of sense. Vide p. 105, 106 of a book, intitled "Two Dissertations concerning Sense and the Imagination, with an Essay on Consciousness." Lond. 1728. 8vo.

This author farther asserts, in opposition to Mr. Locke, that the perception of an idea is not an act of the understanding. He urges, that an idea, by Mr. Locke's own account of it, is an object, or something perceived, and about which the mind is employed in thinking. Wherefore if perception (suppose), which is an operation or act of the mind, should itself be considered as an idea (and under this very title Mr. Locke treats of perception), then one idea would be the object of another idea, and so there would be an idea of an idea, or an object of an object; and one idea would perceive another idea, which there is no making any tolerable sense of. And indeed in explaining or declaring the operation of any faculty, to give it the same name and appellation with the object itself about which it is employed, and which there is a necessity of considering, in order to set forth the particular quality and nature of the operation, and the precise manner of its concerning and having to do with the object, seems very inconsistent with such a purpose or design.

This author has been very elaborate in proving and enforcing the distinction between notions and ideas. In another treatise he observes, that Mr. Locke, in his Essay on Human Understanding, takes no notice of rational notions, and thereby has not only given a partial and imperfect account of his subject, but made an unjust and unfair representation of it. Vide an Essay concerning Rational Notions, printed at London, 1723.

That some confusion may have arisen from giving the same name to these heterogeneous things, cannot be questioned. However Mr. Locke is, in this respect, no more guilty than Malebranche and the Cartesians, who use the term idea in the same extensive sense with him, and from whom, indeed, he seems to have taken it. But then the Cartesians seem to have been more solicitous to distinguish between the ideas of the imagination, and those of the intellect, understanding, or *de l'esprit pur*, as they sometimes express themselves, and have thereby guarded against the inconveniences arising from the too general signification of the term idea. See NOTION.

IDEAS, according to Mr. Locke, are divided into *simple* and *complex*.

IDEAS, *simple*, include all those which come into the mind by sensation; and though the qualities of bodies that affect our senses, are in the things themselves so mixed and united, that there is no separation between them, yet the ideas they produce in the mind are simple and unmixed. Again, some of these ideas we acquire purely by means of one sense; as the ideas of colours, only by the eye; of sounds by the ear; of heat by the touch, &c. Other ideas we gain by

several senses, as of space, extension, figure, rest, motion, &c. for these have their effect both on the sight and the touch. Others, again, are had from reflection only; such as those of perception and willing. There are other simple ideas, again, formed in the mind both by sensation and reflection jointly, as those of pleasure, pain, power, excellence, unity, succession, &c. And some of these kinds of ideas are all, or at least the most considerable, of those simple ideas which the mind hath, and out of which is made all its other knowledge.

The better to comprehend the nature of simple ideas, it will be convenient to distinguish between them, as they are ideas of perceptions in our minds, and as they are modifications of the bodies that cause such perceptions in us, that we may not think, as is usually done, that they are exactly the images and resemblances of something inherent in the object; for most of those of sensation are in the mind no more the likeness of any thing existing without us, than the names that stand for them are the likeness of the ideas.

But here the qualities of bodies which produce those ideas in our minds, are to be distinguished into *primary* and *secondary*. *Primary* qualities are such as are utterly inseparable from the body, in what state soever it be, and such as our senses constantly find in every particle of matter; which are solidity, extension, figure, mobility, and the like. *Secondary* qualities are such, as are, in reality, nothing in the objects themselves, but only powers to produce various sensations in us, by means of their primary qualities: that is, by the figure, bulk, texture, &c. of their particles, as colours, sounds, taste, &c.

Now the ideas of primary qualities are, in some sense, resemblances of them, and their patterns do really exist in the bodies themselves; but the ideas produced in us by those secondary qualities have no resemblance of them at all. There is nothing like our ideas existing in the bodies themselves that occasion them: they are, in the bodies we denominate from them, only a power to produce those sensations in us; and what is sweet, warm, blue, &c. in the idea, is no more than the bulk, figure, and motion of the particles of the bodies themselves, which we call so. See QUALITY.

The mind has several faculties for managing these simple ideas, which are worthy of notice: as, 1. That of discerning justly, and distinguishing rightly, between one and another; in which consists the accuracy of judgment.

2. That of comparing them one with another, in respect of extent, degree, time, place, or any other circumstances of relation or dependence, one on another.

3. That of compounding, or putting together, the simple ideas received by sensation and reflection, in order to make complex ones.

4. Children, by repeated sensations, having got some ideas fixed in their memories, by degrees learn the use of signs, and when they can speak articulately, they make use of words to signify their ideas to others.

Hence, the use of words being to stand as outward marks of our internal ideas, and those ideas being taken from particular things, if every particular idea that we take in should have a particular name affixed to it, names would become endless. To prevent this inconvenience, the mind has another faculty, whereby it can make the particular ideas received from such objects become general; which is done by considering them as they are in the mind, such appearances, separate from all other existences, and circumstances of existence, as time, place, and other concomitant ideas; and this is called *abstraction*, whereby ideas, taken from particular things, become general representatives of all of that kind, and their names, general names. ap-

licable to whatever exists conformable to such abstract ideas. Thus, the same colour being observed to-day in chalk or snow, which we observed yesterday in paper or milk, we consider that appearance alone makes it a representative of all of the same kind, and gives it the name of *representativeness*; by which found we always signify the same quality, wherefoever to be met with, or imagined.

From the powers of combining, comparing, and separating, or abstracting simple ideas, acquired by sensation and reflection, all our complex ideas are formed; and, as before, in the perception of ideas, the understanding was passive, so here it is active, exerting the power it hath in the several acts and faculties above mentioned, in order to frame compound ideas.

IDEAS, *complex*, though their number be infinite, and their variety endless, yet may all be reduced to these three heads; *viz. modes, substances, and relations*. *Modes* are such complex ideas as, however compounded, are not supposed to exist by themselves, but are considered as dependences on, or affections of, substances: such are the ideas signified by the words *triangle, gratitude, murder, &c.*

These are of two kinds: 1. Such as are only variations, or different combinations, of the same simple idea, without the mixture of any other; as a dozen, a score, &c. which may be called *simple modes*. 2. There are others, compounded of simple ideas, of several sorts put together, to make one complex one; as *beauty, theft, &c.*

Substances have their ideas from such combinations of simple ideas, as are taken to represent distinct particular things subsisting by themselves; in which the supposed or confused idea of substance, such as it is, is always the first and chief.

Relations are a kind of complex ideas, arising from the consideration or comparison of one idea with another. Of these, some only depend on the equality or excess of the same simple idea in several subjects; and these may be called *proportional relations*; such as *equal, more, bigger, sweeter*. Another occasion of comparing things together is owing to the circumstances of their origin and beginning; which not being afterwards to be altered, make the relations depending thereon as lasting as the subjects to which they belong. Thus it is with natural relations, as *father, mother, uncle, cousin, &c.* Thus also it is with relations by institution, as *prince and people, general and army, &c.* As to moral relations, they are the conformity or disagreement of men's free actions to laws and rules, whether human or divine.

Farther, *Ideas* may be divided into *clear or distinct*; and *obscure or confused*.

IDEAS, *simple*, are *clear*, when they continue such as the objects present them to us when our organs of sensation are in good tone and order; when our memories retain them, and can produce and present them to the mind whenever it has occasion to consider them; and when, with this, the mind sees that these simple ideas are severally different one from another. The contrary to which is what we call *obscurity and confusion* of ideas.

A *distinct* idea is that wherein the mind perceives a difference from all others; and a *confused* idea is such a one as is not sufficiently distinguishable from another, with regard to which it ought to be different.

IDEAS, again, with respect to the objects whence they are taken, of which they are supposed to represent, come under a threefold distinction; being either *real or fantastical; true or false; adequate or inadequate*.

IDEAS, *real*, are such as have a foundation in nature; or

such as have a conformity with the real being or existence of things, or with their archetypes.

IDEAS, *fantastical or chimerical*, are such as have no foundation in nature, nor any conformity with that being to which they are referred, or with their archetypes.

All our *simple* ideas are real; not that they are images or representations of what does exist, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us such sensations. They are real ideas in us, because by them we distinguish the qualities that are really in the bodies themselves; their reality lies in the steady correspondence they have with the distinct constitutions of real being; but whether with those constitutions as causes or patterns, it matters not, so long as they are constantly produced by them.

As to *complex* ideas; in regard they are arbitrary combinations of simple ideas put together, and united under one general name, in forming whereof the mind uses its own liberty, some are found *real*, and some *imaginary*. 1. Mixed modes and relations, having no other reality than what they have in the minds of men, are real; nothing more being required to their reality, but a possibility of existing conformable to them. These ideas, being themselves archetypes, cannot differ from their archetypes, and so they cannot be chimerical, unless any one jumbles inconsistent ideas in them; indeed, those that have names assigned to them, ought to have a conformity to the ordinary signification of those names, to prevent their appearing fantastical. 2. Our complex ideas of substances being made in reference to things existing without us, whose representations they are thought to be, are no farther real than as they are combinations of simple ideas really united and co-existing in things without us. Those are fantastical that are made up of several ideas that never were found united, as *centaur, &c.*

IDEAS, *real*, are divided into *adequate* and *inadequate*.

IDEAS, *adequate*, are those which perfectly represent those archetypes which the mind supposes them taken from, and which it makes them stand for.

IDEAS, *inadequate*, are such as do but partially, or incompletely, represent those archetypes to which they are referred.

IDEAS, *as to true and false*, it may be observed, that truth and falsehood, in propriety of speech, belong only to propositions; and when ideas are termed *true* and *false*, there is some tacit proposition, which is the foundation of that denomination. Our ideas, being nothing else but appearances or perceptions in the mind, can no more be said to be true or false, than single names of things can be said to be so; for truth and falsehood lying always in the affirmation or negation, our ideas are not capable of them, till the mind passes some judgment of them. In a metaphysical sense they may be said to be true, *i. e.* to be really as they exist; though in things called *true*, even in that sense, there seems to be a secret reference to our ideas, looked upon as the standards of that truth; which amounts to a mental proposition. When the mind refers its ideas to any thing extraneous to it, they are then capable of being true or false; because, in such a reference, the mind makes a tacit supposition of their conformity to that thing; and as this supposition is true or false, so the ideas themselves come to be denominated. Locke's Essay, 8vo. vol. i. passim.

IDEAL, in *Painting and Sculpture*, is used to signify a perfection in form, and a beauty in colouring, deduced from the general principles of nature; but not to be found in any individual person or thing of compound structure, when considered in all its parts; such as man, for instance.

No man or woman, probably, ever existed possessed of that perfect beauty of form in all their parts, of which those parts are fully capable, consistent with the power to perform their intended functions in the animal economy. Therefore artists who aim at representing the human figure in its utmost perfection, are of course called upon imperatively, to vary in some point or other from their models, and to add the beauties of others. This selection of perfect parts depending entirely upon taste, is that ideal in art, (or *beau ideal*, a term adopted from the French,) which is the source of so much beauty and character in the works of a few artists, who possessed super-eminent talents; and which, being misunderstood, or attempted without knowledge and true taste, is equally the source of so much vicious affectation and frippery in those of the greater part, whose aim is to display it.

Sir Joshua Reynolds, in his letter published in the *Idler*, No. 82, has aptly illustrated this subject by observing, that "among blades of grass, or leaves of the same tree, though no two can be found exactly alike, yet the general form is invariable. A naturalist, before he chuses one as a sample, would examine many, since, if he took the first that occurred, it might have, by accident or otherwise, such a form as scarcely would be known to belong to that species; he selects, like the artist, the most beautiful, that is, the most general form of nature."

Every species of the animal, as well as the vegetable creation, may be said to have a fixed or determinate form round which nature continually varies in every direction, as a number of radii issue from one common centre. To instance, in a particular part of the human face, the line that forms the ridge of the nose is most beautiful when it is straight; this, then, is the central form. How infinite are the variations from this line to the convex, concave, and forms made of both, we need not inform our readers. The same remarks attach to every portion of the figure. The head, the neck, the trunk, and the limbs are found almost as various in form as the features of the face; although the general character is the same in all; and fixed for every period of the life of man. In childhood, youth, manhood, and declining years, there are distinct and universal characteristics, whilst each individual in the separate classes is known by his peculiar variations of form and features. It is the duty of the artist who practises in the higher walks of art, to paint man, and not individuals; to learn the general character of the objects he is to represent, and neglect the trifling peculiarities attached to each.

But this sublime branch of study in art may be, and has been, carried to excess. It properly belongs only to one kind of subject, that is, in its more important application; *viz.* the representation of exalted and heroic characters; and of scenes, where the actors are few. Those subjects which relate to the common transactions of mankind, do not so positively require it. In them a greater degree of precise imitation is allowed, indeed required; and where many figures are introduced, the variety of characters requisite, will demand variations from the central form. But even then, unless the scene is taken from vulgar ordinary life, the different characters must not be too minutely wrought. It is true, a thin man must be represented spare of flesh; and a fat one possessing redundancy; but then all the wrinkles commonly attendant upon both are not necessary to mark their characters. Judgment and taste alone can select those which are so; and one of the most difficult lessons an artist has to learn, is, what to omit when he is copying from nature. That much may be omitted, and yet every feature necessary for true and effective representation retained, is

evident from every portrait that ever was painted; even by the meanly instructed pencil of Denner, who attempted to represent the hairs of the beard, and the grainy texture of the skin; and did it with much skill. But are his pictures more like human beings, that is, do they convey an idea of them to the mind of an observer, more strongly than the free and manly works of Vandyke and Sir J. Reynolds, who totally disregarded those minutiae!

The rejection of those trifling points is the ideal of portrait painting, and what alone raises it to an exalted rank in the scale of art. Without it, the painter of portraits is not a whit more ingenious, or more deserving of estimation, than he who imitates with ingenuity a mahogany chest, or any other painter of still life.

The same principle holds good in landscape. Trees should be represented with their own peculiar characters, but they need not have all the minute ramifications of their branches exhibited. The *beau ideal* requires in them a general characteristic form; and not too frequent a variety of species. Claude de Lorraine has sometimes carried this too far, and made all the trees in a picture of one form, or nearly so. It certainly assists in producing simplicity; but in this point nature is so exceedingly lavish of variety, that some of it is necessary to satisfy the eye of one accustomed to observe her productions.

The danger of attempting to produce the ideal in form is that of falling into affectation.

What that ideal in art which should be sought after is, may best be learned by studying the works of the ancient Greek sculptors; and observing wherein they differ from the ordinary forms of nature. The opportunities they possessed, which are utterly unknown to the inhabitants of northern Europe, of seeing the human figure constantly naked, and in violent exercise, enabled them more surely to judge of what was most beautiful in the general form; to select such as possessed those beauties; and unite their various perfections. It is said of Zeuxis the painter, that when employed in painting a Venus, he selected twelve of the most lovely women of the country, and combined in one figure, the charms for which each was most conspicuous.

The ideal in art, therefore, is not something more beautiful than nature; but nature in her perfect state: and he who attempts to produce it by drawing from his imagination rather than his judgment, will more probably fall into the region of error, than soar to the abode of truth. We shall have occasion to speak more of this when we come to treat of style in design. See *STYLE*.

IDEAL Beauty in the Fine Arts. Painters are allowed to talk of the *beau ideal*, who have nature always fitting to them in some garb or other, and they have only to copy her dress and attitudes. But with respect to music, which is entirely a work of art, and of which the beauties as well as deformities are all ideal, it has been asked by a man of more wit than feeling, what it means to say? *Sonate, que veux tu?* And this interrogator was Fontenelle! the most ingenious and agreeable writer on subjects within his competence, which the French language can boast! Ideal, in the common acceptation of the word, implies something which has no reality, and which only exists in imagination; but in speaking of the fine arts, this expression, so far from being disputed, often describes the highest point of perfection at which they can possibly arrive. It is particularly to painting and sculpture that it has been applied; though it equally belongs to poetry and music. There are arts which imitate nothing, or of which the imitations are accidental and feeble: such are architecture and instrumental music.

Let us consider the constituent parts of music—they con-

sist of three elements; melody, harmony, and time or rhythm. We should have mentioned time or measure first, because we have always found that a regular movement, of which the accents are strongly marked, has more effect on common ears than refined melody; but attention to that increases as the ear begins to discriminate, and is polished by degrees. But harmony has been invented after the lapse of many ages, and only brought to perfection by the moderns. However, after innumerable experiments, when not abused, it is found to embellish melody, and to augment its expression.

Now we should be glad to know what share the *imitation of nature* has had in the cultivation and progress of music? The warbling of birds is not measured, their concerts have no harmony, and are often very discordant; nor is their melody appreciable by our organs. The talking of *natural music* is therefore absurd; who does not see that all the beauties of music are ideal, and produced by experiment, or by that instinct which makes us augment and diminish, retouch and correct, till we are quite satisfied with our work? Let us then be more just to the polite arts, and restore to them the noble rank which is their due. They not only imitate but invent; and not content to copy nature when practicable, they can embellish her. They can express the thoughts of man: thoughts which are only the result of ambitious desires, and the ardour with which he seeks pleasure.

The ideal genus opens a wide field to imagination; for the moment our mind is elevated above sublunary, vulgar, and familiar objects, it expands in full liberty. Nor is any art better than mechanical, if it suffers us to remain wholly divested of enthusiasm, and is unable to lift us off the ground.

IDENTITATE NOMINIS, in *Law*, a writ which lies for him who, upon a capias or exigent, is arrested, and committed to prison, for another man of the same name.

IDENTITY, SAMENESS; that by which a thing is itself, and not any thing else. In which sense, *identity* differs from *similitude*, as well as *diversity*.

Our idea of identity we owe to that power which the mind has of comparing the very being of things; whereby, considering any thing as existing at any certain time and place, and comparing it with itself as existing at any other time, &c. we accordingly pronounce it the same.

When we see any thing in any certain time and place, we are sure it is that very thing, and can be no other, how like soever it may be to something else in all other respects; because we conceive it impossible, that two things of the same kind should exist together in the same place, we conclude, that whatever exists any where at the same time, excludes all of the same kind, and is there itself alone. When, therefore, we demand, whether any thing be the same or no, it refers always to something that existed at such a time, in such a place; which it was certain, at that instant, was the same with itself, and no other. Identity, therefore, evidently supposes an uninterrupted continuance of existence.

We have ideas of three sorts of substances: of God; of finite intelligences; and of bodies. God being eternal, unalterable, and every where, concerning his identity there can be no doubt. Finite spirits having had their determinate place, and time of beginning to exist, the relation to that time and place will always determine to each its identity as long as it exists. And the same will hold of every particle of matter to which no addition, or from which no subtraction, is made. These three exclude not one another out of the same place; yet each exclude

those of the same kind out of the same place. The identity and diversity of modes and relations is determined after the same manner that those of substances are; only the actions of finite beings, as motion and thought, consisting in succession, cannot exist in different times and places as permanent beings: for no motion or thought, considered as at different times, can be the same; each part thereof having a different beginning of existence. From whence it is plain, that existence itself is the *principium individuationis*, which determines a being to a particular time and place incommunicable to two beings of the same kind.

Thus, suppose an atom existing in a determined time and place, it is evident, that, considered in any instant, it is the same with itself, and will be so, as long as its existence continues. The same may be said of two, or more, or any number of particles, whilst they continue together, the mass will be the same, however jumbled; but if one atom be taken away, it is then not the same mass. But in vegetables, the identity depends not on the same mass, and is not applied to the same thing: the reason of this is, the difference between an inanimate body, and a crude mass of matter; this latter being only the cohesion of particles any how united, the other such a disposition or organization of parts, as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, leaves, &c. (of an oak, for instance) in which consists the vegetable life. That, therefore, which hath such an organization of parts, partaking of one common life, continues to be the same plant, though that life be communicated to new particles of matter vitally united to the living plant. The case is not so much different in brutes, but that any one may hence see what makes an animal, and continues it the same. The identity of the same man likewise consists in a participation of the same continued life, in succeeding particles of matter vitally united to the same organized body.

To understand identity aright, we must consider what idea the word stands for; it being one thing to be the same substance; another, the same man; and a third, the same person. An animal is a living organized body; and the same animal is the same continued life communicated to different particles of matter, as they happen successively to be united to that organized living body; and our notion of man is but of a particular sort of animal. Person stands for an intelligent being, that reasons and reflects, and can consider itself the same thing in different times and places, which it doth by that consciousness that is inseparable from thinking. By this every one is to himself, what he calls *self*, without considering whether that self be continued in the same, or in diverse substances. In this consists personal identity, or the sameness of a rational being; and so far as this consciousness extends backward to any past action, or thought so far reaches the identity of that person. It is the self same now it was then; and it is by the same self, with this present one, and that now reflects on it, that that action was done. Self is that conscious thinking thing, whatever substance it matters not, which is conscious of pleasure and pain, capable of happiness or misery; and so is concerned for itself as far as that consciousness extends. That with which the consciousness of this present thinking can join itself, makes the *same* person, and is one self with it; and so attributes to itself, and owns all the actions of that thing as its own, as far as that consciousness reaches. Personality is something that cannot be divided, or consist of parts. It is in the strictest sense what Leibnitz calls a *Monad*, which see; and personal identity implies the continued existence of that indivisible thing called self; which, whatever be its precise nature, thinks,

thinks, deliberates, resolves, acts, and suffers. It is not thought, action, feeling; but something that thinks, acts, and suffers my thoughts, actions, and feelings to change every moment; they have no continued, but a successive existence; but that *self*, or *I*, to which they belong, is permanent, and has the same relation to all the succeeding thoughts, actions, and feelings, which I call mine. Should it be asked, what evidences have you that there is such a permanent self which has a claim to all the thoughts, actions, and feelings, which you call yours? It is replied, that the proper evidence I have of all this is remembrance, or, as some express it, consciousness.

Consciousness, says the excellent bishop Butler, of what is past, ascertains our personal identity to ourselves; yet to say that it makes personal identity, or is necessary to our being the same persons, is to say, that a person has not existed a single moment, nor done one action but what he can remember: indeed, none but what he reflects upon. And one should really think it self-evident, that consciousness of personal identity presupposes, and, therefore, cannot constitute personal identity; any more than knowledge in any other case can constitute truth which it presupposes. Though present consciousness of what we at present do and feel is necessary to our being the persons we now are; yet present consciousness of past actions or feelings is not necessary to our being the same persons who performed those actions, or had those feelings. The identity of persons cannot subsist with diversity of substance: personal identity is, therefore, as Mr. Locke expresses it, the sameness of a rational being; and the question, whether the same rational being is the same substance, needs no answer; because being and substance, in this case, stand for the same idea. Consequently, though the successive consciousnesses which we have of our own existence are not the same, yet they are consciousnesses of one and the same thing or object; of the same person, self, or living agent. The person of whose existence the consciousness is felt now, and was felt an hour or a year ago, is discerned to be, not two persons, but one and the same person, and, therefore, is one and the same. Butler's Analogy, Append. Diff. 1.

The identity of a person is a perfect identity: wherever it is real, it admits of no degrees; and it is impossible that a person should be the same in part, and in part different; because, as we have already said, a person is a monad, and is not divisible into parts. But the evidence of identity in other persons besides ourselves admits of various degrees, from what we account certainty to the least degree of probability. But still it is true, that the same person is perfectly the same, and cannot be so in part, or in some degree only. We probably at first derive our notion of identity from that natural conviction which every man has from the dawn of reason of his own identity and continued existence. The operations of our minds are all successive, and have no continued existence: but the thinking being has a continued existence, and we have an invincible belief that it remains the same when all its thoughts and operations change. The evidence we have of our own identity, as far back as we remember, is totally of a different kind from the evidence we have of the identity of other persons, or of objects of sense. The first is grounded on memory, and gives undoubted certainty. The last is grounded on similarity and on other circumstances, which in many cases are not so decisive as to leave no room for doubt. See Reid's Essays, Ess. iii. chap. 4.

This personal identity is the object of reward and punishment, being that by which every one is concerned for himself. If the consciousness went along with the little finger; when

that was cut off it would be the same self, that was just before concerned for the whole body. If the same Socrates, waking and sleeping, did not partake of the same consciousness, he would not be the same person: Socrates waking could not be, in justice, accountable for what Socrates sleeping did; no more than one twin for what his brother-twin did; because their outsides were so like that they could not be distinguished.

But suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that I shall never be conscious of them again; am I not again the same person that did those actions though I have forgotten them? I answer, we must here take notice what the word *I* is applied to, which in this case is the man only; and the same man being presumed to be the same person, *I* is easily here supposed to stand also for the same person. But if it be possible for the same man to have a distinct, incommunicable consciousness at different times, it is past doubt the same man would, at different times, make different persons; which we see is the sense of mankind in the most solemn declaration of their opinions; human laws not punishing the madman for the sober man's actions, nor the sober man for what the madman did; thereby making them two persons.

Thus we say, in English, such a one is not himself, or is beside himself; in which phrase it is insinuated, that self is changed, and the self same person is no longer in that man. But is not a man, drunk or sober, the same person? Why else is he punished for the same fact he commits when drunk, though he be never afterwards conscious of it? Just as much the same person as a man that walks and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish with a justice suitable to their way of knowledge; because in these cases they cannot distinguish certainly what is real, and what is counterfeit; and so the ignorance in drunkenness, or sleep, is not admitted as a plea. For though punishment be annexed to personality, and personality to consciousness, and the drunkard is not conscious, perhaps, of what he did, yet human judicatures justly punish him, because the fact is proved against him; but want of consciousness cannot be proved for him. But in the great day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think no one shall be made to answer for what he knows nothing of, but shall receive his doom; his own conscience accusing, or else excusing him.

To conclude this article, whatever substance begins to exist, it must, during its existence, be the same; whatever composition of substances begins to exist, during the union of those substances, the concrete must be the same. Whatsoever mode begins to exist, during its existence it is the same; and so if the composition be of distinct substances and different modes, the same rule holds. Whence it appears, that the difficulty or obscurity that has been about this matter, rather arises from names ill used, than from any obscurity in the things themselves. For whatever makes the specific idea, to which the name is applied, if that idea be kept steadily to, the distinction of any thing into the same and diverse, will easily be conceived. Locke's Essays, vol. i. chap. 27.

IDEOT. See IDIOT and LUNATIC.

IDES, IDUS, in the Roman Calendar, a denomination given to eight days in each month; commencing in the months of March, May, July, and October, on the fifteenth day; and in the other months on the thirteenth day; and reckoned backward, so as in the four months above

specified to terminate on the eighth day, and in the rest on the sixth.

The origin of the word is contested. Some will have it formed from *idus, to see*; because the full moon was commonly seen on the day of the ides; others from *idos, species, figure*, on account of the image of the full moon then visible; others from *idulium*, or *ovis idulis*, a name given by the Etrurians to a victim offered on that day to Jupiter; others from the Etrurian word *idus, i. e. divido*; because the ides divided the moon into two nearly equal parts.

The ides came between the calends and the nones.

The 15th day in March, May, July, and October, and the 13th of the other months, being called the ides of those months; *idus Martii, Maii, &c.* the 14th day of the same four months, and the 12th of the other eight, were *pridie idus*, or the eve of the ides of March, &c. the 13th day in the four months, and the 11th in the eight, was called the third of the ides of such months, *3 idus Martii, &c.* so the 12th day in the four, and the 10th in the eight months, were the fourth of the ides, *4 idus Martii, &c.* and thus of the rest, to the eighth and sixth days, which made the eighth of the ides, *8 idus Martii, &c.*

This way of accounting is still in use in the Roman chancery, and the calendar of the breviary. The ides of May were consecrated to Mercury; the ides of March were always esteemed unhappy after Cæsar's murder; the time after the ides of June was reckoned fortunate for those who entered into matrimony; the ides of August were consecrated to Diana, and were observed as a feast day by the slaves; on the ides of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the ides of May, and afterwards on those of March.

IDIJE, or *SECTA*, in *Geography*, a province of Japan.

IDIOM, *ἰδιωμα, propriety*, of *ἰδιος, proper, own*, is sometimes used for the peculiarities of a language; sometimes for a dialect, or the language of some particular province; differing, in some respects, from the language of the nation, in general, whence it is derived.

IDIOMS, *Communication of*. See *COMMUNICATION*.

IDIOPATHIC, in *Medicine*, an epithet derived from *ἰδιος, proper*, or *peculiar*, and *πάθος, affection*, and denoting such an indisposition or disease as properly and originally belongs to the part of the body in which it appears, and is not caused by any other or preceding disease, nor dependent on disease in any other part of the body. Hence *idiopathic* stands in opposition to *sympathic*, or *sympomatic*, and *idiopathy* (an obsolete term) to *sympathy*; the sympathic or symptomatic affections being such as arise in consequence of some prior disorder in some other part of the body. Thus when vomiting arises from inflammation in the stomach, it is said to be *idiopathic*; when it arises from injury done to the brain, from a stone in the kidney, or from the state of the uterus in pregnancy, it is *sympathic, sympathetic, or symptomatic* of the diseased state of these distant organs.

IDIOSYNCRASY, from *ἰδιος, peculiar*, *συν, with*, and *κρᾶσι, temperament*, signifies the peculiar disposition or constitution of individuals, in consequence of which particular agents operate upon them, in a manner different from their ordinary mode of action upon persons in general, or peculiar inclinations and aversions, whether in health or sickness, manifest themselves. Thus certain articles of diet, as shell-fish, bitter almonds, &c. taken in the smallest quantity, immediately excite, in some individuals, an eruption or rash on the skin; which is ascribed to the peculiar idiosyncrasy of such individuals. From a similar cause, the operation of medicines is variously modified; a small dose, which is altogether inert

in one habit, will operate violently in another; a drug, which does not offend the stomach, but purges the bowels, in one person, will invariably excite vomiting in another; and so on, according to the different idiosyncrasy of each.

IDIOT, IDEOT, in the *English Laws*, denotes a natural fool, or a person who hath had no understanding from his birth; and therefore in law presumed never likely to attain any.

The word is originally Greek, *ἰδιωτης*, which primarily imports a *private person*, or one who leads a private life, without any share or concern in the government of affairs.

A person who has understanding enough to measure a yard of cloth, number twenty rightly, and tell the days of the week, his parents, his age, &c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is considered by the law in the same state as an idiot; being supposed incapable of any understanding, as wanting all those senses which furnish the human mind with ideas. (4 Inst. 203. Com. Journ. 1610.) For this reason the custody of an idiot and his lands was formerly vested in the lord of the fee (Flet. l. i. c. 11. § 10); and therefore still, by special custom in some manors, the lord shall have the ordering of idiot and lunatic copy-holders (Dyer, 302. Hutt. 17. Noy. 27.); but by reason of the manifold abuses of this power by subjects, it was at last provided by common consent, that it should be given to the king as the general conservator of his people; in order to prevent the idiot from waiving his estate, and reducing himself and his heirs to poverty and distress. (F. N. B. 232.) This fixed prerogative of the king is declared in parliament by statute 17 Edw. II. c. 9. which directs (in affirmance of the common law, 4 Rep. 126.) that the king shall have ward of the lands of natural fools, taking the profits without waste or destruction, and shall find them necessaries; and after the death of such idiots he shall render the estate to the heirs; in order to prevent such idiots from aliening their lands, and their heirs from being disinherited. Idiots, and persons of non-sane memory, are not totally disabled either to convey or purchase, but *sub modo* only. For their conveyances and purchases are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. See *NON-COMPOS*.

For the custody of idiots, see *CUSTODY*.

In criminal cases idiots and lunatics are not chargeable for their own acts, if committed under these incapacities; not even for treason itself. 3 Inst. 6. See *LUNATIC*.

If a man be found by a jury an idiot, *a nativitate*, he may come in person into the chancery before the chancellor, or be brought there by his friends, to be inspected and examined, whether idiot or not; and if, upon such view and inquiry, it appears he is not so, the verdict of the jury, and all the proceedings thereon, are utterly void, and instantly of no effect. 9 Rep. 31.

Idiotism constitutes an incapacity for entering into the matrimonial contract, in which case it is not valid. (1 Roll. Abr. 357.) It was formerly adjudged that the issue of an idiot was legitimate, and consequently that his marriage was valid. This must have been a strange determination; since consent is absolutely requisite to matrimony, and neither idiots nor lunatics are capable of consenting to any thing. And therefore the civil law judged much more sensibly when it made such deprivations of reason a previous impediment; though not a cause of divorce, if they happened after marriage. ff. 23. tit. i. l. 8. and tit. ii. l. 16. See *MARRIAGE*.

IDIOT, *Idiota*, is also used by ancient writers for a person ignorant, or unlearned; answering to *illiteratus*, or *impe-*
ritus.

ritus. In this sense, Victor tells us, in his Chronicon, that, in the consulship of Messala, the holy Gospels, by command of the emperor Anastasius, were corrected and amended, as having been written by idiot evangelists: "Tanquam ab idiotis evangelistis composita."

Idiot, or ἰδιώτης, is properly a person in a private station; and so the word should have been rendered, Acts, iv. 13. and not "ignorant," an epithet by no means applicable to the apostles Peter and John. The term ἰδιώτης is also used, not only in opposition to a public magistrate, but likewise as the opposite of a public speaker: and St. Paul has used it, 1 Cor. xiv. 16. in the sense of "hearer." From this epithet, ἰδιώτης λόγος, which he himself has assumed, 2 Cor. xi. 6. some persons have unwarrantably inferred that his language has a tincture of vulgarity. Whereas ἰδιώτης λόγος expresses nothing more than a man who is no orator, who pays no attention to the elegance of language, but speaks in the dialect of common conversation. In opposition to ἰδιώτης λόγος, St. Paul adds, ἀλλ' ἐστὶν ἡ γινώσκει, in which he was not ἰδιώτης, but a teacher and apostle. The word may possibly be applied to the deviation from classic purity observable in the style of St. Paul, which an author who attempted only to please, might have cultivated with more attention; but setting all idioms aside, the whole expression is applicable to every man who delivers plain truths in artless language. A professor in an university, who is attentive to the accuracy of criticism, but regardless of the graces of composition, is in the strictest sense ἰδιώτης λόγος ἀλλ' ἐστὶν ἡ γινώσκει.

IDIOTA *inquirendo vel examinando, De*, a writ issued out to the sheriff of a county, where the king has notice that there is an idiot natural'y born, so weak of understanding, that he cannot govern or manage his inheritance; directing him to call before him the party suspected, and examine him, and enquire, by a jury of twelve men, whether he be an idiot or not (F. N. B. 232.); and if they find him *purus idiota*, the profits of his lands, and the custody of his person, may be granted by the king to some subject, who has interest enough to obtain them. See **IDIOR**.

This hath been long considered as a great hardship upon private families; but few instances occur of the oppressive exertion of it.

IDIOTISM, derived from ἰδιός, *proper, peculiar*, in *Grammar*, a phrase, or manner of speaking, peculiar to a language, and which cannot be rendered word for word into any other.

Idiotism is defined, by some authors, an inflection of some verb, or a particular construction of some phrase or particle, that is anomalous, and deviates from the ordinary rule of the language of the nation, but which is in use in some particular province of it. Or, it denotes the employing of *e. g.* an English word in a sense which it bears in some provincial dialect, in low and partial use, and which perhaps the corresponding word bears in some foreign tongue, but unsupported by general use in our own language.

Several authors have written of the idiotisms in the Greek and Latin languages; that is, of the particular turns in those tongues which vary the most from each other, and from the more popular among the modern tongues; but the examples of these idiotisms being borrowed from the best authors, idiotism, in this sense, cannot properly be called an irregularity.

Idiotisms, taken in the sense of vulgarisms, have been unjustly ascribed to the language of the New Testament. Whilst we cannot contend with Palaiet, Blackwall, and others, for the classical purity of the language of the New Testament, we can by no means assent to the declaration of Heumann, who, in his notes on the New Testament, asserts

that it is written in the very worst Greek, and in the language of the vulgar; that many words and phrases have been used in a sense unknown to the classics, and given them only by the populace; and that their meaning is not to be discovered by the help of the Greek writers, but merely from conjecture on the general connexion. As the charge of vulgarity has never been proved, and the idiotisms, which are not so numerous as he has pretended, may be explained by other means than mere conjecture, the whole edifice which he has erected on this basis falls of itself to the ground. Count Zinzendorf is no less mistaken, who has pretended to discover in the sermons of Christ certain idiotisms, in use only among the common workmen of Nazareth, that is, vulgar Syriac expressions, translated literally into Greek; and this he has attempted to shew in passages, where several commentators have discovered mysteries. To this charge it has been replied that rabbinisms, not vulgarisms, must be sought for in the sermons of Christ; for the Jews themselves, although in a language which they did not expect from an education in Nazareth, applied to it an epithet, λόγος χαρῆος, Luke, iv. 22., which belongs only to the graces of a polished style. See Michaelis's *Introd. to the New Testament*, by Herb. Marsh, vol. i. p. 172.

IDITA, a name, among Hindoo mythologists, of Parvati, the consort of Siva. In this, as well as in numerous other instances, Parvati corresponds in character with the Grecian Diana, who, under the name of Lucina, was invoked by the heathens of Europe, as presiding over child-birth; and was in this character also called Ilythia. So with the Hindoos, Parvati, the Sakti or energy of Siva, the power of reproduction, is invoked, with an appropriate burnt offering of certain perfumes, by women in labour, under the title of Idita, or Ilita; words in Sanscrit implying *praise*; and applied to the goddess, because she is *praised* by women requiring, or having received, her assistance. See **PARVATI**.

IDLE RIVER, in *Geography*, in Nottinghamshire and Yorkshire, is navigable from its fall into Trent at Stockwith, to the town of Bawtry; as mentioned, with other particulars, in our article **CANAL**. About 21,000 acres of the county of Derby drains to this river; the strata intersected by its channels, and other particulars respecting the upper parts of this river, will be found in Mr. Farey's *Agricultural and Mineral Report on Derbyshire*, vol. i.

IDLENESS, in *Law*. See **VAGABOND**.

IDOL, from εἰδωλον, which signifies the same, of εἶδος, *image, figure*, a statue or image of some false god, to whom divine honours are paid, altars and temples erected, and sacrifices offered.

The idol or image, whatever materials it consisted of, was by certain ceremonies called consecration, converted into a god. While under the artificer's hands, it was only a mere statue.

Three things were necessary in order to change it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with show and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans.

IDOLA, in *Geography*, a small island in the Adriatic. N. lat. 44 25'. E. long. 15 10'.

IDOLATRY, from εἰδωλολατρεία, which signifies the same; composed of εἶδος, *image*, and λατρεύω, *to serve*, the worship and adoration of false gods; or the giving those honours to creatures, or the works of man's hands, which are only due to God.

Several

IDOLATRY.

Several have written of the origin and causes of idolatry: among the rest, Vossius, Selden, Godwyn, and Tennison; but it is still a doubt who was the first author of it. It is generally allowed, however, that it had not its beginning till after the deluge; and many are of opinion, that Belus, who is supposed to be the same with Nimrod, was the first man that was deified.

But whether they had not paid divine honours to the heavenly bodies before that time, cannot be determined; our acquaintance with those remote times being extremely slender.

All that can be said with certainty is, that 426 years after the deluge, when God led Terah and his family out of Chaldea, and Abraham passed over Mesopotamia, Canaan, the kingdom of the Philistines, and Egypt, it does not appear that idolatry had then got any footing in any of those countries; though some idly pretend, that Abraham himself was an idolater.

The first mention we find made of it is in Gen. xxxi. 19. where Rachel is said to have taken the idols of her father: for though the meaning of the Hebrew word *theraphim*, תְּרָפִים, be disputed, yet it is pretty evident they were idols. Laban calls them his gods, and Jacob calls them strange gods, and looks on them as abominations. See THERAPHIM.

The original idolatry by image worship is by many attributed to the age of Eber, 2247 B. C. about 101 years after the deluge, according to the Hebrew chronology; 401 years according to the Samaritan; and 531 years according to the Septuagint; though most of the fathers place it no higher than that of Serug; which seems to be the more probable opinion, considering that for the first 134 years of Eber's life all mankind dwelt in a body together; during which time it is not reasonable to suppose that idolatry broke in upon them; then some time must be allowed after the dispersion of the several nations, which were but small at the beginning, to increase and settle themselves; so that if idolatry was introduced in Eber's time, it must have been towards the end of his life, and could not well have prevailed so universally, and with that obstinacy, which some authors have imagined. Terah, the father of Abraham, who lived at Ur, in Chaldea, about 2000 years B. C., was unquestionably an idolater; for he is expressly said in scripture to have served other gods. The eastern authors unanimously agree, that he was a statuary or carver of idols; and he is represented as the first who made images of clay, pictures having only been in use before; and who taught that they were to be adored as gods. It is said, that he was converted by Abraham. The authors of the Universal History think, that the origin and progress of idolatry is plainly pointed out to us in the account which Moses gives of Laban's and Jacob's parting, Gen. xxxi. 44, &c. From the custom once introduced of erecting monuments in memory of any solemn covenants, the transition was easy into the notion, that some deity took its residence in them, in order to punish the first aggressors; and this might be soon improved by an ignorant and degenerate world, till not only birds, beasts, flocks, and stones, but sun, moon, and stars, were called into the same office; though used, perhaps, at first, by the designing part of mankind, as scare-crows, to over-awe the ignorant. Univ. Hist. vol. i. part ii. p. 853. edit. fol.

Cluverius, German. Antiq. lib. i. maintains Cain to have been the first idolater; and the false gods that he worshipped to have been the stars, to whom he supposed God had left the government of the lower world; but this is mere conjecture.

Sanchoniathon, who wrote his Phœnician Antiquities,

apparently with a view to apologize for idolatry, traces its origin to the descendants of Cain, the elder branch, who began with the worship of the sun, and afterwards added a variety of other methods of idolatrous worship: proceeding to deify the several parts of nature; and men after their death, and even to consecrate the plants shooting out of the earth, which the first men judged to be gods, and worshipped as those that sustained the lives of themselves and of their posterity. Cumberl. on Sanchon. p. 219, &c.

The Chaldean priests, in process of time, being by their situation early addicted to celestial observations, instead of conceiving as they ought to have done concerning the omnipotence of the Creator, and mover of the heavenly bodies, fell into the impious error of esteeming them as gods, and the immediate governors of the world, in subordination, however, to the Deity, who was invisible except by his works, and the effects of his power. Concluding that God had created the stars and great luminaries, for the government of the world, partakers with himself and as his ministers, they thought it but just and natural that they should be honoured and extolled, and that it was the will of God they should be magnified and worshipped. Accordingly they erected temples, or *facella*, to the stars, in which they sacrificed and bowed down before them, esteeming them as a kind of mediators between God and man. Impostors afterwards arose, who gave out, that they had received express orders from God himself concerning the manner in which particular heavenly bodies should be represented, and the nature and ceremonies of the worship which was to be paid them. When they proceeded to worship wood, stone, or metal, formed and fashioned by their own hands, they were led to apprehend, that these images had been, in some way or other, animated or informed with a supernatural power by supernatural means; though Dr. Prideaux imagines, that, being at a loss to know how to address themselves to the planets when they were below the horizon, and invisible, they recurred to the use of images. Dr. Prideaux's Connection, &c. book iii. p. 177. 8vo.

But it will be sufficient to suppose, that they were persuaded that each star or planet was actuated by an intelligence; and that the virtues of the heavenly body were infused into the image that represented it. It is certain, that the sentient nature and divinity of the sun, moon, and stars, was strenuously asserted by the philosophers, particularly by Pythagoras and his followers, (Diogen. Laert. lib. viii. p. 509.) and by the Stoics (Cicero, De Nat. Deor. lib. ii. cap. 15.) as well as believed by the common people, and was indeed the very foundation of the Pagan idolatry. The heavenly bodies were the first deities of all the idolatrous nations, were esteemed eternal, sovereign, and supreme, and distinguished by the title of the natural gods. Thus we find that the primary gods of the heathens in general were Saturn, Jupiter, Mars, Apollo, Mercury, Venus, and Diana; by which we can understand no other than the sun and moon, and the five greatest luminaries next to these. Plutarch expressly censures the Epicureans for asserting that the sun and moon are void of intelligence, whom all men worshipped. Adv. Colotem. p. 1123.

Sanchoniathon (apud Euseb. Præp. Evan. lib. i. cap. 9.) represents the most ancient nations, particularly the Phœnicians and Egyptians, as acknowledging only the natural gods, the sun, moon, planets, and elements; and Plato declares it as his opinion, that the first Grecians likewise held these only to be gods, as many of the barbarians in his time did. In Cratyl. p. 273. F. See also Herodot. lib. i. cap. 131. 238. lib. iii. cap. 16. Diod Sic. lib. i. p. 10, 11. ed. Rhodom. Strab. Geogr. lib. xv. p. 732. Polyb. Hist. lib. vii. p. 699.

IDOLATRY.

p. 699, 700. ed. Gronov. Euseb. Præp. Ev. lib. ii. cap. 2. p. 59. Even Philo (Lib De Somniis) and Origen (in his books Πη Αεχχεν) maintain, that the stars are so many souls incorruptible and immortal. See Farmer on Miracles, chap. iii. § 2.

Besides these natural gods, the heathens believed, that there were certain spirits who held a middle rank between the gods and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. These spirits were called *dæmons*. From this imaginary office ascribed to them, they became the grand objects of the religious hopes and fears of the Pagans, of immediate dependence and divine worship. In the most learned nations, they did not so properly share, as engross the public devotion. To these alone sacrifices were offered, while the celestial gods were worshipped only with a pure mind, or with hymns and praises. As to the nature of these *dæmons*, it has been generally believed, that they were spirits of a higher origin than the human race; and in support of this opinion, it has been alleged, that the supreme deity of the Pagans is called the greatest *dæmon*; that *dæmons* are described as beings placed between the gods and men; and that *dæmons* are expressly distinguished from heroes, who were the departed souls of men. A late ingenious writer has, with great acuteness and erudition, combated this opinion, and maintained, on the contrary, that by *dæmons*, such as were the more immediate objects of the established worship amongst the ancient nations, particularly the Egyptians, Greeks, and Romans, we are to understand beings of an earthly origin, or such departed human souls as were believed to become *dæmons*. This, he says, is a fact attested by all antiquity, whether Pagan, Jewish, or Christian. He appeals to the testimonies of the heathen historians, poets, and philosophers, and to the nature of the worship paid to the heathen deities. He examines the authority of the Old Testament writers; of the authors of the Septuagint version; of Philo and Josephus; of the New Testament; and of the Christian fathers. For a farther view of the matterly manner in which this argument is treated, see Farmer on Miracles, chap. iii. § 2. passim. Farmer on *Dæmoniacs*, § 2. See *DÆMON* and *MIRACLES*.

Voltaire, in the art. *Idols*, Encyclopédie, labours to vindicate the heathens in general from the charge of idolatry. He says, that there has not existed any people on earth who assumed the name of idolaters; and that no such term is found in Homer, or Hesiod, or Herodotus, or any author of the Pagan religion; and that no law was ever enacted, requiring the ultimate worship of idols. The Greeks and Romans, he says, were gentiles and polytheists, but not idolaters; they worshipped the gods by means of these images, and not the images themselves; and were no more chargeable with idolatrous worship than the votaries of the Romish church. He also extends his laboured and spirited vindication to the Persians, Sabians, Egyptians, Tartars, and Turks; and observes, that it is an abuse of terms to call those people idolaters who worship the sun and stars, &c.

Although the Hindoo inhabitants of the East Indies deny the charge of idolatry, using the same description of arguments that are so inconclusively urged by European practitioners of that dangerous species of adoration, in defence of image worship, it is still evident that the mass of the Hindoos are addicted to gross idolatry. Scarcely were the gods of Rome more numerous, certainly less whimsical and monstrous, than their brethren, or perhaps parents, at Bernes. It is, however, reasonable to conclude, that among the thinking portion of both cities were many individuals who, contemplating, although unaided by revelation imper-

fectly, the attributes of the archetype, contemned the artifices by which priestcraft had contrived to direct the worship of their deluded flock, to types and symbols; thus rendering mysterious what is in itself plain, that the initiated alone might possess the key of the mystery they had invented and taught; be the interested medium through which the deity must be propitiated, and themselves dimly seen with awe amid the obscurity of their own creating.

In Moor's Hindoo Pantheon are given exact portraits of many scores of deities worshipped, with appropriate ceremonies, and under various forms and names, by different sects of that grossly superstitious race. Some of these portraits are of images colossal, to a degree perhaps unequalled by any existing statues. (See the article *JAINA*.) Of others, exceedingly diminutive, some are of metallic casts, and apparently extremely ancient, which exhibit every gradation of art from the rudest imaginable specimen, up to a very respectable portion of skill; and even to elegance of form, and to ease and expression of attitude.

Some writers on the religious or superstitious practices of the East Indians, have related, that certain of their deities must, or must not, be of this or that metal or wood: but admitting that the Hindoos recognize practically the notion that *ex quovis ligno*, &c. Major Moor, in his Hindoo Pantheon, proves that the particulars related on that point are erroneous; as he has seen, and indeed gives frequent examples of images made of the very material that, in respect of such individual deity, was said to be unlawful. Another point, too, connected with this subject, he has corrected: for, prior to the publication of the Hindoo Pantheon, and indeed since, it has been asserted that the Hindoos admit no image of Brahma, the personification of the deity's creative power. (See *BRACHIMANS* and *SIVA*.) This is not true of Brahma; of him several representations from images are given in that work: but of Brahm, the deity, the one omnipotent, of whose attributes or powers Brahma, Vishnu, and Siva are personifications, no images or representations are extant among the Hindoos. In their scripture, the Veda, (see *VEDA*,) it is declared, that "of Him whose glory is so great, there is no image." The word "image" is not, perhaps, in this instance, to be taken in its most confined sense.

This awful reverence of the deity prevails, it may be said, throughout and beyond India, in prevention of any "graven image or likeness" of him being attempted, and we cannot but think the interdiction grounded on that feeling highly salutary. Among the Mahometans, indeed, the reverential feeling is carried farther, and to an extent not perhaps necessary; for as well as all representation of the person of God, the prohibition extends also to that of the prophet, and no picture or statue of Mahomet is in existence.

It is, to return to Hindoo idols, a circumstance very creditable to the exterior morality of that extraordinary people, that no indecent exhibitions are even witnessed in their mythological delineations or sculptures. Major Moor says, (*Hin. Pan.* page 383.) that among the hundreds, perhaps thousands, of mythological subjects that came under his notice within the last few years of his residence in India, not one was, in any respect, offensive to decency. Such images, he believes, are never seen in India; at any rate they are certainly very rare, or among so many subjects some instance of their existence must have occurred. The Linga and Yoni even, however gross abstractedly, are not indecently represented; their allusions are not obtrusive, but are veiled in mysterious decency, and must, thus happily hidden from the vulgar eye, be extorted by philosophical curiosity. See *LINGA* and *YONI*.

The principal causes that have been assigned for idolatry are,

are, the indelible idea which every man has of God, and the evidence which he gives of it to himself; an inviolable attachment to the senses, and a habit of judging and deciding by them, and them only; the pride and vanity of the human mind, which is not satisfied with simple truth, but mingles and adulterates it with fables; the ignorance of antiquity, or of the first times, and the first men whereof we have but very dark and confused knowledge by tradition, they having left no written monuments or books; the ignorance and change of languages; the style of the oriental writings, which is figurative and poetical, and personifies every thing; the superstition, scruples, and fears, inspired by religion; the flattery of writers; the false relations of travellers; the fictions of poets; the imaginations of painters and sculptors; a smattering of physics, that is, a slight acquaintance with natural bodies and appearances, and their causes; the establishment of colonies, and the invention of arts, mistaken by barbarous people; the artifices of priests; the pride of certain men, who have affected to pass for gods; the love and gratitude borne by the people to certain of their great men and benefactors; and finally, the Scripture themselves ill understood. One great spring and fountain of all idolatry, in the four quarters of the globe, says sir William Jones (*As. Res.* vol. i. p. 426.) was the veneration paid by men to the sun, or vast body of fire, which "looks from his sole dominion like the god of this world;" and another, the immoderate respect shewn to the memory of powerful or virtuous ancestors and warriors, of whom the sun and the moon were wildly supposed to be the parents. See IMAGE.

· IDOLKA, in *Geography*, a town of Lithuania, in the palatinate of Troki; 26 miles S.W. of Troki.

· IDOLOPŒIA, *Ἰδολοποιία*, in *Rhetoric*, a species of prologopœia, where dead persons are supposed to speak.

· IDOLOTHYTA, *Ἰδωλοθύτα*, things offered in sacrifice to idols; concerning the use of which, the apostle Paul lays down rules in 1 Corinth. chap. viii. ver. 4, 7, and 10.

· IDOLS, *Islands of*, in *Geography*, a cluster of small islands in the Atlantic, near the coast of Africa. N. lat. 8° 50'.

· IDOMENÆ, in *Ancient Geography*, a town of Macedonia, placed by Ptolemy in Emathia, and represented by Hierocles as an episcopal city.

· IDOMENT, in *Geography*, a town of European Turkey, in the province of Macedonia; 26 miles N.N.E. of Edeffa.

· IDRA, a small island in the Adriatic. N. lat. 44° 6'. E. long. 15° 28'.

· IDRAULICO, *Ital.* a word expressing every kind of sonorous instrument, the tones of which are produced by the compression of the air by water. See HYDRAULICON.

· IDRE, in *Geography*, a town of Sweden, in Dalecarlia; 120 miles N.W. of Fahlun.

· IDRIA. See HYDRIA.

· IDRIA, *Ban of*, a district of Carniola, immediately subject to the chamber of Inner Austria, at Gratz. The quicksilver mines of Idria are celebrated in natural history, poetry, and romance. They were discovered in the year 1499; and the hill of Vogelberg has annually yielded more than 300,000 pounds weight of mercury. The common ore is cinnabar; but sometimes the pure quicksilver runs through the crevices. Idria is surrounded with woody hills; and the Vogelberg on the E. produces oaks and broom, while the interior consists of red clay, calcareous rock, and a black soft slate, which covers the metallic veins in a southern direction. The deep descent is by ladders and stairs of stone; and the length of the galleries is computed at 316 paces, or 1580 feet. The operations in these vast mercurial caverns being pernicious to health, are sometimes allotted as a punishment to criminals.

· IDRO, in *Geography*, a town of Italy, in the department of Meia, on a lake; 16 miles N.N.E. of Brescia.

· IDSTEIN, a town of Germany, in the principality of Nassau-Weilburg; 12 miles N. of Meintz. N. lat. 50° 12'. E. long. 8° 12'.

· IDSU, a province of Japan, on the S. coast of the island of Nippon.

· IDSUME, a town of Japan, in the island of Nippon; 140 miles W.N.W. of Meaco. N. lat. 34° 95'. E. long. 131° 50'.

· IDULIA, in *Antiquity*, certain eggs offered to Jupiter on the ides of every month. They were so called from their being offered on the ides.

· IDUMÆA, in *Ancient Geography*, or *Land of Edom*, a country of Asia, on the confines of Palestine and Arabia, or rather comprehending parts of Palestine and Arabia; having Judea on the N., Egypt and a branch of the Red sea on the W., the rest of Arabia Petræa on the S., and the desert of Arabia on the E. Its extent varied in different periods of time. Esau, or Edom, from whom it derived its name, and his descendants, settled along the mountains of Seir on the E. and S. of the Dead sea, from whence they spread themselves by degrees through the W. part of Arabia Petræa, from that sea quite to the Mediterranean. (See EDOM.) In the time of Moses, Joshua, and even of the Jewish kings, they were hemmed in by the Dead sea on one side, and the Eleanitic gulf on the other; but during the Jewish captivity at Babylon, they advanced further N. into Judea, and spread themselves as far as Hebron in the tribe of Judah, taking possession of what had formerly been the whole inheritance of the tribe of Simeon, and half of that which had been the inheritance of the tribe of Judah; till at length going over to the religion of the Jews they became incorporated with them into the same nation. Josephus gives this account of their conversion. Hyrcanus took also Adora and Marissa, cities of Idumæa; and having subdued all the Idumæans, he permitted them to remain in the country, upon condition that they would be circumcised and use the Jewish laws, and submit to live in every respect as Jews. From that time, in the 129th year B.C., they became Jews. Strabo, and after him many later geographers, had divided it into Eastern and Southern Idumæa, with regard to its situation from Palestine. The capital of the former was called "Bozrah," or "Bosra," and that of the latter "Petra," or "Jasael." Josephus, with regard to its extent at different periods, distinguishes it, when at the longest, by the epithet of "Great," in opposition to its more narrow boundaries, and places Hebron among the Idumæan cities. He seems also to distinguish between Lower and Upper Idumæa; but, upon the whole, the country is represented as hot, dry, mountainous, and in some parts barren; the mountains exhibiting dreadful rocks and caverns like the southern part of Judah, which is called a desert, full of such rocky recesses and caverns, which became the lurking-places of thieves and banditti. Concerning its ancient history, see the article EDOM.

Of this country little has been said by modern geographers and travellers, except that it lies mostly waste and uncultivated. It is inhabited by wild Arabs, with whom Europeans have little or no intercourse. The country is now in possession of the Turks; though it doth not appear that they keep any garrisons in it, except on the sea-coast, for securing the road between Egypt and Palestine. Among the castles mentioned by travellers is Larissa, to which we may add Şalka, near the frontiers of Egypt, the residence of the

pacha of this province. The Turks keep foldiers also at Tina, a town on the sea-shore ; Catio, a garrisoned castle, where a toll is exacted from all merchants and passengers, situated in a desert ; Tor, a small sea-port and castle near the straits of Suez, where an aga commands the garrison.

IDYLLION, in *Poetry*, a little poem, containing the description or narration of some adventures.

The word is derived from the Greek *ιδυλλιον*, diminutive of *ιδος*, *figure, representation* ; because this poetry consists in a lively natural image or representation of things.

The learned bishop Lowth, in his " *Praelectiones, &c.* " defines an idyllion to be a poem of moderate length, of an uniform, middle style, chiefly distinguished for elegance and sweetness ; regular and clear as to plot, conduct, and arrangement.

Theocritus is the oldest author who has written idyllions. The Italians imitate him, and have brought the idyllion into modern use.

The idyllions of Theocritus have a peculiar delicacy ; they appear with a clownish, rustic kind of simplicity, but are full of the most exquisite beauties ; they seem drawn from the breast of nature herself, and to have been dictated by the graces.

The idyllion is a kind of poetry which paints the objects it describes ; whereas the epic poem relates them, and the dramatic acts them. The modern writers of idyllions do not keep up to that original simplicity observed by Theocritus ; the people of our days would not bear an amorous fiction, resembling the awkward gallantries of our peasants. Boileau observes, that the shortest idyllions are usually the best.

The modern idyllions differ from those of the ancients, by introducing none but allegorical shepherds or courtiers disguised in their dress ; whereas those of the ancients represent true shepherds. Mr. Hardion observes, that the taste of the present age is so very different from that of the ancients in this respect, that he would not take upon him to give a literal translation of Theocritus's idyllions ; not that he reckons them bad in themselves, nor that he condemns the rules followed in their composition ; but because the rules that were good at the time those poems were written, would, in the present age, be relished but by very few.

The subject of idyllions, as being low of itself, requires the greatest elegance of diction to set it off. Mr. Hardion is of opinion, that Theocritus has the advantage of Virgil in this respect ; observing always the structure peculiar to pastoral poems, which constitutes one of its chief beauties. This structure requires that the fourth foot of every verse should be a dactylus, and sometimes also the first, when it can be done without affectation. Besides, it is also necessary that these dactyli should be made without any caesura following ; and, if possible, there should be a rest in the sense after each dactyle, which would add greatly to the regularity and perfection of each verse. Such are the following verses of Theocritus and Virgil :

" *Εἶπε μοι, ὦ Κορυδαῖν, τίνας αἰ βροεῖς καὶ Φιλωνδα.* "
 Theoc. Idyl. iv. ver. 1.

" *Dic mihi, Damata, cujum pecus ? An Melibæi ?* "
 Virg. Ecl. iii. ver. 1.

This structure in pastoral poems gives a vivacity, which is wonderfully pleasing in the mouth of a shepherd. These rules are observed by Theocritus with all the exactness possible ; but by Virgil seldom ; which is rather to be imputed to the genius of the Latin tongue than his want of ability ;

it being less copious, bold, and pliant, than the Greek. Mem. Acad. Inscript. tom. vi. p. 255, 256.

The invention of the idyllion is ascribed to Daphnis, who, by his extraordinary genius, says Diodorus Siculus, " invented the bucolic poem and song, in the form it continues to appear in at present in Sicily." This passage is considerable, as it fully ascertains the origin of the idyllion, such as it appears in Theocritus, and those that have imitated him.

After Daphnis, another Sicilian shepherd, called Diomus, made himself famous for his pastoral poems. Next came Stesichorus, who, according to Ælian, was the first that made the misfortunes of Daphnis the subject of his songs. He lived, as some chronologers will have it, in the time of Phalaris, about 550 years before the vulgar era ; and lastly, some ages after this Theocritus appeared, who, forming himself on these first models, so far excelled as to give pastoral poetry all the perfection it was capable of receiving. Mem. Acad. Inscript. tom. ix. p. 101.

Bishop Lowth, already cited, produced from the writings of the Hebrews many perfect examples of this kind of poem. The first of those poems which deserve notice are the historical psalms, in celebration of the power and other attributes of the Deity, manifested in the miracles which he performed in favour of his people. One of the principal of these occurs in the 78th psalm ; the style of which is simple and uniform, but the structure is poetical, and the sentiments occasionally splendid. Of a similar kind are the 105th and 106th psalms, very much resembling the 78th, as well in the subject as in the style. The mixture of ease and grace, displayed in the exordium, is the same in all. These psalms, both in plot and conduct, bear a surprising analogy to the hymns of the Greeks ; a species of poetry which was in very early use among them, and almost entirely appropriated to the celebration of their religious rites. The subjects in general were the origin of the gods, the places of their birth, their achievements, and the other circumstances of their history. Such are all the poems of this kind now extant in the Greek ; such are the elegant hymns of Callimachus, as well as those which are attributed to Homer. The poem of Theocritus, entitled the " *Diofcouri,* " or the praise of Castor and Pollux, is also a genuine hymn, and very elegant in its kind ; nor is it improperly classed among the Idyllions, which include all of this species. The 136th psalm may be referred to the class of those of the historical kind. The exordium commences with this well known distich :

" *Glorify JEHOVAN, for he is good ;*
 For his mercy endureth for ever : "

which, according to Ezra (iii. 10, 11.), was commonly sung by alternate choirs. Here the latter line of the distich, being added by the second choir, and subjoined to every verse (which is a singular case), forms a perpetual Epode. Hence we may collect the whole nature and form of the intercalary verse, or burthen of the song ; which expresses in a clear, concise, and simple manner some particular sentiment, that seems to include virtually the general subject or design of the poem ; and it is thrown in, at proper intervals, according to the nature and arrangement of it, for the sake of impressing the subject more firmly upon the mind. That the intercalary verse is perfectly congenial to the Idyllion, is evident from the authority of Theocritus, Bion, Moschus, and even of Virgil. The 107th psalm may be undoubtedly enumerated among the most elegant monuments of antiquity ; and it is chiefly indebted for its elegance to the general plan and conduct of the poem. Another example might

might be selected from Isaiah; for by uniting the conclusion of the ninth chapter with the beginning of the tenth, ingeniously separated by the common division into chapters, we shall find a complete and connected prophecy against the kingdom of Israel or Samaria. (Is. ix. 8. x. 4.) It is replete with terror and solemnity, and possesses a degree of force and sublimity to which the Idyllium seldom rises; though it preserves the form of the Idyllium so perfect and express, that it cannot with propriety be referred to any other class. Besides the instances already mentioned there are others, and probably not a few (in the book of Psalms particularly), which may be equally accounted of the Idyllium species. To this class belong more especially those in which some particular subject is treated in a more copious and regular manner than is usual in compositions strictly lyric. Such is the 104th psalm, in which the poet embellishes his noble subject with the clearest and most splendid colouring of language; and with imagery the most magnificent, lively, diversified, and pleasing, at the same time select, and happily adapted to the subject. Nothing, says our learned author, of the kind extant, can be conceived more perfect than this hymn, whether we consider it with respect to its intrinsic beauties, or as a model of that species of composition. The Greek hymns consisted chiefly of fables, and these fables regarded persons and events, which were neither laudable in themselves nor greatly to be admired: "indeed," says the ingenious prelate, "I do not recollect any that are extant of this sublime nature, except that of the famous stoic Cleanthes, which is inscribed to Jove, that is, to God the Creator, or, as he expresses himself, "to the Eternal Mind, the Creator and Governor of nature." It is doubtless a most noble monument of ancient wisdom, and replete with truths not less solid than magnificent."

The hymn of David, just mentioned, deservedly occupies the first place in this class of poems; and that which comes the nearest to it, as well in the conduct of the poem as in the beauty of the style, is the 139th psalm, which, though perhaps excelled by the former in the plan, disposition, and arrangement of the matter, is not in the least inferior in the dignity and elegance of the figures and imagery.

IDYMA, or IDYMUS, in *Ancient Geography*, a town and also a river of Asia Minor, in Caria; called *Idimus* by Ptolemy.

IDYRUS, a town and river of Asia, in Pamphylia.

JEACOCK, SAMUEL, in *Biography*, brother to the celebrated president of the Robin-Hood society, was by trade a baker, and carried his loaves to his customers on his own shoulders. He would not have been mentioned here among musical dilettanti merely for being fond of music, but for a peculiar talent of which we have never known any other person possessed. This worthy tradesman played a little on several instruments, but chiefly the tenor; and at the Madrigal society, established in his time, he used to sing the base part. He was an excellent judge of instruments played with the bow; their strings, tone, and construction; found out their defects, and often cured them. He was one of the best ringers and swimmers of his time; and even when in years, was very expert in other manly exercises. But his most extraordinary talent was the being able, without knowing the names of the keys of the harpsichord, to play upon it, with his 10 fingers, without the least hesitation, any number of changes in a peal of 10 bells, which changes amounted to 3,628,800. After seeing as well as hearing this astonishing performance on our own instrument, we tried to express, in musical notation, the changes in favourite peals on eight or ten bells, but were totally unable to play them even with the notes before us,

or to meet, among the greatest performers on the harpsichord, with any one that could. The melodies produced by these changes are so wild and unlike any thing to which the hand or the eye is accustomed, that they are as difficult to a consummate master, as the first tune to a child who has just learned the gammut. See BELLS and CHANGES.

JEALOUSY, in *Ethics*, is that peculiar uneasiness which arises from the fear that some rival may rob us of the affections of one whom we greatly love, or suspicion that he has already done it. The first sort of jealousy is inseparable from love, before it is in possession of its object; the latter is often unjust, generally mischievous, always troublesome.

JEALOUSY, *Waters of*. See WATERS.

JEAN, ST., in *Geography*, an island of Switzerland, in Bienné lake.—Also, a town of Canada, on the left bank of St. Laurence. N. lat. 46° 39'. W. long. 71° 33'.—Also, a town of Canada, on the right bank of St. Laurence. N. lat. 47° 12'. W. long. 70° 12'.

JEAN d'Angely, St., a town of France, and principal place of a district, in the department of the Lower Charente. The place contains 5400, and the canton 13,827 inhabitants, on a territory of 222½ kilometres, in 20 communes. The chief article of trade in this place is brandy, and it has a manufacture of woollen stuffs. N. lat. 45° 59'. W. long. 0° 25'.

JEAN d'Aulph, St., a town of France, in the department of the Leman, and chief place of a canton, in the district of Thonon. The place contains 1918, and the canton 6344 inhabitants, on a territory of 187½ kilometres, in 6 communes.

JEAN de Bournay, St., a town of France, in the department of the Isère, and chief place of a canton, in the district of Vienne; 12 miles E. of Vienne. The place contains 2848, and the canton 11,733 inhabitants, on a territory of 237½ kilometres, in 14 communes.

JEAN de Breveley, St., a town of France, in the department of Morbihan, and chief place of a canton, in the district of Ploermel. The place contains 2573, and the canton 11,337 inhabitants, on a territory of 262½ kilometres, in 7 communes.

JEAN de Daye, a town of France, in the department of the Channel, and chief place of a canton, in the district of St. Lô. The place contains 124, and the canton 8197 inhabitants, on a territory of 132½ kilometres, in 17 communes.

JEAN du Gard, a town of France, in the department of the Gard, and chief place of a canton, in the district of Alais. The place contains 3203, and the canton 5101 inhabitants, on a territory of 87½ kilometres, in 3 communes.

JEAN de Lofne, a town of France, and principal place of a district, in the department of the Côte d'Or; 15 miles S.E. of Dijon. N. lat. 47° 5'. E. long. 5° 19'.

JEAN de Luz, St., a sea-port town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the district of Bayonne, situated in the bay of Biscay; the harbour of which has lately been improved; 10 miles S.W. of Bayonne. The place contains 2553, and the canton 8457 inhabitants, on a territory of 155 kilometres, in 9 communes. N. lat. 43° 23'. W. long. 1° 35'.

JEAN de Maurienne, St., a town of France, and chief place of a district, in the department of Mont Blanc, lately capital of a county in Savoy, and the see of a bishop, near the union of the rivers Arve and Aral: besides the cathedral it has two parish churches and a convent; 27 miles S.E. of Chambéry. The place contains 2258, and the cantons

17,453 inhabitants, on a territory of 440 kilometres, in 20 communes. N. lat. 45° 16'. E. long. 6° 16'.

JEAN *du Mont*, a town of France, in the department of the Vendée, situated near the sea-coast; 7 miles W.S.W. of Challons.

JEAN *Pied-de-Port*, *St.*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the district of Manleon, having a citadel on a rock, at the entrance of one of the passages of the Pyrenées; 12 miles S.E. of Bayonne. The place contains 1286, and the canton 8205 inhabitants, on a territory of 417½ kilometres, in 20 communes. N. lat. 43° 9'. W. long. 1° 10'.

JEAN *en Rayans*, a town of France, in the department of the Drôme, and chief place of a canton, in the district of Valence; 18 miles E.N.E. of Valence. The place contains 2808, and the canton 6791 inhabitants, on a territory of 232½ kilometres, in 10 communes.

JEAN *de Soleynick*, *St.*, a town of France, in the department of the Loire, and chief place of a canton, in the district of Montbrison; 7 miles S. of Montbrison. The place contains 574, and the canton 7964 inhabitants, on a territory of 180 kilometres, in 16 communes.

JEAN *de Vergé*, *St.*, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Périgueux. The place contains 786, and the canton 9098 inhabitants, on a territory of 277½ kilometres, in 18 communes.

JEAN *de Vertus*, *St.*, a town of France, in the department of the Isère; 24 miles S.S.E. of Grenoble.

JEAN-CAPELLE, in *Ichthyology*, a name given by Ruysch, and some others, to the fish called by authors the *faber Indicus*, or Indian doree; and more expressively named by Artedi the zeus with a forked tail.

JEAN-DE-BARRE, in *Geography*, an island of Africa, in the kingdom of Senegal, about 15 miles in circumference.

JEANNIN, PETER, in *Biography*, was born in 1540, and brought up to the profession of the law. He was, at an early age, appointed advocate in the parliament of Burgundy, and soon distinguished himself by his eloquence and force of reasoning. He was afterwards appointed agent for the affairs of the province. In this situation he nobly resisted, with all his power, the order for perpetrating, at Dijon, the massacre of the Protestants on St. Bartholomew's day, which took place in Paris and other cities. This was particularly meritorious in him who was a most zealous Catholic, so much so that he joined the leaguers in support of their religion; a circumstance which proved highly serviceable to the kingdom; for, being deputed by the duke of Mayenne to negotiate with Philip of Spain, the declared protector of the league, he soon discovered that the real design of that prince, in supporting the civil war in France, was to gain possession of some of its best provinces. On his return, therefore, he exerted himself to detach the duke from the Spaniards, and to acknowledge his lawful sovereign. Henry IV. made him a member of his council, and kept him at his court, where nothing was undertaken without his advice. He died at the age of 82, in the year 1622. This respectable man witnessed the succession of seven kings to the throne of France. His *Memoirs and Negotiations* were published, in 1659, at Paris, in folio; but they have since been printed in four volumes 12mo. They are regarded as excellent guides for the management of important and difficult concerns. Moreri.

JEAN-RABEL, in *Geography*, a town of the island of Hispaniola, at the mouth of a river on the N.W. coast; 10 miles N.E. of St. Nicholas Mole. N. lat. 19° 56'. W. long. 74°.

JEATPOUR, a town of Bengal; 20 miles N. of Kishinagar.

JEBAKSHOUR, a town of Turkish Armenia; 45 miles S. of Arzenagan.

JEBARA CUNACA, a town of Japan, in the island of Nippon; 20 miles N.N.E. of Jedo.

JEBB, SAMUEL, M.D., in *Biography*, a man of learning, and editor of several works, was born at Nottingham. He was entered of Peterhouse, Cambridge, and, imbibing the sentiments of the non-jurors, he accepted the office of librarian to Jeremy Collier. During his residence in college, he published a translation of "Martin's Answers to Emelyn," 1718; and an edition of "S. Justini Martyris Dialogus cum Tryphone," Gr. Lat. 8vo. Lond. 1719. When he quitted Cambridge he married the daughter of an eminent apothecary in London, who gave him instructions in pharmacy. Still, however, he continued his literary pursuits; and in 1722 undertook the editorship of a periodical work, entitled "Bibliotheca Literaria," which only extended to 10 numbers, notwithstanding it was supported by the contributions of several distinguished scholars. He likewise edited the following works: "De Vita et Rebus gestis Mariæ Scotorum Reginae," 8vo. 1725, which was compiled from original records and authors of credit; "Aristidis Orationes, cum Notis," in two volumes 4to. Oxford, 1728, which is a valuable edition of this Greek orator; "Joannis Cæii Britanni de Canibus Britannicis, de variorum Animalium et Stirpium, &c. de Libris propriis, de Pronunciatione Græcæ et Latine Linguae," 8vo. 1729; "Baconi Opus Majus," folio, 1733; "Hodii Lib. ii. de Græcis illustribus, &c." 8vo. 1742; to which he prefixed a Latin dissertation on the life and writings of the author. It is not known at what period Mr. Jebb received the degree of M.D. He settled at Stratford, in Essex, and continued to practice medicine there till late in life, when he retired, with a moderate fortune, into Derbyshire, where he died in 1772. Gen. Biog. Nichols's Anecdotes of Bowyer.

JEBB, Sir RICHARD, Baronet, M.D. was born at Stratford, in Essex, where his father, the subject of the preceding article, practised as a physician. He had a liberal classical education at Oxford; but being by principle a non-juror, from his father, he could not be matriculated, nor take any degree at that university. He afterwards studied medicine in London and in Leyden; and from the university in the latter city he obtained the degree of doctor of medicine. Upon settling in London he entered as licentiate of the College of Physicians; and in the year 1768 he was elected a fellow of that body. He was for some time physician both to St. George's hospital, and to the Westminster infirmary. As a practitioner he became so eminent, that when the duke of Gloucester fell dangerously ill in Italy he was requested to go abroad to attend the health of that prince; and on this occasion his conduct gave so much satisfaction that he was called abroad a second time to visit the same prince, on a future illness, in 1777. About this time he was made physician-extraordinary to the king; and in 1780 was appointed physician in ordinary to the Prince of Wales. He not only held these offices about the royal family, but was for several years one of the physicians chiefly employed by them. Upon the death of Sir Edward Wilmot, in 1768, he was appointed one of the physicians in ordinary to his majesty; but this office he did not enjoy many months; for, being in attendance on two of the princesses, who were affected with the measles, he was suddenly attacked with a fever in their apartments at Windsor, and fell a victim to the disease, after a few days' illness, on the 4th day of July, 1787, in the 58th year of his age.

Jebb, John, an eminent scholar, divine, and physician, was the eldest son of the Rev. John Jebb, dean of Cathell, sprung from a family in Nottinghamshire, and was born at London in the year 1736. Having finished his early education at several schools in England and Ireland, he was admitted a pensioner of Trinity-college, Dublin, in 1753, and in the following year entered at St. Peter's college, Cambridge, where, in 1757, he took the degree of B.A., and commenced the office of private tutor. In 1760 he proceeded to the degree of M.A. and was confirmed fellow. In 1762 he received deacon's orders, and in the following year those of priest. He was elected by the university to the rectory of Ovington, in Norfolk, in 1764, and in the same year married Ann, daughter of the Rev. J. Torkington and of lady Dorothy Sherrard, with whom he lived in happy union of sentiment and affection to the time of his death. In 1765 he published, in conjunction with two friends, *viz.* the Rev. Robert Thorpe and the Rev. George Wollaston, a work held in high estimation at Cambridge and elsewhere, and entitled "Excerpta quædam à Newtoni Principiis Philosophiæ Naturalis, cum notis Variorum," 4to. On the return of our author to Cambridge in 1766, he commenced an important era of his life. Resuming his office as private tutor, and reading occasional lectures, he entered with ardour into the concerns of the university. In 1768 he began a course of lectures on the Greek Testament, in the prosecution of which he avowed opinions of a very liberal kind; and in his political sentiments he ranked himself among the advocates for popular measures. In both these respects he became the undilguised and zealous advocate of reformation both in church and state. Having in 1769 been presented to the vicarage of Flixton, near Bungay, and to the united rectories of Homersfield and St. Crois, and being also nominated chaplain to his wife's relation, the earl of Harborough, he from this time divided his residence for some years between Bungay and Cambridge. In 1770 he published a "Short Account" of his theological lectures, which had subjected him to some obloquy, and in 1772 he re-edited this "Account" with large additions. About this time he took an active part with those who fought relief in the matter of ecclesiastical subscription, and appeared as an advocate of the cause in the Whitehall Evening Post, under the assumed appellation of "Paulinus." His letters were collected in a pamphlet, published in 1772. He was also anxious for the improvement of academical education in Cambridge; with a view to which he wished to establish annual examinations. But all his liberal efforts and plans proved ineffectual with regard to their main object, although it has been thought that they were not altogether fruitless as to their general influence on the state of the university. Soon after this time, Mr. Jebb, actuated by an integrity and zeal which did him great honour, determined to withdraw from the public service of a church, the established doctrines of which he disapproved; and accordingly in September 1775, he resigned all his livings, and in September 1776, he finally left Cambridge. He was now entering anew, as it were, into life; and with a view to an honourable and useful mode of exercising his talents, and of procuring a subsistence, he determined, under the advice of his relation sir Richard Jebb, to assume the medical profession. The necessary qualifications it would not require much time to attain, when we consider the comprehensive mind and the indefatigable assiduity of Mr. Jebb; and therefore after devoting his attention for some time to the studies connected with the profession which he had in view, he obtained in 1777 a diploma of M.D. from St. Andrews, and was admitted a licentiate of the London college, and commenced practice in

February 1778, pursuing at the same time various means of medical improvement. In this year he was elected a fellow of the Royal Society. In his political career he connected himself with those who were adverse to the American war; and as he was always ardent in every cause which he deemed of importance, his zeal on this occasion obstructed his professional success, though he had many friends who thought highly of his talents, and who much wished to serve him. Of his attention to the duties of his profession he gave evidence to the public in 1782 by a work entitled "Select Cases of the Disorder commonly termed the Paralysis of the Lower Extremities; to which is added A Case of Catalepsy." These cases tend to support the practice of Mr. Pott in applying caustics to the tumour of the spine in the above-mentioned paralysis. The ardour of Dr. Jebb's mind, the assiduity of his application, the various anxieties he felt for the interests of the public, and the fatigues which he underwent in his endeavours to promote them, impaired his bodily health and strength, and reduced him to a state of debility, under the progress of which he sunk, whilst he retained the full exercise of his faculties and benevolent feelings; so that he terminated a course of honourable and active service on March 2, 1786, in the 51st year of his age. His works consist of his "Plan of Theological Lectures;" "A Harmony of the Gospels;" letters on the subject of subscription; sermons and theological tracts; papers relative to the state of public education at Cambridge; of medical cases; and of political and miscellaneous papers. They were collected and published in three large volumes 8vo. in 1787 by Dr. John Disney, who has prefixed memoirs of his life, to which we are indebted for the preceding article.

JEBHAN, in *Geography*, a town of Hindoostan, in Lahore; 55 miles N.N.E. of Behnbur.

JEBINIANA, a town of Tunis; 15 miles S.E. of El Jenine.

JEBNA, a town of Palestine, on the seite of the ancient city of Gath, afterwards called "Ibelin;" 10 miles S. of Jaffa.

JEBUGY, a town on the S. coast of Mindanao. N. lat. 7° 15'. E. long. 122° 55'.

JEBUS, in *Ancient Geography*, an ancient name of Jerusalem; before it was conquered by the Israelites. It was so called from its founder Jebus, son of Canaan, and father of the Jebusites. Josh. xviii. 28. Judg. xix. 11.

JECARINUS PISCIS, in *Ichthyology*, a name given by Gaza, and many other writers, to the fish more commonly called *hepatus piscis*, by some *jecur marinum*.

JECTEHEL, in *Ancient Geography*, a name given to Petra, the capital of Arabia Petrea; said to have been derived from the name of a rock, from the summit of which Amaziah, king of Judah, precipitated 2000 Idumæans whom he had taken in battle.

JECUR. See **LIVER**.

Jecur marinum, in *Ichthyology*, is used by Hermolaus and some other writers in the same sense with hepatus.

Jecur uterinum. The placenta is by some thus called, from the supposed similitude of its figure and office with that of the liver.

JEDBURGH, anciently called *Jedworth*, in *Geography*, a royal borough, and capital town of the county of Roxburgh in Scotland, is pleasantly situated on the banks of the river Jed, and is nearly surrounded with lofty eminences. The town lays claim to remote antiquity. The two Jedburghs, or Jedworths, according to Chalmers, are the oldest parishes in Scotland. As early as the middle of the ninth century, bishop Eborac founded a church and village

on the banks of the Jed, at or near this place. At the commencement of the Scoto-Saxon period a castle was standing here, and the village was advanced to the dignity of a burgh, under the influence of the baron. Malcolm IV. is said to have resided very frequently at this castle, and finished his youthful career at this place in the year 1165. In several charters granted by this monarch, by William and Alexander II., Jedburgh is called "Our Burgh." Other monarchs, and nobles of the first rank, made the castle of Jedburgh a place of residence, and many public acts were executed here; and after the demise of Alexander III. the town, monastery, and castle were involved, for several ages, in bloodshed and devastation. Hamilton, an amiable poet, thus laments the effects of wars, on

— "Jedas ancient walls, once seat of kings."

In 1147, David I. founded a monastery for canons regular at this place, and provided it with ample revenues arising from tithes, "the culture of the mill of Jedworth," and a saltwork. Malcolm IV. augmented these revenues. The bishop of Glasgow, and the abbot of Jedburgh, had many altercations respecting their dignities, liberties, customs, rents, &c. and at length the former obtained a decided ascendancy over the latter. The wars between the Scots, and king Edward I. of England, involved the abbot and his canons in ruin. They were driven from their monastery, and sought refuge in different religious houses in England. At the Reformation, the monastery became the property of the king by annexation. A convent of Carmelites was founded here in 1513. Besides the town of Jedburgh, the parish comprehends a large district, which is divided into three parts by the intervention of the parishes of Abbot-rule and Oxnam. The lower division, on both sides of the river, forms the principal part of the parish; the second contains the district of old Jedburgh; and the third, or upper part, laying on the east side of the river, and extending to the border mountains, constitutes the barony of Edgarstown. Besides the established church, the town contains three other places of worship; respectively called the Burger-meeting, anti-Burger-meeting, and Relief congregation. Jedburgh is governed by a provost and three bailies, assisted by a select council of the principal inhabitants. Here are a weekly market, and several fairs. The vicinity of the town is noted for its orchards. In 1800 the number of houses was 676, and of inhabitants 3834. Chalmers Caledonia, vol. ii. —Sinclair's Statistical Account of Scotland, vol. i.

JEDNITZA, a town of Hungary, on the borders of Moravia; 30 miles N. of Topoltzan.

JEDO, JEDDO, or *Jeddo*, the capital of Japan, centrally situated on a bay of the same name, on the S.E. side of the chief island Nippon. The houses never exceed two stories, and have numerous shops towards the streets. The harbour is so shallow, that an European ship would be obliged to anchor at the distance of five leagues. The city towards the bay forms the figure of a crescent, and is of such extent, as the Japanese affirm, that it would occupy a person 21 hours to walk round its circumference, which might thus amount to 21 leagues: and they say, that it is seven leagues in length by five in breadth. Thunberg observes, that it is said to be 63 British miles in circumference, and at any rate rivals Pekin in size. A large river, not named by Kämpfer, but by others called Tonkag, passes through the city, and discharges itself into the haven by five streams, over each of which is a bridge: a considerable branch furrounds the castle, and fills its ditches, over which is the principal bridge, called Nipponbas, which is the centre whence roads and distances are measured. These

streams supply several canals. The bridge now mentioned opens on both sides into a long street, 50 paces wide, that traverses the whole city, and that is thronged with passengers, many of whom are richly dressed, and carried in their chairs and palanquins. This city has suffered much from repeated earthquakes, and also from a fire, which, in 1772, is said to have consumed six leagues of it in length, and three in breadth. Since these calamities have occurred the buildings have been improved, the streets have been widened and made to cross one another at right angles, and several palaces, temples, monasteries, and public edifices have been erected in a more beautiful style. The most superb structure is the emperor's palace, which is surrounded with stone walls and ditches with draw bridges, forming of itself a considerable town, which is said to be five leagues in circumference. It consists of three inclosures, the innermost of which is the residence of the emperor, and behind it are magnificent gardens, and the other two are occupied by the princes and lords that compose his court. The police of the town is under the conduct of two governors, who act alternately for a year; and besides, there are several subordinate magistrates who superintend the streets, the tradesmen, handicrafts, &c. who are very numerous, and of various descriptions. Like other Japanese cities, Jedo has neither walls nor fortifications; but it includes a great number of shops and markets, furnished with all sorts of necessaries and merchandize, which are sold at a higher price than in any other city of the empire, on account of the population of the place, and the difficulty of importation. N. lat. 36 30'. E. long. 140°.

JEDOGAWA, a river of Japan, which passes by Osaka, where it is crossed with several bridges of cedar, from 300 to 360 feet in length.

JEDOWITZ, a town of Moravia, in the circle of Brunn; 10 miles N.N.E. of Brunn.

JEEAGUR, a town of Bengal; 43 miles S.S.E. of Curruckpour.

JEEMBAREE, a town of Bengal; 12 miles N.N.W. of Koonda.

JEEMWOREE, a town of Hindoostan, in Oude; 40 miles E. of Fyzabad.

JEER-CAPSTAN, in *Nautical Language*. See CAPSTAN.

JEERS, or JEARS, in a *Ship*, an assemblage of tackles, by which the lower yards of a ship are hoisted up along the mast to their usual station, or lowered from thence as occasion requires; the former of which operations is called *swaying*; and the latter *striking*.

In a ship of war the jeers are usually composed of two strong tackles, each of which has two blocks, *viz.* one fastened to the lower mast-head, and the other to the middle of the yard. The two blocks which are lashed to the middle, or flings of the yard, are retained in this situation by means of two cleats, nailed on each side, whose arms inclose the ropes by which the blocks are fastened to the yard. The two ropes which communicate with these tackles lead down to the deck on the opposite side of the mast, according to the situation of the upper jeer-blocks. The jeers in merchant-ships have usually two large single blocks on the opposite side of the mast-head, and another of the same size in the middle of the yard. The rope, which communicates with these, passes through one of the blocks hanging at the mast-head, then through the block on the yard, and afterwards through the other hanging-block upon the mast. To the lower ends of this rope, on the opposite sides of the mast, are fixed two tackles, each of which is formed of two double blocks, the lower one being hooked to a ring-bolt in the deck, and the upper one spliced or seized into the lower end of the great rope above, which is called the

the tye. By this contrivance the mechanical power of the tackle below is transmitted to the tye, which, communicating with blocks on the yard, readily sways up or lowers it, either by the effort of both jeers at once, on the opposite sides of the mast, or by each of them separately one after another. Falconer.

They say a man is brought to the jeers, when going to be punished at the jeer-capitan. This is done in the following manner; a capitan-bar being thrust through the hole of the barrel, the offender's arms are extended at full length cross-wise, and so tied to the bar; having sometimes a basket of bullets, or some other like weight, hanging by his neck. In this posture he continues till he be either brought to confess some plot or crime, whereof he is suspected; or that he has suffered what he is censured to undergo, at the discretion of the captain.

JEETKA, in *Geography*, a town of Bengal; 28 miles N.N.W. of Dacca.

JEFFERIES, GEORGE, in *Biography*, an English judge, whose name has already been mentioned in some foregoing articles with becoming indignation, was born at Acton in Denbighshire, and educated at Westminster school, after which he removed to the Inner Temple, where he studied the law with great application. By attaching himself to the duke of York (see JAMES II.) he obtained the place of a Welch judge, the honour of knighthood, and the chief-justice of Chester. In 1683 he was appointed chief-justice of the king's bench, and in 1685 lord chancellor. His cruelties on the western-circuit upon the followers of the duke of Monmouth were of the most savage kind: they were, however, quite satisfactory to the king, who merrily (a wretched subject for royal merriment) denominated this particular circuit "Jefferies's campaign." By supporting all the arbitrary measures of the court, he rendered himself so obnoxious to the people, that when James abdicated the throne and fled from the kingdom, he would gladly have followed his master, but being detected in the disguise of a sailor, he was seized, and would have been torn to pieces by the people, had he not been rescued by the civil power: he was afterwards committed to the Tower, where he died in 1689. Hume's Hist.

JEFFERSON, in *Geography*, a county of Kentucky, in America, bounded N. and W. by Ohio river, S. by Nelson county, and S.E. and E. by Shelby; it contains 8395 inhabitants, of whom 2330 are slaves. The chief town is Louisville.—Also, a county of Georgia, formed in 1796 from the counties of Burke and Warren, bordering on Ogechee river, and Briar and Big creeks. It contains 5684 inhabitants.—Also, a county in Tennessee, Hamilton district, watered by several rivers, and containing, together with the county of Coker, 9017 inhabitants, of whom 695 are slaves.—Also, a county of the state of Ohio, bounded S. by the Ohio, and N. by the lake Erie, including the tract called the Connecticut reserve; and containing 8766 inhabitants. Its chief town is Stubenville.—Also, a post-town of Virginia, on the N. side of Roanoke river, 19 miles below the Oconeachey islands. N. lat. 36° 32'.—Also, a town in Grafton county, North Hampshire, containing 112 inhabitants.—Also, a town of Pennsylvania, nine miles from Amity, and seven from Scottville.—Also, a fort in the state of Ohio, situated on a small stream, which falls into the Great Miami, containing about 100 men; 21 miles N. of fort St. Clair. N. lat. 40° 4'.—Also, a fort on the E. bank of the Mississippi, in Kentucky, near the line of the state of Tennessee.

JEFFERY, THOMAS, in *Biography*, son of a respectable merchant, was born at Exeter towards the close of the

seventeenth century. He received his academical education in the seminary under the care of Mr. Joseph Hallet; in connection with whom he afterwards, for some time, preached. In the year 1726 he settled at Little Baddow, in Essex, where he remained but two years, when he returned to his native city. He had already exhibited talents which led his friends to expect much from his future labours, but Death, who pays no regard to superior abilities, took him away while he was still a very young man. His publications, which were chiefly in defence of our common religion, met with the approbation of the wise and the learned, and even extorted high encomiums from his principal antagonist Mr. Anthony Collins. His principal pieces are entitled "The true Grounds and Reasons of the Christian Religion, in opposition to the false Ones, &c.;" "Christianity the Perfection of all Religion, Natural and Revealed, &c." Mr. Jeffery possessed a strong intellect; he devoted himself to the investigation of the scriptures: so absorbed was he in application and thought, that he would go a whole day without his usual meals, and without recollecting that abstinence to which were owing the languor and exhausted spirits which he felt in the evening. He had an expanded, liberal, and candid mind. Dr. Kennicott highly applauded Mr. Jeffery's answers to Collins; and Dr. Doddridge speaks of the writer as having treated the subject of prophecy, and the application of it in the New Testament, more studiously, perhaps, than any one since the time when Eusebius wrote his "Demonstratio Evangelica." Monthly Mag.

JEFFERY, in *Geography*, a town of North Carolina; 40 miles W.S.W. of Halifax.

JEFFERY'S CREEK, a river of South Carolina, which runs into the Great Pedee. N. lat. 34° 8'. W. long. 79° 29'.

JEFFERYS, GEORGE, in *Biography*, was born at Weldon, in Northamptonshire, and educated at Westminster school, and Trinity college, Cambridge, where he obtained a fellowship. He afterwards studied the law as his future profession, but never practised in it. He died in 1755, at the age of 77: he had in the preceding year published his works in a collective form in one volume quarto, containing miscellanies in prose and verse, and among other pieces, the tragedies of Edwin and Merope.

JEFFREY'S LODGE, in *Geography*, a sand-bank on the coast of Massachusetts, between cape Ann and Casco bay, extending from the N.W. to the S.E.; between 42° 40' and 47° 37' 30" N. lat. and between 68° 52' 30" and 69° 45' W. long.

JEGENOE, a small island of Denmark, in Lyngby gulf, containing two villages. N. lat. 56° 59'. E. long. 8° 38'.

JEGNI-BASAR, a town of Asiatic Turkey, in Natolia; 28 miles N. of Mogla. N. lat. 37° 35'. E. long. 28° 12'.

JEGNICAN, a town of European Turkey, in Bulgaria; 12 miles E.S.E. of Sophia.

JEGNI-KEVI, a town of Asiatic Turkey, in Natolia; 24 miles N.N.W. of Degnizlu.—Also, a town of European Turkey, in Romania; 44 miles W.S.W. of Burgas.

JEGNIPANGOLA, a town of European Turkey, in Bulgaria; 70 miles E.S.E. of Dristra.

JEGNISHEHR, a town of Asiatic Turkey, in Natolia; 15 miles S. of Isnik.

JEGNISHEHR, or *Janickere*, a town of Asiatic Turkey, in Natolia, situated near ruins, supposed to be those of Antioch on the Meander; 28 miles W. of Degnizlu.

JEGUN, a town of France, in the department of the Gers, and chief place of a canton, in the district of Auch; 13 miles E. of Condom. N. lat. 43° 45'. E. long. 0° 32'.

The place contains 2050, and the canton 7978 inhabitants, a territory of 215 kilometres, in 16 communes.

JEHAGH. See GIAGH.

JEHANABAD, in *Geography*, a town of Hindoostan, in Bahar. N. lat. 25° 3'. E. long. 83° 58'.

JEHAOUL, a town of Hindoostan, in Moultan; 15 miles W.N.W. of Adjodin.

JEHENABAD, a town of Hindoostan, in Bahar; 20 miles S.S.W. of Patna. N. lat. 25° 12'. E. long. 15° 11'.

JEHOVAH, in *Theology*, one of the scripture names of God; signifying the Being who is self-existent, and who gives existence to others. (See GOD.) When God declared to Moses, that he had not made known his name Jehovah, he does not mean that they were ignorant of him, as God the creator, self-existing; but that he had not revealed this name, which so well expresses his nature, and by which he would be invoked afterwards.

So great a veneration had the Jews for this name, that after the Babylonish captivity they left off the custom of pronouncing it; whereby its true pronunciation was forgotten. They call it *tetragrammaton*, or the name with four letters; and believe that whoever knows the true pronunciation of it, cannot fail to be heard by God. Simon the Just, they say, was the last who was acquainted with it. The author of the Talmud denounces terrible curses against those who pronounce it; they scruple even trying to do it; and pretend that the angels have not this liberty. But it would be endless, and no less unprofitable, to recite the various whims and fancies which the Jews, the Cabbalists, and the Mahometans have indulged with regard to this name, and that of Allah, corresponding to it among the latter. See ADONAI.

JEJUARA, in *Geography*, a town of Hindoostan, in Bahar; 18 miles N.W. of Durbungah. N. lat. 26° 19'. E. long. 85° 50'.

JEJUNE STYLE. See STYLE.

JEJUNUM, the second of the small guts; thus called from the Latin *jejunus*, hungry; because always found empty. See INTESTINES.

JEJURRY, in *Geography*, a town of Hindoostan, in the country of Visapour; 12 miles E. of Poorundar.

JEJURY, a town in the East Indies, near which is an elegant temple, of considerable celebrity among the Hindoos. It is thus described by major Moor in his Hindoo Pantheon. "A handsome temple, dedicated to the worship of an avatara of Siva under the name of Kande Rao, (see KANDEH RAO,) is at Jejury, a town of some extent, about thirty miles to the S.E. of Poona. I have visited this temple. It is situated in a beautiful country, on a high unconnected hill, and has a very commanding and majestic appearance: the temple, surrounding walls, and steps up to it, are well built of fine stone. I have had occasion to remark, and it has also doubtless been remarked by others, that the seats of churches built by the Jesuits are always on the most healthy, beautiful, and picturesque points, evincing the judgment and taste of that wonderful order of men: the same may, I think, be observed of Hindoo temples; generally, after allowing for the necessary proximity of water, the most beautiful the neighbourhood affords.

"The obtrusive importunity of the beggars prevented me from examining this fine temple at Jejury so fully as I wished; indeed, from their officiousness I could scarcely examine it at all. The Brahmans informed me, on subsequent enquiries, that a stone is there, about two feet square, on which are two Lingas (see LINGA), one larger than the other, whence Kande Rao, and I suppose Malfara, his consort, (see MALBARA,) sprang: there are also two images

of him, one of gold, one of silver, and one of silver of Malfara; all richly ornamented on great days, when they are mounted on horseback or on elephants. If, however, there really be such massive images in metal, they could scarcely be carried by a horse. Images of lighter materials are, I apprehend, substituted; or, metallic heads are embodied, armed and arrayed with clothes; and thus carried about or exhibited. I have several of these hollow heads, to which bodies, &c. could easily be appended: I have also several brass masks, some as large as a man's face, that may answer, and, peradventure, may have answered on similar occasions.

"Jejury temple is very rich: it is said to expend half a lak'h (50,000) rupees, about 600*l.* sterling, yearly in the expences and establishment for Kande Rao; horses and elephants are kept for him; he and his spouse are bathed in Gauges water, and rose water, perfumed with *atr*, and decorated with gems. The revenues, like those of most other temples, are derived from houses and lands given by pious people, and from presents and offerings constantly making by all descriptions of votaries and visitors, according to their means, or to their faith, hope, or charity. At the annual jatra, or fair, which commences on the last day of the dark half of the lunar month Chaitra (in January) a lak'h (100,000) or more persons visit Jejury. It is customary to sacrifice a sheep; and the Brahmans assured me, that twenty, or, in particular years, thirty thousand are slain on this occasion, and to the honour and glory of Kande Rao."

In another work the same author more particularly describes Jejury as a pretty large town, but, with the exception of a few shopkeepers and retailers of fruit, vegetables, and such small wares, apparently wholly inhabited by Brahmans and beggars, the latter of whom were exceedingly importunate and troublesome. Were it not for its temple, the town is not deserving particular notice. The ascent to the temple is on the north-eastern side, by a handsome flight of broad stone steps, and being of considerable height, and rather steep, the walk up is somewhat fatiguing: arches are in many places thrown across over the stairs, which have, on each side, frequent buildings of stone of a pyramidal form for lights; others have the appearance of recesses. The inner temple, where the deity is placed, is ancient and not very handsome; but the enclosure is elegant and extensive, beautifully finished with fine stone, and the pavement is also of large flags. The enclosure is open, and commands a fine view of the surrounding country. There is a very large bank, elegantly built with fine stone, a little to the southward of the hill on which the temple stands, which is about two miles from a range of hills that runs in a south-easterly direction.

In this temple are kept many beautiful young women as singers and dancers: from the account received by major Moor on the spot, there were more than two hundred at the time of his visit (1792); such as he saw were very handsome. They are here called *Marty*; which see.

JEKIMABAD, a town of Persia, in the province of Segestan; 60 miles E.N.E. of Bost.

JEKISINOKORI, a town of Japan, in the island of Nippon; 65 miles N.N.E. of Meaco.

JEKYL, Sir JOSEPH, in *Biography*, an English lawyer, was born in Northamptonshire in 1643. Little is known of him in early life, but he distinguished himself in the reign of William III. by a steady attachment to the Whigs. He was appointed one of the managers of the trial of Dr. Sacheverel, and on the accession of George I. he was knighted, made master of the Rolls, and a privy counsellor. He successfully maintained the independence of his office against

the lord chancellor King, in a pamphlet, entitled "The Judicial Authority of the Master of the Rolls stated and vindicated." Sir Joseph was an excellent patriot, a kind and benevolent man: when it was proposed to subsidize foreign mercenaries, he contended that the practice was repugnant to the maxims by which England, in former times, had steered and squared her conduct with relation to her interest abroad; that the navy was the natural strength of Great Britain; its best defence and security: but if, in order to avoid a war, they should be so free-hearted as to buy and maintain the forces of foreign princes, they were never like to see an end to such extravagant expences. On another occasion, when it was proposed by his own friends to prosecute the duke of Ormond for high treason, sir Joseph said, if there were room for mercy he hoped it would be shewn to that noble, generous, and courageous peer, who had in the course of so many years exerted his talents for the good and honour of his country. He died in the year 1738. His brother, doctor Thomas Jekyl, was educated at Trinity college, Cambridge; became vicar of Rowd in Wiltshire, lecturer at Newland in Gloucestershire, and minister of St. Margaret's-chapel, Westminster. He was author of several sermons and tracts; and of an "Exposition of the Church Catechism." Smollett's Continuation.

JEKYL Island, in *Geography*, a small island in the Atlantic, near the coast of Georgia, at the mouth of the Alamaha. N. lat. $31^{\circ} 7'$. W. long. $81^{\circ} 40'$. It is said, that the sound at the mouth of this river will afford safe riding for a dozen ships of 40 guns.

JELALABAD, a town of Hindoostan, in Oude; 18 miles S.E. of Azimgar.—Also, a town in Oude; eight miles S. of Lucknow.—Also, a town in Rohilcund; 42 miles S. of Bereilly.

JELALPOUR, a town of Hindoostan, in Oude; 17 miles N.N.E. of Raat.

JELATGUR, a town of Bengal; eight miles N. of Purneah.

JELLAUL, a town of Hindoostan, in Lahore; 13 miles N.W. of Rotas.

JELENGHIAN, a town of Curdistan; 60 miles S.E. of Van.

JELENY, a town of Bohemia; 14 miles S.E. of Konigingratz.

JELGOVAN, a town of Hindoostan, in Bahar; 17 miles N.N.E. of Bahar.

JELINA, a town of Lithuania; 15 miles S.E. of Lida.

JELIOTTE, in *Biography*, a French vocal performer of great talents and public favour at Paris, which continued undiminished to the end of his life.

He was a native of Berne, of a very good family of that province, and not intended for the profession which he embraced, and which, luckily for the public, his early youth made him prefer to that which would have been more agreeable to his parents, and more besetting their rank in life.

No finger was ever gifted with a finer voice, or knew better how to use it, nor was a better musician than Jeliotte. Though he had been dead 25 years when this article was written, (1780,) the charms of his voice, his taste, and his action were not forgotten, nor the transports by which the public expressed their gratitude, whenever he appeared on the stage.

No one was ever so happy in a great number of friends, or ever better deserved them than Jeliotte. His natural wit, ornamented and polished by his knowledge of the world, and his agreeable personal qualities, made him always sought,

for his own sake, as much as for the diversity and charms of his talents. Laborde.

JELLA, in *Geography*, a town of Birmah, on the Ava; 10 miles S. of Lundfey.

JELLALÆAN, or **GELALÆAN** *calendar, epocha, and year.* See **CALENDAR**, **EPOCHA**, and **YEAR**.

JELLANTRA, in *Geography*, a town of Hindoostan, in the circar of Cicacole; 36 miles S.W. of Ganjam.

JELLASORE, a town of Bengal; 80 miles S.S.W. of Calcutta. N. lat. $21^{\circ} 56'$. E. long. $87^{\circ} 16'$.

JELLASSAR, a town of the province of Agra, on the borders of Dooab; 99 miles S.E. of Delhi. N. lat. $27^{\circ} 25'$. E. long. $78^{\circ} 44'$.

JELLING, a town of Denmark, in North Jutland, formerly a city and the residence of kings; 14 miles N. of Colding.

JELLINGHY, a town of Hindoostan, in Bengal, on the right side of the Ganges; 90 miles N. of Calcutta. N. lat. $24^{\circ} 6'$. E. long. $88^{\circ} 48'$.—Also, a river which is a branch of the Ganges, that separates from the main stream near Jellinghy, and after being joined by another branch about 50 miles N. of Calcutta, forms the Hoogly.

JELLOUD, a town of Hindoostan, in Oude; 10 miles S.S.E. of Fyzabad.

JELLOULAH, a town of Africa, in Tunis; 10 miles N.W. of Cairoan.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper consistence with sugar, or of the strong decoctions of the horns, bones, or extremities of animals, boiled to such a height as to be stiff and firm when cold, without the addition of any sugar. See **Harts' HORN**.

The jellies of fruits are cooling, saponaceous, and acescent, and therefore are good as medicines in all disorders of the primæ viæ, arising from calefcent juices, especially when not given alone, but diluted with water. On the contrary, the jellies made from animal substances are all calefcent, and are therefore good in all cases in which an acidity of the humours prevails: the calefcent quality of these is however in a great measure taken off, by the adding lemon juice and sugar to them. There were formerly a sort of jellies much in use, called *compound jellies*; these had the restorative medicinal drugs added to them, but they are now scarcely ever heard of.

The jelly obtained from the various parts of animals contains a mucous substance, very soluble in water, but not in alcohol; and it may be easily obtained by boiling these animal substances in water, and concentrating the decoction, until, by mere cooling, it assumes the form of a solid tremulous mass. The jelly of harts-horn is extracted by a similar operation, and afterwards rendered white with the milk of almonds. This kind of food, duly scented, is served up at our tables by the name of "blanc-mangé." Jellies are in general restorative and nourishing; that of harts-horn is astringent and emollient. Jellies in general have, in their natural state, no smell, and their taste is insipid. By distillation they afford an insipid and inodorous phlegm, which easily putrefies. A stronger heat causes them to swell up, become black, and emit a fœtid odour, accompanied with white acrid fumes. An alkaline phlegm then passes over, succeeded by an empyreumatic oil, and a little carbonate of ammonia. A spongy coal remains, which is with difficulty reduced to ashes, and affords by analysis muriate of soda and phosphate of lime. Water dissolves jellies perfectly; hot water dissolves a large quantity, as they become consistent only by cooling. Acids and alkalis also dissolve them. The nitric acid disengages, as M. Berthollet has shewn,

shewn, nitrogen gas. For other properties, see GELATIN.

If jelly be concentrated to such a degree as to give it the form of a cake, it is deprived of the property of putrefying; and thus the dry or portable soups are formed, which may be of the greatest advantage in long voyages. The following is a receipt given by M. Chaptal for preparing these cakes: calves feet, 4; leg of beef, 12lbs.; knuckle of veal, 3lbs.; leg of mutton, 10lbs. Let these be boiled in a sufficient quantity of water, and the scum taken off as usual; after which the soup is to be separated from the meat by straining and pressure. The meat is then to be boiled a second time in other water; and the two decoctions, being added together, must be left to cool, in order that the fat may be exactly separated. The soup must then be clarified with five or six whites of eggs, and a sufficient quantity of common salt be added. The liquor is then strained through flannel, and evaporated in the water, both to the consistence of a very thick paste; after which it is spread rather thin upon a smooth stone, then cut into cakes, and lastly, dried in a stove until it becomes brittle; these cakes are kept in well-closed bottles. The same process may be used to make a portable soup of the flesh of poultry; and aromatic herbs may be used as a seasoning, if thought proper. These tablets or cakes may be kept four or five years. When intended to be used, the quantity of half an ounce is put into a large glass of boiling water, which is to be covered, and set upon hot ashes for a quarter of an hour, or until the whole is entirely dissolved. It forms an excellent soup, and requires no addition but a small quantity of salt. The cakes of "hockiac," which are prepared in China, and are known in France by the name of "colle de peau d'ane," are made with animal substances, they are used in disorders of the lungs, in the dose of from half a dram to two drams.

M. Proust, professor of chemistry at Madrid, has published directions for preparing jelly from bones in a work, entitled "An Inquiry into the Means of Improving the Subsistence of the Soldier." In order to obtain this jelly in an expeditious and cheap manner, he directs that the bones should be reduced into powder; which may be very readily done between a pair of toothed iron cylinders, as in the ammoniac works. The bones thus comminuted, are to be boiled in eight or ten times their weight of water for the space of four hours, or till about half the water is wasted, when the liquor will be found on cooling of a due gelatinous consistence. A vessel with a tight cover should be used, that the water may acquire as much heat as possible; but it should not be of copper, as this metal is easily dissolved by animal mucilage. According to the experiments of M. Proust, 5lbs. of the middle part of the bone of a leg of beef, will afford nine pints of jelly; the same quantity of the bone of the joint, 15 pints; of the ribs and spine, 11 quarts; of the rump and edge bone, 13 quarts. Five pounds of mutton bone of every sort together, give 19 pints of jelly. Pig's bones yield a little more, the flavour of which is the most agreeable. In warm weather the liquor must be boiled down somewhat more, if it be intended to assume the same gelatinous consistence when cold; as the same quantity of bone that would afford a quart of jelly in winter, will not yield above a pint and a half, or a pint and a quarter in summer, but then it contains proportionally more nourishment. If this jelly be boiled till it acquires a consistence a little thicker than a syrup, then poured out into plates, and when cold cut into pieces, and dried on a net, it will keep a long time, and be particularly useful at sea. One ounce of this dry portable jelly being soaked in water

for a quarter of an hour to soften it, and then boiled, will make from a pint and a quarter to a quart of jelly, according to the season, and equally as good as that which is fresh extracted. Mr. P. prepares, as he informs us, a very pleasant restorative for the sick, by 1½ ounce of sugar, and a little salt, to 14 or 15 ounces of the jelly, and then making it into an emulsion with 12 sweet and four bitter almonds, and a little orange peel. We shall here add, that Mr. P. chops the refuse bones, before they are ground for extracting the jelly, into pieces about an inch long with a cleaver, then throws them into a kettle of water, and lets them boil for a quarter of an hour. The fat obtained in this manner from 16lbs. of rump and edge-bones weighed, when cold, two pounds; and from the same quantity of the bones of the joints he obtained four pounds of solid fat. This, he observes, when fresh, may be used for various ordinary purposes; when it has been kept for some time exposed to the air, it becomes very good tallow for making candles.

JELLY, *Flax-seed*. See FLAX-SEED *Jelly*.

JELLY, *Oat*, a preparation of common oats, recommended by many of the German physicians in all hectic disorders, to be taken with broth of snails or cray-fish.

It is made by boiling a large quantity of oats, with the husk taken off, with some hartshorn shavings and currants together, with a leg of veal cut to pieces, and with the bones all broken; these are to be set over the fire with a large quantity of water, till the whole is reduced to a fort of jelly, which when strained and cold will be very firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a basin of either of the above-mentioned broths, or any other warm liquor. See GELATIN.

JELLY, *Star-wort*. See STAR-WORT *Jelly*.

JELMO, in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. 74° 8'.

JELMORE, a town of Hindoostan, in the circar of Cicacole; 15 miles N. of Cicacole.

JELNA, a town of Lithuania, in the palatinate of Wilna; 10 miles S.E. of Lida.

JELOLPOUR, a town of Hindoostan; 22 miles N.N.W. of Benares.

JELONGA, a town of Bengal; 13 miles E. of Doefa.

JELPESH, a town of Bengal; 30 miles W.N.W. of Beyhar.

JELPIGORY, a town of Bengal; 40 miles W. of Beyhar.

JELSO, a town of Norway, in the diocese of Bergen; 22 miles N.N.E. of Stavanger.

JELVADI, a town of Asiatic Turkey, in Natolia; 22 miles E. of Ibarteh.

JEMAMA. See IMAMÉ.

JEMAPETTA, a town of Hindoostan, in Barramaul; 12 miles S.E. of Namacul.

JEMARROW, a kingdom of Africa, on the S. side of the river Gambia; 120 miles from the sea; inhabited by Mahometans.

JEMBA, a river of Russia, which rises in the province of Upha, and runs into the Caspian sea. N. lat. 46° 57'. E. long. 54° 39'.

JEMBUT, in the *Materia Medica*, a name used by Avicenna and others, to express the seeds in the pods of the carob-tree, or siliqua dulcis; which they call charub or charnub, and the Greeks ceratium.

JEMME, EL, in *Geography*, a town of Africa, in the kingdom of Tunis, called also Tifdra or Tifdrus. This town abounds with antiquities, such as altars, statues, and

a spacious amphitheatre, in a decayed and mutilated state; 40 miles S.S.E. of Cairoan.

JEMDAR, a town of Hindoostan, in Bahar; 17 miles E. of Hajypour.

JEMLAH, a town of Thibet, which gives name to a district; 230 miles N. of Fyzabad. N. lat. $30^{\circ} 35'$. E. long. $81^{\circ} 33'$.

JEMMAPE, or GEMAPPE, a department of France, being one of the 13 belonging to the region, called the re-united country; formed of portions of Austrian Hainaut, of Brabant, of Liege, and of Namur; W. of the Sombre and Meuse; in N. lat. $50^{\circ} 30'$. The capital is Mons. It contains, in extent of territory, 3865 kilometres, and in population 412,129 persons. It is divided into three districts, viz. Tournay, Mons, and Charleroy, 32 cantons, and 423 communes. Tournay has 165,988 inhabitants, Mons 138,533, and Charleroy 107,608. The total of contributions is 3,158,038 francs, and for expences, administration, judiciary, and for public instruction, 267,267 fr. 76 cents. This department comprehends a great variety of soil and productions, with mines of iron, coal, quarries of marble, &c.

JEMMINGHEN, or JEMGUM, a town of East Friesland; 8 miles S.E. of Emden.

JEMOO, a river on the N. side of the island of Java, which runs into the sea. S. lat. $6^{\circ} 47'$. E. long. $111^{\circ} 8'$.

JEMRIGAUCHY, a town of Bootan; 15 miles N.E. of Tassafudon. N. lat. 28° . E. long. $89^{\circ} 45'$.

JEMROUD, a town of the kingdom of Candahar; 30 miles W. of Ghizni.

JEMSEG, a town of New Brunswick; 25 miles E.S.E. of Frederick Town. N. lat. $45^{\circ} 55'$. W. long. $66^{\circ} 13'$.

JEMSERUM, a town of Sweden, in the province of Smaland; 45 miles N. of Calmar.

JENA, a town of Germany, in the principality of Eisenach, near the Saale, situated in a pleasant valley among rising hills, which produce great quantities of wine. It is surrounded with walls, ditches, and towers, and it has an university founded in 1548. The town has four fauxbourgs; 10 miles E. of Weimar. N. lat. $50^{\circ} 54'$. E. long. $11^{\circ} 30'$.—Also, a town of South America, in the province of Quito; 12 miles S. of Archidona.

JENET, a town of Africa, in Sahara; 200 miles S.E. of Gadamis. N. lat. $27^{\circ} 50'$. E. long. $13^{\circ} 10'$.

JENGHIJE, a town of the Arabian Irak, on the Tigris; 12 miles N.W. of Bagdad.

JENGHIKAND, a town of Turkestan, on the Sirr; 27 miles W.S.W. of Tonkat.

JENGI, a town of Hindoostan, in the country of Cutch, near the coast; 21 miles S. of Tahej.

JENGOKO, a town of Japan, in the island of Nippon; 50 miles E. of Jedo.

JENHAT, a circar of Hindoostan, in the subah of Lahore, situated between the rivers Behat and Chunaub, about 120 miles long from N to S. and from 10 to 50 broad: the chief town is Gujurat.

JENJAPOUR, a town of Hindoostan, in Bahar; 20 miles E.N.E. of Durbungah. N. lat. $26^{\circ} 14'$. E. long. $86^{\circ} 28'$.

JENI-BASAR, or NOVI-BASAR, a town of European Turkey, in Bulgaria, on a branch of the river Ibar, containing about 300 houses, occupied by Christians and Turks; anciently the capital of the Rascians; 83 miles N.E. of Ragusa. N. lat. $43^{\circ} 40'$. E. long. $19^{\circ} 59'$.

JENJEREE, a town of Hindoostan, in Bahar; 30 miles N.E. of Monghier.

JENJIAM, a town of Hindoostan, in Moultan; 40 miles W. of Adjodin.

JENIKALE, a town of Russia, in the government of Taurida, in the narrow channel, called the Strait of Taman, between the Black sea and the sea of Azoph; 15 miles N.E. of Kerch. N. lat. $45^{\circ} 10'$. E. long. $36^{\circ} 10'$.

JENIKOW, a town of Bohemia, in the circle of Czaflau; 24 miles S.W. of Czaflau.

JENISHEHR, a town of Persia, in the province of Jorjan; 15 miles S.E. of Jorjan.

JENITZA, a town of European Turkey, in Macedonia, seated on a lake that communicates with the gulf of Saloniki by means of a canal about twelve miles long, anciently the capital of Macedonia, but now a heap of ruins; 24 miles W.N.W. of Saloniki. N. lat. $40^{\circ} 48'$. E. long. $22^{\circ} 30'$.

JENKIN, ROBERT, in *Biography*, was born at Minster, in the Isle of Thanet, in Kent, in the year 1656. He received his classical education in King's school at Canterbury, whence he was sent to the university of Cambridge when he was about eighteen years of age. In 1680 he was elected fellow of St. John's college, and five years afterwards appointed chaplain to Dr. Lake, upon the translation of that learned prelate from Bristol to the see of Chichester. In 1688 his patron gave him the precentorship of his cathedral church, but upon his refusing to take the oaths at the revolution he was obliged to resign that preferment, and to retire also from his fellowship. Little is known of Mr. Jenkin during the next twenty years, but we find him doctor of divinity and master of his college in the year 1711, and at the same time he was appointed lady Margaret's professor of divinity. On the accession of George I., an act was passed obliging all those who held any post, of 5*l.* per ann., to take the abjuration oath. Dr. Jenkins had, at this period, no hesitation in conforming, but he was so much affected at being obliged to eject many worthy and conscientious men who could not subscribe, that he even fell into a state of childifness. He died in the year 1727. As an author he is known by "An historical Examination of the Authority of General Councils, shewing the false Dealing which hath been used in publishing them;" "The Reasonableness and Certainty of the Christian Religion;" and many controversial pieces, particularly "Remarks on some Books lately published, viz. M. Bafnage's History of the Jews: Mr. Whitton's eight Sermons: Mr. Locke's Paraphrase, &c." In another work he accuses M. Le Clerc of treating the fathers, especially St. Augustine, with unjust severity.

JENKIN'S Town, in *Geography*, a settlement on the coast of Africa, in the country of Scherbro. N. lat. 7° . W. long. $11^{\circ} 50'$.

JENKINS, Sir LEOLINE, in *Biography*, a statesman, was born at Llantrifaint, in Glamorganshire, in the year 1623. Having laid a good foundation in grammar-learning at Cowbridge, he went to Oxford, where he remained till after the death of the king in 1648. Upon that event he retired into his native country, and was employed in the tuition of the eldest son of Sir John Aubrey, and other young persons of family attached to the episcopal church. At length, falling under some suspicion, he thought it advisable to go abroad. During three years he led his pupils through a course of study and travel upon the continent; when he returned and lived in retirement till the restoration. In 1661 he was chosen principal of Jesus college, a post which he held till 1673. In the mean time he applied himself diligently to the civil law, was admitted an advocate of the court of arches, and rose successively to the offices of judge of the admiralty

and judge of the prerogative court: he was likewise appointed one of the commissioners for recovering the effects of the queen-mother of France, lately dead. For his services on this occasion he had the honour of knighthood conferred upon him. In 1673 he was appointed one of the ambassadors plenipotentiary for concluding the peace of Nimeguen, and on his return to England he was elected representative in parliament for the university of Oxford, where he opposed the bill for the exclusion of the duke of York, soon after he was made secretary of state and a privy counsellor. He died in 1685, and was buried in the chapel of Jesus college, to which he was a great benefactor. His letters and papers were printed in two volumes folio. "He was," according to bishop Burnet, "a man of exemplary life, and considerably learned; but he was dull and slow: he was a great assertor of the divine right of monarchy, and was for carrying the prerogative very high. He neither spoke nor wrote well." He bequeathed the greater part of his property to charitable uses. * Biog. Brit.

JENKINS, JOHN, an English musician of great eminence in the 17th century, was born at Maidstone, in Kent, 1592. He was a voluminous composer of fancies for viols during the reign of Charles I. and the interregnum, which were in great favour throughout the kingdom. Instrumental music was in a very rude state at this time. His first publication, however, was vocal, being a collection of songs under the title of "Theophila, or Love's Sacrifice," folio, 1651. None of the infinite number of pieces that he composed for viols, which occur in all the manuscript collections of the times, were printed; yet, in 1660, he published twelve sonatas for two violins and a base, with a thorough-base for the organ or theorbo, which were re-printed in Holland, 1664. These were professedly in imitation of the Italian style, and the first of the kind which had ever been produced by an Englishman. It was at this time an instance of great condescension for a musician of character, as the violin was accounted by the lovers of lutes, guitars, and all the fretful tribe.

In manuscript memoirs of music, written by the honourable Roger North, of Rougham, in Norfolk, brother of the lord keeper North, to which we were allowed access by his descendant, the late Rev. Dr. Montague North, canon of Windsor, there is a very diffusive account of Jenkins, the circumstances of whose life have suggested to the author many moral reflections on the instability of musical renown. "It is of small importance," says he, "to the state of the world, or condition of human life, to know the names and styles of those composers of our own country who have excelled the Italians themselves in every species of music, but that for the voice; therefore the oblivion of all such things is no great loss. But for curiosity sake, as other no less idle antiquities are courted, it would doubtless afford satisfaction to professors and lovers of the art, if they could acquire true information concerning their names, characters, and works: of the latter, much knowledge might be obtained, if the old collections, not yet rotten, of many patrons of music were accessible. In these we might still find the productions of Alphonso, Ferabosco, Coperario, Lupo, Mico, Este, and divers others, especially of John Jenkins, whose musical works are more voluminous, and, in their time, were more esteemed than all the rest, though they now (1728) lie in the utmost contempt.

"I shall endeavour to give a short account of this master, with whom it was my good chance to have had an intimate acquaintance and friendship. He lived in king James's time,

and flourished in that of king Charles I. His talents lay chiefly in the use of the lute and base, or rather lyra-viol. He was one of the court musicians, and was once brought to play upon the lyra-viol before king Charles I. as an extraordinary performer. And when he had done, the king said he did wonders upon an inconsiderable instrument. The lyra-viol was a viol da gamba, with more strings, but differently tuned from the common six-string base. Its notation, like that of the lute, was written in entablature. He left London during the rebellion, and passed his time at musical gentlemen's houses in the country, where he was always courted, and at home, wherever he went; and in most of his friends' houses there was a chamber called by his name. For, besides his musical excellencies, he was an accomplished and ingenious person, and of such inoffensive and amiable manners, that he was esteemed and respected for his virtues and disposition, long after age had deprived him of his musical powers.

"It is not possible to give an account of his compositions, they were so numerous, that he himself outlived the knowledge of them. A Spanish nobleman sent some papers to sir Peter Lely, containing fragments of a consort (concerto), in four parts, of a sprightly kind, such as were then called *fancies*, desiring that he would procure for him the rest, *coûte qui coûte*. Lely gave me these papers, as the likeliest person to get them perfected. I shewed them to Jenkins, who said he knew the consort to be his own; but when or where composed he knew not, and was unable to recollect any more about it.

"His fancies were full of airy points, grave and triple movements, and other variety. And all that he produced till his declining age, was lively, active, decided, and fanciful. And of this kind he composed so much, that the private (or chamber) music, in England, was in a great measure supplied by him; and they were the more coveted, because his style was new, and, for the time, difficult: for he could hardly forbear divisions, and some of his consorts were too full of them. But it must be owned, that being an accomplished master on the viol, all his movements laid fair for the hand, and were not so hard as they seemed.

"His vein was less happy in vocal music, though he was fond of setting words, and occasionally of teaching to sing; but he had neither voice nor manner fit for it. In his sprightly moments he made catches, [nothing of this kind now remains of Jenkins, but his little round: "A boat, a boat, haste to the ferry," which is a happy selection and combination of pleasing sounds,] and strains that we called rants, with a piece called "The Cries of Newgate," which was all humour and very whimsical. But of all his concerts, none flew about with his name so universally as the final piece called his "Bells," or "The Five Bell Consorte." In those days the country fiddlers were not so well supplied with light music from London, as since; and a master that furnished them with new tunes, that they were able to play, was a benefactor."

Jenkins lived to the great age of eighty-six, eighteen years after the restoration. And Mr. North, the author of these memoirs, who was born in 1650, lived till 1733.

JENKINS'S *Bay*, in *Geography*, a bay on the back part of the island of St. Eustatius.

JENKINS'S *Island*, a small island near the coast of South Carolina. N. lat. 32° 20'. W. long. 80° 40'.

JENKING, in *Mining*, is applied, in some districts, to the last operations in a coal-pit, or some part of the same, which is about to be abandoned: that of perforating, or robbing

robbing of the pillars or ribs of coal which have been left to support the roof.

JENKYNs, DAVID, in *Biography*, an intrepid judge, was born at Pendoylen, in Glamorganshire, and admitted a commoner of Edmond-hall, Oxford, in 1597. From thence he removed to Gray's-inn, and became an eminent counsellor. By king Charles I. he was appointed a Welch judge, and in 1645 he was taken prisoner at Hereford for his activity in the royal cause, and sent to the Tower. Being brought to the bar of the house of commons he denied the authority of the house, and refused to kneel, for which he was fined 1000*l.* and remanded to prison. In 1650 an act was passed for his trial, but it never took place. He expected to be hanged, and declared that he would die with the bible under one arm, and magna charta under the other. In 1656 he obtained his liberty, and died in 1663. His tracts on legal and political subjects were printed in 1681, in one vol. 12mo.

JENNE', in *Geography*, a town of Africa, in Bambarra, situated on an island in the river Niger or Joliba, at the distance of two days' journey from the lake Dibble in the same river; about 150 miles N.E. of Sego, and about 165 miles S.W. from Tombuctoo. N. lat. 15° 13'. W. long. 0° 40'. Although the town of Jenné is nominally a part of the king of Bambarra's dominions, it is in fact a city of the Moors; the chief part of the inhabitants consisting of Baskreens, or Mahometans, and even the governor himself being of the same sect.

JENNE, a town of Japan, on the N. coast of Nippon; 8 miles N.W. of Kanazava.

JENNET, in *Horsemanship*. See **HORSE**.

JENNIDAH, in *Geography*, a town of Bengal; 14 miles N.W. of Mahmudpour.

JENNINGS, DAVID, in *Biography*, son of an ejected minister, was born at Kibworth, in Leicestershire, in the year 1691. He obtained a good stock of grammar learning at the free-school of his native place, and about the year 1709 he was sent to pursue a course of academical studies in London, under the care of Dr. Chauncey. Having finished his studies he was appointed one of the preachers at an evening lecture at Rotherhithe, and in 1716 chosen assistant preacher at the meeting near Haberdashers-hall. Two years afterwards he was elected pastor to the congregational church in Old Gravel-Lane, Wapping, with which he maintained that relation during forty-four years. Within a year after he entered this charge, he shewed his respect and attachment to the rights of conscience, by refusing to comply with the requisition brought forwards by many of the brethren at Salters-hall, to sign certain articles relating to the Trinity. Mr. Jennings, about the year 1730, published a small volume of sermons addressed to the young, entitled "The Beauty and Benefit of early Piety," which was followed by other publications of a practical nature. In the year 1740 he entered the lists against Dr. John Taylor, concerning Original Sin. He justified the doctrine, and did not act as the fair and liberal antagonist; but notwithstanding their difference in doctrinal points, they were in habits of intimacy and friendship with each other as gentlemen. In the year 1743 Mr. Jennings was elected trustee of Mr. Coward's charities, and one of the lecturers at St. Helen's; and in the following year he became divinity tutor, in the room of Mr. Eames, at the academy, at that time chiefly supported by Mr. Coward's funds. In this work he was earnestly intent: nothing ever diverted him from a daily attendance in the lecture room; and he was indefatigable in the discharge of the duties belonging to his office. The habits of early rising, of order in the arrangement of

business, and of punctuality in his engagements, enabled him to perform more than most men would have been able to get through. As a relief to the studies of the mind he employed himself in the common mechanical arts of life. His method of communicating instruction was easy and familiar, and his general deportment towards his pupils affable and friendly. In some instances he was betrayed into acts of illiberality, which ill accorded with that spirit which in younger life led him to resist the imposition of a formula of faith, devised by the ministers at Salters-hall. He was determined to maintain, in his academy, the reputation for orthodoxy which it had acquired, and would not suffer young men to deviate from his standard of faith. In some cases he had recourse to expulsion, although the characters of the pupils thus treated were most blameless and exemplary. In the year 1747 Mr. Jennings published "An Introduction to the Use of the Globes," &c. which maintained a considerable degree of popularity for more than half a century. In 1749 the university of St. Andrew's in Scotland conferred on the author the degree of doctor of divinity. After this, he published "An Appeal to Reason and Common Sense for the Truth of the Holy Scriptures." He died in September 1762, when he was seventy-one years of age. He was highly valued by his acquaintance, and he had the honour to educate many pupils who proved ornaments to the dissenting interest, and have rendered eminent service to science and the world, some of whom still sustain, by a diligent application of great talents, a respectable and commanding rank in life. After his death, was printed, from a MS. copy, "An Introduction to the Knowledge of Medals," consisting of a course of lectures on the history, the nature, size and shape;—the orders into which they are to be distinguished;—the impression and form, and value and use of medals. In 1766 a more elaborate work was published by Dr. Furneaux from the MSS. of Dr. Jennings, entitled "Jewish Antiquities: or a Course of Lectures on the Three First Books of Godwin's Moses and Aaron: to which is annexed a Dissertation on the Hebrew Language:" in two vols. 8vo. This is a work of great merit, and deserves the perusal of all who would obtain an intimate acquaintance with the scriptures, particularly of the Old Testament. A new edition of the "Jewish Antiquities" was published about three years since, it having been long out of print, and very much called for.

JENNINGS'S Island, in *Geography*, a small island in the gulf of Florida, near the coast of East Florida. N. lat. 25° 28'. W. long. 80° 28'.

JENNY WREN. See **WREN**.

JENOYPOUR, in *Geography*, a town of Hindoostan, in Allahabad; 24 miles N. of Gazyppour.

JENSON, or JANSON, NICHOLAS, in *Biography*, an eminent printer of the 15th century, was brought up to the art of engraving. He was taken away from his employment by Lewis XI., and sent to Mentz to endeavour to bring away the secret of the new discovery of typography. By another account it should seem that he was sent on this mission by Charles VII. in 1458, and it says, that Jenfon, on his return, finding that the king was dead, went and settled elsewhere. He exercised his profession at Venice, in which he acquired a high degree of reputation in the three branches of cutting punches, founding types, and printing. He formed the present Roman character, the neatness of his types command admiration even in the modern improved state of the art, and his editions are in great request with the curious. The first work which issued from Jenfon's press is one entitled "Decor Puel-larum," in 1471. Several editions of Latin books followed,

of which the one of the latest date is 1481, thought to be the last year of his life.

JENTLING, in *Ichthyology*, the name of a river fish caught in the Danube, and molt of the great rivers in Germany, and called by the Germans *sehead*, *seheat*, *jent*, and *koppen*; and by Gesner *capito caruleus*, the blue chub. See *CYPRINUS JEFES*.

JENUCHSHADEGA, in *Geography*, an Indian village in Pennsylvania, on the W. bank of Alleghany river; 14 miles S. E. from the outlet of Chataugue lake.

JENYNS, SOAME, in *Biography*, the only son of sir Roger Jenyns, of Bottisham-hall, Cambridgeshire, was born in London in 1704. He was educated under his father's roof till he was seventeen years of age, when he was entered a fellow-commoner of St. John's college, Cambridge. He was diligent in his studies, and spent three years at the university, after which he entered upon a course of life well adapted to a man of independent fortune. In his first marriage he was not fortunate, a separation took place, which the lady did not long survive: but his second wife outlived him. In younger life he sustained the character of a beau, and his polite attention to the ladies was displayed in his first performance, as an author, which was a poem on "The Art of Dancing," published in 1728, and dedicated to lady Fanny Fielding. From this period he continued to make himself known occasionally by pieces in verse, which were sufficiently numerous to be collected into a volume in 1752. At the death of his father his fortune enabled him to become a representative in parliament for the county of Cambridge. He began his senatorial career by supporting sir Robert Walpole, probably on account of his attachment to the Whig interest, and he continued ever afterwards the habitual adherent to the minister for the time being. This pliant conduct was rewarded by the place of one of the lords of the Board of Trade, which he held from 1755, through every change, till the Board itself was abolished, as an useless appendage to government, in the year 1780. He was ever inclined to moderate measures, and was in his own mind against the coercion made use of with regard to the Americans; he wrote in defence of dean Tucker's scheme of leaving the colonists to themselves, with the expectation, that when tired of freedom, they would gladly resume their dependence on the mother country. As an author, Mr. Jenyns attained a considerable share of celebrity. His poems consist of a variety of miscellaneous pieces; but his prose works are, in point of style, of a superior degree of excellence: his language is pure and perspicuous, and at the same time animated with wit and embellished with eloquence. He was a contributor to the periodical publication entitled "The World," and his papers, five in number, are distinguished by humour and vivacity. In 1757 he published a "Free Enquiry into the Origin of Evil, in six Letters." To account for the existence of evil under the government of an infinitely wise and good Being, he thought that to produce good exclusive of evil is one of those impossibilities which even divine power cannot accomplish. This related to natural or physical evil: with respect to moral evil, his theory was, that it is permitted in order to provide objects for the just infliction of those natural evils which were unavoidable. His work produced many able replies, besides a very severe and masterly critique from the pen of Dr. Johnson, which appeared in the *Literary Magazine*, and which Jenyns never forgot nor forgave. In 1756 he published a pamphlet in favour of a "National Militia," and in 1767 another, entitled "Thoughts on the Causes and Consequences of the High Price of Provisions," &c. which proves that he paid much attention to

political economy. In 1776 he resumed his theological discussions by a work which was much read, viz. "A View of the Internal Evidence of the Christian Religion." The foundation of his reasoning in this piece is, that this religion contains a system of ethics not only superior to, but unlike every thing which had before entered into the mind of man, and therefore that it must have had a divine origin. He contends that it not only carries moral purity to a degree beyond what was ever inculcated by any sect of philosophers, but that it wholly omits or disparages many virtues on which they lay a great stress; as valour, patriotism, and friendship. He contends that it must be of divine origin because no man could have imagined or proposed such a system. This kind of defence of the truth of our holy religion led to the suspicion that he was, under the mask of friendship, undermining its foundation, and he met with some severe strictures from several friends of rational religion, who were unwilling to abandon reason in their regard for Christianity. Upon, however, a fair and candid view of the subject, Mr. Jenyns was probably a very sincere Christian; the whole of his life and conversation bore witness to the sincerity of his views. In 1782 he published "Disquisitions on various Subjects;" in these he argues for the pre-existent state of mankind for the purpose of accounting for the miseries to which they are exposed in this world: and with regard to Christianity he says that its doctrines are "so adverse to all the principles of human reason, that, if brought before her tribunal, it must evidently be condemned;" but the chief force of his wit and argument is directed against the principles of civil liberty, towards which he shews the most determined hostility. He died at the advanced age of eighty-three, in December 1787. As a country gentleman he maintained a very respectable character: he was upright in his conduct, and exemplary in the performance of religious duties. With the liveliness of a man of wit he joined the urbanity of a polite well-bred gentleman, and his social intercourse is represented as highly engaging and delightful. His works have been collected in 4 vols. 12mo., to which is prefixed an account of his life.

JEOFAILE, or JEOFAYLE, in *Law*, a compound of three French words *je ay faille, I have failed*. It is used in a legal sense, when the parties to any suit have, in pleading, proceeded so far, that they have joined issue, which shall he tried, or is tried by a jury, and this pleading or issue is badly joined, so that it will be error if they proceed.

In this case, one of the parties might, by their counsel, shew it to the court, as well after verdict given, as before the jury was charged, by saying, *This inquest you ought not to take; or, To judgment you ought not to go.*

But this occasioning great delays in suits, for the redress thereof several statutes were made; viz. 32 Hen. VIII. cap. 30. by which it was enacted, "That if the jury have once passed upon the issue, though afterwards there be found a jeofaile in the pleading, yet shall judgment be given according to the verdict of the jury." Other statutes have also been made relating to the same thing, in the time of queen Elizabeth and king James I.

The 18th Eliz. cap. 14. ordains, that after verdict given in any court of record, there shall be no stay of judgment, or reversal, for want of form in a writ, count, &c. or for want of any writ original or judicial; or by reason of insufficient returns of sheriffs, &c. But this is not to extend to appeals of felony, indictments, &c. By 21 Jac. I. cap. 13: if a verdict shall be given in any court of record, the judgment shall not be stayed or reversed for variance in form between

between the original writ or bill, and the declaration, &c. or for want of averment of the party's being living; or because the *venire facias* is in part misawarded; for misnomer of jurors; want of return of writs, or because the return officer's name is not set to the return, &c. The stat. 16 & 17 Car. II. cap. 8. enacts that judgment shall not be stayed or reversed after verdict in the courts of record at Westminster, &c. for default in form; or because there are not pledges to prosecute upon the return of the original writ, or because the name of the sheriff is not returned upon it, for default of alleging the bringing into court of any bond, &c. or for the omission of *vi et armis*, or *contra pacem*; mistaking the Christian name or surname of either party, or the sum of money, day, month, or year, &c. in any declaration or pleading, being rightly named in any record, &c. preceding, &c. &c. But all such defects as are not against the right of the matter of the suit, or whereby the issue or trial are altered, shall be amended by the judges, though not in suits of appeal, of felony, indictments, informations on penal statutes, which are excepted out of the act. The 22 & 23 Car. II. cap. 4. made this act perpetual. By 4 & 5 Ann. cap. 16. all the statutes of jeofails shall extend to judgments, entered by confession, *nil dicit*, or *non sum informatus*, in any court of record; and no such judgment shall be reversed, nor any judgment or writ of inquiry of damages thereon shall be stayed, for any defect which would have been added by those statutes, if a verdict had been given; so as there had been an original writ filed, &c. The 5 Geo. I. cap. 13. ordains, that, after verdict given, judgment shall not be stayed or reversed for defect in form or substance, in any bill or writ, or for variance therein, from the declaration, or any other proceeding.

JEOGERY, in *Geography*, a town of Africa, in the kingdom of Jagra. N. lat. 13° 12'. W. long. 14° 57'.

JE OUASET, a town of the Arabian Irak, on the Tigris; 110 miles N.W. of Bassora.

JEPHTHAH, in *Scripture History*, one of the judges of Israel, was a son of Gilead by one of his concubines, (Judg. xi. 1, 2.) who, upon his father's marriage, was expelled by the family from their house; and who, retiring into the land of Tob, became captain of a band of rovers. The Israelites, who inhabited beyond Jordan, being pressed by the Ammonites, applied to Jephthah for assistance, and offered to place themselves under his command; accordingly he consented to succour them on condition that at the end of the war they would acknowledge him for their prince. A.M. 2817. B.C. 1187. Jephthah, having been invested with the chief command, remonstrated with the king of the Ammonites on the injustice of the war in which he was engaged, and obtaining no satisfactory reply, he levied a powerful army, and marched against him to battle. But before he engaged, he made a vow, that he would sacrifice, or consecrate to him, the first living creature that should come out of his house to meet him on his return. The contest was soon decided by a complete victory; and the conqueror, as he approached his house at Mizpeh, perceived his daughter, an only child, advancing to congratulate him on his success, with music and dancing, and other tokens of filial affection. Recollecting his vow, the interview occasioned the most poignant distress; but when he communicated it to his daughter, she received the intelligence with a firm and submissive mind; and determining to acquiesce in the accomplishment of her father's vow, she merely requested a delay of two months, that she might retire with her companions to lament her infelicity in being devoted to a life of celibacy. At the expiration of the stipulated interval, she returned to her father, "who did with her according to the vow which he had vowed." As to the ob-

ject of this vow, and the manner in which it was fulfilled, Jewish and Christian writers, both ancient and modern, have entertained very different sentiments. It has been a very generally received opinion, that Jephthah offered his daughter as a burnt sacrifice; and in favour of this notion it has been alleged, that it is most agreeable to the natural construction of the Hebrew text; that there is no rule, or precedent in scripture, to justify the practice of devoting persons to perpetual virginity, and that this would have been as contrary to the law of God as if he had sacrificed her; that when Jephthah made this vow, he could have expected no person to come out of his door to meet him, but a human person; that if he had intended no more than the sacrifice of a bullock, or a ram, there was no occasion for such a solemn vow, or if he had meant a brutal sacrifice, he would have vowed the offering of hecatombs rather than of a single animal, on an occasion which he thought so important and interesting; and, moreover, that it was a "custom in Israel, that the daughters of Israel went yearly to lament the daughter of Jephthah," (Judg. xi. 39, 40.) and this custom, it is said, seems to have been intended for an annual rite *in perpetuum*, and not that they went yearly to talk with her, as long as she lived. On the other hand, it has been maintained by writers of great celebrity, that Jephthah, a judge of the Hebrew people, who were mere worshippers of the true God, whose law did not admit of human sacrifices, who had often declared his abhorrence of such abominations, and who had on this account rejected the Canaanites, could not have been guilty of this gross act of heathen superstition; more especially as his name is connected with other ancient worthies, who in the epistle to the Hebrews (xi. 32.) are enumerated as illustrious instances of the power of faith. Accordingly they have argued that Jephthah devoted his daughter to perpetual virginity, for the honour, and in the service, of God. They allege, that she desired time, before the vow was accomplished, to bewail her virginity, and not the loss of her life. (Judg. xi. 37.) The object of the vow was, therefore, perpetual virginity, and not death; and Jephthah would naturally be troubled, when his daughter met him (v. 35.) because she was his only child (v. 34.), and the accomplishment of his vow, in the milder sense of it, would render his family extinct in Israel, and he would thus exclude himself from the prospect of having the Messiah among his descendants. In favour of the milder interpretation of this vow it is further pleaded, that the words *ליתנוה לבתי-יפתח* (Judg. xi. 40.) which we render "to lament the daughter of Jephthah," should be rendered "to talk with the daughter of Jephthah," that is, to visit and comfort her in her reclusal life: the word *תנה* being justly rendered (Judg. v. 11.) to rehearse. It is further said, that in the words *והיה ליהיה והעליתיהו עולה* (Judg. xi. 31.), the *ו* (vau) should be understood not copulatively, but disjunctively; and then the meaning would be, "whatsoever cometh to meet me, shall either be the Lord's, or I will offer it up for a burnt offering;" that is, in case it should be a creature fit for sacrifice. Others have thought it necessary to vindicate Jephthah's character from the blemish of murder; they have also pleaded, that he is not censured in any part of sacred history for this act; that God would not have given victory and success to Jephthah in his expedition against the Ammonites, upon his obliging himself under a solemn vow to offer a human sacrifice; and that he is mentioned, as we have already said, in the catalogue of believers in the epistle to the Hebrews. Although we can lay no great stress on some of the arguments that are alleged in vindication of Jephthah's character, and we cannot help considering his vow as rash and unguarded; we must incline to the more favourable

favourable opinion. It is not improbable, that Homer grounded his fable of Agamemnon's sacrificing his daughter Iphigenia on some tradition of Jephthah's sacrifice; and it is urged, that the name of Iphigenia seems to be a corruption of Jephthigenia, the daughter of Jephthah. Ovid, who has dressed up the story in his way, makes Diana put a stag in her room; and seems, therefore, to have blended the tradition of Abraham's sacrifice with that of Jephthah.

Soon after Jephthah was exalted to that dignified station, which was the recompence of his valour, the Ephraimites, envious of that glory in which they had not been allowed to participate, combined against him; but the contest was soon determined by their entire defeat. The Gileadites, whom he had commanded, seized the fords of the river Jordan, and put to death all those fugitives who endeavoured to escape into their own country; and in order to distinguish Ephraimites from other Israelites, who had occasion to cross the river, he ordered them to pronounce the word "Shibboleth," signifying an ear of corn, and which was pronounced "Sibboleth" by those of that tribe. As many, therefore, as were detected by this test were killed without mercy. The number of the Ephraimites that fell on this occasion amounted to 42,000. After this event we know nothing more of Jephthah, excepting that he judged Israel, or the two tribes and a half beyond Jordan, six years, and then died about the year 1182 B.C. Judges, xi. xii. JEREJA, a town of Africa, in the kingdom of Fonia.

JEREMIAH, in *Scripture History*, a canonical book of the Old Testament. The divine writer was of the race of the ten priests: the son of Hilkiah of Anathoth in the tribe of Benjamin. He was called when very young to the prophetic office, about the thirteenth of Josiah, or 628 B.C.; and continued in the discharge of it above forty-one years. Jeremiah's life was often exposed to danger, and he was committed to prison, on account of his remonstrances against the kings of Judah, and the predictions, delivered by him, which announced the calamities that awaited them; particularly under the reign of Jehoiakim and of Zedekiah. After the conquest of Jerusalem by Nebuchadnezzar, he was set at liberty by order of the king, and it was left to his option either to accompany Nebuzaradan, the general of Nebuchadnezzar, to Babylon, or to remain in Judea with Gedaliah, who was appointed governor of the miserable remnant of the people that was left in that country. Jeremiah preferred the latter alternative, and went to reside with Gedaliah at Mizpeh. After the assassination of Gedaliah, Jeremiah, accompanied by Baruch, removed to Egypt. Of the subsequent events of his life, we have no authentic account. He is said by St. Jerom, &c. to have been stoned to death by the Jews at Tahpanhes, where he resided, for

preaching against their idolatry; but it is most likely that he died in Egypt, much advanced in years, and broken by the calamities which happened to himself and his country. Some rabbis, however, assert, that he returned to Judea, and others say that he went to Babylon, and died there.

There were several collections of Jeremiah's prophecies; one made by God's command in the fourth year of Jehoiakim, chap. xxxvi. 2. This contained all the prophecies he had published to that time, as well against the other nations as against the Jews. The former of these in our present collection are put by themselves at the end of the book, from chap. xlii. to the end of the last. But in the present copies of the Septuagint they follow immediately after the thirteenth verse of the twenty-fifth chapter. Another collection of these prophecies, mentioned chap. i. 3. comprehends all those which Jeremiah had uttered to the time of the captivity, and were probably collected by Baruch, his amanuensis, and are put together without any regard to the order of time. To this was added another collection of prophecies, published about the time of his going down into Egypt, contained in chap. xlii. xliii. xliv. at the end of which Ezra, or some others, after the captivity, added those prophecies which Jeremiah delivered against the Gentiles. The fifty-second chapter was probably added by Ezra, and is chiefly taken out of the latter part of the second book of Kings, with additions, which Ezra might supply out of the public records. The book of Jeremiah is altogether written in Hebrew, except the eleventh verse of the tenth chapter, which is Chaldee.

It has been observed, that there is great confusion in the arrangement of Jeremiah's prophecies. A late excellent commentator, Mr. Blaney, has endeavoured, with great judgment, to restore their proper order, by a transposition of the chapters, wherever it appeared to be necessary. The first twelve chapters seem to contain all the prophecies that were delivered in the reign of Josiah. Soon after the accession of Jehoiakim to the throne, upon the deposition of Jehoahaz, Jeremiah was commissioned to denounce the divine judgments against him and the people, unless they repented of their wickedness. He thus provoked their indignation; and they accused him as a person whose sedition deserved death. He was acquitted, however, by the nobles, and by a powerful influence preserved from the king's vengeance. About four years afterwards he predicted the destruction of Jerusalem and of the temple, and the Babylonish captivity, which he foretold would last 70 years. For this prophecy he was sent to prison, and he narrowly escaped with his life. His prophecies under this reign are continued from the 13th to the 20th chapter inclusively; to which we must add the 22d, 23d, 25th, 26th, 35th and 36th chapters, together with the 45th, 46th, 47th, and probably the 48th, as far as the 34th verse of the 49th chapter. Under the reign of Zedekiah, the last king of Judah, Jeremiah was frequently deputed to the exercise of his prophetic office. His predictions in this reign were contained in the 21st and 24th chapters, the 27th to the 34th, and the 37th to the 39th inclusively, together with the last six verses of the 49th chapter, and the 50th and 51st chapters concerning the fall of Babylon. It does not appear at what period of Jeremiah's life he delivered the prophecy concerning the future restoration of Israel to their own land, and the re-establishment of their civil and religious constitution under the Messiah, comprized in the 30th and 31st chapters.

St. Jerom has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal

equal to those two prophets in the sense of his prophecy.

We shall close this article with an extract from the admirable lectures of bishop Lowth (see lect. xxi.) relating to the character of Jeremiah as a writer. "Isaiah," he says, "Jeremiah, and Ezekiel, as far as relates to style, may be said to hold the same rank among the Hebrews, as Homer, Simonides, and Æschylus, among the Greeks." "Jeremiah, though deficient neither in elegance nor sublimity, must give place in both to Isaiah. Jerom seems to object against him a sort of rusticity of language, no vestige of which, I must however confess, I have been able to discover. His sentiments, it is true, are not always the most elevated, nor are his periods always neat and compact; but these are faults common to those writers, whose principal aim is to excite the gentler affections, and to call forth the tear of sympathy or sorrow. This observation is very strongly exemplified in the *Lamentations* (see that article), where these are the prevailing passions; it is however frequently instanced in the prophecies of this author, and most of all in the beginning of the book (ch. ix. xiv. 17, &c. xx. 14—18.) which is chiefly poetical. The middle of it is almost entirely historical. The latter part, again, consisting of the six last chapters, is altogether poetical (ch. xlvi.—li. to v. 59.); it contains several different predictions, which are distinctly marked, and in these the prophet approaches very near the sublimity of Isaiah. On the whole, however, I can scarcely pronounce above half the book of Jeremiah to be poetical."

The version of Mr. Blaney, published in 1784, and accompanied with numerous and valuable notes, is deemed to be the best extant; the author having availed himself of the assistance afforded by Dr. Kennicott's collection, and other sources of information, domestic and foreign. Blaney's notes. Lowth de Sacra Poesi Præl. lect. xxi. Dupin. Lowth's Paraph. Gen. Biog.

JEREMIAH, in *Geography*, a town of Palestine, anciently called *Anathoth*, the birth-place of the prophet Jeremiah; 6 miles E. of Jerusalem.

JEREMIE, CAPE, a cape on the S. coast of the island of Hispaniola. N. lat. 18° 16'. W. long. 17° 15'.

JEREMIE, a jurisdiction, town, and cape, within the bay of Leogane, on the southern peninsula of the island of St. Domingo. The jurisdiction contains two parishes, and its soil is excellently adapted for the culture of coffee. The town is seated on the W. side of the bay; and point Jeremie lies in N. lat. 18° 42' 30". W. long. from Paris 76° 32'.

JEREMYSQUAM, an island of America, in Lincoln county and state of Maine, which, with Folly island, forms the mouth of Sheepscott river, in Wiscasset bay.

JERF, a town of Norwegian Lapland; 100 miles W.S.W. of Wardhuys.

JERFALCON, the English name of the gyrfalcon, a very fierce, bold, and large bird, the largest of all the falcon kind. See **GYRFALCON**.

JERGUER, in the *Custom House*, one who oversees the accounts and conduct of the waiters.

JERICH0, in *Ancient Geography*, a considerable city of Palestine, in the tribe of Benjamin, about six miles W. from Jördan, and 22 almost E. from Jerusalem. It was situated in a spacious plain, producing all sorts of fruits, especially palm-trees, whence it was called "the city of palm-trees." Jericho was the first city in Canaan taken by Joshua. (Josh. ii. 1, 2, &c.) in the year 1469 B.C., and burnt by special order. About 537 years afterwards, Hiel of Bethel undertook to rebuild it (1 Kings, xvi. 34.); and on this occasion

lost his two sons. But before this period there was a city of Jericho in the vicinity of the original place of the same name. The Jericho of Hiel acquired its original splendour and population: it was adorned with a magnificent palace and other edifices by Herod, and it gained reputation from having been the place where Jesus Christ performed many miracles. Its importance and splendour remained for many ages, till at length it was sacked by Vespasian. Adrian re-established it A.D. 138, and after subsequent disasters, it was repaired by the Christians, and made the seat of a bishop; but in the 12th century it was finally destroyed by the infidels. This famous city, the walls of which were 20 stadia, or 2½ miles in circumference, is now reduced to a poor village, called "Raha," on a plain six or seven leagues long, by three wide, round which are several barren mountains, that render it extremely hot. Instead of the balm of Mecca, which it formerly produced, there is another species, resembling a plum-tree, called "Zakkoun," which yields a sweet oil, celebrated for healing wounds. This is now the sole commerce of Raha.

JERICH0, a town of the duchy of Magdeburg, seated on the Elbe; 32 miles N.N.E. of Magdeburg. N. lat. 52° 50'. E. long. 12° 5'.—Also, the circle of the same duchy, which includes the town, also Burg and Sandau, and a few villages.

JERICH0, *Rose of*, in *Botany*. See **ANASTATICA**.

JERICO, in *Geography*, a post-town in Chittenden county, Vermont, S.E. of Essex, and N.E. of Williston, separated from the latter by Onion river, and containing 728 inhabitants.—Also, a post-town of New York, in Chenango county, on the E. branch of the Susquehanna, containing 939 inhabitants.

JERJERIAIA, a town of the Arabian Irak, on the Tigris; 36 miles S.E. of Al-Modain.

JERIM, a small town of Arabia, in the province of Yemen, the seat of a Dola, who resides in a castle situated on a rock. The houses are built of stone, and of bricks which had been dried in the sun. After a dry season, locusts are very numerous in a plain near this town; they are then gathered and dried for winter provisions at Jerim, as well as in other places of Arabia. The market is a place of amusement. Tailors, shoemakers, blacksmiths and other artificers sat along the streets, behind low walls, and wrought at their trades in the open air. Surgeons were seen drawing blood with a common knife, and dressing the wound with pieces of hartshorn, cut off at the root of the horn. The number of houses in this place is about 2000; 80 miles N.E. of Mocha. N. lat. 14° 17'. E. long. 44° 22'.

JERKIN, a name given by some to the male of the jerr-falcon. See **GYRFALCON**.

JERKITTYA, in *Geography*, a town of Hindoostan, in Bahar; 22 miles S.E. of Bettiah.

JERMAH, or **GERMAH**, a town of Africa, in Fezzan, supposed to be built on the site of Garama, the capital of the country of the Garamantes; situated S. of Zuéla, and nearly at the same distance from Mourzouk. It is distinguished, like Zuéla, by numerous herds, especially of sheep and goats, that are observed around it; by the various and abundant produce of its fields; and by numerous and majestic ruins that indicate its former splendour; though at present the houses are cottages built of clay; 60 miles S.E. of Mourzouk.

JERMOLI, in *Biography*, the principal tenor singer in the comic opera, succeeded Trebbi in 1777, when the Todi was the first Buñ. Neither his voice, action, or

style of singing, were of the first class, or above mediocrity; and when Lovattini quitted this country, he left a blank in the comic opera, which has never since been filled up to our satisfaction.

JERMUK, in *Geography*, a river of Syria, anciently "Hieromax," which runs into the lake of Tiberias, near its southern extremity.

JEROM, or **JEROME**, *St.*, **EUSEBIUS HIERONYMUS**, in *Biography*, an eminent father of the Christian church, was born of Christian parents at Stridon, on the confines of Dalmatia and Pannonia, probably about the year 342; though others date his birth in 329, 330, or 331; and as he died in the year 420, they say that he was about 90 years of age when he died. Several circumstances corroborate the former statement, assigned by Lardner as the era of his birth. He commenced his studies in grammar and other parts of literature at Rome, where he resided at the time of the emperor Julian's death. Donatus, the celebrated grammarian, was one of his preceptors; and his studies in logic and various branches of philosophy were directed by other teachers. His application and proficiency were very distinguished at an early period of life; and it appears that, during his residence at Rome, he cultivated the theory and practice of rhetoric, and laid the foundation of that extensive acquaintance with theology and ecclesiastical history, and also with the Hebrew language, in which he afterwards excelled. From Rome he removed to Gaul; and at Aquileia he formed an intimate acquaintance with Rufinus, a presbyter of that city. He afterwards returned to Italy, having collected, while he was in the western empire, a considerable library, to which in the progress of his life he made many valuable additions. From Italy he went into the East, where he spent several years, partly in the deserts of Syria, partly at Antioch, and partly at Constantinople. At Antioch he was ordained presbyter by Paulinus in 378; accepting the office on condition that he should not be confined to one church, or be drawn away from that monastic life which he conceived to be most favourable to the prosecution of his studies. On this kind of life he seems to have entered when he was 30 years of age; and though during a period of four years he enlarged his acquaintance with the oriental languages, and with those branches of knowledge which assisted him in understanding and interpreting the scriptures, the austerities he practised had so impaired his health, that it became necessary for him to return to Antioch, in order to recruit his strength. The church at Antioch was at this time distracted by contending parties; but Jerome declined taking a decided part with either of them, till he had obtained a letter from Damasus, bishop of Rome, which determined him to espouse the cause of Paulinus. Having, after his ordination, which we have already mentioned, resided for some time at Bethlehem, he made an excursion from thence to Constantinople, with a view of deriving benefit from the instructions of Gregory Nazianzen, and from whom he learned, as he himself acknowledges, the right method of expounding the holy scriptures. In the year 382, he accompanied Paulinus, bishop of Antioch, and Epiphanius, bishop of Salamis in the island of Cyprus, to Rome; and here he was employed by pope Damasus, as his secretary, in conducting a variety of negotiations for extending the authority of the papal power. In the superintendance of a society of Roman ladies, who had renounced the world, and devoted themselves to a religious life, which Damasus assigned him, he acquitted himself to the satisfaction of the pope; but not without incurring the displeasure of the friends and relations of those weak fe-

males, who abandoned their stations in civil society, and misapplied their wealth to the support of useless and pernicious institutions. He had likewise other enemies, who disapproved the freedom with which he reprehended the corrupt manner of the clergy, and the vices of the people. Another circumstance that rendered his situation at Rome unpleasant to him was the part he took in his disputes with the followers of Origen, whom he had often commended, and many of whose works he had translated into Latin, but whose peculiar opinions he now opposed as heretical. The Origenists were thus exasperated, and circulated some scandalous but unfounded reports of a disreputable connection with Paula, in whose house he lodged, and who afterwards, with her daughter, followed him to the East. (See **EUSTOCHIUM**.) Jerome, thus disquieted at Rome, determined to return to the East; and the death of Damasus hastened the execution of his purpose; and in 385 he embarked on board a ship bound for Antioch. From Antioch he went to Jerusalem, where he pretends to have been witness to a number of miracles, which have gained little credit either among Protestants or respectable Catholics. In Egypt he attended the lectures of the learned Didymus, and he visited the monasteries in the desert of Nitria. In 385 he settled at Bethlehem, where he was joined by Paula and other ladies who had followed him from Rome, as well as by many other persons of both sexes, who admired his piety, and who were attached to his strict discipline. At Bethlehem Paula founded a church and four monasteries, one for men, which was committed to the superintendance of Jerome, and three for women, over which she herself presided. In this situation he employed his talents and learning to many useful purposes, in the education of several young persons of rank, and in the composition of various works, that reflect honour on his name and memory; and he might have been as happy as he was useful, if he had not indulged an intemperate detestation of the opinions of Origen, and engaged in numerous ardent contests with those who defended and propagated them. In 410 the monastery of Jerome afforded an asylum to many of those fugitives who sought relief in the Holy Land from the ravages of the Goths, who laid Italy waste, and besieged Rome; but such was the unjustifiable bigotry of his temper, that he excluded all who favoured the opinions of Origen from a share in his hospitality: At Bethlehem Jerome terminated his life in the year 420.

Few will be inclined to dispute Jerome's title to the character of being the most learned of all the Latin fathers. This title is evinced by the testimony of the best judges, and by the numerous works of which he was the author. His judgment, however, was not found and discriminating; nor was his reasoning perspicuous and accurate; and his style has been justly represented as more declamatory than argumentative. But the acrimony of his temper, and the total want of candour that appears in his controversial writings, throw a dark shade over all his other good qualities. "His complexion," says Mosheim, "was excessively warm and choleric; his bitterness against those who differed from him extremely keen; and his thirst of glory insatiable. He was so prone to censure, that several persons, whose lives were not only irreproachable, but even exemplary, became the objects of his unjust accusations." The learned Cave says, "he was a very hot and furious man, who exercised no command over his passions. When once provoked, he treated his adversaries in the roughest manner, and did not even abstain from invective and satire; witness what he has written against Rufinus, who was once his friend, John of Jerusalem, Jovinian, Vigilantius, and others. Upon these men, when

when they gave him the slightest provocation, he poured forth a torrent of all the abusive terms which he could devise, without any regard to their persons, dignity, or learning." His behaviour to the Origenists; his declaration principally respecting such, "we receive and entertain all strangers without regard to merit; none are excepted but heretics;" and his other declaration in his controversy with Rufinus, "let us but have the same faith, and we are reconciled," preclude the charge of want of candour, if we say that Jerome would not have confined himself to the mere abuse and invective of words, if he had been entrusted with power. There is but a step between starving heretics in distress, and tying them to the stake. None can approve of the high terms in which he extols celibacy and virginity, so as to seem to disparage the marriage state; and of his culpable credulity we have ample evidence. The candid Lardner, without disguising or condemning the charges which have been alleged against him upon the best authority by others, allows him to bear testimony in his own favour, and he acquits him from the imputation of vanity: thus he speaks of himself in various passages collected from his works: "That he had been from the beginning diligent and inquisitive; that all his days he had been employed in the schools of rhetoricians and philosophers, or in reading the scriptures of the Old and New Testament; that, beside Latin and Greek, he had endeavoured to make himself master of Hebrew; that he did not rely upon his own judgment and understanding in interpreting the scriptures, but consulted other commentators, and was willing to improve by their labours; that he never thought himself too old to learn, but embraced all opportunities of increasing in knowledge; that he was not employed, as many monks were, in making baskets of rushes, and screens of palm-leaves, to get a livelihood, but in studying the scriptures, and putting out correct editions of them."

Of all the productions of Jerome, the most useful are his interpretations of the sacred scriptures, and those of his letters, which contain critical remarks and dissertations on particular texts in the bible. The principal of his works, which are enumerated by Cave and Dupin, are, a new Latin version of the whole "Old Testament," from the Hebrew, accompanied with a corrected edition of the ancient version of the "New Testament," which, after having been at first much opposed, was adopted by the Catholic church, and is commonly distinguished by the appellation of "Vulgate," which see; "Commentaries" on most of the books of the Old and New Testament; "A Treatise on the Lives and Writings of Ecclesiastical Authors;" "A Continuation of the Chronicle of Eusebius;" moral, critical, historical, and miscellaneous "Letters." The first printed edition of his works was that at Basil, under the care of Erasmus, 1516—1526, in six vols. folio, of which there have been several subsequent impressions at Lyons, Rome, Paris, and Antwerp. The most correct edition is that of Paris, by Father Martianay, a Benedictine monk of the congregation of St. Maur, 1693—1706, in five vols. fol. Cave, H. L. vol. i. Dupin. Mosheim. Jortin's Rem. E. H. b. ii. pt. ii. Lardner's Works, vol. v. Gen. Biog.

In Jerom's works many particulars occur relative to the music of his time, and the chants of the church, especially in his commentary on the epistle to the Ephesians, ch. v. ver. 19. p. 652, where there is a memorable passage in favour of ecclesiastical singing: "Speaking to yourselves in psalms and hymns, and spiritual songs, singing and making melody in your heart to the Lord," cries out, "Audiant hæc adolescentuli: audiant hi quibus psallendi in ecclesia officium est, Deo non voce, sed corde cantandum: nec in Tragœ-

dorum modum guttur et fauces dulci medicamine colliniendas, ut in ecclesia theatrales moduli audiantur et cantica, sed in timore, in opere, in scientia scripturarum."

JEROME of Prague, so called from the name of the city in which he was born, devoted his youth to the pursuit of knowledge, which he sought after in all the more considerable cities of Europe; particularly in those of Prague, Paris, Heidelberg, Cologne, and Oxford. In the four former universities he was admitted to the degree of M.A., and in one of them to that of D.D. in the year 1399. At the latter place he became acquainted with the works of Wickliff, many of which he translated into his native language. Upon his return to Prague, in the year 1400, he openly avowed himself a follower of Wickliff, and became attached to Hufs, who was at the head of the party in Bohemia, which had espoused the doctrines of the British reformer. Jerome, though superior to Hufs in abilities and learning, was not so well qualified as the leader of a party, because, with all his great and good qualities, he wanted that gentle, conciliatory temper for which Hufs was distinguished. They both concurred, however, in ardent efforts for restraining the despotism of the papal court, and reforming the licentiousness of the clergy. In the year 1410 he was invited by the king of Poland to regulate the university at Cracow; from Poland he went to Hungary, in which country he was accused of heresy; and upon his removal to Vienna he was imprisoned on account of his opinions, but obtained his liberty in consequence of the solicitation of the university of Prague. As soon as he heard that his friend Hufs was at Constance, ready to appear before the Council, he patriotically exhorted him to maintain a firm and unyielding temper in this great trial, and strenuously to insist upon the corrupt state of the clergy, and the necessity of reformation, assuring him, at the same time, that if he should receive information in Bohemia, that his adversaries were likely to overpower him, he would immediately repair to Constance, and give him every kind of assistance in his power. Hufs earnestly dissuaded him from the execution of his purpose, as equally unprofitable to him and dangerous to Jerome himself; but he was invincible, and arrived at Constance on the fourth of April, 1415, about three months before the death of Hufs. Although he entered the town privately, his visit and the design of it was soon made public; and he was informed by his friends that he could be of no service to Hufs, and that the council, so far from being disposed to hear him, intended to seize him. In these circumstances he thought it most prudent to retire, and accordingly withdrew to Iberling, an imperial town about a mile from Constance. From this place he addressed a letter to the emperor, professing his readiness to appear before the council, if that prince would give him a safe-conduct. But Sigismund had the honesty to refuse. Jerome then tried the council, but could obtain no favourable answer. In this state of perplexity he posted papers in all the public places of Constance, avowing himself prepared to appear at Constance in defence of his character and doctrine, which had been much defamed; and also his resolution to retract every error that should be proved against him, on condition that the faith of the council might be pledged for his security. As he received no answer to these papers, he set out on his return to Bohemia, carrying with him a certificate signed by several of the Bohemian nobility then at Constance, which testified that he used all possible means, which prudence suggested, in order to procure a hearing. At a village, upon the borders of the Black Forest, Jerome fell by accident into company with some priests, and a conversation occurring with reference to the council of Constance, Jerome became warm,

and among other severe things he called that assembly the "school of the devil," and "a synagogue of iniquity." The priests, incensed by this language, informed against him to the chief magistrates, by whom he was arrested and delivered into the hands of the duke of Sultzbach. The duke, having Jerome in custody, wrote to the council for directions; and he was desired to send his prisoner immediately to Constance. The elector-palatine then met him, and conducted him in triumph to the town; himself riding on horseback, with a numerous retinue, who led Jerome, in fetters, by a long chain, after him. As soon as he was brought before the council, the clamour against him became loud and tumultuous; and among others, who disgraced themselves on this occasion, was John Gerson, chancellor of the university of Paris, one of the most learned, as well as the most knowing men of his time, but destitute of that candour which usually attends knowledge. In the chancellor's invective and reproach the rectors of the universities of Cologne and Heidelberg concurred; but Jerome had no opportunity of replying. A thousand voices burst out from every quarter, "Away with him! burn him! burn him!" After an interval of about half an hour the tumult partly subsided; and Jerome, availing himself of a momentary pause, looked round the assembly with a noble air, and cried out aloud, "Since nothing can satisfy you but my blood, God's will be done." He was then carried from the assembly into a dungeon, under the custody of a guard. Whilst he was ruminating upon his approaching fate in this cell, he heard a voice addressing him in these words, "Fear not, Jerome, to die in the cause of that truth, which, during thy life, thou hast defended." "Whosoever thou art," replied the intrepid prisoner, directing his eyes to the window from which the voice seemed to proceed, "who deignest to comfort an abject man, I give thee thanks for thy kind office. I have indeed lived defending what I thought the truth: the hardest task yet remains, to die for its sake; but God, I hope, will support me against flesh and blood." The guard was alarmed, and Maddonwitz, who had rendered services to Hufs, was discovered to be the offender. This incident was a pretence for a more severe treatment of Jerome, who was immediately conveyed to a strong tower, where, his hands being tied behind his neck, he was left to languish in that painful posture for two days, without any aliment besides bread and water. These severities were inflicted with the design of forcing him to make a recantation; and the illness which they occasioned, in the course of which he urged the council to allow him a confessor, afforded an opportunity of pressing him with arguments to this purpose. Jerome, however, remained immovable. A similar attempt was made upon him immediately after the death of Hufs; but he was still invincible. However, though he was not to be subdued by the simple fear of death, imprisonment, chains, hunger, sickness, and even torture, through a succession of many months, was too great a trial for human nature. Three times was he brought before the council, and carried back to the horrors of his dungeon, before his enemies could prevail against him. At length he began to waver; and on the 23d of September, a fatal day, which he recollected with shame and grief, he read a loud and ample recantation of all the opinions he had maintained, couched in words directed by the council. In this paper he acknowledged the errors of Wickliff and Hufs, entirely assented to the condemnation of the latter, and declared himself, in every article, a firm believer with the church of Rome. Having thus acted against his conscience, he retired from the council with a heavy heart. His chains, indeed, were taken away; but the load was transferred from his body to his mind. Vain were the caresses of those about

him: they only mocked his sorrow. His prison was now indeed a gloomy solitude. The anguish of his own thoughts had made it such. Paletz and Du Cassis, the chief managers against him, soon perceived this change; and they determined to bring him to a new trial. Several persons, however, and particularly the cardinals of Cambray and Florence, objected to a new trial. But their endeavours were ineffectual, a torrent of zeal and bigotry bore down all opposition; and even the learned Gerson again disgraced himself by joining in the tumultuous clamour; with great indecency employing his pen, as well as his tongue, upon this occasion. This kind of agitation continued for half a year: so that it was not till May in the year 1416, when Jerome was called again before the council. The prospect afforded him pleasure, and he rejoiced at an opportunity of acknowledging publicly that shameful defection, which hung so heavy upon him. The chief articles alleged against him were, his adherence to the errors of Wickliff—his having had a picture of that heretic in his chamber, arrayed in the common ornaments of a saint—his counterfeiting the seal of the university of Oxford in favour of Wickliff—his despising the authority of the church after excommunication—and his denial of transubstantiation. Having protested his innocence, and given a circumstantial detail of his coming to Constance, and of all that had since befallen him. he raised his voice, and having expressed himself with some asperity against his accusers, he told them that he was going to lay himself more open to them than he had yet done. He then, with great emotion, declared before the whole assembly, that the fear of death only had induced him to retract opinions which from his heart he maintained: that he had done injustice to the memory of those two excellent men, John Wickliff and John Hufs; whose examples he revered, and in whose doctrine he was determined to die. He concluded with a severe invective against the clergy; the depravity of whose manners, he said, was now every where notorious. His speech produced a wonderful effect on the whole assembly; and many wished that his life might be saved. His judges, however, precipitated the passing of sentence; and on the same day, or a few days after, he was condemned for having held the errors of Wickliff, and for apostatizing. He was then immediately delivered over to the civil power, and, attired with a cap like that with which Hufs had been adorned, he was led to execution. The post to which he was chained was hewn into a monstrous and uncouth figure of Hufs, and ornamented into a ridiculous likeness of him. When the wood began to blaze, he sang a hymn; and when the flames scorched him, he was heard to cry out "O Lord God! have mercy upon me!" and a little afterwards, "Thou knowest how I have loved the truth." The wind parting the flames, his body, full of large blisters, exhibited a dreadful spectacle to the beholders; his lips continued still moving, as if actuated by intense devotion. During a full quarter of an hour, he discovered the signs, not only of life, but of intellect. Even his enemies thought the rage of his judges pursued him too far, when they saw his wretched coverlet, and the other miserable garniture of his prison, by their order, consumed in the fire after him; and his ashes, as those of Hufs had been, thrown into the Rhine.

The celebrated Poggio of Florence was present at the trial of Jerome, and in a letter to his friend Leonard Aretine, has given an interesting account of it. For the whole letter we refer to Shepherd's life of Poggio Bracciolini, and for several extracts to Gilpin's life of Jerome. "It was indeed amazing," says this celebrated writer, "to hear with what force of expression, with what fluency of language, and with what excellent reasoning he answered his adversaries;

adversaries; nor was I less struck with the gracefulness of his manner; the dignity of his action; and the firmness and constancy of his whole behaviour."—"Here," said Jerome," as cited by this writer, standing in the midst of the assembly, "here is justice; here is equity. Beset by my enemies; I am already pronounced a heretic; I am condemned, before I am examined.—Were you Gods omniscient, instead of an assembly of fallible men, you could not act with more sufficiency. Error is the lot of mortals; and you, exalted as you are, are subject to it. But consider, that the higher you are exalted, of the more dangerous consequence are your errors.—As for me, I know I am a wretch below your notice: but at least consider, that an unjust action, in such an assembly, will be of dangerous example." When Jerome was accused of hating and defaming the holy see, the pope, the cardinals, the prelates, and the whole estate of the clergy, he stretched out his hands, and said, in a most moving accent, "On which side, reverend fathers, shall I turn me for redress? whom shall I implore? whose assistance can I expect? which of you hath not this malicious charge entirely alienated from me? which of you hath it not changed from a judge into an inveterate enemy?—It was artfully alleged indeed! Though other parts of their charge were of less moment, my accusers might well imagine, that if this were fastened on me, it could not fail of drawing upon me the united indignation of my judges."

On the third day of this memorable trial, what had past was recapitulated; when Jerome, having obtained leave, though with some difficulty, to speak, began his oration with a prayer to God; whose divine assistance he pathetically implored. He then observed, that many excellent men, in the annals of history, had been oppressed by false witnesses, and condemned by unjust judges. Beginning with profane history, he instanced the death of Socrates, the captivity of Plato, the banishment of Anaxagoras, and the unjust sufferings of many others. He then instanced the many worthies of the Old Testament, in the same circumstances, Moses, Joshua, Daniel, and almost all the prophets; and lastly those of the New, John the Baptist, St. Stephen, and others, who were condemned as seditious, profane, or immoral men. An unjust judgment, he said, proceeding from a laic was bad; from a priest, worse; still worse from a college of priests; and from a general council, superlatively bad.—These things he spoke with such force and emphasis, as kept every one's attention awake.

"The perjured witnesses," said Jerome, "who have appeared against me, have won their cause; but let them remember they have their evidence once more to give before a tribunal, where falsehood can be no disguise."

"His voice," says Poggio, "was sweet, distinct, and full: his action every way the most proper, either to express indignation, or to raise pity; though he made no affected application to the passions of his audience. Firm and intrepid he stood before the council; collected in himself; and not only contemning, but seeming even desirous of death. The greatest character in ancient story could not possibly go beyond him. If there is any justice in history this man will be admired by all posterity.—I speak not of his errors: let these rest with him. What I admired was his learning, his eloquence, and amazing acuteness. God knows whether these things were not the ground-work of his ruin.

"With a cheerful countenance, and more than Stoical constancy, he met his fate; fearing neither death itself, nor the horrible form in which it appeared. When he came to the place, he pulled off his upper garment, and made a short prayer at the stake: to which he was soon after bound with

wet cords, and an iron chain; and included as high as his breast with faggots.

"Observing the executioner about to set fire to the wood behind his back, he cried out 'Bring thy torch hither. Perform thy office before my face. Had I feared death, I might have avoided it.'

"As the wood began to blaze, he sang an hymn, which the violence of the flames scarcely interrupted.

"Thus died this prodigious man. The epithet is not extravagant. I was myself an eye-witness of his whole behaviour. Whatever his life may have been, his death, without doubt, is a noble lesson of philosophy." See BRACCIOLINI.

JEROME DE SANTA FÉ, a learned Spanish Jew in the fifteenth century, whose original name was Joshua Larchi. He became a Christian, and upon his baptism changed his name for that under which he has been just described. He was physician to Peter de Luna, who was chosen pope by the cardinals at Avignon in opposition to Boniface IX., and took the name of Benedict XIII. When this pontiff was in Spain, in the year 1412, he ordered a public conference to be held between some learned Christians at Tortosa, and the most celebrated Jewish rabbis in Arragon and Catalonia, on the subject of the Messiah's character, and the evidence brought forwards to prove that Jesus of Nazareth was that person: on this occasion Jerome acquitted himself with credit to his own learning and abilities, and to the new faith which he had embraced. In the following year he presented to the pope a treatise in confutation of the errors of the Jews, and another against the Talmud, which are said to have produced such an impression upon the Jews, that more than five thousand became Christians. They were published at Frankfort under the title of "*Hebræo-magisus*," in the year 1602.

JEROM'S Channel, *St.*, in *Geography*, an inlet in the straits of Magellan, which branches off to the N.N.W. about 20 miles in length, forming a communication between the Straits and Indian sound.

JEROM'S Point, *St.*, a cape on the coast of Patagonia, in the straits of Magellan, forming the W. point of entrance into St. Jerom's channel; 11 miles E. of cape Quad.

JERONIMO DE TAOS, *St.*, a town of New Mexico, on the Brava; 62 miles N. of Santa Fé.

JERONYMITES, or HIERONYMITES, a denomination given to divers orders, or congregations of religious; otherwise called *Hermits of St. Jerom*.

The first, called *Hermits of St. Jerom* of Spain, owe their origin to the third order of St Francis, whereof the first Jeronymites were members. Gregory the eleventh confirmed this order under the name of St. Jerom, whom they had chosen for their patron, and their model; and gave them the constitutions of the convent of St. Mary of the Sepulchre, with the rule of St. Augustine; and for habit, a white tunic, with a scapulary, a little capuche, and a mantle, all of their natural colour, without dyeing, and of a mean price.

The Jeronymites are in possession of the convent of St. Laurence, in the Escorial, where the kings of Spain are buried.

In Spain there is likewise an order of nuns of St. Jerom, founded by a lady towards the close of the 15th century. Sixtus put them under the jurisdiction of the Jeronymites, and gave them the constitutions of the monastery of St. Martha of Cordova, which were afterwards changed by Leo X. for those of the order of St. Jerom.

Hermits of St. Jerom, of the Observance, or of Lombardy, were founded by Lupus d'Olmedo in 1424, in the mountains of Cazalla, in the diocese of Seville.

The third order of Jeronymites was founded by Peter Gambacorti, about the year 1377; but the vows they made were only simple, till 1568, when Pius V. appointed them to be solemn. They have houses in Tyrol, Italy, and Bavaria.

The fourth congregation of Jeronymites, are the *Hermits of St. Jerom of Fiezoli*, begun in 1360, when Charles de Montegraneli, of the family of the count of that name, retiring into solitude, first established it at Verona. It was approved by Innocent VII. under the title and constitutions of St. Jerom. But Eugenius IV. changed it for that of St. Augustine. As the founder was of the third order of St. Francis, they preserved that habit; but, in 1460, Pius, permitting such as pleased to change it, occasioned a division among them. This order was finally suppressed by Clement XI. in 1668.

JEROPOTAMO, in *Geography*, a river of Candia, anciently "Lathæus," which runs into the Mediterranean, 8 miles N.N.W. of cape Metala.

JERSEY, an island in the British Channel, N. lat. $49^{\circ} 25'$. W. long. $2^{\circ} 11'$, situated about four leagues from the coast of Normandy, and 25 from that of England. It is considered as belonging to Hampshire, and comprizes an area of 12 miles in length by six in breadth; forming about 72 square miles, English measure. The island is divided into 12 parishes (having only eight churches), subordinate to the see of Winchester, and contains the two towns of St. Helier's and St. Aubin's. The population of the isle amounts to about 20,000, of which 3000 are able to bear arms, and are formed into two regiments. The shores abound with rocks and quicksands. On the northern side the cliffs are from 40 to 50 fathoms in height; but the southern shore is nearly level with the sea. A mountainous range runs through the centre, the sides of which abound with orchards; from the produce large quantities of cyder are made annually. It is computed that 24,000 hogsheds have been made in one year. This propensity of the inhabitants for cyder has occasioned them to convert their arable lands into orchards; and hence they have been obliged to import corn from the Baltic, England, and, in times of peace, from France. Formerly they raised enough, not only for home consumption, but for exportation. An abundance of cattle and sheep are reared here; and native wool forms an important article for trade and manufacture. There were formerly five monastic foundations in the island. All the accessible parts of the coast are well fortified with batteries, watch towers, &c. The latter have embrasures for small cannon, and loopholes for musketry. St. Aubin's bay is guarded by two very strong castles, or forts. These, and the whole military government of the island, are under the controul of a governor, an officer nominated by the English ministry. The civil jurisdiction is vested in a bailiff and 12 jurors, who are regulated by local laws chiefly derived from the ducal customs of Normandy. Jersey, Guernsey, Sark, and Alderney, were formerly part of the duchy of Normandy; and, though now united to the British crown, still preserve many Norman customs and laws. The legislature of England cannot enforce any law here unless it has previously been sanctioned by the bailiff and jurors. Some of the Jersey merchants employ several vessels in the Newfoundland trade. The French language is generally spoken here, and this is mostly used both in the pulpit and at the bar. Elizabeth castle, the principal fort of the island, was begun by queen Elizabeth, and hence its name. King Charles I. enlarged it; and king Charles II. who was twice here, increased and completed it. The governor and garrison now reside here, and the whole occupies an island in St. Aubin's bay. Mount-Orgeuil

castle was a place of strength before Henry the Fifth's reign, and was a fortress of very considerable consequence in the time of Edward III. This was also strengthened by queen Elizabeth. It stands on an eminence which is ascended by 200 steps. From the top may be seen the cathedral of Constance. This island is said to have abounded with druidical temples and altars. Bindaxtro, who wrote some tracts concerning Jersey, and died in 1691, states, that there "were not less than 50 of these temples and altars in the island," of which the greater part were destroyed when Falle wrote his history. The Cromlechs are here called Pouque-lays. In Camden's *Britannia*, vol. iii. p. 751, edit. 1789, is an extract of a letter from Mr. Morant to Dr. Stukeley, giving an account of several of these remains; and in Grose's *Antiquities* is a particular description, with two plates, of a very singular circular temple, which was found covered over with earth near the town of St. Helier. This was removed to Park Place, Berkshire, by general Conway, who was governor of the island when it was found.

In January 1781, the French, under baron de Rullicourt, landed here, and took possession of the garrison, the governor, &c. Major Pierfon, the second in command, attacked the French, and so desperate was the conflict that both of the commanders were killed, but the invaders were compelled to surrender as prisoners of war. Falle's *Account of Jersey*. Camden's *Britannia*. Grose's *Antiquities of England*.

JERSEY, *New*, one of the United States of America, situated between 39° and $41^{\circ} 24'$ N. lat. and between the meridian of Philadelphia and 1° E. long.; and bounded E. by Hudson river and the sea; S. by the sea; W. by Delaware bay and river, which divides it from the states of Delaware and Pennsylvania; N. by a line drawn from the mouth of Mahakkamak river, in lat. $41^{\circ} 24'$ to a point on Hudson river in lat. 41° . This province is 160 miles long and 52 broad, and contains about 8320 square miles, or 53,24,800 acres. It is said to have been first discovered by capt. Hudson, who, in 1609, entered into the service of the Dutch, by whom it was first settled, about the year 1614. Its original inhabitants were a tribe of Indians, who called themselves Linnellinopes; by the French they were denominated Les Loups, and by the English, Delawares. This confederacy comprised numerous subordinate clans, of which the principal were the Chihocki, who dwelt on the W. side of the river Delaware; the Wanami, who ranged from the Raritan in New Jersey to the sea-coast; the Munseys, on the upper streams of the Delaware, down to the Leheigh; the Wabingas, or river Indians, who resided between the Delaware and Hudson, and from the Kittatany to the Raritan; and the Mohickons or Mankattans, who occupied Staten island, York island, and part of Long island, from the highlands to the ocean. These confederate tribes waged war for the greatest part of a century with the Iroquois, or five nations, but were at last subdued, and reduced to the most humiliating terms, about the year 1682, when William Penn landed in Pennsylvania.

This province formed a part of a large tract of country called New Belgium, or New Netherland; and being ceded to the English, it was granted, in 1664, by Charles II. to his brother James, duke of York, who made it over to lord Berkeley and sir George Carteret. After several divisions and transfers, which were sources of quarrels and confusion, the proprietors, in the year 1702, surrendered their charter to the crown, and the country was united to the government of New York. In 1706 Jersey was made a separate government. New Jersey is now divided into 13 counties, which are subdivided into 94 precincts or townships, as in the annexed table.

TABLE.

JERSEY.

T A B L E.

	Counties.	Principal Towns.	Length.	Breadth.	Total Number of Inhabitants.	Number of Slaves.
These seven counties lie from S. to N. on Delaware river. Cape May and Gloucester extend across to the sea.	Cape May	None	30	9	571	141
	Cumberland	Bridgetown	50	20	8,248	120
	Salem	Salem			10,437	172
	Gloucester	Woodbury and Gloucester	} 30	22	13,360	191
	Burlington	Burlington and Bordertown				
	Hunterdon	Trenton	37	12	20,253	1,301
	Suffex	Newtown			19,500	439
Bergen	Hackinsack			12,601	2,301	
These four counties lie from N. to S. on the eastern side of the state.	Essex	Newark and Elizabethtown	} 80	30	17,785	1,171
	Middlesex	Amboy and part of Brunswick				
	Monmouth	Freehold			16,918	1,596
	Somerset	Boundbrook and part of Brunswick	} 25	20	12,296	1,810
	Morris	Morristown				
Total,	Thirteen.				184,139	11,423

The militia of this state in 1793 amounted to 19,077, between the ages of 18 and 45 years; and the whole number of men capable of bearing arms amounted to between 30 and 40,000. The government of this state is vested in a governor, chosen annually by the council and assembly jointly, a legislative council composed of one member from each county, chosen annually by the people and general assembly, composed of three members chosen as above. The governor sits in and presides over the legislative council; his privy or executive council consists of any three members of the legislative council; and the governor and any seven members of the council are a court of appeal in the last resort as to points of law in civil cases, and possess a power of pardoning criminals in all cases whatever. The council may originate any bills, excepting preparing and altering any money bill, which is the sole prerogative of the assembly. Every bill is read three times in each house. None of the judges of the supreme court, or other courts, sheriffs, or any person possessing any poll of profit under the governor, justices of peace excepted, is entitled to a seat in the assembly. The courts of justice in this state are justices' courts, courts of quarter-sessions of the peace, courts of common-pleas, supreme courts, orphans' courts, courts of chancery, and high court of errors and appeals. The English laws, as far as they are not repugnant to revolution principles, are adopted by the constitution; but in the distribution of property, where there is no will, each son has two shares, and each daughter has one share. In this state there are about 50 Presbyterian congregations, subject to the care of three presbyteries: viz. those of New York, New Brunswick, and Philadelphia. Besides these there are upwards of 40 congregations of Friends, 30 of the Baptists, 25 of Episcopalians, 28 of Dutch Reformers, 20 of the Methodists, and a settlement of Moravians. All are allowed by the constitution to worship God according to the dictates of their own consciences; and are not compelled to attend or support any worship contrary to their own faith and judgment. All Protestant inhabitants, of peaceable beha-

viour, are eligible to the civil offices of the state. For the colleges in this state, see COLLEGE. The capital town of this province is Trenton; besides which there are Burlington, Perth Amboy, Brunswick, Elizabethtown, Newark, Swedesborough, Salem, &c. which see respectively. The rivers in this state, though not large, are numerous; the principal are the Passaic, Raritan, Hackinsack, Delaware, Cohansey creek, Mulicus, Alloway creek, Ancocus creek, Paulin's Kiln, Raccoon creek, Salem creek, and some others. This state is remarkable for mill-seats, 1100 of which are already improved; 500 with flour-mills, and the rest with saw-mills, fulling-mills, forges, furnaces, slitting and rolling-mills, paper, powder, and oil-mills. The greatest part of the soil of New Jersey is sandy; some of it barren and unfit for cultivation; but that near the sea-coast is said to be many feet deep, in some places 50, without rocks or stones, when you come to salt-marsh, and has much the appearance of being artificial; the good land in the southern counties lies principally on the banks of rivers and creeks; the soil on these banks being generally a stiff clay, which, in its natural state, produces various species of oak, hickory, poplar, chestnut, ash, &c. The barren parts produce little else but shrub-oaks and yellow pines. These sandy lands yield an immense quantity of bog-iron ore, which is wrought very advantageously in the iron-works in these counties. The salt meadows along the lower part of the Delaware river and bay afford plentiful pasture for cattle in summer, and hay in winter; but the swarms of muskitoes in the months of June, July, and August, are very troublesome both to man and beast. The inhabitants along the sea-coast subsist principally by feeding cattle on the salt-meadows, and by various kinds of fish, abundantly supplied by the sea, rivers, and creeks. They raise Indian corn, rye, potatoes, &c. but not for exportation. Their swamps afford lumber, which is conveyed with ease to a good market. The sugar maple-tree is common in Suffex county, upon the Delaware. In the hilly and mountainous parts of the state, which are not too rocky for cultivation, the soil is of a stronger kind,

kind, covered, in a state of nature, with stately oaks, hickories, chestnuts, &c. and when cultivated, producing wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and farmers feed great numbers of cattle for the markets of New York and Philadelphia; and many of them keep large dairies, as there are large tracts of fine meadows between the hills. The orchards in many parts of the state are said to be equal to any in the United States, and the cider is reckoned the best in the world. Those parts of New Jersey that are contiguous to New York and Philadelphia, supply their markets with many kinds of vegetables, as apples, pears, peaches, plums, strawberries, cherries, and other fruits; cider in large quantities, and of the best quality, butter, cheese, beef, pork, mutton, and other meats.

The trade of New Jersey is carried on almost solely with New York and Philadelphia; though it has some good ports of its own. The articles exported are chiefly wheat, flour, horses, live cattle, hams which are much commended, lumber, flax-seed, leather, iron in great quantities, and formerly copper-ore. The imports consist chiefly of West India goods. The manufactures of this state have been inconsiderable, though they are now improving; and they consist principally of the articles of iron, nails, and leather. Tanneries are numerous and valuable; paper-mills and nail manufactories are wrought with profit in several parts of the state. Wheat is also manufactured into flour, and Indian corn into meal; and these are profitable articles. But iron is the most ample source of wealth to the state. Iron-works are erected in Gloucester, Burlington, Sussex, Morris, and other counties. In the whole state it is supposed there are yearly made about 1200 tons of bar-iron, 1200 ditto of pigs, and 80 ditto of nail-rods, exclusive of hollow ware, and various other castings, to a great amount. This state affords vast quantities of iron and copper-ore. The iron-ore is of two kinds: one capable of being manufactured into malleable iron, and found in mountains and low barrens; and the other called bog-ore, found in rich bottoms, and yielding iron of a hard, brittle quality, which is commonly manufactured into hollow ware, and used sometimes instead of stone in building. Many copper-mines have been discovered in different parts of the state. Mines have also been discovered of lead and plaster of Paris, and the state is said also to contain coal. In the town of Newark and its vicinity, there are immense quarries of valuable stone, much used in building.

The inhabitants of this state are a collection of Low Dutch, Germans, English, Scotch, Irish, and New Englanders, or their descendants; and of course differ much in their manners and character; and this difference is in some measure increased by different forms of religion, and also by intercourse with the inhabitants of other states. The people in West Jersey trade to Philadelphia, and incline to the fashions and manners of that city: whilst those of East Jersey trade to New York, and acquire a resemblance to the inhabitants of this capital. But whatever differences may subsist among them in consequence of these circumstances and of their different occupations and professions, the people of New Jersey are generally industrious, frugal, and hospitable. The women are allowed to be discreet, amiable, genteel, and also handsome, in due proportion to their whole number. Morse's American Universal Geography, vol. i. 1805.

JERSEY, *New*, in *Botany*. See CEANOTHUS.

JERSEY, among *Woolcombers*, denotes the finest wool, taken from the rest by dressing it with a Jersey comb.

JERTH, in the *Materia Medica*, a name given to a certain kind of moss, according to Schæffer, growing very plentifully in Lapland, and other cold countries. The root of this is the part used in medicine, and the method of giving it is in decoction. They boil a large quantity of it in the whey made of rein-deer's milk, and give the patient large draughts of it warm every hour or two; by that means keeping up a good perspiration, which they increase or diminish according to the nature of the case. The principal diseases to which they are subject are pleuritis and the small-pox; and it is wonderful to find how well they get through these two dangerous complaints by this regimen alone. Upon the whole, the virtue of so much warm and diluting liquor seems the principal thing to be depended upon by them; for if they cannot readily get the jerth root, they scruple not to supply its place with the stalks of angelica, and the medicine seems to succeed as well this way as the other, both in the small-pox and other cases.

JERVAS, CHARLES, in *Biography*, a portrait painter, whose name is more indebted for its reputation to his pupil Pope having offered false incense to him in a copy of verses, than to his own merits. He was a pupil of Kneller, and acquired a fortune by marriage. He died in 1739.

JERVIS'S CANAL, in *Geography*, an inlet or arm of the Pacific ocean, on the W. coast of North America, in the gulf of Georgia, examined and so named by captain Vancouver in the year 1792. N. lat. 49° 40'. E. long. of the entrance 236° 22'.

JERUSALEM, derived from *ירושלם*, *to see*, and *שלום*, *peace*, *q. s.* the vision or inheritance of peace, a celebrated city of Asia, the capital of Palestine or Judea, is supposed, though perhaps without sufficient authority, to have been built on the site of Melchizedek's *Salem*, and hence called "Salem" and "Solyma." It was situated in the midst of a rocky and barren country, on the frontiers of the two tribes of Benjamin and Judah, so that it was sometimes considered as a part of the one, and sometimes of the other; but by the distribution of Joshua (ch. xviii. 28.) it belonged to Benjamin, whereas it pertained to Judah by right of conquest, this tribe having twice subdued it, first under the Judges, and afterwards under David. After the building of the Temple, it was considered as the metropolis of the nation, belonging to all Israel in common, and not properly either to Benjamin or Judah. Jerusalem was founded upon hills, and surrounded by mountains: the two largest hills were Zion and Acra, upon which the first buildings were erected; and on mount Moriah, Solomon, at a subsequent period, built the temple. Mount Zion bounded to the south the whole circumference, and reached from east to west: the western side was the most elevated, and circumscribed by the valley of Hinnom, or Ge-hinnom, as the eastern was by that of Jehosaphat, which is supposed to have joined the other towards the south. Here were the fountains of Gihon and Siloam, the brook Kidron, and the waters of Ethan, which Pilate, at a much later period, conveyed through aqueducts into the city. To the north of Zion was another valley, called by Josephus "the valley of Cheesemongers," probably the same as that distinguished in Zephaniah (ch. i. 11.), by the epithet "Machthehs," which the LXX have translated *της κατασκευαστου*, *q. d.* that which was cut in or made hollow. Acra, with the said valley to the south, stood to the north of Zion, having its declivity on every side equal. Upon Zion stood the High city, called, in the time of Josephus, the High Market-place; the Lower city stood upon Acra, but before that period bore other names. The ancient city Jebus, which David took from
the

JERUSALEM.

the Jebusites, was not large: it stood on a mountain S. of the temple. When David subjected and expelled the Jebusites, he seized their fortrefs and city, B. C. 1048, and called the latter after his own name, "the City of David." Between the mountains, Zion and Acra, on which the Upper and Lower cities were erected, there was a valley, which separated the two cities, but which was filled up by David and Solomon, so that the two cities were joined. 1 Kings, ix. 15. 24. xi. 27.

Jerusalem, in its most flourishing state, was divided into four parts, each inclosed within its own walls; namely, the old city of Jebus, which stood on mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the residence both of himself and his successors; on which account it was emphatically styled "the City of David." The "Lower City," called also the "Daughter of Zion," being built after it, on which stood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabean princes; and the stately amphitheatre raised by Herod, capable of containing 80,000 spectators; the strong citadel by Antiochus, to command the temple, afterwards razed by Simon the Maccabee, who recovered the city from the Syrians; and lastly, a second citadel, built by Herod, upon a high and craggy rock, called by him Antonia. The "New City," mostly inhabited by tradesmen, artificers, and merchants: and "Mount Moriah," on which appeared the celebrated temple of Solomon, described in the 6th and 7th chapters of the 2d book of Kings, destroyed by Nebuchadnezzar, re-built by the Jews on their return from Babylon, and afterwards renewed, augmented, adorned, and enriched by Herod. See TEMPLE.

Little is said concerning the walls of Jerusalem. We read, however, that after David had taken "the strong hold of Zion," he called it the city of David, and dwelt in that fort, having built round about Milla and inward. Solomon, from whose time the appellation of Jerusalem seems to have superseded that of Jebus, and his successors, took care to improve the walls. Hezekiah built up that part which was demolished by Joash, king of Israel, and added another without. After the reign of Manasseh, there is mentioned a new city, called the "Second," inclosed with walls by that prince. (2 Chron. xxiv. 22. xxxiii. 14. 2 Kings, xxii. 24.) The Maccabees considerably enlarged it on the north, by inclosing a third hill, as part of Jerusalem. Josephus speaks of a 4th hill, called "Bezetha," which Agrippa joined to the city: this new city lay north of the temple, along the brook Kidron, or Cedron. In ancient Jerusalem there were ten gates, five from W. to E. by S., and five others by N. Nehemiah mentions also four towers. It is not easy to ascertain the extent of this city in its different changes. Its most ancient state of perfection was in the reign of Solomon, in whose time this city appeared in its greatest splendour. In this state of uncertainty about its limits, we may venture to state its circumference at first to have been seven or eight stadia, or a Roman mile. In Solomon's time it was, without doubt, twice or three times as large. After the captivity, when it was rebuilt, it occupied much the same space as before, as we may infer from Nehemiah's description of the ruins, and its condition after it was repaired. According to Josephus, the whole circumference of Jerusalem was 33 stadia, or about four miles 125 paces. But Hecatæus, who describes it as it was in his time, under Ptolemy Lagus, gives it no less than 50 stadia, probably including the out-parts, which did not properly belong to it; and Hecatæus adds, that there were in Jerusalem 120,000 inhabitants; which statement is not improbable. The cir-

cumference of the ancient city, according to Eusebius, (Præp. Evang. l. ix. c. 36.) was 27 stadia, or 2550 toises. A plan, says Gibbon, taken on the spot, assigns no more than 1980 for the modern town. For the different opinions respecting its measurement, we refer to Villalpendus and Reland.

From the period of the reign of Solomon, when the temple was dedicated, B. C. 1004, to the destruction of the city, it underwent many revolutions and vicissitudes; some of the principal of which we shall recite. In the fourth year of the reign of Rehoboam, son of Solomon, B. C. 971, the city was besieged and taken by Shishak, or Sefac, king of Egypt, who carried away the treasures of the temple, as well as of the royal palace. In about a century after, B. C. 826, Jehoash, king of Israel, advanced to Jerusalem, having taken Amaziah, king of Judah, and plundered the temple and royal palace, and demolished the city-walls. (2 Kings, xiv. 13. 2 Chron. xxv. 23.) In the year B. C. 608, Pharaoh Necho, king of Egypt, having slain Josiah, king of Judah, captured his son Jehoahaz, who had been raised to the throne in the room of his father, imposed upon Jehoiakim, appointed by Necho as his successor, a tax of 100 talents of silver, and 10 of gold, pillaged the city and temple, and thus made Jerusalem tributary to Egypt. In the 4th year of Jehoiakim, B. C. 606, Nebuchadnezzar besieged Jerusalem, which now fell under the dominion of the Chaldeans. When Jehoiakim attempted three years after to throw off the yoke of servitude, the king of Chaldea sent a powerful army against him, which desolated Judea, took Jehoiakim prisoner, and put him to death, carrying away a number of his subjects as slaves to Babylon. His son Jehoiachin, who succeeded him, reigned at Jerusalem only three months. Nebuchadnezzar laid siege to Jerusalem, and compelling Jehoiachin to surrender, carried him, his family, and many of the inhabitants captive to Babylon. Upon this occasion Nebuchadnezzar seized on all the riches of the temple and royal palace, and destroyed those golden vessels which Solomon had appropriated to the service of God. In the room of Jehoiachin, Zedekiah was raised to the throne; but when this prince rebelled against the king of Chaldea, he sent an army against Jerusalem, which, in the 11th year of Zedekiah, B. C. 588, took the city, and, after putting out his eyes, carried him away as a captive. Nebuchadnezzar, being then at Kiblah, a city of Syria, sent his general Nebuzaradan utterly to destroy Jerusalem. The walls of the city were razed, the royal palace and temple were demolished, their riches and ornaments transported to Babylon, and the people were carried away into slavery. Cyrus, king of Persia, having conquered Babylon in the year B. C. 538, set the Hebrews at liberty, and in the year B. C. 536, issued an edict for their return to their own land, for a restoration of the sacred vessels carried away by Nebuchadnezzar, and for the rebuilding of their temple, after a captivity of 70 years, if we reckon from the fourth year of Jehoiakim, B. C. 606. (See CAPTIVITY.) The Jews, obstructed by the Samaritans, and other hindrances, were 20 years employed in constructing this new edifice, so that it was finished in the year B. C. 515. But the walls and gates were not rebuilt till after the return of Nehemiah, in the space of 12 years and four months, the 82d year after the decree of Cyrus, or B. C. 454. After the time of Nehemiah, Jerusalem enjoyed peace till the year B. C. 332, when Alexander, having taken Tyre, demanded assistance of the Jews; and being refused by the chief priest, who pleaded as an oath made to Darius not to take part with his enemies, the conqueror was incensed, and repairing to Jerusalem, determined to be revenged on the city and its inhabitants;

JERUSALEM.

but being met by a multitude of people dressed in white, the priests arrayed in their robes, and the high priest in a garment of purple and gold, having on his head a tiara, with a plate of gold above it, upon which was inscribed the name of the Lord, his passion subsided; and approaching the high priest, he offered his adoration to God, and paid his respects to Jaddua, and saluted all the Hebrews. After the death of Alexander, Jerusalem remained subject to the kings of Egypt; Ptolemy Soter, the son of Lagus, having taken it by stratagem in the year B.C. 320, and having carried into captivity about 100,000 persons. In the year B.C. 170, Antiochus Epiphanes besieged Jerusalem, pillaged the city and temple, put to death 80,000 of the inhabitants, made 40,000 of them slaves, and sold 40,000 more. Three years after, the sacrifices were interrupted in the temple, the statue of Jupiter Olympius was placed on the altar, and the abomination of desolation was seen in the house of God. After three years, Judas Maccabæus went up to Jerusalem, purified the temple, and restored the sacrifices. In the following year B.C. 164, Antiochus Eupator laid siege to Jerusalem, but a peace being concluded, he was received into the city by Judas Maccabæus; however, he violated his oath, and caused the wall between the temple and the citadel, which defended the former from the attacks of the Syrians, to be utterly demolished. In the year B.C. 143, Simon Maccabæus fortified Jerusalem, by erecting high and strong towers on the walls; and he took and destroyed the citadel, which was then in the hands of the Syro-Macedonians, and which had kept Jerusalem 26 years dependent on the king of Syria. John Hyrcanus succeeded his father Simon in the year B.C. 135, and soon after Antiochus Sidetes, king of Syria, declared war against him, besieged Jerusalem, destroyed the walls of the city, and then retired, in the year B.C. 63, Pompey, having subdued Syria, laid siege to Jerusalem, and made Judea tributary to the Roman empire. But though he and some of his officers entered into the most holy places of the temples, they took nothing away. During the reign of Herod the Great, Jerusalem was much enlarged and embellished. He constructed a superb royal palace, a theatre, and an amphitheatre, for the purpose of celebrating various games in honour of Augustus. He also projected the design of rebuilding the temple, or at least of enlarging that which had been erected after the return of the Jews from the Babylonish captivity, and having begun the work in the 18th year of his reign, he completed it in eight years. (See TEMPLE.) Under the reign of the emperor Tiberius, Jerusalem was made signal in all future ages by the death and resurrection of our Lord and Saviour JESUS CHRIST, who was unjustly accused and condemned, and crucified on mount Calvary. (See CALVARY.) It is needless to recite any of those trivial circumstances that pertain to this city, between the event now mentioned, and its destruction by Titus. The country of Judea, and Jerusalem in particular, had been reduced to a wretched state by contending factions, and by resistance to the oppression of Roman governors. The dissatisfaction that prevailed at length terminated in the desolation and carnage of war. This was commenced, according to Josephus, (Ant. l. 20. xi. 1.) in the second year of the government of Gessius Florus, who succeeded Albinus, the successor of Porcius Festus, mentioned in the Acts of the Apostles, in the month of May, in the 12th year of the emperor Nero, and the 17th year of Agrippa, mentioned Acts, xxv. and xxvi, that is, in the month of May, A.D. 66. The emperor Nero entrusted the conduct of it, on the part of the Romans, to his general Vespasian, who, accompanied by his son Titus, and a powerful army, arrived in Syria, A.D. 67. Vespasian, soon after succeeding to the

empire, committed the prosecution of the war against the Jews to his son Titus, who joined the army, amidst the acclamations of the populace, A.D. 70. Jerusalem was in the most woeful condition when Titus undertook the siege of it, April 14th, A.D. 70. Having made himself master of the first wall, May 4th, he caused a great part of it towards the north to be demolished. His favourable offer of terms to the besieged was rejected; and five days after he took the second wall, and after a repulse, he gained possession of it again in four days, and demolished the part that remained of it in the northern quarter. Failing to batter down the third wall, Titus renewed his proposal to the inhabitants, and for this purpose employed Flavius Josephus, who had been taken prisoner, and who, after having received his liberty, had attached himself to the Roman camp. The majority of the people were inclined to accept the easy conditions that were proposed; but they were resisted by some zealots, and Josephus was treated with every mark of indignity and reproach. Titus was enraged, and his clemency was changed into unjustifiable severity. He ordered the hands of those who had sought shelter in his camp to be cut off, and in this mutilated state sent them back to the city; and others were crucified in the sight of their countrymen. Within the city famine began to make dreadful havoc, so that parents were obliged to satisfy their hunger by devouring the flesh of their own children; an action which appeared so unnatural to the Roman general, that he swore he would bury the remembrance of it under the ruins of Jerusalem. Titus accelerated by all the means in his power the operations of the siege, and at length, applying his battering rams to the third wall, or the wall enclosing the fortress, he made himself master of the tower of Antonia. The Romans wished to get possession of the temple without destroying it; but a soldier threw a burning torch amidst a quantity of combustible materials in the northern part of it, and thus set it on fire. The temple was burnt on the 18th day of the month of August, A.D. 70, the same day and month, on which it had been burnt by the king of Babylon. The Romans with concern, and the inhabitants with the most poignant sorrow, perceived this building reduced to ashes; and very soon, *viz.* on the 8th day of September, A.D. 70, and in the 2d year of the reign of Vespasian, the city of Jerusalem fell into the hands of Titus. It was then given up to be plundered by the soldiers, and most of its inhabitants were put to the sword. In conformity to the orders of Titus, the city was destroyed to its foundations, and even the ruins of the temple were demolished. A plough-share, it is said, was drawn over the consecrated ground, as a sign of perpetual interdiction. According to Josephus, whose account of the Jewish war, and of the siege and capture of Jerusalem, is in almost every one's hands, the number of prisoners taken during the whole war was 97,000, and that the number of those who perished in the siege amounted to 1,100,000; but Tacitus, who lived in the first century, in the time of Vespasian and Titus, heard it reported, that the number of the besieged, including those of every age and sex, was only 600,000. Notwithstanding the destruction of their city, many Jews remained in the town or in its vicinity, and erected new buildings for their accommodation; but they paid tribute to the Romans, and became subject to their laws. It is a circumstance that deserves to be recorded, that, as we have good reason to believe, no Christians were involved in the miseries of the last siege of Jerusalem. They are supposed to have left it before the siege began. Some went to Pella, as Eusebius mentions (H. E. l. iii. c. 5), a city on the other side of the Jordan. Others might go elsewhere, into Asia, or

JERUSALEM.

other remote countries, where they could get a settlement. St. John, it is supposed, left Judea, and went to Ephesus in the year 66, or about that time, just before the war commenced. Some Jews of Jerusalem, and other parts of Judea, might go with him, or follow him afterwards. And, under his direction and assistance, they might procure a comfortable settlement in places not far from him. After the termination of the war in Judea, it is supposed that the Christian believers, who had retired into the country beyond Jordan, returned to Jerusalem, and formed a church there.

In process of time, the Jews incensed Adrian by their turbulent disposition, and he resolved to level the city of Jerusalem with the ground, that is, those buildings which the Jews had erected, to destroy three towers that were left by Titus for the convenience of the Roman garrison, and to sow salt in the ground on which the city had stood. Thus did Adrian, whatever were his motives, literally fulfil the prediction of our Saviour, that neither in the city nor the temple should one stone be left upon another. This final destruction took place 47 years after that of Titus. The further attempts of Adrian are recited under the article *ÆLIA Capitolina*. For an account of the honours paid to Jerusalem and its vicinity by the mother of Constantine the Great, see *CALVARY*, *Invention of the Cross*, and *HELENA*. For Julian's attempt to rebuild the temple at Jerusalem, see *JULIAN* and *TEMPLE*. The emperor Justinian erected a magnificent church to the Virgin Mary at Jerusalem. For the foundation of this church a level was formed, by raising part of a deep valley to the height of the mountain. The stones of a neighbouring quarry were hewn into regular forms; each block was fixed on a peculiar carriage drawn by 40 of the strongest oxen, and the roads were widened for the passage of such enormous weights. Lebanon furnished her loftiest cedars for the timbers of the church; and the seasonable discovery of a vein of red marble supplied its beautiful columns, two of which, the supporters of the exterior portico, were esteemed the largest in the world. To complete the celebrity of this church, the holy vessels of the Jewish temple, recovered by Belisarius after their long peregrination, says Gibbon, were deposited in it.

In the year 614, the Persians, under the command of Chosroes, took Jerusalem by assault. The sepulchre of Christ, and the stately churches of Helena and Constantine, were consumed, or at least damaged by the flames; the devout offerings of 300 years were rifled in one sacrilegious day; the patriarch Zachariah, and the "true cross" were transported into Persia; and the massacre of 90,000 Christians is imputed to the Jews and Arabs, who swelled the disorder of the Persian march. However, in 628, Jerusalem and the holy cross were restored to Heraclius, who banished from the city all the Jews, and prohibiting their coming within three miles of it. After the battle of Yermuk in 626, and a siege of four months, Jerusalem surrendered to the Saracens, under the command of the caliph Omar, and it remained for several centuries under the government of the caliphs, who were Mahometans, and of course the prevailing religion was Mahometan. The Turks, after having reduced Damascus by fire and sword, took possession of Jerusalem A.D. 1076; and under the government of these masters, the condition of the Christians was very deplorable; the pilgrims, who were numerous from all parts of the world, were grievously insulted and oppressed by the Turkmen; the pathetic tale of their sufferings excited the millions of the west to march under the standard of the cross to the relief of the Holy Land. "A nerve," says Gibbon, "was touched of exquisite feeling; and the sensation vibrated to the heart of Europe." The Turks were constrained to

surrender Jerusalem to the caliph of Egypt; but after a short possession he was obliged to deliver it to the Crusaders. See *CROISADE*.

Jerusalem, long so famed in history for its sanctity and its opulence, is now reduced to a poor, thinly inhabited town, of at most three miles in circuit. It is called by the Turks "Cudsembaric" and "Coudheriff." The Orientals, however, never call it by any other name than "Elkods," the Holy: sometimes adding the epithet "el sherif," the noble. The ground between Rome and Jerusalem is rugged, mountainous, and barren. When its situation is considered, destitute of water, and surrounded by dry channels of torrents and steep heights, we may well be astonished at its ancient greatness. It is seated on an eminence, but surrounded by others of greater height; and its walls, which remain tolerably perfect, and constructed of a reddish stone, form the chief object in the approach. The best view of Jerusalem is from the mount of Olives, on the east of the city. In front is the chief mosque, which, according to the tradition of the Mahometans, contains the body of Moses; from the same mount may be discovered, on a clear day, the "Dead Sea," nearly S.E., reflecting a whitish gleam; the intervening region appearing very rocky. The "tombs of the kings," as they are called, are worthy of notice, being of Grecian sculpture on a hard rock. There are several ornaments on the sarcophagi of foliage and flowers, and each apartment is secured with a massive pannelled door of stone. These tombs, which have been frequently ravaged in search of treasure, are supposed to have been constructed in the time of Herod and his successors, kings of Judea. The inhabitants are partly Christians and partly Mahometans, and they are actuated by a spirit of discord and hatred towards one another. From the respect which they profess for the sacred places contained in this city, one would be apt to imagine that they were a very devout people; but Volney represents them as well deserving the reputation of the vilest people in Syria, not excepting even those of Damascus. He supposes their number to amount to 12 or 14,000: Browne states the present population of Jerusalem at from 18 to 20,000. The Christian women, who abound in Jerusalem, wear white veils, as a distinction from the Mahometan, who wear other colours. Arabic is the general language, except among the Armenians and Greeks. Jerusalem has had from time to time governors of its own, with the title of Pachas: but it is now governed by an aga, motfallan, or deputy governor, appointed by the pacha of Damascus, who is allowed so few troops, that all Palestine may be regarded as in the power of the Arabs. The motfallan, availing himself of the disposition to make pilgrimages to Jerusalem and its vicinity, which has prevailed for many ages, and which still continues, farms his government, and receives the revenues arising from the Miri, the customs, and especially from the follies of the Christian inhabitants. In order duly to appreciate the value of this last article, it must be understood, that the different communions of Schismatic and Catholic Greeks, Armenians, Copts, Abyssinians, and Franks, mutually envying each other the possession of the holy places, are continually endeavouring to outbid one another in the price they offer for them to the Turkish governors. They are constantly endeavouring to obtain some privilege for themselves, or to take it from their rivals; and each sect is perpetually informing against the other for irregularities. Hence proceed those hatreds, and that eternal jangling which prevail between the different convents, and the adherents of each communion. Every dispute yields profit to the Turks; and also perquisites for the motfallan, which annually amount to upwards of 100,000 piastres.

Every pilgrim pays him an entrance fee of ten piaſtres, and another for an effort for the journey to the Jordan, beſides other ſums as fines for miſbehaviour during the ſtay of the pilgrims, and duties on the exportation of certain ſingular commodities from Jeruſalem, ſuch as beads, relics, ſanctuaries, croſſes, paſſions, agnus deus, ſcapularies, &c. of which near 300 cheſts are ſent off annually. The fabrication of theſe utenſils of piety procures ſubſiſtence for the greateſt part of the Chriſtian and Mahometan families of Jeruſalem and its neighbourhood; men, women, and children being employed in carving and turning wood and coral, and embroidering in ſilk, with pearls, and gold and ſilver thread. The convent of the Holy Land, alone, lays out annually to the amount of 50,000 piaſtres in theſe wares, and thoſe of the Greeks, Armenians, and Copts, taken together, pay a larger ſum. Theſe commodities, exported to Turkey, Italy, Portugal, and eſpecially to Spain, produce a return of conſiderable ſums, either in the form of alms or payments. To theſe the convents join another article not leſs lucrative, *viz.* "the viſits of the pilgrims." It is well known that at all times the devout curioſity of viſiting the "holy places" has occaſioned Chriſtians of every country to reſort to Jeruſalem. It was formerly taught by the miniſters of religion as indiſpenſibly neceſſary to ſalvation, and this pious zeal pervading all Europe, gave riſe to the cruſades. (See *CROISADES.*) Since their unfortunate iſſue, the zeal of Europeans has cooled, the number of pilgrims has diminiſhed, and they are now reduced to a few Italian, Spaniſh, and German monks; but this is not the caſe with the Orientals, their prieſts and monks, deriving advantage from this fervour, do not ceaſe to promote it. The Greeks, eſpecially, declare that "the pilgrimage enſures plenary indulgence, not only for the paſt, but even for the future; and that it abſolves not only from murder, inceſt and pederſty; but even from the neglect of faſting, and the non-obſervance of feſtivals, which are far more heinous offences." Accordingly, every year a crowd of pilgrims of both ſexes, and of all ages, ſet out from the Morea, the Archipelago, Conſtantinople, Anatolia, Armenia, Egypt, and Syria, the number of whom, in 1784, amounted to 2000. This zeal, however, is found to be very expenſive: ſince the moſt moderate pilgrimage never coſts leſs than 166*l.* and ſome of them, by means of offerings, amount to 2500*l.* Yafa is the port where the pilgrims diſembark; they arrive in November, and repair without delay to Jeruſalem, where they remain, in inconvenient but very expenſive lodgings, till after the feſtival of Eaſter. The pilgrims muſt alſo be at great charge in paying for maſſes, ſervices, and exorcifms, and alſo in the purchaſe of crucifixes, beads, &c. On Palm Sunday they go to purify themſelves in the Jordan, which is an expenſive expedition. One year with another, it produces to the governor 15,000 Turkiſh ſequins, or 4687*l.* When Eaſter is paſt, each perſon returns to his own country, proud of being able to rival the Mahometan in the title of pilgrim, and bearing imprinted on their hands, wrifts, or arms, figures of the croſs or ſpear, with the cypher of Jeſus and Mary. The difference between theſe two claſſes of pilgrims is, that thoſe of Mecca are called "Hadjes," and thoſe of Jeruſalem "Mokodſi," a name formed from that of the city, "El-Kods." The number of pilgrims who reſide at Jeruſalem for five or ſix months, leave behind them a ſum not leſs than 62,500*l.* (See *PILGRIMAGE.*) Theſe pilgrims draw together to Jeruſalem a ſwarm of mendicants; and yet notwithstanding the wealth accumulated and expended in this city under the influence of prieſtercraft and ſuperſtition, the church of the Holy ſepulchre, the glory of former times, and the monument of Helena's piety, is ſo

much neglected, that the ſnow falls into the middle of it: the beams, ſaid to be cedar, are falling, and the whole roof is in a ruinous ſtate. The Armenian convent is ſaid to be elegant, and ſo extenſive as to furniſh accommodation for no leſs than 1000 pilgrims. When Mr. Browne viſited this city in February 1797, a very deep ſnow lay upon the ground for 12 or 13 days. The Catholic convent has a large ſubterraneous ciftern, into which the ſnow, melting from the roof and other parts, is conveyed, and ſupplies the monks with water for a great portion of the year. *Anc. JERUSALEM, *Sage of.* See *PULMONARIA.*

JERUYO, in *Geography*, a ſingular mountain, ſituated in the valley of Urecho, in Mexico or New Spain; which before the year 1760 was a ſmall hill, bearing a fugar plantation, but from September in that year it has continued to emit fire and burning rocks, that have formed themſelves into three high mountains, whoſe circumference in 1766 was nearly ſix miles. At the eruption the aſhes were forced to the diſtance of 150 miles.

JERXHEIM, a town of the principality of Wolfenbuttel; 13 miles E.S.E. of Wolfenbuttel.

JESAN, a delightful mountain of Japan, near the lake of Oitz; which is eſteemed ſacred, and, according to *Kæmpfer*, is ſaid to preſent not leſs than 3000 temples.

JESAW, a town of Pruffia, in the circle of Natangen; 10 miles S. of Konigsberg.

JESEN, in *Ichthyology.* See *JENTLING.*

JESENITZA, in *Geography*, a town of Croatia; 35 miles N.W. of Bihaçs.

JESERNICO, a town of Italy, in the country of Friuli; 12 miles W. of Palma la Nuova.

JESERO, a ſingular lake in the iſle of Cherfo, which only diſſuſes its waters every fifth year.

JESHANA, in *Scripture Geography*, a city of Ephraim (2 Chron. xiii. 19.), probably the ſame with *Zin* (Numb. xxxiv. 4.), placed by Eufebius and Jerom ſeven miles N. of Jericho.

JESHIMON, probably the ſame with *Heſmona*, *Aſcmona*, or *Eſcmona*, a city in the wilderneſs of Maon, belonging to Simeon, lying in the S. of Paleſtine, and even in Arabia Petraea, 1 Sam. xxiii. 24.

JESI, in *Geography*, a town of the marquiſate of Ancona; the ſee of a biſhop, containing three churches and ten convents;

convents; 16 miles W.S.W. of Ancona. N. lat. $40^{\circ} 31'$. E. long. $13^{\circ} 10'$.

JESILBASCH, *Green-head*, a name of reproach which the Persians give to the Turks, because their emirs wear a green turban.

JESIORO, in *Geography*, a town of Poland, in the palatinate of Kiev; 56 miles S.S.W. of Czyrkassy.

JESSAMINE, in *Botany*. See **JASMINUM**.

JESSAMINE, in *Geography*, a county of Kentucky, in America; containing 5438 inhabitants, of whom 1553 are slaves. The chief town is Nicholasville.

JESSANT, formed from the obsolete French *jeffer*, to rise, or spring out, in *Heraldry*, is applied to a fleur-de-lis, or the like figure, seeming to spring or shoot out of some other charge. He bears sable; three leopards' heads; jessant, fleurs-de-lis, or.

JESSE, a large brass candlestick, with many sconces hanging down in the middle of a church or choir. This invention was first called *jeffe*, from the similitude of the branches to those of the *arbor jeffæ*. This useful ornament of churches was first brought over into this kingdom by Hugh de Flory, abbot of St. Austin's, in Canterhury, about the year 1100.

JESSELMERE, in *Geography*, a town of Hindoostan, in the circle of Bickaneer; 60 miles W. of Bickaneer. N. lat. $27^{\circ} 28'$. E. long. $72^{\circ} 51'$.

JESSEN, a town of Saxony, on the Elster; 10 miles E.S.E. of Wittenberg. N. lat. $51^{\circ} 48'$. E. long. $13^{\circ} 3'$.

JESSES denote ribbons hanging down from garlands and crowns; also the short straps of leather fastened to a hawk's legs, and so to the vervels; and birds, in *Heraldry*, are said to be *jeffed*, when these jesses are of a different tincture from the other parts.

JESSIMA, in *Geography*, one of the islands of Japan.

JESSNITZ, a town of Germany, in the principality of Anhalt, on the Muldau; nine miles S. of Dessau. N. lat. $51^{\circ} 42'$. E. long. $12^{\circ} 20'$.

JESSO, **JEDSO**, or *Yedso*, a large island in the North Pacific ocean, N. of Nippon, which having received some Japanese colonies, is generally regarded as subject to Japan; but, being inhabited by a savage people, is rather considered as a foreign conquest than as a part of this civilized empire. The inhabitants live chiefly on fish and game. This island is divided by a narrow strait, about 20 miles broad, from the island of *Segalian*, or *Tchoka*, which see. N. lat. 42° to 45° . E. long. $146^{\circ} 10'$ to $147^{\circ} 10'$.

JESSORE, a town of Bengal; 54 miles N.E. of Calcutta. N. lat. $23^{\circ} 7'$. E. long. $89^{\circ} 16'$.

JESTING, or *Concise Wit*, as distinguished from continued wit or *humour* (which see), lies either in the thought, or the language, or both. In the first case it does not depend upon any particular words or turn of the expression. But the greatest fund of jests lies in the language, *i. e.* in tropes or verbal figures; those afforded by tropes consist in the metaphorical sense of the words, and those of verbal figures principally turn upon a double sense of the same word, or a similitude of found in different words. The third kind of jokes, which lie both in the sense and language, arise from figures of sentences, where the figure itself consists in the sense, but the wit turns upon the choice of the words. Ward's *Orat.* vol. ii. Lect. 40. See **WIT**.

JESUATES, **JESUATÆ**, an order of religious, otherwise called *Apostolical Clerks*, or *Jesuates of St. Jerom*.

They were founded by John Colombini in 1368, and approved of by Urban V. in 1369, at Viterbo; where he himself gave, to such as were present, the habit they were to wear. They followed the rule of St. Augustin,

and were ranked by Pius V. among the order of Mendicants.

They were called *Jesuates*, because their first founders had the name of Jesus continually in their mouths: to which they added the name of St. Jerom, because they chose that saint for their protector.

For two centuries the *Jesuates* were mere lay-brothers; but in 1606, Paul V. gave them leave to enter into holy orders. In most of their houses they were employed in pharmacy, distributing their medicines gratis; others practised distillation, and sold aqua vitæ; which occasioned their being called *aqua-vitæ mongers*.

Being very rich in the late of Venice, that republic solicited their suppression, and obtained it of Clement IX. in 1668, their effects being employed towards supporting the expences of the war in Candia.

JESUITISSÆ, in the *Romish Church*, an order of nuns which followed the rule of the Jesuits, which was suppressed by pope Urban VIII. in the year 1630.

JESUITS, an order of religious, founded by Ignatius Loyola, a Biscayan military gentleman, of a fanatical and ambitious spirit, called also *the Society of Jesus*.

They are also sometimes called *Loyalites*, and sometimes *Inighists*, from the Spanish name of their founder, which was *Inigo de Guipuscoa*.

This order, which was the most political and best regulated of all the monastic orders, and from which mankind have derived more advantages, and received greater hurt, than from any other of these religious fraternities, has rendered itself very considerable by its missions into the Indies, and by its other employments relating to the study of the sciences, and the education of youth. The council of Trent calls them "Regular Clerks of the Company of Jesus."

In the year 1538, Ignatius, having assembled ten of his companions at Rome, chosen mostly out of the university of Paris, proposed to them to make a new order. After this, he presented the plan of his institution, suggested, as he gave out, and his followers still teach, by the immediate inspiration of heaven, to the Roman pontiff, Paul III. who appointed a committee of cardinals to examine it; upon whose report, that the establishment was unnecessary as well as dangerous, Paul refused to approve it. This opposition was principally urged by the learned and worthy cardinal Guidiccioni.

This opposition was vanquished by the dexterity of Ignatius, who proposed, that besides the three vows of poverty, chastity, and monastic obedience, the members of this society should take a fourth vow of obedience to the pope; binding themselves to go whithersoever he should command, for the service of religion, and without requiring any thing from the holy see for their support. However, Ignatius, and his company in the same charter of their order in which they declare their implicit and blind allegiance to the court of Rome, promise a like implicit and unlimited allegiance to the general of their society. The pontiff, perceiving this institution to be an object of consequence, confirmed it under the name of the "Company of Jesus" by a bull in 1540; and appointed Ignatius Loyola to be the first general of the order. Loyola was originally an illiterate soldier, and is supposed by many to have been only a flexible instrument in the hands of able and ingenious men, who made use of his fortitude and fanaticism to answer their purposes, and persons much more learned were employed to compose the writings which bear his name. Geddes's *Tracts*, vol. iii. p. 429.

By this bull the number was restrained to sixty; but that restriction

JESUITS.

restriction was taken away two years afterwards by another bull. The order has since been confirmed by several succeeding popes, who have added many new rights and privileges to it.

In less than half a century after its institution, the society obtained establishments in every country that adhered to the Roman Catholic church; in the year 1608, the number of Jesuits had increased to 10,581. In the year 1710, the order possessed 24 professed houses; 59 houses of probation; 340 residencies; 612 colleges; 200 missions; 150 seminaries and boarding-schools; and consisted of 19,998 Jesuits.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola, men far superior to their master in abilities, and in the science of government. Several circumstances concurred to the rapid progress and extensive influence of the Jesuits. They were taught to consider themselves as formed for action, and bound to exert themselves continually, as soldiers in the service of God, and of the pope, his vicar on earth. And that they might have full leisure for their active service, they were totally exempted from those functions, the performance of which is the chief business of other monks. They were required to attend to all the transactions of the world; to study the dispositions of persons in high rank, and to cultivate their friendship; and by the constitution as well as genius of the order, a spirit of action and intrigue was infused into all its members. Besides, the form of government of this order was peculiar: Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of this order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate, he could impose upon them any task, or employ them in whatsoever service he pleased. To his commands they were required to yield not only outward obedience, but to resign to him the inclinations of their own wills, and the sentiments of their own understandings. There is not in the annals of mankind any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth. It is carefully provided, that the general should be perfectly informed with respect to the character and abilities of his subjects. Every novice, who offered himself a candidate for entering into the order, was obliged to manifest his conscience to the superior, or to a person appointed by him every six months: each member was likewise enjoined to observe the words and actions of the novices, and to disclose every thing of importance to the superior. The provincials and heads of the several houses were also obliged to transmit to the general, regular, frequent, and minute reports concerning the members under their inspection. These reports were digested and arranged in registers, by which the general might easily survey the state of the society in every corner of the earth; observe the qualifications of its members, and choose proper instruments for any necessary service. The number of these reports received annually by the general was 6584, which divided by 37, the number of provinces in the order, gives 177 reports concerning the state of each province transmitted annually to Rome. The general also received, by the constitution of

the order, an account of the civil affairs of the country where his subjects resided; so that he was furnished with full information concerning the transactions of every prince and state in the world. The Jesuits, from their first institution, considered the education of youth as their peculiar province; and before the expiration of the 16th century, they had obtained the chief direction of this business in every Catholic country in Europe. They had also become the confessors of almost all its monarchs; they were the spiritual guides of almost every person eminent for rank or power; and they possessed the highest degree of confidence and interest with the Papal court, as the most zealous and able champions for its authority. The order, notwithstanding the vow of poverty which they contrived to elude, acquired ample possessions in every Catholic country. Besides the sources of wealth common to all the regular clergy, they obtained, under a pretext of promoting the success of their missions, and of facilitating the support of their missionaries, a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce, both in the East and West Indies: they also aimed at obtaining settlements, and accordingly acquired possession of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

The progress and influence of the Jesuits were likewise much promoted by their mutual union for the good of the common cause; by their reputation for learning and science, in which they excelled all the other orders, though M. d'Alembert says, that the order has never produced one man, whose mind was so much enlightened with sound knowledge as to merit the name of a philosopher: by the severity of their discipline and regularity of their conduct and manners; by propagating a system of relaxed and pliant morality, which accommodated itself to the passions of men, justified their vices, tolerated their imperfections, and authorized almost every action, which the most audacious or crafty politician would wish to perpetrate. So that the abbé Boileau says of them, they are a people who lengthen the creed and shorten the decalogue; by extending the jurisdiction and absolute power of the court of Rome; and by the zeal which they have manifested in combating the opinions and checking the progress of the Protestants.

The end principally proposed by this order was to gain converts to the Romish church; with which view they dispersed themselves in every country and nation, and with amazing industry and address pursued the end of their institution. No difficulty so great that they could not surmount, no danger so imminent that they would not undergo; and, as some say, no crimes so shocking that have not been perpetrated by them for the service of their cause.

Of all the Jesuits, who distinguished themselves by their zealous and laborious attempts to extend the limits of the church, none acquired a more shining reputation than Francis Xavier, commonly called "The Apostle of the Indians." He sailed for the Portuguese settlements in India in 1522, and soon diffused the knowledge and profession of the popish religion over a great part of the continent and neighbouring islands. In 1529 he laid the foundation of a considerable church in Japan; against which, however, a violent persecution was commenced in 1615, and lasted several years, and terminated in the utter extirpation of Christianity, and an edict forbidding all Europeans, a few Dutch merchants excepted, to approach the Japanese dominions; and having embarked for China, he died in 1552, within sight of it. Others, after his death, and particularly Ricci,

JESUITS.

Ricci, an Italian, penetrated into China, and established churches, some remains of which subsist to this day. Robert de Nobili is much celebrated by the Jesuits on account of his success in proselyting the Brachmans: for the method he used, see BRACHMANS. The Jesuits are charged by the Jansenists and Dominicans with many fraudulent practices in their attempts to propagate Christianity in China; and particularly with endeavouring to persuade the Chinese, that the doctrine of Confucius and that of the gospel were not essentially different, and that Jesus Christ had been known and worshipped in their nation many years ago. Ricci allowed the Chinese converts to retain the profane customs and the absurd rites of their Pagan ancestors; but his opinion was condemned by the Dominicans and Franciscans. This difference laid the foundation of a long and violent contest. Innocent X. in 1645, pronounced sentence in favour of the Dominicans; but, about eleven years after, Alexander VII. granted the Chinese the indulgence proposed by Ricci. Complaints were renewed by the Dominicans in 1661, and again in 1674, under the pontificate of Innocent XI.; and the dispute was carried on both in Europe and China, from the year 1684, till the question was decided to the disadvantage of the Jesuits in the year 1704, by Clement XI.; but this edict was mitigated in 1715. It is well known that the inquisition erected by the Jesuits at Goa, where the body of Xavier lies interred, and is worshipped with the highest marks of devotion, and the penal laws, whose terrors they employed so freely in propagation of the gospel, contributed much more than their arguments and exhortation, which were but sparingly used, to engage the Indians to embrace Christianity.

About the beginning of the 17th century, the Jesuits obtained admission into the fertile province of Paraguay, in South America, where they found the inhabitants in a barbarous and savage state; they began with instructing and civilizing them; cultivating amongst them the arts and manufactures, and accustoming them to the blessings of society, security, and order. By this method they secured their esteem and confidence; and a few Jesuits presided over some hundred thousand Indians. However, it appears from the most credible relations, that they soon changed their views from the propagating of Christianity, to schemes of insatiable avarice and boundless ambition: and they have sent yearly to the members of their order, in Europe, immense quantities of gold, drawn from several American provinces where they have power and property, but chiefly from Paragaay, which belonged to them only: and it is evident, from later discoveries, which have proved the ruin of the Jesuits in Spain and Portugal, that they had established an independent empire in this province, subject to their society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominions over all the southern continent of America. They cut off every kind of communication between the Spaniards and Portuguese in the adjacent settlements, and the Indians; inspired the latter with hatred and contempt of these nations; industriously avoided giving the Indians any knowledge of the Spanish, or other European language; instructed them in the art of war; formed them into bodies of cavalry and infantry, and provided them with artillery and magazines stored with all the implements of war. Such was the state of things when, in the year 1750, the courts of Madrid and Lisbon entered into a treaty for fixing the limits of their respective dominions in South America. In the execution of the treaty, in the year 1752, the Jesuits demurred; and a war ensued between the Spanish and

Portuguese on one side, and the Indians, animated by the Jesuits, on the other; which was the real and original cause of the disgrace of the Jesuits at the court of Portugal.

The Jesuits have been justly charged with inculcating the most licentious and dangerous maxims with regard to morality and religion: such are the following extracted from their writings. That persons truly wicked and void of the love of God, may expect to obtain eternal life in heaven, provided that they be impressed with a fear of the divine anger, and avoid all heinous and enormous crimes through the dread of future punishment: that those persons may transgress with safety, who have a probable reason for transgressing, *i. e.* any plausible argument or authority in favour of the sin they intended to commit: that actions intrinsically evil, and directly contrary to the divine laws, may be innocently performed, by those who have so much power over their own minds, as to join, even ideally, a good end to this wicked action, or to speak in their style, who are capable of directing their intention aright: that philosophical sin is of a very light and trivial nature, and does not deserve the pain of hell: by philosophical sin they mean an action contrary to right reason, which is done by a person who is either absolutely ignorant of God, or does not think of him during the time this action is committed: that the transgressions committed by a person blinded by the seduction of lust, agitated by the impulse of tumultuous passions, and destitute of all sense and impression of religion, however detestable and heinous they may be in themselves, are not imputable to the transgressor before the tribunal of God; and that such transgressions may often be as involuntary as the actions of a madman: and that the person who takes an oath, or enters into a contract, may, to elude the force of the one, and the obligation of the other, add to the form of words that express them, certain mental additions and tacit reservations. Some of these maxims were condemned by a public edict of pope Alexander VII. in 1659; and that relating to philosophical sin met with the same fate in 1690, under the pontificate of Alexander VIII. Neither of these bulls are to be found in the "Bullarium Pontificum;" but they are industriously preserved by the Jansenists and Dominicans. The corrupt morality of the Jesuits was humourously and learnedly attacked by the famous Pascal, in his work, entitled "Les Provinciales, ou Lettres écrites par Louis de Montalte, à un Provincial de ses Amis et aux Jesuits, sur la Morale et la Politique de ces Pères." The Jesuits, however, obtained a sentence against the Provinciales, by which they were condemned to be burnt publicly at Paris. Another excellent book, by Perrault, published at Mons, in 3 volumes 8vo., in the year 1702, entitled "La Morale des Jesuits, extrait fidèlement de leurs Livres, imprimés avec la Permission et l'Approbation des Superieurs de leur Compagnie, par un Docteur de Sorbonne," was burnt at Paris, in the year 1670, at the request of the Jesuits. The famous Arnauld, with some of his Jansenist brethren, have undertaken to prove, that the Jesuits reduced their pernicious maxims to practice, in a celebrated work, entitled "La Morale Pratique des Jesuits," consisting of eight volumes 8vo., the second edition of which was published at Amsterdam in the year 1742. For an account of the controversy between the Jesuits and Jansenists, see JANSENISTS.

The Jesuits had no particular habit; but changed and accommodated it to times and occasions. The order consisted of five different classes; *professed fathers, spiritual coadjutors, approved scholars, lay brothers*, called also *temporal coadjutors*, and *novices*. Some writers make only three classes, *viz.* the *professed members*, the *scholars*, and the *novices*. Some
add

JESUITS.

add a sixth class, under the title of *adjuncts*, which they say was numerous, and was incorporated with the other classes, and disguised under different sorts of apparel.

The *professed fathers*, which made the body of the company, took the three solemn vows of religion publicly, and to these add a special vow of obedience to the head of the church, as to what regards missions among idolaters, heretics, &c.—The *spiritual coadjutors* also made public vows of chastity, poverty, and obedience; but omitted the fourth relating to missions.—*Approved scholars* were those who, after two years novitiate, had been admitted, and had made three vows of religion; not solemn, indeed, but yet declared. These were in the way to become professed, or spiritual coadjutors, according as the general thought fit. These degrees, especially that of professed, were never conferred till after two years novitiate, and seven years study, seven of regency, a third year of novitiate, and thirty-three years of age; the age at which our Saviour is supposed to have been crucified. The vows of the scholars were absolute on their side, but only conditional on the side of the order; the general having it in his power to dispense with them.

The order was divided into *assistances*, the assistances into *provinces*, and the provinces into *houses*. It was governed by a general, who was perpetual and absolute. He resided at Rome, and was elected by a general congregation of the order. He had with him five persons, who were, as it were, his ministers. They were called assistants, and bore the name of the kingdom or country to which they belonged, and by which they were appointed; *viz.* of Italy, France, Spain, Germany, and Portugal. To these belonged the care of preparing the matters of their respective assistances, and of putting them in a method to facilitate their dispatch.

Each province had four kinds of houses, *viz.* *professed houses*, which could have no lands belonging to them; *colleges*, where the sciences were taught; *residences*, where were a number of workmen employed in such offices, as had any immediate relation to preaching, confession, missions, &c.; and houses of *novices*. Among the colleges there were some called simply *colleges*, and others called *seminaries*. These last were set apart for the young Jesuits to go through their courses of philosophy and theology in; the others were for strangers.

Each province was governed by a *provincial*, and each house by a *superior*; who was called *reſſor* in the colleges, and a *superior* in the other houses. Ignatius regulated the discipline of these houses, and especially of the colleges, by what he had observed in the Sorbonne, while he studied at Paris.

The professed of this order renounced by a solemn vow all preferment, and especially prelacy; and could not receive any, unless enjoined thereto by the pope, under pain of sin. This the pope sometimes did; inasmuch that they have had eight cardinals of their order.

The reader will find, in the preceding part of this article, a brief but comprehensive account of the Jesuits, as to their origin and influence, and the chief causes on which their influence depended, and the nature of their constitution: it remains to direct his views to their decline and actual suppression, in some parts of Europe, where their credit, power, and opulence had at one time arrived to a prodigious height. In France, the assassination of Henry IV. by Jean Châtel, one of their scholars, and the writings of the Jesuit Guignard, in favour of regicide, induced several of the parliaments of the provinces to expel them, as a detestable and diabolical society, the corruptors of youth, and enemies

to the king and state. But they were again favoured by Louis XIII. and cardinal Richelieu, and also by Louis XIV.; in whose reign they obtained the revocation of the edict of Nantes against the Protestants, and succeeded almost to their utmost wishes in suppressing the Jansenists, their inveterate enemies. However, at this period, their affairs seem to have taken a different turn. Father Tellier's violence in destroying the famous Port-Royal, and the universal commotion occasioned by the bull Unigenitus, raised clamours against them, which never subsided till their ruin. The refusal of the sacrament to the Jansenists served also to light up the flame which succeeded, and before it could be extinguished, effected the dissolution of the Jesuits. About this time they also refused, as it is said out of respect to the queen and dauphin, to undertake the spiritual guidance of La Pompadour: and whilst they offended the court by their scruples, they displeased it equally by their intrigues; laying snares for disgracing persons in place, whose only crime was a disregard for their society. They also offended men or letters by their violent declamations against the Encyclopédie, and by their abuse of Voltaire, the author of the Henriade. In this situation of the Jesuits, the war broke out between England and France, which involved the society in that famous law-suit, which directly brought on its destruction. Having carried on a considerable commerce in the island of Martinico, and sustained some losses by the war, they wanted to compound their debts with their correspondents in Lyons and Marseilles. These correspondents, looking upon the society in general to be answerable for their brethren in Martinico, addressed themselves to a certain Jesuit in France, demanding justice. This good father, and the Jesuits in general, demurred, and stood trial before the grand-chamber of the parliament of Paris, where they were cast; and not only sentenced to pay the immense sums in litigation, but interdicted for the future all manner of commerce. This sentence led into an examination of their constitution by their own books; which appeared to be contrary to the laws of the kingdom, the obedience due to the king, the safety of his person, and the peace of the state. Besides, the Jesuits were grown rich, insolent, and imperious; and though they professed to have renounced the world, they were found to be tutors, courtiers, merchants, politicians, priests, and wanted nothing less than to be governors and rulers of the earth. These were sufficient motives for suppressing them: the attempt to assassinate the French king in 1757 was charged on the Jesuits: and the actual assassination of the king of Portugal in the following year, which induced the Portuguese minister to drive them all out of the kingdom, in 1759 increased the odium against them. The parliament of Paris having taken a whole year to enquire into the nature of their institution, and news of the capture of Martinico in the mean while arriving, the minister, as M. d'Alembert says, in order to cause a diversion, thought on the expedient of proceeding farther against the Jesuits; and the principal of their college was commanded to obey the arrests of parliament, and to shut up their schools on the first of April, 1762. On the sixth of August following, their institution was unanimously condemned by the parliament, without any opposition on the part of the sovereign; the society was of course dissolved; and their possessions alienated and sold; the other parliaments of the kingdom following sooner or later the example of that of Paris: nay some of them acted with still greater severity, driving them out of their provinces without standing upon forms of law. In general, however, individuals were permitted

mitted to reside in France, on renouncing the society, and taking oaths of allegiance to the king. In a little while after, the king issued an edict, which abolished the society throughout all France. The parliament of Paris, on registering this new edict, ordained the Jesuits to reside each in his own diocese, and to present themselves every six months before the magistrates of the place in which they shall dwell. The same arret forbade them to come within ten leagues of Paris, and banished them at least six leagues from Versailles, but prohibited them not from dwelling at Fontainebleau and Compiègne, where the court resided at least three months in the year. The Jesuits were expelled from Portugal in 1759; from France in 1764; from Spain and Naples in 1767; and their society was totally abolished, in 1773, by pope Clement XIV. JESUS, formed of the Hebrew יהושע, *Jehoshuah*, from יושע, and denoting "he that shall save," or "the Saviour," is an appellation appropriated by extraordinary direction, and in a very peculiar and distinguishing manner, to the Son of God and the Saviour of the world; the long predicted and expected Messiah. (Luke, i. 26—38.) This name is frequently used in connection with that of "Christ," for the origin and meaning of which see that article. For the different senses in which the appellations *Son of God* and *Son of Man* have been understood, see those articles respectively. No one who adverts, even in the slightest manner, to the history of our blessed Lord given by the four Evangelists, and to the writings of those who were supernaturally instructed to teach his doctrine, can hesitate for a moment in allowing the propriety of ascribing to him the name of "Jesus" in a super-eminent degree: for though this was a name of Hebrew etymology, and was given, under one form or other, to several distinguished persons among the Jews, it never could be more fitly applied than to him, who, acting under a divine commission, saved mankind from sin and death, and conducts them to knowledge, pardon, holiness, and immortality. See *CHRISTIAN Religion*.

Of the life of Jesus Christ we have an authentic account by the four evangelists, Matthew, Mark, Luke, and John. (See each article respectively, and also *EVANGELISTS*.) The account of these historians chiefly relates to his discourses and conduct after he commenced the exercise of his public ministry. After giving us brief information concerning his birth, lineage, family, and parents, they tell us that he was born at Bethlehem; and that in order to avoid the jealousy and cruelty of Herod, he was taken by his parents into Egypt. Upon the death of Herod he returned to Judea; but excepting one specimen that is recorded of his early wisdom, when he disputed with the Jewish doctors in the temple at the age of 12 years, we know little of his history till he attained the age of about 30 years. Whether

he was employed in his father's business, during his earlier years, as some have asserted, it is not possible certainly to determine. We know, however, that he increased in wisdom as well as stature, and in favour with God and man. Before he commenced his public ministry, his advent was announced by John the Baptist, and he was baptized by him in the river Jordan. In the course of his subsequent life, which was of no long duration, he maintained a character singularly irreproachable, and in the most perfect degree exemplary. He was active and unwearied in communicating instruction, and in performing miracles, which, in their nature, mode of operation, and general objects, exhibited the unparalleled benevolence of his disposition, and which served to evince, to every unprejudiced observer, his divine origin and mission. In his character and conduct, as well as in his humble and suffering state, he manifested to the world that he was the predicted and long expected Messiah; and the predictions which he himself delivered, served, in their ultimate issue and accomplishment, to manifest the same important and useful purpose. For his assistance in the dissemination of his super-excellent doctrine, and by way of preparing suitable successors, when his life terminated, he appointed apostles and evangelists, who were supernaturally endowed and qualified for the service which was assigned them. After a limited period of service and suffering, a conspiracy was formed against him by the leaders of the Jewish nation; which, after the purposes of his mission, during his life, were fulfilled, took effect by the treachery of Judas Iscariot. At length he was brought before the Sanhedrim; and though Pilate, the Roman governor, testified to his innocence, and wished to preserve his life, the clamour of the populace prevailed. Jesus was condemned to suffer an ignominious death, and the sentence was speedily executed. By his death he accomplished the purposes of the divine wisdom and goodness, as he had previously fulfilled them in the course of his life; and on the third day rose from the dead, agreeably to his prediction, and appeared at sundry times and in various places to his disciples. (See *RESURRECTION*.) Having spent the interval of 40 days in affording satisfactory evidence of his restoration to life to competent witnesses, and in instructing his apostles concerning the nature of his kingdom and the objects of their commission, he visibly ascended to heaven, and, as a further evidence of his continued existence, and of the powers with which he was invested, conferred extraordinary gifts on his apostles, deputed and qualifying them for propagating his religion in the world. See *CHRISTIAN Religion*.

Concerning the person of Jesus Christ, the rank of being he sustained, and the manner of his introduction to the world, divines, both ancient and modern, have entertained very different opinions. With regard to the person of Jesus Christ (see *PERSON*), some have supposed that he is the same in substance, and equal in power and glory, with the Father. The second article of the church of England expresses this doctrine in the following words: "The Son, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God, of one substance with the Father, took of man's nature in the womb of the blessed Virgin, of her substance; so that two whole and perfect natures, that is, the godhead and manhood, were joined together in one person, never to be divided: whereof is one Christ, very God and very man, who truly suffered, was dead and buried." Others, who cannot adopt this generally received opinion concerning Christ, as God, of the same substance, and equal with the Father, reject the common meaning of the word *person*, and admit only what

they call a modal distinction. But in order to avoid the charge of Sabellianism, which they conceive to be a very pernicious opinion, and which holds one person only in the Deity, under three different denominations, they say, that though the Father, the Son, and the Holy Ghost are not three distinct beings, or individuals, there is a distinction, which may be represented by that of three persons. (See SABELLIANS.) Others again, dreading the tritheism charged upon the common opinion, suppose the Son to be inferior to the Father in every respect but this, that they are co-eternal, and have all the divine attributes that are communicable, not of themselves, but of the Father. Episcopius and Cudworth adopted this opinion, and were followed by Dr. Clarke, Jackson, &c. Dr. Clarke, in particular, maintained, that there is one Supreme Being, who is the Father, and two subordinate, derived and dependent beings; but he waves calling Christ a *creature*, as the ancient Arians did, and principally on that foundation disclaims the charge of Arianism. (See SEMI-ARIANS.) Bishops Pearson and Bull, and also Dr. Owen, were of opinion, that though God the Father is the *fountain* of the Deity, the whole divine nature is communicated from the Father to the Son; yet so as that the Father and Son are not separate, nor separable from the divinity, but do still exist in it, and are most intimately united to it. Dr. Watts, who has been followed by others, in what some have denominated the “indwelling scheme,” and which, as it is sometimes interpreted, has merely shades of difference from Sabellianism, maintained, that one supreme God dwells in the human nature of Christ, which he supposes to have existed the first of all creatures; and he speaks of the divine *Logos* (which see) as the *wisdom* of God, and the *Holy Spirit* (see SPIRIT) as the divine *power*, or the influence and effect of it; which, he says, is a scriptural person, *i. e.* spoken of figuratively in scripture under personal characters. Others, classed, however they differ from one another, under the general denomination of Arians, suppose the Son to be a spiritual being or intelligent agent, subordinate and inferior to the Father; not the same with the Father, or equal to him, or of the same nature and essence; but said to be God, on account of his great excellence and power, derived to him by the will of the Father. But of those who adopt this general opinion there are various gradations, as we have already shewn under the article ARIANS. Others, who are supposed to adopt sentiments similar to those of the ancient Nazarenes and Ebionites, and who in later times have been denominated Socinians and Unitarians, though they have no exclusive title to the latter appellation, maintain, that Jesus is a man, possessing a reasonable soul united to a human body, and favoured by God with extraordinary communications of knowledge and power. Some of this class believe that Jesus was a man, not made as Adam, but born of a woman, not in the ordinary way of generation, but of a virgin, by the immediate operation and miraculous power of God (Luke, i. 35.); but others, rejecting the sentiment of a miraculous conception, are of opinion that Jesus Christ was literally and truly the son of Joseph and Mary, born like other men in the ordinary course of nature, and subject to similar infirmities. This man, they say, was endowed with extraordinary gifts and powers for fulfilling the important commission with which he was entrusted; and when the purposes of his selection and appointment were completed, he died, and was raised from the dead, in testimony to the truth of the important doctrine taught by him, and as a pattern of that resurrection of which he assured his faithful followers. Whether this opinion, or that of those who maintain the pre-existent dignity of the spirit of Jesus Christ, and

its union with a corporeal frame by an extraordinary interposition of divine power, be most agreeable to the high notions we are led to entertain of the impeccable and exemplary character and super-eminent office sustained by Christ, as the teacher, saviour, and judge of mankind, and also to the language of the Old and New Testament by which he is described, we leave to the unprejudiced consideration and impartial decision of the reader. Persons of both these descriptions equally maintain the unity of God, and of the object of worship; and are therefore unquestionably entitled to the appellation of Unitarians. Moreover, it is his duty to deliberate, and to inquire without prejudice, equally disregarding the charge of credulity and innovation, whether he ought not to retain, or even now to adopt, the commonly received notion concerning the person of Jesus Christ, sanctioned as it is by the authority of many learned divines, who, after diligent examination, conceive it to be most conformable to the language of scripture, and to the doctrine of divine revelation. See TRINITY and UNITARIANS.

Under the article *EPOCHA of Christ*, we have stated the opinions that have been generally adopted with regard to the era of our Saviour's nativity and the time of his death. But as different sentiments have been maintained respecting the duration of his ministry, we shall here inquire into the reasons on which they are founded. To this purpose, St. Luke says (ch. iii. 1, 2.) “Now in the 15th year of the reign of Tiberius Cæsar, Pontius Pilate being governor of Judea, — the word of God came unto John, the son of Zacharias:” and the evangelist adds (ch. i. 21—23.) “Jesus also being baptized. — And Jesus himself began to be about 30 years of age.” It is added in St. John's gospel, as another note of time to our present purpose, (ch. ii. 20.) “Forty and six years was this temple in building.” From several circumstances stated by Dr. Lardner, it appears that Jesus was born about a year and six or seven months before the death of Herod, that is, before the latter end of the year of Rome 748 or 749, that is, in September or October. We have shewn under the article *EPOCHA* with what propriety our Lord might be said to be “about 30 years of age” in the fifteenth year of Tiberius, supposing it to be the fifteenth of his proconsular empire. Accordingly, if the fifteenth of Tiberius's proconsular empire began the 28th of August, A.U. 778. A.D. 25, and if John the Baptist began to preach in November that year, but did not baptize Jesus till after he had preached a year and some months, then the passover at which these words were spoken was the passover A.U. 780. A.D. 27. Or, if the fifteenth year of Tiberius's reign began A.U. 779. A.D. 26, and John began then to preach, and Jesus was baptized by him some time before the passover next following, still these words would be spoken by the Jews at the passover A. U. 780. A.D. 27. The eighteenth year of Herod's reign, from the death of Antigonus, is supposed to have begun some time in A.U. 734. Herod might make his offer to the Jews of rebuilding the temple at the feast of tabernacles in November that year: from November A.U. 734. to the passover A.U. 780. A.D. 27, is almost 45½ years; at this time, therefore, the Jews might not improperly say, the temple had been 46 years in building. The 46th year was then current, and it was to the purpose of the Jews rather to add to than to diminish the time which had been spent in that work; so that there is no time more suitable to these words of the Jews than the passover A.D. 27; though there is no manner of inconsistency between understanding the fifteenth of Tiberius, of his proconsular empire, and supposing that these words were spoken at the passover

passover A.D. 28, and then the temple might have been 46 years in building. The words of St. Luke, "and Jesus himself began to be about 30 years of age," may be understood with some latitude. Jesus might be 32 years of age or more at this time; the word *about*, *versu*, being often used when a precise exactness is not intended or expected. Matt. xiv. 21. Mark, vi. 44. Luke, ix. 14. John, vi. 10. Acts, ii. 41. Luke, i. 56. xxii. 41. John, i. 39. Acts, v. 36. Understanding St. Luke's words in this manner, it would be easy to shew the agreement of his numbers with the time of our Saviour's nativity. The fifteenth of Tiberius's sole empire began A.U. 781. A.D. 28. If Jesus was baptized the sixth of January A.U. 782. A.D. 29, he would be but some months above 33 years of age, though he was born so soon as September A.U. 748. And if he was born A.U. 749, then, though his baptism be placed in the beginning of A.U. 783. A.D. 30. still he would be little more than 33 years of age. All the other notes of time are also very easily reconciled with this fifteenth year of Tiberius's sole empire. Pontius Pilate came into Judea before the passover, in the twelfth year of Tiberius's sole empire, A.U. 779. A.D. 26, and continued there ten years, therefore he was undoubtedly governor of Judea at the commencement of John the Baptist's ministry, and till after our Saviour's crucifixion. As for the words of the Jews, spoken by them at the first passover of our Saviour's ministry, "Forty-six years has this temple been in building;" it is but to suppose that they referred not to the time when Herod made the proposal of repairing the temple, in the eighteenth year of his reign, but to the time when, in pursuance of that proposal, he actually set about the work, after he had got all things in readiness for it, and it will be easily perceived that these words are agreeable to truth. Dr. Lardner suggests, that the supposition of St. Luke's intending the first of the epochs above-mentioned, that is, the fifteenth of Tiberius's proconsular empire, seems to be very much favoured by the first Christians; who generally place the crucifixion of Jesus at the passover of the fifteenth of Tiberius's sole empire, when the two Gemini were consuls of Rome, A.D. 29. With regard to the duration of our Lord's ministry, it appears from the above statement to be between two and three years. Thus also, according to the Harmony of Tatian, A.D. 220, it consists of two years and a part, for the third year, in which our Lord dies, is not complete. Tatian therefore computes three passovers in the gospels, at the last of which Jesus suffered. And it is evident that he reckoned no more, because he does not suppose the "feast" of the Jews, mentioned John, v. 1. to have been a passover, but pentecost, as he plainly calls it. This, says Dr. Lardner, is a mark of antiquity; modern harmonists, who prolong our Lord's ministry beyond the space of three years, generally reckon this feast, though without any good reason, a passover. So Irenæus computed three passovers in our Lord's ministry; and Origen too says, that Judas was not three years with Jesus. Indeed it appears, that this father thought our Saviour's whole ministry was above two, but not quite three years, while the most public part of it did not consist of more than a year and some months: and this, says Dr. Lardner, "I have long taken to be the truth, so far as I am capable of learning it from a careful reading of the gospels." In St. John's gospel are three passovers, and our Saviour's ministry has two years and a part; but the former part of his ministry there related, was not so public as that after John's imprisonment. In the other three evangelists, who relate chiefly our Lord's most public preaching after John

the Baptist's imprisonment, is the history of only somewhat more than the space of one year; how much more it is not very easy to say; all which is much confirmed by comparing them with St. John. Eusebius discovered four successive passovers in the gospel of St. John, and therefore was of opinion that our Saviour preached three years and a half; and his opinion has been generally prevalent. Some critics, indeed, have extended the public ministry of Christ a year or two farther, and sir Isaac Newton makes it to comprehend five passovers: whereas the oldest Christian fathers were almost universally of opinion, that our Lord preached no longer than one year, or one year and a few months. Mr. Mann some years ago proposed the hypothesis of *one year*, to which he seems to have been led by his peculiar interpretation of Daniel's 70 weeks, with which he makes it to correspond. The birth of Christ he assigns to the seventh year before the commencement of the common Christian era, A.U. 747. Jul. Per. 4707, and he places his death in the year 26, or the fifteenth of Tiberius, reckoned from the time of his becoming associate in the empire with Augustus. Mr. Mann lays great stress upon the testimony of the ancient fathers, cited by sir Isaac Newton in his "Observations upon Daniel," viz. Clemens Alexandrianus, Origen, Tertullian, Julius Africanus, Lactantius, Jerome, Austin, Sulpicius Severus, and Prosper, to whom he adds Justin Martyr, and Valentinus the heretic. Besides, he observes that Luke mentions only two epochs in his history of Christ, that of his birth and that of his baptism; and therefore he was, with reason, understood by the fathers to comprehend in the second epoch his death with his baptism, both happening within the compass of the same year, or but a few months more. To this, says he, may be added the probability that the evangelist mentions both Annas and Caiaphas as high priests, because Annas was in that office in that year which included most of the preaching and miracles of Christ, and Caiaphas in the other, in the first quarter of which our Lord suffered. Moreover, the passage in Isaiah, lxi. 1, 2, which our Lord read in the synagogue at Nazareth, and which he notified to be then fulfilled, viz. "The spirit of the Lord is upon me, for he has anointed me to preach the acceptable year of the Lord," was anciently, says Mr. Mann, thought to signify that Christ was to preach but one year, distinguished by that appellation. Besides, Matthew, Mark, and Luke evidently supposed the preaching of only one year; and even John's gospel, which alone has been thought to suppose more, will not, in fact, be found to do so. For he mentions only one summer and one winter. He describes the events of only two passovers, one pentecost, one feast of tabernacles, and one feast of dedication; and he mentions them in their natural order, if we suppose that the sixth chapter of this evangelist hath been transposed out of its proper place, and that it should precede the fifth. Against Mr. Mann's hypothesis, it has been objected that in John, vi. 4, we read, "And the passover, a feast of the Jews, was nigh." But he answers, that John could not have written thus; because he had mentioned the passover in ch. ii. and related several of the events of it: he could not, therefore, suppose that his readers would want an explanation of the term in that place. Gerard Vossius, and other critics, would therefore read, "And a feast of the Jews was nigh," and they imagine, that the word "passover" was first added as a conjectural explanation of some person or other. However, it is again alleged, that the ancient fathers could never have imagined, as they did, that Christ preached only one year, if this third passover had been so expressly mentioned in their copies of this gospel. Besides,

there is no mention of Christ's afflicting at any third passover. Mr. Mann's hypothesis has been adopted by Dr. Priestley, who has endeavoured, by an examination of Mr. Mann's reasoning, and by new arguments, to confirm it. He alleges, that some very short periods of our Lord's public ministry appear, according to the accounts of all the evangelists, to have been very full of business; and if, he says, our Lord had passed three or four years in this manner, and the twelve apostles had also been teaching and working miracles in six different places, for the space of a year or more, in that small country, and the 70 also in 35 places more, for the same space of time as is generally supposed; such a number of miracles would have been performed, as this author cannot but think must have exceeded every proper purpose of them. Either there could have been no unbelievers left in Judea; or, if the tendency of the miracles had been to exasperate, such a resentment would have been excited in the minds of the Jewish rulers, as, without a greater miracle than any of the rest, could not but have terminated in his death long before. Besides, it is more easy to account for the prejudices of the apostles, and their ignorance of the true nature of Christ's kingdom, even at and after our Lord's death, and the supposition that his ministry was of a short, than that it was of a long duration. Farther, if our Lord really preached three or four years, and, consequently, if the evangelists have sometimes passed over all the events of whole years at a time, is it not surprising that none of them should ever connect those very distant parts of their narrative by such phrases as *the year following, after this, or after two years, &c. &c.*; their usual transition, *after these things, or afterwards,* cannot be construed to mean *after a year or two.* Again, if Jesus had been preaching and working miracles, both in Judea and in Galilee, almost a year before the death of John the Baptist, agreeably to the common hypothesis, Herod, who reigned in Galilee, could not but have heard of him, and therefore could not but have known that he was not John that was risen from the dead, as in Matt. xiv. 1. Whereas, if we suppose that Jesus had preached only a few weeks before the death of John, we may imagine, that, engaged as Herod was in a multiplicity of business and pleasure, he might not have heard of him till that time; and therefore might, with some plausibility, conjecture, as he did, that he was John risen from the dead. This argument is considered by Dr. Priestley as almost conclusive against the common hypothesis. Moreover, all our Lord's journeys, of which the evangelists give any account, agree in so many circumstances, that they are evidently the same, and are supposed to be so by all harmonists. All his journeys to Jerusalem amount to no more than four; three of which, at least, every pious Jew was obliged to make in the compass of every year. John, who supplies many of the deficiencies of the other evangelists, only makes up the number of them to four. Dr. Priestley considers the objections to this hypothesis, urged by archbishop Newcome and others, and endeavours to obviate them. He then arranges the leading events in the life of Christ, and points out the particular periods in which they occurred, together with the circumstances attending them; and closes with a computation of the time that was necessary for the purpose of Christ's ministry. He annexes a calendar, exhibiting the months and days that elapsed between the first of the Jewish month Nisan, answering to the 17th of March in the Julian computation, to the 30th of Nisan, corresponding to the 2d of April in the following year, together with the principal events that happened during each particular period. According to this calendar, Jesus, be-

fore the passover in the 14th of Nisan, had attended the preaching of John, had been baptised by him, had passed 40 days in the wilderness, and had preached in Judea, probably both before and after his return to Cana in Galilee, where he turned the water into wine. The ensuing pentecost happened on the 6th of the Jewish month Sivan, or the 20th of May; the transfiguration, the 6th of Abb, or the 18th of July; the feast of tabernacles, the 15th of Tifri, or the 24th of September; the feast of dedication, on the 25th of Celsu, or 2d of December; the resurrection of Lazarus, in the beginning of Adar, or February; the triumphant entry into Jerusalem, on the 10th of Nisan, or 13th of March; the passover, at which the Lord's supper was instituted, on the 14th of Nisan, or 17th of March; the crucifixion of Christ, on Friday the 15th of Nisan, or 18th of March, A. D. 29; his resurrection, on the 17th of Nisan, or 20th of March; and his appearance to the apostles, when Thomas was present, on the 24th of Nisan, or 27th of March. Calmet's Dict. Lardner's Works. Priestley's Harmony. Newcome's Harmony.

JESUS de Cuyaba, El, in *Geography*, a town of Brazil, in the government of Matto Grosso.

JESUS Island, a small island in the Pacific ocean, discovered by Mendana in 1567, and inhabited by a copper-coloured and mulatto race of men; eight degrees due N. of the New Hebrides. S. lat. 6° 50'. E. long. from Paris 165°.—Also, an island in the river St. Laurence, near that of Montreal, about 24 miles long and six wide.

JESUS de Machaca, a town of Peru, in the diocese of La Paz; 40 miles W. of La Paz.

JESUS Maria, a town of South America, in the province of Cordova; 30 miles N. of Cordova.

JESUS Maria de los Montes, a town of South America, in the government of Buenos Ayres; 60 miles S. of Santa Cruz de la Sierra la Nueva.

JESUS, in *Ichthyology*, a name given by the people of Dantzic to the fish called by Gesner the blue chub, or capito ceruleus. It is called also *jese, jesen, and jesitz.*

JESUS, Fathers of the Oratory of. See ORATORY.

JESUS, Order of. See Order of SERAPHIM.

JESUS Christ, Order of, was instituted at Avignon, in Italy, by pope John XXII. in the year 1320. The reigning pope was appointed sovereign and master of the order. The badge of the order, which is worn by the knights pendent to a scarlet ribbon tied to a button-hole of the waistcoat, is a cross of gold, enamelled gules, and edged with gold.

JESUS and Mary, Order of, was instituted in Italy, in the year 1615, by pope Paul V. The knights of this order were sworn to defend the holy see of Rome against all infidels and heretics; and for that purpose each knight was constantly to keep ready a horse completely accoutred, a sword, and a lance, and each of his domestics armed with a fusil. The badge of this order was a cross of eight points, like that of Malta, red, edged with gold, bearing in the centre the letters I. H. S. and over them the letter Ω , the symbol of the Holy Virgin.

JET, GAGATES, in *Natural History*, the name of a fossil substance, the characters of which are these: it is a solid, dry, opaque, inflammable body, found in large detached masses of a fine and regular structure, having a grain like that of wood, splitting more easily horizontally than in any other direction, very light, and moderately hard, not fusible, unless in a moderately strong heat, but readily inflammable, and burning a long time with a fine greenish white flame, and bituminous smell. Its specific gravity is 1.3. See *Pitch-coal* under the article COAL.

Jet has been often confounded with the common cannel coal, though a proper consideration of their distinguishing characters is sufficient to establish the difference between them.

Jet is always found in detached masses lodged in other strata; cannel coal constitutes of itself whole strata. Jet has the grain of wood, and splits horizontally much more easily than in any other direction; cannel coal has no peculiar grain, and splits with equal ease any way. Jet is but moderately hard, cannel coal not less so than many stones; and jet, when set on fire, flames a long time; cannel coal but a little while. Jet is found in Italy, Germany, and the East Indies, but no where so plentifully as in England; it is very common in Yorkshire, and other of the northern counties, and is found in many of our clay pits about London.

Mr. Farey remarks, that jet is perhaps only in England found imbedded in the alum shale strata of Yorkshire; of which numerous specimens are met with in the shale cliffs near Whitby, and at Huntcliff and Cleveland, as Dr. Grew mentions; although the alluvial clays, and the sands on the shores of most places on the eastern coast of England, produce specimens of jet. Near Leige, and near Zuicea, in Mesena, it is found in considerable quantities; and on the coasts of Basilan or Bassilian, one of the Philippine isles. Mr. Mawe, in his Mineralogy of Derbyshire, p. 92 and 93, mentions indurated bitumen found in that county which resembles jet.

By distillation jet yields first an acid liquor, then a thin, and afterwards a thick black oil. By friction it becomes electrical, as amber does. See AMBER.

JET, in *Medicine*, was highly praised by the ancients, but the modern practice has never enquired whether justly or not. Dioscorides tells us, that it is an excellent emollient and discutient; he recommends a fumigation of it for diseases of the womb, and says, that water, in which burnt jet has been quenched, is a cordial. Aëtius orders it to be extinguished in wine for the same purpose. It has been much used by the perfumers.

There is also a fictitious jet, made of glass, in imitation of the mineral jet: this is now usually drawn out into long hollow threads, which are cut and fashioned at pleasure. It is much used in embroideries, and in the trimmings of mourning, and may be made of any colour, though it is usually black and white; and of late is denominated *bugles*.

JET *d'Eau*, a French word, signifying a fountain that casts up water to any considerable height in the air.

The velocity of a small jet of water issuing in any direction from a reservoir, is nearly equal, in favourable circumstances, to the velocity acquired by a body in falling through the height of the surface of the reservoir above the orifice. Supposing a very small plate of water, immediately within the orifice, to be put in motion at each instant by means of the whole pressure of the fluid, which is equal to the weight of a column on the same base, of the height of the reservoir; and supposing the whole pressure to be employed in generating the velocity of the thin stratum, neglecting the motion of the surrounding fluid, this stratum would be urged by a force as much greater than its own weight as the column is higher than its thickness, through a space which is shorter than the height of the column in the same ratio. But the spaces being inversely as the forces, the final velocities are equal; and the velocity then generated would be equal to that of a body falling through the height of the column. And although a part of the pressure of the column is expended in producing motion in its own particles,

this part is not wholly lost, because the velocity of these particles renders them more easily actuated by the pressure of the succeeding column. Still, however, some deduction must be made for the lateral motions of the neighbouring particles, which tend rather to diminish the quantity of the discharge, than to lessen the actual velocity of the jet: the particles approaching, and even passing through the orifice obliquely, contract the diameter of the stream nearly in the ratio of 4 to 5, when the aperture is in a thin plate: but the velocity in the contracted part is only one-fortieth or one-fiftieth less than that which is due to the height.

Here we may observe, that the velocity of the discharge through different kinds of apertures may be found by multiplying the square root of the height in feet by a certain co-efficient: this, for the undiminished velocity, is 8.0229; for an orifice imitating the form of the contracted stream, 7.8; for bridges with pointed piers, 7.7; for bridges with square piers, 6.9; for short pipes, from two to four times as long as their diameter, 6.6; for orifices in a thin plate, and for weirs, about 5. When the orifice is made between two reservoirs, the discharge is nearly in the same relation to the difference of their heights.

A jet of water issuing from an orifice of a proper form, and directed upwards, rises nearly to the height of the head of water in the reservoir. For it has been shewn, that the velocity is nearly equal to that which is produced by the fall of a body through the height, and each of the particles may be considered nearly as a separate projectile.

If a jet issue horizontally from any part of the side of a vessel, standing on an horizontal plane, and a circle be described having the whole height of the fluid for its diameter, the fluid will reach the plane at a distance from the vessel, equal to that chord of the circle in which the jet initially moves. The horizontal velocity of the jet, being equal to that which is acquired by a body falling through the distance AB (*Plate XIV. Hydraulics, fig. 1.*), below the surface, would describe, in the time of falling through AB , a distance equal to $2 AB$ (see *ACCELERATED Velocity*), and in the time of falling through BC , in which the jet will reach the horizontal plane, a distance greater in the ratio of those times, or of the square roots of the spaces. Call AC , 1 ; then $1 : AD :: AD : AB$, $AD^2 = AB$, and $AD = \sqrt{AB}$; in the same manner $CD = \sqrt{BC}$, therefore the times are as AD and CD : but $AD : CD :: AB : BD$, and $2 BD$, or DE , will be equal to the space CF described by the horizontal velocity in the time of falling through BC . See *Hydraulic Laws of FLUIDS.*

Notwithstanding what we have above stated with regard to the ascent of a jet, it is well known that a jet d'eau will never raise water so high as its reservoir; and, therefore, gives less water than if it went to the full height. Of this phenomenon there are several causes: the first is, that the velocity of the lower particles of the jet is greater than the velocity of the upper; and, therefore, the lower water strikes that which is next above it; and as fluids move every way, by its impulse widens and consequently shortens the column. Another cause is, that the water at the top of the jet does not immediately fall off, but forms a kind of ball or head, the weight of which depresses the jet; if the jet be a little inclined, it will play higher, but be less beautiful; besides, the friction against the sides of the hole of the ajutage, or spouting-pipe, will make a small jet rise to a less height than a larger one from the same reservoir. To remedy this inconvenience, the spouting holes should be increased in proportion to the height of the spouting water, provided that they are not made too wide for the pipe of conduct.

conduct. The fourth cause is the air's resistance, which is proportional to the square of the velocity, with which the water of the jets of different heights strike it: and, therefore, the deficiency in height being in the same proportion, a jet that plays with a double velocity will have that deficiency four times as great, &c. Thus, if a jet of five feet high lose one inch in height, by coming from a reservoir of

five feet one inch high, a jet produced from a reservoir of ten feet four inches, will rise but ten feet; and in this manner a table might be easily formed shewing by what height of reservoirs jets of a determinate height may be produced. The following table shews in feet, and decimals of a foot, what jets will be produced by reservoirs of a determinate height.

Reserv.	Jet.										
5	4.91	21	20.58	39	34.93	56	48.24	73	60.71	90	72.48

By various experiments that have been made by Mr. Mariotte, Dr. Defaguliers, and others, it has been found, that if the reservoir be five feet high, a conduct-pipe 1 $\frac{3}{4}$ inch diameter will admit a hole in the ajutage from $\frac{1}{4}$ of an inch to $\frac{3}{8}$ of an inch; and so on as in the following table:

Height of Reservoir.	Diameter of the Ajutage.	Diameter of the Pipes of Conduct.
5 Feet	$\frac{1}{4}$ to $\frac{3}{8}$	1 $\frac{3}{4}$ inch.
10	$\frac{1}{4}$ th to $\frac{1}{2}$ an inch	2 inches.
15	$\frac{1}{2}$ an inch	2 $\frac{1}{2}$ inches.
20	an inch	2 $\frac{1}{2}$ inches.
25	$\frac{1}{2}$ an inch	2 $\frac{3}{4}$ inches.
30	to $\frac{3}{4}$ of an inch	3 inches, or 3 $\frac{1}{2}$.
40	$\frac{3}{4}$ of an inch	4 $\frac{1}{2}$ inches.
50	$\frac{3}{4}$ of an inch	5 inches.
60	1 inch	5 $\frac{3}{4}$ inches or 6.
80	1 $\frac{1}{4}$ inch	6 $\frac{1}{2}$ inches or 7.
100	1 $\frac{1}{4}$ or 1 $\frac{1}{2}$ inch	7 or 8 inches.

Here the jet is supposed to be within 100 or 150 yards of the reservoir; but if the conduct-pipe much exceeds this length, it must be of a larger diameter than what is here assigned. Thus for jets from $\frac{3}{8}$ of an inch to those of an inch and $\frac{1}{2}$, and from reservoirs from 40 to 90 feet height, if the distance be from 150 yards to $\frac{1}{4}$ of a mile, the diameter of the pipe should be of six inches; from $\frac{1}{4}$ of a mile to two miles, it must be of seven inches; and from two miles to five, it must be of eight inches diameter for the same jet.

If it be required to keep any number of jets playing whose ajutages are given in diameter, by one common conduct-pipe, we must find the diameter of an ajutage equal to all the given ones. Thus if there be four ajutages of $\frac{3}{4}$ of an inch diameter each, then the square of $\frac{3}{4}$ is $\frac{9}{16}$, which

multiplied by the number of ajutages 4, makes $\frac{36}{16}$: the square root of which is $\frac{6}{4} = 1\frac{1}{2}$ = the diameter of the ajutage equal to all the four small ones. A pipe of conduct of 10 inches diameter will supply all the jets, as being a little more than six times as great as the diameter of the one large ajutage now found. After this manner the dimensions of a conduct-pipe may be found in any other number of ajutages.

In order to make a jet play to the greatest possible height, the part of the conduct-pipe at the ajutage should not turn up at right angles, but with a gentle easy curve: for the best structure of the ajutage, see AJUTAGE. See also FOUNTAIN. Defaguliers' Course of Exp. Phil. vol. ii. lect. vii. annot.

JET Rings, annular pieces of jet of large dimensions, found in many parts of England, and esteemed Roman antiquities. They are of different kinds; some being plain, others wrought, but all of them are much too large for rings. The smallest of them are three inches in diameter; yet the bore is not above an inch and a half, which makes them as much too small for the wrist as they are too large for the fingers.

JETAIBA, in Botany, a name given by some authors to the trees which afford the gum anime of the shops.

JETANS, or CAMANCIES, as the Spaniards call them, or Padoucas as they are denominated by the Pawnees, in Geography, a powerful nation, entirely erratic, without the least species of cultivation, subsisting solely by the chase. Their wanderings are confined to the frontiers of New Mexico on the W., the nations on the Lower Red river on the S., the Pawnees and Osage on the E., and the Utahs, Kyaways, and various unknown nations on the N: Their nation, although entirely in the territories of the United States, is claimed exclusively by the Spaniards, and may be said to be decidedly in their interest. They are the only nation who border on the Spanish settlements, which that government

government treats as an independent people. They are by the Spaniards reputed brave.

JETHLAH, or **JETHALA**, in *Ancient Geography*, a town of Palestine, in the tribe of Dan. Josh. xix. 1, 2.

JETPOUR, in *Geography*, a town of Hindoostan, in Guzerat; 10 miles N. of Junagur.

JETSON. See **FLOTSON**.

JETTY, in *Engineering*, is the name for a small pier or projection into a river, for narrowing it and raising the water above that place. See *Transactions of the Society of Arts*, vol. xxiv.

JETTY-head, in the *Royal Dock-yards*, is a name usually given to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, whose side forms one of the cheeks of a wet or dry dock.

JETZ, in *Geography*, a town of Japan, in the island of Niphon; 84 miles N.N.E. of Meaco.

JEU, *Fr.* in *Music*, the action of playing upon an instrument. See **JOUER**.

Plein-jeu and *demi-jeu* are often used by the French for *forte* and *piano*.

JEVER, in *Geography*, a town of Germany, and capital of a country called "Jeverland," situated in the N.E. part of East Friesland, on the W. side of the mouth of the Wefer, which belongs to the prince of Anhalt-Zerbit; 28 miles N.E. of Emden. N. lat. 53° 30'. E. long. 7° 53'.

JEUNE, **CLAUDE LE**, in *Biography*. See **CLAUDIN**.

JEUREV-POLSKAI, in *Geography*, a town of Russia, in the government of Vladimir; 32 miles N.N.W. of Vladimir.

JEUX, *Fr.* See **GAMES**.

JEUX d'Orgues, *Fr.* flops of an organ.

Prestant	unison with the	Open diapason,
Bourdon	double base	Borduun,
Bombarde	base to the hautbois	Bassoon,
Nazard	octave of the 5th	Twelfth,
Tierce } Lariget }	double octave of the } sharp 3d }	Tierce,
		{ Octave of the } twelfth,
		Vox humana.

Many of the names of flops in French organs are the same as in English organs built by Renatus Harris soon after the restoration: such as the flute, tierce, lariget, cornet, furniture, trumpet, vox humana, or voix humaine, cromorne, clarion, &c. We shall give English equivalents to the rest in the article **ORGAN**, where will be found a list of the flops in the famous organ at Haerlem.

JEW-BILL, in *Laws*, is the famous statute 26 Geo. II. cap. 26. which enabled all Jews to prefer bills of naturalization in parliament, without receiving the sacrament, as ordained by stat. 7 Jac. I. This act was repealed by 27 Geo. II. c. 1.

JEWEL, any precious stone, or ornament beset with them. (See **DIAMOND**, **RUBY**, &c.) The use of jewels prevailed to a great degree, and at an enormous expence, among the Jews, Greeks, and Romans; and has continued in various nations to this day.

JEWEL, JOHN, in *Biography*, a learned prelate of the church of England, and zealous champion for the Protestant cause, descended from a very respectable family, was born at Buden, in Devonshire, in the year 1522. He received at different schools, in his own county, the elements of a learned education, and before he was fourteen years of age we find him at Merton college, Oxford, where he made great progress in the learning of the place, and was

at the same time initiated in the principles of the reformed religion. In the year 1539, he removed to Corpus Christi college, of which he had been elected a scholar, and in the following year he took his first degree. Soon after this he commenced tutor with high reputation, and contributed much to promote the reformation, by privately instructing his pupils in Protestant principles. Mr. Jewel, at this period, though looked up to by his contemporaries on account of his great learning, was not more celebrated for his literary acquirements, than he was for eminent piety, and the exemplariness of his manners. In 1544, he was admitted to the degree of M.A., and upon the accession of Edward VI. in 1546, he openly avowed himself a Protestant, and embraced every opportunity which offered itself to promote the progress of the reformation, both in his college lectures, and in private conversation. He obtained some church preferment, and his talents as a preacher procured for him great acceptance, and general applause. The zeal which he displayed during the whole of king Edward's reign, to disseminate Protestant principles, occasioned his being one of the first victims to the resentment of the Papists upon the accession of queen Mary: he was immediately expelled from his college, but so high did he stand for real talent, that he was at the same time appointed the orator of the place, and actually employed to draw up a congratulatory address upon the accession of the new queen. It has indeed been thought, that this appointment was intended for the purpose of ensnaring him, either by rendering him odious to his own party, if he accepted it, or by provoking the enmity of the Catholics, if he refused it. Mr. Jewel, however, disappointed his enemies, for the address which he drew up on the occasion was worded by him in such respectful and guarded terms, that it gave no offence to either party, and was favourably received by the queen. Mr. Jewel now withdrew from the impending storm, but his enemies followed him, and being urged with the threat of a cruel death, his fortitude forsook him, and he signed his belief of doctrines which his understanding rejected, and his heart abhorred. This public declaration was of but little service to him, his enemies thirsted for his blood, and the furious Bonner was resolved, if possible, to attain the object of his wishes, but after encountering a thousand hair-breadth escapes, he was safely landed on the Continent, and thus freed from the perils which threatened him. He immediately proceeded to Frankfort, and made a public confession before the English exiles in that city of his sincere contrition on account of his late subscription, begging pardon of God, and of the church, for the weakness which he had discovered in that transaction. After a short stay at Frankfort, he went to reside with his old friend Peter Martyr at Straßburg, whom he accompanied to Zurich, where he assisted him in the publication of some of his writings, and in the composition of his theological lectures. On the death of queen Mary, Mr. Jewel returned to his native country, and was graciously received by queen Elizabeth, who appointed him one of the sixteen divines selected to hold a public disputation in Westminster abbey, upon the principal points of controversy between the Protestants and Papists. He was also commissioned with others to visit certain dioceses in the western parts of England, with the view of eradicating Popery from them, and, in the year 1560, he was promoted by his sovereign to the bishopric of Salisbury. He was incessant in the work attached to his office, and was literally worn out in the duties which he conceived to belong to the pastoral office. He died in September 1571, at Monkton-Farley, in Wiltshire, when he was in the fiftieth year of his age: he was author of a vast number of works, many of which are

still held in high estimation. They were collected and printed uniformly in 1609, and some of his letters are preserved in Bishop Burnet's History of the Reformation. He was one of the most eminent scholars among the reformers: was a great proficient in the learned and in some of the modern languages: he had a strong memory, which he so improved by art, that he was able to repeat most exactly what he had written after once reading it. *Biog. Brit.*

JEWEL-Blocks, in a *Ship*, are two small blocks, which are suspended at the extremity of the main and fore-top-fail-yards, by means of an eye-bolt, driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is to retain the upper part of the top-mast-fludding-fails beyond the sheets of the top-fails, so that each of these fails may have its full force of action, which would be diminished by the incroachment of the other over its surface.

JEWISH Music. See **HEBREW Music**.

JEWISH Nation. See **HEBREWS**.

JEWIT, **RANDAL**, or **RANDOLPH**, in *Biography*, a disciple of Orlando Gibbons, and bachelor of music in the university of Dublin, was organist of Christ-church in that city, where he was succeeded by Batefon.

In 1639, Jewit resigned his place at Dublin, where his successor was Benjamin, afterwards Dr. Rogers; and returning to England, he was appointed organist of Wincheller, where he died after having acquired great esteem for skill in his profession.

JEW'S EAR. See **AURICULA Jude**.

JEW'S Frankincense, in *Botany*. See **STYRAX**.

JEW'S Mallox. See **CORCIORUS**.

JEW'S Stone, in *Natural History*. See **Lapis JUDAICUS**.

JEW'S Stone, in *Mining*, signifies basalt, wint, or trap, in the collieries of Shropshire. See *Plymley's Report* on the Agriculture of that County, p. 61, &c.

JEWS, in *Geography and History*, an appellation which, in its most extensive sense, comprehends all the descendants of the celebrated patriarch Abraham, who was the father and founder of the Jewish nation; but, in its more restricted sense, it includes those who belonged to the tribe of Judah, and who inhabited Judæa. Although they have been usually distinguished by this denomination, it is a name that was not given them till after the Babylonish captivity, when the tribe of Judah became the most considerable of what was left of Israel. In preceding times they were denominated Israelites, or more commonly Hebrews. For the etymology of this latter appellation, see **HEBER**. Under this title they occupied the *Land of CANAAN*, (which see,) whither their progenitor Abraham had migrated, and where he settled in the year B.C. 1921. (See **ABRAHAM**.) The subsequent possessors of it were the Israelites, so denominated from the name of Jacob, among whose 12 sons, forming so many distinct tribes, it was partitioned in the manner already stated under the article *Land of CANAAN*. (See also **JUDAH**, **JUDEA**, and **PALESTINE**.) When the patriarchal government, which seems to have subsisted in the early ages of the world, became impracticable (see **PATRIARCHAL**); the form of the Hebrew government underwent a material change, and was subject to various revolutions from the commencement of the national polity of the people of Israel, or Jews, to its final dissolution. While they sojourned in Egypt, it is natural to imagine, that as long as Jacob and

Joseph lived, they were their own masters, and were governed by their own laws; and though they were afterwards enslaved by the Egyptians, they nevertheless had some form of civil government among them, exercised by persons under the denomination of Elders; who are supposed to have been the wisest and gravest men, in the highest esteem among them, or, as Mr. Selden conjectures, the heads of their tribes. During their migration through the wilderness, from Egypt to Canaan, the Theocracy was established. (See **THEOCRACY**.) As God was their king, Moses was his viceroy, in whom the supreme power, ecclesiastical as well as civil, under God, was lodged. By him Aaron and his sons were put into the priesthood; the royal palace, or tabernacle, was built by his direction; by him it was consecrated; he gave the nation the whole body of their laws; he was commander-in-chief of all their forces. Whatever Moses did, he did by commission from God; and though he was only God's lieutenant or viceroy, he was, on account of an authority, which he held only in subordination to God, called king in Jeshurun. (Deut. xxxiii. 5.) Upon the entrance of the Israelites into the land of Canaan, B.C. 1451, under the conduct of Joshua, he became, in consequence of an oracular appointment, and in consequence of having been invested with the office, while Moses was living, the successor of Moses. (Numb. xxvii. 15—23.) And after his death, the people acknowledged Joshua for his successor, stipulating to render him that obedience which they had paid to Moses. (Josh. i. 16, 17.) In the year B.C. 1445, Joshua divided the land of Canaan among the 12 tribes; and died in the year B.C. 1426. Some have said that Joshua was succeeded by the Judges. But it has been doubted, and not without reason, whether the Judges were properly successors to Joshua in the same office, as he had been to Moses. The legislative office which Moses had possessed having expired at his death, so, it is said, did the office of Joshua, as "præfectus ordinarius," and captain-general for his life, at his. Upon this the Hebrew government became aristocratical; excepting that, in respect to the peculiar supremacy of Jehovah, it was monarchical. In the Hebrew commonwealth every city had its elders, who formed a court of judicature, with a power of determining lesser matters in their respective districts. Each tribe had also its respective prince; these are called the heads of the thousands of Israel (Numb. x. 4.), and were, perhaps, the same with the 12 captains of the host, mentioned in the 2d chapter of Numbers; and their office, therefore, related chiefly, if not entirely, to military affairs. We also read of the princes of the congregation, who presided in judiciary matters. (Numb. xxxii. 2. Josh. ix. 15. xvii. 4.) They are called elders, princes, and nobles, on account of the dignity of their office (Exod. xxiv. 9. 11.), and they were 70 in number. (Numb. xi. 16, 17. 24, 25.) See **SANHEDRIM**. As for the judges, of whom we read after the death of Joshua, they seem to have been appointed only on particular occasions; but were not "præfecti ordinarii," like Moses and Joshua; nor were they continued in their office during life, but only as long as there was occasion for their service. (See **JUDGES**.) The first of these judges was Othniel, who, in the year B.C. 1405, the 40th year after the peace established in the land by Joshua, gave rest to Israel. The 2d judge was Ehud the Benjamite, B.C. 1325; he was succeeded by Deborah the prophetess, B.C. 1285, who with Barak the general of the Israelites defeated the Canaanites under Sifera: the 4th judge was Gideon, B.C. 1245, who routed the Midianites, but declined the offer of kingly power: the 5th judge was Tola, B.C. 1233: the 6th was Jair, B.C. 1210: the 7th was Jephthah, B.C.

1188; the 8th was Ibzan, B.C. 1182; the 9th was Elon, B.C. 1175; the 10th was Abdon, B.C. 1165; the 11th was Eli, the high priest, B.C. 1157; the 12th and last judge was Samuel, B.C. 1116. (See CAPTIVITY.) We have here followed the chronology of Blair's Tables. The Judges were succeeded by kings, who were of two sorts; *viz.* those that reigned over the whole Hebrew nation, and who were only three. Saul, David, and Solomon; and those that reigned over some of the tribes only. Saul began his reign in the year B.C. 1095, and having reigned 40 years, was succeeded by Ishboseth his son, who reigned seven years over part of Israel; and had for his successor David, who was anointed to be king after Saul by Samuel, B.C. 1093, and who became sole king, B.C. 1048. Having reigned wholly and in part 40 years, he was succeeded by his son Solomon, B.C. 1015, who died B.C. 975. After his death the kingdom was divided. The kings of the house of David, beginning with Rehoboam, were 20 in number, if we reckon Athaliah the queen, who usurped the throne for six years, after the death of her son Ahaziah. (2 Kings, xi.) These kings reigned over the two tribes of Judah and Benjamin, until Nebuchadnezzar carried Zedekiah, the last of them, captive to Babylon, B.C. 587. They took their title from the larger tribe, and were called kings of Judah. The kings of Israel, who reigned over the other ten tribes, from the time of their rebellion against Rehoboam, the son of Solomon, to the Assyrian captivity, were of several different families, and were in all 19 from Jeroboam, the first, B.C. 975, to Hoshea or Hoshea, the last, B.C. 721, when the Israelites were carried into captivity, and their kingdom terminated after a duration of 253 years.

As the Hebrew nation was divided into two distinct kingdoms, so each kingdom suffered a distinct captivity; the one called the Assyrian, the other the Babylonish. For an account of each, see CAPTIVITY.

When Cyrus, having conquered Babylon, and almost all the western parts of Asia, issued a decree B. C. 536, for the return of the Jews from their captivity and the rebuilding of their temple; many of them, particularly of the tribes of Judah and Benjamin, gladly availed themselves of the liberty; and some, even of the ten tribes, joined themselves to the rest, and returned with them to their own land. Many, however, chose to remain where they were; and indeed had been already so widely dispersed, during the years that had elapsed since the Assyrian captivity and formed permanent settlements, that they had neither opportunity nor inclination for returning with their brethren. Many enquiries have been made concerning the dispersed Jews of the ten tribes; and it has been till of late a prevalent opinion, that they were either wholly lost, or that they had at different times found their way in detached bodies to their own country. In consequence of some late discoveries, there is reason to believe, that they still exist in various parts of the East. Under the articles AFGHANS and CAPTIVITY, we have already stated the result of some enquiries with respect to the Jews of these tribes; and we have derived farther information from the researches of the Rev. Dr. Claudius Buchanan, lately published, Cambridge, 1811. Whilst this author was in the East, he heard that Jews existed in distinct colonies in certain parts of India; that some of them had arrived there long before the Christian era, and had remained in the midst of the Hindoos to this time a distinct and separate people, persecuted by the native princes from age to age, and yet not destroyed. The author also noticed the existence of an ancient colony of Jews on the coast of Malabar, particularly at Cochin. Being at Cochin in February 1807, he formed an acquaintance with the Jews; and found that they

live in a town about a mile distant from Cochin, called "Jews' Town." It is almost wholly inhabited by the Jews, who have two respectable synagogues. Jews from remote parts of Asia reside here, and as they have constant communication by ships with the Red sea, the Persian gulf, and the mouths of the Indus, this place is the fountain of intelligence concerning that people in the East. The resident Jews are divided into two classes, called the "Jerusalem or White Jews," and the "Ancient or Black Jews." The former reside at this place; the latter have also a synagogue here, but the great body of that tribe inhabit towns in the interior of the province. With regard to the history of the White Jews, our author obtained a written narrative, in the Hebrew language, of their arrival in India, which has been handed down to them from their fathers; and they exhibited to him an ancient brass plate, containing their charter and freedom of residence, given by a king of Malabar. Of their first arrival this narrative records, that after the destruction of the second temple, their fathers, dreading the conqueror's wrath, departed from Jerusalem, a numerous body of men, women, priests, and Levites, and came into this land. They had among them men of reputation for learning and wisdom; and God gave the people favour in the sight of the king who then reigned here, and he granted them a place to dwell in, called "Cranganor." He allowed them certain privileges, and the royal grant was engraved on a plate of brass. This was done in the year from the creation of the world 4250 (A. D. 490); and this plate of brass is still in their possession. "Our forefathers," they say, "continued at Cranganor for about 1000 years, and the number of heads who governed were 72. Soon after our settlement, other Jews followed us from Judea; and among these came that man of great wisdom, Rabbi Samuel, a Levite of Jerusalem, with his son Rabbi Jehuda Levita. They brought with them the "silver trumpets," made use of at the time of the "Jubilee," which were saved when the second temple was destroyed; and we have heard from our fathers, that there were engraven upon those trumpets the letters of the ineffable name. There joined us also from Spain and other places, from time to time, certain tribes of Jews who had heard of our prosperity. But at last, discord arising among ourselves, one of our chiefs called to his assistance an Indian king, who came upon us with a great army, destroyed our houses, palaces, and strong holds, dispossessed us of Cranganor, killed part of us, and carried part into captivity. By these massacres we were reduced to a small number. Some of the exiles came and dwelt at Cochin, where we have remained ever since, suffering great changes from time to time," &c. &c. The native annals of Malabar confirm the foregoing account in the principal circumstances; as do the Mahometan histories of later ages; for the Mahometans have been settled here in great numbers since the eighth century.

Our author farther informs us, that by looking at the countenance of the "Black Jews," you may be satisfied that their ancestors must have arrived in India many ages before the "White Jews." Their Hindoo complexion, and their very imperfect resemblance to the European Jews, indicate that they have been detached from the parent stock in Judea many ages before the Jews in the West; and that there have been intermarriages with families not Israelitish. The White Jews look upon the Black Jews as an inferior race, and as not of a *pure* cast; and this circumstance plainly demonstrates, that they do not spring from a common stock in Judea. The Black Jews gave our author much interesting information; and recounted the names of many other

small colonies resident in Northern India, Tartary, and China, and gave a written list of 65 places. Upon inquiring of them concerning the ten tribes, they said that it was commonly believed among them, that the great body of the Israelites are to be found in Chaldea, and in the countries contiguous to it; being the very places whither they were first carried into captivity; that some few families had migrated into regions more remote, as to Cochin and Rajapoor in India, and to other places yet farther to the East; but that the bulk of the nation, though now much reduced in number, had not to this day removed 2000 miles from Samaria. Our author afterwards made a tour through the towns of the Black Jews, in the interior of the country, Tritoor, Paroor, Chenotta, and Maleh; and he found many MSS., chiefly in the Rabbinical character. One of these is an old copy of the books of Moses, written on a roll of leather. The skins are sewed together, and the roll is about 48 feet in length. Some of the Jews suppose that this roll came from Senna, in Arabia; others have heard that it was brought from Cashmire. The Cabul Jews, who travel into the interior of China, say, that in some synagogues the law is still written on a roll of leather made of goats' skins dyed red; not on vellum, but a soft flexible leather.

Whilst our author was amongst the Jews of Malabar, he made frequent inquiries concerning the ten tribes. When he mentioned, that it was the opinion of some that they had migrated from the Chaldean provinces; he was asked to what country we supposed they had gone, and whether we had ever heard of their moving in a great army on such an expedition. It will be easy perhaps to shew that the great body of the ten tribes remain to this day in the countries to which they were first carried captive. We learn from Josephus, who lived in the time of Vespasian, and who recites a speech made by king Agrippa to the Jews, exhorting them to submit to the Romans; that the ten tribes were then captive in Media under the Persian princes: and Jerome, in the fifth century, treating of the dispersed Jews in his notes on Hosea, says, unto this day the ten tribes are subject to the kings of the Persians, nor has their captivity ever been loosed. And again, the ten tribes inhabit at this day the cities and mountains of the Medes. No family dares to leave the kingdom of Persia without permission of the king. In the provinces of Cashmire and Affghanistan, some of the Jews submitted to great sacrifices, and remain Jews to this day; but the greater number yielded, in the course of ages, to the power of the reigning religion. Their countenance, their language, their names, their rites and observances, and their history, all conspire to establish the fact. Mr. Forster (Travels) was so much struck with the general appearance, garb, and manners of the Cashmirians, as to think, without any previous knowledge of the fact, that he had been suddenly transported among a nation of Jews. The tribes of the Affghan race are very numerous, and of different casts, extending on both sides of the Indus, and the mountainous region, which commences in Western Persia; some of these tribes are evidently of Jewish extraction. Our author, however, concludes upon the whole, that the greater part of the ten tribes, which *now exist*, is to be found in the countries of their first captivity. But to return from this digression—

Although some of the ten tribes returned on the occasion above-mentioned, most of them remained among the heathens. This appears to have been the case in the reign of Artaxerxes Longimanus, supposed by Prideaux to be the Ahasuerus mentioned in the book of Esther, and this must have been nearly eighty years after their first return in the reign of Cyrus, B. C. 458. It was at this time that Ezra

obtained an ample commission from Artaxerxes for his return to Jerusalem, with all of his own nation who were willing to accompany him. (Ezra, ch. vii.) Upon this many more of the Jews returned to their own land. Nevertheless, few of the ten tribes, in comparison of those of Judah and Benjamin, ever returned from their dispersion. It appears, that at the time of Haman's conspiracy, probably four or five years after the second return under Ezra, there was a multitude of the Jews dispersed through the various provinces of the Persian empire; besides those who had mingled with idolaters and embraced their religion. Ezra, who was governor of the Jews in their own land for thirteen years, was succeeded by Nehemiah, who had a new commission granted him by Artaxerxes in the 20th year of his reign, B. C. 445, with full authority to repair the wall of Jerusalem, and to fortify it in the same manner as before it was dismantled by the Babylonians.

The Jews, who, after the return from the captivity, were settled again in their own land, were no longer divided into two kingdoms, but formed one people under one government, which varied in its form through several succeeding ages. Upon their return from the captivity, Judea became a province of Syria, tributary to the sovereignty of the Persian empire. But though tributary, the Jews enjoyed their own religion, and were governed by their own laws; and their governors, though they acted by virtue of a commission from the court of Persia, were, nevertheless, of their own nation; as Zerubbabel, Ezra, and Nehemiah; so that the administration of the Jewish state was committed to their high-priests. This state of things, and this form of government, continued for upwards of 200 years, until the time of Alexander the Great, who, having destroyed the Persian empire, B. C. 331, and established the Grecian universal monarchy, reduced the Jews into a state of subjection to him and his successors. But they were not properly conquered by him, as the other nations were; but obtained his protection in the singular manner related by Josephus, Antiq. l. xi. c. 8. 5. 3—5. edit. Havre. (See JERUSALEM.) Jaddua, the Jewish high-priest, having ingratiated himself with Alexander by his prudent conduct, and by shewing him the prophecy of Daniel, which predicted the overthrow of the Persian empire by a Grecian king, and being ordered to request on behalf of the Jews whatever was agreeable to them, petitioned that they might enjoy their own laws and religion, and be excused from paying tribute every seventh year, because in that year they neither sowed nor reaped. All this was freely granted by Alexander. After the death of Alexander, the Jews became subject and tributary to the kings of Egypt or Syria, as by various events one or the other extended their dominion to Judea, which lay between these two countries. After a severe contest, Judea was subdued by Ptolemy, and 100,000 Jews were made captive; but afterwards, reflecting on their accustomed fidelity to their conquerors, he restored to them all the privileges which they had enjoyed under the Macedonians. Five years after the subjugation of Judea by Ptolemy, he was forced to surrender it to Antigonus, the Macedonian general, who treated the Jews in a manner so tyrannical, that many of them fled into Egypt, and others put themselves under the protection of Seleucus Nicator, king of Syria, who granted them considerable privileges. At this time Judea seemed to be in danger of depopulation, till it was recovered by Ptolemy Soter in the year B. C. 292. The prosperity of the Jews, however, was of short duration; for under the reign of Ptolemy Philopator they were grievously oppressed by the incursions of the Samaritans, whilst Antiochus Theos, king of Syria, invaded Galilee. Antiochus, how-

ever,

ever, was defeated by Ptolemy, who, being resisted by the Jews in his attempt to profane the temple, raised against them a dreadful persecution; but this persecution being stopped, the Jews were again received into favour. When Ptolemy Epiphanes succeeded his father Philopator, B.C. 204, Antiochus, the great king of Syria, invaded Palestine; and the Jews, unmindful of their obligations to the kings of Egypt, joined the invader. In recompence of the services which they rendered him, Antiochus proposed to restore their metropolis to its ancient splendour, liberty, and privileges, and to recal all those Jews who had been driven out of it; and from singular respect to the temple of their God, he granted them 20,000 pieces of silver towards the charges of their worship, 1400 measures of fine wheat, and 375 measures of salt, for their usual oblations. He also declared his intention to repair the temple at his own cost, to allow them the free exercise of their religion, to restore the public service, and the priests, Levites, &c. to their usual functions; and besides other privileges which he conferred upon them, he granted an exemption from all taxes for three years to all the dispersed Jews that should come within a limited time to repeople that metropolis. By these and other extraordinary favours, Antiochus so attached the Jews to his interest, that Judea, and the other neighbouring provinces, readily submitted to him. Upon the death of Antiochus, their friend and protector, B.C. 187, they found as kind a patron in his son and successor, Seleucus Philopator. Judea at this time enjoyed a profound peace, and their laws were observed with great strictness under their worthy high-priest, Onias III., until a misunderstanding, which occurred between him and Simon, a Benjamite, who had been made governor of the temple, brought a series of evils on the Jewish state. Simon treacherously communicated information to Seleucus, that the temple of Jerusalem contained immense treasures, which might be seized for his use. Heliodorus was dispatched to Jerusalem for this purpose; and having acquainted Onias with the king's orders, which he was commissioned to execute, the priest remonstrated, and endeavoured to dissuade him from any attempt of this kind. Heliodorus, however, endeavoured to force the temple, but whilst the Syrians were endeavouring to enter, they were smitten with such a panic, that they fell down half-dead. When the traitor Simon found that he had missed his aim, he laid the whole blame on the good high-priest, pretending that he was the person who had called Heliodorus to Jerusalem, and thus raised a party against him. Onias, fearing the consequences of such a faction, went to Antioch to complain of this outrage to the king. He was well received, and Simon was banished; but Seleucus, dying soon after, B.C. 175, was succeeded by his son Antiochus Epiphanes, generally supposed to be that "vile person," of whom Daniel prophesied under that appellation (chap. xi. 21, &c.), and he actually proved altogether as profane and cruel as the prophet represents him; for he laid siege to Jerusalem, and took it by storm, and in the course of two days massacred 40,000 of its inhabitants, and sold as many more to the neighbouring nations for slaves. He impiously found his way into the temple, and into the holy of holies; he sacrificed a great sow upon the altar of burnt-offerings, and caused broth to be made of some part of the flesh, and to be sprinkled all over the temple. He afterwards plundered the sacred edifice of all its golden and silver vessels and utensils, to the value of 1800 talents of gold; and having made a similar plunder in the city, he left it, after he had, to the further vexation of the Jews, appointed Philip, a Phrygian, to be their governor, who was a man of a cruel and barbarous temper; and the apostate

Menelaus, the brother of Onias, who had been basely murdered, in the possession of the high priesthood, B.C. 170. It would be tedious to enumerate the horrid acts of cruelty which were committed under the authority and direction of Antiochus, than whom we cannot conceive a greater monster of barbarity. Not satisfied with the savage and brutal measures that were executed against the Jews, he determined either totally to abolish their religion, or to exterminate their whole race. Accordingly he issued a decree, that all nations within his dominions should conform to his religion, and worship the same God, and in the same manner that he did, under the severest penalties. This decree being levelled chiefly against the Jews, he sent commissioners to execute it in Judea. One of these, named Apelles, came to Modin, where dwelt Mattathias, a very honourable priest, and zealous for the law of his God; he was the great-grandson of Asmonæus, from which circumstance the family probably derived the name of Asmonæans. This Mattathias, with his five sons, were tempted, by the most ample promises of protection and favour, on the part of the king, to renounce their religion. But he contemned the offer, and magnanimously declared, that if the whole Jewish nation, and even the whole world, were to conform to the king's edict, he and his sons would continue faithful to their God to the last moment of their lives. At the same time, perceiving one of his countrymen just going to offer sacrifices to an idol, he fell upon him and instantly killed him, agreeably to the requisition of the Mosaic law in cases of that kind. Upon this, his sons, actuated by similar zeal, killed the king's officer and his men; overthrew the altar and idol; and running about the city, cried out, that those who were zealous for the law of God should follow them. They then retired into the mountains, whither they were followed by many of the Jews; and having there formed an army, stood upon their defence. Afterwards, leaving their families, they went about the country destroying the heathen altars and idolaters, and restoring the worship of God according to the law, wherever they came. Mattathias, who died B.C. 166, was succeeded by his son Judas, surnamed Maccabeus (see Maccabees), who was one of the most distinguished heroes of whom the Jews can boast. His army consisted only of 6000 men; but the deficiency of number he supplied by his zeal and bravery. Of his signal exploits and various conquests, we cannot here give a minute detail. It must suffice to observe, that having rid the province of Judea of the enemy, he marched to the metropolis, purified the city and temple, restored the altars, holy place, and worship; commencing the religious service with the dedication of the new altar, and other holy utensils, which was performed on the 25th day of the month Cisleu; the same day in which it had ceased by the profanation of the temple three years before, and in the second year of Judas's government. The news of Judas's success exasperated Antiochus Epiphanes almost to madness; and he still retained his purpose of extirpating the Jewish race. But he had scarcely uttered his purpose, before he was seized with a pain in his bowels of the most excruciating nature, and this disease, accompanied with still more agonizing reflections and feelings of mind, terminated in his death, B.C. 164. Judas still pursued his successful military operations; till at length the Syrians were under a necessity of suing for peace, B.C. 163. This year, in Blair's Tables, is the era of the government of Judea by the Asmonæans or Maccabees, which lasted 126 years. The peace between the Syrians and Judas was of short duration. Upon the renewal of the war, Judas defeated them in five engagements; but in the 6th he was abandoned by all his men except 800 who, together with

their chief; were slain in a severe contest, which lasted from morning till evening, B.C. 161. The Jews were much afflicted by the death of Judas. He was succeeded, however, by his brother Jonathan, who conducted their concerns with no less prudence and success than Judas, till, after having governed the Jewish state near 17 years, he was decoyed into the power of Tryphon, a Syrian usurper, and soon after murdered, B.C. 144. Simon, the only surviving son of Mattathias, succeeded his brother Jonathan: who frustrated all the hostile designs of the traitor Diodotus, called Tryphon, against Judea. Simon was not only appointed commander-in-chief of the forces of the Jews, but promoted to the dignity of high-priest, in which office he was solemnly installed. This pontiff renewed the alliance with Rome and Sparta; repaired and fortified all his garrisons, especially that of Bethsura, on the confines of Judea; took Joppa and Gaza; and drove out the Syrian garrison from Acra, the fortress of Jerusalem. The wife of Demetrius, who had been driven from his dominions, and kept prisoner by the Parthians, despairing ever to recover her captive husband, invited his brother Antiochus to make an effort for gaining the Syrian crown. Upon his arrival, he sent a very obliging letter to the Jewish high-priest, in which he confirmed to him all his dignities, revenues, and authority; and to his nation all the freedom and immunities which had been formerly granted by his brother to them, or which they now actually possessed. To this he added, besides many great promises, a power of coining their own money in Judea, of which that pontiff immediately availed himself. But when that prince had established himself on the throne by the marriage of Cleopatra, and the death of Tryphon, Simon, either suspecting the sincerity of his late promises, or being desirous of making his friendship to him appear more considerable, sent a fresh embassy to Rome, to renew and strengthen his alliance with that nation. Simon was at last treacherously murdered by his son-in-law Ptolemy, about the year B. C. 135. The successor of Simon, both as prince and high-priest, was his son Hyrcan, who immediately adopted measures for the safety of his own person, as well as that of the city and country. Having succeeded in throwing off the Syrian yoke, he turned his arms against the Samaritans, took their capital Samaria, made himself master of Palestine, and added to it all the provinces of Samaria and Galilee; all which he enjoyed to the end of his life. His reign was no less remarkable on account of his great wisdom and piety at home than his conquests abroad. Never did the Jewish religion or commonwealth appear with greater lustre since the return from the captivity; but that which raised his glory above any of his predecessors, or successors, was, if we may believe Josephus (Bell. Jud. l. ii. c. 3.), and the 4th book of Maccabees, his enjoying three dignities, which never all concurred in any one besides himself; *viz.* the royal dignity, the high-priesthood, and the gift of prophecy. Of the last-mentioned, however, the instances that are produced are very equivocal and liable to great suspicion. The last year of Hyrcan's reign was much embittered by a quarrel with the Pharisees, to whom he had been always partially attached; and this contention is thought to have shortened his days. One of the Pharisees suggested a doubt of his legitimacy, alleging that his mother had formerly been a slave, and consequently, that he was incapable of enjoying the high-priesthood. This report was credited, or at least pretended to be so, by the whole sect; and it irritated Hyrcan to such a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharisees, who occasioned all the troubles and seditions that disturbed the closing period of his life. Hyrcan died in the year B. C. 107; and was succeeded by

his son Aristobulus, who manifested himself to be a most cruel and barbarous tyrant. His power was happily of short duration; for in the year B. C. 106, he was succeeded by his brother Alexander Jannæus, who was, next to king David, the greatest conqueror that ever sat on the Jewish throne. His abode at Jerusalem was rendered very undesirable by the tumults excited by the Pharisees; and he therefore left the city to such foreign enemies and conquerors. During his absence the Pharisees raised a rebellion at home, which was terminated in the year B. C. 86, when the rebels were treated with great inhumanity. Alexander, having made several conquests in Syria, died in the year B. C. 79. Although he left two sons, Hyrcanus and Aristobulus, he bequeathed the government of the kingdom to his wife Alexandra during her life, and then to either of his sons whom she might think proper to appoint. The Pharisees disquieted her administration; and nothing less would satisfy them than the total extermination of their adversaries, the Sadducees, who were grievously persecuted for four years, and then, for their future security, dispersed among the several garrisons of the kingdom. When her death seemed to be approaching, Aristobulus collected a party to secure the crown to himself; but the queen, having before made Hyrcanus high-priest, appointed him to succeed her in the royal dignity. At her decease, she left her two sons competitors for the crown. In a contest between the two brothers, Hyrcanus was compelled to abandon all title both to the royal and pontifical dignity. His party, however, was not extinguished. Antipater, father of Herod the Great, took part with Hyrcanus, and having carried him off into Arabia, under a pretence that his life was in danger in Judea, he interested Aretas, king of that country, in his behalf; who, with a view of restoring him to the throne, invaded Judea, and defeated Aristobulus. This prince had recourse to the Romans, who, under the command of Scourus, defeated Aretas, with the loss of 7000 men, and drove him out of the country. The two brothers afterwards appealed to Pompey, who was at that time commander-in-chief of all the Roman forces in the East, and made him the arbitrator of their differences. He deferred giving an opinion, with a promise that, as soon as he had subdued Aretas, he would come into Judea and divide their controversy. Aristobulus was offended, and on the other hand Ptolemy resented the want of respect on his part, and, entering Judea with his troops, summoned Aristobulus to appear before him. From the behaviour of Pompey, Aristobulus perceived that he was in the interest of his brother, and accordingly he fled to Jerusalem, with a design of exerting himself to the utmost of his power against the Romans. Pompey followed him, and soon brought him to abject submission. The citizens of Jerusalem demurred, and the garrison shut the gates against Pompey. Exasperated by this conduct, he besieged and took the city, B. C. 63, and restored Hyrcanus to the priesthood and also the government, with the title of "Prince;" but forbidding him to assume that of "King;" to wear a diadem, or to extend his territories beyond the limits of Judea. Pompey, having thus subdued the Jewish nation, set out for Rome, and carried with him Aristobulus, with his two sons, Alexander and Antigonus, and his two daughters, to adorn his future triumph. Alexander, however, found means to make his escape into Judea, where he raised an army, and having fortified some strong holds, made incursions into the neighbouring country. Hyrcanus sunk into his natural indolence, and left the management of public affairs to Antipater, who, for purposes of personal and family aggrandizement, ingratiated himself with the Romans. Hyrcanus was in no condition to oppose Alexander; and there-

fore again besought the assistance of the Romans. Alexander ventured a battle, and was defeated; but, by the interest of his mother with the Roman general, obtained a pardon for his past aggressions. Hyrcanus was again restored to the pontifical dignity; and the province was divided into five districts, having each a separate court of judicature. The first of these was at Jerusalem; the second at Gadara; the third at Amath; the fourth at Jericho; and the fifth at Sephoris in Galilee. The government of Judea was now changed into an aristocracy. The war between Pompey and Cæsar afforded the Jews some respite; and favoured the ambitious projects of Antipater. Cæsar confirmed Hyrcanus in his priesthood; added to it the principality of Judea, which was entailed on him and his posterity for ever; and restored the Jewish nation to their ancient rights and privileges; and soon after, when Cæsar himself came into Judea, he granted liberty to fortify the city, and to rebuild the wall which Ptolemy had demolished. During the life of Cæsar the Jews were highly favoured, and might be said scarcely to feel the Roman yoke; but after his death, B. C. 44, their condition underwent a material change. Antigonus, son of Aristobulus, brother of Hyrcanus, by means of some friends he had among the Jews, and by the assistance of the Parthians, made himself master of Jerusalem and all Judea, and took Hyrcanus prisoner, who was put into the hands of the Parthians. This circumstance, and several others occurred, which embroiled Judea; nor were the tumults and disorders of this province quelled till Herod visited Rome, and was created king of Judea by the friendship and interest of Marc Antony and Octavius, in the year B. C. 40. The view of Herod, in his journey to Rome, was to obtain the kingdom of Judea for Aristobulus, brother of his wife Mariamne, by his father, grandson of Aristobulus, and by his mother, of Hyrcanus. But the senate of Rome, by the recommendation above-mentioned, and also moved by some reasons of state, conferred the kingdom of Judea upon Herod. Having had this unexpected success at Rome, he returned with all expedition to Judea, and in about three years' time, B. C. 37, got possession of the whole country. When Jerusalem was taken by Sosius and Herod, and by the death of Antigonus, beheaded by order of Marc Antony, at the request of Herod, the Asmonean family terminated, 126 years after Judas Maccabæus. Herod was a persecutor and tyrant; he began his reign with the death of many of the adherents of his rival Antigonus, and with the confiscation of their effects. He also decoyed Hyrcanus, the banished pontiff, from Parthia, that, notwithstanding his most solemn promises to the contrary, he might put him to death. His own family did not escape his cruelty. He had married Mariamne, the daughter of Hyrcanus; whose brother, Aristobulus, was made high-priest at the intercession of his mother; but the tyrant, knowing that Aristobulus had a better right to the kingdom than himself, caused him to be drowned in a bath; and then sacrificed his own wife Mariamne. Her death was soon followed by that of her mother Alexandra, and this by the execution of several other persons, who had united their endeavours with her's for securing the kingdom to the sons of the deceased queen. His contempt of the Jewish ceremonies, and introduction of a number of heathenish games, exposed him to the danger of assassination; but the conspirators, failing in their attempt, were afterwards discovered by some women, who were put to the rack, and sentenced to suffer death, together with their families. Having thus disposed the people to a revolt, he found it necessary to fortify Jerusalem with additional works, to rebuild Samaria, and to garrison several fortresses in Judea. Although the relief which he

afforded to his subjects in a time of famine served in some measure to allay their hatred and animosity; yet, by relapsing into his former cruelty, their hatred of him was renewed, nor did it subside till his death. About the year B. C. 23, he began to adorn the chief cities with sumptuous buildings, and to rebuild the temple. (See JERUSALEM and TEMPLE.) But all these works were not sufficient to divert the king's attention from his usual jealousy and cruelty. Prompted by his sister Salome, and one of his sons, Antipater, he murdered his two sons by Mariamne, Alexander and Aristobulus; but his cruelty and jealousy were pre-eminently displayed in his attempt to destroy the Saviour of the world. At length he was seized with a loathsome and incurable disease, which terminated in his death, very much to the joy of his subjects, Nov 25th, B. C. 4. He had previously put Antipater to death, and divided his kingdom among his sons in the following manner: Archelaus had Judea, but his power did not extend over the whole land of Israel, and particularly not to Galilee; Antipas, or Lerod, was tetrarch of Galilee and Perea, and so continued till he was removed by Caligula, the successor of Tiberius (see HEROD-ANTIPAS); and Philip had the regions of Trachonitis, Gaulonitis, Batanea, and Pania, which he erected likewise into a tetrarchy, and governed 37 years, till his death in the 20th year of Tiberius. For other particulars relating to Herod the Great; see his article. The death of Herod was followed by insurrections and tumults. Archelaus was opposed by his brethren, and obliged to appear at Rome before Augustus, with whom many complaints were lodged against him. (See ARCHELAUS.) Upon the banishment of Archelaus, A. D. 6 or 7, Judea was reduced to a Roman province, and put under the government of Roman officers sent from Rome; and appointed to be a branch of the province of Syria. But in order to keep this country of Judea in good order, there was an officer, with the title of procurator, sent by Augustus, to reside and govern there, invested with the supreme authority, or, as Lardner says, the power of life and death. The first of these was Coponius, the next Marcus Ambivivus, his successor Annus Rufus, in whose time Augustus died, A. D. 14. The next was Valerius Gratus, who was appointed procurator by Tiberius, and continued in the province 11 years; and was then succeeded by Pontius Pilate, who governed Judea during a period of ten years, which expired some time before the passover, A. D. 36. After the removal of Pilate, for about four or five years at the most, it may be questioned, whether the Jews had now any procurator residing among them with the power of life and death, as they had from the year of our Lord 7, to the year 36 or 37. But however this be, it is certain that they were subject to the Romans. For when the Samaritans, with whom the Jews are supposed to have joined, waited upon Vitellius, the president of Syria, intreating that Pilate might be removed, they made very solemn professions of their willingness to continue under the Roman government, and only complained of the tyranny of Pilate. Dr. Lardner is of opinion, however, that they had no procurator residing among them from the time of Pilate's removal to Agrippa's accession to the kingdom of Judea, in the reign of Claudius. In considering the circumstances of the Jews in their own country at this time, as it is described by the writers of the New Testament, and other ancient authors, we may regard both their religious and civil state. That they had, according to the sacred writers, the free exercise of their religion, is evident from the whole tenor of the history contained in the Gospels and the Acts of the Apostles. They had their synagogues, in which the law and the prophets were read; and

in which our Saviour taught. In the whole history of our Saviour's ministry there is no mention of any restraint, or obstruction which they met with in their worship, except that which occurs in Luke, xiii. 1. It appears also probable that they were at liberty to perform all their religious services, if we consider, that the Romans always permitted the people conquered by them to practise their own religious rites in their own way; nor do they seem to have departed from this principle till after the period of the evangelical history. Josephus also assures us of this fact. The Roman governors did, indeed, sometimes offer abuses, or suffer abuses to be committed in the country, contrary to the institutions of the law; and they also injured them with respect to their civil property. But these abuses do not seem to have been very numerous; when any were committed, it was without the emperor's authority; and, usually, the Jews at length obtained satisfaction. In considering the civil state of the Jews, Dr. Lardner distributes their history into four periods; *viz.* the first, which reaches from the preaching of John the Baptist to our Saviour's resurrection; the second, from thence to the time of Herod, the king, mentioned Acts, xii.; the third, the reign of this Herod; and the fourth, from the end of this reign to the conclusion of the evangelical history. In the investigation of this subject, and the conclusions resulting from it, learned men have entertained different opinions; particularly with regard to the extent of the power and authority possessed by the Jews, and with respect to the question, whether they had the power of life and death, or only a right to inflict some lesser penalties. This enquiry should be restricted to the state of the Jews in Judea, properly so called; and therefore it does not comprehend the beheading of John the Baptist, which was perpetrated by Herod, tetrarch of Galilee, son of Herod the Great; who, without doubt, had the power of life and death, however he abused it, in his own territories. With reference to the first period, we are assured by all the evangelists, that our Saviour was brought before Pilate, governor in Judea, during the whole time of our Saviour's ministry, and condemned by him; and he was crucified by Pilate's officers; and yet the Jews are more than once said to have crucified Christ, because his death was owing to their prosecution and importunity. Nor is it uncommon to ascribe to men not only those things which they themselves do, but those also which are brought about by their means. For the particular illustration of this subject, we must refer to Lardner's Works, vol. i. ed. 8vo. After adducing and examining, with his usual accuracy and impartiality, the main passages of this period, concerning the power which the Jews possessed in their own country, he concludes with the following summary. They practised their own religious rites, worshipped at the temple and in their synagogues, followed their own customs, and lived very much according to their own laws. They had their high priests, council or senate; inflicted lesser punishments; they could apprehend men, and bring them before the council; and if a guard of soldiers was needful, could be assisted by them, upon asking the governor for them; they could bind men and keep them in custody; the council could summon witnesses, take examinations, and when they had any capital offenders, carry them before the governor. This governor usually paid a regard to what they offered; and, if they brought evidence of the fact, pronounced sentence according to their laws. But he was the proper judge in all capital causes; for when the council of the Jews had before them a case, which they pretended to be of this kind, having prepared it, they went with it immediately to the governor, who re-examined it, and pronounced the sentence. Our learned author has examined and ma-

turely considered the various occurrences of the three subsequent periods, and satisfactorily shewn, that whatever power the laws exercised with regard to the infliction of lesser penalties, and however tumultuously and illegally they might have acted in particular cases, they had no power of life and death. The arguments deduced from the facts stated by the evangelical historians are farther confirmed by the testimony of ancient writers. Ulpian, a famous Roman lawyer, expressly says, "The magistrates of municipal places (see MUNICIPAL CITIES) may not punish a slave with death; but the inflicting lesser penalties is not to be denied them." This single authority is sufficient to decide the question. The Jews lived according to their own laws, as municipal people did; but then, if these last, who were Roman citizens, had not the right of punishing a slave with death, certainly the Jews had not, whilst under the Roman government.

Soon after Pilate's deposition, Caius Caligula promoted his old friend Agrippa to the regal dignity; but he did not long enjoy this honour. (See AGRIPPA.) On his death, A.D. 44, Judea was made a Roman province by Claudius, who sent Cuspius Fadus thither as governor; he was succeeded by Tiberius Alexander, an apostate Jew of sacerdotal race, and nephew to the famous Philo. The subsequent governors were Ventidius Cumanus, Claudius Felix, mentioned Acts, xxiv., Portius Festus, before whom Paul made his famous defence (Acts, xxv. xxvi.), Albinus, nominated by Nero, who suppressed the Sicarii, or those robbers who were at this time become very numerous in Judea, and Gessius Florus, the last and worst governor that Judea ever had, whose atrocious conduct prepared the way for that war, which terminated with the total ruin of the Jewish nation. During his flagitious government, great numbers of Jews forsook the province, and sought an asylum among foreign nations; whilst those that remained applied to Cestius Gallus, governor of Syria, who was at Jerusalem at the passover, beseeching him to pity their wretched state, and free them from the tyranny of a man who had totally ruined their country. The number of people at Jerusalem was found by computation to amount to 2,556,000. Josephus thinks they rather amounted to 3,000,000. In May, A.D. 66, began the Jewish war with the Romans; it took its immediate rise from a contest between the Jews and Syrians concerning the city of Cæsarea. The Jews maintained that it belonged to them, because it had been built by Herod, and the Syrians pretended that it had been always considered as a Greek city. The decision of the dispute was referred to Nero, whose determination produced an insurrection on the part of the Jews, which rapidly spread through the whole country. Robberies, murders, and every kind of cruelty prevailed. The Jews, on their part, spared neither Syrians nor Romans, but retaliated their cruelties wherever they occurred. The Cæsareans fell suddenly on the Jews of their city, and massacred 20,000 of them; 2000 were murdered at Ptolemais; and 50,000 are said to have been slaughtered at Alexandria. At Jerusalem, Florus caused his troops one day to plunder the high market, and to kill all they met; and accordingly they murdered 3500 persons, men, women, and children. In the mean time a great number of assassins, having joined the rebels, drove the Romans out of the fortresses of Massada, Antonia, and the towers of Phasaël, Mariamne, and others. They set fire to the palaces of Agrippa, Berenice, the high priest Ananias, and his brother Ezechias; and these two last persons they murdered without mercy. The revolted Jews extended their conquests beyond Jordan, and took the fortresses of Machæron and Cyprus, which last they razed to

the ground, after having put all the Romans to the sword. At length Cestius Gallus was roused; and having marched into Judea with a powerful army, burned all the towns and villages in his way, massacred all the Jews he could find, and pursued those that escaped and that were in arms, almost as far as Jerusalem. The Jews were thrown into such consternation, that they abandoned all the outer quarters of the city, and retired into the inner cincture near the temple. Cestius set fire to the former, and resolving to besiege the latter, took up his head-quarters in the royal palace. Instead of pushing on the siege, it was shamefully raised by the advice of some generals of Cestius, whom Florus had corrupted; so that the insurgents, recovering their spirits, pursued him to Gideon, and defeated him with great slaughter. The Jews now deliberated concerning the best means of carrying on the war against the Romans, and appointed some of their bravest chiefs to command the several cantons and fortresses of Judea. Josephus, the writer of these wars, was appointed governor of the two Galilees; Joseph, the son of Gorion, and the high-priest Ananus, had the government of Jerusalem; and to Eleazar, the chief of the revolters, was assigned that of Idumæa. In the mean while there reigned such dissention among the Jews, that many of the better sort, foreseeing the bad effects of the resentment of the Romans, forsook the city. The Christians retired into Pella, a small city on the other side of Jordan, in the tetrarchy of Herod, whither the war did not reach. When Nero received advice of the state of affairs in Judea, he nominated Vespasian, who had signalized himself in Germany and Britain, to march with all speed against Judea with a powerful army. He accordingly repaired to Syria, where he collected all his forces and those of his auxiliaries, while his son Titus was sent to fetch the fifth and tenth legions from Alexandria to Judea. Before their arrival, 10,000 of the Jews, who besieged Ascalon, were killed by Antony; and on a second attempt their loss was doubled. In the beginning of the year 68, Vespasian, joined by Titus, entered Galilee, with a force of 60,000 well-disciplined men; and having burnt Gadara, advanced to besiege Jotapa. Josephus, governor of that province, having previously supplied the place with stores, defended it with great bravery 47 days; but it was at length taken by assault, and the garrison were put to the sword. All the Jews were murdered or made prisoners. Forty thousand are said to have been slain, and Josephus was among the prisoners. As soon as the news of the capture of Jotapa reached Jerusalem, the Jews, who heard that Josephus was among the slain, made great lamentations for the loss of him for a whole month; but when they were informed that he had surrendered himself a prisoner to the Romans, they began to consider him as a base betrayer of their country; and to persecute him with the most irreconcilable hatred and disdain. The Romans pursued their conquests; and after the reduction of Tarichea and Tiberias, all the other cities of Galilee submitted to the Romans, except Gischala and Gamala, and the mountain of Itabyr. These places were at length taken with great loss to the Jews; and the reduction of Gischala having completed the conquest of Galilee, Titus rejoined his father at Cæsarea, where their troops had some respite before they undertook the siege of Jerusalem. At this time the Jewish nation was divided into two very opposite parties; one, which wished to submit to the Romans, and another, sprung from the Gaulonitish incendiary, called the Zealots, which breathed nothing but war, confusion, and cruelty. This latter party committed the most horrid acts of plunder and massacre; and took possession of Jerusalem. After having butchered all persons of any distinction or character, they began to

wreak their rage on the common people who opposed them. This savage despotism obliged many of the Jews to forsake Jerusalem and take shelter under the Romans, though they did it at the hazard of their lives, the gates and avenues of the city being so closely guarded that it was extremely dangerous to retire, and many who were caught in the attempt were immediately put to death. Vespasian remained at Cæsarea an inactive spectator of the dismal condition of the Jewish nation. At length the Zealots themselves divided into two factions; the most profligate of them joined John of Gischala, and others opposed him. During this anarchy, there arose in the country a new gang of Sicarii, who, having seized the strong fortresses of Massada, arranged themselves under a bold adventurer, called Simon, and made this their place of retreat. These plundered, burned, and massacred every where, and carried their booty into that place. Nero, about this time, A.D. 68, put an end to his life at Rome: and Vespasian was busily employed in making preparations for the siege of Jerusalem. In the mean while Simon, at the head of a great army, committed hostilities against the Zealots; and having successfully invaded Idumæa, posted his army at the gates of Jerusalem. Simon without, and John within, vied with each other in their crimes and cruelties. At length Simon was, by an act of treachery, admitted into the city, where he laboured to make his authority absolute. Whilst Judea was thus miserably distracted with foreign and intestine wars, the Roman empire was in a state of great confusion. But as soon as Vespasian was chosen emperor, A.D. 69, he restored a calm to the empire. Josephus, who had previously apprised him of his advancement to the throne, began to reap the benefits of his anticipation. The emperor, recollecting his predictions, recompensed his fidelity with many signal favours. As soon as Vespasian received intelligence that his election was confirmed at Rome, he left the best of his troops with his son Titus, with orders to besiege Jerusalem and to destroy it utterly; and then he prepared for returning to the capital of his empire. The Jewish dissensions in the mean while increased. Three factions subsisted in Jerusalem, which were incessantly contending with and weakening each other: till at length Titus, with four legions under his command, marched against the city in different directions. On his approach, the persons who composed the three factions, seeing that they were besieged by so powerful an army, under so brave a general, thought it necessary to unite in a vigorous defence against the common enemy. It was not long, however, before their union was dissolved; and one faction being destroyed, Simon and John sometimes made united sallies against the besiegers, and at other times turned their arms against one another, as if they had pledged themselves to make their ruin more easy to the Romans. The progress of the siege we shall not here minutely describe; some notice has already been taken of it under the article JERUSALEM; and for a fuller account we refer to Josephus (Bell. Jud. lib. vi. cap. 7.) The siege commenced in April, and lasted till the 8th of September, A. D. 70, when the city was taken and entered by Titus. According to Josephus, the number of prisoners amounted to 97,000, besides about 11,000, who were either starved through neglect, or starved themselves through fullness and despair. Suetonius and Cornelius Nepos reckon but 600,000 slain and prisoners in the course of this war; but they lived at a distance, and were less competent to give a just estimate of the number than Josephus, who was a party and an eye-witness; though he is thought to have exaggerated in compliment to Titus and the Romans. From the computation of Justus Lipsius, on the authority of Josephus, the whole number

of the Jews that perished in the several places through the kingdom, and elsewhere, from the beginning to the conclusion of the war, amounts to 1,354,490 persons. Besides these, a vast multitude died in the caves, woods, wildernesses, common sewers, in banishment, and in many other ways, of whom no computation could be made; 10,000 were slain at Jotapa, not admitted into the author's computation. Allowing for the prisoners and others that have been omitted, the whole amount will be above one million four hundred and sixty thousand. Simon and John, the two grand rebels and leaders of the principal factions, were reserved for the triumph of Titus. These two infamous persons appeared at the head of 700 of the most beautiful Jewish captives who adorned this triumph. Simon was dragged through the streets of Rome with a rope about his neck, severely scourged, and put to death with some of his associates; but John was sent into perpetual imprisonment. The last fortress that was attacked and taken was Massada, the besieged, under Eleazar, the grandson of Judas the Gaulonite, having agreed to destroy one another; and thus this dreadful war terminated. Vespasian ordered the Jewish lands to be sold for his own use; and all the Jews within the Roman empire were commanded to pay into his treasury the usual tribute of half a shekel, or two drachmas, which they had formerly been obliged to pay for the use of the sanctuary. He likewise caused all the branches of the house of Judah to be cut off, to deprive them at once of all hopes of a deliverance, or future Messiah. Thus ended the Jewish nation and worship; nor have they been able to regain any settlement in their native country of Judea; but there is scarcely a country on the face of the globe where they are not to be found. They still remain, as a monument of the truth of our religion, a distinct people, unincorporated among the inhabitants of the countries in which they reside. They still profess to pay a regard to the worship and ceremonies enjoined by the law of Moses, to which they have added many rites that are merely of traditional authority. They also entertain the unfounded expectation of a Messiah to deliver them from the low state into which they are sunk. In many countries, and in different ages, they have been most cruelly massacred, and it is lamentable to think that they have been generally more mildly treated by Pagans and Mahometans than by Christians. It would be endless to recite the numerous edicts that have been framed against them, and it would be painful to recount the instances of severe persecution which their history furnishes. And yet, notwithstanding all the contempt and insult, and suffering which they have endured, they still subsist in almost every part of the globe. There are few countries from which they have not been repeatedly banished, though they have availed themselves of the opportunities for returning, which change of circumstances has afforded them; and many of them have acquired both wealth and reputation, notwithstanding the oppression which they have endured. There is hardly any country in Europe in which the Jews have enjoyed greater liberty than in Poland. Here they have had their stately synagogues and academies; and their house of judgment, or court of judicature, was endowed with singular authority, being allowed to judge of criminal as well as civil cases. Poland has been looked upon as a nursery of learned rabbins, and the country to which the Jews have been formerly accustomed to send all their youths to study the Talmud, and the rites of their religion. The city of Hamburgh has been called the "Lesser Jerusalem," on account of the many Jews that live and traffic in it. The Jews have been endowed with great privileges at Prague. In Hungary they had in the 17th century the privilege of farming the revenue; till an edict of Ferdi-

nand II. deprived them of it in 1630. Here they held their grand council, A.D. 1650, in which was debated the grand point, whether the Messiah was come? (See *AGEDA*.) In Holland they are said by one of their writers to have enjoyed greater liberty and quietness, and to have been more flourishing and wealthy than in any other part of the world. We find nothing worth mentioning concerning the Jews in England till the time of king John; except that they were invited into this kingdom by William the Conqueror. Even so early as the reign of king Stephen, A.D. 1145, they were accused of crucifying a young Christian in contempt of Christ and his religion, and were accordingly punished for it; they were again persecuted for the same atrocious fact at Gloucester, in the reign of Henry II., A.D. 1160; and for a third, committed at St. Edmundsbury, A.D. 1181; but these tales were probably false accusations alleged against them as apologies for oppressing and plundering them. The exactions imposed by king John, A.D. 1210, fell with peculiar weight on the Jews, whom he caused to be imprisoned and tortured, because they refused to pay the taxes which he imposed upon them. At length he confiscated all their effects and banished them by a public edict. They were not treated in a much better manner under the long reign of Henry III., when many of them chose to become Christians, in order to avoid the severity of his government; but being afterwards detected, they were punished for their dissimulation. The Jews of Norwich, A.D. 1235, were accused of having stolen a Christian child, and of having kept him a whole year, in order to circumcise and crucify him on the ensuing passover; but the fact being detected, they underwent a due punishment. Some other similar facts have been mentioned, which at this distance of time, and considering the various means that were used for raising money, cannot be duly authenticated. The Holy war, to which Henry was pressingly invited by the pope, A.D. 1252, proved another pretence for squeezing money out of his subjects, and especially from the Jews, whom he made no scruple to strip of all they had left. Another cause of demand was the Spanish war. After their expulsion by king Edward, A.D. 1291, they never more appeared in a body in this kingdom from that time, till they were recalled to it in the time of Oliver Cromwell. Rabbi Menasse, it is said, came over into England A.D. 1656, with a design of procuring a settlement for the Jews, and was well received by Cromwell and the parliament; as was also his apology for the Jews, in which he exploded all the calumnies raised against his nation, especially those of their crucifying and using the blood of Christian children at their passover: he is said to have pleaded his cause so well, as to obtain a better settlement and greater privileges for them than they had before enjoyed in England.

Formerly in this country, as it is said, the life of a Jew was at the disposal of the chief lord where he lived, and also all his goods. So strong were the popular prejudices against them, that in the year 1348 a fatal endemic distemper, which raged in a great part of Europe, was ascribed to their having poisoned the springs and wells; in consequence of which, a million and a half of them were cruelly massacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. But we rejoice to think that we live in a more enlightened period, when a more liberal system is established. The countries of Europe, we trust, are beginning to perceive the wisdom and benefits of universal toleration. In England the Jews are allowed the free exercise of their religion, liberty of trade, and the quiet enjoyment of their property: though some accession to their freedom is still wanting. (See *Jew's Bill*.) Here,
like

like those of Holland, they are commonly distinguished into German and Portuguese, and have their respective synagogues, chiefs, schools, &c. but no academy; so that they are obliged to send their youth to be educated in Germany, or at Amsterdam. The former are the most indigent, as well as the most zealous for their religion, and most careful to instruct their children in it, and in the knowledge of the Hebrew tongue; whereas the latter, being opulent, are more remiss in these respects; inasmuch that many of them cannot so much as understand the liturgy of their synagogues, but have it translated into Portuguese. However, both of them have had some learned rabbis. The rich among them are very generous and charitable, not only to their own poor, but to those of the Christians. Attempts are now (1811) making for communicating instruction to their poor, and for converting them to Christianity. In France they have lately obtained a very considerable extension and establishment of their privileges; an act of political wisdom which in due time will, without doubt, be imitated by other states; so that Jews will not only be merely tolerated in other countries, which is now the case in several countries of Europe, but obtain a permanent settlement. *Anc. Univ. Hist. vols. ii and iii. Mod. Univ. Hist. vol. xi.*

Jews, are those who profess obedience to the laws and religion of Moses. See **JUDAISM**.

By stat. 1 Ann. c. 30. if Jewish parents refuse to allow their Protestant children a sitting maintenance, suitable to the fortune of the parent, the lord chancellor, on complaint, may make such an order as he shall see proper.

JEZDIKAN, or **JEZKAN**, in *Geography*, a town of Persia, in Adirbeitzan; 90 miles W. of Tabris.

JEZDKAST, or **YEDKAS**, a town of Persia, in Farsistan; 42 miles S. of Ispahan.

JEZIDES, or **JEZIDEANS**, a term used among the Mahometans, to signify *heretics*.

In which sense *Jezeidan* stands opposed to *Mussulman*. Leunclavius tells us, that the name is derived from an emir, called *Jezeid*, who killed the two sons of Ali, Hasan and Hussein, two grandsons of Mahomet on their mother's side, and persecuted the posterity of the prophet. The Agareniens, whose emir or prince he was, looked on him as an impious and heretical person, and hence took occasion to call all whom they accounted heretics, *Jezeidans*.

Beaufobre conjectures, that the denomination of this sect is derived from the name of Jesus; but it seems rather to be borrowed from the Persian *Jezid* or *Jezeidan*, signifying the good God, in opposition to Arimanius, the evil principle; so that the term points out this sect as the worshippers of the good or true god. After all, this name may have been derived from the city *Jezeid*.

Some authors mention the *Jezeides* as a particular people, speaking a language different both from the Turkish and Persian, though somewhat akin to the last. They farther tell us, that there are two kinds of *Jezeides*; the one *black*, the other *white*. The white have no slit in the bosom of their shirt, but barely an opening for the head to pass through; a thing that they observe with a great deal of strictness, in memory of a circle of gold and light, which they say fell from heaven upon the neck of their grand scheid, or chief of their sect. The black *Jezeides* are faquirs, or religious, and go arrayed in sable garments.

The Turks and *Jezeides* bear a strong aversion to each other, and the greatest affront one can put upon a Turk, is to call him a *Jezeidan*. On the contrary, the *Jezeides* love the Christians; being persuaded that *Jezeid*, their chief, is Jesus Christ; or rather, because some of their traditions

mention, that *Jezeid* made an alliance with the Christians against the *Mussulmen*.

They drink wine, even to excess, when they can get it, and eat swine's flesh. They never undergo circumcision, excepting when they are forced to it by the Turks. Their ignorance is surprising; they have no books. Indeed they pretend to believe in the Gospel, and in the sacred books of the Jews; but they never read either one or other of them. They make vows, and go on pilgrimage; but have no mosques, temples, nor oratories, no feasts, nor ceremonies; all their religious worship consisting in singing hymns to Jesus Christ, the Virgin, Moses, and Mahomet. When they pray, they look towards the east, in imitation of the Christians: whereas the *Mussulmen* turn towards the south. They believe the devil may possibly, one day, come into favour again with God; and that he is the executor of God's justice in the other world: for which reason, they make it a point of prudence not to speak ill of him, lest he should revenge himself of them.

The black *Jezeides* are reputed saints: and it is forbidden to weep at their death; instead whereof they make rejoicings: and yet, for the generality, they are no more than shepherds. They are not allowed to kill the animals they eat; that office belongs to the white *Jezeides*. The *Jezeides* go in companies like the Arabs; and are an unsettled, wandering tribe, who frequent the Gordian mountains, and the deserts of Curdistan, a province of Persia. They often change their habitations, and live in black tents made of goats' hair, and encompassed with large rushes and thorns interwoven. They dispose their tents in a circle, placing their flocks in the middle. The buy their wives; the stated price whereof is two hundred crowns, be they better or worse. They are allowed divorce, provided it be to become faquirs. It is a crime among them to shave their beard, though ever so little. They have some customs which intimate that they sprung originally out of some sect of Christians: for instance, in their feasts one of them presents a cup full of wine to another, bidding him take the cup of the blood of Jesus Christ; which last kisses the hand of him who presents it, and drinks.

JEZIERNICA, in *Geography*, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S.W. of Novogrodek.

JEZIOROCZE, a town of Lithuania, in the palatinate of Wilna; 32 miles W.N.W. of Brallaw.

JEZORA, a town of Lithuania, in the palatinate of Troki; 12 miles N.E. of Grodno.

JEZREEL, in *Scripture Geography*. See **ESDRAELON**.

IF, in *Geography*, a small, fortified, and garrisoned island in the Mediterranean, near the coast of France, at the entrance of the port of Marseilles.

IFFEBAN, a town of Persian Armenia; 138 miles E.N.E. of Erivan.

IFFROS, a town of Arabia, in the province of Yemen; 12 miles E.S.E. of Tääs.

IFLAMABAT, a town of Hindoostan, in the country of Bengal; 124 miles S.S.E. of Dacca.

IFRAN, or **UFARAM**, a town and district of Africa, near the Atlantic, belonging to Morocco; 40 miles S.W. of Non.

IFVER KYLEE, a town of Sweden, in the province of Tavastland; 26 miles N.N.E. of Jamsio.

IGA, a sea-port town of Japan, in the island of Niphon, and bay of Owari; 85 miles S.E. of Meaco. N. lat. 35° 10'. E. long. 138°.

IGARIFE, a river of Brazil, which runs into the Paraguary.

IGALSHA, one of the smaller Shetland islands, near the W. coast of Mainland. N. lat. $60^{\circ} 57'$. W. long. $1^{\circ} 48'$.

IGAT, a small island in the East Indian sea. S. lat. $7^{\circ} 11'$. E. long. $130^{\circ} 35'$.

IGEIALIN, a small island in the strait between Russia and America. N. lat. $65^{\circ} 40'$. E. long. $189^{\circ} 36'$.

IGGON, a small island on the W. side of the gulf of Bothnia. N. lat. $60^{\circ} 43'$. E. long. $17^{\circ} 7'$.

IGILGILI, in *Ancient Geography*, a town of the eastern part of Mauritania Cæsariensis, situated near the promontory which forms the bay of Saldæ, to the east. It has been episcopal. See JIJEL.

IGILLIUM, now *Giglio*, an island of Italy, in the vicinity of that of Dianium, towards Etruria. The thick woods of this island served as a place of refuge for a great number of Romans, who fled from the sack of Rome by Alaric.

IGLAU, in *Geography*, a town of Moravia, capital of a circle of the same name, which contains 21 towns, 294 villages, and 6433 houses. The town is well built, fortified, and populous; and contains 1195 houses, two convents, and a village. The cloth manufactured in this town is good, and is conveyed to Italy by Trieste. The town has also considerable commerce in corn and hemp; 62 miles S.E. of Prague. N. lat. $49^{\circ} 25'$. E. long. $15^{\circ} 30'$.—Alfo, a river of Moravia, which runs into the Teya near Mufchau.

IGLORSOIT, a town of East Greenland. N. lat. $61^{\circ} 25'$. W. long. $45^{\circ} 10'$.

IGNATEVSKOE, a town of Russia, in the government of Ekaterinoflav; 40 miles S. of Bachmut.

IGNATIA, in *Botany*, so named in the *Supplementum* of Linnæus, because the seeds are known in the *Materia Medica* by the name of *Faba Sancti Ignatii*, or St. Ignatius's Beans. Linn. Suppl. 20. Schreb. 135. Willd. Sp. Pl. v. 1. 1053. Mart. Mill. Dict. v. 2. Gärtn. t. 179. Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Apocineæ*, Juss. Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, short, bell-shaped, with five upright, ovate, blunt teeth. *Cor.* of one petal, funnel-shaped; tube thread-shaped, a span long, smooth, erect; limb flat, in five deep, oblong, obtuse, entire segments. *Stam.* Filaments five, inserted into the receptacle, as long as the tube, thread-shaped, very smooth; anthers cohering in the form of an oblong, acute, hispid, five-sided tube. *Pist.* Germen minute, superior, ovate, smooth; style thread-shaped, the length of the stamens; stigma in two deep awl-shaped divisions. *Peric.* Berry large, pear-shaped, smooth, of one cell, with a thick woody coat. *Seeds* numerous, smooth, crowded, hard, oblong, somewhat angular; the plumula stalked.

Effl. Ch. Calyx inferior, five-toothed. Corolla with a very long tube. Berry coated, of one cell, with many seeds.

1. *I. amara*. Linn. Suppl. 149. (*Ignatiana philippina*; Lour. Cochinch. 126.)—Native of the East Indies.—A tree, with long, twining, copious, smooth branches. *Leaves* opposite, stalked, ovate, entire, a span long, very smooth. *Panicles* axillary, small. *Flowers* very long, drooping, white, scented like jasmine. *Fruit* the size and shape of a middling pear. *Seeds* scarcely an inch long, very bitter, celebrated as a cure for weakness in the stomach, and for intermitting fevers.

Jussieu refers this plant to the genus *Strychnos*, but Gärtner points out the stalked cotyledons (or plumula), as almost peculiar to it, and not found in that genus.

IGNATIUS, in *Biography*, one of the apostolical

fathers, was bishop of Antioch, in Syria, towards the latter part of the first and the beginning of the second century. According to Eusebius and St. Jerom, he succeeded Euodius in the see of Euodius, having been ordained, says the former, in the year 69, after the death of Peter and Paul at Rome, or, as others say, by Peter; and hence we may conclude, that he was acquainted with several of the apostles. Indeed, St. Chryostom says, that he conversed familiarly with them, and was perfectly acquainted with their doctrine. This venerable man was condemned, in the persecution of Trajan, to be devoured by wild beasts in the public theatre at Rome, whither he was brought from Syria by the emperor's order for this purpose. The time of his martyrdom has been placed by Eusebius, and after him by Dupin, Tillemont, Cave, and Lardner, in the 10th year of Trajan, A. D. 107; but by Pearson, Loyd, Pagi, Le Clerc, and Fabricius, in 116: the former, however, is thought to be the most probable opinion concerning the time of his death. Eusebius and Jerom mention seven epistles written by this father, and besides these, other epistles have been ascribed to him which are universally supposed by learned men to be spurious. Of the above-mentioned seven, there are two editions; one called the larger, and oftentimes the interpolated; and another, called the smaller. It is now, says Lardner, the general opinion of learned men, that the larger are interpolated, and that the smaller have by far the best title to the name of Ignatius. The larger, says this judicious writer, who compared the two editions, are an interpolation of the smaller, and not the smaller an epitome or abridgment of the larger. But whether the smaller themselves are the genuine writings of Ignatius, bishop of Antioch, is a question that has been much disputed among the ablest critics. Upon duly considering the testimonies alleged from Iræneus, Origen, and Eusebius, and also the internal characters of simplicity and piety, which occur in these epistles, (*viz.* the smaller), Dr Lardner concludes it to be probable, that they are for the main the genuine epistles of Ignatius. As to the time in which they were written, this is determined by that of his martyrdom. For they were written after he was condemned to the wild beasts, and whilst he was conducted as a prisoner from Antioch to Rome. These epistles are now extant in Greek, and in an ancient Latin version, which latter was published by archbishop Usher in 1664. In 1646, Isaac Vossius published six of the seven epistles in Greek, from a MS. at Florence: the epistle to the Romans, which was wanting, has been since published in Greek by Ruinart, from a MS. at Paris. In Ignatius's epistles there are frequent allusions and references to particular books, or texts, of the New Testament; and it has been observed by some learned men, that this ancient writer has made mention of the scriptures of the New Testament under some general names and divisions. Lardner's Works, vol. ii.

Ignatius is said by Socrates, the ecclesiastical historian, lib. vi. cap. 8. "to have established antiphonal singing at Antioch, from a vision, in which he saw the blessed spirits above singing hymns to the sacred Trinity, alternately; which method of singing," says the same author, "Ignatius taught to the church; and this, together with the account of the miracle which gave rise to it, was communicated to all the churches of the East."

Nicephorus, St. Chryostom, Anastasius, and many others, acquiesce in this account of the origin of antiphonal singing, as do our countrymen Hooker, Hammond, Beveridge, and Dr. Comber.

IGNATIUS LOYOLA. See JESUITS.

IGNATIUS'S Bean, *Faba Sancti Ignatii*, in the *Materia Medica*, the fruit of a plant growing in the East Indies and Philippine islands, described by father Camilli, in the Philosophical Transactions, under the name of Catalongay, and Cantara; and by Plukenet, under that of Cucurbitifera malabathri foliis scandens, cujus nuclei faba sancti Ignatii nuncupati. The Spaniards call it *cathalagon*. It is a dry and hard fruit, or kernel of a fruit, of the size of a large hazel nut; and is much celebrated for its medicinal virtues, being recommended in vertigoes, lethargies, epilepsies, asthma, quartan agues, and worms. It is also given against distemperatures of the stomach, and as an alexipharmic. The dose in substance, as an emetic, is ten or twelve grains; and in smaller doses it sometimes promotes a plentiful sweat: Neumann says that he has known intermitting fevers cured, by drinking, on the approach of a paroxysm, an infusion of some grains of the seed in carduus water; and Dr. Lewis has been informed, that two grains were found to have as much effect as a full dose of bark. But it seems too hazardous for general use. See *NUX Vomica*, *STRYGINOS*, and *IGNATIA*.

IGNAVUS, in *Natural History*, a name given to the animal called in English the sloth. See *BRADYPUS* and *SLOTH*.

IGNIARIUS LAPIS, a name given by some to the pyrites, or fire-stone, from its yielding a great quantity of sparks when struck against steel.

IGNICOLÆ, *Worshippers of Fire*. See *GABRES*.

IGNIS AQUA, *Fire-Water*, a name by which Helmont, in some of his writings, calls the alkalest, or universal dissolvent, so much talked of by him and Paracelsus.

IGNIS Fatuus, a common meteor, chiefly seen in dark nights frequenting meadows, marshes, and other moist places, and often seen in burying-grounds, and near dunghills. It is known among the people by the appellations *Will with a Wisp*, and *Jack with a Lantern*.

Sir Isaac Newton calls it a vapour shining without heat; and it has been supposed to be of the same nature with the light issuing from putrescent substances. Willughby and Ray were of opinion that it is occasioned by shining insects; but all the appearances of it observed by Dr. Derham, Beccaria, and others, sufficiently evince, that it must be an ignited vapour. The form and size of the ignes fatui are very various and often variable. The late experiments on air serve to furnish a rational explication of this phenomenon, to which the ignorant and superstitious have ascribed so many alarming purposes. Inflammable air has been found to be the most common of all the factitious airs in nature; and to be the usual product of the putrefaction and decomposition of vegetable substances in water: and signior Volta, in a letter to Dr. Priestley, informs him that he fires inflammable air by the electric spark, even when the electricity is very moderate: and he supposes, that this experiment explains the inflammation of the ignes fatui, provided they consist of inflammable air issuing from marshy ground by the help of the electricity of fogs, and by falling stars, which are very probably thought to have an electrical origin. (Priestley's *Obs. on Air*, vol. iii. Appendix, p. 382.) The reader will find a particular account of various particulars relating to the ignis fatuus, in the *Phil. Trans. Abr.* vol. vii. p. 147, &c.

Dr. Shaw describes an ignis fatuus, which he saw in the Holy Land, that was sometimes globular, or in the form of the flame of a candle; and immediately afterwards spread itself so much as to involve the whole company in a pale inoffensive light, and then contract itself again, and suddenly disappear. But in less than a minute it would become visible as before; or, running along from one place to another,

with a swift progressive motion, would expand itself, at certain intervals, over more than two or three acres of the adjacent mountains. The atmosphere at this time had been thick and hazy, and the dew on their bridles was unusually clammy and unctuous.

In the same weather, he observed those luminous appearances, which, at sea, skip about the masts and yards of ships, and which the sailors call *corpufanse* by a corruption of the Spanish *cuerpo santo*. Shaw's *Travels*, p. 393.

IGNIS Gebennæ, in *Chemistry*, a name given by Paracelsus to a certain menstruum, capable of dissolving all bodies, and remaining itself unaltered by them.

Van Helmont seems to make this the same with the alkalest, so celebrated in his writings, and so ardently sought after by all the chemists since his time.

IGNIS Judicii. See *JUDICIUM Dei*, and *ORDEAL*.

IGNIS Sacer, literally *holy fire*, in *Medicine*, an appellation which has been given, from ancient times, to various diseases, of which external redness and heat, followed by ulceration or gangrene, seem to have been the principal characteristics.

Other appellations have been used as nearly synonymous with this; such as *ignis Sancti Antonii*, *feu St. Antoine*, or *St. Anthony's fire*, *morbus ardentium*, or *mal des ardens*, &c. By different writers, however, these terms have been applied to diseases of considerable difference of character, by which much confusion has been produced. We have already stated that the word *sacer*, or *sacred*, was employed to denote any thing *great*; and was used as an epithet to diseases of uncommon severity and duration, which, as Aretæus observes, seem to require more than human power to cure them (see *EPILEPSY*), and were often considered as inflictions of the divine vengeance. The name of St. Anthony seems to have been first associated with an epidemic and fatal disease, which prevailed in many parts of France, and especially in Dauphiné, about the end of the 12th century, when the religious houses of the order of St. Anthony were used as hospitals for those who were attacked with the disease. (Mezeray, *Abrégé Chronologique*.) It was the popular opinion in France, in the 12th and 13th centuries, that all the patients, who were conveyed to the abbey of St. Anthony, which had been recently founded at Vienne, in the province just mentioned, where the bones of this saint had been deposited, were cured in the space of seven or nine days. It is stated (in the "*Histoire des Ordres Monastiques*," tom. i. p. 337.) that in 1702, there were still some black and withered limbs which had been preserved in that abbey from the period alluded to. Similar maladies were epidemic both at an earlier and later period: and it appears from a memoir by M. Le Comté, physician to the abbey at Vienne, that the same disease prevailed in Dauphiné in 1709. This physician affirms that the disease might be cured by judicious medical treatment; but that the most certain relief was obtained by addressing a vow to St. Anthony. See a full and able history of the subject in the "*Memoires de la Société Royale de Médecine de Paris*," tom. i. p. 260. by M. M. de Jussieu, Paulet, Saillant, and the abbé Tessier, who were nominated by the society to investigate it.

From this circumstance, it would appear that the *erysipelas*, which consists of an inflammation of the skin, accompanied by the rising of large blisters, analogous to those produced by the action of fire, whether in burning or scalding, has obtained in this country the appellation of *St Anthony's Fire*. It is not, however, the disease above alluded to as formerly epidemic in France.

The Latins understood by the term *ignis sacer* the erysipelas of the Greeks, as well as the *zona*, or *Herpes zoster*,

which we call *shingles*. See Celsus, De Med. lib. v. cap. 28, who places the disease among the *mala ulcera*, and mentions two species, one of which is apparently the *zoster*.—Alfo, Marcellus, de Medicamentis, cap. xx.—Plin. Nat. Hist. lib. xxvi. cap. 2. See HERPES.

It would appear, that the confusion among modern writers above mentioned, has arisen from the application of the terms *ignis sacer*, feu sacré, feu St. Antoine, and mal des ardens, to three varieties of disease, essentially distinct from each other, exclusive of the erysipelas: these are the common plague, the dry gangrene, or *ergot*, and the *raphania*. The two first, it appears, were prevalent about the same periods, in the tenth, eleventh, and twelfth centuries, affecting chiefly the lower classes of the people; whence historians have confounded the symptoms of the two maladies. But from the investigation of M. M. Jullien, &c. it is obvious that the disease, more particularly designated by the title of “mal des ardens,” was an acute pestilential fever, attended with extreme heat, and with buboes in the groin, *i. e.* the *pestis inguinalis*, or *inguinalis*, or, in the words of Mezeray, *peste qui prenoit en l’aine*; which was also “the plague” described by Ambrose Paré, Boccacio, Guy de Chauliac, Vinarius, &c. in the 14th century. This was likewise the opinion of Astruc. But the second, *ignis sacer*, or feu St. Antoine, was, in fact, a chronic disease, of considerable duration, accompanied by severe pain, and terminating in a shrivelling and drying of one or more of the limbs, which became black, and ultimately dropped off, if the life of the patient survived.

In the *mal des ardens*, or plague, no drying or dropping off of the limbs occurred; and in the *feu sacré* no inguinal buboes, or acute fever. In short, the latter was obviously the disease which was subsequently denominated *ergot*, and has been attributed, by the majority of writers on the subject, to the use of rye as aliment, which was affected with the disease so named, to which that grain is liable. (See ERGOT in *Agriculture* and *Medicine*.) Notwithstanding what has been maintained by the majority of authors, as stated in the article just referred to, it seems probable that this disease, which has been also called the *dry gangrene*, originated rather from a state of starvation, or imperfect nutriment, than from the *ergoted* rye in particular. “For it occurred only after unfavourable seasons, when dearth prevailed, and was augmented by wars; and it afflicted almost exclusively the labouring people, the peasantry, and mendicants; who,” as M. Gaffoud observes, “in order to avoid actual famine, were compelled to live upon a sort of bread made of the meal of acorns, of grape-stones, of the roots of fern, and other such crude and unnutritious substances.” Camerarius positively asserts, that this gangrene was observed in the extremities of persons who had certainly not eaten any *ergoted* rye. (See Acad. Natur. Curios. Cent. iv. Obs. 82.) It was probably to these dry and contracted limbs that the term *scleterybe* was applied by Pliny and Galen, as well as to those which occur in the last stages of scurvy, rather than to the spasmodic contractions in St. Vitus’s dance, or *Chorea Sti. Viti*, to which they have since been applied. (See CHOREA.) These contractions occurred among the Roman soldiers in Germany, and were attributed to the use of water from a particular spring (see Pliny Nat. Hist. lib. xxv. c. 3); but more probably originated from imperfect nutriment.

A third disease, which has been several times epidemic in Germany and Sweden, and seems to differ materially both from the common plague and from the dry gangrene, has been attributed by some to the *ergot* of rye, and confounded, under the title of *ignis sacer*, and *ergot*, with the dry gangrene. This is a febrile disease, which is said to begin with an intense heat, accompanied with a sense of *formication*,

or of the creeping of insects over the skin, which is followed by acute pains in the limbs, and convulsive contractions of the muscles. This disease is said to attack in successive paroxysms, after several of which it terminates by a violent sweating, or diarrhoea. If it continued long, it degenerated into epilepsy or palsy. The sweating sickness of England, and the morbus Hungaricus, seem to have partaken of the nature of this fever; and to have originated, like it, in the use of corrupted and imperfect aliment, when every unfavourable season produced a famine. Many writers, however, were persuaded that it originated from the *ergot* of rye; while others attributed it to the *honey-dew* and *blight*, *ustilago*, with which the corn and herbs were affected. The malady was epidemic in Sweden in 1746 and 1754, when it was observed that the *raphanus raphanistrum* grew in great abundance among barley; and Linnæus, suspecting this to be the cause of the disease, fed some fowls with the seeds, which were said to become convulsed; whence he gave the name of *Raphania* to the disease, which was adopted by Dr. Cullen. (Lin. Amoenit. Acad. vol. v. Cullen Nosol. Method. Gen. li.) It was called *Morbus convulsivus epidemicus* by the Marburg professors, and from the sense of formication, was popularly termed, in Germany, *die kriebel krankheit*. (See Gregor. Horst. Opera, tom. ii. lib. viii. Obs. 22. Cullen Nosol. with the numerous references there given; and particularly the paper of M. Saillant, in the Mem. de la Soc. Roy. de Med. tom. i. p. 303; likewise the genera of Eclampsia, sp. 1. *typhodes*, and Convulsio, sp. 8. *ab ustilagine*, in the Nosology of Sauvages.) It may, perhaps, be again questioned, however, whether, in these experiments of Linnæus, and in those of the abbé Tessier before mentioned (see ERGOT), the animals fed with the seeds of the raphanistrum and *ergot*-ed rye were not rather starved, for want of nutritious food, than poisoned by that which was deleterious. Is it probable that the rye, through extensive provinces, should be all affected with the *ergot*, so as to produce a general epidemic? Is not the disappearance of the disease in our own times rather to be attributed to the general improvements in agriculture, which have rendered dearth less frequent and extensive, and to the increase of commerce, which has facilitated the supplies of nutritious food, to make up for these partial deficiencies, than to the disappearance of the disease of corn? See RAPHANIA.

IGNIS, *St. Antonii*. See ERYSIPELAS.

IGNISPICIUM, among the *Romans*, a species of divination taken from the fire used in sacrifices. See PYROMANCY.

IGNITION, in *Chemistry*, the application of fire to metals, till such time as they become red-hot without melting. This happens in gold and silver; but especially in iron; but lead and tin are too soft and fusible to bear ignition.

IGNORAMUS, q. d. *We do not know*; in *Law*, a word used by the grand jury, impannelled on the inquisition of causes criminal, and formerly written upon the bill, when they dislike their evidence, as defective, or too weak to make good the presentment. But now they assert in English, more absolutely, “not a true bill,” or, which is the better way, “not found.”

The effect of which is, that all farther inquiry upon that party for that fault is thereby stopped, and he is delivered without farther answer. See BILLA VERA.

IGNORANCE, the privation, or want of knowledge.

Ignorance, according to Mr. Locke, is chiefly owing to three causes: want of ideas; want of a discoverable connection between the ideas we have; and want of tracing and examining our ideas. See IDEA.

There are some things we are ignorant of for want of ideas: all the simple ideas we have are confined to the observation of our senses, and the operations of our own minds, which we are conscious of in ourselves. What other ideas it is possible other creatures may have, by the assistance of other senses or faculties, more or perfecter than we have, or different from our's, is not for us to determine; but to say there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive there was no such thing as light and colours, because he had no manner of idea of any such thing.—What faculties, therefore, other species of creatures have, to penetrate into the nature and inmost constitutions of things, we know not; this we know, and certainly find, that we want other views of them, besides those we have, to make discoveries of them more perfect. The intellectual and sensible worlds are in this perfectly alike; that the parts which we see of either of them, hold no proportion with that we see not; and whatsoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almost nothing, in comparison of the rest. Again, the want of ideas, which we yet seem capable of, is another great obstacle in our way, and keeps us in ignorance of things, which we conceive capable of being known. Bulk, figure, and motion, we have ideas of; yet, not knowing what is the particular bulk, motion, and figure, of the greatest part of the bodies of the universe, we are ignorant of the several powers, efficacities, and ways of operation, whereby the effects we daily see are produced. These are hid from us in some things, by being too remote; and in others by being too minute.

This, at first sight, shews us how disproportionate our knowledge is to the whole extent even of material beings: to which if we add the consideration of that infinite number of spirits that may be, and probably are, which are yet more remote from our knowledge, and whereof we have no cognizance at all; we shall find this cause of ignorance conceals from us, in an impenetrable obscurity, almost the whole intellectual world; a greater, certainly a more beautiful world than the material: for, abating some very few ideas of spirits, which we get from our own mind by reflection, and from thence the best we can collect of the Father of all spirits, the author of them, and us, and all things, we have no certain information so much as of the existence of other spirits, but by revelation: much less have we distinct ideas of their different natures, states, powers, and several constitutions, wherein they agree or differ one from another, and from us: and therefore, in what concerns their different species and properties, we are under an absolute ignorance.

Another cause of ignorance is, the want of discoverable connexion between those ideas we have: where we want that, we are utterly incapable of universal and certain knowledge; and are, as in the former case, left only to observation and experiment. Thus the mechanical affections of bodies having no affinity at all with the ideas they produce in us, we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as the effects or appointments of an infinitely wise agent, which perfectly surpasses our comprehension. The operation of our minds upon our bodies is as inconceivable: how any thought should produce a motion in body, is as remote from the nature of our ideas, as how any body should produce any thought in the mind. That it is so, if experience did not convince us, the consideration of the things themselves would never be able, in the least, to discover to us. In some of our ideas there are certain relations, habitudes, and connections, so visibly included in

the nature of the ideas themselves, that we cannot conceive them separable from them by any power whatsoever: in these only we are capable of certain and universal knowledge. Thus the idea of a right-lined triangle necessarily carries with it an equality of its angles to two right ones; but the coherence and continuity of the parts of matter, the production of sensation in us, of colours and sounds, &c. by impulse and motion, being such wherein we can discover no natural connection with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect. The things that we observe constantly to proceed regularly, we may conclude, do act by a law set them; though by a law we know not, whereby those causes work steadily, and effects constantly flow from them, yet their connections and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them. Several effects come every day within the notice of our senses, of which we have so far sensitive knowledge; but the causes, manner, and certainty of their production, we must, for the foregoing reasons, be content to be ignorant of. In these we can go no farther than particular experience informs us of matter of fact; and, by analogy, we guess what effects the like bodies are, upon other trials, likely to produce. But as to perfect science and natural bodies (not to mention spiritual beings), we are so far from being capable of any such thing, that it may be reckoned lost labour to seek after it.

The third cause of ignorance is, our want of tracing those ideas we have, or may have; and finding out those intermediate ideas, which may shew us what habitude of agreement or disagreement they may have one with another: and thus many are ignorant of mathematical truths for want of application in inquiring, examining, and by due ways comparing, those ideas.

IGNORANCE, in *Law*, is a want of knowledge of the laws; which will not excuse a person from suffering the penalty annexed to the breach of them; because every one is obliged, at his peril, to know the laws of the land. "Ignorantia juris, quod quisque tenetur scire, neminem excusat," is as well the maxim of our own law, as it was of the Roman. (Plowd. 343. Ff. 22. 6. 9.) The ignorance or mistake which constitutes a defect of will is, when a man, intending to do a lawful act, does that which is unlawful. For here the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. Or if a man, intending to kill a thief or housebreaker in his own house, by mistake kills one of his own family, this is no criminal action (Cro. Car. 538.); but if a man thinks he has a right to kill a person excommunicated, or outlawed, wherever he meets him, and does so; this is wilful murder according to the principle above stated.

IGNOROMOUS, in *Geology*, is a term used by Mr. Kirwan (*Geolog. Essays*, p. 161. 274, &c.) to denote the substances thrown out of volcanos; and in which also he includes the materials of pseudo-volcanic tracts, or those which have been exposed to accidental fires, like the burning of a seam of coals, &c.

IGRANI, in *Geography*, a town of European Turkey, in Dalmatia; 44 miles E.S.E. of Mostar.

IGRIDI, a town of Asiatic Turkey, in Caramania, situated on a large lake.

IGUALADA, a town of Spain, in Catalonia; 18 miles S.E. of Cervera.

IGUANA, in *Zoology*, the name of a species of lizard, very frequent in the West Indies. It is an amphibious animal,

mal, of the lizard shape, and in colour partly brown and partly grey, in some of the animals; and in others of a beautiful green, variegated with black and white spots. From its neck to the extremity of its tail, it has a continued series of flat-pointed and ferrated scales, of a fine green colour. These are largest at the neck. See LACERTA.

IGUAPE, in *Geography*, a river of Brazil, which runs into the Atlantic, S. lat. 3° 35'. W. long. 38° 56'.

IGUAY, a river of South America, which rises in Paraguay, and crossing Brazil, runs into the Atlantic, forming a large estuary at its mouth, where it is called "Rio Grande." S. lat. 31° 54'.

IGUEN, a river of Brazil, which runs into the Atlantic, S. lat. 10° 20'.

IGUIDI, a town and district of Africa, in the country of Sahara; the country is also called "Lempta."

IGUINAS, a small island in the bay of Panama. N. lat. 7° 40'. W. long. 81° 8'.

IGUIRA, a town of Africa, on the Gold Coast, in the country of Soko, near which is dug very fine gold.

IGUITPO, a town of Brazil, in the government of St. Paul.

IGUNSKOI, a town of Russia, near the eastern extremity of the continent of Asia. N. lat. 65° 45'. E. long. 188° 34'.

IGUVIUM, now *Gavio*, in *Ancient Geography*, a town of Italy, in Umbria, situated towards the S.W. among the mountains. It was municipal, and at some distance from it was a temple of the Apennine Jupiter.

JHANSU-JEUNG, in *Geography*, a town, castle, and valley of Thibet. The town, if it may be so called, consists of a monastery, situated on the concave side of a steep rock, and of about 150 houses, which rise in rows, one behind the other. They are square, pretty regular in their form, and the whitened walls have a band about their tops, two or three feet broad, of a deep garnet colour, which, with the addition of temples, gilded ornaments, and the decorated dwellings of their superior priests, make a very handsome and brilliant spectacle. The whole building was surrounded by high walls, which were continued along the ridge of the rock, and crossed by many intermediate gateways or lodgements, so as to command the monastery, which fronted towards the castle, as well as to overlook the other side of the rock, which is extremely rugged, and almost perpendicular. The vicinity abounds with beggars of all ages and of both sexes. The castle stands upon a rock, which, from its perpendicular height, and the irregularity of its cliffs, is not impregnable, must at least be extremely difficult to be subdued by the assaults of any Tartar enemy. The valley of Jhansu, which is very extensive, has greatly the appearance of having been once the bed of a lake. It is particularly famous for the manufacture of woollen cloth, for which there is a very great demand. These cloths, which are confined to two colours, garnet and white, seldom exceed half a yard in breadth; they are woven very thick and close, like our frieze; they are very soft to the touch, for the fleece of their sheep appears to be remarkably fine, and supplies an excellent material. Its superior pliability and warmth induce almost all the priests, both here and in Bootan, to use it for the short vest which they wear next the skin; and those who can afford it have also their winter mantle of the same. For this manufacture, the valley of Jhansu, from its central position, is very conveniently situated, both as to receiving the material and conveying the cloth, when manufactured, to Teshoo Loomboo, Lassa, and Bootan. It has, in consequence, become the principal settlement of manufacturers; and it certainly possesses every natural and effen-

tial advantage of space, climate, and fertility. It is extremely rich with abundant crops of corn, and exceedingly populous; 130 miles W.S.W. of Lassa. N. lat. 28° 49'. E. long. 89° 32'. Turner's Thibet, p. 227.

IHLE, a river of Brandenburg, which, by the addition of an artificial canal, forms a communication between the Havel, 9 miles W. of Brandenburg, and the Elbe.

IHNE, a river, which rises from a lake in the New Mark of Brandenburg, passes by Stargard, Golnow, &c. and runs into the Damnuisch see or Oder, 9 miles below Damme.

JHONSEN, ROBERT, in *Biography*, an ecclesiastic, and a learned musician, was one of the first of our church composers who disposed his several parts with intelligence and design. In writing upon a plain-song moving in slow notes of equal value, which was so much practised in these times, he discovers considerable art and ingenuity in the manner of treating subjects of fugue and imitation; in which kind of writing he seems to have been much superior to Taverner.

IHRE, JOHN, public professor of rhetoric and politics in the university of Upsal, was born in March 1707. He was, on account of the early death of his father, chiefly educated under his grandfather, then archbishop of Upsal. In 1730, when he had completed his studies, he set out on his travels to enlarge his literary acquirements, and improve himself by the company and conversation of learned men. In 1733 he returned to Upsal, where he disputed "De Usu Accentuum Hebræorum," and was elected a member of the Academy of Sciences. In 1737 he was made public professor of poetry, and in 1748 he was appointed by the king professor of rhetoric and politics; an office, the duties of which he discharged for 40 years with great reputation, and with much real benefit to his pupils. In the year 1756 king Adolphus Frederick raised him to the rank of a counsellor of the chancery; two years after to that of patrician; and in 1759 conferred on him the order of the Polar Star. He died in 1780 in the 74th year of his age. He was author of many works, which will be lasting monuments of his great learning and indefatigable industry. In the year 1756 he undertook a Sueco-Gothic Lexicon, and began to arrange the materials which he had been preparing for the purpose. In 1766 he published a "Lexicon Dialectorum," in which he explained and illustrated obsolete words, still used in the provinces; and in 1769 his "Glossarium Sueco-Gothicum" was published in two volumes folio. Sweden is indebted to him for many other works, particularly for an explanation of the old catalogue of the Sueco-Gothic kings, to which are added the Old West-Gothic Laws. In his dissertations "De Runorum Antiquitate, Patria, Origine, et Occasu" he asserts that the Runic writing was formerly used in the greater part of Europe, was introduced into Sweden about the sixth century, and became entirely extinct in the beginning of the 15th. He was possessed of a sound judgment and a retentive memory; and so clearly were his ideas arranged, that he had never any need to correct what he had composed. He was of a mild disposition, loved innocent mirth, had an open friendly heart, and entertained the utmost reverence for the Supreme Being.

JHYLUM, in *Geography*, a town of Hindoostan, in Lahore; 73 miles N.N.W. of Lahore.

JHYLUM River. See BEHUT.

JIB, in a *Ship*, is the fore-most sail of it, being a large stay-sail extended from the outer end of the bowsprit, prolonged by the jib-boom, towards the fore-top-mast head.

JIB-Boom is a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the

bottom of the jib, and the stay of the fore-top-gallant-mast. It is attached to the bowsprit by means of two large boom-irons, or by one boom-iron, a cap on the outer end of the bowsprit; or by the cap without, and a strong lashing within.

JIBBEL-AURESS, in *Geography*. See **AURESS**.

JIBBEL-Deera, a mountain of Algiers, in the province of Titterie; 50 miles S.S.E. of Algiers.

JIBBEL-Karkar, a range of rocky mountains in the western province of Algiers; 20 miles N.E. of Tremecen.

JIBBEL-Dwee, a mountain of Africa, in the western province of Algiers; S. of El Khadarah.

JIBBEL-Ikell, a mountain of Africa, in the northern part of Tunis, anciently mount Cerna; about 15 miles S.W. of Bizerta.

JIBBEL-Mustewab, a mountain of Algiers, in the province of Constantina, the chief abode of a clan of Kabyles, called Welled-Abdenore; 45 miles S. of Constantina.

JIBBEL-Seilat, a mountain of Africa, in the Sahara; 78 miles S.S.E. of Algiers.

JIB-BELEAH, a range of mountains of Africa, forming a boundary between Tunis and Tripoli.

JIBING. See **GYBING**.

JIDDA, in *Geography*, a sea-port town of Arabia Felix, in the sherriffate of Mecca, situated on the Red sea, and first surrounded with walls by Sultan El Guri in 1514, in order to protect it from the Portuguese, who were then beginning to become formidable on the Red sea. Although the walls are still standing, and also the bridges, they are now in a ruinous state. The palace of the Pacha is but an indifferent building; but there are other fine buildings in the town, constructed of coral stone. The other houses are slight wooden fabrics. As Jidda is entirely destitute of water, the inhabitants are supplied with that which is collected by the Arabs in reservoirs among the hills, and brought by them from thence upon camels. The dress of persons of distinction resembles that of the Turks in Cairo; but the poorer sort wear only a shirt without breeches. The dress of the women is that of the Arabian females in general; large drawers, a flowing shirt, and a veil. The employment of many of the poorer sort is fishing, from which they earn but a scanty subsistence. The country round Jidda is sandy and barren; and the sea seems to have receded from the land here as well as in other places, as, at a certain distance from the shore there are hills composed of coral-rock, resembling the banks of coral lying along the coast. The Arabs have a singular method of taking wild ducks in the harbour; the person who is in search of the game stripping himself, and covering his head with sea-weeds, and thus approaching the ducks, which, unalarmed at the sight of the weeds, he seizes by the feet. As Jidda is part of the dominions of the sherriff of Mecca, the Turkish sultan sends a Pacha to this city; but the supreme authority is shared between the sherriff and the Turkish governor, who is annually changed. The revenue arising from the customs is divided between the sultan and the sherriff. The dues of custom are fixed at 10 per cent. upon the value of the goods, arbitrarily estimated, so that they may be really considered as equal to 12 or 15 per cent. The English, however, are particularly favoured, even more than the subjects of the sultan; they pay only eight per cent. and are suffered to discharge this in goods, whereas all others must produce money. Although the trade of Jidda is considerable, this city is no more than a mart between Egypt and India. The ships from Suez seldom proceed farther than this port; and those from India are not suffered to advance to Suez. The circumjacent country affords nothing but Taif almonds

for objects of traffic; and of these the English carry 500,000 weight annually to India. Balm of Mecca is also brought hither from the neighbourhood of Medina, as an article for exportation. The imports are greater, because both Mecca and Medina are to be supplied from this market. Large quantities of corn, rice, lentiles, sugar, oil, &c. are imported from Egypt, without which this part of Arabia could not possibly be inhabited. All goods from Europe come also by way of Egypt; and, on the other hand, those which are brought hither from India, pass generally into Egypt. No money is coined in this province; the specie current here is altogether foreign, and the same as at Constantinople and Cairo. But the larger coins pass at a higher rate here than at Cairo, because small money, brought by the pilgrims, is more plentiful here than even where it is coined. The trading janizaries in this place are properly merchants, who are protected by the privileges of that body in which they are enrolled from the impositions to which this traffic would otherwise be liable; but they perform no military duty, and receive no pay. N. lat. 21° 17'. Niebuhr. Bruce.

JIDGER, a river of Hindoostan, probably the same with the Selima, which runs on the west of Sirhind to the south, towards Soonam, about 60 miles S.W. of Sirhind; between which and the Setlege a canal was formed by Ferofe.

JIDMEELAH, a town of Algiers; 28 miles W. S.W. of Constantina.

JIDDOON, a district of Asia, situated on the E. side of the river Sindé, on the borders of Cachemire and Thibet.

JIG, in *Music*, implies both a dance and a tune, generally in rapid triplets of $\frac{8}{8}$, $\frac{9}{8}$, or $\frac{12}{8}$. See **GIGA**.

JIGAT, or **JUGGAT Point**, in *Geography*, a cape of Hindoostan, forming the western extremity and fifth division of Guzerat, on which point is a pagoda. N. lat. 22° 23'. E. long. 68° 12'.

JIGGER, in *Sea Language*, is a machine consisting of a piece of rope about five feet long, with a block at one end, and a sheave at the other; and used to hold on the cable, when it is heaved into the ship by the revolution of the windlasses. See **HOLDING ON**.

JIGGER-tackle, is a light small tackle, consisting of a double and single block, used on various occasions by seamen.

JIGGUROON, in *Geography*, a town of Hindoostan, in the circar of Sirhind; 23 miles W.S.W. of Sirhind.

JIGNI, a town of Hindoostan, in the circar of Gohud; 18 miles S.S.E. of Kooch.

JIG-PIN, in *Mining*, is a pin of wood, which the drawers of ore or coals, &c. by stowes or turn-beams, put into a hole, to prevent the handles turning round, when it is wished to suspend the barrel or corve in or over the shaft.

JIHON, in *Geography*. See **AMU** and **OXUS**.

JIJEL, a town of Algiers, in the province of Constantina, now reduced to a few houses and a small fort, in which the Turks have a small garrison; it is situated on a point of land near the sea; 30 miles E.N.E. of Boujeiah. This was formerly called *Igilgili*, which see. N. lat. 36° 56'. E. long. 6°.

JILGOUN, a town of Asiatic Turkey, in the province of Caramania; 28 miles E. of Akferai.

JILLIFREE, a town of Africa, in the kingdom of Barra, on the banks of the Gambia. N. lat. 13° 16'. W. long. 16° 7'.

JIMMALL, a town of Abyssinia; 40 miles S. of Miré.

JIMMEL,

JIMMEL, a town of Africa, in the kingdom of Tunis, anciently called "Tegæa;" 11 miles S.W. of Lempta.—Alfo, a town of Algiers, 33 miles S.W. of Conftantina.

JIMMELAH, a town of Africa, anciently "Genella," near which are magnificent ruins, the remains of an amphitheatre, &c.; 27 miles S.S.W. of Conftantina.

JINBALA, or **GUINBALA**, a kingdom of Africa, being an ifland formed by two branches of the Niger, which feperate at leaving the lake Dibble, and again unite about 15 miles from Tombuctoo. It is of an oval form, about 80 miles long, and about 40 in its greateft breadth. The country is laid to be fertile, and abounding fo much with fwamps and creeks, that the Moors have not been able to fubdue it. The inhabitants are negroes. Its capital is Jinbala, fituated on one branch of the Niger, and ferving as a refiling place for merchants, who trade between Tombuctoo and the western parts of Africa. N. lat. 16° 4'. E. long. 0° 16'.

JINCUGHI, a town of Afatic Turkey, in Natolia; 18 miles N. of Kiutaja.

JINDEYA, a town of Africa, in the country of Woolly; 30 miles W.S.W. of Medina.

JINGLER, a town of Hindooftan, in Oude; 33 miles S.E. of Gooracpour.

JINNETT, a fea-port town of Algiers, in the province of Titterie, fituated on a fmall creek of the Mediterranean, at the mouth of the Yiffer. Great quantities of corn are annually exported from this part to Europe; 33 miles E. of Algiers. N. lat. 36° 43'. E. long. 4° 10'.

JINZO, a town of Spain, in Galicia; 12 miles S.E. of Orenfe.

JINZOOWARAH, a town of Hindooftan, in the country of Guzerat; 40 miles S. of Janagur.

IJO, a town of Sweden, in the government of Ulea; 20 miles N. of Ulea.—Alfo, a town of Japan, in the ifland of Xicoco. N. lat. 34°. E. long. 134° 10'.

JIONPOUR, a circar of Hindooftan, in Allahabad, about 50 miles long and 30 broad.—Alfo, the capital, which is a fmall city on the Goomty river; about 40 miles N.W. of Benares, and on the road from that city to Fyzabad. N. lat. 25° 46'. E. long. 82° 55'.

JIOSORRA, a town of Africa, in Bambarra. N. lat. 14° 38'. E. long. 3° 40'.

JIRBAN, a town of Arabia, in Yemen; 8 miles N.W. of Sana.

JIRREE, a town of Hindooftan, in the circar of Gohud; 25 miles W. of Narwa.

JIRWARY, a town of Hindooftan, in the circar of Gohud; 7 miles S.W. of Gwalior.

JITTIS, a town of Sweden, in the province of Tavastland; 62 miles E. of Tavasthus.

JIVANI, a name of the Hindoo regent, or god of fire, correponding in many points with the Vulcan of western mythologifts. Another of his names is *Pavaka*, which fee.

JIYA, in *Zoology*, the name of an American animal, of the otter-kind, called alfo *carigucibeiu*. It is an amphibious creature, of the fize of a middle-fized dog. Its head is round, and like a cat's; but its nofe is fomewhat pointed; its eyes are black; its ears roundifh, and placed very low as in the otter; and it has a fort of beard or whifkers, compofed of a few ftiff hairs; the feet have all five toes, the inner one being fmall than any of the others; the hair is foft, not long, and all black, except thofe on the head, which are brown, and fome which compofe a yellowifh fpot under the throat. Its note is much like that of a young puppy. It feeds on fifh, and other animals. Ray.

IK, in *Geography*, a river of Ruffia, which runs into the

Kama.—Alfo, a river of Ruffia, which runs into the Sak-kara.

IKALIS, a town of Sweden, in the government of Abo; 40 miles E.N.E. of Biorneborg.

IKARUNGA, a town of Japan, in the ifland of Niphon; 75 miles N. of Meaco. N. lat. 36° 16'. E. long. 136°.

IKDER, a town of Afatic Turkey, in Natolia; 30 miles S. of Satalia.

IKEIKANI, a town of Afatic Turkey, in Natolia; 65 miles E. of Conftantinople.

IKENDA, a town of Japan, in the ifland of Niphon; 140 miles W.N.W. of Jedo.

IKENILD STREET, one of the four famous ways that the Romans made in England. See **WATLING-STREET**.

IKLERA, in *Geography*, a town of Hindooftan, in Katchwara; 34 miles E.N.E. of Saurungpour.

IKOLLA, a province of Africa, in the kingdom of Angola, E. of Loanda.

IKON, a town of Africa, on the Gold coaft, where the Dutch have a factory.

IKTIMAN, a town of European Turkey, in Bulgaria; 25 miles E.S.E. of Sofia.

IKUA, a town of Japan, in the ifland of Ximo; 50 miles N.N.E. of Nangafaki.

ILA, **LAY**, *Illa*, or *Iflay*, is one of the Hebrides, lying to the fouth-weft of Jura, and in the county of Argyll, Scotland. It extends twenty-eight miles from north to fouth, and eighteen from eaft to weft. On the eaft fide the furface is hilly, and covered with heath, but the greater part of the ifland is flat. The coaft is rugged and rocky, but indented by numerous bays and harbours, which are fafe landing-places for fmall veffels; and at Lochindale is a harbour for fhips of confiderable burthen, with a quay, oppofite to the large village of Bowmore. There are feveral lakes; and the ifland is well watered by numerous freams and rivers, abounding with trout and falmon. In the centre of the ifland is a lake called Loch Finlagan, three miles in circumference, with the iflet of the fame name in the middle, the ancient refidence of the Macdonalds, the great lords of the ifles; but the palaces and offices are now in ruins. Inftead of a throne, the chief flood on a ftone feven feet fquare, in which there was a hollow cut to receive his feet: here he was crowned and anointed, in prefence of his chieftains, by the bifhop of Argyll and feven inferior priefts. The ftone is ftill preferved. The ceremony, after the new lord had collected his kindred and vaffals, was truly patriarchal. Having put on his armour, helmet, and fword, he took an oath to rule as his anceftors had done; to govern as a parent would his children: his people, in return, fware that they would render him the obedience due to a parent. Anciently, the dominions of this potentate included Iffa, Jura, Colonsay, Mull, Arran, &c.: and the peninfula of Kintyre ufually fared the fate of the ifles; for we find that, in 1093, after one of the grants of the kings of Scotland, the lord of the ifles, in order to bring Kintyre within the compafs of the grant, had his barge drawn under fail over the ifthmus of Tarbert; after which, confidering his power, not even the Scottifh monarch was fo hardy as to deny that Kintyre was an ifland. About the year 1586, the dominion of the ifles confifted only of Iffa, Jura, Kintyre, and Knapdale; fo reduced was it from its former extent during the reign of James III. Near Finlagan is another little ifle, called Ilan-na-corrle, *i. e.* the ifland of Council, where thirteen judges constantly fat to decide differences between the fubjects of the Macdonalds, for which they received the eleventh part of the value of the contefted property.

In the first isle were buried the wives and children of the lords of the isles: but their own bodies were deposited in the more sacred ground of Iona. Besides the castle on the island, these powerful lords had a house and chapel at Laggannon, on the side of Loch-in-dal; a strong castle on a rock in the sea, at Dunowaick, at the south-east end of the island; for, after their expulsion from the Isle of Mann, in 1304, they made this island their place of residence; sometimes making their abode at Daireudhain in Kintyre, where the modern burgh of Campbelltown is situated. The island was formerly divided into four parishes, Kilchonan, Kildalton, Killarrow, and Kilmeny; but the two last are now united. The total population of the island, as stated in the statistical reports of the three parishes in 1793, was 9500. The quadrupeds, enumerated by Mr. Pennant, besides the domestic animals, are weasels, otters, and hares; the latter dark-coloured, small, and bad runners. The birds are eagles, peregrine falcons, muir-fowl, ptarmigans, and red-breasted gooseanders. Vipers swarm in the heath; and the natives are said to cure the wound by a poultice of hemlock and henbane. In this island several ancient diversions and superstitions are still preserved: the latter, however, are almost extinct, or only lurk among the very meanest of the people. Yet the power of fascination still retains a strong hold on their minds. The late-wakes, or funerals, were attended with sports and dramatic entertainments, composed of many parts; and the actors often changed their dresses suitable to their characters. The subject of the drama was historical, and preserved by memory. The general language of the common people is the Gaelic; yet English is well understood, and taught in all the schools. The chief amusements are singing and dancing; in the latter are exhibited an ease and gracefulness of motion peculiar to this island. Ila abounds with mines of lead and copper, which are very rich, and have been long wrought. There are also vast quantities of that ore of iron called bog-ore, of the concrete kind, and below it large strata of vitriolic mundic. Near the veins of lead are found specimens of barytes and excellent emery. A small quantity of quicksilver has been found in the muirs, and it is probable that a more attentive search would discover more of that valuable mineral. Limestone and marble are abundant; but of these the inhabitants are scarcely acquainted with the value. Pennant's Tour to the Hebrides.

I.L.A. in *Hindoo Mythology*, a female who appears in several undefined or equivocal characters. Sir William Jones notices her as the daughter of the seventh Menu, or Noah (see MENV), and wife of a son of Chandra, or the Moon. She is thus one of the maternal ancestors of both the great classes of people distinguished among the Hindoos by the titles of children of the sun, Surya-vansa (see SURYA-VANSA), and children of the moon, Chandra-vansa; Ila's father, Menu, being of the former race, and hence surnamed Vaivasvata, or offspring of the sun. (See VAIVASWATA.) In another of her characters she appears to be a personification of the earth, and the wife of Menu or Noah; in another as his son: in all of which may be traced some appearance of allegory referring to the important part borne by the great restorer of our species, as parent and protector of terrestrial productions. On one occasion she incurred the displeasure of Parvati, the Juno of the Hindoo Olympus, who cursing her, caused her to become alternately one month a man and a month a woman; but by the efficacy of devotions paid to a linga (see LINGA), the symbol of Siva, she was restored to her permanency of sex through the favour, thus propitiated, of that divinity. This fable we shall not attempt to explain. See Moor's Hindoo Pantheon.

ILAK, or JALAK, in *Geography*, a town of Nubia, on the Nile, which some suppose to have been the site of the ancient Meroe. N. lat. 17° 48'. E. long. 34° 10'.

ILAMBA, or ELUANÉ, the name of two provinces of Africa, in the kingdom of Angola; the Upper is the more inland, and the Lower nearer the Atlantic. Both are fertile, and yield a considerable revenue to the crown of Portugal.

ILANTZ, the capital of the Grey league, a small town of Switzerland, containing about 60 houses, and partly surrounded by walls. It is the place where the general diet of the three leagues assembles every third year. The adjacent country is fertile in every species of grain and pasture. The points of view are extremely fine, exhibiting a small plain skirted by cultivated mountains, and backed by a ridge of barren rocks which bound the valley of Lugnetz. N. lat. 46° 40'. E. long. 9° 18'.

ILANTZINSKOI, a town of Russia, in the government of Irkutsk; 10 miles N.N.W. of Verchnei or Udinsk.

ILAT, a small island on the east coast of the island of Bouro. S. lat. 3° 35'. E. long. 127° 33'.

ILATHERA BARK. See CLUTIA.

ILBERG, in *Geography*, a town of Sweden, in the province of Warmeland; six miles N.W. of Carlstadt.

ILCHESTER, properly IVELCHESTER, is an ancient borough, market-town, and parish in the hundred of Tintinhull, Somersetshire, England, and is situated on the river Ivel. Its Roman name was *Ipsalis*, and it was one of the most eminent stations the Romans possessed in these parts. It was by them environed with a strong wall and deep ditch, which originally was filled with water from the river. Its form was an oblong square, the Fosse-road passing through it from north-east to south-west. The vestiges both of the wall and ditch are still discernible, the former being regularly composed of stone and brick-work intermingled: the ditch on the north-west side is now filled up, and become a road called Yard-lane. The Fosse-road was here paved with large flag-stones; some of which are visible in the old ford through the river near the bridge. At the time of the Norman conquest, Ivelchester was a city of considerable note, and contained several parish churches. Vast arches and immense foundations of ancient buildings lie beneath the surface of the ground; and the entire site of the old city is filled with subterraneous ruins. The present town exhibits but small indications of its former greatness. It consists of four streets but indifferently built; and has one parish church, and a meeting-house for Dissenters. The church has a tower, fifty feet high, constructed of Roman stone. The assizes for the county were fixed to be held here by a patent granted by Edward III., but they have long since been held only alternately with Wells, Taunton, and Bridgewater. The county gaol is still here. The civil government of this borough is vested in a bailiff and twelve capital burghesses, who, together with the inhabitants not receiving alms, return two members to parliament. The first return was 26 Edward I. An hospital for the entertainment of pilgrims and poor travellers was founded, about the year 1226, by William Dacus; it was afterwards converted into a nunnery; the ruins are still extant. A weekly market on Wednesday has existed here ever since the conquest, but has greatly declined. Here are two annual fairs. Ilchester is 122 miles distant from London: the return under the population act of 1801 was 138 houses, and 942 inhabitants. The celebrated philosopher Roger Bacon, justly accounted the wonder of his age, was born in this town, A. D. 1214. Collinson's History of Somersetshire, vol. iii.

ILDINSKOI, a cape of Russia, in the Pacific ocean, near the northern part of Kamtschatka. N. lat. $59^{\circ} 15'$. E. long. $164^{\circ} 14'$.

ILDUM, in *Ancient Geography*, a town of Spain, belonging to the Ilercaones, at some distance from the sea, N.E. of Segobriga. In Antonine's Itinerary it is marked on the route from Dertofa to Saguntum.

ILERAY, in *Geography*, one of the smaller western islands of Scotland, near the N. coast of Benbecula. N. lat. $57^{\circ} 30'$. W. long. $7^{\circ} 25'$.

ILERCAONES, in *Ancient Geography*, a people of Spain, in the Tarragonensis, towards the mouth of the Ebrus.

ILERDA, or LERIDA, a town of Spain, upon the Sicoris: its situation at the foot of the Pyrenees exposed it incessantly to the horrors of war from the time when the Romans began to penetrate into Spain. Under Gallienus it was almost entirely destroyed by the Barbarians, who, migrating from Germany, ravaged the western parts of the empire.

ILERGETES, a people of Hither Spain, E. of the Vascones. Their principal towns were Ilerda, Bergusia, and Ofca.

ILES, in *Agriculture*, a term provincially applied in some places to denote the beards or awns of different descriptions of grain, such as barley, wheat, &c. See AWNS.

ILETERTON, in *Geography*, a town of Thibet, 30 miles S.W. of Cha-tcheou.

ILEUM, in *Anatomy*, the third division of the small intestine. See INTESTINE.

ILEX, in *Botany*. Linn. Gen. n. 172. Reich. 184. Schreb. 232. Juss. 379. Mart. Mill. Dict. v. 2. Smith Fl. Brit. 192. Aquifolium, Tournef. 371. Class and order, *Tetrandria Tetragynia*. *Polygamia Dioecia*, Hudf. Nat. Ord. *Dumosea Rhamni*, Juss.

Gen. Ch. Cal. Perianth four-toothed, very small, permanent. Cor. one-petalled, four-parted, wheel-shaped; divisions roundish, spreading, rather large, with cohering claws. Stam. Filaments four, awl-shaped, shorter than the corolla, anthers small. Pist. Germen roundish; style none; stigmas four, obtuse. Peric. Berry roundish, four-celled. Seed solitary, bony, oblong, obtuse, gibbous on one side, cornered on the other.

Eff. Ch. Calyx four-toothed. Corolla wheel-shaped. Style none. Berry four-celled.

1. *I. aquifolium*. Common Holly. Linn. Spec. 181. Syst. 168. Reich. 1. 354. Hort. Cliff. 40. Upf. 22. Hudf. Engl. 446. Wither. Ar. 168. Mill. fig. t. 46. Hunt. Evel. 262. Thunb. Jap. 79. Lour. Cochinch. 91. (Aquifolium, Hall.) Helv. n. 667. Ilex, Scop. Carn. n. 177. Varieties α . *I. aculeata baccifera*, Bauh. Pin. 425. Aquifolium vulgo, Bauh. Hist. 1. 114. Tourn. Inst. 600. Aquifolium, Ger. 1155. Raii Hist. 1622. Syn. 466. β . *I. heterophylla*. Various leaved Holly. Ait. Hort. Kew. 1. 169. "Leaves toothed, spiny, and entire." γ . *I. crassifolia*. Thick-leaved Holly. Ait. Hort. Kew. 1. 169. "Leaves thicker, equally ferrate." δ . *I. recurva*. Slender Holly. Ait. Hort. Kew. 1. 169. "Leaves narrower, recurved." ϵ . *I. ferox*. Hedgehog Holly. Ait. Hort. Kew. 1. 169. Linn. Syst. 168. β . Reich. 1. 354. β . "Leaves with the upper surface spiny."

2. *I. opaca*. Carolina Holly. Ait. Hort. Kew. 1. 169. "Leaves ovate, acute, spiny, smooth, flat, flowers scattered at the base of the last year's shoots." Native of Carolina: flowers in May and June.

3. *I. Perado*. Thick leaved smooth Holly. Ait. Hort. Kew. 1. 169. "Leaves ovate with a point, unarmed, almost entire." Native of Madeira: flowers in April and May.

4. *I. Prinoidea*. Deciduous Holly. Ait. Hort. Kew. 1. 169. "Leaves elliptic-lanceolate, acute, deciduous, ferrate, ferratures without prickles. Native of Carolina and Virginia: flowers in July.

5. *I. Cassine*. Dahoon Holly. Linn. Spec. 181. Reich. 1. 354. Hort. Cliff. 40. *I. caroliniana*; Mill. Dict. n. 3. Aquifolium carolinense, fol. dentatis baccis rubris. Catefb. Carol. 1. t. 31. α . *I. Cassine latifolia*. Broad-leaved Dahoon Holly. "Leaves lanceolate-oblong, ferrate." β . *I. C. angustifolia*. Narrow-leaved Dahoon Holly. "Leaves lanceolate, almost quite entire." Ait. Hort. Kew. 1. 170. "Leaves alternate, distant, evergreen, lanceolate, ferrate, ferratures acuminate." Native of Florida and Carolina.

6. *I. vomitoria*. South-sea Tea or evergreen Cassine. Ait. Hort. Kew. 1. 170. (Cassine Paragua; Mill. Dict. n. 2 fig. t. 83. f. 2. Pluk. Mant. t. 376. f. 2. Catefb. Carol. 2. t. 57.) "Leaves alternate, distant, oblong, bluntish, crenate-ferrate, ferratures without prickles." Native of West Florida. The leaves are used for making an infusion in the manner of tea; which is accounted by the Indians very wholesome, and is almost the only physic they use in some parts. The plant is supposed to be the same with that which grows in Paraguay, where the Jesuits make a great revenue from the leaves.

7. *I. asiatica*. Linn. Spec. 181. Reich. 1. 354. "Leaves broad-lanceolate, blunt, quite entire." Native of the East Indies.

8. *I. runcifolia*. Linn. Spec. 181. Reich. 1. 354. Plum. Ic. 118. 2. "Leaves wedge-form, three-cupped." Native of South America.

9. *I. integra*. Linn. Syst. 168. Thunb. Jap. 77. "Leaves oblong, obtuse, entire; peduncles one-flowered."

10. *I. rotunda*. Linn. Syst. 168. Thunb. Jap. 77. "Leaves rounded, acute, entire; peduncles umbelliferous."

11. *I. crenata*. Linn. Syst. 168. Thunb. Jap. 78. "Leaves ovate crenate, peduncles on the branches scattered, bearing two or three flowers.

12. *I. emarginata*. Linn. Syst. 168. Thunb. Jap. 78. "Leaves obovate, emarginate, flowers axillary, usually in pairs."

13. *I. ferrata*. Linn. Syst. 168. Thunb. Jap. 78. "Leaves ovate, acute, ciliate, ferrate, flowers axillary, solitary. Flowers in June."

14. *I. japonica*. Linn. Syst. 168. Thunb. Jap. 79. "Leaves opposite sessile, flowers in terminating racemes, and flowers in April."

15. *I. latifolia*. Linn. Syst. 168. Thunb. Jap. 79. "Leaves ovate ferrate, flowers axillary, aggregate."

16. *I. crocea*. Thunb. Prodr. 32. "Leaves oblong ferrate, ferratures ciliate spiny." Native of the Cape of Good Hope.

This genus consists of small trees or shrubs, with alternate leaves, evergreen, toothed and thorny; and axillary many-flowered peduncles. The common holly rises from 20 to 30 feet, and sometimes more. It grows wild in many parts of Europe, in North America, Japan, Cochinchina, &c.; and is found in woods and forests in many parts of England. In English it is called "Hulver" and "Holme." For its uses, see HOLLY.

ILEX, in *Gardening*, contains plants of the hardy evergreen tree or shrubby kinds; of which the species mostly cultivated are the common holly (*I. aquifolium*); the Dahoon holly (*I. cassine*); and the South sea tea, or evergreen cassine (*I. vomitoria*).

There are a great many varieties of both the green-leaved and variegated sorts. Of the first the common green-leaved prickly, the smooth green-leaved, the narrow ferrate green-leaved,

leaved, the green-leaved yellow-berried, the box-leaved green, and the hedge-hog green; and of the latter the common prickly, with silver striped leaves, with gold striped leaves, with blotched leaves; the smooth with white striped leaves, with yellow striped leaves, with blotched leaves, with narrow striped leaves, the blotched yellow berried; the cream-coloured, the copper-coloured, the white-leaved, the mottled-edged, the hedge-hog silver-edged, the gold-edged hedge-hog, the white-blotched hedge-hog, the yellow-blotched hedge-hog, and the painted lady variegated.

And of the second sort there are varieties with broad leaves, and with narrow leaves, with scarcely any serratures.

Method of Culture.—These plants are all capable of being increased from seeds, and by the operations of budding and grafting upon proper stocks.

The seeds or berries should be sown, as soon as they are perfectly ripened, in small beds prepared for the purpose. But as they are long in germinating, it is the practice with some to deposit them, for a year before they are sown in the beds, in pots filled with earth or sand, or in a hole in the earth, in a dry situation; the first is probably the best method. The plants mostly rise in the second spring, when they should be kept well weeded and watered. After they have had two years' growth in these beds they should be removed, and planted out in nursery rows at the distance of two feet, and one apart in the rows. They should remain in these till of a proper size to be planted where they are to remain, keeping them perfectly clean, and the ground occasionally stirred about them.

The proper seasons for removing them are either the early autumn or spring; the former in dry grounds, and the latter in those that are of a retentive nature.

In the second sort the seeds, after being prepared as above, should be sown in pots, and plunged the second spring in a gentle hot-bed, in order to bring up the plants. They should then be kept in the pots, and have protection in the winter season till they have become of hardy growth, when they may be turned out and planted in warm situations. They afterwards require protection in very severe winters by mats or other means.

And the third sort may be managed in the same way as the second, the young plants being gradually inured to the open air, having only the morning sun at first. They should be kept in the pots four or five years, as they grow slowly, being well protected in the winter. They all succeed best in a dry soil.

All the varieties of the different soils are to be continued either by budding or grafting upon stocks of the first sort. The first should be performed in the latter part of summer, and the latter in the early spring, upon stocks of two years' growth. See **BUDDING, GRAFTING, and INOCULATING.**

All the sorts and varieties are highly ornamental in the clumps, borders, and other parts of pleasure-grounds, affording much variety when judiciously intermixed. The first sort frequently rises to a large tree, having a fine white hard wood useful for various purposes. The bark also affords the substance called bird-lime, which is prepared by boiling it till the green part is capable of being separated from the white, then laying it in a cool cellar for a few days, afterwards pounding it till it becomes a tough paste, washing it repeatedly, till it gets quite clear, then placing it in an earthen vessel to ferment or become fine, when it will be fit for use.

I L E X. See **HIPPOMANE** and **QUERCUS.**

I L E X Aquifolium, in *Natural History.* The leaves of this plant were found, among others, preserved in the silt and peaty matters, below the ordinary level of the tides; at Sutton, in Lincolnshire, by Dr. De Serra and Sir Joseph Banks, in 1796. *Phil. Transf.* 1799.

ILFRACOMB, in *Geography,* is a sea-port, market-town, and parish in the hundred of Braunton and county of Devon, England. It derives considerable trade from the herring-fishery in the Bristol channel. The peculiar situation and safety of the harbour occasion many vessels to put in here, when it is dangerous for them to enter the mouth of the river Taw for Barnstaple. In consequence of this circumstance, much of the port business of that place is transacted at Ilfracomb. Nature and art seem to have combined in forming the harbour, which, appearing like a natural basin, is almost surrounded by craggy heights, overspread with foliage. On three sides the rocks rise in a semicircular sweep; and on the fourth a bold mass of rock stretches nearly half-way across the mouth of the bay. This rock rises almost to a point; and on the top is erected a light-house, which has the appearance of a place of worship. Along the side of this rock, to the opening of the harbour, runs an artificial pier, judiciously constructed to prevent the accumulation of sand; so that by the joint assistance of the natural barrier and this piece of masonry, ships of 230 tons burthen may ride completely land-locked, and safe from the violence of the weather. An inscription, over the gate of the pier, informs us that the town was indebted for this valuable addition to its convenience and advantage, to Sir Bourchier Wray, bart., who, in the year 1760, partly rebuilt, lengthened, and enlarged this extensive barrier. Previous to the year 1731, the pier was 850 feet long, but the violence of the sea having nearly destroyed it, the parliament then passed an act for repairing and enlarging it, with the harbour, &c. The town consists principally of one well-built street, extending a mile in length, from the church to the sea side. A number of good houses, chiefly for the summer accommodation of strangers, is ranged along side of the harbour. The church is a large plain structure, but not demanding any particular notice. Camden, though prebendary of this place, scarcely mentions it in his *Britannia.* The civil government of the town is vested in a mayor, bailiffs, and other officers. Ilfracomb is 202 miles distant from London; has a well-supplied market on Saturdays; and contained, at the time of the late return to parliament, 455 houses, and 1838 inhabitants.

Three miles east of the town is Watermouth, the seat of Joseph Davie, esq. The house is situated on an eminence, having in front an inlet of the sea, which forms a most beautiful basin, environed by rocks on the right and left. The varied character of rock, lake, and dale, constitutes very singular and romantic scenery. Warner's Walk through the Western Counties. Mason's Observations on the Western Counties. Beauties of England and Wales, vol. iv.

ILGINSKAIA, a town of Russia, in the government of Irkutsk, at the conflux of the Ilga and Lena; 52 miles S. of Orlenga.

ILGINSKOI, a town of Russia, in the government of Irkutsk, on the Ilga; 140 miles N. of Irkutsk. N. lat. 54° 30'. E. long. 105° 14'.

ILHA GRANDE, an island in the Atlantic, near the coast of Brasil, about 15 miles long and three broad. S. lat. 23° 15'.

ILHEO, a small island in the Atlantic, near the coast of Africa. S. lat. 23° 30'.

ILHEOS, a sea-port town of Brasil, and capital of a district, called "Rios dos Ilheos," situated at the mouth

of a river of the same name. S. lat. 15° 25'. W. long. 36° 36'.

ILI, a river of Tartary, which runs into lake Palcati; 20 miles N.W. of Harcas.

ILIA, in *Anatomy*, the technical term for those parts of the body, which are bounded by the upper broad portions of the ossa innominata. It is one of the subdivisions of the abdominal cavity. See ABDOMEN.

ILIABAD, in *Geography*, a town of Hindooftan, in the Carnatic; four miles S.W. of Arnee.

ILIAC, in *Anatomy*, an epithet applied to certain organs of the body, situated in or near the ilia. Thus we have the common or primary ilia arteries (iliacæ communes); the external and internal iliac arteries (iliaca externa et interna); veins of the same names, corresponding to these; the posterior iliac artery (iliaca posterior or glutæa).

ILIAC *Passion*, or *Ileus*, in *Medicine*, a term used by many modern writers to designate those forms of intestinal disease, in which, after severe attacks of pain in the belly, the inversion of the peristaltic motions of the intestines is such, as to occasion a vomiting of feculent matter. This may happen from any great obstruction of the bowels; but chiefly occurs when either inflammation is induced, or a severe spasmodic constriction takes place in some part of the canal. The ileus, therefore, is only another term for inflammation of the bowels, or *enteritis* in the one case, and for *colic* in the other. (See these articles.) The name was probably appropriated with a view of discriminating an affection of the small intestines, or *ilium* (ἰλίου), from a similar disorder of the large intestines, or *colon*, which had been termed *colica*: but such distinction is not easily ascertained; and the *ileus* can only be considered as an extreme degree of *colic*, where inflammation has not actually supervened. The terms *misferere mei*, *volvulus*, and *chordapsus*, have also been used as appellations of the disease. All the causes of obstruction to the free passage of the feces along the canal of the intestines, inasmuch as they commonly induce inflammation, or spasmodic contraction, and invert the peristaltic motion, may produce ileus: such as *hernie*, or ruptures, intussusception, *calculi*, indurated feces, &c.; and the remedies applicable to colic and enteritis respectively will cure the disease. It is to be observed, however, that as this complete inversion of the peristaltic motion of the canal implies the most severe degree of these diseases, so it is necessarily an alarming and dangerous symptom whenever it appears.

ILIACOUR, in *Geography*, a town of Hindooftan, in the country of the Nays; 20 miles N.E. of Tellicherry.

ILIACUS INTERNUS, in *Anatomy*; iliaque, ilio-trochanteric; a muscle of the lower extremity, placed in the iliac fossa, and at the upper and anterior part of the thigh, and extending from the two anterior thirds of the crista of the ilium to the trochanter minor of the thigh-bone. It is thin and broad above, narrower and thicker below, so as to be in some degree fan-shaped. Its anterior surface is concave above and convex below: that portion of it which is above the crural arch is covered by the peritoneum, loosely attached by cellular substance, by the cæcum on the right, and by the sigmoid flexure of the colon on the left side of the body. The anterior crural nerve is also in contact with it here. Below the crural arch, the iliacus internus is covered on the outside by the sartorius, on the inside by the crural vessels and nerve, and in the middle by the fascia lata. The posterior surface covers the iliac fossa, and is attached to the two superior thirds of this excavation; it covers also the anterior inferior spine of the ilium, and is attached to its inner edge; it then covers the upper end of the rectus, and

the hip-joint, to the orbicular ligament of which it is attached.

The internal edge is covered above by the psoas magnus; below, these two muscles are united into one mass. The outer edge is extended obliquely from the anterior superior spine of the ilium to the base of the little trochanter; it is covered by the sartorius, and covers a little of the triceps. The upper edge is attached to the two anterior thirds of the inner margin of the crista of the ilium, and to the ilio-lumbar ligament. From these parts the muscle descends, growing thicker and narrower. Confounded with the psoas, it passes behind the crural arch, descends obliquely from without inwards, and is attached to the trochanter minor, and to the neighbouring part of the body of the thigh-bone.

The fleshy fibres of this muscle arise from the iliac fossa, the crista and spines of the bone, and terminate on the external and posterior surface of the tendon common to it with the psoas magnus. The internal ones are the shortest, and are nearly vertical; those in the middle are longer and pass obliquely from without inwards; the external are the longest and still more oblique. The latter accompany the tendon even to the trochanter, and some are attached to the former below that process.

The iliacus internus carries the thigh-bone forwards upon the pelvis, and rotates it so as to twist the limb outwards. It bends the pelvis forwards upon the thigh. It produces the first of these effects in progression, when the limb, which had been left behind, is elevated and carried in front of the other: the second action is exhibited when the trunk of the body is carried forwards on the limb so advanced.

ILIAD, *Iliaz*, the name of an ancient epic poem, the first, and finest, of those composed by Homer. See *ERIC Poem*.

The critics maintain the Iliad to be the first, and yet the best, poem that ever appeared in the world: Aristotle's Poetics are almost wholly taken from it; the philosopher had nothing to do but to form precepts from the poet's practice. Some authors tell us, that Homer invented not only poetry, but all other arts and sciences; and that there are the visible marks of a perfect knowledge in every one of them to be seen in the Iliad.

The word is derived from the Greek Ἰλίου, of *Ilion*, *Ilium*, Troy, a famous city of Asia, which the Greeks besieged for the space of ten years, and at last destroyed, on account of the rape of Helena, which makes the subject of the work.

The poet's design in the Iliad was, to shew the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among them. In order to which, he sets before their eyes the calamities that befel their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. See *FABLE*.

In order to form a proper judgment of the distinguishing excellence of this poem, it is necessary, says Dr. Blair, (*Lectures*, vol. iii.) that the reader should transport his imagination almost three thousand years back in the history of mankind, and consider that he is about to peruse the most ancient book in the world, next to the Bible. He will thus divest himself of all our modern ideas of dignity and refinement; nor will he be led to look for the correctness and elegance of the Augustan age. What he ought to expect is a picture of the ancient world, exhibiting characters and manners that possess a considerable tincture of the savage state. The opening of the Iliad is destitute of that kind of dignity, which a modern expects to find in a great

epic poem. The subject is merely the quarrel of two chieftains about a female slave. The priest of Apollo beseeches Agamemnon to restore his daughter, who, in the plunder of a city, had fallen to Agamemnon's share of booty. Upon his refusal, Apollo, at the prayer of his priest, sends a plague into the Grecian camp. The augur, when consulted, declares, that Apollo cannot be appeased without restoring the daughter of his priest. Agamemnon is enraged at the augur; professes that he likes this slave better than his wife Clytemnestra; but as it was necessary to restore her in order to save the army, he insists upon having Briseis, the slave of Achilles, in her room. Achilles is enraged at this demand, reproaches him for his rapacity and insolence, and solemnly swears, that, in revenge for this treatment, he will withdraw his troops, and afford the Grecians no farther assistance against the Trojans. He accordingly withdraws. His mother, the goddess Thetis, interests Jupiter in his cause; who, for avenging the wrong which Achilles had suffered, takes part against the Greeks, and thus plunges them into deep distress; until at length Achilles is pacified, and he and Agamemnon are reconciled. Such is the basis of the whole action of the Iliad. (See ACTION.) In the days of Homer no subject could have been more happily chosen than that of the Iliad; which laid the foundation of the Trojan war. So great a confederacy as the Grecian states, under one leader, and the ten years' siege which they carried on against Troy, must have spread far abroad the renown of many military exploits, and interested all Greece in the traditions concerning the heroes who had most eminently glorified themselves. Upon these traditions Homer, who is supposed to have lived two or three centuries after the Trojan war, grounded his poem; and the interval of time that elapsed between the war and the period of his describing it, left him at full liberty to blend fable with the records of true history. The subject of his choice was only that part of the Trojan war which comprehends the quarrel betwixt Achilles and Agamemnon, and the events resulting from that quarrel. These, though they included merely an interval of 47 days, yet occupy the most interesting and most critical period of the war. By this management he has given greater unity to what otherwise would have been an unconnected history of battles. He has also gained one hero, or principal character, viz. Achilles, who reigns throughout the work; and he has shewn the pernicious effects of discord among confederated princes. The praise of high invention has in every age been justly allowed to Homer; and this invention is signally displayed in the prodigious number of incidents, of characters, divine and human, with which his poem abounds; the surprising variety with which he has diversified his battles, in the wounds and death, and little history pieces, of almost all the persons slain. His judgment is also no less conspicuous than his invention. His story is uniformly conducted with great art. He rises upon us gradually; his heroes appear, in succession, as objects of our attention: the distress thickens as the poem advances; and every thing is so contrived as to aggrandize Achilles, and to render him, agreeably to the intention of the poet, the capital figure. Homer, however, is principally distinguished, above all other writers, in the characteristical part. His exhibition of characters is rendered lively and spirited by his dramatic mode of writing, or by his continually recurring to dialogue and conversation. As this is the most simple and artless, it is evidently the most ancient. See a specimen of it in Gen. xlii. 7—15. To the speeches of Homer, which are upon the whole characteristic and lively, we owe, in a great measure, the admirable display which he has given of human nature. Every

one who reads him, becomes familiarly and intimately acquainted with his heroes. We seem to have lived among them and conversed with them. His art in painting characters is eminently displayed in those of Helen and Paris. As for his character of Achilles; see *ACHILLES*. The gods also made a great figure in the Iliad; inasmuch that Homer has become the standard of poetic theology. By the intervention of his gods, he has greatly diversified his battles; and by frequently shifting the scene from earth to heaven, the mind is agreeably relieved in the midst of so much blood and slaughter. It has, however, been objected to Homer, that his gods want dignity; but in apology for him, it should be remembered, that, according to the fables of those days, the gods are but one remove above the condition of men, and possess all the human passions. Nevertheless, though Homer frequently degrades his divinities, he knows how to make them appear, in some conjunctures, with the most awful majesty. Jupiter, the father of gods and men, is, for the most part, introduced with great dignity, and several of the most sublime conceptions in the Iliad are founded on the appearances of Neptune, Minerva, and Apollo, on great occasions. As to Homer's style and manner of writing, it is easy, natural, and in the highest degree animated. In his style he is the most simple of all the great poets, and in this respect it resembles most that of the poetical parts of the Old Testament. Of the simplicity of his style, we can form no adequate idea in the midst of the elegance and luxuriance of the language of Mr. Pope's translation, however excellent that translation may be deemed as a poetical performance. In the midst, however, of that plainness of diction for which Homer is distinguished, there are every where breaking forth upon us flashes of native fire, of sublimity and beauty, which hardly any language but his own could preserve. His versification has been universally acknowledged to be uncommonly melodious; and to carry, beyond that of any poet, a resemblance in the sound to the sense and meaning. In narration, continues Dr. Blair, Homer is, at all times, remarkably concise, which renders him lively and agreeable: though in some of his speeches he is tedious. He is every where descriptive, and descriptive by means of those well chosen particulars, which form the excellency of description. Virgil gives us the nod of Jupiter with great magnificence:

“Annuit; et totum nutu tremescit Olympum.”

But Homer, in describing the same thing, gives us the fable eye-brows of Jupiter bent, and his ambrosial curls shaken, at the moment when he gives the nod; and thereby renders the figure more natural and lively. In drawing our attention to any interesting object, he paints it in a manner to our sight. The shot of Pandarus' arrow, which broke the truce between the two armies, as related in the 4th book, may be given for an instance, and, above all, the admirable interview of Hector with Andromache in the 6th book, where all the circumstances of conjugal and parental tenderness; the child affrighted with his father's helmet and crest, and clinging to the nurse; Hector pulling off his helmet, taking the child into his arms, and offering up a prayer for him to the gods; Andromache receiving back the child with a smile of pleasure, and at the same instant bursting into tears, *καρπὸν γάλακτος*, as it is finely expressed in the original, form the most natural and pleasing picture that can possibly be imagined. Homer, it is observed, particularly excels in battles. In describing these, his genius is most highly displayed, inasmuch that Virgil's

gil's battles, and indeed those of most other poets, are cold and unanimated in comparison of those of Homer. No poet abounds so much with similes. Several of these are extremely beautiful: such as those, of the fires in the Trojan camp compared to the moon and stars by night; Paris going forth to battle, to the war-horse prancing to the river; and Euphorbus slain, to the flowering shrub cut down by a sudden blait; all which are among the finest poetical passages that are any where to be found. His comparisons, however, are not reckoned among his greatest beauties, for several reasons suggested by Dr. Blair. See Lectures, vol. iii. p. 247. For the conduct of the Iliad, see father Bossu, Madam Dacier, and M. De la Motte.

The Iliad is divided into twenty-four books, which are marked with the letters of the alphabet. Pliny gives us an account of an Iliad written on so very slender a paper, that the whole might be contained in a nut-shell.

The ingenious Mr. Barnes, of Cambridge, has very strenuously attempted to prove Solomon to have been the author of the Iliad.

The English translation of the Iliad by Mr. Pope is well known. This translation, though faithful in the main to the original, and though thought by some to have occasionally improved even Homer, is nevertheless no other than Homer modernized. There is, as Dr. Blair observes, no author to whom it is more difficult to do justice in a translation than Homer.

ILIGATANGAN, in *Geography*, one of the small Philippine islands, N. W. of Leyta. N. lat. $11^{\circ} 24'$. E. long. 124° .

ILIGNO BAY, a bay on the S. W. coast of the island of Mindanao. N. lat. $7^{\circ} 30'$. E. long. 20° .

ILIOS, in *Anatomy*, a name given to one of the divisions of the os innominatum. See EXTREMITIES.

ILIJA, in *Geography*, a town of Asiatic Turkey, in the province of Diarbekir, situated on the Euphrates; 60 miles W. of Diarbekir.

ILIM, a river of Russia, which rises in N. lat. $54^{\circ} 20'$, and runs into the Angara, near Samakina, N. lat. $57^{\circ} 25'$, E. long. $102^{\circ} 2'$.

ILIMSK, a town of Russia, on the Ilim, in the government of Irkutsk, in the environs of which are found the most beautiful black fables; 152 miles N. of Irkutsk. N. lat. $56^{\circ} 30'$. E. long. $103^{\circ} 56'$.

ILINSKA, a town of Russia, in the government of Irkutsk, on the Lena; 56 miles N. E. of Kirensk.

ILINSKOI, a town of Russia, in the government of Tobolsk; 8 miles N. of Atchinsk. — Also, a town of Russia, in the government of Tver; 32 miles E. N. E. of Tver. — Also, a town of Russia, in the government of Olonetz; 8 miles N. of Olgikoi. — Also, a town of Russia, in the government of Novgorod, on the river Sula, opposite to Tcherepovetz.

ILION, a town of Thibet; 25 miles W. N. W. of Haratoube.

ILION, or ILIUM, in *Ancient Geography*. See TROY.

ILIPA, ALCOLEA, a town of Spain in Bætica, N. of Hispalis, upon the right bank of the Bætis. Strabo relates, that the environs of this town had mines of silver. Its medals bear the head of a female, supposed to be Ceres, with emblems of abundance.

ILIPPE, in *Botany*. See BASSIA.

ILIPULA, NIEBLA, in *Ancient Geography*, a town of Spain, in Bætica, W. of Tucci. Livy calls it *Ilipa*, but Ptolemy and M. D'Anville name it *Ilipula*.

ILIS, in *Geography*, a town of South America, in the province of Popayan; 20 miles S. of Pasto.

ILISSIDES, in *Mythology*, a surname of the Muses, from the river Ilissus in Attica, the waters of which were reckoned sacred.

ILISSUS, in *Ancient Geography*, a town of Attica, called by Pliny "locus Ilissos." — Also, a small river of Attica, on the route from Athens to Cyno-Sarges, which had to the west a small river called Eridanus. This river was consecrated to the Muses and other divinities.

ILITA, in *Hindoo Mythology*, a name of Parvati, consort of Siva; similar, perhaps, to *Idita*, which see.

ILITHYA, derived from *ἐπιβύω*, to spring from, in *Mythology*, the daughter of Jueo, and sister of Hebe, who presided over deliveries. This goddess had a temple at Rome, in which were registered the birth and death of every citizen; a custom established by Servius Tullius.

ILIVILIHU, in *Natural History*, a name given by the inhabitants of the Philippine islands to a very remarkable species of birds, common in that country. It is called by some writers *coturnix parvula montana*, the small mountain quail, and it is indeed a quail in all the characters; but it is very beautifully variegated in its colours, and is smaller than a sparrow. It lives in hilly places, and is a very well tasted bird. See QUAIL.

ILIUM OS, *FraSures of*, in *Surgery*. See FRACTURE.

ILL, L', in *Geography*, a river of France, which rises in the department of the Upper Rhine, near Fernette, and runs into the Rhine near Strasburg; navigable for boats from Schlettstat.

ILLA, in *Botany*. See CALLICARPA.

ILLAHABAD, in *Geography*, a town of Hindoostan, in the circar of Mahur; 35 miles N. of Neermul.

ILLAHON, a town of Egypt; 12 miles S. E. of Fayoum.

ILLAMBAZAR, a town of Hindoostan, in Bengal; 25 miles S. S. E. of Nagore.

ILLE, a town of France, in the department of the Eastern Pyrenees, on the Teck, containing about 2000 inhabitants; 12 miles W. of Perpignan.

ILLE, a river of France, which rises near Dingé, in the department of the Ille and Vilaine, and joins the Vilaine near Rennes.

ILLE and VILAINE, a department of the north-west region of France, bounded on the N. by the English channel, and the department of the Channel, on the E. by the department of the Mayenne, on the S. by the Lower Loire, and on the W. by the departments of the Morbihan and the North coast, about 60 miles in length from N. to S. and from 20 to 48 in breadth, from E. to W. It takes its name from the two rivers Ille and Vilaine, which unite together at Rennes, the capital of the department. This department contains 347 square leagues, and 488,605 inhabitants. It is divided into six districts, *viz.* St. Malo, including 101,089 inhabitants, Fougères, 76,577, Vitré, 74,885, Redon, 66,707, Montfort, 55,971, and Rennes, 113,376. The number of cantons is 43, and of communes 352. The contributions amount to 3,014,223 fr. and the expences charged upon it to 421,693 fr. 66 cent. This department, of a clayey soil and intersected by gentle eminences, is indifferently fertile, and badly cultivated; producing scanty crops of grain, flax, fruits, and good pastures on the borders of the rivers. The fertile marsh of Dol is reckoned the Delta of the territory. There are considerable forests, mines of iron and lead, quarries of stone, &c.

ILLECEBRA, in *Botany*. See SEDUM.

ILLECEBRUM, Illecebra of Pliny, pretty or enticing plants. Linn. Gen. n. 290. Reich. 313. Schreb. 407. Juss. 89.

ILLECEBRUM.

89. Sm. Fl. Brit. 267. (Corrigiola, Dill. Gen. 169. Moehr 106. Paronychia, Tournef. 281.) Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Holoracea*, Linn. *Amaranthi*, Juss.

Gen. Ch. Cal. Perianth five-leaved, cartilaginous, five-cornered; with coloured leaflets, which are sharp with diftant points, permanent. Cor. none. Stam. Filaments five, capillary, within the calyx. Anthers fimple. Pijl. Germen ovate, fharp, ending in a fhort bifid fstyle; ftigma fimple, obtufe. Peric. Capfule roundifh, acuminate, both ways five-valved, one-celled, covered by the calyx. Seed fingle, roundifh, fharp on both fides, very large.

Obf. The fruit in feveral fpecies is different.

Efl. Ch. Calyx five-leaved, cartilaginous. Corolla none. Stigma fimple. Capfule five-valved, one-feeded.

1. *I. brachiatum*. Linn. Syft. 247. Reich. 1. 580 (Achyranthes brachiata; Linn. Mant. 50.) "Stem upright, herbaceous, brachiata, leaves oppofite, even, annual." Native of the East Indies.

2. *I. fanguinolentum*. (Achyranthes fanguinolenta; Linn. Spec. 294. Verbena rubra; Rumph. Amb. 7. 60. t. 27. f. 2.) "Frutescent, leaves oppofite, fpiques compound, heaped." Perennial. Native of the East Indies.

3. *I. canarienfis*. Linn. Syft. 248. Suppl. 161 "Shrubby, leaves elliptic, acute, ftipules and bractes ovate, fhorter, panicles terminating, dichotomous." Found on the ifland of Teneriffe by Maffon.

4. *I. lanatum*. Linn. Syft. Reich. Ait. Hort. Kew. Lour. Cochinch. Vahl. Symb. (2. Achyranthes lanata; Linn. Spec. 295. Mill. fig. t. 11. f. 1. A. villofa; Forfk. Defcr. 48. n. 64. Chenopodium, Burm. Zeyl. t. 26. f. 1. Amaranthus, Pluk. Phyt. t. 75. f. 8. "Spikes fub-aggregate, fhorter than the leaf, branches long, rod-like." β . Great woolly illecebrum. "Spikes folitary, on fpreading branchlets." γ . with round leaves. Retz. Obf. 2. 13. n. 28. β . "Leaves ovate, fomewhat hairy, fpiques lateral, calyxes woolly." Native of the East Indies and Cochinchina.

5. *I. javanicum*. Linn. Syft. Reich. Ait. Hort. Kew. (Calofia lanata; Linn. Spec. 298. Syft. 247. Reich. 1. 579. Mill. Dict. n. 6. Irefine javanica; Burm. Ind. 212 t. 65. f. 2. Amaranthus albus; Pluk. Phyt. t. 10. f. 1.) "Leaves lanceolate, tomentofe, fpiques cylindrical, numerous, terminating." Native of the East Indies.

6. *I. verticillatum*. Whorled knot-grafs. Linn. Spec. Reich. Hort. Cliff. Hudf. Angl. Wither. Arr. Fl. Dan. Krock. Siles. (Corrigiola; Dill. Giff. 169. Raii Syn. 160. Paronychia ferpyllifolia paluftris; Vaill. Par. t. 15. f. 7. Tournef. par. ed. Angl. 2. 160. Polygonum ferp. verticill. Raii Syn. ed. 2. 160. Pet. Brit. t. 10. f. 7. Polygala repens; Ger 449. 1. Emac. 163. Park. Theat. 1333.—Nivea; Bauh. Pin 215. "Flowers in whorls, naked; ftems procumbent." Native of many parts of Europe in wet pafures; flowers in July and Auguft. This is the only British fpecies.

7. *I. fuffruticofum*. Shrubby I. or knot-grafs. Linn. Sp. 298. Reich. 1. 581. (Paronychia hispanica fruticofa, myrtifolia; Tourn. Inft. 508. Mill. Dict. v. 2. n. 4.) "Flowers lateral, folitary, ftems fuffruticofe." Native of the fouth of Europe. Flowers from May to Auguft.

8. *I. cymofum*. Linn. Sp. and Syft. Reich. Ger. Prov. 337. 3. (Polygonum capitulis ad genicula echinatis; Bocce Sic. 41. t. 20. f. 3. Raii Hift. 214.) "Spikes cymed, directed one way, item diffufed." Native of the fouth of France, the ifle of Elbe, and Portugal.

9. *I. ariftatum*. Ait. Hort. Kew. 1. 290. "Flowers fubfcafced, leaves lanceolate, filky, awned." Native of the Canary iflands. Flowers in June and July.

10. *I. Paronychia*. Mountain I. or knot-grafs. Linn. Sp. Reich. Ger. Prov. (I. ferpyllifolium; Villars. Dauph. 2.

558? an polygonifolium, ejufd. 557? Herniaria; Linn. Hort. Cliff. 41. Upt. 54. Polygonum minus candicans; Bauh. Pin. 281. P. montanum niveum; Park. Theat. 445. 1.) "Flowers fenced with fhining bractes, ftems procumbent, leaves even." Native of the fouth of Europe. Flowers in July and Auguft.

11. *I. divaricatum*. Forked I. Ait. Hort. Kew. 1. 291. "Flowers bracted, fubfcafced, peduncles dichotomous, panicled, leaves ovate-oblong, petioled." Native of the Canary iflands. Flowers in July and Auguft.

12. *I. capitatum*. Linn. Reich. Villars. Ger. Prov. (Herniaria erecta; Sauv. Monfp. 129. Paronychia narbonenfis erecta; Tournef. Inft. 508. Polygonum minus candicans, &c. Magn. Monfp. P. montan. niv. minimum; Lob. Ic. 420.) "Flowers with fhining bractes, hiding terminating heads, ftems fomewhat erect, leaves ciliate, villofe underneath." Native of Provence, Spain, and the Levant.

13. *I. benghalenfis*. Linn. Reich. "Stem upright, herbaceous, leaves alternate and oppofite, lanceolate, pubefcent." Native of Bengal, Java, &c. in the East Indies.

14. *I. arabicum*. Linn. Reich. (Corrigiola albella; Forfk. Defcr. 207. n. 31.) "Flowers fcattered, heaped, bractes fhining, equalling them, ftems procumbent." Found in Arabia by Forfkhal.

15. *I. achyrantha*. Linn. Reich. (Achyranthes repens; Linn. Sp. ed. 1. Achyranthes repens, fol. Bliti pallidi; Dill. Elch. 8. t. 7. f. 7.) "Stems creeping, hairy, leaves ovate, mucronate; one oppofite, fmaller, heads fubglo-bular, fomewhat fpiny. Native of Buenos Ayres.

16. *I. polygonoides*. Linn. Reich. (Gomphrena polygonoides; Linn. Sp. ed. 1. Herniaria; Brown. Jam. Amaranthoides; Herm. Parad. Sloan. Jam. Raii Suppl. Amaranthoides; Plum. Ic. 94. t. 21. f. 2. "Stems creeping, rough-haired, leaves broad-lanceolate, petioled, heads orbiculate, naked." Native of America on fea-fhores.

17. *I. ficoideum*. Linn. Reich. Jacq. Amer. Peft. 43. t. 90. (Gomphrena ficoidea; Linn. Syft. Jacq. Amer. Amaranthoides marina, &c. Plum. Sp.) "Stems creeping, fmooth, leaves broad, lanceolate, petioled, heads orbiculate, pubefcent." Native of America, on the coaft; now wild in Spain. A noxious weed in Martinico.

18. *I. feffile*. Linn. Reich. Vahl. Symb. Lour. Cochinch. (Gomphrena feffilis; Linn. Sp. ed. 1. Alternanthera; Forfk. Defcr. 28. Amaranthus humilis; Burm. Zeyl. Amaranthoides humile; Pluk. Phyt. Olus Squillarum; Rumph. Amb. 6. 37. t. 15. f. 1. Coluppa; Rheed. Mal. 10. 21. t. 9.) "Stems creeping, bifarioufly tomentofe, leaves lanceolate, fubfeffile, heads oblong, fmooth." Native of the East Indies, and in wet places about Canton in China. Flowers from July to October.

19. *I. vermiculatum*. Linn. Reich. (Gomphrena vermicularis; Linn. Sp. Brown. Jam. Caraxeron humile; Vaill. Act. Per. 1722. Amaranthoides humile, &c. Herm. Parad. t. 15. Amarantho affinis, &c. Brey. Prodr. 2. Trifolii fpicum crithmum marinum non fpinofum braffilienfe; Raii Hift. 1331.) "Stems creeping, fmooth, leaves fubcylindric, flefhy, heads oblong, fmooth, terminating." Native of Brazil and Curagoa; Jamaica, and the fandy fhores of South America.

20. *I. alfin-folium*. Linn. Reich. Paronychia hispanica fupina alfinifolia, capitulis minoribus; Tournef. Inft. 508. "Stems diffufed, leaves ovate, flowers heaped, bractes fhining." Native of Spain.

21. *I. frutescens*. L'Herit. Stirp. Nov. 4. 75. t. 37. "Stem fhrubby, diffufed, dichotomous, leaves oppofite, mealy." Flowers and ripens its feeds in fummer. The East

India;

Indian I. *Monsonia* has elegant spikes of reddish flowers. The whole genus requires revision, and a comparison with *Herniaria*, *Celosia*, &c.

The 7th, 8th, 10th, and 12th species, which are natives of the south of Europe, may be propagated by seeds on a bed of light earth in the beginning of April. When the plants are come up, they should be transplanted either into pots, or a warm dry border, watering and shading them, till they have taken new root. In an ordinary winter they will live in England in the open air. Those that are in pots should, in severe winters be placed in a common frame, so as to enjoy the open air in mild weather, and be screened from frost. They may be also increased by cuttings, which, taken off in May or June, and planted in a shady border, will in two months put out roots; in moist weather they may be transplanted, and treated as the old plants. The rest, 4, &c, being natives of the East and West Indies, and other hot climates, are tender and will not thrive in the open air in England; their seeds must therefore be sown on a hot-bed in spring; and afterwards, if they are plunged into the tan-bed in the stove, their branches will put out roots, by which they may be propagated in plenty.

ILLEGITIMATE BIRTH, or *Delivery*, in *Law*. See DELIVERY, and ABORTION.

ILLENAS, Los, in *Geography*, a town of the island of Hispaniola; seven miles N. of St. Domingo.

ILLESEAS, a town of Spain, in New Castile, situated about midway in the road from Toledo to Madrid; containing two parishes and three convents; 15 miles S.S.W. of Madrid.

ILLEVIABLE, in *Law*, a debt or duty which cannot, or ought not, to be levied.

The word *nihil* is usually set on a debt, or due, that is illeivable.

ILLIBERIS, in *Ancient Geography*, since called *Helena*, a town of Gaul, at the foot of the Pyrenées, upon the sea-coast towards the east; now *Elne*.

ILLICI, or ILLICE, a town of Spain, in the Tarragonensis, upon the gulf called "Illicitanus Sinus."

ILLICIUM, *ab illiciendo*, in *Botany*, denoting an *enticing* plant, from its being very fragrant and aromatic. Linn. Gen. n. 611. Reich. 746. Schreb. 940. Mant. 167. Ellis in Phil. Transf. for 1770. Gærtn. t. 69. Juss. 280. Class and order, *Polyandria Polygynia*. Nat. Ord. *Coalbumata*, *Magnoliæ*, Juss.

Gen. Ch. Cal. Perianth six-leaved, deciduous, the three inferior leaflets oval; the three superior alternate ones narrower and resembling petals. Cor. Petals many (27), disposed in a triple series; the nine inferior obtuse, concave, the nine middle shorter and narrower; the interior nine still shorter and narrower. Stam. Filaments very many (30), short, depressed; anthers upright, oblong, obtuse, emarginate. Pist. Germens very many (20), disposed in a circle, ending in very short spreading styles; stigmas at the upper side of the style, oblong. Peric. Capsules several (commonly eight, Loureir.), ovate, compressed, hard, spreading into a circle, bivalve, (one-valved, L. opening at the upper edge, G.) Seed solitary, ovate, rather compressed, glossy.

Ess. Ch. Calyx six-leaved. Petals 27. Capsules several, disposed in a circle, bivalve, one-seeded.

1. I. *anisatum*, yellow-flowered aniseed-tree. Linn. Sp. 664. Sytt. 507. Reich. 2. 624. Gærtn. Fruct. 1. 338. Lour. Cochinch. 353. Thunb. Jap. 235. Berg. Mat. Med. 514. (Zingi fructus stellatus f. Anisum Indicum; Bauh. Hist. 1. 485. Somo vulgo skimmi; Kæmpf. Amæn. 680. t. 881.) "Flowers yellow." This plant is stomachic and carminative, and is used in the Eastern countries in the colic, rheumatism, &c. In China it is used for seasoning

sweet dishes. In Japan they place bundles and garlands of the aniseed-tree in their temples before their idols, and on the tombs of their friends. They also use the powdered bark as incense to their idols.

2. I. *floridanum*, red-flowered aniseed-tree. Linn. Reich. Ellis in Phil. Transf. 1770, vol. 60. p. 524. Gærtn. Fruct. 1. 339. Hortus Kewenf. 2. p. 250. "Flowers red." Native of Florida.

The aniseed-tree may be propagated by seeds, if they can be procured; or by laying down the young branches; or by cuttings which strike freely. It requires the same treatment as *Gardenia*; which see.

ILLIERS, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Chartres; 12 miles S.W. of Chartres. The place contains 2617 inhabitants, in 9383 cantons, on 232½ kilometres and 20 communes.

ILLIMANI, a mountain of Peru, near La Paz, supposed to contain immense quantities of gold.

ILLINITIONS, in *Geology*, is used by Mr. Kirwan (*Geolog. Essays*, p. 152.) to denote the divided masses of argillaceous iron ore, thought by Buffon and others, without sufficient reason, to owe their origin to decayed vegetables.

ILLINOIS, in *Geography*, a lake of North America, about 20 miles long and five broad in the middle. The inhabitants of the adjacent country are called Illinois Indians. The number of warriors is about 260. N. lat. 40° 35'. W. long. 89° 18'.

ILLINOIS, or *Illini*, a river which rises from the lake Illinois, and runs into the Mississippi, N. lat. 38° 40'. W. long. 92° 12'. The lands on the banks of the Illinois, particularly on the S.E. side, are perhaps as fertile as any part of N. America. They produce, in the most luxuriant plenty, wheat, rye, Indian corn, peas, beans, flax, hemp, tobacco, hops, grapes, apples, pears, peaches, dyeing roots, medicinal plants, &c. Here also are found large forests of hiccory, oak, cedar, mulberry trees, &c. Savannas, or natural meadows, are both numerous and extensive. On the N.W. side of this river are a coal mine, half a mile in extent, and two salt ponds, 100 yards in circumference, and several feet in depth. The Illinois furnishes a communication with lake Michigan, by Chiago river, between which and the Illinois are two portages not exceeding in length four miles. The whole length of the river from the source of Theakiki, which is at a short distance from the river St. Joseph, opposite to fort Joseph on the N., is 480 miles. The Indians have ceded to the United States, by the treaty of Greenville, in 1795, a tract of land 12 miles square, at or near the mouth of the Illinois, and also a tract 6 miles square, near the south end of Illinois lake. This lake is merely a dilatation of the river, and is situated about 240 miles below the source of Theakiki, and 43 below the salt-ponds.

ILLISIO, in *Surgery*, a bruise or contusion.

ILLITERATURE, in *Law*; if an illiterate man be to seal a deed, he is not bound to do it, if none be present to read it, if required: and reading a deed false will make it void. (2 Rep. 3. 11.) A man may plead *non est factum* to a deed read false; as when a release of an annuity was read to an illiterate person, as a release for the arrears only, &c. agreed to be released. (Moore, 148.) If there is a time limited for a person to seal a writing; in such case illiterature shall be no excuse; because he might provide a skilful man to intrust him; but when he is obliged to seal it upon request, &c. there he shall have convenient time to be intrusted. 2 Nelson's Abr. 946.

ILLITURGI, in *Geography*, a town of Spain, in Bœtica, situated

situated towards the N.E. upon the Bætis—Alfo, a town of Hispania Tarragonensis, on this side of the Ebrus.

ILLOK, a town of Sclavonia, situated on the Danube; 16 miles W. of Peterwaradin. N. lat. $45^{\circ} 23'$. E. long. $18^{\circ} 8'$.

ILLORA, a town of Spain, in the province of Grenada; 16 miles N. of Loja.

ILLOSIS, from *illud*, to turn round, in Surgery, a distortion of the eyes.

ILLUMINATION, in a general sense, denotes the act of a luminous body, or a body that emits light; sometimes, also, the state of an opaque body that receives it.

ILLUMINATION, *Circle of*. See CIRCLE.

ILLUMINATIVE *lunar month*. See MONTH.

ILLUMINATORS, artists whose province it was, by a kind of miniature painting, to embellish books with ornamented letters and small paintings. The practice is of great antiquity.

ILLUMINED, ILLUMINATI, a Church term, anciently applied to such persons as had received baptism.

This name was occasioned by a ceremony in the baptism of adults: which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, ILLUMINATI, is also the name of a sect of heretics, who sprang up in Spain about the year 1575, and were called by the Spaniards, *Alambrados*.

Their principal doctrines were, that, by means of a sublime manner of prayer, which they had attained to, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, or good works: and that they could give way, even to the vilest actions, without sin.

The sect of the illumined was revived in France in the year 1634, and were soon after joined by the Guerinets, or disciples of Peter Guerin, who together made but one body, called also illumined: but they were so hotly pursued by Louis XIII. that they were soon destroyed.

The brothers of the Rosy Cross are sometimes also called illumined. See ROSYCRUCIAN.

ILLUSTRIOUS, ILLUSTRIS, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was first given to the most distinguished among the knights who had a right to bear the *latus clavus*: afterwards, those were entitled illustrious who held the first rank among those called *honorati*; that is, the *præfecti prætorii*, *præfecti urbis*, treasurers, comites, &c.

There were, however, different degrees among the illustres: as in Spain, they have grandees of the first and second class, so in Rome they had their illustres, whom they called great, *majores*; and others less, called *illustres minores*. For instance, the *præfectus prætorii* was a degree below the master of the offices, though they were both illustres.

The novels of Valentinian distinguish as far as five kinds of illustres; among whom, the *Illustres administratores* bear the first rank.

ILLYRIA, ILLYRICUM, or ILLYRIS, in *Ancient Geography*, a country of Europe, the boundaries of which have not been precisely ascertained. It was wholly contained between the rivers Naro or Narenta and Drilo. Some authors, among whom we may reckon Pliny and Ptolemy, extend the limits of this country so as to include Liburnia and Dalmatia, which see respectively. M. D'Anville has assigned to Illyricum the whole country which lies between Istria and the small river Arsia, as far as the mouth of the Drilo; but he observes, that the Illyric nations extend much farther. The rivers of Illyricum are the Arsia, forming the boundary of Italy, Oeneus, Tedanius, Titur, Naro, and Drinus or Drilo. The mountains form an elevated and

extensive chain, separating Illyricum from Pannonia. Part of this chain bears the name of Albius or Albanus Mons, and considered as a kind of continuation of the Carnic Alps, traverses Illyricum through its whole length from W. to E., as far as mount Scardus in Dardania. The sea coast is covered with a number of islands. It appears from an inscription of Gruter, that Illyricum was divided by Augustus into two provinces, the Superior and Inferior; but the situation of each is left doubtful by ancient historians and geographers. According to Ptolemy, the whole of Illyricum was divided into Liburnia and Dalmatia; and it was bounded on the N. by Pannonia, part of it having Istria on the west; on the E. by Mæsia Superior, and on the S. by Macedonia, and also on the coast by the Adriatic gulf. In the seas that washed the coasts of Liburnia and Dalmatia there were several islands, called the Illyric islands.

ILM, or STADT-ILM, in *Geography*, a town of Germany, in the county of Schwartzburg Rudolstadt, on the Ilm; 14 miles S. of Erfurt. N. lat. $50^{\circ} 46'$. E. long. $11^{\circ} 9'$.

ILMAWAY, a town on the W. coast of the island of Samar. N. lat. $11^{\circ} 39'$. E. long. $124^{\circ} 50'$.

ILMEN, a lake of Russia, in the government of Novogorod, on which stands the ancient city of this name, about 48 miles long, and from 12 to 18 wide.

ILMENAU, a town of Germany, in the county of Henneberg, on the side of the Elbe, near which are some mines of silver and copper; 10 miles E. of Schmalkalden.

ILMINSTER, a market town and parish in the hundred of Abdick, and county of Somersfet, England. It contained, in the year 1800, 366 houses, and 2045 inhabitants. This place appears to have been of some note in the time of the Saxons: for Ina, king of the West Saxons, gave the church and manor to the abbey of Michelney, in this county. To this monastery it continued annexed till the dissolution of religious houses in the time of king Henry VIII. This monarch granted it to Edward, earl of Hereford; but on this nobleman's attainder, in 1551, Ilminster reverted to the crown. It was afterwards granted to the Seymour family, and in 1793 belonged to John Hanning, esq. of Barington court. The church is a large handsome edifice, and was made prebendal in the time of king Richard I. Among other monuments it contains, is one to the memory of Nicholas and Dorothy Wadham, the founders of a college in Oxford, bearing their name. In this church were four chantries, respectively dedicated to St. Mary, St. Catharine, the Holy Cross, and St. John the Baptist. The town consists of two principal streets, one of which extends nearly a mile in length; and the other about half a mile. In the year 1491 a fire consumed several houses here. Previous to the Norman conquest this town was privileged with a market. Near the centre of the town is a commodious market-house, or town-hall; also a long range of shambles. The cloth manufacture formerly flourished here to a very great degree; and at present a considerable business prevails in the manufactory of narrow cloths. A free German school was founded here in the year 1550 by Humphrey Walron and Henry Greenfield. Since the first endowment the revenues have been greatly increased by subsequent benefactions. This parish is divided into five tithings, and comprehends eight hamlets. The market is held on Saturdays, and an annual fair is held the last Wednesday in August. Collinson's History, &c. of Somersetshire, vol. i.

ILMOLA, a town of Sweden, in the government of Wafa; 44 miles N.E. of Christianstad.

ILOCCOS, a province of the island of Luçon.

ILOMANTZ, a town of Sweden, in the government of Kuopio; 90 miles E. of Kuopio.

ILORCIS, in *Ancient Geography*, Lorca, a town of

Hither Spain, towards the west of Carthago Nova, called by Pliny "Monumentum Scipionis."

ILORI, in *Geography*, a town of Mingrelia, on the coast of the Black sea; 14 miles S.E. of Igaur. N. lat. 43° 8'. E. long. 40° 42'.

ILSBO, a town of Sweden, in the province of Helsingland; 9 miles N. of Hudwickfwall.

ILSLEY, EAST, or *Market Ilsey*, anciently *Huldesty*, or *Huldesty*, is a small market town in the hundred of Compton, Berkshire, England. It is 53 miles distant from London; and was returned to parliament in the year 1801, as containing 114 houses and 512 inhabitants. A weekly market is held on Wednesdays, and it has two fairs annually. But the town is principally noticed for its sheep market, which, next to that of the metropolis, is supposed to be the largest in England. It commences on Wednesday, in Easter week, and continues to be held every alternate Wednesday till Midsummer. This market of late years has become of the first importance; the annual average of sheep fold being upwards of 250,000, comprising lambs, tegs, wethers, and ewes. The principal purchasers are the farmers of Hertfordshire and Buckinghamshire, in which counties they are afterwards fattened for the London market. At Kates-Gore, in the parish of East Ilsey, were large stables, built by William, duke of Cumberland. Lysons's *Magna Britannia*, vol. i.

ILST, or YLST, a town of Holland, in the department of Friesland, defended by a ditch filled with waters by the river Weymer; 12 miles N.E. of Staveren.

ILSTORP, a town of Sweden, in West Gothland; 27 miles S.S.E. of Gotheborg.

ILTEN, a town of the principality of Luneberg; 16 miles S.S.W. of Zelle.

ILTERIB, a town of Syria, in the pachalic of Aleppo; 15 miles N.W. of Aleppo.

ILUA, in *Ancient Geography*, called also *Ætolia*, an island in the Mediterranean, on the coast of Etruria. See ELBA.

ILUCHANO, in *Geography*, a town of Russia, in the government of Upha; 32 miles S.S.E. of Menzelinsk.

ILUCIA, in *Ancient Geography*, a town of Hither Spain, belonging to the Oretani.

ILU-MULU, in *Botany*. See SPINIFEX.

ILUNUM, in *Ancient Geography*, a town of Spain, in the Tarragonensis, belonging to the Ballitani. Ptol.

ILURBIDA, a town of Spain, in the Tarragonensis, in the country of the Carpetani. Ptol.

ILWILTZKOLSTE, in *Geography*, a town of Sweden, in the province of Skonen; 10 miles S. of Christianstadt.

ILY, in *Botany*. See ARUNDO bambos.

ILYE, in *Geography*, a town of Transilvania, on the river Maros; 32 miles S.S.W. of Weisenburg.

ILZA, a town of Austrian Poland, in the palatinate of Sandomirz; 14 miles S. of Radom.

IMABARI, a town of Japan, on the N. coast of the island of Xicoco. N. lat. 34° 10'. E. long. 134° 20'.

IMAGE, IMAGO, in *Optics*, a natural, lively representation of an object, opposed to a smooth, well-polished surface, or mirror.

The Latin word, *imago*, comes originally from the Greek *μιμνησκειν*, *imitari*, to imitate, or mimic.

IMAGE, taken more largely, denotes the spectre, or appearance, of an object; whether by reflection or refraction.

In all plane mirrors, the image is of the same magnitude as the object; and appears as far behind the mirror, as the object is before it.

In convex mirrors, the image appears less than the object; and farther distant from the centre of the convexity than from the point of reflection.

Mr. Molyneux gives the following rule for finding the diameter of an image, projected in the distinct base of a convex mirror; as the distance of the object from the mirror is to the distance from the image to the glass; so is the diameter of the object to the diameter of the image. See LENS, MIRROR, REFLECTION, and REFRACTION.

IMAGE is also used for the trace, or mark, which outward objects impress on the mind, by means of the organs of sense. See IDEA.

IMAGE also signifies an artificial representation performed by man; as in painting, sculpture, and the like. In which sense the word is now generally used in speaking of things holy, or imagined to be so.

The noble Romans preserved the images of their ancestors with a great deal of care and concern, and had them carried in procession at their funerals and triumphs: these were commonly made of wax, or wood; though sometimes of marble, or brass. They placed them in the vestibules of their houses; and they were to stay there, even if the house happened to be sold, it being accounted impious to displace them. Appius Claudius was the first who brought them into the temples, in the year of Rome 259, and he added inscriptions to them, shewing the origin of the persons represented, and their brave and virtuous achievements.

It was not, however, allowed for all who had the images of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to such as had honourably discharged themselves of their offices: for those who failed in this respect forfeited that privilege; and in case they had been guilty of any great crime, their images were broken to pieces.

The Jews absolutely condemn all images, and do not so much as suffer any statues or figures in their houses, much less in their synagogues, or places of worship.

The use and adoration of images are things that have been a long time controverted in the world.

It is plain from the practice of the primitive church, recorded by the earlier fathers, that Christians, for the first three centuries after Christ, and the greater part of the fourth, neither worshipped images nor used them in their worship. However, the greater part of the Popish divines maintain, that the use and worship of images were as ancient as the Christian religion itself: to prove this, they allege a decree, said to have been made in a council held by the apostles at Antioch, commanding the faithful, that they may not err about the object of their worship, to make images of Christ and worship them. (Baron. ad an. 102.) But no notice is taken of this decree till 700 years after the apostolic times after the dispute about images had commenced. The first instance that occurs in any credible author of images among Christians, is that recorded by Tertullian de Pudicit. c. 10. of certain cups, or chalices, as Bellarmine pretends, on which was represented the parable of the good shepherd carrying the lost sheep on his shoulders: but this instance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or chalices. Another instance is taken from Eusebius, Hist. Eccl. lib. vii. cap. 18. who says, that in his time, there were to be seen two brass statues in the city of Paneas, or Cæsarea Philippi; the one of a woman on her knees, with her arms stretched out, the other of a man over-against her, with his hands extended to receive her; these statues were said to be the images of our Saviour, and the woman whom he cured of an issue of blood. From the foot of the statue representing our Saviour, says the historian, sprung up an exotic plant, which, as soon as it grew to touch the border of his garment, was found to cure all sorts of dilemperers. Eusebius, however, vouches

none of these things: nay, he supposes that the woman who erected this statue of our Saviour was a Pagan, and ascribes it to a Pagan custom. Farther, Philostorgius, Eccl. Hist. lib. vii. c. 3. expressly says, that this statue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship brass or any other matter. The primitive Christians abstained from the worship of images, not, as the Papists pretend, from tenderness to heathen idolaters, but because they thought it unlawful in itself to make any images of the Deity. (Justin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Dei. lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symp. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arab. lib. vi. p. 202.) Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the second commandment, the arts of painting and engraving were rendered unlawful to a Christian, styling them evil and wicked arts. (Tert. de Idol. cap. 3. Clem. Alex. Admon. ad Gent. p. 41. Orig. contra Celsum, lib. vi. p. 182.) The use of images in churches, as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned, as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preserved by Jerome (tom. ii. ep. 6.), bears strong testimony against images, and may be considered as one of the first Iconoclasts. The custom of admitting pictures of saints and martyrs into the churches, for this was the first source of image worship, was rare in the latter end of the fourth century; but became common in the fifth: however, they were still considered only as ornaments; and, even in this view, they met with very considerable opposition. In the following century the custom of thus adorning churches became almost universal, both in the East and West. Petavius expressly says (De Incar. lib. xv. cap. 14.), that no statues were yet allowed in the churches; because they bore too near a resemblance to the idols of the Gentiles. Towards the close of the fourth or beginning of the fifth century, images, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the sixth and in the beginning of the seventh century, that images were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by pope Gregory the Great; as appears by two letters of his written in 601. From this time, to the beginning of the eighth century, there occurs no single instance of any worship given, or allowed to be given, to images, by any council or assembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; inasmuch, that in the year 726, when Leo published his famous edict, it had already spread into all the provinces subject to the empire. See the history of the opposition to them under **ICONOCLASTS**. See Bower's Hist. of the Popes, vol. iii. p. 202, &c.

The Lutherans condemn the Calvinists for breaking the images in the churches of the Catholics, looking on it as a kind of sacrilege; and yet they condemn the Romanists (who are professed image-worshippers) as idolaters: nor can these last keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among them. See **ICONOCLASTS**.

The Mahometans have a perfect aversion to images; which was what led them to destroy most of the beautiful monu-

ments of antiquity, both sacred and profane, at Constantinople.

The method of casting images, &c. among the Hindoos, is in the usual stile of simplicity, that, with the little variety of tools observed to be in use, has been so frequently remarked of eastern people. The following paragraph from the Hindoo Pantheon is descriptive of this process of Indian metallurgy. "The reason why an exact duplicate of an image is a proof of its not being of Hindoo workmanship, will appear in the description of their mode of casting in metals. First, the artist makes in wax the exact model, in every particular, of his intended subject, be it what it may, whether an image of a deity, or the hinge of a box: over this he plasters a covering of fine clay, well moistened and mixed, leaving an aperture at some part; when dry it is put on a fire, with the hole downwards, and the wax, of course, melts out. The platter is now a mould, and receives at the aperture the molten metal, giving it externally, when cool, the exact form of its own concavity; in other words, of its original waxen model. The plaster or crust, or mould, is now broken off, and the image (say) is produced sometimes sufficiently correct to require no after-polishing. The beautiful specimens of Hindoo mythology cast at Benares, under the superintendance of Mr. Wilkins and some Pandits, have never since received the least polish or filing; but are now seen at the India-house museum, exactly as they made their first appearance from the mould: from these classical subjects several of my plates have been engraved.

"That Hindoo casts have but little muscular expression, is not, perhaps, to be considered altogether as defective, or attributed to want of skill in the artists. The human subject with them is rounder and plumper, less marked by angles and muscles, than the harder and ruder persons of higher latitudes, who, of course, exhibit more "nerve and pith." The models from which Hindoo founders have borrowed their forms, partake more of the roundness of Apollo, than of the muscle of Hercules." Hin. Pan. p. 420.

IMAGE, in *Rhetoric*, also signifies a lively description of any thing in a discourse.

Images, in discourse, are defined, by Longinus, to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind.

But, in the more limited sense, he says, images are such discourses as come from us, when, by a kind of enthusiasm, or an extraordinary emotion of the soul, we seem to see the things whereof we speak, and present them before the eyes of those who hear us.

Images, in rhetoric, have a very different use from what they have among the poets: the end principally proposed in poetry is astonishment and surprize; whereas the thing chiefly aimed at in prose is to paint things naturally, and to shew them clearly. They have this, however, in common, that they both tend to move, each in its kind.

These images, or pictures, are of vast use, to give weight, magnificence, and strength to a discourse. They warm and animate it; and, when managed with art, according to Longinus, seem as it were to tame and subdue the hearer, and put him in the power of the speaker. See **HYPOTYPOSIS**.

IMAGINARY QUANTITIES, or *Impossible Quantities*, in *Algebra*, are certain expressions that arise in various algebraical and trigonometrical operations, to which no value, either rational or irrational, can be assigned, yet being substituted in the equations whence they were deduced, are found to answer the condition of the question. These expressions arise in the extraction of the even roots of a negative quantity, and may be all reduced to one of the forms $a\sqrt{-1}$,

IMAGINARY QUANTITIES.

or $b + a\sqrt{-1}$; a part only of this latter form being imaginary, but this, when taken collectively with the other part, renders the whole expression, like itself, imaginary. Whenever a quantity of this kind arises in the solution of a problem, it indicates that there are some conditions supposed that are impossible, and hence it may be said, that an imaginary expression is a sign of impossibility. Thus, for example, let there be proposed the two equations $x + y$

$= 10$, and $xy = 26$, to find x and y . First, $x = \frac{26}{y}$, there-

fore $\frac{26}{y} + y = 10$, or $y^2 - 10y = -26$; whence is ob-

tained $y = 5 \pm \sqrt{-1}$, which is an imaginary expression; and hence we conclude, that the two conditions in the problem proposed were inconsistent with each other; that is, the product of no two quantities, whose sum is equal 10, can be equal to 26; or 10 cannot be divided in two parts, such that their product shall be equal to 26. But if we substitute this value of y in the equation $y^2 - 10y = -26$, it will be found to answer the conditions required.

The first notice that is taken of imaginary expressions, or of the square root of negative quantities, is found in Cardan's algebra, who was most probably first led to the consideration of them, from the solutions of those cubic equations, which are now termed irreducible, and in which such expressions always arise, the roots of them being of the form $x = \sqrt[3]{b + a\sqrt{-1}} + \sqrt[3]{b - a\sqrt{-1}}$, each of which parts are imaginary; and thus it is, that some compensation takes place, and the root, though expressed in such terms, that no value can be given to either, is notwithstanding equal to a real quantity; this very singular circumstance, as soon as it was observed by Cardan, would no doubt lead him to an investigation of this species of quantity, but neither he, nor any other author, has yet been able to unravel the mysteries that these symbols involve, nor has any subject of mathematical enquiry led to more angry disputes: some asserting that such expressions as the mind can form no conception of, or at least of what they are intended to represent, ought not to be introduced into a science, the excellence of which consists in the rigour and evidence of its demonstrations, and that results thus obtained are unworthy of notice. On the other hand, it has been contended, that in all cases where the results thus deduced have been compared with those arising from the strictest geometrical investigations, they have always been found perfectly to agree; and that the symbol $\sqrt{-1}$, although we can form no idea of what it represents, yet that being subjected to the same rules as other analytical symbols, the results derived from its introduction, are equally certain and conclusive: while others, taking a mean between these extremes, admit, that though, from analogy, there is no reason to doubt the truths obtained by means of these imaginary symbols, yet that it always adds a degree of conviction, when the results are verified by a more rigid analysis, and consequently that they ought not to be employed when other means are equally successful. Baron Masères is decidedly of the first of these opinions, on which subject he has a work, entitled "A Dissertation on the Use of the negative Sign in Algebra;" in which is demonstrated the nature of those signs, and the rules that are commonly given for working with them, and where he has also shewn, that equations of the second and third degree may be effected without this introduction, or at least without the consideration of negative roots. Mr. Woodhouse's opinion on this

subject may be seen in his "Analytical Calculations;" and a very ingenious paper on the same head is inserted in the "Philosophical Transactions" for 1778, by professor Playfair of Edinburgh, who has there given us several examples in which these imaginary expressions may be introduced to advantage into trigonometrical and other species of calculation.

Of the Algorithm of Imaginary Quantities.—After what has been said of the various opinions entertained by different able mathematicians on this subject, it will not be surprising to find that the algorithm of these quantities has also been unsettled, such as the rules for multiplication, division, and involution; some authors making the results in these operations different from others, and each assigning reasons for the rules he has given; it will, however, be useless to follow them through their particular arguments, as there are some of them specious, and many of them fallacious; we shall therefore barely state those reasons on which the rules now commonly adopted are founded. It is an established principle in algebra, that $+a \times +a = a^2$, and $-a \times -a = a^2$; and hence, conversely, it follows, that $\sqrt{a^2} = +a$, or $-a$; but this ambiguity has no place, if we know how a^2 was generated, and have occasion to retrace the steps of our operation; that is, we cannot say that $\sqrt{-a \times -a} = \pm a$; nor that $\sqrt{+a \times +a} = \pm a$; but the square root of a^2 , in both these cases, is determined; that is, when considered with regard to its generation it has only one root; whereas, had its origin not been known, we must have given the ambiguous sign to the root a , and for this obvious reason, that we know not when a is unconditionally assumed, whether it be the representative of $(+a)$, or $(-a)$; these being both expressed by the same symbol a . The restriction of which we have been speaking, sometimes takes place in equations; thus, for example, suppose it were required to find the value of x in the equation $\sqrt{12 + x} = 6 + \sqrt{x}$; we soon find $x = 4$; but there is this limitation, that the square root of x , or of 4, must necessarily be -2 , and not $+2$; as the latter supposition will not answer the conditions of the equation; and the reason is obvious, namely, that we first found $\sqrt{x} = -2$; and then $x = 4$; but now, in re-tracing our steps, we must remember how this 4 was generated, and that it has not two roots, or has not the ambiguous sign belonging to it, as the square root of 4 would have if unconditionally assumed; in fact, the ambiguity in the extraction of the square root arises only in those cases in which we are unacquainted with the generation of the quantity whose root is to be extracted; and here it must necessarily occur, because we have before agreed to represent both $(+a)$ and $(-a)$ by the same character a^2 .

If therefore it be required to find the product of $\sqrt{-1} \times \sqrt{-1}$, we see immediately that it is equal to $\sqrt{(-1)^2} = \sqrt{1}$; but under this limitation, that the root can only be expressed by -1 , and therefore this product may always be represented by -1 ; or by $-\sqrt{1}$; and it can never have any other form. If the product $\sqrt{-1} \times \sqrt{-1} \times \sqrt{-1}$ were required, this would on the same principles be represented by $-\sqrt{-1}$; and the fourth power of $\sqrt{-1}$ is equal to $+1$; but with this limitation, that the root of this quantity can only be -1 , and not ± 1 : hence then we have $(\sqrt{-1})^2 = -1$, $(\sqrt{-1})^3 = -\sqrt{-1}$ and $(\sqrt{-1})^4 = 1$, $(\sqrt{-1})^5 = \sqrt{-1}$; and consequently, the 6th power will be the same as the 2d; the 7th the same as the 3d; the 8th the same as the 4th, and so on.

And

IMAGINARY QUANTITIES.

And exactly the converse of these rules must be observed in division. These examples involve all the cases that can arise; for if the quantities to be multiplied or involved be $\sqrt{-a} \times \sqrt{-b}$, we have only to write these, $\sqrt{a} \cdot \sqrt{-1} \times \sqrt{b} \cdot \sqrt{-1} = -\sqrt{ab}$; and $(\sqrt{-a})^2 \times (\sqrt{-b})^2 = ab(\sqrt{-1})^2 = -ab$; this product may be put under a simpler form, $\sqrt{-a^2} \times \sqrt{-b^2} = a\sqrt{-1} \times b\sqrt{-1} = ab(\sqrt{-1})^2 = -ab$: this shews the necessity of always separating the quantities into such factors, that only -1 is found under the radical, for according to the common rules for the multiplication of surds, we should have $\sqrt{-a^2} \times \sqrt{-b^2} = \sqrt{-a^2 \times -b^2} = \sqrt{a^2 b^2} = ab$, which is a false result; but the error is explained from what is observed in the preceding paragraph; for we have no right in this case to assume $\sqrt{a^2 b^2} = ab$, because we know its generation, and that it arose from the product of two negative figs, and therefore its root must necessarily be $-ab$, and not $\pm ab$.

Having thus established rules for the multiplication, division, and involution of imaginary quantities, we shall give an example, on which a well known trigonometrical formula is deduced from an imaginary expression for the sine and cosine of an angle.

Let a be an arc of a circle, of which the radius is unity, and let e be the number that has unity for its hyperbolic logarithm; then the sine of the arc a , or $\text{fin. } a = \frac{e^a \sqrt{-1} - e^{-a} \sqrt{-1}}{2\sqrt{-1}}$; and $\text{cofin. } a = \frac{e^a \sqrt{-1} + e^{-a} \sqrt{-1}}{2}$, which exponential and imagi-

nary values of the sine and cosine are well known to geometers; and the investigation of them, according to the received arithmetic of impossible quantities, may be as follows.

Let $\text{fin. } a = z$, then $a = \frac{z}{\sqrt{1-z^2}}$. To bring this fluxion to such a form that its fluent may be found by logarithms, both numerator and denominator are to be multiplied by $\sqrt{-1}$, then $a = \sqrt{-1} \times \frac{z}{\sqrt{1-z^2}}$; and (by form 6 Harm. Men.) $a = \sqrt{-1} \times \log. \frac{z + \sqrt{(z^2-1)}}{\sqrt{-1}}$. Hence $\frac{a}{\sqrt{-1}}$, or $1 \times \frac{a}{\sqrt{-1}} = \log. \frac{z + \sqrt{(z^2-1)}}{\sqrt{-1}}$, and because 1 is the $\log. e$; $e^{\frac{a}{\sqrt{-1}}} = \frac{z + \sqrt{(z^2-1)}}{\sqrt{-1}}$; therefore, if both parts of the fractional index of e be multiplied by $\sqrt{-1}$, $e^{-a} \sqrt{-1} = \frac{z + \sqrt{(z^2-1)}}{\sqrt{-1}}$. Again, if the arc a be considered as negative, its sine becomes also negative, and therefore $-a = \sqrt{-1} \times \log. \frac{-z + \sqrt{(z^2-1)}}{\sqrt{-1}}$; or $-a \sqrt{-1} = -\log. \frac{-z + \sqrt{(z^2-1)}}{\sqrt{-1}}$; and $a \sqrt{-1} = \log. \frac{-z + \sqrt{(z^2-1)}}{\sqrt{-1}}$; whence also, $e^a \sqrt{-1} = \frac{-z + \sqrt{(z^2-1)}}{\sqrt{-1}}$. If from this equation the former be

taken away, there remains $-\frac{2z}{\sqrt{-1}} = e^a \sqrt{-1} - e^{-a} \sqrt{-1}$

$e^{-a} \sqrt{-1}$; whence dividing by $2\sqrt{-1}$, we have $z = \text{fin. } a = \frac{e^a \sqrt{-1} - e^{-a} \sqrt{-1}}{2\sqrt{-1}}$; and by adding together the equations, a value of the cosine may be found in the same imaginary terms which were assigned above. Now by means of these expressions, many theorems may be demonstrated; it may for example be shewn, that if a and b are any two arcs of a circle of which the radius is unity, then

$$\text{fin. } a + \text{cofin. } b = \frac{\text{fin. } a + b}{2} + \frac{\text{fin. } a - b}{2}$$

For $\text{fin. } a = \frac{e^a \sqrt{-1} - e^{-a} \sqrt{-1}}{2\sqrt{-1}}$; and $\text{cofin. } b = \frac{e^b \sqrt{-1} + e^{-b} \sqrt{-1}}{2}$, therefore $\text{fin. } a + \text{cofin. } b = \frac{e^{a+b} \sqrt{-1} - e^{-a-b} \sqrt{-1} + e^{a-b} \sqrt{-1} - e^{b-a} \sqrt{-1}}{4\sqrt{-1}} = \frac{\text{fin. } a + b}{2} + \frac{\text{fin. } a - b}{2}$; which is a well known formula, and it has been deduced by means of the imaginary expressions that we first found, and various other examples of a similar nature might here be given.

This example, with several others, all tending to shew the utility of these imaginary expressions, may be seen in the paper of Mr. Playfair before referred to, after which, and many ingenious remarks on this subject, the professor concludes his paper with the following observation: "Supported on so sure a foundation, the arithmetic of impossible quantities will always be found a useful instrument in the discovery of truth, and may be of service when a more rigid analysis can hardly be applied; for this reason many researches concerning it, which in themselves might be deemed absurd, are yet not destitute of utility: M. Bernoulli has found, for example, that if r be the radius of a circle, the circumference equal $\frac{4 \log. \sqrt{-1}}{\sqrt{-1}} \cdot r$; considered as a qua-

drature of the circle, this imaginary theorem is wholly insignificant, and would deservedly pass for an abuse of calculation; at the same time we learn from it, that if in any equation the quantity $\frac{\log. \sqrt{-1}}{\sqrt{-1}}$ enters, it may be made to disappear by the substitution of a circular arc."

We have said nothing in the foregoing paragraphs of a paper on the subject of imaginary quantities by M. Buëe, published in the Philosophical Transactions for 1806, in which the author endeavours to shew, that imaginary quantities are signs of perpendicularity, a notion peculiar to himself; but there are other parts of the essay that display very considerable ability and ingenuity, but of which our limits will not allow a particular description.

IMAGINARY Roots of an Equation, are those roots, or values of the unknown quantity in an equation, which contain some imaginary expression. Thus the roots of the equation $y^2 - 10y + 26$, are $5 \pm \sqrt{-1}$; and the three roots of the cubic equation $x^3 - 1 = 0$, are $x = \frac{-1 + \sqrt{-3}}{2}$; $\frac{-1 - \sqrt{-3}}{2}$; and 1 : of which the

latter is the only possible value of x , the two former being imaginary or impossible. Sometimes the root of an equation may be represented by imaginary expressions, when it is in fact equal to a real quantity, as is the case in the solution of cubic equations of the irreducible form, according to the method of Cardan. Albert Girard was the first author who treated

treated expressly on the imaginary roots of equations, and shewed that every equation has as many roots, either real or imaginary, as is denoted by the highest power of the index; see his "Inventions Nouvelles en l'Algebra." D'Alembert, in the Memoires of Berlin for 1746, first demonstrated, that every imaginary expression may be reduced to the form $a\sqrt{-1}$, or $b + a\sqrt{-1}$; and that the number of imaginary roots always enter in pairs, and consequently every equation of an odd dimension must have at least one real root, but an equation of an even degree may have all its roots impossible. Waring also, in his "Meditationes Algebraicæ," has treated largely on this head, see chapters 2 and 3 of that work; in which will be found many excellent observations on this subject, with rules for determining the number of imaginary or impossible roots in a given equation of any dimensions.

The rule given by sir I. Newton, in his Universal Arithmetic, for finding the number of impossible roots in an equation is as follows. Constitute a series of fractions, whose denominators are the series of natural numbers 1, 2, 3, 4, 5, &c. continued to the number representing the index or exponent of the highest power of the equation, and their numerators the same series of numbers, in the contrary order; and divide each of those fractions by that next before it, and place the resulting quotients over the intermediate terms of the equation; then under each of the intermediate terms; if its square, when multiplied by the fraction over it, be greater than the terms on each side of it, place the sign +; but if not, the sign -; and under the first and last term place the sign +; then will the equation have as many imaginary roots, as there are changes of the under written signs from + to -, and from - to +. Thus, for the equation $x^3 - 4x^2 + 4x - 6 = 0$, the series of fractions is $\frac{1}{1}, \frac{2}{2}, \frac{1}{3}$; and the second of these, divided by the first, gives $\frac{2}{1}$, or $\frac{1}{3}$; and the third, divided by the second, is also $\frac{1}{3}$; hence these fractions placed over the intermediate terms will stand thus,

$$\left\{ \begin{array}{cccc} & \frac{1}{3} & \frac{1}{3} & \\ x^3 & - 4x^2 & + 4x & - 6 \\ + & + & - & + \end{array} \right.$$

Now, because the square of the second term multiplied by its supercribed fraction is $\frac{16}{3}x^2$, which is greater than $4x^2$, the product of the two adjacent terms, therefore the sign + is set below the second term; and because the square of the third term multiplied by its corresponding fraction is $\frac{16}{3}x$, which is less than $24x$, the product of the terms on each side of it, therefore the sign - is placed under that term; also the sign + is set under the first and last terms. Hence the two changes of the sign, first from + to -, and then again from - to +, indicate that the given equation has two impossible roots.

When two or more of the terms are wanted together, under the place of the first of the different terms write the sign -, under the second the sign +, under the third the sign -, and so on, always varying the signs, except that under the last of the deficient terms, which must always be +, when the adjacent terms on both sides of the deficient terms have contrary signs; as in the equation

$$\begin{array}{cccccc} x^3 & + & a^2x^2 & + & 0x^3 & + & 0x^2 & + & 0x & + & b & = & 0 \\ + & + & - & + & - & + & - & + & - & + & & & \end{array}$$

which has four imaginary roots.

This rule, however, may sometimes fail of giving the true number of impossible roots, on account of the roots being more than there can be changes of the sign, but this seldom happens.

This rule is demonstrated by Maclaurin, who has also

given another of his own, which never fails; and the same has also been done by Mr. Campbell. See Philosophical Transactions, vols. 34 and 35.

IMAGINARY Root. See ROOT.

IMAGINATION, as it has been often defined, is a power or faculty of the soul, whereby it conceives and forms ideas of things, by means of impressions made on the fibres of the brain, by sensation. This power depends on the memory. Ideas enter into the mind by the senses; the memory retains them; and the imagination compounds them. Some writers have distinguished two sorts of imagination; the one, which consists in retaining the simple impression of objects, is called the *passive* imagination; the other arranges the images that are received, and combines them in a thousand ways, and is called the *active* imagination. The organs of our senses are composed of fibrillæ, or little fibres, which, at one end, terminate in the outward parts of the body and skin, and at the other in the middle of the brain. These fibres may be moved two ways; either beginning at that end which terminates in the brain, or at that which terminates without. Now the agitation of these fibres cannot be communicated to the brain, but the soul will be affected, and perceive something. If then the agitation begins where objects make their first impression, *viz.* on the external surface of the fibres of our nerves, and is communicated thence to the brain; the soul, in that case, judges that what she perceives is without, that is, she perceives an external object as present; but if only the anterior fibres be moved by the course of the animal spirits, or in some other manner, the soul then imagines, and judges, that what she perceives is not without, but within the brain; that is, she perceives an object as absent; and herein lies the difference between sensation and imagination.

The faculty of imagining, or imagination, only consists, according to the doctrine of Malebranche, in the power which the soul has of forming images of objects, by producing a change in the fibres of that part of the brain, which may be called the principal part, because it corresponds to all the parts of our body, and is the place where the soul (if it may be so said) immediately resides. It matters not which that part is, nor whether the opinion of Willis be true, who places the common sense in the two bodies, called *corpora striata*, and the imagination in the *corpus callosum*; or that of Fernellius, who places sensation in the pia mater that encompasses the substance of the brain; or that of Descartes, who places it in the pineal gland: it suffices that there is some such part.

Since then the imagination only consists in a power which the soul has of forming images of objects, by impressing them on the fibres of the brain, it follows that the larger and more distinct the vestigia or tracks of the animal spirits, which are the lines or strokes, as it were, of those images, are; the more strongly and distinctly the soul imagines those objects. Now as the breadth, depth, and cleanness of the strokes of a sculpture depend on the force wherewith the graver acts, and the obedience which the copper yields, so the depth and cleanness of the tracks of the imagination depend on the force of the animal spirits, and the constitution of the fibres of the brain; and it is that variety which is found in those two things, to which we owe almost all the vast difference which we observe in people's minds. On the one side are abundance and scarcity, briskness and slowness, largeness and smallness, of the animal spirits; and on the other hand, delicacy or grossness, humidity or dryness, stiffness or flexibility of the fibres of the brain; and lastly, a particular relation which the animal spirits may have with those fibres: from the various combinations of which things,

will

IMAGINATION.

will result a sufficiently great variety, to account for all the different characters which appear in the minds of men: and from the same principle flows that difference which is observed in the same person's mind, at different times, and under different circumstances, as in childhood, manhood, and old age, in sickness, health, &c.

It may here be observed, that the fibres of the brain are more agitated by the impression of objects than by the course of the animal spirits; and for this reason the soul is more affected with objects, which it perceives by sensation, and which it looks on as present, and capable of giving it pleasure or pain, than by those perceived by imagination, which it judges to be distant. And yet it sometimes happens, that in persons whose animal spirits are extremely agitated by fasting, waking, drinking, a fever, or some violent passion, these spirits move the inward fibres of the brain as forcibly as inward objects do; so that these persons perceive things by sensation, which they should only perceive by imagination; for imagination and sensation only differ from each other, as the greater from the less. (See *Malebranche, Recher. de la Verité, lib. ii.* See *MADNESS, DELIRIUM, PHRENSY, MELANCHOLY, &c.*)

Imagination or fancy, says the ingenious Mr. Harris, though as to its origin it may be subsequent to sense, yet is truly prior to it in dignity and use. It is this which retains the fleeting forms of things, when things themselves are gone, and all sensation is at an end. The difference between sense and imagination appears from hence; that we have an imagination of things that are gone and extinct, which cannot be made the objects of sensation. We have an easy command over the objects of our imagination; whereas our sensations are necessary, when their objects are present. Imagination is also distinguished from memory, as the former views some relic of sensation reposed within us, without thinking of its rise, or referring it to any sensible object, whereas memory views such relic, referring it at the same time to that sensible object, which in time past was its cause and original, and recollection is the road which leads to memory, through a series of ideas, however connected, whether rationally or casually. Besides, imagination may exhibit, after a manner, things that are to come: but memory is confined in the strictest manner to the past. *Hermes, p. 354, &c. ed. 2d.*

Conception is frequently used as synonymous with imagination. Thus Dr. Reid says (*Essays on the Intellectual Powers of Man, p. 397.*) that "imagination, in its most proper sense, signifies a lively conception of objects of sight. This is a talent of importance to poets and orators, and deserves a proper name, on account of its connection with their arts." He adds, that "imagination is distinguished from conception, as a part from a whole." Professor Stewart (in his *Elements of the Philosophy of the Human Mind, p. 135, 8vo.*) distinguishes between conception and imagination. The business of conception, according to this ingenious writer, is to present us with an exact transcript of what we have felt or perceived. But we have, moreover, a power of modifying our conceptions, by combining the parts of different ones together, so as to form new wholes of our own creation. Accordingly he employs the word imagination to express this power, which, in his opinion, is the proper sense of the word; if imagination be the power which gives birth to the productions of the poet and the painter. This is not a simple faculty of the mind. It presupposes abstraction, to separate from each other, qualities and circumstances which have been perceived in conjunction; and also judgment and taste to direct us in forming the combinations. The two powers of conception

and imagination, though distinct, are very nearly allied; and are frequently so blended, that it is difficult to say, to which of the two some particular operations of the mind are to be referred. There are also many general facts which hold equally with respect to both. Logicians in general have maintained, that conception, or imagination, often used as synonymous with it, is attended with no belief of the existence of its object. But this is a principle which professor Stewart has controverted. (See *CONCEPTION.*) Imagination, according to Dr. Hartley, is the faculty to which we ascribe the recurrence of ideas in a vivid manner, without regard to the order of past impressions. All ideas, he says, are the result either of new impressions, or of association with preceding ideas, though the connection cannot in every instance be immediately traced out. In that state of mind denominated a reverie, a person is more attentive to his own thoughts than to external impressions, and therefore more of his ideas are deducible from association, and fewer from external impressions. And as dreams are the imaginations or reveries of a sleeping man, these are deducible from impressions lately received, from the state of the body, and particularly of the stomach and brain, and also from association. See *DREAM.*

Every man, says Dr. Reid, is conscious of a succession of thoughts, which pass in his mind while he is awake, even when they are not excited by external objects; and this continued succession of thought has, by modern philosophers, been called the "imagination." It is often denominated the "train of ideas," and is made up of many other operations of mind, as well as conceptions or ideas. Memory, judgment, reasoning, passions, affections, and purposes; in a word, every operation of the mind, excepting those of sense, is exerted occasionally in this train of thought, and has its share as an ingredient; so that we must take the word idea in a very extensive sense, if we make the train of our thoughts to be only a train of ideas. These trains of thought in the mind are of two kinds: they are either such as flow spontaneously, like water from a fountain, without any exertion of a governing principle to arrange them, or they are regulated and directed by an active effort of the mind with some view and intention. These two kinds, however distinct in their nature, are for the most part mixed in persons awake and arrived at years of understanding; and they take their denomination from that which is most prevalent. It is to be observed, however, that a train of thought, which at first was studied and composed, may by habit present itself spontaneously. Those trains of thought that are spontaneous must be the first in the order of nature. When the work of the day is over, and a man lies down to relax his body and mind, he cannot cease from thinking, though he desires it. Something occurs to his fancy; that is followed by another thing; and so his thoughts are carried from one object to another, till sleep closes the scene. In this operation of the mind, it is not one faculty only that is employed. Though memory acts the most considerable part, other powers are exercised and directed to their proper objects. In reveries of this kind we judge and reason, form an opinion of persons and things, and pass sentence accordingly. Such trains of thought may be called *historical*. Others may be denominated *romantic*, in which the plot is formed by the creative power of fancy, without any regard to what did or will happen. In these also, the powers of judgment, taste, moral sentiment, as well as the passions and affections, come in and take a share in the execution. Mr. Addison, in the "*Spectator*," calls this play of the fancy "*castle-building*." The romantic scenes of fancy are most commonly the occupation of young minds,
net

IMAGINATION.

not yet so deeply engaged in life as to have their thoughts taken up by its real cares and business. In persons come to maturity, there is even in these spontaneous sallies of fancy some arrangement of thought. But how is this arrangement effected? It has all the marks of judgment and reason, yet it seems to go before judgment, and to spring forth spontaneously. It is highly probable, that whatever is regular and rational in a train of thought, which presents itself spontaneously to a man's fancy, without any study, is a copy of what had been before composed, by his own rational powers, or those of some other person. They are the result of habits previously acquired. In order to account for the regular arrangement of these operations of fancy that are in a great degree spontaneous, we need only recur to the natural powers of judgment and invention, the pleasure that always attends the exercise of those powers, the means we have of improving them by imitation of others, and the effect of practice and habits, without supposing any unaccountable attractions of ideas by which they arrange themselves. Besides the original powers which fancy possesses, which are very different in different persons, it has likewise more regular motions, to which it has been trained by a long course of discipline and exercise; and by which it may *extempore*, and without much effort, produce things that have a considerable degree of beauty, regularity, and design. Upon the whole we may observe, that every thing that is regular in that train of thought, which we call fancy or imagination, from the little designs and reveries of children, to the grandest productions of human genius, was originally the offspring of judgment or taste, applied with some effort greater or less. In order to account for this successive train of thought in the mind, a theory, which was suggested by Mr. Hobbs, has been more distinctly explained by Mr. Hume. That author thinks, that the train of thought in the mind is owing to a kind of attraction which ideas have for other ideas that bear certain relations to them. The relations which produce this attraction of ideas, he thinks, are these three only, *viz.* causation, contiguity in time or place, and similitude. These, according to this writer, are the only general principles that unite ideas. Dr. Reid very justly observes, that this enumeration of the relations of things is very inaccurate. Lord Kames, in his "Elements of Criticism," and Dr. Gerard in his "Essay on Genius," have given a much fuller and juster enumeration of the causes that influence our train of thinking. To these works we refer. After all, this attraction of ideas may be resolved into the power of habit. As far as it is in our power to give a direction to our thoughts, which it undoubtedly is in a great degree, they will be directed by the principles common to men, by our appetites, our passions, our affections, our reason, our conscience; and that the trains of thinking in our minds are chiefly governed by these, according as one or another prevails at the time, every man will find in his experience. We shall here subjoin two or three reflections of a more practical nature, and of higher importance. It must be allowed that our happiness or misery in life, that our improvement in any art or science we profess, and that our improvement in real virtue and goodness, depend in a very great degree on the train of thinking that occupies the mind both in our vacant and in our more serious hours. "As far, therefore, as the direction of our thoughts is in our power (and that it is so in a great measure cannot be doubted), it is of the utmost importance to give them that direction which is most subservient to those valuable purposes. The human imagination is an ample theatre, upon which every thing in human life, good or bad, great or mean, laudable or base, is acted. How happy is that

mind in which the light of real knowledge dispels the phantoms of superstition; in which the belief and reverence of a perfect all-governing mind casts out all fear, but the fear of acting wrong; in which serenity and cheerfulness, innocence, humanity, and candour, guard the imagination against the entrance of every unballowed intruder, and invite more amiable and worthier guests to dwell! There shall the Muses, the Graces, and the Virtues, fix their abode; for every thing that is great and worthy in human conduct must have been conceived in the imagination before it was brought in to act. And many great and good designs have been formed there, which, for want of power and opportunity, have proved abortive. The man, whose mind is occupied by these guests, must be wise; he must be good; and he must be happy." Reid's Essays on the Intellectual Powers of Man, Ess. iv.

IMAGINATION, *Pleasures of the*, are referred by Mr. Addison, in the sixth volume of the "Spectator," to three sources, *viz.* beauty, grandeur or *sublimity*, and *novelty*; which see respectively. These pleasures, as the author describes them, are such as arise from visible objects, either when we have them actually in view, or when we call up their ideas into our minds by paintings, statues, descriptions, or any the like occasion. These pleasures are not so gross as those of sense, nor so refined as those of the understanding. They are more conducive to health than those of the understanding, which are wrought out by dint of thinking, and attended with too violent a labour of the brain. Delightful scenes, whether in nature, painting, or poetry, have a kindly influence on the body as well as the mind, and not only serve to clear and brighten the imagination, but are able to disperse grief and melancholy, and to let the animal spirits in pleasing and agreeable motions. The Creator hath wonderfully displayed his benignity by endowing us with the powers of taste and imagination for participating such pleasures; and the additional embellishment and glory, which, for promoting our entertainment, the Author of nature hath poured forth upon his works, is one striking testimony, among many others, of benevolence and goodness. This thought, first suggested by Mr. Addison, Dr. Akenfide, in his "Poem on the Pleasures of the Imagination," has happily pursued:

"————— Not content
With every food of life to nourish man,
By kind illusions of the wandering sense,
Thou mak'st all nature, Beauty to his eye,
Or Music to his ear.——"

IMAGINATION, *Influence of, on the corporeal Frame*. The influence of this faculty of the mind upon the constitution and operations of the body has been the subject of some discussion from very early times. But it is remarkable, that while philosophers and physicians attributed to it a series of phenomena, which a more accurate investigation has shewn to arise from other causes; they at the same time overlooked, or rather ascribed to different sources, many other facts, which subsequent inquiry has proved to originate from the influence of the imagination. The principal operation of this faculty, acknowledged by the older physicians, was that of pregnant women upon the body of the child *in utero*: and this opinion, although it was long ago satisfactorily refuted by some philosophical observers, (see Dr. Blondel's answer to the twelfth chapter of Dr. Turner's treatise on Diseases of the Skin, and *Lettres sur le Pouvoir de l'Imagination des Femmes enceintes*, Paris 1745,) has been maintained by many other writers of reputation, and is still popularly current, if not received as an established truth by the less enlightened part of the medical profession. Nothing, however, we conceive, but the

the inveteracy of the prejudices of education, can account for the support of a doctrine, which reason, experience, and anatomical science concur to refute. On the other hand, the phenomena actually occasioned by the operation of the imagination on the corporeal functions, are so numerous, and yet at times appear so extraordinary, that they merit a particular investigation: for it is the consequence only of inattention to the subject, and of the general appetite of mankind, especially in ages of ignorance, for whatever is occult and mysterious, that the principle was not long ago established, and the facts rendered familiar to all. Rational science, built upon observation and experiment, has in a great measure banished the notions of magic and witchcraft, even from the peasantry; but it remained for the philosophical minds of a Franklin, a Lavoisier, &c. to propound the mysteries of Mesmer, and the other professors of *animal magnetism*, at Paris, near the close of the eighteenth century;—and for that of a Haygarth, to expose the rationale of *Perkinism* and the *metallic traders*, in our own country, at the beginning of the nineteenth. (See Rapport des Commissaires chargés par le Roy de l'examen du Magnétisme Animal, Paris 1784;—and a pamphlet, “On the Imagination as a Cause and as a Cure of Disorders of the Body, exemplified by fictitious Tractors and epidemical Convulsions; by John Haygarth, M.D. &c.” Bath, 1800.) In truth, the influence of the faculty of imagination over the functions of the body affords an explanation of numerous facts in the moral as well as physical history of man, which have been accounted for upon various occult principles; such as diabolical or dæmoniacal possession; the power of incantations and amulets; the miraculous influence of relics, images of saints, &c.; the operations ascribed to some magnetic or electrical principle in nature; to the touch of kings, and of various gifted persons; and many other circumstances.

Before we pursue this interesting inquiry, however, we shall dismiss the subject, so far as relates to the supposed operation of the imagination in pregnant women.

I. All the varieties of deformity and monstrosity, as well as of cutaneous marks and blemishes of infants, were formerly ascribed to the imagination of the mother dwelling upon some analogous object, or to her disappointed longings for some particular article of food or drink. Hippocrates himself observes, that the desire of a pregnant woman is capable of marking the tender infant with the thing desired: and subsequently, the observations to this effect, and the number of histories illustrative of it, have been so multiplied by authors of reputation, that the defenders of the doctrine still appeal to experience, as decisive in favour of the ancient and popular opinion; they consider the matter as established upon the evidence of indisputable history. But to those who are acquainted with the records of medicine, it is not necessary to state, that they abound with so many extravagant and fabulous details, which have been collected and repeated with the utmost credulity, that to admit them as truths would require a renunciation of the best principles of modern science. It is enough to peruse the marvellous collections of Schenk and Marcus Donatus, to be satisfied of this proposition, as to the occurrences themselves; but in respect to the causes of the phenomena, (which is a matter of difficult investigation,) authority is of no weight, when placed in opposition to sound anatomical and physiological principles.

The most common deformities, attributed to the influence of the mother's imagination, are spots, tubercles, &c. on the skin, most commonly of a red or purplish colour, which are supposed to resemble different sorts of fruit, such as raspberries, cherries, strawberries, &c. or the stains of port-

wine; and other spots covered with a downy hair, and compared to the skin of a mouse, a mole, &c. These appearances have been commonly ascribed to the disappointed longings of the female, during utero-gestation, for the particular fruit, which is supposed to be impressed on the skin; or to some agitation of mind, occasioned by these things being thrown at her, or certain animals jumping upon her. But many more extraordinary phenomena are on record. Among the cases stated by Turner, we find an instance of an “infant's head pierced quite through by reason of an fright of the mother;” another of a child born with the leg broken or distorted, by the mother looking on a crucifix, and viewing the broken limbs of one of the malefactors by the side of Christ; of a child of sir J. B. which was born wanting one hand, in consequence of his lady being frightened, when pregnant, by the unexpected view of a beggar's stump arm upon her coach door; of another child, which, in consequence of the mother being pursued by her husband with a drawn sword, threatening to cut her over the forehead, near the time of her delivery, was brought forth with a large wound on its forehead, from which a fatal hæmorrhagy took place; and of another infant, whose abdominal viscera hung out all naked below the navel at birth, in consequence of the mother having been compelled to witness the killing of a calf three months before parturition, at the opening of which she felt an extraordinary motion in herself, when she saw how the bowels came tumbling from the belly; not to mention instances of children born with the head of a cat, with a hairy skin and bear's claws, or of different colour from that of the parents, in consequence of frights, or of the frequent contemplation of pictures of bears, or of negroes, &c. See Turner on Diseases of the Skin, chap. xii.

Now, in all these instances, the impressions on the imagination are alleged to have occurred in the course, or even at an advanced period, of the pregnancy. Before this occurrence then, it is presumed that the child *in utero* was of the natural and perfect form; that is, the infant, which is born with a large discolouration or protuberance on its skin, had, up to this period, a fair and smooth skin; that the child who is born with six toes, had, till then, only five; that the child, brought forth with one leg or one arm, had originally two; and the monster produced with the head of a cat, had originally a natural human head, until the mother was frightened by the cat getting into her bed, when she was “big with child” (Turner); and so on, with regard to every other preternatural appearance, whether it be an increase, decrease, or alteration of the parts of the body. It seems almost sufficient barely to state the matter in this light, in order to demonstrate the absurdity of the opinion. For surely it does not require a train of reasoning or of experiment to prove, that neither man nor woman can, by the force of imagination, “add an inch to the stature,” or take an inch from it, or transform any part of their bodies into the resemblance of other animals, or of vegetables and fruit. It is not less clear, that no woman can, by an effort of imagination, form a child; and, if not a whole child, neither can she add new parts to a child already completely formed, nor destroy any of the parts so formed, nor transmute any of those parts into other forms of structure. For example, let us take the instance of the lady, who, when advanced five or six months in her pregnancy, was so terrified by a beggar thrusting the stump of an amputated arm into her coach, that the child, of which she was afterwards delivered, was born with the stump of an arm resembling that of the beggar. Let us consider what an operation must be performed to work this effect: a child at the term of five

IMAGINATION.

or six months is of considerable bulk, and the arm itself not small. This arm, then, must drop off by the power of imagination: there must be no blood lost to endanger the life of the child; and the wound must be healed before the birth. This might seem sufficiently improbable: but, admitting that the limb could drop off by the force of fancy in the mother, it must still remain in the uterus until the delivery; and the bones at least could not putrify and waste away, although the flesh might. But it never was pretended that, in cases of this nature, any part of the deficient limb was found by the midwife. And, what is a material point in the argument, the stumps of all such imperfect limbs have a smooth and regular skin, which plainly indicates that they were from their first formation of the same figure: for had there been a wound, there would have been a scar; and scars are very distinguishable from sound skin.

When we consider the nature of the connection between the fœtus in utero and the mother, this view of the subject is still farther confirmed. The infant is not one body with the mother, as some writers have asserted, any more than the plant is one substance with the earth, which nourishes it. (See *Lettres sur le Pouvoir de l'Imagination de Femmes enceintes*, Paris, 1745.) There is no communication of nerves whatever between the mother and the child, nor is there any direct vascular communication: the infant has its own distinct circulation of blood, carried on by the action of its own heart and arteries, which last do not terminate in the vessels of the mother, but in the veins of the child, which reconduct the blood to its heart: nor is there any direct communication of the vessels of the mother with those of the fœtus. (See *EMBRYO*.) This identity of the circulation and nervous system of the fœtus, renders it altogether inconceivable that the sensations, fears, or desires of the mother should be in any way communicated to it; or that any impression on the imagination of the mother should produce any changes in its structure, or appearance. As it never happens, by any series of fancies or passions, that the figure of the objects of them is traced upon the skin of the mother; so it is equally impossible, and more improbable, that such changes or appearances should be impressed upon the infant, thus insulated from any nervous influence of the parent.

Besides, with respect to the *navi*, moles, and other marks on the skin, it is obvious to those who have paid any attention to them, that the resemblance which they are said to bear to various sorts of fruit, &c. is purely fanciful; that they are generally of two or three kinds, consisting of a multiplicity, or network, of small blood-vessels, which constitute the common red and purplish marks; or of large brown moles, &c.; and that the fancied occurrence of greater redness in those of the former class, which are compared to fruit, at the time when such fruit is ripe, arises merely from the increased circulation and distention of the small blood-vessels in hot weather. When these and other deformities are connate, the mother, already possessed with the belief that some such cause as could affect the mind must have existed, is not long at a loss; her memory or her prejudice soon furnishes her with some fact, which was never attended to perhaps when it happened, and the instance of her child is added to the long catalogue of those which preceded. For the minute accordance of the fact is never required. Thus there is no defect more common than that of a hare-lip; and when this appears, the mother does not fail to recollect, that at some time in the course of the nine months she had wished for a hare, or had been frightened by a hare, or had by chance seen somebody with a hare-lip, no matter which, the occurrence is satisfactorily ac-

counted for, and the *fact* is established. Yet had not medical observers given this *name* to the disease, the actual resemblance of a human countenance, thus deformed, to that of a hare, would not perhaps readily suggest itself.

But, the truth is, although we cannot explain the causes of these irregularities and monstrosities of human births, any more than various other anomalies and *lusus nature* in the animal and vegetable world in general, yet we must refer them all to the same origin: for in regard to his corporeal frame, his generation, and mechanical structure, man is subject to the same laws with the rest of the living creation. The growth of the human fœtus seems not to differ from the development of the germ, in the eggs of oviparous animals, or in the seeds of plants. All these are liable to every conceivable variety of conformation; to deformities, redundancies, defects, and anomalous dispositions of parts, both internal and external: yet the influence of imagination is, in the latter cases, out of the question. But it would seem, that a nut with two kernels, a chicken with two heads, or a child with a double head, body, and limbs, (a monstrosity not very rare,) are upon a very similar footing: and, that it would be as philosophical to attribute the monstrous chicken to the imagination of the hen that hatched the egg, or the double nut to the fancies of the hazle-bush, as to ascribe the extraordinary infant to the fears or apprehensions of the mother.

In all the above examples, the changes, supposed to be effected by the imagination on the child in the womb, are said to take place after the development of the germ or embryo has considerably advanced; and it is to such operations only that our attempts at refutation apply. For as to the mysterious influence of the mind in the act of procreation, on which "the *callipædia*, or the art of begetting beautiful children" depends, although much has been said on the subject in all ages, we confess ourselves altogether unable to enter into the discussion. The original conception may doubtless be modified by circumstances, which are incapable of producing subsequent changes in the embryo. If the placing of streaked or pilled rods before the flocks at the time of their conjunction, as mentioned in holy writ, (*Gen. chap. xxx.*) was the occasion of the generation of black and white lambs; the notions of some ancient and modern philosophers and poets may be verified in respect to the human conception. Thus the tyrant Dionysius, who was deformed and ill-favoured himself, in order that he might have a comely issue, is said to have always had a beautiful picture set before his wife in the bed-chamber, that by the force of fancy she might conceive the likeness of it. Galen attributed the same effect to the sight of a picture. (*Lib. de Theriac ad Pison. c. 14.*) And the poet Hesiod exhorts his friends not to set about the work of procreation after they return from funerals, lest the sorrowful idea be transmitted to the conception, and the tender fœtus marked with some frightful character.

Μη δ' ἀπο δυσσημον τάφη ἀπονοστήσαντα,
Σπειμαίνων γενέη, ἀλλ' ἀνανάτω ἀπὸ δανό.

Hes. Lib. ii. de Op. et Dieb.

Dr. Darwin has many speculations upon this subject; but he refers all the influence to the imagination of the male parent, and denies the influence of that of the female, not only during the period of pregnancy, but at the moment of conception; and he thinks the *callipædia* is an art which may be taught: "but," he properly observes, "the manner of accomplishing this cannot be unfolded with sufficient delicacy for the public eye." See *Zoonomia*, vol. i. sect. xxxix. 6 and 7.

II. Although,

IMAGINATION.

II. Although, however, we may be convinced of the error of ascribing the actual changes of structure, which constitute the deformities and monstrosities of infants, to the imagination of the mother, operating upon the embryo after it is completely developed; yet we have the most satisfactory evidence of the powerful influence of this faculty over the nervous and vascular system, and of effects resulting from this influence, which might *à priori* be deemed equally extraordinary, as the metamorphoses abovementioned. Who, for example, could suppose that, on the one hand, many painful, spasmodic, and convulsive affections, both local and general, could be removed by impressions exciting only the imagination of the patient; or, that on the other hand, various anomalous sensations, actual syncope or swooning; and even the most violent epileptic and hysterical convulsions, could be occasioned by influencing the same faculty? We conceive, however, that no fact in physiology is more clearly demonstrated. We shall first state the evidence which experiment has established, and then the inferences which may be deduced, and extended to many other analogous phenomena. The most striking illustration is to be found in the history of

§ 1. *Animal Magnetism*.—In consequence of the extent to which the practice of *animal magnetism*, as it was called by its inventor, M. Mesmer, was carried in Paris, the French king appointed a committee, consisting of four physicians, and five members of the Royal Academy of Sciences, to investigate the matter, in the year 1784. Among the latter were M. M. Bailly, Lavoisier, and Dr. Franklin, who was at that time the American minister at Paris. This agent, which Mesmer pretended to have discovered, he affirmed, was “a fluid universally diffused, and filling all space, being the medium of a reciprocal influence between the celestial bodies, the earth, and living beings;—it insinuated itself into the substance of the nerves, upon which therefore it had a direct operation;—it was capable of being communicated from one body to other bodies, both animated and inanimate, and that at a considerable distance, without the assistance of any intermediate substance;—and it exhibited in the human body some properties analogous to those of the loadstone, especially its two poles. This *animal magnetism*,” he added, “was capable of curing directly all the disorders of the nervous system, and indirectly other maladies; it rendered perfect the operation of medicines; and excited and directed the salutary *crises* of diseases, so that it placed these *crises* in the power of the physician. Moreover, it enabled him to ascertain the state of health of each individual, and to form a correct judgment as to the origin, nature, and progress of the most complicated diseases, &c.” In short, he said, “La Nature offre dans le magnétisme un moyen universel de guerir et de preserver les hommes.” (See Memoire sur la Decouverte du Magnetisme Animal, par M. Mesmer, Doct. en Med. de la Faculté de Vienne, 1779.—Also his *Precis Historique des Faits relatifs aux Mag. An. jusques en Avril, 1781.*) M. Deslon, a pupil of Mesmer, also practised *animal magnetism* at Paris, and undertook to demonstrate its existence and properties to the commissioners. He commenced his instructions by reading a memoir, in which he maintained, that “there is but one nature, one disease, and one remedy; and that remedy is *animal magnetism*.”

The first step of the commissioners was to examine the mode and instruments of operation, and the effects of the agent. It was observed that M. Deslon operated upon many individuals at the same time. In the middle of a large room was placed a circular chest of oak, raised about a foot from the floor, which was called the *baquet*: the lid of this chest was pierced with a number of holes, through

which there issued moveable and curved branches of iron. The patients were ranged in several circles round the chest, each at an iron branch, which, by means of its curvature, could be applied directly to the diseased part. A cord, which was passed round their bodies, connected them with one another; and sometimes a second chain of communication was formed by means of the hands, the thumb of each one's left hand being received and pressed between the fore-finger and thumb of the right hand of his neighbour. Moreover, a *piano-forte* was placed in a corner of the room, on which different airs were played; sound being, according to the principles of Mesmer, a conductor of magnetism. The patients, thus ranged in great numbers round the *baquet*, received the magnetic influence at once by all these means of communication; by the branches of iron which transmitted to them the magnetism of the *baquet*; by the cord entwined round the body; by the union of thumbs, which conveyed to each the magnetism of his neighbour; and by the sound of the music, or of an agreeable voice, which diffused the principle through the air. The patients were, besides, directly magnetised, by means of the finger of the magnetiser, and a rod of iron, which he moved about before the face, above or behind the head, and over the diseased parts, always observing the distinction of the magnetic poles, and fixing his countenance upon the individual. But above all, they were magnetised by the application of the hands, and by pressure with the fingers upon the hypochondria, and the abdominal regions, which was often continued for a long time, occasionally for several hours together.

The patients, subjected to this treatment, at length began to present very various appearances in their condition, as the operation proceeded. Some of them were calm and tranquil, and felt nothing; others were affected with coughing and spitting; others again experienced slight pains, partial or universal heats, and considerable perspirations; and others were agitated and tortured with convulsions. These convulsions were extraordinary in their number, severity, and duration. The commissioners saw them, in some instances, continue for three hours, when they were accompanied with expectoration of a viscid phlegm, which was ejected by violent efforts, and sometimes itreaked with blood; one young man often brought up blood copiously. The convulsions were characterized by violent involuntary motions of the limbs, and of the whole body, by spasms of the throat, by agitations of the epigastrium and hypochondres, and wandering motions of the eyes, accompanied by piercing shrieks, weeping, immoderate laughter, and hiccup. They were generally preceded or followed by a state of languor and rambling, or a degree of drowsiness and even of coma. The least unexpected noise made the patients start; and it was remarked, that even a change of measure in the air, played upon the piano-forte, affected them, so that a more lively movement increased their agitation, and renewed the violence of their convulsions. Nothing can be more surprising, or more inconceivable by those who have not witnessed it, than the spectacle of these convulsions, say the commissioners: all seem to be under the power of the magnetiser; a sign from him, his voice, his look, immediately rouses them from a state even of apparent sopor. In truth, they add, it was impossible not to recognise, in these constant effects, a great power or agency, which held the patients under its dominion, and of which the magnetiser appeared to be the sole depositary. See *Rapport des Commissaires chargés par le Roi, de l'Examen du Magnétisme Animal; à Paris, 1784.*

Such, then, were the phenomena (of the reality of which they could not doubt) produced by the operation of this

IMAGINATION.

new agent, the nature and origin of which it was the duty of the commissioners to investigate. This convulsive and lethargic state, it may be noticed, was considered as a *crisis*, such as the constitution or the art of medicine is enabled to effect, for the purpose of curing diseases; and for the sake of brevity, we shall adopt the term, to express this occurrence, regardless of the hypothesis which led to its use.

On witnessing the same experiments, frequently repeated, the commissioners remarked, that among the patients who fell into the *crisis*, there were always many women, and very few men; that the *crises* were not effected in less than the space of an hour or two; and that as soon as one person was thus taken, the rest were similarly seized in a very short time. But they were unable to obtain any satisfactory results from experiments made upon so many persons at once. They resolved, therefore, to endeavour, by experiments upon individuals, in a more private way, to ascertain the direct effects of the newly discovered agent on the animal economy, in a state of health; which, if the agent existed, could of course be rendered manifest by its effects: and they determined to become themselves the subjects of the first experiments. No inquiry was ever conducted in a more philosophical manner, or terminated in a more complete and unequivocal development of the nature of the subject. Great and extraordinary as the powers of this new agent seemed to be, the phenomena were proved to be referrible solely to the *imagination* of the parties magnetised.

The commissioners submitted to be magnetised together, excluding all strangers, by M. Deslon, once a week, for the space of two hours and a half: they were ranged round the *baquet*, encircled by the cord of communication, with an iron branch from the *baquet* resting upon the left hypochondre of each, and forming from time to time the communication of thumbs: they were magnetised by the fingers or the metallic rod being moved about and presented to different parts of the body, as well as by the pressure of hands on the pit of the stomach and sides of the belly. The most irritable and delicate of the commissioners were magnetised the most frequently, and for the longest time. But none of them experienced any effects or sensations; or at least any that could be ascribed to magnetism. Three of them were valetudinarians, and some of their usual uneasy feelings were excited partly by the fatigue, and partly by the strong pressure made on the stomach. They submitted to the experiment on three days successively: still without any effect. The quiet and silence of the eight commissioners, thus magnetised, without any uneasiness or any new sensation, formed the most perfect contrast with the noise, agitation, and disorder of the public magnetism: here was the magnet without any influence, and the operator despoiled of his power. They were warranted, therefore, in concluding, "that magnetism has no agency in a state of health, or even in a state of slight indisposition."

They resolved, then, to make their next trials of its influence upon persons actually diseased; and seven persons, of the lower class, were magnetised by M. Deslon, in the presence of the commissioners, at Dr. Franklin's house. Two women, the one asthmatic, the other with a swelling on the thigh, and two children, the one six and the other nine years of age, felt nothing, and remained unaffected. One man, with diseased eyes, felt a pain in the ball of one of them, which also discharged tears, when the finger of the magnetiser was brought near it, and moved quickly about for a considerable time: but when the other eye, which was most diseased, was magnetised, he felt nothing. A nervous, hysterical woman, to whom the pressure of the abdomen was painful, and who had a *hernia*, said she felt a pain in the head when the finger

was pointed near the rupture, and that she lost her breath when it was brought opposite the face. When the finger of the magnetiser was repeatedly moved up and down, she experienced some catchings of the muscles of the head and shoulders, like one surprised and afraid. The seventh patient, a man, suffered some effects of the same sort, but much less marked.

Four persons, two ladies and two gentlemen, of good education, and in bad health, were afterwards magnetised. Three of these underwent the operation several times, and felt nothing: but the fourth, a nervous lady, being magnetised during an hour and twenty minutes, generally by the application of the hands, was several times on the point of falling asleep, and felt some degree of agitation and uneasiness. On a subsequent occasion, a large company, assembled at Dr. Franklin's, (who was confined by illness,) were all magnetised, including some patients of M. Deslon, who had accompanied him thither: there were present several Americans, one of whom, an officer, had an intermittent fever; yet no person experienced any effects, except M. Deslon's patients, who felt the same sensations to which they had been accustomed at his public magnetising.

These experiments, then, furnished some important facts. Of fourteen invalids, five experienced some effects from the operation, but nine felt none whatever. All the effects observed in the nervous lady, however, might be occasioned by the irksomeness of the same posture for so long a time, and by her attention being strongly fixed upon her feelings: for it is frequently sufficient to think of these nervous attacks, or to hear them mentioned, in order to reproduce them when they are habitual. The three other instances occurred among persons of the *lower class*: and this circumstance was remarked with surprise by the commissioners; that the only effects, which could be ascribed to magnetism, manifested themselves in the poor and ignorant; while those who were better able to observe and to describe their sensations, felt nothing. At the same time, it was observed, that *children*, although endowed with the peculiar sensibility of their age, likewise experienced no effect. The notion, that these effects might be explained by natural causes, therefore, suggested itself to the commissioners. "If we figure to ourselves," they observe, "a poor ignorant person, suffering from disease, and anxious to be relieved, brought before a large company, partly consisting of physicians, with some degree of preparation and ceremony, and subjected to a novel and mysterious treatment, the wonderful effects of which he is already persuaded that he is about to experience; and if, moreover, it is recollected, that he is paid for his compliance, and supposes that the experimenters will be gratified in being told that he perceived certain operations; we shall have natural causes by which these effects may be explained, or at least very legitimate reasons for doubting that the real cause is magnetism." *Rapport des Commiss. p. 30.*

Since the supposed effects of the *animal magnetism*, then, were not discoverable in those who were incredulous; there was great reason to suspect, that the impressions which were produced, were the result of a previous expectation of the mind, a mere effect of the *imagination*. The commissioners, therefore, now directed their experiments to a new point; namely, to determine how far the imagination could influence the sensations, and whether it could be the source of all the phenomena attributed to magnetism.

The commissioners had recourse now to a M. Jumelin, who magnetised in the same way with M. M. Mesmer and Deslon, except that he made no distinction of the magnetic *poles*. Eight men and two women were operated on by M. Jumelin; but none of them experienced any effect. At
length

IMAGINATION.

length a female servant of Dr. Le Roy, who was magnetised in the forehead, but without being touched, said she perceived a sense of heat there. When M. Jumelin moved his hand about, and presented the extremities of his five fingers to her face, she said that she felt as it were a flame moving about: when magnetised at the stomach, she declared that the heat was there; at the back, and the same heat was there: she then affirmed that she was hot all over the body, and suffered a head-ache. Seeing that only one person, out of eleven, had been sensible of the magnetism, the commissioners thought that this person was probably possessed of the most mobile imagination. They therefore tied a bandage over her eyes, and she was magnetised again: but the effects no longer accorded with the parts to which the magnetism was directed! When it was applied successively to the stomach and to the back, the woman only perceived the heat in her head, and a pain in her eyes, and in the left ear! The bandage was removed, and M. Jumelin applied his hands to the hypochondres; she immediately perceived a sense of heat in those parts; and, at the end of a few minutes, said that she was faint, and actually swooned. When she was sufficiently recovered, her eyes were again bandaged; M. Jumelin was then removed to a distance, silence was commanded, and they made the woman believe that she was again magnetised. The effects were now precisely the same, although no one operated, either near her or at a distance: she felt the same heat, particularly in the back and loins, and the same pain in the eyes and ears! At the end of a quarter of an hour, a sign was made to M. Jumelin to magnetise her at the stomach; he did so, but she felt nothing; he magnetised her back, but without effect; in fact the heat of the back and loins gradually ceased, and the pains in the head remained!

Here, then, was demonstrative evidence of the operation of the imagination. When the woman saw what was done, the sensations were placed in the parts magnetised; but when she could no longer see, they were referred to the most distant parts, where no magnetism was directed; and, above all, they were equally felt, when she was not magnetised at all, and not felt when she was magnetised, after a little repose, but unknown to herself. The fainting of a nervous woman, when made the subject of a mysterious experiment, and continued in a posture of restraint for a considerable time, is explicable upon natural causes. This experiment also shewed, that the distinction of poles was purely chimerical. It was repeated the following day upon a man and a woman, with the same results. Sensations, felt when they were not magnetised, could only be the effect of imagination: and it was found only necessary to excite and direct the imagination, by questions, to the parts where the sensations were to be felt, instead of directing the magnetism upon those parts, in order to produce all the effects. A child of five years old was then magnetised; but it felt nothing, except the heat which it had previously contracted in playing.

These experiments were repeated by the commissioners in various ways, upon many different persons, of all classes, and with the same results, differing only according to the difference of susceptibility of the imagination of the individuals. They found effects constantly experienced, when no magnetism was used, and *vice versa*, (when the eyes were covered,) according to the direction of the patient's attention by questions put to him with address. Now this practice could not lead to any error; since it only deceived their imagination. For, in truth, when they were not magnetised, their only answer ought to have been, that they felt nothing.

Some facts, communicated to the commissioners by M. Sigault, an eminent physician at Paris, place the power of the imagination in a strong light. "Having announced," he says, "in a great house, that I was an adept in the art of Mesmer, I produced considerable effects upon a lady who was there. The voice and serious air which I affected, made an impression upon her, which she at first attempted to conceal; but having carried my hand to the region of the heart, I found it palpitating. Her state of oppression indicated also a tightness in the chest, and several other symptoms speedily ensued: the muscles of the face were affected with convulsive twitches, and the eyes rolled; she fell down in a fainting fit, vomited her dinner, and had afterwards several motions from the bowels, and felt herself in a state of incredible weakness and languor. A celebrated artist, who gives lessons in drawing to the children of one of our princes, complained during several days of a severe head-ache, which he mentioned to me when we met accidentally on the Pont-Royal. Having persuaded him that I was initiated in the mysteries of Mesmer, almost immediately, by means of a few gestures, I removed his pain, to his great astonishment." Dr. Sigault justly remarks, that it is probably by such an impression on the mind, that the sight of the dentist removes the tooth-ache, when the patient has gone to him for the purpose of having his tooth drawn. He adds, that being one day in the parlour at a convent, a young lady said to him, "you go to M. Mesmer's, I hear." "Yes," he replied, "and I can magnetise you through the grate;" presenting his finger towards her at the same time. She was alarmed, grew faint, and begged him to desist; and, in fact, her emotion was so great, that had he persisted, he had no doubt that she would have been seized with a fit. *Rapport, note p. 39—41.*

But although the commissioners were convinced, by their experiments, that the *imagination* was capable of producing different sensations, of occasioning pain, and a sense of heat, and even actual heat, in all parts of the body; and therefore that it contributed much to the effects, which were ascribed to *animal magnetism*: yet the effects of the latter had been much more considerable, and the derangements of the animal economy, which it excited, much more severe. It was now, therefore, to be ascertained, whether by influencing the imagination, convulsions, or the complete *crisis* witnessed at the public treatment, could be produced. In proof of this point, their experiments were not less conclusive, as the following relation of one or two of them will evince. As M. Deslon acknowledged that the complete success of the experiments would depend upon the subjects of them being endowed with sufficient sensibility, he was requested to select some of his patients, who had already proved their susceptibility of the magnetic influence, upon whom the trials might be made.

According to the principles of the magnetisers, when a tree had been touched by them, and charged with magnetism, every person who stopped near the tree would feel the effects of this agent, and either fall into a swoon or into convulsions. Accordingly in Dr. Franklin's garden at Passy, an apricot tree was selected, which stood sufficiently distant from the others, and was well adapted for retaining the magnetism communicated to it. M. Deslon, having brought thither a young patient of twelve years of age, was shewn the tree, which he magnetised, while the patient remained in the house, under the observation of another person. It was wished that M. Deslon should be absent during the experiment; but he affirmed that it might fail, if he did not direct his looks and his cane towards the tree. The young man was then brought out, with a bandage over his eyes, and successively

IMAGINATION.

successively led to four trees, which were *not magnetised*, and was directed to embrace each during two minutes; M. Deslon at the same time standing at a considerable distance, and pointing his cane to the tree actually magnetised. At the first tree, the young patient, on being questioned, declared that he sweated profusely; he coughed and expectorated, and said that he felt a pain in the head: he was still about twenty-seven feet from the magnetised tree. At the second tree he found himself giddy, with the head-ache as before: he was now thirty feet from the magnetised tree. At the third, the giddiness and head-ache were much increased; he said he believed he was approaching the magnetised tree; but he was still twenty-eight feet from it. At length, when brought to the fourth tree, *not magnetised*, and at the distance of twenty-four feet from that which was, the *crisis* came on; the young man fell down in a state of insensibility, his limbs became rigid, he was carried to a grass-plot, where M. Deslon went to his assistance, and recovered him.

This experiment, then, was altogether adverse to the principle of magnetism, not negatively, but positively and directly. If the patient, said the commissioners, had experienced no effect under the tree actually magnetised, it might have been supposed that he was not in a state of sufficient susceptibility; but he fell into the *crisis* under one which was not magnetised; therefore not from any external physical cause, but solely from the influence of the *imagination*. He knew that he was to be carried to the magnetised tree; his imagination was roused, and successively exalted, until, at the fourth tree, it had risen to the pitch necessary to bring on the *crisis*.

Many other experiments furnished the same results. M. Deslon was requested to select, from among his poor patients, those who had shewn the greatest sensibility to the magnetism; and he accordingly brought two women to Paris. While he was magnetising Dr. Franklin and several persons in another apartment, the two women were put into separate rooms. Three of the commissioners remained with one of the women, the first to question her, the second to write, and the third to represent M. Deslon, who (they persuaded her, after having bandaged her eyes) was brought into the room to magnetise her. One of them pretended to speak to M. Deslon, requesting him to begin; but *nothing was done*; the commissioners remained quiet, only observing the woman. In the space of three minutes, she began to feel a nervous shivering (*frisson nerveux*); then she felt in succession a pain in the head and in the arms, and a pricking in the hands, she became stiff, struck her hands together, got up from her seat, and stamped with her feet: in a word, the crisis was completely characterized. Two of the commissioners were in an adjoining room with the other woman, whom they placed by the door, which was shut, with her sight at liberty, and made her believe that M. Deslon was on the other side of the door, magnetising her. She had scarcely been seated a minute before the door when a shivering began; in one minute more she had a clattering of the teeth, but yet a general warmth over the body; and, by the end of three minutes, the *crisis* was complete. The breathing became hurried; she stretched out her arms behind her back, writhing them strongly, and bending the body forwards; a general tremor of the whole body came on; the clattering of the teeth was so loud as to be heard out of the room; and she bit her hand so as to leave the marks of her teeth in it.

Now, the commissioners observe, these two women were never touched, not even their pulse felt. A more clear and demonstrative proof of the power and agency of the imagination could not have been afforded them. It may be

added, however, that one of these women, being sent to M. Lavoisier's, actually fell into the *crisis* in the antichamber, before she had seen either M. Deslon, or any of the commissioners; but she knew that she was to meet them there. While she was alone in the antichamber, a short time afterwards, different persons went to her who had no connection with magnetism, and the convulsive motions began again. They remarked to her that no one magnetised her; but so much was her imagination excited, that she replied, "If you did nothing to me I should not be in this condition." She knew in fact that she came there for the purpose of being the subject of experiment, and the approach of any one, or the least noise, attracted her attention, recalled the idea of magnetism, and produced a fresh accession of convulsions.

It is unnecessary to carry this detail of facts any further. No experimental inquiry could have been more ably prosecuted, and no philosophical truth more clearly developed, than that the mere operation of the imagination is sufficient to produce all those great and extraordinary changes in the animal economy, which were ascribed to an hypothetical agent in nature, which was termed magnetism. If, indeed, it should be still maintained, that the effects, produced in these isolated experiments, fell short of the phenomena which occurred at the *public magnetisings*, there is another principle of the human constitution, which will fully account for this difference in the degree, independently of other physical circumstances necessarily existing in the latter mode of treatment; we mean the principle of *imitation*, as it has been termed, of which we shall say more under its proper head. (See IMITATION.) Independently of the warmth and contamination of the air, in a crowded room, which particularly affects the head and the nervous system, and of the influence of music in increasing all emotions, and in addition to the multiplied impressions upon the sight and hearing, as well as those of touch and pressure, not employed in the private trials, this principle of *imitation*, which heightens all emotions, and augments all tendencies to action, would be sufficient to explain the difference. It was remarked that when one person fell into the *crisis*, the rest were speedily overcome. In like manner, we see a sort of contagion in all the emotions and impressions excited in a crowded assembly. Hence the powerful impressions made by public spectacles, and the enthusiast excited in theatres by generous sentiments; hence the general ardour which spreads at once through an army in the hour of battle; or, on the contrary, the universal panic which is propagated with inconceivable rapidity, often from the slightest causes, or from causes merely imaginary; and hence also the ungovernable fury of mobs. But to trace the principle to a closer analogy, all nervous and convulsive diseases are liable to propagate themselves among those who witness them, and thus to become, as it were, epidemic; whence hysterical and epileptical convulsions have prevailed at times in large schools, manufactories, and even in religious assemblies, in a most distressing manner, and were prevented only by a complete separation of the individuals, or by exciting strong counter-impressions on the mind, such as the dread of punishment, &c. (See IMITATION.) The greater effects, therefore, produced at the public operations of the magnetisers, are explicable upon the known principles of the human constitution, and serve to confirm, rather than to invalidate, the inferences of the preceding investigation.

§ 2. *Metallic Traitors*.—Complete as the detection of the delusion of Mesmer, and the other advocates of *animal magnetism*, by the commissioners of Paris, was, and numerous

IMAGINATION.

as the facts were, which evinced the efficacy of touching, or even pointing at the body with the fingers, or a rod of iron, &c. in removing as well as in exciting pains and distressing sensations, it could hardly have been expected that another delusion, founded upon the same grounds, could again be disseminated, after the short interval of sixteen or seventeen years, so as to find advocates among philosophical men, and to enrich the author of the contrivance. Such, however, was the fact. We now state it, rather as a matter of record than of information, that, in the year 1798, an American, of the name of *Perkins*, introduced into this country a method of curing diseases, for which he obtained the royal letters patent, by means of two small pieces of metal, denominated *Tractors*. These were applied externally near the part diseased, and moved about, gently touching the surface only; and thus multitudes of painful disorders were removed, some most speedily, and some after repeated applications of the metallic points. Pamphlets were published, announcing the wonderful cures accomplished by this simple remedy; and periodical journals and newspapers teemed with evidence of the curative powers of the *tractors*; inasmuch, that in the course of a few months, they were the subject of general conversation, and scarcely less general use. The religious sect of the Quakers, whose benevolence has been sometimes displayed at the expence of their sagacity, became the avowed and active friends of the *tractors*; and a public establishment, called the "*Perkinean Institution*," was formed under their auspices, for the purpose of curing the diseases of the poor, without the expence of drugs or medical advice. The transactions of this institution were published in pamphlets, in support of the extraordinary efficacy of these new instruments. In somewhat less than six years Perkins left the country, in possession, as we have been informed on good authority, of upwards of ten thousand pounds, the contributions of British credulity; and now (1811) the *tractors* are almost forgotten.

We by no means intend to impeach the veracity of those who attested the many extraordinary cures performed by the application of the *tractors*; on the contrary, we have no doubt that many of them were actually accomplished, at least temporarily: after what we have already stated, when treating of *animal magnetism*, (such as the sudden cure of the artist's head-ache, on the bridge, by M. Sigault's gestures,) and what we shall proceed to state respecting the effects of *counterfeit* *tractors*, it were impossible not to admit the truth and correctness of the majority of the accounts of the efficacy of *Perkinism*. We must observe, however, that the efficacy was founded on the delusion: and had not the scientific world been at that time in a state of comparative ignorance respecting the principle of which Galvani had recently obtained a glance; had they been in total ignorance of that principle, or possessed of more than that "little knowledge" of it, which "is a dangerous thing," such an imposture would scarcely have gained ground for a day, among those who were acquainted with the proceedings of the French commissioners in the affair of Mesmer. But Perkins associated the idea of the Galvanic principle, or animal electricity, with the operation of his *tractors*, by constructing them of two different metals, which the Italian philosopher had shewn to be necessary to excite the operation of the agent which he had discovered: and the obscurity which hung over this subject, (for the great development of the Galvanic principle by the pile of Volta, and the trough which followed, had not then taken place,) left a new field for hypothesis, and the anomalous character of the facts contributed to induce even philosophers to listen to the relation.

But Dr. Haygarth, a philosopher, to whom his profession and his country are deeply indebted for more important services (see *CONTAGION, FEVER-ward, and HOUSE of Recovery*), suspected the true source of the phenomena, produced by the *tractors*, from the first promulgation of the subject. Recollecting the development of the animal magnetism, he suggested to Dr. Falconer, about the end of the year 1798, when the *tractors* had already obtained a high reputation at Bath, even among persons of rank and understanding, that the nature of the operation of the *tractors* might be correctly ascertained by a pair of *false tractors*, resembling the real ones; and it was resolved to put the matter to the test of experiment in the general hospital of that city. They therefore contrived two *wooden tractors*, of nearly the same shape as the metallic, and painted to resemble them in colour. Five cases were chosen of chronic rheumatism, in the ankle, knee, wrist, and hip: one of the patients had also gouty pains. All the affected joints, except the last, were swelled, and all of them had been ill for several months.

On the 7th of January, 1799, the *wooden tractors* were employed. All the five patients, except one, assured us that their pain was relieved, and three much benefited by the first application of this remedy. One felt his knee warmer, and he could walk much better, as he shewed us with great satisfaction. One was easier for nine hours, and till he went to bed, when the pain returned. One had a tingling sensation for two hours. The *wooden tractors* were drawn over the skin so as to touch it in the *slightest* manner. Such is the wonderful force of the imagination!

Next day, January 8th, the true metallic *tractors* of Perkins were employed exactly in like manner, and with similar effects. All the patients were in some measure, but not more relieved by the second application, except one, who received no benefit from the former operation, and who was not a proper subject for the experiment, having no existing pain, but only stiffness in her ankle. They felt (as they fancied) warmth, but in no greater degree than on the former day." Of the Imagination as a Cause and as a Cure of the Disorders of the Body, exemplified by fictitious *Tractors* and epidemical Convulsions. By John Haygarth, M. D. F.R.S. &c. Bath, 1800.

Such were the first experiments attempted with the view of ascertaining the nature of *Perkinism*! But Dr. Haygarth's pamphlet contained an account of still more decisive trials made in the Bristol infirmary, by Mr. Smith, one of the surgeons to that establishment. This gentleman first operated, with two *lead* *tractors*, on Tuesday, April 19th, on a patient who had been some time in the Infirmary, "with a rheumatic affection of the shoulder, which rendered his arm perfectly useless." In the course of six minutes no other effect followed the application of these pieces of *lead* than a warmth upon the skin: nevertheless the patient informed Mr. Smith, on the following day, that "he had received so much benefit, that it had enabled him to lift his hand from his knee, which he had in vain several times attempted on the Monday evening, as the whole ward witnessed." But although it was thus proved that the patent *tractors* possessed no specific powers independent of simple metals, he thought it advisable to lay aside metallic points, lest the proofs might be deemed less complete. "Two pieces of wood, properly shaped and painted, were next made use of; and in order to add solemnity to the farce, Mr. Barton held in his hand a stop-watch, whilst Mr. Lax mimed the effects produced. In four minutes the man raised his hand several inches, and he had lost also the pain in his shoulder, usually experienced when attempting to lift any thing. He continued to undergo the operation daily,

and

IMAGINATION.

and with progressive good effect; for on the 25th he could touch the mantle-piece.

“On the 27th,” Mr. Smith continues, “in the presence of Dr. Lovell and Mr. J. P. Noble, two common iron nails, disguised with sealing-wax, were substituted for the pieces of mahogany before used. In three minutes the same patient ‘felt something moving from his arm to his hand,’ and soon after he touched the Board of Rules, which hung a foot above the fire-place. This patient at length so far recovered, that he could carry coals, &c. and use his arm sufficiently to assist the nurse: yet previous to the use of the spurious tractors, ‘he could no more lift his hand from his knee than if a hundred weight were upon it, or a nail driven through it,’ as he declared in the presence of several gentlemen, whose names I shall have frequent occasion to mention. The fame of this case brought applications in abundance; indeed it must be confessed, that it was more than sufficient to act upon weak minds, and induce a belief that these pieces of wood and iron were endowed with some peculiar virtues.” See Dr. Haygarth’s Pamphlet, p. 8.

Many other equally striking instances of the curative operation of the imagination, when excited by the *sham* tractors, might be quoted from the pamphlet in question; but we shall confine our account to a case, which fell under our own observation. Immediately after the publication of Dr. Haygarth’s exposition, the writer of this article, then a student at Edinburgh, was desirous of being convinced, by personal experience, of the truth of his suggestion. Having procured two pieces of stick, painted both of a leaden colour, himself and a friend operated upon three or four individuals in various painful complaints. A servant girl, afflicted with a most acute head-ache, which she declared had rendered her nights altogether restless for nearly a fortnight, readily submitted to these potent *electrical* instruments, as we called them. We moved them about near the forehead, *never touching her*; and in four minutes she said she felt a sensation of a transient chilliness in the head; in a minute or two more she felt as if cold water was running down the temples, and the pain was somewhat diminished; but in the space of ten minutes she declared that the head-ache was entirely gone. On the following day she came to thank us for the good sleep which she had enjoyed through the night, and then continued free from head-ache: but we understood that in a few days she suffered a slight return of it. In the other cases some relief was afforded, but not so marked as in this; they were, indeed, of an inflammatory nature, and less likely to be speedily cured.

After having perused this abundant evidence of the powers of the imagination, not only in producing various affections of the body, but in removing others which exist, we can have no difficulty in crediting many relations of cures performed by persons supposed to be gifted with extraordinary powers, or employing other pretended agents, all of which may be referred to the same common principle. One of the most singular instances of this kind, both from the number of cures performed, and the rank, learning, and character of the persons who attested them, is to be found in the person of Valentine Greatraks, who flourished in the latter part of the 17th century.

§ 3. *The Cures of Valentine Greatraks, and others.*—The proceedings of this pious and apparently sincere man are very interesting, as affording a history of the power of imagination and confidence over certain disorders of the body. He was the son of an Irish gentleman of good education and property, who died in his childhood. Disgusted with the religious and political contentions of his country in the time of Cromwell, he retired from the world apparently in a state of

melancholy derangement and bad health, which had been nearly terminated fatally. On recovering he became one of the puritans of the day, and after having acted some time as a magistrate, he had “an impulse or strange persuasion” in his mind, which continued to present itself, whether he was in public or in private, sleeping or waking, “that God had given him the blessing of curing the king’s evil.” Accordingly he commenced the practice of touching for this disease about the year 1662, which he continued for three years; at this time the ague became very epidemical, and the same impulse within him suggested, “that there was bestowed upon him the gift of curing the ague,” which he also practised with success, by laying his hands on the patients. At length he found his power extended to epilepsy and paralytic disorders, &c.; but he candidly acknowledges that many were not cured by his touch. Nevertheless the unbounded confidence in his powers, and consequently the facility with which the imagination of the ignorant would be acted upon, must be manifest from the following statement, which he sent to Mr. Boyle. “Great multitudes from divers places resorted to me, so that I could have no time to follow my own occasions, nor enjoy the company of my family and friends: whereupon I set three days in the week apart (from six in the morning till six at night), to lay my hands on all that came, and so continued for some months at home. But the multitudes which came daily were so great, that the neighbouring towns were not able to accommodate them: whereon, for the good of others, I left my home, and went to Youghall, where great multitudes resorted to me, not only of the inhabitants, but also out of England; so that the magistrates of the town told me, that they were afraid that some of the sick people that came out of England might bring the infection into the place: whereon I retired again to my house at Affane, where (as at Youghall) I observed three days, by laying my hands on all that came, whatsoever the diseases were (and many were cured, and many were not); so that my stable, barn, and malt-house were filled with sick people of all diseases almost, &c.” See “A Brief Account of Mr. Valentine Greatraks, and divers of the strange Cures by him lately performed. Written by himself in a Letter addressed to the Hon. Robert Boyle, esq.” London, 1723, p. 32. This pamphlet was published originally in 1666.

We shall not extend this article by quoting the histories of cases certified by several physicians, as well as by divines and philosophers; among whom were the names of Robert Boyle, Dr. Cudworth, Dr. Whichcot, &c. We may remark, that some of the cases of head-ache and rheumatism, resemble most accurately those which were cured by the spurious tractors above-mentioned; and that the hand of Greatraks can only be conceived to have operated in the same way. The influence of the imagination was likewise obvious in several convulsive affections, in the same manner as in the women at Passy, who fell into the *crisis* before the magnetism was applied. Greatraks mentions several poor people that went from England to him, “and amongst the rest, two that had the falling-sickness, who *no soon-er saw me, than they fell into their fits immediately*,” and he restored them, he affirms, by putting his hands upon them. (Loc. cit. p. 34.) Nay, he tells us, that even the touch of his *glove* had driven many kinds of pains away (p. 30), and removed strange fits in women (p. 32.); and that the stroking of his hand or his glove had, in his opinion, and that of other persons present, driven several devils, or evil spirits, out of a woman, one after the other, “every one having been like to choke her (when it came up to her throat), before it went forth.” Now, this whole description contains a pretty accurate

IMAGINATION.

Accurate picture of an ordinary hysterical fit, with its attendant *globus*, terminating with the discharge of flatus. P. 31.

About the same period, a Capuchin friar, whose name was Francisco Bagnone, was famous in Italy for the same gift of healing, by the touch of the hands only; and was attended wherever he went by great multitudes of sick people, upon whom he operated numerous and surprising cures, which were deemed true miracles. So general was the belief in his curative powers, that even a prince of Parma, who had laboured under a febrile disease for the space of six months, was induced to apply to him, and was immediately cured by his voice only. The prince himself, and many others that were present, afterwards bore public testimony to the fact. It appears, however, as might be anticipated, and as Greatraks honestly acknowledges with respect to his own attempts, that great numbers of persons, who applied to the friar with full faith in his powers, were not benefited. A celebrated Venetian physician, Tacchenius, affirms that it was notorious, that many (etiam plurimos) of the sick left his presence as feeble and wretched as when they were admitted: "et ita abiisse, ut admitti erant, miseros atque imbecilles, et vidi ipse et vulgo constat." It is curious to observe, how the same discussions and the same arguments are repeated in different ages, when the same subject is agitated. Tacchenius says, that many persons, especially of the higher classes, ascribed the whole of the affair to the imagination: but to this it was replied, that children, wrapped in their swaddling clothes, were cured through the faith of their parents. Nevertheless, he says, he saw some children brought to the monk several times, who were carried home as sickly as they went. Yet he confesses himself unable to make up his opinion respecting so occult a matter, which is maintained and disputed by so many people. It will be recollected, that the friends of Perkins maintained, in answer to Dr. Haygarth's observations, that sheep and horses had been cured by the metallic tractors, and therefore the influence of imagination was out of the question.

Pechlin, a celebrated Danish physician, to whom the above stated facts were communicated, and who referred them exclusively to the imagination, mentions another person, of the name of Marcus Avianus, a man of austere manners, and bearing a high reputation for sanctity, who obtained a great fame, with a certain class of credulous people, for the cure of diseases in this way. It is certain, however, he adds, that all his efforts were not equally successful; and many, who were apparently cured, speedily relapsed. See Jo. Nic. Pechlini Observ. Physico-Medic. lib. iii. Obs. xxxii.

But it is unnecessary to enumerate the individuals, the De Mainaducs, the Prescotts, &c. who have at different times been distinguished by the possession of various occult methods of healing the sick. The practice has occasionally prevailed in almost all ages; and we have seen, in the detail of experiments above related, that the faculty of the imagination, in certain habits and conditions of the body, and especially in the irritable female constitution, is actually capable of producing all those effects on the corporeal frame, which have been deemed the result of occult agency and extraordinary powers.

§ 4. *Effects of Magic, Incantations, Amulets, Holy Relics, &c.*—Admitting this, then, as an established principle of the human constitution, and making due allowances for the exaggerations and misrepresentations of ignorance and superstition, we are enabled to give a rational explanation of many historical relations, which have been considered as altogether fabulous, or as direct violations of truth. We are well

aware of the facility with which the imagination is excited in an uninformed person, and more particularly in an age of profound ignorance, which is, for that reason, commonly an age of superstition. We know, too, that in the middle ages, when every form of science was almost unknown, and the laws of nature had not been investigated, the smallest discovery in natural philosophy, chemistry, or astronomy, was deemed the result of supernatural communication with the world of spirits; and the discoverer or possessor of the knowledge was looked upon as a being gifted with supernatural powers. In such a state of the human mind, when natural philosophy, meagre as it was, was disguised with the name, and clothed with all the supposed agencies of *magic*; and when every person, with a little more knowledge than his neighbours, was master of so many *magicks*, so many *tractors*, by which he could rule the imaginations of the multitude; it cannot be the subject of our wonder, that the magician's rod (or the philosopher's cane) should produce such mighty operations, or that a scrap of his writing should be a remedy for many maladies. These only executed what was afterwards performed by M. Deslon's extended fingers, and Valentine Greatraks' glove! The effects, then, of the *incantations*, *amulets*, and all the arts of magic, witchcraft, and astrology, by which the more artful pretenders to superior knowledge imposed upon the people, may be allowed to have actually occurred, and to have been the result of natural causes; and they are plainly referrible to one common source, with those of animal magnetism, Perkinism, and various other modifications of the imagination in fetters.

It is scarcely necessary to add, that, during the same periods of ignorance and superstition, those extremely pious and comparatively learned persons, who have been enrolled in the catalogue of saints, must necessarily have obtained the most complete veneration and confidence from the multitude; and hence, after their death, every relic of their bodies or clothing, the shrines in which they were entombed, fragments of the instruments of their execution (in the cases of martyrdom), and every other object that could excite, by association, those reverential feelings, usually called up by a contemplation of their character, would become so many agents upon the imagination, by which all the extraordinary changes in the animal economy above described might be effectually produced. Thus we cannot doubt that there is much foundation for the histories of recovery from various diseases, occasioned by removing the sick to the tombs of celebrated worthies, or placing them before the statues and images of these persons, or by touching them with nails taken from the coffins, or rings from the fingers, or the bones of the fingers themselves of these saints, or by the influence of an infinity of relics of this sort, which cannot be supposed to possess less power over a superstitious mind, than the painted *tractors* of a surgeon, or the glove of an enthusiast.

§ 5. *Influence of the Imagination in Aid of Medicine.*—Since it is obvious, then, that the imagination is capable of producing very important changes in the nervous and vascular systems, independently of the operation of medicine; the physician will infer, that this faculty may be employed as a powerful adjuvant in his hands, and that, by a combination of the most active remedies of both body and mind, he may extend the usefulness of his art to the utmost bounds. A very able physician, Dr. Lind of Haflar, long ago deduced this inference from an interesting occurrence at Breda, related by Vander Mye. "An important lesson in physic," he says, "is here to be learned, namely, the wonderful and powerful influence of the passions of the mind upon the state

IMAGINATION.

and disorders of the body. This is too often overlooked in the cure of diseases; many of which are sometimes attempted by the sole mechanical operation of drugs, without calling into assistance the strong powers of imagination, or the concurring influences of the soul. Hence it is, that the same remedy will not produce the like effect, even in the same person, when given by different hands." (See Lind's Treatise on Scurvy.) The history given by Vander Mye is strongly illustrative of the subject before us.

During the siege of Breda, in 1625, the garrison was afflicted with the scurvy in a most dreadful degree. "When the prince of Orange heard of their distress," says this physician, "and understood that the city was in danger of being delivered up to the enemy by the soldiers; he wrote letters addressed to the men, promising them the most speedy relief. These were accompanied with medicines against the scurvy, said to be of great price, but of still greater efficacy: many more were yet to be sent them. The effects of this deceit were truly astonishing! Three small phials of medicine were given to each physician, not enough for the recovery of two patients. It was publicly given out, that three or four drops were sufficient to impart a healing virtue to a gallon of liquor. We now displayed our wonder-working balsams; nor were even the commanders let into the secret of the cheat put upon the soldiers. They flocked in crowds about us, every one soliciting that part may be reserved for their use. Cheerfulness again appears on every countenance, and an universal faith prevails in the sovereign virtues of the remedies. The herbs now beginning to spring up above the ground, of these we make decoctions, to which wormwood and camphor were added, that by the prevalent flavour of these, they might appear medicines of no mean efficacy. The stiff contracted limbs were anointed with wax, melted in rapeseed or linseed oil. The invention of new and untried physic is boasted; and amidst a defect of every necessary and useful medicine, a strange medley of drugs was compounded. The effect, however, of the delusion was really astonishing; for many were quickly and perfectly recovered. Such as had not moved their limbs for a month before, were seen walking the streets sound, straight, and whole. They boasted of their cure by the prince's remedy: the motion of their joints being restored by a simple friction with oil, and the belly now of itself well performing its office, or at least with a small assistance from medicine. Many who declared they had been rendered worse by all former remedies, recovered in a few days to their inexpressible joy, and the no less general surprize by taking (almost by having brought to them) what we affirmed to them to be their gracious prince's cure." Lind's loc. cit. and Fred. Vander Mye, de morbis et symptomatibus popularibus Bredanis, tempore obsidionis.

Another rule of medical practice is to be deduced, Dr. Haygarth observes, from the facts which were ascertained from the experiments with the fictitious tractors. "A patient ought always to be inspired in the best manner possible, with confidence in any remedy which is administered: but if a favourable opinion of it cannot be obtained, and especially if there be a marked prejudice against it, another (though a less powerful) medicine ought to be preferred." Haygarth, loc. cit. p. 28.

The preceding statements illustrate also the great advantages of medical reputation, in consequence of the faith of the sick in the medicines prescribed by those who are possessed of it. This explains what has been frequently observed, that the same remedy will produce more beneficial effects, when prescribed by a famous physician, or an assuming empiric, than when taken from the hands of a per-

son of less character and notoriety. Magnificent and unqualified promises, in the latter case, inspire weak minds with implicit confidence. "Omne ignotum pro magnifico." Upon this principle we may account for the marvellous recoveries frequently ascribed to empirical remedies, which are often inert drugs, and generally applied by the ignorant patient in disorders totally different from what the quack himself pretends that he can cure. Hence also it may be observed, that new medicines, even when their composition is known, if recommended to the public with exalted praise, have sometimes been attended with great success, much greater than future experience confirmed. From the same views it is apparent, why reputation, however absurdly obtained, will contribute to enable certain persons to cure some diseases. Thus kings, old women, and seventh sons, who have had medical diplomas assigned to them by common consent for many ages, have probably sometimes worked cures. Nevertheless we have seen, that there were other attractions to the presence of kings, besides the royal touch, when that was in vogue; and the angel was perhaps the best ingredient in the remedy. See EVIL, King's.

After all that has been said, some persons may nevertheless be sceptical as to the power of the imagination over the corporeal organs, illustrated in this article, and think it impossible that such great physical changes can be produced by a mere mental affection. How, they will ask, can any operation of mind at once modify the actions of vessels, nerves, and muscles, over which the will has no controul? Nothing is more mysterious or inscrutable than the operations of the mind upon the body; so that the proximate cause of the motion of the muscles of any organ, by a thought, a volition of the mind, is altogether incomprehensible. The only answer, therefore, that can be given to this question, consists in shewing that analogous effects of the operation of the mind in regard to organs not subject to the will are frequent in the animal economy.

We have a familiar example of the instantaneous change in the action of blood-vessels, occasioned by an affection of the mind in the act of *blushing*, in which the cutaneous vessels of the face are immediately distended with blood, from the feeling of shame: and a still greater distention of vessels occurs in some other organs of the body, as the immediate consequence of certain passions. On the contrary, other mental emotions, such as fear and terror, as speedily diminish the action of the blood-vessels; whence the sudden *pallor* which overspreads the person under such emotions; nay, when these are violent, the whole system of circulation, heart and arteries together, is often instantaneously suspended in its motions; if this suspension be merely temporary, as is usual, *syncope* or *fainting* only occurs; if it be permanent, which has sometimes happened, death ensues. In delicate and irritable habits, and therefore especially in the female sex, very slight affections of the mind will produce *convulsions*, and all the other effects which were exhibited in the *crises* of animal magnetism. *Hysterical* paroxysms are thus frequently produced by the mimic pathos of a theatrical scene; by the slightest emotions of alarm and apprehension, and even by joy; and they often ensue after a continued attention to some interesting object. Even the convulsions of *epilepsy* have been excited by the mere sight of a person afflicted by them. (See IMITATION.) In fact, the mind has an extensive influence over spasmodic and convulsive diseases, which depend chiefly upon the unusual mobility of the nervous system, from the slight convulsion of *hiccup* to the most violent hysterical fit: and as the motions of the heart and arteries are closely connected with the state of the brain and nerves, through the same medium the force, rapi-

dity,

dity, and regularity of the circulation may be variously affected. It would seem, indeed, that by a continued direction of the *attention* to particular parts of the body, combined with a belief in the efficacy of a supposed remedy applied to them, the action of particular portions of the circulating system may be considerably modified. For not only has this effect arisen from the external employment of the *traçtors*; but even the internal organs, *e. g.* the stomach and bowels, have been acted upon by medicines of supposed efficacy which had been swallowed. There are instances on record of *bread pills* operating as purgatives, when administered with the assurance that they would produce that effect: and it is well known, that not only the sight of a person in the act of vomiting, but even the thought or recollection of it, has produced the inverted action of the fibres of the stomach, and vomiting itself. Turner mentions a young gentleman who was a patient of his, and who having taken several drastic emetics, became so disgusted, that he could vomit by the force of imagination as effectually as from the most active medicine. The sight of a bolus produced this effect immediately, again and again, whenever it was produced. "Nay, so great and admirable," says Turner, "is the idiosyncrasy of this gentleman, that if at meals or in company, though never so well before, other persons talked but of a bolus, or himself casually thought upon the same, it was odds if he was not forced to rise from table and fall a vomiting." Turner on Diseases of the Skin, chap. xii. See also Pechlin. Obs. Med. Phys. the third book of which relates chiefly to the influence of the mind on the body; and Whytt on Nervous Disorders, chap. v. sect. 6.

On the whole, then, there is ample evidence of the influence of the mind over the actions of the nervous and muscular parts of the body, which are not under the subjection of the will; and therefore we have the concurring proofs, both from analogy and direct experiment, in favour of referring all the phenomena comprehended in this article, to one and the same principle. See also IMITATION.

IMAGINATION, in *Music*, was too much fettered during the seventeenth century by canon, fugue, and ecclesiastical modes, to attempt the use of her wings. In the perusal of the music of the times, we collected fragments of the infant lisp in the vocal language, which has been since so highly polished; but neither found in the subjects of fugue, or vocal divisions, any thing like invention or grace, till after the time of Carissimi and Stradella, who seem to have been the first gifted musicians in Italy.

In England, crowded and elaborate as is the harmony, and uncouth and antiquated the melody in the collection of the best compositions of the time, in queen Elizabeth's virginal book, there is a manifest superiority in those of Bird over all the rest, both in texture and design. In a later age his genius would have expanded in works of invention, taste, and elegance; but, at the period in which he flourished, nothing seems to have been thought necessary for keyed-instruments, except variations to old tunes, in which all the harmony was crowded, which the fingers could grasp, and all the rapid divisions of the times, which they could execute. Even nominal fancies were without fancy, and confined to the repetition of a few dry and unmeaning notes in fugue, or imitation. Invention was so young and feeble, as to be unable to go alone; and old chants of the church, or tunes of the street, were its leading-strings and guides.

IMAGINIFER, among the Romans, an ensign-bearer, who carried the standard on which was represented the image of the reigning emperor. See SIGNA.

IMAGLIN, in *Geography*, a small island in the Straits, between the western coast of America, and the east point of Russia. N. lat. 65° 40'. E. long. 189° 44'.

IMAGO, in *Natural History*, is a name given by Linnaeus to the third state of insects, when they appear in their proper shape and colours, and under no more transformation.

IMALGAN, in *Geography*, a small island in the sea of Mindoro. N. lat. 10° 51'. E. long. 121° 5'.

IMAM, or IMAN, a minister in the Mahometan church, answering to a parish priest among us.

The word properly signifies what we call a prelate, *antistes*, one who presides over others; but the Mussulmen frequently apply it to a person who has the care and intendency of a mosque, who is always there at first, and reads prayers to the people, which they repeat after him.

IMAM is also applied, by way of excellence, to the four chiefs or founders of the four principal sects in the Mahometan religion.

Thus Ali is the imam of the Persian, or of the sect of the Schiites; Abu-beker the imam of the Sunnites, which is the sect followed by the Turks; Saphii, or Saff-y, the imam of another sect, &c.

The Mahometans do not agree among themselves about this *imamate*, or dignity of the imam. Some think it of divine right, and attached to a single family, as the pontificate of Aaron. Others hold, that it is, indeed, of divine right, but deny it to be so attached to any single family, as that it may not be transferred to another. They add, that the imam is to be clear of all gross sins; and that otherwise he may be deposed, and his dignity may be conferred on another. However this be, it is certain, that after an imam has once been owned as such by the Mussulmen, he who denies that his authority comes immediately from God, is accounted impious; he who does not obey him, is a rebel; and he who pretends to contradict what he says, is esteemed a fool, among the orthodox of that religion. The imams have no outward mark of distinction; their habit is the same with that of the Turks in common, except that the turban is a little larger, and folded somewhat differently.

IMAM of *Sana*. See SANA and YEMEN.

IMAMIA, a name given to that sect of the Mahometans, to which the Persians adhere. See IMAM.

IMAMZADE, in *Geography*, a town of Persia, in the province of Farsistan; 20 miles S. of Darabgherd.

IMAMZADE-*Kasim*, a town of Persia, in the province of Irak; 30 miles S.W. of Ghulpaigan.

IMANDRA, a considerable lake of Russian Lapland.

IMAUUS, in *Ancient Geography*, part of a long chain of mountains, which traversed Independent and Russian Tartary, with the extent and direction of which the ancients were very imperfectly acquainted. According to them, this chain divided Scythia into two parts, *viz.* Scythia intra Imaum, and Scythia extra Imaum. Ptolemy not only describes an Imaus as running N. and S., which is the Belur-Tag of the Russians and Tartars, with its ridges to the W., now called Argun, Ak-tau, &c.; but another Imaus passing E. and W. to the N. of Hindoostan. As the Northern Imaus of Ptolemy is clearly the Belur-Tag, so his Southern Imaus may be safely regarded, says Pinkerton, as the Himmaleh of the Hindoos; which we may allow to have been known to the ancients, who were no strangers to the rich Gangetic regions of Hindoostan. Nor was it absurd to consider the Himmaleh as a S.E. prolongation of the Northern Imaus. See HIMMALEH.

IMBA, in *Geography*, a town of Japan, in the island of Nippon; 70 miles E. of Jedo.

IMBANKING. See BANKING.

IMBARGO, or EMBARGO, a stop or stay put upon ships, or merchandize, usually by public authority. See EMBARGO.

IMBATTLED. See EMBATTLED.

IMBECILITY, a state of languor and decay; wherein the body is not able to perform its usual exercises or functions.

IMBER, in *Ornithology*. See COLYMBUS *Immer*.

IMBEZLE, or IMBEZZLE, is probably from the old English word to waste, pilfer, or purloin.

As where a person intruded with goods, wastes, consumes, and diminishes them, he is said to imbezzle them. Persons that imbezzle, or illegally dispose of any woollen, linen, fustian, cotton, or iron materials; or gloves, leather, shoes, &c. with which they are entrusted for manufacture, shall forfeit double the value, or be sent to the house of correction, and there whipped, and kept to hard labour fourteen days: and for the second offence, forfeit four times the value, &c. Buyers and receivers are liable to the same penalties, 13 Geo. II. c. 8.

If any servant imbezles, purloins, or makes away his master's goods, to forty shillings value, it is made felony without benefit of clergy, 12 Ann. c. 7. Imbezling the king's armour, or stores, is felony by 31 Eliz. c. 4.; other inferior imbezlements and misdemeanours of the same kind are punished with fine, corporal punishment, and imprisonment, by 9 & 10 Will. III. c. 41. 1 Geo. I. c. 25. 9 Geo. I. c. 8. and 17 Geo. II. c. 50. The usual method of proceeding against high officers who imbezle the public money is by impeachment in parliament. At common law the offender is subject to a discretionary fine and imprisonment. Imbezling, or vacating records, is a felonious offence against public justice, 8 Hen. VI. c. 12.

IMBIBE, is commonly used in the same sense as *absorb*, viz. where a dry porous body takes up another that is moist.

IMBLOCATION, in *Middle Age Writers*, a particular method of disposing of the dead bodies of excommunicated persons, by raising over them a heap of stones, or earth. This was done in the fields, or near highways; it being unlawful to bury them in holy ground, or even to inter them at all. See BURIAL.

The word is derived from *loc*, tumulus.

IMBRA CHRISTOS, in *Geography*, a town of Abyssinia; 145 miles S.E. of Gondar.

IMBRICARIA, in *Botany*, was so named by Dr. Smith in his paper on the "Botanical Characters of some Plants of the Natural Order of *Myrti*." Linn. Soc. Transf. v. 3. 257. This is the *Jungia* of Gærtner, but Linnæus in his *Supplementum Plantarum* having already dedicated a plant, of a very different genus, to the memory of Jungius, it became necessary to give this of Gærtner another denomination. Professor Gmelin called it *Mollia*, but as that was of uncertain derivation it was purposely changed. "In preference; therefore, to *Mollia* (says Dr. Smith), this genus is called *Imbricaria* in allusion to its imbricated foliage. A farther reason for my choice of this name is to abolish the *Imbricaria* of Gmelin, taken up by him from Jusseu, which I know from original specimens to be the identical *Mimusops Kauri* of Linnæus, of which Jusseu, after Commerçon's Manuscripts, made a distinct genus on account of its fruit having eight cells, and as many seeds; but Commerçon observed that four or more of these were often abortive; and on the other hand Rumphius tells us

the *Mimusops* has often as many as three or four perfect seeds. It is probable, therefore, that the germen has eight cells and eight seeds, most of which are generally abortive; a striking instance of the necessity of studying that part in all its states."

Gen. Ch. *Cal.* Perianth superior, in five segments. *Cor.* of five petals. *Stam.* Filaments five. *Pist.* Germen of two cells, one of which is frequently abortive; style solitary; stigma globose. *Peric.* Capsule inferior, crowned with the rounded teeth of the calyx, coriaceous, smooth, ovate, somewhat compressed. *Recept.* none. *Seeds* from four to eight, final, ovate, brown.

Ess. Ch. Petals five. Stigma capitate. Capsule covered by the calyx, of two cells and many seeds.

1. *I. crenulata*. Linn. Soc. Transf. v. 3. 259. (*Jungia imbricata*; Gærtner.) "Leaves obovate-wedge shaped, crenulated towards the top. Petals and calyx toothed." A native of Port Jackson, New South Wales.—*Stem* about a foot high, tough and wiry, thickly imbricated with smooth, shining, carinated leaves. *Flowers* lateral. Whole plant smooth.

2. *I. ciliata*. Linn. Soc. Transf. v. 3. 259. "Leaves triangularly-linear. Calyx fringed. Germen five-sided" A native also of New South Wales.—*Stem* branched, thickly imbricated with minute, shining leaves, among which the flowers seem imbedded.

These are the only species known; but it has been suggested that the *Jungia tenella* of Gærtner might be added to this genus. This last mentioned author suspected the *Efcallonia* of Linn. Suppl. to be the same as his *Jungia*, but these genera differ essentially in the latter having a capsule instead of a berry, not to mention other particulars.

IMBRICATED is used, by some botanists, to express the figure of the leaves of some plants, which are hollowed like an *imbrea*, or gutter-tile, or are laid in close series over one another like the tiles of a house.

IMBRICATED Cup, *imbricatus calyx*, a term used by authors to express the cups of some of the plants which have compound flowers; in which the common perianthium, surrounding the whole cluster of flowers, is composed of several series of squamæ, the exterior of which is short, and the interior longer, but in great part hid under these upper ones.

IMBRICATED Shell, *imbricata concha*, in *Natural History*, a term used in general to express any species of shell-fish, whose shells are elevated into transverse ridges, lying over one another at the base, in the manner of the tiles on a house-top. It has also been used as the name of a peculiar species of shell: this is a *cordiformis*, or heart-shell, whose sides are remarkably ridged in this transverse manner, and at the same time so divided longitudinally by seven high ribs running from the apex to the edge, that the whole represents the roof of a house with the beams and rafters, before they are covered by the tiling. Hence the French call it *faïtière*.

IMBRO, in *Geography*, an island in the Grecian Archipelago, mountainous and woody, with plenty of game; about 20 miles in circumference and containing five villages, two of which are defended by castles. N. lat. 40 10. E. long. 25 46'.

IMELBORN, a town of Germany, in the county of Henneberg; 34 miles S.E. of Saßungen.

IMER, LA SIGNORA, in *Biography*, a female opera singer in London 1746, at the same time as Monticelli. Though she was nominally the first woman, she never surpassed mediocrity in voice, taste, or action.

IMGNAEL, in *Geography*, a town of Norway, in the diocese of Drontheim; 56 miles N.N.E. of Runfdal.

IMHOFF, JOHN WILLIAM, in *Biography*, an eminent genealogist, was a German of a noble family, who devoted himself to the study of history, politics, and particularly the descents and alliances of all the great houses in Europe. His principal works are "De Notitia Procerum Germaniæ;" "Historia Genealogica Italiæ et Hispaniæ;" "Familiarum Italiæ, Hispaniæ, Portugalliæ, Magnæ Britanniæ, cum Appendice;" "Recherches sur les Grands d'Espagne." He died in 1728.

IMIDSU, in *Geography*, a town of Japan, in the island of Nippon; 130 miles N.W. of Jedo.

IMIRETTA, IMERITIA, or IMMERETIA, a country of Asia, in European Turkey, which lies between the Caspian and Black seas, bounded on the E. and S E. by Georgia, on the N. by Osetia, or that part of Circassia, called the government of Caucasus, on the W. by Mingrelia, and on the S. by Turkish Armenia. It pertains to the ancient Iberia, and is about 80 miles from N. to S., and nearly as much from E. to W. The country is mountainous and poor; and the inhabitants are wanderers and vagabonds. Although it could formerly supply an army of 20,000 men, it is now thinly peopled, on account of the number of children purchased by the Turks, and an imposition laid upon them of furnishing annually 80 young men, between 10 and 20 years of age. The governing prince assumes the title of king of kings. The towns are few; but the principal seems to be Cotatis.

IMITATION, in the *Arts of Design*, has, as in other things, two acceptations; one of a confined, the other of a more vague sense. In the first it signifies merely copying closely the forms or colours of a work of art or nature; in the second, it is sufficient that the style of the thing imitated be maintained; and it is in this latter sense most frequently applied. Thus Raphael may be said to have imitated in his latter works the style of Michael-Angelo in design; and Julio Romano his master Raphael. Thus the whole Venetian school endeavoured to imitate Titian and Paul Veronese; and the Flemish Rubens, Rembrandt, and Teniers.

Imitation, thus considered, is the true source of advancement in art. Were it not for the attempt to follow in the paths of great men, the arts would be always in their infancy; be always stationary in their progress, if we may use the expression; and therefore whilst we deprecate a long continuance of dull copying the effects and defects of the greatest masters, we would recommend to all youths engaged in the polite arts, at all times to keep in their mind's-eye at least, the works of those who have successfully passed the ordeal of time: and most probably if they have original genius within them, its fire will be most usefully elicited by rivalry thus laudably excited. And not to youths alone will this conduct be found useful; right happy ought he to feel himself, who, adopting this plan, shall become able to unite the various beauties he may thus select.

Too much stress has been laid upon what is termed originality, to which title it would appear eccentricity has the surest claim. But that is not the foundation upon which the great artists of Italy, Spain, and Flanders, proceeded in their labours. Step by step they advanced upon the merits of their predecessors; till at last their own excellencies seem to leave little room for further advance in true taste: yet that mode of study which has produced so much, bids most fair to produce whatever may best be effected in art: viz. a careful imitation in the first instance of what has been done, till the mind is informed of the most important principles of art: and then a judicious examination, how far these works correspond with

nature; and wherein they are capable of receiving new beauties, consistent with the laws and principles by which she is governed. How far positive imitation of nature is, in painting or sculpture required by, or consistent with the best principles of those arts, see the article IDEAL, in *Painting and Sculpture*.

IMITATION may here be considered as one of the sources of pleasure to Taste. Accordingly it gives rise to what Mr. Addison terms the secondary pleasures of imagination, which form, without doubt, a very extensive class. For all imitation affords some pleasure; not only the imitation of beautiful or great objects, by recalling the original ideas of beauty or grandeur, which such objects themselves exhibited; but even objects, which have neither beauty nor grandeur, nay, some which are terrible or deformed, please us in a secondary or represented view. The high power, says Dr. Blair, which eloquence and poetry possess, of supplying taste and imagination with such a wide circle of pleasures, they derive altogether from their having a greater capacity of imitation and description than is possessed by any other art. Of all the means which human ingenuity has contrived for recalling the images of real objects, and awakening, by representation, similar emotions to those which are raised by the original, none is so full and extensive as that which is executed by words and writing. By the alliance of this happy invention, there is nothing, either in the natural or moral world, but what can be represented and set before the mind, in colours very strong and lively. Hence it is usual among critical writers, to speak of discourse as the chief of all the imitative or mimetic arts; they compare it with painting and with sculpture, and in many respects prefer it justly before them. However, neither discourse in general, nor poetry in particular, can be called altogether imitative arts. We must distinguish, says Dr. Blair, betwixt imitation and description, which are ideas that ought not to be confounded. Imitation is performed by means of somewhat that has a natural likeness and resemblance to the thing imitated, and of consequence is understood by all; such are statues and pictures. Description, again, is the raising in the mind the conception of an object by means of some arbitrary or instituted symbols, understood only by those who agree in the institution of them; such are words and writing. Words have no natural resemblance to the ideas or objects which they are employed to signify; but a statue or a picture has a natural likeness to the original. And therefore imitation and description differ considerably in their nature from each other. Nevertheless, imitation and description agree in their principal effect, of recalling, by external signs, the ideas of things which we do not see. But though in this they coincide, it should not be forgotten, that the terms themselves are not synonymous, that they impart different means of effecting the same end; and of course make different impressions on the mind. Blair's Lect. vol. iii. See POETRY.

IMITATION, in *Music*, dramatic or theatrical, belongs to imitation, as much as poetry and painting do: in this instance it is a principle common to all arts. But this imitation does not belong to all arts to the same extent. All that the imagination can convey to the mind belongs to poetry. Painting, which cannot present its pictures to the imagination, but to sense, and to one sense only, can only paint objects submitted to the judgment of the eye. Music should seem to have the same bounds with respect to the ear; however, she can represent every thing, even objects that are only visible: by an illusion almost inconceivable, she seems to put the eye into the ear; and the greatest miracle of an art, which totally depends on movement, is, that it can excite an idea of repose. Night, sleep, solitude,
and

IMITATION.

and silence; all enumerated among the great pictures of music. It is known that noise can produce the effect of silence, and silence the effect of noise: as when we fall asleep during an even-toned and monotonous reading, and that we wake the instant it ceases. But music acts more immediately upon our sensation in exciting by one sense similar affections to those which we can excite by another. And, as the relations cannot be sensible unless the impression is forcibly made, painting, stripped of this force, cannot return to music those imitations which music draws from her ideal painting. Let all nature sleep, the person who contemplates her at such time is not asleep. And the musician's art consists in substituting to the insensible object that of movement, which its presence excites in the heart of the beholder. It will not only agitate the sea, increase the flames of a conflagration, render the stream of a river more rapid, produce showers, and swell torrents; but will paint the horror of a frightful desert, blacken the walls of a subterraneous dungeon, calm the tempest, render the air tranquil and serene, and shed from the orchestra new freshness on the grove. It will not represent these things directly; but it will awaken in the mind the same sensations which we feel in seeing them.

It has been said in the article HARMONY, that we can draw from it no principle of musical imitation, as there is no relation between chords and objects which we wish to paint, or passions which we would express. See MELODY.

IMITATION, in its technical sense, is using the same, or a similar passage or melody, in many different parts, which are heard one after the other: in the unison, 5th, 4th, 3d, or in any other interval whatever. Imitation is always pleasing, even if many notes are changed, provided the air is not so disguised as to be no longer recognizable, and the rules of modulation are not violated. Often, in order to render imitation more perceptible, it is preceded by a rest, or by long notes, which seem to extinguish the melody at the very moment when it is renewed by the imitation. Imitations are warrantable at our pleasure; they are confined to no particular intervals, they may be continued or changed for another, or the imitation made in *modo contrario*, or contrary motion, or in what way we please. The several performers like it better than a dull and dry accompaniment; it renders a part more amusing to the player and important to the hearer; the rules are as relaxed as those of fugue are rigid; for which reason great masters disdain imitations from the facility with which they are composed; and when pursued too closely with the manifest ambition of being particularly noticed, they discover the *young* contrapuntist. Rousseau.

IMITATION, *Principle of, in Medicine.* Man was characterized by Aristotle as an *imitative* animal; and a propensity to imitation appears from the first dawn of reason in infants, and in some measure accompanies us through life. By this term, we do not mean to designate that voluntary and deliberate imitation, by which we copy the dress, language, or manners of others; but that sort of *irritative* imitation, (to adopt the language of Dr. Darwin,) of which we are almost unconscious, and to which we are drawn mechanically, as it were, by a propensity, which it requires an act of volition to resist;—"cette imitation machinale, qui nous porte malgré nous à répéter ce qui frappe nos sens," as the French commissioners have expressed it. (Rapport des Commissaires, chargés par le Roi de l'Examen du Magnétisme Animal, p. 77; Paris 1784.) The most familiar example of this propensity that can be adduced, is the act of *yawning*, which is readily propagated from one person through a whole company. But there is scarcely any irregular action of any organ of the body, which has not been caught (to use a

common phrase), in consequence of this tendency to imitation, by different individuals: thus *squinting*, *flammering*, *winking* with the eyes, and various unteemly habits, have been frequently acquired, by associating with those to whom they were already habitual. In a similar manner, many people are immediately excited to the act of *vomiting* by the sight of a person in the same act; and various convulsive disorders have been caused by looking on others affected with them. Baglivi mentions a young man, who, looking at a person in an *epileptic* fit, was himself affected in the same manner: and Dr. Whytt says, "it has frequently happened in the Royal Infirmary here (at Edinburgh), that women have been seized with *hysteric* fits, from seeing others attacked with them;" a fact, which the writer of this article has also witnessed in the same hospital.

A remarkable example of this infectious nature of convulsive diseases, (if the term may be used in this sense,) occurred in the poor's house at Haerlem, under the inspection of the learned Dr. Boerhaave, of which his nephew has given the following account. "In the house of charity at Haerlem, a girl, under an impression of terror, fell into a convulsive disease, which returned in regular paroxysms. One of the by-standers, intent upon assisting her, was seized with a similar fit, which also recurred at intervals; and on the day following, another was attacked; then a third, and a fourth; in short, almost the whole of the children, both girls and boys, were afflicted with these convulsions. No sooner was one seized, than the sight brought on the paroxysm in almost all the rest at the same time. Under these distressing circumstances, the physicians exhibited all the powerful antiepileptic medicines with which their art furnished them; but in vain. They then applied to Boerhaave, who, compassionating the wretched condition of the poor children, repaired to Haerlem; and whilst he was inquiring into the matter, one of them was seized with a fit, and immediately he saw several others attacked with a species of epileptic convulsion. It presently occurred to this sagacious physician, that, as the best medicines had been skilfully administered, and as the propagation of the disease from one to another appeared to depend on the imagination, (or the principle of imitation,) by preventing this impression upon the mind, the disease might be cured: and his suggestion was successfully adopted. Having previously apprised the magistrates of his views, he ordered, in the presence of all the children, that several portable furnaces should be placed in different parts of the chamber, containing burning coals, and that irons, bent to a certain form, should be placed in the furnaces; and then he gave these farther commands:—that all medicines would be totally useless, and the only remedy with which he was acquainted, was, that the first who should be seized with a fit, whether boy or girl, must be burnt in the arm, to the very bone, by a red-hot iron. He spoke this with uncommon dignity and gravity; and the children, terrified at the thoughts of this cruel remedy, when they perceived any tendency to the recurrence of the paroxysm, immediately exerted all their strength of mind, and called up the horrible idea of the burning; and were thus enabled, by the stronger mental impression, to resist the influence of the morbid propensity." (Abr. Kaau-Boerhaave, *Impet. faciens*; Hippoc. dictum, ix. § 406.) This case affords at once an illustration of the powerful operation of the imitative principle, and of the influence of the imagination, when excited by strong impressions, over the diseases of the body, as related in a preceding article. See IMAGINATION.

If we trace the operation of this imitative propensity a little farther, we find that convulsive disorders are not only communicated, in this manner, to persons who live in the same

IMITATION.

same house or apartment; but that they have, in many instances, been propagated from house to house, by the intimate intercourse of persons in the same neighbourhood, and thus a sort of *epidemical convulsions* has been produced. At the latter end of the year 1796, Dr. Haygarth was consulted respecting a convulsive malady, which prevailed for some time among the tenants of the earl of Uxbridge and Holland Griffith, esquire, in the island of Anglesey. This disease gradually spread from one girl to twenty-three others, all between the age of ten and twenty-five; except one boy, seventeen years old, all the patients were females. This disorder began with pain in the head, and sometimes in the stomach and side, but not very violent: this was succeeded by violent twitchings or convulsions of the upper extremities, continuing with little intermission, and causing the shoulders almost to meet by the exertion. The second person attacked was sister of the first, and lived in the same house; the third and fourth were acquaintances, and had been much alarmed at seeing the fits of the first patient. In the course of two or three months, eighteen girls were thus attacked, of whom only two had recovered. The influence of the imagination, as well as of the principle of imitation, was obvious from the general alarm and anxiety which prevailed; a state of mind which predisposes to the operation of this principle, as was exemplified by the animal-magnetism. (See IMAGINATION.) "All of them," says Mr. Griffith, "as far as I can understand, were taken much in the same manner with the first three. Their lower extremities are free from spasms, although they find themselves considerably relaxed. The least alarm throws them into a shaking fit. They have in general a hiccup. The anxiety of parents, sisters, brothers, friends, &c. for their recovery, is particularly obvious in this neighbourhood." (See Dr. Haygarth's pamphlet, "On the Imagination as a Cause and as a Cure of Disorders of the Body; exemplified by fictitious Tractors, and epidemical Convulsions," 1800.) This intelligent physician, after prescribing some antispasmodic medicines, desired Mr. Griffith to use all his authority to prevent girls and young women from having any communication with persons affected with these convulsions, and to keep those who were ill of the distemper separate from each other, as much as possible. "I warned him," Dr. Haygarth says, "that if these cautions were not observed, the epidemic might spread through the whole island of Anglesey." Loc. cit. p. 35.

Dr. Haygarth was led to take this view of the subject, from his recollection of the case of the children in the poor-house at Haerlem, and of the occurrence of a convulsive disease of the hysterical kind, which, about thirty years before, had spread through the shire of Angus, in Scotland. Several imperfect descriptions of this malady may be found in the "Statistical Account" of Scotland. (See also Edin. Med. and Surg. Journ. for Oct. 1807, vol. iii. p. 434.) Dr. Whytt long ago noticed the frequency of convulsions in Zetland, and he adduced the extreme facility with which they were propagated among the young women of that island, as a proof of the existence of a wonderful sympathy between the nervous systems of different individuals, by means of which various motions and morbid symptoms are often transferred from one to another, without any corporeal contact or infection. (Essay on Nervous Disorders, chap. iii. sect. vi.) An account of this disease, related by the minister of the parish of Unst, the most northerly of the Shetlands, is given in the Edinburgh Journal, just quoted. "There is a shocking distemper, which has of late years prevailed pretty much," (he writes in 1774,) "especially among young women, and was hardly known 30 or 40 years

ago. About that period *only one person* was subject to it. The inhabitants gave it the name of convulsion fits; and indeed, in appearance, it something resembles an epilepsy. In its first rise, it began with a palpitation in the heart, of which they complained for a considerable time; it at length produced swooning fits, in which people seized with it would lie motionless upwards of an hour. At length as the distemper gathered strength, when any violent passion seized, or on a sudden surprize, they would all at once fall down, toss their arms about, writhe their bodies into very odd shapes, crying out all the while most dismally, throwing their heads about from side to side, with their eyes fixed and staring. At first this distemper obtained in a private way with one female, but she *being seized in a public way at church*, the disease was communicated to others, but whether by the influence of fear or *sympathy* is not easy to determine." (P. 438, vol. iii.) In another of the northern parishes, Delsing, the disease was very prevalent. "The patient is first seized with something like fainting, and immediately after utters wild cries and shrieks, the sound of which, at whatever distance, immediately puts all who are subject to the disorder in the same situation. It most commonly attacks them *when the church is crowded*, and often interrupts the service in this and many other churches in the country. On a sacramental occasion, fifty or sixty are sometimes carried out of the church, and laid in the church yard, where they struggle and roar with all their strength for five or ten minutes, and then rise up without recollecting a single circumstance that happened to them, &c." (See Statistical Account, vol. i. p. 385, 1791.) In this description we recognize the features of hysteria; and the influence of moral causes in removing, as well as in inducing these convulsive maladies, was evinced in the parish of Northmaven, where the disease was thus extinguished. "The cure is attributed to a rough fellow of a kirk-officer, who tossed a woman in that late, with whom he had been frequently troubled, into a ditch of water. She was never known to have the disease afterwards, and others dreaded the like treatment." (Stat. Acc. vol. xii. p. 363, 1794.) Here the principle of cure was perfectly analogous to that resorted to by Boerhaave in the work-house at Haerlem.

Every species of mental emotion is propagated in a similar manner among crowds of people under various circumstances, and the more readily when they are accompanied by corporeal actions. If the sight of a number of persons, in the act of yawning, almost irresistibly impels us to yawn with them; so the sight of a multitude of sorrowful countenances, or of countenances in furious anger, carries us into similar feelings, and renders us most acutely susceptible of corresponding impressions from the slightest causes. Hence arises much of the *magnanimity* of armies, on the one hand, and the facility of the propagation of *panic*, on the other; hence the uncontrollable fury of mobs, &c. But there is no general emotion, which renders the body more completely subservient to every degree of this sympathetic or imitative influence, than that of religious enthusiasm. This was exemplified, in a striking manner, in the epidemic convulsions, which occurred in the parish of Cambuslang, in Lanarkshire, in 1742, and is well described by Dr. Meik. The minister, Mr. McCulloch, who was an enthusiast, and a follower of Whitefield, by incessant zeal and labour in his vocation, and by reading and circulating, in halfpenny pamphlets, various missives, attestations, and journals, giving an account of conversions in different parts of the world, excited an extraordinary concern about religion in his neighbourhood. In consequence of a petition, signed by ninety masters of families, a weaver and a shoemaker

being.

IMITATION.

being at their head, he gave evening lectures on the week days occasionally; and afterwards they were daily employed for many hours in fervent prayer; in the minister's house, and hearing his lectures; and great numbers cried out publicly, and many returned to his house expressing strong convictions of sin and alarming fears of punishment. "The way in which the converts were affected," says Dr. Meik, "for it seems they were affected much in the same way, though in very different degrees, is thus described. They were seized all at once, commonly by something said in the sermons and prayers, with the most dreadful apprehensions concerning the state of their souls, inasmuch that many of them could not abstain from crying out in the most public and frightful manner, "bemoaning their lost and undone condition by nature, &c. &c.; declaring that they saw the mouth of hell open to receive them, and that they heard the shrieks of the damned;" but the universal cry was, "what shall we do to be saved?" The agony under which they laboured, was expressed not only by words, but also by violent agitations of body; by clapping their hands and beating their breasts; by *shaking* and *trembling*, by *faintings* and *convulsions*; and sometimes by excessive bleeding at the nose. While they were in this distress, the minister often called out to them, not to flatter or smother their convictions, but to encourage them; and after the sermon was ended, he retired with them to the manse, and frequently spent the best part of the night with them in exhortations and prayers." &c. Some of those, it is said, who thus "fell under conviction," were never converted; but some were converted in a few hours.

It is impossible to read this account without recollecting the operations of Mesmer with his animal magnetism, and their close similarity with these fanatical proceedings; especially the exact analogy of the phenomena, when the magnetised persons were said to *fall into the crisis* ("tomber en crise"), and these zealots to *fall under conviction*. Both these events were the result of strong impressions on the imagination continued for some time; in both, the shakings and sobbings, the faintings and convulsions occurred; and in both these crises were most rapidly produced, after one person had become thus affected. (See IMAGINATION.) Under the article just referred to, we have adduced the demonstrative proofs, obtained by the French commissioners, that all those phenomena attributed to *magnetism*, were the products of the heated *imagination*, augmented by the principle of *imitation*; and we cannot but refer these analogous effects of fanaticism to the same natural causes. Upon this ground they were generally explained at the time by rational people. "That the work of Cambuslang ought to be ascribed neither to the influence of the Holy Spirit, nor to the influence of the devil, but to the influence of fear and hope, of sympathy and example, aided by peculiar circumstances, was the general opinion of those," Dr. Meik observes, "who are known in the church of Scotland by the name of the moderate party. The only extraordinary circumstance relating to this work, is the external effect on the bodies of men by which it manifested itself; and these, they thought, might be sufficiently explained by the operation of natural causes, &c." "When this work was once begun, they maintained, that the effects of sympathy and example (*i. e.* the principle of imitation) sufficiently explain its future progress. Every day's experience shews that we are *disposed to imitate* the actions of others, and that we are naturally, and, as it were, *mechanically* moved by seeing them, either in the depth of distress, or in the height of exultation. The operation of these principles was visible in almost every instance. Whenever any one was affected,

many others were affected in a similar manner. Whenever any one cried aloud, either through excessive grief or joy, but especially the former, many others cried aloud likewise, using the same words, or words of the same meaning. Statist. Acc.

At a still more recent period, namely, in the summer of 1803, a species of *chorea*, or St. Vitus dance, became epidemic in Tennessee, in America, connected with the prevalence of religious enthusiasm. Great numbers of people were collected together, especially at their extraordinary meetings, which commonly lasted from three to five days; and many of them remained on the spot day and night, the whole or greater part of the time, worshipping their Maker almost incessantly. "The outward expressions of their worship consisted chiefly in alternate crying, laughing, singing, and shouting, and, at the same time, performing that great variety of gesticulation which the muscular system is capable of producing. It was under these circumstances that some found themselves unable, by voluntary efforts, to suppress the contractions of their muscles; and to their own astonishment and the diversion of many of the spectators, they continued to act from *necessity* the curious character which they had commenced from *choice*. The disease no sooner appeared than it spread with rapidity through the medium of the principle of *imitation*: thus it was not uncommon for an affected person to communicate it to the greater part of a crowd, who, from curiosity or other motives, had collected around him. It is at this time (1805) in almost every part of Tennessee and Kentucky, and in various parts of Virginia; but it is said not to be so contagious (or readily communicated) as at its commencement. It attacks both sexes, and every constitution; but evidently more readily those who are enthusiasts in religion (such as those above described), and females: children of six years of age, and adults of sixty, have been known to have it; but a great majority of those affected are from fifteen to twenty-five. The muscles generally affected are those of the trunk, particularly of the neck, sometimes those of the superior extremities, but rarely, if ever, those of the inferior. The contractions are sudden and violent, such as are denominated convulsive, being sometimes so powerful, when in the muscles of the back, that the patient is thrown on the ground, where for some time his motions more resemble those of a live fish, when thrown on land, than any thing to which I can compare them. This, however, does not often occur, and never, I believe, except at the commencement of the disease, &c." See an Inaugural Essay on Chorea Sancti Viti. By Felix Robertson, of Tennessee, Philadelphia, 1805. Edin. Med. and Surg. Journal, vol. iii. p. 446.

In consequence of the facility with which such convulsive motions are communicated by *imitation*, various corporeal movements which fanaticism or enthusiasm had associated with devotional exercises, have become characteristic of certain sects, to which they have even given names. From this source, it would appear, have originated the appellations of *Jumpers*, *Whirlers*, *Tremblers*; and even our now placid sect, the *Quakers*, have doubtless derived their denomination from some similar habit. A singular spasmodic disease, the *chorea Sti. Viti*, or *Saint Vitus's dance*, has most probably derived its appellation from the resemblance of the involuntary motions of the limbs to some of those religious or fanatical gesticulations. Tradition states that it was so named from the annual religious assemblies and fanatical dances, in honour of St. Vitus, which were celebrated on the first of May, at Ulm and Ravensburg, and other parts of Germany. See CHOREA.

This subject is far from being exhausted. The preceding statements,

statements, however, seem to afford a satisfactory illustration of a sympathy, or a mechanical, *i. e.* an involuntary tendency to *imitation*, which is a part of the human constitution, and is as visible in the slightest actions, such as yawning, as in those which more forcibly arrest attention, and excite emotions, such as convulsive fits. And when to this principle we add the power of the imagination over the physical state of the body, as evinced by the effects of metallic and counterfeit tractors, of the touching of kings and other gifted persons, of fainted shrines and relics, and of animal magnetism, &c.; we are enabled to explain the occurrence of a number of extraordinary phenomena in the history of man, which, if we viewed his moral and physical faculties separately, would appear altogether inexplicable by natural causes.

Dr. Haygarth has deduced this practical inference, for the direction of the physician, from the consideration of these facts; namely, that convulsive disorders ought not to be admitted into the female wards of hospitals; a suggestion which he caused to be acted upon in the Cheller Infirmary. And it is important to know that, in districts where convulsive diseases are observed to be spreading, any medical or other intelligent and humane neighbour, who has influence and authority to hinder all intercourse between persons afflicted with and liable to such disorders, may prevent such calamities. See Dr. Haygarth's pamphlet, also *Rapport des Commissaires* above quoted, p. 67, *note*, where separation was proved to be an effectual cure. Similar cases may be found, in a work of M. Hecquet, "*Le Naturalisme des Convulsions.*"

IMITATION, in *Oratory*, is an endeavour to resemble a speaker or writer in those qualities, with regard to which we propose them to ourselves as patterns. The first historians among the Romans, says Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how closely Virgil has imitated Homer in his *Æneid*, Hesiod in his *Georgics*, and Theocritus in his *Eclogues*. Terence copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad August. who himself owes many of his beauties to the Greek lyric poets. Cicero appears, from many passages in his writings, to have imitated the Greek orators. Thus Quintilian says of him, that he has expressed the strength and sublimity of Demosthenes, the copiousness of Plato, and the delicacy of Isocrates. *Inst. Or. lib. x. cap. 1.*

Writers on rhetoric have proposed three enquiries under the head of imitation, *viz.* Who are to be imitated? What we are to imitate? and in what manner? With respect to the first we shall only observe, that in common cases it is not always what is absolutely best, but comparatively so in its own kind, and best suits their own taste, that should determine persons in the choice of their patterns for imitation: however, only the best writers, and those whom we can most safely trust, says Quintilian, are to be read long. With respect to the second enquiry, the things to be imitated are the perfections of the best masters in their several kinds; and these are different, according to the various subjects in which they excel. As to the manner of imitation, it ought to be considered, that he who only copies or translates from another, and endeavours to pass it off for his own, is not an imitator but a plagiarist. The true art of imitation consists in so diversifying what we take from others, as, if we can, to improve it, or at least not suffer it to receive any detriment by our alteration. And this may be done, by so enlarging a thought, or expression taken from another, as in a good measure to render it

our own: by either abridging, or only taking a part of what another has said before us; by keeping the thought and applying it to a different subject; and finally, by preserving the thoughts and applying them to the same subject, but changing their order, and representing them in a different dress. See Ward's *Orat.* vol. ii. sect. 53 and 54.

IMITAZIONE, *Ital.* imitation, in *Music*. See FUGATO.

IMIZIMIS, in *Geography*, a town of Morocco, on the mountains of Atlas; 60 miles S.W. of Morocco.

IMLIATSKAIA, a town of Russia, in the government of Upha, on the river Imliat; 60 miles E.N.E. of Tcheliabinsk.

IMMA, in *Ancient Geography*, a town of Asia, in Syria; situated at the northern point of a mountain E. of Orontes, towards the south-east of Antiochia.

IMMACULATE, *without stain*, a term much used among the Romanists: when speaking of the conception of the Blessed Virgin, they call it immaculate.

When the cap is given to a doctor of the Sorbonne, he is obliged to swear that he will defend the immaculate conception. This was decreed by an act of the Sorbonne in the fourteenth century; in imitation of which, eighty other universities made the same order.

The military orders in Spain are all solemnly obliged to defend this prerogative of the Virgin. See CONCEPTION.

There is also a Congregation of the Immaculate Conception; in most nunneries whereof is a society of secular maids, whose end is to honour the immaculate conception: of which they make a public protestation every year, and a private one every day. See THEATINES.

IMMANENT, in *Logic*. The schoolmen distinguish two kinds of actions; the one *transfent*, which pass from the agent to the patient; the other *immanent*, which continue in the agent. See ACTION.

IMMATERIALITY, abstraction from matter; or what we understand by pure spirit.

Plato proves the immateriality of the soul from these six topics. 1. Its simplicity. 2. Its independency on the body, which is twofold; in its *esse*, and in its *operari* in existing, and in acting or operating separately. 3. Its rule and authority over the body. 4. Its likeness and similitude to God, which discovers itself in the pleasure it enjoys in spiritual things, in its aiming at spiritual objects, &c. 5. Its spiritual manner of perceiving material objects. And, lastly, its indivisibility, capacity, activity, and immortality. See SOUL.

IMMEDIATE, that which precedes or follows some other thing, without any interposition.

IMMEDIATE also signifies something that acts without means, or without medium. In which sense we say, immediate grace, and immediate cause, &c.

IMMEDIATE *Mode*. See MODE.

IMMEDIATE *Fire*. See FIRE.

IMMEMORIAL, an epithet given to the time or duration of any thing whose beginning we know nothing of.

In a legal sense, a thing is said to be of time immemorial, or time out of mind, that was before the reign of our king Edward II.

IMMENDORF, in *Geography*, a town of Austria, eight miles N. of Sonneberg.

IMMENZAUSEN, a town of the principality of Hesse-Cassel; eight miles N.N.W. of Cassel. N. lat. 51° 5'. E. long. 9° 25'.

IMMENSE, that whose amplitude, or extension, no

finite measure whatsoever, or how oft soever repeated, can equal.

IMMENSTADT, in *Geography*, a town of Germany, in the county of Konigsberg, on a small river, which soon after joins the Iller; 12 miles S. of Kempten.

IMMER, one of the islands called New Hebrides, in the South Pacific ocean. S. lat. 19° 16'. E. long. 169° 46'.

IMMERETIA. See **IMIRETTA**.

IMMERSION, an act by which any thing is plunged into water, or some other fluid.

In the first ages of Christianity, baptism was performed by immersion; by three immersions. The custom of immersion is said to be still preserved in Portugal, and among the Anabaptists in other parts. See **BAPTISM**.

IMMERSION, in *Pharmacy*, is the preparation of some medicine, by letting it steep for some time in water, in order to take some ill quality or taste from it.

This is done in rhubarb, to moderate its force; in lime to take away its salt; and in olives, which are preserved in brine.

IMMERSION, in *Astronomy*, is when a star or planet comes so near the sun, that we cannot discern it; being as it were enveloped, and hid in the rays of that luminary.

IMMERSION also denotes the beginning of an eclipse of the moon; that is, the moment when the moon begins to be darkened, and to enter into the shadow of the earth.

The same term is also used with regard to an eclipse of the sun, when the disk of the moon begins to cover it.

In this sense, immersion stands opposed to *emergence*, which signifies the moment wherein the moon begins to come out of the shadow of the earth; or the sun begins to shew the parts of his disk which were hid before.

IMMERSION is frequently applied to the satellites of Jupiter, and especially to the first satellite; the observation whereof is of so much use for discovering the longitude.

The immersion of that satellite is the moment in which it appears to enter within the disk of Jupiter; and its emergence the moment wherein it appears to come out.

The immersions are observed from the time of the conjunction of Jupiter with the sun, to the time of his opposition; and the emergences from the time of his opposition to his conjunction. The peculiar advantage of these observations is, that during eleven months of the year they may be made, at least, every other day. The perfection of the theory, and the praxis thereon, we owe to M. Cassini.

IMMERSION, *Scruples of*. See **SCRUPLE**.

IMMICTIO, an inability of retaining the urine. See **INCONTINENCE of Urine**.

IMMORTAL, that which will last to all eternity, as having in itself no principle of alteration or corruption.

Plato defines immortality *ἄσπετος ἀθάνατος ἀϊδιος μόνος*, *animal essence and eternal mansion*; and proves the immortality of the soul from two kinds of arguments; the one *artificial*, and the other *inartificial*.

The *inartificial* arguments for the soul's immortality are testimonies and authorities, whereof he cites several; and adds in general, that all the great men and poets, who had any thing divine in them, have at all times asserted the immortality of the soul.

Artificial or proper arguments for the immortality are either *speculative* or *practical*: of the first kind are those drawn from, 1. The simple, uniform, spiritual, and divine nature of the soul. 2. From its infinite capacity. 3. Its desiring and longing after immortality, and its inward horror of falling into nothing; proving it absurd that

the soul should die, when life is its proper and adequate object. 4. Its rational activity; proving that whatever has in itself a principle of rational and spontaneous motion, by which it tends towards some supreme good, is immortal. 5. The various ideas which it has of spiritual things; particularly the idea it has of immortality: and, 6. Its immateriality.

His practical or moral arguments for the immortality of the soul, are drawn from, 1. The justice of God, which can never suffer the wicked to escape unpunished, nor the good unrewarded after death. 2. The dependence which religion has on this opinion, because, without this persuasion, there would be no religion in the world. 3. The opinion which men have, that justice and every kind of virtue are to be cultivated, that they may at last live with God. 4. The stings of conscience, and anxious solicitude we are under about a future state. See **SOUL**.

IMMORTAL Flower, in *Botany*. See **GOMPHRENA**.

IMMUNITY, a privilege or exemption from some office, duty, or imposition.

Immunity is more particularly understood of the liberties granted to cities and communities.

The princes heretofore granted all kinds of immunities to ecclesiastics, exempting them from all impositions; but the ecclesiastics of those days were not so rich as those of ours: they gave all they had to the poor.

There is still a privilege of immunity in some places, and especially in Italy, belonging to ecclesiastical things, and persons; who are exempted from certain dues, and are sheltered from the pursuits of justice. Though there are some crimes for which they cannot plead the privilege of their immunity, as premeditated murder, &c.

IMMUTABLE SYSTEMA. See **SYSTEM**.

IMMUTABILITY, the condition of a thing that cannot change.

Immutability is one of the divine attributes. See **GOD**.

IMMYNS, JOHN, in *Biography*, a self-taught musician, said to have become a notable lutenist after 40, by the perusal of Master Mace, whose ideas, taste, and language seem to have been perfectly congenial. Immys founded the Madrigal society, and was so convinced of the perfection of that species of music, particularly of queen Elizabeth's reign, that "he looked on Handel and Bononcini as the great corrupters of the science." He had a cracked counter-tenor voice, played on the common flute, the viol da gamba, violin, and harpsichord, but on none of them well. Though originally an attorney, there was doubtless a conflict between the two professions—

——— "but music won the cause."

However, with all his harmonical zeal and enthusiasm, he never obtained a higher rank in the profession, than that of amanuensis to Dr. Pepusch, and copyist to the Academy of Ancient Music at the Crown and Anchor. Yet he was always in cheerful spirits; and the honour of having established the Madrigal society, and being its chairman at different alehouses in the city, presiding over dilettanti tradesmen, mechanics, and psalm singers, contributed as much, perhaps, to his pride and felicity, as the being president of the Royal Society, or speaker of the house of commons could have done. But alas! the tyrant Death dragged him from all his sublunary felicity in 1764.

IMOLA, INNOCENCIO DA. See **FRANUCCI**.

IMOLA, in *Geography*, a town of Italy, in the department of the Amona, anciently called "Forum Corneli," or "Forum Julii," situated on an island, formed by the river Salerno, surrounded with walls, towers, and ditches, and defended

fended with a strong castle; the see of a bishop, suffragan of Ravenna. It contains 16 churches and 17 convents. After having been occupied by different possessors, Cæsar Borgia became master of it, and annexed it, with the rest of Romagna, to the dominions of the church; 18 miles S.E. of Bologna. N. lat. 44° 22'. E. long. 11° 32'.

IMOMNAGUR, a town of Hindoostan, in Bahar; 25 miles E.S.E. of Bahar.

IMORI, a town of Japan, in the island of Nippon; 16 miles S. of Meaco.

IMPACH, a town of Austria; six miles W.N.W. of Crems.

IMPALED, in *Heraldry*, is understood of a shield party per pale, or divided into two halves by a line drawn palewise through the middle, from the top to the bottom.

When the coats of arms of a man and his wife, who is not an heiress, are borne in the same escutcheon, they must be impaled, or marshalled in pale, *i. e.* the husband's on the right side, and the wife's on the left; and this the heralds call *baron and femme*, two coats impaled.

Impaling hath been practised in three different ways: 1. By dimidiation, that is, by halving or cutting the shields of the arms of both husband and wife into two equal parts, and then joining the dexter half of the husband's coat to the sinister half of the wife's; thus making up or forming a whole shield. In this mode, called "Accolée," the French kings used to impale the arms of Navarre. The 2d mode is by dimidiating the husband's arms, and impaling that with the full coat of the wife's. The *last* general and present rule is that of impaling the two whole coats, except when there is a border round one or both of them; for the border must never be carried all round an impaled coat. This dimidiation of arms was much used in the reign of king Edward I.; in proof of which it is asserted by Mr. Sandford in his "Genealogical History," that Margaret, sister to Philip IV. king of France, and second wife to king Edward I., had, on her seal, in 1299, the arms of England so dimidiated with those of France, and that she was the first queen of England who had her arms so marshalled. This method of impaling arms by dimidiation hath been for some time laid aside in England, though it has been continued in France. It was a frequent practice with the nobility of England, from the reign of Edward III. to that of Henry VII. to quarter the arms of the wife; and also to place her arms in the first quarter, in preference to the paternal coat of the husband's family, particularly if her family was of greater dignity; and Mr. Nisbet, in his "System of Heraldry," informs us, that it is a custom in Scotland, when a man marries an heiress, for him to quarter her arms with his own paternal coat; but he allows that it is not practised in any other country. Our heraldic authors say, these are the rules to be observed in impaling the arms of husband and wife. 1st. The husband's arms are always to be placed on the right side as baron, and the wife's on the left as femme. 2dly. That no husband can impale his wife's arms with his own, on a surcoat of arms, ensign or banner, but may use them impaled on other utensils. 3dly. That no husband impaling his wife's arms with his own, can surround the shield with the order of the garter, or with any other order; because, as Mr. Sandford argues, although the husband may give his equal half of his escutcheon, yet he cannot share his temporary order of knighthood with her, except she be sovereign of the order. The mode lately adopted for knights of the Garter, Bath, and Thistle, to wear their arms and those of their wives in two separate shields, with the garter or order round their own coat only, is taken from the French; but Mr. Edmondson does not hold this to be good

armoury, because the arms cannot be said to be impaled baron and femme, as hath been usual in England upwards of 600 years. However, on the decease of the knight her husband, when she becomes a widow, the wife ought not in any respect to bear the garter round her arms, because, on the demise of the knight, his honour of knighthood reverts to the crown.

It hath been laid down as a rule by many, that if a man hath had two wives, he may impale both their arms on the sinister side, those of the first wife in chief, and those of the second in base. It hath also been said, that if a man hath had two wives, he may place his own arms in pale, and those of his two wives on the dexter and sinister side, giving the first the dexter side; and so, if he had six wives, he may place the arms of three of them on the dexter side, and those of the other three on the sinister side. But the errors of these positions, says Mr. Edmondson, are so flagrant, that they need little argument to refute them. The intent of impaling a wife's arms is to shew that the man is then married to a woman of that particular family, whose arms are impaled with his own; therefore, when by her death he is released from that marriage, he ceases to bear the arms of her family. The case is different in regard to a widow: whilst she remains such, she is obliged to bear the arms of her deceased husband.

Kent asserts that no women, except such as are heiresses, are entitled to have their arms impaled with those of the husband; but this is absurd, because impaling arms is intended to point out the family into which the husband is married, and not to indicate that the wife brought with her any real or personal property whatever. In impaling of a coat, you never put any marks of cadency for the first, second, and third daughter; but if there be any marks of cadency on the father's coat, all his daughters must continue the same.

Impaled arms are also borne by officers, as well ecclesiastical as civil, as archbishops, bishops, kings of arms, &c.; but with this difference from those of the manner of impalement of the arms of baron and femme, *viz.* that the arms of the church are to be placed on the dexter side, and the man's on the sinister. The like rule is to be observed in relation to civil officers.

IMPALEMENT, in a *penal* sense. } See EMPALEMENT.
IMPALEMENT, in *Phytology*.

IMPALPABLE, that whose parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, formed of *in* and *panis, bread*, a term used among divines to signify the opinion of the Lutherans with regard to the eucharist; who believe that the species of bread and wine remain, together with the body of our Saviour, after consecration. See CONSUBSTANTIATION.

IMPANATORES. See ADESSENARIJ.

IMPANNELLING, in *Law*. See EMPANNELLING.

IMPARES SCAMILLI. See SCAMILLI.

IMPARFAIT, Fr. imperfect. This word has many acceptations in music: as an imperfect chord, imperfect concord, imperfect cadence, &c. always opposed to perfection. The bearings which temperament requires, and which every interval, except the octave will allow, without greatly offending the ear, occasion *imperfect intervals*. See INTERVAL and TEMPERAMENT.

IMPARLANCE. See EMPARLANCE.

IMPARSONEE, in *Law*, is applied to a parson that is inducted, and in possession of a benefice.

IMPARTITO, *Ital.* is said of the solution of a canon, when it is written in score, or drawn out in different parts;

in opposition to *canone chiuso*, or a canon wrapt up in mystery.

IMPASSIBLE, that which is exempt from sufferings; or which cannot undergo pain, or alteration.

The Stoics place the soul of their wife man in an impassible, imperturbable state. See APATHY.

IMPASTATION, the mixture of divers materials of different colours and consistencies, baked or bound together with some cement, and hardened either by the air, or fire.

IMPASTATION is sometimes used for a sort of mason's-work, made of stucco, or stone ground small, and wrought up again, in manner of a paste.

Authors are of opinion that the obelisks, and the huge antique columns still remaining, were made, some by impastation, and others by fusion; but this is wholly erroneous; they are all cut out of quarries, yet open in Egypt, Arabia, &c.

IMPASTING, in *Painting*. See EMPASTING.

IMPATIENS, in *Botany*, is a genus so named from the great elasticity of the futures of its seed-vessels, which is completely impatient of the touch, curling up with the greatest velocity, and scattering round the seeds, the instant any extraneous body comes in contact with it. From this remarkable circumstance it has obtained the English appellation of "Touch me not." Linn. Gen. 458. Schreb. 597. Willd. Sp. Pl. v. 1. 1173. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 243. Ait. Hort. Kew. v. 3. 292. (Balsamina; Juss. 270. Tournef. t. 235. Gærtn. t. 113.)—Class and order, *Pentandria Monogynia*. Nat. Ord. *Corydales*, Linn. *Gerania*, Juss.

Gen. Ch. *Cal.* Perianth very small, of two roundish, pointed equal leaves, placed towards the sides of the flower, coloured, deciduous. *Cor.* Five-petalled, irregular; the upper petal roundish, flat, slightly trifid, making a sort of upper lip; lower pair very large, obtuse; intermediate pair opposite, rising from the base of the upper petal; nectary receiving, like a hood, the base of the flower. *Stam.* Filaments five, very short, narrower towards the base, incurved; anthers five, connate, divided at the base. *Pist.* Germen superior, ovate-acuminate; style none; stigma simple, shorter than the anthers. *Peric.* Capsule one-celled, five-valved, bursting longitudinally and with great elasticity, the valves rolling spirally. *Seeds* several, roundish, fixed to a columnar receptacle.

Ess. Ch. Corolla of five petals, irregular, with an hooded nectary. Anthers slightly connected. Capsule superior, of five elastic valves. Calyx of two leaves.

Obs. The anthers being united induced Linnæus and many other authors to refer this genus to *Syngenesia Monogamia*; but since the abolition of that order from the Linnæan system, it of course belongs to *Pentandria Monogynia*. In some species the middle petals are wanting, and in some the horn of the nectary. The capsule differs in figure; hence the *Impatiens* of Rivinus had a long capsule, and his *Balsamine* an ovate one.

1. 1. *Noli me tangere*. Yellow balsam, or Touch me not. Linn. Sp. Pl. 1329. Engl. Bot. t. 937. "Flower-stalks solitary, bearing many flowers. Leaves ovate. Joints of the stem swelling."—Not infrequent in the northern parts of England and Wales, particularly in the neighbourhood of the lakes of Cumberland, flowering in August.—*Root* fibrous, small, spreading horizontally. *Stem* solitary, erect, about two feet high, succulent, pellucid, smooth and polished. *Leaves* alternate, on foot-stalks, ovate, obtuse, serrated, the lower serratures brittle; Villars remarks they become flaccid and as if withered in the night, but this is

not always the case. *Flower-stalks* axillary and branched, bearing three or four yellow, pendulous flowers, dotted with red internally. *Nectary* funnel-shaped, with a recurved top. *Capsule* oblong, gibbous, pendulous; its valves so elastic that they burst and scatter the seeds before the capsule is ripe. Hence the Latin names of "Impatiens" and "Noli me tangere;" and the English names of "Quick in hand," alive, as it were, in the hand. Gerard calls it "Codded Arsmart," and Parkinson, "Wild Mercury." The elasticity of the seed-vessel has furnished names in most of the European languages. In the day time the leaves are expanded, but at night they hang pendant, contrary to what is observed in most plants which, from a deficiency of moisture, or a too great perspiration from heat, commonly droop their leaves during the day. This plant was formerly considered as diuretic and vulnerary, and was given to relieve the hæmorrhoids and the strangury. Boerhaave regarded it as poisonous. It is now confined wholly to the flower-garden, where, however, it is not often seen. It is the only species of *impatiens* wild in Europe. It is also found in Canada. With us, it occurs in Wales and the northern counties of England, in moist shady places, and by the banks of rivulets. It flowers in July and August.

We have described the only British species of this singular genus. Willdenow enumerates twelve species, which, like the seven Linnæan ones, are divided into such as have single-flowered peduncles, and such as have many flowers on each stalk, in which latter division the *Noli me tangere* occurs.

The seeds of these plants should be sown on a moderate hot-bed in the spring, and when the plants are an inch high, they should be transplanted on another hot-bed at about four inches distant each way, shading them from the sun till they have taken new root; after which free air should be copiously admitted to them, when the weather is favourable, and they should be often refreshed with water. When they are so large as to touch each other, they should be taken up with balls of earth to their roots, and each planted in a separate pot filled with light rich earth, and plunged into a very moderate hot-bed under a deep frame, shading them from the sun till they have taken fresh root. They should then be accustomed to bear the open air, into which part of the plants may be removed in July, placing them in a warm situation; where, in a favourable season, they will flower and make a fine appearance. But part should be kept in a glass case or deep frame, in order to get good seeds. Those who are curious to preserve these plants in perfection pull off all the single and plain coloured flowers from the plants which they preserve for seeds, leaving only those flowers which are double, and of good colours: and thus they may be continued without degeneracy.

IMPEACHMENT, from the Latin, *impetere*, to set upon, or attack; or rather from the French, *empêcher*, to hinder, in *Law*, is the accusation and prosecution of a person for treason, or other crimes and misdemeanors. Any member of the lower house of parliament may impeach any one belonging either to that body or the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. (12 & 13 Will. III. c. 2.) A commoner cannot, however, be impeached before the lords for any capital offence, but only for high

high misdemeanors. A peer may be impeached for any crime; the articles of impeachment are a kind of indictment, found by the house of commons, and afterwards tried by the lords, who, in cases of misdemeanors, are considered not only as their own peers, but as the peers of the whole nation. This custom is derived from the constitution of the ancient Germans, who, in their great councils, sometimes tried capital accusations relating to the public: "licet apud concilium, accusare quoque, et discrimen capituli intendere." Tacit. de Mor. Germ. 12. Blackst. Com. vol. iv

IMPEACHMENT of Waste, a restraint from committing of waste upon lands and tenements; or a demand of recompence for waste made by a tenant who has but a limited estate in the land granted.

He that hath a lease without impeachment of waste, hath by that a property or interest given him in the houses and trees, and may make waste in them without being called to an account for it. See **WASTE**.

IMPECCABLES, in *Church History*, a name given to those heretics, who boasted that they were impeccable. and that there was no need of repentance; such were the Gnostics, Priscillianists, &c.

IMPECCABILITY, the state of a person who cannot sin: or a grace, privilege, or principle which puts him out of a possibility of sinning.

IMPEDIMENTS, in *Law*, are such hindrances as put a stop or stay to a person's seeking for his right by a due course of law. Persons under impediments are those under age, or coverture, *non compos mentis*, in prison, beyond sea, &c. who, by a saving in our laws, have time to claim, and prosecute their rights, after the impediments are removed, in case of fines levied, &c.

IMPEDIMENTS of Marriage. See **MARRIAGE**.

IMPEDIT, in *Law*. See **QUARE IMPEDIT**.

IMPENETRABILITY, a quality whereby a thing becomes unable to be pierced or penetrated; or a property of body whereby it fills up certain spaces, so that there is no room in them for any other body.

IMPENITENCE, or **IMPENITENCY**, an hardness of heart, which makes a person persevere in vice, and prevents his repentance.

IMPERATIVE, in *Grammar*, is one of the moods or manners of conjugating a verb, serving to express a commandment; as *go, come*, &c. The imperative, according to bishop Wilkins, is one of the primary modes or moods, the indicative being the other: by this the speaker expresses his will to him that has the thing in his power; namely, to his superior by petition, to his equal by persuasion, and to his inferior by command; and the manner in which these affect the copula (be it so, or let it be so) is called the imperative mood, of which there are these three varieties. Wilkins's Real Character, part iii c. 5. The same distinction is observed by Mr. Harris, who makes the imperative mood a species of the requisitive when applied to inferiors; but when pertaining to equals, or superiors, it is a precativ or optative. Hermes, p. 144. ed. 2d. See **MOOD**.

In Hebrew, and other oriental languages, the future tense has frequently an imperative signification.

IMPERATOR, among the *Romans*, a title of honour given to generals after a victory; first by the acclamations of the soldiers, and afterwards confirmed by the senate. See **EMPEROR**.

IMPERATORIA, in *Botany*, is supposed to have derived its name from its reputed imperial virtues in medicine, whence also it has obtained with our herbalists the appella-

tion of "Masterwort."—Linn. Gen. 143. Schreb. 153. Willd. Sp. Pl. v. 1. 1458. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 327. Ait. Hort. Kew. v. 1. 358. Just. 220. Lamarek Dict. v. 3. 242. Illustr. t. 199. Gertn. t. 21. —Class and order, *Pentandria Digynia*. Nat. Ord. *Umbellatae*, Linn. *Umbelliferae*, Just.

Gen. Ch. Cal. Umbel universal flat-spreading; partial unequal. *Invol. universal* none; *partial* very slender, with one or two leaflets, almost as long as the umbel. *Perianth proper* obsolete. *Cor. universal* uniform; *florets* all fertile: *partial*. Petals five, inflex-emarginate, nearly equal. *Stam.* Filaments five, capillary; anthers roundish. *Pist.* Germen inferior; styles two, reflexed; stigmas obtuse. *Peric.* none. Fruit roundish, compressed; gibbous in the middle, margined. *Seeds* two, ovate, marked on one side with two furrows, surrounded by a broad margin.

Ess. Ch. General Involucrum none. Flowers all fertile. Petals inflexed, notched, nearly equal. Fruit roundish, compressed, bordered, swelling in the middle, with three ribs. Umbels flat.

1. I. *Astruthium*. Masterwort.—Linn. Sp. Pl. 371. Engl. Bot. t. 1380. Woodv. Med. Bot. t. 35.—Found by Mr. Lightfoot on the banks of the Clyde, and this is the only authority for its being added to the list of British plants.—It flowers in June.—*Root* perennial, tuberous, acrid and aromatic. *Stems* erect, about a foot and a half high, mostly simple, round, striated, smooth. *Leaves* twice ternate, smooth, acutely serrated and cut. *Umbels* terminal, of many rays, flattish, smooth. *Flowers* white or bluish-coloured, regular. *Fruit* emarginate at the top and base, smooth.

Masterwort has long been supposed a sovereign remedy against poison. Gerarde says it is "also singular against all corrupt and naughty aire and infection of the pestilence—cures pestilential carbuncles and botches—cold fits of agues—dropy—dissolves all ventosities or windiness of the stomach and other parts—and greatly helpeth such as have taken great squats, bruises, or falls from some high place." This account of its virtues may lead us to suppose that this plant was considered by ancient botanists as the master-key of pharmacy.—At present it is occasionally used as an aromatic, but is of course superseded by many plants which have that property in a superior degree.

IMPERATRIX, a name given by some authors to the *Meum* or Spignel.

IMPERFECT CONSONANCES, in *Music*. Sometimes the thirds and the sixths are, though improperly, called imperfect consonances, because they are of two kinds, major and minor of each: while the fifth and fourth are said by these writers to be perfect, because they never change; which, however, is not correct, since there is the minor, false, or flat fifth, or semidiapente, and the major, false, or sharp fourth, or tritone; and thus every note of the scale has its major and minor, as well as the thirds and sixths. (See **INTERVAL**.) Dr. Calcott recommends some further distinctions on this subject in his Musical Grammar, art. 189, &c.

IMPERFECT Chords, or incomplete, are such as do not include all their accessory sounds.

IMPERFECT Instruments, are those with a fixed number of notes or intervals in the octave, (less than 44; according to Maxwell,) as the common keyed-instruments with 12 sounds, flutes, oboes, bassoons, &c. and, in general, all such whereon the performer has it not in his power to vary his sounds, so as to produce perfect chords with other notes struck or sounded at the same time, a thing impossible throughout the 12 keys major and 12 minor, on any instrument which cannot command 44 different sounds with-

in the octave, according to Mr. Maxwell, or 60 at the least, according to Mr. Henry Lifton. The imperfect instruments in common use, are incapable of executing any tempered system of intervals except the isofonic, or equal temperament, so that every key therein shall be alike harmonious, because wolves, bearing-notes, or intervals very different to what they are intended to be must occur, or be substituted for the proper ones, unless 21 sounds at least can be introduced into the octave, as was done by Dr. R. Smith on his harpsichords, or 24 notes, as is done on Mr. D'Loeschman's patent pianofortes and organs for harmonizing 33 keys: we have already, under the article *HAWKÉ'S Temperament*, pointed out the impossibility of the 17 notes on that gentleman's patent instruments performing without wolves in more than 23 keys, while some of them are not the most usual, or those which first arise in the regular order of modulation: all these of 12, 14, at the Temple, 16 at the Foundling organ, 17, 21 and 24 notes, are imperfect instruments, and incapable of yielding perfect or untempered harmony in any piece of music. See PERFECT INSTRUMENTS.

IMPERFECT *Intervals*, are such as have not a ratio expressible in small or whole numbers: thus $\frac{3}{4}$, or the fourth, is a perfect interval, but $\frac{3 \cdot 2}{4 \cdot 3}$, or $\frac{32}{43}$, is not a perfect interval;

but the false, or trumpet fourth, $\frac{3 \cdot 2}{4 \cdot 5}$, or $\frac{32}{45}$, is also an imperfect interval, the tritone. The tempered intervals, adapted to imperfect instruments, are imperfect intervals, whether such deviate one or more of some small interval from perfection, as $\frac{243}{320}$ the comma deficient fourth, $\frac{2187}{3200}$ the

double comma deficient fifth, $\frac{16384}{19683}$ the schisma-excessive

minor third, &c.; or deviate any fractional part or parts of a small interval from perfection, as $1 \div \frac{1}{4}$, a fifth flattened, $\frac{1}{4}$ th of the major comma for the mean tone temperament, $\frac{1}{10}$ a fifth flattened $\frac{1}{3}$ d of the major comma for a system with perfect major sixths, &c.

IMPERFECT *Plants*, among *Botanists*, are such as either really want flower and seed, or are supposed to want them; no flower or seed having been discovered in the greater part of those plants included in this class by the botanical writers, at the time when they were thus denominated. See PLANTS.

IMPERFECT *Mixts*. See MIXT.

IMPERFECT *Numbers*, in *Arithmetic*. See NUMBERS.

IMPERFECT *Tense*, in *Grammar*, signifies an indefinite time between the present and the past; as, *I taught, I heard*. The imperfect was sometimes employed by the ancients to denote what is usual and customary: thus *surgebat* and *scribebat* signify not only *he was rising, he was writing*, but upon occasion they signify, *he USED to rise, he USED to write*. The reason of this is, that whatever is customary, must be something which has been frequently repeated; but what has been frequently repeated must require an extension of time past. It was also used by the ancients, in which they have been followed by the moderns, in a suspensive kind of inscription; as *Ἀπέλλης ἐπιόει*, *Apelles faciebat*, but not *ἐπιόεισε*, or *fecit*; by which use of the imperfect they avoided the shew of ignorance, and had prepared an apology in case of censure, by saying that the work was *once indeed in hand*,

without pretending that *it was ever finished*. Harris's *Hermes*, p. 136, &c. See TENSE.

IMPERFETTO, *Ital.* imperfect. See INTERVAL.

IMPERFORATE ANUS. It sometimes happens, that infants are born with the anus imperforate, and when the defect is not soon discovered, and some endeavour made to obviate it, the consequences are, in a short time, almost invariably fatal. The afflicted infant is restless, cries much, and suffers a frequent and distressing inclination to empty the rectum. In the fits of suffering, the child's face swells, and its eyes become red, and more or less protruded from their sockets. At length the belly is affected with a general swelling and tenderness, and death takes place in four or five days, either from the inflammatory and gangrenous mischief within the abdomen, or from the convulsions excited. It is a very curious circumstance, however, that there are cases on record, where children have lived several weeks, and even years, with an imperforate anus, the excrement having been discharged all such time by the mouth. (See *Journal de Médecine*, ann. 1770, p. 510, and tom. 8. p. 60.) Such instances, indeed, are exceedingly uncommon; but they are important, inasmuch as they tend to evince, that the operation usually performed for the relief of an imperforate anus, may be attempted, even at a late period, with a considerable chance of success. When an infant labours under the above-mentioned complaints, and the meconium does not come away, the practitioner is naturally led to examine the appearance of the anus, and thus the nature of the case is detected.

There are various kinds of imperforate anus. Sometimes the termination of the rectum is shut up by a preternatural membrane, or thin portion of skin. This is the most common, and, at the same time, the most favourable case, both the diagnosis and treatment being free from all difficulty. The membrane, shutting up the anus, is plainly visible to the practitioner immediately upon his making the requisite examination, and, occasionally, it is so distended with the confined feces, that it projects from the anus in the form of a pouch or sac. Here the proper method is to divide the membrane with a bistoury, and if the part composing the obstruction is thick, the incision may be made in a crucial shape, and four angles, or flaps, cut away with the knife or scissors. Dressings and bandages are not required after the operation, the exit of the excrement and air prevents a closure of the opening; and it seldom happens that any symptoms arise deserving particular notice.

Sometimes the lower end of the rectum is properly formed and open; but the intestine is inwardly closed at a greater or lesser distance above the anus. Such imperviousness is also occasionally produced by a preternatural membrane; though, in some cases, it is the effect of an adhesion of the sides of the bowel together, there being, in fact, a total obliteration of the cavity of the intestine at the part which is impervious. When the obstruction happens to be situated a very little above the anus, it may easily be felt by the finger; but when it occurs so high up, that the finger cannot reach it, the case may be set down as irremediable. That a part of the rectum is impervious, may be inferred from the infant's having no stools, and from the immediate discharge of clysters, whenever given to promote the passage of the excrement. In this circumstance, how can we venture to introduce any instrument, with a design of perforating the obstruction, without having the guidance of the finger, and without being able to know whether we are piercing the part composing the obstruction, or wounding the side of the bowel? Whether, in so hopeless a case, it is proper to attempt the formation of an artificial anus, will be presently considered.

When

IMPERFORATE ANUS.

When the obstruction can be felt with the finger an operation is admissible, and it may be most conveniently performed with the pharyngotomus introduced on the finger. A large curved trocar might also answer the purpose; but the operation is neither free from difficulty nor danger. In the event of the part of the intestine above the obstruction being greatly distended with feces, a kind of fluctuation is sometimes not only perceptible above the impervious place, but likewise through the coats of the bowel at the circumference of the obstruction; and in this case it is often exceedingly difficult to distinguish the exact situation into which the instrument ought to be pushed, so as to form a communication between the upper and lower portion of the intestine. Should the puncture be made in a wrong direction, the side of the bowel would be wounded, and a fatal extravasation of its contents into the pelvis be the consequence. A mistake of this sort would be the most difficult to avoid, were the intestines closed by a membrane of a thickish firm texture; for then the fluctuation of the fecal matter would be less plain, just in the situation of the obstruction, than at the circumference. On the other hand, when the membrane, rendering the bowel impervious, is very thin, the fluctuation of the intestinal matter may be easily felt through it, and the practitioner has less difficulty in determining where the perforation ought to be made. When the imperviousness of the bowel is the effect of an accretion of its sides together, and the intestinal canal is quite annihilated at the part, the fluctuation of the intestinal matter is less plain in the situation of the obstruction than at the sides of it, and indeed may be quite imperceptible. In all such cases the operation cannot fail to be attended with considerable peril, as every thing depends upon the direction in which the instrument is introduced, which direction should be such as will open a communication between the upper and lower portions of the intestine, and can only be ascertained with difficulty. When the membrane that has been pierced is thin, no particular dressings are needed after the operation, the opening being more likely to be widened by the passage of the intestinal contents than to close again; but if the puncture has been made through a thick substance, surgical authors recommend a tent, or piece of a thick bougie, to be occasionally worn for some time after the operation, in order to prevent the opening from becoming shut up again.

In certain examples not the slightest appearance nor vestige of an anus can be discovered, the rectum terminating in a cul-de-sac. Here the operation is attended with several difficulties, and the event is therefore generally fatal. The greater or lesser distance of the cul-de-sac extremity of the rectum from the external integuments, however, is a circumstance making a material difference in the degree of hazard. The practitioner cannot ascertain this point unless the contents of the bowel happen to lie so near the skin as to communicate to the fingers of an examiner the feel of fluctuation. When this is the case the operation is easy of performance, and the consequences for the most part successful. The further the intestine is situated from the integuments, the smaller is the chance of being able to save the infant's life. When the end of the bowel lies very high up it may be impossible to reach and open it with a cutting instrument. Sometimes the rectum is entirely wanting, and the colon terminates in a cul-de-sac.

A more favourable case is met with where nature indicates the place in which the opening of the anus ought to be, by a red depression, small folds and wrinkles, or some such appearance. But, in many instances, the part is every where so even and uniform, that there is nothing to point

out where the incision ought to be made. Here the knowledge of anatomy is the only light to the practitioner. He makes the first cut through the skin, between the os coccygis and the beginning of the raphe of the perineum. He is to recollect, however, that in new-born infants the lower end of the rectum is not so close to the os coccygis as in adult subjects. An interspace, of nearly an inch, ought therefore to be left between the point of this bone and the posterior extremity of the incision. In male infants it is as well to introduce a catheter into the bladder before the operation. By this means the surgeon will not only be enabled to determine with greater precision the place of the first incision, but also to avoid the urethra as the wound is gradually made deeper. Surgical writers think it advantageous to make a crucial incision in the skin and subjacent cellular substance.

The first wound is to be gradually rendered deeper, care being taken to direct each stroke of the knife with the forefinger of the left hand. The principal objects in view are to avoid the urethra and bladder, and find out the end of the rectum. An injury of the urethra may easily be avoided; when care is taken to introduce a catheter before the operation, and to feel the instrument repeatedly with the left hand during the employment of the knife. Sometimes the rectum is so distended with its contents as to press upon the neck of the bladder, and occasion a retention of urine. Here the dilated bladder might easily be wounded, were the surgeon, before the operation, to neglect to introduce a catheter, and draw off the urine. The surgeon is occasionally directed to the cul-de-sac termination of the bowel by the fluctuation of the accumulated feces; sometimes by a certain hardness which he perceives at the bottom of the wound; and which is produced by the sphincter muscle in a state of contraction. When there are no marks of this kind to guide him, nothing will be of any use to him except anatomical knowledge, and the rule always to incline the incision towards the os sacrum, where no important parts can be injured, instead of forwards, where the bladder, or vagina, is situated.

At length, the surgeon either succeeds in finding out the end of the intestine, or else his endeavours prove ineffectual, although the wound has already been carried to a reasonable depth. When the extremity of the bowel is found, the infant is indeed relieved for the present, but it is far from being out of danger. Experience proves that the majority of children die after this operation. The causes of this fact may be various; but, probably, it often happens that the side of the intestine is cut, and that an extravasation of the intestinal matter in the pelvis ensues. In the event of the bowel being found, the surgeon can do nothing more than make as capacious an opening in it as can be done with safety, promote the evacuation of the feces by gentle aperients, and place a tent in the wound in order to keep the new outlet pervious. The tent is always productive of irritation and pain, and consequently it should constantly be as soft and flexible as possible. A flexible tube is by no means an eligible instrument for introduction; for, if it should be too small, the stools would not pass through it; and, if too large, it would give rise to pain and inflammation. Even when the operation is followed by favourable consequences, an involuntary discharge of the feces frequently continues. Cases, however, do occur where the cure is in every respect perfect, the infant emptying its bowels naturally, and under the control of the will.

When the surgeon has carried the incision to a considerable depth, and cannot meet with the bowel, ought he to venture to cut still more deeply? The attempt, it must be confessed,

confessed, is attended with some danger, and is uncertain in its consequences; but as death is inevitable if no outlet for the feces can be procured, circumstances seem to justify such an endeavour to preserve the child. The occasional success, also, which has attended the proceeding, further corroborates its propriety. After extending the incision to the depth of two inches, without finding the intestine, a trocar, introduced an inch more deeply, has successfully opened the bowel. If, in such a case, the surgeon were to use a trocar, with a slit cannula, the puncture might be immediately dilated with a bistoury passed into the tube.

When the rectum cannot be found and opened in the foregoing manner, Littre has proposed making an opening into the abdomen near the left groin, dividing the sigmoid flexure of the colon, attaching the opened portion to the external wound, and thus establishing an artificial anus. This operation has not only been found very practicable upon the dead subject, but has actually been performed by Sabatier, Lehrbuch, &c. upon living infants with the happiest consequences. It is not to be dissembled, however, that the event is exceedingly doubtful, especially as the practitioner can never know beforehand how far the large intestines may be closed, or where the cul-de-sac extremity lies; but, upon the whole, the operation certainly appears to be warrantable, not merely on account of the hopeless condition of the infant, but because the attempt has unquestionably been known to succeed.

Calisen has proposed searching for the descending colon in the region of the loins. For this purpose he recommends an incision to be made on the left side of the spine, between the false ribs and the crista of the os ilium, upon the front edge of the quadratus lumborum muscle. It must be acknowledged, that in this situation there is more chance of finding the intestinal canal pervious; and that here an apparatus for lessening the inconveniences of an artificial anus admits of being more conveniently applied. But, all things considered, this operation is liable to more objections than the method proposed by M. Littre, which has likewise the important recommendation of having already proved successful.

Sometimes, besides the anus being imperforate, the large intestine has a preternatural opening into the urethra, or bladder. In female infants such a malformation is less pernicious in its consequences than in male children. In the former the meatus urinarius is short and dilatable, and the feces find a ready outlet; in the latter death usually ensues, unless an opening be speedily made for the passage of the excrement in the natural situation of the anus. Even when this has been executed, all the danger is not over; for it does not follow, as a matter of course, that the preternatural opening in the gut will close, because a new outlet has been formed. However, there are cases on record proving that this beneficial change may happen. Sometimes the preternatural opening in the intestinal canal is situated in the vagina or at the navel, in which circumstances external means may be employed to promote the closure. There are likewise cases recorded by writers, where women have discharged their feces, during the whole of their lives, through the vagina, or bladder.

In certain instances the anus is not closed, but only very small. This state is sometimes an original malformation. In other examples it arises after birth from a variety of causes, as after the operation for the fistula in ano, &c. The case may be cured, or at least relieved, by dilating the opening on each side with a bistoury, and employing tents.

Perhaps the most important case of impervious rectum is that which proceeds from a scirrhus induration and thicken-

ing of the coats of that intestine. Such disease is mostly seen in persons rather advanced in life, and more frequently in women than men. It ordinarily begins in a slow and insidious manner, producing at first several complaints, which are apt to be imputed to other causes, especially to piles. The case in the early stage is, therefore, in general not much understood. The patient feels an inclination to go to stool; but he voids little, and what comes away passes with great difficulty. He usually suffers shooting pains about the rectum; and the agony is often so severe, particularly when the patient is at stool, as to induce fainting. The excrement which comes away is remarkably thin. As the disease advances, the rectum at length becomes quite impervious, and a misere then comes on, which commonly proves fatal, as a free passage for the feces can seldom be procured again with sufficient celerity. The induration occasionally ulcerates, and the neighbouring parts are destroyed in various ways.

The disease may be detected by proper examination, in which the rectum will be found to be hard and contracted. Sometimes, on its inner surface, hard lumps and furrows can be felt. The more ancient and considerable the hardness is, the more difficult is the cure. The colon is liable to be thus rendered impervious, in which circumstance the case is fatal. (See Mem. of the Med. Society of London, vol. ii.) The coats of the rectum have been found an inch thick, and quite cartilaginous.

Tents are the principal means of relieving the scirrhus-contracted rectum, just in the same manner as bougies are calculated for the cure of strictures in the urethra. Large bougies, made for the purpose, might also answer best for the dilatation of the rectum. But whatever instrument is used, its size must be gradually augmented. The passage of the stools is every day to be facilitated with clysters. Several kinds of medicines have been tried internally, as cicuta, mercury, burnt sponge, &c. Default found the mineral alkali very efficacious, so much so, that he sometimes effected a complete cure in the space of from three to six months, even though the disease had fallen into the ulcerated state. The medicine, however, must always be continued, till the disease is entirely removed; for when the treatment is discontinued too soon, the disorder is apt to recur. Sometimes it is necessary to use the knife, that is, when an indurated transverse fold is formed in the rectum, so as both to hinder the passage of the excrement, and the introduction of the tent or bougie. Richter's Anfangsgründe der Wund-arzneykunst, Band 6. Kapitel 19.

IMPERFORATE *Hymen*. See VAGINA *Imperforate*.

IMPERFORATE *Iris*. See PUPIL, *Closure of*.

IMPERFORATE *Meatus Auditorius*. See MEATUS *Auditorius*.

IMPERIAL, something belonging to an emperor, or empire.

Thus we say, his imperial majesty, the imperial crown, imperial medals, the imperial chamber.

IMPERIAL *Cities*, in Germany, are those which own no other head but the emperor.

These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor, and pays him the Roman month; but in other respects, and in the administration of justice, the magistrate is sovereign. The imperial cities have a right of coining money, and of keeping forces, and fortified places: their deputies assist at the imperial diets, where they are divided into two branches; that of the Rhine, and that of Suabia. There were formerly twenty-two in the former, and thirty-seven in the latter;

latter; but there are now only forty-nine in all; thirteen belonging to the former, and thirty-six to the latter.

IMPERIAL Diet, is an assembly or convention of all the states of the empire. See **DIET**.

IMPERIAL Table, in *Surveying*, an instrument made of brass, with a box and needle, staff, &c. used in measuring land.

IMPERIALE, in *Geography*, a town of Chili, situated on a river which runs into the Pacific ocean; destroyed by the Indians; 60 miles N. of Valdivia.

IMPERII RECESSUS. See *RECESSUS Imperii*.

IMPERSONAL VERB, in *Grammar*, is such an one, as is only used in the third person singular; as *oportet, licet, &c.* Every verb, says the ingenious Mr. Harris, whether active or passive, has in language a necessary reference to some noun for its nominative case; and the doctrine of impersonal verbs has been justly rejected by the best grammarians, both ancient and modern. *Hermes*, p. 175.

IMPERVIOUS, a thing not to be pervaded, or passed through; either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETIGO, in *Medicine*, a term which has been employed in many indefinite significations by writers in the Latin language. Pliny uses it as synonymous with the *Lichen* of the Greeks (*Nat. Hist. lib. xx. cap. 1.*), in which he is followed by the majority; he is, however, inconsistent with himself, since, on other occasions, he employs the term to express other diseases. The definition which Celsus gives of *Impetigo*, does not in any respect correspond with the description of the *Lichenes* given by the Greeks: he includes these distinctly and correctly under the head of *Papula*; and his *Impetigo*, as Sennertus remarks, is the *Lepra* of the Greeks (*Cels. de Medicina, lib. v. cap. 28.* Sennert. *Med. Pract. lib. v. cap. 30.* Willan on Cutaneous Diseases, part i. p. 38.) Sauvages and Cullen have adopted the term *impetigo* for the title of one of the orders in their respective systems of nosology, in the classes of *Cachexia*. The *Impetiginæ*, in Dr. Cullen's system, include those species of cachectic diseases, which particularly discolour and deform the skin and external parts of the body; namely, scrofula, syphilis, scurvy, elephantiasis, leprosy, jaundice, &c. (Class IV. Ord. III.) The *Impetiginæ* of Sauvages include only those chronic and commonly contagious diseases which are accompanied by clustered swellings, ulcerations, crusts, &c.; *viz.* syphilis, scurvy, elephantiasis, lepra, scabies, and tinea. Class X. Ord. V.

Dr. Willan confines the use of the term *impetigo*, as a genus to a *pustular eruption*, commonly occurring in patches, and discharging a fluid, which, under one or two of its varieties, forms crusts or scabs on the surface; the running tetter of authors. But as the part of his treatise of cutaneous diseases, which will contain the description of *impetigo*, is not yet published, we are unable to enter farther into his views of the subject at present.

IMPETRATION, the act of obtaining any thing by request or prayer.

IMPETRATION was more particularly used in our statutes for the pre-obtaining of benefices and church offices in England from the court of Rome, which did belong to the disposal of the king, and other lay patrons of the realm; the penalty whereof is the same with that of provisors, 25 E. III. See **PROVISOR**.

IMPETUS, in *Mechanics*. See **FORCE**, **MOMENTUM**, and **MOTION**.

IMPETUS, Paracentric. See **PARACENTRIC**.

IMPEY'S ISLAND, in *Geography*, a small island in the Mergui Archipelago. N. lat. 10° 22'.

VOL. XVIII.

IMPEZZATO, Ital. See **EPAIS** and **SPISSUS**.

IMPING, in *Falconry*, the inserting a feather in the wing of a hawk, in the place of one that is broken.

IMPIRA, in *Geography*, a town of South America, in the province of Cordova; 90 miles S. of Cordova.

IMPLANTATION. See **TRANSPLANTATION**.

IMPLEAD, to sue, or prosecute by course of law. See **PLEADING**.

IMPLEMENTS, formed either from the Latin, *implere, to fill up*; or from the French, *employer, to employ*; is used for all things necessary for a trade, or the furniture of a household.

In this sense we frequently find it used in wills, and conveyances of moveables.

IMPLEMENT, in *Agriculture*, a term applied to any sort of tool or instrument by which any kind of work is executed.

IMPLEMENTS of Husbandry, the several different kinds of tools or machinery by which the various sorts of labour and operations of the art are performed. They consist principally of spades, ploughs, harrows, drags, drills, hoes, mills, carts, waggons, &c. See these different heads.

In the formation and construction of all sorts of tools and machinery for the uses of the farmer, the principal aim should be that of rendering the work they are to perform more cheap, easy, expeditious, and complete, by having them perfectly suited to the operations for which they are intended, and at the same time not too weighty, while they possess sufficient degrees of strength for the different purposes to which they may be applied. It is conceived by a late writer on rural affairs, that there is probably no sort of implements that admits of greater improvement than those employed in husbandry, on the principle of lessening weight, without materially diminishing the strength. It is strongly observed, that "every one knows that, if a beam of any length be made of equal thickness throughout its whole length, and a weight sufficient laid upon it, it will inevitably break in the middle, and never at either of the ends; yet, unless it be in the poles of a sedan chair, an instance can scarcely be recollected, in which weight has been diminished on this principle. On the contrary, it is not at all unusual, in the construction of such implements, to see the thickness diminished nearly one-half at the very weakest place, by means of a mortise cut out of it there, while its thickness in other parts is four times greater than would enable it to bear an equal burden. No attention is paid in placing the wood in that position wherein it would be best able to resist the pressure to which it must necessarily be subjected; although it is very well known that the same quantity of materials may be made to bear in one position above ten times as much as it could do in another. It is well known that mortises weaken the wood to an astonishing degree when they are injudiciously placed; yet it is no uncommon thing to see two cross-mortises, each of them twice the size that in any case could have been necessary, made through a beam, perhaps at the very weakest part of it, just as accident may direct, without even so much as an attempt to vary their position, far less to wholly avoid them, which in many cases might be effected without the least inconvenience or impropriety.

It is well understood, that a small brace, judiciously made use of, may greatly augment the strength without adding to the weight of an implement; yet contrivances of this nature, which are obvious to the mere tyro in mechanics, seem to be totally disregarded: far less do the constructors of such tools think of adopting new devices of this description, which a very moderate degree of ingenuity would readily point out. The importance and advantages of having every part firm and compact in a tool which is to be subjected to

jolting and shaking, are universally recognized; yet, from the most trifling considerations, this principle may be seen departed from, and loads of superfluous materials added in vain to supply the defects that are in this way produced. And these remarks do not apply to one set or sort of implements only, but almost to every common tool or machine that is employed in the art of husbandry.

It is obvious, that these principles and circumstances, however evident in themselves, have not only been little attended to by the cultivators of the soil, but in a great measure overlooked by those who have been chiefly engaged in the making of tools of this description. It can scarcely have escaped observation that, in most of the districts of the country, though numerous useful tools and machines have been lately invented and improved, there are still various kinds to be met with, which are not only extremely inconvenient from their clumsiness, but employed with great disadvantage in consequence of their heaviness. A difference, however, in regard to strength, as well as other objects, becomes necessary sometimes from the nature of the situation and other circumstances, and by these the mechanist must frequently be directed in constructing these sorts of tools. And as implements of this kind are generally made use of by labourers who have but little knowledge of the nature, power, and operation of them, they should constantly be constructed on the most obvious and simple principles, as well as in such modes, and of such materials, as that they may be afforded at an easy rate; as where they are charged at a high price, it must of necessity operate greatly against their introduction into general use.

The descriptions of the several different implements and machines that are capable of being employed with advantage in the various departments of agriculture, may be seen under the different heads to which they properly belong.

IMPLEX ACTION. See ACTION.

IMPLICATION, in *Law*, is where the law doth imply something that is not declared between parties in their deeds and agreement; and when our law giveth any thing to a man, it giveth implicitly whatever is necessary for the enjoying the same. The want of words may be helped in some cases by implication; and so one word or thing, or one estate given, shall be implied by another: and there is an implication in wills and devises of land, whereby estates are gained.

IMPLICIT, derived from *in*, and *plico*, *I fold*; something tacitly comprized, or understood: that is, contained in a discourse, clause, or proposition, not in express terms, but only by induction and consequence.

IMPLICIT Faith. See FAITH.

IMPLIED Condition, Contract, Malice, and Warranty. See the substantives.

IMPLIED Sound, in *Music*, is a term used by Mr. Holder in his "Essay towards a rational System of Music," p. 350. 362. 370, &c., to express what he thought to be the grave harmonic of certain sounds, but owing to a false rule by which he calculated, many of these are no such things as the Tartinian sounds he supposed them to be, and many parts of the fanciful theory which he raises therefrom, are, as might be expected, at variance with all established facts and rules in harmonics. See our article *GRAVE Harmonic* and *HOLDER's Temperament* of the musical scale.

IMPLY a contradiction, a phrase used among philosophers in speaking of the object of divine omnipotence.

God can do every thing that does not imply a contradiction proceeding from God: by which is not meant a relation of the action to the executive power of God, but a relation to the other attributes and simple perfections of God.

IMPONDERABLE SUBSTANCES, in *Chemistry*. Instead

of considering repulsion as a general agency or force, philosophers, finding that the cause producing it is capable of being communicated from one body to another, and that some of the phenomena of its transition indicate it to be a distinct principle, have been disposed to regard it as a peculiar subtle kind of matter, the same with that to which the phenomena of heat have been referred, and which, in the modern chemical nomenclature, has been denominated *Caloric*, which see. Though the materiality of this power has not been demonstrated, the supposition has much probability, and accords nearly with the phenomena. It may be regarded as the cause of repulsion, whatever be the nature of this power, whether it be regarded as a quality of bodies, a general force, or a distinct kind of matter; the same principle which produces the phenomena of heat is undoubtedly that which counteracts the attractions exerted between the particles of bodies. The connection of light and heat has led to the opinion of their identity; it is well ascertained that the particles of light are mutually repellent. From heat and light there is a natural transition to the agent which gives rise to the phenomena of *Electricity* and *Galvanism*, which see. They all possess one common character, which is that of not being subject to the attraction of gravitation, or at least their gravity is incapable of being appreciated: hence they are distinguished by the name of "imponderable substances." They possess the greatest subtilty or tenuity: we cannot easily insulate or obtain them in a separate state of existence: they are observed only in states of combination, or in their rapid transition from one body to another: we can scarcely measure their force, and we are unable to trace their particular combinations, or consider them as essential constituent principles of any compound.

IMPORTANCE of Action, in *Poetry*. See ACTION.

IMPORTATION, the act of importing or bringing merchandize from foreign countries, in contradistinction to exportation.

IMPOSITION of Hands, an ecclesiastical action, by which a bishop lays his hands on the head of a person, in ordination, confirmation, or in uttering a blessing. This practice is also frequently observed by the Dissenters at the ordination of their ministers, when all the ministers present place their hands on the head of him whom they are ordaining, while one of them prays for a blessing on him and his future labours. This some of them retain as an ancient practice, justified by the example of the apostles, when no extraordinary gifts were conveyed. However, they are not agreed as to the propriety of this ceremony; nor do they consider it as an essential part of ordination.

Imposition of hands was a Jewish ceremony, introduced, not by any divine authority, but by custom: it being the practice among those people, whenever they prayed to God for any person, to lay their hands on his head.

Our Saviour observed the same custom, both when he conferred his blessing on children, and when he cured the sick; adding prayer to the ceremony. The apostles likewise laid hands on those upon whom they bestowed the Holy Ghost. The priests observed the same custom when any one was received into their body. And the apostles themselves underwent the imposition of hands afresh, every time they entered upon any new design. In the ancient church, imposition of hands was even practised on persons when they married; which custom the Abyssinians still observe.

But this term, which, in its original signification, is general, is now restrained, by custom, to that imposition which is practised at ordination. Spanheim has written a treatise "De Impositione Manuum;" and Tribenhorius and Braunius have done the same. See ORDINATION.

IMPOSITION of Tonnage, &c. See DUTY, &c.

IMPOSSIBLE, that which is not possible, or which cannot be done or effected. A proposition is said to be impossible when it contains two ideas which mutually destroy each other, and which can neither be conceived, nor united together in the mind.

Thus it is impossible, that a circle should be a square; because we conceive clearly, that squareness and roundness destroy each other by the contrariety of their figure.

There are two kinds of impossibilities, *physical* and *moral*. Thus,

Physical impossibility, is that which is contrary to the laws of nature. A thing is *morally* impossible, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things considered, it appears impossible.

Thus it is morally impossible, that all men should be virtuous; or that a man should throw the same number with three dice a hundred times successively.

A thing which is impossible in law, is the same with a thing impossible in nature: and if any thing in a bond or deed be impossible to be done, such deed, &c. is void. 21 Car. I. B. R.

IMPOSSIBLE Condition, in Law. See CONDITION.

IMPOSSIBLE Forms of Equations, in the *Indeterminate Analysis*, are those that will admit of no rational solution, such as $2x^2 \pm 3y^2 = z^2$; $3x^3 \pm 7y^3 = z^3$; $3x^4 \pm 7y^4 = z^4$; &c.

Possible Forms.

$$\begin{array}{l} 2n, 2n + 1 \\ 3n, 3n + 1 \\ 5n, 5n \pm 1 \\ 7n, 7n + 1, 7n + 2, 7n + 4 \\ \left\{ \begin{array}{l} 11n, 11n + 1, 11n + 4, 11n + 5 \\ 11n + 9, 11n + 3 \end{array} \right. \end{array}$$

Impossible Forms.

$$\begin{array}{l} 3n + 2 \\ 5n + 2, 5n + 3 \\ 7n + 3, 7n + 5, 7n + 6 \\ \left\{ \begin{array}{l} 11n + 2, 11n + 6, 11n + 7 \\ 11n + 8, 11n + 10 \end{array} \right. \end{array}$$

Now by means of these linear forms, we readily obtain those of the quadratic forms, such as $2x^2 \pm 3y^2 = z^2$; which is demonstrated to be impossible, as follows.

First, the three indeterminates $x, y,$ and $z,$ may be considered as being prime to each other, for if they have any common measure, as $x = \phi x', y = \phi y',$ and $z = \phi z',$ the whole equation may be divided by that common measure, and thus reduced to another, in which the indeterminates are prime to each other; and therefore if an equation be possible, when the terms have a common measure, it is also possible when divided by it, and conversely if an equation be impossible when the terms are prime to each other, it is also impossible in all other cases. Assuming therefore, that in the equation $2x^2 \pm 3y^2 = z^2,$ $x, y,$ and $z,$ are prime to each other, we may proceed as follows. Whatever is the form of $y^2;$ $3y^2$ is divisible by 3, and is therefore of the form $3n;$ and x^2 must be of one of the

forms $3n,$ or $3n + 1;$ these being the only possible forms of squares numbers to modulus 3. But if x be of the form $3n,$ we shall have $2(3n) \pm 3n = z^2,$ of the form $3n,$ that is, z and x are both of the form $3n,$ which is contrary to the supposition, since $x, y,$ and z are all three prime to each other; therefore x^2 cannot be of the form $3n;$ let it then be of the form $3n + 1,$ and the equation becomes $2(3n + 1) \pm 3n = z^2,$ of the form $3n + 2;$ but $3n + 2$ is an impossible form for squares, therefore z^2 cannot be of the form $3n + 2,$ and consequently the proposed equation is impossible.

And we should have been led to the same result, if we had considered the equation under the more general form, $(3p + 2)x^2 \pm 3y^2 = z^2;$ that is, all equations falling under this form are impossible; hence all the following equations are readily obtained.

$$\left. \begin{array}{l} 2x^2 \pm 3y^2 = z^2 \\ 5x^2 \pm 3y^2 = z^2 \\ 8x^2 \pm 3y^2 = z^2 \\ 11x^2 \pm 3y^2 = z^2 \\ \&c. \quad \&c. \end{array} \right\} \begin{array}{l} \text{Impossible} \\ \text{forms of} \\ \text{equations.} \end{array} \left\{ \begin{array}{l} 2x^2 \pm 6y^2 = z^2 \\ 5x^2 \pm 6y^2 = z^2 \\ 8x^2 \pm 6y^2 = z^2 \\ 11x^2 \pm 6y^2 = z^2 \\ \&c. \quad \&c. \end{array} \right.$$

In the same way it may be demonstrated that the following equations are all impossible.

$$\left\{ \begin{array}{l} (5p + 2)x^2 \pm 5qy^2 = z^2 \\ (5p + 3)x^2 \pm 5qy^2 = z^2 \\ (7p + 3)x^2 \pm 7qy^2 = z^2 \\ (7p + 5)x^2 \pm 7qy^2 = z^2 \\ (7p + 6)x^2 \pm 7qy^2 = z^2 \end{array} \right. \left\{ \begin{array}{l} (11p + 2)x^2 \pm 11qy^2 = z^2 \\ (11p + 6)x^2 \pm 11qy^2 = z^2 \\ (11p + 7)x^2 \pm 11qy^2 = z^2 \\ (11p + 8)x^2 \pm 11qy^2 = z^2 \\ (11p + 10)x^2 \pm 11qy^2 = z^2 \end{array} \right.$$

These formulæ might be carried on indefinitely, each of which will furnish an infinite number of impossible forms of squares to each respective modulus; only observing that the indeterminate q must always be prime to the modulus with which it enters.

The impossible forms for cubes are ascertained in a similar manner, by first finding the linear forms of them, and then combining them as in the foregoing case; thus all cubes are of one of the forms $7n, 7n + 1, \text{ or } 7n + 6$; that is, all cube numbers are either divisible by 7; or, when divided by it as far as possible, the remainder will be either 1 or 6; and hence again it follows, that $7n + 2, 7n + 3, 7n + 4, 7n + 5$, are all impossible forms of cube numbers; or if a number, when divided by 7, leaves for a remainder 2, 3, 4, or 5, that number is not a cube. Again, all cube numbers are of one of the forms $9n, \text{ or } 9n \pm 1$; and consequently, no number of the form $9n + 2, 9n + 3, 9n + 4, 9n + 5, 9n + 6, 9n + 7$, can be a cube, as these are all impossible forms.

The equation $2x^3 \pm 7y^3 = z^3$ is impossible.

Here, as in the case of squares, $x, y,$ and $z,$ may be considered as prime to each other; and, therefore, for the same reason as that stated in the foregoing demonstration, x^3 cannot be of the form $7n$, as we should then have z^3 also of the same form, which is contrary to the hypothesis, these quantities being prime to each other; so that if the equation be possible, it must be when x^3 has one of the forms $7n \pm 1$, and this supposition gives $2(7n \pm 1) \pm 7n = z^3$; of the form $7n \pm 2$, which is an impossible form for cubes; and therefore the equation $2x^3 \pm 7y^3 = z^3$ is impossible.

In the same way it may be shewn, that each of the following equations is impossible.

$$\left. \begin{array}{l} 2x^3 \pm 7y^3 = z^3 \\ 3x^3 \pm 7y^3 = z^3 \\ 4x^3 \pm 7y^3 = z^3 \\ 5x^3 \pm 7y^3 = z^3 \\ 9x^3 \pm 7y^3 = z^3 \\ 10x^3 \pm 7y^3 = z^3 \end{array} \right\} \left\{ \begin{array}{l} 2x^3 \pm 9y^3 = z^3 \\ 3x^3 \pm 9y^3 = z^3 \\ 4x^3 \pm 9y^3 = z^3 \\ 5x^3 \pm 9y^3 = z^3 \\ 6x^3 \pm 9y^3 = z^3 \\ 7x^3 \pm 9y^3 = z^3 \end{array} \right.$$

And these, again, may be farther generalized, by writing them

$$\left. \begin{array}{l} (7p + 2)x^3 \pm 7qy^3 \\ (7p + 3)x^3 \pm 7qy^3 \\ (7p + 4)x^3 \pm 7qy^3 \\ (7p + 5)x^3 \pm 7qy^3 \\ (7p + 9)x^3 \pm 7qy^3 \\ (7p + 10)x^3 \pm 7qy^3 \end{array} \right\} \left\{ \begin{array}{l} (9p + 2)x^3 \pm 9qy^3 \\ (9p + 3)x^3 \pm 9qy^3 \\ (9p + 4)x^3 \pm 9qy^3 \\ (9p + 5)x^3 \pm 9qy^3 \\ (9p + 6)x^3 \pm 9qy^3 \\ (9p + 7)x^3 \pm 9qy^3 \end{array} \right.$$

No one of which equations can ever become equal to a cube, either in integers or fractions; provided that q be taken prime to the modulus with which it enters.

A similar mode of investigation may be pursued with all the higher powers, the only difficulty being in fixing upon a proper modulus; that is, such a number as hath the most impossible forms belonging to it, which requires a separate investigation. (See POWER.) But almost every power has some modulus that renders it expressible in three forms; thus,

All 3d powers	are of one of the forms	$7n,$ or $7n \pm 1$
4th powers	- - - -	$5n,$ or $5n \pm 1$
5th powers	- - - -	$11n,$ or $11n \pm 1$
6th powers	- - - -	$7n,$ or $7n \pm 1$
8th powers	- - - -	$17n,$ or $17n \pm 1$
9th powers	- - - -	$19n,$ or $19n \pm 1$
10th powers	- - - -	$11n,$ or $11n \pm 1$
&c. &c.		&c. &c.

Here the 7th power is now omitted, not being reducible to a similar form; by means of these linear forms various others, as $ax^m \pm by^m = cz^m$, may be demonstrated to be impossible.

Beside these equations, which are demonstrable to be impossible, from the linear forms of the respective powers, there are others that have been noticed by Bachet, Fermat, Lagrange, Euler, &c.; but these generally require very laborious demonstrations, of which Euler has given several descriptions in the Petersburg Acts. The Memoirs of Berlin also contain many papers on this subject by Lagrange; thus, $x^3 \pm y^3 = z^3$ is impossible, as is also $x^4 \pm y^4 = z^4$, and various others; and generally, the equation $x^n \pm y^n = z^n$ is impossible, if n be greater than 2. This proposition was first proposed by Fermat as a challenge to all the English mathematicians of his time, but the general demonstration of it was not published till very lately, viz. for November 1810, in Nicholson's Philosophical Journal, by Mr. P. Barlow, and to which the reader is referred for a complete investigation of this interesting numeral proposition. See also Barlow's "Elementary Investigations, &c."

IMPOSSIBLE Roots of Equations. See IMAGINARY Roots.

IMPOSSIBLE Quantity, in Algebra. See ROOT.

IMPOST, from *impono, I impose*, in Law, properly denotes the tribute or tax appointed by a sovereign to be paid for such merchandize as is brought into any haven in his dominions from foreign nations. See DUTY.

Impost is distinguished from *custom*, in that custom more properly signifies the duties paid to the king for goods shipped off or exported. But the two are frequently confounded together.

IMPOSTHUME, by corruption from *impostem* and *apostem, abscess*, a collection of matter, or pus, in any part of the body, either owing to an obstruction of the fluids in that part, which makes them change into such a matter; or to a translocation of it from some other part where it was generated. See ABSCESS.

IMPOSTORS, RELIGIOUS, are such as falsely pretend to an extraordinary commission from heaven; and who terrify and abuse the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment. 1 Hawk. P. C. 7.

IMPOSTS, in Architecture, the capitals of pillars, or pilasters, which support arches. See Basilic in Plate Architecture.

An impost, sometimes also called *chaprel*, is a sort of little cornice, which crowns a pier, and supports the first stone, whence an arch or vault commences.

Imposts conform to their proper orders. The Tuscan is a plinth only; the Doric has two faces crowned; the Ionic has a larmier over the two faces, and its mouldings may be carved; the Corinthian and Composite have a larmier, frieze, and other mouldings.

The projection of the impost must not exceed the naked of the pilaster. Sometimes the entablature of the order serves for the impost of the arch; and this looks very grand and stately.

The impost is a thing essential to an ordonnance; inasmuch as without it, in the place where the curve line of the arch meets with the perpendicular line of the pillar, there always seems a kind of elbow.

P, in *fig. Basilic*, represents an impost made open or flat in the middle, and bounded by fillets or ogee. This kind of impost is said to be the invention of lord Burlington. and it may be called a Burlington impost. It is enriched with a *guloic*, or

bands forming circles and intersecting each other : when there are two rows it is called a *double guloic*.

The following rules are given by some modern authors for dividing the impost of arches: in the Tuscan impost the fascia hath 3 parts, the ogee 1, the fillet $\frac{1}{2}$, the corona 3, and the band $1\frac{1}{2}$. For the projections, the fascia $\frac{1}{2}$, the ogee two parts, corona 3, and the whole $3\frac{1}{2}$. In the Doric, the frieze 2, fillet $\frac{1}{2}$, astragal $\frac{3}{4}$, cyma recta $2\frac{1}{4}$, fillet $\frac{1}{2}$, corona 2, ogee 1. For the projections, fillet $\frac{1}{2}$, astragal 1, corona $2\frac{1}{2}$, and the whole $3\frac{1}{2}$.

In the Ionic, fillet $\frac{1}{2}$, cyma 4, ovolo $1\frac{1}{2}$, corona $1\frac{1}{2}$, ogee 1. For the projections, cyma $1\frac{3}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

In the Corinthian, the frieze $1\frac{3}{4}$, fillet $\frac{1}{4}$, astragal $\frac{1}{2}$, cyma $2\frac{1}{4}$, ovolo 1, corona $1\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{4}$, astragal $\frac{3}{4}$, cyma $1\frac{3}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

In the Composite, frieze 2, fillet $\frac{1}{2}$, astragal $\frac{3}{4}$, the cyma $1\frac{1}{2}$, corona $1\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{2}$, astragal $\frac{3}{4}$, ovolo $1\frac{1}{2}$, cyma $2\frac{1}{4}$, corona $2\frac{1}{2}$, the whole $3\frac{1}{2}$.

IMPOTENCE is more particularly used to denote an inability in the male to impregnate the female. This inability, however, arises from two very different conditions of the body; in one of which the venereal congress cannot be accomplished; but, in the other, although coition be effected, the semen is not transmitted into the uterus. Whence the nosologists have properly distributed the varieties of this inability under two heads, or distinct diseases, *viz.* *Anaphrodisia*, or a defect of the venereal appetite and power, which is *impotency* strictly so called; and *Dyspermatismus*, or an impeded and interrupted emission of the semen in the generative act. The various mechanical impediments which constitute the latter species of the disease, have been enumerated under the proper head; and consist principally in disorders of the canal of the urethra, by which the passage is obstructed, or of the adjoining parts by which it is compressed; in either case, the exit of the seminal fluid is impeded, or altogether prevented.

The *anaphrodisia*, or incapability of coition, may originate from three causes; to wit, from a connate or original imperfection in the conformation of the organs subservient to generation, a circumstance of very unusual occurrence; from a paralysis affecting the muscoli erectores of the penis (*Anaphrodisia à paralyse*, Sauvages, class vi. genus xiii. spec. 1.); or from a too ready efflux of the semen, *e.g.* during the evacuation of the bowels, or at the commencement of the distention of the virile organ (*A. gonorrhœica*, Sauv. spec. 2.) Where the disease consists in a malconformation of the organs, or of any of their appendages, it must be of course beyond the reach of medical relief. When it originates from palsy, affecting the erector muscles, it is scarcely more favourable; since it is then only a part of a more general palsy affecting one side of the body (hemiplegia), or the lower extremities (paraplegia), or originating from injury to the spinal nerve, occasioned by falls or other external violence. When the complaint is occasioned by an extreme relaxation, as it were, of the secretory vessels, inasmuch that the semen is poured out from the slightest irritation in their vicinity (such as the passage of the stools, or the friction of the dress), or from the smallest determination of blood to the parts before the distention of the member is produced, medical treatment, with proper regimen, may be resorted to with success. This species of *anaphrodisia* has been ascribed to early masturbation, to excess in venereal pleasures, and to the occurrence of frequent gonorrhœas; but it cannot be doubted, that designing quacks have multiplied and exaggerated the representations

of this kind beyond the truth, and that their books have done more harm than good, by the imaginary disorders with which they have afflicted weak and hypochondriacal men. In such cases, the ordinary means of strengthening the body by light and nourishing diet, and by the use of the bark and steel, or other vegetable and mineral tonics, together with the use of the cold bath, must be resorted to. In many of those cases, Mr. Hunter observes, washing the penis, scrotum, and perinæum with cold water, is often of service; and to render it colder than we find it at some seasons of the year, common salt may be added to it, and the parts washed when the salt is almost dissolved. Hunter on the Ven. Disease, pt. iii. chap. xii.

The able and distinguished physiologist just alluded to, remarked that the influence of the mind upon the operations of the body was most conspicuous in respect to this function, and that various states of apprehension, consciousness of impropriety, &c. sometimes altogether prevented the performance of it: the necessity, therefore, of investigating into the state of the mind, when impotency is complained of, was strongly pointed out by him from long observation, and illustrated by the following case: A gentleman consulted him respecting the loss of virility; but after some inquiry, Mr. Hunter found that the physical powers were not defective, and that it could only arise from a particular state of mind: whence the mind was to be applied to for the cure; and Mr. Hunter assured him that he might be cured, if he could only rely on his own power of self-denial. The patient was requested, therefore, to sleep with the individual with whom his inability had manifested itself, having first promised himself to abstain from any connection for six nights, let his inclinations and powers be what they might. This plan produced a complete alteration in the state of his mind, and was followed by a perfect and permanent cure. (Loc. cit.) See *DYSPERMATISMUS*.

Impotency is a canonical disability to avoid marriage in the spiritual court. The marriage is not void *ab initio*, but voidable only by sentence of separation during the life of the parties.

IMPRACTICABLE CASE, in *Algebra*. See *IRREDUCIBLE*.

IMPRECATION, derived from *in*, and *precor*, *I pray*; a curse, or wish that some evil may befall any one.

The ancients had their goddesses called *Imprecations*, in Latin *Dire*, *i.e.* *Deorum iræ*, who were supposed to be the executioners of evil consciences. They were called *Dire* in heaven, *Furies* on earth, and *Eumenides* in hell. The Romans owned but three of these Imprecations, and the Greeks only two. They invoked them with prayers and pieces of verses to destroy their enemies.

IMPREGNATION, derived from *impregnare*, of *pregnans*, a woman with child; the emission of the seed of the male in coition, by which the female conceives, or becomes with young. See *GENERATION*.

IMPREGNATION is also figuratively used in pharmacy, when a liquor imbibes the particles of some other body.

Thus a menstruum is said to be impregnated with a body dissolved in it, as much as its pores are able to receive.

IMPREGNATION, in *Natural History*, is one of the modes in which organized substances have become mineralised and preserved in the strata of the earth; Mr. William Martin, in his "Outlines," p. 50, defines this term, as applying to the mechanical impregnation of organic substances with mineral matters, and he shews the distinctions between this and a chemical union of mineral substances with the organic matter, called conversion.

IMPRESSED SPECIES. See SPECIES.

IMPRESSING, in the *Sea Language.* See MANNING *the Fleet.*

IMPRESSION, in *Natural History,* is a term implying the interior of the matrix or mould in which an extraneous fossil has been inclosed and its form impressed. The matrix is said to be filled when the reliquium remains in the impression, empty when the reliquium has been renewed from the impression. Sometimes, after the organic body has been removed, mineral or inorganic matter takes its place, and assumes the external form of the reliquia, and such are often called *casts*, which is the state in which the fossil shells of a great number of strata are found. Mr. James Parkinson, at the commencement of his "Organic Remains," was inclined, vol. i. p. 37, to exclude impressions and casts from the rank of secondary fossils or organic remains, but the further researches of this able writer seem to have considerably modified his ideas on this subject.

IMPRESSION, in *School Philosophy,* is applied to the species of objects which are supposed to make some mark or impression on the senses, the mind, and the memory.

The Peripatetics tell us, that bodies emit species resembling them, which species are conveyed by the exterior senses to the common sensory: these impressed species, being material and sensible, they say, are rendered intelligible by the active intellect; and when thus spiritualized, are called *expressions*, or *express species*, as being expressed from the others.

IMPRESSION is also frequently used in speaking of the editions of a book, or of the number of times it has been printed.

Impression, however, differs from *edition*: the former, properly speaking, takes in no more than what belongs to the printing, the letter, paper, margin, page, distances of words and lines, and the disposition of every thing that may have a good or bad effect upon the eye; the latter, besides all this, takes in the care of the editor, who has revised the copy, corrected or augmented it, adding notes, tables, and other like things, which he judged might contribute towards making the book more useful and correct.

Indeed, very frequently the word *edition* only refers to this latter part; as when, in speaking of the works of St. Augustine, we quote the edition of Erasmus, the Lovaniits, Benedictines, &c. where we have no regard to the printing part, but only to the care and pains of the editors.

IMPRESSION, Privilege for. See PRIVILEGE.

IMPRESSIONS on *gems* and *medals.* See GEMS and MEDALS.

IMPREST, Auditors of. See AUDITORS.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another; and extends not only to a gaol, but to a house, stocks, or a man's being held in the street, &c. (2 Inst. 589.) None shall be imprisoned but by the lawful judgment of his peers, or by the law of the land. Mag. Ch. 9 Hen. III. c. 2. 25 Edw. III. stat. 5. c. 4.

No person is to be imprisoned, but as the law directs, either by the command or order of a court of record, or by lawful warrant, which warrant must be in writing, under the hand and seal of the magistrate, and expressing the cause of the commitment, in order to be examined (if necessary) upon a "habeas corpus;" or the king's process, on which one may be lawfully detained; and at common law a person could not be imprisoned unless he were guilty of some force or violence, for which his body was subject to imprisonment,

as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly pursues the statute in the manner of doing it, for otherwise it will be deemed false imprisonment, and in consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, "Till delivered by due course of law," and not "Until farther order;" which has been held ill, and thus it also is, where one is imprisoned on a warrant, not mentioning any cause for which he is committed. If there be no cause expressed, the gaoler is not bound to detain the prisoner. For the law judges in this respect, faith Sir Edward Coke, like Festus the Roman governor; that it is unreasonable to send a prisoner, and not to signify withal the crimes alleged against him.

A person being sent to prison by a warrant from a secretary of state, without assigning any cause, &c. it was adjudged, that he ought to be discharged for that reason. Persons may also, by bail or habeas corpus, be discharged from their imprisonment in any case bailable. See the articles HABEAS CORPUS, BAIL, PRISON, PRISONER, and GAOL.

IMPRISONMENT, False. See FALSE and APPEAL.

IMPROMPTU. See IMPROMPTU.

IMPROPER FEUDS, in *Law.* See FEUD.

IMPROPER Fractions, in *Arithmetic.* See FRACTIONS.

IMPROPRIATION is a term used where the profits of an ecclesiastical benefice are in the hands of a layman.

In which sense it stands distinguished from appropriation, which is where the profits of a benefice are in the hands of a bishop, college, &c. though the two are now often used promiscuously. There are said to be 3845 impropriations in England.

IMPROPRIETY, the quality of something that is not fit, or proper. See PROPER, and PROPRIETY.

Grammarians observe three kinds of faults against purity in language; a solecism, barbarism, and impropriety: an impropriety is committed when a word is used that has not a proper signification.

This is an offence against lexicography, as barbarism respects etymology and the solecism syntax. It is the business of the lexicographer to assign to every word of the language the precise meaning or meanings which use hath assigned to it. This fault may be committed either in single words or in phrases. Improprieties as to single words are such as a writer is apt unwarily to be seduced into by some resemblance or proximity in sound or sense, or both. It is by proximity in sound that several are misled to use the word "observation" for "observance," as when they speak of the religious observance of a festival for the religious observance of it. By a similar mistake "endurance" hath been used for "duration," and confounded with it; whereas its proper sense is patience. This was the case in the days of queen Elizabeth, when endurance was synonymous with duration, though in this acceptance it is now obsolete. Thus also "human" and "humane" are sometimes confounded; the adjectives "ceremonious" and "ceremonial" are sometimes used promiscuously; and the word "construction" is variously applied, &c. &c. With regard to improprieties arising from a similitude in sense, we may mention "veracity" strictly applicable to persons, used for "reality," which pertains to things; "verdict" used for "testimony;" "risible" for "ridiculous," &c. &c. To this class we may refer the "idiotism," or the employing of an English word in a sense which it bears in some provincial dialect, in low and partial use, and which perhaps the corresponding word bears in some foreign tongue, unsupported by general use in our

own language: such are "impracticable" when it is used for "impassable," and applied to roads; "intend" when used for "mean," "decompound" for "analyse," &c. &c. Another error of the same kind is the "latinism;" such as the use of the word "affection," when applied to things inanimate, and signifying the state of being affected by any cause; and "integrity" when used for "entireness." To these properly succeeds that sort of the "vulgarism" in which only a low and partial use can be pleaded in support of the application that is made of a particular word. Of this an example occurs in the following passage cited from the "Guardian" (N 57) "'Tis my humble request you will be particular in speaking to (for on) the following points." Of the same stamp is "on't" for "of it." The derivatives, "falseness," "falsity," "falseness," from the root "false," are often erroneously applied for one another, though they ought to be distinguished. "Falseness" is properly used in a moral sense for want of veracity, and applied only to persons; the other two are applied only to things. "Falsity" denotes that quality in the abstract, which may be defined contrariety to truth. "Falseness" is an untrue assertion. The same misapplication occurs in the use of the word "conscience" for "consciousness."

Of improprieties that occur in phrases the first we shall mention is, when the expression, on being grammatically analysed, is discovered to contain some inconsistency, such as the phrase "of all others" after the superlative; e. g. "the most perfect of all others" should have been "more perfect than any other," or "the most perfect of all" the things to which it refers. To this class belong those improprieties which involve in them some absurdity. Others are those by which an author is made to say one thing when he means another. Another species of impropriety is that in which there appears some slight incongruity in the combination of the words; e. g. "when you fall into a man's conversation, &c." for "fall into conversation with a man:"—"the false taste the town is in, &c." for the "false taste of the town." Campbell's Philosophy of Rhetoric, vol. i. p. 456, &c.

IMPROVEMENT, in *Agriculture*, a term applied to any sort of amelioration which is produced on lands either by the several different operations and processes which they are capable of admitting, or by the general practices of cultivation. See DRAINING and WATERING, &c.

IMPROVEMENT of *Landed Property*, the art of rendering it more valuable to the proprietors, and at the same time more beneficial to the public. It has been well remarked that the possessors of this sort of property "have a double interest, a two-fold motive to incline them toward the improvement of their estates; namely, to augment their personal incomes, and to increase the prosperity of the land they live in."

The species of improvements that landed property is capable of admitting, are considered as very numerous; but they may probably be arranged under the following heads.

1. Reclaiming watery lands.
2. Appropriating commonable lands.
3. Consolidating appropriated lands.
4. Laying out estates.
5. Laying out farm-lands.
6. Laying out farms.
7. Improving farm-lands.
8. Improving wood-lands.
9. Improving waters.
10. Improving mines, quarries, &c.

The first of these objects may in most cases be effected by proper draining and embanking, the second by inclosure, the third by means of exchange, purchase, or sale; and the

whole of the rest by the several methods that are described under the particular heads to which they immediately belong. See DRAINING, EMBANKING, COMMONABLE Lands; &c. &c.

It is suggested, that by the political constitution of this country the government has no power or legal means of advancing its prosperity by the improvement of *appropriated territory*; unless by special acts of the legislature. And that even these are confined to a few particular objects; as drainage, inclosure, and the consolidation of intermixed lands; and these only, where a plurality of interests are concerned. In the mass of improvements which are here to be brought forward, and in all cases of private property, it is out of the power of the public to interfere. A proprietor may suffer his estate to lie waste with impunity, provided he thereby injures no other man's private property. And if an estate be permitted to lie partially waste, or under-productive, for the want of due improvement, the loss to the public, though not so large, is of the self-same nature. In the appropriation of a wild uncultivated country, it is hinted, that it might be wise in a government to reserve a power of rendering its lands productive, as a wise possessor of an estate reserves the right of keeping his farms in tenantable repair and husband-like cultivation at the expence of the tenant who refuses or neglects to perform his duty. But as no such reservation has been made, nor in any way claimed in this country, the proprietors of its lands are, it is supposed, bound not only by the ties of interest, but by those of honour, to promote their improvement.

It is considered that the basis or ground-work of improvement on which a practical man may tread with safety and full effect, is an accurate delineation of the *existing state*, together with a faithful estimate of the *present value* of the lands and other valuable particulars of an estate to be improved. A general map of the appropriated lands, promptly exhibiting the several farms and fields as they lie, and shewing the existing watercourses, embankments, fences, and buildings, the woodlands, standing waters, morasses, and moory grounds; the known mines and quarries, together with the commonable lands, if any, belonging to the estate, forms a comprehensive and useful subject of study to the practical improver. It is to him, what the map of a country is to a traveller, or a sea-chart to a navigator. If an estate is large, a faithful delineation of it will enable him in a few hours to set out with advantages respecting the connections and dependencies of the whole and its several parts, with which as many days, weeks, or months could not furnish him, without such scientific assistance. If, on the same plan, the rental value of each mine, quarry, woodland, and productive water in its present state be stated, the preparatory information which science is capable of furnishing may be considered as complete. And it remains with the artist to study, with persevering attention, the subject himself, in order to discover the species of *improvements* of which it is susceptible, and the suitable means of carrying them into execution. See *Landed PROPERTY*.

IMPROVIDE', in *Law*: See *QUI IMPROVIDE'*.

IMPROVISARE, *Ital.* to sing or play extempore.

IMPROVISATORE, *Ital.* an extemporaneous singer of verses upon a given subject. A voluntary player, an organist who is able to treat in a masterly manner a given subject of fugue, extempore, is justly allowed to be a man of considerable abilities.

The improvisatori, in poetry, seem confined to the southern provinces of Europe. Italy, Spain, and Portugal, appear exclusively to enjoy the gift. It is indeed unwillingly credited elsewhere. And yet there is nothing more com-

mon in Italy, than to see, during the carnival, two masks meet, defy, challenge, and attack each other in verse, and answer, stanza for stanza, to the same air, with a vivacity, dialogue, melody, and accompaniment, which, without the having been present, it is difficult to comprehend. But Dionysius Halicarnassens informs us, that in the first Roman triumph of Romulus over the Cænienses, the army followed in three several divisions, hymning their gods in songs of their country, and celebrating their general with *contemporary verses*: this account affords a very venerable origin to the improvisatori of Italy; as the event happened in the fourth year of Rome, seven hundred and forty-nine years before Christ, and the fourth year of the seventh Olympiad.

This surprising faculty, in modern times, extends to females. Such was the admirable improvisatrice, Madalena Morelli, commonly called the Corilla, whom we saw and heard at Florence in 1770; and who, besides her poetical inspirations, played well on the violin, resting it on her lap, not her shoulder, like Madame Sirman. It was at the house of Nardini, of whom she had learned the violin, that we heard her perform. She had likewise a pleasing voice, and sung with taste, expression, and no inconsiderable degree of execution. This accomplished female having been long celebrated all over Europe for the marvellous fertility and readiness with which she instantly produced the most elegant verses on whatever subject, and in whatever measure, she was requested to give specimens of her talents; after having been received with acclamation into the celebrated academy of the Arcadi at Rome in 1775, in the presence of the first nobility and men of letters and science, in July 1776 she was solemnly crowned in the Campidoglio, as Petrarch had been in the fourteenth century. See CORILLA.

IMPULSIVE, a term in philosophy, applied to the action of the body which impels or pushes another.

Thus the arm is said to give an impulsive motion to the stone that it throws. See PROJECTILE.

In this sense, impulsive stands contradicting with *attractive* and *repulsive*.

Sir Isaac Newton suggests, that attraction itself may possibly be effected by an impulsive power.

IMPURITY, in the *Mosaic* law. There were several sorts of impurity contracted under the law of Moses. Some were voluntary, as the touching of a dead body, or of any animal that died of itself, or of any creeping thing; or unclean creature; or the touching things holy by one who was not clean, or was not a priest; or touching persons under impure circumstances. Other kinds of impurity there were of an involuntary nature; for which we must refer the reader to Calmet, who shews what kind of purification was prescribed for each species of pollution. See Numb. xix. 11—14. Levit. xi. 24—43. Levit. xii. 23—45. Id. xv. 25. Calm. Dict. Bibl. in voc.

IMPUTATION, a term much used among divines, sometimes in a good, and sometimes in an ill sense: in the latter it is used to signify the charging the sin to the account of one, which was committed by another. The word, however, is generally used in an ill sense; for when we place any good to the account of another, we use the word attribute.

Thus Adam's sin is said by some divines to be imputed to all his posterity; all his descendants by his fall becoming as criminal in the sight of God, as if they had fallen themselves; and bearing the just punishment of his first crime. See ORIGINAL SIN.

Imputation, used in a good sense, signifies the charging of another's justice or merit.

Thus the justice of Jesus Christ is said to be imputed to us; his merits, and the price of his sufferings, being applied to us.

IN, in the *Manege*.—To put a horse IN, is an expression that signifies to breed and dress him, by putting him right upon the hand and the heels.

IN, in the *Sea Language*, denotes the state of any of a ship's sails, when they are furled or stowed; it is used in opposition to *out*, which implies that they are set, or extended to assist the ship's course.

IN-penny and out-penny, in our *Old Writers*, money paid by the custom of some manors on the alienation of tenants, &c.—In-penny and out-penny “*consuetudo talis est in villa de East Radham, de omnibus terris quæ infra Burgagium tenentur, viz. quod ipse, qui venderit vel dederit dictam tenuram alicui, dabit pro exitu suo de eadem tenura unum denarium, & simile de ingressu alterius; et si prædicti denarii a retro fuerint, ballivus domini distringet pro eisdem denariis in eadem tenura.*” Regill. Prior. de Cokesford, p. 25.

IN and Out, in *Ship Building*, is a term often used to signify the scantling of the timbers the moulding way, but more generally applied to the bolts which connect the sides of the ship together by being driven the thwartship way through the knees, riders, &c.

INA, in *Biography*, king of Wexsex, one of the most illustrious princes in the Saxon heptarchy, succeeded to the crown in 689, and began his course by attempts at extending his dominions by force of arms. He invaded Kent, but was induced by a large sum of money to desist from his enterprise. He then obtained possession of Cornwall and Somersethire, which he annexed to his kingdom, treating the vanquished with a degree of humanity hitherto but little practised by the Saxon conquerors. By his code of laws he is placed as a legislator at the head of the Saxon kings previously to Alfred. Though he was disturbed by some insurrections at home, his long reign of thirty-seven years may be regarded as one of the most glorious and most prosperous of the heptarchy. In the decline of life he made a pilgrimage to Rome, and after his return shut himself up in a cloister, where he died. Home.

INA, in *Geography*, a town of Japan, in the island of Nippon; 22 miles N.W. of Fanissima.

INACCESSIBLE *Height* or *Distance*. See ALTITUDE, DISTANCE, &c.

INACCESSIBLE *Island*, in *Geography*, a small island in the South Atlantic ocean, and one of those called the islands of Tristan de Cunha. It has obtained the name from its being a high, bluff, apparently barren plain, visible at the distance of 14 or 15 leagues, about nine miles in circumference, and having on the whole a very forbidding appearance; with a high rock detached from it at the south end. S. lat. 37° 19'. W. long. 11° 50'.

INACHIA, *Ἰναχία*, in *Antiquity*, a festival in Crete, celebrated in honour of Leucothea, or Ino.

The word is compounded of Ino, and ἀχθῆ, i. e. grief; being, perhaps, a commemoration of Ino's misfortunes.

INACORI, in *Geography*, a town of Hindoostan, in Marawar; 20 miles N.N.W. of Ramanadporum.

INACTION, *cessation of action*, a term much used in the mystical divinity; by which is understood a privation, or annihilation of all the faculties; whereby the door is, as it were, shut to all external objects, and a kind of ecstacy is procured, during which God speaks immediately to the heart. It is the state of inaction that is held the most proper for receiving the Holy Spirit; and in this fit of dozing, they say,

say, it is that God communicates sublime and ineffable sentiments and graces to the soul.

Some do not make it consist in this stupid kind of indolence, or general suspension of all sensation: but by inaction only mean a cessation of desires, in which, as the soul does not determine itself to any positive acts, neither does it abandon itself to useless meditations, or the vain speculations of reason; but demands in general every thing that may be agreeable to God, without prescribing any thing to him.

This latter is the doctrine of the ancient mystics, and the former that of the modern ones, or the quietists.

In general, however, it may be said, that inaction is not the most likely way of pleasing God; by our actions chiefly we are to gain his favour: he will have us to act; so that inaction cannot be agreeable to him.

INACTIVITY of Matter. See *Vis inertiz*.

INADEQUATE IDEA, or *notion*, is a partial or incomplete representation to the mind. See *IDEA*.

INAGUA, or YANAGUA, in *Geography*, two islands of the West Indies, near the N. W. coast of St. Domingo. N. lat. 21° 2' to 20° 26'. W. long. 72° 50' to 71° 30'.

INAJA GUACUBA, in *Botany*, a name by which some authors have called the cocoa-nut tree, or *palma Indica nucifera* of other writers.

INAKA, in *Geography*, a town of Japan, in the island of Nippon; 130 miles W. of Meaco.

INALIENABLE, that which cannot be validly alienated, or made over to another. See *ALIENATION*.

Thus the dominions of the king, the church, minors, &c. are inalienable, otherwise than with a reserve of the right of redemption for ever.

INAMBLUCIA, in *Natural History*, the name of a genus of fossils of the class of the selenites; but of the number of the columnar, not the rhomboidal kinds, and composed merely of parallel fibres. See *SELENITES*.

INAMELLING, or ENAMELLING. See *ENAMELLING*.

INANIMATE, derived from *in*, taken privatively, and *anima, soul*, denotes a body that has either lost its soul, or that is not of a nature capable of having any.

Thus a dead man is an inanimate lump, and metals are inanimate bodies.

INANITION, in *Medicine*, emptiness, or that state of the stomach when it has been too long deprived of food.

Man, as well as many other animals, is capable of subsisting for a considerable length of time without food. But, in this case, among other effects of inanition, such as languor, debility, &c., the most remarkable consequence which ensues, is the extreme irritability of the stomach itself, which is now easily excited to extraordinary vascular action, by the smallest quantity of food or drink, so that it is difficult to avoid occasioning inflammation of that organ, in attempting to restore the health and strength of the sufferer. This law of the vital power, (excitability, or sensorial power, in the language of Brown and Darwin) is the ground-work of the systems of medicine promulgated by these two physicians; namely, that whenever the accustomed stimulus of any organ, or of the body at large, has been long withdrawn, such an accumulation of that power takes place, that a much smaller stimulus than ordinary is capable of producing extraordinary excitement. (See *EXCITABILITY*.) In such cases, therefore, the utmost caution is required to restore the natural stimulus by slow degrees; using first substances of the least stimulating power, and in very small quantity. Thus in a frost-bitten limb, which is produced by the too great abstraction of the stimulus of heat, the attempt to restore its

vitability by warm applications is invariably productive of inflammation and gangrene, and the limb will drop off, if the life of the patient be not also destroyed. The only successful mode of restoration is to rub the part with snow, or with cold water, which are of a temperature something above the cold of the limb. (See *COLD*.) In like manner, in the attempt to restore a person to strength, who has suffered from *inanition*, the first nutriment given must be fluid, that it may not irritate by its hardness and weight, in small quantity, for a similar reason, destitute of every heating and stimulating quality, from vinous, spirituous, or aromatic substances, and very easy of digestion, or containing little nutriment, so that the action of the stomach may not be too much excited for accomplishing the digestive process. Hence in extreme cases, a spoonful of milk and water, or milk alone, to be repeated every hour, would be one of the safest and most effectual remedies: and by slow and cautious steps, nutriment of a more substantial kind, and more copious in quantity, might be afterwards resorted to, attending rather to the wants of the stomach, than to the stated hours of meals.

INANITY, the school term for emptiness, or absolute vacuity, and implies the absence of all body and matter whatsoever, so that nothing remains but mere space.

INARCHING, in *Gardening*, a particular sort of grafting, called also by some grafting by approach. It is used when the stock intended to be grafted on, and the tree from which the graft is to be taken, stand so near one another, that they may be brought to touch. The branch to be inarched is to be fitted to that part of the stock where it is to be joined, the rind and wood are to be pared away on one side for the length of three inches, and the stock or branch where the graft is to be united is to be served in the same manner, so that the two may join equally together, and the sap meet; a little tongue is then to be cut upwards in the graft, and a notch made in the stock to admit it, so that when they are joined, the tongue will prevent their slipping, and the graft will more closely unite to the stock. Having thus brought them exactly together, they may be tied with some bals or worsted, or other soft tying, and then the place must be covered with some grafting clay, to prevent the air from drying the wound, and the wet from rotting the stock: a stake must be fixed in the ground, to which both the stock and the graft must be tied, to prevent the wind's displacing them. When they have remained in this state four months, they will be sufficiently united, and the graft may then be cut off from the mother-tree, observing to slope it close to the stock, and at this time there should be fresh clay laid all round the part. This operation should be performed in April or May, that the graft may be perfectly united to the stock, before the ensuing winter. It is principally practised upon oranges, myrtles, jessamines, walnuts, and firs, and some other trees, which do not succeed well in the common way of grafting. But it is a wrong practice when orange trees are designed to grow large, for these are seldom long-lived after the operation. See *ABLACTATION* and *GRAFTING*.

INARTICULATE, an epithet applied to such sounds, syllables, or words, as are not pronounced distinctly. See *ARTICULATION*.

INAUGURATION, the coronation of an emperor, or king; or the consecration of a prelate, so called in imitation of the ceremonies used by the Romans, when they were received into the college of augurs. See *CROWN, KING, and BISHOP*.

The word comes from the Latin *inaugurare*, which signifies to dedicate a temple, or to raise any one to the priesthood, having, in order to that, first taken auguries. See AUGUR, and AUGURY.

IMBATZKOI NOVIMSKOI, in *Geography*, a town of Russia, in the government of Tobolsk, on the Enisei; 124 miles S. of Turuchansk. N. lat. $63^{\circ} 40'$. E. long. $89^{\circ} 14'$.

IMBATZKOI *Verchnei*, a town of Russia, in the government of Tobolsk; 168 miles S. of Turuchansk.

IN-BOARD, a term used to signify any thing that is within the ship; as the in-board works are all designed on a drawing so called, &c.

INCA, or YNCA, an appellation which the natives of Peru give to their kings and princes of the blood.

The chronicle of Peru relates the origin of the incas: this country had been a long time the theatre of all sorts of wars, horrible crimes, and dissensions, till at length there appeared two brothers, the one of whom was called Manco Capac: of this person the Indians use to tell wonders; they say he built the city of Cusco, settled laws and policy, and taught them to adore the sun: and he and his descendants took the name of inca, which, in the language of Peru, signifies *king*, or *great lord*. These incas grew so powerful, that they made themselves masters of the whole country, from Chili to Quito, establishing in every province their peculiar policy and religious institutions, and held it till the divisions between the brothers Huascar and Atahualpa; which the Spaniards under Pizarro laying hold of, made themselves masters of Peru, and put an end to the empire of the incas, in 1533. They number only twelve of these incas. It is said, the most considerable among the nobles in the country still bear the name of inca.

INCALESCENCE, compounded of *in*, and *caleo*, or *caleo*, *I grow warm*, the growing hot of any thing, either by motion and friction, or as quick-lime does by pouring water on it.

INCALESCENT MERCURY, a name given by Mr. Boyle to some mercuries of an uncommon preparation; which, by being mingled with a due proportion of gold-leaves, or small filings, would amalgamate and grow hot with the gold.

INCAMERATION, derived from *in*, and *camera*, *chamber*, in the *apostolic chancery*, the union of some land, right or revenue, to the domains of the pope. See CHAMBER.

INCANTATION, derived from the Latin *in*, and *canto*, *I sing*, (see CHARM, and CARMEN,) *incantment*; words and ceremonies used by magicians to raise devils; or rather to impose on the credulity of the people. See CONJURATION, FASCINATION, MAGIC, WITCHCRAFT, &c.

INCAPACITY, in matters of benefices, among the canonists, is of two kinds; the one renders the provision of a benefice null in its original; the other is accessory, and annuls the provisions which at first were valid.

Incapacities of the first kind, are the want of a dispensation for age in a minor, for legitimation in a bastard, for naturalization in a foreigner, &c.

Of the latter kind, are grievous offences and crimes: as being concerned in seeing a sentence of death executed, &c. which, they decree, vacate the benefice to all intents, or render the holding it irregular.

INCARNACION, in *Geography*, a town of Paraguay; 360 miles S. of Assumption.—Also, a town of New Navarre; 18 miles W. of Casa Grande.

INCARNATION, in *Theology*, signifies the act whereby

the Son of God assumed the human nature; or the mystery by which Jesus Christ was made man, in order to accomplish the work of our salvation. The era used among Christians, whence they number their years, is the time of the incarnation, that is, of Christ's conception in the virgin's womb.

This era was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the era of Dioclesian had been in use.

Some time after this, it was considered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occasioned them to postpone the beginning of this era for the space of one year, retaining the cycle of Dionysius entire in every thing else.

At Rome they reckon the years from the incarnation, or birth of Christ, that is, from the 25th of December, which custom has obtained from the year 1431. In France, and several other countries, they also reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Florentines retain the day of the birth, and begin their year from Christmas. See Petav. de Doct. T. iii. p. Grandamicus de Dei Nat. See ÆRA and EPOCHÆ.

INCARNATIVE, an epithet in *Surgery*, applied to such medicines as tend to promote the process, by which wounds and ulcers become filled up with granulations.

INCARNATIVE *Bandage*. See BANDAGE.

INCARNATIVE *Suture*. See SUTURE.

INCENADA DE BARRAGAN, in *Geography*, a town of South America, situated on the W. bank of the Barragan, at its union with the Plata. The houses are irregularly built, and the inhabitants are generally indolent and poor; 21 miles W. of Buenos Ayres.

INCENDIARY, INCENDIARIUS, in *Law*, is applied to one who is guilty of maliciously setting fire to another's dwelling-house, and all out-houses that are parcel thereof, though not contiguous to it, nor under the same roof, as barns and stables. A bare intent, or attempt to do this by actually setting fire to a house, unless it absolutely burns, does not fall within the description of *incendit et combussit*. But the burning and consuming of any part is sufficient, though the fire be afterwards extinguished. It must also be a malicious burning; otherwise it is only a trespass. This offence is called arson in our law.

Among the ancients, criminals of this kind were to be burnt. "Qui ædes, acervumque frumenti juxta domum positum sciens, prudensque dolo malo combusserit, vincetus igni necatur." See ARSON. See also BLACK-ART and FIRE-CKOCKS.

INCENSE, from *incensum*, q. d. *burnt*; as taking the effect for the thing itself; an aromatic, odoriferous resin, otherwise called *frankincense*.

INCEPTIVE, a word used by Dr. Wallis, to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing such as are. See INFINITE, and INDIVISIBLE.

Thus a point has no magnitude itself, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCERATION, in the *Materia Medica*, the mixing of liquids with something that is dry, by a gentle soaking, till the

the composition be brought to a substance of the confidence of soft wax.

INCERTAINTY, in *Law*, is where a thing is so ambiguously set down, that the plain meaning cannot be understood: and this is said to be the mother of contention. The questions of uncertainty arise sometimes on matter of record, as writs, counts, pleas, verdicts, &c. and sometimes on deeds or writings, or upon contracts, &c. (5 Rep. 121. Plowd. 25.) In law proceedings, uncertainty will make them void; for all proceedings in law are to be certain and affirmative; but the defendant may be at a certainty as to what he should answer, &c. (Plowd. 84.) If the court and verdict in an appeal be uncertain, there can be no judgment given thereon; and it is the same on an indictment. (3 Mod. 121.) Uncertainty in deeds renders them void; but sometimes a term for years granted by lease, may be made certain by reference to certainty; and uncertainty may be reduced to certainty by matter, *ex post facto*, implication, &c. (Plowd. 6. 273. 6 Rep. 20.) If there are two men of one name, and a devise of lands, &c. is to one of that name, without any distinction, it will be void for uncertainty; though perhaps an averment may make it good. (2 Bulstrode, 180.) Uncertainty in declarations of uses, of fines, of lands, &c. is rejected in law; for otherwise there would be no certain inheritances. 9 Rep.

INCEST, the crime of venereal commerce between persons who are related in a degree prohibited marriage by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection, so necessary in marriage, might be heightened by this double tie; and yet the rules of the church have formerly extended this prohibition even to the seventh degree, but time has now brought it down to the third or fourth degree. See **MARRIAGE**.

Most nations look on incest with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the sister: the reason was, because they thought it too mean to join in alliance with their own subjects: and still more so to have married into the families of any foreign princes.

As to the Persians, there was a still more abominable sort of incest practised by their magi: if we may trust Catullus, carn. 91.

“Nam magus ex matre & gnato gignatur oportet,
Si vera est Perfarum impia religio.”

In 1650, incest and wilful adultery were made capital crimes; but at the Restoration it was not thought proper to renew a law of such unfashionable rigour: and these offences have been ever since left to the feeble coercion of the spiritual court, according to the rules of the canon law.

INCEST, *Spiritual*, is the like crime committed between two persons who have a spiritual alliance, by means of baptism or confirmation.

INCEST, *Spiritual*, is also understood of a vicar, or other beneficiary, who enjoys both the mother and the daughter; that is, holds two benefices, the one whereof depends on the collation of the other.

Such a spiritual incest renders both the one and the other of those benefices void.

INCESTUOUS, the name of a sect or heresy, which arose in Italy about the year 1065.

The heresy of the Incestuous had its beginning at Ravenna; the learned of which place, being consulted by the Florentines about the degrees of affinity which prohibit marriage, made answer, that the seventh generation, mentioned

in the canons, was to be taken on both sides together; so that four generations were to be reckoned on one side, and three on the other.

They proved this their opinion by a passage in Justinian's Institutes, where it is said, that a man may marry his brother's or sister's grand-daughter, though she be but in the fourth degree: whence they concluded, that if my brother's grand-child be in the fourth degree with respect to me, she is in the fifth with respect to my son, in the sixth with respect to my grandson, and in the seventh with respect to my great grandson.

Peter Damian wrote against this opinion, and pope Alexander II. condemned it in a council held at Rome.

INCH, a measure of length, in China, is $\frac{1}{4}$ th of the Chinese foot = 10 fen = 100 li = 100 hao.

INCH, *English lineal*, $\frac{1}{7}$ th of an English foot = $1\frac{1}{3}$ digits or finger's breadth = 3 barley-corns = 48 hair's breadths = $\frac{1}{36}$ th English yard = .938306 pounces of France = .02539185 metres of the new measures = .1262626 links.

INCH, *English square or superficial*, is $\frac{1}{144}$ th, or .00694444 square feet = .000644746 square metres of the new measures of France = .01594225 square links.

INCH, *English cubic or solid*, is $\frac{1}{1728}$ th, or .000578704 cubic feet = .0000163713 cubic metres of the new measures of France = .00201291 cubic links.

INCH, *French, of length*, or pounce of the old measures of France, was $\frac{1}{72}$ th of the Paris foot = 12 lines = 1.0657 English inches = .02706137 metres of the new measures = .1345644 links.

INCH, *Scotch, of length*, is $1\frac{1}{3}$ th English inches = 1.0054054 = $\frac{1}{2}$ th Scotch foot.

INCH, in *Geography*, an island in the bay called Lough Swilly, in the county of Donegal, Ireland. It is very fertile, and contains about 2000 acres. Its land and the adjoining shores are high, with cultivation spreading over them, and little clusters of cabins with groups of wood. The water is of great depth, and a safe harbour for any number of ships. Inch was the great resort of the Lough Swilly herring fishery, which at one time employed 500 boats, and afforded subsistence to a great number of people. A large salting house with necessary store rooms was built in the island, but the profits of the fishery have declined.

INCH, a town of Scotland, in the county of Aberdeen; 10 miles N. W. of Inverary.

INCH-Caloch, an island of Scotland, in Loch-Lomond, on which are the remains of a conventual church.

INCH-Calm, a small island of Scotland, on the northern side of the Frith, anciently called Amonia; on which are the ruins of a celebrated abbey of Augustine monks, founded about the year 1123, by Alexander I, king of Scotland, who was thrown upon it by a tempest, in gratitude for his escape, and dedicated to St. Columba. It was pillaged by the fleet of Edward III. of England, when he invaded Scotland. Some ruins still remain. N. lat. 56° 3'. W. long. 3° 18'.

INCH-Garvie, a small island in the Forth, opposite to Queensferry, fortified with cannon to defend the river.

INCH-Keith, a small island of Scotland, in the Frith of Forth; so called from the name of a brave hero who fought valiantly against the Danes in 1010, to whom it was granted; 12 miles E.S.E. of Dumfermline. N. lat. 56° 3'. W. long. 3° 9'.

INCH-Kenneth, a small island near the W. coast of Mull. N. lat. 56° 29'. W. long. 6° 10'.

INCH-Marnoch, a small island, about a mile in extent, near the W. coast of the isle of Bute; it has 120 acres of arable

land, 40 of brushwood, nearly 300 of moor, together with strata of coral and shells on the W. side.

INCII-Murrin, an island in Loch-Lomond, two miles long, which is converted into a deer-park. On it are the remains of a mansion, belonging to the family of Lenox.

INCII-Point, a cape of Ireland, between Dingle bay and Cattlemain harbour, in the county of Kerry; 13 miles E. from Dingle.

INCII of Cand'e, a manner of selling goods among merchants. The method of it is thus: Notice is usually given upon the Exchange in writing and elsewhere, when the sale is to begin: against which time the goods are divided into several parcels, called *lots*, and papers printed of the quantity of each, and of the conditions of sale; as, that none should bid less than a certain sum more than another had bid before. During the time of the bidding a small piece, of about an inch, of wax-candle, is burning; and the last bidder, when the candle goes out, has the lot or parcel exposed to sale.

INCHASING, in *Sculpture*. See **ENCHASING**.

INCHIGERLA, in *Geography*, a small town of the county of Cork, province of Munster, Ireland, near the source of the river Lee, over which it has a bridge. It is situated in a wild mountainous country, and is a very poor place. It is eight miles W.S.W. from Macrump, and 24 W. from Cork.

INCHIN, a small island in the Pacific ocean, near the coast of Chili. S. lat. 45° 40'.

INCHOATIVE, a term signifying the beginning of a thing, or action; the same with what is otherwise called *inceptive*.

INCHOATIVE verbs denote, according to Priscian and other grammarians, verbs that are characterized by the termination *scio* or *scor*, added to their primitives: as *augefco*, from *augeo*, *calefco*, from *caleo*, *dulcefco*, from *dulcis*, *irafcor*, from *ira*, &c.

INCHOFFER, **MELCHION**, in *Biography*, a learned German, was born at Vienna in 1584. Having laid the foundation of a learned education, he applied himself to the study of the law, and became a distinguished proficient in it at the age of 23. He then quitted it, and entered himself among the Jesuits, went to Rome and employed his time in the study of philosophy, theology, and the mathematics. Shortly after this he was called to fill the chair of professor in those faculties, during several years at Messina, in Sicily. In 1630 he published a book entitled "The Virgin Mary's Letter to the People of Messina proved to be genuine." Complaints were preferred against him before the congregation of the "Index" at Rome, on account of this publication. He immediately repaired to the city, vindicated himself, and was allowed to reprint his work, with a small alteration in the title. He died at Milan in 1648, when he was about 64 years of age. Having received some injuries from his brethren, he wrote a satire against them, which was printed after his death under the title of "Monarchia Solipforum." Inchoffer was author also of "Tractatus Syllepticus, in quo quid de Terræ solisque motu, vel statione secundum Sacram Scripturam et S.S. Patrum sentiendum, &c. Ostenditur, 1633;" "De sacra Latinitate, de variis Linguæ Latinæ mysteriis, ex Origine, Progressu, Fine," &c.; "Historiæ trium Magorum;" likewise the first volume of a work entitled "Annalium Ecclesiasticorum Regni Hungariæ," which is said to have exhibited such proofs of critical skill and deep research, as occasioned regret that the author did not live to complete his plan.

INCHTURE, in *Geography*, a town of Scotland, in the

county of Perth, on the road between Perth and Dundee; 9 miles E. of Perth.

INCIDE, in *Medicine*, to *cut*, whence also the adjective *incisive*, obsolete terms, applied to certain articles of the materia medica, to denote the action and quality by which certain fluids are detached from the parts to which they adhere, by an operation which has been conceived analogous to *cutting* with a sharp instrument, probably from the peculiar sensation which they excite. These *incisives* are principally *acids*, *alkalis*, or neutral salts, the action of which upon the palate, and other sensible parts, is, from the same analogy, called *sharp*. Hence also, in popular language, we speak of *cutting the phlegm*, &c. But this action is principally a chemical *coagulation of the mucus* (as in the case of sore throat), which then loses its adhesive qualities, and is easily rejected; and not a mechanical division of the particles, by means of the pointed and sharp atoms of those acid and saline matters, as the original employers of the term imagined.

INCIDENCE, in *Mechanics*, expresses the direction in which one body strikes on another; otherwise called *inclination*.

In the incursions of two moving bodies, their incidence is said to be *perpendicular* or *oblique*, as their directions or lines of motion make a straight line, or an oblique angle at the point of contact.

INCIDENCE, *Angle of*, commonly denotes the angle comprehended between an incident ray, or other body, and a perpendicular to the plane in the point of incidence.

Thus, supposing A B (*Plate I. Optics, fig. 3*) an incident ray proceeding from the radiant point A, to B the point of incidence, and H B a perpendicular to D E in the point of incidence: the angle A B H, comprehended between A B and H B, is the angle of incidence, by others called the angle of inclination.

INCIDENCE, *Angle of*, is also used by Dr. Barrow, and some others, for the complement of the above angle, or of the angle of inclination.

Thus, supposing A B an incident ray, and H B a perpendicular, as before; the angle A B D comprehended between it and the reflecting or refracting plane D E, is the angle of incidence; and the angle A B H the angle of inclination.

Others, with Wolfius, make another distinction; which see under the articles **ANGLE**, **REFLECTION**, and **REFRACTION**.

It is demonstrated by optical writers, 1°. That the angle of incidence A B H is always equal to the angle of reflection H B C, or the angle A B D to the angle C B E, and they lie in the same plane. See **REFLECTION**.

2°. That the sines of the angles of incidence and refraction are to each other accurately, or very nearly in a given ratio. See **REFRACTION**.

3°. That from air to glass the sine of the angle of incidence is to the sine of the refracted angle as 300 to 193, or nearly as 14 to 9: on the contrary, that from glass to air, the sine of the angle of incidence, is to the sine of the refracted angle as 193 to 300, or as 9 to 14. See **REFRACTION**.

It is true, sir Isaac Newton having shewn, that the rays of light are not all equally refrangible, there can be no precise ratio fixed between the sines of the angles of refraction and incidence: but the proportion which comes nearest is that above specified. See **LIGHT**, **COLOUR**, **REFRANGIBILITY**, &c.

INCIDENCE of Eclipse. See **ECLIPSE** and **IMMERSION**.

INCIDENCE, *Axis of*. See **AXIS of incidence**. Such is the line B H, *fig. 3*.

INCIDENCE, *Cathetus of*. See **CATHETUS of incidence**; see also **REFLECTION**.

INCIDENCE, *Line of*, in *Catoptrics*, denotes a right line, as A B (*fig. 3*), whereby light is propagated from a radiant point A, to a point B, in the surface of a speculum. This is also called an *incident ray*.

INCIDENCE, *Line of*, in *Dioptrics*, is a right line, as A B, *Plate VI. fig. 4*, whereby light is propagated unrefracted, in the same medium, from the radiant point to the surface of the refracting body H K L I.

INCIDENCE, *Point of*, is the point B on the surface of the reflecting or refracting medium, in *Plate I fig. 3*, and *Plate VI. fig. 4*, on which the incident ray falls.

INCIDENCE, *Scruples of*. See **SCRUPLES**.

INCIDENT, in a general sense, denotes an event, or a particular circumstance of some event.

INCIDENT, in *Law*, is a thing appertaining to, or following another, that is more worthy or principal. A court-baron is inseparably incident to a manor; and a court of pie-powders to a fair.

INCIDENT, in a *Poem*, is an episode, or particular action, joined to the principal action, or depending on it.

A good comedy is to be full of agreeable incidents, which divert the spectators, and form the intrigue. The poet ought always to make choice of such incidents as are susceptible of ornament suitable to the nature of his poem. The variety of incidents well conducted makes the beauty of an heroic poem, which ought always to take in a certain number of incidents to suspend the catastrophe, that would otherwise break out too soon.

INCIDENT Ray. See **RAY**, **INCIDENCE**, and **INCLINATION**.

INCIDENTS, in the *Materia Medica*. See **ATTENUANTS**.

INCINERATED SALTS, the same with lixivial salts. See the following article, and **LIXIVIAL**.

INCINERATION, derived from *in*, and *cinis, ashes*, in *Chemistry*, the reduction of vegetables into ashes, by burning them gently.

Thus fern is incinerated for the making of glafs.

INCISED WOUNDS, wounds made with sharp-edged, cutting instruments. See **WOUNDS**.

INCISION, the same as incised wound.

INCISION, *Crucial*. See **CRUCIAL**.

INCISION, *grafting by double*. See **GRAFTING**.

INCISIVUM FORAMEN, in *Anatomy*, a hole in the bony palate, just behind the incisor teeth, forming a communication between the palate and the nasal cavities. See **CRANUM**.

INCISIVUS, or **INCISORIUS**, an epithet applied by Winslow to some muscles about the lips. The incisivus medius is the depressor alæ nasi. (See **DEPRESSOR**.) The incisivus lateralis is the levator labii superioris. (See **DEGLUTITION**.) The incisivus inferior is the levator menti. See **DEGLUTITION**.

The openings leading from the nose to the palate have been called ductus incisivi.

INCISORES, the four front teeth of each jaw; so named because they possess sharp cutting edges. By Linnæus they are called dentes primores. See the description of the teeth in the article **CRANUM**.

INCISORIUM, from *incido*, to cut, the table for operations and dissections, used by surgeons and anatomists.

INCISORIUS, in *Anatomy*. See **INCISIVUS**.

INCLAVE, in *Heraldry*, a term used by Morgan to express an irregular line in heraldry, differing from the indented, invected, and all the others. It is called by some patee, and by others the dove-tail line, from its resemblance to that joint, known among our joiners by this name. It is

also called by some the labelled line. It has these names from the figure of the points, as they proceed from the ordinary, such as a chief or fess resembling the ends of labels.

INCLINATION, in *Medicine* and *Chemistry*, the operation of pouring off a clear liquor from some fæces, or sediment, by only gently slooping the vessel.

This amounts to the same with what is otherwise called *decentration*.

INCLINATION, in *Physics*, expresses the mutual approach or tendency of two bodies, lines, or planes, towards one another; so that their directions make at the point of contact an angle of a greater or lesser magnitude.

INCLINATION of a right line to a plane, is the acute angle which such a right line makes with another right line drawn in the plane through the point where the inclined line intersects it, and through the point where it is also cut by a perpendicular drawn from any point of the inclined line.

INCLINATION of Meridians, in *Dialling*, the angle that the hour-line, on the globe, which is perpendicular to the dial plane, makes with the meridian.

INCLINATION of an incident ray, otherwise called the *angle of inclination*. See **ANGLE of INCIDENCE**.

INCLINATION of a reflected ray, is the angle which a ray after refraction makes with the axis of inclination.

Thus, if A B, (*Plate I. Opt. fig. 3*.) be the incident ray, H B a perpendicular to D E in the point R, and B C the reflected ray, C B H will be the inclination of the reflected ray, and A B I the inclination of the incident ray.

INCLINATION of the axis of the earth, is the angle which it makes with the plane of the ecliptic: or the angle between the planes of the equator and ecliptic.

INCLINATION of the magnetic needle. See **DIPPING-needle**.

INCLINATION of a planet, is an arc or angle comprehended between the ecliptic, and the plane of a planet in his orbit. See each planet.

INCLINATION of a plane, in *Dialling*, is the arc of a vertical circle, perpendicular both to the plane and the horizon, and intercepted between them.

To find this, take a quadrant, and apply its side to the side of a square, and apply the other side of your square to your plane: if the plumbet fall parallel to the side of the square, then the lower side of the square stands level; by which draw an horizontal line, whereon erect a perpendicular, and apply your square to that perpendicular; and if the plumbet falls parallel to the side of the square, then that is also a level line, and your plane stands horizontally: if the plumbet fall not parallel to the side of the square, then turn your square, until it does; and draw an horizontal line, on which erect a perpendicular, to which apply your square, and observe what angle your plumbet makes on the quadrant, with the side of the square: that is the angle of the inclination of the plane. See **DECLINATION**.

INCLINATION of two planes, is the acute angle made by two lines drawn one in each plane, through a common point of section, and perpendicular to the same common section.

Thus, in *Plate VIII. Geometry, fig. 101*, the inclination of the plane K E G L to the plane A C D B, is the angle H F I, made by the right lines H F and F I in the point F, perpendicular to the line of section E G.

INCLINATION, Angle of, in *Optics*, is the same with what is otherwise called the *angle of incidence*.

INCLINATION, Argument of. See **ARGUMENT**.

INCLINATION, in a moral sense. See **APPETITE**.

INCLINATION, in *Mining*, is used sometimes to express the fall or declivity of a stratum which deviates from the horizontal, or a mineral vein, windike, or fault, which deviate from the vertical, and such strata or fissures are said to dip, deep,

deep, pick, decline, tilt, have a declivity, or to hade, want, batter-off, underbeat, &c. in different districts or situations. See **DIP** and **HADE**.

INCLINED PLANE, in *Mechanics*. See **Inclined PLANE**. See also **MECHANICS**, and **MECHANICAL powers**.

INCLINED Planes, in *Engineering*, are strong frames of wood or masses of earth and masonry, formed into an inclined plane at top, on which a single or double rail or tram-way is laid for drawing up and letting down boats or waggons from one water level of a canal to another, or from one part of a rail-way to another, where a deficiency of water prevents the use of locks, or the descent is too rapid for a rail-way to descend: formerly, inclined planes for boats were called rolling bridges. In our article **CANAL** we have given the principles of setting out and constructing inclined planes, and instanced all the most considerable works of this kind in Great Britain.

INCLINED Plane, in *Rural Economy*, a term applied to that sort of plane which forms an oblique angle with the horizon. In the construction of carriage-ways for the conveyance of different kinds of heavy loads up steep elevations and other rising grounds, this mode has lately been had recourse to with much advantage, in enabling great weights to be drawn on them with much less power of draught. In collieries, and other similar extensive works, roads formed on this principle are frequently found highly beneficial. It has been lately observed, that though this sort of convenience may have hitherto been principally confined to coal works, mines, and other undertakings of the same nature, the period is now at hand "when carriages, moving on level surfaces, or on gently inclining planes, with little friction, and without obstruction, are fast spreading over the face of the country." Besides those which have been noticed, there are many other uses and situations in which they may be employed with the utmost utility and advantage. See **RAILWAYS**.

INCLINED Towers. See **TOWERS**.

INCLINERS, in *Dialling*. See **DIAL**, and **DECLINERS**.

INCLOSING of LAND, in *Agriculture*, the act, operation, or process of taking in and dividing grounds by means of fences. The advantages that necessarily result from the inclosure of land, whether in a state of waste, common, or otherwise, are extremely numerous, and of the most material consequence to the community. It has been observed, that "in addition to those of ascertaining and securing the property, it holds out not only the most ready and certain means of improvement in the cultivation of the former, but in such as have been long under the plough, or any other system of management; being equally useful in its tendency to bring them into the most perfect and advantageous states of culture. Without inclosing, it is conceived, however, much attention may have been paid, or expence incurred, in carrying on the various processes that are requisite in preparing land for the reception and growth of good crops; whether of the grain, root, or grass kinds, it is obvious that they can neither be conducted under the most beneficial management, nor yield the full advantage they are capable of, while they continue in a free and open state. Where the land is in a state of arable cultivation without inclosure, the crops, of whatever sort they may be, must constantly be exposed to depredations of various kinds; and if in the state of grass or pasture, injuries of the most prejudicial nature must frequently be unavoidably sustained. And the great advantage and importance of inclosing land are still more fully demonstrated in the differences which may be observed in respect to the quantity and value of the produce, in such as have been thus divided, over that which is cultivated in

the state of open or common field." It has been stated by Mr. Donaldson, that "in proportion as a field or a country is bleak, naked, and exposed to chilling blasts and winter storms, in the same proportion will it be unproductive, compared with lands more favourably situated. Inclosing is a mean of obtaining, by art, a certain degree of that genial warmth so essential to the production of valuable crops, but which nature is not always pleased to bestow. Every day's experience proves that where grounds are sheltered from the violence of storms, as by garden walls, or by plantations of forest trees, they are more productive, and vegetation is earlier than in others similar in every respect, unless in regard to exposure. How many instances occur to establish this fact in respect to large fields, as well as to gardens, orchards, &c. Let the observant farmer, who possesses an inclosed farm, examine that part of a field where, owing to the decay of fence, the wind enjoys a free passage, and he will be satisfied of the benefit of inclosing, from the superiority of the crop in the other part of the field over that which is within the influence of this additional exposure. While, on the other hand, the possessor of an open field farm, by examining the superior verdure that takes place in any part of an open field, that is, by some accidental circumstances sheltered in a remarkable degree, may satisfy himself, that were the whole equally sheltered, the produce would be more abundant." In the Mid-Lothian Report it is likewise stated, that "as the warmest air lies nearest the surface of the earth, being that portion of the atmosphere, which, like a blanket, nature spreads over the soil and its productions, fences of all kinds tend more or less to prevent such a valuable covering from being blown off by the winds." Indeed, by judicious fencing in, or inclosing of land, there can be no doubt but that warmth and shelter is afforded to cattle of various kinds. Under these circumstances, animals are invariably found not only to advance in flesh much more rapidly, but to be freer from disorders, than when kept in situations or exposures that are bleak, and which cannot afford warmth or shelter to them. "If any person entertain doubts respecting the inclosed pastures being better adapted for rearing and fattening live stock than open fields, he may easily satisfy himself by comparing the live stock in an inclosed parish with that of one in the open field state." It is supposed there must be much mistake "if he will not find them in the latter, not only fewer in number, but each animal, on an average, thirty or forty per cent. inferior in value." In fact, inclosing, it is conceived, "may be denominated the first step towards effecting improvements in the breeds of the different species of live stock. And on the whole, this "is reasoning on plain established facts, and on such as afford the most indubitable evidence of the superiority of inclosed fields, whether for tillage or pasturage. Were farther proof necessary, the additional rent that is every where paid for inclosed land, beyond that paid for land of an equal quality in the open field state, is sufficient to place the matter beyond all possibility of doubt."

Besides, the value of the land in most situations is considerably improved by the practice of inclosing. The proportion of increase that may be produced in this way, whether the lands inclosed be in a state of lease, or in the occupation of the proprietor, must, however, necessarily depend greatly on the nature of the soil, and the system of management that is afterwards pursued.

In a work on modern agriculture it is remarked, that "lands of a middling quality, good turnip soil for instance, are probably benefited to a greater degree by inclosing, than those of superior or inferior quality. Lands of this description, in the open field state, may, it is contended, be considered

INCLOSING OF LAND.

considered as rented to the full at fifteen shillings per acre ; whereas there are few instances where such lands, when inclosed, are rented under twenty shillings ; an advance so great as to afford the proprietor a handsome profit after paying the interest of the money expended. Thus does inclosing not only increase the quantity and quality of the produce, so as to enable the farmer to pay his landlord a higher rent, and to contribute a larger share to the revenues of the state, but from so many people being constantly employed in making and repairing the fences, inclosing, in this view, must also be considered as beneficial."

It must, however, be allowed, that there are in many districts of this kingdom extensive, barren, and mountainous tracts of ground that are not capable of ever being inclosed with the least chance of advantage ; or which, if they could be inclosed, could never derive any amelioration or improvement from it : the only methods in which they can be bettered, is by being rendered in some situations more free from injurious surface moisture, by judicious drainage, or the introduction of better breeds of the several kinds of domestic animals which may be turned upon them. Some of the large sheep farms in different parts of Scotland, as in the shire of Peebles and the Highlands, are much in this state, no other sort of inclosing being necessary than merely a *ring fence*, or boundary round the different farms. And where any kind of inclosures become requisite within such fences, they are simply such as permit of the culture of a small number of acres for the use of the farmeries, or in the view of forming plantations for protection and shade, &c.

In other situations where the lands are capable of being cultivated almost constantly under the grain system, inclosing, at least with any kind of high fences, may, in a great measure, if not wholly, be unnecessary. But, in common, where lands are proper for being cultivated under a system of husbandry, such as that of alternating grass or other kinds of green crops with those of grain or root crops, and in that way having the means of combining improvement in the breed of live stock with that of the cultivation of grain, the practice of inclosing must always be necessary and advantageous in a high degree.

Yet, however advantageous in these different points of view the benefits resulting from the inclosing of lands may be, the practice is far from being so much promoted and attended to as its importance seems to deserve. And it is probable that this may in some measure have proceeded from the great difficulty that necessarily attends the business in almost every instance, and particularly where waste or common field lands are to be inclosed, on account of the great diversity of claims upon them, as well as sometimes from the improper management of the persons who have the direction of the business. Where inclosures of this sort are to be made, the circumstances that are chiefly to be regarded are those of the rights of the different classes of claimants, without any distinctions, the ascertaining fully the nature and extent of the land to be inclosed, the provision of proper cottages for the poor in the acts of inclosure, and the appointment of commissioners duly qualified for the execution of the business.

It has been remarked by Mr. Somerville, in a paper on the different modes of forming inclosures, in the second volume of "Communications to the Board of Agriculture," that inclosing has long been considered, and very justly, not only as a certain means of improving waste and uncultivated lands, but also as an essential requisite to the completion of improvements upon the best soils, and such as have been long under tillage. For whatever care or expence may have been employed in clearing, draining, tilling, manuring, weeding,

&c. the whole of the benefits resulting from these can never be completely united, while the soil remains in an open uninclosed state. When the fields are in grass they cannot be pastured to advantage without fences ; and when they are in tillage, the crops, of whatever kind they may be, are exposed to every injury that can be suffered from the encroachments of sheep, cattle, or other animals. In many of the counties throughout the kingdom, the features of this improvement are strongly marked, and the ideas of shelter, ornament, and increased produce, are visible to even the most superficial observer, and afford a very just comparative estimate of the advantages to be derived from inclosing, by contrasting the value of lands that are inclosed with others of the same quality that still remain in an open field state ; the saving in point of labour, the perfect security to the crop while the lands are under tillage, together with the warmth and shelter afforded to the stock and herbage when the fields are in pasture, form a striking contrast when compared with the open, unsheltered, unprotected, and unproductive state of uninclosed fields. Obvious as these advantages are, it is to be regretted that the system of inclosing has, in too many instances, met with much opposition ; and even in those cases where its benefits are clearly ascertained, much difference of opinion still exists, with regard to the nature of the fences requisite for different situations, the materials or plants that should be used, the best mode of executing them, and the season of the year most suitable for doing the work. The opposition so often made to bills of inclosure brought into parliament is a very striking proof of the former ; and the little judgment that is shewn in accommodating the fence to the natural circumstances of the fields to be inclosed is conclusive as to the latter. It too often happens that proprietors and farmers, without duly considering either the nature of their soil or its local situation, resolve upon and adopt a mode of inclosing which they have seen successful in other places, without once considering that the soil, climate, and other circumstances, which combined to render the plan successful in the situations they wished to copy, are totally wanting in theirs. Owing to this much money is expended and many attempts prove abortive ; the system of inclosing falls into discredit, and is considered as impracticable in many cases where good and lasting fences might be reared at the same, perhaps less, expence than such as have failed. The reason commonly assigned is the rigour of the climate, while the true and only cause is, the ignorance or want of discernment in the persons who make these unsuccessful attempts.

Indeed the mistakes committed in this way are innumerable. Sometimes live fences are planted in situations, and upon soils where it is impossible they can grow, far less arrive at perfection ; and where substantial stone fences could be made, not only at little expence, but the building of which, by collecting the stones, would rid the adjoining surface of a nuisance, and remove an incumbrance which too often constitutes a material bar to its cultivation. The discernment necessary to discover this is not great ; notwithstanding which, we too frequently have occasion to observe large fields inclosed, either with dwarfed, crabbed, ill-grown hedges, and rotten decayed palings, or with turf or earthen mounds, obtained by paring off the best part of the surface soil ; while the fields thus wretchedly inclosed by fences, which, on account of their inutility and perishable nature, must one day be abandoned, are covered with numerous large stones, the removal of which is an essential requisite to their improvement. The same circumstance often happens where live fences might be reared, which, in every instance where they can be brought to perfection, are to be considered as preferable.

INCLOSING OF LAND.

preferable to any other. In place of making the hedge with such plants as are suited to the soil and climate, they are often directly opposite—dwarf, flinted, white thorn hedges being very frequently seen upon cold wet lands, and in bleak exposed situations; upon which, if beech, black-thorns, or crabs, had been planted, they would have grown readily, and made complete fences in a very short time. In other instances the fence fails, or becomes faulty, from circumstances which the planter may be disposed to consider as immaterial. For example, in inclosing a large field, a great part of the outline of which is wet, if white-thorns are planted in the ordinary way upon the common surface, they will never make a good fence; whereas by planting them in the face of the bank of earth thrown out of the ditch, being thus raised above the level of the field, and placed upon a dry bed, they thrive, and soon establish themselves; while upon very dry lands, with open bottoms that possess little capacity for retaining moisture, the hedge very often dies from an opposite cause. When the plants are set upon the mound raised above the common surface, if the season is but commonly dry, their growth is considerably impeded from the want of moisture; and in severe winters, from the porous nature of the soil, the frost gets access to the roots, and either kills whole rows or lines of hedges in a few weeks, or so far hurts them as to check their future growth and improvement.

And it is stated, that in perusing the different county reports, all the surveyors concur in opinion as to the utility of inclosures; but that it is mentioned by several of them, in terms of regret, that the obstacles thrown in the way of this valuable improvement, by ignorance and obstinacy, are great and manifold. In some cases they speak in terms of the highest panegyric of the utility, cheapness, and durability of certain fences, such as quicks, beeches, crabs, &c. when they are planted upon the soils to which they are respectively the best adapted; while in others they mention, in pointed terms, the perishable nature and transitory value of many of the fences employed, the annual expence required to keep certain descriptions of them in repair, (the dead hedges and paings,) and the great extent of valuable ground that is occupied by the others, especially the inclosures made by double ditches with a bank between them and a hedge on each side, and of the common hedge and ditch, and hedge and bank, which, at the same time that they occupy a considerable space of ground, are very seldom good fences, in some instances covering thrice, and in others four times the space that a fence of a different kind would do, if properly kept. Great contrariety of opinion also prevails in regard to making trees a part of the inclosure, either in hedge-rows or belts of planting. From such diversity and opposition of sentiment, it is difficult to form any fixed or certain opinion upon the subject in question.

The different points to which the proprietor or occupier ought to pay particular attention, before he commences any plan of inclosure, would seem to be

- 1st. The nature of the soil.
- 2dly. Its present worth, and the increase of value expected from inclosing it.
- 3dly. The objects to be attended to in making inclosures; and whether the greatest value of the fences is expected to arise from their simply confining their stock, or from their affording shelter to both stock and crop, or from the union of shelter and inclosure.
- 4thly. The modes of inclosure suited to the natural circumstances of the soil, climate, &c.
- 5thly. The materials for making the fences, and the means of obtaining them. And,

6thly. Expence, which is another important point to be considered, but which must depend upon so many local circumstances, that it is impossible to form any estimates that could be of much service in guiding the improver.

Nature of the Soil.—In respect to this, a careful inquiry seems to be one of those requisites essential to the success of every plan of inclosure; for though there are, comparatively speaking, few situations, however elevated above the level of the ocean, and scarce any description of soil, where a good live fence may not be reared, with one sort of plant or another, yet it is an object of the first importance to know the plants best suited to every variety of soil, as, by a judicious choice of these, much loss and difficulty is avoided, and good substantial fences are made in a short time, and in many situations where, from a mistake as to the plants employed, the fence has languished for years, and ultimately perished, notwithstanding every care that could be bestowed upon it. In some instances, we have known twenty years experience barely sufficient to undeceive those who had made mistakes of this kind. In a few cases, however, where this obstinacy has given way to common sense and observation, and where the plants of which the hedge was originally made have been taken up, and others better adapted to the soil substituted in their room, these last have, without much trouble, made a good fence in a very short space of time, and with very little trouble.

It is well known that white-thorns, or quicks, as they are commonly called, are reared with great ease, and, under proper management, soon make useful and handsome fences upon all dry soils, provided the situation is not too high and exposed. In such places, though the plants do not perish entirely, they never attain the strength or vigour necessary to make a good fence. In cases where the natural surface of the ground is rather too moist for white-thorn, the excess of damp may be carried off by a ditch on one side of the plants in the usual way. In marshy situations, where a ditch on one side would be insufficient to lay the soil dry enough for the success of white-thorns, it ought to have a drain on each side of the bank on which the thorns grow, and which would be particularly favourable for the growth of ash-poles and various other sorts.

But in every case where thorns are planted upon the common surface without a ditch, and upon dry ground that has been previously prepared by dung, lime, &c. they grow better than where ditches are used, because the ditches serve as open drains to carry off the moisture, a circumstance which in dry seasons is often very detrimental to the growth of the hedge. Except in weeding, the thorns should not be touched for the first four or five years of their growth, unless it be to crop the most luxuriant of the lateral shoots: at the end of that time they should be completely trimmed and put into shape, leaving the top shoots untouched, till the hedge attains the necessary height; when this ought also to be cut over, and its farther growth upwards prevented by regular yearly cuttings afterwards. See FENCE and HEDGE.

And black-thorns, crabs, &c. may frequently be treated in nearly the same manner as the white-thorn. There is, however, one remarkable difference between them, which is, that both the crabs and black-thorns will thrive, and become good fences, in situations where the white-thorn would perish: upon *tills* and clays, for example, many fields of that description are completely inclosed with them, which could never have been rendered fenceable if white-thorns had been employed. Also, the holly, when properly attended to, forms a thick and beautiful fence, and has an advantage over most others in affording the same degree of shelter

INCLOSING OF LAND.

shelter at all seasons. It grows well upon all soils, but particularly upon deep and moderately dry loams. Its progress is, however, slow, even in the most fortunate situations, which renders it unfit for common use; unless in pleasure-grounds, or places where taste or fancy requires it. When intermixed with the white-thorn it is, however, more rapid in its growth, and forms a most beautiful kind of fence.

But the use of beech, for the purposes of fences, has not hitherto been very common; they are, however, fast coming into use, and perhaps will soon be the only kind employed in the uplands, or upon the cold wet soils in the lower districts of the kingdom; for these situations, so far as the experience of several parts of Scotland can ascertain that point, they are, it is said, remarkably adapted. In East Lothian there are several tracts of land, the soil of which is of a very inferior quality, that have had their value greatly increased, by inclosing them with beech hedges, upon which thorns were formerly tried without success, and much trouble and expence incurred in the attempt; while the beeches, which originally cost no more than the thorn, without any trouble, very soon become good fences. Along with their growing so readily in these unfavourable situations, they possess a property well suited to a cold or exposed country; namely, that of preserving their leaves through the winter, and indeed till an advanced period in the spring; by which they afford shelter to the grazing stock, and also to the pasture in the early part of the season, when it is apt to be hurt by the cold, nipping, frosty winds. The birch is likewise peculiarly adapted to cold clays, where it seldom fails to thrive, and form a good fence; some caution, however, is necessary as to the management of it. It is also said to be the only plant which succeeds in the sandy rabbit-warren land, such as is found in some parts of Suffex. In all cases where it is intended to cut or plash it, the operation should be done about the end of autumn, as the juices are at that time retiring to the root, and long before the circulation is again renewed the wounds are healed: whereas, when the cutting is deferred till the spring, or beginning of summer, when the circulation is going on, the juices flow out by the wound, and continue to run off in that way during the whole of summer; by which means the plants are so weakened and exhausted, that many of them die, a misfortune which is entirely prevented by cutting about the end of autumn, or during the winter season.

Upon all wet or marshy grounds, willows, alders, and poplars thrive, and are extremely useful in completing inclosures in many situations, where other plants would either perish entirely, or remain in a dwarf stunted state. In Huntingdonshire, and several of the fenny parts of England, these plants, in conjunction with the alder, form almost the only description of live fences that are met with: their value in those parts is well known; and in every similar situation throughout the kingdom, if proper trials were made, they would be found equally useful. Hedges made with willows have an advantage over almost every other, as, after the hedge has arrived at a certain height, and is properly laid down and bound together, the young shoots may be annually taken off, and sold to basket-makers for a considerable sum of money. They have another obvious advantage, namely, the ease with which they are propagated, being raised by simple cuttings, without any other trouble than that of merely sticking them into the earth. Where this is practised, and in most situations it may be done with great ease, the farmer or proprietor will not only have his fields inclosed, but the fence will be converted into a source of revenue, by the sale of the young shoots yearly. Where the Huntingdon willow is used, a farther emolument may arise to the

proprietor, by allowing a certain proportion of the plants to run up into trees; with very little care they soon arrive at a great size, and are of considerable value; the wood is soft, easily wrought into any form, takes a fine polish, and can be stained of any colour. The use of willows, poplars, &c. is not confined solely to wet or marshy grounds, they thrive upon almost every soil, and, indeed, make more progress upon such as are moderately dry than upon very wet lands; upon the latter, however, they grow better than any other plant, and on that account deserve a preference in many cases.

And the hazel, elder, &c. are plants which grow well upon all dry soils, and, if properly managed, by laying wattling, &c. produce wood enough to form a very sufficient fence; but their want of prickles render them less eligible than thorns. The elder possesses a property which, along with the beauty of its flowers, will give it a preference to most other plants in many situations; namely, that of its being propagated from cuttings, with as much ease as the common willow. Where the hazel is used for inclosing with, and the proprietor is disposed to take the necessary trouble, it may be rendered very useful, by cutting the hedge within four feet of the surface every second or third year, and felling what is cut off to coopers or basket-makers: hazels are well known to make the best and most durable hoops, and generally bring a high price for that purpose in most situations.

Though the larch has not hitherto been much used as a hedge plant; yet, from its growing so readily, and bearing the operation of clipping so well, it seems very much adapted for that purpose. In exposed situations, where thorns would fail, the larch would be found an excellent substitute, and many fields may be inclosed with it that would otherwise remain open. Where it is intended to inclose a field with larches, the plants made use of should be at least seven years old, and the strongest that can be obtained of that age. They should be taken up in the most careful manner, preserving the whole of the roots, and planted in a trench where a considerable quantity of dung or compost has been put. The most proper season for this operation is about the end of November, or in the early part of January; at either of which periods, if they are carefully lifted, and replanted without any destruction of the roots, they will suffer no check whatever, and grow readily and vigorously in the spring. It is worthy of notice that the tops ought never to be allowed to exceed the height of six feet; because, after they pass that height, the wind has so great an effect upon them as to destroy any binding that may be made with their lower branches; cutting the tops has also another beneficial effect, namely, that of making them push out more vigorously below. Larches have, however, one defect, in common with hazels and some other plants, namely, the want of prickles, which certainly impairs the value of any fence made with them; as neither sheep nor cattle are disposed to respect any hedge so much as those that are made with plants of the prickly kind.

The whin, or furze, is also a plant that is known to grow spontaneously, and attain a great size upon soils and in climates where scarcely any other would live. In all cases where whins are found growing naturally, and of any considerable size, hedges of them may with safety be attempted: but as the whin seldom grows to any considerable height, hedges are not often made with it. This material, however, forms a good fence when a sufficient number of plants can be reared and brought to perfection; and, from its numerous prickles, very effectually prevents both horses, sheep, and cattle, from attempting to break through it. It has, how-

INCLOSING OF LAND.

ever, one defect, and that is considerable : being raised a good deal above the common surface, the plants are exposed to many accidents, arising from drought, frost, &c. ; accordingly it often happens in severe winters, that whole lines of whin hedges are killed at once, and of course much labour and expence thrown away.

There are, besides these, several other kinds of plants, such as the bramble, mulberry, &c. ; and various sorts of fruit trees and shrubs, such as the gooseberry, &c. that may be occasionally employed in the same intention with advantage, though they have not yet been much had recourse to in such a view.

Present Value of the Soil, and the Improvement of it by Inclosure.—It may be remarked that in every plan of improvement, whether by inclosing or otherwise, it is very material to ascertain the present worth of the land, and the probable increase of value that may be expected from the undertaking; for unless this point is judiciously weighed, the operations will proceed at random, and much labour and expence may be incurred without any adequate advantage resulting therefrom. For much and justly as the advantages of inclosing are extolled, (and they are unquestionably great,) there are certain circumstances of soil and local situation that bid complete defiance to this and every other attempt at improvement. For example, in high rocky situations, where the soil is not only thin, but of a bad quality, where the lands can never be subjected to the plough, and where the herbage is not likely to be much ameliorated by shelter, little benefit will be derived from inclosing. The only advantage resulting from the practice in such cases seems to arise from the saving of a shepherd's wages, which, when the flock are pastured in an inclosed field, is rendered unnecessary; but which, if accompanied with no other advantage, will be found a paltry equivalent for the expence of inclosing the soil. On the contrary, however high or exposed the situation may be, if the soil is of a good quality, and a species of plants can be met with of a nature so hardy as to bear the climate, the value of the property will be so far improved by the shelter arising from the fence, as amply to compensate the expence incurred in making it. In many of the bleakest and most exposed situations in Britain, the soil, though greatly elevated above the level of the ocean, is equal in quality to what is met with even in the most favoured situations, and for the most part requires nothing but shelter and judicious culture to render it highly valuable. In detailing the different kind of fences, especially that known by the name of hedge and belt of planting, an opportunity was taken of pointing out several instances, where the mode of inclosing has benefited the property so inclosed, in a tenfold proportion, in a very few years. Upon this point it remains only to hint, that every person, whether proprietor or farmer, mould, before he commences his operations, pay very particular attention to the present value of property in an uninclosed state, and the extent to which it may be improved by inclosing; and without such previous knowledge, in place of being repaid by the pleasure arising from seeing the property ornamented and improved in proportion to the trouble and outlay of money, large sums will often, it is supposed, be expended, without adding to the general appearance of the country, or materially contributing to augment the value of the soil and property.

Objects to be regarded in forming Inclosures.—It may here be noticed, that, in some situations, all that is required is merely the confinement of the stock, in others, shelter to the stock and herbage are the principal objects; but in a great majority of cases, the union of both is necessary to complete the system of inclosing. In wild low situations perhaps a stone

wall, or a low thorn fence, will answer every purpose required, and produce every benefit that could be expected from the inclosure; yet these fences would be found totally incompetent to the purposes of inclosure in the hilly and upland parts of the country; for, though confining the stock might be completely answered by either, the important requisite of shelter would be entirely wanting. Other matters of equal importance ought to enter into the consideration of persons inclosing. The separation of the soils inclosed, so as to render that of each field as nearly as possible of an uniform quality, the separation of stock as may be thought most advisable, together with the securing a sufficient supply of good water, are requisites so essential to the success of the undertaking as to entitle them to a high degree of attention. Mr. Donaldson, in speaking of inclosures, says, that the old fences were planned with a view chiefly to inclose soils as similar as possible within each division; beauty or regularity does not, he thinks, seem to have attracted much of the proprietor's or farmer's attention; utility, it would appear, they kept principally in view. Our modern improvers, on the other hand, in too many instances at least, shew an evident disposition to sacrifice utility to taste and regularity in appearance. Hence, it is not uncommon, in a new inclosed parish in England, or even in an estate in Scotland, where the proprietor has the sole power of management, to see several different sorts of soils in the same inclosure, which, with proper attention, and a little sacrifice of taste, might have been included in the adjoining fields with much greater propriety. Thus, in place of forming the fences in such directions as that the greatest advantage might have been derived, by not only inclosing and subdividing the estate, but also by separating, in every possible case, soils of different and opposite qualities, it not unfrequently happens, that the sands of Norfolk and the clays of Lincolnshire are, as it were, inclosed within the same fence; than which it is impossible to figure any management more improper. If a regular rotation of cropping be adopted on a farm where each inclosure contains a variety of soils, it will of course be suited to that sort which most prevails. When the most prevalent soil is of a light and sandy nature, the portions of better soil contained in each inclosure must be cultivated under a system, in regard to cropping, not the best calculated to produce the greatest returns. On the other hand, when the predominant soil is deep and fertile, that of a lighter nature must be exhausted, were a mode of cropping pursued calculated only for the soil of superior quality. Whereas, had a judicious arrangement been made in regard to the form of the inclosures, the good and bad soils might, in many cases, have been kept separate; and, as often happens, two rotations of cropping adopted on the same farm with equal propriety. Perhaps also fences in straight lines, in place of curves, might be disputed on the score of taste; but that is a question foreign to the object of the present investigation, which has utility only for its object.

The new inclosures differ as much from the old in regard to size as in form. The old inclosures generally contain from three or four to six or eight acres; few of such as can be properly denominated old exceed ten; while those that have been formed in latter times extend from ten to twenty, sometimes to forty or fifty. This difference in the size of inclosures is greatly, if not entirely, owing to the change of opinion in regard to what was and what now is considered by individuals as the proper size of farms. In the same, or nearly the same proportion as farms were enlarged, so were the dimensions of the new inclosures. The more ancient inclosures, such as those in several parts of Essex, Kent, Suffolk, &c. are evidently too small, while those in many other districts

INCLOSING OF LAND.

districts are too large. There is a medium in regard to the size of inclosures, as well as in other things; and to discover and adhere to it, as nearly as circumstances will allow, is certainly for the interest of the proprietors, the tenants, and the public. Where the inclosures do not exceed three or four acres, the quantity of land taken up in erecting the fences is a very heavy *per centage*, viewing the inclosure as a part of the farm, of the estate, or of the national territory. A free circulation of air is also prevented, especially if there be hedge-row trees, to such a degree, that it may be difficult to say whether the crops are more benefited or injured by the fences when so closely placed. As one of the most important advantages that can be derived from inclosing is shelter, large inclosures must, on the other hand, be equally improper. When a tract of thirty or forty acres is included within one fence, it would be absurd to suppose that the fence can afford the same shelter as if these thirty or forty acres had been subdivided into three or four fields. When the inclosures are made so large, the advantage of fencing, in so far as regards shelter, must be merely a secondary object with the person who erects the fence.

Having pointed out the loss and inconvenience arising from too small and too large inclosures, it may be necessary to suggest what, upon the whole, ought to be considered the best size. This it is proposed to do on the authority of Mr. Bakewell, from whom the British farmer might have learned many useful lessons on subjects connected with husbandry. Besides what related more especially to the improvement of the different species of live stock, it was the opinion of that expert farmer, that fifty acres of pasture, divided into five inclosures, would go as far in grazing cattle as sixty acres all in one field. If there was a man in the island that exceeded another in knowledge as a breeder and grazier, it was Mr. Bakewell; his opinion, therefore, founded on the experience of many years, may be considered as conclusive in regard to the proper size of inclosures, in so far as the breeder or grazier is concerned; and from what is above stated, it appears that from eight to twelve-acre fields are best calculated for either of these purposes. Mr. Marshall also, in corroboration of this, hints in his "Rural Economy of Gloucestershire," that the most experienced dairy farmers in that district consider what he calls a suit of pastures as a more profitable mode of pasturing cows than one large inclosure. As no farm can be kept constantly in tillage with advantage, and as the best mode of cropping that can be adopted for the generality of soils is, in his apprehension, that by which nearly the one-half of the farm is in tillage, and the other in pasture, it is necessary, in determining the proper size of inclosures, to have regard to the two great branches of husbandry, namely, grain and grass. In regard to the latter, so far as the practice of the two counties most remarkable for grazing and dairying can go, the matter seems determined; and in respect to corn husbandry, as middle-sized inclosures enjoy the advantage of shelter to a greater degree than those of larger size, and a more free circulation of air than those of small dimensions, there can be no reason to hesitate in determining, that the size of inclosures best suited for the breeder, the grazier, and the dairyman's purposes, will also best answer those of the cultivator of grain.

Modes of inclosing suited to the natural Circumstances of the Soil, &c.—It is stated by Mr. Somerville, in the work already mentioned, that this matter has been in some degree discussed in the preceding article of inclosure. There cannot, however, remain a doubt that the success of every attempt that is made in the way of inclosing must in a great measure depend upon the discernment of the person who

undertakes it. A material consideration in such cases is, to determine whether live or dead fences are the most eligible or best suited to the natural circumstances of the soil. The former comprehends every fence made with growing plants; the latter includes not only the different kinds of wall or dike made with dry stone, stone and lime, stone and clay, turf, &c. but also the different kinds of dead hedges and palings. Into this estimate ought also to enter the comparative usefulness and durability of each, together with the first cost. In general, the first class, namely, live fences, where the plants are properly chosen, and well adapted to the soil, are uniform in this respect, that, under proper management, their value is yearly increasing; while that of even the best-constructed dead fences is annually growing less. Where they consist of dead hedges or palings, their decay is certain, and commonly rapid; and even when they are constructed with stone and lime, which are by far the most durable of that class; though they make perfect fences at once, and the proprietor or occupier enters into immediate possession of every advantage that can arise from them, yet from the hour they are built their decay commences, and, after the first few years, a regular and progressive expence is incurred to keep them in repair in a proper manner.

It is asserted, that in all upland situations, the first class of fences will be found the best: of that class, however, the beech hedge, and hedge with a slip of planting, deserve a preference, as they unite in the highest degree the important requisites of shelter, ornament, and inclosure. The beech, under proper management, attains a great size even upon the poorest soils, and soon forms a useful fence in situations where thorns and other kinds of hedge plants would either perish or remain in a dwarfish state; with this additional material advantage, that, by keeping its leaves during the winter, it affords shelter to the stock and pasture at the most inclement season, and when it is most wanted. The inclosing fences in these situations should likewise be high in order to produce the greatest effect and utility. But that in low situations, where little is to be apprehended from the want of shelter, thorn hedges kept low, or any of the different kinds of stone walls, will answer every purpose; and as the soil in these low situations is for the most part of very great value, those fences, from the little space they occupy, will be found preferable to every other kind.

Materials for forming the Fences, and the Means of providing them.—In speaking of the nature of the materials for making fences, in the above observations upon the modes of inclosing suited to the natural circumstances of the soil, it has been pointed out what appeared the best, upon the supposition that the materials could be readily obtained at a reasonable price. In many situations, however, the scarcity and apparent want of many of these materials form an almost insuperable obstacle to inclosing upon the plan above hinted at. For instance, in the remote parts of the kingdom, where the different kinds of trees and hedge plants are either very scarce, or not attainable but at an enormous price, it will often be found necessary, in the inclosing of upland districts, to surround the fields with stone walls in place of hedge, or hedge and slip of planting; and in not a few situations in the low lands, where stone walls would be the most eligible fence, from the scarcity of that article, hedges, or hedge and ditch, are had recourse to. Under such circumstances necessity is the law; and the person inclosing must accommodate his plans to his resources. It will, however, frequently happen, that the materials wanted will be met with upon the spot, not only without expence, but with much advantage to the property; as in cases where the

INCLOSING OF LAND.

fields are infested with stones, their removal will at once facilitate the improvement of the field, and furnish good materials for inclosing it. But even where the resources are less visible, and there are no stones upon the surface, by a careful examination of the sub-stratum plenty may often be met with; or, in defect of these, clay for making either bricks or mud-walls may be had merely for the trouble of digging or getting it up.

In forming other kinds of dead fences for inclosing lands, such as palings, hedges, &c. materials for constructing them may be procured in almost any situation, from the thinnings of young plantations, from coppices, and the cutting down of old hedges; even the deficiency of hedge plants and young trees might be, in a great measure, if not entirely, got the better of, if every proprietor were to have a small nursery for raising them for his own use, and that of his tenants. To the convenience and saving of expence with which this practice would be attended, we have to notice an unspeakable advantage, namely, that arising from the use of plants propagated in, and inured to, the climate where they are afterwards to grow. It must require little knowledge of the subject to convince any one, that plants, of whatever kind, reared in the upland and hilly parts of the kingdom, will thrive better than such as have been reared in the warmest and most sheltered spots. To what, it is asked, are we to ascribe the amazing size and luxuriant growth of many trees in the islands of Scotland, or even in Norway or North America, but to the circumstance of their having come into existence in the climate and situation where they were afterwards destined to grow: and by being thus early inured to the climate, became, to all intents and purposes, indigenous plants.

It may in addition be remarked, in regard to adapting the plants to the soil, that it is not the least important consideration with persons inclosing, after having determined whether live or dead fences should be used, to make choice of the plants best suited to the soil. In the flat low parts of the country, where the soil is loamy or gravelly, and at the same time moderately dry, and not greatly exposed to any prevailing winds, white-thorns will be found both the cheapest and the best. Hazel, elder, and a multitude of others, might be used for that purpose in these situations; but they are liable to objections to which the thorn is not. If in these low situations it is meant to plant trees along with the fence, either in hedge rows or belts, the dry soils should, it is observed, be planted with oak, ash, elm, plane-tree, chestnut, beech, &c. and the moist parts with poplars, and the different kinds of willows; by such means the whole will thrive, and in a short time become valuable to the proprietor. In the upland and hilly parts of the country, unless the soil is wet indeed, the hedge plants should consist either entirely of beeches, or a mixture of beech and larch; the last is known, as has been seen above, to answer well in these exposed situations, and not only endures planting and clipping without injury, but thrives remarkably under these operations; where the soil, however, is wet or spongy, a different description of plants should be used; willows of different kinds, poplars, birch, or alder, will then be found the best, and ought, in preference to every other, to be made use of. By thus adapting the plants to the soil and climate, few plans of inclosure will prove abortive in any situations so far as the fencing it is concerned.

Expence of performing the Work.—It is obvious that this must be extremely various according to the nature of the situation and other circumstances; but it will seldom be very great where due care is taken in the direction and execution

of the business, and the necessary materials are capable of being had near at hand, and in sufficient abundance.

From the perusal of the different surveys now in possession of the Board of Agriculture, it would appear, that, in almost every county throughout the kingdom, considerable tracts of the soil are inclosed; and that many plans of additional inclosures, to a very considerable extent, are now in contemplation. The surveyors appointed by the Board are unanimous in their approbation of the system, which they represent as so beneficial in its consequences, that in many cases the value of the property has been thereby increased in a fourfold proportion, and, in some well-authenticated instances, considerably more. The inclosing fences at present in use are of great variety; and a part of them, particularly such as have been made of late years, executed in a handsome substantial manner, uniting at once the important points of shelter, inclosure, and ornament. The appearance of these, owing to the judicious manner in which they are managed, convey to the mind the strongest ideas of permanent and valuable improvement. The different kinds of stone-walls, by having a broad foundation sunk deep enough in the earth to place them beyond the reach of frost, tapering gradually upwards, and secured at top with a proper coping, are found to last many years, with but very slight repairs. The hedges, from the circumstance of their being planted at a proper season, the plants made use of adapted to the nature of the soil, and afterwards kept in order by regular weeding and trimming, are of immense value, and form the most beautiful and lasting fences that can be imagined. Many other descriptions of fences are equally perfect and valuable; but though these circumstances are mentioned with much satisfaction, and must give pleasure to every person who feels, or has the smallest interest in the improvement or welfare of his country, it is with pain remarked, that in too many instances the system of inclosing is extremely defective; and much less solicitude has been shewn to secure and unite the whole of the benefit to be derived from it, than the importance of the subject deserves. To confine the flock seems, in too many instances, to have been the sole object; while the weightier matters of shelter, both for the flock and pasture, separation of soils, separation of flock, and many other points of equal importance, have been entirely overlooked. In too many instances, no attention has been paid to the natural circumstances of the soil intended to be inclosed. High inaccessible walls, belts or slips of planting, and hedge rows of trees, being very often met with in the lowest and warmest situations, where little or no shelter is necessary; while in the hills and uplands, and along the sea-coast, where shelter is indispensable, both for the flock and pasture, and where its advantages are incalculable, the fence very often consists of a naked stone wall, which, though it may, and indeed does answer the purpose of confining the flock, possesses no other advantage; and many tracts of immense extent, the value of which might be improved in a tenfold proportion by hedges and belts of planting, exhibit a naked bleak appearance, and continue exposed to every blast. The loss and disadvantage attending this injudicious mode of inclosing are strikingly obvious. In the low warm parts of the country, where the land is of immense value, much of it is occupied by fences which the nature of the situation does not require, while in the more elevated and exposed parts, where shelter is the *sine qua non* of improvement, and where the land occupied by the fence is, comparatively speaking, of small value, the fence, in place of affording the necessary shelter both to the stock and pasture, is barely adequate to the purpose of inclosing the field. Under such circumstances, the pasture will for the most part be scanty;

INCLOSING OF LAND.

scanty; and neither a breeding nor a feeding stock will make half the progress upon it that they usually do in cases where they enjoy the benefit of complete shelter. A defect equally injurious to the proprietor or occupier, and highly inimical to permanent improvement, seems also to prevail in the choice of the materials of which inclosures are generally made. In every instance where circumstances will admit of it, present use ought, if possible, to be united with durability in the formation of every fence; an attention to this is, however, too often totally wanting, both with proprietors and farmers. Provided the present purpose is answered, future consequences are disregarded; and neither a knowledge of the perishable nature of the materials made use of, which daily experience presents to their view, nor the frequent and heavy expences to which they are put for repairs, have been sufficient to make them alter their system. Amongst these perishable fences are to be ranked the different kinds of earthen and mud walls, of turf, of turf and stone, together with the whole of the wooden fences, comprehending the different kinds of paling, dead hedges, &c. It is added, also, that the ancient custom of inclosing fields with high earthen banks or mounds, sometimes with and sometimes without a paling on the top, which prevailed formerly in many parts of England, and which is now pursued in the north of Scotland, though it did very well as a rude essay in the way of improvement, when other modes of inclosing were either unknown or imperfectly understood, and might for a time answer the purpose, either of confining the grazing stock while the field was in pasture, or protecting the corn crops when it was under tillage, is perhaps the worst and most perishable of all inclosing fences. After being reared with much labour, and committing a theft upon the adjoining surface, which is pared off to a considerable distance on each side, it remains but a very few months, or even weeks, in a perfect state; indeed, from the moment it is made it begins to decay: and the operation of the weather upon it, for a few years, renders it useless as a fence. Accordingly in many parts of the island the remnants of such fences are met with, which, though they were originally of considerable height, and to appearance strong and formidable, are now so completely beat down and levelled by the action of the weather, as to render it in some cases a matter of difficulty for the curious to trace their foundations, or the direction in which they formerly ran. The case is the same with walls formed entirely of turf, or a mixture of turf and stone. These, though made at considerable expence, and, as has been already noticed, by robbing the neighbouring surface, are equally perishable as the simple earthen mound. Upon whole farms, and even estates, that were formerly inclosed with turf, or stone and turf walls, nothing now remains but their vestiges, which, while they exhibit a striking proof of their perishable nature, afford at the same time a salutary lesson to proprietors and others, to beware of such temporary expedients; as, however cheap such fences may be in the first instance, in their best state they are but imperfect, and in the end are the worst and most expensive of any. An equal defect, it is asserted, prevails in many instances where the inclosing fence is entirely of stone. When the walls, in place of having a good foundation sufficiently removed beyond the reach of frost, broad at bottom, tapering gradually upwards, and finished at top with a substantial coping of flag-stones and lime or turf, so formed as to prevent the decay of the building, are in many instances built upon the plain surface, with scarce any taper towards the top, and without any coping at all, except

perhaps a slight one of turf, which soon moulders away, and, if the wall is built with lime or clay, permits the moisture to soak down and destroy it. The same providence and want of judgment discovers itself in carrying these walls through every kind of soil, wet as well as dry. In the formation of extensive inclosures, it very often happens that a part of the line in which the inclosing fence is to run is wet and spouty; in place of paying attention to that circumstance, discontinuing the wall where the dry land terminates, and either attempting to lay the spouty parts dry by draining, or plant a hedge of willows, poplars, or other plants adapted to wet soils upon the surface, the wall is too frequently continued through the whole. The consequence (as may very naturally be expected) is, that the wall, for want of a solid dry foundation, soon tumbles down, or is continually needing repairs. Along with this inattention to the shape of walls, considerable loss arises from building them with round, or what are termed land-stones. These, from their shape, are incapable of presenting a sufficient extent of surface to each other to bind them, or give stability to the building, by which means it seldom lasts long, though clay, or even lime is made use of. The practice of mixing clay is particularly inexpedient, as in general the first winter's frost, or a long continued series of wet weather, saturates the clay so completely, that the wall swells, bursts, and is thrown down. And the practice of inclosing with the different kinds of dead hedges and palings is productive of equal loss both to individuals and the community. Were these fences made to answer only a temporary purpose, such as protecting a young hedge, &c. &c. the loss would not be great, as their original value is small, and, long before they were totally decayed, the hedges they were meant to protect would be so far advanced, as to make good fences without their assistance. From the refusal of the different reports, however, it appears that in many of the English counties they are resorted to in cases where permanent plans of inclosing are intended, and are the only fence made use of. The surveyors who have noticed the practice are unanimous in their disapprobation of it, and represent the fences as perishable, and in the highest degree expensive. In several whole districts, dead hedges of different kinds form the only fence, and occasion an annual expence upon the property so inclosed, amounting from a fifth to a tenth part of the rent. Nearly an equal loss and expence is incurred in inclosing with paling; and what adds to the regret that arises from the observation of this ruinous practice is, the soil and climate in most cases where it prevails are well calculated for the growth of live fences. It is evident that what is said above will be considered by the public at large as a reproach, and will be felt as such by those concerned. We admit that the feelings of individuals ought, in every instance where it is compatible with the public welfare, be respected; but where either their opinions or practices are hurtful to the country, or hostile to its improvement, they are justly reprehensible. Forbearance in such cases is vice; and though exposing their faults may, in some instances, cover them with shame, yet the task is necessary; and by fixing the attention of the public upon the subject, has very often the effect of preventing the most serious abuses and bringing about valuable improvements.

Where wet ditches constitute the fence, either in their simple state, or as making a component part of another fence, such as ditch and hedge, &c. due attention has in very few instances been paid to secure every advantage that might be derived from their use. Proceeding without judgment,

INCLOSING OF LAND.

judgment, the ditches in many counties are made equally deep and wide upon wet and dry lands, from an erroneous opinion, that the drainage of the field, and the future prosperity of the hedge, require a ditch of certain dimensions. In place of laying off the field in such a style as to make the ditches subservient to the purposes of drainage as well as inclosure, they are frequently dug at random, of an uncommon depth and width, with a high bank or mound of earth on the side next the field, so strong and thick that no water can find its way through it. In that way the ditch, in place of acting as an open drain for carrying off the water from the adjacent fields, acts as a kind of barrier to prevent it from getting away; while, from the want of a proper level and outlet, when once filled it becomes a kind of reservoir; and by continuing filled with water three parts of the year, chills the roots of the inclosing hedge plants so much, that they either perish entirely, or remain small, stunted, and diseased. In this place it may be necessary to observe, that the use of ditches as open drains has in many instances been completely misunderstood. In most of the old inclosures they were thought valuable only in proportion to the quantity of water they were capable of containing, without considering whether they were so situated as to convey that water to a proper outlet. In the Reports of the counties of Ayr and Stirling, these deep and wide ditches are described, and their defects noticed: in the former county they are from six to eight feet wide, and of a proportionable depth; and in the latter, they are in many cases upwards of twelve feet wide. The quantity of valuable ground occupied in that way, over such extensive districts, must be immense; and when to this is added the injury done to the hedges from their roots being chilled, and the inconvenience arising from having a tract of country so much cut and intersected by these canals during winter, which prevents all passage through them, and the danger of weak horses or cattle, or even unfortunate travellers, who mistake their road in the dark, falling into them (circumstances which unfortunately too often occur), together with the expence of making such deep excavations, it will readily appear that the practice is bad, and that every purpose both of drainage and inclosure might be answered, at perhaps a fourth part of the expence, and without any of the risks or inconveniences we have mentioned. See FENCE and HEDGE.

It is further remarked, that in many parts the defective method of rearing and managing the hedges is no less striking. In place of making the whole hedge of one kind of plants suited to the nature of the soil, and such as, when arrived at a certain age, are capable of making a good fence, the inclosure is frequently surrounded with a motley mixture of shrubs, many of which, even in their most perfect state, are unfit for making a fence; while others, though they might have answered that purpose pretty well if the whole fence had been made with them, yet, from the circumstance of their being mixed with others, which not only come into leaf, but also shake their leaves at a different season, both hurt each other's growth, are offensive to the eye, and take from the general appearance of the country. Such, however, are the fences in some parts of the finest counties in England, where, upon the top of a high bank that has been raised by robbing the adjoining ground of its soil, a motley hedge, consisting of various plants, is met with, full of gaps filled up with stones or dead wood, forming a very insufficient fence, either for the purpose of confining the stock while the field is in pasture, or of protecting the crops while it is under tillage. In other cases, when the plants of which the hedge consists

are of one kind, it too often happens, that they are by no means suited to the nature of the soil. For example, in inclosing a large field where a part of the line of fence is perfectly dry, and a part of it wet and swampy, in place of planting quicks or white-thorns upon the dry spaces, and willows, poplars, birches, or such plants as thrive in damp situations upon the wet parts, the whole field is often surrounded with thorns, greatly to the hurt of the proprietor and occupier; as upon the dry land the thorns thrive, and in a few years make a good fence, while upon the wet parts they either fail entirely or are good for nothing; whereas, with a little judgment in accommodating the plants to the soil, planting quicks upon the dry land, and willows, poplars, &c. upon the spouty and swampy parts, the whole would thrive, and there would be no defect in the line of inclosure. To this mistake (a want of judgment in accommodating the plants to the soil) are to be added the defects which commonly take place in the after-management and training of hedges. It is now well known, that the whole, or the greater part of the plants of which hedges are made, if left to themselves without pruning or weeding, run up to a considerable height, grow broad and bushy at top, and become open and naked at bottom. To prevent this there is no remedy known, but that of cutting over the main stems of the plants of which the hedge consists, after they have attained a certain height, and pruning or trimming the lateral branches in such a way as to preserve the hedge thick and broad at the bottom, and give it a gradual taper towards the top. But in place of this management, the hedge, in most instances, after being planted, is abandoned to its fate, and neither weeding, pruning, nor indeed any other attention bestowed upon it: in that way a number of the plants are either choked by weeds, or remain in a dwarf stunted state; and such as survive this usage are allowed to shoot up at random, and soon attain a great height without being useful as a fence, and by the spreading of their branches at top, not only become naked and open below, but cover three times the space of ground that hedges differently kept usually do.

It may be observed, in general, in regard to the directions of the inclosing fences, that they should run up the sides, and immediately across the tops of the elevations, by which their heights are in appearance considerably increased. But in some cases it may be better to carry them in an oblique manner across, as affording greater advantage in the direction of the ridges and in producing shelter and shade. They have in common the most beneficial effects in the level and valley lands, when they are placed in a parallel direction to the rising grounds, and when they intersect one another at right angles, and where the inclosures approach nearly to perfect squares. See FENCE and HEDGE.

In addition to the various advantages that have been already mentioned, the inclosing of land enables the farmer to act as is the most suitable and convenient in respect to the cultivation of his different crops, as well as to pursue various other plans of good husbandry that could not otherwise be attempted.

In cases where farms are to be inclosed, it will be advantageous to begin with having a survey and plan made, that they may thereby be divided and proportioned out with greater propriety and precision, so as to render them pleasing to the eye and convenient to the farmer; and if there be places of residence upon them, the whole of each may be made to become ornamental to the residences, by a judicious disposition of the hedges and plantations. And when there are different farms, they should be so divided, that

the dwelling of each tenant may be as contiguous to his land as conveniency will admit of, in order to prevent length of carriage, and to facilitate attendance, labour, &c. See *Waste Land*.

INCOGNITA, in *Natural History*, is a term which has frequently been applied to the animal and vegetable remains found imbedded in the strata of the earth, from the circumstance of their not agreeing, when examined with sufficient care to minutely discriminate, with the known existing species to which they bear a resemblance in many instances: it has been thought by many late naturalists, that all the reliquia of the strata are incognita, or belong to extinct and unknown races of organic beings, sometimes called the primitive creation, and the antediluvians, but not with propriety, because the animals and plants that existed before Noah's flood were of the very same kind as we now have.

INCOGNITO, a term borrowed from the Italians, used when a person is in any place where he would not be known; but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train, or the usual marks of their distinction and quality; or when they travel without their proper titles.

The grandees in Italy make a common custom of walking the streets incognito; and always take it amiss, on such occasion, when people pay their compliments to them. It is not barely to prevent their being known that they take these measures, but because they would not be treated with ceremony, nor receive the honours due to their rank.

When the horses in princes, cardinals, and ambassadors coaches have no tassels, which they call *fiocchi*, and the curtains, which they call *bandinelle*, are drawn, they are reputed to be incognito; and nobody that meets them is obliged to stop, or make his honours to them.

The cardinals also, when they would be incognito, leave off the red hat.

INCOMBUSTIBLE, that which cannot be burnt or consumed.

Metals melt, stones calcine, and are yet incombustible. Cloth made of lapis amianthus (see **AMIANTHUS**) has been deemed incombustible: it is cleaned by fire, but not burnt. See **ASBESTOS**, and **LINUM Incombustibile**.

INCOMBUSTIBLE Lint, a name given by authors to a peculiar kind of asbestos, or earth flax, which never is formed into compact masses as the other species are, but is always found in loose filaments, and those of a very flexible nature, and extremely fit to work.

This is a kind of asbestos, wholly different from the species known to the ancients, and is found, so far as is yet known, only in the county of Aberdeen in Scotland, in the neighbourhood of Achinore, near the Highlands. See **ASBESTOS**, and **LINUM Incombustibile**.

The fabricating a cloth of this substance has not yet been attempted; but Mr. Wilson, who first discovered it, had some of it spun into yarn, which gives proof that the other is practicable. Phil. Trans. N^o 276 p. 1005.

INCOMBUSTIBLES, Simple, in *Chemistry*, are those whose characteristic property is a strong tendency to unite to oxygen: the combination is not accompanied by the emission of heat and light, and the compounds formed are capable of supporting combustion. (See **SUPPORTERS**.) Only two substances possess this character, namely, **AZOT** and **MURIATIC Acid**, which see.

INCOMBUSTIBLE Wood, in *Natural History*. Dr. Grew, in

his Catalogue of the Rarities in Gresham College, p. 269, mentions pieces of wood half petrified, which held in the fire become red like a coal, but do not flame or smokoak.

INCOMMENSURABLE, a term in *Geometry*, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both.

In the general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both; or, when those quantities are not to one another as unity to a rational number; or as one rational number to another. See **COMMENSURABLE**.

The side of a square is incommensurable to the diagonal, as is demonstrated by Euclid; but it is commensurable in power, the square of the diagonal being equal to twice the square of the side.

Pappus, lib. iv. prob. 17, speaks also of incommensurable angles. Surfaces which cannot be measured by a common surface, are also said to be incommensurable in power. See **DIOPHANTINE Problems**.

INCOMPATIBLE, that which cannot subsist with another without destroying it.

Thus, cold and heat are incompatible in the same subject; the strongest overcoming and expelling the weakest.

INCOMPATIBLE Benefices, in *Law*, are those which cannot be retained together, if they be with cure, and of a particular value in the king's books. See **CHAPLAIN**.

INCOMPLEX OPPOSITION. See **OPPOSITION**.

INCOMPOSIT, in *Music*, is a term used by Euclid to express such intervals in certain Greek scales of music, as resulted or were required to make up the whole diatessaron or minor fourth. In the chromatic molle, the incomplex interval, which, with two **TRIENTAL Dies** (see that article), is required to complete the tetrachord, being the difference between a fourth and two-thirds of a major tone, is $184\frac{3}{4}\Sigma + 3\frac{3}{4}f + 16m$, or $184.61678\Sigma + 4f + 16m$, its common logarithm is .9091629.4502, and in those of Euler or decimals of the octave .301755, and it contains 16.83717 major commas. According to Holder's treatise, 11th edit. p. 101, this incomplex interval was rated by Euclid to contain "a tone and half and a third part of a tone," which is $1\frac{1}{2}T$, but this is $190.62071\Sigma + 4f + 16m$, and differs more than half a comma from the above, and is one among the many instances in which it will appear, that even this prince of mathematicians had but imperfect ideas of the comparative values of furd or fractional musical intervals, to which the modern invention of logarithms has opened so easy a road. See **INTERVAL**.

INCOMPOSIT of the Chromatic Sesequialum, in the *Greek Music*, is the excess of the fourth above one-sixth part of a major tone, which in Mr. Farey's notation is $219\frac{1}{2}\Sigma + 4\frac{1}{2}f + 19m$, or $219.38322\Sigma + 4f + 19m$, its common logarithm is .8921121.0420, its Euler's log. = .358397, and it contains 19.99746 major commas. Euclid is said to have represented this incomplex interval as being seven of his dieis quadrantal, or $1\frac{1}{2}T$, which, however, is $182.072864\Sigma + 3f + 16m$, and consequently differs more than three commas from it: another instance of what has been observed above. See **INTERVAL**.

INCOMPOSIT of the Diatonic Molle, is the excess of the fourth above $1\frac{3}{4}$ major tone, which is $72\Sigma + 1\frac{3}{4}f + 6\frac{1}{4}m$, or $71.927136\Sigma + 2f + 6m$: its common logarithm is .9645781.7767, and its Euler's or binary log. = .117671, and it contains 6.56564 major commas. Euclid states this to be equal to three quadrantal dieses, but which is $\frac{3}{4}T$, or

78.072865 $\Sigma + f + 7 m$, and differs more than half a comma from the above

INCOMPOSITE *Ditone of the Enharmonic Genus*, is the excess of a fourth above half a tone major, or $3^2 \div 8 \cdot 2$, which is $202 \Sigma + 4f + 17\frac{1}{2} m$, or $202.00393 \Sigma + 4f + 17 m$, whose common logarithm is .9006375.2462, and its Euler's log. = .330076, and it contains 18.41741 major commas.

INCOMPOSITE NUMBERS are the same with what Euclid calls *prime numbers*. See PRIME and NUMBER.

INCOMPOSTO, *Ital. uncomounded*, which see.

INCONCINNOUS, in *Music*. Discords are distinguished into concinuous and inconcinuous intervals; the concinuous are such as are practicable and fit for music, having a good effect when combined with concords according to the rules of harmony. The other discords that can have no admission in music are called inconcinuous, as being out of proportion, and making no part of the scale. (See DISCORD and PROPORTION.) Systems, in ancient music, are also divided into concinuous and inconcinuous; a system is said to be concinuous, or regularly divided, when the parts considered as simple intervals are concinuous, that is, when singly used in melody, or combined in harmony.

INCONCINNOUS *Intervals*, according to M. Hensling, are such as are a comma flatter or sharper than perfect; such are also called deficient or redundant, or comma-deficient and comma-redundant intervals, and are marked with a grave or an acute accent, as $3'$ or $4'$. Dr. Calcott observes, in the *Overend MS.* vol. vi. p. 92. in the library of the Royal Institution, that of the six inconcinuous intervals $3'$, $6'$, $4'$ and $3'$, $6'$, and $5'$, the $3'$, $5'$ and $6'$, $4'$ are used in harmony, but the $3'$ and $6'$ only in the melody of modern music. Of the inconcinuous scale of Aristides, an account is given in vol. i. p. 201 of the manuscripts above quoted.

INCONCINNOUS *System*. See SYSTEM.

INCONSONANCE, in *Music*, is of the same import nearly with dissonance, or a jarring and unpleasant sound.

INCONTINENCE of URINE implies, in *Surgery*, an inability of retaining this fluid in the bladder, so that in some instances the patient's water dribbles away incessantly; in others only a frequent discharge of it is made; but in all cases, the evacuation is quite involuntary, and not under the controul of the will.

Sometimes the urine dribbles away continually, while the patient not only has no inclination to void it, but even no sensation of its being voided. In other examples, the patient can hold his water in a certain degree; but the propensity to evacuate it comes on so frequently, suddenly, and irresistibly, that the bladder immediately empties itself, notwithstanding the dictates of the will, and every effort on the part of the patient to the contrary. Another kind of incontinence of urine only happens in the night-time, when the patient is asleep.

Women are more subject than men to an incontinence of urine; but, on the other hand, they are less frequently troubled with retentions. The reason of this circumstance admits of satisfactory explanation, by adverting to the large size and shortness of the female urethra, and to the general causes depriving patients of the power of containing their urine.

1. We shall first speak of the incontinence of urine attended with a weakness or paralytic affection of the sphincter vesicæ muscle. As, in this case, the neck of the bladder is, as it were, constantly open, the urine escapes through the urethra immediately after it has descended from the ureters. Sometimes the weakness, or paralysis of the sphincter is entirely a local defect; on other occasions, it is merely a symptom

of another general disorder. In the first of these examples, the affection of the sphincter is frequently the consequence of a difficult labour, in which the neck of the bladder has sustained injury from the long and great pressure made upon it. A paralysis of the sphincter may also be an effect of the laceration and violent distention of the neck of the bladder, in extracting a stone from this organ in the operation of lithotomy. Here it is proper to remark, that the evil may generally be imputed to the misconduct of the surgeon, who, after neglecting to make a sufficient division of the parts with his cutting instruments, drags out the stone through the inadequate opening *totis viribus*. Indeed, we have seen some old greyheaded operators whose fair exertion of strength has been unequal to draw out the stone, and who have only succeeded by dint of their weight, in other words, by leaning backwards and hanging on the forceps. Every deliberate surgeon who knows how often lithotomy proves fatal from manual roughness and violence, must acknowledge that such operators almost deserve another kind of hanging, and that the tumble backwards to which they are commonly exposed, would hardly be a sufficient punishment for their awkwardness and ignorant barbarity. It is not only the duty of the surgeon to make an ample and direct opening into the bladder, he ought to draw out the stone in a slow and gentle manner, so as to afford an opportunity for the parts to yield as much as possible.

Much danger, and serious injury of the neck of the bladder, are likewise frequently ascribable to the stone being forcibly extracted with its long axis across the wound. So zealous and eager are many operators, that when once they get hold of the calculus, they never let it go again, whatever may be the position in which it is grasped. Fearful of losing time, or perhaps of never being able to seize the foreign body again, they keep fast hold, and are only able to effect the extraction by the most awkward and unwarrantable violence. (See LITHOTOMY.) The present kind of incontinence of urine is often a consequence of the debility incident to old age. Sometimes the disorder proceeds from the destruction of the sphincter muscle by ulceration. Instances occasionally present themselves where an analogous incontinence of urine happens from congenital malformation, the fluid escaping through a preternatural opening, which is unprovided with any sphincter. The complaint may be attendant as a symptom upon all other diseases, which are accompanied by loss of sensation, lethargic complaints, delirium, or extreme debility; it is frequently induced by apoplexy, and injuries and diseases of the vertebrae and sacrum.

Although the infirmity is not in itself attended with danger, it occasions considerable inconvenience. The constant dribbling of the urine keeps the patient's clothes continually wet, produces a very unpleasant smell, and gives rise to inflammation, excoriation, and ulceration of the adjacent parts.

It deserves remembrance, that in women, and persons of advanced age, a mistake may easily be made concerning the real nature of the case. What is frequently supposed to be in elderly people an incontinence of urine, is, in fact, often quite the contrary, namely, a retention of urine, accompanied by a paralysis of the bladder. When this receptacle is full, some urine always makes its escape against the will of the patient, and at length such involuntary discharge becomes incessant, in consequence of the bladder remaining continually full. With regard to females, who, after difficult labours, are afflicted with an inability of retaining their water, practitioners generally conclude without hesitation, that the infirmity is dependant upon a paralysis of the sphincter muscle, while it not unfrequently proceeds from

a fistulous opening, formed between the bladder and vagina, in consequence of a slough, or ulceration.

In cases where the weakness or paralysis of the sphincter vesicæ is altogether a local affection, the internal and external employment of tonics and stimulants is indicated. The following plans and remedies are said to have been used with success:—bathing the feet and parts about the pubes with cold water; introducing cold injections into the bladder; laying in the vagina a sponge, which has been filled with cold water; pumping cold spring water upon the pubes and perineum; giving, every four hours, half a drachm of alum with ten grains of gum arabic; using as a lotion, which is to be applied externally, or within the vagina by means of a sponge, a liquor composed of wine, brandy, and a decoction of astringent herbs; exhibiting bark internally; applying a blister upon the sacrum, or perineum, repeatedly; giving from fifteen to thirty drops of the tincture of cantharides with some lac amygdalæ; placing the parts about the pubes in a shower bath; electricity; frequently rubbing the spine and sacrum with a stimulating liniment, composed of cocoa, butter, and the oils of lavender and nutmegs, or else of hartshorn and spiritus serpilli; administering chalybeates, &c.

Whenever the weakness or paralysis of the sphincter vesicæ occurs, merely as a symptom of another disease, the first indication is to endeavour to remove this last affection; and then if the paralysis of the sphincter should continue, the surgeon is to try some of the preceding tonic and stimulating remedies.

The long enumeration which we have given of methods which have been practised with success, may be likely to create indecision, with respect to such plans as claim the preference. We have no hesitation, then, in declaring our belief, that the records of surgery, and the lessons of daily experience, are most strongly in favour of applying blisters to the sacrum, and bathing the region of the pubes, and the perineum with cold spring water. The efficacy of blisters, in this species of the disorder, is surprisingly displayed in a series of successful cases, related in the Medical Observations and Inquiries. We have also a high opinion of the internal employment of the tincture of cantharides, with bark and steel medicines, especially when aided by electricity, or frictions of the spine and sacrum with a stimulating liniment.

When the disorder proves incurable, the surgeon always has it in his power to recommend some apparatus for lessening the inconveniences with which the patient is annoyed. A thing which answers the purpose in male subjects, is a sort of flask or bottle, which is to be placed in such a manner that the urine may run into it, by which means all bad smell, uncleanness, and wetness will be avoided. The flask must also be so put on as not to be irksome to the patient when he moves about. That which is described in Juville's *Traité des Bandages*, consists of three pieces; namely, an ivory mouth, an elastic gum-neck, and a silver body. The vessel is fastened by means of tape to a leathern girt, which goes round the waist. The ivory mouth is round, and about eighteen lines in diameter. Its external margin is furnished with several small apertures, through which the tapes are intended to pass. Its inner surface is slightly excavated, so that it fits more exactly on the parts about the pubes. Its external surface is a little convex, and provided with a projecting arm, which is here and there perforated, and is designed for having the elastic gum-neck attached to it.

The neck of the apparatus must be made of a single piece

of elastic gum, without any seam, about four or five inches long, and of sufficient breadth to contain the penis. The lower end of this tube is screwed to the silver body of the instrument. At the top of the screw part of the body are three pins, which internally cross each other, in the form of a star, and are intended to support a bit of sponge that is put within the neck. In the silver receptacle is a funnel, the lower end of which is furnished with a valve. The silver part of the instrument is flat, four inches broad, and when the apparatus is put on, always lies at the inside of the thigh, in a small pocket made in the patient's breeches for its reception. The sponge, in the elastic tube, and the valvular funnel, in the silver receptacle, effectually prevent any return and escape of the urine, which would otherwise happen when the patient raises his thigh, or sits down. When the body of the instrument is full, it is to be screwed off, and emptied; nor is there the least occasion to take off the whole of the apparatus. On certain occasions the patient, if he chooses, can screw on a receptacle of larger size.

It has been objected to instruments of the preceding description, that they cannot be constantly retained upon the part, taken off and on, and carried about by the patient, without great trouble and inconvenience. Hence some surgeons have given the preference to an instrument, whereby the penis and urethra may be gently compressed, so as to retain the urine in the bladder, and discharge it, by day or night, at pleasure, (as is asserted,) with little more trouble than in the ordinary way, by opening and shutting the little, light, and easy instrument called a yoke. Nuck was the inventor of a famous contrivance of this kind, which is represented in the plates of Heister's system of surgery, together with another yoke, devised by the latter practitioner himself. See *Tab. 26. figs. 8, and 9.*

It is justly remarked by modern writers, that the jugum penis hardly admits of being worn when there is a tendency to erections; and, in other cases, the machine is always apt either to make too little pressure, so as not to restrain the urine, or else too much, so as to produce pain.

To female patients, the foregoing contrivances are, of course, totally unadapted, and, in this sex, it is somewhat difficult to obviate and diminish the inconveniences arising from an incontinence of urine. Sponge, which has commonly been introduced within the vulva, is of little use; for it must be taken out, and replaced again, exceedingly often, or else, in consequence of its becoming quickly full of urine, this fluid runs down as fast as if no means at all were taken to hinder such annoyance. Besides, when the patient sits down, the urine is partly pressed out of the sponge, and, making its escape, wets the clothes, and causes much uncleanness. This circumstance led to the idea of compressing the female urethra against the os pubis, so as to close the passage, and several instruments for this purpose have been invented and recommended. One of the simplest instruments of this sort is a pessary, which is made very convex on the side towards the os pubis, so as to compress the meatus urinarius against this bone; and, in order that the pressure may neither be too powerful nor too feeble, we are particularly advised to employ pessaries made of elastic gum.

Default assures us, that the objects in view are best fulfilled by an instrument, which has a steel spring, resembling that of a common truss, and extending round the pelvis. In the middle of the spring, precisely over the symphysis pubis, is a metallic plate, from which proceeds downwards a long, narrow, somewhat curved piece of steel, on the

lower end of which is fixed a pad, designed for pressing the meatus urinarius against the os pubis. In order that the degree of pressure may be more nicely regulated, the long steel branch may be constructed with a hinge, or joint, at its middle. The upper part of this piece of steel ought to project a little beyond the lower portion, so as to allow a screw to be placed in it, whereby the lower bit of steel, and the pad belonging to it, may be pressed, in the requisite manner, towards the os pubis. (See *Journal de Médecine*, tom. iii.) A similar, but apparently a still more commodious instrument of this kind, is described by Le Rouge in the *Journal de Médecine, Chirurgie, et Pharmacie*, tom. lxxvii. p. 459.

Experience alone can determine whether such inventions will answer the intended purpose. Richter apprehends, that the constant pressure must, at length, prove painful, and that, if it were not strong, it could not hinder the urine from escaping. Reasons of this sort have induced some writers to recommend the employment of a flask, or receptacle for the urine, as well for female as male patients. An apparatus has been invented, consisting of a bandage, that passes round the body, and is provided with an elastic piece of steel which descends over the mons veneris, and presses an oblong tin funnel against the orifice of the meatus urinarius. A bit of sponge is placed within the funnel, and projects a little over its edge, being calculated to lie upon the opening of the urethra, imbibe the urine, and conduct it into the funnel, from which it drops into a bladder, or skin pouch, purposely placed for its reception. (Botticher, vom Chirurgischen Verbands.) As the preceding apparatus must, in all probability, put the patient to inconvenience when she sits down, Richter suspects, that it might be best to introduce into the urethra a flexible catheter, the lower end of which is to be fastened to Juville's flask, after being properly fixed in the manner described in speaking of the latter apparatus. The receptacle can easily be retained on the inside of the thigh.

Having treated of the incontinence of urine, attended with a paralysis of the sphincter vesicæ, we shall next speak of that species of the disorder which has been called *Spasmodic*, and usually arises from the operation of some irritation or another upon the bladder. In a case of this nature, it is always a chief indication to discover and remove, if possible, the active irritation, which, according to surgical authors, may be of several kinds: worms, hemorrhoids, cold, suppression of the menses, a calculus in the bladder, an abscess near the anus, &c. The treatment must, of course, be subject to considerable variety. When the particular nature of the irritation cannot be detected, the practitioner must employ general anodyne and antispasmodic remedies, opium, the warm bath, &c. In these cases, the uva ursi has been prescribed with infinite advantage. The present sort of incontinence of urine occasionally occurs merely as a symptom of epilepsy, hysteria, &c. In this circumstance, the treatment is to be entirely directed against the original disease. The disorder is frequently produced by pressure on the bladder, and therefore we see it brought on by polypi of the uterus, pregnancy, or a descent of the womb.

The third species of incontinence of urine, or that to which patients are only subject in the night-time, cannot always be regarded as a disease. In young subjects, the case is usually one of the three following kinds: the boy either neglects to get up, when he feels an inclination to make water; or he sleeps so soundly, that he is utterly insensible of the calls of nature; or lastly, he dreams that he

is making use of a chamber-pot, and empties his bladder, as it were, voluntarily. The first of these cases requires proper advice, and, if that will not do, moderate chastisement. The second, it would certainly be the height of absurdity and cruelty to endeavour to obviate by corporal punishment; it is a true infirmity, incidental to childhood, and commonly disappearing as the boy grows a little older. The application of punishment to the third instance is likewise quite irrational and improper. Children liable to the nocturnal incontinence of urine, ought rather to be kept from drinking too late in the evening, and care should always be taken to make them use the chamber-pot before they are put into bed. The children also, if possible, should be waked in the course of the night, in order that they may make water.

When adults are troubled with the infirmity, or children continue afflicted, notwithstanding the trial of ordinary plans, a quarter of a grain of the pulv. cantharid. may be administered, every evening, in some milk of almonds. When this plan fails, we have reason to suspect, that the incontinence of urine is owing to the operation of a preternatural irritation on the bladder. In this circumstance, if relief is to be derived from medicines, it must be from such as opium and ipecacuanha.

In obstinate cases, it has been suggested, that benefit might be derived from advising the patient to retain his urine a good deal in the day-time, by which means the bladder, being accustomed to hold a considerable quantity of fluid, would not be so prone to contract in the night-time for the expulsion of a small quantity.

Should all the above methods prove ineffectual, the only resource left is to put on the patient, just before bed-time, one of the machines already described in a previous part of the present article.

In the particular case, where a fistulous communication exists between the bladder and vagina, in consequence of ulceration, or sloughing, if the aperture will not heal by making the patient lie a good deal on the abdomen, we may scarify the sides of the opening, and endeavour to make them unite with a future. Perhaps, in some instances, the opening might be healed by touching it with caustic, making the patient lie upon her abdomen, and keeping a catheter, as much as possible, in the urethra.

INCONTINENCY, in a moral sense, is of divers kinds; as in cases of bigamy, rapes, sodomy, or buggery, getting bastards; all which are punished by statute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of priests is punishable by the ordinary, by imprisonment, &c. 1 Hen. VII. cap. 4.

INCORPORATION, formed from *in*, and *corpus, body*, the mixing the particles of different bodies so together, as to make an uniform substance or composition of the whole, without leaving any possibility of discerning the ingredients or bodies mixed, in any of their particular qualities.

INCORPORATION, in *Law*. See **CORPORATION**.

INCORPOREAL, SPIRITUAL; a thing, or substance, which has no body. See **SPIRIT** and **BODY**.

Thus the soul of man is incorporeal, and may subsist independently of the body. See **SOUL**.

Those ideas which are independent of bodies, can neither be corporeal themselves, nor be received within a corporeal subject: they discover to us the nature of the soul, which receives within itself what is incorporeal, and receives it in a corporeal manner too; whence it is, that we have incorporeal ideas even of bodies themselves. Fenelon.

INCORPOREAL Inheritance, in *Law*. See **INHERITANCE**.

INCOR-

INCORRUPTIBLE, that which cannot be corrupted. See CORRUPTION.

Thus spiritual substances, as angels, human souls, &c. and thus also glass, gold, mercury, &c. may be called incorruptible.

INCORRUPTIBLES, INCORRUPTIBLES, the name of a sect which sprang out of the Eutychians.

Their distinguishing tenet was that the body of Jesus Christ was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he eat without any occasion, before his death, as well as after his resurrection. And hence it was that they took their name.

INCRASSANTS, or INCRASSATING MEDICINES, in the language of the old writers, and of the humoral pathology, such medicines as were imagined to condense or thicken the

blood and humours, which were of a morbidly thin or fluid consistence. Both the diseased condition, and the operation of medicines upon the fluids, were probably equally gratuitous. See HUMORAL Pathology.

INCREASING FAULT, in *Mining*, is applied by Mr. Farey in his Report on Derbyshire, vol. i. p. 122, to describe those dislocations of the strata, which are not alike in all parts of the same fault, but increase in proceeding one way along the fault, and decrease, or derange the measures, a less number of fathoms, yards, feet, &c. in proceeding in a contrary direction: the phenomena attending this important class of faults, are described in the volume above quoted, and their application to mineral surveying is shewn.

INCREMENT, INCREMENTUM, in *Rhetoric*, a species of climax, gradually rising from the lowest to the highest. Such as that of Seneca: "Turpissima tamen est jactura, quæ per negligentiam venit: et, si volueris attendere, magna vitæ pars elabitur male agentibus, maxima nihil agentibus, tota aliud agentibus." See CLIMAX.
