CYCLOPÆDIA:

OR, A NEW

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

HIBISCUS.

HIBISCUS, in *Botany*, ἰβίσκος, a Greek name, of unknown derivation, for the ἀλθαία of Theophrastus, supposed to be the Marsh Mallow, or something very near it; hence the word was chosen by Linnæus to designate a genus of that family, which had hitherto received only barbarous or ill-constructed appellations.—Linn. Gen. 356. Schreb. 468. Willd. Sp. Pl. v. 3. 806. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 454. Cavan. Disc. fasc. 3. 143. Juss. 273. Lamarck. Illustr. t. 584. Gærtn. 134 (Ketmia; Tourn. t. 26.)—Class and order, *Monadelphica Polyandria*. Nat. Ord. *Columnifera*, Linn. *Malvacea*, Juss.

Gen. Ch. *Cal.* Perianth double; the outer permanent, of many linear, sometimes spatulate, leaves, rarely united into one at their base; inner of one leaf, cup-shaped, either five-cleft half way down and permanent, or with five teeth only and deciduous. *Cor.* Petals five, roundish-oblong, narrowest at the base, spreading, attached below to the tube of the stamens. *Stam.* Filaments numerous, connected in their lower part into a tube, in whose upper part, both at its summit and sides, they become separate and lax; anthers kidney-shaped. *Pist.* Germen superior, roundish; style thread-shaped, longer than the stamens, five-cleft in its upper part; stigmas five, capitate. *Peric.* Capsule of five cells and five valves; the partitions double, contrary to the valves. *Seeds* one or more in each cell, kidney-shaped inclining to ovate.

Eff. Ch. Calyx double; the outer of many leaves or segments. Stigmas five. Capsule of five cells, with several seeds.

The species constituting the genus *Hibiscus* are a numerous tribe of the largest and finest plants of the malvaceous order. They are 36 in Syst. Veg. ed. 14th, 66 in Willdenow; yet of the former *H. præmorsus*, *spinifex*, *cancellatus*, and *zeylanicus*,

are removed to the new genus *Pavonia*, and *H. Malabaricus* to the *Achania* of Banks and Solander, well marked by its convoluted corolla, ten stigmas, and pulpy fruit; see *ACHANIA*.—Scarcely any of them are natives of Europe. They generally grow between the tropics, yet some are found in North America, and some have been brought from the Cape of Good Hope. Though so numerous, they are not capable of being distributed into any well-defined sections or subdivisions.—The stem is generally shrubby or arboreous; rarely herbaceous with an annual root, and still more rarely so with a perennial one. Leaves alternate, stalked, simple, more or less lobed, with a pair of narrow stipulas at the base of the footstalk. Pubescence generally soft and stellated, sometimes bristly and simple, sometimes wanting; in *H. populneus* scaly, but this was, with great reason, thought a distinct genus by Dr. Solander. Flower-stalks axillary or terminal, all simple and single-flowered. Corolla usually large, red, purplish, or yellow with more or less of a purple spot, for the most part very ornamental; sometimes variable according to the age of the flower. The fibres of the stem are tenacious like hemp, and the juices of the whole plant very mucilaginous, sometimes accompanied by an unpleasantly scented secretion. We do not recollect any fragrance in the blossoms, at least of those few which it has fallen to our lot to examine alive in the gardens or stoves of Europe.—The following are among the species most worthy of notice.

H. palustris. Linn. Sp. Pl. 976. Curt. Mag. t. 882. Cavan. Diss. t. 65. f. 2.—Stem herbaceous, quite simple. Leaves ovate, partly three-lobed, downy beneath. Flower-stalks distinct from the foot-stalks.—Native of marshes in North America; hardy in our gardens, but scarcely flowering

B

HIBISCUS.

flowering without some artificial heat. The *root* is perennial. *Stems* annual, about two feet high, perfectly unbranched, leafy, round, and nearly smooth. *Leaves* three or four inches long, two or three broad, pointed, ovate, serrated, often with two small lateral points or lobes; smooth above; rarely hoary beneath. *Flowers* large, rose-coloured, darker in the centre. *Stamens* and *pistil* yellow. *Stigmas* very large and globose. The *flower-stalks* are truly axillary, not united for some distance to the footstalk of the leaf, by which it is supposed to be distinguished from *H. Moscheutos*; but we think, with Dr. Sims in Curtis's Botanical Magazine, that these two species are hardly to be considered as more than varieties. The latter is represented in Cavan. Diff. t. 65. f. 1, whatever may be the *Alcea rosea peregrina*, *forte Rosa moscheutos Plinii*, Cornut. Canad. 144. t. 145.

H. tiliaceus. Linn. Sp. Pl. 976. Cavan. Diff. t. 55. f. 1. (Pariti; Rheede Malab. v. 1. 53. t. 30. Novella; Rumph. Amb. v. 2. 218. t. 73.)—Leaves roundish-heart-shaped, undivided, pointed, crenate. Stem arboreous. Outer calyx in ten segments united half way up.—One of the most common trees in every part of the East Indies, thriving in all sorts of situations and soils, and cultivated for the sake of its shade, even more than the beauty of its flowers, in towns and villages, and by road sides. The *foliage* resembles that of the Carolina Lime, *Tilia pubescens*. The *flowers* expand in an evening, and are pale yellow, with a dark purplish stain in the bottom. A coarse cordage is made of the bark; the wood is light and white, useful for small cabinet work; the mucilage of the whole plant is applied to some medical purposes.

H. Rosa-Sinenfis. Linn. Sp. Pl. 977. Sm. Spicil. 7. t. 8. Curt. Mag. t. 158. Cavan. Diff. t. 69. f. 2.) Schem-pariti; Rheede Malab. v. 2. 25 t. 17, with a double flower, as is also *Flos fetialis*; Rumph. Amb. v. 4. 24. t. 8.)—Leaves ovate, pointed, serrated, smooth. Stem arboreous.—The native country of this species is uncertain, but no plant is more generally cultivated in China and the East Indies for ornament, especially the double-flowered kind, which is used on all occasions to decorate the houses, temples, &c., as roses are in England. Their shape and brilliant red colour have acquired them the appellation of the China Rose. The single flower, with its long pendulous column of stamens, and vivid crimson stigmas, is in our opinion much more elegant than the double, but is rarely seen in collections, though the latter is considered as almost essential to every hot-house. The *tree* is said to be as large as a hazel. The *leaves* are of a fine green, and smooth. *Flowers* large, crimson. They serve the Europeans in India for the ignoble purpose of blacking their shoes, being rubbed upon the leather, which, when it has received a sufficient degree of colour, is polished with the hand.

H. mutabilis. Linn. Sp. Pl. 977. Andr. Repof. t. 228. Cavan. Diff. t. 62. f. 1. (Rosa-Sinenfis; Ferrari Flor. 479. t. 485—499. Merian. Surin. 31. t. 31. Hina-pariti; Rheede Malab. v. 6. 69. t. 38—42.)—Leaves heart-shaped, angular, five-lobed, pointed, toothed. Outer calyx of eight leaves. Capsule villöse. Stem arboreous.—Native of China, Japan, and various parts of the East Indies, where, as well as in the West Indies, it is much cultivated for the beauty of its flowers, most generally double, which are white at first opening in the morning, but become rose-coloured before they fade at night. The *leaves* somewhat resemble those of the vine, and are roughish, variable in the length of their points. Ferrari and Rheede have illustrated this fine plant by an unusual profusion of plates in their several splendid works.

H. syriacus. Linn. Sp. Pl. 978. Curt. Mag. t. 83.

Cavan. Diff. t. 69. f. 1. (*Alcea arborefcens*; Camer. Hort. t. 3, 4. *Althæa arborefcens*; Ger. em. 933. *A. frutex*; Park. Parad. 369. t. 367. f. 5.)—Leaves ovate, somewhat wedge-shaped, three-lobed, cut, smooth. Outer calyx of about eight leaves, as long as the inner. Stem arborefcens.—Native of Syria and Carniola; a hardy shrub in our gardens, where it is popularly known by the name of *Althæa frutex*. It is perhaps the last shrub that comes into leaf with us, and one of the latest in flowering. The *blossoms* are handsome, rose-coloured with a crimson eye, produced in abundance, and liable to variations in colour which render them still more desirable. They have no scent.

H. hiliiflorus. Cavan. Diff. t. 57. f. 1.—Leaves obovate, entire, bluntish, ribbed, smooth; occasionally three-lobed. Outer calyx five-cleft, very short. Stem arboreous.—Gathered on the woody mountains of the Isle de Bourbon by Commerfon, who, thinking it a distinct genus, intended to call it *Cremontia*. The above characters mark it sufficiently. The *flowers* are large, not much expanded, purplish, externally silky and whitish. Few of the genus are more striking either in their blossoms or foliage.—The French call it Fleur de St. Louis.

H. speciosus. Ait. Hort. Kew. v. 2. 456. Curt. Mag. t. 360.—Leaves deeply palmate, smooth: their segments lanceolate, somewhat serrated. Stem, stalks, and calyx smooth.—Native of Carolina, nearly hardy with us, being perennial, with an annual herbaceous stem. The *flowers* are peculiarly showy, being of a rich scarlet, and larger than most of their family.

H. Abelmoschus. Linn. Sp. Pl. 980. Cavan. Diff. t. 62. f. 2. (Flos moschatuus; Merian. Sur. 42. t. 42.)—Leaves with seven angles, serrated; somewhat peltate and heart-shaped at the base. Stem bristly.—Native of the East and West Indies, chiefly remarkable for the rich musky taste of its seeds, known by the name of *Bammia moschata*, for which they are cultivated in the East. The plant is shrubby, very hispid. *Leaves* very deeply divided. *Flowers* large, yellow. *Capsule* two or three inches long.

H. Trionum. Linn. Sp. Pl. 981. Curt. Mag. t. 209.—Leaves in three very deep divisions, cut, somewhat pinnatifid. Calyx inflated, membranous, hairy.—The beautiful Venetian Mallow, or Flower of an hour, is one of the few European species of *Hibiscus*, and also one of the few that are annual. It is commonly cultivated for the elegance of the flowers, which are sulphur-coloured, with five purple external stripes, and a violet eye, contrasted with the yellow anthers. The purple hairy stigmas too are remarkable, as well as the bladderly hispid inner calyx.

HIBISCUS, in *Gardening*, contains plants of the shrubby and flowering exotic sorts, among which the species chiefly cultivated are, the Syrian shrubby hibiscus, or althæa frutex (*H. syriacus*); the bladder hibiscus, bladder ketmia, or flower of an hour (*H. trionum*); the China rose hibiscus (*H. rosa sinensis*); and the changeable rose hibiscus (*H. mutabilis*), or Martinico rose.

The first species has several varieties, as with pale purple flowers, having dark bottoms; with bright purple flowers, and black bottoms; with white flowers, and purple bottoms; with variegated flowers and dark bottoms, termed *painted lady althæa frutex*; with pale yellow flowers, and dark bottoms; and with variegated leaves, and double flowers.

And of the second species there are varieties, with erect purplish stems, and larger flowers, with a deeper colour; and with large paler-coloured flowers.

The last species has also a variety with double flowers, from which the single is often produced; but the seeds

of the single rarely afford plants that vary to the double sort.

Method of Culture.—The first species is capable of being multiplied either by seeds, layers of the branches, or cuttings of the young shoots.

In raising them by seed, it should be procured from abroad, and be sown in the early spring season, either in pots filled with light earth, or on a border in a warm exposure; but the former is the better method. The pots must be plunged in a gentle hot-bed, in order to bring the young plants forward. Afterwards the plants should be watered during the summer season in a moderate degree, and be protected in the winter from the effects of frost.

After the plants have had the growth of about two years they may be planted out in nursery rows, or in the places where they are ultimately to grow.

Where the layer mode is employed, the branches should be laid down into the ground in the autumnal season, nicking the shoots on the back parts at one or two of the joints, and placing them well in the earth. They mostly become pretty well rooted in the course of ten or twelve months, at which time they may be taken off, and placed out in their situations.

In using cuttings the young shoots should be preferred, which should be planted in pots of light earth early in the spring, plunging them in a mild hot-bed. They may also be planted in a shady border in the summer season. As soon as the plants are become fully rooted, they should be taken up with great care, and planted out where they are to grow, which may be done either during the autumn or in the spring.

The second species may be increased by sowing the well-ripened seeds in the autumn or spring, in patches of several seeds together, in the situations in which they are designed to grow and flower. As soon as the plants are come up, and have attained some growth, they should be thinned out to two or three plants in each patch.

The last two species are also capable of being multiplied, by sowing the seeds, when perfectly ripened, in the early spring in pots of rich light earth, plunging them directly in a moderate hot-bed, under glass frames, or, which is much better, in the bark-bed of the hot-house. As soon as the plants have made their appearance, and acquired some few inches in growth, they must be removed separately into small pots, giving them water freely, and then replunging them in the hot-bed, where they are to be preserved.

In some cases they are likewise capable of being raised by planting cuttings made from the young shoots in pots filled with the same sort of mould, either in the spring or summer, affording them water immediately, and then placing them in the bark hot-bed. The after-management is the same as in the other sorts.

The first two species, which are hardy, afford an excellent effect in the clumps and borders, in intermixture with other plants of the flowery sort; while the last two, which are tender, display considerable variety in collections of the stove and conservatory kinds, by the beauty of their flowers.

HIBISI, in *Geography*, a town of Asiatic Turkey, in Caramania; 80 miles W. of Satalia.

HIBRAHIM, or **ST. MARY**, an island in the Indian ocean, near that of Madagascar; 50 miles long and 14 wide. S. lat. 16° 56'. E. long. 51° 56'.

HIBRETPOUR, a town of Hindooſtan, in Lahore; 27 miles N. of Firoſepour.

HICETAS, the Syracusan, in *Biography*, an ancient philosopher and astronomer, who flourished at an unknown period. He was probably the first person who taught that the sun and stars were fixed and permanent bodies, and that the earth had a rotatory motion. It is even said that Copernicus derived from this philosopher the first hint of his true system of the universe.

HICHATAS, in *Geography*, a town of West Florida, near the Apalachicola. N. lat. 31° 43'. W. long. 85°.

HICK, in *Nautical Affairs*, signifies the handle or lever of the rudder of a barge, called also the tiller.

HICKERY, in *Geography*, a town of America, in the state of Pennsylvania, on the Alleghany; 20 miles N. E. of Fort Franklin.

HICKES, **GEORGE**, in *Biography*, was born at Newsham, in Yorkshire, in the year 1642. He was educated at North-Allerton, from whence he was admitted a servitor at St. John's college, Oxford. Soon after the Restoration, he removed to Magdalen college, where he took the degree of B.A., 1662. He went to Lincoln college in 1664, was elected fellow, and in the following year commenced M.A. was admitted to holy orders, and undertook the office of a tutor to the college, the duties of which he discharged with great reputation till the year 1673, when he was obliged to seek for some change, in order to recruit his health, which had been injured by severe labour. He accompanied Sir George Wheeler in a tour on the continent, and at Paris he learnt that it was the intention of the court to revoke the edict of Nantz. In 1675 he returned to Oxford, obtained some preferment, and was soon after appointed domestic chaplain to the duke of Lauderdale, whom he attended to Scotland. Here he accepted the degree of doctor of divinity. From this period he received other preferments in the church, and among others, the deanery of Worcester, and would probably have been made bishop of Bristol, but the death of the king, while the subject was in agitation, put an end to all his future hopes of ecclesiastical promotion. He had already discovered great zeal against the principles of popery, that he could expect no favour from James II.; nevertheless, he was so much of a churchman, and so steadily attached to the Stuart family, that he refused to take the oaths of allegiance to king William and queen Mary, was suspended, and in 1690 was deprived of his benefices. Before he quitted possession, however, upon seeing it announced in the Gazette that the deanery of Worcester was granted to Mr. William Talbot, he drew up a claim of right to it, which, in 1691, he fixed up, in his own hand-writing, over the great entrance into the choir. This paper was called by the secretary of state "Dr. Hickes's manifesto against the government," and drew upon the author a prosecution from the officers of the crown. This he anticipated, and very wisely quitted the country for concealment in the metropolis. Here and in its neighbourhood he remained unmolested till the year 1699, when the lord high chancellor Somers, out of regard for his great erudition, and as an encouragement to him in writing his dictionary of the old Northern languages, procured an act of council, by which the attorney-general was ordered to enter a *noli prosequi* to all proceedings against him. He died in 1715, in the seventy-fourth year of his age. His principal works were "Institutiones Grammaticæ Anglo-Saxonicæ et Mæſo-Gothicæ," 4to; and "Antiquæ Literaturæ Septentrionalis, Libri duo," folio. This last is reckoned the author's master-piece, and is still held in high estimation. He was author of three volumes of sermons, and of a multitude of tracts in defence of himself, and the other non-jurors and their principles, an account of which may be found in the

the *Biographia Britannica*. Dr. Hickes was unquestionably a man of great learning, and very conversant in the writings of the Christian fathers, whom he regarded as the best expositors of the scriptures. Of his integrity he afforded abundant evidence, by the sacrifices to which he submitted, rather than suffer his conscience to be violated, and his moral conduct is said to have been unexceptionable and exemplary. *Biog. Brit.*

HICKES'S Bay, in *Geography*, a bay on the N.E. coast of New Zealand, discovered by Capt. Cook in 1769, so called from Mr. Hickes, the lieutenant of the *Endeavour*; 14 miles W.N.W. of Cape Runaway.

HICKES'S Keys, a cluster of islets and rocks, in the bay of Honduras, near the coast of Mexico. N. lat. 17° 10'. W. long. 88° 54'.

HICKFORD, in *Biography*, an English dancing-master, whose school-room, in Brewer's-street, succeeded that in York-buildings for benefit concerts and musical performances, during the early part of the last century.

In 1731, Geminiani Martini, the celebrated performer on the hautbois, and Arrigoni, the lutinist, had a weekly subscription concert at Hickford's room; where Carbone, Dubourg, Clegg, and Veracini had likewise their benefits, as had all the second-rate opera singers. About the year 1744, Hickford himself established a weekly subscription concert, of which Festing was the leader, Vincent the hautbois, Wiedman the German flute, Miller the bassoon, Coperale the violoncello, and Frasi, with some other Italians from the opera, the singers.

This concert continued in high favour till the decease of Festing and establishment of Giardini in this country.

HICKMAN, in *Geography*, a settlement of America, in Fayette county, Kentucky, on the N. side of Kentucky river; 10 miles N. of Danville.

HICKSFORD, a post-town of America, in Greenville county, Virginia; 209 miles from Washington.

HICKUP, *Hiccock*, or *Hicough*, in *Medicine*, terms which have probably originated from the peculiar sound issued in the affection which they are used to denote, signify a rapid, convulsive, and sonorous inspiration, effected by the motion of the diaphragm, and generally connected with irritation of the stomach. It is the *λυγμός* or *λύγος* of the Greeks, and the *singultus* of the Latins.

This troublesome spasmodic affection is too well known to require any minute description here. Some have considered it as a disorder of the stomach exclusively; while others more correctly assert, that the action of the diaphragm is principally concerned in producing it. It is obvious, indeed, that the peculiar disyllabic sound, produced during the spasm, commonly arises from an affection of some of the organs of respiration, and this is not less obviously the diaphragm. This spasmodic contraction of the diaphragm, however, is most excited in consequence of some irritation within the stomach, and especially about the upper orifice or cardia. Thus a large quantity of food, taken without drinking, or a small portion of very dry food, such as bread, will often bring on the hiccup; but it is speedily appeased, in such cases, by a draught of any liquid. Distention of the stomach, by a very copious meal, or by food imperfectly masticated, will also frequently induce a hiccup; which, of course, is easily prevented by an opposite course, temperance, and slow eating. Certain acid substances, swallowed, or generated in the stomach, are apt to excite the convulsive action of the diaphragm, which constitutes hiccup. Thus various spices, especially when taken copiously, and other pungent matters, such as garlic, &c.

often produce it; and the acids, and other irritating fluids, which result from imperfect digestion, and occasion a sense of heat and uneasiness about the cardia, or heart-burn, frequently also excite hiccup.

On the other hand, hiccup is often observed to arise from the opposite state of the stomach to that of over-distention, namely, from inanition. It is not so easy to account for this variety of the disorder, unless we suppose that the fluids, secreted within the stomach, become, during its empty state, a source of irritation adequate to excite the sympathetic action of the diaphragm. Hiccup is also apt to occur, after great evacuations by purging and vomiting, as in cholera, and after hemorrhages. And it often accompanies inflammation, or other severe irritation, in the viscera, especially those of the abdomen, in phrenitis, or inflammation of the brain, in apoplexy, in obstructions of the bowels, &c. It is very common in almost all disorders of the organs connected with digestion: thus it is generally one of the symptoms of a scirrhus state of the liver; and is sometimes found in simple jaundice, in which the biliary ducts are obstructed, although the liver itself is found. Sometimes it is one of the fore-runners of the epileptic paroxysm. Heberden's Comment.

From some one or other of these causes, hiccup will sometimes continue to distress the patient, not only for several months, but even for some years, at times with great constancy, and at other times with considerable intermissions. In some instances, this troublesome symptom has been known to harass a person during the space of many months, without any other signs of ill health. (See Heberden, Comment. De Morbor. Hist. et. Curat. cap. 81.) The final cause of the hiccup has been supposed to be the removal of any irritating substance from the lower part of the œsophagus, or from the upper orifice of the stomach to a less sensible part of that organ by the concussion of the whole.

The hiccup, in its most ordinary form, where no particular disease is present, is a trifling affection; but when it is a symptom of other diseases, and especially of acute or febrile diseases, it is often itself a severe complaint, by the irritation which it produces, and very often indicative of danger, or of the approach of dissolution. Hippocrates has founded several of his prognostic aphorisms upon this symptom. In inflammation of the bowels (enteritis), in long continued colic, in strangulated hernia, in stricture of the rectum, intus-susceptio, or other impediment to proper evacuation of the canal, hiccup ensues towards the close of the disease, and, when accompanied by great fulness and tension of the abdomen, with debility of the pulse, languor, and prostration of strength, is to be considered as a most unfavourable symptom. In all acute fevers it is an unpleasant symptom, implying generally a morbid condition of the abdominal viscera or of the brain, which it is to be apprehended will terminate unfavourably. The symptom, however, has sometimes preceded a favourable change of the fever; so that the older physicians have remarked, that an exception from its indication of danger arises, when appearances of an approaching crisis concur with it. Hippocrates observes that hiccup is a bad symptom in old people after a severe purging. (Aphorism 41. sect. 7.) It is unfavourable, indeed, after every severe evacuation of this sort; but more particularly in the aged, whose strength is necessarily impaired. He remarks, too, that hiccup is a bad symptom in inflammation of the liver (Aph. 58. sect. 5—17. sect. 7), and that a sneezing, supervening during a hiccup, removes it. Aph. 7. sect. 6.

It is scarcely necessary to speak of *the cure of hickup*, since it is either so slight an affection, in general, as to require no medical assistance, on the one hand; or a symptom of some other disease, to which our attention must be chiefly directed, on the other. In the former case, it usually ceases spontaneously in a short time, or is readily removed by a little warm fluid, as tea, coffee, and the like. When it arises from over-distention of the stomach by a too copious supply of food, or from the use of certain spices or other acrid substances, it will be in the patient's power to avoid any return of it in future from the same causes. When the hickup is more permanent and troublesome, moderate doses of the antispasmodics will commonly relieve it; probably by blunting the sensibility of the nervous coat of the stomach, and invigorating its muscular fibres. Thus a little opium or conium (*cicutâ* of the old pharmacopœias), or a few drops of the tincture of opium and of sulphuric ether, will frequently remove the paroxysm at once. When the hickup appears to be connected with the generation of acid in the stomach, it may be alleviated by magnesia, chalk, and the alkaline waters, at the same time, a light and moderate diet, with occasional laxatives, and aromatic bitters, may be used with a view to unload and strengthen the stomach. This, like many other spasmodic actions of muscular parts, may be often removed by drawing the attention of the patient strongly to any particular object, or by exciting any mental emotion; a fact, which popular observation has evinced. When the hickup is merely a symptom of some other disease, the treatment of it is a matter of very secondary importance; our efforts being of necessity directed chiefly to the removal of the primary disease, with the cessation or alleviation of which the hickup will of course cease or be alleviated, according to the old maxim, "*sublatâ causâ tollitur effectus.*" The treatment of such primary diseases will of course be elsewhere detailed. See Sennertus, *Med. Pract.* lib. iii. part 2. sect. 2. cap. 10. Hoffmann, *Syst. Med. Rat.* Heberden, *Comment.* cap. 81. Sauvages, *Nosol. Method.*

HICKWALL, in *Ornithology*, the name of a small species of wood-pecker, called by authors *picus varius minor*; a small bird of not above an ounce weight, very beautifully variegated with black, white, and brown. The head in the female of this species has a white spot on the crown, and in the male a red one. It climbs trees like the common large wood-pecker, and like it feeds on worms and other insects which it finds there. See PICUS *Minor*.

HID *Island*, in *Geography*, an island of the N.W. territory of America, in Plain river, the northern head-water of the Illinois.

HIDAGE, or HYDAGE, an extraordinary tax, anciently payable to the king for every hide of land. See HIDE.

"Sunt etiam quædam communes præstationes, quæ servitia non dicuntur, nec de consuetudine veniunt, nisi cum necessitas intervenerit, vel cum rex venerit; sicut sunt hidagia, coragia, & carvagia, & alia plura de necessitate, & ex consensu communi totius regni introducta, & quæ ad dominum non pertinent," &c. Bracton, lib. ii. cap. 6.

King Ethelred, in the year of Christ 994, upon the landing of the Danes, at Sandwich, taxed all his lands by hides. Every 310 hides of land, on this occasion, found one ship furnished; and every eight hides found one jack and one saddle, for the defence of the realm. William the Conqueror took six shillings for every hide of land in England.

HIDAGE is also used for being quit of that tax; otherwise called *hide-gild*.

HIDALGO, *q. d. a son of birth*, in *Modern History*, a title given in Spain to all who are of noble family.

HIDDE, in *Geography*, a town of Arabia; 10 miles E. of Jidda.

HIDDENSON, an island in the Baltic, near the W. coast of Usedom, about ten miles long and two broad. N. lat. $54^{\circ} 35'$. E. long. $13^{\circ} 10'$.

HIDE, in *Commerce*, the skin of a beast; particularly that of a bullock, cow, or horse. See SKIN and TANNING.

We have hides of divers denominations, according to their state, quality, &c.

HIDE, *Curried*, is that which, after tanning, has passed through the currier's hands, and has thus received its last preparation, and is fitted for use. See CURRYING.

HIDE, *Racu*, or *Green Hide*, is that which has not undergone any preparation; being in the same condition as when taken off the carcase.

HIDE, *Salted*, is a green hide, seasoned with sea-salt and alum, or salt-petre, to prevent its spoiling and corrupting, either by keeping it too long in cellars, or in transporting it too far in a hot season.

There are also hides dried in the air, sent from America; particularly those of buffaloes.

HIDE, *Tanned*, is a hide either green, salted, or dried, farther dressed and prepared by the tanner, by paring off the hair, and steeping it in pits of lime and tan. See TANNING.

Tanned hides are commonly carried along with the artillery of an army. They are used in the fire-workers stores, for covering powder or charged bombs from the rain or from sparks of fire. They are also used on batteries, or in a laboratory.

HIDE, or *Hyde*, *Hyda*, in our *Ancient Customs*, denoted a measure or quantity of land, containing so much as could be yearly tilled with a single plough.

Beda calls the hide of land *familia*, and defines it to be so much as was sufficient for the ordinary maintenance of one family. In other authors it is called *mansum*, *mansio*, *carucata*, &c.

Crompton, in his *jurisdict.* fol. 322, says, a hide of land contains one hundred acres, = 10 acres = 10 square furlongs = 4 virgates = 8 bovates or ox-gangs = 8 nooks = 200 obolata = 400 roods = 16,000 perches or poles = 1000 square chains = 100,000 square staves = 10,000,000 square links = 484,000 square yards = 1,742,400 square paces = 4,356,000 square feet, &c.: he adds, that eight hides make a knight's fee. In ancient manuscripts, the hide is fixed at 120 acres. But Sir Edward Coke notes, that a knight's fee, a hide or plough-land, a yard-land, and an ox-gang of land, do not contain any certain determinate number of acres. See CARRUCATE.

The distribution of England into hides of land is very ancient, there being mention made of it in the laws of king John, cap. 14. "*Henricus I. maritand. filix suæ gratia imperatori, cepit ab unaquaque hida Anglia tres sol.*" Spelman. See SUBSIDY.

HIDE, in *Geography*, a river in America, which runs into the Mississippi, N. lat. $43^{\circ} 24'$. W. long. $92^{\circ} 2'$.

HIDE and Gain, in our *Old Writers*, signified arable land; to gain the land being as much as to till it.

HIDE-bound, a disorder of a horse or other beast, wherein his skin sticks so tight to his ribs and back, as not to be loosened from it with the hand.

The disorder is sometimes owing to poverty and bad keeping; at other times to over-riding or a surfeit, the horse being suffered when he is hot to stand long in the wet; or to a morbid dryness of the blood, which, not having its natural

natural course, causes the skin to shrink up and cleave to the bones.

Among *Husbandmen*, trees also are said to be hide-bound when the bark sticks too close.

Hide-bound Land, in *Agriculture*, a term used in some districts to denote tough, poor sward land, which has mostly been badly laid down to grass.

HIDEL, in our *Ancient Statutes*, signifies a place of protection or sanctuary.

HIDGILD, or HIDEGILD, in the laws of king Canute, is explained by *pretium redemptionis servæ*; the price by which a servant was to redeem his skin from being whipped.

The word is formed from the Saxon *hide*, skin, and *gild*, payment. "Si liber festis diebus operetur perdat libertatem; si servus corium perdat vel hidgildum:" *i. e.* let him be whipped (which was the punishment for servants), or let him pay for his skin; by which payment he is to be excused from whipping.

HIDRA, in *Geography*, a town of Africa; 110 miles W.S.W. of Tunis.

HIDRO, a mountain of Naples; 15 miles W.S.W. of Otranto.

HIDROA, ἰδρῶς, in *Medicine*, from ἰδρῶς, *sweat*, signifies an eruption of miliaria pustules on the skin, occurring chiefly during the summer, in the south of Europe. The complaint was entitled *sudamina* and *papule sudoris* by the Romans, *sudor* signifying also *sweat*; whence we may infer their opinion of its connection with the perspiration, which the hot season produced. It appears to be nearly the same disease as that which occurs in tropical climates during the hottest months, especially to European settlers, and is denominated, from the sensation accompanying it, the *prickly heat*. See *HEAT*, *prickly*.

HIDROCRITICA, a term used to express the judgments passed by physicians on their patients, on observing the sweats that have attended the disease.

HIDRONOSOS, a name given, by some authors, to that terrible disease the *sudor Anglicanus*, or sweating sickness.

HIDROPYRETOS, of ἰδρῶς, *sweat*, and πυρετός, *fever*, the *fevering fever*, a name given by some to the *sudor Anglicus*, or sweating sickness.

HIDROTICS, or HYDROTICS, in *Medicine*, the same with sudorifics.

The word is composed of the Greek ἰδρῶς, *sweat*.

Contraÿerva, zedoary, guaiacum, angelica, &c. are of the number of hidrotics, or hidrotic medicines.

HIELM, in *Geography*, a small island of Denmark, in the Cattegat, near the coast of Jutland. N. lat. 56° 8'. E. long. 10° 49'.

HIELMAR, a lake of Sweden, in the province of Sudermanland, about 70 miles in circumference; 60 miles W. of Stockholm.

HIEMALIA, in *Antiquity*, the same with brumalia.

HIEN, in *Geography*, a town of China, of the third rank, in the province of Pe-tche-li. 12 miles S. of Ho-kien.

HIEN-YAN, a town of China, of the third rank, in Chan-fi; 12 miles W.S.W. of Si-nghan.

HIEOU-KI, a town of China, of the third rank, in Fo-kien; 26 miles S. of Yen-ping.

HIEOU-NHING, a town of China, of the third rank, in Hou-quang; 40 miles S. of Ou-tchang.

HIERA, in *Ancient Geography*, one of the Cyclades, an island of the Archipelago, situated between Thera and Therasia. This island, called the "Sacred island," was dedicated to the gods of hell, because it had been seen to issue, all on fire, from the bottom of the sea, as the effect of

a volcano. Pliny says that this event took place 130 years after that which had separated Thera from Therasia. M. de Choiseul affirms, according to father Hardouin, that there is a mistake in the dates, and that it was not till 40 years after that the island of Hiera made its appearance. In the year 196, B. C., says Justin (l. xxx. c. 4.), there was seen to issue, after an earthquake, an island between Thera and Therasia, which was called "Sacred," and which was dedicated to Pluto. Dion Cassius mentions the sudden appearance of a small island near that of Thera, during the reign of Claudius. Syncellus mentions it in the 46th year after Christ, and places it between Thera and Therasia. But it appears that, some time after, there arose another island called Thia, which disappeared, or was united to the "Sacred" island. Mention is made of it in Pliny (l. iv. c. 12.), in Theophanes, and in Brietius (vol. ii. p. 236.) Nothing remarkable happened afterwards till 1427, when a great explosion produced a rather great and very distinguishable increase to the island of Hiera, of which mention is made in some Latin verses engraved on a marble at Scauro, near the church of the Jesuits. In 1573 was formed, after a fresh explosion of some continuance, the "Little Kammeni," such as we see it at the present day. The island Hiera, called "Old Kammeni," to distinguish it from "New Kammeni" (see *KAMMENI*), is upwards of a mile in length, and appears to be nothing but a mass, without regular strata, of volcanic substances, and particularly of rocks of basalt. It is covered with a little earth, mixed with pumice-stones and volcanic ashes, which have given rise to the vegetation that has been there long established. This island is desert and uncultivated. In the summer only asses and mules are sent thither to graze. On the part, supposed to have been added to it at a later period, there is not as yet any trace of vegetation, and this part remains less elevated than the rest of the island. On Hiera are observed clefts somewhat considerable, which take the direction of its length, and extend almost from the one extremity to the other. These have, without doubt, been occasioned by the earthquakes which have very frequently occurred in these countries. Olivier's Travels in the Ottoman Empire.

HIERACHIOIDES, in *Botany*, a name given by Vailant to a genus of plants, since called by Linnæus *Crepis*; which see.

HIERACITES, HIERACITÆ, in *Ecclesiastical History*, a sect of ancient heretics, at the close of the third century, denominated, from their leader Hierax, a bookseller of Leontium, and eminently distinguished by his extensive learning, and a venerable air and sanctity of virtue.

He absolutely denied the resurrection of the body, maintaining, that the soul alone rose again, and that the resurrection was altogether spiritual. Epiphanius accuses that he might have imbibed this error from Origen.

The same Hierax, and his followers, likewise condemned the use of flesh, wine, and marriage; being of opinion that they were only allowed under the Old Testament, and till the coming of Jesus Christ; but that under the new law they were prohibited, as incompatible with the kingdom of God.

St. Epiphanius produces the passages of scripture whereon he founded this doctrine. He adds, that Hierax did not adopt Origen's opinion with regard to the Trinity, but allowed the Son to be really and truly begotten of the Father. He was also orthodox with respect to the Holy Ghost, excepting for some peculiarities received from the Melchisedecians, on which he had refined, maintaining that Melchisedec was the Holy Ghost. He also excluded from the kingdom of heaven children, who died before they had arrived to the use of reason.

HIERACIUM.

reason. He lived a very austere life, and promoted the same among his followers; but, after his death, they degenerated very rapidly.

HIERACIUM, in *Botany*, from *hierax*, a hawk, because hawks were supposed to sharpen their sight by the application of its juice to their eyes. The absurdity of the idea proves the venerable antiquity of the name. Hawkweed.—Linn. Gen. 402. Schreb. 529. Willd. Sp. Pl. v. 3. 1559. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 827. Ait. Hort. Kew. v. 3. 121. Juss. 169. Tourn. t. 267. Lamarck. Illustr. t. 652. Gærtn. t. 158.—Class and order, *Syngenesia Polygamia-aqualis*. Nat. Ord. *Compositæ semisiliculose*, Linn. *Ciboraceæ*, Juss.

Gen. Ch. *Common Calyx* imbricated, ovate, of many linear, very unequal, longitudinal and incumbent scales. *Cor.* compound, imbricated, uniform; the florets hermaphrodite, numerous, equal, each of one petal, ligulate, linear, abrupt, with five teeth. *Stam.* Filaments five, capillary, very short; anthers united into a cylindrical tube. *Pist.* Germen nearly ovate; style thread-shaped, the length of the stamens; stigmas two, recurved. *Peric.* none, except the closed, ovate, permanent calyx. *Seeds* solitary, short, obtusely quadrangular; down capillary, sessile. *Recept.* nearly naked.

Eff. Ch. Receptacle nearly naked, dotted. Calyx imbricated, ovate. Down simple, sessile.

Obf. This genus is far more comprehensive in Tournefort than in Linnæus, embracing various species of *Crepis*, *Hypochaeris*, *Picris*, &c. The *Hieracia* of Vaillant have all branched stems; that author separating from them, by the name of *Pilosella*, such as have simple radical flower-stalks.

Thirty-five species are defined in the 14th edition of the *Systema Vegetabilium*, 70 in Willdenow's *Species Plantarum*, though many of the former are now sent away, by the last-mentioned author, to his *Apargia* and other genera. Some indeed are removed by him into this genus from *Leontodon* and *Crepis*, but its chief increase is derived from new discoveries in the mountainous parts of Europe.

The whole are commodiously and naturally divided into three sections; 1st, stalks radical, single-flowered; 2dly, stalks radical, many-flowered; 3dly, stem leafy.

They are almost, without exception, perennial herbaceous plants, *H. glutinosum* only having an annual root, and *H. fruticosum*, Willden. n. 69, a shrubby stem. Their herbage is commonly hairy or rough, especially the calyx and top of the flower-stalks, which are in many instances clothed with dense, black, partly glandular, prominent, soft hairs. The leaves are simple, now and then spotted, usually entire in such species as are but little or not at all caulescent, more or less deeply toothed, or even pinnatifid, in the rest. Those placed on the stem are alternate, sessile, or frequently clasping that part by their arrow-shaped or heart-shaped base. The flowers are diurnal, of a full golden yellow, in a very few instances orange or lemon coloured, and in still fewer pink or purplish. Though the seed-down is properly described as simple, it is very generally rough, often verging towards a feathery structure.

Examples of the first section are,

H. alpinum. Linn. Sp. Pl. 1124. Fl. Lap. n. 283. Lightf. Scot. 434. t. 18. Engl. Bot. t. 1110. (*H. villosum alpinum*, flore magno singulari, caule nudo; Dill. in Raii Syn. 169. t. 6. f. 2.) Leaves oblong, undivided, entire or notched. Stalk almost leafless, single-flowered. Calyx hairy.—Found on all the highest mountains of Europe, in rocky places, flowering in July. It is remarkable for its large solitary flower, whose calyx is black, clothed with long dense tawny hairs. The leaves vary much in the number and

depth of their marginal incisions—Willdenow quotes for this Jacquin's Fl. Austr. t. 191, which he had properly cited as the species immediately preceding as *H. alpestre* of that author, very distinct from the *alpinum*, in its downy more slender calyx, regularly toothed leaves, and taller stem.

H. Pilosella. Linn. Sp. Pl. 1125. Curt. Lond. fasc. 4. t. 54. Engl. Bot. t. 1093. Bulliard. Fr. t. 279. (*Pilosella repens*; Ger. em. 638.)—Leaves elliptical, entire, downy beneath. Scions creeping. Stalk single-flowered, leafless.—Very common throughout Europe in dry exposed places, on gravelly banks, funny lawns, and the tops of park walls, where it blossoms from May to the end of July, expanding its bright sulphur-coloured flowers, elegantly striped at the back with crimson, to the meridian sun, "while the surrounding herbage, and even its own foliage, is withered and burnt up." The flowers close early in the afternoon. The leaves are beset with long rigid bristles, and singularly white beneath. The plant spreads widely by means of its long trailing leafy runners; on the Alps they are shorter, and the flowers larger. There is also an alpine variety, whose leaves are white on both sides.

Whether Willdenow has done right in referring the Linnæan *Leontodon bulbosum* hither, the only specimen we have of that rare plant will not enable us to decide, but every character in its outward appearance shews that it ought not to be generically separated from *L. tuberosum*, which he reckons an *Apargia*.

In the second section (stalks radical, many-flowered,) are *H. dubium*. Linn. Sp. Pl. 1125. Fl. Brit. 828. Tr. of Linn. Soc. v. 9. 226. (*H. Auricula*; Fl. Dan. t. 1111. H. n. 53. Hall. Helvet. v. 1. 22. *Pilosella major prima*; Tabern. Kreuterb. 507.)—Leaves elliptic-lanceolate, nearly entire, hairy. Scions creeping. Stalk with several flowers. Native of rather moist mountainous pastures. Mr. Hudson and Mr. Woodward are both mentioned as having gathered it in the north of England, and we have from the Cambridge garden roots, said to be natives of Scotland. It differs from the last chiefly in having the leaves green on both sides, and the flowers two, three, or four, on each stalk, of a sulphur colour underneath as well as above. Some botanists have confounded the synonyms of the present with the following, on which subject copious illustrations may be seen in the Transactions of the Linnæan Soc. v. 9. 225.

H. Auricula. Linn. Sp. Pl. 1126. Fl. Brit. 829. (*H. dubium*; Fl. Dan. t. 1044. H. n. 52; Hall. Helvet. v. 1. 22.)—Leaves lanceolate, entire. Scions creeping. Stalk nearly leafless, many-flowered, umbellate.—On mountains in various parts of Europe, especially in the most lofty situations about the Glaciers of Switzerland. Mr. Hudson mentions gathering it on Dalehead, not far from Grassmere, Westmoreland, though sparingly. We never saw a British specimen. What is shewn for it in the botanic gardens is a mere variety of the last. The present has fewer runners, perfectly lanceolate leaves not dilated into a round or obovate shape, except one or two of the lowest, and smaller flowers, of a deeper, almost orange colour, with a far more hairy calyx.

H. aurantiacum. Linn. Sp. Pl. 1126. Jacq. Austr. t. 410. Don. Herb. Brit. fasc. 2. 41. Sm. Engl. Bot. t. 1469. (*H. hortense latifolium*, five *Pilosella major*; Ger. em. 305.)—Leaves elliptical, entire. Stem nearly leafless, simple, hairy, bearing a corymbus of many flowers.—Found in mountainous woods in France, Italy, Switzerland, and Germany, but it was not known to be a native of Britain till Mr. G. Don discovered it in several woods in Banffshire, and at Craigston, near Turref, North Britain. In gardens it has long been known by the name of Grim the Collier,

Collier, and is distinguished by the rich orange hue of its *corolla*, contrasted with the black hairy *calyx*. It blooms in July, and forms large tufts if planted in shady places.

H. incarnatum. Jacq. Ic. Rar. t. 578.—Leaves obovate-oblong, wavy and toothed, hairy. Stalk many-flowered, somewhat corymbose, rough at the base, leafless. Calyx smooth.—Native of subalpine places in Carinthia and Carniola, very remarkable for its elegant pink *flowers* and deeper red anthers. The *leaves* are all radical, two or three inches long, light green, rough, with numerous short rigid hairs. Stalk about a foot high, slender, naked, bearing a sort of corymbose panicle.

H. Gmelini. Linn. Sp. Pl. 1127. (*H. foliis ex sinuato dentatis, caulibus supra ramolis subnudis, pedunculis hirsutis unifloris*; Gmel. Sib. v. 2. 23. t. 8. f. 2.)—Leaves lyrate-runcinate, smooth. Stalk leafless, corymbose.—Gathered in Siberia by Steller, and communicated by Gmelin to Linnæus. The most curious particular in the history of this plant is that a birch leaf, happening to stick to the bottom of the specimen, caused Linnæus to define it "with radical leaves ovate, serrated, and smooth." This strange error could not have been guessed without an inspection of his herbarium. "*Quandoque bonus dormitat Homerus.*"

In the third section (with leafy stems,) are,

H. paniculatum. Linn. Sp. Pl. 1127.—Stem erect. Leaves numerous, elliptic-lanceolate, toothed, naked. Panicle capillary, divaricated.—Found by Kalm in Canada. We have it also, from the Rev. Dr. Muhlenberg, gathered near Lancaster, in Pennsylvania. The stem is 12 or 18 inches high, terminating in a singularly delicate, smooth, wide-spreading panicle, of small yellow flowers, not half the size of our common *Lapsana*.

H. montanum. Jacq. Austr. t. 190. Willd. n. 36. (*H. n. 38*; Hall. Helvet. v. 1. 16. *H. latifolium montanum præaltum glabrum, endiviæ folio*; Boec. Mus. v. 1. 148. t. 113. *Hypochæris pontana*, an error of the press for *montana*; Linn. Sp. Pl. 1140. *Andryala pontana*; Villars. Dauph. v. 3. 67. t. 23.)—Stem simple, leafy, single-flowered. Leaves sessile, obovato-lanceolate, with hooked teeth. This fine species grows on the alps of Austria, Savoy, Switzerland, and Dauphiny. The root is externally black, and runs deep into the ground. Stem from one to near three feet high, simple, solid, furrowed, roughish; leafy in the lower part; elongated and naked at the top, bearing one large handsome yellow flower, whose calyx is black, shaggy, and somewhat tawny. The leaves are about three inches long, acute, thin, veiny, smooth, edged with small, unequal, more or less hooked, teeth. Linnæus in his own copy of Sp. Pl. has corrected the error of the press, which led his transcribers astray, but which any of them might easily have detected by turning to Boccone; yet Willdenow copies the synonym of the latter, retaining the error in question, as well as another referring to vol. 2. instead of 1. We cannot too often insist on the editors of any of the works of Linnæus turning to, and correcting, quotations. This at least is in their power, and would be far more useful than many alterations, concerning which their judgment and experience may possibly be inferior to that of their author. In the latter part of this censure we aim not at our friend Willdenow, who, except some trifling or erroneous changes in specific characters, and his universally copying from the original edition, like his predecessors, remarks, that these apply to an immediately preceding species, without altering such reference, though he introduces ever so many new ones between the two, (witness his *Hieracium paludosum*, n. 44.) has proved himself in many respects a highly meritorious editor.

Several more species of this section are found on the continent, and many of them in Britain. The latter, as far as hitherto determined, are *H. murorum*, Engl. Bot. t. 2082; *maculatum*, t. 2121; *sylvaticum*, t. 2031; *Lacusefoni*, t. 2083, which we are rather inclined to place here on account of its affinity to the rest, though (like *murorum* indeed,) it has but one or two stem-leaves; *paludosum*, t. 1094; widely different from *murorum*, notwithstanding the suspicion of Linnæus; the stem is hollow; whole plant intensely bitter; *cerinthoides*, Linn. Sp. Pl. 1129, found in the Highlands, by Mr. G. Don; *molle*, Engl. Bot. t. 2210; *villosum*, Jacq. Austr. t. 87; *sabaudum*, Engl. Bot. t. 349; *denticulatum*, t. 2122; *preanthoides*, t. 2235; and *umbellatum*, t. 1771. We have imperfect specimens of several more, either varieties or species, from Scotland, but they require to be cultivated and observed in different states, before they can be finally settled, this being one of the most difficult of European genera, in which it vies with *Saxifraga* and *Potentilla*. S.

HIERACIUM, in Gardening, contains plants of the herbaceous hardy, flowering perennial sorts, of which the species most usually cultivated are, the orange-flowered hawkweed (*H. aurantiacum*); and the gum-fuccory hawkweed (*H. chondrioides*.) The former is frequently distinguished by the name of golden moufe-ear, and when of a dark colour by that of Grim the collier. And it varies in the colour of the flower from red to orange, as well as several shades of yellow.

Method of Culture.—These different species of plants are capable of being increased by means of sowing the well ripened seeds early in the spring upon a bed or border of fresh earth, which has an exposure towards the east. As soon as the plants have a few inches growth, they must be removed into other beds in order to stand until the autumn, when they should be planted out where they are to remain. A better practice is, however, that of at first setting them where they are intended to continue.

They are also capable of being multiplied by means of slips from the roots, which should be planted in the autumn or spring in the places where the plants are to remain. In each of these modes of increasing them, they should have pretty full supplies of water in dry seasons.

When planted in such soils as are neither too rich, nor too much filled with moisture, the roots will continue for a great number of years.

These plants give variety in the clumps, borders, and other parts of pleasure grounds, in which they should constantly be placed towards the fronts.

HIERACOME, in *Ancient Geography*, a town of Asia, in Syria, situated to the east of the gulf of Issicus, between two chains of mountains.

HIERACUM, a town of Upper Egypt, in the Thebaide, placed in Antonine's Itinerary between Ithi and Pessa; 20 miles from the former and 28 from the latter.

HIERACURRA, in *Geography*, a town of Hindoostan, in Golconda; 35 miles S.E. of Hydrabad.

HIERÆA, in *Ancient Geography*, a small country of Libya.

HIERAMÆ, a town of Asia, in Caria. Steph. Byz.

HIERA PICRA, in *Pharmacy*, originally a kind of electuary, first described by Galen, composed of aloes, cinnamon, asarabacca, spica nardi, saffron, and mastic, made up with honey, or syrup of violets and honey.

It is denominated from the Geek *ἱερός*, sacer, holy, because of its rare virtues; and *πικρὸς*, anarus, bitter; aloes, which is the base thereof, rendering it extremely bitter.

It was used to purge and cleanse the stomach, remove obstructions,

obstructions, promote the menses and hæmorrhoids, and sweeten the blood; but its chief use among us is in powder, for making the tinctura sacra.

Besides this *simple* *hiera picra*, there is a *compound* sort, called *diacolocynthidos Pachii*, because colocynthis is the base thereof; and it was first used, with good success, by Pachius of Antioch, in divers obstinate diseases. It is composed of colocynth, opopanax, aristolochia rotunda, agaric, and other ingredients. It is used in epilepsies apoplexies, palsies, and lethargies; and to excite the menses, and promote the expulsion of the after-birth.

There is also a third sort of *hiera*, called *lib rans*; but rarely used. Dr. Quincy says, it is one of the most ridiculous medleys ever contrived. It passes for a cordial, &c.

HIERA PICRA, *Tincture of*. See *TINCTURA SACRA*.

HIERAPOLIS, or *HIEROPOLIS*, in *Ancient Geography*, a town of Phœnicia, in the Cyræstic territory. Ptolemy. —Also, a town of Asia, in Phrygia. Ptol. Steph. Byz. places it between Phrygia and Lydia, and says, that it had hot baths and several temples.—Also, a town of the island of Crete, which was episcopal.—Also, a town of Caria.—Also, an episcopal town of Arabia, under the metropolis of Babba, in the Moabitude territory.—Also, another episcopal town of Arabia, under the metropolis of Boitra.—Also, a town of Asia, in Syria, called “Bambyee” and now “Mambedj,” S S W. of Zeugma, at an equal distance from a chain of mountains and the Euphrates, or two days’ journey N.E. of Aleppo. The worship of the great Syrian goddess, called “Atergatis,” was established in this town; but no traces now remain of her temple. The only remarkable monument is a subterraneous canal, which conducts the water from the mountains of the N. for the distance of four leagues. The name of Hierapolis still subsists in that of another village, called “Yerabolos,” situated on the Euphrates.

HIERAPUMNAL, in *Geography*, a town of Meckley; 60 miles S of Munnipour.

HIERAPYTNA, in *Ancient Geography*, a town of Crete, called also “Cyrha,” “Pytna,” and “Camyros,” and supposed to be the same place which Ptolemy calls “Hiera Petra,” or the Sacred Rock. The ruins of this city are still visible on the coast over-against the rocks called by the ancients the “Isles of Asses.” Hierapytna was one of the strongest places on the island, when Metellus undertook the conquest of Crete; but it is at present only a village known by the name of “Girapietra.”

HIERARCHY, *HIERARCHIA*, in *Theology*, the order or subordination among the several choirs or ranks of angels. The word is Greek *ἱεραρχία*, formed of *ἱερός*, *sacer*, *holy*, and *αρχή*, *principatus*, *rule*; *q. d.* *ἱεραρχία*, *holy command*, or *rule in holy things*.

St. Dionysius, and other of the ancient writers, establish nine choirs or orders of celestial spirits; *viz.* seraphim, cherubim, thrones, dominions, principalities, powers, virtues, angels, and archangels: and these they divide into three hierarchies.

HIERARCHY is also used for the subordination between prelates and other ecclesiastics. See *PRIEST*, &c.

Archbishops, bishops, priests and deacons, compose the hierarchy of the church of England. In that of Rome, the pope has likewise a place at the head of the hierarchy.

F. Cellot, a Jesuit of Paris, has published a volume express (*De Hierarchia & Hierarchis*) on the hierarchy, and those who compose it. He there distinguishes a created and an uncreated hierarchy; a divine and a human, or ecclesi-

astical hierarchy; and in this, a hierarchy of jurisdiction, a hierarchy of an order, and a hierarchy of graces, the most sublime of all.

He defines hierarchy, in the general, a command or sovereignty in holy things; “*principatus*, five *imperium*, in *rebus sacris*”; on which footing he holds, that hierarchy excludes all below bishops; and that neither priests nor deacons can be reckoned among the number of hierarchists. Bellarmin, Hallier, Aurelius, &c. he holds, were all mistaken, and did not distinguish between being *of* the hierarchy, and being *under* it.

HIERASSON, in *Ancient Geography*, an episcopal town of Arabia, under the metropolis of Beryra.

HIERATIC PAPER, among the *Ancients*, was the finest sort of paper, which was set apart only for sacred or religious uses. See *PAPER*.

HIERATIN, in *Ancient Geography*, a town situated on the coast of the gulf of Persia, at the mouth of a river named Heratemis.

HIERES, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the district of Toulon; nine miles E. of Toulon. This town was formerly a sea-port, where pilgrims bound for the holy land were accustomed to embark; but it is now at a considerable distance from the sea; situated on the side of a hill, in a delightful country, where is a perpetual spring, and surrounded by beautiful gardens, affording the best fruit in France; oranges, citrons, and pomegranates grow in the open air. Near the town are large salt-works, in which the salt is made partly from sea-water and partly from a salt-lake near the town. The noxious effects of the exhalations from the salt-lake have been remedied by a canal cut from the lake to the sea. The gulf of Hières, between the town and the island so called, is a famous road for vessels, with good anchoring ground and sufficient depth of water. The place contains 6528, and the canton 6528 inhabitants, on a territory of 205 kilometres in one commune. N. lat. 43° 7'. E. long. 6° 12'.

HIERES Islands, a cluster of small islands in the Mediterranean, near the coast of France, which take their name from the town of Hières. They are famous for a great variety of medicinal plants. N. lat. 43° 2'. E. long. 6° 10'.

HIERISOS, a town of Europæan Turkey, in Macedonia, near the coast; 50 miles S.E. of Saloniki.

HIERKEN, a town of Norway, in the diocese of Drontheim; 40 miles S.E. of Romsdal.

HIERO, in *Biography*, king of Syracuse, succeeded his brother Gelon in the year B. C. 478. Being of a jealous and tyrannical disposition, his brother, who fell under his suspicions, fled to the court of Theron, king of Agrigentum. A war between the two monarchs was the consequence, which continued with various success several years, till it was ended by a treaty advantageous to Hiero, who married the sister of Theron, and then admitted his brother to favour. After a reign of no great length this prince fell into a lingering malady, the pains of which he endeavoured to divert by the conversation of poets and philosophers, whom he had drawn to his court by liberal encouragement. He died about the year 467 B. C. Pindar addressed four of his odes to Hiero, who was a successful competitor in the Olympic and Pythian games. Simonides was induced in his old age, to comply with an invitation of this prince; and it was his question “What is God?” which produced the philosopher’s celebrated request of time repeatedly doubled, for answering a query which seemed more difficult the more it was considered. Æschylus, and other great men

and poets, are mentioned as ornaments of his literary and social circles. Univer. Hist. Bayle.

HIERO II. king of Syracuse, was son of Hierocles, a descendant of Gelon. His mother was a female slave, and the father was so ashamed of his offspring, that he is said to have ordered him to be exposed in the woods, where he was casually nourished with wild honey. His escape from the fangs of death was regarded as little short of a miracle, and he was on that account brought home and very carefully educated. He soon became distinguished among his companions, as well by his dexterity in all manly exercises, as by his readiness in receiving instruction. As a warrior he served in his youth under Pyrrhus king of Epirus, and at the age of twenty-five he was regarded as one of the ablest commanders of his army. On the departure of Pyrrhus from Sicily, Syracuse became a prey to the factious. Hiero, at the head of his men, entered the city with his colleague, and assumed the reins of government. To strengthen his interest among the people he married the daughter of Leptines, a person of great authority, and committed the domestic management to his father-in-law, while he was absent in the field. There were at this time large bodies of mercenaries in pay, whose insolent and mutinous spirit was the source of constant disturbances. Hiero freed himself from these by a stratagem which was more successful than honourable. Leading the whole army against the Mamertines, a ferocious body of adventurers who had seized upon Messana, he formed two separate divisions of the mercenaries and Syracusans, and ordered the former to attack the enemy, pretending that he meant to support them with the latter. They entered on the contest with the utmost degree of valour, and were in the end almost entirely cut to pieces. When Hiero saw that he had nothing now to fear from his allies, he supplied their places with the Syracusan military, who without difficulty gave the Mamertines a signal defeat, and made himself master of the surrounding country. On account of this success he was unanimously raised to the throne of Syracuse about the year 265 B. C. In a short time he offered terms of peace and alliance with the Romans, which were readily accepted; and he ever after continued the steadiest of all the foreign friends of the republic, and as a reward of his constancy he enjoyed a long and prosperous reign of almost uninterrupted tranquillity. His mild and equitable rule extinguished party animosities among his people, while his attention to the interests of agriculture enabled him to patronize all the arts by which a nation is made flourishing. He undertook, and with the aid of Archimedes accomplished, some public works of great magnificence. He encouraged commerce, and fitted out numerous fleets of trading vessels to convey the superfluous harvests of Sicily to other countries, and, it is said, that the commercial spirit of Hiero was fully allied to the liberality of princely opulence. He relieved the Rhodians, after a most disastrous earthquake, with a hundred talents in money, and many other valuable donations. After the fatal battle of Thrasymenus, in the second Punic war, he sent a fleet laden with provisions to the port of Ostia, and directed his ambassadors, after condolences expressed in the most pathetic terms, to offer to the republic these and whatever other supplies it might stand in need of; and also for the sake of the Augury to accept of a statue of Victory of pure gold, weighing three hundred pounds. The senate was highly gratified with this mark of attachment at such a period, and decreed that the Victory should be placed in the temple of the Capitoline Jupiter. Hiero, notwithstanding his zeal for the cause of the republic, was mortified by the conduct of his son Gelon, who openly declared for the Carthaginians, and by his influence would probably have obliged

his aged father to a passive acquiescence in his measures, had he not been carried off by a sudden illness. Hiero died about the year 215 B. C., in the 90th year of his age, and the 54th of his reign. He was universally regretted, and all the inhabitants of Sicily showed by their lamentations, that they had lost a common father and an affectionate friend. He was a liberal patron of literature, and wrote a book on agriculture.

HIERO. See FERRO.

HIERO'S Crown, in *Hydrostatics*. The history of this crown and of the important hydrostatical proposition, to the discovery of which it gave occasion, is as follows: Hiero, king of Syracuse, having furnished a workman with a quantity of gold for making a crown, suspected that he had been cheated, and that the workman had used a greater alloy of silver than was necessary in the manufacture of it; he, therefore, applied to Archimedes for a discovery of the fraud. This celebrated mathematician was led by chance to a method of detecting the imposture, and of determining precisely the quantities of gold and silver of which the crown was composed; for he observed, whilst he was bathing in a tub of cold water, that as he immersed his body in it, the water ran out; and he immediately concluded, that the water which ran out, when his whole body was immersed, was equal in bulk to his body. It is said, that he was so pleased with the discovery, as to run about naked crying out, *Ευρηκα, Ευρηκα, I have found it*; and others affirm, that he offered a hecatomb to Jupiter for having inspired him with the thought.

On this principle he procured a ball of gold and another of silver, exactly of the weight of the crown, considering, that if the crown were altogether of gold, the ball of gold would be of the same bulk as the crown, and when immersed in water, would raise the water just as high as the crown immersed; but if it were wholly of silver, the ball of silver, being immersed, would raise the water no higher than the crown immersed; and if the crown was of gold and silver mixed in a certain proportion, this proportion would be discovered by the height to which the crown would raise the water higher than the gold and lower than the silver. Accordingly, let *A M L B* (*Plate VIII. Hydrostatics, fig. 3.*) be a vessel filled with water to the height *D C*, and let the mass of gold, equal in weight to the crown, on being immersed into the water raise the surface of it to *E*, and the mass of silver raise it to *G*; then if the height of the vessel above *D C* be divided into equal parts, and $D F = 11$, and $D G = 19$, it is plain the bulks of gold and silver will be as $D F$ to $D G$, and the specific gravities in the inverse proportion of these quantities, or as $D G$ to $D F$. If the crown be immersed, it will raise the surface of water to *E*; whence the proportion of the bulks of the gold and silver in the crown may be determined. For since the difference of the specific gravities of the gold and silver is $D G = D F = F G = 8$, if the bulk of the crown is divided into eight equal parts, it is evident, that since the specific gravities of the debased and pure gold crowns will be as the bulks inversely, that is, as $D F$ to $D E$, we can easily find the point *H*, which will express the specific gravities of the former; for $D E : D F :: D G : D H$. This point *H* always divides the difference $F G$ into two parts $G H$, $H E$, which have the same proportion as the parts of silver in the crown to the parts of gold; for as the point *E* ascends, the point *H* descends, and when *E* coincides with *G*, *H* falls upon *E*, and the crown becomes wholly silver; on the contrary, when *E* descends to *F*, and *H* ascends to *G*, the crown becomes wholly gold; therefore, $F H$ will be every where to $H G$ as the parts of gold to the parts of silver

silver in the crown. Consequently, in the present case, because the crown, when immersed, raises the water to the height D E, and H is three divisions below G, it shews that three of the eight parts of the crown are silver, and the other five parts gold, as H is five of the divisions above F. Hence, the bulk of the gold in the crown is to that of the silver as 5 to 3. In some such method as this Archimedes deduced his proposition, *viz.* that the difference of the specific gravities of the compound and lighter ingredient, *i. e.* 5, (supposing the specific gravity of gold to silver as 19 to 11, and the specific gravity of the king's crown to be 16,) is to the difference of the specific gravities of the heavier ingredient and the compound, *i. e.* 3, as the bulk of gold to that of silver made use of: so that if the whole crown were divided into eight parts, the gold would consist of five, and the silver of three; and the magnitudes 5 and 3, multiplied by the specific gravities 19 and 11 respectively, will give the numbers 95 and 33, expressing the proportion of the weight of the gold to that of the silver.

This proposition of Archimedes may be demonstrated analytically in the following manner: let the magnitudes of the gold and silver in the crown be A and B, and their specific gravities as *a* and *b*; then since the absolute gravity of any body is compounded of its magnitude and specific gravity, the weight of the gold is *a* A, of the silver *b* B, and of the crown *a* A + *b* B = *c* × A + B, supposing *c* to be the specific gravity of the mixture. Hence *a* A - *c* A = *c* B - *b* B; and consequently, *c* - *b* : *a* - *c* :: A : B, as before. Cotes's Hydrostatical, &c. Lectures, p. 81. Martin's Phil. Brit. vol. i. p. 305, &c. See SPECIFIC GRAVITY and EQUATION.

HIEROBOTANE, in *Botany*. See VERVAIN.

HIEROBULUM, a name given by the ancients to the colechicum.

Some have wondered that the medical writers of those times should give this name, which signifies the *sacred root*, to a thing that was generally allowed to be a poison; but Wedelius has proved that it may be given, under proper regulations, with safety and great success, in malignant and petechial fevers, and in the worst kinds of the small-pox and measles. The manner he gave it was in a mixture with bezoar and plantane-root, and this he called his *arcanum duplicatum catholicum*, or pestilential alexipharmic. The ancients had a custom of wearing this root about their necks, by way of an amulet, to prevent infection; and it was probably from this that it obtained the name of the sacred bulb.

HIEROCERYCE, in *Mythology*, the chief of the sacred heralds in the mysteries of Ceres, whose office was to exclude all improper persons, to preserve order in the celebration of these mysteries, and to recite the formulæ of initiation.

The hieroceryce represented Mercury, and was distinguished by the same attributes; the office was perpetual, and belonged to the family of the Ceryces, the descendants of Ceryx, the last son of Eumolpus.

HIEROCHLOE, in *Botany*, from *ἱερός*, *sacred*, and *χλωή*, *a green herb or grass*, so named by Gmelin, because this grass has a similar appellation in Prussia, and is there strewed before the church-doors on festival days, being considered as sacred to the Virgin Mary. Loefel calls it *Gramen Maris*. Its scent, when it begins to dry, is that of Woodruff, or the most fragrant new hay.—Gmel. Sib. v. 1. 101. Brown. Prodr. Nov. Holl. v. 1. 208. (Difarrhenum; Billard. Nov. Holl. v. 2. 82. See DISARRHENUM.)—Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Glume of two valves, containing three florets; its valves ovate, acute, membranous, unequal. *Cor.* of two valves; the outer ovate, coriaceous, ribbed, often rough, sometimes shortly awned; the inner smaller, membranous, naked, emarginate, with inflexed edges. *Stam.* Filaments three in each of the lateral florets, capillary, recurved, shorter than the corolla, two in the central or terminal one; anthers pendulous, linear, forked at each end. *Pist.* in the central floret only; Germen superior, ovate, small; styles short, approximated; stigmas longer than the corolla, linear, downy. *Peric.* none, except the permanent corolla. *Seed* solitary, ovate, pointed, small, not attached to the corolla.

Eff. Ch. Calyx of two valves, containing three florets; the lateral ones male, with three stamens; central one hermaphrodite, with two. Corolla of two valves.

A genus of smooth grasses, which in drying acquire the sweet scent of Woodruff, or new hay, approaching to the bitter-almond flavour. The flowers are panicked; their central floret mostly without awns, the lateral ones often awned. It contains many species, according to Mr. Brown, natives of the colder parts of both hemispheres.—Examples of *Hierochloe* are

H. antarctica. Brown 209. (Difarrhenum antarcticum; Billard. Nov. Holl. v. 2. 83. t. 232.)—Panicle loose, somewhat drooping. Glumes single-ribbed, with an even keel. Lateral florets awned, downy, fringed at the margin and keel with curved hairs; central one pointed. Leaves flat.—Native of Van Diemen's Land.—Mr. Brown remarks, that *Holcus redolens*, Fort. Prodr. 92. n. 563, taken by that author from Solander's manuscripts, appears by the Banksian herbarium to be very nearly related to the above, differing only in having the inner glume of the calyx furnished with three ribs at the base, and the hairs which fringe the edges and keel of the lateral florets longer and straighter. This was found in New Zealand, and we presume it may safely be deemed a variety only. *Aira antarctica*, Forst. Prodr. 8. n. 41, suspected by La Billardiére to be his *Difarrhenum antarcticum*, is found by Mr. Brown, on examining an authentic specimen, to be very different, and to belong to the genus *Avena*.

H. redolens. (Holcus redolens; Vahl. Symb. fasc. 2. 102.) Panicle close. Keels of the glumes beset with little scattered teeth. Florets bearded at the base; fringed at the margin and summit. Leaves involute.—Native of Terra del Fuego. Rather larger than the foregoing, with awns as long as the corolla, whose edges are strongly fringed, and its extremity abrupt. The colour of the corolla is a rich brown; that of the calyx paler but not quite white.

Other species are the *Holcus borealis* and *australis* of Schrader's Fl. Germ. v. 1. 252, 253, included by Linnæus in his *H. odoratus*, Sp. Pl. 145; and *H. alpinus*, sent us by Dr. Swartz as described by himself in Schrader's Journal, but we have not been able to discover it in the volumes we possess. This last has a small, dense, ovate, copper-coloured panicle, awns nearly equal to the corolla, and involute leaves. Not having access to the whole of the species of which we have incomplete information, we cannot safely attempt to define even those that we know, because we cannot contrail the whole together.

HIEROCLES, in *Biography*, governor of Bithynia and præfect of Alexandria, flourished about the year 303, and distinguished himself as an adversary and persecutor of the Christians. He was a man of letters, and wrote "Two Books," addressed "To the Christians," of which Lactantius has given an account (Inst. l. v.), and which have been answered by Eusebius of Cæsarea. (Cont. Hier. ad Calc. em.

Evangel.) In these books Hierocles endeavoured to shew, that the sacred scriptures abound with inconsistencies and contradictions. He also reviled Peter and Paul, and the other disciples, as men ignorant and illiterate, some of whom got their livelihood by fishing, and propagators of falsehood. He also affirms, that Christ was banished by the Jews, and afterwards assembled a band of 900 men and committed robbery. We are also informed, that Hierocles made a comparison of Christ with Apollonius of Tyana, giving the preference to the latter. From the account of the work of Hierocles, which is given by Lactantius and Eusebius, Dr. Lardner deduces the following conclusions: that Hierocles had read the scriptures of the New Testament, if not of the Old likewise; that he bears testimony to the existence of the several parts of the New Testament, the Gospels, and the Epistles; that he did not dispute the genuineness or antiquity of the writings of our apostles and evangelists, but merely endeavoured to disparage them; that he did not deny the truth of our Saviour's miracles, but endeavoured to depreciate them by ascribing them to magical arts; that the respect shewn to Jesus by vast numbers of men, though he was defamed by many, and though he was crucified, is a demonstration, that he was not a man of a bad character, for robbers and other malefactors, who suffer for their crimes, are never deified nor much respected after their death; it appears also, that Hierocles was the first who had formed a comparison of our Saviour with Apollonius. Lardner's Works, vol. viii.

HIEROCLES, a Platonic philosopher of Alexandria, flourished about A. D. 450. He was cruelly scourged at Constantinople for his adherence to the Pagan superstitions; and it is said that, in the midst of his torture, when he received some of the blood into his own hand, he threw it upon the face of his judge, repeating the following verse from Homer (*Odyss. l. ix. v. 347.*):

Κυκλωΐ, τῆ, πῆ, πῆ, πῆ, ἐπὶ ζῶντες ἀνθρώπων κρεῖα.

“Cyclops! since human flesh has been thy feast,
Now drain this goblet, potent to digest.”—Pope.

It appears, however, that notwithstanding this unjust treatment by the Christians at Constantinople, he afterwards philosophized at Alexandria in his usual manner; and hence we may infer, that the severities with which the Gentile people, and particularly their learned men and philosophers, were treated, were not extremely rigorous. Hierocles wrote a treatise “On Providence,” of which Photius has given large extracts, and in which he appears to be an advocate for the Eclectic philosophy, labouring to reconcile the doctrines of Plato and Aristotle concerning providence, the origin of the world, the immortality of the soul, and other subjects. He pursues the same method of philosophizing in his book “On Fate,” and in his “Commentary on the Golden Verses of Pythagoras,” which is still extant. Besides these, there are large fragments of other works preserved in Stobæus, and generally published together with the works above-mentioned. All these are valuable, tending to recommend and promote virtue; but not with that force which flows from revelation, enjoining every part of moral righteousness by divine authority, and with the assurance of recompences in a future state. Lardner's Works, vol. ix. Brucker's Hist. Phil. by Enfield, vol. ii.

HIEROCORACES, *q. d. sacred crocus*, in *Mythology*, were ministers of Mithras, or of the Sun, which the Persians worshipped under this title.

HIEROGLYPHIC, ἱερογλυφικα, a symbol or mystic

figure, used among the ancient Egyptians to cover or conceal the secrets of their theology.

The word is composed of the Greek ἱερός, *sacer, holy*, and γλυφικῶν, *sculpeve, to engrave*; it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

HIEROGLYPHICS are properly emblems or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus is commonly esteemed the inventor of hieroglyphics; he first introduced them into the Heathen theology; from whence they have been transplanted into the Jewish and Christian. See **HERMES**.

Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence it was, that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the secrets of their morality and history; and this they did by a kind of cabbala, which, at the same time that it instructed them, only amused the rest of the people. Hence the use of hieroglyphics, or mystic figures, to veil their morality, politics, &c. from profane eyes. (Spon.) This author, it may be observed, and many others, do not keep to the precise character of a hieroglyphic, but apply it to profane as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things. Thus, according to Clemens Alexandrinus, Stron. v. a lion is the hieroglyphic of strength and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx, of subtilty, &c.

Such is the opinion that has generally been embraced both by ancient and modern writers, of the origin and use of hieroglyphics; it has been almost uniformly maintained that they were invented by the Egyptian priests, in order to conceal their wisdom from the knowledge of the vulgar. But the late bishop Warburton hath, with much ingenuity and learning, endeavoured to shew, that this account is erroneous.

According to this writer, the first kind of hieroglyphics were mere pictures; because the most natural way of communicating our conceptions by marks or figures was by tracing out the images of things; and this is actually verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture-writing. But the hieroglyphics invented by the Egyptians, were an improvement on this rude and inconvenient essay towards writing; for they contrived to make them both pictures and characters; in order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole, as in the hieroglyphics of Horapollo, which represent a battle of two armies in array by two hands, one holding a shield, and the other a bow; then putting the instrument of the thing, whether real, or metaphorical, for the thing itself, as an eye and sceptre to represent a monarch, a ship and pilot the governor of the universe, &c. and finally, by making one thing stand for or represent another, where their observations of nature or traditional superstitions led them to discover or imagine any resemblance; thus, the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly surmounted his misfortune was represented by the skin of the hyæna, because this was supposed to furnish an invulnerable defence in battle.

The Chinese writing, he observes, was the next kind of improvement

improvement in the use of hieroglyphics; the Egyptians joined characteristic marks to images, the Chinese threw out the images, and retained only the contracted marks, and from these marks proceeded letters. The general concurrence of different people in this method of recording their thoughts, can never be supposed to be the effect of imitation, similar views, or chance; but must be considered as the uniform voice of nature, speaking to the rude conceptions of mankind; for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Scythians, likewise, of the North, and the intermediate inhabitants of the earth, *viz.* the Indians, Phœnicians, Ethiopians, &c. used the same way of writing by picture and hieroglyphic.

The bishop farther shews, that the several species of hieroglyphic writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to shew how, in process of time, the Egyptian hieroglyphics came to be employed for the vehicle of mystery. They used their hieroglyphics two ways; the one more simple, by putting the part for the whole, which was the *curiologic* hieroglyphic; and the other more artificial, by putting one thing, of resembling qualities, for another, called the *tropical* hieroglyphic; thus the moon was sometimes represented by a half circle, and sometimes by a cynocephalus. They employed their proper hieroglyphics to record openly and plainly, their laws, policies, public morals, and history, and all kinds of civil matters; this is evident from their obelisks, which were full of hieroglyphic characters designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription of the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-horse, expressed this moral sentence; All you who come into the world and go out of it know this, that the gods hate impudence. However, the tropical hieroglyphics, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal; thus Egypt was sometimes expressed by the crocodile, sometimes by a burning censor with a heart upon it; where the simplicity of the first representation and the abstruseness of the latter shew, that the one was a tropical hieroglyphic for communication, and the other a tropical symbol invented for secrecy.

Enigmatic symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and though they might have been intelligible at first, yet, when the art of writing was invented, hieroglyphics were more generally disused, the people forgot the signification of them, and the priests, retaining and cultivating the knowledge of them, because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion.

Symbols were the true original of animal worship in Egypt, as sir John Marsham conjectured, *Can. Cron.* p. 58. because in these hieroglyphics was recorded the history of their greater deities, their kings, and lawgivers; represented by animals and other creatures; the symbol of each god was well known and familiar to his worshippers, by means of the popular paintings and engravings on their temples, and other sacred monuments; so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them in their addresses to any particular god, to turn to his representative mark or symbol; especially when we consider farther, that the Egyptian priests seized a divine original for hieroglyphic characters, in order to increase the veneration of the people for them.

These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship.

Another consequence of the sacredness of the hieroglyphic characters was, that it disposed the more superstitious to engrave them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemys, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called abraxas, are frequently to be met with in the cabinets of the curious, and are engraven with all kinds of hieroglyphic characters. To these abraxas succeed the talismans. Warburton's *Divine Legation of Moses* demonstrated, vol. ii. passim.

HIEROGRAMMATEI, ἱερογραμματεῖς, among the *Ancient Egyptians*, were the priests appointed to explain mysteries of religion, and to direct the performance of the ceremonies thereof; and for this purpose they had a kind of sacred alphabetical character, different from the political one, and which the writer, cited in the last article, considers as one of the four kinds of Egyptian writing. This, as well as the epistolic, used in civil matters, was formed by the letters of an alphabet; and, from its being used only in religious matters, was called hierogrammatic. The other two species of writing were the hieroglyphic and symbolic.

The hierogrammatei invented and wrote hieroglyphics and hieroglyphical books, and occasionally explained them, together with other matters relating to the doctrines of religion. If we may believe Suidas, they were all prophets; at least, he relates, that a hierogrammateus foretold to an ancient king of Egypt, that there would be an Israelite of great wisdom, virtue, and renown, who should humble Egypt.

The hierogrammatei were always near the king, to assist him with their informations and councils: the better to fit them for this, they made use of the skill and knowledge they had acquired in the stars and the motions of the heavenly lights, and even of the writings of their predecessors, wherein their functions and duties were delivered. They were exempted from all civil employments, were reputed the first persons in dignity next the king, and bore a kind of sceptre in form of a plough-share.

After Egypt became a province of the Roman empire, the hierogrammatei sunk into neglect.

HIEROLOGY, denotes a discourse on sacred things. Among the Jews and Greeks, this term was used for the nuptial benediction.

HIEROMANTIA, ἱερομαντία, in *Antiquity*, a general name for all kinds of divination, made from the various things offered in sacrifice to the gods. They first made conjectures from the external parts and motions of the victim; then from its entrails, from the flame in which it was consumed, from the cakes and flour, from the wine and water, &c. Vide Pott. *Archæol. Græc. lib. ii. cap. 14. tom. i. p. 314.*

HIEROMENIA, ἱερομενία, in *Ancient Chronology*, a name given to the month in which the Nemean games were celebrated. It was the same with the Athenian month Bœdromion, and answered to the latter end of our August and beginning of September.

HIEROMNEMON, ἱερομνηστής, among the *Ancient Greeks*, signified a delegate chosen by lot, and sent to the great council of the Amphictyons, where he was to take care of what concerned religion. The hieromnemes were reckoned more honourable than the other members of that assembly, the

the general meetings of which were always summoned by them, and their names were prefixed to the decrees made by that council.

HIEROMNEMON, composed of *ἱερός*, *holy*, and *μνηστήρ*, *one who advertises or puts in mind of*, an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and shew him the prayers, psalms, &c. which he was to rehearse.

He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, as the master of the ceremonies now does to the pope.

The hieromnemon was commonly a deacon: when he was in priest's orders, as it sometimes happened, he was excused from dressing the patriarch in his pontifical habits. Whether he were deacon or priest, he had always under him an officer named *castricius*. He had also the keeping of the book entitled "Contacion," or book of ordination; and that called the Enthronianismus, which was a sort of ritual.

HIEROMNEMON, in the *Writings of the Ancients*, was also the name of a stone said to have been used in divination, and called by others *crotylos* and *amphicome*. There is no description left us of it by the ancients, from which we may guess what stone it was, or from whence it was brought.

HIERONESOS, in *Ancient Geography*, an island of the Mediterranean, between Sicily and Africa. Pliney.

HIERONYMITES, compounded of *ἱερός*, *holy*, and *εἰρημ*, *name*, or *Hermits of St. Jerom*. See **JERONYMITES**.

HIEROPHANTES, or **HIEROPHANTA**, from *ἱερός*, *holy*, and *φαίνω*, *I appear*, in *Antiquity*, a priest among the Athenians.

The hierophantes was properly the chief person that officiated in the Eleusinia, that great solemnity sacred to Ceres.

This office was first executed by Eumolpus, and continued in his family for twelve hundred years, though, when any person was appointed to this dignity, he was required always to live in celibacy.

St. Jerom says, that the hierophantes extinguished the fire of lust, by drinking cicuta, or the juice of hemlock, or even by making themselves eunuchs. Apollodorus observes, that the hierophantes instructed persons initiated into their religion in the mysteries and duties thereof, and that it was hence he derived his name: for the same reason he was called *prophetes*, the prophet. He had officers under him to do the same thing, or to assist him therein, who were also called *prophetes* and *exegetæ*, i. e. *explainers of divine things*.

To the hierophantes it belonged to dress and adorn the statues of the gods, and to bear them in processions and solemn ceremonies.

There were also women employed in the ceremonies of the Eleusinia, and named Hierophantida.

HIEROPHYLAX, of *ἱερός*, *holy*, and *φυλάξ*, *keeper*, of *φυλάξ*, *I keep*, an officer in the Greek church. His function is that of guardian or keeper of the holy things, utensils, vestments, &c. answering to our *sacrista* or *sexton*.

HIEROSCOPY, **HIEROSCOPIA**, formed of *ἱερός*, *holy*, and *σκοπέω*, *I view or consider*, a kind of divination performed by considering the victim, and observing every thing that occurs during the course of the sacrifice.

HIERSAC, in *Geography*, a town of France, in the department of the Charente, and chief place of a canton, in the district of Angoulême. The place contains 593, and the canton 11,113 inhabitants, on a territory of 205 kilometres, in 14 communes.

HIERTING, or **LETING**, a sea-port of Denmark, situated at the mouth of the Warde, with one of the best

harbours in N. Jutland; 22 miles N.W. of Ripen. N. lat. 55° 29'. E. long. 8° 22'.

HIERTLANDA, a town of Sweden, in the province of Smaland; 30 miles N. of Wexio.

HIETANIEMI, a town of Sweden, in West Bothnia; 24 miles N. of Tornea.

HIGANQUET, a town on the E. coast of the island of Mindanao. N. lat. 9° 26'. E. long. 125° 51'.

HIGDEN, **RALPH**, in *Biography*, one of the English chroniclers, was a monk of St. Werburg's, in Chester, where he died in the year 1377. His historical work was entitled "Polychronicon," originally written in Latin, but translated into English by John de Trevisa, and printed by Caxton. It is in seven books, and extends from the creation to the year 1357. This author is valuable as having preserved several documents relative to the times of the ancient Britons and Saxons, from chronicles now lost. The best edition is that of 1642, fol.

HIGH, **ALTUS**, a term of relation applied to a body, considered, according to its third dimension, or its elevation above the horizon, or even above the ground.

HIGH is also used to denote a person in power, dignity, &c.

HIGH Chancellor, Lord. See **CHANCELLOR**.

HIGH Church. See **CHURCH**.

HIGH-Bearing Cock. See **COCK**.

HIGH Commission Court. See **COMMISSION**.

HIGH Constable of England. See **CONSTABLE**.

HIGH Court of Parliament. See **PARLIAMENT**.

HIGH and Dry is a phrase, among *Seamen*, denoting the situation of a ship when she has run a-ground, so as to be seen dry upon the strand.

HIGH Dutch is the German tongue in its greatest purity, as spoken in Misnia, &c. See **TEUTONIC**, &c.

HIGH, in *Music*, is sometimes used in the same sense with *local*, in opposition to *low*; and sometimes in the same sense with *acute*, in opposition to *grave*.

HIGH Operation, in *Surgery*, is a method of extracting the stone; thus called, because the stone is taken out at the upper part of the bladder.

For the method of performing the high operation, see **LITHOTOMY**.

The high operation is said to have been first practised by Rossetus: others say by Franco, a surgeon of Lausanne. It was retrieved by Mr. Douglas, and practised with good success by Mr. Cheselden and others.

HIGH-Peak of Derbyshire, in *Geography*, has too often been mentioned as denoting some particular precipice, or frightfully rugged district, instead of being only one of the hundreds of the county, and including a great portion of well cultivated and populous tracts. What further shews this mistake, as Mr. Farey observes in his "Report on Derbyshire," is, that the Low Peak hundred, or wapentake of Wirksworth, includes all the high and rugged lands on the west border of Derbyshire, from Ashbourn, almost to Whaley bridge, including Axe-edge, and others of its highest hills.

HIGH Places. See **GROVE**.

HIGH Point, in *Geography*, a cape on the N. coast of the island of Barbadoes. N. lat. 13° 22'. W. long. 58° 30'.

HIGH Priest. See **PONTIFEX**.

HIGH Relievo. See **RELIEVO**.

HIGH Sea, or ocean, is that far from land. See **SEA**.

HIGH Steward, Lord. See **STEWARD**.

HIGH Taper, in *Botany*. See **MULLEIN**.

HIGH Town, in *Geography*, a town of America, in the state of Georgia; 112 miles W. of Tugeloo.

HIGH Tor, at Matlock, is the name of a very high and perpendicular rock of lime-stone alternating with toad-stone, amygdaloid, or basalt, close on the E. side of the Derwent river, about $\frac{1}{2}$ d of a mile S.W. of Matlock church: a section of the strata in this remarkable cliff may be found in the Philosophical Magazine, vol. xxxi. plate 2.

HIGH Treason. See TREASON.

HIGH Treasurer, Lord. See TREASURER.

HIGH Water, is that state of the tides when they cease to flow up, or the greatest height of the flood-tide. See TIDE.

HIGH-waved Cockle, in *Natural History*, is the name of a species of fossil-shells, found in great numbers in the Bath free-stone, on King's Down, near Bath, along with other shells, called pundibs, and two other kinds. Mr. Walcott, in his petrifications found near Bath, figure 30, represents this shell, and describes it as having many ribs from the hinge to the hedges; beak-pointed; margin with a high wave: and says that it is common on the ploughed fields of some stone-brack soils.

HIGH-Way, Via Regia, a free passage for the king's subjects; on which account it is called the king's high-way though the freehold of the soil belongs to the lord of the manor, or the owner of the land. (2 Inst. 705.) Those ways that lead from one town to another, and such as are drift or cart-ways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and their reparation is under the care of surveyors. A nuisance in a high-way is a common nuisance, and punishable by indictment; but a way to a parish-church, or to the common fields of a town, or to a private-house, or, perhaps, to a village which terminates there, and is for the benefit of the particular inhabitants of such parish, house, or village only, may be called a private-way, but not a high-way, because it belongeth not to all the king's subjects, but only to some particular persons, each of whom, as it seems, may have an action on the case for a nuisance therein. (1 Hawk. 201.) So if I have a private way without a gate, and a gate is hung up, an action lies upon the case, for I have not my way as I had before. (Litt. R. 267.) So if one grants me a way, and afterwards digs trenches in it to my hindrance, I may fill them up again. (Godb. 53.) All private ways are to be repaired by those who use them.

A river that is common to all men, is also called a high-way. 1 Hawk. 201.

Where a high-way lies within a parish, the parish is bound to repair it, unless it appears that the same ought to be repaired by some particular person, either by reason of tenure or prescription. At common law it is said that all the country ought to make good the reparations of a high-way, where no particular persons are bound to do it, because the whole country have their ease and passage by that way.

If a high-way leading through a field is out of repair, travellers may justify going out of the track, though there be corn sowed; and in case a high-way is not sufficient, any passenger may break down the inclosure, and go over the land adjoining, until a sufficient way be made. All kinds of injuries to high-ways, that render them less commodious to travellers, are deemed nuisances; such as laying logs of timber in them, erecting gates, or making hedges across them, permitting boughs of trees to hang over them, &c. By stat. 13 Geo. III. cap. 78. no tree or bush is to be allowed to grow or stand within fifteen feet of the centre of the high-way, on forfeiture of 10s. by the owner. The possessors of land next adjoining shall cut, prune, or plash their hedges, and lop trees growing in or

near such hedges, or be liable to a complaint of the surveyor, after ten days notice; and the justices at a special sessions shall order such hedges to be cut or plashed, and such trees to be lopped; and the possessor, who refuses to comply within ten days after notice of such order, shall forfeit 2s. for every twenty-four feet in length of such hedge, and 2s. for every tree; the surveyor shall order the same to be done, and the possessor, beside the penalties, shall pay the charges of doing the same, to be levied by distress, by warrant of one justice. The occupiers of such lands shall keep their ditches, drains, and water-courses, in proper order, on forfeiture of 10s. after ten days notice given by the surveyor. No stone, timber, soil, or other matter, shall be laid in the high-way, so as to obstruct or prejudice it, and remain there five days after notice by the surveyor, on forfeiture of 10s. and if such stone, &c. shall be laid within fifteen feet of the centre of the high-way, the owner of the adjacent lands, after five days notice, may remove and dispose of the same to his own use. Persons making incroachments on the high-way by any fence, or breaking up the soil, within fifteen feet from its centre, shall forfeit 40s. to the informer, and the surveyor shall cause the damage to be repaired by the offender; and one justice may levy the penalty and expence by distress. The surveyor is required to give written notice to those who offend in these respects; and if they do not comply within twenty days after such notice, he shall proceed to remove nuisances, &c. to cleanse ditches, &c. and to cut hedges, &c. at the expence of the offender, who shall besides forfeit for his neglect one penny for every foot in length. If the high-way is wilfully obstructed by carriages or implements of husbandry, the person offending shall forfeit 10s.

It is farther enacted by the same statute, 13 Geo. III. cap. 78. that no driver of any cart, dray, or waggon, shall ride upon such carriages, without having some person on foot to guide the same, excepting such carriages as are conducted by persons holding the reins of the horse or horses drawing them; or damage or obstruct the passage of any person or carriage in the street or high-way, or quit the high-way, or wilfully be at such a distance from his carriage, so that he cannot have the government of the horses, &c. drawing the same; or refuse or neglect to make way for loaded carriages; or drive a carriage not having the owner's name, and refuse to discover it, under the penalty of forfeiting any sum not exceeding 10s. if the driver be not the owner of the carriage; and if he be the owner, any sum not exceeding 20s. on conviction by confession, view of the justice, or oath of one witness, before one justice. Owners of carriages are also required to have their names and places of abode painted in large legible letters on some conspicuous part; and the owner of every stage waggon, or cart, shall, moreover, have the following words, *common-stage waggon*, or *cart*, as the case may be, under the penalty of a forfeiture not exceeding 5l. nor less than 20s. And no ale-houses shall be kept by toll-collectors at any public bridge, under a penalty of 5l.

It is also enacted by the same statute, that the justices shall issue their precept to the surveyor, requiring him to erect posts or stones in places where several high-ways meet, with inscriptions on them in large legible letters, containing the names of the towns or chief villages to which the several ways lead; and also in places subject to floods, inscribed with marks denoting the greatest depth of the water: and if he shall neglect or refuse for three months, he shall forfeit 20s. And if any persons remove or destroy posts, blocks, banks, &c. set up for the security of horse and foot:

caufeway,

HIGH-WAY.

cutseways, or the battlements of bridges, or destroy or even deface any mile-stone or direction post, they shall forfeit, on conviction on the oath of one witness, before one justice, or upon view of the justice, a sum not exceeding 5*l.* nor less than 10*s.* and on default of payment be committed to the house of correction for any term not exceeding one month, nor less than seven days.

The same statute farther enjoins, that no waggon, the fellies of whose wheels are nine inches broad, shall be drawn with more than eight horses, nor carts of the same dimensions with more than five horses; and no waggon, the fellies of whose wheels are six inches broad, and rolling on each side a surface of nine inches, shall be drawn with more than seven horses; and no waggon rolling a surface of six inches only, with more than six horses: nor cart, the breadth of whose wheels is six inches, with more than four horses; and no waggon, the fellies of whose wheels are of less breadth than six inches, shall be drawn with more than five horses, nor cart of the same breadth with more than three horses: the owner that offends against these regulations shall forfeit 5*l.* and the driver, not being the owner, 10*s.* for every horse above the proper number, to the sole use of the informer. But carriages moving upon wheels or rollers, of the breadth of sixteen inches on each side with flat surfaces, shall be allowed to be drawn with any number of horses. No regulations affecting the number of horses, and wheels of carriages, shall extend to carriages used in carrying one stone or block of marble, cable rope, piece of metal, or piece of timber, or to such ammunition and artillery as may be required for his majesty's service. For all the purposes of this act two oxen, or horned cattle, shall be considered as one horse.

By the common law, no high-way can be changed without the king's licence first obtained, upon a writ of *ad quod dampnum*. In aid of the common law, and to render the changing of high-ways less troublesome and expensive, power is given by 13 Geo. III. cap. 78. to the justices of the peace to widen, divert, and change high-ways, as they shall judge most convenient. And it is enacted that the surveyor shall make every public cart-way leading to any market town, twenty feet wide at the least, and every public horse-way or drift-way eight feet wide at the least, wherever the ground between the fences shall admit of it; or on the view of two justices, it shall be widened or diverted at their pleasure, provided that its breadth exceeds not thirty feet, and that no houses or buildings are pulled down, or any garden, park, court, or yard, taken away; and the owners of the ground, which shall be laid into the high-way, or through which it shall pass, shall be recompensed for it, and every injury redressed. The expences of making, repairing, &c. high-ways, are defrayed by equal assessments, made by the warrant of a justice, at a special sessions, on all occupiers of lands, tenements, woods, tithes, and hereditaments; provided that no such assessment in one year shall exceed sixpence in the pound. In extraordinary cases another assessment may be made, provided this and the preceding shall not in any one year exceed the rate of nine-pence in the pound.

By the same statute the justices are enjoined to hold a special sessions for the high-ways, in the week next after the Michaelmas general quarter-sessions yearly; and notice shall be given to the constables of the respective parishes at least ten days before it shall be held. Surveyors of the high-ways are to be chosen yearly out of a list of proper persons, nominated by the householders, assessed to any parochial or public rate, by the justices at their sessions; and their number shall depend on the extent of the parish, &c. But no

person is liable to be appointed to serve this office within three years from the time of his having served it, without his own consent. Those who refuse to serve, after having been nominated by the parish and justices, shall forfeit 5*l.* and if they were only nominated by the justices, they shall forfeit 50*s.* In this case, the justices may appoint a proper person to this office, with a salary not exceeding one eighth part of what shall have been raised by assessment of six-pence in the pound for the use of the high-ways in the district where the assessment hath been raised; and they shall also appoint one substantial inhabitant of such parish, &c. for assistant to such surveyor, till the next annual appointment, whose refusal incurs a forfeiture of 50*s.* And if a second person refuse, he shall also forfeit 50*s.* and a third shall be appointed, with a salary. Special surveyors returned to the justices by two parts out of three of those who have the choice, with a settled salary, may be appointed by them with the said salary. In case of the death of a surveyor, two justices at a special sessions may appoint another in his room.

It is the business of the surveyor to preserve high-ways in proper repair, &c. For this purpose it is enacted by the statute (34 Geo. III. c. 74.) that every person keeping a team, draught, or plough, *i. e.* who keeps a waggon, cart, wain, plough, or tumbrel, and three or more horses or beasts of draught, shall six days in the year furnish one wain, cart, or carriage, and other necessaries, and two able men, on the day and place appointed by the surveyor. Those who occupy lands of 50*l.* a year shall do the same; and in like manner for every 50*l.* a year respectively. Those who occupy lands under 50*l.* shall pay to the surveyor, in lieu of the duty, for every 20*s.* annual value of their land, &c. one penny for every day's statute duty, &c. and the same for every 20*s.* above the annual value of 50*l.* and less than 100*l.* Persons keeping a team, but occupying land of the yearly value of 30*l.* shall be obliged to send only one labourer with such team. Persons not keeping a team, but keeping one or more cart or carts, and one or more horses, shall send one labourer with each cart; and persons keeping a wheel-carriage, but no team, nor occupying 50*l.* a year, in the parish, township, or place where he resides, shall pay to the surveyor 1*s.* in respect of every day's statute duty, for every horse which he shall use in such carriage. Every inhabitant eighteen years of age, and upwards, but under sixty, nor chargeable in any other way for 4*l.* a year, or upwards, and not being an apprentice or menial servant, or not having served or compounded in any other place for that year, shall go in person, or find a labourer, on each of the aforesaid days. Carriages shall be changed, at the discretion of the surveyor, for men, three being allowed for each team, or 2*s.* 6*d.* shall be paid in lieu of them. Persons liable to perform statute duty may compound at such rates as the justices shall think fit, not exceeding 6*s.* nor less than 3*s.* for each team, for each day, or, in default of their adjudging the same, the sum of 4*s.* 6*d.*; for every cart and one horse 2*s.*; for every cart with two horses 3*s.* in lieu of each day's duty. And every inhabitant liable to perform such duty, and not chargeable in any other respect, may compound for 4*l.* each day. The surveyor shall give four days notice to those whose attendance is required, and they shall bring with them their own tools, continue at work for eight hours in each of the appointed days; and defaulters in finding a team, &c. shall forfeit 10*s.* those in sending a cart with one horse and man, 3*s.* for not sending a cart with two horses and one man, 5*s.* and for each labourer 1*s.* 6*d.* Surveyors for neglect of duty, where no particular penalty is imposed, shall forfeit a sum

sum not exceeding 5*l.* nor less than 10*s.* at the discretion of the justices. All defects of repairs of high-ways shall be presented in the county where they lie: and the indictment must shew, that they are high-ways; also the places from and to which they lead: where the nuisance was done, and how far it extends; it must likewise state the fact clearly. Justices may present on their own view. For the farther regulations relating to high-ways, the principal of which have been already recounted, the reader is referred to 13 Geo. III. cap. 78.

High-ways, turnpike. See TURNPIKE.

High-way men, are robbers on the high-way; for the apprehending and taking of whom, a reward of 4*0l.* is given by the statute of 4 W. c. 8. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap. 16. superadds 10*l.* to be paid by the hundred indemnified by such taking.

HIGHAM FERRERS, in *Geography*, a borough, market-town, and parish in the hundred of the same name, in the county of Northampton, England, is a place of considerable note, and is situated on a rocky elevation, abounding with springs, about half a mile from the northern banks of the Nen. Northward of the church, is a space called the Castle-yard, the scite of a castle, which is supposed to have been erected by one of the Ferrer's family. But it more probably owes its origin to Thomas, earl of Lancaster, son of Edmund, the younger son of Henry III.; who obtained this lordship in the fiftieth year of that monarch's reign. This nobleman, in the fifth of Edward II., was at the head of the association, which, under the pretext of supporting public liberty, demanded and obtained the dismissal of Piers de Gaveston, the royal favourite. The Castle-yard is divided into two parts, by a deep foss, running from east to west. That on the south side contains about two acres: the only remains are hollows, heaps of ruins, and foundations of walls. The northern division, both in extent and strength, appears to have been the most considerable work. It comprises nearly four acres, having on the east side a very large moat, about fifty feet wide, and five hundred long; and another on the south side of similar dimensions. This, it is conjectured, was the scite of the castle; and the space to the south, the situation of the advanced and covering works. The church is a handsome structure: at the west end of the nave, on a handsome embattled tower, is raised a finely proportioned hexagonal spire; the western front of the tower displays some curious architectural features; at the base is a pointed arched door-way, with two openings for doors beneath flattened arches: the surrounding jambs, pediment, &c. are charged with sculpture of figures, foliage, &c. On each side of the chancel are ten stalls; one ornamented with a carved head of archbishop Chichele; another with his arms; the rest with various enigmatical devices. In the chancel is an inscription to the memory of the archbishop's parents. This prelate founded a college here in the year 1422, for eight secular canons. The building, now in a ruinous state, was some years since converted into an inn: a portion of the revenues forms the endowment of the present free-school. He also founded and endowed the Alms, or Bead-house, for twelve poor men and one woman.

Higham is a borough by prescriptive right, and was incorporated in the reign of Philip and Mary. The corporation comprises a mayor, seven aldermen, thirteen capital burgesses, and other inferior officers. The aldermen are chosen out of the burgesses; and the mayor annually elected from the body of aldermen. The mayor has a right of holding a court every three weeks, for determining actions for debt, in any sum under forty pounds. The borough,

VOL. XVIII.

by virtue of the same charter, returns one member to parliament; the elective franchise being vested in all the inhabitants not receiving alms. The town is small, consisting of two streets, a lane, and what is here called the market-lead, in which stands a cross, bearing a cube at the top, and on the four sides are carved in stone different figures, emblematic of the crucifixion. By the returns under the population act, the number of houses is 125; of inhabitants, 726. From its formerly having had three weekly markets, it was probably then much more populous. Those kept on Mondays and Thursdays have long been disused, and the one held on Saturday is much decayed; though here are still seven well accustomed fairs. The distance from London is 64 miles. Higham is particularly noted as the birth place of Henry Chichele, who was archbishop of Canterbury in the reigns of Henry V. and VI.; of whose love of learning and liberal encouragement for its diffusion, the noble institutions he founded and endowed are strong and lasting monuments. Bridges's History of Northamptonshire, 2 vols. fol.

HIGHGATE, a populous hamlet, principally in the parish of Hornsey, and hundred of Ossulston, Middlesex, England, occupies, as its name partly implies, a high situation. It is about four miles north of London, and its buildings are irregularly dispersed over a large extent of ground, along the ridge, and down the sloping declivities of a hill. This place is said to derive its name from a gate-house, or gate, that was formerly standing at the top of the hill, and belonged to the bishops of London, who exacted toll from all persons with carriages, horses, cattle, &c. that passed through it. Before this toll-bar was raised and road formed, the road from London to Barnett and northwards, was through Hornsey-park to Colney-Hatch, &c., but this being very "miry and deep in winter," as Norden states, it was agreed between the bishop of London and the landholders in this part of the country, that a new road should be formed "through the park, at Highgate Hill," by the former, and that he and his successors should be authorized to collect toll from all passengers. At the time Norden wrote, this toll was farmed for 40*l.* annually; and in 1794 it was rented at 150*l.* a year. The gate-house was taken down in 1769, when the road "was opened at the joint expence of the Islington and Whetstone trust," as expressed on a board attached to a tavern built on the scite of the old toll-house. Tolls are still demanded for cattle, loaded carriages, and horses for sale. Near the gate-house is the parochial chapel, one aisle of which was erected in 1565, and the other at a later period. It contains two or three monuments with busts, &c., and in it some persons of eminence have been interred. Among whom the following names occur: William Platt, esq., who died in 1637; Lewis Atterbury, LL. D. obiit 1731; sir Francis Peinberton, died 1697. Connected with the chapel is a free-school house, which owes its erection to sir Roger Cholmeley, knight, chief justice of the Queen's Bench in 1562, who also bequeathed a legacy to defray the education of poor boys of Highgate, and to support a master, &c. The school-house occupies the scite of an ancient hermitage. Highgate is noted, among the lower classes of the community, for a silly, burlesque, nugatory oath, which the inhabitants of some of the public-houses occasionally administer to their visitors. A pair of large horns is placed on the head of the person, and he is required to swear "that he will not eat brown bread when he can get white; will not drink small beer when he can get strong; will not kiss the maid when he can kiss the mistress," &c. This absurdity was probably invented by a cunning publican, to attract customers, and his scheme at first gave considerable publicity to the

D

house

house and village, but is now seldom employed. Highgate is a great thoroughfare to the northern parts of England and Scotland. Hence a vast number of coaches, waggons, &c. pass through it daily. The hill, from Holloway to the chapel, is long and steep. To avoid this steep ascent different schemes have been proposed at different periods, but hitherto all that has been effected to obviate the evil, or lessen its force, is a removal of some feet of earth from the summit of the hill, and placing it at the bottom. In the year 1838 a new and novel scheme was proposed by Mr. Robert Varie, an engineer, to form an arched subterranean tunnel, for a public road, through Highgate-hill, and this plan is now prosecuting with avidity.

HIGGATE, a township of America, being the north-westernmost except Alburgh, in Vermont, Franklin county, containing 324 inhabitants.

HIGHLAND CREEK, a river of America, in Kentucky, which runs into the Ohio. N. lat. $37^{\circ} 32'$. W. long. $88^{\circ} 22'$.

HIGHLAND Point, a cape on the N. E. coast of New Zealand, at the entrance of Lowland bay. S. lat. $37^{\circ} 48'$. W. long. $182^{\circ} 16'$.

HIGHLANDS, a mountainous tract of country in America, on the banks of Hudson's river, in the state of New York, between 40 and 60 miles N. of New York city. The passage on the river, through these highlands, for the distance of about 18 miles, is very grand and romantic. In these highlands are situated the important fortresses of West Point, Fort Montgomery, and Stony Point. These mountains abound with iron ore.

HIGHLANDS, a natural division of Scotland, formed by the Grampian mountains, and including the northern and mountainous provinces, and applied to this part of the country in contradistinction to the "Lowlands," which comprehend the southern districts. The appellation of Highlands is more strictly confined to Argyleshire, the coast of Perthshire, and of Inverness, and the entire counties of Ross, Sutherland, and Caithness, extending also to the Hebrides or Western isles. The whole of this district is wild, rugged, and mountainous, separated by vales, from which the direct rays of the sun are for some months intercepted by the elevated mountain, and into which the rivers flowing from them are precipitated. The three principal rivers, formed by numerous streams and torrents issuing from the hills, are the Tay, the Spey, and the Forth. Before the commencement of the last century, little or no communication subsisted between the Highlands and Lowlands, as they were unconnected by regular roads and bridges, and the entries from the one to the other, were, for the greater part of the year, impassable. In order to facilitate an intercourse between these different parts of the country, general Wade, under a commission from George I., travelled, in 1724, to the most difficult and dangerous passes of the mountains, and projected the bold undertaking of forming spacious roads in these rugged districts. In 1726 he began the work, and by means of five hundred soldiers, employed under proper officers, in the summer season, he completed it in 1737. These roads were two hundred and fifty miles in length, and from twenty to twenty-five yards broad, guarded from the injuries of the rains and torrents, to which they were subject, by aqueducts and side-drains. The huge stones raised out of the ground by means of engines, are set up by the road side, to serve as guides in deep snows; and at each interval of five measured miles, pillars are erected, on which the number of miles is inscribed. The roads enter the mountains at three different parts of the low country; one at Crieff, 24 miles N. of Stirling; another at Dunkeld, 12 miles N. of Perth; and

the last goes along the side of Loch-Lomond, in Dunbartonshire, by Lufs. Since the period in which Gen. Wade finished his operations, the military roads have been farther extended, and a ready communication has been opened with every part of the country. Before the period to which we have now referred, the Highlands of Scotland were in a state somewhat similar to that of England before the Norman conquest. The inhabitants, who were a branch of the ancient Celts, probably the first inhabitants of Britain, and who have since been called Caledonians, were divided into tribes, called clans. Those of the inferior order were vassals of particular chiefs, to whom they were attached, and on whom they relied for that safety which the laws could not afford them. On the other hand, the security and consequence of a chieftain depended on the number and fidelity of his servants and retainers; who, on account of their relation to him, assumed a dignity, and acquired in their manners a degree of politeness, to which other uncivilized nations are strangers. The rents of farms which these vassals occupied were inconsiderable, and were chiefly paid by military service: so that the value of a proprietor's land was estimated, not by the money it produced, but by the men whom it could send into the field; and that the number of dependants might be increased, the farms or allotments of land were small, and barely sufficient for a scanty subsistence to the tenants. As an inconsiderable proportion of the country was cultivated, and as no intercourse subsisted between the inhabitants and any other nation, little time was employed in agriculture and commerce. The greatest part of it was consumed in indolence or amusement, unless when their superior summoned them to avenge on some neighbouring tribe an insult or injury. No more grain was raised, nor was any more raiment manufactured by any family than that which barely sufficed itself. Villages and hamlets, situated in valleys for shelter, were rudely constructed of turf and stone. In spring the natives ploughed or dug some adjacent patches of soil, in which barley or oats were sown; in summer they prepared and collected turf and peat for fuel; in autumn they gathered in their scanty crops of grain and hay; and the residue of the year was devoted to pastime or predatory excursions. In winter evenings, around a common fire, the youth of both sexes generally assembled for the song, the tale, and the dance. A taste for music was prevalent among them. Their vocal strains were plaintive and melancholy; their instrumental airs were either lively for the dance, or martial for the battle. In the time of Ossian, of ancient celebrity, the harp was the chief instrument of music; its simplicity suited the mildness of their manners, and its wild notes were well adapted to the poetical effusions of the bards. In a later period, when the quarrels of their chieftains embroiled them in a state of almost continual warfare, the harp yielded to the bagpipe, an instrument of the most warlike kind, which still continues to supply the most favourite music. The greater part of the Highland music, especially the most ancient, as suited to the harp, is of the soft, tender, and elegiac cast, chiefly expressive of the passions of love or grief; many of the latter pieces are sprightly and cheerful, adapted to the regions of fancy and of festivity. Other pieces are of a martial nature, every note of which is expressive of rage or fury. They have also a mixed species of music, intended to commemorate some great battle or contest, when the elegiac, the martial, the mournful, and the joyful are united; but of all these the favourite of the Highlanders is that species called "Strathspey reels," used in their dances. Every family of note retained an historian to narrate its heroic deeds and feats of valour, or a bard, who sung the praises of the chieftain and his clan. Some fragments of their poetry

try have been handed down from remote ages, and recently moulded into heroic poems, of which we have a specimen in the poems of Ossian. Since the extinction of the order and office of bards, the Gallic poems and tales are in a great measure lost or adulterated. The language of the Highlanders is still the Gaelic (see GAELIC); and the genius and character of its poetry are well known; being tender, simple, beautiful, and sublime. Strangers, who have ventured to penetrate into the fastnesses of the Highlanders, have been received and treated in the most hospitable manner; but, as for themselves, they seldom wandered, except for the purposes of devastation or plunder. The dress of the country was the last remains of the Roman habit in Europe, well suited to the nature of the country and the necessities of war. It consisted of a light woollen jacket, or tartan, wove in squares of various colours, in which red, green, blue and black are most prevalent. The feil-bag, or kilt, is a short petticoat of the same stuff, reaching to the knees; and the hose, or short stockings, are woven in diamonds of red and white, tied under the knee with garters, often beautifully ornamented: the Highlanders have generally a pouch made of the skin of a badger, fox, or other animal, hanging before, in which they keep their tobacco and money, and this part of their dress is generally adorned with silver buttons and tassels; their plaid is also of tartan, consisting of twelve or thirteen yards of cloth, wrapped round them in a graceful manner, fastened round the middle by a belt, falling to the knees behind, and confined by a brooch or silver pin to the top of the left shoulder: this is often their only cover, both within doors, and when obliged to repose in the fields. The truis or trews, which are a sort of tartan pantaloons, are only worn by the gentry, instead of the kilt. Indeed, sir John Sinclair contends, that the trews were the most ancient dress of the Highlanders, and that the kilt is of comparatively modern introduction. The Highlanders generally affected to have their dress of the colour of the heath on which they reposed, probably from a principle of security in time of war, or that they might not be discovered while they lay in the heaths, waiting for their game. Their ancient arms were the broadsword and target, Lochaber axes, (now only used by the town-guard of Edinburgh,) and a dirk (short dagger), to which, before the act for disarming the Highlanders, in 1748, the pistol stuck into the girdle had been added. Always armed with a dirk and pistol, they were ready to resist an assault, or revenge a provocation, as soon as it was given. This circumstance contributed to render them polite and guarded in their behaviour to one another. When embodied by their chieftain, they were armed with a broadsword, a dagger, a target, a musket, and two pistols. In close engagement, and in broken ranks, they were irresistible. The only foe they dreaded was cavalry. As soon as the battle was over, most of the troops dispersed, and returned home to dispose of their plunder, and to provide for their families. Their religion was deeply tinged with superstition. They believed in ghosts and apparitions; by appearances in the heavens they predicted future events; they practised charms and incantations for the cure of various diseases; and to some individuals they thought the divinity had communicated a portion of his prescience.

The state of Society in the Highlands has been greatly changed and ameliorated since the rebellions in 1715 and 1745. The Roman dress and the use of arms were prohibited by government; roads, as we have already observed, constructed at a vast expence, opened an easy communication with the low country; and the courts of barons were suppressed by the jurisdiction act. The heads of clans have now ceased to be petty monarchs; and the services of their vas-

als are no longer requisite for their defence or aggrandisement. Divested of their legal authority, they now endeavour to preserve their influence by wealth. With this view their attention is directed to the improvement of their estates. Their ancient mode of living is also entirely altered; and the Highland gentleman, in every respect, differs little from a proprietor of the like fortune in the southern country. A spirit of industry has been excited among the tenants, while, in many places, arts and manufactures are encouraged; and the lower classes are, in consequence of the establishment of schools, provided with the means of education.

“The Highlanders (see *Encycl. Brit. art. Highlanders*), are of a quick and penetrating genius, strongly tinged with a curiosity or thirst of knowledge, which disposes them to learn any thing very readily. They are active and industrious, where oppression does not discourage them by excluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent seamen and soldiers. They are generally of a middle size, rather above it than otherwise: their eyes are brisk and lively, their features distinctly marked, and their persons tight and well made. Their countenance is open and ingenuous, and their temper frank and communicative.”

HIGHLANDERS, in *Rural Economy*, a term frequently applied to the highland, and some other sorts of Scotch cattle.

HIGHMORE, JOSEPH, in *Biography*, one among the most successful portrait-painters in England from the time of sir Godfrey Kneller (under whom he is said to have studied, and who particularly noticed him, by distinguishing him as the “Young Lawyer”), till the days of Hudson, and his incomparable pupil Reynolds. He was the third son of Mr. Edward Highmore, a coal-merchant in Thames-street, and nephew of Mr. Highmore, serjeant-painter to king William, with whom Mr. (afterwards sir John) Thornhill served his apprenticeship. He was born in the parish of St. James, Garlickhithe, June 13th 1692, and was first intended for the law, and articulated as clerk to an attorney in 1707; but he left it for painting, to which his inclination had always attached him, and was much employed. His leisure hours had been uniformly devoted to the art of designing, and to the study of geometry, perspective, architecture, and anatomy; and he made great proficiency in these several departments of science, though he had no other instructors than books. Afterwards, indeed, he had an opportunity of attending the anatomical lectures of Mr. Cheselden, and he entered himself at the Painter’s Academy, in Great Queen-street, where he drew for 10 years. It was in the year 1715, on the expiration of his clerkship, that he commenced the practice of painting as a profession, and settled in the city. In this year Dr. Brook Taylor published his “Linear Perspective,” whose theory our author adopted, and upon which he grounded his subsequent practice; and it has been allowed that few, if any, of the profession were so well acquainted with that excellent, though in some respects intricate, system. As his reputation and business increased, he removed from the city to Lincoln’s-Inn-Fields, in March 1723-4, where he had an opportunity of introducing himself to the nobility, by engaging with Mr. Pine, the engraver, to make drawings for his prints of the knights of the Bath. In the summer of 1732 he visited the continent; and at Antwerp he had peculiar pleasure in contemplating the works of Rubens, his favourite master. In 1734 he made a similar excursion to Paris, where he had the satisfaction of being shewn, by cardinal de Polignac, his famous group of antique statues, the court of Lycomedes, then just brought from Rome. In 1750 he had the misfor-

tune to lose his excellent wife, daughter and heirs of Mr. Anthony Hiller, of Effingham, in Surrey, whom he had married in 1716. On the first institution of the Academy of Painting, Sculpture, &c. in 1753, he was elected one of the professors, an honour which, on account of his numerous avocations, he was under a necessity of declining. His principal works were the portraits of the knights of the Bath, on the revival of that order in 1725. In 1754 he published "A critical Examination of those two Paintings (by Rubens) on the ceiling of the banqueting-house at Whitehall, in which architecture is introduced so far as relates to perspective; together with the discussion of a question which has been the subject of debate among painters, viz. "Whether parallel perspective be at all times just?" Another literary work gained him more applause, viz. "The Practice of Perspective, on the Principles of Dr. Brook Taylor," &c. written many years before, but not published till 1763. In 1765 he published, without his name, "Observations on a Pamphlet, entitled Christianity not founded on Argument." He also published, with his initials, J. H. two small volumes of "Essays, Moral, Religious, and Miscellaneous, with a Translation, in Prose, of Mr. Brown's Latin Poem on the Immortality of the Soul." He also communicated to the public, through the medium of the Gentleman's Magazine, for 1769, "A natural and obvious Manner of constructing Sun-dials, deduced from the Situation and Motion of the Earth with respect to the Sun;" and in that for 1778, his remarks on colouring suggested, by way of a note on the "Epistle to an eminent Painter." Of his numerous portraits, during an extensive practice of 46 years, several of which have been engraved, our limits will not allow us to give a minute detail. Some of the most capital of his performances in the historical branch were "Hagar and Ishmael," a present to the Foundling hospital; "The good Samaritan;" "The finding of Moses;" "The Harlowe Family," as described in Clarissa; "Clarissa;" "The Clementina" of Grandison; and the "Queen-mother of Edward IV. with her younger Son, &c. in Westminster Abbey." In 1761 he retired from business, and in 1762 removed to the house of the Rev. Mr. Duncombe, who had married his daughter, at Canterbury, where he passed the remainder of his life, without ever revisiting the metropolis. His mind, however, retained its powers of activity, and he was always usefully as well as agreeably employed. A strong constitution, habitual temperance, and constant attention to his health in youth, as well as age, prolonged his life, and preserved his faculties to his 88th year; and he may be said to have fallen asleep on March 3, 1780. He was interred in the south isle of Canterbury cathedral, leaving one son, Anthony, educated in his own profession, and a daughter, married to Mr. Duncombe. His talents and character will be respected by all who have a taste for the arts and for principles of religious virtue, exemplified by a corresponding practice. One of his grandsons, Anthony Highmore, esq. is now an eminent solicitor in London, and traces the footsteps of his ancestor by his general conduct.

HIGHMORE, NATHANIEL, a physician and anatomist, was born at Fordingbridge, in Hampshire, on the 6th of February 1613. He went to Oxford, where he was elected a scholar of Trinity College in 1632, and took his degree of M.D. in 1642. He settled at Sherborne, in Dorsetshire, where he obtained a considerable share of reputation in the practice of his profession. He died on the 21st of March 1684, at the age of 71, and was buried at Candlepurse in that county, of which place his father had been rector. Dr. Highmore, though with limited opportunities of dissection, pursued the study of anatomy with zeal, and

his name has remained attached to some discoveries not strictly his; as that of the *antrum maxillare*, of which he obtained a view from an extracted tooth, which suggested the operation of piercing into it from the jaw, practised by Cowper. Caserius had mentioned the cavity under the name of *antrum genæ*. His principal work is, "Corporis humani Disquisitio Anatomica," printed at the Hague in 1651, in folio. The descriptions in this work are too brief, and the reasonings unnecessarily copious; and the figures chiefly copied from Vesalius. His other writings are, "Exercitationes duæ, quarum prior de passione hysterica, altera de affectione hypochondriaca," Oxon. 1660. These dissertations abound with physiological remarks and hypotheses, some of which are ingenious, but were attacked by Dr. Willis. In consequence of this, Highmore printed, in 1670, "De hysterica et hypochondriaca passione, Responsio Epistolæ ad Willisium." He likewise published "A History of Generation," 8vo. 1651, which has some good figures of the embryo in the egg, during the state of incubation. Gen. Biog. Eloy. Dict. Hist.

HIGHNESS, a quality, or title of honour, given to princes.

The kings of England and Spain had formerly no other title but that of highness; the first, till the time of Henry VIII. and the second, till that of Charles V. See KING.

The petty princes of Italy began first to be complimented with the title of highness in the year 1630. And the duke of Orleans assumed the title of royal highness, in the year 1651, to distinguish himself from the other princes of France.

The duke of Savoy, afterward king of Sardinia, bore the title of royal highness, on account of his pretensions to the kingdom of Cyprus. It is said that the duke only took the title of royal highness, to put himself above the duke of Florence, who was called *great duke*; but the great duke has since assumed the title of royal highness, to put himself on a level with the duke of Savoy.

The prince of Condé first took the title of most serene highness, leaving that of simple highness to the natural princes.

At present, all the sons of crowned heads are styled royal highness, as the electors of Germany are called electoral highness.

HIGHWORTH, in *Geography*, a market town and parish in a hundred of the same name, and county of Wilts, England, is situated on a hill, whence its name appears to have been derived. It was formerly called a borough, but at present has no other privileges than the right of electing a mayor and aldermen, who possess some nominal powers. The parish of Highworth consists of about 2000 acres of land, and comprises several chapels and hamlets. The principal of these is Seven-hampton, a chapel annexed to this vicarage. In this the Warneford family long had a seat; and built for themselves a private oratory, or a monumental chapel, on the south side of Highworth church, wherein there are some pieces of ancient armour. In the same church is a mural tablet to the memory of sir John Croft, bart. of Dunstan Park, Berkshire, who died in 1797. Against one of the pillars is a table, containing a long list of charitable donations to the poor. The petty sessions, for the division of Highworth, are held at this town, and a fixed pillory is preserved in the market place. Here are a small weekly market on Wednesdays, and three annual fairs. About three miles W. of the town, in the tything of Broad-Blunden, is an ancient encampment, on an eminence called Castle Hill, near which a Roman road from Spine to Corinium, passed. Two miles eastward of Highworth is Colehill-house,

Hill-house, the feat of lord Folkestone. The house was built from the designs of Inigo Jones. Highworth contained 254 houses in the year 1801, and 1493 inhabitants. Britton's Beauties of Wiltshire.

HIGLER is a name frequently mentioned in our statutes for a person who carries from door to door, and sells by retail small articles of provisions, &c. They are laid under various restraints by the statute laws. See HAWKERS.

HIGUERA, in *Geography*, a town of Spain, in Estremadura; 12 miles north of Xeres de los Caballeros.—Alfo, a town of Mexico, in the province of Cinaloa; 28 miles E. of Cinaloa.

HIGUERA, *Cape*, a cape of Spain, on the coast of Biscay. N. lat. 43° 22'. W. long. 1° 55'.

HIGUEY, or YGUEX, *Alta Grecia*, a city in the S.E. part of the Spanish division of St. Domingo, the most easterly of all the settlements in the island, celebrated formerly for its fertility, and for the quantity of sugar which it produced. It has now only about 500 inhabitants, and is distant about 40 leagues E. of St. Domingo.

HIIA, a town of Abyssinia, 40 miles E. of Axum.

HIJAR, or IXAR, a town of Spain, in Aragon; 25 miles S.E. of Saragossa.

HIIS TESTIBUS, *q. d. these witnesses*, in *Law*, a phrase anciently added in the end of a deed, written in the same hand with the deed; upon which the witnesses were called, the deed read, and then their names entered. See WITNESS.

The clause of *hiis testibus*, in subjects deeds, continued till, and in, the reign of Henry VIII. but it is now omitted. Coke on Littleton.

HIKE, in *Rural Economy*, a term implying to strike with the horn, in the manner cattle often do.

HILARIA, in *Antiquity*, feasts celebrated every year, by the Romans, on the eighth of the calends of April, or the 25th of March, in honour of Cybele, the mother of the gods: as is observed by Macrobius, lib. i. cap. 10. and Lampridius, in his life of Alexander Severus.

The hilaria were solemnized with great pomp and rejoicing. Every person dressed himself as he pleased, and took the marks or badges of whatever dignity or quality he had a fancy for. The statue of the goddess was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which, at this time of the year, begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons, which succeeded one another.

The Romans took this feast originally from the Greeks, who called it *αἰετῶσι*, *q. d. ascensus*; the eve of that day they spent in tears and lamentations, and thence denominated it *κατακλιῶσι*, *descensus*.

Afterwards the Greeks took the name *ἡλιζία*, from the Romans; as appears from Photius, in his extract of the life of the philosopher Isidore.

Casaubon maintains, that beside this particular signification, the word hilaria was also a general name for any joyful or festival day, whether public, or private and domestic. But Salmassius does not allow of this.

Tristram, tom. i. p. 482, distinguishes between hilaria and hilaria. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public lasted several days, during which all mourning and funeral ceremonies were suspended.

HILARION, in *Biography*, the founder of the monastic life in Palestine, was born at Gaza, in 291, of a Pagan fa-

mily, but quitted the errors of his fathers and embraced Christianity. He distributed all his property among the poor, and withdrew into a desert, where he passed his time in solitude and devotion, and acquired a high character for piety and devotion. The number of his disciples soon became very numerous, whom he distributed into different establishments throughout Palestine and Syria, over which he exercised a most vigilant superintendance. He died in the year 371, at the island of Cyprus.

HILARIUSE, JOSEPH, an eminent antiquary and medallist, was born at Enzesfeld, in Lower Austria, in 1737. He was educated among the Jesuits, and afterwards became an eminent teacher of grammar and rhetoric at Vienna, of which college he was appointed *præfectus rei nummarie*. In the year 1770 he renounced the vows of his order, and in a short time after was appointed professor and director of the Imperial cabinet of ancient coins. He was likewise dean of philosophy and the fine arts. He died in 1798, leaving behind him a high character for extensive knowledge, irreproachable morals, and great wit.

HILARODI, *ἡλαροδοί*, compounded of *ἡλαρός*, *joyful*, and *ὠδή*, *song*, in the *Ancient Music and Poetry*, a sort of poets among the Greeks, who went about singing little merry diverting poems or songs; though somewhat graver than the Ionic pieces.

The hilarodi appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the *crepida*, which was only a sole, tied over the foot with straps.

They did not sing alone, but had always a little boy or girl to attend them, playing on some instrument.

From the streets they were at length introduced into the tragedy, as the *magodi* were into comedy.

The hilarodi were afterwards called *Simodi*, from a poet named Simus, who excelled in this kind of poetry.

HILARODIA, a poem, or composition in verse, made or sung by a kind of rhapsodists, called *hilarodi*.

HILARO-TRAGÆDIA, a dramatic performance, partly tragic or serious, and partly comic or merry.

Scaliger holds, the hilaro-tragœdia and hilarodia to be one and the same thing. Others rather take the hilaro-tragœdia to have been pretty nearly what we call a tragic-comedy. Others, again, will have it to have been a pure tragedy, only terminating with a happy catastrophe, which brings the hero out of a wretched into a fortunate state. But the first opinion seems the most probable, and the best warranted.

Suidas mentions one Rhinthon, a comic poet of Tarentum, as the inventor of this kind of poem: whence it was also called *Rhinthonica fabula*.

HILARY, in *Biography*, was bishop of Poitiers in Aquitania, and flourished about the year 354. He is placed by Jerom among his illustrious men, from whom we learn that, after his conversion to Christianity from the Pagan religion, he became a zealous champion for what was then deemed the orthodox faith against the Arians, labouring to confute them by his writings, and condemning their opinions by the councils which he caused to be assembled at Poitiers. His twelve books on the Trinity, his treatise concerning synods addressed to the bishop of the Gauls, and his Commentaries upon the Psalms, the Gospel of St. Matthew, the Book of Job, and the Canticles, are mentioned by Jerom as his principal works. Of these the last and best edition is that of the Benedictines at Paris, in 1693. Hilary died at Poitiers, in the reign of Valentinian and Valens, about the year 366. In his Prologue to the Commentaries on the Psalms, Hilary gives a catalogue of the books of the Old Testament;:

he appears to have received the Epistle to the Hebrews, though it was not universally received by the Latin Christians, and he often quotes the book of the Revelation, and ascribes it to John the apostle.

HILARY, deacon of Rome, was born in Sardinia, and appointed to his office about the year 354. He is mentioned by Jerom in his account of ecclesiastical writers, who represents him as a zealous Homousian, and afterwards a rigid Luciferian; and he pleasantly calls him another Deucalion, as if he would bring again an universal deluge on the world, because he was for rebaptising Arians, and other heretics, when they came over to the church. Differing from other Christians in this particular, he separated from the church, and wrote treatises in favour of his opinion. Cave ascribes to Hilary the "Commentary upon Thirteen of St. Paul's Epistles," usually joined with St. Ambrose's works, which he supposes to have been written before the year 384; and this learned writer considers him also as the author of "Quæstiones in Vetus et Novum Testamentum," written about 370, and usually joined with St. Augustine's works. Several other writers concur with Cave in ascribing the first work to Hilary, but differ with regard to the latter; and indeed both works are much interpolated. Hilary, considered as the author of the Commentaries, &c. quotes most books of the Old and New Testament. Lardner's Works, vol. iv.

HILARY, a saint in the Roman calendar, born at Arles in 401, of noble and very opulent parents, was distinguished while very young by his proficiency in knowledge and the brilliancy of his talents. Having been persuaded by his relation Honoratus, to devote himself to the religious life, he sold his patrimonial estate, distributed the money arising therefrom among the poor, and entered into a monastery, where he subjected himself to the austerities of the cloister, and applied with diligence to theological studies. He was promoted to the see of Arles in the year 429, which forced him from his cloister into the more active scenes of life. Having entered upon the episcopal duties of his see, he discharged them with uncommon zeal and assiduity, setting before his flock an illustrious example of the virtues which he recommended to their practice. He was an eloquent and impressive preacher, and freely reprov'd the vices of the great, without being moved by a dread of their displeasure. He presided in a council at Orleans in 441, and died in 449, at the early age of 49. His works are (1) "Homilies;" (2) "The Life of St. Honoratus;" (3) "An heroic Poem on the early part of the Book of Genesis;" and "A short Letter 'o Eucherius bishop of Lyons," which may be found in the seventh volume of the Biblioth. Patrum. Moreri.

HILARY, or HILARIUS, pope, was a native of Sardinia, and while he was only a deacon in the church, he was sent, with the character of pope Leo's legate, à latere, to assist at the general council summoned to meet at Ephesus, in the year 449, for the purpose of deciding on the questions at issue between Eutyches and Flavianus, patriarch of Constantinople. In that council he embraced the interests of Flavianus, and protested with great firmness and intrepidity against the sentence of his deposition. His conduct on this occasion led him into difficulties, and withdrawing unexpectedly from Ephesus he travelled by night, and in roads not usually frequented, till he thought he had perfectly escaped the power of Dioscorus, who had presided at the council. After this he was raised to the archdeaconry of the Roman church, and from this station he was elevated, in the year 461, to the papal dignity. No sooner was he ordained, than he devoted his principal care to the exten-

sion of the power and authority of the Roman see. In the year 462 he held a council at Rome, at which he enacted such decrees as suited his own views, having met with no opposition from the bishops who were assembled at this time. So submissive were the prelates to the edicts of Hilarius, that he had an opportunity of extending his own authority every day, and making them entirely dependent upon him, by favouring the pretensions sometimes of one and sometimes of another. In the year 465, an opportunity offered of attempting to extend the papal authority over the churches of Spain, and he sent a sub-deacon into that country to see that his pleasure should be carried into effect. In their letters to the pope, the Spanish prelates had been induced, to express the greatest respect for the apostolic see, and to acknowledge the bishop of Rome for the successor of St. Peter, "whose primacy ought to be loved and feared by all." Hilary, in the year 467, violently opposed a design of the new emperor Anthemius, to grant leave to the several sects of Christians to assemble publicly by themselves, to own openly the doctrines which they held, and to serve God in the manner which they believed most agreeable to him. This noble design was suggested to the emperor by one of his favourites, who was friendly to the rights of conscience; but the pope, to whose authority such a measure must ultimately prove fatal, obliged the emperor to relinquish his design, and to take an oath that he would suffer no schismatical assemblies to be held at Rome. Hilary died in the course of the same year, having presided at the head of the church nearly six years. Twelve of his letters may be found in the fourth volume of the "Collect. Concil." Moreri.

HILARY, or *Helier*, *St.* in *Geography*, the principal town in the island of Jersey, consists of several streets. It is protected from the north winds by high grounds, and is open to the sea on the south-west. Between the town and the hills is a tract of fine meadows, watered by a rivulet which descends from the hills, and passing in different channels through the town, is a pleasant and beneficial appendage to the place. Near the centre of the town is a large quadrangular area, surrounded by respectable houses, among which is the court-house, or seat of justice, call'd La Cohue Royale. St. Hilary is mostly occupied by merchants, shopkeepers, artificers, and dealers in liquor. For the accommodation of persons attending the market, which is kept every Saturday, here are different buildings and places adapted to their respective pursuits. For the dealers in corn there is a building, supported by pillars, and shambles for the butchers. The parochial church is large and commodious, and the service is alternately performed in French and English. Among the monuments it contains, is one to the memory of major Pearson, who was killed in defending the town in Jan. 6, 1781, when a party of French, under baron de Rullicourt, had invaded the island. The garrison and the lieutenant-governor had capitulated, but the major, with a few soldiers, rallied, and, though the former lost his life, he was the cause of saving the island; for the French commander was killed and his soldiers taken prisoners. The harbour is protected by a strong castle or fort, the residence of the governor, or lieutenant-governor of the island. It occupies the whole of a small island, at the distance of about half a mile from the town, and is accessible by a causeway at low-water. On the top of a high rocky hill, near the town, was discovered, in the year 1785, a mass of stones ranged in a circular form, some perpendicular, and others lying horizontally on the former. It was call'd a Druidical temple, and was completely covered with earth at the time of discovery. General Conway, then governor, had the stones removed to Park Place, in Berkshire, where they were again erected and disposed in their

original form. The circle is 66 feet in circumference, and consists of forty-five stones, some of which are seven feet in height. (See JERSEY.) Gough's Camden, and Fall's Account of Jersey.

HILARY Term, in Law. See TERM.

HILAU, or UABE, in Geography, a town of Peru, in the diocese of La Paz; 25 S.W. of Chicuito.

HILAY, a small island in the Pacific ocean, near the coast of Peru; S. lat. 16° 50'.

HILBERG, a town of Norway, in the diocese of Drontheim; 44 miles W. of Romfald.

HILBURGHAUSEN, a town of Germany, and capital of a principality, belonging to a branch of the house of Saxony, called Saxe-Hilburghausen, separated from Coburg in the year 1672; the town is seated on the Werra, and is the usual residence of the duke; 32 miles E. of Erfurt. N. lat. 50° 19'. E. long. 10° 55'.

HILCONAUR, a town of Hindooftan, in Bednore; 10 miles N.N.E. of Simogou.

HILDANUS, in Biography. See WILLIAM FABRICIUS.

HILDEGARDE, a female saint in the Roman calendar, was born in the county of Spanheim, in the Palatinate, in the year 1098. She was at an early period devoted to a religious life, and in process of time was chosen abbess of St. Rupert's Mount, near Bingen, on the Rhine. Here she acquired a character for a high degree of sanctity, and assumed the pretensions and powers of a prophetess, divinely instructed, in dreams and visions, to announce to mankind the will of God. Her claims were well adapted to the dark and superstitious age in which she lived, and occasioned an immense resort to her of credulous persons of all ranks, who consulted her as an oracle, and respected her decisions as the commands of the most high God. Several of the popes, to further their own objects, pretended to credit her miraculous powers, and were among the number of her correspondents, as were the archbishops of Mentz, Cologne, Treves, and other prelates on the continent. To all their letters she returned answers in a mystical and prophetic style. She died in the year 1180, leaving behind her many works which were at the time in high estimation; of these a part of the following are now to be met with in the Biblioth. Patrum: "Scivias, seu Visionum five Revelationum, lib. iii. 1513, fol.;" "Vita S. Roberti Confessoris Bingeniorum Ducis;" "Epistolæ, xxxviii.;" "Questiones Variæ in Scrip. Sac.;" and "Expositio Regulæ S. Benedicti." Moreri.

HILDESHEIM, in Geography, lately an ecclesiastical state of Germany and a princely bishopric, bounded on the N. by the duchy of Luneburg, on the E. by the duchy of Wolfenbuttel, and the principality of Halberstadt, on the S. by the principality of Calenberg, and on the W. by Calenberg, and extending from E. to W. about 40 miles, and 32 from N. to S. The soil of the greatest part of this state is fit for tillage, and produces corn, flax, hops, and legumes in abundance; but its breed of cattle, horses, sheep, and swine is merely sufficient for the consumption of the inhabitants. The south part is hilly, and is for the most part covered with oak, beech, ash, and birch, and where it is destitute of wood, it has mines of iron. This state contains 12 towns, the chief of which are Hildesheim and Parna, and 248 villages: its principal rivers are the Leine, Innersee, and Ocker. The bishopric was founded by Charlemagne in 822. The inhabitants are partly Lutherans and partly Roman Catholics. In 1803 this bishopric was secularised, and given among the indemnities to the king of Prussia, but in 1807, after the peace of Tilsit, it was transferred to the new kingdom of Westphalia.

HILDESHEIM, formerly one of the Hanse-towns, a city of Westphalia, to whose sovereign it was surrendered in 1807, situated near the Innersee, is an old-fashioned, large, irregular town, divided into the New and Old towns, which were united in 1583. The magistrate, and most of the inhabitants, are Lutherans; the rest are Roman Catholics, who are in possession of the cathedral; but the Protestants have eight churches; 26 miles W.S.W. of Brunswick. N. lat. 52° 12'. E. long. 10°.

HILDESLEY, MARK, in Biography, an English prelate, was born at Markton, in Kent, in 1698, and educated at the Charter House, from whence he was sent to Cambridge, where he was chosen fellow, in the year 1723. Being admitted into holy orders, he was appointed one of the preachers at Whitehall, and was afterwards made chaplain to lords Bolingbroke and Cobham. In 1731 he obtained the living of Hitchin in Herefordshire, and shortly after he was inducted to the living of Holwell in Bedfordshire, where he distinguished himself as a diligent parish priest. On the death of Dr. Wilson, bishop of Sodor and Man, he was appointed his successor, but before his consecration he was created doctor of divinity by archbishop Herring. During the period of seventeen years, in which Dr. Hildesley presided over the diocese of Man, he took every method in his power to promote the interests of the people over whom he was placed. He procured an entire translation of the Old and New Testament to be made into the Manks language. This work had been begun by his predecessor bishop Wilson, who, at his own expence, had printed the gospel of St. Matthew, and had prepared for the press the other evangelists, and the Acts of the Apostles. Dr. Hildesley was enabled to indulge his own liberal spirit in this design, as well by the assistance which he received from many persons of rank and eminence, as by an income which he derived from the mastership of Sherburn hospital, presented to him by the bishop of Durham, and which he held with the bishopric till his death. The worthy prelate had this work so much at heart, that he frequently said, with the feelings of an humble but anxious mind, "he only wished to see it finished, and that then he should be happy, die when he would." On the 28th of November 1772, he received the last part of the translation, when in the presence of an affectionate and congratulating family, he sung with pious emphasis, "Nunc Domine Dimittis!" On the next day he officiated in his own chapel, and preached with unusual energy on the uncertainty of human life, and on the following day he was attacked by a stroke of apoplexy, which soon deprived him of his intellectual powers, and proved fatal to him in a very few days, when he was in the seventy-fourth year of his age. Gen. Biog.

HILELA, or HALEF, in Geography, a town of Africa, in the country of Sugulmessa.

HILL, JOSEPH, in Biography, was born at Bromley, in Yorkshire, in 1625, and received his college education at St. John's, Cambridge, after which he became fellow of Magdalen college, from whence, on account of his nonconformity, he was ejected in the year 1662. He died pastor of a congregation at Rotterdam in 1707. He published an enlarged edition of Schrevelius's Greek Lexicon, and was author of "Dissertations on the Antiquity of Temples and Churches."

HILL, AARON, an English poet, was born in London in 1685, and was left almost wholly unprovided before he had attained the age of fourteen, by the death of his father. He had naturally an adventurous spirit, and at the age of fifteen took a voyage to Constantinople, where his relation, lord Paget, was ambassador from the English nation. He was received.

received with surprise, but treated with great kindness, and a tutor provided for him, under whose care he travelled through Palestine, Egypt, and various parts of the East. In 1703 he returned to his own country with lord Paget, who would have provided for him, but the death of his lordship deprived him of all hopes from that source. Some time afterwards he travelled for three years with sir W. Wentworth on the tour of Europe. In 1709 he appeared before the public as an author, by "A History of the Ottoman Empire," partly from materials which he collected in that country: in the same year he published a poem in favour of the earl of Peterborough, which introduced him to the favour of that nobleman, and to the notice of the heads of the Tory party. He now became manager of the Drury Lane theatre, for which he wrote his *Elfrid*, or the Fair Incontinent. Upon some difference with the duke of Kent, who was lord chamberlain, Hill threw up his theatrical management, which he had conducted entirely to the satisfaction of the public. He was a man of warm feelings, and a good deal given to projects. He obtained a patent for extracting oil out of beech mast, and a company of subscribers was formed for the purpose of carrying the undertaking into effect. The trial was fairly made, but experience shewed the folly of the scheme, and after three years it was abandoned. He became manager of the Opera house, and wrote for it the opera of *Rinaldo*, the first which Handel composed in England. About the year 1718, he published a poem, entitled the Northern Star, or a panegyric on Peter the Great, for which the empress Catherine sent him a gold medal. He died in February 1750, in his sixty-eighth year, and was interred in the cloisters of Westminster Abbey. His character has been given by one of his biographers in a few words; "he was a great schemer as well as a poet; but as in the former character he never acquired riches, so in the latter he never rose above mediocrity." His works were published in four volumes 8vo. after his death. He was a man of active and extensive benevolence: he was kind and affectionate in all the relations of society, and few men have been more beloved. Of his various plays, two of them, *viz.* *Zara* and *Merope*, are still occasionally brought forward with applause; but a dramatic writer and poet cannot claim a high rank, whose best pieces are translations.

HILL, in *Geology*, a less eminence or elevation on the surface of the earth, with respect to height and extent, than a *mountain*; which see.

To find the height of a hill, see the latter part of the article LEVELLING.

On the *structure* of hills it may be proper to observe, that the far greater part of the hills on the surface of the earth are occasioned by the *Excavation* of an adjacent valley, (see that article,) and such hills have the edges of the strata composing them only visible towards or in the slopes of such vallies; another class of hills, and which frequently form ridges of considerable length, is occasioned by the out-crop, basset, or *Ending* of rocks and other thick and hard strata, (see that article), and such hills only exhibit the edges of their strata on one side, which is more commonly their W. or N.W. side than any other, and which Mr. A. Aikin calls their escarpment, facing of which there usually is a plane or comparatively flat country: to the hills of this class are to be referred the edges of denuded tracts, like those of chalk which surround the wealds of Suffex, Kent, and Surrey, the grit-stone which surrounds the valley of Ashover, or the central lime-hill of brick in Derbyshire, the red marle which surrounds the Ashby-de-la-Zouch coal-field in Derbyshire and Leicestershire, the first grit rock which, like a lengthened horse-shoe, surrounds three sides of the great mi-

neral lime-stone tract of Derbyshire and Staffordshire, &c.: it being extremely rare, that faults or vertical derangements, or what M. De Luc calls angular motions of the strata, has occasioned hills or cliffs. A third class of hills has recently been denominated *Hummocks* by Dr. W. Richardson, (see that article,) and these are composed of piles of strata left in the area of a surrounding denudation, or abruption, just as labourers leave dead-men or buoys in removing tracts of ground, in order for their masters to see and thereby measure the quantity of earth which has been removed: these curious hills are not peculiar to the isolated knowles of low tracts, but after the hummocks of strata which have been removed for miles all around, form the highest points in the district. In the list of hills with the top stratum of each, which Mr. Farey has given in his Report on Derbyshire, (see also *Phil. Mag.* vol. xxxvii. p. 161.) a great number of hummocks are noticed: in this class of hills the top stratum, at least, has its edges on all sides exposed, as otherwise it would belong to one of the former classes, though frequently more edges of strata are to be seen on one side than on the other, particularly if the strata in the hummock have a considerable dip or inclination, and such are called by Mr. Jamefon shield-formed strata. (*Geognofy*, vol. iii. p. 64.) Gravel or other alluvial matters are often heaped upon hills, so as to form caps or hummocks thereon; and sometimes, though very rarely, hills may be found composed wholly of heaps or hummocks of gravel or alluvia. It remains to mention only one other class of hills, which are composed of unstratified masses, like those of Charnwood forest in Leicestershire, and numerous other anomalous masses or nodules in the red-earth or marle of England, the limestone-shale and others of the British series of strata, and of other parts of the world. On the height of British hills, we must refer to the ample lists given in Mr. Jamefon's *Geognofy*, vol. iii. pages 313 to 320; and for the strata which are found on the top of each of about 700 hills in Derbyshire and the adjoining counties, to Farey's Derbyshire Report, vol. i. p. 16.

HILL, in *Geography*, a town of America, in Virginia, on the Rappahannock; 17 miles N.N.W. of Urbanna.

HILL's Bay, a bay in Chesapeake bay. N. lat. 37° 32'. W. long. 76° 20'.

HILL Creek, a river of America, which runs into the Ohio, N. lat. 38° 57'. W. long. 84° 45'.—Also, a river of Maryland, which runs into the Potowmack, N. lat. 39° 40'. W. long. 78° 23'.

HILL and Trough, in *Mining*, are used to denote strata which alternately rise and fall in parallel lines, similar to the surface of ridges and furrows in some ploughed fields, hence called rigg and fur, or ridge and furrow, by the colliers, where the floor of their coals assume this shape, which sometimes, though rarely, is the case. The floor of the fuller's-earth mine, at Hogstyend, in Wavendon, Bucks, near Woburn, lies in ridge and furrow. The cause of these and other deviations from planes in the strata, undisturbed by faults, is deserving of great attention from geological observers.

HILLARY, in *Geography*, a town of Sweden, in the province of Smaland; 42 miles S.W. of Wexio.

HILLEBECK, a town of Norway, in the diocese of Aggerhuus; 13 miles S.W. of Christiania.

HILLEBRUN, a town of Sweden, in the province of Gestricia; eight miles N. of Gessle.

HILLEGURRY, a town of Hindoostan, in Bednore; 40 miles S.E. of Simogu.

HILLEL, called *Pollio* by Josephus, in *Biography*, was one of the most eminent men that ever existed among the Jewish doctors, for birth, learning, authority, and posterity. As to his birth, he was by his mother of the seed of David; with

with regard to his learning in the Jewish law and traditions, the Jewish writers, by an unanimous suffrage, assign him the first rank among all the ancient doctors of their nation: as to authority, he occupied the highest station of honour among his people during a succession of 40 years: for so long he filled the chair of president of the Sanhedrim at Jerusalem, with singular reputation and honour, rivalling in wisdom and justice his remote predecessor Simon the Just: and with respect to his posterity, he was succeeded in his high office, as well as in his learning and general celebrity, by his lineal descendants to the tenth generation. His immediate successor was his son Simeon, who is supposed to have been the same who took Christ in his arms, on his being first presented in the temple, and sung over him "Nunc dimittis," (Luke, ii.) After Simeon succeeded Gamaliel his son, who presided in the Sanhedrim, when Peter and the apostles were called before that council (Acts, v. 34.), and was the same at whose feet Paul was bred up in the sect and learning of the Pharisees (Acts, xxii. 3.) He was succeeded by his son Simeon, who perished in the destruction of Jerusalem. At a further distance in this line of descent was R. Judah Hak-kadosh, who is said to have composed the Mishna, and whose name on that account has been held in high veneration among the Jewish people. In the progression of this descent was Hillel the second, who was the compiler of the present calendar of the Jews. Hillel, as we have said, was descended on the side of his mother from the family of David, but by his father he was of the tribe of Benjamin. He was born in Babylon, and at the age of 40 years he came to Jerusalem, where he devoted himself to the study of the law, and attained to such eminence, that after 40 years he became president of the Sanhedrim, being then 80 years old, and continued in that office for 40 years, so that according to this account he lived 120 years. He was the founder of a famous school at Jerusalem, in which he educated above a thousand scholars in the knowledge of the law. Among his disciples, Shammai was the most celebrated, and came nearest to his master in learning of all the Mishnaical doctors: and accordingly he was appointed vice-president of the Sanhedrim. When Herod took possession of Jerusalem, in the first year of his reign, (A.D. 27.) he put to death all the counsellors of the great Sanhedrim, except Pollio and Sameas, *i. e.* Hillel and Shammai. When the latter became vice-president of the former, he did not always concur in opinion with his master. There were many points in which they differed; and this difference produced divisions and quarrels between their scholars, so that two parties subsisted among the Pharisees of that period; and the contention proceeded so far, that several were slain on both sides. At length, however, the school of Hillel prevailed against that of Shammai; the determination, as it is said, having been given for the former by a "Bath Kol," that is, by a voice pretended to have come from heaven, and by this fiction all disturbances among them were appeased. Hillel was of a mild and peaceable temper, but Shammai was of an angry and violent spirit; and hence proceeded most of the disputes and conflicts that occurred between the schools of these two great doctors, of which Shammai being at length weary, consented to terminate them by the fiction we have now mentioned. Prid. Conn. vol. iv.

HILLER, MATTHEW, a learned German divine of the Lutheran persuasion, was born at Stuttgart in the year 1646. He finished his studies at Tubingen, where he took the degree of M. A. in 1669. He obtained some church preferment, and was professor of logic and metaphysics at Tubingen, and in 1692 he was appointed to the Hebrew professorship. After this he was created professor in ordinary of the Greek and oriental languages. He died in 1725, at the age

of 79 years. He was author of "Sciographia Grammaticæ Hebrææ," and various other works.

HILLER, an ingenious and popular composer of comic operas at Leipzig, in the German language, the airs in which were in general favour among the lovers of simplicity and unlearned music, 30 years ago.

This worthy professor is a candid critic and biographer, and has been the careful editor of innumerable curious ancient and modern musical productions.

HILLEROD, in *Geography*, a town of Denmark, in the island of Zealand; burnt down in 1733, and rebuilt in the following year; 14 miles N.N.W. of Copenhagen.

HILLIA, in *Botany*, is a genus named by Jacquin, in honour of the celebrated fr John Hill, M. D. the author of various books on the subject of natural history.—Jacq Amer. 96. t. 66. Linn. Gen. 175. Schreb. 233. Willd. Sp. Pl. v. 2. 239. Swartz. Obf. Bot. 134. Mart. Mill. Dict. v. 2. Juss. 202. Lamarec. Illustr. t. 257.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Rubiaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, of six oblong, acute, erect leaves. *Cor.* of one petal; tube cylindrical, six-furrowed, very long; limb in six oblong, flat, deep segments. *Stam.* Filaments six, very short; anthers oblong, erect, within the throat of the corolla. *Pist.* Germen inferior, oblong, imperfectly hexagonal; style thread-shaped, the length of the tube; stigma capitate. *Peric.* Capsule oblong, compressed, of two cells. *Seeds* numerous, very small, pappose, affixed to the linear receptacle.

Ess. Ch. Calyx superior, of six leaves. Corolla six-cleft, very long. Berry inferior, with two cells and many seeds.

Obf. Six little leaves stand under the germen, (within the two larger bractæas,) which Swartz considers as an inferior calyx, but this appears to us so paradoxical that we prefer calling them bractæas.

1. *H. longiflora*. Swartz. Prod. 58. Curt. Bot. Mag. t. 721. Andr. Bot. Repof. t. 145. (*H. parasitica*; Linn. Sp. Pl. 1662.)—"Corolla of six lanceolate, revolute segments. Leaves ovate, acute." A native of moist shrubby places on the mountains of Jamaica, flowering in the summer. The plant is not strictly parasitical, though its roots creep amongst the mossy trunks and branches of old trees. Indeed the name *parasitica* has been supposed to have been bestowed on this plant in allusion to the literary character of the author, after whom the genus is named. It is a *shrub* about a fathom high, branching and smooth, with a shining, cinereous bark. Leaves opposite, spreading, entire, scarcely nervose, without veins; standing on round, smooth, foot-stalks. Flowers terminal, sessile, solitary, very long, white, and extremely fragrant; outer bractæas two, very large, tube of the corolla three or four inches long; anthers white. Stigma bilid, dark green.

2. *H. tetrandra*. Swartz. Prod. 58. Ind. Occ. v. 1. 630.—"Corolla of four ovate segments. Stamens four. Leaves obovate." Habitat the same as that of the last species. It flowers in August.—A *shrub*, three or four feet high. Roots creeping, and throwing out long fibres. Stem loosely branched, smooth. Leaves opposite, wedge-shaped at the base, somewhat fleshy, of a bright green. Flowers terminal and axillary, sessile, solitary, yellowish-white.

These are the only two species known to us, and indeed the latter is adopted entirely on the authority of Swartz.

HILLIARD, NICHOLAS, in *Biography*, a portrait-painter, who studied and imitated the works of Hans Holbein. He was the son of Nicholas Hilliard, a tradesman at Exeter, and was born in that city in 1547. He had the honour of painting the two rival queens, Elizabeth and Mary, queen of Scotland. He never obtained the solidity

and truth of Holbein in his works; his colour is weaker, and his drawing not so free nor true; yet he wrought with great neatness, enriched his pictures with pearls and jewels, touched with great delicacy and spirit; and the hair and beards of his portraits are painted in fine lines, and not, like Holbein's, soft and broad. He was very much employed by the nobility and gentry, and was admired and highly prized in his time. Enjoying his reputation to the age of 72, he died in 1619.

HILLIGENHAVEN, in *Geography*, a town of the duchy of Holstein, situated on the Baltic; 37 miles N. of Lubeck.

HILLOCK, a name often applied to a small fort of hill, as well as to little risings occasionally met with in sword lands, that are caused by ants and other animals. See **MOUNT**.

HILLOCK-ORE, in *Mining*, is a bad sort of smitham ore, which is dressed from the refuse vein-stuff on the mine-hillocks in Derbyshire, and is sometimes called pippin ore.

HILLOCKS, are the conical heaps of rubbish drawn from the lead-mines, and which usually surround the tops of the shafts; the following mines in Derbyshire have prodigious large hillocks of feaigh, or white vein-stuff, *viz.* Bondog-hole, in Middleton, by Wirksworth; Gang, in Cromford; Gregory, in Overton; Hill-top, in Middleton, by West Hucklow-edge, in Great Hucklow; Moss-rake, in Bradwell; Samuel, on Middleton moor, near Wirksworth, &c.; see Mr. Farey's list of mines, in his Report on Derbyshire, vol. i. The refuse of mines, or hillock-stuff, poisons fowls kept on or near it, by the small particles of lead-ore which they pick up along with their food.

HILLOCKY, a term signifying full of ant-hills.

HILLS, *Lake of the*, in *Geography*, a lake of North America, N. lat. 58° 36', into which the Elk river discharges itself. See **ATHABASCA** and **CHIEPEWYAN**.

HILLSBOROUGH, a market and post-town in the county of Down, province of Ulster, Ireland. It is a well built and thriving town, the property of the marquis of Downshire, who has a house in it. There is a magnificent church, built by the late earl of Hillsborough, grand-father of the present marquis, to whose exertions the town was much indebted for its flourishing state. It was formerly a borough which returned two members to parliament; but, like many others, lost its privilege on the Union. The magistrates are a sovereign and deputy sovereign, and the marquis of Downshire, who takes from it his title of earl, is hereditary constable of the fort. Hillsborough is 69½ miles N. by E. from Dublin, and 20 miles S.W. from Belfast. N. lat. 54° 26'. W. long. 6°.

HILLSBOROUGH, an island on the Labrador coast, on a bay at the head of which is Nain. N. lat. 57° 20'. W. long. 61° 20'.—Also, a county of America, in New Hampshire, bounded N. by Grafton county, S. by the state of Massachusetts, W. by Cheshire, and E. by Rockingham county; and containing 43,899 inhabitants, whose chief employment is agriculture. The chief towns are Amherst and Hopkinton.—Also, a post-town in the before-named county, situated on the northern head branches of Contocook river, about eighteen or twenty miles W. of Concord; incorporated in 1772, and containing 1311 inhabitants.—Also, a township in Somerset county, New Jersey, which contained, in 1790, 2201 inhabitants; 15 miles W. of Brunswick.—Also, one of the middle districts of North Carolina, bounded N. by the state of Virginia, S. by Fayetteville district, E. by Halifax, and W. by Salisbury, and comprehending the counties of Granville, Person, Caswell, Orange, Wake, Chat-

ham, and Randolph. It contains 80,012 inhabitants, of whom 22,198 are slaves. The chief town is Hillsborough.—Also, the town last-mentioned, capital of the district of its name, situated in Orange county, on the N. side of Eno river, in an elevated, fertile, and healthy country, and containing about 80 houses, a court-house, a gaol, and an academy; 180 miles W.N.W. of Newbern, and 452 S.W. by S. of Philadelphia.—Also, a post-town in Loudon county, Virginia; 33 miles from Washington.—Also, a river of East Florida, which runs into the gulf of Florida, N. lat. 27° 36'. W. long. 81° 30'.—Also, another river of East Florida, which runs into the gulf of Mexico, N. lat. 28° 10'. W. long. 82° 30'.

HILLSBOROUGH Bay, a bay on the N. coast of the island of Dominica, formed at the mouth of a river of the same name. N. lat. 15° 42'. W. long. 62° 22'.—Also, a bay on the S. coast of the island of St. John, in the gulf of St. Lawrence. N. lat. 46° 10'. W. long. 62° 40'.

HILLSBOROUGH Cape, a cape on the N.E. coast of New Holland. S. lat. 20° 56'. E. long. 148° 44'.

HILLSDALE, a post-town in Columbia county, New York, containing 4702 inhabitants; 15 miles E. of Hudson city.

HILLTOWN, or **HILTON**, a small town near the centre of Chester county, Pennsylvania; 28 miles W. of Philadelphia.—Also, a township of Bucks county, in the same state, having 1154 inhabitants.

HILLY LAND, in *Agriculture*, that description of ground which is much raised into hills. This sort of land requires much care and attention in its cultivation, especially in the ploughing, sowing, and working of the more elevated parts. See **HUSBANDRY**, **PLOUGHING**, and **TILLAGE**.

HILLO, in *Geography*, a river of Chinese Tartary, which runs into the sea of Japan, N. lat. 42° 54'. E. long. 134° 31'.

HILONGOS, a town on the W. coast of the island of Leyta. N. lat. 10° 25'. E. long. 124° 40'.

HILPOLTSTEIN, a town of Germany, in the territory of Nuremberg; 17 miles N.N.E. of Nuremberg.—Also, a town of Bavaria, in the principality of Neuburg; 27 miles N. of Neuburg.

HILSAH, a town of Hindoostan, in Bahar; 17 miles W. of Bahar. N. lat. 25° 18'. E. long. 85° 28'.

HILSBACH, a town of Germany, in the palatinate of the Rhine; 20 miles E. of Spire.

HILTERS, a town of Germany, in the bishopric of Fulda; 14 miles E. of Fulda.

HILTON, **JOHN**, in *Biography*, an English musician and publisher of music during the reigns of queen Elizabeth, James, and Charles I.: who, though he furnished a madrigal in the "Triumphs of Oriana," 1601, is found active as a composer and editor fifty years after.

He was a bachelor in music of the university of Cambridge, organist of St Margaret's Westminster, and also clerk of that parish. Though he began to flourish in the latter end of queen Elizabeth's reign, his genius for composition did not much expand, at least publicly, during the next reign; though early in that of Charles I. he published "Fa Las" for three voices, and in 1652, an excellent collection of catches, rounds, and canons, for three and four voices, under the quaint title of "Catch that catch can;" among which there are many by himself, that were deservedly admired by his cotemporaries, and which still afford great pleasure to the lovers of this species of humorous and convivial effusions. He died during the Protectorship, and was buried

buried in the cloister of Westminster Abbey. He is said to have had an anthem sung in that church, before his body was brought out for interment; but as not only the cathedral service was suppressed during this period, but the liturgy itself and every species of choral music, the fact seems unlikely and ill-founded.

HILTON Head, in *Geography*, an island of S. Carolina; W. and S.W. of which lie Pinckney's, Balls, Dawfuskie's, and some smaller islands; and between these and Hilton Head are Calibogie river and Sound, which form the outlet of May and New rivers.

HILTON's Point, lies in Piscataqua river, New Hampshire, and is the spot where the united streams of Newichawannock and Cochecho rivers meet the western branch, and form the Piscataqua. The course of the river, from thence to the sea being about seven miles, is so rapid, that the water never freezes.

HILUM, in *Botany*, the *Scar* or *Eye*, is that particular part of the seed attached to the seed-vessel, through which nourishment passes for the support of the internal parts. It is extremely visible in the bean, and as all the vessels belonging to the seed are found to meet in this point, and to divaricate from it, they must be intimately connected with the inner surface of the *hilum*. This point is often strongly contrasted in colour with the rest of the seed, as is the case in *Cardiospermum*, *Dolichos*, &c. "In describing the form or various external portions of any seed, the *hilum* is always to be considered as the base. When the seed is quite ripe, the communication through this channel is interrupted: it separates from the parent plant without injury, a scar being formed on each. Yet the *hilum* is so far capable of resuming its former nature, that the juices of the earth are imbibed through it previous to germination."

HIMANGO, in *Geography*, a town of Sweden, in the government of Wafa; 25 miles N.E. of Gamla Karleby.

HIMANTIA, in *Botany*, from *ἱμαίον*, *ἱμαίον*, a strap or thong of leather. Perfoon. Syn. 703. — *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Creeping, villous, branched and fibrous.

1. *H. domestica*.—Very large, brownish, inclining to violet, soft, cohering into a membranous substance.

This pernicious fungus is found occasionally in houses, insinuating itself, sometimes to the extent of an ell, amongst wrought wood, which it destroys.

2. *H. sulphurea*.—Pale sulphur-coloured, cottony, formed of roundish, entangled, branched fibres.—On the trunks of Fir-trees.

3. *H. candida*.—Parasitic on leaves, tender, white; dilated like a feather at the top.—This is the *Byssus candida* of Hudson, p. 607; *B. tenerrima villosa et elegantissimè ramulosa*; Dill. Musc. 7. t. 1. f. 15, A; frequent among decayed leaves, as those of hawthorn, in mossy dells in winter. It much resembles Mr. Dillwyn's *Conferva nivea*, Syn. n. 59. t. C. Perfoon mentions a larger and more unconnected variety, found on dry branches.

4. *H. lateritia*. (*Clavaria filiformis*; Bulliard, t. 448, f. 1.)—Wavy, somewhat branched, unconnected, red-brown; its summits swelling, whitish.—Found in France, on half-rotten leaves. It is described by Bulliard as sometimes brown, sometimes greyish-brown, but mostly of a brick colour.

5. *H. umbrina*.—Fibrous, tender, villous, dark brown.—Found rarely on dry fir wood. Distinguished from *Rhizomorpha corticalis*.

6. *H. farinacea*.—Red brown, dry, with a whitish powder;

its fibres depressed.—Found on wood and branches of trees. Ludwig.

HEMANTOPUS, *Long-legged Plover*, in *Ornithology*. See CHARADRIUS *Himantopus*.

HIMANTOSIS, in *Surgery*, a relaxation and lengthening of the uvula, which hangs down like a thong of leather, *ἱμαίον*; from which the word is deduced, having this latter signification.

HIMAS, the same as *Himantosis*.

HIMAEUS, or **IMAEUS**, in *Geography*. See HIMALEH.

HIMERA, in *Ancient Geography*, a town of Sicily, W. of Cephalenis, at the mouth of a river of the same name, now called *Salfo*. It is said to have been founded by a colony of Zaclians, about the year of Rome 104. It was destroyed by the Carthaginians under Hannibal, who took the place by assault, razed it to its foundation, and treated the inhabitants with great cruelty, in the year of Rome 350. Near this city were baths, called "Himeræ Therme."—Also, a town of Libya.

HIMIELA, **LA**, in *Geography*, a town of Spain, in the province of Jaen; 12 miles E. of Ubeda.

HIMMALEH, anciently called *Emodus*, *Himaus*, or *Imaus*, a range of mountains in Asia, extending from the Ganges, above Sirinagur, to Cashmere, and separating Cashmere and the dependencies of Hindoostan from Great Thibet, and Cashgar from Little Thibet. Himmaleh is a Sanscrit word, which signifies "snowy;" and the ancient appellations were probably derived from this term, to which Pliny seems to refer, when he says, "Imäus, incolarum lingua nivofum significante." This ridge of mountains appears to incline, in its northern course, towards the continuation of HINDOO-KHO, and even to join it. Here then, we are to imagine, an extensive tract, of a triangular form, whose base of 200 miles or more, is a line drawn from Cashmere to the eastern confines of Anderab; and whose sides are the continuation of Himmaleh on the E., and that of Hindoo-Kho on the W. This space contains, amongst other countries, those of Little Thibet (or Balti-estan), and Sakita; the *Bylta* and *Saca* of Ptolemy; as also Kuttore, which answers to the *Comedi* of the same geographer; it also contains the sources of the Indus. From the descriptions of *Little Thibet* and *Kuttore* (which see) we may conclude, that this whole space is mountainous, and that its general level is far elevated above the countries on either side of it. We have no particular information, says major Rennell, respecting the position of the range of mountains which forms the base, or southern side of the triangle; but circumstances lead us to conclude, that the highest of these mountains are far removed from the northern frontier of the provinces, subject to, or commonly regarded as a part of Hindoostan; and that the mountains which properly constitute the boundary of Hindoostan, towards Kuttore (or Caferistan), commence in the parallel of Cashmere, or about 34½ degrees; and extending westward from that celebrated country, separate Puckholi, Sewad, and Bijore on the south, from Caferistan on the north; and advancing from thence to a junction with mount Hindoo-Kho, in the line between Cabul and Anderab, separate Lumghan, which appears to have been the ancient frontier of Cabul, from those districts, which, after the time of Baber, were added to, and have since become a part of the province of Cabul; according to its defined limits in the *Ayin-Acharee*. On the north of this range, the whole country may be regarded as mountainous; on the south the mountainous tract is confined chiefly to Sewad, Bijore, Teerah, and a part of Puckholi. (Rennell's Mem.) By Col. Crawford's observations, a peak

of Himmaleh, seen from Patna, exceeds 20,000 feet above Nipal, which is probably 5000 feet above the sea.

HIMMUTNAGUR, a town of Bengal; 25 miles N.E. of Purneah.

HIMS, a town of Arabia, in the province of Lachfa, near the Persian gulf; 50 miles N. of Lachfa.

HIMTABADS, a town of Bengal; 25 miles W. of Dinagepour.

HIM-TCHAN, a town of China, of the third rank, in Pe-tche-li; 50 miles S.W. of Pao-ting.

HIN, a Hebrew measure, containing the sixth part of an epha; or one wine gallon and two pints.

HIN, in *Geography*, a city of China, of the second rank, in Chen-si. N. lat. $38^{\circ} 27'$. E. long. $112^{\circ} 22'$.

HINAL, a town of Mexico, in the province of Yucatan; 12 miles N. of Campeachy.

HINAGIE ISLANDS, three or four islands in the Indian sea, near the coast of Africa. S. lat. $6^{\circ} 50'$.

HINATOAN, a town on the E. coast of the island of Mindanao. N. lat. $8^{\circ} 12'$. E. long. $126^{\circ} 18'$.

HINCHA, or St. JEAN DE GOAVA, a town in the island of Hispaniola. N. lat. $19^{\circ} 14'$. W. long. $72^{\circ} 42'$.

HIN-CHANG, a town of China, of the third rank, in Kiang-nan; 25 miles W.N.W. of Cheou.

HINCHINBROKE, CAPE, a cape so called by capt. Cook, on the W. coast of North America, at the entrance into Prince William's sound; within which is an anchoring place, in eight fathoms water, with a clayey bottom, at about a quarter of a mile from the shore. N. lat. $60^{\circ} 15'$. E. long. 213° .

HINCHINBROOK ISLAND, one of the New Hebrides in the Southern Pacific ocean, a little to the north of Sandwich island; about six miles in circumference.—Also, an island in the S.E. part of Prince William's sound, near the W. coast of North America. Its form is triangular; it has a large bay on its N. coast, and is above 48 miles in circumference. N. lat. $60^{\circ} 24'$. E. long. $213^{\circ} 50'$ to $114^{\circ} 24'$.

HINCKLEY, a market town and parish in the hundred of Sparkenhoe, Leicestershire, England, is situated near the borders of Warwickshire. Soon after the conquest it was created a barony, and held by Hugh de Grentesmaifnel, who erected a stately castle and a parish church within this domain. "The ruins of the castle," says Leland, "now longyuing to the king, sumtyme to the earl of Leyrester, be a five miles from Leyrester, and in the borders of Leyrester forest, and the boundes of Hinckley be spatious and famous there." Even the earth-works of the castle are now nearly levelled. The ditch and town-wall may however be traced in many places, and also the vestiges of what are called two Roman works: a mount near the river, and the ruins of a bath adjoining the church. A priory was founded here, according to Tanner, by Robert Blanchmaines, and according to Dugdale, by Bossu, the father of Robert; but Mr. Nichols controverts both those claims, and ascribes it to Hugh de Grentesmaifnel, who gave the priory, with the appropriation of the parish church, to the abbey of Lira in Normandy. This priory, like all foreign cells, was often seized by the crown during the wars with France, and was wholly suppressed by Henry V. The parish of Hinckley is of very great extent, and includes Stoke-Golding, Dadlington, Wyken, and The Hyde, which, though distinct villages, (the latter being in the county of Warwick,) are considered as hamlets of Hinckley. The town, under its

original lords, certainly enjoyed the privileges of a borough; but being connected with the house of Lancaster, and taking a decided part on that side in the civil contest; those privileges, whatever their extent might be, became forfeited to the conquering monarch of the house of York. The town is now divided into the borough, and the bond without. The limits of the former were anciently those of the town; which has been extended by the successive addition of four streets. The civil government is vested in the mayor, constables, and headboroughs. The assizes for the county were formerly held here; and here were a gaol and a gallows. The parish church of Hinckley is an ancient edifice; the body of it is probably to be ascribed to the thirteenth century; the west door resembles those of the time of Edward I. or II.; the window immediately over it is supposed to be an improvement made about the reign of Edward IV.; at which period, the building of the steeple, which is 40 yards high, may, with probability, be dated. To the church of Hinckley four chapels were formerly annexed, that of Dadlington, and those of Wyken and Hyde, which have been long since demolished. The ancient chapel of Stoke was taken down at the beginning of the fourteenth century, by sir Robert de Champane, by whom the present church was then founded. The chapel of Dadlington bears evident marks of antiquity. Besides these places of worship on the establishment, there are in Hinckley five meeting-houses for Presbyterians, Independents, Quakers, Baptists, and Methodists; and a chapel for Roman Catholics. The trade of the town has been greatly augmented by the introduction of the stocking manufacture. The first frame was brought here before the year 1640, by William Iliffe, and is said to have cost him sixty pounds; which must have been a very considerable sum at that time, as the price of a good frame is not more at present than fifteen guineas. With this single frame, which, with the help of an apprentice, he kept constantly working night and day, he gained a comfortable subsistence for his family. The manufacture is now so extensive, that a larger quantity of hose is supposed to be made here than in any other town in England. Nottingham has more frames; but many of those being employed in the finest sorts of silk and cotton, the number of stockings there made is less than at Hinckley, where the frames are generally employed on strong serviceable hose, of a lower price, in cotton, thread, and worsted. The number of frames in the town and adjacent villages is computed at upwards of 1200, which furnish employment for nearly 3000 persons. Hinckley is 100 miles distant from London; has a respectable market on Mondays, and seven annual fairs. The population of the town and its dependencies, which has been progressively increasing, was returned to parliament in the year 1801 as 5686, inhabiting 1059 houses. At a short distance from the town is a spring, called The Holy Well, originally dedicated to the Virgin Mary, and once known by the name of Our Lady's Well. Nichols's History, &c. of Leicestershire.

In 1808, a new organ, which is a beautiful ornamental piece of mechanism, was set up in Hinckley church, by Mr. G. P. England of Tottenham-court road. It was erected by a liberal subscription, and cost 500 guineas. It has 21 stops, and contains 1370 pipes.

HIND, a female itag of the third year. See HUNTING.

HIND-*call*, a female hart of the first year. She fawns in April and May. Her flesh is softer than that of a hart, but not so flavory, and is dressed after the same manner. If it be roasted it ought to be larded, dipped in a marinade.

rinade or pickle, and moistened while it is roasting. See HUNTING.

HIND Hand, in the *Manege*. See HAND.

HINDAK, in *Geography*, a town of Asiatic Turkey, in Natolia; 25 miles S.W. of Boli.

HINDELOOPEN, a sea-port town of Holland, in the department of Friesland, situated on the Zuyder-see. It has no walls, and its harbour is small. It is governed by five burgomasters, and six eschevins. The inhabitants are chiefly employed in fishing, and building small vessels; 21 miles S.W. of Leuwarden. N. lat. 51° 58'. E. long. 5° 23'.

HINDENI HOMINES, formed from the Saxon *hindene*, a society or company, anciently signified a society, or club of men.

In the time of our Saxon ancestors, all men were ranked into three classes, or *hindens*; the *lowest*, the *middle*, and the *highest*; and they were valued according to the class they were in; that in case an injury were done by any one, satisfaction might be made according to the value or worth of the man it was done to.

The *lowest* were those who were worth ten pounds, or two hundred shillings; called *viri ducentini*, or *twybyndemen*, and their wives, *twybyndas*.

The *middle* were valued at six hundred shillings; and were called *sixbyndemen*, and their wives *sixbyndas*.

The *highest* were valued at twelve hundred shillings; and were called *twelvebyndemen*, and their wives the *twelvebyndas*.

HINDENNY, or **ENDRI**, in *Geography*, a river of Hindoostan, which passes by Adoni, and between Bishnagur and the Kistnah, falls into the Toombuddra.

HINDERAA, a town of Norway, in the diocese of Christianland; 20 miles N. of Stavanger.

HINDERABI, or **ANDARVIA**, an island in the Persian gulf, about three or four miles long, and one broad, separated from the coast of Persia by a channel half a league across, with depth of water from seven to 15 fathoms, and a muddy bottom. N. lat. 26° 44'. E. long. 54°.

HINDERSOE, a small island in the N. part of the gulf of Bothnia. N. lat. 65° 38'. E. long. 22° 24'.

HINDIA, a circar of Hindoostan, in Candeish, bounded N. by Bopal, E. by Kerleh, S. by the Taptee river, and W. by Bejapour. Its chief towns are Hindia, Hurdah, Husingabad, and Barawney.—Also, the capital of the fore-mentioned circar, situated on the Nerbudda; six miles E. S. E. of Indore. N. lat. 22° 35'. E. long. 77° 10'.

HINDMUND, or **HEERMUND**, a large inland river of Persia, in the province of Segistan, which rises from two widely separated sources, one in the mountains of Gaur, a part of the Hindoo-Kho, and the other far to the south from the mountains of Gabelabad. These streams join not far to the E. of Bost, whence the river pursues a westerly course, and, according to the account of Otter, very soon divides into many branches, which are lost in the central deserts of Persia. Our geographers, on the contrary, suppose that the Hindmund passes by Zarang into the sea of Zerch. Piaker-ton.

HINDOE, an island in the North sea, near the coast of Norway, about 150 miles in circumference. N. lat. 68° 36'.

HINDON, a market-town and borough in the county of Wilts, England, is noted in the annals of parliamentary history, and borough intrigues, for the contested elections that have occurred here. It is deemed an open borough, and the right of election vested in the bailiff and all the inhabit-

ants paying scot and lot; the number of which amounts to about 210. A notorious scene of bribery and corruption, respecting this borough, was developed before a committee of the house of commons in 1775, when it was determined, that out of four candidates, neither of them was duly elected a burgess, and that the speaker should not issue his warrant for a new writ. The committee were also of opinion that it would be expedient to dis-franchise the said borough. A bill was brought into parliament for this purpose, but was thrown out on account of some items of informality. A new bill was afterwards prepared, and read twice during the sessions of 1775, but being strongly opposed by counsellors, petitioners, &c. it was not passed that year. A third bill was brought in early in the following sessions, which was also relinquished, in consequence of the harassing opposition made to it. A new writ was then issued, and two members again returned for the borough. It is considered to be the property, and under the influence of the Beckford family, of Fonthill. A particular account of the preceding case, and proceedings, is given in the History of Boroughs, vol. iii. The first time it returned members to parliament was in the 27th year of Henry VI. Hindon consists principally of one long street, built on the declivity of a gentle hill; and is surrounded by part of the Downs. Here are a small weekly market held every Thursday, and two annual fairs. About two miles S. of the town is Fonthill-Abbey, the seat of William Beckford, esq. The building is singular, and its situation, seclusion, and history, are also replete with singularities. On the apex of a lofty hill, nearly the whole of which is covered with plantations, is a large building, assuming the exterior forms and character of a cathedral church. A lofty arched porch, an octagonal tower, with turrets, pinnacles, and gables, are seen rising above the trees, and together constitute a mass which may be seen at the distance of several miles in almost every direction. The interior of this mansion is however more an object of curiosity, and more calculated to excite admiration than the exterior. All the rooms are fitted up in a style imitative of the elaborate carvings, tabernacle work, &c. of the most decorated church architecture; to heighten the effect of which, paintings, gilding, sculpture, and the most costly articles in upholstery, &c. are all brought together. The richest treasures of the fine arts, and literature, are also enshrined within the walls; yet these curiosities and rarities are secluded from public view, and the whole plantations and house are environed by a high wall, surmounted by a chevaux de frise of iron.

HINDOO-KHO, or *Indian Caucasus* of Alexander, part of a long ridge of mountains in Asia, which forms the N.W. boundary of Cabul, and separates it from Balk and Badakshan. This ridge takes a N.E. direction, between Bamian and Anderab, after which it passes between the E. and N.E., until it appears again at the sources of the Jihon, (or Oxus,) at about 100 miles to the E. of the city of Badakshan; and from thence passing on to the N., it gives rise also to the Siron (on Jaxartes.) (See HIMALAÏE.) The city of Cabul is situated near the foot of this mountain. (See CABUL.) Between the mountains of Hindoo-Kho and those of Candahar, the country takes the form of an extensive valley, from Cabul to the borders of Korasan. The river Heermund or Hirmend issues from the north of these mountains, and the waters of Cabul from the east. Hindoo-Kho is continued westward, under the name of Gaur (which see), and in position answers to *Parepamisus*.

HINDOOS, the inhabitants of that part of India, denominated

HINDOOSTAN.

nimated Hindoostan, who profess the religion of the Brahmins. (See BRACHMANS.) They are called *Gentoos*. For an account of them, see that article. See also the next article.

HINDOOSTAN, a country of Asia, which, by the people of modern Europe, has been understood to mean the tract situated between the rivers Ganges and Indus on the E. and W.; the Thibetian and Tartarian mountains on the N; and the sea on the S. But strictly speaking, the extent of Hindoostan is much more circumscribed; and the name ought to be applied only to that part of the above tract, which lies to the N. of the parallels of 21 or 22°. The Nerbuddah river is, indeed, the reputed southern boundary of Hindoostan, as far as it goes; and the southern frontiers of Bengal and Bahar compose the remainder of it. The countries on the S. of this line, according to the Indian geographers, go under the general name of DECCAN; and comprise nearly one-half of the tract generally known by the name of the Mogul empire. But as the term Hindoostan has been applied in a lax sense to this whole region, it may be necessary to distinguish the northern part of it, by the name of Hindoostan *Proper*. This tract has indeed the Indus, and the mountains of Thibet and Tartary, for its western and northern boundaries; but the Ganges was improperly applied as an eastern boundary, as it intersects in its course some of the richest provinces of the empire; while the Burrampooter, which is much nearer the mark as an eastern boundary, was utterly unknown. In this circumscribed state, the extent of Hindoostan *proper* is about equal to France, Germany, Bohemia, Hungary, Switzerland, Italy, and the Low Countries, collectively; and the Deccan and Peninsula are about equal to the British islands, Spain, and Turkey, in Europe. See DECCAN.

The learned Mr. Wilkins assured major Rennell, that no such words as "Hindoo," or "Hindoostan," are to be found in the Sanscrit dictionary. The people among whom the Sanscrit language was vernacular, styled their country "Bharata." The Hindoos, however, call their country "Medhyama;" and they pretend that it was the portion of "Bharat;" one of the nine brothers, whose father had the dominion of the whole earth. (See Asiatic Researches, vol. i. p. 419.) It is then probable, that the word "Hind" furnished that of India to the Greeks; and the termination *Stan*, signifying country in the Persian, is of more modern date. It has happened, on this as well as similar occasions, that the name "India" has been applied not only to the country originally designed by it, but to others adjacent to and beyond it; for the countries between Hindoostan and China came to be called the *farther* India, or India *extra Gangem*; whereas Hind, or India, properly belonged only to the country of the people called Hindoos; or those of India *intra Gangem*. The name is as ancient as the earliest profane history extant; and this circumstance serves, as well as others, to prove the high antiquity of the Persian language. For other appellations of the Hindoos and Hindoostan, see GENTOO.

HINDOOSTAN, *History of*. Hindoostan, under one appellation or another, has laid claim to very high antiquity; but the earlier period of its history is involved in great obscurity and uncertainty. If we may credit the relations of some historians, the enterprising ambition of Sesostris, supposed king of Egypt about 1485 years B. C., induced him to fit out a fleet of 400 ships in the Arabian gulf, which conquered all the countries stretching along the Erythrean sea to India. At the same time, his army, led by himself, marched through Asia, and subjected to his dominion every

part of it as far as to the banks of the Ganges; and crossing that river, advanced to the eastern ocean. (Diod. Sic. lib. i.) Strabo, however, rejects the accounts of the Indian expedition of Sesostris; and he not only asserts, in the most explicit terms, that this monarch never entered India (lib. xv.), but he ranks what has been related concerning his operations in that country with the fabulous exploits of Bacchus and Hercules. Arrian also concurs in the same sentiments with respect to the exploits of Sesostris in India. (Hist. Ind. c. 5. Arrian, Exped. Alex.) And as Herodotus seems to have derived his information concerning India, not from the Egyptians, but from the Persians, it is probable that in his time there was little intercourse between Egypt and India. Dr. Robertson, in his "Historical Disquisition concerning India," has suggested a variety of considerations which evince the improbability of any such expedition as that of Sesostris into India. It is much more probable, that the Phœnicians, having wrested from the Idumæans some commodious harbours towards the bottom of the Arabian gulf, held from these a regular intercourse with India on the one hand, and with the eastern and southern coasts of Africa on the other. But as the distance from the Arabian gulf to Tyre was considerable, and the conveyance of goods by land tedious and expensive, they took possession of Rhinocolura, the nearest port in the Mediterranean to the Arabic gulf; and thus they were forwarded, partly by land and partly by sea, to Tyre. It is probable that Solomon's profitable traffic included that of India. As his kingdom extended from the Euphrates to the Red sea, and to the borders of the Red sea, (1 Kings, iv. 24.) it opened to him two of the great avenues to the east, by the way of the Red sea, and the Persian gulf. Volney suggests, that the object which Solomon had in view, when he took possession of Palmyra, was to use it as an emporium of the East India trade, by the way of the Persian gulf, and the course of the Euphrates. This was about 1000 years before our era. Solomon's trade, however, was merely temporary.

The first and most authentic accounts of Hindoostan are those which are given us by Herodotus, who lived 113 years before the expedition of Alexander the Great. From him (l. iv. c. 42. 44.) we learn, that Darius, the son of Hystaspes, explored regions of Asia formerly little known. Having subjected to his dominion many of the countries which stretched S. E. from the Caspian sea towards the river Oxus, his curiosity was excited to acquire a more extensive and accurate knowledge of India, on which they bordered. For this purpose he appointed Scylax of Caryandra to take the command of a squadron fitted out at Calpatyrus, in the country of Paçtya (the modern Pekkely), towards the upper part of the navigable course of the river Indus, and to fall down its stream until he should reach the ocean. After employing two years and six months in this expedition, he gave such an account of the populousness, fertility, and high cultivation of that region of India, through which his course lay, as rendered Darius impatient to become master of a country so valuable. This he soon accomplished; and though his conquests in India do not seem to have extended beyond the district watered by the Indus, he levied a tribute which amounted to near a third part of the whole revenue of the Persian monarchy. But neither the voyage of Scylax, nor the conquests of Darius, diffused any general knowledge of India. About 160 years after the reign of Darius Hystaspes, Alexander the Great undertook his expedition into India. Accordingly he set out from Bactria, and crossed that ridge of mountains, which, under various denominations, forms the "Stony Girdle" (to adopt the phrase of oriental geographers)

HINDOOSTAN.

geographers) that encircles Asia, and constitutes the northern barrier of India; and thus he discovered the route which was taken by the subsequent invaders of this country, Tamerlane and Nadir Shah. After passing the mountains, he encamped at Alexandria Paropamisana, not far from the mountains denominated the Indian Caucasus by his historians, and now known by the name of *Hindoo Kbo* (which see); and having subdued or conciliated the natives seated on the N.W. bank of the Indus, he crossed the river at Taxila, now Attock. He then marched forward in the direct road towards the Ganges, and the opulent provinces that lay towards the S.E., now comprehended under the general name of Hindoostan. But being opposed on the banks of the Hydaspes by Porus, a powerful monarch of the country, and by some other Indian princes, he was diverted from his route, and obliged to turn more towards the S.W., and to march through one of the richest and best peopled countries of India, now called the *Panjab*, (which see). It was his intention to have pursued his march to the Ganges, and the fertile regions through which that river flowed; but his troops, having already suffered much, unanimously refused to advance farther, and Alexander was obliged to issue orders for marching back to Persia. This memorable transaction took place on the banks of the Hyphasis, which was the utmost limit of Alexander's progress in India; so that he did not traverse the whole extent of the Panjab. Upon his return to the Hydaspes, he found that the officers, with whom he had entrusted the charge, had assembled a numerous fleet, which he declined to sail down the Indus to the ocean, and from its mouth to proceed to the Persian gulf, that a communication by sea might be opened with India and the centre of his dominions. The conduct of this expedition was committed to Nearchus; and he was accompanied down the river by Alexander himself with a very great and magnificent armament. The distance to the ocean was no less than 1000 British miles, and the navigation occupied nine months. Of the extensive region through which they passed, a considerable portion, particularly the Upper Delta, stretching from the capital of the ancient Malli, now Moultan, to Pataia, the modern Tatta, is distinguished for its fertility and population. Alexander, having accomplished this object, led his army back by land to Persia; and Nearchus, after a coasting voyage of seven months, conducted the fleet safely up the Persian gulf into the Euphrates. With respect to the general state of India we learn, that in the age of Alexander, though there was not established in it any powerful empire, resembling that which in modern times stretched its dominion from the Indus almost to Cape Comorin, it was even then formed into monarchies of considerable extent. From the memoirs of Alexander's expedition, preserved by Arrian, we also derive the first authentic information concerning the climate, the soil, the productions, and the inhabitants of India; and it is remarkable that the descriptions given by Alexander's officers delineate what we now behold in India, at the distance of 2000 years. The stated change of seasons, now known by the name of "Monsoons," the periodical rains, the swelling of the rivers, and the inundations occasioned by them, and the appearance of the country during their continuance, are particularly mentioned and described. No less accurate are the accounts which they have given of the inhabitants, their delicate and slender form, their dark complexion, their black uncurled hair, their garments of cotton, their living entirely upon vegetable food, their division into separate tribes, or "caits," the members of which never intermarry, the custom of wives burning themselves with their deceased husbands, and many other particulars; in all which they per-

fectly resemble the modern Hindoos. Alexander, however explored only a small portion of the vast continent of India. His operations did not extend beyond the modern province of Lahore, and the countries on the banks of the Indus, from Moultan to the sea. In India, however, he founded two cities on the banks of the Hydaspes, Nicæa and Bucephalia, and a third on the Acesines, both navigable rivers, which, after uniting their streams, fall into the Indus. By means of these cities he evidently intended to keep open a communication with India, not only by land but by sea; and also by clearing the navigation of the Euphrates and Tigris, he proposed that the valuable commodities of India should be conveyed from the Persian gulf into the interior parts of his Asiatic dominions, while by the Arabian gulf they should be carried to Alexandria and distributed to the rest of the world. Seleucus, one of the successors of Alexander, entertained high ideas of the advantages that might be derived from a commercial intercourse with India, and with a view of securing and extending them, he marched into the country, and advanced considerably beyond the utmost boundary of Alexander's progress. In order to obtain some knowledge of the country and the manner of its inhabitants, he selected Megasthenes, who had accompanied Alexander in his expedition to India, and deputed him as ambassador to Palibothra, the famous capital of the Prasi, situated on the banks of the Ganges. Here he resided several years, and was probably the first European who ever beheld that mighty river, far superior to any of the ancient continent in magnitude, and no less distinguished by the fertility of the countries through which it flows. By this journey and settlement of Megasthenes, the Europeans gained an acquaintance with a large extent of country of which they had not hitherto any knowledge. From his writings the ancients seem to have derived almost all their knowledge of the interior state of India, and the ample accounts of Diodorus Siculus, Strabo, and Arrian, appear manifestly to be a transcript of his words. But Megasthenes, being fond of the marvellous, has unfortunately blended with the truths which he related many extravagant fictions, and diminished our confidence in his other relations. The embassy of Megasthenes to Sandracottus, and another of Daimachus to his son and successor Allitrochidas, are the last transactions of the Syrian monarchs with India, of which we have any account. Nor can we fix with accuracy the time, or describe the manner in which their possessions in India were wrested from them. It is probable that they were obliged to abandon the country soon after the death of Seleucus. When Bactria, originally subject to Seleucus, became an independent state about 69 years after the death of Alexander, the link of the chain that connected India with Syria was broken. The Indian trade was about the same time transferred from Tyre to Alexandria in Egypt, where it flourished under the auspices of the Ptolemies, (see BERENICE,) until Egypt became a Roman province, and was continued on a more extensive scale by the Romans themselves; nor did it forsake Alexandria until the re-discovery of the passage by the Cape of Good Hope. This traffic opened to the Egyptians and Romans a knowledge of the coasts and products of India. It is extraordinary, however, considering how much the detail of the coasts was known to Ptolemy, that the general form of his map should so much deviate from the truth; for he makes the coasts between the Indus and Ganges to project only in a slight curve; whereas, they are known to form the sides of a triangle, whose perpendicular almost equals its base; Cape Comorin being the apex of it. Whoever, says major Rennell, compares the proportional dimensions of India, found

HINDOOSTAN.

in Diodorus Siculus, Pliny and Arrian, will find them tolerably just; and will be inclined to think that the worst set of ancient maps of India has travelled down to us; and that Ptolemy, in constructing his map of that part, did not express the ideas of well-informed people of his own time on that subject. Pliny was about 60 years before Ptolemy, and Arrian about 20 years after Ptolemy; their accounts of the dimensions of India were taken from Eratosthenes and Megasthenes. Diodorus says, that India is 32,000 stadia from N. to S., and 28,000 from E. to W.; that is, the breadth is seven-eighths of the length. Arrian gives the measures collected by Eratosthenes and Megasthenes; and says, that India is bounded on the W. by the Indus; on the N. by a continuation of Mount Taurus, called in different parts Paro-pamisus, Emodus, and Himaus; and on the S. by the ocean, which also shuts up the eastern parts of it. Few authors, (says he,) have given us any account of the people that inhabit towards the mouths of the Ganges, where Palibothra is situated. The distance from the mountains, at the head of the Indus, to its mouth, according to Eratosthenes, is 13,000 stadia; and from the said mountains to the eastern sea, the extent is somewhat less; but as a huge tract of land runs out 4000 stadia into the sea, (meaning the peninsula,) it may be reckoned 16,000 stadia; the distance from Palibothra to the western extremity of India, measured along the great road, is 10,000 stadia; and the whole length, (that is, from E. to W.) is 20,000 stadia. Arrian, likewise, gives the measures according to Megasthenes, who reckoned India 22,300 stadia from N. to S., and 16,000 broad from E. to W.; making that the breadth which Eratosthenes reckons the length. Megasthenes's proportion is, on the whole, according to major Rennell, the truest; for India is about 28 degrees of a great circle in length from N. to S.; or from the Indian Caucasus to Cape Comorin; and about 20° in breadth from the Indus to the mouth of the Ganges; and reckoning from the most distant mouth of each river, it will be 22° in breadth. Thus we see that Arrian had as just an idea of the proportional dimensions of India, as we had 40 years ago; for it was then reckoned narrower than the truth by at least two degrees. Pliny gives the measures along the coasts between the mouth of the Ganges and Pattala, (or Tatta,) in the mouth of the Indus at 3320 miles, *i. e.* according to Rennell, Roman miles of 1000 paces. The true measure of these coasts, rejecting the sinuosities, and attending only to the general form, is 40 degrees of a great circle. Allowing, with M. D'Anville, 75 Roman miles to a degree, the above number of miles will amount to 44° instead of 40°, the true measure; but reckoning the pace at four feet 10.02 inches English, there ought to be 78½ Roman miles to a degree, and thus the 3320 Roman miles will be 42°, or within ½ part of the truth. Pliny, therefore, it is evident, knew nearly the form of the peninsula; and Ptolemy was ignorant of its general form, although he knew so much concerning the particulars.

Arrian's geography of India relates chiefly to the northern parts, or those seen by Alexander and Megasthenes; and his catalogue of rivers contains only those that discharge themselves into the Ganges or Indus.

It is unquestionable, that the Hindoo or Braminical religion was universal over Hindoostan and the Deccan, before the time of Alexander's conquest, according to the accounts given us by Herodotus and Arrian. But though there might be an universality of religion, there were many distinct languages; and history, both ancient and modern, assures us that India was divided into a number of kingdoms or states, from the time of Herodotus down to that of Acbar.

There appears, however, to have been, generally, independently of these divisions, a large empire or kingdom, which occupied the principal part of that immense valley or plain, through which the Ganges takes its course; the capital of which has fluctuated between Delhi and Patna, as the limits of the empire have varied. This kingdom was that of the "Prasii," and "Gangaridæ;" in the times of Alexander and Megasthenes; which appears, by the strength of its armies and the number of elephants trained to war, to have been very powerful. This kingdom, as major Rennell supposes, could not have been less in dimensions than France, extending westward to the Panjab country, and including at least part of Bengal; and, as Arrian describes it, its state was rich. The inhabitants were good husbandmen, and excellent soldiers; governed by nobility, and living peaceably; their rulers imposing upon them nothing harsh or unjust.

Major Rennell observes, that there is no known history of Hindoostan (resting on the foundations of Hindoo materials, or records,) extant, before the period of the Mahomedan conquests; for either the Hindoos kept no regular histories, or they were all destroyed, or secluded from common eyes by the Pandits. The travels of Cosmas in the sixth century (see COSMAS), and of the two Mahomedan travellers in the ninth, afford few materials for history; and but little can be gleaned from Marco Paolo, a Venetian nobleman, who crossed the peninsula, and went up the western side of it to Guzerat, in the 13th century. It is chiefly to Persians that we are indebted for that portion of Indian history which we possess. The celebrated Mahomed Ferishta, early in the 17th century, compiled a history of Hindoostan, from various materials, most of which, according to Col. Dow, who translated this history, were collected from Persian authors. But the translator allows, that the most valuable part of this history is that posterior to the first Mahomedan conquests, about the year 1000. The first Mahomedan conqueror, who made any establishments in Hindoostan, was Mahmood, emperor of *Ghizni*; which see. In the year 1000 he entered Hindoostan; and although in 1008 all the Hindoo princes, from the west of the Ganges to the river Nerbuddah, united against him, for the common defence of their religion, which he wished to extirpate, and which he actually attempted to annihilate by the savage destruction of their temples, they were defeated. After several successful but desolating expeditions, Mahmood died in 1028, possessed of the eastern, and by much the largest part of Persia; as well as, nominally, of all the Indian provinces from the western part of the Ganges to the peninsula of Guzerat, and from the Indus to the mountains of Agimere; but the Panjab was the only part of it that was subjected to regular government under the Mahomedans; as being in the vicinity of the Ghiznian empire. As for the Rajpoots of Agimere, they still preserved their independence, among their rugged mountains, and close vallies; and not only then, but, in a great measure, down to the present time; being, in respect of Hindoostan, what the country of Switzerland is to Europe; but much more extensive and populous. From Mahmood to Aurungzebe the Indian conquerors were contented with the nominal subjection of those hardy tribes; among whom, military enthusiasm, grafted on religious principles, is added to strength and agility of body; and this race is disseminated over a territory equal to half the extent of France, as it existed before the late revolution. It goes under the general name of Rajpootana; and is the original country of the founder of the Mahratta state; whose ruler, about half a century ago, aspired at universal empire in Hindoostan. (See MAHRATTAS.) Upon the death of Mahomed Gori, in 1205, the
Indian

HINDOOSTAN.

Indian part of the Ghiznián empire, then divided, fell to Cuttub, who founded the Patan or Afghan dynasty in Hindoostan. The Afghans originally inhabited the mountainous tract lying between India and Persia, or the ancient Paropamisus. (For their history, see ARGHIANS.) Before Cuttub's elevation to the throne, he had carried his arms under Mahomed Gori, into Agimere and Guzerat. Lahore was, originally, his capital; but with a view of fixing the imperial residence nearer to the centre of his conquests, he removed to Delhi. The emperor Altunsh, who succeeded to the Patan throne in 1210, completed the conquest of the greatest part of Hindoostan proper. He appears to have been the first Mahomedan that made a conquest of Bengal; and it was during this reign (1221) that Gengiz Cawu, among his extensive conquests, accomplished that of the empire of Ghizni; but he left Hindoostan undisturbed. About A. D. 1243, the Moguls, or Munguls, successors of Geniz, who possessed, or rather over-ran the countries on the N. W. of Hindoostan, made several irruptions into it; but it was not till more than 150 years afterwards, that, under Timur, or Tamerlane, they penetrated into the centre of India. The provinces of Hindoostan were held rather as tributary kingdoms, than as provinces of the same empire; and they seldom failed to revolt when a favourable opportunity offered. Of the state of the internal government of Hindoostan, a judgment may be formed by the punishment inflicted on the Mewatti, or the Banditti tribe, which inhabit the hilly tracts within 25 miles of Delhi. In 1265, 100,000 of these wretches were put to the sword, and a line of forts was constructed along the foot of their hills.

“Rebellions, massacres, and barbarous conquests,” says major Rennell, “make up the history of this fair country (which, to an ordinary observer, seems destined to be the paradise of the world); the immediate effect of the mad ambition of conquering more than can be governed by one man: for the whole empire being portioned out to rapacious governors, who domineering over the governed, until their spirits were sufficiently debased, were at last able to persuade them, that their common interest lay in taking up arms, to render these governors independent.”—“It would appear as if the warm climates, and more especially the open countries, situated within them, were destined to be the seats of despotism; for that the climate creating few wants, and the soil being productive without any great exertion; the inhabitants of it do not possess those energies that, in a cooler climate, prompt mankind to investigate their natural rights, and to assert them. This, however, is a point that I shall not venture to decide on; although I believe it is a fact not to be disputed, that throughout the known parts of the world, despotism prevails most in the warm climates. The Patan, Mogul, and Tartarian conquerors in Hindoostan and China, however hardy at first, have, in a course of ages, sunk into the same state of effeminacy with their subjects; and, in their turn, have, with them, received a new matter. Let those who are in the habit of complaining of the severity of a northern climate, reflect, that whatever physical evils it may produce, it matures the great qualities of the mind; and renders its inhabitants pre-eminent among their species; while a flowery poet, or a more flowery hillorian, is the most eminent production of the tropical regions.” (See CLIMATE.)

The Moguls, having gained acquisitions in the provinces on the W. of the Indus, in consequence of the neglect of the kings of Delhi, at length crossed that river, and invaded the Panjab; and so formidable did they appear to Feroze II., that some tribes of them were permitted to settle in that

country. (A. D. 1292.) In 1293 this emperor projected, at the suggestion of Alla, governor of Gurrah, an attack upon the Deccan, a tract nearly equal in extent to what he actually possessed in Hindoostan, and which extended from the shores of the Indos to the mouth of the Ganges, and from the northern mountains to Cattack, Sirong, and Agimere; the greatest part of Malwa, with Guzerat and Sindi, being then independent. Alla, incited first by avarice, having succeeded in his object, deposed and murdered the emperor, and took possession of the throne in 1295, beginning his plan of conquest by the reduction of Guzerat; but while he was pursuing his conquests, the watchful and restless Moguls penetrated even to Delhi, and plundered its suburbs. Alla, having extended his victories and possessions, died in 1316. At this period all Hindoostan proper was comprehended in the Patan empire (so called from the dynasty in possession of the throne), and the interior policy is said to be so well regulated, that strangers might travel through the empire in perfect security. Feroze III., who succeeded in 1351, appeared more desirous of improving the empire, after the defection of Bengal and the Deccan, &c. than of extending it by arms. Accordingly, canals and public works, for the improvement of agriculture and of the inland navigation, were his favourite objects during a reign of thirty-seven years. The Moguls made another irruption in 1357; and after the death of Feroze, in 1388, rebellion and civil war, during a course of several years, prepared the empire for foreign subjection, and a minority in the person of Mahmood III., who succeeded in 1393, brought matters to a crisis. In this state of things, Timur, who had already extended his empire over all the Western Asia and Tartary, turned his arms towards Hindoostan in 1398. In the preceding year his grandson Peer Mahomed had prepared the way by reducing the Panjab and Moultan; and before the close of the year, he himself crossed the Indus, and took possession of Delhi without a battle. “This inhuman monster,” says Rennell, “who had credit enough with a poet of the (last) century, to be introduced on the stage, as a hero, possessing great and amiable qualities, obtained in Hindoostan the title of “the destroying prince;” and was truly worthy of it, from the numerous massacres and exterminations executed under his immediate direction.” He was rapid in his destructive movements; he spent little more than five months between the time of his crossing and re-crossing the Indus; and he appears to have paid more attention to seasons than Alexander had done; as Timur chose the fair season for his expedition, whereas Alexander was in the field, in the Panjab, during a whole rainy season. Timur, however, may be said rather to over-run than to subvert or conquer: for he did not disturb the order of succession in Hindoostan, but left Mahmood on the throne, reserving to himself the possession of the Panjab country only; which his successors did not long retain. During his life, which ended in 1405, he was prayed for in the mosques of Hindoostan, and the coin was struck in his name; but this might be more the effect of policy in the usurpers of Mahmood's throne than the act of Timur. It does not appear that he carried much treasure with him out of Hindoostan. But Nadir Shah's acquisition of the precious metals, at a later period, was great beyond all ideas of accumulation in Europe; and is only to be accounted for by the influx of those metals from America, during that interval. The death of Mahmood happened in 1413; and with him ended the Patan dynasty, founded by Cuttub in 1205. The throne was then filled by Chizer, a Seid, one of the race of the prophet Mahomed, whose posterity occupied it until the year 1450, when Belloli, an Afghan of

HINDOOSTAN.

the tribe of Lodi, took possession of it, on the abdication of Alla II., under whom all Hindoostan fell into separate governments. The son of Belloli recovered a considerable part of the empire, and in 1501 made Agra the royal residence. It was during this reign that the Portuguese first accomplished the passage to India by the Cape of Good Hope. The empire fell again into utter confusion under Ibrahim II. in 1526; and this paved the way for the conquest of Hindoostan by Sultan Baber, a descendant of Tamerlane and of Gengiz Khan; who reigned over a kingdom composed generally of the provinces situated between the Indus and Samarcand. Dispossessed of his dominions by the Uzbeks, he determined to try his fortune in Hindoostan, whose distracted situation flattered his hopes of conquest. From Cabul, where he resided, he undertook his first expedition across the Indus, in 1518. In his fifth expedition (A.D. 1525) he defeated the emperor of Delhi, and put an end to the dynasty of Lodi. Baber reigned only five years in Hindoostan, during which time his chief employment was the reduction of the eastern provinces. His son Humaioun succeeded him in 1530; but though he was a prince of considerable abilities and great virtues, he was driven from his empire in 1541. During his expulsion, his son Acbar was born, whom we may reckon among the greatest of the sovereigns of Hindoostan. The state of this country was so unsettled, that no less than five sovereigns appeared on its throne in the course of nine years. A strong party in Hindoostan invited Humaioun back; and he returned in 1554, but died in the following year. His good character facilitated the accession of his son Acbar, who was about the age of fourteen years, in 1555, when his father died. For a general account of Acbar's character and reign, we shall refer to the biographical article **AKBAR**, and also to the history of Hindoostan by Col. Dow. We shall here add some further particulars. As in the person of Baber, the line of Tamerlane first ascended the throne of Hindoostan, so in that of Acbar, the grandson of Baber, it may be said to have been established. The conquest of their ancestor, about a century and a half before, had no share in effecting the present settlement. Baber was in reality the founder of the Mogul dynasty; and from this event Hindoostan came to be called the "Mogul" empire. The first years of Acbar's reign were employed in the reduction of the revolted provinces from Agimere to Bengal; and his conquests were secured by a proper choice of governors, by wise regulations, by an unlimited toleration of religion, and by a proper attention to the propensities of the people; to all which a long and vigorous reign was peculiarly favourable. The Hindoos still formed the bulk of the people; even in those provinces, which, from their vicinity to the country of the conquerors, had been the most frequently over-run; and experience had taught the Mahomedan conquerors that the passive religion and temper of the Hindoos would, if left to themselves, never disturb the established government. But the Deccan was a stumbling-block to the Mogul emperors, and therefore engaged the particular attention of Acbar. See **DECCAN**.

Acbar, who died in 1605, was succeeded by his son Selim, under the appellation of Jehanguire, who reigned about 22 years. It was in this reign, and in the year 1615, that sir Thomas Roe was sent as the first English ambassador to the emperor of Hindoostan. The Portuguese had by this time acquired considerable settlements in Bengal and Guzerat; but only those in Guzerat, where they also possessed some extent of territory, attracted the notice of the court. Shah Jehan succeeded his father in 1628; and during this reign, *viz.* in 1633, the first serious quarrel happened between the Euro-

peans (Portuguese) and Moguls; and the Portuguese were expelled from Hoogly, on the Ganges. In 1658 the civil war was commenced between the emperor and his sons, as well as between the sons themselves; which terminated in the elevation of Aurungzebe, the third in descent, after he had deposed his father, and murdered or expelled his brethren. For an account of his life and reign, see **AURUNGZEBE**. Aurungzebe was succeeded by his son Manzum, who took the title of Bahader Shah, and reigned five years. Whilst he was meditating the reduction of the Rajpoot princes of Agimere, who had formed a strong confederacy, his attention was engaged by the Seiks, a new sect of religionists, who appeared in arms in the Lahore province, and ravaged the whole country from thence to the banks of the Jinnah river. These Seiks had silently established themselves along the foot of the eastern mountains during the reign of Shah Jehan. They differ from most religionists in that, like the Hindoos, they are perfectly tolerant in matters of faith, and require only a conformity in certain signs and ceremonies; but, unlike the Hindoos, they admit profelytes. They are now become one of the most potent states in Hindoostan. These were, after much trouble and delay, reduced by the emperor, who then took his residence at Lahore, where he died in 1712. A contest for the empire took place between his four sons; and this ended in the establishment of Jehaunder; but at the end of nine months he was dethroned by Ferozkere, great grandson of Aurungzebe. It was in this reign that the English East India company obtained the famous "Firman," or grant, by which their goods of export and import were exempted from duties, or customs; and this was regarded as the company's "Commercial Charter in India," while they stood in need of protection from the princes of the country. In 1717 Ferozkere was deposed, and blinded by the Seids, who assumed the disposal of the empire and all its concerns. From this time affairs declined very rapidly; and the empire, which had acquired some degree of consistency under the house of Timur, was now about to be dismembered in a degree beyond what it had experienced, even before the era of the Mahomedan conquests. Mahomed Shah, grandson of Bahader Shah, was placed on the throne by the Seids in 1718; but he contrived, by a rebellion and a battle, to get rid of the Seids. About this time, Nizam-ul-Muluck, viceroy of the Deccan, was rising into power, and meditating independency; and while he was formidable in the south, the Mahrattas directed their attacks against the middle and northern provinces. Malwa, and the open parts of Agimere, were over-run by them; and their detachments insulted even the capital of the empire. The weak Mahmood had, in the early part of his reign, endeavoured to conciliate them, by paying them a tribute, amounting to one-fourth of the net revenue of the invaded provinces; but this concession only increased their insolence, and terminated in their seizing on the provinces themselves.

In 1738 the Nizam invited Nadir Shah, the usurper of the Persian throne, who was then engaged in the siege of Candahar, to invade Hindoostan, hoping to profit by the confusion which would thus be occasioned. In the following year Nadir Shah entered Hindoostan; but the state of things being at this time uncertain, he offered to evacuate the empire for 50 lacks of rupees (half a million). But the intrigues of the Nizam and his party occasioned the weak emperor to throw himself on the clemency of the invader, who entered Delhi, and demanded 30 millions sterling, by way of ransom. Tumults, massacres, and famine, were the result; 100,000 of the inhabitants were massacred, and 62 millions of plunder were said to be collected. Nadir mar-

ried

ried his son to a grand-daughter of Aurungzebe, restored Mahomed Shah to his throne, and returned to Persia, after obtaining the cession of all the countries subject to Hindoostan, lying on the W. of the Indus. The Nizam was thus left in possession of the whole remaining power of the empire, which he sacrificed to his own views in the Deccan, where he established an independent kingdom for himself. The Mahratta invasions of the Carnatic in 1740 and 1741, and the defeat and death of Doast Ally, nabob of Arcot, by their arms, called the Nizam home, who, on his arrival, settled the Carnatic, by placing Anwar O'dien, father of Mahomed Ally, in the nabobship of Arcot, which was then understood to comprehend nearly the present Carnatic. Bengal became independent of Delhi a little before this time (1738), under Aliverdy Cawn; and not long after it was invaded by a vast army of Mahrattas, both from Poonah and Berar, under the sanction of the emperor's name, who, unable to satisfy their demands, sent them to collect for themselves the arrears of revenue since the defection of Aliverdy. About the same time, the Rohillas, a tribe from the mountains that lie between India and Persia, erected an independent state on the E. of the Ganges, and within 80 miles of Delhi. These appeared very strong symptoms of the total dissolution of the empire. Nadir Shah died in 1747; and Abdalla, one of his generals, seized on the eastern part of Persia, and on the bordering provinces of India, that had been ceded by Mahomed Shah to Nadir; and these he formed into a kingdom, known at present by that of Candahar, or the country of the "Abdalli," comprizing nearly the ancient empire of Ghizni. Mahomed Shah, who died this year, after a reign of 29 years, was succeeded by his son, Ahmed Shah. During his reign of six years, the entire division of the empire took place; nothing remaining to the house of Timur except a small territory round Delhi, together with the city itself (now no longer a capital), exposed to repeated depredations, massacres, and famines, by the contests of invaders. The last army that might be reckoned "imperial," was defeated by the Rohillas in 1749, by which their independence was firmly established in the eastern part of the province of Delhi. The Jates, or Jats, a Hindoo tribe under Soorage-Mull, established themselves, and founded a state in the province of Agra. The Deccan and Bengal were usurped by the Nizam and Aliverdy. Oude was seized on by Seiklar Jung, father to the late Sujah Dowlah, and grand-father to the subsequent reigning nabob of Oude, Azoph Dowlah; Allahabad by Mahomed Kooli; Malwa was divided between the Poonah Mahrattas, and several native princes, and Zemindars; Agimere reverted of course to its ancient lords, the Rajpoot princes; and the Mahrattas possessed, in addition to their share of Malwa, the greatest part of Guzerat, Berar, and Orissa, besides their ancient domains in the Deccan. Abdalla, having established his new kingdom very early in this reign, entered Lahore and Moultan (or the Panjab) with a view to the conquest of them. Thus the whole country of Hindoostan proper was in commotion from one extreme to the other, and universal anarchy prevailed. Perhaps, in the annals of the world, it has seldom happened that the bonds of government were so suddenly dissolved, over a portion of country containing at least 60 millions of inhabitants. Upon the death of the Nizam in 1748, contests ensued for the throne of the Deccan, and occasioned the interference of the French and English, as auxiliaries, in the wars that happened in consequence of them, and that lasted till the year 1754. The result enabled the English to establish their security and influence in the Carnatic; and the French, in addition to the solid advantage of getting posses-

sion of the northern circars, valued at half a million sterling, of annual revenue, gained the splendid but uncertain privilege of influencing the councils of the Nizam, by attending his person with their army. The Mogul was now become merely nominal, and the emperors were deprived in a great degree of their importance. Usurpers, however, endeavoured to obtain the sanction of their names, and the coin, throughout the whole tract, known by the name of the Mogul empire, is to this day struck in the name of the nominal emperor. In 1753 the emperor Ahmed was deposed by Gazi, after having reigned about six years.

In the preceding year the Mahrattas had been called in to assist in reducing the Jats, who were in possession of Agra, and became troublesome neighbours to the emperor; and in the present year the Berar Mahrattas established themselves in Orissa, by cession from Aliverdy, nabob of Bengal, who was also compelled, for a short time, to pay them a tribute for Bengal and Bahar, amounting to one-fourth of the clear revenue. This, together with the Mogul's former permission to collect the arrears of revenue due to him, is the foundation of their claims on Pengal and Bahar; and which they have never relinquished, although the times may have been unfavourable to their asserting them. Allumguire II. grandson of Bahader Shah, was placed by Gazi on the nominal throne; but Abdalla, being at this time in possession of Lahore, threatened Delhi, and in 1756 he laid the unfortunate city under heavy contributions. The emperor and his family were now reduced to the lowest state of royalty, alternately soliciting the assistance of Abdalla and of the Mahrattas, and as much in dread of their allies as of their enemies. In 1760 Allumguire was deposed and murdered by Gazi. His son and successor, Shah Aulum, made a fruitless attempt to reduce the Bengal provinces; but his expedition ended in 1761, by surrendering himself to the British, who had taken the field as allies to the nabob of Bengal. In 1759 and 1760 Hindoostan was visited, for the sixth time, by Abdalla, and Delhi was again plundered and almost depopulated. The Mahrattas, in these times of confusion and revolution, were gathering strength; and, possessed of extensive domains and vast armies, they projected the expulsion of Abdalla, and the restoration of the Hindoo government throughout the empire. Thus the principal powers of Hindoostan were arranged into two parties, the Hindoos and Mahomedans; for the Jats joined the Mahrattas; and Sujah Dowlah, with the Rohillas, and other Mahomedan chiefs of less note, joined Abdalla; and a battle ensued in the plains of Carnawl and Panniput. There were said to be 150,000 Mahomedans, and no less than 200,000 Mahrattas. Victory declared for Abdalla, after a very bloody and destructive battle; so that the Mahrattas were compelled to relinquish their pretensions to universal empire in Hindoostan; and from that period (1761) their power has been sensibly on the decline. (See MAHRATTAS.) Abdalla's influence at Delhi was now unlimited; and he determined to place Shah Aulum on the throne of his ancestors. But he dreaded trusting himself in the hands of Abdalla, who set up Jewan Buckt, the son of Shah Aulum, for emperor, exacting an annual tribute; so that in reality Abdalla was emperor, and if he had been disposed to establish himself in Hindoostan, he might probably have begun a new dynasty of emperors in his own person. The territory of the young emperor, and of Nidjib Dowlah his guardian, was merely the northern part of the province of Delhi; and his father, Shah Aulum, the legal emperor, was without territory, and almost without friends. However, the expulsion of the nabob of Bengal, Cossim Ally, by the English, in 1763, by drawing Sujah Dowlah into the quarrel, brought the wandering emperor again into notice; but he had more to hope from the

success of the British arms than those of his patron, Sujah Dowlah; and the uninterrupted success that attended them in 1763, 64, and 65, by the dispersion of the armies of Cossim Ally and of Sujah Dowlah, and by the entire conquest of Oude and Allahabad, left the emperor and Sujah Dowlah no hopes, but from the moderation of the victors. (See BENGAL.) The private distresses of Shah Aulum, the emperor or great mogul!, were so pressing, during Mr. Hastings's last journey to Oude (1784) that his son, Jewan Buekt, came to solicit assistance from the English. Since the peace of 1782, Madajee Sindia, a Mahratta chief, and the possessor of the principal part of Malwa, has taken the lead at Delhi; and has reduced several places situated within the districts formerly possessed by the Jats, and it may be concluded, that Sindia has in view to extend his conquests on the side of Agimere, and to establish for himself a considerable state or kingdom. The provinces of Agra and Delhi, and their vicinity, are in a wretched state. Having been the seat of continual war for near 50 years; the country is almost depopulated, and most of the lands, of course, lie waste; and the wretched inhabitants dare not provide more than the bare means of subsistence for fear of pillage. Nothing but the natural fertility of the soil, and the mildness of the climate, could have kept up any degree of population, and rendered the sovereignty of it, at this day, worth contending for. In the Mogul empire, many parts of it were 1000 miles distant from the seat of government; and accordingly its history is one continued lesson to kings, not to grasp at too much dominion; and to mankind, to circumscribe the undertakings of their rulers.

Among the new powers that arose on the downfall of the Mogul empire, we ought to mention the French and English. As for the Portuguese, their power had past its meridian before this period; besides, their views being commercial, they wisely chose insular situations, such as Goa, Bombay, Salfette, Diu, &c., and never appear to have possessed any very considerable extent of territory, although they kept on foot a large army of Europeans. The Dutch system was nearly the same; and their prosperity, in a great measure, grew out of the misfortunes of the Portuguese; who, having fallen under the dominion of Spain, became obnoxious as well to the jealousy of rivalship, as to the revenge of the Hollanders. The French power was of short duration, but brilliant while it lasted. It began during the government of M. Dupleix at Pondicherry in 1749, and ended in 1761 by the capture of this their principal settlement. (See CIRCAR.) The French appear to have been the first European power that trained the natives of India to regular discipline, as well as the first who set the example of acquiring territorial possessions, of any great extent, in India; in which they have been so successfully followed by the English. Although the English were firmly and peaceably established in Bengal in 1765 (see BENGAL); yet within two years they were engaged in a very arduous contest in the peninsula, with Hyder Ally, the sovereign of Mysore, leagued with the Nizam or Subah of the Deccan. (See HYDER ALLY.) In 1767, when he had arrived at the height of his fortune, the war between him and the English broke out. Having bought off the Mahrattas, with a considerable sum of money, and the restoration of some places he had taken from them, and detached the Nizam from the English, the war was prosecuted on both sides with vigour. After some sharp battles on the frontiers of the Carnatic and Mysore, a strong detachment of the British army seized on Hyder's province of Coimbatore, a fertile district on the south of Mysore, and commanding a ready way to Hyder's capital, Seringapatam. The war was continued with various success during the years

1767, 1768, and part of 1769; when Hyder, with a strong detachment of troops, chiefly horse, eluding the British army, came within seven miles of Madras, and dictated a peace to the government of that place. This peace was disreputable to the British councils only; since the hands of the commander in chief (general Joseph Smith) were tied up, at the very moment, the most favourable for striking a blow; and when Hyder, fearing the general's approach, could purchase his security no other way than by intimidating government into the measure of laying their commands on the general not to advance; by which measure he might possibly have cut Hyder and his detachment to pieces. The Nizam had, very early in the war, been detached from Hyder's alliance; chiefly by the strong measure of sending a detachment from Bengal into the heart of Golconda; which made him tremble for his capital, Hydrabad. The peace left matters much in the same state as they were before the war; and whatever credit Hyder might have gained by its termination, was done away by the total defeat which he suffered in 1771 from the Mahratta army, within a few miles of his capital; into which he escaped with great difficulty, with a small remnant of his army; afterwards defying the attacks of his numerous enemies, who had neither the skill nor the ordinary requisites for a siege. His revenues and his army were improved by the few years of peace that followed. When the Mahrattas, in 1773, crossed the Ganges to invade the Rohilla country, a brigade of the British army marched to the western frontier of that country, and drove the Mahrattas across the river. For this protection, the Rohilla chiefs had stipulated to pay Sujah Dowlah (the British army acting as his allies) 40 lacks of rupees; but when the service was performed, the payment of the money was evaded. This breach of treaty led to the invasion and conquest of the Rohilla country in the following year, 1774. A considerable tract of land in the Dooab was also conquered from the Jats and other adventurers, by which the boundary of Oude was advanced westward within 25 miles of Agra; north-westward, to the upper part of the navigable course of the Ganges; and south-westward to the Jumnah river. In 1775, on the death of Sujah Dowlah, and the accession of his son Azuph, a new treaty was made with the British government, by which the quantum of the subsidy for the use of the brigade was increased; and the province of Benares, which produced a clear revenue of 240,000*l.* per annum, was ceded to the company. The war with the Poonah Mahrattas occasioned the march of a brigade across the continent to the side of Bombay and Surat in 1778-9. This is said to be the most brilliant epoch of the British military history in India. The brigade, which consisted of less than 7000 men, all native troops, commanded by European officers, marched from the banks of the Jumnah to the western sea, in spite of the Mahrattas, whose empire they traversed almost the whole way. The French war breaking out at this time, and Hyder Ally expecting a communion of interests with the French, broke into the Carnatic, in the autumn of 1780, with 100,000 troops, foot and horse, the best of their kind that had ever been disciplined by a native of India. His success in cutting to pieces colonel Baillie's detachment, and the consequent retreat of the Carnatic army, occasioned a despair of the British interests in that quarter, in the opinion of most people in Europe. Mr. Hastings and sir Eyre Cooté thought otherwise; and there was sent from Bengal, to the relief of the Carnatic, a brigade of about 7000 men, with ample supplies of money and provisions. Until these troops and supplies arrived, the British possessed nothing more in the Carnatic than the ground occupied by their camps and fortresses. Under sir Eyre Cooté, Hyder

HINDOOSTAN.

was successfully combated during two campaigns; at the end of which (October 1782) he found the possession of his object, the Carnatic, at so great a distance, that he appeared to be sincerely desirous of peace. Hyder perceived the necessity of abandoning his ambitious projects; and he would actually have done so, in all probability, if he had not expected a more seasonable and effectual co-operation on the part of the French, with whose assistance he hoped to effect our expulsion in a campaign or two. But he became more jealous of the French than of the English; and if the peace of Paris had left the Carnatic in his hands, instead of Mahomed Ally's, the French would have found the ill effect of his conduct respecting them; for he certainly never intended that they should assume any character in it besides that of merchants. With this disposition of mind, Hyder died soon after, in 1783, and was succeeded by his son Tippoo, who made peace with the English in March 1784, at Mangalore. Tippoo was a prince of inferior abilities, and on a future occasion he expiated his ill-arranged plans by his death, and the partition of his territories in 1799.

The establishment of the British power in the Mogul empire has given a totally different aspect to the political face of that country from that which it would have worn, if no such power had ever existed. It is certain, that the Mahrattas, if they had been left to pursue their plans of conquest, would have acquired Corah and Allahabad in 1772, as well as the Rohilla country in 1773; and afterwards they might have over-run, at their leisure, the province of Oude, and its dependencies. The British interference prevented this. On the other hand, Hyder might have kept possession of the Carnatic. Some may be tempted to ask, whether Hyder might not be as good a sovereign as Mahomed Ally; or the Mahrattas, as Azuph Dowlah? Whatever may be the answers to these questions, says major Rennell, they have no reference to the British politics, which required that Hyder or Tippoo should not possess the Carnatic, in addition to Mysore; and that the Mahrattas should not possess Oude, or Rohilcund.

It has been suggested, that the British might have extended their possessions in Hindoostan, *ad libitum*; lord Clive, however, thought, that the Bengal provinces and the circars, together with a moderate tract of land round Madras, and the island of Salsette, near Bombay, were fully equal to the measure of good policy, and to our powers of keeping possession.

"The state into which Hindoostan has fallen," says Rennell, "since the downfall of the Mogul empire, is materially different from what it was before it was united under the Mahomedan conquerors. It was then parcelled out into several moderate kingdoms, which appear to have preserved a degree of balance among themselves; but now Hindoostan and the Deccan may be said to consist of six (or, since the partition of Tippoo's territories, of five) principal states, which hold, as tributaries, or feudatories, all the inferior ones; of which there are many. The reader will not be at a loss to know, that the two Mahratta states, the Nizam, Tippoo, the Sikhs, and the British, are those I mean; for whatever verbal distinctions may be made, a compulsive alliance is at least a dependant, if not, in fact, a tributary situation." Rennell's Memoir, Ed. 3. 1793.

HINDOOSTAN, *Geography of*. This celebrated portion of Asia, long known by the name of the empire of the Great Mogul, because it was then subject to Mogul emperors, successors of Timur, extends from cape Comorin on the south, to the mountains which form the northern boundary of Cashmere; that is, according to the most recent maps, from about the 8th to about the 35th degree of N. lat., being

about 27 degrees, or nearly 1890 British miles. The northern boundary may be farther extended to the *Hindoo Koh*, and mountains running E. and W. on the N. of the province of Kuttore. In breadth this country extends from the river Araba, on the W. of the province of Sindi, to the mountains which separate Bengal from Cassay and the Birman dominions, that is, from about the 66th to the 92d degree of E. long., comprehending 26°, which, in the latitude of 25°, include 1600 British miles. On the N. the boundaries are the mountains already mentioned. On the W., towards Persia, other ranges and deserts form the frontier, till the river Araba terminates the southern separation. The other boundaries are supplied by the Indian ocean and bay of Bengal, where the eastern extremity is limited by the little river Naaf, and those mountains which separate the British possessions from Aracan, Cassay, and Cassar. The northern boundary generally consists of the southern ridges of the Thibetian Alps. On the N.E. of Bengal a similar ridge divides Hindoostan from the small territory of Afam, which seems an independent state, never having formed a part of Hindoostan, of dubious connection with Thibet, and hitherto unsubdued by the Birman. According to the plan sketched out and pursued by major Rennell, and judiciously adopted by Mr. Pinkerton, we may distribute the various regions of Hindoostan into four general sections: *viz.* the Gangetic, the Sindetic, the central, and the southern.

Gangetic Hindoostan, comprehending the countries on the Ganges, extends from the eastern boundaries of Bengal to the country of Sirhind, an interval of about 1000 British miles. Its greatest breadth, from the sources of the Chumbul, to the mountains of Sewalik, may be about 450 British miles; and the least, on the W. of the province of Bengal, about 230. This section comprises the provinces of Bengal, Bahar, Allahabad, Oude, and Agra; with part of Delhi and Agimere, and of Malwa in the south. The British possessions in this part of Hindoostan, including Bengal, Bahar, Benares, and some other districts to the W., extend about 550 miles in length by 300 in breadth, forming a very powerful kingdom. The native population is computed at 10 or 11 millions of black subjects, exclusive of the English, whose number is not ascertained. Sir William Jones, however, concluded from the actual enumeration of one province, that all the British possessions in Hindoostan included no less than 30 millions of Hindoos; but major Rennell estimates the entire population in the time of Aurungzebe at 60 millions. The revenue of these British provinces is computed at 4,210,000*l.*; and deducting the expence of collection, military and civil charges, &c. being 2,510,000*l.*, the clear revenue will be 1,670,000*l.* (See BENGAL, and CALCUTTA, its chief city.) In the eastern part of the British possessions, the most considerable town is Dacca, which see. (See also MOORSHEEDABAD and HOOGLY.) The capital of the province of Bahar is Patna; which see respectively. Benares (which see) is near the western frontier of the British possessions. Beyond the British possessions towards the W. is Allahabad, in a province of the same name, ceded to the English in 1798; and to its S.W. are the diamond mines of Penna, in the small province of Bundelcund, or Bundela, which see. The present capital of Oude is Lucknow; to the N.W., near the northern frontier, is Berilli; and about 50 miles W. from Lucknow is Canoge, which see. (See also AGRA and DELHI.) The farthest city in the south of Gangetic Hindoostan is Oujein; and the river Nerbudda may be considered as its most southern limit. The surrounding states on the E. and N. are the Roshawn of Rennell or Aracan, Cassay or Meckley, Afam, Beotan, Nipal, Gorkah, Kamaoon, and Sirinagur, which see respectively.

HINDOOSTAN.

Sindetic Hindoostan, including the countries on the river Sindch, or Indus, extends from the northern mountains of Cashmire, and the Hindoo-Koh, in the north of Cabul, to the mouth of the Indus; being about 900 miles in length, and in medial breadth about 350. Besides part of the provinces of Delhi and Agimere, it contains the extensive province of Moultan, with Lahore, Cashmire, Cabul, the frontier region of Candahar, and that of Sindi at the mouth of the Indus. The chief cities in this extensive region are, Lahore, Cashmire, Cabul, Ghizni, Candahar, Moultan, and Tatta; which see respectively.

Central Hindoostan, comprehending the middle provinces, is chiefly bounded by Gangetic Hindoostan on the N.; and on the W. by the sandy desert, and the ocean. Its southern limit is the river Kistnah, with its tributary stream the Beemah; and on the E. it is washed by the bay of Bengal. The length from E. to W. *i. e.* from Jigat point to cape Palmiras is little less than 1200 miles, and the medial breadth is about 400. In this section are comprehended the province of Orissa, with part of Golconda, Berar, Dowlatabad, Candeish, and Guzerat, besides other districts of inferior name; and on the eastern shore are the British provinces of the Circars. The chief cities are Ahmedabad, taken by the English in 1780, and ceded to the Mahrattas in 1783. Cambay, Surat, Bombay, Burhampour, Ellickpour, Nagpou, Aurungabad, and Dowlatabad.

Southern Hindoostan, called the Deccan, or South, and also Carnada or the Carnatic, is bounded by the river Kistnah, and its most northern subsidiary streams flowing into the Beehmah, and may be considered as extending from the latitude of Bombay to the southern point of cape Comorin, about 830 miles in length, and about 350 of medial breadth. (See DECCAN.) In this division may also be included the island of Ceylon, the coasts of which are now possessed by the English, who have supplanted the Dutch; while the native princes retain the extensive inland parts. In addition to the district round Madras, the British power was extended in 1792 and 1799, over wide provinces in the south and west of Mysore; and Seringapatam, the capital, is also in our possession; so that our territories in this portion of Hindoostan only yield in extent and consequence to those on the Ganges. The chief cities and towns in this division are Seringapatam, the most important; Salem and Attore on the E.; Dindigul, Coimbatore, and Palicaud, on the S.; and on the W. coast Panimay, Ferokabad, Calicut, now nearly deserted, Tellicherry, and Mangalore; and on the N. Carwar, within 40 miles of the Portuguese settlement of Goa, while on the S. we approach within a like distance of Cochin. In the Carnatic we have Madras, and not far from the western frontier of our settlement at Madras is Arcot, esteemed the capital of the Carnatic. To the south of these British possessions are Tranquebar, a Danish settlement in the kingdom of Tanjore and Pondicherry, formerly the principal settlement of the French. On the western coast, or that of Malabar, stands Cochin, which see. To the north of the British territories are Goa, Poona, Viliapour, Hydrabad, Calberga, &c.

The three leading powers of Hindoostan are the British, the Mahrattas, and the Nizam; to which may be added on the W., or Sindetic division, the Seiks, and Zemaun Shah, or whatever prince holds the eastern division of Persia. The following table, extracted by Mr. Pinkerton, with a few alterations, from major Rennell's Memoir, will convey a satisfactory view of the state of territory, and the ruling powers in Hindoostan.

I. British Possessions.

1. Bengal and Babar, with the Zemindary of Benares.

2. Northern Circars, including Guntoor.
3. Barra-Mahal, and Dindigul.
4. Jaghire in the Carnatic.
5. The Calicut, Palicaud, and Coorga countries.
6. Coimbatore, Canara, and other districts acquired 1799.

II. British Allies.

1. Azuph Dowlah, Oude.
2. Mahomed Ally, Carnatic.
3. Travancore, and Cochin.

III. Mahratta States.

Poona Mahrattas.

1. Malwa.
2. Candeish.
3. Part of Amednagur, or }
Dowlatabad.
4. Viliapour.
5. Part of Guzerat.
6. ——— Agra.
7. ——— Agimere.

Tributaries.

1. Rajah of Jyenagur.
2. ——— Joodpour.
3. ——— Oudipour.
4. ——— Narwah.
5. ——— Gohud.
6. Part of Bundelcund.
7. Mahomed Hyat, Bopalol.
8. Futy Sing, Amedabad.
9. Gurry Mundella, &c.

8. Allahabad.
9. Sanore, Bancapour, Darwar, &c. situated in the Dooab, or country between the Kistnah and Toombuddra rivers.

Berar Mahrattas.

1. Berar.
2. Orissa.

Tributary.

Bambajeca.

IV. Nizam Ali, Soubah of the Deccan.

1. Golconda.
2. Aurungabad.
3. Beder.
4. Part of Berar.
5. ——— Adoni, Rachore, and Canoul.
6. Cuddapali, Comban, and Gandicotta.
7. Part of Gooty, Adoni, and Canoul.
8. Part of the Dooab.
9. Other districts acquired in 1799.

V. Seiks.

Lahore, Moultan, and the western parts of Delhi.

As the other great power chiefly extends over Persia, and may be regarded as foreign, it only remains to mention the small states.

1. Successors of Zabeda Cawn. Schaurmpour.
2. Jats.
3. Pattan Rohillas, Furruckabad, Rohilcund.
4. Adjig Sing, Rewah, &c.
5. Bundelcund, or Bundela.
6. Little Ballogittan.

To which may now be added the Raja of Mysore.

Before the fall of Tippoo in 1799, the British possessions were supposed to contain 197,496 square British miles, being about 60,000 more than are comprised in the united kingdoms of Great Britain and Ireland; and the number of inhabitants was computed at 10 millions. The acquisition in 1799 probably adds 15,000 square miles, and the population subject to Great Britain is supposed to be 12 or 14,000,000. The net revenue exceeded 3 millions before the cessions by Tippoo in 1792, computed at 400,000l.; while those in 1799 do not appear much to exceed half that sum. For an account of the Mahrattas, Seiks, Jats, and Afghans, see these articles respectively.

The original population of this extensive country may be generally considered as indigenous, yet it presents considerable

varieties; those in the northern parts being fairer, and those in the southern almost or wholly black, but without the negro wool or features. The tinge, however, of the women and superior classes is deep olive, with sometimes a slight and agreeable mixture of the ruddy, and the Hindoo form and features may be said to approach the Persian or European standard.

Of the mythology and religion of the Hindoos we have already given an account under the article GENTOOS. (See also BRACHMANS and CAST.) The governments are as various as the several states. Although the Bramins are the most dignified cast, the sovereignty has been abandoned to the military cast, and the monarch was presumed to be proprietor of all the lands, except those belonging to the church. The "Ryots" held their possessions by lease at a fixed rate, and considered them as perpetual. The "Zemindars" were, as some conceive, only collectors of the royal rents from the Ryots, or farmers; but, as others imagine, they were learned gentlemen, who had an hereditary right to these rents, upon paying a settled proportion to the crown. The laws are blended intimately with their religion; and an account of them may be found in the code published by Mr. Halhed, and referred to under GENTOOS.

The population of this extensive part of Asia consists of Hindoos blended with Persians, Greeks of Bactriana, ancient Scythians, Mahometans of various origins, Patans or Afghans from the mountains towards Persia, Moguls, including Tartars and Mahometan tribes from the east of the Caspian, who, with the Arabs and Persians, are generally called Moors; and it is supposed to amount to 60 millions, of which number the British possessions may probably contain a quarter. In the time of Aurungzebe the general revenues of Hindoostan were computed at 32 millions sterling, equal, allowing for the comparative price of the productions of the country, to 160 millions sterling in modern England. The manners and customs of the Hindoos are very much incorporated with their religion, and are universally similar, with some few exceptions in mountainous and other peculiar districts. Their houses and dresses are of the most simple kind, and to a Bramin nudity is no reproach. Their amusements consist of religious processions, and though dancing girls are numerous, theatrical exhibitions are less common than in countries farther to the east. The general ancient language of Hindoostan is believed to have been the *Sanscrit*; which see: but of this there are various dialects in different provinces. Of their literature we have had many confused and contradictory reports; but their most important books are the Vedas. (See BRACHMANS.) Dr. Robertson alleges several considerations in proof of the ancient and high civilization of the Hindoos; but against his arguments to this purpose others have advanced many objections. (See CAST.) The arguments of M. Bailly and others for the antiquity of the Hindoo astronomy have been attacked with great force by Mr. Bentley, in a learned dissertation published in the sixth volume of the Asiatic Researches, 1799: and the result appears to be, that the system, so highly extolled and traced to remote antiquity, cannot be of a greater age than 731 years; or that it was composed about A. D. 1068.

The chief univerfity in the north is that of Benares; and in the Deccan, the academy of Tricour, on the Malabar coast, is also in great repute: and at Cangiburam, in Carnate, we are told, there is still a celebrated Brahman school, which, according to the testimony of Ptolemy, existed in the first century of the Christian era, and its members, it is said, are equal in celebrity to the Brahmins of Benares. The manufactures of Hindoostan have been celebrated from a remote antiquity, particularly those of muslins and other cotton fabrics. Piece goods, as we call them,

are mentioned by the authors of the Periplus, and other ancient writers, who commend both the manufacture and the beautiful colours of the dyes. In the time of Strabo, the Hindoos were famous for elegant works in metals and ivory. Hindoostan, however, is not celebrated at this day for any manufacture, except those of muslins and calicoes; the other exports consisting of diamonds, raw silks, with a few wrought silks, spices, drugs, &c.

Painting and sculpture are in their infancy; and yet the temples are majestic and solemn. Hindoostan has, in all ages, been chiefly famed for its native products; its diamonds, and some other precious stones, its spices, aromatics, and drugs; rice also, sugar, and many articles of luxury, are products of Hindoostan.

The climate and seasons are considerably diversified by difference of latitude and local situation; nevertheless, through the wide regions of Hindoostan there is some similarity of climate. (See BENGAL.) Although in Thibet the winter nearly corresponds with that of Switzerland, and other parts of Europe, in the whole extent of Hindoostan, except in Cashmere, there can hardly be said to be a vestige of winter, except the thick fogs of our November; and excessive rains, or excessive heats, form the chief varieties of the year. The aspect of the country is very much diversified; but there are no mountains of any very great height; the Gauts (which see) not being estimated at above 3000 feet. The vast extent of Hindoostan consists chiefly of large plains, fertilized by numerous rivers and streams, and interspersed with a few ranges of hills. The periodical rains and intense heats produce a luxuriance of vegetation, almost unknown to any other country in the globe; and the variety and richness of the vegetable creation delight the eye of every spectator. The soil in some places is so excellent, that it consists of black vegetable mould to the depth of six feet. Rice is the chief grain, which is industriously watered on the dry sandy lands of the coast of Coromandel. Maize and the sugar-canes and cotton are also much cultivated. But the implements of husbandry are in general so imperfect, that they owe to the fertility of the land what they want either in skill or diligence of agricultural operations.

The two principal rivers of Hindoostan are the Ganges and Burrampooter, which see; the chief tributary streams of the Ganges are the Gagra or Sarjoo, the Jumnah, which receives the Chumbul, Betwa, and several others, and the Soan. The Indus, or Sindel, with its confluent streams, is also a principal object. Its tributary streams are very numerous; see SINDEN. The chief rivers of the central part of Hindoostan are the Pudda, Nerbudda, and Taptee, on the W.; the Subanreeka, the Godaveri, &c. In the southern part of Hindoostan are the Kistnah, Pennar, Paliar, and Caveri. This country has few lakes; those of Colair, Chilka, Pullicat are mentioned by Rennell. The mountains, discriminated by their modern names, are the Tiperia, Garro, Himmaleh, Hindoo-Koh, Gauts, &c. Hindoostan abounds with forests, some of which are near the mouths of the Ganges, &c. others in the rude unexplored regions on the W. of the Circars. On the east of the Indus is a sandy desert, between 4 and 500 miles long, and from 60 to 150 miles broad; it is styled that of Agimere, and was known to Herodotus. The botanical productions of this fertile country are too numerous and various to be recited. Its cattle are frequently of a large size, with a hunch on the shoulders; and its sheep are covered with hair instead of wool, except in the most northern parts. Antelopes, camels, elephants, apes and monkeys, dogs, wild boars, bears, wolves, foxes, jackals, hyenas, leopards, panthers, lynxes, and many other quadrupeds are found in this country. It would be endless

HINDOOSTANEE.

to enumerate the birds, fishes, and insects that abound in Hindoostan. We shall conclude this article with mentioning some of its most celebrated mines. Those of the diamond are near Vitiapour and Golconda, at Raolconda, in a district on the river Mahanada, S. of Sumboulpour, Gandicotta on the river Pennar, and Penna in the territory of Bundelcund, about 60 miles S. of the river Jumnah, which flows into the Ganges. (See DIAMOND.) Roberton's India. Raynal's Indies, vol. i. Rennell's Memoir, passim. Pinkerton's Geography, vol. ii.

HINDOOSTANEE, the vernacular language of the Hindoos. It is also frequently denominated *Hindu*, *Oorloo*, and *Rekhtu*. It is compounded of Sanscrit, Persian, and Arabic. The first of these was the great original language of India, and to it may be traced such terms in the provincial dialects as are of truly Indian original: and such words as bear no relation to the Sanscrit roots are either Persian or Arabic.

The Persian was carried into India by the Mogul conquerors, and being the language of the court, naturally gained a footing in the law and in the revenues. It has also for some centuries been the common medium of negotiation between the several states of Hindoostan; and from thence became an almost indispensable qualification for those who were engaged in the management of Indian affairs. The Persian is still used by all the Mogul officers of government, in their several departments of accounts and correspondence. Thus the Hindoostanee received a great influx of Persian terms, and many peculiarities of the Persian idiom. The original language of the Hindoos, from a similar cause, became debased by a copious mixture with Arabic. When the Mahometan invaders first settled in India, from the necessity of having some medium of communication with the natives, whom they had conquered, they applied themselves to the study of the Hindoostanee dialect. The knowledge of the Sanscrit was impracticable, from the invincible aversion of the Gentoos to teach to foreigners, and to conquerors, the use of their own tongue. The latter, therefore, had no resource but to introduce, as far as they could, their own language. New adventurers, continually arriving, kept up a constant influx of exotic words, and the heterogeneous mass gradually increased its stock, as conquest or policy extended the boundaries of its circulation. But these alterations affected words only. The grammatical principles of the original Hindoostanee, and the ancient forms of conjugation and inflexion remained the same; and whilst the primitive substantives were excluded, or exchanged, the verbs maintained both their inflexions and their regimen. The Sanscrit, indeed, has a dual number, both to nouns and verbs, the Hindoostanee to neither. Verbs in Sanscrit have the same form for both the masculine and feminine genders. The Hindoostanee verbs are distinguished by different terminations for the different sexes, like those of the Arabic. These are the capital outlines of dissimilarity between the Sanscrit and the Hindoostanee; but in the original appropriation of particular words to particular senses, in the idiomatic turns of expression, and complexion of speech, we may observe the strongest family likeness. The characters also, peculiar to the Hindoostanee, are exactly the same with those of the Sanscrit, but of a ruder shape, yet still exhibiting a more accurate resemblance than is found in many of the Greek letters in inscriptions of different eras.

From the above statement it is obvious, that the primitive Hindoostanee tongue has by no means preserved its purity or its universality to the present age: for the modern inhabitants of India vary almost as much in language as in religion: and at present those persons are thought to speak this com-

pound idiom with the most elegance, who mix with rare Indian verbs the greatest number of Persian and Arabic nouns. Such of the Hindoos as have been connected with the Mussulman courts, or admitted to any offices under that government, have generally complimented their masters by a compliance with these literary innovations. But the Bramins, and all other well-educated Gentoos, whose ambition has not overpowered their principles, still adhere with a certain conscientious tenacity to their primeval tongue.

As the intercourse and communication of the Mussulmen with the natives of India was greater or less, according to certain circumstances and situation, the Hindoostanee naturally varied considerably with respect to the prevalence of one or other of the three great languages composing it. This circumstance, says Mr. Bailey in his Collegiate *Theses* on the importance of this language, will sanction a division of it into three distinct dialects, namely, the pristine or country; the middle or familiar; and the learned or court dialect; each of which are respectively useful in different districts. In the first or pristine dialect, there is a smaller admixture of foreign words. Hence this is more nearly related to the original dialect of the country. In the second, or familiar dialect, the number of foreign words bears nearly an equal proportion to the original ones. In the third, or court dialect, Arabic and Persian words are by far the most numerous.

In recommending the study of this language, the above-mentioned author asserts that to the merchant, the traveller, the civil and military officer, the philosopher and physician, in short, to every one who carries on concerns of any moment in India, the Hindoostanee language is more generally necessary and advantageous than any other. For this reason it is of late become an object of indispensable attainment to all those young gentlemen who are destined to engage in Indian affairs. In the whole of the vast country of Hindoostan, scarcely any Mussulman will be found who does not understand and speak the Hindoostanee. Every Hindoo also, of any distinction, or who has the least connection either with the Mussulmen or the British government, is acquainted more or less with this language. It is moreover the general medium by which foreigners, such as the Portuguese, Dutch, Danes, French, Arabs, Turks, Americans, Persians, Moguls, and Chinese communicate their ideas to each other. In almost, too, all the armies of India this appears to be the language universally used: though many of the individuals composing them must be better acquainted with the dialects peculiar to their respective districts. Finally, from Cape Comorin to Cabul, a country about 2000 miles in length, and 1400 in breadth within the Ganges, few persons will be found in any large villages or towns, which have been conquered or much frequented by Mussulmen, who are not sufficiently conversant in the Hindoostanee, and in many places beyond the Ganges this language is current and familiar.

The dialect called the *Moors*, is that mixed species of Hindoostanee which owed its existence to the Mahometan conquests. In this idiom several elegant poems and tales have been composed by learned Persian and Mogul authors, and are still extant in the libraries of the curious. These are always written in the Persian hand, which is by no means calculated for expressing the sound either of the Hindoostanee vowels or nasal consonants. The Mahometans of the lower rank have a few books on religious subjects in this language and in the *Nazgore* characters; which are also used by some of them in their petty accounts. Europeans, on their arrival in India, reduced to a necessary intercourse with Mahometan servants or Sepoys, habitually acquire
from

from them this idiom in that imperfect and confused state, which is the consequence of the menial condition of their instructors. Yet this curious system of study hath produced more than one attempt to a grammar and vocabulary.

These attempts are unworthy of notice; but the labours of Dr. Gilchrist deserve particular attention. His English and Hindoostanee dictionary, which was intended to be followed by another part in Hindoostanee and English, is a highly valued production, and his grammar, as containing a copious detail of the language with numerous specimens of Indian poetry, is a performance not less valuable and useful to the oriental student, though it cannot boast the simplicity, the taste, the philosophical acuteness, and the extensive acquaintance with the classical languages which distinguish the Persian grammar of sir W. Jones, or Mr. Halhed's grammar of the Bengalese. But Dr. Gilchrist's chief merits consist in the attempt which he has made to teach the Hindoostanee language in European characters. To effect this purpose with success, required great skill and diligence, as many European letters correspond as little in sound, as they do in form, to those of Asia. There are two general modes, (says sir W. Jones, in his Dissertation on the Orthography of Asiatic Words,) of exhibiting Asiatic words in our own letters; they are founded on principles nearly opposite, but each of them has its advantages, and each has been recommended by respectable authorities. The first professes to regard chiefly the pronunciation of the words intended to be expressed, and this method, as far as it can be pursued, is unquestionably useful; but new sounds are very inadequately presented to a sense not formed to receive them; and the reader must, in the end, be left to pronounce many letters and syllables precariously; besides that, by this mode of orthography all grammatical analogy is destroyed, simple sounds are represented by double characters, vowels of one denomination stand for those of another; and possibly with all our labour we perpetuate a provincial or inelegant pronunciation. The second system of Asiatic orthography consists in scrupulously rendering letter for letter without any particular care to preserve the pronunciation. The first of these methods had an advocate in major Davy, an elegant Persian scholar, and a member of the Asiatic society; the second found two able supporters in Mr. Halhed and Dr. Wilkins, to whom sir W. Jones bears the honourable testimony of having done more towards promoting Indian literature, than Europe or India can ever sufficiently acknowledge. The former justly remarks that the two greatest defects in the orthography of any language, are the application of the same letter to several different sounds, and of different letters to the same sound, and these defects he truly pronounces to be so common in English that he was exceedingly embarrassed in the choice of letters to express the sound of the Bengal vowels, and was at last by no means satisfied with his own selection; Dr. Gilchrist has adopted neither of the above modes, but embraced a scheme which affords the advantages of both, without the inconveniences peculiar to either. His plan is to define the sound of the European letters, and then to use them in every word as representatives of the Hindoostanee elements, without ever the slightest variation. The Indian letters seldom experience any change of pronunciation, and it was only necessary to adjust their sound to our characters, in order to express them with corresponding uniformity. By this plan he has paid due attention to the pronunciation of each word, and of its elements. His system is peculiar to himself, and is likely to be rejected by those who cannot pay to it the time and attention necessary to perceive its excellence, and to reap its advantages. The scholar who can make this sacrifice, will readily acknowledge the usefulness of Dr. Gilchrist's

system, though he cannot fail to lament the pedantry and want of simplicity which disfigures his works.

HINDOWN, in *Geography*, a town of Hindoostan, in the Subah of Agra; 25 miles N. of Kerowly. This has been a large city, and contains extensive buildings, but, in consequence of the depredations of the Mahrattas, is now thinly inhabited.

HINE, or **HIND**, in the *Saxon Language*, signifies a servant, or one of the family; but it is now taken in a more restrictive sense, for a servant at husbandry; and the matter hinc is he that oversees the rest.

HING, in *Geography*, a town of China, of the second rank, in the province of Kiang-nan. N. lat. $32^{\circ} 35'$. E. long. $305 26'$.

HINGES, in *Building*, those necessary iron ligaments, by means whereof doors, lids, folds of tables, &c. make their motion, whether of opening, shutting, or folding.

The species of hinges are many, viz. bed, box, butts, casement; casting, chest, coach, desk, dove-tails, effes, folding, garnets, weighty, side, side with rising joints, side with squares, screw, scuttle, shutter trunk of fundry sorts, and hook and eye hinges.

HINGHAM, in *Geography*, is a small town and parish in the hundred of Forchoe, in the county of Norfolk, England, 96 miles distant from London, and contains 179 houses, and 1203 inhabitants. It was anciently part of the possessions of the Marshals, afterwards earls of Pembroke; from whom it came to the Morleys, and thence to the Wodehouses, in which family it is at present vested. The church, which is a handsome structure, with a large and lofty tower, was rebuilt by Remigius de Hetherfete, the rector, aided by the munificence of the patron, John le Marshall, in the reign of Edward III. Several chapels and numerous images decorated the interior prior to the Reformation. In the church were held seven guilds, each having a stipendiary chaplain serving at the respective altars, constituting a choir. On the north side of the chancel is a noble canopied monument, reaching from the floor to the roof, richly decorated with stone imagery and tracery: many of the brasses are gone, but from the arms remaining it appears to have been erected to the memory of Thomas lord Morley, who died in the reign of Henry VI. Hingham has a weekly market on Saturdays, and three annual fairs. Blomesfield's History and Antiquities of Norfolk.

HINGHAM, a post-town of America, in Suffolk county, Massachusetts, situated on a small bay, S. from Boston bay. It contains a number of houses, compactly built, two congregational churches, and a well endowed school. It is 19 miles S.E. of Boston. The township is about four miles square, including two parishes, incorporated in 1635, and containing 2112 inhabitants.

HING-HOA, a city of China, of the first class, in the province of Fo-kien, near the sea-coast. It is adorned with several triumphal arches and majestic public buildings. The adjacent country furnishes rice and silk in abundance. N. lat. $25^{\circ} 28'$. E. long. $118^{\circ} 56'$.

HING-NGHAN, a city of China, of the second rank, in Chen-si, on the river Han. N. lat. $32^{\circ} 34'$. E. long. $108^{\circ} 54'$.

HINGWANG, in *Natural History*, a name given by the people of the East Indies to a species of red arsenic, which they use in painting and in medicine. They find it in and about the copper mines. It is calcined several times, in order to fit it for internal use. In painting, it makes a very fine orange-colour; but when mixed with cerufs, it makes a lemon-colour, and any other shade of yellow.

It seems to contain some portion of silver, and some cinna-
bar.

HINIGAN, in *Geography*, a town of the Arabian Irak; 100 miles W. of Basora.

HINISBURG, a post-town of America, in Chittenden county, Vermont, E. of and joining Charlotte on lake Champlain, containing 933 inhabitants.

HINKA, a lake of Chinese Tartary, about 108 miles in circumference. N. lat. $44^{\circ} 35'$. E. long. $132^{\circ} 29'$.

HINKAN, a chain of mountains of Chinese Tartary, which reach from N. lat. 55° to 53° and from E. long. 134° to 137° .

HINLOPEN STRAITS, a channel of the North sea, between North-Eastland and Spitzbergen.

HINNERJOKI, a town of Sweden, in the government of Abo; 30 miles S. of Bjorneborg.

HINNULUS, in *Zoology*, a hind; the young of the deer or goat kind.

HINNULUS. See *MOSCHUS Pygmaeus*.

HINNY, a spurious or hybrid quadruped, the produce of the horse with the female ass. Its size is less than that of the horse, the ears and mane the same as in that animal; the colour is redder, and the tail like that of the female parent.

HINOJARES, in *Geography*, a town of Spain, in the province of Jaen; 15 miles S.E. of Ubeda.

HINOJOSA, a town of Spain, in the province of Leon; 25 miles N.N.W. of Ciudad Rodrigo.—Also, a town of Spain, in the province of Estremadura; 16 miles N. of Llerena.—Also, a town of Spain, in New Castile; 10 miles N. of Molina.

HINOJOSAS, LAS, a town of Spain, in New Castile; 36 miles S. of Hneta.

HINSDALE, a township of America, in Cheshire county, New Hampshire, on the east bank of Connecticut river, opposite to Vernon in Vermont, incorporated in 1753, and containing 634 inhabitants; 38 miles above Northampton.

HINZUAN. See JOANNA.

HIO, a town of Sweden, in West Gothland, seated on the Wetter lake, with a good salmon fishery; 80 miles N.E. of Gotheborg. N. lat. $58^{\circ} 20'$. E. long. $13^{\circ} 58'$.

HIORRING, a town of Denmark, in N. Jutland, and diocese of Aalberg, formerly a large city and the see of a bishop, with three churches; but in 1693 almost destroyed by fire, so that the bishopric was removed to Aalberg by Frederic II.; 27 miles N.N.W. of Aalberg. N. lat. $57^{\circ} 27'$. E. long. 10° .

HIORTED, a town of Sweden, in the province of Smaland; 60 miles N. of Calmar.

HIORTOE, a small island of Denmark, near the W. coast of Taafinge. N. lat. $54^{\circ} 53'$. E. long. $10^{\circ} 30'$.

HIP, in *Architecture*, a piece of timber placed between every two adjacent inclined sides of a lipped-roof, for the purpose of fixing the jack rafters. For the manner of finding the length and backing of the hips, see *HIPPED ROOF*.

HIP, a particular part of an animal. See HAUNCH.

HIP, in the *Materia Medica*, the fruit of the cynosbatus shrub, wild briar, hip-tree, or dog-rose. See *ROSA Canina*.

Hips are agreeably dulco-acid, and stand recommended as cooling restringents, in bilious fluxes, sharpness of urine, and hot indispositions of the stomach; but they are very little used in the shops, except in the *conserve*, which see.

HIP-gout, in *Medicine*. See SCIATICA.

HIP-joint, *Disease of*. What is usually understood by the disease of the hip-joint, in *Surgery*, is a distemper very ana-

logous to the white swelling of other articulations. By several writers it is treated of under the name of *ischias*, which term, however, has been mostly applied to rheumatic affections of the hip. Like the white swelling, the disease of the hip-joint probably has its varieties, some of which are undoubtedly connected with scrofula, while others cannot be suspected of having any concern with a strumous habit. Mr. Crowther observes, that no case has hitherto occurred to him, in which the patient was not of the latter kind of constitution, although, if we understand him rightly, he adds an exception in regard to some of the cases, which are produced by accidents. (On White Swelling, &c. p. 257, 258, edit. 2.) We believe, that, in a given number of cases, there are more diseased hips, quite independent of scrofula, than there are white swellings of other joints. It is universally acknowledged, by all experienced surgeons, that young subjects are most liable to scrofulous diseases, and, of course, to that affection of the joints, which is commonly considered to be connected with a strumous constitution. If a person live to the age of five and twenty, perfectly free from all scrofulous symptoms, the hazard of his ever becoming afterwards afflicted with a true scrofulous complaint may be regarded as almost entirely past. Hence, all morbid affections of the joints, first occurring after this period of life, and under such circumstances, cannot be reasonably considered as having any connection with scrofula.

The generality of surgical authors seem to agree, that the disease of the hip-joint is most commonly met with in children under the age of fourteen, and, in this respect, it is exceedingly analogous to the true white swelling. But no age is exempt from the malady; so that, though children form a large proportion of those subjects who are afflicted, yet the number of adults, and even of old persons, is much more considerable, in a given number of these cases, than we find to occur in the same number of cases, in which the knee is diseased. Such is our reason for believing; that there are more hip cases unconnected with scrofula, than there are examples of white swellings being similarly circumstanced. The observation is of course only applied to a definite number of cases of each disease; for the much more frequent occurrence of morbid knees, ankles, wrists, and elbows, would destroy the accuracy of the remark, if taken in a general sense.

The approach of the hip disease is far more insidious, than that of a white swelling. The latter is generally preceded by severe pains; while the only fore-runner of the former is frequently a slight weakness and limping of the affected limb. This state is too often overlooked, and, when noticed by men little versed in the profession, is commonly treated on principles the most repugnant to surgical science. Embrocations are generally prescribed, without any injunction to keep the limb in a quiet state. The application is also oftentimes made to the knee, or other part of the extremity; for as there is frequently an uneasiness about that joint, when the hip is affected, and as no pain whatever is sometimes mentioned, as occurring in the latter situation, till a more advanced period of the malady, it is not uncommon to see careless practitioners directing their remedies to some situation very different from that of the disease. This combination of neglect and ignorance is the more to be lamented, inasmuch as the incipient period of the complaint is the only one in which a favourable prognosis can ever be made, mere rest, and repeated topical bleeding, having now more effect, in the course of a fortnight, than large painful issues will afterwards generally have in the long space of a twelvemonth.

The

HIP-JOINT.

The first diagnostic symptoms of disease in the hip-joint, if we merely look for them in the situation of that articulation, are not particularly conspicuous. It is true, that a fixed pain behind the trochanter major, in some instances, very soon excites the attention of the surgeon to the seat of the morbid affection. But mere pain in a joint, quite free from visible enlargement, and external change of colour, is generally disregarded as a complaint of no importance in young subjects, and as a mere rheumatic, or gouty affection in adults. Even when the pain begins to be severe, it is commonly not confined to the seat of the disease, but shoots downward, in the course of the vastus externus muscle, to the knee, and along the outer part of the fibula to the malleolus externus. The patient often refers most of his painful sensations to the groin. In short, there is no particular symptom occurring in the precise situation of the morbid affection, so as to form an infallible pathognomonic mark of its existence. But still the characters of the disease are very strong, when examined by a surgeon, who has paid attention to the subject.

Almost as early as the least limping can be perceived, some diminution in the circumference of the leg and thigh has actually taken place, as may be easily discovered by a careful measurement.

The hip-joint is deeply situated, so that its accidents and diseases cannot be examined as readily as those of many other articulations. The generality of surgeons little think, that the proper place for pressing on the hip-joint, with a view of ascertaining the presence of disease, is a little on the outside of the femoral artery, soon after it has descended below the brim of the pelvis. At this spot, the surgeon may apply pressure to the front of this large articulation, and if it be diseased, considerable pain will be the consequence of the experiment.

The limping gait denotes, that something is wrong in the limb, and if this symptom cannot be attributed to an affection of the vertebræ, or a recent accident; and if it be conjoined with the above-mentioned emaciation of the affected member, an exasperation of pain on pressing the front of the acetabulum; the evidence of disease in the hip becomes more and more convincing. It has appeared to us, that the weakness of the lower extremities from diseased vertebræ always affects both limbs at once, and is unattended with pain about the knee, circumstances completely discriminating this complaint from the feebleness of the limb, arising from the disordered state of the hip-joint.

The marks of discrimination, just pointed out, between two diseases of so different a nature, may appear to some persons quite superfluous. We entertain an opposite opinion. The disease of the vertebræ, and the affection of the hip, are both in the incipient state often attended with little else than a certain weakness in walking, at least with no other symptom, which would strike an uninformed person. Almost every surgeon must have seen many cases in which the vertebræ are diseased, and attended with more or less lameness, without there being any preternatural projection of the spinous processes whatsoever. Such projection, indeed, from the nature of the changes going on in the bones, can never happen, till the disease has made considerable advance. Besides, it is a well known fact, that some practitioners are either so negligent, or ignorant, that they never advert at all to the state of the back, as the cause of lameness. How many cases have we seen, in which children's legs have been rubbed with liniments, while their backs were never examined, nor suspected, as being the seat of the primary disease, to which the paralytic weakness of the limbs was en-

tirely owing. If Mr. Crowther's assertion be true, that in cases of diseased vertebræ, one limb is little affected with lameness, while the power of the other is much impaired, the necessity for every sign of discrimination will be still greater, because, when the spinous processes do not project, as is often the case at first, a serious lameness on one side will be the only one particular complaint, both in disease of the spine and of the hip. The observations, however, which we have made, by no means justify the conclusion, that either in the early or advanced period of the distemper of the vertebræ, one leg is always, or even generally, affected with little lameness in comparison with the great weakness of the other. But whether there are examples, in which one limb suffers so much more than the other or not, has nothing to do with the fact advanced, that in cases of diseased vertebræ, both limbs are affected with weakness. The projection of the spinous processes is, in the earlier periods of the disorder, far less invariable.

Another remarkable symptom of the disease of the hip, in its early stage, is an elongation of the limb, a circumstance, which is quite manifest, on comparing the condyles of the os femoris, the patella, the trochanter major, and the malleolus internus of the diseased limb, with the same parts of the sound one.

Until lately, no satisfactory explanation had been given, by surgical writers, of the manner in which the lengthened state of the limb was produced in the early stage of the hip disease. "The ancients, and, indeed, many practitioners, even of modern times, have assigned as causes of the increased length of the limb, a supposed relaxation of the orbicular ligament, or a distention of the articular cavity by fluid effused into the capsule. Such are the notions brought forward by Galen and Fabricius, to illustrate the meaning of the two aphorisms of Hippocrates, concerning the nature of this disease." *Sæpe in articulis humor pituitosus acervatur, quem myxam appellat, (Hippocrates,) a quo madefacta articulationis ligamenta, laxiora redduntur: atque ideo facile a cavitate articulus excidit, et rursus non cum difficultate incidit.* Galen in Aphor. Hippocr. Comm. 6. See Crowther on White Swelling, &c. p. 259. edit. 2.

We shall pass over the erroneous opinions, that the limb is lengthened by a distention and relaxation of the orbicular ligament, or by a swollen state of the head of the thigh-bone, and a thickening of the acetabulum, or in consequence of a destruction of the articular cartilages, and of the ligament completing the lower and inner margin of the acetabulum. In short, nothing can be more certain, than that while the elongation of the limb lasts, the head of the bone must be situated in the acetabulum, or else the muscles would draw the bone upwards, and shorten the member, as we find actually occurs as soon as the upper and posterior part of the acetabulum, and the ligamentum teres are so destroyed, that they make no resistance to this kind of dislocation.

If then the head of the bone does not quit its situation, the lengthened state of the limb can depend upon nothing less, than an alteration in the position of the pelvis. That the pelvis does undergo a change of its posture is now perfectly ascertained. The publication in which this fact was first noticed, we believe, is Dr. Falconer's pamphlet on ischias. "The tubercle, or lower part of the ischium may, in many instances, but not always, be discovered by feeling it behind to be lower on the affected side than the other. A man, now in the hospital, is a remarkable instance of the difference between the height of the bones on each side; and a pelvis of a person who died at the same place, and was preserved there many years, shewed it still more strongly." It ap-

HIP-JOINT.

appears, from some remarks in Mr. Crowther's work on the white swelling, that Mr. John Hunter used to attribute the lengthening of the limb to the situation of the pelvis. Mr. Crowther and Mr. Lawrence instituted together an examination of this point, upon two children with diseased hips, and they ascertained, that when the patients were laid on the table, with the whole body in a straight line, the anterior superior spinous process of the ilium on the affected side was lower than that of the sound one, just in proportion to the difference in the length of the two limbs; this was about a quarter of an inch in one patient, and a full inch in the other. A similar obliquity of the pelvis was equally manifest from behind, when the patients were placed on the abdomen, with the precaution of laying the body in a straight line. It was impossible to place the pelvis in its natural horizontal position, without bringing the body into a curved line, and when this was done, the lower extremities, instead of falling straight under the body, deviated from the perpendicular towards the diseased side. A straight line drawn along the spinous processes of the sacrum, and continued downwards, did not fall between the lower limbs, as it would in a pelvis, possessing its natural position, but, on the contrary, extended to the heel of the sound limb. Mr. Crowther thinks, that in these cases, the obliquity of the pelvis can be ascribed to no other cause, than that of the patient's endeavouring to throw the weight of the body, as much as possible, on the sound hip. The pain, and the general weakness of the affected limb, induce a constant effort of this kind. Hence children are observed bending the knee and hip, and hopping about on the healthy limb. The pelvis naturally sinks on the diseased side, and this deviation, which would affect the centre of gravity of the whole body, is counterbalanced by a bend of the upper parts of the trunk towards the sound side. Accordingly, both the patients under Mr. Crowther were noticed to incline their heads towards the shoulder of the sound side of the body. On White Swelling, &c., p. 26 — 268, edit. 2.

Another remarkable symptom which attends the disease of the hip-joint, is the alteration in the natural fulness and convexity of the nates, that part appearing flattened which is usually most prominent. The glutæus magnus becomes emaciated, and its edge no longer forms so bold a line, as it naturally does, at the upper and back part of the thigh, in the sound state of the limb. This is one very strong feature of the early state of the disease, and has been accurately represented in one of the plates of the late Mr. Ford's book on the present subject.

Though there may be more pain about the knee than the hip at some periods of the malady in its incipient state, the former joint may be bent and extended without any increase of uneasiness; but the thigh-bone cannot be moved without a vast increase of the patient's sufferings.

Patients with diseased hips soon get into the habit of bearing the weight of the body chiefly on the other limb, so that they bend the thigh of the affected side forwards, in order to touch the ground only lightly with the foot. This is at all times found to be the most easy position of the limb, and every attempt to put the member in a straight posture gives considerable pain.

Such is the first stage of the disease in its ordinary form, in which we generally find the health little disturbed.

When the hip is touched, the patient does not in general suffer any particular pain, unless the pressure be applied to the front of the joint, the part which is undoubtedly the most superficial. Yet it deserves notice, that a few instances do occur, in which all the soft parts surrounding the joint

are tense, exceedingly painful when handled, and in which the integuments are even tinged with a light pink colour.

It remains for us to describe the second stage of the disease, or that which is attended with suppuration.

The symptoms which are the fore-runners of the formation of pus, are different in different cases. This variety depends upon the presence of acute or only chronic inflammation. When the former occurs, the parts surrounding the joint become tense and extremely painful; the skin is even reddish, and the patient experiences an attack of inflammatory fever. As the local pain abates, rigors take place, a swelling forms in the vicinity of the joint, and very soon points.

When the abscess is the consequence of that languid kind of inflammation which usually occasions serofulous collections of matter, there is not so remarkable an increase of pain in the articulation, before the commencement of suppuration. Startings and other spasmodic complaints have been set down as the most certain signs of the formation of matter in this disease. When the pus is formed in this slow manner, it does not make its way to the surface of the body so quickly, as when the abscess has been the immediate result of an attack of active inflammation on the morbid joint. A large fluctuating tumour presents itself; but it does not directly point. The patient suffers greater uneasiness in the part; yet his sensations do not amount to that acute description of tenderness, which affects in the foregoing instance not only the deep, but also the most superficial parts around the articulation.

At length the limb becomes shortened, and this circumstance, when the retraction is very considerable, arises from nothing less, than an actual dislocation of the head of the thigh bone, in consequence of the destruction of the cartilages, ligaments, and articular cavity. The shortening of the limb may happen before suppuration as well as after it. There are instances, in which the head of the bone is dislocated, and ankylosis ensues without the occurrence of any abscess at all.

Sometimes, before matter is formed, the patient is seriously debilitated by hectic symptoms. In the suppurative stage of the distemper, these effects on the constitution always become worse. The patient loses his appetite, cannot sleep, has a small frequent pulse, colliquative sweats; and, too often, a very obstinate and debilitating diarrhœa.

The openings through which the abscess is discharged continue, in most instances, to emit an unhealthy kind of matter for a long time after their first formation, becoming in fact the terminations of sinuses, which lead down to the diseased joint.

When the disease follows external violence, the inability of using the limb is said by Sabatier not to be so complete, as when that symptom depends upon a fracture of the neck of the thigh bone; a circumstance, which may assist the judgment of the surgeon in any doubtful case.

When a diseased hip is examined after death, collections of matter are often seen on the glutæi muscles, on the dorsum of the os ilium, and in the acetabulum. Sometimes, the muscles at the upper and fore-part of the thigh are covered with pus. The femur is frequently found drawn up on the external surface of the ilium. The cartilage which covers the head of the thigh bone is occasionally quite destroyed, while the round ball itself is marked with deep excavations, the effect of caries. The acetabulum is often totally destroyed, so that the os femoris, not being confined in the articular cavity, is pulled upwards by the muscles. Even the outside of the ilium is sometimes affected with a kind of caries.

According to Mr. Ford, the os innominatum is always
more

more extensively carious than the thigh bone. We have seen a case, where the head of the latter bone was quite perfect, notwithstanding the acetabulum was completely annihilated. If this statement be generally, or even frequently correct, it must refute the doctrine of De Haen, that the distemper begins in the soft parts, at the same time, that it displays the absurdity of all thoughts of undertaking amputation at the hip, since most of the disease, situated on the bones of the pelvis, could not be taken away.

The remote causes of the hip disease are very imperfectly understood. External violence is undoubtedly one, and the testimony of numerous respectable writers confirms, that lying down on the damp ground in summer time, and, indeed, all kinds of exposure to damp and cold, are frequently conducive to the origin of the disorder. For this reason, the lower orders of society are rather more subject to the affliction than the higher classes. The particularities, however, in the affected joint, or, in the constitution, which cause the disease to take place in some persons, and not in others, though similarly circumstanced in life, are perhaps beyond the reach of human investigation. A serofulous habit is certainly one predisposing circumstance; but the disease often takes place without any suspicion of serofula, and without any palpable cause whatever.

When the disease is attended with a degree of active inflammation, the most advantageous treatment is topical bleeding with leeches, cupping the circumference of the affected joint, and applying the saturnine lotion. When the pain is severe, the hip may be fomented in the morning and evening, and an opiate may be administered at night. Care must be taken to keep the bowels open with mild purgatives.

The foregoing plan is always highly beneficial, while there are manifest marks of active inflammation about the joint. But it is not to be continued after such state has subsided. Morbid anatomy tends to shew, that the hip disease consists in the same alteration of the bones, ligaments, and cartilages, as we find prevails in the generality of white swellings. Experience proves, that both diseases ought to be treated on similar principles. The plan, therefore, on which the best surgeons place the greatest reliance, is the endeavour to stop the progress of the disease by making an issue with caustic just behind and below the great trochanter. This issue is to be kept open with peas. The benefit which it effects, is accomplished not merely through the discharge that is produced, but also on the principle of counter irritation. For nothing is more certain in medical science, than the frequent possibility of arresting and subduing one disease by the artificial formation of another. In general, it will be requisite to keep the issue open for several months, or even a year or two, before the distemper is effectually checked. During all this time, the patient should be advised to rest the limb as much as possible.

The efficacy of the Bath water, in the cure of the hip disease, has been much praised by Drs. Oliver, Charlton, and Falconer. The patient is put into a warm bath for 15 or 25 minutes, two or three times a week. It is to be noticed, that the Bath water is only recommended as an external application, and merely in the early stage of the disease, before suppuration has commenced. We suspect, that many cases, which have been set down as cured by the Bath water, have been rheumatic affections; and we believe that any warm bathing would have had equal power over the hip disease.

When abscesses form, the surgeon should let out the matter, and apply a poultice. The issue, however, is not to be discontinued; or, if the inflammation or any other circumstance should compel the surgeon to heal it for a time, it will be proper to make another as soon as the joint is in a

more easy state. We scarcely need observe how necessary it is to support the patient's strength with tonics, good air, eligible nourishment, &c. when hectic symptoms prevail. Pain is to be appeased, and sleep procured by opium. See Ford on the Disease of the Hip-joint, Falconer on Ischias, Crowther on White Swelling, edit. 2. Samuel Cooper on the Diseases of the Joints.

Hip-mould, in *Building*, is by some used for the back of the hip. Others understand it as a prototype, or pattern, commonly made of a piece of thin wainscot, by which the back and the sides of the hip are set out.

Hip-shot, a disorder of a horse, when he has wrung or sprained his haunches or hips, so as to relax the ligaments that are to keep the bone in its due place.

The signs are, that the horse will halt much, and go asidelong, trailing his leg after him; and the hip which is hurt will be lower than the other, the flesh falling away on the side of his buttock.

Hip-tiles. See *TILES*.

HIPPA, in *Zoology*. See *CANCER*.

HIPPAGOGA, in *Antiquity*, a vessel used in transporting horses. It was otherwise called hippago.

HIPPARCHION and *RUFFINUS*, in *Biography*, celebrated performers on the lyre, meeting in contention for the prize at the public games, Hipparchion was so terrified at the sight of the crowd in the theatre, that he was utterly unable to dispute the premium, which was bestowed on Ruffinus. Hence the name of Hipparchion became proverbial for any one who promised much, and performed nothing.

HIPPARCHIA. See *CRATES*.

HIPPARCHUS, an ancient astronomer, was born at Nice, in Bithynia, and flourished between the 154th and 163d Olympiads. He was the first person who attempted to count the number of the fixed stars; and his catalogue is still preserved in Ptolemy's "Almagest," where they are set down with their longitudes and apparent magnitudes. According to Pliny he foretold the course of the sun and moon for 600 years; he predicted the times of eclipses, and taught mankind that they ought not to be alarmed at the recurrence of such phenomena. Thales was the first among the Greeks who could foretel the approach of an eclipse; and among the Romans, Sulpitius Gallus began to be successful in that kind of prediction, and he made a seasonable essay of his skill on the night before the day in which the decisive battle against Perseus was fought. Hipparchus came after these, and greatly improved that science, making ephemerides, and other learned and useful helps to the practice of astronomy. He discovered a new star; and he is memorable for having been the first who discovered the *PRECESSION of the Equinoxes*, which see. He endeavoured to reduce to rule the many discoveries which he had made, and invented new instruments by which he marked the places of celestial objects, and their magnitudes. Hipparchus made his first observations in the isle of Rhodes, but he afterwards pursued his studies in Bithynia and Alexandria. His commentary upon the phenomena of Aratus, which is a kind of criticism on that poem, is still extant. This commentary was first published by Peter Victorius at Florence, about the middle of the 16th century; but a more correct edition of it was given by father Petau, with a Latin version and notes, in his *Uranologia*, published at Paris, 1650. Hipparchus was author of many other works, which were highly spoken of by the ancients, but which are now lost. Every man of science has without hesitation agreed in rendering a just tribute to the praise of this astronomer, on account of the obligations which this kind of knowledge is under to him. He is likewise celebrated for his ardent patriotism and public spirit, under the influence of which he

is said to have been greatly instrumental in delivering his country from tyranny. He is thought to have died about 125 years before the Christian era, and statues were erected to his memory. Bayle. Hutton's Math. Dict.

HIPPARCHUS's *Period*. See PERIOD.

HIPPASUS, in *Biography*, is enumerated among the Greek writers on music whose works are lost. He was a native of Metapontus, a disciple of Pythagoras, and, according to Theon of Smyrna, an excellent musician.

HIPPED ROOF, in *Architecture*, is that whose ends rise immediately from the wall plate, with the same inclination to the horizon as the other two sides of the roof have.

Backing of a hip is the angle made on its upper edge, to range with the two sides or planes of the roof between which it is placed.

Jack rafters are those short rafters fixed to hips equidistantly disposed in the planes of the sides and ends of the roof, and parallel to the common rafters, to fill up the triangular spaces, each of which is contained by a hip rafter, the adjoining common rafter and the wall plate between them.

The feat or base of the rafter is its ichnographic projection on the plane of the wall-head, or on any other horizontal plane.

The principal angles concerned in hipped roofing are, the angle which a common rafter makes with its feat on the plane of the wall-head; the vertical angle of the roof; the angle which a hip makes with the adjoining common rafter; the angles which a hip make with the wall plate on both sides of it; the angle which a hip rafter makes with its feat; and the acute angle which a hip rafter makes with a vertical line. The principal lengths concerned are, the height of the roof; the length of the common rafters and their feats; the length of the hips and their feats; and, lastly, the length of the wall plate contained between the lower end of a hip and the lower end of the adjacent common rafter.

The sides and angles may be found by geometrical construction or trigonometrical calculation. It is evident, that if the hipped end of a roof be cut off by a vertical plane parallel to the wall, through the upper extremity of the hips, it will form a rectangular pyramid, or one whose base is a rectangle. The base of this pyramid is bounded by the wall plate between the two hips on one side, and on the opposite side by the feat of the two adjoining common rafters; on the other two opposite sides by that part of the wall plate on each side contained by the lower end of the hip and the next common rafter adjoining. One of the sides is the isosceles triangle contained by the two adjoining common rafters with their feat; the opposite side is the hipped end of the roof, forming also an isosceles triangle; the other two opposite sides are the right-angled triangles contained by the two hips and the two adjoining rafters on the side of the roof. This rectangular pyramid may be divided into three triangular pyramids by the two vertical triangular planes, formed by the hip rafters, their feats, and the common perpendicular from their vertex.

Two of these pyramids, when the plan of the building is a rectangle, are equal and opposite. In each of these equal and opposite pyramids the base is a right-angled triangle, contained by the feat of the hip rafter, the feat of the adjoining common rafter, and the part of the wall plate between the hip and the adjoining common rafter. One of the sides is a right-angled triangle contained by the adjoining common rafter, its feat, and perpendicular; a second side is a right-angled triangle contained by the common rafter, the

hip rafters, and the wall plate between them; and the remaining third side is the triangle contained by the hip rafter, its feat and perpendicular. With regard to the remaining pyramid, its base is a right-angled triangle contained by the feats of the two hips and the wall plate between them, the right angle being that contained by the feats of the two hips; two of its sides are the triangular planes passing the hip rafter, which are also common to the other two pyramids; its third side is the hipped end of the roof.

Given the plan of a building, or the form of a wall plate of a hipped roof, and the pitch of the roof, to find the various lengths and angles concerned, whether the roof is square or bevel.

To find the Length of the Rafters Geometrically.—Let ABCD (*Pl. LXXXV.*) be the plan. Draw EF parallel to the sides AD and BC in the middle of the distance between them. On DC, as a diameter, describe the semicircle DFC. Draw FD and FC, then the angle DFC is a right angle. Draw GFH perpendicular to EF, cutting the sides AD and BC in G and H. From FE cut off FI equal to the height or pitch of the roof, and join GI. From FC cut off FK equal to FI, and join KD; then GI is the length of a common rafter, and DK that of the hip; for if the triangles GFI and DFK be turned round their feats, GF and DF, until their planes become perpendicular to the triangle GFD, the perpendicular FI will coincide with FK, and the point I will coincide with the point K; the lines GI and DK, representing the rafters, will then be in their true position.

The same by Calculation.— $G I^2 = G F^2 + F I^2$ (Euclid 1. 47), therefore $G I = (G F^2 + F I^2)^{\frac{1}{2}}$ the length of the common rafter, $D F^2 = G F^2 + G D^2$ the square of the feat of the hip. $D K^2 = D F^2 + F K^2 = G F^2 + G D^2 + F I^2$, therefore $D K = (G F^2 + G D^2 + F I^2)^{\frac{1}{2}}$.

In the same manner the other hip rafter CL is found, as also the hip rafters AM and BN.

To find the Backing of the Hips and the Shoulders of Jack Rafters and Purlins.

Geometrically.—Let it be required to find the backing of the hip rafter, whose feat is CF.

Imagine the triangle CFL to be raised upon its feat CF, until its plane becomes perpendicular to the plane of the wall plate ABCD, then there will be two right-angled solid angles; the three sides of the one are the plane angles FCD, FCL, and the hypotenusal plane angle DCL. In each of these solid angles the two sides containing the right angle, viz. the plane angles FCH, FCD, and the perpendicular plane angle CFL, which is common to both, being given, to find the two opposite inclinations to the sides FCH and FCD, and the remaining third sides.

Now the angles GDC and HCD are bisected by the feats FD and FC of the hip rafters; for if EF is produced to meet DC in U, U will be the centre of the circle DFC; and UC, UF, UD, are equal to each other: and because UF is equal to UC, the angle CFU is equal to FCU; but CFU is equal to the alternate angle FCH; therefore the angle FCU is equal to FCH: that is, the angle UCH is bisected by the feat FC of the hip rafter. In the same manner it may be shewn that UDG is bisected by the feat DF of the other hip rafter. From any point O in FC, draw OV perpendicular to LC, cutting it in P, and OW perpendicular to FC, cutting DC in W; from OC cut off OQ equal to OP. Join QW, then OQW will be the inclination opposite the plane angle

H I P

angle F C U, and this is the angle which the end of the roof makes with the vertical triangle contained by the hip rafter, its feat and perpendicular. Produce W O to meet B C in X, and join Q X, then W Q X is the inclination of the two planes of a side, and end of the roof, whose intersections are B C and C D, on the plane of the wall-head. Now the angle W Q X, which is double the angle W Q O, is the backing of the hip. Make P V equal to Q W, and join C V, then will P C V be the angle contained by the two sides L C, C D, or that of the hypothenufial planè angle contained by the intersection B C, and the hip rafter L C. This angle may be otherwise found thus: produce G H to R; make C R equal to C L, then the angle H C R is equal to P C V. Now the angle H C R, or P C V, is the angle which the purlins (when one of their faces is in the side of the roof) makes with the hip rafter L C; and the angle C V P, or C R H, is the angle which a jack rafter makes with the same hip: in the same manner may the backings of the other hips be found. The other bevel of the jack rafters is the angle H I F. To find the other bevel for cutting the shoulder of the purlin proceed thus: on F, as a centre, with the distance F G, describe the arc G Y; draw F Y perpendicular to G I; Y Z parallel to E F, cutting F D in Z, and Z & parallel to G H, cutting A D in &. Join & F, then G & F is the angle which the other side of the shoulder makes with the length of the purlin.

At the upper end of this diagram is shewn the manner of finding the two bevels for cutting the shoulder of the purlin against the hip rafter, when the side of the purlin is not in the plane of the side of the roof.

To find the same things by calculation.—The backing of the hip rafter, and hypothenufial side, is obtained as follows: it has been shewn that the three plane angles, and the three inclinations of solid angles, consisting of three plane angles, are found exactly as the sides and angles of spheric triangles, any three parts being given; the degrees of the plane angles being exactly the same as the sides of the spheric triangle, and the inclinations the proper measures of the spheric angles; therefore if two of the plane angles should be perpendicular to each other, the spheric triangle representing this solid angle will have also two of its sides perpendicular to each other. Now in this, there are given the two sides containing the right angle to find the hypothenufe and angles.

It is shewn by writers on spherical trigonometry, that in any right-angled spheric triangle, radius is to the cosine of either of the sides, as the cosine of the other side to the cosine of the hypothenufe. Suppose the plane angle F C L to be 27°, and the angle F C H 52°, to find the hypothenufe and angles of a right-angled spheric triangle, one of whose legs is 27° and the other 52°, it will therefore be

As radius, sine of 90°	-	-	-	= 10.00000
Is to the cosine of F C L, 27°				= 9.94988
So is the cosine of F C H, 52°				= 9.78934
				19.73922
				10.00000
				9.73922
To the cosine of the hypothenufial side } 56° 44'				= 9.73922

This ascertains the angle which the jack rafter makes with the hip. Since all the sides are now given, we shall have, by another well known property of the sines of the sides

H I P

being as the sines of the opposite angles, the following proportion,

As the sine of the hypothenufe 56° 44'	=	9.92227	
Is to the sine of a right angle, or 90°	=	10.00000	
So is the sine of the side F C H, 52°	=	9.89653	

19.89653
9.92227

To the sine of the opposite angle 70° 28'	=	9.97426	
---	---	---------	--

Therefore the backing is twice 70° 28'	=	140° 56'	
--	---	----------	--

In finding the angle opposite the side F C H, it was not necessary that the hypothenufial side should have first been found, it might have been found independently thus: the sine of either of the sides about the right angle is to radius, as the tangent of the remaining side is to the tangent of the angle opposite to that side; therefore

As the sine of the side F C L, 27°	-	= 9.65705	
Is to the tangent of the side F C H, 52°	=	10.10719	
So is radius, sine of 90°	-	= 10.00000	

20.10719
9.65705

To the tangent of the angle opposite the } side F C H, 70° 28'	}	= 10.45014	
---	---	------------	--

In the same manner may other bevels be found by trigonometrical calculations; but as such extreme exactness is not necessary, the geometrical constructions ought to be well understood.

HIPPELAPHUS, among the *Ancient Zoologists*, was only the name of a large race of flags with longer hair on the neck, giving it the appearance of a mane. See CERVUS *Elaphus*.

HIPPER RIVER, in *Geography*, is a small river which rises in the East Moors of Derbyshire, in the township of Brampton, and falls into the Rother at the S.E. end of the town of Chesterfield. This river collects all the rain waters of about 7000 acres of land, according to Mr. Farey's Report of Derbyshire, vol. i., where the strata are mentioned over which it flows. A great variety of manufactures are established on this river in New or Little Brampton and Chesterfield.

HIPPEUS, or EQUINUS, in *Physiology*, a sort of comet which some writers suppose to bear a resemblance in its tail to a horse. But the shape of this kind of comet is not always alike; being sometimes oval, and sometimes imitating a rhomboides. Its train also is sometimes spread from the front or fore-part, and sometimes from the hind-part.

Hence this class of comets is distinguished into equinus barbatus, equinus quadrangularis, and equinus ellipticus. See COMET.

HIPPI PROMONTORIUM, in *Ancient Geography*, *Ras-el-Hamrah*, a promontory of Africa, E. of the promontory of Tapfus, and N.W. of the promontory of Stoborrurn.

HIPPIA, a town of Greece, in Thessaly, in Perrhæbia. —Also, a fertile and delightful level country at the mouth of the Cephissus.

HIPPIA, in *Botany*, a name which seems to have originated with Valerius Cordus for the common Chickweed, *Stellaria media*, Fl. Brit. See his Hist. Stirp. 159. It is said by Ambrosinus to be derived from *ἵππος*, a horse, because it affords

HIPPIA.

swords that animal a grateful food. Whatever truth there may be in this account, we are unable to trace the meaning of Linnæus in applying it to the little syngenchous genus, resembling Tanfy, of which we are here to treat.—Linn. Mant. 158. Schreb. 586. Willd. Sp. Pl. v. 3. 2382. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 278. Juss. 184. Lamarek. Dict. v. 3. 130. Illustr. t. 717. Gærtn. t. 164.—Class and order, *Syngenesia Polygamia-necessaria*. Nat. Ord. *Compositæ Discoidæ*, Linn. *Corymbifera*, Juss.

Gen. Ch. *Common Calyx* hemispherical, of several ovate, somewhat imbricated, scales. *Cor.* compound, discoid; with numerous male florets in the disk, and ten female ones in the circumference; the petal of the males is funnel-shaped, five-cleft, erect; that of the females obsolete, tubular, slightly three-cleft. *Stam.* Filaments in the male florets five, very short; anthers still shorter, united into a cylinder. *Pyl.* Germen in the female florets large, bordered; style cloven; stigmas erect. *Peric.* none, except the unchanged calyx. *Seeds* in the female florets oval, encompassed all round with a very broad margin, without any crown. *Recept.* naked.

Eff. Ch. Receptacle naked. Seed-down none. Seeds with a broad margin. Calyx hemispherical, somewhat imbricated. Florets of the radius ten, obsolete, obscurely three-cleft.

1. *H. frutescens*. Linn. Mant. 291. Suppl. 390. (Tanacetum frutescens; Linn. Sp. Pl. 1183. T. africanum arborefcens, foliis lavandulæ multifido folio; Comm. Hort. v. 2. 201. t. 101.)—Shrubby, erect, and hairy. Leaves pinnatifid. Flowers corymbose.

A native of the Cape of Good Hope, flowering in our greenhouses from February to August, and sometimes perfecting seed in the autumn. The whole plant is clothed with soft shaggy hairs, especially the young leaves and branches, and has the smell and taste of common Tanfy. *Stem* shrubby, round, alternately branched, leafy, five or six feet high, with a brown bark. *Leaves* scattered, stalked, an inch or inch and half long, deeply and elegantly pinnatifid, their segments numerous, parallel, elliptical, entire, decurrent into the stalk. *Flowers* terminal, corymbose, deep yellow, like Tanfy, but smaller. The chief beauty of the plant consists in its foliage, which is so regularly cut as to be almost pectinate. Indeed Linnæus, thinking it at one time an *Eriocephalus*, named it *E. pectinifolius* in his Syst. Nat. ed. 12. v. 2. 579.

2. *H. minuta*. Linn. Suppl. 389.—Herbaceous, procumbent, creeping. Leaves pinnate. Flower-stalks axillary, single-flowered.—Sent by Mutis from New Granada. *Root* of very long fibres. *Stems* procumbent, creeping, a few inches in length, branched, round, hairy. *Leaves* opposite at the base of the branches, otherwise alternate, scarcely an inch long, pinnate or very deeply pinnatifid, their leaflets or lobes much resembling those of the former species, but sometimes having one or two notches. They are hairy when young, nearly smooth when full-grown. *Footstalks* rather longer than the leaves, sheathing and membranous at the base. *Flower-stalks* axillary, longer than the leaves, deflexed, simple, slender, naked, solitary, each bearing an extremely small yellowish flower, of the difficulty of examining which the younger Linnæus might well complain; but he has copied his father's manuscript from the back of the specimen, and possibly the whole was written by the latter, as was the case with the greater part of the *Supplementum*, though published in the name of the former. We have already pointed out a mistake into which Jussieu has been

led respecting this plant. See *GYMNOSTYLES nasurtifolia*.

3. *H. stolonifera*. Broter. Lusit. v. 1. 373. Phytogr. fasc. 1. 29. Willd. n. 3.—Herbaceous, procumbent, creeping. Leaves pinnatifid. Flowers sessile at the root.—Frequent in Portugal, according to the worthy father Brotero, growing in moist ground, especially where the soil is chalky, and flowering in winter, sometimes so late as April. The plant is insipid and inodorous. *Root* annual, fibrous, crowned with the sessile flowers, and throwing out from beneath them a few shoots, scarcely above half an inch long. *Leaves* copious, radical, spreading in a circle, smooth or slightly downy, pinnatifid with five, seven, or only three lobes, which are very small and linear-lanceolate. *Footstalk* from half an inch to an inch long, being twice the length of the leaf, or more. *Florets* enveloped in down, all tubular; the females 40 or more, in the circumference; males seven or eight only, in the centre. *Corolla* of the females awl-shaped or bristle-like, closely embracing the style, with a scarcely perceptible limb; that of the males funnel-shaped, apparently three-cleft. The styles of the former all meet over the male florets in the centre, while the flower is in perfection. *Seeds* numerous, smooth, wedge-shaped, or obovato-triangular, the upper angles pointed; crowned with the style and a membranous partial calyx, without down, and winged longitudinally.—Such are the most important circumstances in Brotero's description, which certainly prove the plant a *Gymnostyles*, under which genus we should have ranged it, had this account come under our notice before. It does not appear to be any of the species we have described, but makes a fourth, and the only European one. We have not however seen any specimen.

4. *H. integrifolia*. Linn. Suppl. 389. (Grangea; Lamarek. Illustr. t. 699. f. 1.)—Roughish, upright. Leaves lyrate, unequally ferrated; the upper ones undivided. Flowers in terminal clusters.—Native of the East Indies? Our specimen came from the Paris garden, as the *Grangea* of Jussieu and Adanson; we have already alluded to it under the first species of that genus; (see *GRANGEA*;) but were not then aware of its being figured as such by Lamarek. The original specimen, named by the younger Linnæus, is very bad, and the leaves were not perceived by him to be lyrate. He not unaptly compares them to those of a nettle, which their deep unequal serratures resemble. The stem is herbaceous, a foot or two high, roughish. Leaves alternate, stalked, two inches long and one broad. Flowers the size of a small pea, in loose, terminal, erect clusters; their florets very numerous; receptacle convex; seeds obovate, bordered. We are certain this plant is not a *Grangea*, but dare not aver it to be a good *Hippia*, though we see no positive objection. The seeds indeed are much narrower than in *H. frutescens*.

5. *H. bicolor*. (*H. integrifolia*; Ait. Hort. Kew. v. 3. 278. Spharanthus africanus; Burm. Ind. 185. t. 60. f. 2, but not of Linnæus; Cotula bicolor; Willd. Sp. Pl. v. 3. 2171, excluding the synonym of Lamarek.)—Roughish, spreading. Leaves obovate, deeply ferrated. Flowers in terminal, divaricated, leafy clusters.—Native of the East Indies. We had it (as the plant adopted by Willdenow from Roth,) out of the stove of the Cambridge garden in October, 1805, and have no doubt of the synonyms of Burmann and Aiton. It appears sufficiently distinct from the last described in its spreading mode of growth, paler colour, differently shaped and less divided leaves, whose serratures are more pointed, and in the divaricated clusters. In genus it certainly accords with the *integrifolia*, which name would suit the present species better than that to which it is applied. S.

HIPPIAS, in *Biography*, a philosopher of Elis, and a disciple

disciple of Hegesidamus; he was crowned at the Olympic games, and wrote upon music.

HIPPIATRICE, of ἵπποι, *horse*, and ἰατρος, *physician*, the art of curing the diseases of brutes, and particularly horses.

This makes what we rather call the *farrier's art*. See **FARRIER**.

HIPPION, in *Botany*, a name synonymous in some authors with *Horfe Violet*, derived from ἵπποι, *a horse*; but for whose application in the present instance we cannot account. It is retained by Schmidt in his *Flora Boëmica*, after Gesner, for the *Gentiana* with a bearded corolla, of which he makes a distinct genus. Mr. Brown, however, *Prodr. Nov. Holl.* v. 1. 450, quotes the *Hippion* of Schmidt as a synonym of what he considers as the real *Gentiana*, whose corolla is naked at its orifice.

HIPPIUM, in *Antiquity*, that part or tract of the *hippodrome* which was beaten with the horses' feet. See **HIPPODROME**.

HIPPO DIARRHYTUS, or *Zarytus*, in *Ancient Geography*. See **BISERTA**.

HIPPO-REGIUS, an ancient town of Africa, in that part of Numidia called the Eastern province or Constantina, situated near the sea, on a bay in the vicinity of the promontory of Hippo. The ruins of this ancient city are spread over the neck of land that lies between the rivers Boo-jeemah and Seiboufe, which near the bank is plain and level, but rises afterwards to a moderate elevation. They are about half a league in circuit, consisting of broken walls and cisterns. This city was called Hippo Regius, not only in contradistinction to the Hippo Zarytus, but from its having been one of the royal cities of the Numidian kings. For Silius Italicus (*l. iii. v. 259.*) informs us, that it was formerly one of their favourite seats; and indeed if a city strong and warlike, commodiously situated, as well for commerce as for hunting and diversion, that enjoyed a healthful air, and took in at one view the sea, a spacious harbour, a diversity of mountains loaded with trees, and plains intersected by rivers, would fix the affection and attachment of the Numidian kings, Hippo had all these circumstances to recommend it.

HIPPOBOSCA, in *Entomology*, a genus of the Diptera order, distinguished by having the mouth furnished with a short, straight, and cylindrical two-valved sucker, the valves of which are equal; the antennæ filiform; feet armed with numerous claws, and the body flat and hard. This is the Linnæan character, to which it is added by Scopoli that the rostrum has only one bristle. Geoffroy observes, that the hippoboscæ are the only dipterous insects that want stemmata, except the culices, and that their antennæ are setaceous, and composed of a single hair. According to Schæffer the abdomen is as broad as the thorax. Fabricius adopts the genus as proposed by Linnæus, with the following essential character. Beak short, straight, and bivalve, with the valves equal, and the antennæ filiform; adding, as a secondary character, that the body of the hippobosca is small, ovate, depressed, flat, glabrous, and immarginate: the head small, rounded, and flat: the eyes ovate, lateral, and distant; thorax ovate; scutellum large; and the wings two, membranaceous, and the length of the abdomen.

The hippoboscæ are denominated "Spider flies" by some English writers, no doubt in conformity with the French of Reaumur, "mouches araignées." This is not a name, however, by which they are exclusively known in France, being called in Normandy "mouches bretonnes," and elsewhere "mouches d'Espagne." In England also they bear the name of horse-flies, the largest species being extremely troublesome to horses. They haunt woods and marshy places.

VOL. XVIII.

and are commonly found attached to the bodies of quadrupeds and birds, the blood of which affords them their natural subsistence. In the act of feeding they thrust their acute proboscis into the skin, and occasion a smarting sensation, similar to that inflicted in the bite of a flea, but rather more pungent. They move sluggishly, and with caution, and are at all times so firmly attached to the skin by the assistance of their numerous claws, that it is scarcely possible by any effort to remove them, unless by at the same time plucking out the flesh to which they adhere. The species are not numerous.

Some modern writers divide the hippoboscæ into three distinct genera, retaining to one the former term, and naming the other two *Ornithomyia* and *Melophagus*. The very close affinity the two first mentioned bear to each other in external appearance seems scarcely to allow a deviation so remote from the example of Linnæus and Fabricius as that proposed, and we rather wish to esteem them as two distinct families of the same natural tribe than as distinct genera: the difference that prevails in the structure of the antennæ in those two families is certainly remarkable, and the very peculiar distinction of the head is also to be considered, one having stemmata on that part, and the other none. With regard to *Melophagus*, the dissimilarity in its general appearance is far more striking to the casual observer, this, unlike the two former, being destitute of wings: in the structure of the antennæ it agrees with *H. equina*, a species admitted by every writer under the name of hippobosca. We shall consider these new genera as sectional divisions of the hippoboscæ in the subsequent arrangement.

* *Hippobosca*. Winged; eyes very distinct; head without stemmata; antennæ in the form of a globose tubercle inserted in a hollow at the base of the head.

EQUINA. Wings obtuse; thorax variegated; feet armed with four claws. Linn. *Horse spider fly*, *Donov. Br. Inf.*

Inhabits Europe, and infests cattle, hiding themselves under the hairs, and attaching themselves firmly to the skin by means of the double pair of crotchets or hooks of their feet: it is of a disgusting form, flat, and hard, and, like the two succeeding species, not easily killed by pressure. The head is brown; thorax brown, varied with yellowish, and a band of the same down the middle; wings hyaline, with a brown spot near the outer margin; legs annulated with yellow and brown. Length about three quarters of an inch.

* *Ornithomyia*. Winged; eyes very distinct; head furnished with stemmata; antennæ lamelliform and advanced.

AVICULARIA. Wings obtuse; thorax immaculate. Linn. *Bird spider fly*, *Donov. Br. Inf.* *Ornithomye verte*, Latr.

Infests birds as the former infests quadrupeds, secreting itself among the feathers, and subsisting on their blood. The body is dull brown, with a greenish cast; size inferior to the former; length about half an inch.

HIRUNDINIS. Wings tapering to a point, feet with six claws. Linn. *Donov. Br. Inf.*

Body brown tinged with blueish; abdomen darker. Like the preceding, infests birds, but more generally the swallow, and is often found in the nest of the common European kind.

* *Melophagus*. No wings; eyes less distinct; antennæ in the form of a tubercle, lodged in a hollow; valves of the sucker longer than the head.

OVINA. Body dull, testaceous. Linn. *Donov. Br. Inf.* *Sheep spider fly*, *meloph. ovæ*, Latr. *L'hippobosque des moutons*.

Found lodged among the wool of sheep in Europe.

HIPPOCAMPUS, in *Ichthyology*, a species of *Syngnathus*; which see.

HIPPOCASTANUM, in *Botany*, from ἵππος, *a horse*, and καστανον, *a chestnut*, the Horse Chestnut. Clusius, in his *Hist. Plant.* v. 1. 8, says the name is a translation of the

H

Turkish

Turkish appellation of this tree, *at ceftanefi*, or *ad caftanefi*, given to it becaufe the fruit was found good for the cough or broken wind in horfes. (See *ÆSCULUS*.) Some have fuppofed this fine tree, fo ornamental to our Englifh plantations, parks, and avenues, a native of America; but it appears from the works of Clufius to have been brought from Conftantinople to Vienna, and was found wild by Mr. Hawkins, the companion of the late Dr. Sibthorp, on mount Pindus, of whose celebrated groves it makes a principal part. The greateft wonder is, that no name or description, applicable to fo fingular and beautiful a tree, fhould be difcoverable among the writings of the ancients, and that the epithet *pinifer* fhould have been given to this famous mountain, but none expreffive of what muft conftitute its great and peculiar beauty, the rich foliage and magnificent bloffoms of the horfe-chefnut. See *CLUSIUS*.

HIPPOCENTAUR, formed of ἵππος, *horfe*, κένταυρος, *I fpur*, and ταύρος, *bull*, in *Antiquity*, a fabulous monfter, fuppofed to be half horfe and half man.

What gave occafion to this fable was, that the people of Theffaly, inhabiting near mount Pelion, became thus denominated, becaufe they were the firft who taught the art of mounting on horfeback; which occafioned fome of their neighbours to imagine, that the horfe and man made but one animal.

The hippocentaur fhould feem to have differed from the centaurs, in this, that the latter only rode on bullocks, and the former on horfes, as the names themfelves intimate. (See *CENTAURS*.) Under that article it has been fhewn that the appellation was derived from the practice of breaking or mounting horfes, for which the Theffalians were the moft famous. Thefe horfemen afterwards, in order to acquire greater strength and agility, performed a kind of exercife, in which they fought with bulls, which they pierced with their javelins, or overthrew by grafping them by the horns. Pliny informs us, not only that this exercife was common among the Theffalians, who invented it, but alfo that it was one of the fhows which Julius Cæfar exhibited to the Romans. It is very probable, therefore, that in fpeaking of thefe Theffalians, they added to the name of Hippios that of Centaur, and hence of thefe three words, ἵππος, κένταυρος, was compounded that of hippocentaur, a horfe-man-bull-shooter. As thefe horfemen became formidable afterwards by their depredations, the equivocation which appeared in the name made them to be accounted monfters compounded of two natures. The poets availed themfelves of this idea; and as in other inftances they gave the air of marvellous to the fubjects of which they treated, they made no difficulty in taking horfemen for Centaurs. And thefe horfemen became giants both in hiftory and fable.

On the medals of Gallienus is reprefented a centaur drawing a bow, or holding a globe in the right hand, and the helm of a fhip in the left; with this infcription, *APOLLINI CONS. AUG. To Apollo the confervator of Auguftus*. Tritian confiders both the one and the other as a fymbol of the protection Gallienus received from Apollo in his wars againft the Perfians.

HIPPOCEPHALOIDES, the *horfe-head ftone*.

The word is derived from the Greek ἵππος, *horfe*, and κεφαλή, *the head*; and is a name given by Dr. Plot to a ftone found in Oxfordfhire, and many other places, and fuppofed to refemble the head of a horfe in figure, though the truth is, it requires a very warm imagination to make out the refemblance.

The ftone is compofed of the matter of the common coarfer quarry ftone, and owes its figure to a fhell of the cockle-kind, into which having been received at a time when

it was foft and moift, it has taken the exact figure and lineaments of its inner parts. It is about the fize of the larger bucardita, from an inch and a half to two inches and a half in length, and indeed very much refembles that ftone, having been formed wholly in the fame manner, and in a fhell of the fame genus. Hill's *Hift. of Foffils*, p. 646.

HIPPOCRAS, *Vinum Hippocraticum*, a kind of medicated wine.

Menage approves the conjecture of thofe who derive hippocras from Hippocrates, as fuppofing him the inventor of it, but we may better deduce it from the manica Hippocratis, or Hippocrates's fleeve, ufed in the filtration of it.

Hippocras is a drink compofed of wine, with fpices and other ingredients infufed in it; much ufed among the French by way of a cordial dram after meals.

There are various kinds of hippocras, according to the kind of wine, and the other additional ingredients made ufe of; as white hippocras, red hippocras, claret hippocras, frawberry hippocras, hippocras without wine, cyder hippocras, &c.

That directed in our late college difpenfary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat, infufed in canary, with fugar; to the infufion, milk, a lemon, and fome flips of rofemary, are to be put, and the whole ftrained through a flannel. It is recommended as a cordial, and is good in paralytic, and all nervous cafes.

HIPPOCRATEA, in *Botany*, is fo named in commemoration of Hippocrates, the moft celebrated of ancient phyficians, and univerfally termed the "father of phyfic."—This genus was called *Coa* by Plumier, from the circumftance of Hippocrates having been born in the ifland of Cos, and therefore ufually known by the name of Hippocrates Coas.—Linn. Gen. 25. Schreb. 34. Jacq. Amer. 9. Willd. Sp. Pl. v. 1. 193. Vahl. Enum. v. 2. 26. Mart. Mill. Diét. v. 2. Juff. 251. Lamareck. Illuftr. t. 28. (Coa; Plum. 6. t. 35. Bejuco; Læf. I. 314.) Clafs and order, *Triandria Monogynia*. Nat. Ord. *Tribilata*, Linn. *Acera*, Juff.

Gen. Ch. *Cal.* Perianth of one leaf, fpreading, minute, coloured, deciduous, deeply divided into five, roundifh, fpreading, obtufe fegments, larger than the corolla. *Cor.* Petals five, ovate, fomewhat excavated at the tip. *Stam.* Filaments three, awl-shaped, erect, as long as the corolla; anthers broad, with a tranfverfe furrow. *Pift.* Germen oval; ftyle as long as the ftamens; ftigma obtufe. *Peric.* Capfules three, elliptical, compreffed, large, with two-valved cells; valves keeled and compreffed. *Seeds* five in each capfule, oblong, with a membranaceous wing.

Eff. Ch. *Calyx* in five fegments. *Petals* five. *Nectary* flefhy, bearing the ftamens. *Capfules* three, obcordate or elliptic, gaping in the middle.

Professor Vahl has described eight fpecies of this genus in his *Enumeratio Plantarum*, though Linnæus was only acquainted with *Hippocratea volulilis*, but as this is a genus very little known, and curious for being triandrous in a natural order that has ufually eight or ten ftamens, we are induced to give an abtract of all the fpecies found in the former author, following the profeffor's arrangement.

1. *H. obcordata*. Vahl. Enum. n. 1. (*H. scandens*; Jacq. Amer. 9. t. 9.)—"Leaves ovato-lanceolate, ferrated. Capfules obcordate."—Native of South America. It flowers in April and December, and bears fruit in July.—*Branches* purplifh. *Leaves* from one to three inches long, and little more than an inch broad, rounded at the bafe, a little pointed, entire in the lower part. *Stipula* folitary, ni-

rate,

nute, sctaceous, placed in the axils of the leaves. *Flowers* inodorous, yellowish-green. *Seeds* brown.

2. *H. ovata*. Vahl. n. 2. (*H. volubilis*; Linn. Syst. Veg. 83.)—"Leaves oblong or ovate, lanceolate or elliptic, serrated. Capsules oval."—A native of South America.—*Leaves* two or three inches long, obtuse at each end, smooth above; their stalks purplish, channelled above. Branches of the *panicle* divaricated, and, like the flowers, slightly ferruginous and downy. *Capsules* about two inches long, scarcely an inch broad, very obtuse, seldom emarginate.

3. *H. levigata*. Vahl. n. 3.—"Leaves ovate-oblong, slightly crenate."—Native of Cayenne.—*Branches* slightly ferruginous and downy. *Leaves* three inches long, rather obtuse, shining, of a reddish-brown underneath, gracefully veined; stalks purplish, smooth. The partial flower-stalks two, at the divisions of the *panicle*. Inflorescence very similar to that of the last species.

4. *H. viridis*. Vahl. n. 4. Fl. Peruv. v. 1. 44. t. 74. f. a.—"Leaves ovate, obtusely pointed, serrated and entire. Foot-stalks shorter than the leaves. Capsules oval, emarginate."—Found in groves upon the Andes.—Whole plant smooth. *Branches* forked. *Leaves* spreading, sometimes oblong, somewhat leathery, smooth above; leaf-stalks twisted, short. *Bractees* ovate, acute, hollow. *Flowers* yellow. *Stamens* united into a sort of cup, which includes the germen; anthers gaping at the top. *Germen* obovate, triangular. *Style* three-furrowed at the top; stigma triangular. *Capsules* an inch long.

5. *H. difperma*. Vahl. n. 5. (*H. indica*; Willd. Sp. Pl. v. 1. 193.)—"Leaves elliptical, pointed, minutely serrated. Capsules lanceolate, with two seeds, obtuse at each end."—Native of the East Indies.—Whole plant smooth. *Branches* round. *Leaves* two inches long, slightly serrated towards the end, acute, sometimes rather obtuse, membranaceous, pale green, a little nervous on the upper side. *Panicles* shorter than the leaves. *Flowers* smooth. *Capsules* an inch long, striated, gaping in the middle.

A variety, β , of this species, called by Vahl *Euonymoides*, is described by that author "with oblong or obovate leaves, entire or emarginate at the top." This variety differs in having the branches more remote, and its leaves three or four times as small as in the original; there are also fewer flowers in the panicles.

6. *H. paniculata*. Vahl. n. 6.—"Leaves oblong, acute at each end, obtusely serrated."—Found at Sierra Leone, and described by Vahl from a specimen in the Herbarium of Jussieu.—*Branches* shining, much spreading, extended at the joints, compressed at the top. *Leaves* three or four inches long, membranaceous, pale green. *Flower-stalks* half as long as the leaves. Its *fruit* is not known.

7. *H. macrophylla*. Vahl. n. 7.—"Leaves oblong, pointed, entire, shining, obtuse at the base."—This, like the last, is a native of Africa, and preserved in the collection of Jussieu.—*Leaves* five or six inches long, a little acuminate, membranaceous, pale green, shining above. The *fruit* has not been seen.

8. *H. comosa*. Vahl. n. 8. Swartz. Prod. 17. Ind. Occ. v. 1. 77.—(Bejuco; Læfl. It. 314.)—"Leaves somewhat heart-shaped or ovate, pointed, entire. Peduncles much-branched, capillary. Capsules oblong or obovate."—Native of woods in the interior of Hispaniola, flowering in February and perfecting fruit in the middle of summer. The natives of St. Domingo call it *Amandier des Bois*. *Stem* climbing to a considerable height. *Branches* divaricated, reflexed, pendulous. *Leaves* opposite, entire, smooth on both sides, having shortish, round footstalks. *Panicles* terminal, repeatedly subdivided, bearing numerous, single-flowered, white pedun-

cles. *Flowers* polygamous, most of them barren. *Petals* oblong, obtuse, white, persistent. *Filaments* inserted into the interior margin of the nectary. *Capsules* slightly striated, of two valves, gaping in the middle. *Nuts* four, oblong, angulated, at first soft, but growing harder as they ripen, winged at the side and top; kernels sweetish and oily.

The general habit of this genus is climbing, with very spreading branches, round and smooth in the lower part, and somewhat square at the upper. Leaves opposite, on foot-stalks, smooth on both sides. Panicles axillary and terminal, opposite, dichotomous. Flowers small. Capsules smooth.

HIPPOCRATES, in *Biography*, the most distinguished of the ancient physicians, and usually called the *father of physic*, was born in the island of Cos, in the first year of the 80th Olympiad, or about 460 years before Christ. He was of the family of the Asclepiades, *i. e.* the descendants of Æsculapius; his father, Heraclides, being the seventeenth lineal descendant from that personage, and the sixteenth from Podalirius, who, with his brother, Machaon, followed the army of the Greeks, in the Trojan war, according to Homer. In this family the profession of physic had been hereditarily followed from Æsculapius downwards, and under their direction the Coan school attained its high degree of eminence. His maternal ancestry was also honourable; his mother, Phenarete, being reputed the 18th lineal descendant from Hercules. Born under these favourable circumstances, surrounded from his infancy with all the objects of his studies, and aided by the collective knowledge, as well as incited to research by the fame of his ancestors, Hippocrates devoted himself zealously to the cultivation of the art, which he was destined to refine and improve. Not content with adopting the empirical practice which was hereditary in his family, he studied medicine under Herodicus, who had invented the gymnastic medicine, and was instructed in philosophy and eloquence by Gorgias, a celebrated sophist, and brother of the physician just mentioned. He is said also to have been a pupil of Democritus, (Celsus, lib. i. præf.) which, however, is considered as improbable; and to have been a follower of the doctrines of Heraclitus. In whatever study he engaged, however, he appears to have been a true eclectic, to have thought for himself, and to have adopted only those principles which appeared to be founded in sound reason. Thus, while he elucidated the empirical doctrines handed down to him by the light of philosophy, he corrected, or rather rejected, the false theories with which the philosophers, who had no practical knowledge of diseases, had loaded the science of medicine, and brought it into the true path of observation, under the direction of reason, that is, of a rational experience. Hence he is said to have been the first who separated the science of medicine from philosophy, or rather from mere speculation, which then assumed that name. ("Hippocrates Cous primus quidem, ex omnibus memoriz dignis, ab studio sapientiz disciplinam hanc (scil. medicinam) separavit, vir et arte et facundia insignis." Celsus, loc. cit.) For he considered philosophy and medicine as mutual aids to each other, and the proper union of the two as conferring a god-like qualification on man: "ιστορος γινεσθαι φιλοσοφος ισθθεις." (Lib. De decenti ornatu.) Hence the physicians of the rational or dogmatic sect (so called in opposition to the empiric sect) always acknowledged Hippocrates as their leader, being the first who combined reasoning with experience.

Of the events of his life little is known with certainty: for of those that are recorded, some have a fabulous appearance, and some are actually inconsistent with our knowledge of history. It is certain, that, after the manner of those times, he spent the greater part of his life in travelling; re-

HIPPOCRATES.

fiſiſg, however, for a conſiderable period, at various places, in which he was occupied in the practice of his art. In this way he viſited the greater part of Greece and Aſia Minor; but it appears from his writings that his chief abode was in the provinces of Theſſaly and Thrace, eſpecially at Lariffa, the chief city of the former, where he compoſed ſeveral books. Almoſt all the cafes of diſeaſe, which are well deſcribed in his books "on epidemical diſorders," occurred during his practice in theſe provinces. According to Soranus, he ſpent ſome time at the court of Macedon, where he ſignalized himſelf, in conſultation with Euryphon, a ſenior phyſician, by detecting the origin of the malady of the young Perdiccas. His obſervation of the emotion of the prince on the appearance of Phila, a miſtreſs of his father, led him to pronounce that love alone was capable of curing the diſeaſe which it had occaſioned. His fame cauſed him to receive invitations from different cities of Greece. He is ſaid to have been requeſted by the inhabitants of Abdera to go and cure their celebrated fellow-citizen, Democritus, of the madneſs under which they ſuppoſed him to labour. The alleged letter of the Abderites on this occaſion is ſtill preſerved. On viſiting the philoſopher, Hippocrates pronounced him not mad; but, on the contrary, the wiſeſt man in their city. A ſpeech aſcribed to his ſon Theſſalus is alſo extant, in which the ſervices of Hippocrates to the Athenians are enumerated. It is here ſaid, that Illyria and Pæonia being ravaged by the plague, the inhabitants of thoſe countries offered large ſums of money to induce Hippocrates to come to their relief; but that certain winds which at that time prevailed, led him to foreſee that the peſtilence was likely to penetrate into Greece; he, therefore, reſuſed to quit his own country, but ſent his two ſons, and his ſon-in-law, through the different provinces, to convey the proper inſtructions for avoiding the infection; he himſelf went to Theſſaly, and thence to Athens, where he conferred ſuch eminent ſervices on the citizens, that they iſſued a decree honouring him with a crown of gold, and initiating him and his family in the ſacred myſteries of Ceres and Proſerpine. Hippocrates is likewiſe reported to have reſuſed an invitation from Artaxerxes, king of Perſia, accompanied by a promiſe of every reward and honour which he might deſire, to repair to his dominions during a ſeaſon of peſtilence. The letters alleged to have paſſed on this occaſion are extant, in one of which Hippocrates replies, that "he has food, clothing, and a habitation, in his own country; that it would be unworthy of him to aſpire to the wealth and grandeur of the Perſians, or to cure barbarians who were the enemies of Greece." The enraged king ordered the inhabitants of Cos to deliver up Hippocrates, or to expect the terrors of his vengeance: but the iſlanders declared their reſolution to defend the life and liberty of their valued countryman at all hazards, and nothing was attempted by the Perſian. Moſt of theſe ſtories, however, are deemed fictitious by the moſt intelligent critics. The cure of the young Perdiccas probably originated from the report of a ſimilar cure aſcribed to ERASISTRATUS (which ſee); and the interview with Democritus is not ſupported by any ſatisſactory evidence. The relation of the ſervices of Hippocrates, during the plague at Athens, is alſo together irreconcilable with the accounts of Galen and of Thucydides: the latter of whom is ſilent as to the name of Hippocrates, and affirms that the diſeaſe was unchecked, and that the phyſicians were its firſt victims. Beſides, that plague commenced during the Peloponneſian war, in the 2d year of the 87th Olympiad, at which time Hippocrates was about thirty years old, and therefore could not have had two ſons or a ſon-in-law in a condition to practice. It is ſuppoſed by M. Le Clerc, that Aëtius aſcribed to Hippo-

crates the operations during the plague at Athens, which Plutarch, with more appearance of truth, imputed to Acron of Agrigentum (ſee ACRON); and Dr. Ackermann juſtly conjectures, that theſe fables were all invented after the death of Hippocrates, and aſcribed to him by the followers of the Dogmatic ſect, of which, as we have already obſerved, he was regarded as the founder. (See Fabric. Biblioth. Græca. tom. ii. p. 512. edit. Harles.) The letters and other pieces, which are preſerved with the works of Hippocrates, under the title of τὰ ἔπιτοια, and on the authority of which theſe anecdotes are related, are generally deemed ſpurious.

After a long life ſpent in the ſucceſſful practice of his art, in perfecting his rational ſyſtem of medical inquiry, and in forming diſciples worthy to ſupply his place, Hippocrates died at Lariffa in Theſſaly, at the age of 85, or 90, or, as others affirm, of 104, or even 109 years. He was buried between that city and Gyrtona. Beſides two ſons, Theſſalus and Draco, both eminent practitioners, he left a daughter, married to his favourite pupil, Polybus, who arranged and publiſhed the works of his great maſter; he left alſo a number of diſciples.

How dubious ſoever many of the circumſtances of the life of Hippocrates may be, it is not queſtioned that he acquired a reputation, which has ranked him high among the great men of Greece, and which may be traced from age to age, from the time in which he flouriſhed through all ſucceeding periods. He has not only paſſed, by almoſt univerſal conſent, for the father of phyſic and the prince of phyſicians, but his opinions were every where reſpected as oracles, not only in the ſchools of medicine, but in the courts of law. Philoſophers of every ſect were eager to read, to quote, and to comment upon his writings. He has ſhared with Plato the title of *Divins*; and not only ſtatues, but temples were erected to his memory, and his altars were covered with incenſe, like thoſe of Aſculapius himſelf. Indeed the qualifications and duties required in the character of the phyſician, were never more fully exemplified than in his conduct, or more eloquently deſcribed than by his pen. He had formed a very exalted notion of the dignity and uſefulneſs of his profeſſion, which is only lowered, he ſaid, in the public eſtimation, by the ignorance of its profeſſors; and he ſupported this dignity in his own perſon by the moſt rigid attention to the morality of private life, by great ſimplicity, candour, and benevolence in all his intercourſe with the ſick, and by unwearied zeal in investigating the nature and progreſs of diſeaſes, and in adminiſtering to their cure. He is ſaid to have admitted no one to his inſtructions without the ſolemnity of an oath, the form of which is tranſmitted to us among his writings. In this the moſt religious attention to the advantages of the ſick, the ſtricteſt chaſtity, and inviolable ſecrecy, in regard to whatever it ſeems improper to divulge, are the principal points inculcated.

The books attributed to Hippocrates amount to ſeventy-two in number, of which, however, a conſiderable part are regarded as ſpurious; ſome containing opinions which were not prevalent till long after the age of Hippocrates, and ſome differing altogether in ſtyle and compoſition from the genuine writings of that maſter, which are compoſed in the Ionic dialect, and are diſtinguiſhed by a remarkable conciſeneſs, and, as it were, compreſſion of language, which at times, indeed, borders upon obſcurity. Some pieces have been obviouſly written after the commencement of the Chriſtian era, and Galen affirms that ſeveral interpolations and alterations were made by Dioſcorides and Artemidorus, ſurnamed Capito, in the time of Adrian. Polybus, the ſon-in-law of Hippocrates, who collected and edited his works, is believed to have written ſome of the pieces, and Theſſalus and Draco,

HIPPOCRATES.

his sons, as well as Hippocrates III. and IV., his grandsons, are supposed to have written others, especially several of the books of "Epidemics." Again, Hippocrates, the first of the name, and grandfather of the great Hippocrates, is the reputed author of the treatises *Περὶ ἀγμάτων* and *Περὶ ἀεθέρων*, as well as of that *Περὶ τέχνης*: while some essays have been ascribed to the physicians of the contemporary Cnidian school.

The following works are generally deemed original productions of Hippocrates, the Coan: namely, 1. The essay "On Air, Waters, and Soils;" 2. The first and third books of "Epidemics;" 3. The book "On Prognostics;" 4. The first and second books of "Predictions;" and 5. The books of "Aphorisms;" but the two last contain many interpolations by the two writers above mentioned, and others; 6. The treatise "On the Diet in Acute Diseases;" 7. That "On Wounds of the Head." Haller includes several more treatises in the list of genuine works of Hippocrates, which, however, have been disputed, even from ancient times; such as those "On the Nature of Man;" "On the Humours;" "On Fractures;" "On the Joints;" and one or two others. Upon this subject the reader will find ample information in the able and learned essay of Dr. Ackermann, on the life and writings of Hippocrates, printed in Fabricius's *Bibliotheca Græca*, (4th edit. by Harles) tom. ii. —also in Haller's *Biblioth. Anat. Med. et Chirurg. Gælicke Hist. Med. Period. 5ta. Le Clerc. Hist. de la Médecine*, p. 1. liv. iii. chap. 30.

The prodigious degree of authority, so long attached to the writings of Hippocrates, has occasioned such a multitude of editions, versions, commentaries, dissertations, &c. that many pages would be required to enumerate them. Haller has bestowed much labour upon this object, and may be consulted by the curious. We must confine ourselves here to a cursory notice of the principal editions of the whole works.

The *Greek editions* are those of Aldus, at Venice, in 1526, folio; and of Frobenius at Basle, in 1538, folio.

The *Latin editions* are those of Cratander, at Basle, in 1526, folio, translated by several hands;—of M. F. Calvus, at Rome, 1525 and 1549, translated from MSS. in the Vatican, by order of pope Clement VII. —of J. Cornarius, at Venice, in 1545, 8vo. whose version has been frequently reprinted; and the version of Anutius Foësius, at Francfort, 1596, 8vo. by Wechel.

The *Greek and Latin editions* are those of Hieronymus Mercurialis, at Venice, 1578, folio;—of Zwinger, with the version of Cornarius, at Basle, 1579, folio;—of Anutius Foësius, at Francfort, 1595, several times reprinted;—of J. A. Vander Linden, also with the Latin version of Cornarius, at Leyden, 1665, 2 vols. 8vo. reprinted at Venice, 1757, in 2 vols. 4to.;—of Rhenatus Chartier, together with the works of Galen, at Paris, in 14 vols. folio;—and of Steph. Mack, at Vienna, 1743, 1749, and 1759, 2 vols. folio.

Doctrines of Hippocrates.—To give a minute detail of the extent of the knowledge of Hippocrates in medicine, and in the collateral branches of anatomy, physiology, &c. as it may be collected from his various treatises, would be to write a volume on the subject. We must, therefore, limit ourselves to an outline of his general precepts, referring those of our readers, who may wish for a more ample view of them, to the works above-mentioned as genuine, or to the writers quoted in the course of this article. The anatomical knowledge of Hippocrates was necessarily limited by the prejudices of the times in which he lived, when the human body had never been dissected for the purposes of

anatomical enquiry; Erasistratus and Herophilus, as we have stated, were the first to whom this permission was given. His knowledge of the internal organs could only, therefore, be derived from accident, or a comparison with those of other animals. Hence, much of his physiological doctrines, and of his opinions respecting the causes and seats of disease, must necessarily be erroneous, and the whole extremely defective; especially, when to ignorance of anatomy, the general deficiency of the age, in regard to the properties of the external world, is added. But by unceasing observation of the phenomena of health and disease, Hippocrates in a great measure supplied the want of such knowledge; so that his pathology and principles of cure bear, in many instances, a surprising resemblance to those of our own times, notwithstanding our knowledge of the intimate structure of the human body, and the general improvements in the philosophy of nature.

Hippocrates considered the functions of the body as under the direction of an intelligent or instinctive principle, which he called *nature*. To this principle he ascribed the "distribution of the blood, the spirits, and heat, to the different parts of the body, which receive by these means life and feeling." (*Lib. de Alimento*.) "This faculty," he said, "nourishes, preserves, and causes the growth of all the parts." Its mode of operation he conceived to consist in attracting, preparing, or changing whatever was useful, and in rejecting whatever was injurious or superfluous, after having separated it from the useful; and this he supposed to be effected by a sort of affinity and repulsion in similar and dissimilar parts. This doctrine, under various modifications, has passed through all medical systems, differing in many instances only in the change of names; thus, in the "Nature" of Hippocrates, we see the "Archæus," the "vital principle," the "spirit of animation," the "*vis medicatrix nature*," of the most enlightened medical philosophers of later times. It is not easy to collect an accurate view of the anatomy of Hippocrates, since different statements on many points are to be found in different parts of the works ascribed to him; it is to be regretted, that the book written by Galen, "De Anatomia Hippocratis," is lost. With respect to the *brain*, it does not appear that Hippocrates had the least suspicion of its connection with sensibility and understanding; indeed, so far from considering it as the peculiar seat of the thinking faculty, he places this faculty in the left ventricle of the heart. (*Lib. De Corde*.) He considered the brain as a glandular body, from its texture, and as a receptacle of redundant moisture, collected by the condensation of hot vapours, which it discharges again in desfluxions and catarrhs. (*Lib. De Glandulis*.) In describing the optic nerve, he represents it as a mere tube, through which the aqueous humour is distilled into the eye. But it should be observed, that the book *De Glandulis* is deemed spurious by Galen; and that, *De Corde*, in which the structure of the heart is rather minutely described, is neither mentioned by Erotian nor by Galen. The heart seems to have been regarded, at that time, as the organ for mixing with the blood some aerial principle, drawn from the lungs by its auricles, which are described as inflators, or bellows, calculated for that purpose. Indeed, whatever was known to the ancients in regard to the motion of the blood, seems to have consisted in some vague idea of regurgitation, or a certain flux and reflux, barely sufficient to prevent the stagnation of the contents of the vessels. The lungs were deemed by Hippocrates the absorbers and condensers of superfluous humours, and the moderators of internal heat; the liver, as the source of sanguification and of heat, in common with the other abdominal viscera. His physiology of generation indicated his

HIPPOCRATES:

his imperfect knowledge of the organs concerned in that process; he had an extraordinary notion of the semen being prepared in the brain, and conveyed by the spinal marrow to the vessels provided for its reception. He appears to have had no accurate ideas of muscles or of muscular motion, though he was acquainted with the number, figure, and connection of the bones.

The fluids were divided by Hippocrates into the four humours, blood, phlegm, yellow, and black bile (*Lib. De Natura Hominis*); to which he ascribes peculiar properties of hot, cold, cold, dry, and moist, in different combinations. He considered health as the result of a due temperament and proportion of these several fluids, both in respect to quantity and quality; and looked for the source of disease in the excess, defect, or deprivation of any or all of these humours. He, likewise, included in his system an analogy or connection between the four humours and the four seasons of the year, as well as the four ages of man. Thus phlegm, which is the coldest humour, he believed to be increased during the winter and in old age; whence at those periods pituitous diseases were prevalent, such as expectorations, œdema, &c. In the spring, the blood begins to be redundant, especially in young people, who then suffer bleedings from the nose, dysentery, &c. As the summer and autumn advance, the disposition to bilious diseases augmented, bilious evacuations occur spontaneously, and are procured by medicine. We have seen how this doctrine, of the four humours, and four qualities, when extended to all the agents employed in medicine by Galen, became the prevalent code of physic for thirteen centuries; nor is it long since the relics of it yielded to the influence of experimental science. See *GALENICAL System*.

But it is chiefly in matters of fact and observation that succeeding ages were indebted to the genius of Hippocrates, and in which the influence of his authority is still extensively visible in the language of medical science. He divided the causes of diseases into external, including the influence of air, exercise, rest, sleep, and watching; and internal, comprehending the food, drink, secretions, retentions, and passions of the mind. He divided diseases themselves into *epidemic*, *endemic*, and *sporadic*, according to the present signification of those terms; and again into *acute* and *chronic*, limiting the former to the duration of fourteen days. He, likewise, divided the duration of an acute disease into four stages, the beginning, increase, height, and decline. It was in the third of these stages that he conceived the *concoction* of the morbid humours to be accomplished, and between this and the last stage, when he expected some indication from nature, by what outlet the morbid matter was to be expelled, which constituted the *crisis* of the disorder, and which he was careful not to interrupt. (See *CONCOCTION and CRISIS*.) These *critical* discharges and changes he was led, partly by experience, and partly by hypothesis, to expect on particular days; and many of his rules of prognosis in acute diseases, were built upon the observation of the changes of symptoms on such days. This doctrine, however, we have already discussed at length (see *CRITICAL Days*); and shall only remark, that the notion of a concoction and critical discharge of peccant matter, as the source of the phenomena of febrile and inflammatory diseases, continued, under some modifications, to be the leading feature in medical systems to the time of Hoffmann; that even Dr. Cullen did not altogether reject it; and that it still exists in popular language, and in vulgar medical opinions.

To the industry of Hippocrates we are indebted probably for an account of all diseases which came under his

inspection; and of the whole number, the greatest part are still characterized by the names invented or adopted by him, and not more than five or six of them appear to be extinguished or unknown. Le Clerc has occupied a long chapter in enumerating the diseases which still retain the appellations given them by the father of physic. (See *Hist. de la Médecine*, p. 1. liv. iii. chap. 8.; also, Gælicke, loc. cit. pp. 577—600.) But a distinguishing feature in the pathological talent of Hippocrates was his skill in diagnosis and prognosis; his singular and constant care in watching all the minute changes in disease, having obtained for him a critical knowledge of symptoms, which enabled him not only to discriminate one disease from another, but to foresee almost all their variations and terminations. On this point, Celsus admits that Hippocrates stood unrivalled by any of his successors: “cum recentiores quoque medici, quamvis in curationibus mutarint, tamen hæc illum optime præfagisse fateantur.” (*De Medicinâ*, lib. ii. Præf.) He carefully noticed a multitude of signs, which escaped the eye of superficial observers. In a number of little peculiarities of mind and body, in the position of the limbs, (see *DECUBITUS*), in the voluntary and involuntary motions, and the expressions of countenance, he shewed that indications of great importance might be discerned. But his most certain prognosis was founded on the nature of the secretions, and of the urinary and alvine discharges, the various appearances of which supplied him with such rational grounds of judgment, as succeeding investigation has scarcely been able to impeach. His books of “Aphorisms,” and “Prognostics,” contain the principal summary of his experience in symptomatology. The books of “Predictions,” however, and of “Coan Prognostics,” contain many erroneous precepts, whence Galen doubts their authenticity, and considers all that is valuable in them, as having been compiled from the two former books, and the books of “Epidemics.” It has been disputed among writers, whether Hippocrates had any knowledge of the pulse: and although the affirmative seems probable, it is obvious that he did not lay much stress upon it in forming his indications.

With respect to the practice of Hippocrates, the length, to which this article has already extended, compels us to be brief. It would appear, indeed, that he considered it to be the duty of a physician, rather to watch patiently the progress of the operations of the constitution, and to remove impediments and aid the salutary actions, than to excite any decided changes by the action of powerful medicines. His observations on the powers of nature, and on the wisdom of trusting to her efforts, in preference to the hasty, violent, or uncertain assistance of art, are frequently repeated. His general principles of cure are stated in the following axioms: “that as contraries are cured by contraries, so cold is the remedy for heat, and heat for cold; evacuation will cure repletion, and repletion will repair the loss sustained from evacuation: that the art of medicine consists in supplying deficiencies and retrenching superfluities, in treating relaxation and contraction by their opposites, and in bringing back to their own channels fluids that are moving in improper courses.” (See *Lib. de Prisca Medicinâ*, *De Natura Hominis*, *De Flatibus*, &c.) Their dependence on the curative powers of nature led Hippocrates and the ancients in general to commence their therapeutic operations by the regulation of diet alone, in which, indeed, their whole practice often consisted. In contemplating their plans on this subject, modern feelings, and especially those of Englishmen, are appalled at the discipline which they instituted: for in very acute diseases, they interdicted every kind of nutriment for the first three or four days; allowing only as much thin
drink

drink as was sufficient to moisten the parched throat, which was often administered on a small sponge, to prevent the thirsty patient from swallowing too copious a draught. During this period it was intended to leave the active powers of the constitution at full liberty to drive out or change all morbid matter. But if this effect did not follow, or if the strength of the patient failed in the trial, a more plentiful dilution was then allowed, with a beverage composed of eight parts of water, one of honey, and occasionally one of vinegar, sometimes enriched with the juice of acid fruits, cooling herbs, or some weak sharp wine: ptisan, or barley-water, was also a common beverage given by Hippocrates in acute diseases. This plan, when necessary, was generally continued till the fourteenth day, (the reputed commencement of the chronic term,) when a more substantial diet was allowed, though still without recourse to any medicine, except gentle emetics and laxatives, the former consisting generally of a decoction of hyssop with salt and vinegar, and the latter of expressed juice or decoction of common cabbage, or the herb mercury, or the more pleasant exhibition of whey a little salted. For the last mentioned purpose glysters of sea-water, or of vetches boiled in milk with a little salt, were in common use.

When more powerful medicines became necessary, the ancients recurred to some of the most active purgatives hitherto discovered in the vegetable world; such as black and white hellebore, elaterium, colocynth, and scammony, which were frequently administered in quick succession: but these were never prescribed to children, old people, or pregnant women. Notwithstanding the caution, however, with which these drastic medicines were given, it would seem that the most serious mischief sometimes ensued from their excessive operation; as Hippocrates mentions, among his aphorisms, that "convulsions after taking hellebore are fatal." In order to excite perspiration, he used every external means of increasing heat, such as warming the room, covering the patient, pouring hot water on the head and limbs, with a free internal use of heated liquors, and often of pure wine. And to increase the urine, he gave garlic, cucumbers, melons, celery, fennel, and other strong flavoured herbs.

Hippocrates did not, however, exclusively confine himself to the administration of internal remedies, and the regulation of diet; he resorted to external means of cure, in some of which he appears to have exceeded the bounds of modern activity, as far as he fell short of them, in merely watching the efforts of the constitution in other cases. He employed blood-letting (an operation, the origin of which is concealed by the remoteness of its antiquity) with great freedom. In extreme cases of pain or inflammation, it was his custom to open at once the veins of both arms, and let the blood flow till the patient fainted. He often likewise drew blood copiously from the legs and feet, to relieve complaints of the head and upper parts of the body, by large and deep incisions with the knife, which he then covered with copper or other metallic vessels, exhausted of their air by fire, resembling the cupping glasses of our own times. He seems, indeed, to have entertained many singular notions of the revulsion, which might thus be produced. For example, he recommends bleeding in the forehead for a head-ache in the occiput; and in order to restrain the catamenia, when excessive, he applied large cupping vessels to the mammae. (Aph. sect. v. 60. and 68.) He laid down a maxim, which forms a contrast with the inertness of some of his precepts, that "those diseases, which medicines will not cure, yield to the knife; and those which the knife will not cure, may be removed by fire; but where this last and most powerful remedy fails, the malady must be deemed incurable." (Aph.

§ viii. 6.) Accordingly in obstinate chronic cases, the local bleedings above-mentioned were commonly succeeded by the actual cantery, which produced large and long continued discharges from the head, neck, breast, side, limbs, or other parts, to which the burning was freely applied. Nor did he even spare the bones, which he burnt, sawed, and perforated without scruple; and he used the trepan itself in cases of violent head-ache. It appears, as well from these operations, as from his rational directions for the treatment of fractures and dislocations, and the frequent cautions that he gives respecting the danger and difficulty attending wounds and bruises in nervous or tendinous parts, that Hippocrates combined the practice of surgery with that of medicine. But it would seem that he thought the difficult operations of surgery should be performed only by those, who, by confining their professional employment to this exercise alone, had attained a peculiar dexterity of hand; for he enjoins his disciples, even in their inaugural oath, to forbear from performing the operation of lithotomy.

These operations, as well as the number of medicines mentioned by Hippocrates, imply a considerable previous advancement both in internal and manual medicine. Le Clerc has enumerated upwards of three hundred articles of diet and the materia medica, which were employed by him, from the animal, vegetable, and mineral kingdoms. Among these are various preparations of iron, copper, lead, and silver, alum, nitre, vitriol, &c. Narcotics are mentioned by Hippocrates, and were certainly used in ancient times; but he seems to have been cautious in administering them, and it is even a matter of dispute whether he ever employed opium, the most potent and useful of the whole class. Among the articles of diet, Hippocrates is careful to mention the properties of the flesh of the dog, fox, horse, and ass, which implies that these viands were then in use, at least among the people.

We shall conclude this account of Hippocrates, with the brief and philosophical view of the science of medicine, exhibited in his first Aphorism, which in the terseness of its expression cannot be imitated in a modern language. It contrasts the brevity of human life with the long experience necessary to the cultivation of the art of medicine; and reminds us of the difficulty of obtaining that solid experience in an art where opportunity is transient, where experiment itself is often hazardous and deceptive, and the inferences of the judgment, therefore, extremely difficult. "Vita brevis, ars longa, occasio celeris, experimentum lubricum, judicium difficile." See Le Clerc, Gælicke, and Fabricius, as above quoted; also the works of Hippocrates, Vita Hipp. à Sorano, Walker's Memoirs of Medicine. General Biog.

HIPPOCRATES'S *Sleeve, manica Hippocratis*, a kind of filtre, or straining-bag, formed by joining the opposite angles of a square piece of flannel, in form of a pyramid, and used to percolate or strain syrups, decoctions, &c. for clarification.

HIPPOCRATIA, in *Antiquity*, feasts celebrated by the Arcadians in honour of the equestrian Neptune, from a notion that the deity conferred horses on men. During the celebration of them, horses were exempted from all labour, and were led in procession through the streets, superbly harnessed, and adorned with garlands of flowers. The Romans celebrated these feasts under the title of CONSUALIA.

HIPPOCRATICA FACIES. See FACIES *Hippocratica*.
 HIPPOCRENE, derived from ἵππος, *horse*, and κρήνη, *fountain*, *q. d.* the fountain of the horse Pegasus, was a spring at the foot of mount Helicon, supposed to spring up upon Pegasus's

Fegasus's striking his foot against the mountain. See HELICON and AGANIPPE.

HIPPOCREPIS, in *Botany*, is derived from ἵππεο κρηπίτι, a horse-shoe, in allusion to the particular conformation of its legumes, or rather the parts of its legumes, which resemble as it were a connected series of horse-shoes. Few genera possess so decided and perceptible a character as this, by which it may be at once known, the horse-shoe appearance of its fruit being so striking, that no doubt can exist respecting any of the plants, which constitute the genus before us. Linn. Gen. 381. Schreb. 503. Willd. Sp. Pl. v. 3. 1158. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. v. 2. 777. Ait. Hort. Kew. v. 3. 60. Juss. 361. Lamarck Dict. v. 3. 131. Illustr. t. 630. (Ferrum equinum; Tourn. t. 225.)—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceae*, Linn. *Leguminosae*, Juss.

Gen. Ch. *Cal.* Perianth of one leaf, permanent, five-toothed; the two upper teeth united or less divided. *Cor.* papilionaceous. Standard heart-shaped, with a claw the length of the calyx. Wings ovate-oblong, obtuse. Keel lunulate, compressed. *Stam.* Filaments diadelphous (simple and nine-cleft) ascending; anthers simple. *Pist.* Germen slender, oblong, terminating in an awl-shaped, ascending style; stigma perfectly simple. *Peric.* Legume compressed and membranaceous, very long, curved inwards, cut from the lower suture almost to the upper into several roundish sinuses, so as to consist of several bluntly triangular joints, connected by the upper suture. *Seeds* solitary in each joint, oblong, incurved.

Eff. Ch. Legume jointed, compressed, curved, with many deep sinuses, in one of its edges.

1. *H. unisiliquosa*. Single-legged Horse-shoe Vetch.—Linn. Sp. Pl. 1049. (Ferrum equinum vulgare; Column. Eepr. t. 300.)—"Legumes sessile, solitary, straight."—Native of Italy and Switzerland, where it flowers in June and July. *Root* simple, annual. *Stems* several, simple, various in length, the long linear cotyledons often remaining at their base. *Leaves* alternate, of about five pair of emarginate leaflets, and an odd one, nearly smooth and somewhat glaucous. *Flowers* axillary, solitary, nearly sessile, small, pale yellow. *Legumes* spreading, an inch and half long, frequently with bristly tufts at the back, where every seed is lodged, their sides curiously veined and striated. An excellent figure of this species, under the name of *Ferrum equinum*, may be seen in Gerarde's Herbal. 1235, also in Rivinus, Pentap. Irreg. t. 97. f. 1.

2. *H. multisiliquosa*. Many-legged Horse-shoe Vetch.—Linn. Sp. Pl. 1050. Villars Dauph. v. 3. 400. (Ferrum equinum alterum πολυκρηπίτον; Column. Eepr. t. 300.)—"Legumes stalked, crowded, circular."—Native of a chalky soil in the south of France, Spain, and Italy, flowering in July and August.—This is also annual, and very closely allied in habit to the last. *Stem* simple, furrowed. *Leaves* alternate, of about five pair of emarginate leaflets, and an odd one, smooth, bright green. *Flowers*, axillary, yellow, many-clustered, upon long peduncles. *Legumes* curved, sometimes so much as to form a circle.

3. *H. balearica*. Shrubby Horse-shoe Vetch—Willd. n. 3. Jacq. Ic. Bar. t. 149. Curt. Mag. t. 427.—"Legume pedunculated, crowded, smooth, lobed only in the outer margin."—Native of Minorca, flowering in May and June. *Root* woody, sending forth ascending branches. *Leaves* pinnate, smooth, of about eight pair of ovate-linear leaflets, with an odd one. *Peduncles* very long, terminated by an umbel of many yellow flowers, which have a faint, sweet smell. *Legume* oblong, obtuse, straightish, or a little curved, sinuated

twice or thrice on the upper suture, smooth and brownish furnished with shining, round, brown seeds.

4. *H. comosa*. Tufted Horse-shoe Vetch.—Linn. Sp. Pl. 1050. Sm. Fl. Brit. v. 2. 777. Engl. Bot. t. 31.—"Legumes pedunculated, clustered, curved, waved in the external margin."—Found on dry chalky banks in Kent, Cambridgeshire, and other parts of England, bearing flowers from May to August. This is rather a scarce perennial, with a woody root and smooth herbage. *Stems* prostrate, furrowed. *Leaves* pinnate, of numerous obovate emarginate leaflets, with an odd one. *Stipules* lanceolate. *Peduncles* axillary, very long; partial-stalks short, hairy. *Flowers* yellow. *Legumes* recurved, rough with little glands. *Seeds* kidney-shaped.

5. *H. barbata*. Bearded Horse-shoe Vetch.—Loureir. Cochinch. v. 2. 453.—"Legume pedunculated, straight, spike of flowers oblong, terminal."—Native of fields in Cochinchina.—*Stem* somewhat shrubby, four feet high, erect, round. *Leaves* ovate, entire, smooth, ternate, the middle leaflet larger. *Flowers* purple. *Legume* barbed, mostly on the exterior suture, and deeply emarginate. *Seeds* angularly kidney-shaped, small, compressed.—This species has not yet been introduced into Europe. We know it only from Loureiro.

HIPPODROME, **HIPPODROMUS**, composed of ἵππος, horse, and δρομος, course, of the verb δρῶμαι, curro, I run, in Antiquity, a list, or course, wherein chariot and horse-races were performed, and horses exercised.

The Olympian hippodrome, or horse-course, was a space of ground of 600 paces long, surrounded with a wall, near the city Elis, and on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of moderate height, and the circuit was adorned with temples, altars, and other embellishments. (See STADIUM.) Pausanias (l. vi.) has given us the following account of this hippodrome, or horse-course: As you pass out of the stadium, by the seat of the Hellenodics, into the place appointed for the horse-races, you come to the barrier (Ἀγῆται) where the horses and chariots rendezvous before they enter into the course. This barrier, in its figure, resembles the prow of a ship, with the rostrum or beak turned towards the course. The other end, which joins on to the portico of Agaptus (so called from him who built it), is very broad. At the extremity of the rostrum or beak, over a bar that runs across the entrance (ἐπιλαβή), is placed a figure of a dolphin in brass. (This dolphin is a symbol of Neptune, surnamed Hippias or Equestrian, for his having produced a horse by striking the earth with his trident, according to the fable; without the recollection of which circumstance the reader might be surprized to meet with the figure of a dolphin in a horse-course.) On the two sides of the barrier, each of which is above 400 feet in length, are built stands or lodges, as well for the riding-horses as the chariots, which are distributed by lot among the competitors in those races; and before all these lodges is stretched a cable, from one end to the other, to serve the purpose of a barrier. About the middle of the prow is erected an altar, built of unburnt brick, which every Olympiad is plastered over with fresh mortar; and upon the altar stands a brazen eagle, which spreads out its wings to a great length. This eagle, by means of a machine which is put in motion by the president of the horse-races, is made to mount up at once to such a height in the air, as to become visible to all the spectators; and at the same time, the brazen dolphin before-mentioned sinks to the ground. Upon that signal the cables, stretched before the lodges on either side of the portico of Agaptus,

Agaptus, are first let loose, and the horses there stationed move out and advance till they come over against the lodges of those who drew the second lot, which are then likewise opened. The same order is observed by all the rest, and in this manner they proceed through the beak or rostrum; before which they are drawn up in one line, or front, ready to begin the race, and make trial of the skill of the charioteers and fleetness of the horses. (See *CHARIOT*.) On that side of the course, which is formed by a terrace raised with earth, and which is the largest of the two sides, near to the passage that leads out of the course across the terrace, stands an altar of a round figure, dedicated to *TARAXIPPUS*, the terror of the horses, as his name imports. The other side of the course is formed, not by a terrace of earth, but a hill of moderate height, at the end of which is erected a temple, consecrated to *Ceres* *Chamyne*, whose priests has the privilege of seeing the Olympic games.

There is a very famous hippodrome at Constantinople, which was begun by *Alexander Severus*, and finished by *Constantine*. This circus, called by the Turks *atmeidan*, is 400 paces long, and above 100 paces wide, *i. e.* geometrical paces of five feet each. *Wheeler* says it was in length about 550 ordinary paces, and in breadth about 120; or, allowing each pace to be five feet, 2750 feet long and 600 broad. At the entrance of the hippodrome there is a pyramidal obelisk of granite, in one piece, about 50 feet high, terminating in a point, and charged with hieroglyphics erected on a pedestal of eight or ten feet above the ground. The Greek and Latin inscriptions on its base shew that it was erected by *Theodosius*; the machines that were employed to raise it were represented upon it in basso relievo. See *CIRCUS*.

The beauty of the hippodrome at Constantinople has been long since defaced by the rude hands of the Turkish conquerors; but under the similar appellation of *atmeidan*, it still serves as a place of exercise for their horses. Whether the Olympic hippodrome was so long or so wide as this of Constantinople, it is not now easy to determine; but it must evidently have been considerably longer than an ordinary stadium, in order to allow for the turnings of the chariots and horses round the pillars which served as metas or goals, without running against them, or against one another. The length of the course, or the distance between the two metas or goals, is not easily ascertained. It is probable, however, that the two pillars, *viz.* that from which the horses started, and that round which they turned, which divided the course into two equal lengths, were two stadia distant from each other; consequently, the whole length of the race, for a chariot drawn by full aged horses, consisting of 12 rounds, amounted to 48 stadia, or six Grecian miles; and that of the chariot drawn by colts consisted of eight rounds or 32 stadia, or four Grecian miles; a Grecian mile, according to *Arbutnot's* computation, being somewhat more than 800 paces, whereas an English mile is equal to 1056. *Pausanias* informs us, that in the Olympic hippodrome, near that pillar called *Nyffé*, probably that which was erected at the lower end of the course, stood a brazen statue of *Hippodamia*, holding in her hand a sacred fillet or diadem, prepared to bind the head of *Pelops* for his victory over *Oenomaus*; and it is probable that the whole space between the pillars was filled with statues or altars, as that in the hippodrome at Constantinople seems to have been. Here, however, stood the tripod, or table, on which were placed the olive-crowns and the branches of palm destined for the victors. Besides the hippodromes at *Olympia* and *Constantinople*, there were courses of a similar kind at *Carthage*, *Alexandria* in *Egypt*, and other places.

We have some vestiges in England of the hippodromus,
VOL. XVIII.

in which the ancient inhabitants of this country performed their races. The most remarkable is that near *Stone-henge*, which is a long tract of ground, about 350 feet, or 200 druid cubits wide, and more than a mile and three quarters, or 6000 druid cubits in length, inclosed quite round with a bank of earth, extending directly east and west. The goal and career are at the east end. The goal is a high bank of earth, raised with a slope inwards, on which the judges are supposed to have sat. The metas are two tumuli, or small barrows, at the west end of the course. These hippodromes were called, in the language of the country, *rhedagua*, the racer *rhedagew*, and the carriage *rbeda*, from the British word *rhedeg*, to run. One of these hippodromes, about half a mile to the southward of *Leicester*, retains evident traces of the old name *rhedagua*, in the corrupted one of *razodikes*. There is another of these, says *Dr. Stukeley*, near *Dorchester*; another on the banks of the river *Lowther*, near *Penrith* in *Cumberland*; and another in the valley, just without the town of *Roxlton*.

HIPPODROMUS, in *Chronology*, the *Bœotian* name for the Athenian month *Heccatombæon*, or *Ecatombæon*.

HIPPOGLOSSUM, HORSE-TONGUE, in *Botany*, the name of a plant of the *rufcus*, or butcher's broom kind, called by others the *Alexandrian bay*, or *laurus Alexandrina*.

HIPPOGLOSSUS, in *Ichthyology*, *Holibat*, a species of *PLEURONECTES*, which see.

HIPPOLAPATHUM, in *Botany*, a species of *lapathum*, called also monk's rhubarb.

HIPPOLAUS, in *Ancient Geography*, a promontory of *European Scythia*, which was a tongue of land between the mouth of the *Borylthenes* and that of *Hypanis*. *Herodotus* says, that here was a temple dedicated to *Ceres*.

HIPPOLITHOS, a name given by some authors to the stones found in the stomachs and intestines of horses: there are often a great number of these in one horse; and they are frequently found in the colon of a very large size. See *BEZOR*.

HIPPOLYTUS, ST. in *Biography*, a Christian bishop and martyr, in the third century, was the disciple of *Irenæus*, and the instructor of *Origen*. He is celebrated for his zeal and labours in preaching the gospel, and in defending the Christian religion. The seat of his principal labours was at *Rome*, where it is probable he suffered martyrdom. This event took place in the year 230, under the emperor *Alexander Severus*. Some, however, ascribe it to the persecution under *Maximinus*, five years later; and there are others who contend that it did not occur till the *Decian* persecution, about the year 250. He was held in high estimation for his piety and learning, and he was author of a number of works on a variety of subjects. Of his great fame, a noble monument erected to his honour near *Rome* affords some proof. This monument consists of a marble statue, representing a venerable person sitting in a chair, on the sides of which are engraved, in Greek letters, cycles of 16 years, forming the most ancient paschal canon in existence. It was published in Greek by *Josaph Scaliger*, with commentaries, in 1595, and afterwards in Latin, by father *Giles Bucher* in 1694. *Hippolytus* was author of many other works; but some given to him are unquestionably spurious. *Dr. Lardner* has investigated their authenticity, and having so done he adds, "If I may at last deliver my own opinion, I would say, though scarcely any of them are altogether sincere and uncorrupted, there are few of which some good use may not be made by a man of candour and judgment." *Lardner's Credibility*.

HIPPOMANE, in *Botany*, an ancient Greek name adopted by *Linnaeus* for an American genus to which it
I could

could not possibly originally belong, but whose qualities perhaps may excuse its application. The word is constructed of ἵππος, a horse, and μανία, madness, the ancient plant being of so virulent a nature as to bring madness upon such animals, if they happened to partake of it.—The genus in question is not behind-hand with any plant in noxious qualities.—Linn. Gen. 205. Schreb. 659. Swartz. Obf. Bot. 369. Willd. Sp. Pl. v. 4. 571. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 378. Juss. 391. Lamarek Illustr. t. 793. (Manzanilla; Plum. Nov. Gen. 50.)—Class and order, *Monacia Monadelphica*. Nat. Ord. *Tricocca*, Linn. *Euphorbia*, Juss.

Gen. Ch. Male-flowers in a terminal catkin. *Cal.* Perianth of one leaf, bifid, turbinate, obtuse, very small. *Cor.* None. *Stam.* A single thread-shaped filament, twice the length of the calyx; anthers four, roundish, affixed crosswise to the sides of the filament towards the top. Female-flower solitary, terminal. *Cal.* Perianth withering, of three roundish, concave, obtuse converging leaves. *Cor.* None. *Pist.* Germen ovate, large; style very short; stigma about seven-cleft, acute, reflexed. *Peric.* Drupa globular, very large, one-celled, crowned with the permanent stigma. *Seed.* Nut woody, irregular, acuminated, excavated with little pits and accompanied by appendages, of seven cells and seven valves; kernels solitary, roundish.

Eff. Ch. Male, a catkin. Perianth two-cleft. Corolla None. Female, Perianth three-cleft. Corolla None. Stigma seven-cleft. Drupa with a nut of seven cells.

1. *H. Mancinella*. Linn. Sp. Pl. 1451. Jacq. Amer. 250. t. 159. (*Juglandi affinis arbor julitera lactescens venenata pyrifolia*, Manzanilla Hispania dicta; Sloan. Jam. v. 2. 3. t. 159.)—Leaves ovate, serrated, with one gland at the base; stalks half as long as the leaves.—Native of sandy, watery places near the coast in various parts of the West Indies.—This is a tall and spreading tree, of handsome appearance, compared by Jacquin to a Pear-tree. Every part, when wounded, exudes a plentiful, very white, but highly caustic and venomous milk, raising blisters on the skin like a burn, nor can scarcely any part of the plant be touched with safety. It is reported, that many of the Europeans who first landed at Surinam died suddenly from sleeping under this tree. Jacquin says, that some kind of Land-Crabs become poisonous food from eating the fruit, which is by no means wonderful. The wood, however, is valued for being capable of taking a high polish, and being beautifully variegated with several dark colours. The Leaves are scattered, ovate, acute, with shallow serratures, smooth, veiny, about two inches long, on stalks not quite so long, which are slender and smooth, crowned where they enter the base of the leaf with one, round, depressed gland. The male Catkins grow at the end of the branches and are of a yellowish-green colour. Female-flowers at the division of the twigs, solitary, round and green. Fruit the size of a walnut without the coat, of a yellowish-green, resembling a crab-apple in size and smell; the coat is very thin, and not large. Sloane says, that goats are very fond of the fruit, which does not render either their flesh or their milk poisonous.

It is necessary to observe, that *Hippomane biglandulosa* of the *Plante Surinamenses*, n. 129, *Amen. Acad.* v. 8. 263, appears by the Linnæan Herbarium to be a totally different plant from that originally so called by Linnæus, as well as from the above described. Its leaves are like those of *Magnolia grandiflora*, but we have not materials to determine its genus. Linnæus says, the fruit is tricocous; if so, it may belong to the genus *Sapium* of Jacquin, Willd. v. 4. 572, to which the other Linnæan species of *Hippomane* are now re-

ferred. If they remain so, the specific character of the *Mancinella* becomes superfluous.

HIPPOMANES, compounded of ἵππος, horse, and μανία, madness, a sort of poison, famous among the ancients as an ingredient in amorous philtres, or charms.

Naturalists are not agreed about the nature of the hippomanes. Pliny describes it as a blackish caruncle, found on the head of a new-foaled colt; which the dam bites off and eats as soon as she is delivered. He adds, that if she be prevented herein by any other's cutting it off before, she will not take to, nor bring up her young.

Virgil, and after him Servius and Coumell'a, describe it as a poisonous matter trickling from the pudendum of a mare, when proud, or longing for the horse. Æn. lib. iv. ver. 515.

At the end of Mr Bayle's Dictionary is a very learned dissertation on the hippomanes; and all its virtues, both real and pretended.

HIPPOMYREX, the horse ant, the name of a species of ant much larger and nimbler than the common kind. This builds in woods, and makes its nests of sticks and straws, and fragments of various parts of trees. The common ant builds only with earth.

HIPPONE, in *Mythology*, the goddess of horses and chariots.

HIPPONESUS, in *Ancient Geography*, a town of Asia, in Caria.—Also, a town of Libya.

HIPPONIATES STRUS, a gulf of the Tyrrhenian sea, on the western coast of the kingdom of Naples.

HIPPONITES, a lake of Africa, on the banks of which was built the town of Hippo-Zarytus.

HIPPONIUM, called also *Vita Valentia*, *Bivona*, a town of Italy, upon the western coast of Brutium, at the lower part of a gulf, which opened to the north.

HIPPOPECTINITE, in *Natural History*, or great scallop, is a fossil shell, half a foot over, found in a great rock in Virginia, 40 miles from a sea or river, according to Dr. Grew. *Rarities of Gresham College*, p. 262.

HIPPOPHÆ, in *Botany*, apparently from ἵππος, a horse, and φάω, to destroy, a name in Dioscorides for what he says was used by fullers in dressing cloths, but whose description answers to something of the *Rhamnus* kind. It is however in some points applicable to the shrub for which it is retained by Linnæus.—Linn. Gen. 517. Schreb. 682. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 1075. Juss. 75. Lamarek. Illustr. t. 808. Gærtner. t. 42.—(*Rhamnoides*; Tourn. t. 481.)—Class and order, *Diccia Tetrandria*. Nat. Ord. *Calycifloræ*, Linn. *Eleagni*, Juss.

Gen. Ch. Male, *Cal.* Perianth of one leaf, divided almost to the base into two equal, roundish, obtuse, concave, erect lobes, cohering at their summit, but a little gaping below. *Cor.* None. *Stam.* Filaments four, very short; anthers oblong, angular, nearly equal to the calyx.

Female, *Cal.* Perianth of one leaf, ovate-oblong, tubular, slightly cloven at the top, deciduous. *Cor.* None. *Pist.* Germen superior, small, roundish; style simple, very short; stigma thickish, oblong, recurved, reaching twice the length of the calyx. *Peric.* Berry nearly globose, of one cell. *Seed* solitary, oblong, shining, with a furrow at each side, invested with a double membranous coat.

Eff. Ch. Male, Calyx in two deep segments. Corolla none. Female, Calyx tubular, cloven. Style one. Berry superior. Seed solitary, doubly coated.

Obf. Mr. Viborg, the Danish naturalist, has discovered some hermaphrodite flowers, occasionally intermixed with the others. Gærtner describes but a single coat to the seed, which he properly calls the lining of its cell, overlooking a thicker,

thicker, almost leathery, integument, or arillus, which closely enfolds the seed itself, and which is well displayed by Mr. Sowerby in Engl. Bot.

1. *H. rhamnoides*. Linn. Sp. Pl. 1452. Engl. Bot. t. 425. Pall. Ross. v. 1. t. 68. Fl. Dan. t. 265. (*Rhamnus secundis* Clusii: Ger em. 1334.) Sallow-thorn, or Sea Buckthorn.—Leaves lanceolate.—Native of sandy banks and marshes near the sea, in various parts of Europe, from the south of France to Finland. It is abundant on the Norfolk coast, growing on the cliffs and sand-banks, and flowering about the middle of May, nor is it infrequently cultivated in shrubberies. The woody bushy stem is six or eight feet high, thorny. Leaves scattered, about two inches long, lanceolate or almost linear, bluntish, entire, of a silvery white beneath. Both their surfaces, as well as the young bark and half-ripe fruit, are clothed with minute umbilicated scales, as in the genus *Eleagnus*. Flowers small, green, in the bosoms of the lowermost leaves of each branch, while very young, the two sexes on different shrubs. Berries ripened in autumn, very copiously on the wild plants, never, as far as we have seen, on garden ones. They are the size of large currants, of a glowing orange-colour, pulpy, very acid, agreeable enough when preserved with sugar. Linnaeus found the Finlanders using them as a sauce to their fish, but he complained of their intolerable acidity. Rousseau gives a ludicrous account of the singular politeness of a young man, who seeing him eat these berries, as they were walking together, did not presume to take the liberty of telling him they were considered as poisonous.

2. *H. canadensis*. Linn. Sp. Pl. 1453.—Canada Sea Buckthorn.—Leaves ovate.—Gathered by Kalm in Canada. It differs from the former in its much shorter, broader, ovate or elliptical leaves, very conspicuous for their silvery backs, and the rusty scales scattered over them. The flowers are in little, brown, shining, axillary clusters.

HIPPOPHEOS. This was a name given not only to the larger species of the pheos or stebe, but to a very different plant, a kind of dodder, more vulgarly called epipheos, from its growing upon the pheos, as the dodder of thyme is called epithymum, from its growing upon that plant. It is possible indeed that it might be called originally hippopheos, from its riding, as it were, on the pheos. But however this be, there is great reason to suspect that Dioscorides confounds this dodder with the plant itself, and gives its virtues as those of the proper hippopheos; which, according to Theophrastus, and all the other writers of credit in antiquity, is only a larger species of the pheos, a prickly shrub, not a plant, growing on it. See **EPIPHEOS**.

HIPPOPTHALMIC MUSCLES, a name given by the ichthyologists to a pair of large muscles found in the head of fish, one placed immediately under the eye; these serve to move the eyes; and, with the two maxillary muscles placed under the jaws, are the principal muscular parts of the head of fish.

HIPPOPODES, or **HIPPOPEDES**, composed of ἵππος, horse, and πούς, foot, in *Ancient Geography*, an appellation given to a certain people situated on the banks of the Scythian sea; as being supposed to have horses' feet.

The hippopodes are mentioned by Dionysius, Geogr. v. 310. Mela, lib. iii. cap. 6. Pliny, lib. iv. cap. 13. and St. Anguilline, De Civit. lib. xvi. cap. 8. But the truth is, that they had this appellation given them on account of their swiftness, or lightness of foot.

HIPPOPOTAMUS, in *Zoology*, a genus of Mammalia in the order Belluæ; the front teeth in each jaw are four, those in the upper jaw are remote and form a pair each side; those in the lower are prominent, and the two middle ones

longest; the tusks are solitary, the lower ones long, curved, and obliquely truncated; feet furnished with hoofs at the margin.

Whether in reality there may exist more than one species of this genus appears uncertain; there is every reason to apprehend the morse has been sometimes confounded by travellers with the true hippopotamus; and the discordance which we trace in their reports, arising as it must be conceived from this particular cause, may have erroneously given birth to the prevailing supposition of those writers who believe there are two species. The observations of Sennini seem in favour of the existence of more than one kind, yet his conclusions, however just, are not apparently founded on better authority than the discordance of writers, to which we before alluded. Those who apprehend there are two species consider one as an inhabitant of the fresh water, or rather of inland rivers, lakes, and marshes, and the other to be entirely confined to the sea; the latter is probably the morse.

After the elephant and the rhinoceros, the hippopotamus has been in all ages an object of admiration to mankind; its size is often equal to that of the rhinoceros, and its force but little, if at all, inferior; and thus in magnitude, as well as strength, it yields alone to the decided superiority of the elephant.

The appearance of the hippopotamus when on the land is altogether uncouth, the body being extremely large, flat, and round, the head enormously large in proportion, and the legs as disproportionately short. Authors vary considerably in describing the size of this animal. The length of a male has been known to be seventeen feet, the height seven feet, and the circumference fifteen; the head three feet and a half, and the girth nine feet; the mouth in width about two feet. The general colour of the hippopotamus is brownish; the ears small and pointed, and lined very thickly with fine short hairs; the eyes are small in proportion to the size of the creature, and black; the lips are very thick, broad, and beset with a few scattered tufts of short bristles; the nostrils small. The armament of teeth in its mouth is truly formidable, more particularly the tusks or canine teeth of the lower jaw, which are of a curved form, somewhat cylindrical, striated in a longitudinal direction, and obliquely truncated at the end; these are so strong and hard, that they will strike fire with steel, are sometimes more than two feet in length, and weigh upwards of six pounds each. The teeth in the upper jaw much smaller; those in the lower jaw are of a moderate size; those in the lower strong, somewhat conic, sharp pointed, and projecting forwards almost horizontally. The whole surface of the body is covered with short hair, which is more sparingly set on the under parts than the upper. The tail is short, thick, slightly compressed, a little hairy, and marked by several strong circular wrinkles. The feet are large, and each of the four lobes or toes furnished with a hoof.

The colour of the hippopotamus, when just emerging from the water, is palish brown, or mouse colour, the lower parts inclining to blueish or slate colour, the belly flesh colour, and the skin appearing through the hair. Sparrman speaks of its "slimy appearance when newly come out of the water, which is said to gladden in the moon-shine like a fish," and other writers agree that the blueish tinge of colour that appears on the body, when rising out of the water, is entirely dissipated as the skin becomes dry.

This animal was well known to the ancients. Most commentators conceive it to be the behemoth of Job, who describes its manners, food, and haunts so admirably, as to leave little reason for believing that scriptural writer alluded to any other animal. In the verse, "Behold now Behemoth

HIPPOTAMUS.

which I made near thee; he eateth grafs as an ox." It is represented as an inhabitant of the Nile, in the neighbourhood of Uz, the land of Job, and as an animal that fubfifts on vegetable food; the fecond, "Lo! now his ftrength is in his loins, and his force is in the navel of his belly;"—and "his bones are as ftiong as pieces of brafs, his bones are like bars of iron," indicate its great ftrength and the hardnefs of his bones. Its refidence among the valt reedy marfhes, in rivers overfhadowed with thick forefts, is implied in the verfe, "He lieth under the fhady trees in the covert of the reeds and fens." And in the fifth verfe, "Behold! he drinketh up a river; he trattleth he can draw up Jordan into his mouth," refers to the characteristic widehefs of his mouth, which is poetically defcribed as large enough to exhaufit fuch a ftream as the Jordan.

By writers of antiquity, the hippopotamus is defcribed as poffeffing the moft marvellous powers of ftrength. They alfo feigned that it vomited fire, in allufion, no doubt, to the prodigious hardnefs of its teeth, which give fire with fteel. Among the ancient Egyptians it was revered as a tutelary divinity; they paid it facred honours, and engraved its image upon their obelisks. But if we may credit Diodorus Siculus, they would fometimes wage war againft this object of their adoration, attacking it with fpears and daggers, and after inflicting many grievous wounds, leave the poor lacerated beaft to expire through the lofs of blood. In like manner the negroes of Congo, Angola, Elmina, and other adjacent parts of Africa, at this day regard the hippopotamus as a god, and yet they not only attack and deftroy it, but devour its flefh with great avidity. The hippopotamus occurs among the little figures in the cafts taken from the ancient tombs of Siberia, now at Paris, from whence it is concluded this animal was formerly known in that part of the world; not as an inhabitant, the rigorous coldnefs of the climate forbidding that idea, but as an idol, and being there worfhipped as a divinity as well as in Egypt.

Pliny relates that Scaurus, during his ædilefhip, exhibited before the Roman people four crocodiles, and one hippopotamus, in a temporary lake prepared for the occafion. Auguftus alfo produced one of the latter on his triumph over Cleopatra; and after this the figure of the hippopotamus appears on various medals of the Roman emperors. For many ages after no authentic hiftory of this animal was obtained. The firft among modern defcribers who have noticed it with accuracy was Zerenghi, an Italian furgeon, who, about the beginning of the feventeenth century, printed an account of it at Naples, accompanied by a figure taken from a dried fkin, which figure is again given in the works of Aldrovandus. Since that period the hiftory of this animal has been more fully developed, through the zealous attention beftowed on the fubject by travellers, to whom an opportunity has been afforded of examining the animal in the living ftate, and in its native regions; and to none of whom the curious are more indebted, for fatisfactory information in this particular, than to the ingenious Dr. Sparmann.

The valt ftrength of this animal would render it one of the moft formidable of terreftrial quadrupeds, were its difpofitions ferocious; on the contrary, it is an animal of very tranquil difpofitions, unlefs under circumftances of great irritation, and then its power is really to be dreaded. Its bulk is fo great that twelve oxen have been found neceffary to draw one a fhore that was fhut in a river above the Cape. The largeft hippopotamus, among about thirty, killed by colonel Gordon, was eleven feet long; this was a female; the largeft male, which always exceeds the other fex in fize, was eleven feet eight inches. Dr. Sparmann, however, defcribes fome larger; and Mr. Bruce fpeaks of others in lake Tzana, that

were more than twenty feet long. It is affirmed by Haffelquist, that the hide alone is a load for a camel.

Thefe animals inhabit the warmer parts of the globe; and, as in ancient times, are found in the Nile, where it flows through the fens of Upper Egypt, below which it is rarely feen. The lateft inftance on record of its appearing near the mouth of that river, was in the year 1600, when two were killed near Damietta. It abounds moft in the rivers among the woods and deferts of Ethiopia, and in thofe of Africa, as the Gambia, Senegal, Zaira, retiding equally in rivers near their fall into the fea, and in the inland lakes from the very interior of Africa to the Cape of Good Hope. Formerly they abounded in rivers near the Cape, but are now almoft extirpated; and it was even found neceffary under the Dutch government, in order to preferve the few remaining in the Berg river, to prohibit fhooting them without exprefs permiffion.

From the unwieldinefs of the body and the fhortnefs of the legs, the hippopotamus is not able to move very fwiftly upon the land, and he then becomes timid. His pace is, however, quicker on the land than generally imagined. When purfued he takes to the water, plunges in, finks to the bottom, and is feen walking at perfect eafe, or fwimming with like facility, the great fize of his belly rendering his fpecific gravity equal to that of water. He cannot, however, continue long under water without rifing towards the furface to breathe; and in the day-time he is fo fearful of being difcovered, that when he takes in a frefh fupply of air, the place is hardly perceptible, for he does not venture even to put his nofe out of the water. In rivers unfrequented by mankind he is lefs cautious, and puts his whole head out of the water. If wounded, he will rife and attack boats or canoes with great fury, and often fink them by ftriking, or biting large pieces out of their fides, and thus people are frequently drowned by thefe animals. It is reported alfo that they will at once bite a man in two. In fhallow rivers the hippopotamus makes deep holes in the bottom, in order to conceal its great bulk. When he quits the water he ufually puts out half his body at once, and fmells and looks around, but fometimes rufhes out with great impetuofity, and tramples down every thing in his way. It is hazardous to navigate canoes in rivers much infefed by thefe animals, as the flighteft movement of their bodies may eafily overfet them.

The food of the hippopotamus is entirely of the vegetable kind, in queit of which he quits his watery refidence, under the favourable darknefs of the night, and ranges in fecurity along the banks and adjacent places, deftroying in his progrefs, by the tramlings of his feet, an infinitely greater portion of herbage than could poffibly be required to fatisfy the craving of its appetite. He feeds on the roots of grafs which he readily tears up with his teeth. In cultivated places he commits incredible mifchief, efpecially among the plantations of fugar, rice, corn, and other grain, and among young and tender trees, the fhoots of which he eagerly devours.

The manners of the hippopotami approach nearer to thofe of the hog than the horfe tribe, with which its name implies an affinity; for which reafon Alpin calls them *Cheropotames*, or river-hogs. They commonly fleep in the reedy iflands, in the middle of rivers, and if poffible in fituations furrounded by thick forefts, and deep impenetrable marfhes; and in fuch fituations they bring forth their young. A herd of females is fud to have but one male; they bring forth one young at a time, and that on the land, but fuckle the young in the water. The males often conteit each other's right over the females;

HIPPOPOTAMUS.

females; and the attack of two such powerful animals, as may naturally be imagined, is terrible. The earth shakes beneath them, the water trembles, their blood flows in torrents, and the masses of flesh torn out by their mighty grasp of teeth lie scattered upon the blood-stained scene of conflict. Sometimes the weakest, perceiving his efforts ineffectual, leaves his antagonit master of the field, but this does not happen often; for it is seldom that one or both of them does not perish on the spot. The female is supposed to go with young nine months. She is often seen in the rivers with the young one on her back, and her manner of suckling is not dissimilar to that of the cow, the teats, which are small, and two in number, being placed far back under the belly; the milk is thin and more aqueous than that of the cow. The female, at particular seasons, has a strong smell of musk.

The modes of capture adopted in taking these animals are various. They are sometimes shot, sometimes attacked with harpoons, and sometimes taken in pit-falls prepared for the occasion in the banks of rivers. In some parts the natives place boards full of sharp irons in the ground, which these heavy beasts striking into their feet become incapable of moving, and thus fall an easy prey. Sometimes they are struck in the water with harpoons fixed to cords, and ten or a dozen canoes are employed in the chase. This is the common method in which it is taken in Africa. Hasselquist tells us the Egyptians have a curious manner of relieving themselves in some degree from this destructive animal. "They remark the places (he says) which he frequents most, and there lay a large quantity of peas; when the beast comes ashore, hungry and voracious, he falls to eating what is nearest him; and, filling his belly with the peas, they occasion an unsupportable thirst. He then returns immediately into the river, and drinks upon these dry peas large draughts of water, which suddenly cause his death; for the peas soon begin to swell with the water, and not long after the Egyptians find him dead on the shore, blown up as if killed by the strongest poison."

The flesh of the hippopotamus is eaten in Africa by the poorer orders of people, who, as a matter of emolument, first separate it from the fat, a kind of fine lard with which the animal abounds, and which bears a considerable price, both on account of its flavour, and because it is supposed to possess many admirable virtues. This animal is also taken for the sake of the hide, which on the back is two inches thick or more, and which, when dried, is said to be proof against the stroke of a musket-ball. This is converted by the Africans into shields or bucklers. The value of the teeth is another inducement for its destruction; these, the tusks in particular, being superior in hardness to ivory, at the same time they are not so subject to become yellow, and therefore better for the purpose of the dentist: superstition has further stamped on them an additional value, the Africans considering them as an antidote to poison, and usually wearing some trinkets formed of these teeth about their persons. And finally it may be added, upon the credit of Labat, that the blood of this animal is employed by the Indian painters in the preparation of their colours, though in what manner we are not informed.

The mild disposition of these animals is confirmed by Belon, who assures us that when young they are easily tamed. He saw one kept in a stable, and which shewed no inclination to escape, or do any kind of mischief, when, as sometimes happened, he was released from his confinement. The cry of this animal has been variously described; Adanson, an author of veracity, declares it to be similar to that of the horse, uttered with considerable force.

In conclusion, we shall notice the interesting observations made on the hippopotamus by Dr. Sparrman, a writer whose accuracy is in general indisputable: the style adopted by that author is rather prolix, and it besides abounds in local incidents not immediately necessary to be related, but as these cannot easily be expunged without detriment to the fidelity, and tendency of the representation he has given, it will be best to repeat the observations of that traveller in their varied details, in his own words.

"Towards evening, on the 24th of January 1776, we came to a pit in the river, which our guides knew used to be frequented by sea-cows (meaning the hippopotami). For this reason, all unfrequented ways by which these animals might come up from the river were beset by us separately; our hunting party consisting in the whole of seven persons, namely, five of us Christians, together with my Hottentot, and another belonging to the farmers. Besides this, the rest of the Hottentots were ordered to go to the windward, and to the more open places: and by smacking their whips, and making other noises, to frighten and drive the animal towards us as soon as it should make its appearance; in consequence of which measures, it appeared to us, that when at length obliged to go on shore in quest of its food, it must necessarily come to the hiding-place of some one of the hunters. Every one of these places were just at the edge of the river between the reeds which grew on the dry parts of the river, or in those spots which the water had left, and at the same time close to the very narrow paths which the animal had made for itself at each place; in consequence of which disposition, it would inevitably pass not above six inches, or a foot at most, from the mouth of the sportsman's piece. Consequently our whole dependance was upon two circumstances, viz. that our guns should not miss fire, and that the shot should not fail to prove mortal. In the former case, the sportsman must have inevitably paid for his temerity with his life; though in the latter, he had reason to hope, from instances of what had happened to others, that the fire, together with the report from the piece, as well as the ball itself, would confuse the animal, so as to prevent it from immediately making towards its enemy. The banks of the pit, which were then beset, were in most places steep and perpendicular, and the pit itself almost three quarters of a mile long; but my post, and that of my fellow traveller, (Mr. Immelman,) happened to be at the distance of not above thirty or forty paces from each other. To these very places too, after we had waited at them an hour and a half, in the most profound silence, the enormous animals did not fail to resort. They had already, while on the other side of the river, got scent of the Hottentots, and now shewed, by their swimming up and down, and blowing themselves, as well as by a short but acute and piercing grunt or neighing noise, that they had a great suspicion of the passes: I believe Mr. Immelman was not less eager and anxious than myself, each of us expecting at every moment to have a bout with a large enormous beast, which we knew had given certain proofs of its being able to bite a man asunder. Yet were we each of us at times no less fearful lest the other should have the honour of killing game of such consequence. The hippopotamus, however, left us, and had made its appearance in the same manner, where the farmers were stationed; notwithstanding which at that very instant we heard it shot at by one of the Hottentots.

"The sable darkness of the night, and the glittering of the Hottentot's piece, together with the loudness of the report from it, occasioned by the weight of the charge, and the vibrations of the echo prolonging the sound along the neighbouring chain of mountains, all conspired to compose a most awful and superb spectacle, which was still heightened by the expect-

HIPPOPOTAMUS.

expectation of seeing an animal fall, superior in bulk to the elephant. This sublime spectacle was immediately followed by a ridiculous kind of farce performed by a troop of baboons, which, from their calling and answering each other along a straight line, we could discover to be encamped on a steep rocky mountain in the neighbourhood, with regular outposts in the trees on each side of it. After an interval of a couple of minutes, silence again took place, till two o'clock, when the other Hottentot fired his piece; and another alarm, though of shorter duration, went through the baboons' outposts and head-quarters.

"The next morning, for the arrival of which we ardently longed, in order to satisfy our curiosity, our Hottentot sportsmen related to us the following particulars concerning the adventures of the night. Involved in darkness, covered up to the eyes in reeds, and overshadowed with branches of trees, they could only get a glimpse of the animal, and consequently could not answer for their shots having taken place, and one of them acknowledged, that he was a little confused, as he could not well see what he was about, and for the same reason fired his piece too soon, before the animal had well risen out of the water. The other indeed had had an opportunity, both with the ball and shot that made up the charge, of wounding the animal which went on its road and passed directly by him; but he could not see which part of the animal presented itself before the muzzle of his piece. As soon as he had fired he flunk away, and directly afterwards heard the beast take to the water. The rest of the Hottentots had observed one of these animals, probably a different one from this, run up on a shallow along the river side, and thus make its escape, without having been able to prevent it. After this we staid here till the afternoon, in hopes that the wounded animals would die, and rise to the top of the water. But we staid in vain, and to as little purpose would it probably have been had we waited longer, as there grew by the side of the river a great number of trees, to the roots of which these creatures, it is said, in the agonies of death make themselves fast by means of their long and crooked tusks. On the other hand, supposing those two sea-cows to be but slightly wounded, they would be cautious how they made their appearance, and indeed, in all probability, it would have been a dangerous service to the sportsman who would have ventured to have followed them any farther. Besides, the water had now, in the space of a few hours, risen considerably, and had overflowed many spots fit for lying in ambush; for which reason we departed to another hippopotamus pit, less than this. Here, too, we laid, by way of snare, a large blunderbuss. The Hottentots occupied one post; two of our companions guarded another; other two (an old farmer and his son) stationed themselves at the third, and placed me in the middle of them. Just in this part the banks of the river were of a considerable height, and the river itself was dried up near an extensive shallow, where it was spread out into a little plain covered with pebble stones and gravel. We three then set ourselves down close by the side of each other, in a path made by the sea-cows, making ourselves pretty certain, as the place was flat, and consequently it was light here, of being able, if any hippopotamus should chance to come upon the shallow and look about it, to see it plain enough to kill it with a volley of three shots. But to the great endangering of our lives, we on a sudden found the animal much quicker in its motions as well as bolder than we had thought it; for while I was sitting half asleep and moralizing on the subject, struck with the consideration that we with our guns had at that present moment the dominion over Job's leviathan or behemoth; while on the other hand the flies or small musquitoes had the dominion over

us, (so much indeed, that I was obliged to wrap my face up in a handkerchief,) a sea-cow came rushing towards us out of the river with a hideous cry, as swift as an arrow out of a bow, at the same time I heard the farmer call out "Heer Jesus!" But fortunately, at the very instant he discharged his piece, which flashing full in the animal's face, contributed perhaps more than the ball to make it start back; when setting up another cry, it threw itself into the water again with as great precipitation as it came out.

"At this I was not a little alarmed, yet, what is very singular, not at the danger, which was real, of being trampled under foot, or being bitten asunder by the beast, but in consequence of my apprehensions, which were merely imaginary, of being drowned; for the rattling noise arising from the creatures running out of the water, and along the stony beach, immediately suggested to me the idea that the river had on a sudden overflowed its banks; a supposition to which I was the more inclined, as I knew that this accident very frequently happens here. And as to the hippopotamus, when it is newly come out of the water, and is wet and slimy, it is said to gladden in the moon-shine like a fish, it is no wonder that as soon as I took my handkerchief from before my eyes, it should appear to me at so near a view as I had of it, like a high column of water, which seemed to threaten to carry us off and drown us in a moment; for which reason I ran, or rather flew towards the higher ground, leaving both my guns and my brother centinels behind me. But as just at this spot I was prevented by the steepness of the river's banks from ascending the heights, and nevertheless perceived that neither my companions nor myself were drowned, it ran in my head, for the space of several seconds, that we were all of us dreaming, or else delirious. The farmer's son had fallen asleep, and Bill continued to sleep very soundly. As to the farmer himself, who, panting and breathless, every now and then looked up to heaven, and at the same time with much awkwardness and bungle was endeavouring to make his escape. I made all the haste I could to disengage him from a large wrapper, which, as well on account of his gout as by way of keeping off the flies, he had wrapped round his legs. I then asked him what course the water had taken when it overflowed? and he, after a long pause, answered only by asking me, in his turn, if I was not mad? Upon which I was almost ready to put the same question to myself. And even at last, when all this was unriddled to me, I could not help doubting the truth of it, till I found the farmer's gun was really discharged; for the rattling among the stones, and the squashing in the water occasioned by the sea-cow, was what I first heard, and what made me take to my legs; so that I did not in the least attend either to the report of the gun or the cry of the animal, though these latter appeared to the rest of our party the most terrible; so much indeed, that they occasioned Mr. Immelman, together with the farmer's son-in-law, to fly from their post, though they had seen nothing of all that had happened, and could not easily have come to any harm."

"On the twenty-fifth, from some traces of the sea cows which we found in the dust near another spot, we concluded that many of these huge amphibious animals had lately taken up their quarters in a certain pit thereabouts; which we accordingly prepared to lay siege to in every possible way. In the mean time, we saw a young lion make its escape into a close thicket on the side of this same pit, where it might be perfectly safe from us and our hounds. Not much approving of this animal's being so near a neighbour to us, we thought it best for several of us marksmen to be together at each hiding place; at the same time ordering our Hottentots, partly

HIPPOPOTAMUS.

partly by making a noise and uproar, and partly by the means of making large fires, to frighten the sea-cows from attempting any of the other passes. These animals had probably been beset in the same manner several times before, as this night we scarcely heard any thing of them. In the mean while, however, we flattered ourselves, that by continuing to block them up, we should, at least, by starving them, force them to quit their asylum, and expose themselves on the land, to the fire of our guns.

“On the following day we were likewise on the look out after these animals, between the hours of ten and eleven in the forenoon, and also just before dusk, though upon quite a different plan from what we had before, as we meant now to hit them on their snouts the instant they should stick them up within the reach of our guns out of the water in order to take breath, or more properly (as it is not inaptly called by the colonists,) to blow themselves. In order that the shot might prove mortal, we were obliged, however, on this occasion, to direct it in such a manner, that the ball should pass through the cavity of the nose into the brain. It was merely upon this plan that we went out after the sea-cows before we arrived at Agter Bruntjeshoogte, and were strengthened by the farmer's party. But we constantly found these animals too shy to allow us to put our designs in execution; for although, in those places where they had not been frightened or wounded, they will often, in the middle of the day, raise their heads and part of their bodies above the surface of the water, they at this time scarcely ventured just to put out one of their nostrils, in order to breathe almost imperceptibly; and this only for the most part in those spots in which they were sheltered from us by the hanging branches of trees. Notwithstanding this disadvantageous situation, they, in consequence of the acuteness of their smell, seemed still to discern us, especially when we were to the windward of them; as in that case they instantly withdrew to another part.” “The same night we betook ourselves again to our posts, and at half an hour past eight, it being already very dark, a sea-cow began at intervals to put its head up above the water, and utter a sharp, piercing, and as it were, a very angry cry, which seemed to be between grunting and neighing. Perhaps this cry may be best expressed by the words *beurkk beurkk kubb-kubb*; the two first being uttered slowly, in a hoarse, but sharp and tremulous sound, resembling the grunting of other animals; while the third, or compound word, is sounded extremely quick, and is not unlike the neighing of a horse. It is true, it is impossible to express these inarticulate sounds in writing; but perhaps one may make nearer approaches to it than one can to the gutturo-palatal sounds of the Hottentot language. At eleven o'clock came the same, or else some other hippopotamus, and, in like manner, visited the posts we occupied. He did not, however, dare to come up, though, to our extreme mortification, we heard him come and nibble the boughs which hung over the surface of the water, as well as a little grass, and a few low shrubs which grew here and there on the inside of the river's banks. We were, however, in hopes that this way of living would not long suffice animals, one of which only required almost a larger portion than a whole team of oxen. Thus far, at least, is certain, that if any one should calculate the consumption of provisions made by a sea-cow from the size of its fauces, and from that of its body and his belly, which hangs almost down to the ground, together with the quantity of grass.”

“We passed the following night at the same posts as we occupied on the night preceding, the sea-cows acting much in the same manner as before. On the 28th after sun rise, just as we were thinking of going from our posts home to

our waggons, there came a female hippopotamus with her calf from some other pit or river, to take up her quarters in that which we were blockading. While she was waiting at a rather steep part of the river's banks, and looking back after her calf, which was lame, and consequently came on but slowly, she received a shot in her side, upon which she directly plunged into the water, but was not mortally wounded; for Flip, (the farmer's son,) the drowsiest of all fubinary beings, who had shot her, and that infant could hardly be awakened by two Hottentots, was still half asleep when he fired his piece. And happy was it for him that the enormous beast did not make towards his hiding, or rather sleeping place, and send him into the other world to sleep for ever. In the mean while his shot was so far of service, that one of my Hottentots ventured to seize the calf, and held it fast by its hind legs, till the rest of the hunting party came to his assistance. Upon which the calf was bound fast, and with the greatest joy borne in triumph to our waggons; though while they were taking it over a shallow near the river, the Hottentots were very much alarmed, lest the wounded mother and the other sea-cows should be induced, by the cries of the calf, to come to its rescue; the creature, as long as it was bound, making a noise a good deal like a hog that is going to be killed, or has got fast between two posts. The sound, however, proceeding from the hippopotamus calf was more shrill and harsh. It shewed likewise a considerable share of strength in the attempt it made to get loose, and was found to be quite unmanageable and unwieldy; the length of it being three feet and a half, and the height two feet; though the Hottentots supposed it to be no more than a fortnight, or at most, three weeks old. When at last it was turned loose, it ceased crying; and when the Hottentots had passed their hands several times over its nose, in order to accustom it to their effluvia, began directly to take to them.” “While the calf was yet alive, I made a drawing of it, a copy of which may be seen in the Swedish Transactions for 1778. After this, it was killed, dissected, and eaten up in less than three hours time. The reason of this quick dispatch was partly the warmth of the weather, and partly our being in absolute want of any other fresh provisions. We found the flesh and fat of this calf as flabby as one might have expected from its want of age, and consequently not near so good as that of the old sea-cows; of which I found the flesh tender, and the fat of a taste like marrow, or at least not so greasy and strong as other fat. It is for this reason the colonists look upon the flesh and fat of the sea-cow as the wholesomest meat that can be eaten; the gelatinous part of the feet in particular, when properly dressed, being accounted a great delicacy. The dried tongues of these animals is considered, even at the Cape, as a rare and favourite dish. On my return to Sweden, I had the honour to furnish his majesty's table with a dried sea-cow's tongue, two feet eight inches long. With respect to form, the tongue of a full grown hippopotamus is very blunt at the tip, and is in fact broadest at that part; if, at the same time, it is slanted off at one side, and marked with many lobes, as I was informed it is, this circumstance may, perhaps, proceed from the friction it suffers against the teeth, towards the side on which the animal chiefly chews; at least, some traces of this oblique form were discoverable on the dried tongue I am speaking of.”

The food of the hippopotamus, according to Dr. Sparrman, consists entirely of herbs and grass, a circumstance, he remarks, of which we are informed by father Lobo, and which may partly be inferred from the figure of the stomach. Hence this writer thinks it very improbable the hippopotamus

HIPPOTAMUS.

mus should ever hunt after fish, as is asserted by Buffon and Dampier; and this the more especially, as in some of the rivers in the southern parts of Africa, where the sea-cows are daily seen in great abundance, there is no fish; and in others which they inhabit, only a few "bastard springers" (cyprinus gonorynchus), which are scarcely larger than the common herring. "It is true, (says Dr. Sparrman,) that the sea-cows sometimes frequent the mouths of the rivers here, which are full of sea-fish, and even sometimes the sea itself: we know, however, that these huge quadrupeds are, notwithstanding this, obliged to go from thence upon dry land in quest of food. Neither is it probable that they can drink sea-water, as an instance was related to me of the contrary in a hippopotamus, which having taken refuge in the sea, and yet was obliged to go ashore every night, and drink fresh water from a well in the neighbourhood, till at last it was shot by some people that lay in wait for it there. That the hippopotamuses actually lived in salt water, I have seen evident proofs at the mouths both of the Kromme and Cam-tour rivers, particularly the latter, on my journey homewards; where many of these animals blowed themselves in broad day-light, and thrust their heads up above the water; and one of them in particular, which had been wounded by an ill-directed shot on the nose, neighed from anger and resentment. In Krakekamma, I saw on the beach manifest traces of an hippopotamus, which had come out of the sea, but had retired thither again directly. That very attentive navigator Capt. Burtz informed me, that he had frequently seen, on the eastern coast of Africa, sea-horses (meaning probably the hippopotamus) raise their heads above the surface of the water, in order to blow themselves and neigh. I have been induced to be rather circumstantial on this subject, as M. Adanson had taken it into his head, in his "Voyage au Senegal," to limit the abode of the hippopotamus to the fresh-water rivers only in Africa; and M. de Buffon has taken upon him to support this opinion, and to render Kolbe's testimony to the contrary liable to suspicion.

"The method of catching the hippopotamus consists (besides shooting it) in making pits for it in those parts which the animal passes in its way to and from the river; but this method is peculiar to the Hottentots, and is only practised by them in the rainy season, as the ground in summer is too hard for that purpose. It is said that they have never succeeded in killing this huge aquatic animal with poisoned darts, though this mode of killing game is practised with advantage by the Hottentots, for the destruction both of the elephant and rhinoceros. The colonists, likewise, were not entirely unacquainted with the method mentioned by M. Haffelquist, as being common in Egypt, *viz.* to strew on the ground as many peas or beans as the animals can possibly eat, by which means it bursts its belly and dies. But as this method is very expensive, and they can generally have this animal for a single charge of powder, and a tin ball, shot in a proper direction, they chiefly, and almost entirely have recourse to this cheaper expedient."

Not on his own authority, but on the assurance of old experienced hunters, Dr. Sparrman tells us the hippopotamuses couple in the same manner as the common cattle. A brother sportsman, said he, once observed a peculiar kind of vermin on the body of an hippopotamus. These amphibious animals are likewise much infested with intestinal worms, one of which, found on the calf before-mentioned by Dr. Sparrman, he describes as being a kind of leech of about an inch long, the colour blackish, with a brownish line down the back, and the lower surface pale brown. With regard to

its food, this writer imagines the adult animal may be not very choise, as the calf, apparently pressed by hunger, was observed to eat the dung of one of the oxen belonging to their party.

"Having already (says Dr. Sparrman) exceeded the limits I had prescribed to myself, I do not intend to dwell here on the anatomy of the hippopotamus we caught, particularly as the internal conformation of the calves is somewhat different from that of the adult animal. I shall, therefore, only briefly mention the following particulars: the stomachs were four in number, and consequently one more than in the fetus examined by M. Daubenton, which was kept in spirits. The two first stomachs were each of them about seven inches long, and three inches in diameter; the third nine inches in length, and a little wider than the two former; the fourth was seven inches long, and at the upper part five inches broad, but decreased by degrees on one side till it terminated in the *pylorus*, which had an aperture an inch wide, being about half as wide again as the *cardia*. I did not observe any such valves as M. Daubenton has delineated. The first stomach we found mostly empty, it containing only a few lumps of cheese and curd; it likewise differed from the rest by the superior fineness of its internal coat. The internal membrane of the second stomach was rather coarser, and had many small holes in it; it likewise contained several clods of caseous matter, together with a great quantity of sand and mud. The third stomach had very visible folds, both longitudinal and transverse, on the inside of it, and contained caseous lumps of a yellow colour, and harder consistence than the others, together with several leaves quite whole and fresh, and at the same time some dirt. The interior membrane of the fourth stomach was very smooth, though it was not without folds: in the stomach itself there was a good deal of dirt, with a small quantity of curds, which were whiter than they were in any of the other stomachs. The fourth stomach in a great measure covered the rest, being situated on the right side of the animal, and was found to have the upper part of the melt adhering to its superior and interior edge. This latter viscus, which was one foot long and three inches broad, diverged from it downwards on the left side. The intestinal canal was 109 feet long; the liver measured fourteen inches from right to left, and seven or eight from the hind to the fore-part; on its anterior edges it had a large notch, being in other respects undivided and entire; it was of an oblique form, being broadest towards the left side, where I discovered a gall-bladder five inches in length. In the uterus there was nothing particular worthy of observation. I found two teats, and the heart surrounded with much fat; the length of this muscle was five inches, and the breadth about four inches and a half. The communication between the auricles, called the *foramen ovale*, was above an inch in diameter. Each lung was eleven inches long and undivided; but at the superior and exterior part of the right lung, there were two globules or processes, elevated half an inch above the surface; and on the side corresponding to it, in the left lung, and in the upper part of it, there was a little excrescence terminating in a point: somewhat below this, yet more forwards, there was found likewise a process half an inch in height. Directly over the lower part of the communication formed between the right and the left lung, there was a kind of crest or comb, measuring an inch from the top to the basis."

HIPPOTAMUS *Fossil*. Zoologists are acquainted with one living species of hippopotamus only; but late observations have proved that the bowels of the earth con-

tain the fossil remains of *two* perfectly distinct species, one of which appears not to differ in any respect from the one still existing; the other, being, as it were, a miniature copy of the larger, is nearly of the size of the wild boar. The discovery of this latter we owe to the indefatigable Cuvier, who has likewise proved the existence of the other species in a fossil state. Several authors, prior to that celebrated naturalist, have mentioned fossil bones of the great African hippopotamus, but subsequent observations have proved that they had been rather too rash in forming their diagnosis. Some of the teeth described by Daubenton as the *molars* of the hippopotamus, are proved by Cuvier to be those of the mastodonte, or the great American animal improperly called mammoth. Peter Camper, who has given an account of fossil teeth of the hippopotamus, appears to have fallen into the same error as Daubenton. Merk likewise describes a tooth of a hippopotamus found in the neighbourhood of Frankfort on the Mayn, which turns out to be a worn out intermediate tooth belonging to the same American animal. The tooth of a hippopotamus, mentioned by Deluc as having been found among the volcanic productions in the vicinity of Frankfort, is, according to Merk, nothing but the tooth of a rhinoceros. The teeth which Lang has figured under the same name are probably those of a horse, partly undeveloped, partly worn off. Also, Romé de l'Île, de Lametherie, and Faujas St. Fond were led into error with regard to the teeth they described as belonging to the river horse. Some writers, on the other hand, have been in the possession of real fossil remains of the hippopotamus without being aware of it. Thus Aldrovandus has figured several *molars* of this animal under the name of elephant's teeth, while the real elephant's tooth, of which he has likewise given a representation, was considered by him as belonging to some large unknown animal. The only authors who have been more correct, both in the application of the name of hippopotamus, and in their observations respecting the fossil remains of the animal in question, are Antoine de Jussieu and Daubenton: the fossil bones described by the former as early as 1724, cannot be doubted to be really those of the river horse; and those indicated by Daubenton under the same name, and deposited (promiscuously with others, which, as above-mentioned, belong to the mastodonte) in the museum at Paris, were the first that served to convince Cuvier of the existence of fossil remains of

1. *The great or common Hippopotamus.*—One of the last-mentioned specimens of osseous remains consists in a portion of the right side of the lower jaw containing two molar teeth; the other in a single molar tooth. The place where they were found is not known with certainty. A third specimen, examined by Cuvier, is a fragment of the upper jaw, with two molar teeth, in the collection of M. de Drée; it is penetrated by a ferruginous substance, but does not bear any indication of its origin; it is not, however, improbable that it was found in the neighbourhood of Montpellier.

More satisfactory than the preceding specimens, with regard to its locality, was one in the collection of M. Miot. This bone, which was known to have been gathered in the Val d'Arno, in Tuscany, is an astragalus, resembling that of a hog, to which animal the hippopotamus approaches more than to any other, with regard to the conformation of all its parts. The place where bones of the hippopotamus are actually found being thus ascertained, Cuvier applied to Fabbroni at Florence, who sent him drawings of two molar teeth, and one representing a fragment of a tusk or canine tooth, which Cuvier soon ascer-

tained to belong to the animal in question. Respecting the canine tooth, it is observed by Fabbroni, that it differs from that of the African hippopotamus in its diameter being greater compared with its length, and also in its spiral curvature being much more distinct. He adds, that these teeth are scattered in various parts of the upper valley of Arno, but unaccompanied either by jaws or other bones.

Cuvier thinks there is no material difference either between these fossil teeth or the astragalus he has examined, and those of the living species; and, indeed, it is remarkable, that the animal, whose existence in a fossil state had at first appeared doubtful to geologists, should be one whose fossil remains far more strikingly resemble the bones of the still existing species, than is the case with any other fossil remains which naturalists have referred to living animals, such as the elephant, the rhinoceros, &c.

2. *The small fossil Hippopotamus.*—The mass out of which Cuvier extracted the remains of this species, (but the geological relation of which is unfortunately unknown,) resembles the osseous breccia of Gibraltar, Dalmatia, and Cete, except that the matrix, instead of being calcareous and stalactitical, is a homogeneous sand-stone, which uniformly fills up all the intervals between the bones; the bones also form a far more considerable portion of the mass than is the case in the Gibraltar rock. After having performed the difficult operation of disengaging all the separate osseous fragments, M. Cuvier found that they belonged to an animal, of which no traces had hitherto been discovered, but which was unquestionably a congener of the common hippopotamus. The teeth were found to agree in all essential points with those of the other species; and the remainder of the osseous fragments which were next examined, confirmed, without a single exception, what had been indicated by the characters of the teeth.

For a detailed description, together with the representation of the fossil bones of both these species of hippopotamus, we refer to Cuvier's Memoir, in vol. v. of the *Annales du Museum National d'Histoire Naturelle*.

HIPPOSIS, in the *Writings of the Ancient Physicians*, signifies a reducing any part of the body into its natural situation, by means of compression.

HIPPOTAURUS, in *Natural History*, the name given by authors to a creature generated between a bull and a mare. It seems a very unnatural copulation; but Wagner, in his History of Switzerland, assures us, that the creature produced by it is sometimes found wild in the mountainous parts of that country.

HIPPURIS, in *Botany*, is a name adopted by Linnæus from the ancients, in preference to some that had been given to this same genus by Vaillant and Dillenius. The original *ἵππουρις* of Dioscorides is evidently, from his description of both species, an *Equisetum*, (see that article.) The present plant has great affinity to that genus in habit and place of growth, though differing materially in its generic characters. Its name is compounded of *ἵππος*, a horse, and *ουρα*, a tail. Mr. Curtis has remarked that "*Hippuris* of Linnæus is *Πολυγονου ὄνδα*, *Polygonum semina*, of Dioscorides, arranged by his commentator Matthioli with our *Polygonum aviculare*, and *Herniaria*. Succeeding botanists, imagining, from the growth of its leaves, or from its producing feed, that it had better pretensions to be ranked with the *Equisetum*, absurdly enough called it *Cauda equina semina*, to which Mr. Hudson could not well avoid giving the English name of Mare's-tail." This genus was denominatd *Limnoperuce* by Vaillant and Haller, and *Pinastella* by Dillenius.—Linn. Gen. 5. Schreb.

Schreb. 8. Willd. Sp. Pl. v. 1. 26. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 4. Ait. Hort. Kew. ed. 2. v. 1. 12. Juss. 18. Lamarek Illustr. t. 5. Gært. t. 84.—Class and order, *Monandria Monogynia*. Nat. Ord. *Inundatæ*, Linn. *Naiades*, Juss.

Gen. Ch. *Cal.* Perianth superior, obsolete, undivided, or slightly two-lobed. *Cor.* none. *Stam.* Filament one, erect, inserted on the top of the germen; anther roundish, two-lobed, compressed. *Pist.* Germen oblong; style awl-shaped, erect, longer than the stigma; stigma simple, acute. *Peric.* none. *Seed* only one, roundish, naked, rather bony, covered with a thin sort of membrane.

Ess. Ch. Calyx obsolete, undivided. Corolla none. Stigma simple. Seed one, inferior.

1. *H. vulgaris*, Mare's-tail.—Linn. Sp. Pl. 6. Engl. Bot. t. 763. Curt. Lond. Fasc. 4. t. 1.—“Leaves whorled, numerous, linear.”—A common inhabitant of ditches, pools, and streams which are not very rapid, in Norfolk and the neighbourhood of London, flowering abundantly in May and June. In other parts of England it is of rarer occurrence, seeming to delight in a gravelly soil.—*Root* consisting of long verticillate fibres. *Stem* entirely simple, round, of a reddish tinge, and closely set with whorls of linear, entire, smooth leaves, about eight or more in a whorl. *Flowers* axillary, sessile, and of very simple structure, for “they consist of only an oval germen, crowned with an almost imperceptible margin or calyx, without a corolla, and terminating in a simple, thread-shaped, pointed style, by whose side stands one simple stamen with a two-lobed anther. The germen becomes a single naked seed.”

2. *H. tetraphylla*. Linn. Suppl. 81. (*H. lanceolata*; Retz. Obf. fasc. 3. 7. t. 1. *H. maritima*; Hellen. Diff. t. 1. Retz. Prod. 2.)—Leaves four or five in a whorl, elliptical, obtuse. This was sent to Linnæus by professor Leche of Abo, in Finland, in which neighbourhood it is said to have been first discovered by a Mr. Schulten. It is remarkable that Pallas sent it from Kamtschatka as a new *Elatine*, enquiring of Linnæus if it were distinct from the *Alfingstrum*, though his specimens most evidently display the flowers of an *Hippuris*, with their stamen and style in full perfection. This has the habit of the species just described, differing only in the fewness of leaves in each whorl, and their broad, elliptical shape. Whether it has in winter any difference of appearance in foliage, like the former, whose immersed leaves at that season are peculiarly elongated and pellucid, we have no information. Retzius, in his fasciculus above quoted, contends that this genus is gynandrous.

HIPPURIS, in *Ancient Geography*, an island of the Archipelago, being one of the Cyclades.

HIPPURISCUS, an island of Asia, on the coast of Caria.

HIPPURITES, in *Natural History*, a name given by some writers to a stone which they fancy to represent a saddle. It is described to be a soft argillaceous stone, owing its figure of a saddle to certain depressions. This is only a lusus naturæ, and is of the nature of the hand-stones, and foot-stones, with several others, which fancy has assisted in their resemblances, but which have been very improperly called by particular names.

HIPPURITES is also a name which Dr. Grew applies to a fossil plant of a stony texture, consisting of three stalks elegantly figured, to resemble the equisetum or horse-tail plant. Rarities, p. 268.

HIPPURUS, in *Ichthyology*, a species of *CORYPHÆNA*, which see.

HIPPUS, in *Medicine*, a disorder of the eyes, wherein

they continually shake and tremble, and thus represented objects as if continually fluctuating.

It is thus called from the Greek *ἵππος*, *horse*; because, according to Blanchard, objects appear to shift in it, as much as when we are riding.

HIR, in *Geography*, a town of Persia, in the province of Kerman; 18 miles S. of Sirgian.

HIRA, a word used by the writers in medicine either for the intestinum jejunum, or for all the intestines, or in a yet larger sense for all the contents of the abdomen. Castell. Lex. in voc.

HIRA, or *Alexandria*, *Mesjid-ali* or *Mebam-ali*, in *Ancient Geography*, a town of Asia, near a lake, at some distance from the right bank of the Euphrates: the residence of a dynasty of princes, who served the Persians and Parthians against the Romans.

HIRABAD, in *Geography*, a town of Persia, in the province of Irak. N. lat. 32° 16'. E. long. 55° 50'.

HIRÆA, in *Botany*, so called by Jacquin after John Nicholas de la Hire, a French physiological writer in the Memoires de l'Acad. des Sciences, whose remarks are sometimes cited by Du Hamel and others; and who discovered an exudation resembling manna on the leaves of orange-trees.—Jacq. Amer. 137. Linn. Syst. Veg. ed. 14. 427. Schreb. 307, 804. Willd. Sp. Pl. v. 2. 743. Mart. Mill. Dict. v. 2. (Flabellaria; Cavan. Diff. 436. *Triopteris Hiræa*; Gært. t. 116.)—Class and order, *Decandria Trigynia*. Nat. Ord. *Tribilata*, Linn. *Malpighia*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, small, erect, in five deep segments, permanent, without any nectariferous external glands. *Cor.* Petals five, roundish, concave, widely spreading, with long linear claws. *Stam.* Filaments ten, awl-shaped, erect, slightly connected at the base, five of them alternately shorter; anthers erect. *Pist.* Germens three, superior, ovate, connected; styles awl-shaped, erect; stigmas capitate or cloven. *Peric.* Capsules three, roundish, not bursting, with two very large, transverse, rounded wings, sometimes united, and a smaller longitudinal central one. *Seeds* solitary, ovate.

Ess. Ch. Calyx in five deep segments, without any honey-pores. Petals roundish, with claws. Filaments connected at the base. Capsules three, closed, single-seeded, with two or three unequal wings.

Obf. This genus has been confounded with *Triopteris*, and it is doubtful whether they ought not to be united, according to the sentiments of Gærtner and Jussieu. The chief difference lies in the two nectariferous glands or pores, said to distinguish the calyx of *Triopteris*, and its narrower, more vertical, and more divided wings.

1. *H. reclinata*. Jacq. Amer. 137. t. 176. f. 42. Gært. t. 116. Linn. Mant. 240.—Leaves obovate, blunt at each end, smooth beneath.—Gathered by Jacquin in woods at Carthiagena in South America, flowering in June, and ripening seed in September. It is a weak and trailing *shrub*, seldom rising to the height of more than fifteen feet, and resting its long, pliant, smooth branches upon the neighbouring bushes. The bark is grey. *Leaves* opposite, oblong, somewhat obovate, blunt at each end, entire; smooth beneath; clothed with soft, depressed, scarcely visible hairs above. Their length is from three to six inches. *Footstalks* short, with a pair of brittle-shaped *stipulas* at the base. *Flowers* yellow, beautiful, an inch broad, in very long, compound, terminal clusters.

2. *H. odorata*. Willd. n. 2.—“Leaves ovate, acute; smooth above; downy beneath.”—Found by Isert in Guinea.—A *shrub*. *Leaves* opposite, ovate, acute, entire, veiny; dark

dark green and smooth above; clothed with yellowish shaggy close down beneath. *Chylers* copious at the ends of the branches, axillary, forming a terminal leafy panicle, with downy stalks. The *flowers* are said to be fragrant. *Fruit* exactly like the following. *Willdenow.*

3: *H. pinnata*. Willd. n. 3. (*Flabellaria paniculata*; Cavan. *Diff.* 436. t. 264.)—"Leaves pinnate with an odd one, ovate-oblong, alternate, smooth on both sides."—Gathered by Smeathman at Sierra Leone. About this plant there is much obscurity. Nothing brought by Smeathman answers to it, but some specimens of his well agree with the preceding description, except that the backs of the *leaves* are rather silvery than yellowish. Cavanilles may very reasonably be suspected of a mistake with regard to the leaves, no plant of this natural order being known to have either compound or alternate foliage. We are therefore strongly persuaded that this supposed species is no other than the former.

HIRAM, in *Geography*, a post-town of America, in York county, Maine, containing 184 inhabitants.

HIRARA, in *Zoology*, the name of an animal of the Brasils, much resembling the *hyæna*.

HIRCANIA. See HYRCANIA.

HIRCUS, TRAGUS, or Goat, in *Anatomy*, a part of the auricle, or outer ear; being that eminence next the temples.

HIRCUS, in *Astronomy*, a fixed star of the first magnitude, the same with Capella.

HIRCUS is also a denomination given to the rank smell exhaling from the arm-pits; and which has its source in the axillary glands.

HIRCUS is also used by some writers for a comet, encompassed as it were with a mane, seemingly rough and hairy.

HIRE, PHILIP DE LA, in *Biography*, an eminent mathematician and astronomer, was born at Paris in the year 1640. His father took great care in having him instructed in those branches of mathematics which should lay a foundation for the study of the fine arts. After the death of his father, which took place when the son was only seventeen years of age, he passed some years in Italy, spending his time chiefly in the study of the mathematics, to which he devoted himself with the greatest ardour. On his return to Paris he made himself known to the public by the second part of a treatise on stone-cutting, printed in 1672, in continuation of Gerard d'Argues on the same subject. The reputation which he acquired by this performance, he increased by his "Nouvelle Méthode en Geometrie pour les Sections des Surfaces coniques et cylindriques," and his treatise "De Cycloide." In the year 1678 he was elected member of the Academy of Sciences, and in the following year he published "Les nouveaux Elemens des Sections Coniques:" "Les lieux Geometriques:" "La Construction ou Effectiõn des Equations." In the same year, under the auspices of Colbert, he commenced an undertaking, conjointly with M. Picard, in order to collect materials for a more correct general chart of the sea-coast of France than had been before laid down: and visited the province of Bretagne, where the two mathematicians made the surveys and observations requisite for their design. In 1680 they proceeded to the coasts of Guienne and Gascogne, and in 1681 M. de la Hire was directed to proceed alone to Calais and Dunkirk, in order to determine the exact positions of those places. On this occasion he took the opportunity of measuring the exact breadth of the straits of Dover, which he found to be 21,360 toises. In 1682 he finished his share of the undertaking, and on his return to Paris he published his treatise

"De Gnomonique," which he reprinted in 1698, in an enlarged form. From this time he frequently appeared before the public in the character of an author. And the diversity of his productions, and his continual employments, give us some idea of the great labour which he must have undergone. His days, says his biographer, were almost uniformly spent in close study, or in discharging professional engagements, and a considerable part of his nights was frequently devoted to astronomical observations. Seldom did he enjoy any other relief from his labours than what arose from the exchange of one employment for another; nevertheless his health was generally good, till within a month of his death, which took place in 1718, after he had completed his 78th year. He was regarded as an honest and disinterested man, and as a good Christian. Moreri. Hutton.

HIRLAW, or HARLEV, in *Geography*, a town of Moldavia, on the Bechlui; 30 miles N.W. of Jassy. N. lat. 47° 24'. E. long. 27° 6'.

HIRMUND. See HEERMUND.

HIRPI, in *Ancient Geography*, a name distinguishing a number of families of Italy, at a small distance from Rome, in the territory of the Falisci, who every year marched over burning wood to mount Soracte, in order to offer a sacrifice in honour of Apollo. It is said that, on this account, they were exempt from going to war, and from all other charges. They are described in Virgil's *Æneid*. l. ii. v. 785:

"Summe Deum, sancti custos Soractis Apollo
Quem primi colimus, cui pineus ardor æcervo
Poscitur, et Medium freti pietate per ignem
Cultores multa premimus vestigia pruna."

Varro says, in speaking of this practice of the Hirpi, that they applied some preparations to their feet in order to prevent their being burnt.

HIRPINI, a people of Italy, who formed a part of the Samnites; and as the term *Hirpus* signified in the Samnite dialect a wolf, they are said to have migrated to their new habitations by tracing the steps of these animals. It was towards the end of the second Punic war, that the Hirpini began to be distinguished from the other Samnites. Their territory comprehended the towns of Beneventum, Candium, Abellinum, and Campsa.

HIRRIA, in *Geography*, a town of Hindoostan, in Rohilcund; 28 miles S. of Pillibeat.

HIRSCHBERG, a town of Bohemia, in the circle of Boleslau; 12 miles N. W. of Jung-Buntzel.—Also, a town of Silesia, in the principality of Jauer, and next to Breslau, the town of the most considerable trade in Silesia, having many manufactures both in the town and neighbouring villages. The churches in the town belong to the Roman Catholics, but the Lutherans have purchased the privilege of erecting a church and school without the walls. It has been once and again burned and pillaged; 20 miles S. W. of Jauer. N. lat. 50° 44'. E. long. 15° 48'.—Also, a town of Saxony, in the Vogtland; 14 miles S. W. of Plauen. N. lat. 50° 20'. E. long. 11° 58'.—Also, a town of Bavaria, in the principality of Aichstadt, 22 miles N. E. of Aichstadt.

HIRSCHFELD, a town of Saxony, in the circle of Erzgebürg; seven miles S. of Zwickau.—Also, a town of Lusatia, on the Neisse; 40 miles E. of Dresden. N. lat. 50° 56'. E. long. 14° 59'.

HIRSCHOLM, a town of Denmark, with a castle, in the island of Zealand, where Christian VI. died in 1746; 12 miles N. of Copenhagen.

HIRSEL, in *Rural Economy*, a term employed among the

the northern stock-masters, to denote the division of sheep into particular kinds.

HIRSON, in *Geography*, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Vervins; four miles N. E. of Vervins. The place contains 2150, and the canton 11,127 inhabitants, on a territory of 185 kilometres, in 13 communes.

HIRST, in *Mining*, Ridge or Sow's-back, is applied by the colliers of Scotland, (see Willein's Min. Kin. 2d edit. i. 90.) to the tops or higher parts of undulating strata, or those which lay in **HILL and Trough**, see that article.

HIRTELLA, in *Botany*, so named by Linnæus, as he himself informs us, in the *Hortus Cliffortianus*, p. 17, from *hirtus*, hairy, because of the hairiness of its young branches.—Linn. Gen. 110. Schreb. 153, 824. Willd. v. 1. 1151. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 2. 40. Jacq. Amer. 8. Juss. 340. Lamarck. Illustr. t. 138.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Senticosa*, Linn. *Rosaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, its border in five deep, nearly ovate, spreading, unequal, permanent segments. *Cor.* Petals five, roundish, concave, slightly spreading, equal, deciduous. *Stam.* Filaments five, sometimes but three, inserted into the rim of the calyx on one side, very long, bristle-shaped, flattish, permanent, at length rolled in spirally; anthers orbicular, of two lobes. *Pist.* Germen superior, roundish, compressed and sloping, hairy; style thread-shaped, as long as the stamens, arising from the depressed side of the germen opposite to the stamens, near the bottom; stigma simple. *Peric.* Berry oval, swelling upwards, slightly compressed, somewhat triangular, the style and much of the hairiness which clothed the germen remaining attached to its base on one side. *Seed* one, large, shaped like the pericarp. Aublet describes it as a nut of two cells.

Ess. Ch. Calyx with five permanent segments. Petals five. Filaments inserted into the rim of the calyx, very long, permanent, spiral. Style lateral. Berry superior, with one seed.

The history of the species is singularly confused. We shall endeavour to collect under one view all that has been said of them.

1. *H. americana*. Willd. n. 1. Swartz. Obf. 94. Aubl. Guian. v. 1. 247. t. 98.—Clusters upright, simple, axillary; their common stalk villose. Leaves oblong, pointed. Stamens five.—Native of Cayenne and Guiana. A tree 25 feet high or more, and six inches in diameter, with a reddish bark. Branches long, slender, scattered, and subdivided. Leaves alternate, oval, long-pointed, entire, smooth and green; the largest of them six inches long by 2½ broad. Footstalks very short, with a pair of awl-shaped, downy, deciduous stipulas. Clusters axillary, long, hairy, reddish; their partial stalks alternate, with one or two little scale-like bractæas at their base. Segments of the calyx reflexed. Petals blueish, emarginate. Stamens five, all on one side of the flower, very long, blueish upwards, as are likewise their anthers. Style rough in its lower part with red hairs. This tree flowers in March. Swartz and Willdenow seem to depend entirely on Aublet for this species, yet they take it for the original one of Linnæus, which he saw in Piso's herbarium, and which had five stamens. However this may be, what he describes in the *Hortus Cliffortianus* had but three, and should seem to be different. What he quotes in the *Species Plantarum*, ed. 2: 290. from Marcgraave's Brasil, t. 78. f. 2, and which he says is bad, does not at all agree with any *Hirtella*.

2. *H. triandra*. Swartz. Prodr. 51. Ind. Occ. v. 1. 508. (*H. americana*; Jacq. Amer. 8. t. 8.)—Clusters compound,

terminal, solitary, downy, loosely spreading. Leaves elliptic-oblong, pointed, naked on both sides. Stamens three.—Native of woods, by the sides of torrents in Jamaica, Hispaniola, and other parts of the West Indies, flowering in April and May. The branches are besprinkled with minute warts, their young extremities clothed with depressed fattin-like down. Leaves about three inches long, nearly elliptical; with a taper point, contracted, and somewhat rounded at their base, naked and shining, but rather rough to the touch. Cluster five or six inches long, simple in Jacquin's figure, very compound in our specimens. Fruit an inch long, or more, slightly hairy. Willdenow considers this as the *Hirtella* of Hort. Cliff. Swartz says the petals are white, stamens three, with the rudiments of from two to five minute filaments in the vacant space opposite to them.

3. *H. pendula*. Herb. Linn. fil.—Clusters compound, terminal, long, pendulous, hairy. Leaves oblong, pointed; heart-shaped at the base; downy beneath. Stamens three.—Native of the West Indies? The leaves exactly resemble those in Aublet's figure of *H. americana*, both in size and figure, but are rough with rusty down at the back. The clusters are above a foot long, solitary, terminal, stalked, clothed all over with dense, prominent, rusty, short hairs; their partial stalks generally cloven and two-flowered, the lower ones many of them much more compound and forked. Calyx very hairy; silky within. Stamens three, long and twisted, as well as the style, which is quite smooth throughout. Fruit above an inch long, smooth, obovate, compressed upward, and emarginate. Fine specimens of this, in the herbarium of the younger Linnæus, appear to have made a part of a numerous collection of West Indian plants given him, when in England, by sir Joseph Banks. Yet we find no description in Swartz or any other author applicable to them, nor does the above name any where occur.

4. *H. paniculata*. Swartz. Prodr. 51. Ind. Occ. v. 1. 510. Vahl. Symb. fasc. 2. 43. t. 31.—Clusters compound, terminal, erect, hairy, sometimes aggregate. Leaves oval, acute, shining; their ribs hairy beneath. Stamens five or six.—Native of Guiana. The leaves are peculiarly shining on both sides, though their colour is paler at the back, and the ribs there hairy. In length they greatly vary, but scarcely in breadth. The young branches, flower-stalks, and calyx, are bristly with long prominent tawny hairs. Stamens in our specimens six. Some of Linnæus's remarks appear to indicate this species as what he had seen.

HIRTIUS, AULUS, in *Biography*, was an officer under Julius Cæsar, and wrote a supplementary part of the Commentaries published in his name. The books composed by Hirtius are the eighth of the Gallic war, and those of the Alexandrine and African wars. Of the two latter he received his information partly from Cæsar's own mouth. His style is good, but his narrative is reckoned less clear than that of Cæsar himself. He was made consul, together with Vibius Pansa in the year B. C. 43, and the conduct of the war against Antony was committed to them in conjunction with the young Octavianus. He gave Antony a considerable check in the neighbourhood of Mutina, but his ardour carrying him too far into the enemy's quarters, he received a wound which laid him dead on the spot. Univer. Hist.

HIRUDELLA MARINA, in *Natural History*, the name of a very remarkable little animal of the leech kind. The body of this creature is roundish and oblong, and adorned with many longitudinal lines or furrows; it is about an inch in length, and is of a greyish colour, and somewhat transparent; the bowels are seen through the skin, and appear at first sight like streaks on its surface; in the middle of the belly

belly there is a remarkable protuberance, which, when closely examined, is found to be a muscular body in form of a spherical bladder; this, when most distended, has the appearance of a spherical air-pump, and has all the properties of that machine, to be employed for the service of the animal, and at its pleasure. It resembles, in its common figure, the cup of an acorn, with the mouth a little contracted. The head of the animal is of the same figure with that of the common leech, and serves to suck the juices of other animals in the same manner as in that insect. The part of the body which reaches from the head to the middle protuberance is of a very irregular form, frequently in motion, and continually changing its figure; but the other part moves more slowly, and less frequently, and preserves its shape unaltered. The protuberance has two motions, expansion and undulation.

When the creature has a mind to fix itself any where, it does it by means of this protuberance, which it applies closely down to the substance, and void of air. Hence the external air so firmly presses its sides against the substance, that it is not easy to remove it. When the creature changes its place, it draws the head round to the protuberance, and loosens it so as to be able to change its place as it has occasion.

When this creature is kept out of water, it dies in a few hours; and when after being thus kept out a few minutes, it is put into sea-water, it immediately darts out a fine green thread from its mouth; this it usually makes of the length of its body, or thereabouts, though it varies it occasionally; and by means of this it suspends its body any length that it pleases in the water. It seems to be calculated only for living in the bodies of fish, for the sea-water soon kills it; and it is observed to diminish its bulk very sensibly all the time that it is kept in it. Phil. Trans. No 410.

HIRUDO, in *Zoology*, a genus of *Vermes*, the body of which is oblong, truncated at both ends, unarmed, and cartilaginous; and the progressive motion is effected by dilating the head and tail, and contracting itself into an arch. Linn. To this essential character it should be added, that the two extremities of the true hirudo are capable of being dilated into a fleshy disk, by means of which it can affix itself firmly to the skin of animals, and the mouth, which is triangular, situated under the anterior part of the body.

This is a genus of aquatic worms, known in England by the name of leech; several of its species inhabit our waters, and two in particular, the common or medicinal leech, and the horse leech, are so well known as to be familiar to every one. The body in the leech tribe is composed of a great number of rings; the skin more or less smooth, and the head, when in a state of contraction, more pointed than the tail; the opening of the mouth is triangular, and armed with three strong teeth, besides a numerous assemblage of smaller ones, and a sucker at the bottom, by the assistance of which it draws the blood from the wound inflicted by this formidable armament of teeth in the flesh of the bleeding animal. The teeth of the leech are powerful enough to penetrate not only through the skin of man, but also that of horses and cattle, examples of which very frequently occur when the latter bathe in the water. The hirudo tribe respire by the mouth. The greater portion of the species are furnished with eyes, the number of which however varies according to the species, being sometimes eight, in others six, and again in others no more than two. Every individual of the leech tribe, like those of the snail, is complete in its own conformation, being, as Redi observes, of both sexes, and often producing their young alive. Their common sub-

sistence is the blood of quadrupeds, and other sanguineous animals which they casually meet with in the water, and which, as they can bear an abstinence of some weeks or even months, they generally find in sufficient abundance. Should it prove otherwise they prey on worms and the larvæ of aquatic insects, which they suck to death, as they subsist only on their fluids, and the small portion of blood the vital parts of some particular kinds afford. The leech swims in the manner of the eel, and some of the species live in salt waters, though the greater number are confined entirely to the fresh waters, some preferring the clear and pure element, and others the stagnant pools and ditches, ponds, and marshes which most abound with aquatic plants. There is only one species (the common kind), that can be applied with safety to medicinal purposes.

Species.

MEDICINALIS. Elongated, blackish, lineated above with yellowish; beneath spotted with yellow. *Hirudo medicinalis*, Ray. *Hirudo major et varia*, Gess. *Medicinal leech*.

Inhabits stagnant ponds and ditches in Europe; the body is composed above of numerous annular wrinkles, which are contractile at pleasure, and marked with variegated lines: mouth smaller than the tail; the last composed of an annular muscle, by which it has the power of fastening its body firmly to any smooth surface. The medicinal virtues of this species as a phlebotomist is well known.

SANGUISUGA. Elongated, olive brown, with an ochre-yellow marginal band. Linn. *Hirudo maxime vulgaris*, Ray. *Horse leech*.

Abundant in stagnant waters; the length from four to six inches; the body above dull olive black or brown; beneath paler, with sometimes a few black spots, and tail thicker than the head. Sucks blood with great avidity and in large quantities.

LINEATA. Elongated and grey, with four dorsal lines disposed longitudinally. Müll.

A rare species, found early in the spring in stagnant waters; the length about an inch and a half; body annulated with numerous wrinkles, and six deep black eyes placed in a double row.

VULGARIS. Elongated, yellow-brown, with eight eyes disposed in a lunate series. Müll. *Hirudo ocellulata*, Bergm. &c.

Length fifteen lines, the body sometimes brown, and without spots; sometimes sprinkled above with yellow dots, or with dots of black, or varied in the middle with a knotty line, and a lateral blackish one; and sometimes yellowish with longitudinal lineations, the middle knotty, and the lateral ones with remote red dots; eyes eight in general, or sometimes nine.

STAGNALIS. Elongated, cinereous, with two eyes. *Hirudo stagnalis*, Linn. *Hirudo bioculata*, Müll.

Body whitish, pellucid, sprinkled with cinereous dots and plaited at the sides; eggs about forty, surrounded by a pellucid circle. The young, after exclusion, adhere by their tails to the abdomen of the parent. Length nine lines.

COMPLANATA. Body dilated, cinereous, with a double tuberculated line on the back; the margin serrated. Müll. *Hirudo lateribus attenuatis*, Hill. *Hirudo sex-oculata*, Bergm.

Length four lines, the body with transverse bands, composed of three pale lines, the margin whitish; body beneath grey; head pointed and white, with six eyes; tail orbicular and cinereous. Found in shallow streams.

HETEROCLYTA. Dilated, pellucid and yellow, with entire margin. *Hirudo heteroclyta hyalina pollice lutca*, Linn. *Hirudo hyalina*, Müll.

Body flattish, the anterior part pointed, posterior rather broad, and marked above with numerous fine longitudinal striæ of black specks, and remote brownish ones; head white, eyes four or six; eggs numerous, spherical, green and surrounded with a pellucid ring; the young that escape first are yellow, the latter green.

GEOMETRA. Elongated, yellowish, with a pinnate white dorsal line. *Hirudo geometra, teres, extremitatibus dilatatis*, Linn. *Hirudo piscium*, Müll. *Hirudo ore caudaque ampla*, Frisch.

Inhabits fresh waters, and fixes itself to the bodies of fishes; eyes four, colours varying.

Inhabits fresh waters, and fixes itself on the bodies of trout and other fish after the spawning season; length eight lines, its progressive motion like the movement of a compass in measuring; body tapering before, and very broad at the tail; eyes four; colour variable.

TESSULATA. Cinereous with a tessellated margin; eyes eight, in a double longitudinal row. Müll.

Length eighteen lines; the body dilated and covered with black specks; above with orange and white spots; beneath grey, with two rounded white spots in the middle. Found in rivulets.

MARGINATA. Dilated, brown, with a tessellated margin, and four eyes. Müll.

Inhabits rivers, and resembles the last; the length ten lines; head obtuse before and narrowed behind, white, pellucid, and marked with two transverse brown bands; abdomen reddish brown with very minute striæ meeting beneath in doubled brown lines; back with five rows of whitish dots, the lateral margin white, with a double brown line divided into square patches; tail orbicular and pale, with brown spots on the margin.

GROSSA. Dilated, yellowish, and divided on the forepart. Müll.

A marine species found sometimes within the shell of *Venus exoleta*; the length about twelve lines, the breadth seven. The body marked with fine white striæ, the anterior part narrower and obtuse; eggs very numerous, spherical, and swimming in a gelatinous fluid.

HIPPOGLOSSI. Dilated, whitish, with a double white eye in the middle of the body. Müll.

Inhabits the sea and infests fishes, being often fixed to the skin of the turbot and holibuts. The body is oval, depressed, pellucid, a little pointed before, and ending in a globular ring behind; head somewhat triangular with a cinereous spot each side; eyes not visible; tail with a row of tubercles beneath from the centre, and towards the middle two hooks.

MURICATA. Body round, tapering, tuberculated, and furnished with two short horns on the head. Gmel.

A marine species that infests fishes, leaving a black mark on the spot to which it adheres; the head is larger than the tail; body strongly annulated and tuberculated on the rings; the tail much dilated.

CRENATA. Slightly depressed, sub-oval, with transverse annular striæ, and crenulated margin. Linn. Transf.

Found in shallow streams among aquatic plants. The colour greenish, inclining to ash, the upper surface somewhat convex; its interanea are very visible by means of its vitreous transparency, and appear like so many granula; eyes two and much approximated.

It appears to us not altogether improbable, that among the numbers of species above described, some few at least will be hereafter found to belong rather to the genus *Planaria*, than that of *Hirudo*.

In the first volume of the Linnæan Transactions Dr. Shaw describes an animal of the mollusca family, under the title of *hirudo viridis*, and which, from a note annexed to another paper, in the same volume of the same work, that author afterwards considered referable to the planaria tribe. The correction of this is material, as some writers, depending on the former authority, still retain it among the hirudines. In the removal of this species to the genus planaria, it will be proper to change the trivial appellation by which it was before distinguished, because another species of planaria, very different from the animal described by Dr. Shaw, has been previously designated by the appellation of *viridis*.

The two kinds of vermes introduced to notice by the Rev. Mr. Kirby, in the second volume of the Linnæan Transactions, under the names of *hirudo alba*, and *hirudo fusca*, are, perhaps, planariæ likewise; nor are we entirely satisfied that the species *crenata*, of the same author, and which is also described in the same paper, is strictly of the hirudo tribe. Mr. Kirby himself suggests the idea, that they may be sufficiently distinct to constitute a new genus. Though we agree with Mr. Kirby in this respect, and are inclined with Dr. Shaw to think, they may with propriety be referred to the planaria genus, we cannot so far assent to the opinion of Dr. Shaw, expressed in the note (p. 320.) as to believe the *H. crenata* to be the young of the Linnæan *hirudo geometra*. This last is delineated in all its states of growth by Roefel under the title of *hirudo piscium*, (t. 3.) and the slightest comparison of these figures, with those of *hirudo crenata* in the Linnæan Transactions, will be sufficient, we imagine, to discountenance such conjecture. There is one distinction, at once so obvious, that we cannot refrain to mention it; this consists in the number of the eyes in the two animals, the *hirudo geometra* possessing no less than four, and the species *crenata* no more than two.

We shall finally direct our attention to the *hirudo branchiata* of the Linnæan Transactions, (vol. i.) a species of vermes, which is not, we believe, assigned with any absolute certainty to the genus at present under consideration: in this respect, at least, it is confessedly ambiguous, and as such, appears to have excited some little curiosity in the minds of continental naturalists. The observations of Bosc, on this particular subject, appear to us rather interesting and worthy of being transcribed, and this, the more especially, since they do not seem to place the account of this singular animal, as originally given by its English observer, in that clear and satisfactory point of view we could wish for, or expect.

“On trouve (says M. Bosc) dans le premier volume des Actes de la Société Linnéenne de Londres, la description et la figure d'une sangsue trouvée sur la tortue de mer, qui a de chaque côté sept branchies rameuses fort saillantes. Il est évident que l'on doit en former un genre nouveau, surtout si ce sont réellement des branchies; mais Mentzies, l'auteur de ce mémoire, n'entre pas dans des détails suffisants pour pouvoir l'affirmer d'une manière positive.” We admit with M. Bosc, that the ingenious writer, to whom we are indebted for the discovery of this curious creature, does not enter so fully into detail as to enable us to ascertain the genus to which it may belong, or rather, we might say, to authorise its removal into any other genus, were we disposed to consider its present situation improper. The conclusion of Bosc, that it does not appertain to the *hirudo* genus, is perhaps too incautiously assumed: the animal, he tells us, has seven “branchies” on each side, and it is upon the supposed existence of these, that he reasons on the propriety of its forming a new genus, though he himself, at the same time,

time, doubts whether the lateral appendages to which he alludes be "branchiæ" or not. The existence of such branchiæ would unquestionably be sufficiently decisive to remove it from the hirudo tribe, since the latter respire by the mouth, but as to the actual existence of such branchiæ it is possible we may misconceive the fact: or indeed the ramose appendages to which he adverts may be truly such, for there is nothing, at least, in the description given by Mr. Menzies, either to support or contradict this idea.

The description of this creature, as given by Mr. Menzies, is briefly as follows: *H. depressa*, attenuata, albida, fetis lateralibus ramosis utrinque 7; interaneis fuscis, bifidis, perlucentibus; or, as may be rendered to the English reader: depressed, attenuated, whitish, with seven ramose bristles each side; intestines brown, bifid, and pellucid: and in the general account accompanying this specific description, these lateral appendages are said to be soft, pellucid, branchy bristles.

Thus it is not apparent, from any observation that has fallen from Mr. Menzies, that these lateral appendages are real branchiæ, or respiratory organs: having stated this, it is fair to add, that the conclusion of Bosc, though not to be assumed from the remarks of its original describer, may be nevertheless accurate, and probably is so. The appearance of the animal, if any confidence can be placed in the delineation, seems to favour this conception. The magnified figure of one of these lateral ramose appendages, as shewn in the plate in particular, accords exceedingly in appearance with the breathing organs of some of the mollusca tribe, as exemplified in various species of the nerides, aphroditæ, and others; and should the animal really possess such breathing organs, its internal organization must be altogether so very different from that of the hirundines, that there can be no doubt of the propriety of instituting a new genus for its reception.

HIRVENSELMI, in *Geography*, a town of Sweden, in Tavastland; 75 miles E. of Tavasthus.

HIRUNDO, in *Ornithology*, a genus of the Passerine order, distinguished by the following essential character. The bill is small, weak, curved, subulate, and depressed at the base; gape larger than the head; tongue short, broad, and bifid; wings long; tail mostly forked.

This genus is divided by some writers into two sections, according to the position of the feet, the first having three toes placed forwards and one behind; the other with all the toes placed forwards; the former are the *swallows*, the other the *swifts* of English authors. In both the nostrils are open, and the legs short.

Most of these birds frequent marshy places, and skim the surface of the ground and water in search of insects, which they catch on the wing with great dexterity, by means of the enormous gape of their jaws. Insects are their peculiar and almost exclusive food, and it is for this reason swallows are regarded with a degree of superstitious tenderness in every country that abounds with noxious creatures of that description. Swallows are equally incapable of bearing the extremes of heat and cold, and on that account, except in very temperate weather, they are oftener seen on the wing in the morning before the heat of the day becomes oppressive, and in the evenings towards sunset than at any other times.

These birds walk indifferently owing to the shortness of their legs, and from the same cause rise off the ground, or any low situation with difficulty; and hence when they go to rest, they almost invariably suspend themselves against the sides of walls or other elevations, from which they are enabled to renew their aerial evolutions with facility.

The annual migration of the swallow has been long the

theme of curious observation among naturalists, and few topics of this kind have met with more ample discussion, or given birth to more extraordinary opinions. The truth, however, is, that the migrations of the swallows, like those of most other birds of passage, may be easily explained, since nature does not in this instance, more than any other, deviate from her ordinary course, and of this we have the most positive assurances both in reason and in fact. Nearly all the species of the swallow-tribe are found in the two great continents, remaining in the northern part during summer, appearing near the equinox in spring, and again retiring to more temperate climates as the autumn approaches. Part remain in hot countries all the year, as in Egypt, Æthiopia, Libya, and the countries between the tropics. They regularly pass alternately across the Archipelago from Europe to Africa, and from Africa to Europe as the seasons change; this is the general progress of all the species of the swallow-tribe that inhabit Europe; and the same course of migration from one part of the world to another is observable in the common swallow, the species whose migrations have excited such very peculiar attention among modern writers as well as those of remote antiquity; we shall enter more fully into the details of this interesting subject under the article SWALLOW.

The hirundo genus, including the swallow and the swift family, contains about forty species, the greater part of which are swallows, the swifts being few in number.

Species.

RUSTICA. Front and chin chestnut; tail-feathers, the two middle ones excepted, with a white spot. Linn. Kram. &c. *Hirundo domestica*, Gefn. &c. *L'Hirondelle de Cheminée*, Briss. *Common or chimney swallow*, Will. Donov. Br. Birds, &c.

The common swallow is an inhabitant of most parts of the globe, being of the migratory kind, and visiting different countries at particular seasons. About the latter end of March it arrives in England, and remains till September, during which intervening period it frequents houses, under the roofs, or in the chimnies of which it usually breeds; the nest is composed of mud, intermixed with chaff, feathers, &c. and contains from four to six eggs of a whitish colour speckled with red. Previously to its departure it assembles in vast flocks on the tops of houses, churches, or other elevations, from whence they all depart in a body with extreme regularity, and as it appears under the directions of particular leaders. Those from Europe pass the winter in Africa, South America, India, and other similar climates, returning again towards the north in spring. Like the rest of its tribe the food of the swallow consists of insects, which it takes on the wing. This hirundo (says an ingenious writer) though called the chimney-swallow, by no means builds altogether in chimnies, but often within barns and out-houses against the rafters. In Sweden she builds in barns, and is called ladu swala, (the barn swallow.) Besides, in the warmer parts of Europe there are no chimnies to houses; and in these countries she constructs her nest in porches, gateways, galleries, and open halls. With us the species breeds in chimnies, and loves to haunt those stacks where a constant fire is kept, no doubt for the sake of the warmth. But then it cannot subsist in the shaft at the bottom of which the fire is burning; it prefers one adjoining, in which it builds its nest about five or six feet below the chimney opening at the top. The nest is constructed of mud mixed with short pieces of straw, in the form of the half of a deep dish, and is lined with feathers and grass, which it catches floating in the air. The address with which

HIRUNDO.

the swallow ascends and descends with security through so narrow a pass is wonderful. When hovering over the mouth of the funnel, the vibration of her wings, acting on the confined air, occasion a rumbling noise like thunder. It is not improbable that the dam submits to this inconvenient situation so low in the shaft, in order to secure her brood from rapacious birds, and particularly owls, which frequently fall down chimnies, perhaps in attempting to get at these nestlings. The first brood of young are hatched the last week in June, or the first week in July. The progressive method by which the young are introduced into life is very amusing; first they emerge from the shaft with difficulty enough, and often fall down into the room below; for a day or two they are fed on the chimney top, and then are conducted to the dead leafless bough of some tree, where, sitting in a row, they are attended with great assiduity, and may then be called porchers. In a day or two more they become flyers, but are still unable to take their own food, therefore they play about near the place where the dams are hawking for flies, and when a mouthful is collected, at a certain signal given, the dam and the nestling advance rising towards each other, and meeting at an angle, the young one all the while uttering a quick note of gratitude and complacency. All the summer long is the swallow a most instructive pattern of unwearied industry and affection, for from morning to night while there is a family to be supported she spends the whole day in skimming close to the ground, and in the most sudden and lively evolutions. Avenues and long walks under hedges, and pasture fields, and mown meadows where cattle graze, are her delight, especially if there are trees interspersed; because in such places insects abound. The swallow is the first to announce the approach of birds of prey to the house martin and other little birds, warning them of danger by its shrill alarming note, and associating them in a body to pursue and buffet the intruder. The swallows drink as they fly sipping the surface of the water, and in hot weather are often seen dropping into the water many times together, to wash and cool themselves. The song of this bird is very pleasing.

The swallow, though generally regarded in most countries with a kind of superstitious veneration for its utility in destroying pernicious insects, is in Italy and some other parts esteemed a bird of chase, and the hunting of them at particular seasons a favourite diversion. The flesh is considered as a delicacy little inferior to that of the ortolan.

TAHITICA. Blackish-brown with a purple gloss above; front and neck beneath purple-tawny; belly and vent sooty; tail, bill, and legs black. Gmel. *Otaheite swallow*, Lath. Length five inches; the bill black; irides brown. Inhabits the mountainous parts of Otaheite.

ESCULENTA. All the tail-feathers with a white spot. Osbeck. *Hirundo riparia Cochinchinensis*, Briss. *Hirundo nidis edulibus*, Bont. *Apus marina*, Rumpf. *Salangane*, Buff. *Esculent swallow*.

The esculent swallow is said to be less than the wren, and only two inches and a quarter in length; the bill black; irides yellow; upper part of the body brown; the under whitish; tail forked, with each of the feathers white at the tip; and the legs brown. This description was taken by Brisson from a drawing of the bird by Mr. Poivre, the figure of which is repeated in the ornithology of Brisson. Mr. Marsden, however, describes the bird to be about the size of the common martin, and Dr. Latham, when he published his Synopsis, was inclined to think the bird at least of that size; this he was induced to believe from the size of the eggs which accompany the nest of the esculent swallow,

now in the British Museum, and which are as large as those of the martin, and of the same colour.

The nests of these birds, in shape resembling a lemon cut down the middle, and composed of gelatinous substances alone, render the species worthy of particular curiosity; the nest itself being not only edible, but considered as one of the greatest delicacies of the table by the luxurious Asiatics. This nest, the weight of which is about half an ounce, adheres by one side to the rock. Authors differ greatly as to the materials of which it is composed; Osbeck and others imagine it to consist of sea-worms of the mollusca order: Forrester conceives it to be the sea-qualm, a sort of cuttle-fish found in those seas, or a glutinous sea-plant, called agal-agal. Or it has been again supposed they rob other birds of their eggs, and apply the white of them to that purpose. The fabrication of these nests is very obvious, being composed of several concentric layers, which are seen distinctly when the nest is broken transversely. These nests are found in vast numbers in certain caverns in the various islands of the Soolo Archipelago, situated between the longitude 117° and 120° , and latitude 5° and 7° ; particularly in three small islands, or rather rocks, in the caverns of which the nests are found fixed to the sides in astonishing numbers. They are also found in amazing quantities on a small island called Toë, in the straits of Sunda; the caverns of which are lined with the nests; but no where in greater abundance than about Croëe, near the south end of Sumatra, four miles up a river of that name. But they are not peculiar to the above places; for they are likewise common from Java to Cochinchina on the north, and from the point of Sumatra west, to New Guinea on the east; where the sea is said to be covered with a viscous substance, like half-melted glue, and which some suppose the birds either take up from the surface by means of the bill during flight, or pick up from the rocks when left there by the waves.

The nests are of two colours, the one whitish, the other black, and apparently dirty. The whitish kind is perfectly clear, and is applied to the purposes of thickening broths, and ragouts made of chickens, and to which they contribute, it is said, an exquisite flavour. These nests are first soaked in water to soften, are then pulled to pieces, and, after being mixed with ginseng, are put into the body of the fowl. The whole is then stewed in a pot with a sufficient quantity of water, over a fire of coals all night, and the morning following it is fit to be eaten. The best nests are of a pure yellowish white, and half transparent, and these sell in China from one thousand to fifteen hundred dollars the *pekul*, a weight equal to about 123lbs. English. Those of a black colour being dirty, are worth but about twenty dollars the *pekul*, being serviceable only in making glue. The gatherers take all they can, in the hopes of compelling the birds to make fresh nests, and thus render their next gathering more profitable. The Dutch alone are said, a few years ago, to export from Batavia a thousand pekuls of these nests every year, the whole of which are brought from the isles of Cochinchina, and those lying to the eastward. At Sumatra the bird is known by the name of *layong-layong*.

The above-mentioned nests, (examples of which occur pretty frequently in the cabinets of the curious,) are supposed to belong to the bird described by Brisson, but of this we are not entirely assured: it was before observed, that the bird described by Marsden was far superior in size to that mentioned by Brisson, and from the recent observations of writers, it does really appear these nests may be the fabrication of some other bird with which we are at present unacquainted. The idea entertained by sir George Staunton, (Emb. China) seems to be that these nests may be the produce

HIRUNDO.

duce of more than one species of swallow, and this opinion is extremely plausible, though it must be at the same time admitted the subject is too much enveloped in obscurity to authorize that conclusion. In confirmation of the suggestion we may add that it is not long since another sort of swallow, very different from that recorded by Brisson, was brought, with the nest, as the excellent swallow of the Indies, to Sir Joseph Banks; and which in size agreed much better with that described by Marston, than the bird designed by Poivre. An account of this newly observed kind is inserted in the second Supplement of Dr. Latham's work: its size is equal to that of the common swallow; the beak small and black, and the opening ample: the whole of the plumage above is glossy black; beneath ash; wings long; tail forked, with all the feathers rounded at the tip; and the legs blackish.

BORBONICA. Blackish fuscous, beneath grey, varied with longitudinal brown spots; tail equal; bill and legs black. Gmel. *Grande hirondelle*, &c. Buff. *Wheat swallow*.

Size of the swift; the bill black, and the tail even at the end. Inhabits the isle of France, where it is known by the name of hirondelle des blés, or wheat swallow, from its frequenting places newly sown with that grain, and feeding on it. The species also feeds on insects, in quest of which it often follows herds of cattle, and relieves them from these winged tormentors, by devouring them. The female lays two eggs, of a grey colour, dotted with brown; the nest is composed of straw and feathers. There is a variety of this bird having the three outer tail-feathers whitish at the tips.

FRANCICA. Blackish, beneath and rump whitish or grey. Gmel. *Hirondelle de Bourbon*, Buff. *Grey-rumped swallow*, Lath.

Length four inches and a quarter; inhabits the isle of France, but is not common, and is found chiefly in the neighbourhood of fresh waters.

AMERICANA. Blackish fuscous, glossed with blue and green; beneath whitish; rump and vent rufous; quill-feathers whitish within; tail equal. Gmel. *Hirondelle à queue rousse et queue carrée*, Buff. *Rufous-rumped swallow*, Lath.

Inhabits about the river Plata, in South America; length six inches and a half. A variety of this bird has the throat rufous.

URBICA. Blackish; beneath white; tail-feathers without spots. Scop. &c. *Hirundo minor s. rustica*, Briss. *Hirundo agrifolia*, Gess. *Petit martin*, Buff. *Hausfchwalbe*, Frisch. *Martin, martinet, or martinet*, Willd. *Donov. Br. Birds*, &c.

This species is more frequent than the common swallow; the length five inches and a half; its bill black; mouth yellow; rump white; and legs covered with short white down. This bird is equally common throughout most parts of Europe, and extends over great part of America; it builds under the eaves of houses, but not in chimneys, like the common swallow. It lays twice in the year, from five to three, or only two eggs, the colour of which are white, with the broader end rather dusky.

PANAYANA. Black; beneath white; frontal spot and chin rufous yellow; collar black. Gmel. *Hirondelle d'Anrique*, Sonner. *Panayan swallow*, Lath.

The size of the sand martin; bill black; wings and tail of equal length; the legs black. Inhabits the island of Panay, one of the Philippines.

RUPA. Shining black; beneath rufous; front whitish. Gmel. *Hirondelle à ventre roux de Cayenne*, Buff. *Rufous-bellied swallow*, Lath.

CAPENSIS. Blackish-blue, beneath yellowish, with black-

ish streaks; cap rufous; lateral tail-feathers with a white spot. Gmel. *Hirondelle au capuchon roux*, Buff. *Cape swallow*.

Native of the Cape of Good Hope; the length seven inches; bill half an inch in length, and black; the legs dusky. It is said to build its nest in houses against the ceilings, the form rounded with a cylindrical entrance, the exterior substance mud, with an inner lining of feathers. The female lays four or five eggs, which are speckled.

RIPARIA. Cinereous; chin and belly white. Linn. *L'Hirondelle de rivage*, Briss. *Hirundo riparia*, Aldr. *Sand martin, or Shore-bird*, Will. *Donov. Br. Birds*, &c.

Inhabits sandy places in Europe and America; the length four inches and three quarters; bill blackish; legs blackish, and feathered behind. The female lays from five to six eggs, of a clear white colour, either in a nest, which it builds of dried fibres, straw, and feathers; or in hollows of trees, or cavities in the sand, and sometimes in the steep shores of lakes and rivers.

RUPESSTRIS. Mouse-colour, beneath whitish; tail subequal, the feathers with a white spot on the inner web. Scop. *Rock swallow*.

Makes its nest of clay in the hollows of rocks, and inhabits Carniola. Size of the common martin.

MONTANA. Mouse colour, beneath rufous; quill and tail-feathers grey brown, edged with rufous, the latter, except the middle and outer ones, with a white spot within. Gmel. *Hirondelle grise des rochers*, Buff. *Cragg swallow*, Lath. *Mountain swallow*.

Inhabits the mountains of Auvergne and Dauphiné, and also those of Savoy, arriving at the latter about the middle of April, and departing in the middle of August. The length is five inches and a half; the bill black; legs covered with grey down and mixed with brown, claws black.

PURPUREA. Entirely violet; tail forked, Kalm. *Hirundo apus Carolinensis*, Briss. *Purple martin*, Catelb. *Purple swift*, Arct. Zool. *Purple swallow*, Lath.

Length seven inches and three quarters; bill black; legs and claws blackish; the plumage of the male richly glossed with purple, that of the female dusky brown. The species passes the summer in Carolina and Virginia, retiring to warmer climates at the approach of winter.

SCIBIS. Blueish black; beneath and mouth whitish-ash. Gmel. *Hirundo freti Hudsonis*, Briss. *Hirondella de la Baie d'Hudson*, Buff. *Great American martin*, Edw. *Hudson's Bay swallow*.

Rather larger than the swallow; bill black; quills, and forked tail blackish edged.

SENEGALENSIS. Shining-black; beneath and rump rufous. Gmel. *Grande hirondelle à ventre roux du Senegal*, Buff. *Senegal swallow*.

Length eight inches and a half; the bill black and dusky; rufous on the throat, and under the wings palest. Native of Senegal.

AMBROSIACA. Greyish brown; bill blackish; legs fuscous. Gmel. *Hirundo riparia senegalensis*, Briss. *Hirondelle ambrée*, Buff. *Ambergris swallow*.

Size of a wren; the length five inches and a half; bill half an inch long and black; tail very forked; the legs black. According to Seba the species is said to emit a powerful scent, resembling that of ambergris. The species inhabits Senegal. There is a variety of this species, the plumage of which is pale ash, beneath paler.

FASCIATA. Black; transverse band on the belly and spot on the outer part of the thighs white. Gmel. *Hirondelle à ceinture blanche*, Buff. *White-bellied swallow*, Lath.

L. Inhabits

HIRUNDO.

Inhabits near rivers in Cayenne and Guiana: the length six inches.

TAFERA. Tail-feathers equal; body blackish, beneath white. Gmel. *Hirundo Americana*, Briss. *Tapera*, Sloane, Maregr. &c. *Tapere*, Buff. *Tapera swallow*.

Length five inches and three quarters; the bill black; throat and breast grey brown; quill and tail-feathers blackish brown; tail slightly forked; legs brown. Brisson describes the species as a native of Brazil and Cayenne, and Sloane as an inhabitant of Jamaica, being a bird of passage, and remaining on the island six months of the year.

TORQUATA. Brown, beneath white; tail even; pectoral band brown; between the bill and eyes a white spot. Gmel. *Hirondelle brune et blanche à ceinture brune*, Buff. *Brown collared swallow*.

Native of the Cape of Good Hope. Length eight inches.

LEUCOPTERA. Cinereous glossed with blue and green, beneath, rump, and wings waved with white. Gmel. *Hirondelle à ventre blanc de Cayenne*, Buff. *White-winged swallow*.

Length four inches and a half to five inches; the bill black; wings longer than the tail; quill and tail-feathers brown, glossed with blue and green; the legs pale. A variety of this species is also found, the plumage of which is brown above, beneath spotted with brown. These birds inhabit the marshes of Savannah.

PELASGIA. Tail-feathers equal, naked and subulate at the tip. Gmel. *Hirundo cauda aculeata americana*, Kalm. *Hirundo Carolinensis*, Briss. *American swallow*, Catelby. *Aculeated swallow*, Arct. Zool.

There are two distinct varieties of this species. In one of which the throat is whitish and spotted with rufous, in the other the rump is grey, and the throat grey tinged with rufous. The first inhabits Carolina and Virginia, the other Louisiana; the common occurs in Cayenne. The length is four inches and a quarter, and it builds in chimneys like the common swallow.

ACUTA. Black, beneath brown; tail-feathers naked, and subulate at the tip. Gmel. *Hirondelle noire acutipenne de la Martinique*, Buff. *Acute tailed swallow*.

A small bird not exceeding the size of the common wren. This species is found in Martinique.

PACIFICA. Brown-black; throat and rump blueish-white. *L'Hirondelle brune de la Nouvelle Hollande*, Sonn. *Pacific swallow*.

Native of the islands in the Pacific ocean.

CAUDACUTA. Blackish; front white; wing-coverts varied with white; caudal feathers pointed at the end. *Hirundo caudacuta*, Lath. *L'Hirondelle acutipenne de la Nouvelle Galle*, Viel. *Sharp-tailed New Holland swallow*.

Inhabits New Holland. Size twice that of *Hirundo acuta*.

DAURICA. Blue, beneath white; temples and rump ferruginous. Gmel. *Hirundo alpestris*, Pallas. *Daurian swallow*.

Inhabits the Alpine parts of Siberia, and builds an hemispherical nest in the clefts of the highest rocks. Its size exceeds that of the common swallow; the temples are ferruginous; primary quill-feathers blackish, the tips obtuse with a brown streak; the first long; outer tail-feather twice the length of the rest; vent pale-ash. the feathers black at the tip.

ERYTHROCEPHALA. Dusky black, the feathers edged with white; beneath white; the head red. Gmel. *Red-headed swallow*, Lath.

Size of the least humming bird. Inhabits India.

AONALASHKENSIS. Black; beneath cinereous; rump whitish. Lath. *Aonalashka swallow*.

Inhabits Aonalashka. Length four inches and a half.

INDICA. Fuscous, beneath whitish; greater part of the head rufous. Gmel. *Rufous-headed swallow*, Lath.

Native of India. The length is four inches; some of the wing-coverts edged with white; quill-feathers longer than the tail; bill dusky brown; legs dusky.

NIGRA. Entirely black. Gmel. *Hirundo apus dominicensis*, Briss. *Petit martinet noir*, Buff. *Black swallow*.

The length of this bird is near six inches; the bill black and half an inch long; the tail is forked; and the wings longer by nearly an inch and a half. This species inhabits dry places in the interior of South America, and is not numerous. For the reception of its nest it digs a deep hole in the earth, about half a foot in length, with a long entrance rising to the surface, the opening of which is so very small as only just to permit its entrance. Buffon describes two varieties of this bird, one of which has a white stripe in front, and the other entirely blackish grey.

DOMINICENSIS. Black, with a steel gloss; abdomen white. Gmel. *Grand martinet noir à ventre blanc*, Buff. *St. Domingo swallow*.

Size of the chimney swallow; the bill and legs brown. This species inhabits the West Indian islands during the months of May, June, and July. Its song resembles that of the lark.

PERUVIANA. Black, beneath white; band on the belly pale ash-colour; quill and tail-feathers pale grey, edged with yellowish-grey. Gmel. *Hirundo Peruviana major*, Briss. *Peruvian swallow*.

Native of Peru. The eyes black, surrounded by a brown circle.

CINEREA. Black, beneath cinereous; quill and tail-feathers cinereous, edged with yellowish-grey. Gmel. *Petit hirondelle noire à ventre cendré*, Buff. *Ash-bellied swallow*, Lath.

Less than the common swallow, and inhabits Peru and Otahite. A supposed variety entirely blackish-grey, with the wings longer than the tail, is found in Louisiana.

CHALYBEA. Black with a steel gloss, beneath white; wings and tail black; bill and legs brown. Gmel. *Hirundo Cayensis*, Briss. *Hirondelle de Cayenne*, Buff. *Chalybeate swallow*.

A constant inhabitant of Cayenne throughout the year, and is frequently seen perched on fallen or decayed trees, in the hollows of which it lays its eggs, without the trouble of composing a nest. The length of the bird is six inches; the bill three quarters of an inch long, rather stout, and with the legs brown.

VIOLACEA. Black-blue tinged with violet; greater quill-feathers within, the bill and legs blackish. Gmel. *Hirondelle bleue de la Louisiane*, Buff. *Violet swallow*.

Length eight inches and a half; bill three quarters of an inch and black; the legs black. Inhabits Louisiana.

JAVANICA. Blue-black; front, throat, and fore part of the neck, ferruginous; beneath and rump ash; tail black, the feathers, except the two middle ones, with a white spot each side. *Hirundo Javanica*, Sparrman, &c. *Java swallow*.

About the size of the chimney swallow; the bill and legs black. Inhabits Java.

BICOLOR. Black glossed with blue; front, fore part of the neck, and flank, red-brown; throat fawn colour. *L'Hirondelle noire et fauve*, Sonnini.

Native of America; size of the chimney swallow, and rather longer; the wings and tail edged with greyish-white; the breast grey-brown; middle of the belly and the under

COVERTS

coverts of the tail whitish; tail forked; bill and legs black. The male birds vary in the colour of the plumage, beneath being more or less whitish, tawny or reddish. The colours of the female are more obscure.

CERULEA. Blue, glossed with violet, green, and coppery; front, cheeks, throat, and under parts of the neck, reddish; tail with a crescent-formed band of white. *L'Hirondelle bleue et rouge*, Sonnini.

A new species lately found in Guiana; the length six inches and a half; the bill half an inch; between the neck and breast a blue collar.

**** Toes all placed forwards.** Swift.

APUS. Blackish; chin white. *Hirundo apus*, Linn. *Martinet noir*, and *grand martinet*, Buff. *Mauerfchwabe*, Frisch. *Black martin or swift*, Ray. Will. *Donov. Br. Birds.*

The male of this well known species is about eight inches long, the female rather less; the whole plumage of the former sooty black, except the chin, that of the female more inclining to brown, and the spot on the chin obscure. The swift, from its length of wing, flies well, but its feet are so small that it rises from the ground with great difficulty; its walking also is attended with inconvenience from the same cause, and it rests chiefly by clinging to the sides of walls, and other similar situations. It builds under the eaves of houses, or in steeples, towers, and other lofty buildings; and generally lays five eggs, the colour of which is white, and the form somewhat elongated. The food of these birds consists of insects. They are inhabitants chiefly of the European continent, though sometimes noticed in America. This is the only kind of swift found in Britain.

MELBA. Brown; chin and belly white. *Hirundo melba*, Gmel. *Hirundo major Hispanica*, Briss. *Hirundo riparia maxima*, Klein. *Hirundo Alpina*, Scop. *Grand martinet à ventre blanc*, Buff. *Greatest martin or swift*, Edw. *White bellied swift.*

Length eight inches and a half; the bill black; collar grey-brown varied with blackish; wings and tail glossed with red and green; breast white; lower part of the belly grey-brown; legs flesh-colour, and downy in front. Inhabits the mountainous parts of Spain, and other countries in the south of Europe. It flies higher than the common swift, and, like that species, feeds on insects.

CAYENNENSIS. Blackish-violet; head black; collar two-cleft, band of the eyes, and the thighs white. Gmel. *Martinet à collier blanc*, Buff. *White collared swift.*

Native of Cayenne, where it builds its nest in houses. The nest is large, long, and conic, the greatest breadth five inches, and the length nine inches; it is composed of down well woven together, and the cavity divided obliquely down the middle by a partition which extends over that part of the nest in which the eggs are disposed. The length of this bird is five inches and a quarter.

SINENSIS. Brown, beneath reddish grey; crown pale rufous; eye-brows brown; chin and eye-lids white. Gmel. *Grand martinet de la Chine*, Sonner. *Chinese swift.*

Inhabits China; length eleven inches and a half; bill, irides, and legs blue-grey.

HIRZHOLMEN, or HERTZHOLM, in *Geography*, three small islands of Denmark, lying in the Cattgat, chiefly inhabited by fishermen; 4 miles N.E. of Fladstrand. N. lat. $57^{\circ} 31'$. E. long. $10^{\circ} 24'$.

HISCAR CHADUMAN, or Hifaree, a town of Great Bucharia; 60 miles N.N.E. of Balk.

HISCHERE, two small islands among the Hebrides. N. lat. $57^{\circ} 37'$. W. long. $7^{\circ} 40'$.

HISHOLT, a town of Sweden, in the province of Smaland; 20 miles S.E. of Helmfladt.

HISINGEN, a small island in the North sea, situated near the coast of Sweden, at the mouth of the Gotha, about 16 miles long and six broad, containing seven parishes. The town of Gotheborg was first built on this island. N. lat. $57^{\circ} 45'$. E. long. $11^{\circ} 48'$.

HISMO, a town of Albania, at the mouth of a river; 16 miles N.N.E. of Durazzo.

HISPA, in *Entomology*, a genus of Coleoptera in the Linnæan system, having the antennæ cylindrical, approximate at the base, and feated between the eyes; feelers fusiform; thorax and wing-cases often spinous, and usually toothed at the apex.

The four species of the hispa tribe, known to Linnæus, were *atra*, *testacea*, *sanguinicollis*, and *mutica*, the last of which was not however then considered as appertaining to that genus, being referred by Linnæus to the Dermestes family, under the specific name of *clavicornis*. Geoffroy describes the species *atra* as a native of France, and this he places with his *crioceris*, the genus formed by that writer of the oblong chrysomeleæ; but from which, on close inspection, the true hispæ will be found to differ rather considerably in the structure of the antennæ, and some other less essential particulars. No material progress was made in the knowledge of the species composing the hispa genus till the time of Fabricius, that writer having described and brought together in one view, from the cabinets of Rohr, Bosc, Paykull, and Hunter, no less than 12 species, including the four already mentioned. In the first instance Fabricius included more, several new kinds being united by him with the true hispæ, which, on mature deliberation, he conceived it proper to separate, and divide into two new genera; and thus it happens, that the *Ptilinus* and *Melasis* of his last works are hispæ of the former. This observation will serve to explain, in an obvious manner, the cause of that discordance which prevails between the works last noticed, and the Gmelinian edition of the *Systema Naturæ*; the latter containing, under the genus hispa, a further number of Fabrician species, than the "*Entomologiæ Systematicæ*" of that author, or any of his later works, in which *Ptilinus* and *Melasis* are considered separately. Thunberg has added some new species to the hispæ tribe, and these augmentations have increased the number to nearly twenty species.

The genuine hispæ, according to Fabricius, have cylindrical antennæ; feelers equal, filiform, and thicker in the middle; jaws bifid, and lip horny and entire. *Ptilinus* has the antennæ flabelliform; feelers four, and somewhat equal; jaws short and bifid; and the lip membranaceous and sub-emarginate. In *Melasis* the antennæ are flabelliform, as in *Ptilinus*, but the feelers (four in number) are clavated, with the extreme joint ovate, and the lip membranaceous and entire.

Most of the hispa genus are natives of extra European climates; those found in Europe occur in the winged state on the leaves and roots of different kinds of grass; their larvæ and transformations are unknown.

Species.

ATRA. Antennæ fusiform; thorax and wing-cases spinous. Linn. *Crioceris tota atra*, Geoff.

Found at the roots of grass in Europe.

TESTACEA. Antennæ fusiform; body testaceous; antennæ and eyes black. Linn.

An African species; spines on the thorax lateral, on the wing-cases scattered, the whole black.

BIFUSTULATA. Antennæ ferrated; body hairy, and black; wing-cafes with a rufous spot at the bafe. Fabr.

Native of Italy.

MUTICA. Antennæ hairy; body black; wing-cafes striated. Linn.

Inhabits Europe.

SANGUINICOLLIS. Antennæ fuliform; thorax and bafe of the wing-cafes fanguineous; wing-cafes ferrated. Linn.

An American fpecies; wing-cafes ferrated at the tip with three elevated ftriæ, and the intermediate fpaces punctured.

SERRATA. Antennæ fuliform; body black; wing-cafes pale rufous, ferrated and black at the tip. Fabr.

Native of Surinam; thorax black with rufous fides; wing-cafes ftriated.

DENTATA. Antennæ fuliform; body black; margin of the thorax yellow; wing-cafes ferrated, with a yellow spot at the bafe, and a band in the middle. Fabr.

Head, with the antennæ black; thorax black except the fides; breaft and bafe of the abdomen yellow. Inhabits Cayenne.

ANGULATA. Antennæ fuliform; body yellow; head, dorsal line on the thorax, and finate margin of the wing-cafes black. Fabr.

Native of Cayenne. Head and antennæ black; wing-cafes grooved, truncated, and toothed at the tip; body beneath ferruginous.

EMARGINATA. Antennæ fuliform; body black; wing-cafes with a rufous spot at the bafe, the tip bidentated. Fabr.

Size of the preceding; head rufous; eyes globular, and with the antennæ black; wing-cafes with three raifed lines, tranfverfely grooved; body beneath palifh; legs black; thighs pale at the bafe. Inhabits Surinam.

SERRATICORNIS. Antennæ ferrated, and compressed at the bafe; body black; margin of the thorax, and spot at the bafe of the wing-cafes yellow. Fabr.

Inhabits Surinam, and refembles the laft. The head is whitifh; crown black; wing-cafes grooved, with a fingle raifed line in the middle, and three-toothed at the tip, the middle tooth larger, rounded, and ferrated; breaft and bafe of the thighs white.

BIDENS. Ferruginous; thorax with a black lateral line; tip of each wing-cafe armed with a fingle tooth. Fabr.

Size of the laft; head ferruginous; eyes black; wing-cafes grooved with a double row of dots between each furrow. Native of Surinam.

NIGRICORNIS. Glabrous and fcarlet; antennæ black. Fabr.

Native of the Cape of Good Hope.

BIHAMATA. Unarmed, black, fotted with red; wing-cafes truncated and hooked. Gmel.

Oblong, depressed, and inhabits India.

CORNUTA. Entirely black; anterior and posterior part of the thorax spinous; wing-cafes with longitudinal raifed lines. Thunb.

Inhabits Sweden.

CAPENSIS. Pityh and hispid; thorax with a palmated spine. Thunb.

Found at the Cape of Good Hope.

SCABRA. Entirely black; thorax and wing-cafes with a ferrated fringe at the edge. Thunb.

Inhabits Sweden.

SERRATULA. Brown; antennæ ferrated; wing-cafes ftriated. Thunb.

Inhabits Upfal.

HISPALIS, SEVILLE. in *Ancient Geography*, a town of Hispandia, on the Bætis, which was one of the moft confider-

able towns in Bætica. This city was ancient even in the time of Strabo, Pomponius Mela, Pliny, and Ptolemy, all of whom have mentioned it. Its foundation has been attributed to Hercules, to Bacchus, to the Hebrews, the Chaldeans, and the Phœnicians. When it became a Roman colony, it was much frequented on account of its commerce. It had the furname of Romulensis and the title of Conventus. The changing of the name Hispalis, which fome aferibe to a prince of that name, but which is more probably derived from Spila, or Spala, a Phœnician word fignifying a plain, or verdant country, into that of Colonia Romula, which it bears on i.s medals, is aferibed to Julius Cæfar by Ifidore. Julius Cæfar, according to him, founded Hispalis; and from his name, joined to that of Rome, it was denominated Julia Romula. Many of the medals of this town exhibit traces of the bafeft adulation with regard to Augullus; as his head is adorned with the attributes of the fovereign of univerfal nature. Thofe of Julius are of a fimilar kind. On fome Tiberius appears on one fide, and on the other Germanicus and Drufus, whom he had adopted. See SEVILLE.

HISPANIA, in *Ancient Geography*, an extenfive country, forming a kind of peninfula in the S.W. of Europe, and comprehending Hispandia Tarragonenfis, Lufitania, and Bætica. It lay between 36° and 43° 46' 37" N. lat., and between 8° and 21° E. long. from Ferro. It was bounded on the N. by the bay of Bifcay and the Pyrenean mountains; on the E. and S. by the Mediterranean fea; and on the W. by the Atlantic ocean. The greateft breadth of this peninfula, from N. to S., is 550 miles, and its length 660 on the parallel of 42° N. lat. Spain, or a confiderable part of it, was anciently called *Iberia*, (which fee,) and *Celiberia*, (which fee,) from the Celte and Iberi, two tribes of barbarians fettled on the banks of the Ebro (fee *CELTIBERIAN*); Hefperia, from its fituation, being the weftern province of the Roman empire, of Europe, and of the Continent; and alfo Hispandia, probably from the oriental *ἵσπ*, "Span," or "Sphan," concerning the meaning of which there is fome difference of opinion. Bochart fays that Span fignifies a rabbit, and that this name was given to the country becaufe it was found to abound with thefe animals. Others, however, allege, that the proper fignification of the oriental Span is fomething concealed, or far from view; and fuch, it is alleged, was the fituation of Hispandia with regard to the Phœnicians. Moreover, as the northern region was remote and concealed with regard to the fouth, Span was ufed to denote the north. This appellation, it is faid, was given to it by the Phœnicians, as a remote or concealed country with refpect to the farther extremity of the Mediterranean; and as they approached it along the coast of Africa and towards the ftrait, they alfo might juftly call it, with regard to themfelves, the northern country. Before the Carthaginians made any conquets in Spain, the country muft have been divided into various petty independent kingdoms; and during this early period, the Phœnicians, who were probably the firft people who came hither by fea, planted feveral colonies along the fouthern coasts, in Turdiantia, a diftrict of Bætica; and afterwards fome Grecian adventurers from Marfeilles crossed the gulf of Lyons, and fettled near the N.E. extremity of the country. After the Carthaginians had fubjected it to their dominion, it was partitioned into provinces, the number of which cannot now be afcertained. However, they eftablifhed colonies on the fouth coast, E. of the ftrait of Gibraltar. The firft divifion which the Romans made of that part which they reduced, was into Hispandia Citerior and Hispandia Ulterior, which were governed fometimes by prætors, and fometimes by proconfuls. This divifion took place, as Livy informs us, immediately after

HISPANIA.

after the conclusion of the second Punic war. In the beginning of the Macedonian war, the two provinces were united; but they were again separated in the consulate of Q. Ælius Pætus and M. Junius Pennus. This last distribution of Spain continued till the reign of Augustus, who divided Hispania Ulterior into the two provinces of Bætica and Lusitania, and affixed the name of Provincia Tarraconensis to Hispania Citerior. This latter province, so called from its principal city, comprehended nearly three-fourths of modern Spain, and was separated from Bætica and Lusitania by an imaginary line supposed to extend from the gulf of Carthagera to the conflux of the Agueda and Douro, on the confines of Portugal. Bætica, so called from the river Bætis, was a small province along the coast, on either side of Fretum Herculeum, from the gulf of Carthagera to the mouth of the Anas; and, in general, included the provinces now called Granada and Andalusia. The division, introduced by Augustus, remained as long as the Romans had any power in Spain. (See BÆTICA, LUSITANIA, and TARRACONENSIS.) The most noted rivers in Hispania were the Minius or Minho, Lethe or Lima, Durius or Douro, Tagus or Tajo, Anas or Guadiana, Bætis or Tartessus or Guadalquivir, Singulis or Xenil, Terebus or Tader or Segura, Suco or Xucar, Iberus or Ebro, Sicoris or Segre, Rubricatus or Lobregat, Sambroca or Ter; and its principal bays were the Suconensis sinus or bay of Valencia, Illicitanus sinus or bay of Alicante, Virgitanus sinus or gulf of Carthagera, Gáditanus sinus or bay of Gibraltar, Magnus Portus or bay of Corunna, commonly called the Groine, and Cantabricus sinus or bay of Biscay. Its chief mountains, capes and promontories, as well as towns, will appear under their proper heads, and under the title SPAIN.

As to the history of Hispania, it is hardly necessary to observe, that the Spaniards trace their origin from Tubal, the fifth son of Japhet, who is said to have reigned in Spain from the year of the flood 143 to 258; and that from him they pretend to give a series of monarchs down to three Gerjons, who were killed by the Egyptian Hercules, and of some other invaders from Libya, as far as the time in which they allow the Celtes to have made their first entrance into Spain, in the year of the flood 1350. According to this fabulous account, Spain had been a monarchy, and had lasted 1226 years before the arrival of the Celtes. But dismissing these fables, we shall begin the history of Spain with the arrival of the Celtes in this country, which is said to have taken place in the year 1649 B.C. These people crossed the Pyrenees, and after a contest with the Iberians, as the native Spaniards were called, formed an alliance with them, and by intermarriage they became one people, under the name of Celtiberians. After an interval of about 20 years, the Rhodians came hither by sea, and settling at the foot of the Pyrenean mountains, built a city, to which they gave their name; but which has long since been reduced to ruins. At this time the mines of Spain yielded great quantities of silver; accordingly Aristotle informs us, that the Phœnicians visited this country in the 9th century B.C. to exchange their naval commodities for this metal; and they are supposed to have settled in Bætica and to have built several cities. Eusebius, in his Chronicon, sub Ann ante Chr. 840, mentions several nations, besides Tyrians, Egyptians, and Phœnicians, who made settlements in Spain; such were the Milefians, Cariii or Carians, Lesbians, and Phocians. Nebuchadnezzar also, after the destruction of Jerusalem and conquest of Judæa, is said, by Josephus and Strabo, to have reigned in Spain nine years; at the end of which period, it is affirmed, that he abandoned it to the Carthaginians. (See CARTHAGINIANS.) It is probable,

however, that most, if not all, of these nations, contented themselves with maritime situations, for the advantage of commerce and the command of the sea; and that they penetrated but a little way into the country; while the natives might enjoy their own laws and government, and be glad to trade and barter with them, and feel little solicitude who were masters of the sea-coasts and parts adjacent, provided they could obtain the benefits of commerce with them, and enjoy the produce of their own lands, in peace and tranquillity. The Carthaginians, after many severe contests with the Romans, were dispossessed by the Scipios, and as soon as they became masters of this rich and productive country, or at least of a considerable part of it, they directed their chief attention to its valuable mines, particularly those of silver and gold; and it is said, that Scipio, upon his return to Rome, carried with him 14,342 pounds of silver, besides an immense quantity of coin, cloaths, corn, arms, and other valuable effects. L. Lentulus is said to have brought away 44,000 pounds of silver, and 2550 pounds of gold, besides the money which he distributed among his military followers. L. Manlius carried with him 1200 pounds of silver, and about 30 of gold. Corn. Lentulus, after having governed the Hither Spain two years, possessed himself of 1515 pounds of gold, and of silver 2000, besides 34,550 denarii in coin, whilst his colleague brought from Further Spain 50,000 pounds of silver. It was this prodigious wealth, supplied by the country, which was still thought to be unexhausted, that invited the northern nations many centuries after, to make incursions, and to drive the Romans out of it. (See GOTHS and VANDALS.) Learning, and the liberal arts, if Strabo (lib. iii.) may be credited, began to flourish at an early period in this country; for he tells us, that the Turdetani, a people of Bætica, were very celebrated in this respect, and were possessed of a vast number of volumes of great antiquity, and codes of laws written in verse, and other pieces of poetry of very ancient date. Their language was most probably the old Celtic; but it underwent many changes by means of the different nations who subdued this country, and particularly by the influence of the Romans. Upon the irruption of the Goths and Vandals, it degenerated from its purity. It is evident, if we may depend upon the authority of Strabo, that the ancient Spaniards must have admitted writing many ages before the Gauls, Germans, or any others of Celtic extraction. From the settlement of the Romans, however, their letters, as well as language, extirpated all the rest, and continued in use till their expulsion, when the old Gothic took place. In the educating of their youth, they took great pains to inspire them with a love of liberty, and a contempt of death. This country, by reason of its excellent situation for commerce, and the abundance of commodities, particularly silver, which it furnished, invited thither all the trading nations of Europe, Asia, and Africa; nor is there, perhaps, any kingdom, that ever passed under so many different masters. Egyptians, Phœnicians, Tyrians, Carthaginians, Romans, Gauls, Germans, Goths, Vandals, Moors, and many others had their settlements in it, and thus promoted its trade and navigation, and founded in it great and opulent cities. With regard to the character of the ancient Spaniards, we may observe, that they possessed all the virtues of the old Celtic nation; and inherited fewer of their vices than any others of their descendants; they were brave, magnanimous, and hospitable to a high degree; and so famed for their fidelity, that even after being conquered by the Romans, several of these emperors preferred them to other nations, to be their body-guard. They were sober, frugal, and patient under hardships; jealous of their honour, and

till a few centuries past, rather desirous to preserve their own territories, than to seek new settlements abroad. See SPAIN.

HISPANICUM VIRIDE, *Spanish green*, a name given by some to verdigris.

HISPANIOLA, in *Geography*. See *St. Domingo*.

HISPID LEAF, among *Botanists*. See *LEAF*.

HISPID STALK. See *STALK*.

HISSAR, in *Geography*, a circar of Hindoostan, in the Soubah of Delhi, bounded on the N. by Sirhind, on the E. by Ballogiltan, on the S. by Nardeck, and on the W. by Moultan.

HISSAR Ferozesh, the capital of the above circar, near the river Surfooty, which traverses the circar from N. to S.; 75 miles W. of Delhi. N. lat. $28^{\circ}40'$. E. long. $76^{\circ}4'$.

HISSING, an appellation given by grammarians to the three consonants, *s*, *x*, and *z*.

HISTER, an Etrurian word which implied a stage-player, and during the pestilence at Rome, 364 years B. C. actors were sent for from Etruria, to try to appease the gods by public exhibitions; hence the Roman actors afterwards acquired the name of *histriones*. Livy, lib. vii cap. 2.

HISTER, in *Entomology*, a genus of Coleoptera, the antennæ of which are clavated, and the club solid, with the last joint compressed and decurved; head retractile within the body; mouth forcipated; wing-cafes shorter than the body, and truncated; anterior shanks toothed; hind shanks spinous. In the larvæ, as well as the adult, or winged state, the insects of this family are frequently met with in the dung of horses, cows, and other animals.

Species.

MAJOR. Black; wing-cafes somewhat striated; thorax ciliated at the edges. Linn.

Native of Africa, and differs only in size from the Linnæan *hister maximus*. The hairs at the edges of the thorax ferruginous.

UNICOLOR. Black; wing-cafes obliquely striated. Linn. *Donov. Br. Inf.*

Inhabits Europe and America.

GLABRATUS. Black and polished; wing-cafes somewhat striated, punctured, and as long as the abdomen. Fabr.

Jaws advanced, arched, acute and armed with a tooth in the middle; antennæ black; wing-cafes retuse behind.

SEMPUNCTATUS. Black, polished, brassy; wing-cafes obliquely striated at the base, and obsoletely punctured at the tip. *Herbst.*

Native of Barbary; head and thorax with a brassy hue; all the shanks compressed and ferrated. Found also by Paykull in Sweden; and by Marsham in Britain.

SCABER. Black, and scabrous, with raised dots. Fabr. Inhabits Spain.

CYANEUS. Thorax brassy; wing-cafes blueish. Oliv.

A New Holland species; the head dusky; thorax somewhat punctured at the margin; wing-cafes polished, abbreviated, and obliquely striated at the base; legs black.

PLANUS. Plane opaque and black; wing-cafes very smooth. *Fuesly, &c.*

Native of the south of Europe.

BRUNNEUS. Ferruginous; wing-cafes sub-striated. Oliv.

Inhabits Sweden; and also Britain (*Donov. Br. Inf.*)

PYGMÆUS. Deep black; wing-cafes very smooth. Linn.

Inhabits Europe.

DEPRESSUS. Depressed, black, and polished; wing-cafes somewhat striated. Oliv. *Hister compressus*, *Herbst.*

Found under the bark of birch-trees in Germany (*Panz.*), and in Britain (*Donov. Br. Inf.*).

4-DENTATUS. Depressed, black, and polished; wing-cafes with a single stripe; jaws exerted, and longer than the head. Oliv.

Native of North America.

SULCATUS. Black; thorax with five raised lines, wing-cafes three; the interstices punctured. Oliv.

Inhabits Europe. Small; the head rather prominent each side above the eyes; anterior legs toothed.

DUODECIM STRIATUS. Black, polished; wing-cafes with twelve striæ. *Marsb. &c.*

Found in France (*Vill.*), in Sweden (*Paykull*), and in England (*Donov. Br. Inf.*).

VIOLACEUS. Violaceous; thorax entirely dotted; wing-cafes with five recurved striæ at the base, tip dotted. *Marsb.*

Inhabits Britain. Length two lines and three quarters.

VIRESCENS. Green; thorax entirely dotted; wing-cafes with four recurved striæ, the tip dotted. *Marsb.*

Perhaps a small variety of *hister violaceus*; the length one line and a half.

PICEUS. Entirely pitchy; wing-cafes length of the abdomen, with four striæ. *Marsb.*

Native of Britain; length one line.

OBLONGUS. Depressed, black, and polished; wing-cafes striated; body oblong. Fabr.

Inhabits Sweden, under the bark of the roots of the ash. *Afzelius*. Differs from *H. fulcatus* in the more oblong form of the body.

ABBREVIATUS. Black; wing-cafes with crenated striæ, the inner ones abbreviated.

Native of America. Size of *H. pygmæus*.

SINUATUS. Black, with a sinuate rufous spot in the middle of the wing-cafes. Fabr. *Hister reniformis*, Oliv.

Wing-cafes striated at the inner edge, and smooth at the future. Inhabits Germany.

CRUCIATUS. Black; wing-cafes testaceous, with a common black cross. Fabr.

Native of Barbary. Wing-cafes smooth and polished, the future and spot crossing it in the middle black; hind margin black. Fabr.

2-MACULATUS. Black; wing-cafes striated with a red spot behind. *Donov. Br. Inf.*

Inhabits Europe.

4-MACULATUS. Black; wing-cafes with two red spots on each. Oliv.

Native of Germany (*Panz.*), also found in Britain (*Donov. Br. Inf.*)

ÆNEUS. Brassy; wing-cafes striated at the base, and punctured at the tip. Fabr. *Attelabus cupreus*, *Fourcr.*

Inhabits Sweden (*Paykull*), and Britain (*Donov. Br. Inf.*)

DETRITUS. Black, polished; wing-cafes pitchy, with dusky tip. Oliv.

Wing-cafes with four oblique striæ at the base, the tip punctured. A New Holland species.

PICIPES. Oblong and black; wing-cafes very short; antennæ and legs pitchy. Oliv.

Inhabits Germany. Wing-cafes abbreviated and not striated.

CÆSUS. Black; thorax with a transverse groove; antennæ ferruginous. *Herbst.*

Native of Germany.

PARVUS. Uniform black; wing-cases with six striæ, two inner striæ abbreviated. Marsh.

A new species found in Britain.

INEQUALIS. Black, polished; wing-cases striated exteriorly, towards the future smooth; jaws longer than the head. Fabr. Suppl. *Hister levis*, Rossi.

Inhabits Germany, and also England. Donov. Br. Inf.

QUADRIGUTTATUS. Black, polished, and very smooth, wing-cases dotted, with two pale yellowish spots on each. Fabr.

Lately discovered in Pembrokehire. Donov. Tour Wales. Spots on the wing-cases whitish or reddish.

BIPUSTULATUS. Black, with a red spot in the middle of each wing-case; anterior shanks tridentated. Schrank, &c. *Hister purpurascens*, Paykull.

Length two lines and a half; the species inhabits Sweden (Paykull), Germany (Panz), and Bohemia (Preys).

Obs. This insect must not be confounded with the hister bipustulatus of the Fabrician Suppl. a species twice the size of bimaculatus, and which inhabits India. The colour of this last-mentioned kind is deep black; wing-cases striated, with a red dot in the middle, and the head retuse.

IMPRESSUS. Deep black and polished; wing-cases striated; head with two impressed dots.

Size of hister unicolor, but distinct in having the two impressed dots in front of the head; all the shanks ferrated. Inhabits Kiel.

PULCHELLUS. Brassy-green; wing-cases striated, with a rufous dot behind; vent coppery. Fabr. Suppl.

Small, and inhabits Tranquebar; head and thorax brassy-green, polished and immaculate; vent prominent.

ERYTHROPTERUS. Deep black and polished; wing-cases striated, with the tip rufous. Oliv.

Native of Tranquebar. Allied to hister bipustulatus.

PERPUSILLUS. Rufous brown, and dotted. Marsh.

Length one-third of a line, and inhabits Britain. The form convex, dots not conspicuous without a lens.

MINIMUS. Black, very glabrous and polished. Marsh. Scarcely so large as the last; country the same.

HISTIAEA, in *Ancient Geography*, *Orio*, a maritime town of the island of Eubœa, under mount Telethrius, near the mouth of the river Callas. It was situated on a rock, and therefore called Oreum.

HISTIAËOTIS, a country of Thessaly, situated under mount Ossa and mount Olympus, the latter lying to the N. and the former to the S. This country was also called the "Doride," from Dorus, the son of Deucalion, under whose reign it was inhabited by a Pelasgic nation, which was driven from it by the Cadmæans. But, in process of time, the Perrhæbi, having destroyed the town of Histiaea in the isle of Eubœa, caused its inhabitants to remove to the continent, who gave to the territory which they occupied, the name of Histiotide, according to Strabo, but according to Herodotus, Histiotide.—Also, a small country in the island of Eubœa, of which Histiaea was the capital, and which extended to Artemisium, towards the Cænæum promontorium, at a little distance from Thermopyla.

HISTIODROMIA, the art of sailing, or of conducting vessels on the sea.

The word is compounded of *ἵστιον*, sail, of *ἵστος*, the mast of a ship, which comes from *ἵστυς*, sto, I stand, and *δρομος*, *courſe*, of *δρομα*, I run.

Histiiodromia is the same with what we otherwise call navigation.

Histiiodromia turns on four points, any two whereof be-

ing given, the other two are easily found from them, by the loxodromic tables, sines, tangents, secants, Mercator's charts, &c. These four things are, the difference of latitude, difference of longitude, the course, and the distance run.

HISTORICAL, something that relates to history.

HISTORICAL Column. See COLUMN, *historical*.

HISTORICAL Music, *musica historica*, is that branch of music which treats of the origin and invention of music, of modes, of notes, instruments, &c. as also the lives and writing of celebrated authors on that subject.

HISTORICAL Painting. The derivation of the word historical, at once points out the proper application of it as descriptive of one particular application of the art of painting, (*i. e.*) the representation of events which have occurred, and which are fit subjects for the pen of the historian; but common custom applies it in a more extended, though very improper, sense, as descriptive, not only of what is strictly historic, but what is also of the *poetic* or dramatic nature: and divides the last into four branches only, which are Historical, Portraiture, Landscape, and Still-life. See PAINTING.

HISTORICAL Style. See STYLE.

HISTORIOGRAPHER, composed of *ἱστορα*, *history*, and *γραφω*, I write, a professed historian, or writer of history; or a person who applies himself peculiarly to it.

The province of the historian is important and extensive; and he, therefore, ought to be endowed with great and uncommon qualifications. As it is the office of the historian to record truth for the instruction of mankind, impartiality, fidelity, gravity, dignity, and accuracy are indispensable and essential qualities belonging to a person who undertakes this office. He must neither be a panegyrist nor a satyrill. He must not enter into faction, nor give scope to affection; but contemplating past events and characters with a cool and dispassionate eye, must present to his readers a faithful copy of human nature. Cicero has given us the whole art of composing history in a very compendious and comprehensive manner. No one is ignorant, says he, that the first law in writing history is, not to dare to say any thing that is false, and the next, not to be afraid to speak the truth; that on the one hand there be no suspicion of affection, nor of prejudice on the other. These fundamental principles are generally known: but the superstructure consists partly in things and partly in the style or language. The former require an order of time, and description of pieces. And because in great and memorable events, we are desirous to know first their causes, then the actions themselves, and lastly their consequences; the historian should take notice of the springs or motives that occasioned them; and in mentioning the facts themselves should not only relate what was done or said, but likewise in what manner; and in treating of their consequences, shew whether they were the effects of chance, wisdom, or prudence. Nor should he only recite the actions of great and eminent persons, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and poignancy which are usual at the bar. De Orat. lib. ii. cap. 15.

According to this plan, in the observance of which few are superior to Tacitus, an historian should be not only a man of probity, but free from all passion and bias: he ought to unite the steadiness of a philosopher with the vivacity of a poet or orator. He should also possess a good judgment, to direct him what is proper to be said, and what to be omitted, and to treat every thing in a manner suited to its importance. This faculty will enable him to select such facts as are of the greatest moment; to represent them in

connection

HISTORIOGRAPHER.

connexion with their causes, to trace them to their consequences and effects, and to unfold them in clear and distinct order. Wisdom is the great end of history. It is designed to supply the want of experience; and though it does not enforce its instructions with the same authority, yet it furnishes a greater variety of instructions than it is possible for experience to afford in the longest life. Its object is to enlarge our views of the human character, and to give full exercise to our judgment on human affairs. It must not, therefore, be a tale calculated merely to please, and addressed to the fancy. Gravity and dignity are essential characteristics of history; no light ornaments are to be employed, no slipperiness of style, no quaintness of wit. But the writer must sustain the character of a wise man, writing for the instruction of posterity; one who has studied to inform himself well, who has pondered his subject with care, and addresses himself to our judgment rather than to our imagination. At the same time, historical writing is by no means inconsistent with ornamented and spirited narration. It admits of much high ornament and elegance; but the ornaments must be always consistent with dignity; they should not appear to be sought after; but to rise naturally from a mind animated by the events which it records.

Industry is likewise an essential quality of an accurate historian. Thucydides in his History of the Peloponnesian War, and Polybius in his History of the Roman Affairs, took great pains in procuring necessary information. An historian should be always actuated by a love of truth; to this purpose Polybius observes, that a good man ought to love his friends and his country, and manifest a similar disposition with their's, towards both their friends and enemies. But when he takes upon him the character of an historian, they must all be forgot. In history, all personal considerations should be laid aside, and regard be paid only to their actions. Lib. i. p. 13. See also Lucian, De Hist. Scrib. p. 366.

Suetonius, Thucydides, and Polybius are much commended for the integrity and ingenuity of their temper. Cicero observes, (*ubi supra*;) that history is conversant in great and memorable actions; and therefore a historian should always keep posterity in view, and relate nothing which may not on some account or other be worth the notice of future ages. Those who descend to trivial and minute matters, which are below the dignity of history, should be deemed journalists rather than historians. Whenever a prudent historian thinks it necessary or convenient to take notice of things that are in themselves less considerable, he either does it with brevity, or for some apparent reason, or accounts for it by some just apology. As it is the province of a historian to acquaint us with facts, he should give a narration or description not only of the facts, or actions themselves, but likewise of such things as are necessarily connected with them, *viz.* the characters of persons, the circumstances of time and place, in reference to which chronology and geography have been called the two eyes of history; the views and design of the principal actors, and the issue and event of the actions which he describes. The proper disposition of these various particulars depends on the skill and prudence of the writer.

The drawing of characters, says Blair, is one of the most splendid, and at the same time, one of the most difficult ornaments of historical composition. For characters are generally considered as professed exhibitions of fine writing; and an historian, who seeks to shine in them, is frequently in danger of carrying refinement to excess, from a desire of

appearing very profound and penetrating. He brings together so many contrasts, and subtle oppositions of qualities, that we are rather dazzled with sparkling expressions, than entertained with any clear conception of a human character. A writer who would characterise in an instructive and masterly manner, should be simple in his style, and should avoid all quaintness and affectation: at the same time not contenting himself with giving general outlines only, but descending into those peculiarities which mark a character in its most strong and distinctive features. The Greek historians sometimes give eulogiums, but rarely draw full and professed characters. The two ancient authors, who have laboured this part of historical composition most, are Sallust and Tacitus. In tracing actions and events which the historian records to their springs, and also to their effects and consequences, two qualifications are necessary in order to his doing this with success: *viz.* a thorough acquaintance with human nature, and political knowledge, or acquaintance with government. The former is necessary to account for the conduct of individuals, and to give just views of their character: the latter to account for the revolutions of government, and the operations of political causes in public affairs. Both must concur in order to form a completely instructive historian. With regard to the latter, the materials and means of information, possessed by the ancient historians, were more circumscribed and limited than those of the moderns; far less communication and intercourse subsisted between neighbouring states, by the intervention of established ports, or of ambassadors resident at distant courts. Besides, they wrote for their own countrymen only; they had no idea of writing for the instruction of foreigners, whom they despised, or of the world in general; and hence they are less attentive to convey all that knowledge with regard to domestic policy, which we, in distant times, would desire to have learned from them. Perhaps also, though in ancient ages men were more abundantly animated with the love of liberty, yet the full extent of the influence of government, and of political causes, was not then so thoroughly scrutinized, as it has been in modern times; when a longer experience of all the different modes of government has rendered men more enlightened and intelligent, with respect to public affairs. To the reasons now stated it is owing, that though the ancient historians set before us the particular facts which they relate, in a very beautiful and distinct manner, yet sometimes they do not give us a clear view of all the political causes which affected the situation of affairs, of which they treat. From the Greek historians, we are able to form but an imperfect notion of the strength, the wealth, and the revenues of the different Grecian states; of the causes of several of those revolutions that happened in their government; or of their separate connections and interfering interests. In writing the history of the Romans, Livy had surely the most ample field for displaying political knowledge, concerning the rise of their greatness, and the advantages or defects of their government. Yet the instruction, in these important articles, which he affords, is not considerable. He is indeed an elegant writer, and a beautiful relater of facts; but by no means distinguished for profoundness or penetration. Sallust, when writing the history of a conspiracy against the government, which ought to have been altogether a political history, has evidently attended more to the elegance of narration, and the painting of characters, than to the unfolding secret causes and springs. Instead of that complete information, which we might naturally have expected from him of the state of parties at Rome, and of that particular conjuncture

conjuncture of affairs, which enabled so desperate a profligate as Cataline to become so formidable to the government, he has given us little more than a general declamatory account of the luxury and corruption of manners in that age, compared with the simplicity of former times. It is not meant, however, to censure all the ancient historians as defective in political information. No historians can be more instructive than Thucydides, Polybius, and Tacitus.

Thucydides is grave, intelligent, and judicious; always attentive to give very exact information concerning every operation which he relates; and to shew the advantages and disadvantages of every plan that was proposed, and every measure that was pursued. Polybius excels in comprehensive political views, in penetration into great systems, and in his profound and distinct knowledge of all military affairs. Tacitus is eminent for his knowledge of the human heart; is sentimental and refined in a high degree; conveys much instruction with respect to political matters, but more with respect to human nature.

The historian should also introduce pertinent and useful reflections in the course of his narrations. The best historians, such as Sallust and Livy, &c. have allowed themselves this liberty. But the remarks or reflections of the historian should be brief, and differ in this respect from the encomiums or declamations of the orator. When observations are to be made concerning human nature in general, or the peculiarities of certain characters, if the historian can artfully incorporate such observations with his narrative, they will have a better effect than when they are delivered as formal detached reflections. To this purpose we may observe, that, in the life of Agricola, Tacitus, speaking of Domitian's treatment of Agricola, makes this reflection: "Proprium humani ingenii est, odisse quem læseris;" *i. e.* "It belongs to human nature, to hate the man whom you have injured." This observation is just and philosophical; but the form, in which it stands, is abstract and philosophical. A thought of the same kind has a fine effect elsewhere in the same historian, when speaking of the jealousies which Germanicus knew to be entertained against him by Livia and Tiberius: "Anxius," says he, "occultis in se patrii aviaque odiis, quorum cause acriores quia iniquæ:" *i. e.* "Uneasy in his mind, on account of the concealed hatred entertained against him by his uncle and grandmother, which was the more bitter, because the cause of it was unjust." This profound moral observation is introduced, without the appearance of making it in form, as a part of the narration, in assigning a reason for the anxiety of Germanicus. Tacitus excels in a talent of intermixing after this manner with the course of his narrative many striking sentiments and useful observations. For a more particular account of the distinguishing properties of historical narration; see NARRATION.

Historians have enlivened their narration, by introducing, on various occasions, speeches, which are either oblique or direct; the former recited by the historian in his own person. Of this kind is that of Hannibal in Justin, by which he endeavours to persuade king Antiochus to carry the heat of war against the Romans into Italy. (Lib. xxxi. cap. 5.) And in the latter, the person himself is introduced as addressing his audience; and therefore the words, as well as the sense, are to be accommodated to his character. Such is the speech of Eumenes, one of Alexander's captains and successors, addressed to his soldiers, when they had traiterously bound him in chains, in order to deliver him up to his enemy Antigonus. Justin, lib. xiv. cap. 4.

With regard to direct speeches, there are few ancient historians who have not adopted them, though some of our critics will only admit those which were really spoken by

the persons to whom they are ascribed. The first historian who introduced complete and finished speeches into history, is said to be Thucydides, those of Herodotus being but short and imperfect. (See ORATION.) Letters are sometimes met with in histories, as well as speeches: such are those of Alexander to Darius in Q. Curtius, lib. iv. cap. 1. and those of Tiberius and Drusus in Tacitus, Ann. lib. i. 73. iii. 53. 59. Digressions also, when they are neither too long nor too frequent, may be so managed by the historian, as to afford the reader both delight and profit. (See DIGRESSION.) With regard to the order of history, the historian should so form his introduction, as to give some general view of the subject, to engage the reader's attention, and to possess him with a candid opinion of himself and of his performance; this should be natural, and proportioned to the extent of the work. Such are those of Livy, Herodotus, Thucydides, Tacitus, and others. But order is to be principally regarded in the body of the work: for this purpose the historiographer should either attend to the time in a chronological series, which is best in biography, after the manner of Plutarch and Cornelius Nepos; in the history of particular states, after Thucydides, Livy, and Tacitus, and sometimes also in a general history; though in this latter case, the order of time cannot always be preserved, and therefore the actions of each nation, when several states are independent of each other, must necessarily be separated, in order to prevent confusion. This is the method adopted by Herodotus, Diodorus Siculus, and Justin.

There is one circumstance that deserves to be particularly mentioned, because it deserves the first attention of the intelligent and instructive historian; and this is, that in the conduct and management of his subject he should give it as much unity as possible; in other words, his history should not consist of separate unconnected parts merely, but should be bound together by some connecting principle, which shall make the impression on the mind of something that is one, whole and entire. Whether pleasure or instruction be the end sought by the study of history, either of them is enjoyed to much greater advantage, when the mind has always before it the progress of some one great plan or system of actions; when there is some point or centre to which we can refer the various parts related by the historian. Of all the ancient general historians, the one who had the most exact idea of this quality of historical composition, though, in other respects, not an elegant writer, was Polybius. In his third book he sketches out his own plan; observing, that the subject of which he had undertaken to write is, throughout the whole of it, one action, one great spectacle; how, and by what causes, all the parts of the habitable world became subject to the Roman empire. "This action," says he, "is distinct in its beginning, determined in its duration, and clear in its final accomplishment; therefore, I think it of use to give a general view before-hand, of the chief constituent parts which make up this whole." In another place, he congratulates himself on his good fortune, in having a subject for history, which allowed such variety of parts to be united under one view; remarking, that before this period, the affairs of the world were scattered, and without connection; whereas, in the times of which he writes, all the great transactions of the world tended and verged to one point, and were capable of being considered as parts of one system.

Those who write the history of some particular great transaction, confining themselves to one era, or one portion of the history of a nation, have such great advantages for preserving historical unity, that they are inexcusable if they fail in it. Sallust's histories of the Catilinarian and

HISTORIOGRAPHER.

Jugurthine wars, Xenophon's *Cyropædia*, and his Retreat of the Ten-thousand, are instances of particular histories, where the unity of historical object is perfectly well maintained. Thucydides, otherwise a writer of great strength and dignity, has failed much, in this article, in his history of the Peloponnesian war. On this account, he is severely censured by one of the best critics of antiquity, Dionysius of Halicarnassus. This critic is partial to Herodotus, whom, both for the choice and conduct of his subject, he prefers to the other historian. But we may observe, that Herodotus wrote to the imagination, and Thucydides writes to the understanding. He was a grave, reflecting man, well acquainted with human life; and the melancholy events and catastrophes which he records, but which Dionysius finds fault with, are often both the most interesting parts of his history, and the most improving to the heart. Indeed, the distribution of his subject, which, though not deficient in dignity, wants the gaiety and splendour of that of Herodotus, is faulty, and the critic's observations upon it are better founded, and his preference of Herodotus, in this respect, is not unjust. With regard to style, Dionysius gives Thucydides the just praise of energy and brevity; but censures him, on many occasions, not without reason, for harsh and obscure expression, deficient in smoothness and ease. The historian, however, must not neglect chronological order, with a view to render his narration agreeable. He must give a distinct account of the dates, and of the coincidence of facts. But he is not under the necessity of breaking off always in the middle of transactions, in order to inform us of what was happening elsewhere at the same time. He discovers no art if he cannot form some connection among the affairs which he relates, so as to introduce them in a proper train. He will soon tire the reader, if he goes on recording, in strict chronological order, a multitude of separate transactions, without any other connection besides coincidence of event. Although the history of Herodotus be of greater compass than that of Thucydides, and comprehend a much greater variety of dissimilar parts, he has been more fortunate in joining them together, and digesting them into order. Hence he is a more pleasing writer, and gives a stronger impression of his subject; though, in judgment and accuracy, much inferior to Thucydides. He abounds, indeed, with digressions and episodes; but when these have any connection with the main subject, and are inserted professedly as episodes, the unity of the whole is less violated by them, than by a broken and scattered narration of the principal story. Among the moderns, the president Thuanus has, by attempting to make the history of his own times too comprehensive, fallen into the same error, of loading the reader with a great variety of unconnected facts, going on together in different parts of the world;—an historian otherwise of great probity, candour, and excellent understanding; but through the want of this unity, more tedious, and less interesting than he otherwise would have been.

As history is a species of writing designed for the instruction of mankind, sound morality should always reign in it. Both in describing characters, and in relating transactions, the author should always shew himself to be on the side of virtue. To deliver moral instruction in a formal manner, falls not within his province; but both as a good man and as a good writer, it is expected, that he should discover sentiments of respect for virtue, and of indignation at flagrant vice. Neutrality and indifference, when occasions of this kind occur, are inexcusable; and indicate a culpable deficiency in sensibility and moral feeling. For the style of the historian, see *STYLE*.

So numerous and considerable are the qualifications necessary for an historian, that this province was formerly assigned by the eastern nations to a particular order of men; and both among the Greeks and Romans it was generally undertaken by persons of figure, and such as were eminent for learning, knowledge of the world, and other great abilities: and as it is of such singular service to mankind to have the records of past ages well and faithfully transmitted to posterity, it is to be wished that persons of similar character would, in all countries, undertake it.

Having illustrated the qualities of a good historian by direct or indirect references to ancient writers, it may not be improper to specify some instances in which the moderns have excelled in this kind of writing. Dr. Blair selects Italy as the country in Europe where the historical genius has, in latter ages, shone forth with the greatest lustre. Soon after the restoration of letters, Machiavel, Guicciardin, Davila, Bentivoglio, father Paul, became highly conspicuous for historical merit. All of them appear to have conceived very just ideas of history; and are agreeable, instructive, and interesting writers. They are not, however, without some imperfections, which have been pointed out by critics, and detailed by Blair. Among the French, many historical writers are spirited, lively, and agreeable; and some of them not deficient in profoundness and penetration. Nevertheless, France has not produced any such capital historians as Italy. In our own island, Scotland acquired reputation, at an early period, by means of the celebrated Buchanan. He is an elegant writer, classical in his Latinity, and agreeable both in narration and description; but suspected to be more attentive to elegance than to accuracy; and inaccurate and imperfect in his political views; and charged with being deeply tinctured with the spirit of party. Among the older English historians, the most considerable is lord Clarendon: more impartial in his relation of facts than might have been expected, and distinguished by the spirit of virtue and probity which pervades his work. He maintains the dignity of an historian; and though his sentences are too long and his general manner prolix, his style is, upon the whole, manly; and his merit, as an historian, much beyond mediocrity. He is particularly admirable, and perhaps we may say unequalled in the drawing of characters. Some have asserted that he was the first Englishman who seems to have attempted to write history with any degree of dignity. But this assertion is not strictly accurate. Sir Walter Raleigh and Knowles made the attempt before him, and with no small success, and we may assert the same, in a great degree, concerning sir Francis Bacon and lord Herbert of Cheshire. However, Clarendon has, in this respect, exceeded all his predecessors. Bishop Burnet is lively and perspicuous; but his style is too careless and familiar for history; his characters are marked with a bold and a strong hand, but they are generally light and satirical; and he abounds too much in little stories concerning himself, that he resembles more a writer of memoirs than of history. For a just appreciation of his character as an historian, see the article *BURNET*. During a long period, English historical authors seemed to aim at nothing higher than an exact relation of facts; till of late the distinguished names of Hume, Robertson, and Gibbon, have raised the British character in this species of writing to high reputation and dignity. Dr. Blair observes, that of late years a great improvement has begun to be introduced into historical composition; which consists in a more particular attention than was formerly given to laws, customs, commerce, religion, literature, and every thing else that tends to shew the spirit and genius of nations. An historian is now expected to exhibit manners, as well as facts

and events; and it must be allowed, that whatever displays the state and life of mankind in different periods, and illustrates the progress of the human mind, is more useful and interesting than the detail of sieges and battles. The introduction of this improvement into history has been chiefly owing to the celebrated M. Voltaire, whose age of Louis XIV. commanded the attention, and claimed the approbation of all Europe. See farther on this subject Ward's Oratory, vol. ii. lect. 42, 43, 44, and 45. Blair's Lectures, vol. iii. lect. 36.

The term historiographer is chiefly used for a person who has a peculiar charge and commission to write the history of his time. The historiographer to his majesty is an officer under the lord chamberlain; his salary 200*l.* per annum. There is an office of the same kind in Scotland with the same salary.

HISTORY, a recital or description of things as they are, or have been in a continued orderly narration of the principal facts and circumstances attending them. The word is Greek, *ἱστορία*, *historia*; and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen; being formed of the verb *ἵστωρ*, which properly signifies to know a thing by having seen it; though the idea appropriated to the term history is now much more extensive, and we apply it to a narration of divers memorable things, even though the relator only takes them from the report of others. The origin of the word is from the verb *ἵστωρ*, *I know*; and hence it is, that among the ancients several of their great men were called *polyhistores*, *q. d.* persons of various and general knowledge.

History is divided, with regard to its *subject*, into the *history of nature* and the *history of actions*.

History of Nature, or *Natural History*, is a description of natural bodies; whether terrestrial, as animals, vegetables, fossils, fire, water, air, meteors, &c. or celestial, as the stars, planets, comets, &c. Natural history is much the same with what we otherwise call *physiology*. See *Natural History* and *PHYSIOLOGY*.

History, with regard to *actions*, is a continued relation of a series of memorable events in the affairs either of a single person, a nation, or several persons and nations, and whether included in a great or little space of time; or, it is a narrative of such facts as are fit to be transmitted to posterity for the use of mankind and the better conduct of human life. Cicero calls history the mistress of life, (*De Orat. lib. ii. cap. 9*) as it teaches us both what we ought to pursue and what we ought to avoid.

Thus Thucydides, among the ancients, excellently translated by Smith, and among the moderns, Stanyan, Leland, Gillies, Mitford, the abbe Barthlemi in his *Travels of Anacharis*, have written the History of Greece; Livy, among the ancients, and among the moderns, Catrou and Rouille, Rollin, Vertot, Hooke, Ferguson, Montesquieu, Crevier, Gibbon, &c. that of Rome; Mezeray and F. Daniel, of France; Tyrrel, Echard, Rapin, continued by Tindal, Carte, Guthrie, with the supplement of Ralph, Hume continued by Smollett, Henry, &c. Kennett, in his complete history, including the works of several writers, of whom the most distinguished, in point of historical composition and merit, are Milton, Daniel, Bacon, lord Herbert, Camden, and Wilson, &c. the History of England; Buchanan, not to mention John Major and Hector Boethius, whose works are now almost obsolete, Robertson, whose history is a classic production, and is thought by many to be the doctor's "Palmarium Opus," G. Stuart, sir D. Dalrymple, lord Hailes, Guthrie, &c. &c. of Scotland; O'Connor, Valancy, Ferdinando Warner, O'Halloran, Leland, Crawford, Carte

in his *Life of the Duke of Ormond*; sir James Ware in his *Lives of the Bishops and Writers of Ireland*, improved and enlarged by Mr. Harris, &c. &c. of Ireland; Dr. Powel, Warrington, &c. of Wales; Clarendon, the History of the Rebellion; and Thuanus, bishop Burnet, &c. the History of their own Lives and Times.

Eusebius, Baronius, &c. have written the History of the Church; bishop Burnet that of the Reformation, &c.

Several authors have written on the Method of reading and studying History; among the rest Lucian, Bodin, Vossius the Elder, Whear, Patrici, Beni, Mascardi, De Silhon, F. le Moine, F. Rapin, the abbot De St. Real, F. Thomassin, Frenoy, Prietley, &c.

One of the most useful directions for facilitating the study of history, says Dr. Priestley in his Lectures, (*Lect. 17.*) is to begin with authors who present a "Compendium," or general view of the whole subject of history, and afterwards to apply to the study of any particular history, with which a more thorough acquaintance is desired. The most celebrated epitome of universal history written in Latin, is Turfalin's, which is read in most of the foreign universities. Bossuet's Epitome of Universal History, is greatly and deservedly admired in France; but it brings the history no lower than the time of Charlemagne. One of the most useful epitomes, upon the whole, is that written by baron Holberg in Latin, and translated with improvements into English by Dr. Gregory Sharpe. Its principal defect is, that too little notice is taken of the history of Greece, and that other subjects are dispatched with too much brevity. The most valuable of the larger kind of epitomes are Rollin's of the ancient history, and Puffendorf's of the modern. One of the most obvious contrivances to reduce history into a short compass, and to make an entire course of it easy to be comprehended, and at the same time to observe a proper distinction between the parts of it, has been by "Chronological Tables." See *CHRONOLOGY*.

Much of the perspicuity of history depends on conceiving clearly the order of generations and the right of succession in regal and other families. In this respect, "Genealogical Tables" are of unspeakable use (*See GENEALOGY.*) But the most ingenious and useful contrivance to facilitate the study of history, and to aid the imagination in conceiving distinctly, and comprehending the whole course of it, in all its parts, co-existent and successive, is the "Chart of History." This is properly a picture of all history, and is formed by such natural methods of expression, that it renders visible to the eye, without reading, the whole figure and dimensions of all history, general and particular, and so perfectly shews the origin, progress, extent, and duration, of all kingdoms and states that ever existed, at one view, with every circumstance of time and place, uniting chronology and geography, that it not only, in the most agreeable manner, refreshes the memory without the fatigue of reading; but a novice in history may learn more from it by a mere attentive inspection of a few hours, than he can acquire by the reading of many weeks or months. This chart must answer, in the completed manner imaginable, almost every use of a compendium of history, proper to be read before a larger and fuller course be entered upon; and it will prevent any confusion which might arise from reading particular histories without a regard to their proper order of time or place, better than any abstract of universal history whatever. For by casting our eye for a minute upon this chart, we see, at one glance, the contemporary state of the whole world at the period of which we are reading, and the preceding and succeeding state of the particular country,

HISTORY.

the history of which we are studying. Dr. Priestley has constructed a chart of this kind, of the same size with his chart of biography, drawn upon a like scale, and made to correspond to it in all respects. Among other methods of illustrating and retaining history, we may mention Mr. Grey's "memorial lines," serving to aid us in recollecting dates with exactness. To this we may add the use of a "common-place book," in which the most valuable fruits of history may be deposited.

We shall here subjoin the order in which the principal authors of antiquity should be read, so as to obtain from them a regular series of facts, comprising the history of Asia, Africa, Greece, and Rome, till the dissolution of the empire of Constantinople. The oldest history extant, next to the historical books of the Old Testament, is that of "Herodotus," who flourished about 450 years B.C., a little after the invasion of Greece by Xerxes. His history comprises probably every thing which he had an opportunity of learning concerning the history of the Lydians, Ionians, Lycians, Egyptians, Persians, Greeks, and Macedonians; and, computing from the earliest of his accounts to the latest, his history may be reckoned to commence about 713 years B.C., and to reach to about the year 479 B.C.; a period of about 234 years. A more particular account of several things in the period of which he treats, may be extracted from the following authors; *viz.* Justin (l. i. ii. iii. and vii.), Xenophon's *Cyropædia*, and the lives of Aristides, Themistocles, Cimon, Miltiades, and Pausanias, written by Plutarch and Cornelius Nepos; and those of Anaximander, Zeno, Empedocles, Heraclitus, and Democritus, by Diogenes Laertius. Next to Herodotus, "Thucydides" should be read. Introductory to his history of the Peloponnesian war, which was his principal and professed subject, he gives a summary view of the history of Greece, from the departure of Xerxes to the commencement of that war, which connects his history with that of Herodotus. To complete the period comprehended by his history, after his first book, the eleventh and twelfth books of Diodorus Siculus should be read, together with Plutarch's Themistocles, Aristides, Pausanias, and Cimon, and the second and third books of Justin. And, after the whole of Thucydides, the historical student should read the lives of Alcibiades, Chabrias, Thraſybulus, and Lysias, written by Plutarch or Cornelius Nepos, the fourth and fifth books of Justin, and the first book of Orosius. After Thucydides, the first and second books of "Xenophon's History of Greece" should be read. This completes the history of the Peloponnesian war, with the contemporary affairs of the Medes and Persians. After this, let the student proceed to the "expedition of Cyrus," and the return of the Greeks; and lastly, the remainder of his history of Greece, which contains an account of the affairs of the Greeks and Persians to the battle of Mantinea, which happened in the year 363 B.C.; so that all the historical books of Xenophon comprise a period of about 48 years. To complete the history of this period, recourse may be had to the lives of Lysander, Agesilaus, Artaxerxes, Thraſybulus, Chabrias, Conon, and Datames, written by Plutarch or Cornelius Nepos; the fourth and fifth books of Justin; and the thirteenth, fourteenth, and fifteenth of Diodorus Siculus. After Xenophon's works let the fifteenth and sixteenth books of Diodorus Siculus be read; these contain the histories of Greece and Persia, from the battle of Mantinea to the beginning of the reign of Alexander the Great, in the year 336 B.C. After these two books of Diodorus, let Arrian's history of Alexander be read; and for completing this history, let the reader recur to Quintus Curtius, the tenth and eleventh books of Justin, and Plutarch's life of

Alexander. After Arrian, let him peruse the eighteenth, nineteenth, and twentieth books of Diodorus Siculus, which contain the history of Greece from the year 323 B.C. to the year 301; and to complete this period, the thirteenth, fourteenth, and fifteenth books of Justin, and the Demetrius and Eumenes of Plutarch. After the books of Diodorus, read from the sixteenth to the twenty-ninth book, inclusive, of Justin, which brings down the history to about the year 195 B.C. After Justin, read Plutarch's lives of Pyrrhus, Aratus, Agis, Cleomenes, and Philopamen. The lives of illustrious men written by Plutarch, who flourished about the year 130 after Christ, make an excellent supplement to universal history. To complete the history furnished by these lives of Plutarch, read the fragments of Diodorus. Lastly, in the regular order of history, read the thirtieth book of Justin, and all that follow till the two last, which completes the history of Greece till it is blended with that of the Romans. All the histories above-mentioned are written in Greek, except those of Justin, Quintus Curtius, and Cornelius Nepos, which are in Latin.

The following course of "Roman History" may be considered as comprehending all that is now to be learned of the subsequent ancient history of all other nations, besides Greece and those comprehended in its history. The writer who treats of the early part of the Roman history, in the fullest and most satisfactory manner, is "Dionysius of Halicarnassus," who brought down the history of Rome as far as the beginning of the first Punic war. But of his work, which consisted of twenty books, the eleven first are all that are extant, and they end at the year 341 B.C., the time when the consuls resumed the chief authority in the republic, after the dissolution of the decemvirate. To complete the history of the period of which he treats, read Livy (l. i. ii. and iii.), Plutarch's Romulus, Numa Pompilius, Valerius Poplicola, Coriolanus, and Camillus. After Dionysius, read from the fourth to the tenth book inclusive of Livy, which brings the history of Rome to the year 292 B.C. To supply the chasm between the tenth and twentieth books of Livy, read Polybius, particularly the first and second books, which treat chiefly of the first Punic war; the epitome of the second deced of Livy, books seventeen, eighteen, twenty-two, and twenty-three of Justin, fourteen chapters of the fourth book of Orosius, the fourth and fifth of the third book of the "historia miscellanea" of Paulus Diaconus, Plutarch's Marcellus, and Fabius Maximus; the second tome of the *Annals* of Zonaras, and Appian's Punic and Illyrian wars. After Appian should be read the remainder of Livy, from the twenty-first book to the end, which brings the history to the year 166 B.C., and the epitome to the end. To complete the last books of Livy, read Plutarch's Hannibal, Scipio Africanus, Quintus Flamininus, Paulus Æmilius, and Cato Major. After this read his Gracchi, Marius, Sylla, Cato Minor, Sertorius, Lucullus, Pompey, and Brutus. The reader of history must next proceed to Sallust's history of the war of Jugurtha, which happened 100 years B.C., and of the conspiracy of Catiline, which happened 62 years B.C. Next should follow Julius Cæsar's Commentaries of his own wars, and the supplement by Hirtius and others. To obtain a clear idea of this important period of time, Cicero's epistles, especially those to Atticus, should not be overlooked. The history of Dio Cassius comprised all the time from the building of Rome to the reign of Alexander; but to supply the want of the last twenty, we must be content with what Xiphilinus, who wrote A.D. 1050, has given us in a compendium of them. The period of which Dio Cassius treats will be made more complete by Velleius Paterculus, who lived

HISTORY.

lived under Tiberius. We should then have recourse to Suetonius's lives of the twelve Cæsars; and next to Tacitus's annals and history. This history contains a fund of political knowledge, and, on that account, is very proper to be studied by princes and ministers of state. Tacitus is the last Roman historian who is worth reading, except barely for those *faits* which we have no other method of becoming acquainted with. Suetonius and Tacitus are generally placed in what is called the "silver age" of the Latin tongue; but all the succeeding writers are universally thrown into the "brazen," or "iron" age. These, in the order according to which they should be read, are, the lives of Nerva and Trajan by Aurelius Victor or Xiphilin, Spartian's Adrian, Capitolinus's Antoninus, Herodian, the *Scriptores Romani*, or *Historiæ Augustæ Scriptores*, viz. Spartianus, Lampridius, Capitolinus, Vulcatius, Trebellius Pollio, and Vopiscus supplying the chasm in these writers between Gordian III and Valentinian, from Aurelius Victor, and then the history will be brought down to A.D. 283. Eutropius will furnish a good epitome of the Roman history till about this time, in Latin. All the writers of the Roman history from this time are Greek, except Ammianus Marcellinus; they are Zozimus, A.D. 507; Zonaras, A.D. 1119; Jornandes, A.D. 540; Ammianus Marcellinus, A.D. 375; Procopius, A.D. 502; Agathias, A.D. 567; Nicetas Acominatus, A.D. 1203; Nicephorus Gregoras, A.D. 1341; and Johannes Cantacuzenus, A.D. 1350. In this enumeration we ought not to have omitted a celebrated female historian, viz. Anna Comnena, the daughter of Alexius I., emperor of Constantinople, who wrote the history of the reign of her own father, in which she makes the first mention of the arrival of the crusaders at Constantinople, and gives an account of their conduct during their residence in that city, and their passage into Asia. Her narration is not very favourable to the crusaders. The conclusion of the history of Constantinople, with the rise and progress of the Turks, may be learned from Laonicus Chalcondiles, who put an end to it. He begins his history with Ottoman, the son of Orthogul, who began to reign about the year of Christ 1300. His work consists of ten books, and brings the history to the year 1453, in which Constantinople was taken by Mahomet II.

Of all the modern compilations, derived from these sources of historical knowledge, none are so useful as those which treat of the manners, customs, and laws of the Greeks and Romans. The most complete body of Greek and Roman antiquities is that of Grævius and Gronovius; but this is voluminous and expensive. A person may acquire knowledge enough of this kind, for the purpose of reading the Greek and Latin historians, in Potter's excellent and compendious system of Greek antiquities, and in Kennett's Antiquities of Rome. Books which contain collections of coins and inscriptions should not be neglected; the principal collectors of these kinds of records are Gruter, Lipsius, Clusul, Montfaucon, Prideaux, Mazochius, and Fleetwood for inscriptions; and Spanheim, Urfinus, Patin, Vailant, Hardouin, and Goltzius for coins. In studying the Roman history, a person should become conversant with the civil law, which contains the history of the domestic policy of that great people. He should therefore acquaint himself at least with "Justinian's Institutes;" which contain an authentic outline of their policy. The modern compilations of ancient history are very numerous; but the most complete are "Rollin's" and the "Universal History." Rollin's ancient history has been often recommended to young persons, and it well deserves their attention. Though the

author is only a compiler, he is eloquent. He always writes on the side of virtue, and his moral reflections are useful; though he cannot be considered as distinguished by an extraordinary degree of critical sagacity. The "Ancient Universal History" is a work of established reputation and utility. Its references to original authors are numerous; and though it is, with respect to judgment and style, very unequal, and its chronology is various, as it was executed by different persons, yet it indicates unquestionable traces of labour in research, and impartiality in detail. Its faults, compared with its excellencies, are trifling. The oriental part is particularly entitled to applause, as it conveys a variety of knowledge, which could not otherwise have been easily obtained. One principal advantage is, that it gives a separate history of every individual nation, however inconsiderable; so that we see at once its relative importance, and its connection with the greater empires, by which it might, at length, be swallowed up. The best editions of the ancient universal history are, that in folio, and the first which appeared in 8vo.

As for those who wish to study the English history by the perusal of the works of original writers, and who have leisure for this purpose, we would refer them for an account of them to Nicholson's English Historical Library. Hence, and from other sources of information, they will be led to acquaint themselves with Gildas, the most ancient British historian, who was born in the year 520, and published his treatise "De excidio Britannię" towards the close of his life; the venerable Bede, who was born in 672 or 673; Nennius in 830; Hoel Dha's laws, enacted about the middle of the tenth century; Geoffrey of Monmouth, about the year 1150, the greater part of whose work is fabulous; Caradoc, monk of Lancarvan, contemporary with Geoffrey, who wrote a history of the petty kings of Wales, translated from the Latin original into English, by Humphrey Llwyd, and enlarged by Dr. Powel, and again by W. Wyn, &c. The oldest history of the Saxon affairs is the "Saxon Chronicle," first published by Abraham Wheelock, the work of unknown authors, and terminating at various periods from 977 to 1154. The earliest account we have of the reign of Alfred is that of Asserius, his contemporary: the next Saxon historian is Ethelward, or Edward Paritritius in 1090, who continued his chronicle of the Saxon kings no farther than Edgar. Many things relating to the civil government of these times are dispersed in some particular lives of their saints and kings; particularly those of Offa, Oswin, Ethelwolf, and Edward the Confessor. Of the later writers of the Saxon affairs we may mention Verstegan in his "Restitution of decayed intelligence in Antiquities," corrected by Sheringham and Somner; Selden in his "Analecta;" and Sheringham in his treatise "De Anglorum gentis origine." The "Sachsen Spiegel," or "Speculum Saxonicum," is an excellent manual of the old laws of the ancient Saxons. The history of Great Britain, in certain periods of it, is much connected with the histories of Norway and Denmark; and therefore the Danish antiquities should be investigated, and the Runic characters understood. The Danish antiquary should also be acquainted with the best Islandic historians, the most ancient of whom is Aras Frode, contemporary with Sæmond, about the year 1124; part of whose history of Iceland was published in 1689 by the bishop of Skalholt. There are two Norwegian histories which should be consulted; the former written soon after the year 1130 by Theoderic, a monk, and the other compiled by Snorro Sturlesonius, both of whom draw their materials from the ballads of the Scaldri, whose historical poems, it is generally thought, may be depended upon.

HISTORY.

Two Danish historians, of principal importance to the English antiquary, in the judgment of Mr. Nicholson, are Saxo Grammaticus, and his contemporary Sweno Agonis, of both which we have an excellent edition by Stephanus. The former died at Roschild in 1204; and by his own account, he compiled his history out of the Icelandic ballads; and Sweno declares that he compiled his from the traditions of old people. The great restorer of the decayed antiquities of Denmark was Olaus Wormius, in his "Literatura Runica," and "Monumenta Danica," to whose discoveries an addition has been made by Thomas Bartholine. Much light has lately been thrown on this subject by various antiquaries, and particularly by Mr. Jonstons, professor Thorckelin, and Mr. Pinkerton. The first of our English historians after the conquest was Ingulphus of Croyland, who begins A.D. 626, and ends A.D. 1089. About the same time Marianus Scotus brought down our English history as low as the year 1083. The earliest history in the 12th century was written by Florentius Bravonius, a monk of Worcester, whose book ended with his life in 1119; but it was continued 50 years farther by another monk of the same monastery. Our next historian was Eadmerus, a monk of Canterbury, whose "Historia Novorum, &c." was published by Mr. Selden, and extends from 1066 to 1122. William of Malmesbury is one of the most important and valuable of our ancient historians. He is highly commended by Leland and others. He wrote "De gestis regum Anglorum" in five books, with an appendix in two more, which he styles "Novellæ historiæ." His history comprehends the affairs of England from the first arrival of the Saxons to the close of the reign of king Stephen. Simeon Dunelmensis, monk of Durham in 1164, author of "De Gestis Regum," commences with the death of Bede in 732 and ends in 1129. Ealred, abbot of Rievaulx, gives a short genealogy of our kings to Henry II., but chiefly enlarges in praise of David king of Scots, founder of many Cistercian abbeys. About the same time flourished Henry, archdeacon of Huntingdon, whose eight books, concluding with the reign of king Stephen, were published by sir Henry Savile. William of Newberry begins at the death of Henry I., and ends in the year 1097. The 13th century begins with Gervase monk of Canterbury, who is said to have been a judicious antiquary and methodical historian, and to have made an excellent collection of the British and English history from the arrival of the Trojans to the year 1200. All that is extant commences with the year 1112, the 12th year of Henry I., and ends with the death of Richard I. It bears the character of being executed with great judgment. Cotemporary with these two, was Roger de Hoveden, chaplain to king Henry II., who has deduced our history to the year 1202, the 4th year of king John's reign. The next historian of note is Ralph de Diceto, dean of London, who, about the year 1210, composed two treatises, entitled "Abbreviationes Chronicorum," comprising an abstract of our history, chiefly ecclesiastical, down to the conquest, and "Imagines historiarum," containing the history of some of our kings, terminating with the first year of king John's reign. Selden much admires this author and his works. These writers were soon succeeded by Matthew Paris, a monk of St. Alban's, who is reckoned the first in value and reputation of all our ancient historians. His history comprehends a very important period, from the beginning of the reign of William I. to the end of that of Henry III., and the information it contains is equally curious and useful. His mode of writing is, on the whole, pleasing and agreeable, and his composition simple and perspicuous. The spirit with which he exposes the

pretensions and conduct of the Roman pontiffs is admirable; and it is no wonder that, on this account, he should be disparaged by Bellarmine and Baronius. His history was first published at London in 1571, and at Zurich in 1589. It again appeared in 1606; but the best edition is that of Dr. W. Watts in 1640. Watts's edition again appeared in 1684, but this edition is not equal to the first impression. The 14th century begins with Thomas Wikes, whose history begins at the conquest, and ends at the death of Henry I., A.D. 1304. Nicholas Trivet, who was buried in the year 1328, and his contemporary, Roger Cestrensis, deserve curiosity mention. The chronicle of John Brompton begins with the coming in of Augustin the monk in 528, and ends with the death of Richard I. A.D. 1198: this author has given a collection and version of the Saxon laws in Latin, made in the time of Edward III. The chronicle of Walter Hemmingford, who flourished in the reign of Edward III. begins in 1066, and ends with the year 1308. Ralph Higden wrote a history, styled "Polychronicon," chiefly compiled from the writings of other, and old chronicles now lost. He died in the year 1377. John, vicar of Tinmouth, was a great collector of English histories, which he digested in three very large volumes; they chiefly relate to the miracles of English saints. He was a monk of St. Alban's in 1366. Matthew, a Benedictine monk of Westminster, was a great collector of former histories, and therefore usually styled "florilegus." His history ends at the year 1307, which he probably did not long survive. It was continued by others; chiefly by Adam Merimuth, canon regular of St. Paul's, who begins in 1302, and ends in 1380, probably the year of his death. Henry Knighton wrote a chronicle "Of the Events of England," from the time of Edgar, in 958, to the year 1395, the 19th year of Richard II. in whose time he lived. Although he does not rank high as an historian, he is valuable for the account he gives of the proceedings against Richard II. from which it appears how free our constitution was underflood to be at that period, and how great were the prerogative and power of parliament. His "Chronicon, de Eventibus Angliæ," and his "Historia depositionis Ricardi secundi," are both preserved in Twifden's "Decem Scriptores." The 15th century was one of the most rude and illiterate ages. Amongst the few eminent for learning was sir John Froissart, whose work contains a general history of the affairs of France, Spain, and other parts of Europe; but he also particularly insists on the wars between the English and French, from 1335 to 1400. (See his biographical article.) The next historian worthy of notice is Thomas Walsingham, a monk of St. Alban's, and probably regius professor of history in that monastery, about the year 1440. His short history begins at the conclusion of Henry the Third's reign, where Matthew Paris ends, and is continued to the end of Henry V. His "Hypodigma Neultriz," regards the affairs of Normandy from the time of Rollo to the sixth year of Henry V. in which are many occurrences not elsewhere to be found. William Caxton continued a history begun by the monks of St. Alban's, which commenced with the first inhabitants of this island, to the last year of Edward IV. 1483. The whole work bears the title of "Fructus Temporum." John Ross travelled over England, and made collections out of the libraries to which he had access, pertaining to the history and antiquities of this kingdom. They are preserved in the British museum; and contain many particulars that illustrate the antiquities of our universities. Of the historians above recited, those whose works are entitled to diligent perusal by the historical student, are Ingulphus, Eadmerus,

William

HISTORY.

William of Malmſbury, Roger de Hoveden, William of Newberry, Matthew of Paris, Matthew of Westminster, Henry Knighton, and Froiſſart. Moſt of our ancient hiſtorians will be found in ſir Henry Savile's "Quinque Scriptores Anglicæ Hiſtoriæ," 1596; in the "Decem Scriptores" of 1629; in the "Decem Scriptores" by Twiſden, in 1652; in the "Rerum Anglicanarum Scriptores," published at Oxford in 1684; and in the two volumes of Dr. Gale, the firſt containing five, and the ſecond 15 hiſtorical writers. There are ſeparate editions of Merianus and Duodechinus, of Florentius, of Eadmerus, of Matthew Paris, of Trivet, of Matthew of Westminster, of Froiſſart, of T. Walsingham, and of W. Caxton. Of the hiſtorians in the 16th century, we may mention Robert Fabian, who died in 1512, whoſe "Hiſtoriarum Concordantiæ," bring down the hiſtory from Brutus to William the Conqueror, in the firſt ſix books; and in the ſeventh he gives the hiſtory of our kings from the Conqueror to Henry VII.; Polydore Virgil, an accompliſhed writer, who wrote the hiſtory of our nation in Latin to Henry VIII.; Edward Hall, who died in London in 1547, and who wrote a diſcuſſed account of the wars between the houſes of York and Lancaſter, dedicated to Henry VIII.; Harriſon and Hollinghead, whoſe chronicle is greatly eſteemed; and the ſecond edition of this hiſtory was continued to the year 1586 by John Hooper, alias Vowel. In the 17th century the firſt author who occurs is John Stow, who was an induſtrious ſtudent, and a critical collector; he died in 1605; John Speed wrote a chronicle, which is the largeſt and the beſt, ſays Nicholſon, that is extant; it begins with the firſt inhabitants of this iſland, and ends with the union of the two kingdoms under king James, to whom it is dedicated; Richard Baker, who died in the Fleet, in 1644, published a chronicle, which was well received; the author himſelf wrote the hiſtory of our kings from the Romans to the end of the reign of James I. and it was continued to the reſtoration by Edward Philip. In later times we have had a great number of hiſtorians, or compilers of hiſtory. Among theſe we may enumerate ſir Winſton Churchill, Sandford, Brady, a zealous advocate for the royal prerogative, Tyrrel, a ſtrenuous defender of the ancient rights and privileges of the people, Echard, now almoſt forgotten; Carte, a non-juror and a Jacobite, whoſe general hiſtory, notwithstanding his peculiar opinions and attachments, is undoubtedly a production of great merit in point of information; Guthrie, much neglected, but undeſervedly, as he is a faithful and diligent writer, who had recourſe to original evidence, though in the latter part of his work he inclines too much to Tory principles; and Ralph, whoſe critical hiſtory of the reigns of Charles II. and James II. is a ſupplement to Guthrie, and is a curious and valuable performance. The more conſiderable hiſtorians, whom we ſhall mention, are Clarendon, of whoſe hiſtory we have already given an account; Whitelocke, whoſe Memorials contain a rich repository of moſt valuable materials; Ludlow, an honeſt and zealous republican; Burnet (ſee his article, and above); Rapin, who ſpent 20 years in the compoſition of his excellent hiſtory, and who, though tedious, is on the whole faithful and impartial; Tindal, the continuator of Rapin, Hume, Smollet, Henry, Lyttelton, Harris, Macaulay, &c. &c. &c.; and a great number of others, who have written hiſtories of particular lives and reigns, and whoſe names we cannot recite.

Hiſtory, with reſpect to *time*, is divided into *ancient* and *modern*, diſtinguiſhed into ſeveral epochs, periods, and intervals.

The three periods of time into which hiſtory has been divided are the following, *viz.* the *firſt*, from the creation to

the deluge, which age is reckoned uncertain, becauſe we know no more than the ſhort account given of it in the holy ſcriptures; the *ſecond*, from the deluge to the firſt Olympiad, which, from the many feigned ſtories related in it, is called the fabulous age; the *third*, from the firſt Olympiad to our own times, is called hiſtorical, becauſe the actions done in that period are recorded by writers of true hiſtory. See AGE and CHRONOLOGY.

The moſt ancient of the Greek hiſtorians now left is Herodotus, who lived, according to ſir Iſaac Newton's Chronology, 157 years after the building of Rome. And as to the Romans, Livy himſelf confeſſes, that there were ſcarcely any certain memoirs of their affairs till the city was taken by the Gauls, which was above 100 years later than Herodotus; the accounts before this time having been preſerved chiefly by tradition.

Hiſtory, with reſpect to its *ſubject*, is divided into *univerſal* and *particular*, *ſacred* and *profane*.

F. Menſtrier gives us the proper characters of the divers kinds of hiſtory with great accuracy. He diſtinguiſhes hiſtory with regard to both its matter and its form, and gives curious inſtances of each particular.

Hiſtory, with regard to its *matter*, is either *ſacred*, or *natural*, or *civil*, or *perſonal*, or *ſingular*; to which ſome have added *artificial hiſtory*, giving an account of the origin and progreſs of arts; and *miſcellaneous hiſtory*, which recites many various things as they promiſcuouſly occur in human life.

HISTORY, ſacred, is that which lays before us the myſteries and ceremonies of religion, viſions, or appearances of the Deity, &c. miracles, and other ſupernatural things, of which God alone is the author. Such are, the book of Geneſis, the Gospels, Apocalypſe, &c. See MIRACLES, PROPHECY, REVELATION, &c.

To this we may refer *eccleſiaſtical hiſtory*, which gives an account of the riſe and eſtabliſhment of the ſeveral religions and churches, of the riſe and progreſs of various opinions, ſects, &c. In ancient *ſacred* hiſtory, otherwiſe called the hiſtory of the Old Teſtament, there are ſeven remarkable periods. The firſt comprehends 1656 years, from the creation of the world to the deluge; (ſee *SACRED CHRONOLOGY*.) The ſecond period includes 857 years, from the deluge to the going forth of the Iſraelites out of Egypt. (See DELUGE.) The third period begins with the exodus of the Iſraelites in 2513, extends to the times of the kings, and includes 396 years. (See EXODUS.) The fourth period begins in the year of the world 2909, or from the beginning of the government by kings, and extends to the end of the Babyloniſh captivity, or 3468th year of the world, including 559 years. (See CAPTIVITY.) The fifth period amounts to 372 years, from the year of the world 3468 to the year 3840, or to the times of the Maccabees. (See MACCABEES.) The ſixth period begins with Judas Maccabæus, A.M. 3840, and is continued to the year 3964, or to Herod the Great, comprehending 124 years. (See HEROD the Great.) The ſeventh, or laſt period reaches from Herod the Great to the deſtruction of Jeruſalem, or the 70th year after the birth of Chriſt, containing 106 years. See JERUSALEM.

In more *modern ſacred* hiſtory, more properly called *eccleſiaſtical* hiſtory, which denotes a clear and faithful narration of the tranſactions, revolutions, and events that relate to the external and internal ſtate of the Chriſtian church, Dr. Moſheim has diſtinguiſhed four remarkable periods. The firſt comprehends the ſtate and viciffitudes of the Chriſtian church, from its commencement to the time of Conſtantine the Great. The ſecond period extends from the reign of Conſtantine to

that.

HISTORY.

that of Charlemagne, which produced such a remarkable change in the face of Europe. The third period contains the history of the church from the time of Charlemagne to the memorable period when Luther rose in Germany to oppose the tyranny of Rome, and to deliver divine truth from the darkness that covered it. The fourth period reaches from the time of Luther to the present times. On this plan Dr. Mosheim's ecclesiastical history, a work deservedly held in great esteem, is divided into four books, containing the history of the centuries comprehended by the above periods according to the order of time. (See Holberg's Introduction to Universal History, translated by Dr. Sharpe, with notes, &c., p. 55, &c. ed. 1758; and Mosheim's Ecclesiastical History, translated by Dr. Maclaine, with notes, &c. comprised in 6 vols. 8vo. vol. i. p. 12.) To this work Dr. Warburton, the late learned bishop of Gloucester, bears the following testimony: "Mosheim's Compendium is excellent, the method admirable indeed, the only one deserving the name of an ecclesiastical history." He adds, "It deserves frequent notes."

HISTORY, natural, is a description of the singularities of nature, its irregularities and prodigies, and the alterations it undergoes in the birth, progress, end, and use of things. Such is Aristotle's History of Animals, Theophrastus's History of Plants, and the entire body of Natural History by Pliny; such also are Acosta's Natural History of the Indies, Plott's History of Staffordshire, &c.

HISTORY, civil, is that of people, states, republics, communities, cities, &c. Such are those of Thucydides, Halicarnassus, Livy, Polybius, Mezeray, F. Daniel, Milton, Buchanan, &c.

Civil history may again be subdivided into *particular* and *general*: the former consists of a number of facts relating to the same state, suitably connected and laid together in a proper series; such are Thucydides's History of the Peloponnesian War, comprising the events of the first twenty years of that war; Sallust's History of the War between the Romans and king Jugurtha in Africa; and Cæsar's History of his own Gallic and civil Wars: the latter, or *general history*, is made up of several particular *histories*, whose separate transactions within the same period of time, or part of it, should be so distinctly related as to cause no confusion; such are those of Diodorus Siculus, of Herodotus, of Justin, of Xenophon, and of Polybius, among the ancients; and Thuanus's History; Lord Littelton's History of Henry II; Dr. Robertson's History of Charles V. &c. among the moderns.

Civil history, in its more unlimited extent, is denominated *universal history*. See HISTORY with regard to *actions*, *supra*.

HISTORY, personal, is that which gives the portrait or life of some single person. Such are the lives of Plutarch, Cornelius Nepos, Suetonius, &c. and the lives of the painters, philosophers, saints, &c.

Personal history is the same with what we otherwise call *biography*, and may be denominated *literary history*, as it records the lives and productions of learned men, the controversies that subsisted amongst them, and the rise and advancement of sciences. See BIOGRAPHY.

HISTORY, singular, is that which describes a single action, siege, battle, or even a war or expedition, &c. Such was the conspiracy of Catiline to subvert the Roman state written by Sallust.

History, with regard to its *form*, is either *simple*, or *figurative*, or *mixed*.

HISTORY, simple, is that delivered without any art or foreign ornament; being only a naked and faithful recital of

things, just in the manner and order wherein they passed. Such are the Chronicles of the Eastern Empire, the Fasti, Chronological Tables, Journals, &c.

HISTORY, figurative, is that which is farther enriched with ornaments, by the wit, ingenuity, and address of the historian. Such are the political and moral histories of the Greeks, Romans, and most of the moderns.

This latter is a kind of rational history, which, without stopping at the shell or outside, the appearances of things, discovers the secret springs and movements of the several events; it enters into the thoughts, the breasts of the persons concerned therein; discovers their intentions and views; and, by the result of enterprizes and undertakings, discovers the prudence or weakness wherewith they were laid, conducted, &c. These are much the most useful and entertaining histories. To this class may be particularly referred the Histories and Annals of Tacitus, among the ancients; and those of Guicciardin, Thuanus, and bishop Burnet, among the moderns.

HISTORY, mixed, is that which, besides the ornaments of figured history, calls in the proofs and authorities of simple history, furnishing authentic memoirs, or original letters, manifestoes, declarations, &c. to vouch the truth of what is said. Such are Histories or Collections of Rushworth, M. Rapin Thoyras's History of England, the Genealogical Histories of Duchesne, M. De Marca's History of Berne, &c.

We shall close this article of History in general, with a brief recapitulation and illustration of the benefits that are likely to result from the diligent study of it; and here we shall avail ourselves of the excellent remarks of Dr. Priestley in his "Lectures on History." The first and lowest use of history is, that it agreeably amuses the imagination, and interests the passions, and, in this view of it, it far surpasses all works of fiction. The latter resembles those machines that are contrived to illustrate the principles of philosophy, such as globes and orreries, the uses of which extend no farther than the views of human ingenuity: whereas real history resembles the experiments made by the air-pump, the condensing engine, or electrical machine, which exhibit the operations of nature, and the God of nature himself, whose works are the noblest subject of contemplation to the human mind, and are the ground-works and materials of the most extensive and useful theories. Fiction requires a variety of embellishments to excite and interest the passions; whilst the mere thought that we are listening to the voice of truth serves to keep the attention awake through many dry and indigested narrations of facts. The next, and higher use of history, is to improve the understanding, and strengthen the judgment, and thus to fit us for entering upon life with advantage. History presents us with the same objects which occur to us in the business of life, and affords similar exercise to our thoughts; so that it may be called anticipated experience. In some respects it will be a better guide to us in the conduct of life than experience: because the examples which it presents to us are generally complete, and we see them through a less partial medium than that of experience. History is, therefore, of great importance not only to the advancement of political knowledge, but to that of knowledge in general, because the most exalted understanding is merely a power of drawing conclusions, and forming maxims of conduct from known facts and experiments, of which necessary materials of knowledge the mind itself is wholly barren, and with which it must be furnished by experience. By improving the understanding history frees the mind from many foolish prejudices that tend to mislead it. Such are those prejudices of a national kind, that have induced an unreasonable

unreasonable partiality for our own country, merely as our own country, and as unreasonable for foreign nations and foreign religion, which nothing but the enlarged views resulting from history can cure. It likewise tends to remove those prejudices that may have been entertained in favour of ancient or modern times, by giving a just view of the advantages and disadvantages of mankind in all ages. To an inhabitant of Great Britain it will be one of the greatest advantages resulting from the study of history, that, so far from producing an indifference to his own country, it will dispose him to be satisfied with his own situation, and render him, from rational conviction, and not from blind prejudice, a more zealous friend to the interests of his country. It is from history that all future improvements in the science of government must be derived, and this science, it will be allowed, is of primary importance and interest to those who have sufficient abilities for the study of it, and who are friends of mankind. Another very capital advantage of history is, that it tends to strengthen the sentiments of virtue. It conduces to this purpose by displaying the sentiments and conduct of truly great men, and those of a contrary character, and thus inspiring us with a taste for solid glory and real greatness; whilst it convinces us that these qualities do not consist in the attainments which mankind are too generally pursuing. That true greatness does not consist in riches may be evinced by the examples of Cincinnatus, Fabricius, Scipio Æmilianus, and other Romans in the early ages of their city, who were honoured for their poverty. The emperors Nerva, Trajan, Antoninus, and Aurelius, fold their palaces, their gold and silver plate, their valuable furniture, and other superfluities heaped up by their predecessors, and banished from their tables all expensive delicacies. These princes, together with Vespasian, Pertinax, Alexander Severus, Claudius the second, and Tacitus, who were raised to the empire by their merit, and whom all ages have admired as the greatest and the best of princes, were always fond of the greatest plainness in their apparel, furniture, and outward appearance. When the famous Cornelia, daughter of the great Scipio, was importuned by a lady of her acquaintance to shew her toilette, she deferred satisfying her curiosity till her children, who were the famous Gracchi, came from school, and then said "En! hæc ornamenta mea sunt." "These are my ornaments." Can we think that honours and preferments constitute true greatness, when history teaches us that the most worthy men have generally declined them? On the other hand, the extravagances of Alexander the Great in killing his best friends, the cruelties of the Spaniards in America, the ruin of Sweden by Charles XII. are certainly more proper to shew the folly and madness of unbounded ambition, than their victories are to dazzle our minds with their glare. Nothing so effectually cures a man of the absurd pride of birth and family, as seeing some of the greatest men in history, such as Tamerlane, cardinal Ximenes, and pope Sixtus V. rise from low beginnings. Even Vespasian laughed at those who pretended to derive his descent from Hercules. An excessive passion for fame, as an end of action, reduces a man very low in the light of history. On the contrary, how prodigiously does the character of Cato rise upon us by a few words of Sallust: "Maluit esse, quam videri, bonus;" "He rather chose to be, than to seem, good." The vanity of Nero upon his excelling in music, and gymnastic exercises, and of Commodus on his dexterity in killing wild beasts, completely exposes the affectation of gaining eminence in what is out of our proper sphere. The same maxim is conveyed by Philip, when he asked his son Alexander, if he was not ashamed to play on a musical instrument so well as he did. A simple

narration of some historical incidents excites an admiration of true greatness of mind more than the most elaborate description of it. What can give us a clearer idea of the noble sentiments of strict honour and integrity, than Marshal Turenne's refusing a sum of money, which was offered him, if he would not march his army through a certain territory, because he had not intended to march that way! Does not every person's heart strongly feel the sentiments of benevolence, when he hears the good Titus exclaiming, that he had "lost a day," because he had done no person a good office in it! If a person be capable of forming any idea of greatness of mind in forgiving injuries, he will do it from hearing the following reply made by Lewis XII. to a courtier, who pressed him to punish a person who had offended him before he came to the throne; "It belongs not to the king of France to revenge the injuries offered to the duke of Orleans?" Or, what can give so just an idea of the true spirit and magnanimity of a soldier, as the reply that viscount Dorée made to Charles IX. of France, when he received an order from him to massacre the Huguenots; "I desire your majesty would employ me in what is possible." This example suggests also, that history enables us to form just ideas of the dignity and the weakness of human nature, both of which are extremely useful to us in life. When the earl of Peterborough, at the siege of Barcelona, was settling the terms of capitulation with the Spanish commander, news was brought him that, contrary to the suspension of arms stipulated between them, a party of the allied troops had broken into the town. The earl, with a noble spirit of true honour and heroism, told the Spanish general, that if he would give him leave to enter the town with his English troops, he would drive out his allies, and then return to finish the capitulation, which he actually performed. Without mentioning the fabulous story of Curtius, who is said to have leaped into a gulph, or of Codrus, who procured his own death to save his country, we may observe, that at the siege of Turin one Mica fired a mine, and purposely destroyed himself with the enemy. And how many commanders of ships have blown them up rather than strike their colours! Such facts, together with those which manifest the extent of genius, in men like Aristotle, Archimedes, and sir Isaac Newton, give us high ideas of the dignity of human nature, and the capacity of the human mind. History also, with equal fidelity, gives us a most affecting, and equally instructive view, of our deplorable weakness and frailty, exemplified in the occasional conduct of the greatest of men. What gross and humiliating superstitions have been manifested by men, in other respects, of sound and clear understandings, and of upright honest hearts! Pascal, one of the greatest geniuses and best men that ever lived, entertained a notion, that God made men miserable here in order to their being happy hereafter; and in consequence of this notion, he imposed upon himself the most painful mortification. He even ordered a wall to be built before a window in his study, which afforded him too agreeable a prospect. He also had a girdle full of sharp points next his skin, and while he was eating or drinking any thing that was grateful to his palate, he was constantly pricking himself, that he might not be sensible of any pleasure. It was through a similar weakness that the excellent Fenelon submitted without reserve to the arbitrary sentence of the pope, when he condemned a book which he had published, and even preached in condemnation of his own book, forbidding his friends to defend it. (See the articles FENELON and PASCAL.) Moreover, history tends to strengthen the sentiments of virtue, by the variety of views in which it exhibits the conduct of divine providence, and points out the hand of God in the affairs of men.

HISTORY.

For whatever suggests to us the idea of a divine being, either in the end, or means, of great events, must be favourable to piety and virtue. Who would have imagined, that the desire which Henry VIII. had to be divorced from his wife would have brought about the reformation in England? The indiscretion of a Portuguese priest, who would not give place to one of the king's officers in Japan, and the obliquity of the Jesuits, in refusing to give up the house which a nobleman had given them, when his son claimed it back again, occasioned the extirpation of the Roman Catholic religion in that country. The history of Joseph, that of Esther and Mordecai, and many others that are recorded in the instructive pages of the Old Testament, supply facts to the same purposes. Great events, under the conduct of providence, are brought about contrary to the intention of the persons who were the chief instruments of them, and by the means which were intended to produce a contrary event. Thus persecution has been always the means of promoting the persecuted religion; and thus the well-known adage has been verified: "The blood of the martyrs is the seed of the church." Thus, likewise, Athens, Lacedæmon, Carthage, Rome, and many other states, have been ruined by their own successes. Philip II. of Spain, by his intolerable oppression, was the cause of the freedom of the states of Holland. A regard to divine providence is also extremely useful to heighten our satisfaction in reading history, and throw an agreeable light upon the most gloomy and disgusting parts of it. Moreover, history, in the misfortunes and hardships to which the most distinguished personages have been reduced, gives us a deep conviction of the instability of all human things, and prepares our minds to submit to adversity with more patience and resignation, as to a condition from which we see none are exempt. What other sensation do we feel, while we read that Henrietta, daughter of Henry IV. of France, and wife to Charles I. of England, was reduced to the utmost poverty; and that her daughter, afterwards married to a brother of Lewis XIV. is said to have lain in bed for want of coals to keep her warm, while the people of Paris, blind with rage, paid no attention to her sufferings! Similar sensations are felt, when we read the history of Belisarius, the great and successful general, who is said to have begged his bread, and of Cortez, the renowned conqueror of Mexico, who lived unknown and disgraced in Spain, and was scarcely able to obtain an audience of his master, Charles V., though, when the king asked who was the fellow that was so clamorous to speak to him, he cried out, "I am one who have got your majesty more provinces than your father left you towns." Besides, the reverses of fortune, and calamities of men in high stations, should dispose those who have no opportunity of rising above them, to be content with their situation. The many who have abdicated royalty, as Christina, queen of Sweden, Charles V. emperor of Germany, Victor Amadeus, king of Sardinia, John Casimir, king of Poland, and others, convince us that crowns do not always sit easy; and that persons in high stations have need of a strong sense of honour and integrity to make their fatigues and misfortunes tolerable. In many instances they are objects, not of envy, but of commiseration; and they claim the exercise of a candid judgment. The examples of distinguished personages are apt to make a deeper impression on the mind than those of persons, subject to vicissitude, in the humbler stations of life. The insufficiency of power and riches to bound men's views and to make them happy, is evinced in a thousand instances of almost daily occurrence; but the sentiment makes a deeper impression when we see it exemplified in the history of statesmen and conquerors. It is beautifully exhibited in a

conversation which passed between Pyrrhus and his minister Cyneas, before their expedition into Italy. The minister asked the king what he proposed to do when he had subdued the Romans? He answered, pass into Sicily. What then? said the minister. Conquer the Carthaginians, replied the king. And what follows that? says the minister. Be sovereign of Greece, and then enjoy ourselves, said the king. And why, replied the sensible minister, can we not do this *last* now?

Besides the benefits resulting from the study of history, above briefly recited and illustrated, there are other advantages accruing to mankind from it, in a different manner, as only one instrument of recording transactions. How imperfect, *e. g.* without history, would be our knowledge of genealogies, and consequently of the order of important successions, and how precarious would be the advantage, resulting from conventions and treaties of all kinds, if all the articles of them were deposited only in the memory of the contracting parties. We read that the boundaries of the Grecian states were once determined by a verse of Homer, who, in his description of Greece, relates what they were in his time.

If history be of such distinguished use, we may easily answer a question that has been sometimes proposed; *viz.* at what age it is proper to be read. We need not hesitate in pronouncing, that it can neither be begun too early, nor continued too late. "If history amuse the imagination, exercise and improve the passions, inspire a taste for true glory, just sentiments of, and a love for, virtue, and thereby form the *temper*, and prepare man for conversing with the world; what can be more proper for young persons? And since the mind cannot be too well furnished in these respects, and men cannot have too large a stock of this *anticipated experience*, the study of it must be useful, while there remains any thing of the part we have to act on the theatre of the world. Moreover, since history furnishes materials for the finest speculations, and the most important sciences, it cannot but be of service while we make any use of our intellectual faculties." Prudence will direct those who have the conduct of the studies of young persons to make a proper selection. Histories, which tend chiefly to amuse the imagination, or enforce the plainest instructions in morals, ought rather to be recommended to persons in early life; and histories which furnish greater exercise for the judgment should be reserved for an age in which the judgment is riper. However, there can be no great inconvenience in young persons' being indulged in reading almost all histories promiscuously. No general history is better calculated for the use of such than that of Rollin.

As to the advantages that result from the study of *ecclesiastical history*, they are *general* or *particular*. In a general view of them, the history of the church presents to our view a variety of objects that are every way adapted to confirm our faith. When we contemplate, by the aid of it, the discouraging obstacles, the united efforts of kingdoms and empires, and the dreadful calamities which Christianity, in its very infancy, was obliged to encounter, and over which it gained an immortal victory, this will be sufficient to fortify its true and zealous professors against all the threats, cavils, and stratagems of profane and impious men; the great and shining examples, also, which display their lustre, more or less, in every period of the Christian history, must have an admirable tendency to inflame our piety, and to excite, even in the coldest and most insensible hearts, the love of God and virtue. Those amazing revolutions and events that distinguished every age of the church, and often seemed to arise from small beginnings and causes of little consequence, proclaim, with a solemn and respectable voice, the empire of providence,

vidence, and also the inconstancy and vanity of human things. And among other numerous advantages that result from the study of ecclesiastical history, it is none of the least, that we shall thus see the origin and occasions of those ridiculous rites, absurd opinions, foolish superstitions, and pernicious errors, with which Christianity is yet disgraced in too many parts of the world. This knowledge will naturally lead us to a view of the truth in its beautiful simplicity, will engage us to love it, and render us zealous in its defence; not to mention the pleasure and satisfaction that we must feel in researches and discoveries of such an interesting kind. But in a more particular view of this subject, those who are appointed to instruct youth in the public universities, and also those who are set apart for the service of the church, will derive from this study the most useful lessons of wisdom and prudence, to direct them in the discharge of their respective offices. The inconsiderate zeal and temerity of some, portrayed in their pernicious consequences, will teach circumspection; and the mistakes into which men of eminent merit and abilities have been betrayed will point out the errors to be avoided, and the sacrifices to be made, in order to maintain peace and concord in the church; and, on the other hand, illustrious examples and salutary measures will furnish a rule of conduct, a lamp to shew them the paths they must pursue. Besides, if we except the arms which scripture and reason supply against superstition and error, nothing can enable us to combat them with more efficacy than the view of their deplorable effects, as they are represented to us in the history of the church. Mosheim's *Ecl. Hist.* vol. i. Introduction.

HISTORY is also used for a *Romance*, or a fabulous but probable relation of a series of actions or adventures feigned or invented by the writer. See *ROMANCE*.

Such is the History of the Civil Wars of Grenada, the History of Don Quixote, the Ethiopic History of Heliodorus, &c.

HISTORY, in *Painting*. See *HISTORICAL Painting*.

HISTRIA, a peninsula, N.E. of the gulf of Venice. The first inhabitants of this country were probably Thracians, or more anciently Celtes. The Greeks called the part of the Danube with which they were acquainted "Ister," and it is probable that those who peopled Histria were more anciently known on the banks of the Ister. The principal place of Histria was Pola.

HISTRIO, in the *Ancient Drama*, signified an actor or comedian; but more especially a pantomime, who exhibited his part by gestures and dancing. See *PANTOMIME*.

Livy informs us that the histriones were brought to Rome from Etruria in the year of the city 391, Dec. i. lib. 7. See *HISTER*.

HISTRIO, in *Ichthyology*. See *LOPHIUS Compressus*.

HISTRIN, in *Zoology*. See *HYSTRIX*.

HIT, in *Geography*, a town of the Arabian Irak, on a river of the same name, which soon after joins the Euphrates; near it is a spring of naphtha and bitumen; 100 miles W. of Bagdad.

HITCH, on *Ship-board*, a word denoting a sort of knot or noose, by which one rope is fastened to another, or to some other object, and hence used for catching hold of any thing with a hook or a rope, and to hold it fast. Thus, when the boat is to be hoisted in, they say, hitch the tackles into the rings of the boat; and, when about to weigh anchor, hitch the fish-hook to the fluke of the anchor.

HITCH, in *Mining*, signifies a fault in some districts, and has been defined to be a narrow fissure whose up-throw or down-cast does not much exceed five feet; others have said that a hitch never entirely separates a coal-seam, or never deranges as much as its thickness: we believe, however, that

the miners are not more consistent or agreed on these distinctions, than in the meaning of near 70 names which they have among them for the highly curious phenomenon called a *fault*. See that article.

HITCHEL, the same with hatchel.

HITCHER, in *Nautical Affairs*, is a pole, armed with an iron point and hook, which is used on board of barges or boats for either pulling or shoving them to or off each other, or a wharf, ship, &c. On most canals pointed hitches are prohibited to the boatmen, on account of the damage they do to the lining of puddle in the bottom of the canal to retain its water, as mentioned in our article *CANAL*.

HITCHIN, in *Geography*, a large and ancient market-town and parish in the hundred of Hitchin and Pirton, Hertfordshire, England, is situated in a fertile valley, and surrounded by considerable eminences. It appears to have had its origin in the Saxon times, and was granted by Edward the Confessor to earl Harold, by the appellation Hitchche. In the Domesday book it is called Hiz, a name that, according to Chauncy, it received from the little river Hiz, which flows through it. At the period of making that survey it belonged to the king, and was rated at five hides; two of which are described as lying "in monasterio hujus villæ." Hitchin church is a handsome edifice of stone, occupying the site of a more ancient fabric near the centre of the town, and apparently of the age of Henry VI. or Edward IV. The interior is spacious, and consists of a nave, chancels, and side aisles: its length is upwards of 150 feet; its breadth 67. The sepulchral monuments are very numerous. An inscription for sir Robert de Kendale, knight, and three effigies greatly mutilated, which are now placed under windows of the north aisle, are of more ancient date than the present structure. The first or most westward of these effigies represents a knight cross-legged, in chain armour; and was probably designed for one of the Baliols, who were lords of this manor during the 12th and 13th centuries. The other two figures are the effigies of sir Edward de Kendale, knight, lord of Hitchin, and his lady, who both died towards the end of the reign of Edward III. Some very fine brasses, of the 15th and 16th centuries, occur in different parts of the church; and the windows contain much painted glass. At a short distance south-east of the church was formerly the priory of Biggin, founded for nuns of the Gilbertine order; but at what period is uncertain. The site is now occupied by the school-house, and the appendant-estate is vested in trustees for charitable uses. Hitchin priory was founded for white Carmelites in the time of Edward II.: very few traces of it remain; on the immediate site is now a family mansion. The market at Hitchin, held on Tuesdays, has existed from an early period, and very large quantities of wheat and other grain are sold in it; probably in some degree from being free of toll, by prescriptive right. Two fairs are held annually for the sale of cattle, sheep, &c. Formerly the wool trade was very flourishing here; this town having become the residence of many merchants on the removal of the staple from Calais by Edward III. The town is divided into three wards, viz. Bancroft, Bridge, and Tile-house wards, and is governed by a bailiff, four constables, and two headboroughs for each ward. Among numerous charitable donations in this parish, are those of John Skynner, gent. who, in the year 1668, bequeathed 300*l.* to build almshouses; 300*l.* to purchase lands for their endowment; 100*l.* to apprentice poor children; and 100*l.* towards the further endowment of the free-school. Hitchin is 34 miles distant from London: and, according to the returns under the population act of 1801, contained 674 houses (mostly irregular buildings),

buildings), and 3161 inhabitants. Chauncy's Historical Antiquities of Hertfordshire.

HITCHING, in *Horsemanship*, is to wriggle or move forwards by degrees, or to knock the legs together in walking.

HITHE, in *Geography*. See **HYTIE**.

HITSACKER, a town of the principality of Luneberg-Zelle, situated on an island in the Jetze; 29 miles E. of Luneburg. N. lat. 53° 17'. E. long. 14° 12'.

HITTERO, or **HITTEREN**, an island in the Northern ocean, near the coast of Norway. N. lat. 63° 32'. E. long. 8° 20'.

HIU, a city of China, of the second rank, in the province of Honan. N. lat. 34° 5'. E. long. 113° 35'.

HIVE, in *Rural Economy*, the name of a well known repository for bees. Bee-hives, in different places, and on different occasions, are of very different materials. In some places the hollow trunk of a tree serves the purpose; in others they are made of four boards nailed together in the shape of a long box, and placed with one end upon the ground, or upon a frame of wood-work erected for that purpose. The most usual form of them, however, is conic and bell-shaped; and the common materials of which they are made are twisted osier or straw, nicely matted together, and made into a sort of thick cords, bound round with osier-bark. The last is the most common kind, and serves perfectly well for all the purposes of the bees, and of the persons who make their profits of the honey. The lodgment is sufficiently warm and close for the bees, and a thin frame of boards defends it from being injured by the wet. But persons of speculative dispositions have at all times been desirous of seeing what passed in the hive, and of observing these industrious insects at their work: for this purpose the ancients contrived a method of placing certain squares or panes of a transparent matter, such as horn, or the lapis specularis, or iunglass, in some parts of the sides of the hive, through which they might see all that passed within. This is mentioned by Aristotle, Pliny, and others; but it soon sunk into disuse, and in later ages it has been supposed to be an idle attempt. Mouffet in particular ridicules it, and says, that the bees within would immediately spoil the transparency of any materials thus employed.

This practice of the ancients seems to have been first revived in our country by Mr. Jeddie, who, in the year 1665, published his invention of boxes for preserving the lives of bees, and obtained a patent from king Charles. These were improved by Joseph Warder, physician at Croydon, who enriched his account of the structure and use of these boxes, with several other curious circumstances concerning bees, in his work entitled "The true Amazons, or the Monarchy of Bees." But this method was far from being generally known in the year 1680, since Swammerdam seems to have been altogether unacquainted with it; and to this we are to impute the imperfections of that author's account of bees, because, though a most accurate and faithful writer, he had no opportunities of seeing what has been since discovered with this advantage.

Of late, however, this invention has been commonly practised. A transparent sort of bee-hive may easily be made, by leaving certain squares in a wooden hive open, and afterwards fastening clear glass in these vacant spaces; a frame of wood may cover the whole, so that the light is not always let in upon the bees, and the covering may be removed when the observer is to examine their operations. By this means it is found, that the squares of glass, when properly placed, will keep clean and trans-

parent for many years; and when they are sullied, there are easy methods of cleaning them, by taking them out and replacing them when they have been wiped. When the observer places himself behind the hive, and has one of these squares of glass before his eye, he sees exactly all that passes within, without incommoding or interrupting the creatures at their work. These glass hives, however, are chiefly objects of curiosity, though, in some instances, they have led to discoveries that must gradually contribute to the improvement of the economy of these useful insects.

The principal advantage derived from hives of modern construction, is that of obtaining the honey and wax without recurring to the barbarous expedient of destroying the bees. In the common method, a hole is dug near the hive, (generally in the month of September,) and a stick, at the end of which is a rag that has been dipped in melted brimstone, is fixed in the hole; and, when the rag is set on fire, the hive is immediately put over it, and the earth thrown up round it, so that none of the smoke can escape; and thus the bees are inhumanly and needlessly destroyed. The heaviest and lightest hives are treated in this manner; the former, because they yield the greatest profit, with an immediate return; and the latter, because the bees in them would not be able to survive the winter. Those hives which weigh from fifteen to twenty pounds are thought to be the fittest for keeping. The method of preserving the lives of bees has been brought to a considerable degree of perfection by the late Mr. Thorley of Oxfordshire, and Mr. White of Suffolk. Mr. Thorley, who takes the lead in this improvement, prefers colonies to hives for the following reasons: 1. The more certain preservation of many thousands of these useful insects. 2. Their greater strength, consisting in their number, and their corresponding security from robbers. 3. Their greater wealth, arising from their united labours. To this purpose he tells us, that he has, in some summers, taken two boxes filled with honey (most of it being pure virgin honey of the best kind) from one colony, and left sufficient store for their maintenance: add to these advantages, the pleasure of viewing them, with the greatest safety, at all seasons, even in their busiest time of gathering, and their requiring much less attendance in swarming time. The bees thus managed are also more effectually secured from wet and cold, from mice, and other injuries.

Mr. Thorley's boxes are made of deal, which, being spongy, sucks up the breath of the bees sooner than a more solid wood would do; and yellow dram-deal, thoroughly seasoned, he says, is the best.

The best form of these boxes is an octagon, which, being nearer to a sphere, allows the bees in winter to lie in a round body near the centre of the hive; and thus a due heat is conveyed to all the exterior parts, and the honey is kept from candying. The dimensions, which he recommends, after long trial, are ten inches deep in the inside, the top-board a full inch, and the breadth within twelve or fourteen inches. He has tried boxes containing a bushel or more, but found them not to answer the design like those of a less size. The top of the box should be made of an entire board, or of two boards well glued together, which should be a full inch thick after it has been planed, and project on all sides at least an inch beyond the dimensions of the box. In the middle of this top there must be a hole five inches square, for a communication between the boxes; and this hole should be covered with a sliding shutter of deal or elm, running easily

easily in a groove, over the back-window. The eight pannels, nine inches deep, and three quarters of an inch thick when planed, are to be let into the top, so as to keep them in their proper places; to be secured at the corners with plates of brass, and to be cramped with wires at the bottom, in order to keep them firm. There should be a glass window behind, fixed in a frame, with a thin deal cover, two small brass hinges, and a button to fasten it: this window will serve for inspecting the state and operations of the bees. Two brass handles, one on each side, are necessary to lift up the box; these should be fixed in with two thin plates of iron, near three inches long, so as to turn up and down with the box, and put in three inches below the top-board, which is nailed down close with springs to the other parts of the box. Those who choose a frame within, to which the bees may fasten their combs, need only use a couple of deal sticks of an inch square, placed across in the box, and supported by two pins of brass; one an inch and a half below the top, the other two inches below it; by which means the combs will quickly find a stay. There must also be a passage, four or five inches long, and less than half an inch deep, for the bees to go in and out at the bottom of the box.

The boxes, thus prepared, should be kept in a house, or under a shed, the disposition and structure of which Mr. Thorley has particularly described. He also recommends to paint the apertures of the boxes, which are the habitations of the several colonies, with different colours, as red, white, blue, yellow, &c. in form of a half-moon or square, that the bees may the better know their own home. For the method of furnishing these colonies with inhabitants, see *HIVING*.

Mr. Thorley, son to the above-mentioned gentleman, has, by long experience, improved his father's method of managing bees. The bee-hive of his construction, presented to the Society of Arts, &c. is exhibited in *Plate XX. Miscellany, fig. 1*.

The bottom part, marked *a*, is an octangular bee-box, made of deal-boards, about an inch in thickness, the cover of which is externally 17 inches in diameter, but internally only $15\frac{1}{2}$, and its height 10 inches. In the middle of the cover of this octangular box is a hole, which may be opened or shut at pleasure, by means of a slider *d*. In one of the pannels is a pane of glass, covered with a wooden door *e*. The entrance *f*, at the bottom of the box, is about three and a half inches broad, and half an inch high. Two slips of deal about half an inch square, cross each other in the centre of the box, and are fastened to the pannel by means of small screws: to these slips the bees fasten their combs. In this octangular box the bees are hived, after swarming in the usual manner, and there suffered to continue till they have built their combs and filled them with honey; which may be known by opening the door, and viewing their works through the glass pane, or by the weight of the hive.

When the bee-master finds his laborious insects have filled their habitation, he is to place a common bee-hive of straw, represented at *b*, made either flat at the top, or in the common form, on the octangular box, and drawing out the slider, a communication will be opened between the box and the straw hive; in consequence of which the bees will fill this hive also with the product of their labours.

When the straw hive is well filled, the slider may be pushed in, and the hive taken away, and another placed in its room, with the slider drawn out. This new hive will also be filled in the same manner.

By proceeding in this method, Mr. Thorley assured the society, that he had taken three successive hives filled with honey and wax, from a single hive, during the same summer, and that the food still remaining in the octangular box was sufficient for the support of the bees during the winter. He adds, that if this method was pursued in every part of the kingdom, instead of the cruel method of destroying these useful insects, he is persuaded, from long experience, that wax would be collected in such plenty, that candles made with it might be sold as cheap as those of tallow are sold at present.

Mr. Thorley has also added another part to his bee-hive, which cannot fail of affording the highest entertainment to a curious and inquisitive mind. This part consists of a glass receiver, 18 inches high, eight inches in diameter at the bottom, and in the greatest part 13; this receiver has a hole at the top, about an inch in diameter, through which a square piece of deal is extended nearly to the bottom of the vessel, having two cross-bars, to which the bees fasten their combs. Into the other end of this square piece is screwed a piece of brass, which serves for a handle to the receiver or glass hive. When the bees have filled their straw hive, which must have a hole in the centre covered with a piece of tin, Mr. Thorley places the glass receiver upon the top of the straw hive, and draws out the piece of tin. The bees, now finding their habitation enlarged, pursue their labours with such alacrity, that they fill this glass hive likewise with their stores; and as this receptacle is wholly transparent, the curious observer may amuse himself with viewing the whole progress of their works. It will, however, be necessary to cover the glass with an empty hive of straw, or at least with a cloth, which may be easily removed when the bees are inspected, lest too much light prevent their working. In this way Mr. Thorley, in a good season, has had a glass filled in thirty days, containing 38 pounds of fine honey.

When the glass is completely filled, slide a tin plate between the glass and the hive or box, so as to cover the passage, and in half an hour the glass may be taken away with safety. The few bees that remain will readily go to their companions.

Mr. Thorley has added a glass window to his straw hives, in order to observe the progress of the bees; and this contrivance is useful, especially if one hive is to be removed whilst the season continues favourable for their collecting of honey; for when the combs are filled with honey, the cells are sealed up, and the bees forsake them, and reside mostly in the hives in which their works are chiefly carried on. Observing also, that the bees were apt to extend their combs through the passage of communication into the upper hive, which rendered it necessary to divide the comb when the upper hive was taken away, he puts in that passage a wire screen for netting, the meshes of which are large enough for a loaded bee to pass easily through them; and thus he prevents the junction of the combs from one box to the other, and consequently obviates the necessity of cutting them, and of spilling some honey, which running down among a crowd of bees, incommodes them much.

Mr. White, in his directions for making the bee-boxes of his invention, tells us, speaking of the construction of a single box, that it may be made of deal or any other well-seasoned boards, which are not apt to warp or split. The boards should be near an inch thick; the figure of the box square, and its height and breadth nine inches and five-eighths every way, measuring within. A box of these dimensions will contain near a peck and a half. The front part must have a door cut in the middle of the bottom edge, three inches wide, and near half an inch high. In the back part a hole must be cut

with a rabbet in it, in which is to be fixed with putty a pane of the clearest and best crown glass, about five inches long, and three broad; and let the top of the glass be placed as high as the roof withinside, that the upper part of the combs may be seen; and thus the state and strength of the bees may be judged better of than if the glass were fixed in the middle. The glass must be covered with a thin piece of board, as a shutter, which may be made to hang by a string, or turn upon a nail, or slide sideways between two mouldings. The glass may be made large, or another pane of glass may be fixed on the top and covered with a shutter, for the convenience of observing the bees at their work. The side of the box, which is to be joined to another box of the same form and dimensions, as it will not be exposed to the external air, may be made of a piece of slit deal not half an inch thick. This Mr. White calls the side of communication, because it is not to be wholly inclosed: a space is to be left or cut at the bottom through the whole breadth of the box, and a little more than an inch in height, and a hole or passage is to be made at the top, three inches long, and more than half an inch wide. Through these the bees are to have a communication from one box to another. In the next place a loose board is to be provided, which board is to be half an inch thick, and large enough to cover the side of communication; and likewise several little iron staples, an inch and a half long, with the two points or ends bending down more than half an inch: the use of this part of the apparatus will appear under the article *HIVING*. Moreover, let two ticks be fixed in the box transversely and crossing each other, in order to be a stay to the combs; one about three inches from the bottom, and the other at the same distance from the top; and when the hole is painted, in order to render it more durable, the box is finished. This box, says the inventor, is as plain as possible: it is little more than five square pieces of board nailed together, so that any poor cottager may make his own boxes, without the help or expence of a carpenter.

The other box must be exactly of the same form and dimensions; and the two boxes differ only in this, that the side of communication of the one must be on the right hand, and of the other on the left. The two boxes, with their openings of communication ready to be joined to each, are represented in *Plate XX. Miscellany, fig. 2.*

In *fig. 3.* is exhibited the front of a frame for twelve colonies; *a, a,* are two sills of oak, lying flat on the ground, more than four feet long: in these sills are fixed four oaken posts, about the thickness of such as are used for drying linen. The two posts *b, b,* in the front, are about six feet two inches above the sills; the other two, standing backward, five feet eight inches. You are next to nail some boards of slit deal horizontally from one of the fore-posts to the other, in order to screen the bees from the sun: let these boards be seven feet seven inches in length, and nailed to the inside of the posts, and be well-seasoned, that they may not shrink or gape in the joints: *c, c,* are two splints of deal, to keep the boards even, and to strengthen them.

Fig. 4. represents the back of the frame: *d, d, d, d,* are four strong boards of the same length with the frame, on which the boxes are to be placed; let the upper side of them be very smooth and even, that the boxes may stand true upon them, or it may be more advisable to place under every pair of boxes a smooth thin board, as long as the boxes, and about a quarter of an inch wider. The bees will soon fasten the boxes to this board in such a manner, that you may move or weigh the boxes and board together, without breaking the wax or resin, which, for many reasons, ought to be avoided.

These floors must be supported by pieces of wood or beaters, *e, e,* &c. which are nailed from post to post at each end: they are likewise to be well nailed to the frame, to keep them from sinking with the weight of the boxes: *f* represents the roof, which projects backwards about seven or eight inches beyond the boxes, to shelter them from the rain.

You have now only to cut niches or holes in the frame over-against every entrance into the boxes, as *b, b, b,* *fig. 3.* let these niches be near four inches long, and under each nail a small piece of wood for the bees to light upon. The morning or evening sun will shine upon one or both ends of the frame, let its aspect be what it will; but you may prevent its over-heating the boxes, by a loose board set up between the posts, and kept in by two or three pegs.

In order to take away part of the honey, without destroying or much disturbing the bees, Mr. White advises to examine the state of the colonies about the latter end of August through the glasses; and he observes, that such as have filled a box and a half with their works may spare the half box; but the honey-comb should be particularly examined, and about eight or nine pounds left for their winter store. When this is done, open the mouth of the box you intend to take; then, with a thin knife, cut through the resin with which the bees have joined the boxes to each other, till they are separated; and, after this, thrust a sheet of tin gently between the boxes. The communication being thus stopped, the bees in the fullest box, where most probably the queen is, will be a little disturbed; but those in the other box, where there is no queen, will be in the utmost confusion, running to and fro with a kind of mournful cry, and issuing out at the newly opened door in great disorder: however, when they have got abroad, and discover their companions, they eagerly join them at the mouth of the other box. By this means, in an hour or two, you will have a box of pure honey, without a living bee to molest you, or any dead bees to waste or damage the honey.

Mr. White's boxes are convenient for feeding poor stocks, in order to preserve them, and also for removing moths and insects from any colony that is in danger of being injured by them.

Mr. Wildman recommends the following method of taking the wax and honey, without destroying the bees: remove the hive, from which you would take the wax and honey, into a room, into which little light is admitted: invert the hive gently, placing it on any support, and cover it with an empty hive, keeping the side next the window of the empty hive raised a little, to give the bees sufficient light to find their way into it; while you hold the empty hive steadily supported on the edge of the full hive, between your side and your left arm, keep striking with your hand all round the full hive from top to bottom, in the manner of beating a drum, so that the bees may be frightened by the noise, and mount out of the full hive into the empty one. As soon as all the bees are out of the full hive, which will generally be in about five minutes, the other hive, in which they are collected, must then be placed on the stand from which the full hive was taken, in order to receive the absent bees as they return from the fields.

If this be done early in the season, the operator should examine the royal cells; for if any of them contain young bees, they, as well as all the combs that have young bees in them, must be preserved in the hive. Take out the other combs with a long, broad, and pliable knife, cutting them from the sides and crown as clear as possible, to prevent the future labour of the bees, who must lick up all the honey spilt, and remove every grain of wax. The sides of the hive

should

should then be scraped with a table spoon, to clear away what was left by the knife.

Having thus taken the wax and honey, let a table, covered with a clean cloth, be placed near the stand, and giving the hive, in which the bees are, a sudden shake, striking at the same time with a considerable degree of force, the bees will be shaken on the cloth. Put their own hive upon them immediately, raised a little on one side, that the bees may the more easily enter; and when all are entered, place it on the stand as before. If the hive in which the bees are be turned uppermost, and their own hive placed over it, the bees will immediately ascend into it, especially if the lower side be struck to alarm them; for the effects of fear, impressed on the bees by the continual noise, renders them, for a considerable time, so mild and tractable, that they will bear any handling, which does not hurt them, without any signs of resentment.

Mr. Thorley objects to the method of driving bees, in order to obtain their honey, because the honey will be foul and corrupted, and great numbers of the young brood will thus be utterly destroyed, and the stocks much reduced and endangered.

Mr. Isaac, secretary to the Apian Society in the west of England, has published a small treatise, entitled "The General Apian," in which, among other things, he has described the structure of two hives, one called the "Moreton Hive," and the other the "Cottage Hive." The former is intended for a house or shed, and the latter for the open garden. The Moreton-hive is made of reed, stitched with the splits of willow or bramble; it is of a cylindrical form, twelve inches clear in diameter, and six inches high; it is best made upon a narrow hoop with whinble bit-holes in it to receive the stitches of the first list or round of reed, and a mortise-hole in the fore-part for entrance, $2\frac{1}{2}$ inches in horizontal length by $\frac{1}{4}$ th of an inch in perpendicular height: this entrance should be near $\frac{1}{4}$ th of an inch above the lower edge of the hoop, which edge should be so planed as in every part to touch a plain board. The hive, thus constructed, should be laid upon a level board, with another board upon it, which should be so thick as not to bend under a weight of 56 pounds, which should remain upon it for a day or two, till it is settled in a close state. When the hive is taken off, two of the middle lists should be cut opposite to the entrance for receiving a pane of glass, near three inches long, and as wide as the part of the two lists taken out. The ends of the lists, or coils, should be secured by stiches made with softened mole-snap wire. When the glass is fastened with putty, the stich-holes of the hoop should be filled with the same; and then a small stick should be made to pass *in* through the middle list from right to left, and *out* at the other side of the hive to serve as a support for the combs. This hive should have a set of bars cut in a round deal board, 14 inches in diameter, and $\frac{1}{2}$ an inch thick, nearly rounded to fit the hive. Of these bars there are six, and their width is $1\frac{3}{4}$ ths of an inch. The openings between them, called "streets," must be $\frac{1}{2}$ an inch wide, and extend to within an inch of the circumference of the board, which by these openings is converted into bars to support the combs. Across these bars, on the under side, it may be right to spring a small stay of wood, to keep them from dividing farther, in case the circumference should split at any time. The bars must be fastened on the top of the hive with deal pins, entering through the first into the second or third list; then a round flat top of reed, 14 inches in diameter, must be fastened to them: in this cover, and near the front of the hive, the curious may have a hole made, five inches in diameter, covered by a small board, which may

be turned off at pleasure, for placing over the hole a bell-glass, in which the bees may, in a good summer, be tempted to work. For a good swarm there should also be provided two other hives, with bars of the same sort; but without a top. On the bars of one of them the first hive should be placed, with the glasses or windows, entrances and bars, perpendicularly over each other. There should also be four hoops, of mole-snap wire, fastened about nine inches asunder, in one of the lists of the under hive, through which to pass a cord over the top hive, to keep both firmly together till the swarm is hived and placed in the bee-house. It is the cord that must keep them together. When the bees have filled the first and second, let them be raised on the third.

The "Cottage-hive" is composed of two parts; the higher part is like the common hives, but somewhat less in dimensions; 11 $\frac{1}{2}$ inches within, from the centre of the crown to the edges; the diameter at the edges is 13 $\frac{1}{4}$ inches; the entrance is horizontally two inches long, and $\frac{1}{4}$ of an inch high; opposite to the entrance, three lists above the edge or skirt is a pane of glass, like that in the Moreton-hive, and across the line of vision from the glass to the entrance, a stick is passed *in* at the right and *out* at the left. The other part is the section of a cone, 13 $\frac{1}{4}$ inches diameter in the clear, at the higher edge, and 11 $\frac{1}{2}$ inches at the lower edge, or mouth, which is formed by a hoop, like the Moreton-hive, with the first list sewed in the holes of it with willow, or bramble splits. Over the entrance is a piece of sloped deal, tacked to the hoop and front of the hive, to make it suit the front of the shed, or bee-house; but this piece should not be united to it when it is to stand in the garden. Opposite to the entrance is the window for inspection. But this part, called a "transit," because it serves as a passage between a common hive and one of Wildman's hives, wants no cross-stick to strengthen the combs, as it is two inches wider at the higher than it is at the lower edge or bottom. On the higher edge of the transit there must be fixed bars, made of a round deal board, $\frac{1}{2}$ an inch thick, and 15 $\frac{1}{4}$ inches in diameter. The bars are 6, 1 $\frac{3}{4}$ inch wide; the streets are five, half an inch wide, and there are two outside streets $\frac{3}{4}$ ths of an inch wide, or rather more. The transit, when the bars are fixed, should be pressed by the weight of half a hundred, on a smooth strong board, for a day or two, to settle it. The perpendicular height of the transit is about eight inches; and it will hold as much as the Moreton-hive. The two parts of the cottage-hive must be fastened together, like the first and second Moreton-hives, to receive the bees; and when the second parts are united, it will hold nearly seven gallons. This is called the cottage-hive, because it is the cheapest ever seen by the inventor, as it is of sufficient dimensions for the largest swarm, will admit of being easily divided and deprived, and may be reduced to accommodate a small or poor stock, by taking off the under part against winter; and by means of a good cap, hoop, and cord, it may be secured on an open stand, firmly fixed on the ground, against all the common assaults of wind and weather. Its form, being nearly that of an egg, with a part of the small end cut off, is more friendly to the bees, in respect to warmth in winter, and, therefore, better calculated for breeding in the spring than any other. It possesses all the advantages, without the inconveniences, of the large hive, recommended by the ingenious Mr. Butler, the father of the English Apianians.

See on the subject of this article, Thorley's Inquiry into the Nature, Order, and Government of Bees, 1774; White's Collateral Bee-Boxes; Wildman, &c. on Bees; Key's Ancient Bee-Master's Farewell, 1796; Isaac's General Apianian, 1803. See BEE.

HIVING.

HIVE dross, a name sometimes given to crude or rough wax. See *WAX*.

HIVING, the placing of a swarm of bees in a hive, in order to have the profit of their labours. When the swarm of bees has left an old hive, and is placed in form of a cluster hanging down from the branch of some shrub or low bush, the hiving is extremely easy, and may be done in half an hour after the time of their being still and calm in the cluster; or it may be let alone till an hour or two before sunset, provided that the sun do not shine too vehemently upon the place where they are, for that would disquiet them, and force them to rise; and, in that case they usually take a long flight before they settle again, and are very often lost; this, however, may at any time be prevented by placing an artificial screen before them, composed either of coarse cloth, or of a few branches of trees well covered with leaves.

It is commonly the branch of some shrub or tree that they settle upon, and we always find that they mean this as their settled habitation; for, however soon they are hived, the rudiments and beginnings of combs are found on it. It is true, they always leave these places, if left to themselves, in five or six days; but this is not till they find them so inconvenient that they cannot keep them, either from their being too much scorched by the sun, or exposed to winds and rain. The quantity of wax and honey left in these places, when they have quitted them, abundantly proves, however, that they had meant them for their fixed abode.

When they are placed in a hive, they very soon find themselves much better lodged than in the place they had provided for themselves; and they usually stay in it, and begin to work the next morning.

It might appear a very difficult task to get so large a number of bees into a hive, but it is much less so than it appears to be. They will often take possession of the hive of their own accord when it is hung over them; but the shortest way is to hold the hive under the branch where they are, and then sweep them down into it. This may be done with a branch of a tree with its leaves on it, or with the hand armed with a strong glove, and the face covered. But there are country fellows who will go without any sort of defence, and with their naked hand sweep them carefully off the bough into the hive, which they hold in the other hand underneath.

It is not to be expected that the whole swarm will be thus swept peaceably into the hive; many will fly away, and many clusters will fall beside the hive to the ground. All this, however, creates no difficulty; for the hive being turned bottom upwards, and set on the ground near the tree, with its edges a little raised above the surface, those bees which fell in clusters to the ground will soon crawl to their companions in the hive, and soon after, those which flew off, will descend and follow their example. If it happen, however, that some bees will obstinately keep to the place where they at first fixed themselves, the branch is to be rubbed over with the juice of such plants as the creatures hate the smell of; such are elder, rue, and some others; and if this does not succeed, there must be linen rags burnt under them, the smoke of which will soon drive them off, and make them join their companions, who find themselves more at ease in the hive.

As it is necessary to render the places disagreeable to the bees from which they are to be taken into the hive, so, many people think it very proper to prepare the hive for their reception, by scenting it with such things as they love the smell of. To this purpose they rub the inside of it with baum and bean-flowers, and daub a little honey in some parts

of it. This, however, does not seem necessary, those hives having been found to succeed full as well where it was not done, as those where it was. Reaumur's Hist. Inf. vol. x. p. 205.

Another method of getting a swarm from a branch of a high tree, is to cut off the branch with a saw, as gently and with as little disturbance to the bees as possible. In this case, when the branch is off, a man may carefully descend with it, and the bees will not quit their hold, but will be all carried where he pleases with it, and may by that means be very easily put into a hive.

Sometimes the bees, which go out in a swarm, fix upon a hole in a wall, or a hollow in the trunk of a tree, for the assembling themselves. This is a much better choice for them than the branch of a tree, but it is much worse for the person who is to hive them, for they are very difficult to be got out of these places. The common way of the country people is to attack these swarms in the middle of a cold night, and then they enlarge the opening from without, and placing the hive under it, scoop the bees out of their nest with a ladle, and put them into the hive.

Mr. Thorley tells us, that the best time to plant colonies of bees is either in March or April with new stocks, or in May or June with swarms. If swarms are used, procure, if possible, two the same day, and put them together in two boxes, or in a hive and a box; at night place them in your house, and with a knife and a little lime and hair, stop close the mouth of the hive or upper box, so that not a bee may be able to go in, or out, except at the front door. If boxes are employed, you will, in a week or ten days, see the combs appear in them; but in a hive nothing can be observed till the bees have wrought down into the box. Never plant a colony with a single swarm, as Mr. Thorley says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is a proper time to raise the colony in the dusk of the evening, which should be done in the following manner: place your empty box, with the sliding shutter drawn back, behind the house, near the colony that is to be raised, and at nearly the height of the floor, by the help of another empty box upon the ground; then lifting up the colony with as much expedition as possible, set it down upon the empty box, with the aperture of the colony close to the piece of wood nailed upon it, so that no single bee may get out: when this is done, lift the hive and two boxes, or the three boxes, into the house again, putting them in their proper place.

Mr. Thorley farther adds, that the most effectual method of preserving bees in common hives is, incorporating or uniting two stocks into one, by the help of a peculiar fume or opiate, which will put them entirely in your power for a time, so that you may dispose of, and distribute them at pleasure. The queen, in this operation, is immediately to be searched for and detained. Hives or stocks, which have swarmed once or twice, and are consequently reduced in their number, are the fittest to be joined together, as they will be thus greatly strengthened and improved. However, if you have a stock both rich in honey and full of bees, you may take it, by dividing the bees into two parts, and putting them into two other hives instead of one. But be careful to examine, whether the stock to which you design to join the bees of another, has honey enough to maintain the bees of both; for which purpose it should be full twenty pounds in weight.

The stupifying fume used in this process is the fungus maximus or pulverulentus, or large mushroom, commonly known by the name of bunt, pucknist, or frog-cheese: it is

as big as a man's head, or bigger: when ripe, it is of a brown colour, turns to powder, and is exceeding light. Put one of these pucks into a large paper, pressing it to two-thirds or nearly half its bulk, and tying it very close; then place it in an oven some time after the household bread is drawn, and let it remain there all night; when it is dry enough to retain fire, it is fit for use in the following manner: cut off a piece of the puck as large as a hen's egg, and fix it in the end of a small stick slit for the purpose, and sharpened at the other end, and place this so that it may hang near the middle of an empty hive; this hive must be set with the mouth upward, in a pail or bucket, near the stock you intend to take: then set fire to the puck, and immediately place the stock of bees over it, tying a cloth round the hives, that no smoke may escape. In a little while you will hear the bees fall like drops of hail into the empty hive. You may then beat the top of the hive gently with your hand, to get as many out as you can: after this, loosening the cloth, lift off the hive to a table, knock it several times against the table, and several more bees will tumble out, and perhaps the queen among them; she is often one of the last that falls: if she is not there, search for her among the main body in the empty hive, spreading them for this purpose upon a table. You must proceed in the same manner with the other hive, with the bees of which these are to be united.

One of the queens being found, you must put the bees of both hives together; mingle them thoroughly, sprinkling them at the same time with a little ale and sugar, and put them among the combs of the latter hive, shaking them down in it. When they are all deposited, cover the hive with a cloth, bound close about it, and let them remain shut up all that night and the next day. Some time after this you will be sensible that they are awakened out of sleep. The second night after their union, in the dusk of the evening, gently remove the cloth from the mouth of the hive (taking care of yourself), and the bees will immediately fall forth with a great noise; but it being too late for them to take wing, they will soon return again: then inserting two pieces of tobacco-pipes to let in air, stop them close as before, and keep them thus confined for three or four days longer, after which the door may be left open.

The best time of the year for uniting them is when the young brood are all out, and before they begin to lodge in the empty cells, which they do in great numbers in cold weather and in winter. The operation should be performed early in the afternoon, that, having the greater light, the queen may be more easily found. The few bees that are left in the hive should be suffocated with sulphur.

Mr. Thorley observes, that he never knew such combined stocks conquered by robbers, and that they will either swarm the next summer, or yield a hive full of honey.

Mr. White's method of hiving a swarm into one or more of his boxes is as follows: take the loose board, mentioned under the article HIVE, and fasten it to one of the boxes, so as to stop the communication; this may be done by three of the staples there mentioned, one on the top of the box near the front, the two others on the back near the top and near the bottom; let one end of the staple be thrust into a gimblet-hole made in the box, so that the other end may go as tight as possible over the loose board, to keep it from slipping when it is handled. Be careful to fasten the shutter so close to the glass that no light may enter through it; and cover the box as soon as the bees are hived, with a linen cloth thrown loosely over it, or with green boughs to protect it from the heat of the sun. If the swarm be larger than usual, instead of fastening the loose board to one box, you may

join two boxes together with three staples, leaving the communication open from one to the other, and then hive your bees in both. In all other respects they are to be hived in boxes after the same manner as in common hives. The door of the second box should be carefully stopped up and kept constantly closed, in order that the bees may have no entrance but through the first box.

In the swarming seasons, says Mr. Isaac, hives should be in readiness for the swarms. Three iron hooks should be fastened to as many cords, tied together at such a distance from the hooks as to admit the hive between them, so that the hooks may be fastened in the sides of the hive at equal distances. The cords should be looped above the knot, so that the hive may be supported by them on a forked stick, eight or ten feet long, and pointed at the lower end. When a swarm rises, take some balm leaves and rub the inside of the hive with them, and place them on the outside under one of the cords; then by means of the long stick, wave the hive amongst the bees as they float in the air, and thrust the stick into the ground to support the hive; then walk off, and use your tinkling bell till you see them beginning to enter, at which time the noise should cease. If they are not allured into the hive by these means, they will either pitch elsewhere or go off, in which case they should be followed if possible. If they pitch on the ground, put the hive over them, and shade them with boughs of trees. If they settle on a bush, hold the hive with one hand and shake the bush with the other, just strong enough to make them fall into the hive, and put it down on the ground across a stick, with the entrance a little elevated towards the south; but if they have fixed where this mode cannot be used, the manner of hiving will be more difficult and the success less certain. Mr. Isaac says, that he has sometimes been obliged to tie several sticks together to make a long crook, and to ascend a ladder so as to hold the hive on the points of a long pitch-fork, while an assistant shook with the crook the branch of a high tree on which a swarm had fixed, and the bees seemed glad to be hived. If the bees seem uneasy in the hive, the queen is not with them, or they are determined to go off. If they return to the stock they may swarm again soon; but if they go off and you can follow them, give the old stock another hive, and look about for the queen till they have settled, and avoid treading on any bees left you destroy the queen, or mistake the bees. If you find her, place her at the entrance, and you will thereby secure the swarm. Thorley, White, and Isaac, ubi supra. See SWARM.

HIWASSEE, in *Geography*, a river of America, which discharges itself into the Tennessee, after passing through the Cherokee town, about 40 miles below the mouth of the Clinch. N. lat. $35^{\circ} 38'$. W. long. $85^{\circ} 3'$. It is navigable till it penetrates the mountains on its S. side. These mountains, when possessed by the British, yielded ore, from which gold was extracted. A branch of the Hiwassee, called Amoia, almost interlocks a branch of the Mobile. The portage between them is short, and the road firm and level.

HLINKA, a town of Bohemia, in the circle of Chrudim; 12 miles S. of Chrudim.

HLIWINO, a town of Lithuania, in the palatinate of Minsk; 44 miles E. of Minsk.

HLUBOKI, a town of Russian Lithuania; 40 miles S.E. of Breslaw.

HLUMCZA, a town of Poland, in the palatinate of Volhynia; 60 miles N.N.W. of Zytomiers.

HÖ, a town of China, in Se-tchuen. N. lat. $30^{\circ} 8'$. E. long. 105° .—ALFO, a city of the second rank, in Chen-si. N. lat. $35^{\circ} 48'$. E. long. $102^{\circ} 34'$.—ALFO, a city of the

second rank, in Kiang-nan. N. lat. $31^{\circ} 42'$. E. long. $117^{\circ} 54'$.

HOA, a city of China, of the second rank, in Quang-tong. N. lat. $21^{\circ} 38'$. E. long. $109^{\circ} 49'$.

HOACHE, in *Natural History*, a name given by the Chinese to a peculiar kind of earth, which they have found very useful in the manufacture of their China-ware. It is called hoache from the word *hoa*, which signifies *soft* and *glutinous*, and is described to us as being an earth approaching to the nature of chalk, but harder, and feeling like soap to the touch. There is great reason to believe, that this is either the same earth with our soap-rock of Cornwall, or something very like it. But we are to learn, in regard to the Chinese way of using it, that it is only one of the ingredients of their fine ware, not the whole matter of which it is made.

The Chinese physicians had long used this earth as a medicine, giving it in disorders of the lungs; but it is only of late times that the workmen in porcelain attempted to use it instead of kaolin. It succeeds, however, so well, that the porcelain made of it sells dearer in the Indies than any other kind. The grain of this porcelain is remarkably fine and even, so that it is fitter for receiving the finest pencilling than any other, and it may be made surprisngly light. But there is this disadvantage, that the whole is more brittle than ordinary china, and the just degree of baking it is very difficult to hit; without which it is never strong. The Chinese sometimes make the body of their vessels of the common China-ware, and dip them when dry into a thick liquor like cream, in which the hoache is dissolved; this gives a new and beautiful coat to the vessel. They give the common varnishing over this, and it succeeds to a very great perfection.

The manner in which the Chinese use it for this purpose is this: they first wash it clean with river water, to separate a yellow sort of earth, which lies near it in the mine where they dig it, and is often brought up with it. When it is thus cleaned, they beat it to powder, and mix in it large quantities of water; they stir the mixture well, and then letting the coarser part settle, they pour off the thick liquor, and let it stand till a substance like cream subsides, which they keep moist, and use, as before mentioned, to dip the vessels in, or else they dry it, and use it with the petunse instead of the kaolin in the common manufactures.

It is said that a good porcelain-ware may be made with this earth alone without any other mixture; but the workmen themselves are unwilling to do this, and always chuse, if they do not work in the common way, to add at least two parts of the petunse to eight of the hoache, and with this mixture they make a very good ware, working it in the same manner as they do the petunse and kaolin.

The hoache, though ever so proper to supply the place of the kaolin, could not be used in the common works, because it costs three times the price, it being much scarcer, and brought much farther.

There is another very elegant sort of China-ware, which depends entirely on the hoache for its beauty; it is all white, but though the surface is perfectly smooth and polished, there are seen flowers and other ornaments on it in a very delicate manner. The method of making this is as follows: they make the vessels of the common matter of the porcelain-ware; they then dissolve, in a sufficient quantity of clear water, as much of the refined hoache as will give it the consistence of a syrup. With this they pencil out the figures they intend on the surface of the vessel while not yet quite dry; this penetrates the surface, and the lines and

strokes all appear very determinate. They let this dry thoroughly, and then cover the whole vessel with the common varnish of the porcelain.

When it has been baked the whole appears white, but the figures are very distinctly seen, and appear extremely beautiful. They are of a brighter white than any of the rest, and seem formed of a thin white vapour, running with regularity just under the surface of the vessel. They have a way of doing this with another sort of earth, which they call *chekao*; but this requires more trouble, as it must be roasted and powdered before it is fit for use. The white of this also is not so fine when done as the other. *Observ. sur les Coutumes de l'Asie*, p. 300, &c. See PORCELAIN.

HOACTLI, in *Ornithology*, a species of *Ardea*. See HERON.

HOACTZIN. See *PIASIANUS Cristatus*.

HOADLEY, BENJAMIN, in *Biography*, was born at Westerham, in Kent, in the year 1676. He was educated in grammar learning under his father, who was a clergyman, and master of a private school in his native place, and in the year 1691 he was entered a pensioner of Catharine Hall, Cambridge. Here, in due time, he took his degrees, and became a tutor in the college, the duties of which office he discharged with great reputation. As a divine he was first settled lecturer of St. Mildred, in the Poultry, London. Here he continued ten years; during this period he held other preferment in the church, which he obtained through Dr. Sherlock, dean of St. Paul's. In 1703 he published "The Reasonableness of Conformity to the Church of England represented to the Dissenting Ministers, in answer to the tenth Chapter of Mr. Calamy's Abridgment of Mr. Baxter's History of his Life and Times." This was the occasion of a controversy between Mr. Hoadley and Mr. Calamy, which was carried on with that moderation which did credit to both parties. In 1705 Mr. Hoadley preached a sermon before the lord mayor of London, which gave offence to the high-church party, and was followed by a long controversy, in which many very eminent clergymen took a share. After it had been continued a considerable time, the house of commons addressed the queen requesting her to shew a regard for the signal services which Mr. Hoadley had rendered to the cause of civil and religious liberty, by bestowing upon him some dignity in the church. In answer to this address the queen said, that she would take a proper opportunity of complying with their desire, which, however, she never did. Though neglected by his sovereign he was not forgotten, but was presented, in 1710, by Mrs. Howland, grandmother of the duke of Bedford, to the rectory of Streatham. Of this, he says, "When fury seemed to be let loose, and to distinguish me particularly, she herself, unasked, unapplied to, without my having ever seen her, or been seen by her, chose, by presenting me to the rectory of Streatham, then just vacant, to shew, in her own expression, that she was neither ashamed, nor afraid, to give me that public mark of her regard at that critical time." Almost as soon as king George ascended the throne Mr. Hoadley was nominated one of the chaplains to his majesty, having been created doctor of divinity by archbishop Wake. This was a prelude to higher honours and a more elevated place in that church to which his learning and talents gave him a just title. In 1715 he was raised to the see of Bangor. In 1717 he preached before the king his celebrated sermon on "The Nature of the Kingdom or Church of Christ," which excited against him no little clamour among the clergy of the high-church party, and led to the controversy which bears the bishop's name. No sooner had this sermon been printed by special command, than it was determined

mined to proceed against the author in convocation, as soon as it should sit. The lower house drew up their representation, but before it could be brought into the upper house, that assembly was prorogued by the king's order, nor was it permitted to sit to do business till the heat of their resentment had subsided. Dr. Hoadley's sermon struck at the root of civil and ecclesiastical tyranny: he shewed, in the most decisive manner, that Christ was alone king in his own kingdom and the sole law-giver; that his kingdom is not of this world, and that consequently all encouragements and obstacles of this world were not what Christ approved, tending to make men of one profession, not of one faith; hypocrites not Christians. Another very important tract published by Dr. Hoadley in this controversy was entitled "The common Rights of Subjects defended, and the Nature of the Sacramental Test considered: in answer to Dr. Sherlock's Vindication of the Test and Corporation Acts." The argument maintained in this piece is, that it is a profanation of the holy sacrament to apply it to a purpose of a different nature from what the institutor solemnly appropriated to it, and to make that the tool of this world, which he ordered to have respect only to another: and that the test and corporation acts are repugnant to reason and to justice. In 1720 Dr. Hoadley was translated to the see of Hereford, and in 1723 he was raised to the much more valuable bishopric of Salisbury: still he employed his pen in vindicating the cause of liberty, which was ever near his heart. In 1732 he drew up a memoir of Dr. Samuel Clarke, which was prefixed to the posthumous works of that eminent divine. In the year 1734 he succeeded to the see of Winchester, and shortly after published a very useful treatise, entitled "A plain Account of the Nature and End of the Sacrament of the Lord's Supper, &c." This work, which was intended to represent one of Christ's institutions in its primitive simplicity, has been abridged by Dr. Disney, and published under the title of "The national Christian's Assistant to the worthy receiving of the Lord's Supper." Dr. Hoadley attained to the advanced age of eighty-five, when he died at his palace at Chelsea. He had ever distinguished himself by considerable learning and uncommon talents, which he consecrated in the most honourable manner to the service of mankind. He had at all times shewn himself ready to seize every opportunity to defend the cause of truth, virtue, and religion, and the principles of our excellent constitution, in whatever quarter attacked; and to assert and vindicate, on the most interesting occasions, and against the greatest names, the rights of the throne and those of Englishmen. An account of all the works of this great man may be found in the Supplement to the Biographia Britannica, to which the reader is referred.

HOADLEY, BENJAMIN, M.D. eldest son of the bishop of Winchester of that name, was born in Broad-street, on the 10th of February, 1705. He received his early education at the school of Dr. Newcome at Hackney, and was admitted a pensioner of Bene't college, Cambridge, under the worthy archbishop Herring, who was at that time tutor. He determined to pursue medicine as a profession; and he was distinguished by the progress which he made in mathematical and philosophical studies, under the celebrated blind professor Saunderson. He was created M.D. in 1728 by royal mandamus, and settled in London as a physician. He was early received into the Royal Society; and was made registrar of Hereford, while his father held that see. In 1737 he read the Gullonian lectures in the College of Physicians, which he published in 1740. It was very honourable to his character that he held, for some years, the appointment of physician to both the households, being uo-

minated to that of the king in June, 1742, and to that of the prince of Wales in January, 1745, at a time when the two families were not upon the best terms with each other. He died at his house at Chelsea, on the 10th August 1757, leaving no issue, although twice married. He left the following works: the lectures, above alluded to, under the title of "Three Letters on the Organs of Respiration, read at the College, &c. To which is added an Appendix containing Remarks on some experiments of Dr. Houlston, published in the Transactions of the Royal Society for the year 1736;" 1740, 4to. This work is characterized by Haller, as a very ingenious defence of a bad cause. 2. An Harveian Oration, "Oratio Anniversaria &c," 1742, which has been esteemed an elegant piece of Latin. 3. "Observations on a Series of Electrical Experiments," by himself in conjunction with Mr. Wilson. 4. But Dr. Hoadley will be principally remembered as the author of the pleasing comedy, "The Suspicious Husband," written in 1747, which, by its own gaiety, and the admirable performance of Garrick, in the part of Ranger, became extremely popular, and it still affords fresh pleasure, whenever represented. He afterwards gave some assistance to his friend Hogarth, in the composition of his "Analysis of Beauty." Dr. Hoadley was a man of both elegant and solid accomplishments, possessed of considerable learning in his profession, and an agreeable and sprightly companion. Hutchinso'n Biog. Med. Gen. Biog.

HOAI-KING, in *Geography*, a city of China, of the first rank, in the province of Ho-nan, abounding with medicinal plants. N. lat. 35° 6'. E. long. 112° 34'.

HOAI-NGHAN, a city of China, of the first rank, in the province of Kiang-nan. It is situated in a marsh, and enclosed within a triple wall; the ground on which it stands being lower than the bed of the canal, the inhabitants live in a constant dread of inundation. The suburbs extend to the distance of a league on each side of the canal, and form at their extremity a kind of port on the river Hoang-ho. This place is very populous, and carries on an active and brisk trade. One of the great mandarins, who inspect the canals, and supply the court with provisions, resides here. This city has two of the second and nine of the third class, under its jurisdiction. N. lat. 53° 30'. E. long. 118° 47'.

HOAI-YU-KEOU, a town of Chinese Tartary. N. lat. 40° 54'. E. long. 117° 22'.

HOANG, HOAN-HO, or *Tellozu river*, so called from the yellow colour of the mould and sand at its bottom and sides, a river of China, which has its sources in two lakes, among the mountains situated in that part of Tartary called Kokonor, about N. lat. 35°, E. long. 97°, and, after a very winding course of 2150 miles, through Tartary and China, discharges itself into the Eastern or Yellow sea, N. lat. 34° 5'. E. long. 119° 44'. It is broad but shallow, so as to be hardly navigable; it is rapid in its course, and often overflows its banks, so that it has been found necessary to raise dykes in many places on its sides, and even round many towns in the province of Ho-nan. At about seventy miles from the sea, where it is crossed by the Imperial canal, the breadth is little more than a mile, and the depth about nine or ten feet, but the velocity is about seven or eight miles in the hour. Yu, surnamed the *Great*, directed its course across the provinces of Chan-si, Chen-si, Ho-nan, and Pe-tcheli; and towards its mouth, in order to check its rapidity, he divided it into nine channels, by which it discharged itself into the sea, near the mountain of Kia-che-chan, which then formed a promontory. Since Yu, to the present time, *i. e.* in the interval of about 3950 years, the river Hoang-ho has departed so

much from its ancient course, that its mouth is at present six degrees farther south. It flowed into the sea formerly under the fortieth degree of N. lat. ; at present nearly under the thirty-fourth. Besides, the mountain Kia-che-chan, which was formerly united to the main land of Yong-ping-fou, stands at present in the sea, at the distance of 50 leagues to the S. of that city.

HOANG-TCHEOU, a city of China, of the first rank, in the province of Hou-quang, situated on the Yang-tse, and having under its jurisdiction one city of the second rank, and eight cities of the third. N. lat. $38^{\circ} 28'$. E. long. $114^{\circ} 26'$.—Also, a town of Corea, in Hoan-hi, 85 miles N.W. of King-ki-tao. N. lat. $38^{\circ} 42'$. E. long. $125^{\circ} 52'$.

HOAPINSU, a small island in the Chinese sea, belonging to the group called "Lieou-Kieou." N. lat. $25^{\circ} 44'$. E. long. $123^{\circ} 34'$.

HOAR FROST, *Pruina*. See FROST.

HOARE, WILLIAM, in *Biography*, was born in the year 1707, of respectable parents, at Eye in Suffolk, and received the advantages of education in a school, at that time of high repute for classical instruction. He discovered an early disposition for painting, and gave such incontestible proofs of a natural talent for that art, at an annual prize exhibition, that, after his completion of the usual studies of the school, his father carried him to London, and placed him under the tuition of Grifoni, an Italian painter. From the skill of Grifoni the scholar could derive little profit; but it is probable, that from his conversation he imbibed that ardent desire of visiting the works of the Italian masters, which prompted him to set the example of a system afterwards pursued with so much avidity and success by most of our young students in painting. The name of William Hoare stands first on the list of those English painters who have resorted to Italy with a view to professional improvement.

Arriving at Rome, he placed himself in the school of Francisco Imperiali, and was the fellow pupil of Pompeo Battoni. During a residence of nine years in Italy, he made numerous copies of the historical works of the great masters, and he returned to England, filled with visionary hopes, and an ardent love of his profession, which did not desert him even at the latest period of an extended life.

Finding himself a stranger in London, and without the means of rendering his talents known, he accepted an invitation from some of his friends who resided at Bath, in Somersetshire, and there found such constant employment in painting portraits, that he was induced to settle in that city.

From the study of Rosalba's pictures, he added the practice of crayons to that of oil-painting, and carried it to a degree of excellence second only to the powers of that celebrated paintress.

He maintained at Bath a very high character as a portrait painter, and he enjoyed scarcely less reputation for taste and literature; and, as to these attractive qualities, he added the most unblemished integrity, his house became the continual resort of men of rank and genius. In the course of fifty years of professional attention, he portrayed most of the distinguished characters of the age.

Amidst this easy affluence, he employed the earliest moments of his leisure in the indulgence of his favourite wish of higher achievement in his art. He gave to the altar of St. Michael's church, at Bath, a figure of Our Saviour, as large as, or larger than, life; and afterwards painted for the octagon chapel, in that city, an historical composition, representing, "The Miracle at the Pool of Bethesda."

These exertions procured him commissions for a few historical pictures, the principal merit of which consists in the display of an elegant taste, and faithful study of nature.

Residing at a distance from the metropolis, where the competition of younger artists was continually accelerating the advance of English art, he retained to the last the style which he had adopted in the Italian school. His drawing was more correct than that of most of his contemporaries; but his works are deficient in the richness of colour and effect, which began generally, in his time, to prevail in the school of this country, and by which it is now so eminently distinguished.

His portraits of men were faithful resemblances of their originals, but they are seldom sufficiently divested of the formal air which was long thought requisite to the decorum of portraits. His portraits of women, particularly in crayons, have frequently much grace and softness; his most celebrated portrait in oil is a half-length of William Pitt, the first earl of Chatham.

On the formation of the Royal Academy he was elected one of the original members, and was a constant exhibitor for many years. He died at Bath in 1792.

HOARSENESS, in *Medicine*, *raucedo*, an alteration in the voice, which gives it a preternatural roughness and dissonance, and generally a lower or graver tone. The word is sometimes also applied, though incorrectly, to a diminution or loss of the voice. It is called by Sauvages Paraphonia catarrhalis. Nosol. Method. Class VI. Gen. 16.

The ancient physicians agree in referring hoarseness to a roughness in the internal surface of the trachea or windpipe; and the moderns, before the time of Sauvages, attributed that supposed roughness to the enlargement of milary glands in the part, consequent upon the action of cold, in the same manner as the cutis asperina, or goose-skin appearance, is produced in the skin by the same agent. But that nosologist remarks, that if a German flute be wetted within, and afterwards sand thrown into it so as to roughen the internal surface of the tube, the tone is not rendered either flat or rough, as those physiologists suppose. It cannot be doubted, indeed, from what we know of the effects of inflammation in membranous parts, that this alteration of the voice arises from the thickened condition of the membrane lining the larynx, by which the diameter is altered and rendered irregular, and which, extending also to the muscles of vocality, prevents them from contracting the aperture regularly or sufficiently. In other cases, where there is both a diminution of the power of voice, and a hoarse tone, and these of considerable duration, the affection originates probably from ulceration and partial loss of substance about the larynx or glottis. In some instances, a loss of the voice seems to be dependent upon a degree of paralysis in the muscles of the larynx, by which they are disabled from opening and closing that passage. This variety of the disorder sometimes continues for months, or even years; and the voice generally returns very suddenly, even so as to alarm the patient. (Darwin's *Zoonomia*, Class III. 2. 1. 5.) A temporary hoarseness arises often from shouting or long and loud talking, by which a transient degree of inflammation appears to be produced in the larynx, and is accompanied by a sensation of soreness in the throat.

The hoarseness, accompanying a common catarrh, is, of course, the effect of exposure to cold; that which is occasioned by ulceration in the organs of the voice is commonly occasioned by the syphilitic virus, or some other chronic affection, to which the term scrofulous is sometimes applied.

The cure of hoarseness will necessarily be various accord-

ing-to the nature and origin of it; and as it is commonly only symptomatic of some other disease, will consist in removing that primary affection. When it is connected with a common cold and cough, or sore throat, it will cease with the inflammation accompanying them; but it may be much relieved by inspiring the steam of water alone, or of water and vinegar, or of water and ether. Blisters to the external fauces often relieve the catarrhal hoarseness, and sometimes also the paralytic hoarseness. In the latter variety, and in the hoarseness attendant on chronic coughs in old and feeble people, as well as in some chronic ulcerations of the mouth and throat, certain warm and stimulant gargles and linctuses have been used with advantage. In such cases Dr. Cullen recommended the juice of the hedge-mustard (*Erysimum officinale*) mixed with an equal quantity of honey or sugar. When the crysimum was not at hand, Dr. Cullen substituted a syrup of horse-radish (*cochlearia armoracia*.) "I have found one drachm of the root," he observes, "fresh scraped down, was enough for four ounces of water, to be infused in a close vessel for two hours, and made into a syrup with double its weight of sugar. A tea-spoonful or two of this syrup, swallowed leisurely, or at least repeated two or three times, we have found often very successful in relieving hoarseness." Cullen *Mat. Med.*

In the complete loss of voice, Dr. Darwin recommends electric shocks to be passed through the larynx, by which two young ladies were cured in a fortnight. He likewise suggests the administration of emetics, gargles of decoction of feneka, and frequent endeavours to shout and sing,—friction externally, and tea bathing.

HOASE, in *Sea Language*, is a long flexible tube, formed of leather or tarred canvas, but chiefly of the latter, and employed to conduct the fresh water, which is hoisted aboard a ship, into the casks that are ranged in the hold; and to pass the water, or other liquors, out of one cask into the other.

HOATCHIT, in *Geography*, a country of Chinese Tartary, governed by a Mongul prince, tributary to the empire, formed into two standards; situated to the N. of Peking. N. lat. 45°.

HOATH. See HOWTH.

HOA-TSIANG, a town of Thibet; 30 miles E.S.E. of Hani. N. lat. 40° 55'. E. long. 99 19'.

HOBAL, in *Mythology*, an idol of the ancient Arabs, the worship of which at Mecca was destroyed by Mahomet.

HO-BASCH, in *Geography*, a town of Arabia, in the province of Yemen; 44 miles E. of Zebid. N. lat. 4° 18'. E. long. 44°.

HOBBIES KEYS, a small cluster of islets, and rocks, in the Spanish Main, near the Mosquito shore. N. lat. 12° 18'. W. long. 82° 50'.

HOBBIMA, MINDERHOUT, in *Biography*, a most excellent landscape painter, born at Antwerp about the year 1611. It is not exactly known under whom he learnt the principles of his art; but that nature was his ultimate guide to the perfection he attained, is very evident in his pictures, than which none were ever painted more true.

His choice of subjects, for they generally appear to have been portraits of particular places, is exceedingly picturesque, though of a low and common kind. The border of a wood with a few scattered huts and fields visible through the trees; a narrow lane with a cottage and hedge-rows; a corn-field, and village at a short distance, in his hands, became interesting, from the skill with which he arranged the chiaro-scuro and colouring, and the brilliancy and freedom of touch whereby he gave the full character of each object, and its local place in the perspective of the picture. The forms of

his trees are purely imitated from nature, without any apparent attempts to idealize them, to give them a more compact mass in their extreme parts, as Claude, with a more exalted taste, has effected. Hobbima appears to have taken nature as he found her, and been contented with representing her truly; and he has certainly acquired the first name amongst those who have taken this line of study, which his own countrymen have generally done. Ruyfdael had better selections than he, but was not so rich in colour, nor so powerful in effect. Many of his pictures are supplied with figures by Ostade, A. Vandevelde, and other skilful masters, which gives them additional value; and they are now very highly valued and eagerly sought after.

HOBBISM, or *Philosophy of Hobbes*, in the *History of Literature*, denotes the metaphysical, moral, religious, and political opinions of Thomas Hobbes, a celebrated English writer, who was born at Malmesbury, in Wiltshire, in the year 1588.

Having distinguished himself in early life by his genius, application, and improvement, he was taken into the service and protection of the Devonshire family, which continued, with little interruption, as long as he lived, and which gave him an opportunity of pursuing his studies, and of forming connections with persons of the first reputation for learning and science both at home and abroad.

His first work was an English translation of the "History of Thucydides," which he published with a view to the state of his country, in order to shew the fatal consequences of intestine broils.

Having acquired a thorough acquaintance with the Latin and Greek languages, he applied himself to the study of mathematics; and particularly to the works of Euclid, which he read and admired, principally on account of the clearness of his reasoning, the connection of his arguments, and the wonderful perspicuity of his method. He also devoted his leisure hours to natural philosophy, and especially to mechanics and the causes of animal motion.

In 1640 he retired to Paris, where he became acquainted with the famous Des Cartes, with whom he afterwards corresponded, and whose doctrine concerning innate ideas he strenuously opposed.

In 1642 he printed a few copies of his book "De Cive," a more complete edition of which was printed in Holland in 1647, by the care of Dr. Sorbiere. To this edition two commendatory letters are prefixed; one written by Gasfendi and the other by Merfenne, with whom Mr. Hobbes was on terms of intimate friendship.

In 1650, two other treatises were published at London; one entitled "Human Nature," and another entitled "De Corpore Politico," or the Elements of Law. During this time he had been digesting his religious, political, and moral principles, into a complete system, which he entitled "Leviathan;" and which was printed in English, at London, in that and the following year. Soon after this publication he returned to England, and joined in communion with a congregation where the service of the church of England was used, and continued to resort thither.

In 1654 he published his letter upon "Liberty and Necessity," which occasioned a long controversy between him and Dr. Bramhall, afterward lord primate of Ireland. About this time he likewise began a controversy with Dr. Wallis of Oxford, which lasted as long as he lived, and in which he had the misfortune to have all the mathematicians against him. This controversy did him no credit; for though he was once and again refuted, and his mistakes were clearly pointed out, yet, such was the obstinacy of his temper, he adhered as pertinaciously as ever to his old opinions, and rendered that a personal

a personal quarrel, which ought to have continued a literary dispute. He was no less positive and imperious in maintaining his moral, religious, and political sentiments; and he seems to have discovered, on a variety of occasions, a very unbecoming opinion of his own abilities, and a supercilious contempt for those of other men.

After the restoration, in 1660, the king settled upon him a pension of a hundred pounds a year; but notwithstanding this favour, his *Leviathan* and his treatise *De Cive* were censured by parliament in 1666, a circumstance which much alarmed him. At the same time a bill was brought into the house of commons to punish atheism and profaneness, which, it is said, induced Mr. Hobbes to write or enlarge his book concerning *Heresy*.

In 1675, he published his English edition of the *Iliad* and *Odyssey*; in 1676 his dispute with Dr. Laney, bishop of Ely, concerning *Liberty and Necessity*, was printed; in 1678, appeared his "*Decameron Physiologicum*," or ten Dialogues of Natural Philosophy; and about the same time a new edition of the "*Art of Rhetoric*," to which he added a Dialogue between a Philosopher and a Student of the Common Law of England; in the same year he also published his "*Behemoth*," or History of the Civil Wars from 1640 to 1660.

Mr. Hobbes retained his understanding to his last sickness; inasmuch that he was not only capable of studying mathematics when above eighty-six years old, but also of writing very long poems. It has been said, that he was afraid of apparitions and spirits; but his friends call this a fable, though they acknowledge that he was afraid of being alone, and ascribe it to a fear of being assassinated. Mr. Bayle observes, that he meditated much more than he had read, and that he never cared to collect a large library; and Mr. Hobbes says of himself, that if he had bestowed as much time on reading as other men of letters, he should have been as ignorant as they. He was a great admirer of Homer, Virgil, Thucydides, and Euclid; but he made no account of large libraries, observing that men, for the most part, following one another's steps like sheep, have seldom the courage to go out of the trodden paths and roads which are prescribed to them by their guides. Mr. Hobbes died at the house of his patron, the earl of Devonshire, in the year 1679. For a fuller account of his life and writings, the reader may consult Bayle, or the *Biographia Britannica*, article *Hobbes*.

Mr. Hobbes's religious and political sentiments are chiefly contained in his book *De Cive* and his *Leviathan*; and it is certain, that there have been few persons whose writings, by the extraordinary abilities of their author and the singularity of his notions, for the dogmatical manner in which they are delivered, and the agreeableness of their style, that have had a more pernicious influence in spreading infidelity and irreligion, though none of them are directly levelled against revealed religion.

Mr. Hobbes has been unjustly charged with atheism; for he expressly acknowledges the existence of God, and that we must necessarily arise from the effects which we behold, to the eternal power of all powers, and cause of all causes; and he blames the absurdity of those, who call the world, or the soul of the world, God; nevertheless, he denies that we know any more of him than that he exists, and seems plainly to make him corporeal; for he affirms, that that which is not body is nothing at all: "*Dantur nomina insignificantia; hujus generis est substantia incorporea.*" Religion, he says, arises from the fear of power invisible, feigned by the mind, or imagined from tales publicly allowed, as superstition arises from those that are not allowed; and he

elsewhere resolves religion into opinions of ghosts, ignorance of second causes, devotion to what men fear, and taking things casual for prognostics. He takes pains in many of his works to prove man to be a necessary agent (if these contradictory terms can be properly joined), and expressly asserts the materiality and mortality of the human soul; alleging, against the well-known maxim of Des Cartes, "I think, therefore, I am," another maxim of his own, "I think, therefore, matter can think." And he represents the doctrine concerning the distinction between soul and body in man to be an error, contracted by the contagion of the demonology of the Greeks. The belief of a future state, he says, is grounded upon other men's saying that they knew it supernaturally, or that they knew those that knew them, that knew others, that knew it supernaturally.

With regard to revealed religion, he treats the pretence to inspiration as a sign of madness; he alleges that the books of Moses, and the historical writings of the Old Testament, were not written by those whose names they bear; and that they are derived to us from no higher authority than that of Ezra. As to the books of the New Testament, he acknowledges, that they are the true registers of those things which were done and said by the prophets and apostles; but he pretends, that they were not received as of divine authority in the Christian church, till they were established by the council of Laodicea, in the year of Christ 364. Though he sometimes seems to speak with veneration of the sacred writings, and to make the laws of scripture the laws of God, yet he expressly asserts, that we have no assurance of the certainty of scripture but the authority of the church, or the authority of the commonwealth; that the precepts of scripture derive all their obligation from the will of the magistrate; and that the magistrate is the authoritative interpreter of all scripture doctrines, to whom we are bound to submit. On the same principle he maintains, that the private reason must submit to the public, *viz.* to God's lieutenant; that a subject may be allowed to deny Christ in words, provided he retains the faith of Christ in his heart, when commanded by his sovereign; and that idolatry, to which a man is compelled by the terror of death, is no idolatry.

Mr. Hobbes's opinions with regard to natural religion and civil government are equally erroneous and extravagant; he asserts, that by the law of nature every man has a right to all things, and over all persons, and that the natural condition of man is a state of war, a war of all men against all men; that every man acts reasonably, who endeavours, as far as possible, to mangle all the persons of others, till he sees no other power great enough to endanger him; that the civil laws are the only rules of good and evil, just and unjust, honest and dishonest, and that antecedently to such laws every action is in its own nature indifferent; that there is nothing good or evil in itself, nor any common laws constituting what is naturally just or unjust; that all things are estimated by what every man judgeth to be fit, where there is no civil government, and by the laws of society, where society is established; that the power of the sovereign is absolute, and that he is not bound by any compact with his subjects; that nothing the sovereign can do to the subject can properly be called injurious or wrong; and that the king's word is sufficient to take any thing from any subject, if there be need, and the king is judge of that need. "*Non veritas, sed auctoritas facit legem.*" And yet he elsewhere says, "*Obligatio civium erga eum qui summam habet potestatem tandem nec diutius permanere intelligitur, quam manet potentia cives protegendæ.*"

Wood, in his *Athenæ Oxon.* vol. ii. p. 646, has asserted,

that Mr. Hobbes, in advanced life, retracted many of his opinions published in his *Leviathan*, &c. and composed an apology for himself and his writings; but the authenticity of this apology has been disputed. Leland's *View of the Deistical Writers*, vol. i. letter iii. Mosheim's *Eccl. Hist.* by Dr. Maclaine, vol. v.

HOBBY was a name formerly given to strong active horses of a smaller size; they are reported to have been originally natives of Ireland, and were much liked and used. Nags answer the same description as to size, qualities, and employments.

HOBBY, in *Ornithology*, the English name of a hawk of the long-winged kind; the *falco subbuteo* of Linnæus, called by many authors, by the name *subbuteo*, the name by which others express the ring-tail and hen-harrier. See **FALCO**.

HOBBYHORSE-HEAD, in *Mining*, signifies part of the pulley gear of a coal gin, fixed over the drawing-shaft.

HOBGOBLIN is a name vulgarly applied to fairies or apparitions. Skinner calls the word *rogoblins*, and derives it from *Robin Goodfellow*, Hob being the nick-name of Robin; but Wallis and Junius, with greater probability, derive it from *hoppgoblins*, *empusa*, because they are supposed to *hop* without moving both their feet. Johnson.

HOBITS, in *Gunnery*. See **HOWITZER**.

HOBLERS, or **HOELLERS**, **HOBELARII**, in our *Ancient Customs*, were men who, by their tenure, were obliged to maintain a light horse or hobby, (whence their name,) for the certifying any invasion towards the sea-side.

The name was also used for certain Irish knights, who used to serve as light-horsemen upon hobbies. (18 Ed. III. stat. 1. c. 25, and stat. 5, c. 8.) The term, according to Spelman, continued till the time of Henry VIII. or that of queen Mary; when these troops were distinguished by the name of demilances and light horse. They are mentioned as part of the British army that attended king Edward II. into Scotland in the year 1322. Sometimes archers were mounted on light horses; and they were hence styled hobiler archers.

HOB-NAIL, a nail with a thick strong head, used in shoeing a hobby or little horse. Johnson.

HOB-NOB, or **HAB-NAB**, a cant word formed from *hap ne hap*, and denoting an event which happens at random or by mere chance. Johnson.

HOBOO, a name given by the people of Otaheite, and in the neighbouring islands of the South Sea, to their superfine cloth. It is the thinnest and most finished preparation of the *asuta*, which see.

HOBRECHT, **JACOB**, in *Biography*, or as the Italians write it, *Obrecht*, or *Obrecht*, the most ancient composer of masses, in correct counter-point of four parts, that are come down to us. He was a Netherlander, and the musical preceptor of Erasmus, as Damon was formerly of Socrates. Glareanus, the disciple of Erasmus, says, that he had frequently heard his preceptor speak of Hobrecht as a musician who had no superior, and say, that he had such a rapid and wonderful facility in writing, that he composed an excellent mass in one night, which was very much admired by the learned. Indeed, in scoring his mass "Si Dederò," which was printed at Venice in 1508, it appears, though the movements are somewhat too similar in subject, that the counterpoint is clean, clear, and masterly. And this is the chief praise that is justly due to most of the compositions of the same period; which, in other respects, so much resemble each other, that a few specimens would exhibit almost all the variety of melody and measure which the productions of a whole century can furnish. Indeed, as air and grace were not at this time the objects of a composer's pursuits,

they should not be sought or expected. Those, however, who have heard modern melody, harmony, and modulation, to a degree of satiety, and admire the fugues, canons, and other ingenious contrivances of the sixteenth and seventeenth centuries, would have great pleasure in the performance or contemplation of such music as this, which is become *new* by excess of antiquity. Few or none of the passages have been retained in modern music; and the harmony and modulation having been regulated by the ecclesiastical tones, or modes, which have been so long exploded in this country, every thing would be as new to a *dilettante* of the present age, as if he only now heard music for the first time; so that, those who can tolerate nothing but what is *ancient*, and those, who are in constant search of *something new*, will, in these authors, find music equally adapted to their several tastes, and be likewise furnished with an excuse for their fastidiousness.

HOBROE, in *Geography*, a town of Denmark, in North Jutland, and diocese of Wiborg; 16 miles N.E. of Wiborg. N. lat. 56° 38'. E. long. 9° 49'.

HOBSON'S-CHOICE, a vulgar proverbial expression, applied to that kind of choice in which there is no alternative. It is said to be derived from the name of a carrier at Cambridge, who let out hackney horses, and obliged each customer to take in his turn, that horse which stood next the stable door. Scott.

HOBY, in *Geography*, a town of Sweden, in Sudermania; 15 miles N.W. of Nikioping.

HOCHAUS, a town of Austria; nine miles S.S.W. of Aigen.

HOCHBERG, a marquisate of Germany, annexed to the margraviate of Baden, deriving its name from an ancient castle, situated two miles N.E. from Emendingen, which is the principal town.

HOCHENAU, a town of Austria; nine miles E.N.E. of Zisterdorff.

HOCHFELDEN, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Saverne; 12 miles N.W. of Straßburg. The place contains 1620, and the canton 11,954 inhabitants, on a territory of 150 kilometres, in 30 communes.

HOCHLAND, **HOGLAND**, or *Highland*, an islet or rock in the middle of the gulf of Finland, of an oblong form, about 8 miles in circumference, having upon it two light-houses, and about 30 families of Finns. In the heart of the isle is a deep and gloomy vale about 100 fathoms wide. The soil of this island is generally swampy; but it is not destitute of wood, such as pines, firs, birch, alder, &c. On the highest rocks are three lakes, which are not without fish. Of domestic animals here are a few cattle and a flock or two of sheep. Of wild fowl there are various species. Seals abound and herrings are plentiful. N. lat. 60° 3'. E. long. 27°.

HOCHST, a town of Germany, situated on the Maine; 6 miles W. of Frankfurt.

HOCHSTADT, a town of Bohemia, in the circle of Böhlan; 11 miles from Turnau.

HOCHSTATT, or **HOCHSTETT**, a town of Bavaria, in the principality of Neuberg, on the Danube. Near this place was fought the famous battle of Blenheim (see **BLENNHEIM**); 19 miles N.W. of Augsburg.

HOCHSTETT, a town of the bishopric of Bamberg, on the Aisch; 13 miles S. of Bamberg. N. lat. 49° 46'. E. long. 10° 47'.

HOCHWEISH, a town of Hungary; 20 miles W.S.W. of Kremnitz.

HOCK. See **HAM**.

HOCK-Tuesday money. See HOKE-day.

HOCKHEIM, in *Geography*, a town of Germany, situated near the conflux of the Rhine and Maine; celebrated for its excellent wine; 16 miles N. of Francfort on the Maine.

HOCKHOCKING, a river of America, in the state of Ohio, about 25 miles below the Muskingum, which it resembles, though inferior to it in size. It rises near a branch of the Scioto, and pursuing a S. W. course enters the Ohio, at Bellpré, in N. lat. $38^{\circ} 57'$. It is navigable for large flat-bottomed boats, between 70 and 80 miles; and on its banks are fine meadows, seldom overflowed, and on its borders are rich upland. Its banks supply inexhaustible sources of free-stone, iron-ore, lead, and coal. Here are also productive salt-springs, with beds of white and blue clay of excellent quality. Red bole, and many other useful fossils, have been found on its banks.—Also, a post-town in Ross county, Ohio; 440 miles from Washington.

HOCKQUAR, or HOCKQUART, an island of Upper Canada, on the E. side of lake Superior.

HOCKSENBERG, a town of Prussia, in Pomerelia; 30 miles W. of Dantzic.

HOCKSTETT, a town of the bishopric of Bamberg; 12 miles S. of Bamberg.

HOCUB, in *Botany*, a name given by Vaillant to a genus of plants, called by Tournefort and other authors gun-delia.

HOCUS POCUS, a cant term applied to a juggler or cheat. Dr. Tillotson derives it from the form of consecrating the sacramental bread in the Romish church, *hoc est corpus*. Junius derives it from the Welch *hocced*, a cheat, and *poke*, or *pus*, a bag; the jugglers using a bag for conveyance. The etymology, however, is uncertain. Johnson.

HOD, a sort of tray for carrying mortar, in use among bricklayers.

HODAL, in *Geography*, a sea-port town of Sweden, in West Gothland, on the coast of the North sea; 45 miles N. N.W. of Uddevalla.

HODAM, a town of Scotland, in the county of Dumfries; 10 miles E. of Dumfries.

HODDESDON, a market-town and chapelry in the parishes of Amwell and Broxbourn, in the hundred and county of Hertford, England, is situated near the river Lea; 17 miles distant from London. It consists principally of one street, and, in the year 1801, contained 227 houses, and 1227 inhabitants. The privileges of a weekly market, held on Tuesdays, and a three days annual fair, were granted by Henry VIII. The original market-house, a curious edifice of wood, supported on arches, is yet standing, and is decorated with a number of rude and grotesque figures, carved on different parts. The chapel, a neat brick building, was erected about the year 1786, on the scite of an ancient structure. Near the market-house is a conduit of good water, which is supplied by pipes from a spring at some distance; it was built by the Rawdons, a respectable family in this town; and is kept in order pursuant to the will of Marmaduke Rawdon, esq. who, in 1679, bequeathed an annual provision for that purpose. The town is possessed of an incorporated grammar-school; and in the vicinity is a large cotton-mill. Near the southern extremity of the town is a large house, which presents, both externally and internally, various specimens of curious architecture, sculpture, and carving. See Chauncy's "History, &c. of Hertfordshire," and Lysons's "Environs of London," 4to. 1811.

HODEGOS, a term purely Greek, ἡδεγος, signifying *guide*. The word is chiefly used as the title of a book composed by Anastasius the Sinate, toward the close of the fifth

century; being a method of disputing against the heretics, particularly the Acephali.

Mr. Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c., which went before the Israelites as a guide in the desert.

HODEIDA, in *Geography*, a sea-port town of Arabia, on the Red sea, with a harbour fit only for small vessels. The jurisdiction of the Dola, who is accountable only to the Imam, is confined to this city. His revenue consists in part of the duties upon coffee exported. The mansion-house of the Dola, the custom-house, and the houses of the principal merchants, are constructed of stone; the rest of the town is composed of huts built in the ordinary stile. Near the sea stands a small citadel, incapable of affording a very strong defence. This city has its patron saint Scheick "Sadik," who is honoured with due veneration. At the distance of $\frac{1}{2}$ mile from Hodeida is a well of excellent water, which supplies the inhabitants.

HODEN, a town of Africa, in the Sahara. N. lat. $19^{\circ} 25'$. W. long. 12° .

HODENSTEIN, in *Natural History*. See ENORCHIS.

HODGE-PODGE. See HOTCH-POT.

HODGES, NATHANIEL, in *Biography*, a physician, the son of Dr. Thomas Hodges, dean of Hereford, was born at Kennington. He was educated at Westminster school, and was elected a student of Christ-church, Oxford, in 1648. He obtained the degree of M. D. in 1659, and settled in practice in London. He remained in the metropolis during the continuance of the plague in 1665, when most of the physicians, and Sydenham among the rest, retired to the country: and, with another of his brethren, he visited the infected during the whole of that terrible visitation. These two physicians, indeed, appear to have been appointed by the city of London to attend the diseased, with a stipend. Dr. Hodges was twice taken ill during the prevalence of the disease; but by the aid of timely remedies he recovered. His mode of performing his perilous duty was this: he received early every morning, at his own house, the persons who came to give reports of the sick, and convalecents, for advice; he then made his forenoon visits to the infected, causing a pan of coals to be carried before him with perfumes, and chewing troches while he was in the sick chamber. He repeated his visits in the afternoon. His chief prophylactic was a liberal use of Spanish wine, and cheerful society after the business of the day. Having thus had ample opportunities of ascertaining the phenomena of the disease, he published, in the year 1672, a work under the title of "Loimologia; five Pestis Nupere apud Populum Londinensem grassantis Narratio Historica," 8vo.; which contains the most authentic account of that memorable calamity. He subjoined the bills of mortality of the plague-year, 1665, amounting in all to 97,306 deaths, of which 68,596 were occasioned by the pestilence. This volume was translated into English by Dr. Quincy, and published, with some additional tracts upon the subject, in 1721, when the occurrence of the plague at Marseilles excited considerable alarm in the commercial cities throughout Europe. It is to be lamented, that a man, who had performed those dangerous duties among his fellow-citizens with so much intrepidity and fidelity, should have ultimately been so far reduced in his circumstances, as to be confined in the prison of Ludgate for debt, where he died in 1684. His body was interred in the church of St. Stephen, Walbrook, where a monument is erected to his memory. The only other work published by Dr. Hodges, was entitled "Vindiciæ Medicinæ et Medicorum," and printed in 1660, 8vo. See Gen. Biog. Hutchinson, Med. Biog.

HODGES, WILLIAM, R. A. a landscape painter, who received his tuition in the art from Wilson, whom he assisted for some time, and under whom he acquired a good eye for colouring, and great freedom and boldness of hand; but unluckily, like too many pupils, he caught the defects of his master more powerfully than his beauties; and was, in consequence, too loose in his definition of forms, by which means, that which added grace to the works of the master, became slovenliness in the pupil. "Hodges had the boldness and neglect of Wilson, but not genius enough to give authority to the former, or make us forgive the latter: too inaccurate for scene-painting, too mannered for local representation, and not sublime or comprehensive enough for poetic landscape; yet, by mere decision of hand, nearer to excellence than mediocrity; and, perhaps, superior to some who surpassed him in perspective, or diligence of execution." He accepted an appointment to go out draughtsman with Capt. Cook on his second voyage to the South seas, from which he returned after an absence of three years, and painted some pictures for the admiralty, of scenes in Otaheite and Ulitea. Afterwards, under the patronage of Warren Hastings, he visited the East Indies, where he acquired a decent fortune. On his return home, after practicing the art some time, he engaged in commercial and banking speculations; which, not proving successful, he sunk under the disappointment, and died in 1797, aged 53.

HODMAN, a cant term formerly used for a young scholar admitted from Westminster-school to be student in Christ-church, in Oxford.

HODOMETRICAL (of ὁδος, *way*, and μέτρον, *I measure*.) method of finding the longitude at sea, is that of the computation of the measure of the way of a ship between place and place, *i. e.* observing the several rhumbs or lines in which the ship sails, what way she has made, or how many leagues and parts of a league she has run. This method is liable to great errors.

HODY, HUMPHREY, in *Biography*, was born at Odcombe, in Somersetshire, in 1659, of which place his father was rector. He was educated at a grammar-school, and completed his studies at Wadham college, Oxford, where he took his degrees, and was afterwards chosen fellow and tutor. In 1681, and 1682, he wrote his learned dissertation on Aristotle's History of the Seventy-two Interpreters, which was intended to shew, that it was the invention of some Hellenistical Jew, and written on purpose to recommend and give greater authority to the Greek version of the Old Testament, which, from this story, has received the name of Septuagint. In 1689, Mr. Hody wrote the prologomena to John Malela's "Chronicle," which was published at Oxford two years afterwards. In 1692, he took his degree of D. D., and soon after published a treatise entitled "The Resurrection of the same Body asserted." After this he obtained some considerable preferment in the church, and in the beginning of the reign of queen Anne when the controversy concerning the powers and privileges of an English synod, or convocation, was warmly agitated, Dr. Hody published "A History of English Councils and Convocations, and of the Clergy sitting in Parliament, in which is also comprehended the History of Parliaments, with an Account of our ancient Laws." This work brings down the history from the first synod, which is mentioned to have been held in this island, *viz.* that of Verulam, in 446, to the beginning of the reign of Henry VIII. Dr. Hody was author of many other learned works, and left behind him, which was published in 1742, a work in MS. entitled "De Græcis illustribus Linguæ Græcæ Literarumque Humaniorum Instauratoribus, eorum Vitis, Scriptis et Elogiis." This work consists of two books, VOL. XVIII.

of which the first treats of the learned Greeks who came to Italy before, and the second, of those who came after the taking of Constantinople. Dr. Hody died in 1706, in the 48th year of his age.

HOE, in *Agriculture*, the usual name of a tool employed in tillage husbandry, well known to the modern farmer, and which is constructed in different modes and forms, in order to serve different purposes in cultivation. Tools of this nature are principally distinguished into two kinds, from the differences in the methods in which they are made use of; as *hand* and *horse* hoes, the former sort being used by the hands of the labourer, while the latter are wholly employed by the powers of the horse. Hand-hoes are, likewise, chiefly had recourse to where the crops are put into the ground in the broad-cast, or narrow-row systems, but horse-hoes in such as are sown in distant drills in a regular manner in regard to the rows or lines. Those of the latter sort are far more powerful in their work than those of the hand kind, and capable of executing the business with much greater dispatch.

HOE, Hand. The variations in the shape and construction of this kind of hoe are numerous, but the old square hand-hoe, which is in use for a great variety of purposes, such as those of common hoeing, thinning, and setting out different crops of the turnip and other similar kinds sown in the broad-cast mode; as well as occasionally for striking out the supernumerary plants in such as are cultivated in the row or drill method, is commonly well known to the farmer. It is in general constructed of a square piece of thin iron, which has a hole and sort of socket formed in the middle, on the upper side, into which the handle is fastened; though in some instances a kind of hoop is formed, which is attached to each extremity of the square part, the middle constituting a sort of socket which receives the handle. Some consider this as forming an improvement in the tool, by admitting the mould to pass through the part which constitutes the bow.

These kinds of tools are also made of different dimensions, in order to their more ready application to different sorts of crops and grounds. The most usual sizes are those given below:

Dimensions of Hand-Hoes.

2 inch hand-hoes.	8 inch hand-hoes.
3 inch —————	9 inch —————
4 inch —————	10 inch —————
5 inch —————	12 inch —————

It is usual to employ the two first descriptions of hoes in the more early growth of several sorts of field crops, such as those of the carrot and parsnip kinds, as well as occasionally for wheat and other grain crops. The four-inch size is also sometimes used for these, as well as the first hoeings of turnip crops and others of the small seed kind. Eight and nine-inch hand-hoes are more commonly made use of for the later turnip crops, and for those of the pea and bean sorts, on most kinds of soil.

The last two sizes of hand-hoes are for the most part employed for the early turnip crops, on such soils as are of a sandy or loamy quality and free from stones; and, likewise, occasionally on such as are of a stony nature.

For the purpose of thinning out such plants as stand in a very close state, in a more perfect and effectual manner than by the common hoe, in various kinds of crops, a triangular tool of this sort has been constructed and had recourse to, which is found to answer well. In it one of the points of the angles is placed in a downward direction, by which means

the workman is enabled to cut out the useless plants with a considerable degree of exactness.

And another tool of this nature, which has two cutting points for breaking up and dividing the ground, has been found very beneficial in different intentions. It is said to be in great use in Portugal, and that, from its weight and conical shape, as well as the circumstance of the handle being light and short, it executes its work to a good depth, without any unusual exertion of the person who makes use of it. It is in that country chiefly had recourse to in breaking up the strong grounds of their vineyards, which could not, it is supposed, be effected by our common hand-hoes. This hoe has, likewise, been suggested as capable of being of great utility in the digging and cultivating of ground in steep hilly and mountainous tracts, as well as in the making of compost manures of lime and earth, in the corners of fields where the plough is incapable of being made use of for the purpose; and in all steep situations where the spade cannot be employed. It is not improbable but that it may also be beneficially used in digging over the head-lands in arable fields, as well as in orchard grounds, and among plantations of trees in various cases.

However, in order to effect the work of field culture in a more perfect and expeditious manner, than by means of common hand-hoes, other improved sorts of them have been lately invented by Mr. Ducket, junior, which execute the business on several rows at the same time, and which are capable of being varied so as to suit different objects and purposes of husbandry. They have been had recourse to on such lands as are of the more light quality with very considerable success. They consist of a kind of *double and triple* hoes. By the first of the latter description three rows are capable of being finished at the same instant, the labourer who employs it advancing in the same manner as with the common hoe. Its weight, when furnished with the three heart hoes, is 7lb. 9oz. but which is capable of being wrought by even a woman who is accustomed to such labour. By this means, it is suggested, a much finer tilth is stricken into drills for receiving different kinds of seeds, and more expeditiously than by the angle of the common hoe on any line of direction; and that when one drill has been correctly opened, the others will of course be formed with accuracy.

In a second form of this improved hoe, the shares are distributed in the manner for drawing, the workman in using it moving backward; and in the intention of adding more pressure without subjecting the wrist to fatigue, the contrivance of a rope is had recourse to, which passing round the workman's waist, draws from the part where the hand would have acted.

Its weight, with two twelve-inch hoes, is 7lb. 3oz. It has another disposition of the hoes, which is mostly employed in the making of trenches in mellow fine lands, for the reception of manure in the planting of potatoes and other similar crops. These drills or trenches are formed with much expedition by striking in a line, bringing the mould up into a sort of half ridge, and then finishing it by turning and going back. Its weight, with three straight six-inch hoes, is 6lb. 11oz.

There is still an additional form of this improvement of the common hand-hoe, in which there are two outward hoes, a space being left in the middle betwixt them, by which the tool is enabled to execute its work on each side of a drill or row of any kind of crop without difficulty or danger of hurting it.

It is asserted by the inventor, that by the use of this hoe two acres of barley are capable of being hoed in the

course of a day, and that good work is made with it on wheat and oat crops.

The *double* hand-hoe is still occasionally in use in some places, and is a tool that is simple in its construction, and capable of being had recourse to with benefit on soils of the more open and light description.

Hoe, Broad. This is a tool of the hoe kind that has been advised by some, as more adapted to particular uses than those of the ordinary hand sort, as for the hoeing between the rows of such grain crops as are distributed at narrow distances, as performing the work not only with more expedition, but in a more effectual manner.

Hoe, Macdougals. This is a tool of the hoe description, which bears the name of its inventor or improver, and which has somewhat the form of a small light plough, being drawn by a labourer, who is attached to it by a proper contrivance before, and directed by another behind. It is a very convenient and useful implement in many instances, especially where the crops stand at considerable distances in the rows, so as to permit it to work freely. As open wheels are constantly liable to clog and fill up, it might probably be an advantage in this case to have the wheel made perfectly solid.

Hoe, Horse. This is a very powerful implement of the hoe sort, which is now much in use for the cultivation of moist sorts of crops, that are sown in the drill or row method.

The tools of this description that are employed in the different counties of the kingdom, are extremely various in their nature, form, and construction, according to the uses and purposes for which they are designed, as well as the peculiar states and circumstances of the lands on which they are to be employed, and the nature of the drill machines by which the crops are put into the ground. They also differ greatly in their weights and sizes, as well as in the shapes of the cutting parts or hoes.

But all the different kinds of hoes of this nature have a very great superiority and advantage over those of the hand kind when properly formed, not only in point of dispatch from their working upon a great number of rows at the same time, but from their executing the business to a better depth, and in a much more perfect manner. It is obvious, that by means of this description of hoe, the earth can be much more completely stirred and loosened about the roots of the plants, and the ground be kept far more clean and free from weeds than by the hand method, while the saving in labour and expence is very considerable. There can, therefore, be no doubt of the propriety of using them as much as possible in the business of modern husbandry.

Among the numerous implements of this kind which have been lately invented, the *expanding horse-hoe*, and *six-shared horse-hoe*, described in Mr. Amos's work on drill-husbandry, are deserving of notice, as being practical tools. The former has a superiority in many cases from the circumstance of its being formed with expanding shares, which can be regulated to such distances as may be proper within the limits of twelve and thirty inches. It is found extremely beneficial in the hoeing of bean crops, whether sown in drills or equi-distant rows. Likewise, in crops of the potatoe and cabbage kinds. The inventor has had much recourse to it for these purposes in the county of Lincoln.

The *six-shared horse-hoe* may likewise be very useful in different sorts of grain-crops, which have small intervals, such as those of nine inches, from its being capable of regulation in so far as the rows are concerned. It has also been found capable of application in the preparation and cultivation of

lands of the stiff, stony, and gravelly descriptions, as well as in such as are greatly over-run with weeds and other similar trumpery, by means of having recourse to teeth, tines, or other coulter, in the room of the triangular hoes; which should be fixed in the tool in such a manner as that they may not only cut and divide the more superficial parts of the soil, but also effectually stir it below.

A convenient horse-hoe, for the purpose of hoeing a number of rows at the same time, is capable of being furnished by the drill-machine, improved by Mr. Cook, merely by removing the drill-coulter, and supplying their places with proper shares for hoeing. But in doing this it must be observed, that soils of different qualities and textures will require shares of different forms and sizes, but which can only be regulated by means of experience in any particular sort of land. In sandy, loamy, and all light sorts of soil, or such as have been perfectly broken down and reduced by tillage, shares from five to six inches in breadth for nine-inch drills, and those of eight inches in breadth for twelve-inch drills, will perform their business in a safe and effectual manner. But in strong clays, which are intermixed with pebbles, the shares of the hoes must not have so much breadth; and it is not improbable but that there may be some soils wholly incapable of flat-hoeing. Where, however, the texture of the soil in the intervals of the rows of grain is capable of being torn and stirred by long narrow plates of iron, having the forms of points or chisels introduced into the shanks of the hoe-shares, instead of the hoe-plates, there will be very great advantage obtained in the work. The hoe-plates are capable of being regulated so as to operate to a greater or less depth by different contrivances. It is found that ground cannot lie in too level a state on the surface for the work of effectual and expeditious horse-hoeing. In cases, however, where the ridges or lands are in so convex or rounded a state, as that the whole of the hoe-plates are incapable of performing the work in an equally deep manner in the same operation; such as cannot be rendered useful may be taken out and laid by.

It is suggested by the improver of this horse-hoe, that it is capable of being applied to several other beneficial purposes, in addition to that of hoeing drilled corn crops, such as cutting up the rows of stubble as soon as the produce has been removed, with all such weeds as may have escaped the hoe, and the stirring of summer-fallows, &c. With one man, two horses, and a boy, it is said that ten acres are capable of being wrought over in the course of a day; which is a great convenience, especially in the busy harvest season, when it would be wholly impossible to spare such a number of men and horses as would be necessary to effect the business with common ploughs. The same expeditious method is also capable of affording very great advantages, in cutting up the stubbles, either before or directly after the crops have been taken away, as time may be thereby gained for a second sowing of grass-seeds where the first may have missed, and on cole, rape, and turnips, for the food of sheep or neat-cattle, during the winter or spring.

Another simple and convenient tool of this description, which has been lately employed with success, is the *drill horse-hoe*. It has been used in hoeing and cleaning drilled wheat crops with considerable advantage, in the practice of I. C. Curwen, esq., in Cumberland, who states, that "the simplicity and ease with which it is worked, has enabled him this season to give his wheat-crop, which exceeds one hundred acres, two cleanings, at an expence somewhat less than a shilling per acre each operation; a man and boy, with one horse, being able to clean above seven acres per day.

The direction of the harrow, to prevent its injuring the grain, is effected by an alteration of the chain, by which it is attached to the wheels. The distance of the other teeth from the centre tooth must be regulated by the width of the drills. In case they exceed a foot, the harrow should be broader, to admit of another row of teeth. To clean at nine inches, two inches and a half are allowed on each side of the centre tooth, by which means every part of the earth is cut between the rows of grain. The size and strength of the teeth must be regulated by the nature of the soil."

Upon the utility of this hoe, Mr. Dykes has remarked, "that its effects appeared to him most highly beneficial, in clearing away in the spring all the weeds that had grown during the winter, amongst the wheat, without the least injury to the grain; and also in raising up the top soil, which had become sad and heavy, and thus enabling the spring shoot to take root more easily; and, at the same time, it covers the roots of the corn with fresh soil, which are often left quite bare by the washing of the rains in winter, and subject to be killed by the frosts. It enables the farmer to sow his barley much earlier than he could broad-cast, as it will both clear the corn previous to sowing the grass-seeds, and afterwards harrow them in." It is indeed the advantage has appeared so great, that he has been induced to sow the corn on his fallows by means of the drill.

A practical implement of this sort has likewise been lately contrived by Mr. Waitell, which he denominates a *horse-hoe*. In this tool, by combining the powers of the hoe and harrow a convenient and useful machine is afforded for working the intervals of drilled turnip, and other crops, that have sufficient widths in the rows for admitting its action.

Its various uses are, that "it enables the farmer to cultivate those intervals as completely as a well-wrought fallow, so long as the horse can travel therein without injury to the growing crop. It is not ascertained who was the original inventor of this tool, but the first Mr. Waitell saw was at West Park, in the vicinity of Barnard Castle. That in his possession was brought from Carlisle, and great numbers have been since made from it. They answer perfectly for turnip crops, sown at twenty-seven inches distance in the rows, and are greatly in use for that sort of culture.

There are still a great many other sorts of horse-hoes, but it is not necessary to take notice of them in this place, as they will be considered in speaking of the operations which they are particularly calculated to serve.

Hoes of these several kinds may be seen by consulting the figures in the plate belonging to this article.

Hoe, in *Gardening*, the common name of an useful and well-known garden implement.

These tools are of different kinds, as *drawing* and *scuffing*, each of which has different sizes or dimensions.

The first sort is fixed with its edge inclining a little inward; the workman, in using it, drawing it towards him. It is one of the most useful implements of gardening for many purposes, both for general hoeing, and in drills for sowing many sorts of seeds, loosening the earth about the plants, and moulding up the stems of them, as well as hoeing down weeds between all sorts of plants that stand distant enough to admit it. It is the best adapted of any kind for thinning out esculent crops to proper distances, to acquire their proper growth, such as onions, carrots, parsnips, turnips, spinach, &c. And of this kind there should be three or four different sizes, from six inches width down to two inches, or less.

The first size is a large hoe for common use, about six inches long in the plate, by three or four broad, fixed on a

long handle for both hands, and is the proper sort to use for all common hoeing-work, and for drawing drills for sowing peas, beans, kidney-beans, &c. It is the most eligible sized hoe of any for broad-hoeing, between rows of all those kinds of plants, and all others that stand distant enough, either in rows or otherwise, for the hoe to pass between them, both to cut down weeds and loosen the ground, and to earth up the stems of the plants; and for all other purposes of hoeing where the plants stand distant, both in the kitchen and pleasure-garden.

The second size should be about four inches in the plate longways, and the same breadth as the above. It is useful for drawing drills, and for hoeing among various plants, where the former sort of hoe cannot be commodiously employed; as well as to thin some sorts of esculent crops that require moderate distances, such as Dutch turnips, general crops of carrots, parsnips, &c. It is also a proper sized hoe for hoeing common flower-beds and borders, &c. in most instances.

The third size should be two inches and a half, or not more than three inches broad in the plate; and be fixed on a short handle to use with one hand in small hoeing, thinning out several sorts of esculent crops, and other work among close-growing plants. A smaller one should also be fixed on a longer handle, to use two-handed in hoeing borders, and other compartments of smaller plants standing near together, both in the kitchen-ground, flower-garden, &c. This sized hoe, on a short one-handed handle, is likewise particularly useful for small-hoeing, moulding, and thinning out many kitchen-garden crops in young growth, such as onions, leeks, carrots, parsnips, spinach, &c. to cut them out to the proper distances. It is also a very convenient size for use on many other occasions of hoeing; and for drawing small drills for sowing many kinds of seeds, and hoeing up flower-beds, &c. where the larger hoes cannot be readily admitted between the plants, so as to stir the mould effectually about them.

The fourth size should be about two inches wide, and fixed in a short handle. It is proper for small-hoeing onions and small crops of carrots, radishes, &c. the first time where they stand pretty close, and where it is not designed to thin them out at once to their full distance, but to leave them rather thickish for culling, &c.

The edges of the hoes should constantly be kept sharp by occasional grinding, that they may cut clean and freely.

The second sort, or scuffling-hoe, is commonly called a *Dutch-hoe*. It is fixed with the edge outward, on the end of a long handle, so as that the person using it may push it from him going backward, and never treading on the hoe-ground, as with the drawing-hoe. In regard to size, it should be from about four to six or eight inches wide, open in the middle, for the mould and weeds to pass through, so as not to be drawn in heaps; having a long socket at the back part, in which to fix the handle, which may be five or six feet in length.

This is very proper for scuffling over any piece of ground to destroy weeds, that is clear from crops, or between crops that stand wide, with which a person may make considerably more expeditious work than with a drawing hoe, especially when the weeds are not suffered to grow large; in which case, one man can often do as much as two with the other sort. It is not proper for hoeing out crops of esculent plants, or for earthing up the stems of plants, nor for hoeing where the plants stand close. But it is very useful for cutting down weeds in shrubberies and wilderness quarters, where

the shrubs stand distant from one another. And it is the best sort of any for scuffling over sand-walks, or others made of loose materials, in order to destroy weeds, moss, &c.

When of a small size, it is also found useful to run over flower borders, to cut up straggling weeds; as, being fixed on a long handle, the work may be effected by standing in the walks, without treading on the borders or walks, and thereby doing injury.

There is also a sort of triangular hoe, which has been lately found very useful in hoeing many sorts of small crops that stand rather close.

HOEDIC, in *Geography*, a small French island in the English channel, near the coast of the department of Morbihan; about 9 miles E. of Belle-isle, and 12 S.E. from the peninsula of Quiberon; on it are a town and village of the same name, and a fort. In 1746, this island was taken by the British. N. lat. 47° 41'. E. long. 2° 46'.

HOEING, in *Agriculture*, the work of breaking down, dividing, and rendering the particles of the mould or soil fine, by the use of tools contrived for the purpose, between the rows of drilled grain crops, or those of other sorts, set in rows at still larger distances.

It is one of the most useful and important processes, where crops are sown or set in the drill or row method, and which should constantly be well attended to, and executed.

The advantages of the hoe culture are, in general, considered to be extremely numerous; it completely destroys weeds; increases the means of the plants supplying themselves with food, greatly promotes the fertility of the land; forwards the process of vegetation; and leaves the soil in a great part prepared for succeeding crops. As rain, snow, and dews are capable of being taken up with avidity by the mould of the soil, while it is preserved in a loose, porous, and open condition, though in the contrary state, or that of its being in a hard-bound, firm situation, they seldom reach much below the surface, being speedily again taken up into the atmosphere by the effects of the sun and wind, producing little or no benefit; the work of hoeing must obviously, in this point of view, be of great utility. And accordingly it is found highly efficacious on strong, stiff, loamy sorts of land; while in those of a very light open texture it is often hurtful, by suffering the moisture and other elastic matters to escape too freely, when too much employed.

In conducting the work of hoeing, the ground should be in a medium state of dryness. Light dry soils are mostly capable of being hoed at any season; but such as are of an adhesive compact quality, can only be hoed with benefit, at particular periods, when the mould of them is in a loose friable situation.

In the hoeing process, it is necessary to execute the business in different ways, according to the nature and circumstances of the land. Upon the more stiff, heavy, loamy sorts of soil, which are very apt to produce abundance of weeds, it will be found necessary to repeat it more frequently than on others of the more light and open descriptions. The hoes should likewise be heavier, and the shares stronger, for the former than the latter. In grain, and small seed crops, when drilled at narrow distances, the work of hoeing should be performed by means of small shares that bear a due proportion to the width between the rows. But for other larger sorts of crops that are drilled or set at much wider distances, larger and stronger tools are proper.

Many farmers are of opinion that hoeing is greatly more beneficial when executed with horse hoes, than any of those of the hand kind, from their loosening the soil more deeply, and

HOEING.

and thereby providing more nourishment for the use of the crops. Hence, it is supposed, arises "the vast importance of the operation of horse-hoeing, during continued drought in the spring or summer; and to this cause, in a great part at least, it may probably be owing that lucern, usually sowed and horse-hoed, is said to endure drought so much better than natural grasses, and to appear green and flourishing whilst these are withered and burnt up. The almost instantaneous benefit conferred, by this operation, upon cabbages, which are root-bound from a baked soil, or upon wheat which appears yellow and sickly in the spring, is its best recommendation." These crops may, it is said, "be seen, after being worked in the rows, from a withered sickly hue, and flagging condition, turn erect, and change their colour to a deep and flourishing green within twenty-four hours. Nay, of such importance is the operation of deep and effectual hoeing held by experienced people, that a Kentish farmer has been known, in a time of great drought, to send his men with their spades into the alleys of peas, being afraid of damage from horse-work."

With regard to the number of hoeings that may be necessary for different sorts of crops under the drill system, it must of course vary greatly according to the particular circumstances of the different cases. It is usually, however, about three, four, or even five, in remarkable instances. But it is chiefly to be regulated by the disposition of the land to throw up weeds; where this is considerable, more hoeings will consequently be required, as no weeds should ever be allowed to rise.

In respect to the proper periods of hoeing, there is considerable diversity of opinion, especially as to grain crops, and those of some other kinds.

In wheat, when sown sufficiently early to admit of the work being done in the autumn, the first hoeing is advised never to be executed until the plant has acquired more than one blade, and it may be delayed till it has four or five leaves, in case that no particular occasion for it is seen, and that it be performed before the winter sets in.

The method of hoeing is differently executed in different cases. The author of the horse-hoeing husbandry recommends, that the first operation should be performed from the rows of the plants, in one bout of the machine, by which means a ridge is left in the middle of the interval, and a furrow or channel on each side of it, having the row of plants between, by which the snow and rains are caught in the winter, and much benefit thereby produced, as well as by the greatest possible surface of the soil being exposed to the influence of the atmosphere. It has been contended by the above writer, that, for the first time, the work can scarcely be done to too great a depth, or too near to the rows, provided that the plants are not injured, or rooted up, as by laying the roots almost bare in this way, and exposing them to the action of the frosts, no sort of harm is sustained by them. This is, however, a practice, the utility of which may be justly disputed, as it is more natural to suppose that benefit may be derived from the mould being stirred and laid up to the stems of the plants, than by exposure during the rigours of such seasons. And it is even admitted, that much caution is necessary in approaching the rows of plants, in performing this sort of work on very light soils. It is also suggested, as a common fault among workmen in employing the hoe plough, that they merely skim up and down the middle of the intervals between the rows without going sufficiently near them, or sufficiently deep; and it is advised, as a great improvement of the custom, to trench or draw another

furrow to a proper depth, if practicable, immediately, or otherwise before the ridge be turned back in the spring. In this way the plants are left, as it were, on the brink of a trench, by which means they are preserved constantly dry and free from stagnant moisture, being, at the same time, sheltered by the ridge thrown up in the alley.

In using the drill husbandry on strong soils, there may often be danger in protracting the first horse-hoeing to too late a period, on account of the ground being apt to become too moist for performing the business in an effectual manner.

The work of horse-hoeing in the spring may be begun "as soon as the frosts are out of the ground, and the surface mould is sufficiently firm to support the animals without injury in its execution; the ridges between the rows are now to be divided and turned back, the finely reduced mould from the action and influence of frost and snow being laid to the roots of the plants, by which an abundant supply of nutritious matter is taken up. It is not believed that even the smallest injury is done to the roots, by the breaking and tearing of the innumerable threads and filaments which branch out on every side, as nature, in a very short time, not only remedies the mischief, but provides absorbing mouths in proportion to the supply of nourishment that is made. It is suggested that the farmer must constantly be the judge of the necessity for light harrowing and rolling, before the work of spring-hoeing the rows is begun.

The number and distances of the succeeding horse-hoeings must, in a great measure, be governed by the circumstances of the land, and the convenience of the cultivator, but they have chiefly two objects in view; first, that of turning in the weeds the moment they are in the proper condition; and secondly, that of moving the surface mould before it becomes too much baked, and impervious to the dews: the latter of these points must be carefully attended to in dry parching seasons, as the weight of the crop depends greatly upon it. The advantages of the drill system are here likewise clearly evident. There may be a still further necessity for an additional stirring, in such soils as are much exhausted or impoverished, arising from the crops having taken up the chief of the nourishment which was provided by the former hoeings, consequently a new earthing up of fresh mould near the period of their coming to perfection may be of great service. It is conceived that slight hoe-ploughing can never be in the least injurious, at whatever season it may be executed; but deep working in this way should never be permitted near the rows of the plants either in the spring or the summer months. However, the middle part of wide intervals may be wrought to a good depth, as, in this case, the plants are left well earthed up at the last hoeing.

In respect to the modes of executing the work of horse-hoeing, it is hinted, that "the old method of very wide intervals for the horse-hoe, whilst the seven-inch rows upon the ridges were trusted entirely to the operation of the hand-hoe, seems now to be exploded, and to have given way to the improvement of horse-hoeing the rows in a considerable number at one time." It is probable that this expeditious method was first introduced by Ellis and Duckett. The superiority of such a practice over hand labour cannot be disputed; but when had recourse to on strong rough lands, its powers may be questioned with propriety, and a preference be justly given to the regular and effective working of the hoe-plough. Upon such clayey grounds, deep and effective pulverization is of great consequence, slight surface working producing but little benefit, the earth below being left in a hard

HOEING.

hard unreduced state, almost wholly unfit for the purposes of vegetation.

The work of horse-hoeing must, however, in a great measure, be regulated, in all cases, by the circumstances of the soils, and the particular modes of drill-sowing that may have been employed.

It is stated by a late able writer, that "early in March Mr. Coke uses the hand-hoe, which, for hoeing the rows of wheat and peas, is about six inches wide; and for hoeing those of barley, about four inches wide. By this hoe, the surface is not only turned over, and the weeds between the rows rooted up, but the mould is also accumulated about the roots of the growing corn, and covers, and consequently destroys, the low growth of poppies amongst them, which are a very frequent weed in that part of the country. A second hoeing is performed about the middle of May, and the soil is again not only cleared from weeds, but accumulated against the rising corn, each of which hoeings cost about twenty pence per acre. Nevertheless, it is suggested, that some attentive agriculturists use the horse-hoe belonging to Mr. Cook's drill machine, though the rows of corn are but nine inches from each other; and assert that this occasional trampling of the horse on the young plants is of no very ill consequence, a circumstance well worth observing, as it removes the principal disadvantage of the horse-hoe, which consists in the too great distance of the alternate rows of the corn plants." It is further stated, that "by the earth being thus accumulated against the roots of the corn, it is said to tillure, or tellure, much; that is, to throw out four or six stems, or more, around the original stem, and thus to increase the number of ears, like transplanting the roots; inasmuch that Mr. Coke obtains by this method between four and five quarters of wheat on every acre, which, in the broad-cast, did not yield more than three quarters an acre, besides giving a strike and a half of the seed corn, unnecessarily consumed in the broad-cast method of sowing. To this should be added another advantage, that as the land is thus kept clear from weeds, and has its surface twice turned over, and thus exposed to the air, it is found to save one ploughing for the purpose of a succeeding crop of turnips." But whether this tilluring of the plants may be really beneficial, without hurting their roots by too much exhaustion, has not been hitherto satisfactorily shewn.

A late writer, who objects to the process of hoeing, as practised by Tull, Chateaufieux, and others, as being very imperfect, by leaving the roots of the plants too much exposed and subject to the effects of the drying summer winds, as well as various other causes, in the first operation of the business, supposes, that all the different processes of horse-hoeing may be performed in an equally effectual manner, by the common swing-plough, as by any of the hoe-ploughs which are generally employed. The mode of using the swing-plough in this sort of work, is described and explained in the second volume of "Recreations in Agriculture," at considerable length, with a plate.

But notwithstanding the ease, convenience, neatness, and dispatch with which the work of hoeing may be executed, either by means of ploughs of the common hoe or swing descriptions in such sorts of crops as stand in need of wide intervals, as those of potatoes, cabbages, beans, and others, which are similar in their nature and habits of growth, they are not by any means properly adapted for executing the business in such crops as are put into the ground at narrow distances, such as those of the grain kind. In these cases, such hoe machines as work between many different rows at

the same time, are commonly found the most proper and convenient.

Other implements, such as those of the cultivating and scarifying kinds, may be had recourse to with much advantage, in many cases, in the early spring, in the view of loosening and stirring the earth about the roots of these sorts of crops.

It has been stated by a writer on drill husbandry, that in performing the work of hoeing in wheat crops, as that plant has two sorts of roots, namely, the *feminal* and the *coronal*, the latter of which rarely shows itself until towards the end of March, or the beginning of the following month, that is the proper period for aiding the efforts of nature; which is advised to be done by means of passing over the field with a pair of light harrows, and in this way not only destroying the weeds, but affording an earthing-up to the coronal roots of the plants. As soon as this harrowing has been executed, a roller should be immediately passed over the field, in order to render the soil firm about the roots of the crop, as well as to prepare for a second hoeing; but this process may not be necessary except in the more light kinds of soils. About the beginning of May, and sometimes sooner, it is suggested, that the second hoeing should be undertaken by the use of the six-sharred horse-hoe or the breast-hoe. The latter, however, only hoes one row at a time, and is of course very inferior to the former; which performs the work on six or seven, according to the distances at which the crops are sown. Where this last sort of hoe is employed, the seed box, &c. should be wholly removed, nothing being left but the mere frame of the drill machine, to the coulter bar of which the hoes should be attached. And in the execution of the work, the horse should pass exactly in the same track in which it went in drilling the seed, one hoe less than the number of rows drilled being made use of; that interval between the breadths of the drill implement being hoed by the hand, on account of its being unequal from the unsteadiness of the horse; and by the workman who manages the machine keeping his eye constantly on one of the hoes, so as to preserve it in the middle of the interval, the rest must with certainty be perfectly right in their direction. In cases where the labourer who directs the hoes wants to move them to the right or left, so as to keep them in the middle of the intervals, he should lift up the handles in a slight degree at the time he moves them. But it makes no material difference, whether the coulters or hoes be used or not, as the manner of regulating them is equally the same, and the directions that have been given for the use of the hoes are equally applicable to the use of the coulters in this hoe machine.

The third hoeing is directed to be had recourse to about the latter end of May, or the beginning of the following month, as at that season it greatly invigorates the coronal roots of the plants, and at the same time promotes the growth of the stems or stalks.

And where a fourth hoeing is found requisite, it should be performed about the end of June, or in the beginning of the succeeding month, according to the circumstances of the case. However, as there are considerable variations in the soils and seasons, it is suggested as impossible to ascertain with precision the exact period when the work should be performed. Consequently, much must be left to the judgment and discretion of the farmer; but weeds should in no instance be suffered to become predominant, as thereby much injury must necessarily be sustained in the crops.

When drilled crops of the wheat kind are hoed by the hand method, which should perhaps be only managed in this way; it is supposed by some that the work should be executed,

HOEING.

executed, as soon after the plants are up as possible, by two-inch hoes.

In the execution of this sort of work, on crops of the barley kind, as there are likewise two sets of roots, of a similar nature to those in wheat, as the seminal and coronal, the latter of which is formed about three weeks after the sowing of the seed, it is suggested that upon the appearance of this root, the field should be harrowed, and afterwards rolled, in order to prepare it for the first hoeing process, and that the second and third hoeings should be had recourse to at proper distances of time, being executed exactly in the same way as has been already directed for conducting the work in crops of the wheat kind.

In managing the work in oat crops, it is advised, that as soon as the coronal roots begin to show themselves, the field should be harrowed and rolled as above for the first operation of the hoe. And that the second and third hoeings, in cases where they may be requisite, should be performed in proper times afterwards, and in the same method as has been directed for crops of wheat.

It has, however, been shewn that the work of hoeing is capable of being effected in a very exact and perfect manner, without the necessity of having recourse to the use of hand hoes at all in any of these kinds of grain crops, by means of the improved horse-hoe of Mr. Cook. See HOE.

But in drilled crops of wheat as well as barley, it is the advice of many good cultivators to have the work performed as soon as any weeds make their appearance, whether the horse or hand method is had recourse to for the purpose.

And in cases of this nature, the hoes should constantly be of the same sizes with the drills, that injury may be more effectually guarded against. In these instances the work may frequently be executed by means of one horse fixed to a tool that does the business on four or five rows at the same time, a workman directing it behind by means of the handles.

In the work of horse-hoeing bean and pea crops, the writer of the same system of "Drill-husbandry" recommends, that as soon as the plants can be fully distinguished in the rows, they should be harrowed over and rolled in order to complete them for the first operation of the hoe. And that in cases where the soil is mellow in its nature, the expanding horse-hoe should be employed about the middle of May, at which time the beans or peas will be sufficiently established in the ground, so as not to be injured by the free use of the tool; the shares being kept perfectly sharp, so as to cut the weeds with facility, in order that the expanding harrow may bring them more completely to the surface, and thus finish the second process of the hoe. The crops may then remain three or four weeks, or until more weeds appear to be thrown up, when they should be skim-hoed a second time, which completes the business of the third hoeing. But in the course of some days afterwards, the rows should be hand-hoed in a perfect manner, and then well earthed up, which concludes the work of the fourth hoeing. Two or three weeks after this they should be again hand-weeded, and then earthed up the second time, which finishes the business of hoeing that is usually found necessary. It is advised, however, that if the soil should be of a stiff, gravelly, or stony nature, the hoe-plough should be had recourse to in the second hoeing, ploughing a furrow off from the beans on each side, so as to make a ridge in the intervals between the rows; by which means they will then stand upon a ridge of about six inches in width, which should be well hand-hoed. About a week afterwards, the double mould boarded plough should be employed, to earth up the plants in the rows. And in

two or three weeks they should be again hand-weeded, being earthed up a second time by the double mould boarded plough as soon as the weeds are dead, which mostly terminates the work of hoeing in such crops.

In the business of hand-hoeing crops of this sort, ten-inch hoes are commonly the most proper, the mould in the second process being brought up to the roots of the plants, upon which, especially in peas, they should be made to rest in an inclining position, so as to afford a more complete exposure to the influence of the sun and atmosphere.

In the work of hoeing drilled turnip crops, it is suggested that, as soon as they have got four vigorous rough leaves, they should be harrowed with a pair of light harrows, and in two or three weeks afterwards the second hoeing should be given, either by the breast, or six-shares horse-hoe, in order to cut up the weeds in the intervals, but such weeds as are in or near the rows should be extirpated by the hand-hoe, the turnips being thinned out at the same time. The third hoeing may be had recourse to in two or three weeks after this with the same sort of hoes, the rows being also well hand-hoed, and the turnips set out to their proper distances. And it is hinted that this method of turnip hoeing is equally applicable to the hoeing of cole, with the exception of the harrowing, which should be wholly omitted.

It is advised by many to give the first hand-hoeing in the more early turnip crops, as soon as the leaves spread about four inches each way; repeating the operation at the distance of about a fortnight, so as to leave the plants about twelve inches apart; but in the later crops, the nature and quality of the land should be well considered, and the distance regulated accordingly; however, eight or nine inches are quite sufficient in general.

In carrot crops the method of hoeing is, as soon as the plants are from two to three inches above the ground, to have them harrowed over by a number of harrows fastened together by a pole, so as to be capable of covering the ridge, the horses being made to walk in the furrows, in order to prevent treading the ground, or doing injury to the young plants. In two or three weeks after the harrowing, the second hoeing should be given to clear the intervals of weeds, such as are in or near the plants in the rows should be cut up with the hand-hoe, and the plants thinned out at the same time. The crop may remain for two or three weeks in this state, or until weeds begin again to appear. The hoes should then be again employed, the breast or horse-hoe to clean the intervals, and the hand-hoe for the rows; and where any double carrots are left, they should be taken away, and such plants as are to stand for the crop set out to their proper distances. In the execution of the work in carrot and turnip crops, the four-inch hoe is preferred by some for the latter, and the three-inch for the former, the plants being left in the first hoeing at such a distance as may seem requisite; and in the second setting them out to that of from three to five or six inches distance, according to the nature of the soil.

In the business of hoeing potatoe crops, it has been suggested that, as they are in general set upon light mellow soils, the expanding horse-hoe is well suited to their culture. It has the properties of being expeditious, effectual, and cheap in the execution of the work. The hoeing in this crop may, however, be well performed by the use of the hoe-plough, or indeed any common sowing plough, as already noticed. It is advised, that as soon as the plants are fairly above the ground, they should be harrowed once over in a place as a preparation for the first hoeing; and that in about two weeks afterwards they should be skim-hoed for the second operation, and in two or three weeks more again skim-hoed; the expanding harrow being constantly employed to drag

drag the weeds out of the ground after they have been cut up by the hoe. Directly after the second skim-hoeing they should be well hand-hoed in the rows; and as soon as the weeds are dead, and in some measure decayed, the plants in the rows should be earthed up well by the same tool properly prepared for the purpose. See HOE.

When more weeds begin to shew themselves, but before the potatoes begin to spread too much, they should be hand-weeded in the rows, and then earthed up a second time. When more weeds appear, and seem likely to run into seed before the potatoes are taken up, they ought to be pulled up by the hand, and conveyed from the field, or laid in heaps and consumed by fire, or formed into an earthy compost by means of caustic lime, and rich mould.

In the hoeing of this sort of crop others advise the use of eight or ten-inch hoes, as the land is more or less stony; in the first operation drawing up the mould so as to cover the roots and prevent their rising above the surface; afterwards earthing them up with the mould from betwixt the rows of the plants.

In hoeing cabbage crops, it is suggested, that as the month of May is the principal season for planting them to stand the winter, the work should be finished at that time; and that in about three or four weeks after they have been planted out, the hoe-plough should be had recourse to, ploughing off a furrow from the rows of cabbages on each side, so as to form a sort of ridge in the intervals; the cabbages being left upon a flat ridge of six or eight inches in breadth. These ridges should be well hand-hoed, and the mould brought up well to the plants at the same time. When the work of hand-hoeing has been completed, the expanding harrow may be made use of in order to harrow the ridges in the intervals, by which the weeds are destroyed, and left upon the surface to decay.

Ten or twelve days after this harrowing has been done, the hoe-plough may again be had recourse to, in order to turn back the mould to the roots of the cabbage plants, on each side of the rows: and in about a fortnight after this earthing up, the bottoms of the intervals should be cleared up by the horse-hoe or the hoe-plough, which has not only a very pleasing effect, but is highly useful to the crop. It should likewise be repeated a second time when the weeds begin to shew themselves, before the cabbages spread so as to prevent the horse from passing in the intervals without injury. Where additional weeds are thrown up, they may be removed by hand labour, and any injurious insects that may be present at the same time destroyed. The hoe-plough, or common swing-plough, answers here perfectly for the purpose of hoeing.

Where the hand mode is had recourse to in executing the work of hoeing, a three-inch hoe is commonly first employed, and in the course of the fortnight or three weeks afterwards a four-inch hoe; after that the plants being usually drawn out, and planted so as to give the most suitable distances according to the condition of the soil.

Although both the hand and horse method of hoeing crops must frequently become necessary, it is evident that the latter has considerable superiority in point of cheapness, convenience, and the effectual manner of executing the work. See the culture of the different grain, root, and other crops, under their proper heads.

HOING, in *Gardening*, a necessary operation performed by the hoe, to destroy weeds, loosen the soil, and mould up the stalks or stems of plants of different kinds, and thereby promote their growth.

It is an expeditious method of destroying weeds between

all sorts of plants that stand distant enough to admit it in the intervals and rows.

When principally designed to destroy weeds, it should always be performed to some depth, and in dry weather, the more sunny the better, especially when the weeds are not to be raked off, that they may die as soon as they are cut down, or at least be so much flagged or withered by the sun and air as not to grow again.

This sort of work, besides destroying weeds, is likewise useful in loosening the surface and disposing the earth to receive the greater benefit from the air, dews, rains, &c. to the great nourishment of all sorts of plants, and, by breaking up the surface, dividing the clods, and stirring the earth, keeping it fresh and proving a very beneficial culture to all vegetables. In soils apt to bind after much wet, which causes the plants to appear of a stunted growth, hoeing is of vast advantage in promoting their immediate growth and future progress.

The application of earth about the stems of plants, such as earthing up rows of peas, beans, kidney-beans, cabbages, cauliflowers, &c. is constantly of great service in protecting the strength and vigour of the crops, as well as in giving them a neat appearance.

It is also beneficial in thinning out many close-standing crops to proper distances, cutting out the super-abundant plants and the weeds, and loosening the soil in an advantageous manner. See the particular crops.

HOEI-TCHEOU, in *Geography*, the most southern city of the province of Kiang-nan, in China. It is one of the richest cities in the empire: the people are economical and temperate, but they are active and enterprising in trade. Their tea, varnish, and engravings, are the most esteemed in China. It has six cities of the third class dependent upon it; and the mountains which surround this canton contain gold, silver, and copper mines. N. lat. $29^{\circ} 57'$. E. long. $118^{\circ} 14'$.—Also, a city of China, of the first rank, in Quang-tong, celebrated for the fertility of the country round it, and its extensive trade. Its jurisdiction comprehends 11 cities of the second and third class. N. lat. $23^{\circ} 1'$. E. long. 114° .

HOEMAH, a town on the S. coast of the island of Bourro. S. lat. $3^{\circ} 50'$. E. long. $127^{\circ} 22'$.

HOENFURST, a town of Prussia, in the circle of Nantangen; 26 miles S. of Brandenburg.

HOENSEE, a town of Prussia, in the circle of Samland; 12 miles E.S.E. of Goldap.

HOEREA, a town of European Turkey, in the Morea; 27 miles N.W. of Mistra.

HOEROMSK, a town of Norway, in the diocese of Aggerhaus; 16 miles S.S.W. of Christiania.

HOESSERING, a town of Westphalia, in the principality of Lunenburg-Zelle, situated on the Hardan; 22 miles N.E. of Zelle.

HOET, GERARD, in *Biography*, born at Bommel in 1648, and was a disciple of Warnard van Ryfen, an excellent painter, who had been bred in the school of Poelemburg; but his genius soon exerted itself in such a manner, that he was enabled to proceed happily in his profession, without being indebted to any instructor.

When he commenced artist, he was at first invited to Cleve, where his paintings procured him very great credit; but he was afterwards prevailed on to visit France: yet in that kingdom he had not the good fortune to meet with encouragement in any degree proportioned to his merit; and therefore he turned his attention to England, whither he certainly would have directed his course, had he not been dissuaded by Volterman, who at that time was preparing to

leave

leave the court of London. At last he settled at Utrecht, and in that city and its neighbourhood found a sufficient number of admirers and friends who constantly employed his pencil; and afforded him continual opportunities to display his abilities, in executing several grand and beautiful designs for ceilings, saloons, and superb apartments, and also in finishing a great number of easel pictures for their cabinets.

The reputation of Hoet, for knowledge and skill in his profession, was so universally established at Utrecht, that he was appointed director of an academy for drawing and painting, which he conducted with great honour to himself, and remarkable advantage to his pupils. He had a lively imagination, a very ready invention, and a fine genius for composition; as also a nice adherence to the costume. His manner of painting was clean and neat, and he was thoroughly master of the true principles of the chiaro-scuro. His figures in general are designed with elegance, and drawn with correctness; his colouring is lively, natural, and full of harmony, from the judicious opposition of his light and shadow; his touch is light and firm, and his pictures have a great deal of transparency. His small easel paintings are exceedingly delicate in the touch and the finishing; and yet his larger works are always pencilled with a freedom that is suitable to those grander compositions.

Many capital pictures of this master are in the palace of Slangenbergh; and his eminent talents may be seen in the grand stair-case at Voorsk, the seat of the earl of Albemarle. In Holland, and also in our kingdoms, several charming pictures of Hoet are preserved; some of them in the manner of Poelenburg, and others in the style of Carel du Jardin. He died in 1733, aged 85.

HOF, or HOFF, in *Geography*, formerly imperial, a town of Germany, in the principality of Culmbach, on the Saale, by which it is divided into the Old and New Town. It has three faubourgs, four churches, an academy, and a woollen manufacture. In its environs are quarries of marble, red, black, and grey, some of the latter being marked with red spots like blood; 46 miles N.E. of Bamberg. N. lat. 50° 18'. E. long. 12° 30'.—Also, a town of Norway, in the diocese of Aggerhuus; 36 miles N. of Berga.

HOFF, a town of Moravia, in the circle of Olmutz; 18 miles N.E. of Olmutz. N. lat. 49° 46'. E. long. 17° 27'.—Also, a town of Prussia, in the province of Natangen; four miles S. of Landiberg.

HOFFHEIN, a town of the duchy of Wurzburg; 36 miles N.E. of Wurzburg.

HOFFKIRCHEN, a town of Austria; 10 miles S. of Aigen.

HOFFLITZ, a town of Bohemia, in the circle of Leitmeritz; five miles S.E. of Tetschen.

HOFFMAN, in *Biography*, an excellent composer of instrumental music, particularly symphonies, was maestro di cappella in the cathedral of St. Stephen at Vienna in 1772, and a master much esteemed at that time in the imperial capital.

HOFFMANISTS, in *Ecclesiastical History*, denote those who espoused the sentiments of Daniel Hoffmann, professor of the university of Helmstadt, who, from the year 1598, maintained that philosophy was a mortal enemy to religion; and that what was true in philosophy was false in theology. These absurd and pernicious tenets occasioned a warm and extensive controversy; at length Hoffmann was compelled by Julius, duke of Brunswick, to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of sound philosophy with true and genuine theology.

HOFFMANN, GASPAR, a physician of some eminence

about the beginning of the seventeenth century, was a native of Gotha, in Thuringia, where he was born in November, 1572. By the assistance of a friend he was supported during his residence at the most celebrated universities of those times, and graduated at Basle in the year 1605. In 1607, he was appointed professor of the theory of medicine at Altdorf, the duties of which, and of other professorships, he continued to fulfil, with credit and reputation, until his death, which occurred in November, 1648. Gaspar Hoffmann was generally considered by his contemporaries as a man of great erudition, and was author of numerous publications, in which he shewed a bigotted attachment to the doctrines of the ancients, especially of Aristotle. His works are not sufficiently interesting, however, at present to require an enumeration of their titles. Haller considered much of his display of knowledge as spurious; and affirms that, as he wrote upon anatomical subjects without having touched a knife, so he treated copiously on the practice of physic, without having visited the sick. Eloy. Dict. Hist. Haller Bibl. Med. Pract.

HOFFMANN, MAURICE, a physician, anatomist, and botanist, was born at Furstemwald, a small town in the Middle Mark of Brandenburg, in September, 1622. During his early youth, his native country was desolated by war and pestilence, which compelled his parents to fly from place to place, and interrupted the education of Maurice, whose acquirements did not go beyond the art of writing. Having lost his father and mother at the age of sixteen, his ardour for knowledge led him to Altdorf, in 1638, where a maternal uncle was professor of medicine. Here he made a most rapid progress in philosophy and the learned languages, and commenced the study of physic. In 1641 he repaired to the then celebrated university of Padua, where he was particularly devoted to the study of anatomy and botany. In the former of these sciences he is entitled to the name of a discoverer, if the relation of Bartholin be true; that, while yet a student, he was amusing himself with the dissection of a turkey, and discovered the pancreatic duct, which he shewed to the anatomist Wirsung, with whom he lodged at Padua, and who afterwards found it in the human subject, and gave it his own name. After a residence of three years in Italy, Hoffmann returned to Altdorf, where he received the doctor's cap in April, 1645, and was soon appointed to a professorship; for in the year 1648 he obtained the extraordinary chair of anatomy and surgery; and in the following year he succeeded Gaspar Hoffmann as ordinary professor of these departments. He likewise was appointed successor to Lewis Jungerman, in the botanical chair, in 1653. He urged the strongest suggestions relative to the necessity of a garden for the culture and demonstration of plants, and was not less strenuous in his representations in favour of the establishment of a laboratory and an anatomical theatre: and it was to his exertions that the university was indebted for these valuable acquisitions. In addition to his academical occupations, he pursued the practice of medicine with considerable assiduity; and he obtained such eminence as a practitioner, that several of the German princes honoured him with the title of their physician. In a word, his industry in the closet, his skill and humanity at the bed-side of the sick, his eloquence in the chair, and his various social qualities, rendered him worthy of the general estimation in which he was held. He died of apoplexy, on the 20th of April, 1698, in the sixty-seventh year of his age. He had been three times married, and had eighteen children.

Maurice Hoffmann wrote several dissertations on anatomical topics, but his principal works were botanical. On this subject he published "*Floræ Altdorfensæ Deliciæ Hortenses*,"

tenfes," 1660, or a catalogue of the plants in the botanical garden; to which several appendices were afterwards printed, containing the additional plants, which were introduced in subsequent years. He likewise printed "*Floræ Altdorfinae Deliciæ Sylvestres*," 1660, being a catalogue of the wild plants, growing spontaneously in the neighbourhood of Altdorf: and "*Descriptio Montis Mauriti in agro Leimbürgenium, &c.*" 1694, being a catalogue of the plants of Mount Maurice and the adjacent countries. Eloy. Dict.

HOFFMANN, JOHN MAURICE, son of the preceding, was born at Altdorf, in October, 1653. He acquired a knowledge of the learned languages at Herfspruck, and studied medicine and philosophy under his father, and subsequently at Frankfort upon the Oder, and at Padua. After a residence of two years in the last mentioned university, he made the tour of Italy, and returned to his native city, where he was admitted to the degree of M. D. in 1675. His talents and acquirements obtained for him successively the highest honours and offices in the faculty at Altdorf. He began with the professorship extraordinary of anatomy, to which he was appointed in 1677, and in 1681 he became ordinary professor of the same branch. In the following year, the professorship of chemistry was given to him, and he read several courses in the laboratory, with which his father's solicitations had enriched the university. He afterwards undertook the professorship of botany. In 1709, he resigned the anatomical chair, and confined himself to the professorship of the practice of medicine, which he retained as long as he remained at Altdorf. But Hoffmann was not more distinguished by the able performance of his academic duties, than by the success of his practice; so that he was sought for by persons of the highest rank, and especially by the princes of the house of Anspach. He was appointed physician to the marquis of Anspach in 1695, and accompanied him in a journey to Italy; and after the death of this patron, in 1703, he found the same kindness from his successor, who pressed him earnestly to remove to Anspach. But it was not until the year 1713, that Hoffmann could be prevailed upon to quit his academic duties: in that year he fixed himself at Anspach, where he died in October, 1727, at the age of seventy-four. He left several works of repute: *viz.* two dissertations on anatomy and physiology; one on what has since been called morbid anatomy, entitled "*Difquisitio corporis humani Anatomico-Pathologica*;" *ibid.* 1713. "*Acta Laboratorii chemici Altdorfini*," 1719. "*Syatagma Pathologico-therapeuticum*," 1728, in two vols. 4to. and "*Sciagraphia Institutionum Medicarum*," a posthumous publication. He also continued his father's "*Floræ Altdorfinae*." See Hutchinso Biographia Medica. Eloy. Dict. Hist. de la Médecine.

HOFFMANN, FREDERIC, the most eminent physician of his name, was born at Halle, in Saxony, on the 19th of February, 1660. He received his early education in his native town, and had made great progress in philosophy and the mathematics, when, at the age of fifteen, he lost his father and mother during the prevalence of an epidemic disease. In 1679 he commenced the study of medicine at Jena, and in the following year attended the chemical lectures of Gaspar Cramer, at Erfurth; and, on his return to Jena, received the degree of M. D. in February 1681. In the year 1682 he published an excellent tract "*De Cinnabari Antimonii*," which gained him great applause, and a crowd of pupils to a course of chemical lectures, which he delivered there. At the conclusion of this course, he was induced to visit Minden, in Westphalia, on the invitation of a relation, and practised his profession there for two years with considerable success. He then travelled into Holland and thence to

England, where he was received with distinction by men of science, and particularly by Paul Herman, the botanist in the former, and Robert Boyle in the latter. On his return to Minden, in 1685, he was made physician to the garrison there, and in the following year was honoured by Frederic William, elector of Brandenburg, with the appointments of physician to his own person, and to the whole principality of Minden. Nevertheless he quitted that city in 1688, in consequence of an invitation, which his rising reputation procured him, to settle at Halberstadt, in Lower Saxony, as public physician. His fame continued to extend, and he published a treatise "*De insuffientia acidi et visceri*," by which he overthrew the system of Cornelius Bontekæ. In 1689 he married the only daughter of Andrew Herfel, an eminent apothecary, with whom he had lived forty-eight years in perfect union, when she died. About this time, Frederic III., afterwards first king of Prussia, founded the university of Halle; and in 1693 Hoffmann was appointed primary professor of medicine, and composed the statutes of that institution. As a colleague in the medical professorship he recommended the celebrated Stahl, who proved the great rival of his fame as a teacher. He was most active in the exercise of his professional duties; and while he introduced a spirit of free and enlarged inquiry into the new university, he extended its fame and elevated its character, by the eloquence and profound information displayed in his lectures. At the same time his own reputation was spread abroad by the learned works which he published, and procured him admission into the scientific societies at Berlin, Petersburg, and London, as well as the honour of being consulted by persons of the highest rank. He was called upon to visit many of the German courts in his capacity of physician, and received honours from several princes; from whom some say that he received ample remuneration in proportion to the rank of his patients; while others have asserted that he took no fees, but contented himself with his stipends. Haller asserts that he acquired great wealth by various chemical nostrums which he vended. In 1704 he accompanied some of the Prussian ministers to the Caroline warm baths in Bohemia, on which occasion he examined their nature, and published a dissertation concerning them. On subsequent visits, he became acquainted with the Sedlitz purging waters, which he first introduced to public notice, having published a treatise on them in 1717: and he afterwards extended his enquiries to the other mineral waters of Germany. Among other illustrious patients, who applied to him in these excursions, were the emperor Charles VI. and his empress. In the year 1708, he was called to Berlin to take care of the declining health of Frederic, and was honoured with the titles of archiater and aulic counsellor, together with a liberal salary. After three years residence at this court he returned to Halle, and gladly resumed his academical functions. He continued also to labour in the composition of his writings; and in 1718, at the age of 60, he began the publication of his "*Medicina Rationalis Systematica*," which was received with great applause by the faculty in various parts of Europe, and the completion of which occupied him nearly twenty years. He likewise published two volumes of "*Consultations*," in which he distributed into three "*centuries*," the most remarkable cases which had occurred to him; and also "*Observationum Physico-Chemicarum selectionem Libri tres*," 1722. In 1727 he attended the prince of Schwartzemburg through a dangerous disease; in recompence for which his noble patient created him count palatine. He quitted Halle in 1734, in order to pay a short visit to his daughter and son-in-law at Berlin, which, however, was made longer than he intended; for he was detained five months by the king of Prussia,

Prussia, Frederic William, in order to attend him during a dangerous illness, which had attacked him in his camp on the Rhine. During this attendance Hoffmann is said, by dignified remonstrance, to have secured himself against the brutal rudeness with which the monarch treated his other physicians; and he was ultimately treated with great honour, being elevated to the rank of privy counsellor, and presented with a portrait of the king, set in diamonds. His majesty likewise procured the portrait of Hoffmann, from the same painter, which was placed in the palace of Monbijou: and to Hoffmann's only son he presented a professorship of medicine in the university of Halle, with the title of his consulting physician. Hoffmann declined a pressing invitation to settle at Berlin, on account of his advanced age, and returned to Halle in April 1735. The illness and death of his beloved wife, in 1737, turned his thoughts to the consolations of religion, and he drew up in Latin a summary of Christian doctrine, which, at the king's desire, was translated into German. He continued to perform his academical duties until the year 1742, when he died in the month of November, aged eighty-two.

Frederick Hoffmann was an industrious and copious writer. Haller has occupied thirty-eight quarto pages in the enumeration of his works in detail. The principal of these were collected, during the life of the author, by two Genevese booksellers, and published with his approbation, and with a preface from his pen, in 1740, in six volumes folio. It was re-printed by the same booksellers, the frères de Tournes, in 1748; and in the following year, having raked together every thing which his pen had touched, they published a supplement in three additional volumes folio, which was also re-printed in 1753-4. The writings of Hoffmann contain a great mass of practical matter of considerable value, partly compiled from preceding writers, and partly the result of his own observation; but they contain also many trifling remarks, and not a little hypothetical conjecture, which was indeed a common fault of the times; and in the detail there is considerable prolixity and repetition. As a theorist his suggestions were of great value, and contributed to introduce that revolution in the science of pathology, which subsequent observation has extended and confirmed. His doctrine of *atony* and *spasms* in the living solid, by which he referred all internal disorders to some "preternatural affection of the nervous system," rather than to the morbid derangements and qualities of the fluids, first turned the attention of physicians from the mere mechanical and chemical operations of the animal body to those of the primary moving powers of the living system. To Hoffmann Dr. Cullen acknowledges the obligations we are under for having first put us into the proper train of investigation; although he himself did not apply his fundamental doctrine so extensively as he might have done, and every where mixed with it a humoral pathology as incorrect and hypothetical as any other. Hoffmann pursued the study of practical chemistry with considerable ardour, and improved the department of pharmacy, by the addition of some mineral preparations; but, on the whole, and especially in his latter years, his practice was cautious and even inert, and he trusted much to vegetable simples. See Eloy. Dict. Hist. Vit. Fr. Hoffmann à J. H. Schultze, and his Epist. to the king of Prussia, both prefixed to the Geneva edition of his works. Gen. Biography. Preface to Cullen's First Lines.

HOFFMANNIA, in *Botany*, so called by Swartz, in honour of several able German botanists of the name of Hoffmann. Mauritius, and his son John George Henry, were successively professors at Altdorf. The former died in 1698, the latter in 1727. They published catalogues of the Altdorf garden;

and of the wild plants of that neighbourhood. Frederick Hoffmann, professor at Halle, who died in 1742, aged 82, published various medico-botanical dissertations on Sugar, Cloves, Balsam of Peru, Yarrow, Manna, &c. and in one of them recommended the leaves of *Veronica officinalis*, as preferable to the tea of China; a doctrine which has made as little progress in the world, as some others better founded in truth. Professor George Francis Hoffmann of Göttingen is particularly distinguished by his descriptive work on *Sahces*, and his splendid *Plante Liebenose*, both in folio; and has also favoured the world with several other botanical writings. He was born in 1760, and is one of the most eminent cryptogamic botanists of the present day.—Swartz. Prodr. 2. Ind. Occ. v. 1. 241. t. 5. Schreb. 788. Willd. Sp. Pl. v. 1. 613. Mart. Mill. Dict. v. 2. Class and order, *Tetrandria Monogynia*. Nat. Ord. *Stellate*, Linn. *Rubiaceae*, Juss.

Gen. Ch. *Cal.* Perianth superior, small, of one leaf, with four erect acute teeth. *Cor.* of one petal, valver-shaped; tube extremely short; limb in four deep, lanceolate, spreading segments. *Stam.* Filaments none; anthers four, attached to the base of the tube, linear awl-shaped, erect, pressed close to the style. *Pist.* Germen inferior, oblong, quadrangular; style awl-shaped, the length of the stamens; stigma obtuse, downy, scarcely notched. *Peric.* Capsule oblong, bluntly quadrangular, pulpy, crowned with the calyx, of two cells and two valves. *Seeds* numerous, roundish, affixed to an ovate distinct receptacle in each cell.

Ess. Ch. Calyx four-toothed. Corolla valver-shaped, in four deep segments. Filaments none; capsule pulpy, with two cells, two valves, and many seeds affixed to distinct ovate receptacles.

Obs. The receptacles, as described by Dr. Swartz, evince the propriety of terming this fruit a pulpy capsule, and not a berry, the latter properly requiring the seeds to be imbedded in pulp, without any distinct receptacles, much less valves.

1. *H. pedunculata*. Sw. Ind. Occ. v. 1. 242. The only species. Found by Swartz in rather moist shady places on the high mountains of Jamaica. The stem is herbaceous, two or three feet long, branched, smooth, rather shrubby at the base; its branches round and hairy. Leaves stalked, opposite, crossing each other in pairs, ovate, pointed, entire; wedge-shaped at the base; above ribbed, shining, rough with elevated points; veiny, pale and hairy beneath. *Stipulas* opposite, very short, acute, thick and hairy, standing between the footstalks. *Flower-stalks* axillary, opposite, solitary, longer than the footstalks, many-flowered, lax, hairy. *Calyx* coloured. *Corolla* yellowish at the points, striated with red at the bottoms of the segments. *Antbers* yellow, cohering as in the nightshade, *Solanum*. *Berry* scarlet when ripe.

HOFFMARKT, in *Geography*, a town of Austria, situated on the river March; 26 miles E.N.E. of Vienna.

HOFFMARKT, *Furth*, a town of Germany, in the margraviate of Anspach, on the Rednitz, peopled with mechanics and artificers; such especially as cannot obtain the freedom of Nuremberg. The Jews are numerous, and have a school and printing-house; five miles N.W. of Nuremberg.

HOFFWA, a town of Sweden, in West Gothland; 80 miles N. E. of Uddevalla.

HOFFHAIMER, PAUL, in *Biography*, published at Nuremberg, in 1539, a tract in Latin entitled "Harmonia Poetica," the second part of which contains a notation of all the rhythms and measures of the feet of Latin verse. This tract is among Anthony Wood's printed books, in the Ashmole Museum. Paul Hoffhaimer is celebrated by Lucianus

not only as an admirable performer on the organ, on whom the emperor Maximilian conferred great honours, but as a composer of the very first class, whose productions, which were not only learned and correct, but florid and pleasing, had remained unrivalled during thirty years.

HOFMAN, EUCHORUS, published, in 1582, at Stralsund, where he was corrector of the public school, a treatise on the tones or modes of the church, "Doctrina de Tonis, seu Modis Musicis." This author, who is a follower of Glarianus, pretends that "the science of the modes, or *canto fermo*, which is the most excellent part of music, is but little understood by the moderns; but he draws his information from musicians of the highest authority."

HOFMANSTORP, in *Geography*, a town of Sweden, in Smaland; 12 miles S. E. of Wexio.

HOG, a town of Sweden, in the province of Helsingland.—Also, a small island in Pamlico sound, near the coast of North Carolina. N. lat. 34° 56'. W. long. 76° 36'.—Also, a small island in the Atlantic, near the coast of Virginia. N. lat. 37° 30'. W. long. 75° 42'.—Also, an island on the E. side of lake Champlain, in Franklin county, Vermont; nine miles long, and generally about three miles broad.—Also, an island in Narraganset bay, Rhode island, about two miles in circumference; two miles from Bristol.—Also, an island below Peach island, in Upper Canada, situated in the strait of Detroit, where it opens into lake St. Clair; containing about 300 acres of land fit for tillage, and a large quantity of marsh or meadow land. It has some wood; the land is low, but fit for pasturage, well improved, and contains in all about 1700 statute acres.—Also, one of the smaller Shetland islands, near the E. coast of Mainland. N. lat. 60° 30'. W. long. 1° 12'.—Also, a small island in the East Indian sea, near the E. coast of Palawan. N. lat. 10° 18'. E. long. 119° 36'.—Also, an island in the East Indian sea, 40 miles long and six broad; 60 miles W. of Sumatra. N. lat. 2° 30'. E. long. 95° 50'.—Also, an island in the East Indian sea, about 20 miles in circumference. S. lat. 7° 5'. E. long. 114° 55'.—Also, an island in the East Indian sea, 15 miles long, and six broad, near the W. coast of Saleyer. S. lat. 6° 12'. E. long. 120° 15'.

HOG, *Cape*, a mountainous headland on the coast of Syria, forming the S. point of the bay of Alexandretta, anciently called the "Rhosius." N. lat. 36° 27'. E. long. 38° 8'.

HOG ISLANDS, a cluster of small islands situated near the coast of the county of Kerry, between Ballinakelie's bay, and the entrance of Kenmare river, within three or four miles of Hog's Head. There is also a single island called Hog island in the river Shannon, near its mouth.

HOG'S HEAD, a cape of Ireland, on the S. W. coast, forming the eastern boundary of Ballinakelie's bay, in the county of Kerry. N. lat. 51° 44'. W. long. 10° 8'.

HOG, in the *Linnean System of Zoology*. See SWINE.

The common hog, or *sus scrofa* of Linnæus, is covered with bristles. In a wild state it is of a dark brinded colour, and under the bristles there is a soft curled hair; the ears are short and a little rounded. In its tame state, the ears are long, sharp-pointed, and slouching; the colour is generally white, sometimes mingled with other colours. The hog, in its wild state, is found in most parts of Europe, except the British isles and the countries north of the Baltic; in Asia, from Syria to the borders of the lake Baikal; in Africa, on the coast of Barbary; and in the forests of South America.

Tame hogs are found universally, except in the frigid zone and Kamtschatka, and such places where the cold is very severe. The Chinese hog is only a variety of the common hog; its belly hangs almost to the ground, its legs

are short, its tail reaches to the heels, and the body is generally bare: it is a much cleaner animal than ours. Hogs are stupid and voracious animals; inasmuch that they will eat their own offspring, and devour even infants; but it is observed, that the hog is not indiscriminate in the choice of its food; for it has been found to eat 72 species of vegetables, and to reject 171. In America it clears the country of rattle-snakes, which it eats with safety. Hogs cannot bear excessive cold, and are very restless in high winds.

There are few animals that are useful in a greater variety of ways than hogs. They are extremely prolific; their flesh is agreeable and wholesome food to those who use much exercise; and as it takes salt better than any other kind, it is of great importance to a commercial nation. Hogs furnish *brayn*, and *lard*, and *bristles*. (See each article.) In Minorca, the ass and the hog are yoked together to plough the land; and the hog has been applied to the same use in our own island, *viz.* in that part of Murray which lies between the Spey and Elgin. Pennant. See BOAR.

These animals are very profitable to the owner in different points of view, especially on some particular kinds of farms, as those of the arable and dairy descriptions. Indeed, on most farms, a few animals of this kind may be kept to great convenience and profit, as preventing the necessary waste of different refuse materials of the food kind, which can only be converted to such uses. These animals are also capable of being kept to great profit in different descriptions of large manufactories where the consumption of grain is extensive; as in those of brewing, distilling, and the making of starch, &c. The breed of hogs should be constantly well suited to the nature of the farm, and the extent of the keep which is capable of being provided for them, otherwise there may often be considerable loss sustained. The close, compact, short-legged breeds, which have much disposition to take on flesh, are, in general, to be preferred. But where the keep is good and abundant, breeds which attain a much larger size may sometimes be more beneficial and proper. See *LIVE STOCK* and *SWINE*.

Hogs are apt to dig up the ground and to break fences; but this may be prevented, by putting rings in their noses, and yokes about their necks. Leicestershire, Northamptonshire, and Hampshire, are famous for these animals, which seems owing to their being clayey countries, and that more peas and beans are sown there than in other places. The wild kind never grow so large as the tame, but they are much better tasted. The keepers of hogs should always chuse such boars for the purpose of breeding as are long-bodied, and have deep bellies and sides, short noses, thick thighs, short legs, high claws, a thick neck, and a thin chine, well set with large bristles. It is not proper to keep too many breeding sows; for they will produce so many young at a time, and this three times a year, that they will not find food enough. They usually bring thirteen or fourteen young ones in a litter, sometimes more, but they can bring up no more than they have teats to suckle. Young shoots, as they are called, that is, swine of three quarters of a year old, are best for pork, and those of a year and a half for bacon. The male pigs that are reared should be gelt, and the sows spayed; and for this purpose, those which are pigged in the spring are the best. Moist and sedge grounds are good for swine, for they eat the roots of many of the plants that grow there; and the fruit of the beech, chestnut, and hedge-bushes, fatten them well, and make their flesh much better tasted than when bred entirely in the sty.

Mr. Young observes, that hogs may be kept in summer, with great advantage to the farmer, in clover fields; and that lucern

Lucern is superior to clover for this purpose, and that saint-foin is very good; but that burnet is very bad. In winter they may be well maintained with carrots, parsnips, beets, and potatoes. The dairy should be appropriated to rearing pigs and feeding sows that have young. It appears, from other experiments of this writer on the fattening quality of several sorts of food for hogs, that pollard alone is a cheaper food than peas alone; that boiled carrots are much the most profitable; that huck-wheat is more profitable than peas; that several kinds of food mixed are better than any given alone; that the meal of any one, or various kinds of grain, is better and more profitable than the whole grain mixed or alone; and that peas and barley are much sweeter food than beans. The keeping of hogs in any city or market-town is indictable as a public nuisance.

Hog Cistern, a contrivance prepared for the purpose of containing and preserving the food employed in the keeping of hogs or swine. This sort of basin, or cistern, should be formed in such a situation as may be convenient for the kitchen, dairy, and hog-yard, being constructed in such a manner as that there may be no loss sustained in its leaking and letting out the more liquid contents. Into this tub or cistern every thing should be collected from the house, and other places, in order to be formed into wash, or soup, for the store pigs, and thereby no loss be incurred. Where large stocks of hogs are kept, it is a matter of great convenience and utility to have different tubs or cisterns of this nature, that the food may be properly prepared, and in sufficient quantities for constant use, as by this means the food admits of being more suitably mixed and blended together.

The proper construction of these sorts of receptacles is a matter of very considerable importance; in Norfolk they are chiefly built with bricks and terrace, which is an expensive method of forming them. Wooden vessels are not by any means either durable or commodious, and those of lead dangerous. Bricks laid in clay are suggested as perfectly water-tight, especially when backed by a coat of the same substance. In forming these cisterns, pits or cavities of suitable dimensions should be dug out, as of five or six feet in length, and four or five in breadth, having the depths of about five feet. The whole of the bottom of the cavity should then be well bedded with good clay, well moistened and rammed down, smoothing the surface over neatly with a trowel. Upon this flooring three courses of bricks, laid in mortar made with the best clay, should be placed in such a way as that the joints of one course may fall in the middle of the bricks of the course under it, the whole being laid lengthways, and not crossed in the usual method. The sides must be carried up half a brick thick, which is a brick in width, being laid in the mortar of good clay; the vacancy left between the brick-work, and the sides of the cavities being firmly rammed with moist clay, so as to combine the bricks as much as possible with the clay and the sides of the pits, forming them into a sort of solid body. The brick and clay-work should be carried up equally together, beating back again such bricks as may have been forced forward in the ramming of the clay, leaving the surface in the cistern quite even and regular. As, when brought up level with the surface of the ground, cisterns of this nature, of five feet and a half by four, usually measure about three feet in length, and two and a half in depth, the seam or layer of clay on the bottoms and sides must be about four inches in thickness. By way of affording a good covering to cisterns of this kind above the ground, a sort of slanting shed should be constructed over them by building slight brick-walls on each side of them to the height of three or more feet, with a gable raised at one

end, the other being left open as a door, and the top closed by a roof and tiles. This method of covering such reservoirs is far superior to those merely having flaps, or other similar contrivances.

Hog's Fennel, in *Botany*. See PEUCEDANUM.

Hog, Hedge. See ERINACEUS.

Hog, Sea Hedge. See ECHINODERMA, CENTRONIA, and SEA URCHIN.

Hog, Hairs of, in *Agriculture*, the stiff bristly sort of hair that is taken off from the body of hogs when they are killed, by means of scalding and scraping. This is a substance, where it can be collected in sufficient quantity, that may be made use of with advantage as a manure. It is capable of being occasionally purchased in the London markets at about nine or ten shillings the quarter, which is a ten bushel sack stuffed quite full; and is applied to the land in such a way, as to be turned in just before the crops are sown. In this method it is found to answer perfectly in soils of the more light description. Seal hair has likewise been found capable of being employed in the same mode with equal success.

Hog Manure, the name of that sort which is produced by hogs in the sties, yards, and other places where they are kept and confined. This is found, by experience, to be a very powerful and efficacious sort of material, being considered by some as nearly equal to that of the horse. It has, however, been suggested as an objection to it by some, that weeds are more liable to rise after the application of it, than that of some other kinds of manure.

The farmers who use the dung of hogs for their lands, generally take care to save it by well paving the sties, and increase the quantity by throwing in bean-stalks, stubble, and many other things of a like kind; and, by good management of this kind, many farmers have procured fifty or sixty load of excellent manure a-year out of a small sty. The very best way of using this dung is to mix it with horse-dung; and, for this reason, it is best to have the sty near the stable, that the two cleanings may be mixed in one heap, and used together.

They have, in many parts of Staffordshire, a poor, light, shallow land, on which they sow a kind of white pea. The land is neither able to bear this, nor any thing else, to their advantage, for reaping. But when the peas are ripe, they turn in as many hogs as the quantity of peas will fatten, suffering them to live at large, and remain there day and night; and, in consequence of this, the land will produce good crops of hay for several years afterwards, or, if too poor for that, it will, at the worst, raise grass enough to make it a good pasture-ground. See DUNG and MANURE.

Hog-plum, in *Botany*. See SPONDIAS.

Hog-sheep, a term often applied to the male or wedder of one year old, as from the time of weaning to that of its being first horn.

Hog-steer, among *Hunters*, a wild boar of three years old. See BOAR.

Hog-sty, the name of a house or building constructed for the purpose of confining and keeping different kinds of hogs and swine. Much, especially in the saving of labour, and the making of manure, as well as in the food and keeping of the animals, depends upon the sties being formed in a convenient manner. They are usually built in a very plain and simple method, the chief objects being considered those of warm dry situations for the animals to lie in, with small areas or yards before them, and proper troughs fitted up for holding their food. They are most commonly constructed with lean-to or shed-roofs, and have but seldom more than six or seven feet width, with height in the same proportion. In order to have them as convenient as possible, they should be at no very great

great distance from the house and offices, being well placed for the kitchen and dairy, but as little connected with the other out-buildings as may be. Some have suggested the great propriety and advantage, in particular cases, of having them connected in such a manner with the scullery, as that the whole of the refuse articles from it may be readily conveyed to them by means of pipes or other similar contrivances.

Where they are at a distance they should constantly be so situated as that the servants need not have occasion to enter the farm yards in the business of feeding them.

Although it be the common notion that hogs are naturally filthy in their habits, there are probably very few domestic animals that are more pleased when they have clean comfortable beds, and certainly not any on which cleanliness has a more evident effect, so far as thriving, feeding, and fattening are concerned. With the view of keeping them perfectly dry at all periods, a slight, but sufficient degree of inclination or slope outwards should constantly be given to the floors of the sties as well as those of the areas or yards with which they are connected, and proper drains be constructed for conveying away any moisture that may be present in them. The outside yards should also be a little raised above the surface of the ground, and the sties somewhat elevated above the yards. It is necessary also that there should be a number of divisions, in order to keep the different kinds of hog stock separate, as there should never be too great a number kept together, it being found by experience that they thrive and fatten better where the numbers are small, and as nearly as possible similar in the sizes. Suitable divisions are consequently to be formed for female hogs when with the boar; others for breeding swine, as well as for their farrowing in; and still others for properly weaning the young pigs in, for keeping the store pig stock in, and for fattening the hogs of proper ages in. Where the nature of the situations will admit of it, the areas or yards should be pretty extensive. And in cases where it can be done, it is of vast advantage to have water conveyed through them, as it serves not only to keep them clean with greater ease and facility, but answers a variety of other beneficial intentions.

It has been suggested by a writer on rural economy, that all pig-sties should be provided with rubbing posts. "Having occasion to shift two hogs out of a sty without one into another with a post accidentally put up to support the roof, he had a full opportunity of observing its use. The animals, when they went in, were dirty, with broken ragged coats, and dull heavy countenances. In a few days they cleared away their coats, cleaned their skins, and became sleeky haired: the enjoyments of the post were discernible, even in their looks, in their liveliness, and in their apparent contentment. It is not probable that any animal can thrive while afflicted with pain or uneasiness. Graziers suffer single trees to grow, or put up dead posts in the ground, for their cattle to rub themselves against; yet it is probable a rubbing post has never been placed intentionally in a sty; though perhaps, for a two-fold reason, rubbing is most requisite to swine."

In the construction of hog-sties, it is difficult to point out any plan that can be generally had recourse to, as they must constantly depend upon the nature of the place and various other circumstances of a local kind. It has, however, been lately suggested, that pig-sties that are of considerable extent, should constantly be in the form of a circle, or they must sustain great loss in point of convenience. In which case the centre should contain the boiling or steaming house, with a granary for corn, meal, bran, and other similar articles; having a range of cisterns in divisions around it, for the reception of the matters from the copper or steaming apparatus, as well as by pipes from the kitchen, dairy, and other places.

Around these there should be a path, and beyond it the fence, which may be a wall or paling; in which the troughs with hanging lids should be fixed, for supplying the food directly from the cisterns on one side, and for the hogs feeding at on the other: next to this there should be a range of yards, and another of low sheds beyond it, and, lastly, the receptacle for the dung. The pies or potatoe stores should at one end point nearly to the entrance, and the water should be raised to the coppers and cisterns at once by means of a proper pump; there being a trough or some other conveyance from the dairy to the cisterns for the milk, whey, and other liquid matters. This sort of arrangement, it is supposed, will be extremely convenient and beneficial, while, at the same time, the expence need not be heavy. The attaching of a certain extent of grass land, or that of sown grasses, in proper divisions, into which the hogs may be capable of being turned as it may be found necessary, is, it is hinted, a matter of vast utility, where the nature of the situation will admit of its being done. Where there is not a proper and conveniently formed pig apparatus, little idea can be had of its advantage in the making of manure. Yet this alone, it is conceived, is an object that would justify any good farmer in going to a certain expence in attaining so profitable a portion of what should constitute his farm-yard system. It is stated as lamentable to see in nine-tenths of the farmeries of the kingdom, so many parts of the proper piggery scattered and unconnected in such a way as to prevent convenience, multiply labour, and retard the forming of plentiful supplies of valuable manure. The building of a hoggerie, somewhat though not exactly upon this principle, was found to cost, including the boiling house, copper, pond, cisterns, shed, paling, paving, and troughs, about 78*l.*, independent of the timber. By means of a yard of this description, one man will be capable of managing three times as many hogs as would otherwise be the case. And where they are properly and completely littered, the quantity of excellent manure that is formed is very astonishing. The extent of 98 loads of very rich dung compost, valued on the spot at five shillings the load, has been found to be made by the number of about 80 or 90 fattening hogs, or a clear profit of 15 or 16*l.*, derived solely from that article; and it would be double that, if the littering was performed in a complete manner. These statements fully prove the prodigious importance of possessing such conveniences in the fattening of great numbers of hogs, in the view of raising manure.

Supposing the whole of the expence, including every thing, in one of these sties, to rise to 100*l.* and the interest to be five pounds per annum; it is asked, what comparison there can be between the annual expence of five pounds, and the prodigious utility of having the power of constantly fattening with scarcely any expence of labour, any number of hogs that may be required? By means of such conveniences the whole of the peas, beans, barley, buck-wheat, potatoes, parsnips, carrots, and other similar sorts of food that are capable, or can be produced on a farm, may be converted to the purpose of rearing, feeding, or fattening of hogs; by which the farmer has the means of improving his ground in the cheapest manner, and to the fullest extent.

At present, the expence of such sheds and yards would be nearly double the above sum; and, where erected upon the most correct plan, still considerably more. The general principle should, however, be followed in sties of much smaller dimensions. In many cases and circumstances, other plans and forms may, however, be followed with great propriety and advantage, being contrived so as to suit the local nature of the different situations

Hog-trough, a kind of box or other contrivance constructed for the purpose of containing the food of hogs until it be consumed. There are various kinds of troughs of this nature, which are formed of different sorts of materials under different circumstances; but those of wood and stone are by much the most usual. From the circumstance of hogs being liable to spill and waste a considerable portion of their food by getting their feet into it, Mr. Bateson has been induced to attempt the prevention of it, by having a rail or covering made to slope from the back to the fore part of the trough, which may be formed of any sort of thin deal, just sufficient room being left to admit the heads of the animals. Divisions are likewise made crossways of the troughs, in proportion to the number of the hogs, in order to prevent the strongest from driving away such as are weak. But these divisions are not necessary to extend to the bottom of the troughs; they should, however, rise a little higher than the top, and are capable of being formed of portions of boards, which are about eight or ten inches in breadth. But another way of preventing them from wasting their food, it is conceived, would be to have shallow wooden troughs placed about a foot from the ground, having large deep troughs above them with open bottoms. The food is deposited in the large upper troughs, but at the same time no more is capable of passing down, than what rests in the bottoms of the shallow troughs; consequently, when that is consumed, a fresh supply will continually take place from the large upper troughs.

However, for food of the more liquid kind, such as milk, whey, and others of a similar kind, there may, it is supposed, be a stone trough below, and spars or holes in the bottom of the shallow trough, to let the fluid matters pass through. These sorts of troughs are capable of being made to serve two divisions of the sty at the same time, by having them fixed up between them. Where water can be conducted through the sty in a small stream, by means of an open sort of spout, so that it may conveniently supply the animals, it will be found of very great advantage.

Hog-weed, in *Botany*. See *BOERHAVIA*.

Hog-weed, a name frequently applied provincially to knot-grass.

Hog, on board of a *Ship*, is a sort of flat scrubbing broom, formed by inclosing a number of short twigs of birch or such wood, between two pieces of plank fastened together, and cutting off the ends of the twigs, and serving to scrape the sitch from a ship's bottom, under water, particularly in the act of boot-topping. For this purpose they fit to this broom a long staff with two ropes; one of which is used to thrust the hog under the ship's bottom, and the other to guide and pull it up again, close to the planks. This business is commonly performed in the ship's boat, which is confined as close as possible to the vessel's side during the operation, and shifted from one part of the side to another, till the whole is completed. *Marine Dict.*

Hogs' Bones, Petrified, in *Natural History*. Writers on extraneous fossils have mentioned but very few bones or teeth which they refer to the genus *sus* or hog, and have preserved little which is precise enough to entitle them to this classification. M. G. A. Cuvier, who gives a memoir on this subject, in the 14th vol. of the "Annales du Muséum," of which a translation may be seen in the *Phil. Mag.* vol. 35, p. 219, considers all the fossil remains which can safely be referred to the genus *sus* (whose characters, applicable to this enquiry, he gives) to belong to the peats and most modern of the alluvia of low grounds, or to be peat or recent fossils.

HOGARTH, WILLIAM, in *Biography*, one of those few original and extraordinary characters whom it has pleased Providence occasionally to bless the world with; to enlighten mankind, and to carry the arts and sciences necessary for their comfort, pleasure, and improvement, nearer to perfection. It cannot, indeed, be truly said of Hogarth, that he improved the practice of the arts of painting and engraving which he professed; but he merited the praise of having more powerfully exhibited their moral utility than any of his predecessors; and that in a new and till then unthought of mode, more generally felt and understood, being adapted to the feelings of all orders of men, as it arose from a close observance of the actions and expressions common to all under the influence of the passions. Moved by the impulse of genius rather than the tuition of man, he travelled in a path unexplored by any before him, and which yet remains closed to succeeding artists. Possessing, by early practice, the knowledge of the art of engraving, he was happily enabled to disseminate, by its means, the ingenious inventions and labours of his mind, in a manner more perfect than those of other painters have been presented to the world, or than probably ever again will be done, till another painter shall be his own engraver. Stimulated by the love of fame, and the desire of many of his friends, Hogarth, towards the close of his life, composed a short history of himself, from whence we shall extract the most essential parts; and present our readers with some illustration of his works, his character, his pretensions to public favour, and the reception he experienced.

His father's name was Richard, he was a man devoted to literature; but his pen, like that of many other authors, did not enable him to do more for his children than to give them education; and merely, as his son observed, put them in a way of shifting for themselves. William, of whom we now treat, was born in London, in the parish of St. Bartholomew the Great, on the 10th of November, 1697. What will those who hold the non-existence of innate genius for peculiar arts, &c. reply to Hogarth's account of the sensations he experienced in his infancy? *viz.* "Having naturally a good eye and fondness for drawing, shows of all sorts gave me uncommon pleasure when a child, and mimicry was remarkable in me."—"An early access to a neighbouring painter drew my attention from play, and I was at every possible opportunity employed in making drawings."—"My exercises, when at school, were more remarkable for the ornaments which adorned them, than for the exercise itself; in the former, I soon found that blockheads with better memories could much surpass me, but for the latter I was particularly distinguished."—"It was therefore very conformable to my own wishes that I was taken from school and served a long apprenticeship to a silver-plate engraver." This engraver was Mr. Ellis Gamble, of Cranbourn-alley.

"I soon found this business in every respect too limited. The paintings of St. Paul's cathedral and Greenwich hospital, then going on by Sir James Thornhill, ran in my head; and I determined that silver-plate engraving should be followed no longer than necessity obliged me to it. Engraving on copper was, at twenty years of age, my utmost ambition. To attain this, it was necessary that I should learn to draw objects something like nature, instead of the monsters of heraldry." Animated by this desire, he considered how he could, by the shortest way, obtain possession of the knowledge he required; and spurning the regular mode of academical study, adopted a plan of his own. "Many reasons," he says, "led me to wish that I could find the shorter path; six forms and characters in my mind; and instead of copying lines, try and read the language of the

art; and, if possible, find its grammar, by bringing into one form the various observations I had made, and then try how far I could combine them, and apply them to practice.

“Laying it down first, as an axiom, that he who could by any means acquire and retain in his memory perfect ideas of the subjects he meant to draw, would have as clear a knowledge of the figure as a man, who can write freely, hath of the twenty-four letters of the alphabet, and their infinite combinations (each of these being composed of lines); and would consequently be an accurate designer:—

“I, therefore, endeavoured to habituate myself to the exercise of a sort of technical memory, and by repeating in my own mind the parts of which objects were composed, I would by degrees combine and put them down in pencil. Thus, with all the drawbacks which resulted from the circumstances in which I was placed, I had one material advantage over my competitors, *viz.* the early habit I thus acquired of retaining in my mind’s eye, without coldly copying it on the spot, whatever I intended to imitate.

“My pleasures and my studies thus going on hand in hand, the most striking objects that presented themselves, either comic or tragic, made the strongest impressions on my mind; but had I not sedulously practised what I had thus acquired, I should very soon have lost the power of performing it.”—“Instead of burthening the memory with musty rules, or tiring the eyes with copying dry and damaged pictures, I have ever found studying from nature the shortest and safest way of attaining knowledge in my art. By adopting this method, I found a redundancy of matter continually occurring. A choice of composition was the next thing to be considered, and my constitutional idleness naturally led me to the use of such materials as I had previously collected; and to this I was further induced by thinking, that if properly combined, they might be made the most useful to society in painting, although similar subjects had often failed in writing and preaching.”

In concurrence, therefore, with this reasoning, Hogarth set about qualifying himself for the pursuit of his object immediately upon the expiration of his apprenticeship, which was about the year 1718; and began to engrave on copper for the book-sellers. This praise-worthy emulation wrought with him as it generally does with those who dare to enter to self-denying a course of existence. He continued to live in industrious indigence for some time, whilst those who had the means of vending his early productions were growing rich by his labours.

It is said of one of those patrons of the youthful artist, that he very generously offered him half-a-crown a pound for a finished plate; and at another time the same person offered to Mr. Major two plain pieces of copper for two engraved ones; with the *generous view* that the youth might not lack the means of exerting his ingenuity!

Feeling the full weight of this kind of treatment, Hogarth resolved upon publishing on his own account. But in this he had to encounter another enemy in the body of print-sellers, who, upon his publishing his first plate of “The Taste of the Town, or Burlington Gate,” (in 1724,) soon procured copies of it, and sold them at half the price; so that he was obliged to sell the plate as their shops were the only places of sale.

“Owing to these kinds of circumstances, till I was near thirty years of age,” he says, “I could do little more than barely maintain myself by engraving.”

It is probable, that about the time of publishing the above-mentioned print he commenced painter; as Mr. John Ireland states, in his account of Hogarth, that he was in pos-

session of a set of pictures designed for the large plates he published from Butler’s *Hudibras* in 1726. They are but indifferent in the promise they hold forth of their author, and are executed in somewhat of the style of Hemskirk. From this time he was known as a painter, and employed in painting portraits, and small pictures of family conversations, as they are called, or groups of family portraits.

In 1729, he married the only daughter of Sir James Thornhill, without the consent of the knight her father; who probably regarded him as an inferior artist, and felt degraded by the union, till the designs for the *Harlot’s Progress* were laid before him; satisfied then that his daughter had chosen a man of extraordinary merit, though poor in purse, he became reconciled to the match, and lived till his death in terms of intimacy with his son-in-law, and was a constant and generous friend to him.

Hogarth proceeded with success for some time in painting his portraits, “but feeling it a kind of drudgery, and as I could not act like some of my brethren, and make it a sort of manufactory to be carried on by the help of back-ground and drapery painting, it was not sufficiently profitable to pay the expences of my family. I therefore turned my thoughts to a still more novel mode in painting and engraving modern moral subjects, a field not broken up in any country or any age.

“The reasons which induced me to adopt this mode of designing were, that I thought both writers and painters had, in the historical style, totally overlooked that intermediate species of subjects which may be placed between the sublime and grotesque. I therefore chose to compose pictures on canvas, similar to representations on the stage: and farther hope that they will be tried by the same test and criticised by the same criterion.

“In these compositions, those subjects that will both entertain and improve the mind bid fair to be of the greatest public utility, and must, therefore, be entitled to rank in the highest class.”—“I have endeavoured to treat my subject as a dramatic writer; my picture as my stage, and men and women my players; who, by means of certain actions and gestures, are to exhibit a *dumb show*.

“In pursuing my studies, I made all possible use of the technical memory, which I have before described, by observing, and endeavouring to retain in my mind lineally, such objects as best suited my purpose: so that, be where I would, while my eyes were open, I was continually at my studies; and acquiring something useful to my profession. A redundancy of matter being by this means acquired, it is natural to suppose, that I introduced it into my works on every occasion that I could.

“By this *idle* way of proceeding, I grew so profane as to admire nature beyond the first productions of art; and acknowledged I saw, or fancied, delicacies in the life so far surpassing the utmost efforts of imitation, that when I drew the comparison in my mind, I could not help uttering blasphemous expressions against the divinity of Raphael, Correggio, and Michael-Angelo. For this, though my brethren have most unmercifully abused me, I hope to be forgiven. I confess to have frequently said, that I thought the style of painting which I had adopted, admitting that my powers were not equal to doing it, might, one time or other, come into better hands, and be made more entertaining, and more useful, than the eternal blazoning, and tedious repetition, of hackneyed beaten subjects, either from the scriptures, or the old ridiculous stories of heathen gods: as neither the religion of the one or the other requires promoting among Protestants, as it formerly did in Greece; and at a later period in Rome.”

HOGARTH.

In language of this nature Hogarth was accused of vanity, and of enviously endeavouring to under-rate what he was unable to execute. And certainly with much justice the remarks appear to have been made; for, previously to his adopting the line of conduct in painting, which was so suitable to his peculiar genius, he attempted several pictures in the grand historical style, and in all failed most woefully. It is apparent that he at no time of his life understood the object or character of that species of art, and was, therefore, ill qualified to judge of its value. But probably he was urged to the strong declarations which he indulged in, by seeing the success of infamous dealers in bad copies, and continually bearing, as all painters are obliged to do, bad originals exalted beyond all bounds, because they are supposed to be the productions of this or that man of genius; while, in fact, they may be the inferior labours of some mongrel imitator. What, however, but the extreme of vanity, could induce a man, so ill trained in art, to think of contending with Poussin and Correggio in history, and with Vandyke in portrait. He asserted himself equal to either in their way, and in both proved himself grossly defective. In his own line and manner, and in that alone, distinct from every one, he was super-excellent; conceiving his subjects with most consummate intelligence, and executing them with appropriate character and style.

After some time he felt the effect of the remarks of his adversaries (though he never acknowledged his incapacity), and almost entirely abandoned portraiture and serious history; and wisely adhered to his judicious choice of subject and manner; for the adoption of which he felt such powerful reasons as are mentioned above.

He had, however, in the interim, favoured the world with various productions of that kind, which were then, and still are, and probably for ever will be, highly esteemed. In 1733 he published his first great work, "The Harlot's Progress;" and in 1735, it was followed by its counterpart, "The Rake's Progress." The very extraordinary merit of these productions, and the favourable reception they met with, soon induced the print-sellers to be guilty of the base and mean conduct of having copies made of them, and thus rob the ingenious author of his well-earned reward.

To prevent this nefarious practice from continuing, Hogarth, in conjunction with Vertue and five other artists, in the year 1735, applied, by petition to the legislature, for a bill to protect their property, similar to that for the security of copy-right in literary productions. A bill was consequently passed to secure the property of an engraved plate to the original possessor of it for fourteen years from the first day of publication; which was to be specified on the print. From this time, and owing more to this circumstance than any other, prints have become a very considerable article of commerce in this country. Our artist commemorated the circumstance, by an emblematical engraving, with an inscription expressive of the subject; impressions from which he issued at various times, and on the publication of one of his electioneering prints in the following year, he made it the subscription ticket.

Upon the security of this act, Hogarth employed himself with alacrity, and produced other works, which, while taste and good sense prevail in the world, will ensure the admiration of all who possess these useful qualities, by their ingenuity, and the force of their satire. In 1736 he published "The Sleeping Congregation;" "The Distressed Poet;" and some others of less note. In 1738 "The Four Parts of the Day; Morning, Noon, Evening, and Night;" "Strolling Actresses dressing in a Barn;" &c. In 1741, "The Enraged Musician;" and in this and three following years,

he appears to have laboured hard at a number of minor productions, and in preparing the plates of his most celebrated work, "The Marriage-à-la-mode," of which he had given notice in 1743. He had projected a counter-part to this subject of "A Happy Marriage," to be treated likewise in six prints; but one only of the designs for it was completed, and that was never engraved.

The very excellent and admired series of prints just alluded to, were followed, in 1747, by those of the "Industrious and Idle Apprentices;" works whose moral utility is felt and acknowledged by all. Gay's "Macheath in the Beggar's Opera," by his spirited gallantry, is said to have been the cause of many a youth falling into bad courses: it is hardly possible to calculate the efficacy of these prints in a contrary direction; probably much more than lectures or sermons of the utmost eloquence could produce. The impression they made at the time was almost incredible.

Hogarth's own account of the motives which induced him to publish these two series do him infinite honour, and shew the nobleness of his views. "These twelve prints were calculated for the instruction of young people, and every thing addressed to them is fully described in words as well as figures," &c.—"Considering the persons they were intended to serve, I have endeavoured to render them intelligible, and as cheap as possible. Fine engraving is not necessary for such subjects, if, what is infinitely more material, character and expression is properly preserved."—"These prints I have always found sell much more rapidly at Christmas than at any other time."

Soon after the treaty of Aix la Chapelle, Hogarth, in search after character and matter for the employment of his pencil, went over to France; but allowing his natural inclination to get the better of his judgment, and seduce him to draw "The Gate of Calais," of which he, after his return, published the humorous print under that title, he was prevented, by imprisonment in his lodgings, from proceeding beyond that town; and soon after compelled to go on board a ship and return to England.

In 1745, finding that, however great the success of his prints might be, the public were not inclined to take his pictures off his hands, he was induced to offer some of them, and those of the best he had then produced, for disposal by way of auction; but after a plan of his own, viz by keeping open a book to receive biddings from the first day of February to the last day of the same month, at 12 o'clock. The ticket of admission to the sale was his print of "The Battle of the Pictures;" a humorous production, in which he ingeniously upheld his assertions concerning the preference so unfairly given to old pictures, and the tricks of the dealers in them. See Nichol's and Ireland's Account of Hogarth.

The pictures thus disposed of were,

The six of the Harlot's Progress, for	£ 88	4	0
Eight of the Rake's Progress	184	16	0
Morning	21	0	0
Noon	38	17	0
Evening	39	18	0
Night	27	6	0
Strolling Players dressing in a Barn	27	6	0

In 1746, having finished his picture of "The March of the Guards towards Finchley," he offered proposals for a print from it, and a scheme to dispose of the picture itself, by a lottery of chances, at so low a price as three shillings, in addition to 7s. 6d. subscribed for a print. Having disposed of 1843 chances, he gave his remaining numbers, amounting to 167, to the Foundling hospital, one of which, when the plate was finished, and the lottery drawn, in the year 1750, was fortunate, and that very extraordinary and

R

ingenious

ingenious production thus became the property of that Institution; within whose walls it yet remains, with several other of his productions; particularly an excellent portrait of captain Thomas Coram, founder of the hospital, and an historical picture of "Moses brought before Pharaoh's Daughter."—By this scheme, Hogarth obtained 300*l.* for the picture, observing, "that it was his only chance of being paid for his time: such was the patronage of the arts at that period in England; now happily very highly increased, to the credit of the public, and the advancement of the practical part of the art at least.

In the year in which the above-mentioned print was published, Hogarth was employed by the benchers of Lincoln's Inn to paint a picture for their hall, in consequence of their having been bequeathed 200*l.* by lord Wyndham, chancellor of Ireland, for the purpose of ornamenting that room as they thought proper. On the proposal of lord Mansfield, the voice of the members was given for a picture by our artist, and, unhappily for his reputation, he chose a subject of an elevated and serious nature, "St. Paul before Felix." From one who presumed to smile at the high estimation in which the real works of the renowned artists of Italy were held, and boasted of his power to rival them, the world had a right to expect much.

Instead of answering such expectation, he totally failed. In every requisite for such a work, it must be owned, by his best friends, this picture is wretchedly defective. It still occupies its original situation, and exhibits an useful lesson to those who place too high a value on their natural talents; and teaches them not to waste their powers on matters for which previous education has not prepared them; nor too readily to under-rate those of others, exerted in a different manner. Every branch of the art of painting requires its appropriate studies, and no man can combine materials with which he is unacquainted. Hogarth, employed to earn his bread from the first, had not the time or the means, in this country, to inform himself properly of what was grand and impressive in the art. That which was expressive in common life he felt, and delineated with great force, but with common-place effect. Selection of beauty, of dignity and grandeur, which this subject required, he evidently knew nothing of; and consequently failed in his attempt to inspire his figures with such qualities.

Whether he felt this himself when the picture was completed may be doubted; but he certainly attempted to parry criticism, by satirising his own work, and published a ludicrous print of the subject, nearly of the same composition, but attempted to throw the effect upon Rembrandt's manner of etching. Upon advertising a print of the real picture, he adds, "On the first payment a receipt will be given, which receipt will contain a new print (*in the true Dutch taste*) of "Paul before Felix;" which, after the subscription is over, will not be sold at a less price than one guinea each."

At the same time he advertised for sale his most beautiful series of pictures before mentioned, "The Marriage-a-la-mode," by a manner of bidding peculiar to himself; from which he excluded all dealers in pictures. The mode he adopted was by written tickets, on which subscribers wrote their names and the price they would give. This was kept open for the space of one month. But either the public were not alive to the beauties and excellencies of these incomparable works, or his manner of proceeding displeased them: for the fact is, there were few competitors, and they were sold at the low price of 120 guineas, with their frames, to Mr. John Lane, of Hillingdon; on whose death they became the property of his nephew, colonel Cawthorne.

Being offered at auction by Mr. Christie, in 1792, the proprietor bought them in at 900 guineas. A short time afterwards they were bought by Mr. Angerstein, at the price of 1000 guineas, and with him they still remain, justly and deservedly admired for their fulness of character and expression, and their beauty of composition, colouring, and execution, and are a complete falsification of Mr. Walpole's assertion, "that Hogarth was no painter."

In the following year, 1751, he published his moral and instructive prints of "Beer-street," "Gin-lane," and "The four Stages of Cruelty." The generous and truly humane motives which induced him to make the four last designs he himself has thus described: "These prints were engraved with the hope of, in some measure, correcting that barbarous treatment of animals, the very sight of which renders the streets of our metropolis so distressing to every feeling mind. If they have had this effect, I am more proud of having been the author, than I should be of having painted Raphael's cartoons."

During the time of which we have been treating concerning Hogarth's practice and studies, he continued occasionally to paint portraits; but it was not his forte. He produced, indeed, several acknowledged strong likenesses, but without any elevation of sentiment or character.

He now thought it proper, in order to justify and enforce many points upon which he had disagreed and contended with other artists, to turn author. He had, in the year 1745, painted his own portrait with his dog; before him lay a palette spread with colours, and on it was drawn a waving line, which he entitled "The Line of Beauty." In this, Hogarth had a design. It appeared an enigma, and he himself relates, that, "no Egyptian hieroglyphic ever amused for a time more than it did. Painters and sculptors came to me to know the meaning of it, being as much puzzled with it as other people, till it came to have some explanation; then, and not till then, some found it out to be an old acquaintance of theirs."—"Others denied that there could be such a rule either in art or nature, &c." See preface to the work, which, in 1753, he thought fit to publish under the title of "*The Analysis of Beauty*," written with a view of fixing the fluctuating ideas of *Taste*." Its object is to shew that waving lines are the source of beauty; and that grace is superadded, when that line is twilled to a certain degree, and becomes serpentine. In it are numerous references to various objects represented in two prints, which he etched and published with the book, and in which, if he has not satisfactorily illustrated the whole of his intention, he has done enough to prove the truth of his main position. Every artist may obtain benefit by the perusal of the work. It is divided into chapters, treating of those points, which, in his mind, formed the basis of beauty; *viz.* fitness, variety, symmetry, simplicity, intricacy, quantity; and he adds to these, others on lines, compositions with the waving line, compositions with the serpentine line, proportion, light and shade, colouring, the face, attitude, and action.

Hogarth, in the consciousness of the pencil, not the pen, being the instrument by which he could best illustrate his ingenious and original thoughts; at first intended to engage some literary person to write what he should dictate, but soon discarded that idea: and having written his work, subjected it by parts to the correction of Dr. Morrell, after whose death, the Rev. Mr. Townley kindly undertook the unthankful task of castingigation on a young author; who, nevertheless, profited so much by the remarks on the first pages, that he greatly advanced in facility of expression as he proceeded with it. The style is plain and unadorned, but clear and intelligible.

His mode of illustration is original and ingenious. We are satisfied there is great truth in his principles and observations; and that the world of art is greatly indebted to him for the work, though there are many opinions in which we cannot coincide; and wish he had not indulged so freely in ill-natured and spleenic allusions to persons and things not connected with his subject. These latter drew upon him, in consequence, much invective and satire; and by his own account, "the uneasiness it occasioned him, more than counter-balanced the pleasure afforded by its general success." See his own history, written by himself, in John Ireland's *Illustrations*, vol. iii. p. 103. where he has given much additional and ingenious reasoning on the subject of his book, but speaks solely of the unfairness of the attacks made upon him; which were many, and of no very delicate nature. In opposition to this, he had the favourable testimony of many learned men, (Warburton among them,) in its favour. It was translated into German by Mylius, under the author's inspection; and an Italian translation was soon afterwards published at Leghorn.

In 1754, the members of the Imperial Academy at Augsburg, erected for the study and improvement of arts and letters, were induced, on the appearance of this work among them, to elect Hogarth a counsellor and honorary member. In addition to this high founding title, he had a more substantial benefit conferred upon him this year, by the appointment of serjeant painter to the king, which produced him 200*l.* per annum.

In 1755 he published the plates of the election, which was the last series of prints he favoured the world with; but he afterwards sent forth several single prints, fraught with useful moral instruction, conveyed by ingenious satire on the public follies of the day. The most striking among them, were, "The Cockpit," "Enthusiasm delineated," and "The Medley, or a satire on Credulity, Superstition, and Fanaticism," which last appeared in 1762.

In the interim he made another unsuccessful attempt at serious historical painting; and that under circumstances particularly unfavourable to him; the failure in which, or rather the public circumstances connected with it, was thought by many to have hastened his end. He was induced by vanity to endeavour at rivalry with a picture, said to be by Correggio, of "Sigismunda weeping over the Heart of her Lover." The consequence was, what might justly have been expected, disappointment, with the world at least, however he might himself appreciate it. He set the same value upon it as its prototype had brought at sale by public auction, *viz.* 400*l.* The nobleman for whom it was painted excused himself from taking it, and it remained with Hogarth to his death. It is at present in the possession of Mr. Alderman Boydell. See an account of it in Ireland's and Nichol's *Anecdotes*, &c. of Hogarth.

It is lamentable, that a man so highly useful and honourable to his country and the arts he professed, should, by singularity, and by an impolitic, although upright mode of conduct, bring enemies upon himself as he advanced in years; who, unequal to cope with him for the bright rewards of genius, yet had influence enough in the world to sling him, and that remorselessly, by petty, paltry efforts. These, though they could never seriously wound his fame, yet disturbed his repose, and prevented the enjoyment of those well earned encomiums the wife and virtuous were inclined to bestow upon his meritorious efforts. Such, unhappily, was the fate of Hogarth. Strong in mind, original in reflection, and deeply reflective, but narrowed by want of education; he lavished abroad opinions peculiar to himself; opposing old and well-founded reasonings, because he saw more of

their abuse than of their utility. He appears to have been a humourist, but of the best class. He spoke his mind freely, heedless of the result. Its effect upon him proves to others who may be inclined to follow the same course, that it is not always to be pursued with impunity.

To shew that these remarks are well founded, we shall insert his own account of his feelings on the observations made upon his *Sigismunda*; "the most violent and virulent abuse thrown on *Sigismunda* was from a set of miscreants, with whom I am proud of being *ever at war*. I mean *the expounders of the mysteries of old pictures*. I have been sometimes told they were beneath my notice. This is true of them individually, but as they have access to people of rank, who seem as happy in being cheated as these merchants are in cheating them, they have a power of doing much mischief to modern artists. However mean the vender of poisons, the mineral is destructive; *to me its operation was troublesome enough*. Ill-nature spread so fast, that now was the time for every little dog in the profession to bark, and revive the old spleen which appeared at the time of the *Analysis*. The anxiety that attends endeavouring to recollect ideas long dormant, and the misfortunes which clung to this transaction, coming at a time when nature demands quiet, and something besides exercise to cheer it, added to my long sedentary life, *brought on an illness which continued twelve months*. But when I got well enough to ride on horseback, I soon recovered."

In a state thus irritable, goaded by malignity and envy, and resting entirely upon his own conscious rectitude, and the consolation of a few friends, who knew how to estimate his talents and his genuine worth, for support; he continued to employ himself on minor labours; till, in 1762, he unfortunately elicited a flame of enmity in the breasts of two powerful antagonists, under whose united efforts he sunk. These were Wilkes and Churchill, whose great ingenuity and keen satire he drew upon himself, by exhibiting them in his print of "The Times," as incendiaries; fomenters of public disturbances. His own account of this circumstance we shall extract from J. Ireland's *Illust.* vol. iii. p. 212, et seq. "This being a period when war abroad, and contention at home filled every body's mind, prints were thrown into the back-ground, and the stagnation rendered it necessary that I should do some *timed thing* to recover my lost time, and stop a gap in my income. This drew forth my print of "The Times," a subject which tended to the restoration of peace and unanimity, and put the opposers of these humane objects in a light which gave great offence to those who were trying to foment destruction in the minds of the populace. One of the most notorious among them, till now rather my friend and flatterer, attacked me in a North Briton, in so infamous and malign a style, that he himself, when pushed, even by his best friends, was driven to so poor an excuse, as to say, *he was drunk when he wrote it*. Being at that time very weak, and in a kind of slow fever, it could not but seize on a feeling mind. My philosophical friends advise me to laugh at the nonsense of party-writing—who would mind it? But I cannot rest myself." To revenge himself, he published a likeness of Wilkes, which doubtless he thought was the greatest satire upon his pretension to political honesty and heroic character that he could produce. This drew upon him Churchill the poet, who severely treated him in an epistle, fraught with the grossest abuse and the utmost malignity, and even falsehood, though in some parts justly complimentary. All that the bitterness of resentment could dictate, or the malevolence of the keenest satire inspire, is poured forth in it upon the devoted Hogarth, who could only retort by a print of a bear with a pot of porter and a

ragged staff, on the knots of which was written lies, lies, lies!

This unhappy event Hogarth did not long survive. It is said that he did not suffer in mind by the coarse attack of Churchill, so much as by the previous one by Wilkes; he says of it himself, that "it made no impression, but perhaps in some measure effaced or weakened the black strokes of the North Briton." And he concludes his own memoir by saying, "Thus have I gone through the principal circumstances of a life which, till lately, passed pretty much to my own satisfaction, and I hope in no respect injurious to any other man. This I can safely assert, I have invariably endeavoured to make those about me tolerably happy, and my greatest enemy cannot say I ever did an intentional injury; though, without ostentation, I could produce many instances of men that have been essentially benefited by me. What may follow God knows! Finis."

Such is the candid appeal, which, in consciousness of sound principle and rectitude of heart, this excellent artist and well intentioned man made to his contemporaries and to posterity. Let the human weakness he exhibited in common with his fellow men teach them, like his works, (which necessarily lead to moral reflection), that strict government of the heart and mind, and kind indulgence to the infirmities of others, are the surest guides to happiness; here, as well as hereafter.

His last original production he termed *Finis*, the Bathos, or the Art of sinking in Sublime Painting; which Mr. J. Ireland justly terms an enigmatical and punical print. The origin and production of which he thus describes.

After dinner, with a few social friends at his own table, he was asked what will be the subject of your next print? "The end of all things;" was his reply. If that should be the case, added one of his friends, your business will be finished, for there will be an end of the painter. With a look that conveyed a consciousness of approaching dissolution, and a deep sigh, he answered, "there will be so, and therefore, *the sooner my work is done the better.*" With this impulse, he next day began the plate, and seeming to consider it as a *terminus to his fame*, never turned to the right or left until he arrived at the end of his journey.

The above print was published in March 1764, and in the October following, death put a *finis* to the labours of this extraordinary man, and deprived society of one of its most useful members; who contributed alike to its amusement and its improvement, and has left a perpetual fund of both for the benefit of future ages.

The following concisely critical dissertation upon the character and works of Hogarth, from the elegant pen of the late Horace Walpole, earl of Orford, we conceive will be agreeable to our readers, and prove a valuable addition to the above account of his life.

"Having dispatched the herd of our painters in oil, I reserved to a class by himself that great and original genius, Hogarth; considering him rather as a writer of comedy with a pencil, than as a painter. If catching the manners and follies of an age *living as they rise*, if general satire on vices and ridicules, familiarised by strokes of nature, and heightened by wit, and the whole animated by proper and just expressions of the passions, be comedy, Hogarth composed comedies as much as Moliere; in his *Marriage A-la-mode* there is even an intrigue carried on throughout the piece. He is more true to character than Congreve; each personage is distinct from the rest, acts in his sphere, and cannot be confounded with any other of the *dramatis personæ*. The alderman's footboy, in the last print of the set I have mentioned, is an ignorant rustic; and if wit is struck

out from the characters in which it is not expected, it is from their acting conformably to their situation, and from the mode of their passions, not from their having the wit of fine gentlemen. Thus there is wit in the figure of the alderman, who, when his daughter is expiring in the agonies of poison, wears a face of solicitude, but it is to save her gold ring, which he is drawing gently from her finger. The thought is parallel to Moliere's, where the miser puts out one of the candles as he is talking. Moliere, inimitable as he has proved, brought a rude theatre to perfection. Hogarth had no model to follow and improve upon. He created his art; and used colours instead of language. His place is between the Italians, whom we may consider as epic poets and tragedians, and the Flemish painters, who are as writers of farce and editors of burlesque nature. They are the Tom Browns of the mob. Hogarth resembles Butler, but his subjects are more universal; and amidst all his pleasantry, he observes the true end of comedy, reformation; there is always a moral to his pictures. Sometimes he rose to tragedy, not in the catastrophe of kings and heroes, but in marking how vice conducts, insensibly and incidentally, to misery and shame. He warns against encouraging cruelty and idleness in young minds, and discerns how the different vices of the great and the vulgar lead by various paths to the same unhappiness. The fine lady in *Marriage A-la-mode*, and Tom Nero in the *Four Stages of Cruelty*, terminate their story in blood,—the occasions the murder of her husband; he assassinates his mistress. How delicate and superior too is his satire, when he intimates in the College of Physicians and Surgeons that preide at a dissection, how the legal habitude of viewing shocking scenes hardens the human mind, and renders it unfeeling. The president maintains the dignity of insensibility over an executed corpse, and considers it but as the object of a lecture. In the print of the *Sleeping Judges*, this habitual indifference only excites our laughter.

"It is to Hogarth's honour that, in so many scenes of satire or ridicule, it is obvious that ill-nature did not guide his pencil. His end is always reformation, and his reproofs general. Except in the print of the Times, and the two portraits of Mr. Wilkes and Mr. Churchill, that followed, no man, amidst such a profusion of characteristic faces, ever pretended to discover or charge him with the caricatura of a real person; except of such notorious characters as Chartres and mother Needham, and a very few more, who are acting officially and suitably to their professions. As he must have observed so carefully the operation of the passions on the countenance, it is even wonderful that he never, though without intention, delivered the very features of any identical person. It is at the same time a proof of his intimate intuition into nature; but had he been too severe, the humanity of endeavouring to root out cruelty to animals would atone for many satires. It is another proof that he drew all his stores from nature and the force of his own genius, and was indebted neither to models nor books for his style, thoughts or hints, that he never succeeded when he designed for the works of other men. I do not speak of his early performances at the time that he was engaged by booksellers, and rose not above those they generally employ; but in his maturer age, when he had invented his art, and gave a few designs for some great authors, as Cervantes, Gulliver, and even Hudibras, his compositions were tame, spiritless, void of humour, and never reach the merits of the books they were designed to illustrate. He could not bend his talents to think after any body else. He could think like a great genius rather than after one. I have a sketch in oil that he gave me, which he intended to engrave; it was done at the

time that the house of commons appointed a committee to enquire into the cruelties exercised on prisoners in the Fleet to extort money from them. The scene is the committee; on the table are the instruments of torture. A prisoner in rags, half starved, appears before them; the poor man has a good countenance, that adds to the interest. On the other hand is the inhuman gaoler. It is the very figure that Salvator Rosa would have drawn for Iago in the moment of detection. Villany, fear, and conscience, are mixed in yellow and livid on his countenance; his lips are contracted by tremor, his face advances as eager to lie, his legs step back as thinking to make his escape; one hand is thrust precipitately into his bosom, the fingers of the other are catching uncertainly at his button-holes. If this was a portrait, it is the most speaking that ever was drawn; if it was not, it is still finer.

“It is seldom that his figures do not express the character he intended to give them. When they wanted an illustration that colours could not bestow, collateral circumstances, full of wit, supply notes. The nobleman in *Marriage A-la-mode* has a great air—the coronet on his crutches, and his pedigree issuing out of the bowels of William the Conqueror, add to his character. In the *Breakfast* the old steward reflects for the spectator. Sometimes a short label is an epigram, and is never introduced without improving the subject. Unfortunately some circumstances, that were temporary, will be lost to posterity, the fate of all comic authors; and if ever an author wanted a commentary, that none of his beauties might be lost, it is Hogarth—not from being obscure (for he never was that but in two or three of his first prints, where transient national follies, as lotteries, free-masonry, and the South-sea, were his topics), but for the use of foreigners, and from a multiplicity of little incidents, not essential to, but always heightening, the principal action. Such is the spider’s-web extended over the poor’s box in a parish-church; the blunders in architecture in the nobleman’s seat seen through the window, in the first print of *Marriage A-la-mode*; and a thousand in the *Strollers* dressing in a Barn, which for wit and imagination, without any other end, I think the best of all his works; as for useful and deep satire, that on the Methodists is the most sublime. The scenes of Bedlam and the Gaming-house are inimitable representations of our serious follies or unavoidable woes; and the concern shewn by the lord-mayor, when the companion of his childhood is brought before him as a criminal, is a touching picture, and big with humane admonition and reflection.

“Another instance of this author’s genius, is his not condescending to explain his moral lessons by the trite poverty of allegory. If he had an emblematic thought, he expressed it with wit, rather than by a symbol. Such is that of the whore setting fire to the world in the *Rake’s Progress*. Once indeed he descended to use an allegoric personage, and was not happy in it; in one of his election prints *Britannia’s chariot* breaks down while the coachman and footman are playing at cards on the box. Sometimes too, to please his vulgar customers, he stooped to low images and national satire, as in the two prints of *France and England*, and that of the *Gates of Calais*. The last indeed has great merit, though the caricatura is carried to excess. In all these the painter’s purpose was to make his countrymen observe the ease and affluence of a free government, opposed to the wants and woes of slaves. In *Beer-street* the English butcher tossing a Frenchman in the air with one hand, is absolute hyperbole; and what is worse, was an after-thought, not being in the first edition. The *Gin-alley* is much superior, horribly fine, but disgusting.

“His *Bartholomew-fair* is full of humour; the *March to Finchley*, of nature; the *Enraged Musician* tends to farce. The *Four Parts of the Day*, except the last, are inferior to few of his works. The *Sleeping Congregation*, the *Lecture on the Vacuum*, the *Laughing Audience*, the *Consultation of Physicians* as a coat of arms, and the *Cockpit*, are perfect in their several kinds. The prints of *Industry and Idleness* have more merit in the intention than execution.

“Towards his latter end he now and then repeated himself, but seldom more than most great authors who executed so much.

“It may appear singular, that of an author whom I call comic, and who is so celebrated for his humour, I should speak in general in so serious a style; but it would be suppressing the merits of his heart to consider him only as a promoter of laughter. I think I have shewn that his views were more generous and extensive. Mirth coloured his pictures, but benevolence designed them. He smiled like Socrates, that men might not be offended at his lectures, and might learn to laugh at their own follies. When his topics were harmless, all his touches were marked with pleasantry and fun. He never laughed, like Rabelais, at nonsense that he imposed for wit; but, like Swift, combined incidents that divert one from their unexpected encounter, and illustrate the tale he means to tell. Such are the hens roosting on the upright waves in the scene of the *Strollers*, and the devils drinking porter on the altar. The manners or *costume* are more than observed in every one of his works. The very furniture of his rooms describe the characters of the persons to whom they belong; a lesson that might be of use to comic authors. It was reserved to Hogarth to write a scene of furniture. The rake’s levee-room, the nobleman’s dining-room, the apartments of the husband and wife in *Marriage A-la-mode*, the alderman’s parlour, the poet’s bed-chamber, and many others, are the history of the manners of the age.

“But perhaps too much has been said of this great genius as an author; it is time to speak of him as a painter, and to mention the circumstances of his life, in both which I shall be more brief. His works are his history.

“His apprenticeship was no sooner expired, than he studied drawing from the life, in which he never attained to great excellence. It was character, the passions, the soul, that his genius was given him to copy: his force lay in expression, not in tints and chiaro-scuro. At first he worked for booksellers, and designed and engraved plates for several books; and, which is extraordinary, no symptom of genius dawned in those plates. His *Hudibras* was the first of his works that marked him as a man above the common; yet what made him then noticed, now surprises us to find so little humour in an undertaking so congenial to his talents. On the success however of those plates he commenced painter, a painter of portraits; the most ill-suited employment imaginable to a man whose turn certainly was not flattery, nor his talent adapted to look on vanity without a sneer. Yet his facility in catching a likeness, and the method he chose of painting families and conversations in small, then a novelty, drew him prodigious business for some time. It did not last, either from his applying to the real bent of his disposition, or from his customers apprehending that a satirist was too formidable a confessor for the devotees of self-love.

“His *Midnight Moder Conversation* was the first work that shewed his command of character: but it was the *Harlot’s Progress*, published in 1729 or 1730, that established his fame. The pictures were scarce finished, and no sooner exhibited to the public, and the subscription opened, than above twelve hundred names were entered on his books.

book. The familiarity of the subject, and the propriety of the execution, made it tasted by all ranks of people. Every engraver set himself to copy it, and thousands of imitations were dispersed all over the kingdom. It was made into a pantomime, and performed on the stage. The Rake's Progress, perhaps superior, had not so much success, from want of novelty; nor indeed is the print of the Arrest equal in merit to the others.

"The curtain was now drawn aside, and his genius stood displayed in its full lustre. From time to time he continued to give those works that should be immortal, if the nature of his art will allow it. Even the receipts for his subscriptions had wit in them. Many of his plates he engraved himself, and often expunged faces etched by his assistants when they had not done justice to his ideas.

"Not content with shining in a path untrodden before, he was ambitious of distinguishing himself as a painter of his history. But the genius that had entered so feelingly into the calamities and crimes of familiar life, deserted him in a walk that called for dignity and grace. The burlesque turn of his mind mixed itself with the most serious subjects. In his Danaë the old nurse tries a coin of the golden shower with her teeth, to see if it is true gold: in the Pool of Bethesda, a servant of a rich ulcerated lady beats back a poor man that sought the same celestial remedy. Both circumstances are justly thought, but rather too ludicrous. It is a much more capital fault that Danaë herself is a mere nymph of Drury. He seems to have conceived no higher idea of beauty.

"So little had he eyes to his own deficiencies, that he believed he had discovered the principle of grace. With the enthusiasm of a discoverer, he cried, Eureka! This was his famous line of beauty, the ground-work of his Analysis, a book that has many sensible hints and observations, but that did not carry the conviction, nor meet the universal acquiescence he expected.

"He fell afterwards into a grosser mistake. From a contempt of the ignorant virtuosi of the age, and from indignation at the impudent tricks of picture-dealers, whom he saw continually recommending and vending vile copies to bubble-collectors, and from having never studied, indeed having seen, few good pictures of the great Italian masters, he persuaded himself that the praises bestowed on those glorious works were nothing but the effects of prejudice. He talked this language till he believed it; and having heard it often asserted, as is true that time gives a mellowness to colours and improves them, he not only denied the proposition, but maintained that pictures only grew black and worse by age, not distinguishing between the degrees in which the proposition might be true or false. He went farther; he determined to rival the ancients—and, unfortunately, chose one of the finest pictures in England as the object of his competition. This was the celebrated Sigismonda of sir Luke Schaub, now in the possession of the duke of Newcastle, said to be painted by Correggio, probably by Furnio, but no matter by whom. It is impossible to see the picture, or read Dryden's inimitable tale, and not feel that the same soul animated both. After many essays, Hogarth at last produced his Sigismonda—but no more like Sigismonda, than I to Hercules. None of the sober grief, no dignity of suppressed anguish, no involuntary tear, no settled meditation on the fate she meant to meet, no amorous warmth turned holy by despair; in short, all was wanting that should have been there. He set the price of 400*l.* on it, and had it returned on his hands by the person for whom it was painted. He took subscriptions for a plate of it, but had the sense at last to suppress it. I make no more apology for this account than for the encomiums I have bestowed on him. Both are dictated by truth, and are the history of a

great man's excellencies and errors. Milton, it is said preferred his Paradise Regained to his immortal poem.

"The last memorable event of our artist's life was his quarrel with Mr. Wilkes, in which, if Mr. Hogarth did not commence direct hostilities on the latter, he at least obliquely gave the first offence, by an attack on the friends and party of that gentleman. This conduct was the more surprising, as he had all his life avoided dipping his pencil in political contests, and had early refused a very lucrative offer that was made to engage him in a set of prints against the head of a court-party. Without entering into the merits of the cause, I shall only state the fact. In September 1762 Mr. Hogarth published his print of the Times. It was answered by Mr. Wilkes in a severe North-Briton. On this the painter exhibited the caricature of the writer. Mr. Churchill, the poet, then engaged in the war, and wrote his epistle to Hogarth, not the brightest of his works, and in which the fiercest strokes fell on a defect that the painter had neither caused nor could amend—his age; and which, however, was neither remarkable nor decrepit; much less had it impaired his talents, as appeared by his having composed but six months before one of his most capital works, the satire on the Methodists. In revenge for this epistle, Hogarth caricatured Churchill under the form of a canonical bear, with a club and a pot of porter—*et vinulâ, tu dignus et hic*—never did two angry men of their abilities throw mud with less dexterity.

"He sold about twenty-four of his principal pictures by auction in 1745. Mr. Vincent Bourne addressed a copy of Latin hendecasyllables to him on his chief pictures; and Roquet, the enameller, published a French explanation, though a superficial one, of many of his prints, which it was said, he had drawn up for the use of marshal Belleisle, then a prisoner in England."

HOGENPOUR, in *Geography*, a town of Hindoostan, in Bednoere.

HOGERUS, in *Biography*, an abbot, who is said to be the author of a curious MS. treatise on music, N° CCLIX, in the library of Bene't college, Cambridge; where it is entitled "Musica Hogeri, five Excerptiones Hogeri Abbatis ex Autoribus Musicæ Artis:" "The Music of Hogerus, or Extracts from Writers on the Art of Music, by the Abbot Hogerus." Who this abbot was, or when he lived, will not now be easily discovered. His name has long puzzled the learned: and we find, among the letters of Baptista Doni, that this MS. was a subject of a correspondence between him and Dr. Thomas Rigel, of London, in the year 1639. Doni, who had emissaries at this time all over Europe, in search of musical curiosities, upon hearing of this extraordinary MS. in his letter to Dr. Rigel concerning it, says "De Hogerii abbatis excerptis (siquidem exstarent) brevia quedam specimina dumtaxat cuperem: quum enim autor sit mihi plane ignotus, affirmare non audeo, an talia sint ejus scripta, ut totus scribi mereatur."—The doctor, in his reply to Doni, the same year, tells him, that after making all possible inquiry in the library at Cambridge—"Nullum Hogerii scriptum in ea bibliotheca inveniri." Whether this

—was

was true, or only a short way of getting rid of the trouble incident to such inquiries, we know not; but we find the book entered in the catalogue that goes under the name of Dr. Gale, thus: "Excerptiones Rogeri Baconi ex auctoribus Musicae Artis." It is possible that this book may have been transcribed by, or for, this powerful man; and it is the more possible, as he admitted music among his studies, and is said, by his biographers, to have written "De valore Musices, pr. Secundum Boetium et ceteros auctores." However this may have been, the MS. which is beautifully written on vellum, and extremely well preserved, contains more than it promises; for the two musical treatises of Hubald and Odo, both written in the tenth century, are not given in fragments or abstracts, but entire, and unmixed with the writings of any other authors. See HUBALD and ODO.

HOGGENBERG, in *Geography*, a town of Austria; 12 miles S.W. Freydtadt.

HOGGEREL, a name that signifies the same thing with *hog-sheep*, in particular districts.

HOGGET, or HOGREL, is a young boar of the second year.

HOGGIT' denotes the male or wedder sheep, from the period of taking it from the ewe, to the time of its attaining the age of one year.

HOGI, in the *Eastern Churches*, as at Cairo, is an under attendant on the mosque, who is the reader under the sheik.

HOGKNE, in *Geography*, a town of Asiatic Turkey, in the government of Mosul; 32 miles W. of Mosul.

HOGLAND, a town of Norway, in the diocese of Aggerhuus; 32 miles N. of Frederickstall.

HOGOE, properly *Haut-Gout*, a mels in cookery, so denominated from its high flavour, or relish.

HOGOLIN, or HOGOLEU, in *Geography*, one of the Caroline islands, or New Philippines; about 90 British miles in length, by 40 in breadth.

HOGSBY, a town of Sweden, in the province of Sma-land; 33 miles N. of Calmar.

HOGSHEAD, a measure of capacity, and is of several kinds, *viz.*

HOGSHEAD of *Ale or Beer*, in the country, is 51 ale gallons = 204 ale quarts = 408 ale pints = $1\frac{1}{2}$ barrel = 3 country kilderkins = 6 country firkins = $\frac{1}{4}$ ths, or .9444 London beer hogheads = $\frac{1}{2}$ ths, or 1.0625 London ale hogheads = .9825 wine hogheads = 14382 cubic inches = 8.32291 cubic feet = .30568 cubic yards = 28.9616 cubic links.

HOGSHEAD of *Ale*, in London, is 48 ale gallons = 192 ale quarts = 384 ale pints = $1\frac{1}{2}$ London ale barrel = 3 London ale kilderkins = 6 London ale firkins = $\frac{1}{7}$ ths, or .941176 country ale or beer hogheads = $\frac{2}{3}$ ths, or .8888 London beer hogheads = .930117 wine hogheads = 13536 cubic inches = $7\frac{2}{3}$ ths, or 7.8333 cubic feet = .290123 cubic yards = 27.25804 cubic links.

HOGSHEAD of *Beer*, in London, is 54 ale gallons = 216 ale quarts = 432 ale pints = $1\frac{1}{2}$ London beer barrel = 3 London beer kilderkins = 6 London beer firkins = $\frac{1}{5}$ ths, or 1.125 London ale hogheads = $\frac{1}{3}$ ths, or 1.058824 country ale or beer hogheads = 1.04638 wine hogheads = 15228 cubic inches = 8.8125 cubic feet = .32638 cubic yards = 30.66526 cubic links.

HOGSHEAD of *Wine, Cyder, Mead, Metheglin, Olives, &c.* (5 Ann.) is 63 wine gallons = 252 wine quarts = 504 wine pints = 2016 wine gills = $1\frac{1}{2}$ tierce = 2 wine barrels = $3\frac{1}{2}$ rundlets = 1.011649 country ale or beer hogheads = 1.07513 London ale hogheads = .955673 London beer

hogheads = 14553 cubic inches = 8.4219 cubic feet = .311921 cubic yards = 29.30601 cubic links.

HOGSHEAD of *Water*, in *Engineery*, according to Beighton, Harris (Lexicon Tech. Measures and Smeaton's Rep. vol. i. p. 214.) is 63 ale gallons = 17766 cubic inches = 10.28125 cubic feet = $\frac{1}{2}$ ths London beer hogheads = 35.76137 cubic links: but, according to Mr. Smeaton, (Reports, vol. i. p. 245, 247, &c.) it is 52 ale gallons = 14664 cubic inches = 8.4861 cubic feet = 29.51732 cubic links. Dr. Defaguliers used the London beer hoghead of 54 gallons in his experiments on pumping.

HOGSHEAD of *Lime* in Somersetshire, is five heaped bushels or bags, (see Bath Soc. Papers, vol. x. p. 58.) = .078125 carriages.

HOGSIO, in *Geography*, a town of Sweden, in the province of Angermanland; 14 miles N.N.W. of Hernofand.

HOGSTA, a town of Sweden, in the province of Up-land; 7 miles N. of Upfal.

HOGSTIES, one of the small Bahama islands, surrounded with rocks. N. lat. $21^{\circ} 40'$. W. long. $73^{\circ} 50'$.

HOGSUND, a town of Norway, in the province of Aggerhuus; 23 miles S.W. of Christiania.

HOGUE, LA, a town of France, in the department of the Channel; opposite to which was fought, in 1692, the battle of la Hogue, in which the English fleet, under admiral Russel, obtained a glorious victory over the French, and 15 French men of war were taken, burned, or destroyed; 5 miles S. of Barfeur. N. lat. $49^{\circ} 35'$. W. long. $1^{\circ} 11'$.

HOGUE, Belle, a cape on the N. coast of the island of Jersey; 5 miles N. of St. Helier.

HOGWALTA, a town of Sweden, in Warmeland; 30 miles N.W. of Carlstadt.

HOHENBERG, a county and principality of Germany, situated between Wurtemberg and the Austrian Brisgau. It is divided into Upper and Lower counties, lying at some distance from each other. The chief towns are Rotenburg, Ehingen, Hord, and Schramberg.—Also, a town of Germany, in the principality of Bayreuth; 10 miles E.N.E. of Wunsiedel.—Also, a town of the bishopric of Bamberg; 5 miles E.N.E. of Kupferberg.

HOHENBURG, a town of Austria, on the river Trafen; 20 miles W. of Ebenfurth.

HOHENECK, a town and castle of Germany, in the principality of Bayreuth; 14 miles N. of Anspach.

HOHEN-ELB, a town of Bohemia, in the circle of Konigingratz; 23 miles N. of Konigingratz. N. lat. $50^{\circ} 30'$. E. long. $15^{\circ} 30'$.

HOHENEMBS, a county and principality situated to the S. of the lake of Constance.

HOHENESTED, a town of the duchy of Holstein; 10 miles S.W. of Nordtorp.

HOHENFELS, a town of Bavaria, in the lordship of Brietenack; 17 miles N.N.W. of Ratisbon.

HOHEN-FREDEBERG, a town of Silesia, in the province of Schweidnitz; 5 miles N.N.W. of Freyburg.

HOHENFURT, a town of Bohemia, on the Molda; 4 miles S.S.W. of Rosenber.

HOHEN-LIMBURG, a town of Germany, in the county of Mark; 9 miles S. of Schwiert.

HOHENLOE, or HOLACH, a county and principality of Germany, W. of the marggrate of Anspach, about 26 miles from N. to S. and 23 from E. to W.; consisting of mountains, vallies, and plains. The southern parts abound with vineyards, and the northern are cultivated for corn: the vallies have excellent meadows and pasture land, which feed great numbers of a valuable kind of cattle: and the mountains are clothed with oak, fir, pine, beech, and birch; and supply

supply plenty of game. The inhabitants are chiefly Lutherans, intermixed with some Roman Catholics.

HOHENMAUT, or WISSOKY-MEYTO, a town of Bohemia, in the circle of Chrudim, with a small territory annexed; 14 miles E. of Chrudim. N. lat. $49^{\circ} 54'$. E. long. $15^{\circ} 56'$.

HOHENSCHAU, a town and castle of Bavaria, near which are iron mines and forges; 70 miles W. of Salzburg.

HOHEN-SOLMS, a town of Germany, whence a branch of the family of Solms derives the title of count, situated in a valley near a high mountain, and inhabited by Calvinists, though the surrounding villages are occupied by Lutherans; 5 miles N.N.E. of Wetzlar. N. lat. $50^{\circ} 38'$. E. long. $8^{\circ} 35'$.

HOHENSTADT, or ZABRECH, a town of Moravia, in the circle of Olmutz; 24 miles N.W. of Olmutz. N. lat. $49^{\circ} 49'$. E. long. $61^{\circ} 41'$.

HOHENSTEIN, a town of Prussia, in the province of Oberland, with a castle. N. lat. $53^{\circ} 27'$. E. long. $20^{\circ} 15'$. —Also, a town of Saxony, in the marggravate of Meissen; 9 miles E.N.E. of Pirna. N. lat. $50^{\circ} 56'$. E. long. $14^{\circ} 10'$.

HOHENWART, a town of Bavaria; 9 miles S. of Ingolstadt.

HOHENZOLLERN, a principality of Germany, divided into three branches, viz. Hohenzollern, Hechingen, and Hohenzollern Sigmaringen: each prince having a revenue of about 30,000 florins.

HOHNSTEIN, a county of Westphalia, situated in Thuringia.

HOIET, a small island in the East Indian sea, near the coast of Queda. N. lat. $6^{\circ} 36'$. E. long. $99^{\circ} 47'$.

HOJILAMSA, a town on the E. coast of the island of Celebes. N. lat. $0^{\circ} 51'$. E. long. $124^{\circ} 59'$.

HOIN, a town of Persia, in the province of Adirbeitzan; 42 miles S.S.E. of Ardebil.

HOIST, in *Sea Language*, denotes the perpendicular height of a flag or ensign, as opposed to the *fly*, which signifies its breadth from the staff to the outer edge.

HOISTING signifies the operation of drawing up any body by the assistance of one or more tackles. Hoisting is never applied to the act of pulling up any body by the help of a single block, except in the exercise of extending the sails, by drawing them upwards along the mast or stays, to which it is invariably applied.

HOISTING *Jack*, in *Mechanics*, is a machine used for raising large weights to small heights, under which they can be placed. They are of two kinds; one in which a rack is pushed upwards by means of a pinion and winch-handle, and wheels, when great power is required; and others, in which a screw is moved upwards by means of a revolving nut, turned by a lever. In the Repository of the Society of Arts in the Adelphi, two models of hoisting-jacks are preserved for public inspection, viz. Mr. Abraham Stagholt's, class iv. N^o 47, described in *Trans. Soc. Arts*, vol. i. p. 319, and Bailey's Machines, vol. i. 168; and Mr. William Moccock's class iv. N^o 116. vol. vii. 239. and vol. viii. p. 179. See JACK.

HOISTING *Tackle*, is an ingenious and very effective way of raising weights, lately introduced very extensively by Mr. Simeon Thompson, who has a patent for its application.

HOITLALLOTL, in *Ornithology*, the courier pheasant of Latham. See *PHASIANUS Mexicanus*.

HOITLING, in *Ichthyology*. See *GADUS Merlangus*.

HOITZANATL, in *Ornithology*. See *CORVUS Mexicanus*.

HOITZITLIN. See *CERTHIA Carulea*, and *CERTHIA Mexicana*.

HOITZTLACUATZIN, in *Zoology*. See *HYSTRIX Prehensilis*.

HOIZITILTOTOTL, in *Ornithology*. See *TROCNILUS Punctulatus*.

HOKE-DAY, HOCK-DAY, or *Hock-Tuesday*, in our *Ancient Customs*, (*Dies Martis, quæ quinquenam Paschæ vocant*), the second Tuesday after Easter week: a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes in the time of king Ethelred II. in 1002; they having been, in that reign, almost all destroyed in one day in the different parts of the kingdom, and that principally by women. Mr. Bryant apprehends, that a holiday could not have been instituted for the commemoration of so cruel an event, which afforded matter for humiliation and sorrow rather than of festivity and mirth. Others have, therefore, thought that Hoke-day alluded to the death of Hardicanute, the last monarch of the Danish race, at a marriage-feast in Lambeth, on the 8th of June, 1042; by whose death, the English were for ever released from the wanton insults and boundless exactions of him and his countrymen. (See a Memoir on Hoke-day, by the Rev. Mr. Denne, in the *Archæologia*, vol. vii. p. 244.) This is still kept up in some counties, and the women bear the principal sway in it, stopping all passengers with ropes and chains, and exacting some small matter from them to make merry with. This day was very remarkable in former times, inasmuch as to be used on the same footing with Michaelmas, for a general term or time of account. We find leases without date, reserving so much rent payable *ad duos anni terminos, scilicet ad le hoke-day, et ad festum sancti Michaelis*. In the accounts of Magdalen college, Oxford, there is yearly an allowance, *pro mulieribus hockantibus*, of some manors of theirs in Hampshire; where the men *hock* the women on Mondays, and the women *hock* them on Tuesdays. The meaning of it is, that, on that day, the women in merriment stopped the way with ropes, and pulled passengers to them, desiring something to be laid out for pious uses.

HOKE-DAY *Money*, or *Hoke-Tuesday Money*, a tribute anciently paid the landlord for giving his tenants and bondsmen leave to celebrate hock-day, or hoke-day, in memory of the expulsion of the domineering Danes.

HOKE-NORTON, in *Geography*, a village of England, in the county of Oxford, where the Danes were defeated by the Saxons, under Edward the Elder, about the year 914. Vestiges of the camps are yet visible; 5 miles N.N.E. of Chipping Norton.

HO-KIEN, a city of China, of the first rank, in the province of Pe-tcheli, situated between two rivers abounding in fish, and remarkable for the neatness of its streets. It has under its jurisdiction two cities of the second, and fifteen of the third class; 87 miles S. of Peking. N. lat. $38^{\circ} 28'$. E. long. $115^{\circ} 43'$.

HOLAIVA, or HOOLAIVA, one of the Hapacæ islands, in the South Pacific ocean, uncultivated and uninhabited when Capt. Cook visited it in 1777, except by one man employed in catching fish and turtle. The trees and plants are similar to those of Lefooga, to which it is joined by a reef that is dry at low water; 30 miles N.N.E. of Annamooka. N. lat. $19^{\circ} 52'$. E. long. $185^{\circ} 36'$.

HOLAMIN, a small island of Scotland, near the S.W. coast of Mull. N. lat. $59^{\circ} 19'$. W. long. $61^{\circ} 21'$.

HOLANDS, a town of Norway, in the diocese of Christianland; 8 miles S. of Stavanger.

HOLAR.

HOLARRHENA, in *Botany*, from ὅλος, *entire*, or *solid*, and ἀνήρ, *a male*; apparently alluding to the anthers being entirely filled with pollen, and unaccompanied by superfluous appendages. Brown *Apocin.* (from *Tr. of the Wernerian Soc. v. 1.*) p. 51.—Class and order, *Pentandria Digynia*. Nat. Ord. *Contorta*, Linn. *Apocinæ*, Juss. Brown.

Ess. Ch. Corolla falver-shaped, with equi-lateral segments; its orifice and tube destitute of scales. Stamens inclosed in the tube, and inserted into its base; anthers unconnected with the stigma, lanceolate, entire, curving lengthwise. Germens two; style very short; stigma common, cylindrical. No scales at the base of the germens. Follicles slender.

This genus consists of two species, natives of Ceylon or other parts of the East Indies. One of them is *Carissa mitis*, Vahl. *Symb. fasc. 3. 44.* so named originally by Koenig, from whom there is a specimen in the Banksian herbarium. They are upright smooth shrubs, with membranous leaves. The flowers grow in terminal and lateral cymes.

HOLBEACH, in *Geography*, is an ancient market-town, and parish in the wapentake of Elloe, Holland division of Lincolnshire, England. It is situated in the Fens; and very indifferently built. A grant of a weekly market and an annual fair was obtained from Henry III. by Thomas de Malton, lord Egremont, about the middle of the thirteenth century; when a stone cross was erected in the market-place. The chief building in Holbeach is the church, which is a large handsome structure; and consists of a nave, chancel, aisles, porch, and square tower, with an octangular ornamental spire. The north porch has two circular towers, with embattled parapets, at its extreme angles. The church contains some fine monuments. An hospital was established and endowed in this town by sir John de Kirton, knt. about the year 1350, for the support of a warden, chaplain, and fourteen pensioners. A free grammar-school was also founded here about the same time by a licence from king Edward III., who granted certain lands for its support. Another free-school was established here about the year 1670, by George Farmer, esq. and the revenues for its support have been much increased by subsequent donations and bequests. Holbeach is 106 miles distant from London, and contains 556 houses, occupied by 2683 persons. This town has derived some honour from two eminent natives; Henry de Rands, called, from the place of his birth, Holbech, who was bishop of Lincoln in the reign of Edward VI.; and Dr. William Stukeley, whose name and memory are respected by every admirer of English antiquities.

The village of Gedney, a mile and half distant from Holbeach, is worthy notice for the lightness of its church, which has fifty-three windows; in those of the north aisle are considerable remains of fine painted glass. *Beauties of England*, vol. ix.

HOLBECK, a sea-port town of Denmark, in the island of Zealand, situated in the gulf of Helsingør, with a good harbour, whence considerable quantities of corn are annually exported; 30 miles W. from Copenhagen. N. lat. 55° 42'. E. long. 11° 44'.

HOLBEIN, JOHN, or **HANS**, in *Biography*. This admirable painter was born at Basle in 1498, and instructed in the art by his father John Holbein. In the early part of his life he pursued his studies with incessant assiduity; and being possessed of an elevated genius, his progress was exceedingly rapid, so that he soon became far superior to his instructor. He excelled all his contemporaries in portrait; and in that style arrived at so high a degree of perfection, that Zuccherro, who certainly was well qualified to judge of his merit,

did not hesitate to compare his portraits with those of Raphael and Titian.

He painted equally well in oil, water-colours, and distemper, in large and in miniature; but he had never practised the art of painting in miniature, till he resided in England, and learned it from Lucas Cornelii; though he afterwards carried it to its highest perfection. His paintings of that kind have all the force of oil-colours, and are finished with the utmost delicacy. In general he painted on a green ground, but in his small pictures frequently he painted on a blue.

The invention of Holbein was surprisngly fruitful, and often poetical; his execution was remarkably quick, and his application indefatigable. His pencil was exceedingly delicate; his colouring had a wonderful degree of force; he finished his pictures with exquisite neatness; and his carnations were life itself. His genuine works are always distinguishable by the true, round, lively imitation of flesh, visible in all his portraits, and also by the amazing delicacy of his finishing.

He visited London at the request of Erasmus, who recommended him to sir Thomas More; and sir Thomas immediately employed him, shewed him every mark of respect and real friendship, entertained him at his own table, allowed him an apartment in his house, and detained him for three years. In which time he painted the portraits of his patron, and all the family of sir Thomas; as also several portraits of his relations and friends, which were hung up in a grand hall. As soon as king Henry VIII. beheld those performances, he was so struck with their beauty, their life, and admirable likeness, that he took Holbein into his service, and favoured him highly as long as he lived.

It is observed by most authors, that Holbein always painted with his left hand; though one modern writer objects against that tradition, (what he considers as a proof,) that in a portrait of Holbein painted by himself, which was in the Arundelian collection, he is represented holding the pencil in the right hand. But, with great deference to the opinion of that ingenious connoisseur, that evidence cannot be sufficient to set aside so general a testimony of the most authentic writers on this subject; because, although habit and practice might enable him to handle the pencil familiarly with his left hand, yet, as it is so unusual, it must have had but an unseemly and awkward appearance in a picture; which probably might have been his real inducement for representing himself without such a particularity. Besides, the writer of Holbein's life, at the end of the treatise by De Piles, mentions a print by Hollar, still extant, which describes Holbein drawing with his left hand. Nor is it so extraordinary or incredible a circumstance; for other artists, mentioned in this volume, are remarked for the very same habit; particularly Mozzo of Antwerp, who worked with the left; and Amico Aspertino, as well as Ludovico Cangiagio, who worked equally well with both hands.

The genius and excellence of this master were sufficiently shewn in the historical style, by two celebrated compositions which he painted in the hall of the Steel-yard company; and they were universally admired for the richness of the colouring, as also for the strong character in the figures through the whole. Zuccherro, on seeing those pictures, expressed the highest esteem for Holbein, and even copied them in Indian ink.

Holbein undoubtedly had many excellencies, which procured him, very deservedly, the admiration of all Europe; but to equal him in portrait with Raphael and Titian, as Zuccherro did, or to place him on an equality with the best

of Raphael's disciples in composition, as Abbé du Bos has done, seems to be not altogether justifiable; for, notwithstanding the abundant merit of this master in many respects, it cannot be denied that the German taste predominates through most, if not all, of his compositions.

It is indeed to be lamented, that such a number of pictures are positively asserted to be of the hand of Holbein, which are a dishonour to his pencil; but any judicious person, who hath observed one genuine picture, will not easily be imposed on.

In the Florentine collection are the portraits of Holbein, Luther, sir Thomas More, and Richard Southwell, all painted by this master; and in the cabinet of the king of France, besides several portraits, there is an historical subject by Holbein, representing the "Sacrifice of Abraham," which is accounted a fine performance. He died in 1554, aged 56.

HOLBORNE ISLE, in *Geography*, a small island near the N.E. coast of New Holland; 20 miles N.W. of cape Gloucester.

HOLBERG, LOUIS, Baron Von, in *Biography*, a celebrated Danish writer, was born at Bergen, in Norway, about the year 1685. Owing to the early death of his parents, who had brought up a numerous family very respectably, he first went into the army, and then discovering an attachment to learning, he was put under the care of a private tutor by a near relation. The straightness of his own, and likewise of his friends' circumstances, was the cause of the many vicissitudes which he experienced before he had attained to man's estate. At length he completed his studies at Copenhagen, and then returned to his native place, where he became private tutor in the family of the suffragan of the bishop of Bergen. His temper was ill adapted to the situation, and in a few weeks he collected what money he was able to procure and set off for Holland. His resources were soon exhausted, and he was glad to return, directing his course to Christianland, where he obtained a living by teaching the languages. After this he went to England; and at Oxford his skill in music and the learned tongues obtained for him many pupils. His love of change had hitherto kept him in a state of poverty, and though he had many good offers, some of which he accepted, yet he never staid long enough in one place to benefit by them. He dedicated his "Introduction to the Modern History of France" to Frederic IV. which procured for him the place of an extraordinary professor at Copenhagen, which he had a very short time, when he travelled, by the way of the Netherlands, into France. After a considerable stay at Paris he went to Rome, where he spent a winter, and then returned to the French capital by way of Florence, Bologna, Turin, and Lyons. He next went to Copenhagen, where he published, in the Danish language, "An Introduction to the Law of Nature and Nations." After this he obtained an appointment which raised him above poverty, being made professor of metaphysics, though, according to his own account of the matter, it was one of the subjects with which he was least acquainted. This promotion was followed by a place in the consistory, which gave him a higher rank, and made a farther addition to his income. His reputation as a writer being established, he frequently appeared before the world as an author, and in 1735 he became rector of the university of Copenhagen, and in two years after he was entrusted with the management of its finances. While at the head of the university, he exerted himself to promote the interests of learning, and gave prizes to those students who excelled in the different branches of literature. He was a successful author, and obtaining much property by his literary labours,

he purchased an estate in Iceland, and at his death, which happened in 1754, he bequeathed a large sum of money to the academy of Soroe in Iceland, for the purpose of educating young nobility, on which account his memory has been celebrated by an annual oration. He settled also 16,000 dollars, the interest of which was to be employed in providing establishments for young women at Copenhagen. Holberg possessed a strong turn for satire and ridicule, of which he gave an admirable specimen in "Klimm's Subterranean Travels, containing a new Theory of the Earth, with a Description of the Fifth Monarchy, which hitherto has been totally unknown." This work has gone through many editions, and been translated into different languages. It is thus described by one of the translators: "Holberg's acuteness in discovering the imperfections of most governments, the instructive manner in which he criticises, and which evidently display a philosophical mind and depth of judgment; his accurate spirit of observation; his lively ridicule which, for the most part, is under the veil of philanthropy and naiveté, together with the elegance of the style, not only obtained a favourable reception to this work on its first appearance, but will secure it for ages. On account of the romantic event it records, it may be classed with Lucian's "True History," or "Gulliver's Travels;" but it exceeds both in variety of matter, as well as in delicacy of satire. Lucian only laughs, and Swift is too bitter, whereas Holberg steers a middle course between both." In his country baron Holberg is principally known by his "Introduction to Universal History," which was translated many years since by Dr. Gregory Sharpe; and a new edition of this work was given to the public in 1787, by William Radcliffe, A.B. Of the baron Dr. Sharpe says, "he was author of many works in prose and verse, almost all of them written in the Danish language. He wrote 25 plays, a metamorphosis, the reverse of Ovid's, relating the change of flowers, trees, and animals into men; he was the author of several satires in verse; of the entertaining voyage under ground of Klimms, in Latin, called *Iur Subterraneum*; of some epigrams; of his own life; of an excellent ecclesiastical history; another of the Danes, and one of the Jews, with several moral, historical, and other pieces; and he was always infirm and studious, had travelled much, and loved and imitated the manners of the English." See Dr. Sharpe's preface to the Introduction to Universal History.

HOLBOURN HEAD, in *Geography*, a cape of Scotland, on the N. coast of the county of Caithness. N. lat. 58 39'. W. long. 3 20'.

HOLCE, ὀλκερ, a word used by some of the Greek authors, as the name of a dram weight; and by others, as Dioscorides, &c. to signify a weight in general.

HOLCOMBE, HENRY, in *Biography*, was a chorister in the cathedral of Salisbury, and having a very fine treble voice, was sent for up to London, to perform in the first attempts at operas on the Italian model. In "Camilla," he performed the part of Prenesto; and being very young at that time, is called, in the printed copy of the music, *the boy*. In Rosamond, he performed the part of the page, under the same title. His voice breaking, he soon after quitted the stage, and became a music-master. He had many scholars, particularly in singing; for which, from constantly frequenting the opera, after he had ceased to perform there, and hearing all the great singers from Valentini and Nicolini, to Sencino and Farinelli, he must have been well qualified, and we have been assured by very good judges, who had often heard him sing in private, that his taste was perfectly Italian.

One song only of his composition, "Happy hours, all hours excelling," is printed in the Musical Miscellany.

But his elegant ballad of "Arno's Vale," written on the death of Gaston, the last duke of Tuscany, of the house of Medici, by Charles earl of Middlesex, afterwards duke of Dorset, and addressed to his favourite, the Muscovita, a singer, was afterwards in great favour, and printed in a collection of twelve songs set by Holcombe, and published a short time before his death, which happened about the year 1750.

HOLCUS, in *Botany*, a name in Pliny, ἄλκος of the Greeks, and by the ancients understood as a kind of wild barley, with awns, growing in dry stony places. Professor Martyn deduces it from ἄλκος, a furrow, but we do not find this etymology, nor any other that has fallen in our way, satisfactory. The name, as applied by Linnæus, embraces a heterogeneous assemblage, in which is the *Sorghum* of the ancients; but some species have of late been removed from it; (see *HIEROCHLOÆ*.) Mr. Brown, in his *Prodr. Nov. Holl.*, wishes to confine the genus nearly to that peculiar tribe to which the *Sorghum* belongs, and which is well illustrated by Mieg in the *Acta Helvetica*, v. 8. 114. t. 8, this last-named author expressing a desire that such might be separated, under the name of *Sorghum*, as a distinct genus from the *Holcus* of Linnæus. To this we gladly assent, and then perhaps our English species, *mollis*, *lanatus*, and *avenaceus*, may serve as the basis of *Holcus*, for we cannot agree with Haller and Mieg to refer the two first, any more than the last, to *Avena*. In pursuance of this plan, we shall for the present put aside *Sorghum*, for the consideration of ourselves or our successors in its proper place. The following therefore will be the characters and synonyms of our *Holcus*.—*Sm. Fl. Brit.* 88. *Engl. Bot.* t. 1169, 1170, 813. *Schr. Germ.* v. 1. 247, section 1. Leers t. 7. f. 6, 7. —Class and order, *Triandria Dizyria*. *Nat. Ord. Gramina*.

Gen. Ch. *Cal.* Glume of two valves, erect, beardless, ovate, containing two florets; one of them elevated on a stalk. *Cor.* of two valves; the lower or outer one largest, awned at the back in the least perfect floret. Nectary a cloven membranous scale. *Stam.* Filaments three in each floret, capillary, rather short; anthers long, linear, cloven at each end. *Pist.* Germen ovate; styles two, capillary, diverging; stigmas oblong, feathery. One floret has either no pithil, or only an imperfect one. *Peric.* none, except the permanent glumes. *Seed* solitary, ovate, attached to the hardened corolla.

Eff. Ch. Calyx of two valves, two-flowered; one floret with an imperfect germen. Corolla of two valves; the outer one awned.

1. *H. lanatus*. Meadow Soft-grass. *Linn. Sp. Pl.* 1485. *Curt. Lond. fasc.* 4. t. 11. *Schreb. Gram.* 145. t. 20. f. 1. *Sm. Engl. Bot.* t. 1169. *Knapp. t.* 37. *Leers.* 219. t. 7. f. 6. (*Gramen pratense paniculatum molle*; *Scheuchz. Agrost.* 234. t. 4. f. 24, A, B.)—Calyx-glumes woolly. Lower floret beardless; upper with an arched recurved awn. Leaves downy on both sides.—Abundant in meadows and pastures throughout Europe, especially where the ground is sandy, flowering in June and July. The roots are perennial, fibrous, tufted, not creeping. Stems several, a foot or two in height, simple, erect, leafy, jointed, clothed with soft, deflexed, dense hairs. Leaves flat, acute, greivish, clothed on both sides, but especially beneath, with similar pubescence; the sheaths of the uppermost longest and swelling. *Stipula* short and blunt. *Panicle* erect, compound, dense, downy, hoary, mostly with a purplish tinge; its ultimate stalks capillary. *Calyx-valves* nearly equal in length, the

innermost broadest. *Florets* not rising above the calyx; the upper one scarcely ever having any pithil. Its outer glume is blunt, terminating in a small awn, which, when the flowers are arrived at full maturity, is recurved in an arched manner, and is well compared by *Scheuchzer* to a fishing hook. This grass is mown for hay, along with any others that happen to grow with it, but has not been recommended for particular cultivation.

2. *H. mollis*. Creeping Soft-grass.—*Linn. Sp. Pl.* 1485. *Curt. Lond. fasc.* 5. t. 8. *Schreb. Gram.* 149. t. 20. f. 2. *Sm. Engl. Bot.* t. 1170. *Knapp. t.* 38. *Leers.* 218. t. 7. f. 7. (*Gramen caninum paniculatum molle*; *Scheuchz. Agrost.* 235. t. 4. f. 25.)—Calyx-glumes partly naked. Lower floret beardless; upper with a sharply-bent awn. Root creeping.—Native of shady copses and hedges, but much less frequent than the former, from which it is distinguished by its creeping root, and the acute angle formed by the awn of the male floret when ripe and dry. It is moreover a more slender and less downy grass, with a smaller panicle, but larger flowers, and more prominent awns. It blossoms in July, and is considered of no value to the husbandman, but rather noxious, as a kind of couch-grass. The widely-spreading roots are, indeed, in some situations, difficult of extirpation, but they do not thrive in open land.

3. *H. avenaceus*. Oat-like Soft-grass. *Wiggers. Holfat.* 72. *Sm. Fl. Brit.* 90. *Engl. Bot.* t. 813. *Knapp. t.* 39. *Schr. Germ.* v. 1. 247. (*Avena elatior*; *Linn. Sp. Pl.* 117. *Curt. Lond. fasc.* 3. t. 6. *Mart. Rust.* t. 7. *Leers.* 40. t. 10. f. 4.)—Calyx-glumes unequal, smooth. Male floret lowest, with a bent awn. Root knotty.—Common in pastures, meadows, and waste ground, flowering in June and July. Root perennial, of two knots, or swollen joints, one above the other. Stems a yard high. Leaves darkish green, rough and rather harsh. *Stipula* short, abrupt, minutely toothed. *Panicle* half-whorled, the branches consequently leaning one way. *Flowers* much larger than the two preceding, scarious, shining, not downy. *Anthers* pendulous, purple. The male *stipula* has the rudiments of a germen, and is lowest in this species, always conspicuously awned; the other is but slightly elevated. No use is made of this grass.

Schrader makes a species, under the name of *H. bulbosus*, of what we consider as a variety of this, growing in cultivated fields, and thence, if we mistake not, acquiring rather more bulbs, and downy joints to the stem, both circumstances originating probably from a more exposed and dry station than is natural to it. *Gramen bulbosum nodosum*, *Label. Ic.* v. 1. 23, is considered as a representation of this.

H. laxus of Linnæus, by his character of the florets, should seem to belong to this genus, but its racemose habit is very dissimilar, and the flowers require to be examined by those who have access to them alive. It grows in North America, and has the habit, but not the character, of *Michaux's Festuca diandra*, *Boreal. Amer.* v. 1. 67. t. 10.

H. striatus, Linn. is the very same thing as his *Panicum curvatum*.

H. ferratus, Linn. *Suppl.* 433, found at the Cape by *Thunberg*, is probably of some other genus, possibly a *Sorghum*. Its strongly ferrated leaves are extremely peculiar.

H. latifolius, Linn. *Sp. Pl.* 1486, is also *Cenchrus Japaceus* of the same work, two pages forward. This is an East Indian grass, with three or four singularly barbed florets in each calyx, quite unlike a genuine *Holcus*, but we

cannot investigate its flowers, so as to decide, with any certainty, concerning its true genus.

HOLCUS, in *Agriculture*, the name by which a genus of grasses is known; but few of the species of which are found useful to the farmer. It signifies soft grass.

HOLCUS *lanatus*, the meadow soft grass, which is supposed, by Mr. Curtis, to be a very common grass in all meadows and pastures, as well as in waste grounds and woods newly cut down, and which is also hardy, as well as productive of foliage, flowering a month later than the *anthoxanthum*, and when its red panicle appears, it is considered by the farmers that their grasses are ready for the scythe. Its foliage is soft and woolly, which, if not disliked by cattle on that account, may, it is supposed, rank with some of the best grasses; if it were more curly, it would, however, be more valuable. It is not, however, thought so well of by Mr. Sole; as from its particular softness, he cannot conceive it excellent either as a pasture or hay grass. It is the grass which is usually known to farmers in this country by the name of Yorkshire-white.

HOLCUS *mollis*, the name by which the creeping soft grass is known. It has been suggested by Mr. Curtis in his "Tract on Grasses," that he is induced to think better of it now, than when he figured and described it in his "Flora Londinensis," having found that it will grow well in a sandy soil, and bear the drought of summer, better than most others. And it is added that captain Dorset is of opinion that it may even be cultivated to advantage in soils of the barren sandy kind.

HOLD, in the *Manege*. See RETAIN.

HOLD, in *Rural Economy*, a term applied to female animals, which after being covered or connected with the males, without miscarriage, are said to hold.

HOLD, of a *ship*, the lowest part of the ship, including all that part of her inside lying between the floor and the lower deck, through her whole length.

The hold is the store-room in a merchant ship, or the place wherein the goods, at least all the heavier and more cumbersome, are stowed: the rest are disposed between the two decks; at least in Dutch ships, which have their holds very shallow, and the space between the decks very high. The hold contains the ballast, provisions, and stores, of a ship of war. The several store-rooms are separated by bulk heads, and are denominated according to the several articles they contain, the sail-room, the bread-room, the fish-room, the spirit-room, &c.

To find the burden of a ship, the hold is to be measured.

HOLD, in *Sea Language*, is understood to signify a particular situation with regard to the shore, by which she is enabled to keep within a sufficient distance, to facilitate her course, or answer some other important object. *Keep a good hold of the land*, implies to keep near, or in sight of the land.

HOLD, *after*, denotes that part of the hold which lies abaft the main-mast.

HOLD, *fore*, is that part of the hold which is situated in the fore-part of the ship, or before the main hatchway.

HOLD *its own*, at *S. a.* A ship is said to hold its own, that keeps her course right forward.

HOLD, *to rummage the*, is to remove and clear the goods and things therein.

HOLD, *predy the*, in the *Sea Language*. See PREDY.

HOLD, *to trim the*. See TRIM.

HOLD, *stowing the*, a sea-phrase for taking goods into the hold. See STOWAGE.

HOLD, in *Music*, is a mark, like an arch, with a point in

the middle of it, placed over some single notes, which has been used to signify that such note is to be made longer than ordinary; but it now more commonly denotes that the song ends there, and is only used when the song ends with a repetition of the first strain, or part of it.

HOLDE, in our *Old Law Books*, is used for the bailiff of a city or town: and sometimes for a general.

HOLDEN, in *Geography*, a township of America, in Worcester county, Massachusetts, seven miles N. of Worcester, and 51 W. of Boston; containing 1142 inhabitants.

HOLDEN, JOHN, in *Biography*, author of an excellent essay towards a rational system of music.

We are unable to give a biographical account of this ingenious author; but his work, which was published at Glasgow, in long quarto, half bound, in 1770, seems to have been much less noticed by the public than it deserves. Its principles are good, and explained in clear and correct language. Without discovering a marked partiality for ancient or modern music, or an exclusive predilection for the productions of any particular country or individual, he has endeavoured, and we think with considerable success, to explain the materials with which good compositions are built; and, without pedantry or fantastical innovations, has ranged through the wide extended regions of the art. We will not say that this little treatise (in size) renders all other books on the subject unnecessary, or that the author has left nothing for subsequent writers to do. No; all we mean to say is, that what he *has* done, is *well* done; but if his work had been much more voluminous than it is, much must have been left for ingenious, intelligent, and speculative writers to say on the subject, and during the lapse of more than 30 years, since this book appeared, such a rapid progress has been made in the theory and practice of the art, that Mr. Holden, if still an inhabitant of earth, might fill a second volume of his work by describing, the new passages and effects in the works of Haydn and Mozart alone, that have delighted the lovers of music, since the publication of his first volume.

The author, in Part I., has treated with clearness and ingenuity the following subjects:

- Of the natural scale, 26 sections.
- Application of the scale, 9 do.
- Of the modern system of music, 22 do.
- Of time, 45 do.
- Miscellaneous explanations, 15 do.
- Harmonical consonances, 26 do.
- Of dissonances.
- Of fundamental progressions.
- Of the flat series.
- Of chromatic.
- Of plain discant.
- Figurative melody.

Part II.

- Of the theory of music (found).
- Single musical sounds.
- Of musical sounds in succession.
- Of harmonical arithmetic (ratios).
- Of combined sounds.

This author is no fervid follower of any preceding writer: his precepts seem to arise from experience and reflection.

His calling the pause and final mark, N^o 101, a *bold*, is not a term in use at present. The Italian term for it is *corona*, or crown. It is, sometimes, colloquially called in England a *bull's eye*; but it is vulgar ☉ ☉

Indeed,

Indeed, in these chapters we have a musical dictionary, or technica: rules for thorough base: harmonics, and many other things, which the titles of the chapters do not profite.

There is in this work no parade of great reading, or knowledge of languages; yet we perceive that the author is not unacquainted with Zarlino, Rameau, d'Alembert, Rousseau, and Serre of Geneva.

In the plate facing p. 76, he calls C, with a ϵ in the key of G, a fundamental base; but the fundamental base to that chord as 4th of the key, is A with a 7th, and the author seems to be not perfectly familiarised to Rameau's *basse fondamentale*.

The plate facing p. 100, is a bad specimen of his abilities in composition. The repeating the same harmony to the first note of a new bar, as had been given to the last note of the preceding bar, will always be found insipid, and what is constantly avoided by contrapuntists of the first class.

He gives us instances of his harmony, but none of his melody; except such as are psalmodic.

But melody is very hard to teach. Keeping good company, that is, frequently hearing good music, forms the taste, and stimulates invention. A man that hears nothing but psalmody and national tunes, will never produce graceful and elegant melody, or great effects in harmony.

HOLDEN'S *Temperament of the Musical Scale*. In Mr. John Holden's "Essay towards a Rational System of Music," he recommends a system of tuning common-keyed instruments, in which the series of eight 5ths C, G, D, A, E, B \times F, \times C and \times G upwards are each flattened $\frac{1}{4}$ th of a major comma, and the three 5ths c, F, b B, and b E downwards, are also flattened $\frac{1}{4}$ c, leaving a wolf or bearing 5th between \times G and b E. Mr. Farey, in the 5th Scholium to his *Musical Theorems*, in the *Phil. Mag.* vol. xxxvi. p. 46, shews, that in this regular douzeave, the fifths are as much tempered flat as the major thirds are sharp (not flat as printed), and whence we obtain the fifth's temperament = 2.20157 Σ flat, the Vth wolf = 12.20944 Σ , the IIIrd temperaments 2 20157 Σ sharp, the IIIrd wolves = 16.61259 sharp, the VIIth temperaments = 4.40314 Σ sharp, and the VIth wolves = 18.81316 Σ sharp. Only three of the fifths, viz. between C \times , G \times , b E, and b B in this system, differ from those in Mr. HAWKE'S *Douzeave System*, see that article.

At pages 338 and 364 of the work above quoted, Mr. Holden, proceeding on the mistaken principles to which we have adverted in our article *GRAVE Harmonics*, gives an ascending and a descending scale of intervals, which, when combined and reduced to one fundamental, stand as follows: viz.

	Σ	<i>f</i>	<i>m</i>		Σ	<i>f</i>	<i>m</i>
<i>c</i> { $\frac{1}{2}$	612	+ 12	+ 53	\times F { $\frac{7}{10}$	314.947 ²	+ 6	+ 27
{ $\frac{3}{5}$	598.0528	+ 12	+ 52	{ $\frac{3}{5}$	301	+ 6	+ 26
<i>B</i> { $\frac{1}{3}$	568.947 ²	+ 11	+ 49	<i>F</i> { $\frac{3}{4}$	254	+ 5	+ 22
{ $\frac{8}{15}$	555	+ 11	+ 48	{ $\frac{16}{11}$	240.0528.	+ 5	+ 21
<i>b B</i> $\frac{4}{7}$	494.0528	+ 10	+ 43	<i>E</i> { $\frac{7}{5}$	221.947 ²	+ 4	+ 19
<i>A</i> { $\frac{7}{12}$	475.947 ²	+ 9	+ 41	{ $\frac{6}{5}$	208	+ 4	+ 18
{ $\frac{16}{17}$	462	+ 9	+ 40	{ $\frac{4}{5}$	197	+ 4	+ 17
{ $\frac{3}{5}$	451	+ 9	+ 39	<i>b E</i> { $\frac{2}{3}$	153.947 ²	+ 3	+ 13
\times G { $\frac{63}{105}$	407.947 ²	+ 8	+ 35	{ $\frac{6}{5}$	140	+ 3	+ 12
{ $\frac{16}{15}$	394	+ 8	+ 34	<i>D</i> { $\frac{2}{3}$	117.947 ²	+ 2	+ 10
<i>G</i> { $\frac{1}{2}$	371.947 ²	+ 7	+ 32	{ $\frac{8}{9}$	104	+ 2	+ 9
{ $\frac{2}{3}$	358	+ 7	+ 31	\times C { $\frac{2}{3}$	36	+ 1	+ 3
				<i>C</i> $\frac{1}{1}$			

By the decimal fractions of schifmas (Σ) in the third column, it will appear, which of these ratios involve the number 7, which does not belong to the diatonic system, amounting to nearly one-half of the whole number of notes, with which this fanciful system is encumbered.

HOLDER, WILLIAM, in *Biography*, doctor of divinity, canon of Ely, residentiary of St. Paul's, and sub-dean of the Chapel Royal, not only merits particular notice as an able and learned writer on the theory of music, but as an ecclesiastical composer of anthems, of which three or four are preserved in Dr. Tindley's collection, British Museum. From the regularity and unembarrassed arrangement of the several parts in these specimens of his composition, it is easy to discover, that he had not studied and practised counterpoint in the superficial manner of an idle dilettante, but with the application of a diligent professor.

Besides his eminence as a divine, and deep knowledge in music, he distinguished himself as a philosopher, a mathematician, and a philologist. He was one of the first fellows of the Royal Society, and in treating several curious subjects, nice selection and application of words manifest him to have

been a consummate master of our language. Indeed, the strength, precision, clearness, and compression of his style have been hardly ever equalled by any writer on philosophical subjects in our country; particularly in his admirable treatise on the "Elements of Speech," published 1669, and drawn up with the benevolent design of giving relief to a person that was deaf and dumb. In this essay he has analysed, dissected, and classed the letters of our alphabet so minutely and clearly, that it is well worthy the attentive perusal of every lover of philology, but particularly of lyric poets and composers of vocal music; to whom it will point out such harsh and untunable combinations of letters and syllables as from their difficult utterance impede and corrupt the voice in its passage.

In 1694, Dr. Holder published "A Discourse concerning Time," in which, among other things, the deficiency of the Julian Calendar was explained, and the method of reforming it demonstrated, which was afterwards adopted in the change of style. It is to be lamented that in treating this subject with so much clearness and ability, so good a musician did not extend his reflections on the artificial parts of

of time, to its divisions and proportions in musical measures; a subject upon which the abbatte Sacchi has written in Italian, "Del Tempo nella Musica;" but which rhythmically, or metrically considered in common with poetry, has not yet been sufficiently discussed in our own language.

The same year was published by Dr. Holder, "A Treatise on the Natural Grounds of Harmony," in which the propagation of sound, the ratio of vibrations, their coincidence in forming consonance, sympathetic resonance, or *sons harmoniques*, the difference between arithmetical, geometrical, and harmonic proportions, and the author's opinion concerning the music of the ancients, to whom he denies the use of harmony, or music in parts, are all so ably treated, and clearly explained, that this book may be read with profit and pleasure by most practical musicians, though unacquainted with geometry, mathematics, and harmonics, or the philosophy of sound. This book is said, in the introduction, to have been drawn up chiefly for the sake and service of the gentlemen of the chapel royal, of which he was sub-dean, and in which, as well as other cathedrals to which his power extended, he is said to have been a severe disciplinarian; for being so excellent a judge and composer himself, it is natural to suppose that he would be the less likely to tolerate neglect and ignorance in the performance of the choral service. Michael Wise, who perhaps had fallen under his lash, used to call him Mr. *Snub-dean*.

Dr. Holder died in 1696, aged 82, and was buried in the subterraneous chapel of St. Paul's church, where a marble monument is erected to his memory, with an inscription reciting his titles, talents, and extensive knowledge.

HOLDERNESS, in *Geography*, a township of America, in Grafton county, New Hampshire, on the E. side of Pemigewasset river, incorporated in 1761, and containing 531 inhabitants; 64 miles N.N.W. of Portsmouth.

HOLD-FAST, an iron hook, in shape of the letter S, fixed in a wall, to retain and support it.

This term also denotes a tool used by joiners, &c., which goes through their benches, to hold fast such work as cannot be finished by being held in the hand.

HOLDING ON, in *Sea Language*, is the act of pulling back the hind-part of any cable, or other rope, which is heaved round by the capstan or windlafs, or drawn in by the purchase of a tackle. As there are only a few turns of any rope above the barrel of the capstan or windlafs when it is employed in heaving, an equal quantity of the rope will necessarily come off from the capstan at the same time; and this is accordingly pulled back as strongly as possible to prevent it from surging or jerking round the barrel, by being held too loosely; so that holding-on denotes the act of retaining any quantity of rope acquired by the effort of a capstan, windlafs, or tackle, as these are employed in hoisting as well as in heaving.

HOLDING *water* signifies the operation of stopping a boat in her course, by holding the oars in the water, and bearing the blade or flat part strongly against the current made along-side, by her passing swiftly through the water.

HOLDING *over a term*, &c., in *Law*. By 4 Geo. II. cap. 28. in case any tenant for life or years, or other person claiming under or by collusion with such tenant, shall wilfully *hold over* after the determination of the term, and demand made and notice in writing for recovering the possession of the premises, by him to whom the remainder or reversion shall belong; such person so holding over, shall pay for the time he continues at the rate of double the yearly value of the lands so detained. See EJECTMENT and TRESPASS.

HOLDSWORTHY, in *Geography*, a small market town

and parish in the hundred of Black Torrington, Devonshire, England, is situated near the western borders of the county, between two small streams, which fall into the river Tamar, at a small distance. In the year 1801, this town was returned to parliament as containing 204 houses, and 1045 inhabitants: the chief employment of the latter is derived from the operations of agriculture. Holdsworth is 214 miles W. from London; has a weekly market on Saturdays, and three annual fairs. Polwhele's History and Antiquities of Devonshire.

HOLE, in *Anatomy*, denotes such a cavity of a bone as penetrates from one side to the other.

HOLE, *Black*, at *Calcutta*, denotes a place of confinement, eighteen feet by eighteen feet, containing three hundred and twenty-four square feet, in which a hundred and forty-six persons were shut up by order of the viceroy; so that there was a square for each person of twenty-six inches and a half by twelve inches, which was just sufficient to hold them, without pressing violently upon each other. To this dungeon there was only one small grated window; and the weather being very sultry, the air within could neither circulate nor be changed. In less than an hour after their being inclosed, many of the unhappy people were seized with extreme difficulty of breathing, several were delirious, and the place was filled with incoherent ravings and exclamations of distress; the cry of *water! water!* was predominant. This was handed to them by the centinels, but had no effect in allaying their thirst. In less than four hours, many were suffocated, or died in violent deliriums. In an hour more, the survivors, except a few at the grate, were to the highest degree phrenitic and outrageous. At length those at the grate became so insensible, that we have no account of what happened, till they were released at six o'clock next morning, having been confined from seven the preceding evening. Such were the effects of animal effluvia in a close and unventilated place, in the space of eleven hours, that out of a hundred and forty-six persons, no more than twenty-three came out alive, and those in a high putrid fever, of which, however, by fresh air, &c. they gradually recovered.

HOLE, in *Geography*, a town of Norway, in the diocese of Aggerhuus; 15 miles N.W. of Christiania.

HOLE *town*, a town on the W. coast of the island of Barbadoes. N. lat. 13° 12'. W. long. 58° 31'.

HOLE, in *Mining*, signifies the act of holeing, clearing, kiving, curving, under-going, or under-mining the face or bank of coal in a coal-pit, preparatory to its being fell or wedged down, the processes of which will be found in Mr. Farey's Report on Derbyshire, vol. i.

HOLEING, signifies the under-mining or loosening of coals in a pit. See HOLE.

HOLEING-*stuff*, signifies the small earth or coals which is cut or picked out from under the coal in a pit: the small coals thus obtained are sometimes holeing-coal, sleek, &c.

HOLEN, in *Geography*, a town of Norway, in the diocese of Aggerhuus; 18 miles from Tonsberg.

HOLENECK, a town of the duchy of Stiria; 10 miles S. of Voitsberg.

HOLERS, in *Mining*, are a set of colliers, whose business it is, during the night, where coals are worked the long way, to hole, or undermine the banks or face of coal, ready for the next day's work.

HOLESCHAU, or HOLESOW, in *Geography*, a town of Moravia, in the circle of Prerau; 20 miles S. E. of Olmutz. N. lat. 49° 18'. E. long. 17° 32'.

HOLIBUT, or HOLYBUT, in *Ichthyology*, a name given by the people of some parts of England to the turbot in general;

neral; but in other parts only to the larger fishes of that species. See *PLEURONECTES Hypoglossus*.

HOLINGSLED, RALPH, in *Biography*, an English chronicler, descended from a family settled at Bosely in Cheshire, was educated at Cambridge, where he is said to have taken his degree of M. A. in 1544. He lived in some capacity, probably as steward, with Thomas Burdett, esq., of Bromcote in Warwickshire, at which place he died about the year 1580. Holingsled has given name to a compilation of English history from the earliest periods, of which the first edition was published at London in 1577, in two volumes folio. The second edition was published ten years after, and brought down the history to the preceding year. Holingsled was employed by Reginald Wolfe, printer to the queen; and he was assisted by several other persons, and upon his death it was continued by John Stowe. Very considerable retrenchments from the first edition were made in the second and third, of those parts which were not agreeable to Elizabeth and her ministers, by order of the privy council. Amidst the tediousness and vulgarity of these chronicles many facts are to be found, highly useful in elucidating the manners and customs of the more early periods. *Biog. Brit.*

HOLISTHEMA, in *Surgery*, a dislocation.

HOLITZ, in *Geography*, a town of Hungary; 32 miles W.N.W. of Topoltzen.—Also, a town of Bohemia, in the circle of Chrudim; 10 miles N. E. of Chrudim.

HOLKABERG, a town of Sweden, in East Gothland; 35 miles S.W. of Linköping.

HOLL, a word which is provincially employed to signify the hollow of a ditch, in contradistinction to the dick or bank of it.

HOLLAND, PHILEMON, in *Biography*, was born at Chelmsford, in Essex, about the year 1551; and after receiving the rudiments of learning at the grammar-school of that place, was sent to Trinity college, Cambridge, of which he became fellow, and left the university after having taken the degree of M. A. He was appointed head master of the free-school of Coventry, where he had settled; and in this laborious station he not only attended assiduously to the duties of his office, but served the interests of learning, by undertaking those numerous translations, which gained him the title of *Translator general of the age*. But, as if these occupations were insufficient for the employment of his time, he likewise turned his studies to medicine, and practised in that profession with considerable reputation in his neighbourhood; and at length, rather late in life, he became a doctor of physic, in the university of Cambridge. He was an amiable man in all the relations of private life, and by his habits of temperance and regularity attained his 85th year, not only with the full possession of his intellects, but with his sight so good, notwithstanding his incessant use of it, that he never had occasion to wear spectacles. He continued to translate till his 80th year; and his translations, though devoid of elegance, are accounted faithful and accurate; and afford a memorable proof, how much a single man may perform, if his whole time be employed to advantage. He translated into English "Livy," "Pliny's Natural History," "Plutarch's Morals," "Suetonius," "Ammianus Marcellinus," "Zeno-phon's Cyropædia," and "Camden's Britannia," to the last of which he made several useful additions; and into Latin he translated the geographical part of "Speed's Theatre of Great Britain," and a French "Pharmacopœia of Brice Bauderon." A quibbling epigram upon his translation of Suetonius has often been retailed in jest books.

"Philemon with translations so does fill us,
He will not let Suetonius be Tranquillus."

See Aikin *Biog. Mem. of Medicine*.

HOLLAND, in *Commerce*, a fine, white, even, close kind of linen cloth, chiefly used for shirts, sheets, &c.

It is principally wrought in the provinces of Holland, Friseland, and other parts of the United Provinces; whence the appellation.

The principal mart or staple of this cloth is at Haerlem, whither it is sent from most other parts, as soon as wove, there to be whitened in the ensuing spring.

That manufactured in Friseland is the most esteemed, and called Frise Holland. It is the strongest and the best coloured of any of that fineness: it is never calendered, nor thickened, as the rest; but it is imported just as it comes from the whistler: it is distinguished by its being yard quarter and half wide; which is half a quarter more than those commonly called Frise Hollands, which are not right.

HOLLAND, gulfic, is very white and fine, and is chiefly used for shirts, being the strongest of any for its fineness, except true Frise. It is just yard wide.

HOLLAND, Altmær, is a very strong cloth, and wears exceeding well. It is about yard quarter and half wide.

HOLLAND, in *Geography*, an appellation applied to the Seven United Provinces collectively, *viz.* Guelderland, Holland, Zealand, Utrecht, Overysel, Groningen, and Friseland (which see), but primarily belonging to the chief of them. This country, once a celebrated republic, derives its name from the German word "Hohl," synonymous with the English term hollow, and denoting a concave or very low country. The people are called Dutch, from the German "Deutsch," or "Teutsch;" but "Deutschland" properly signifies the vast extent of Germany itself, though by the English restricted to a small portion, using a dialect of the German language. These provinces extend from the north of Groningen to the southern boundary along Austrian Flanders and Brabant, about 150 British miles; and in breadth, from the North sea to the kingdom of Westphalia, about 100 British miles. Their content, in square miles, is estimated at 10,000. They form a kind of peninsula, which is divided into N. and S. Holland; the former including all to the N. of Amsterdan, and the latter extending from the states of Zealand and Brabant to the river Ye. The population has been recently computed at 2,758,632, which, allowing the extent of territory in square miles to be 10,000, will give 275 for each square mile. After the dismemberment the French accounts state the population at 1,881,881. That of Holland, the chief province, has been calculated at 980,000. The country is low and marshy; some part of it being lower than the sea, from the inundation of which it is secured by dykes or dams; and the meadows, which are covered with water in the winter, are freed from it by means of mills, that are contrived for discharging it into the ditches and canals. Without these ditches and canals, serving as drains to the country, the soil would in most parts be incapable of cultivation. Among the marshes that deform the general face of the country, the traveller observes numerous and important cities and towns with admiration, and not without very honourable ideas of the astonishing powers of active industry, which have formed a habitable and enviable abode amidst the greatest natural disadvantages. The marshes, morasses, and heaths, which are characteristic of the different provinces, are however intermixed with groves, gardens, and meadows. Though the general aspect of the country presents an intimate combination of land and water, with few hills and woods, but rather moderate

HOLLAND.

moderate elevations consisting of barren sand, Holland furnishes little scope for the operations of agriculture, the land being mostly appropriated to pasturage, excepting that small portion of it which is assigned to the culture of madder and tobacco. In the province of Guelderland, and the barony of Breda, the waste grounds are extensive, being over-run with broom and heath, and the soil being generally a black sand. In the north of Holland, and in Friesland (which see), the pastures supply such a quantity of good butter as to form a staple article of commerce. The chief rivers of the United Provinces are the Rhine, and the Meuse or Maas, which see respectively. The lakes are few and of small extent, if we except that which is called the sea of Haerlem, on the north of which is the Ye, a broad piece of water, resembling a creek of the sea rather than a river, which passes by Amsterdani. This country has neither mountains nor elevated wood-lands, nor mines; its horses are chiefly procured from England and Flanders, and for its cows and oxen it is primarily indebted to Holstein. Fish abound on its shores, and particularly turbot and soals; but its herrings are chiefly obtained from the Northern ocean, by way of the port of Flardingcn, or Vlaerdingen, W. of Rotterdam. The climate of this country is cold and humid, and therefore the dress of the inhabitants is calculated more for warmth than elegance; the houses and streets, both in the towns and villages, are distinguished by their cleanliness and neatness, and form a contrast to the squalid appearance of the German villages. The temperament of the Dutch is phlegmatic; and they are characterised by labour and perseverance rather than ardent and impetuous activity. Their ruling passion is the love of money. To such a degree does this passion prevail, if we may credit the report of a female traveller (Mrs. Radcliffe), that "the infatuation of loving money, not as a mean but an end, is paramount in the mind of almost every Dutchman, whatever may be his other dispositions and qualities; the addiction to it is fervent, inveterate, invincible, and universal, from youth to the feeblest old age." In stature the Dutch are low, and the women are commonly taller than the men; and notwithstanding the predominant passion of the country, the ancient female affection for gold and jewels is not yet eradicated. The moisture of the climate leads to the use of high-seasoned food, and of spirituous liquors. Besides the usual games, the chief amusements of the Dutch, in the days of their prosperity and wealth, were the theatres and the tea-gardens. The opulent merchants took delight in their villas, which were thickly planted among the numerous canals; and though their gardens were small, they were richly stored with tulips, hyacinths, and other flowers of immense value. In winter shooting was a favourite pastime; and the canals were crowded with people of all ranks. Others, however, whose means could afford it, amused themselves under the domestic roof, amidst their expensive collections of pictures and prints, which they contrived to render a lucrative article of commerce. The Dutch canals of the United Provinces, which are not less numerous than the roads in other countries, have been a means of commercial intercourse as well as of personal amusement, as they have served to augment their inland trade when their foreign commerce has declined, till late measures of the state, carried into effect by the ruler of the continent, have been no less injurious to them than to their neighbours. The chief manufactures of Holland are linens, pottery, and painted tiles; leather, wax, snuff, starch, paper, and also some articles of woollen, cotton, and silk. In a period of national prosperity and opulence, when their colonies were numerous on the coast of Hindoostan, in

Ceylon, at Batavia, and at the Cape of Good Hope, &c. and their maritime power very considerable, the most valuable branch of their commerce consisted in spices and drugs, brought from their settlements in the East Indies. Their fishery in the northern seas, and on our coasts as well as their own, was an object of importance. At a later period they have derived no small advantage from being the grand deposit of commerce between Great Britain and the Continent; but this intercourse is for the present interrupted; and more especially their inland trade with Germany and France, by the canals and Rhine. One of the most profitable articles of this trade consisted in the vast floats of timber which arrived at Dort, from Andernach and other places on the Rhine, and from the German forests. The length of these rafts is from 700 to 1000 feet, and the breadth from 50 to 90, and the floating island was directed by 500 labourers; and it is said, by the female traveller already cited, that the sale of one raft, on its arrival at Dort, occupied several months, and frequently produced more than 30,000*l.* sterling. The Dutch language is a dialect of the German; and the literature of the United Provinces has sustained an honourable rank. Among those who have contributed to its reputation in this respect we may mention Erasmius, Johannes Secundus, or Hans de Twede, Grotius, Boerhaave, Paul Merula, Adrian Junius, Meursius, Doufa, Heintius, the Younger Vossius, and Hoogewegen of Leyden, who died in 1794, after having acquired the reputation of being the first Greek scholar in Europe. The largest and most celebrated Latin schools in this country were those at Rotterdam, Breda, Middleburg, Groningen, &c.; and its five universities are those at Leyden, Utrecht, Harderwyck, Franeker, and Groningen, besides two inferior colleges at Amsterdani and Deventer. At Haerlem there is an academy of sciences.

The Protestant religion, in the Calvinistic form, prevails through the United Provinces; and the treaty of Union, in 1579, provided for its perpetuity. In 1583, indeed, the states of Holland proposed, that no other form should be tolerated; but this resolution was wisely rejected; and every religion is permitted, on condition that it does not oppose the fundamental laws, or teach any doctrines that are subversive of the state; but employments of any consequence are restricted to Protestants. The ecclesiastical state is composed of four ranks, *viz.* professors at universities, preachers, elders, and deacons; and the government of the church is administered by consistories, classes, and synods. The consistory is the lowest court, commonly consisting of the clergy and elders of a particular town; while a class consists of deputies from several, and is commonly assembled three times in the year; a part of its duty being to visit the churches, and watch over the conduct of the clergy. The synods are either provincial or national; the first being assembled every year, while the national synod is only summoned on the most important occasions, when essential doctrines are to be discussed; and the last of these was that of Dort in 1618. The provincial synods are 53 in number, and consist of 1570 preachers. There are also many Walloon churches dispersed through the provinces, who hold a kind of synod twice a year, composed of deputies from their own sect. The Roman Catholics are supposed to have 350 churches, served by 400 priests. The other chief sects are Lutherans, Remonstrants, or Arminians, who have 43 teachers, Anabaptists, Jews, and a few Quakers.

As to the political history of the United Provinces, we may observe, that the original population of this country appears to have been Celtic; but when the Romans conquered the country, it was occupied by the Batavi, the most

HOLLAND.

northern people of Belgic Gaul, supposed to be a German or Gothic progeny. (See *BATAVI*.) The Frisians, the next people adjoining to the Batavi on the N., extended themselves in the seventh century down to the Scheldt. In the eighth century the Frisians were subdued by the Franks under Charles Martel; but both the Frisians and the Franks became intermixed in the population of the country with the Batavians. (See *FRISONS* and *FRANKS*.) Our limits will not allow us to trace the history of these provinces, whilst they continued separate, and in a great measure independent of each other; nor can we detail the various conflicts with which they endeavoured to assert and maintain their liberty against the tyranny of the king of Spain and his emissaries. It will be sufficient to take up their history in the year 1566, when Holland and some inferior provinces revolted from the oppressive dominion of Philip II.; and thus commenced those sanguinary contests, which terminated in the union of Utrecht, Jan. 23d, A.D. 1579. For this purpose deputies from the provinces of Holland, Zealand, Utrecht, Friesland, Groningen, Overijssel, and Guelderland, met at Utrecht, and signed a mutual alliance, which formed the basis of that commonwealth, which afterwards became so renowned under the appellation of the United Provinces. This treaty of alliance was founded upon the infractions of the pacification of Ghent, solemnly acceded to by Philip, and a late invasion of certain towns in Guelderland. It was not intended by this alliance to divide the seven provinces from the other 10, or to renounce the pacification of Ghent; but its object was to preserve the liberty stipulated in that pacification, by more vigorous operations, and united councils. The chief articles of this union deserve to be recited, and they are as follow: the seven provinces shall unite in interest, as one province, never to be separated or divided by testament, donation, exchange, sale, or agreement; reserving to each particular province and city all its privileges, rights, customs, and statutes. In all disputes arising between any of the provinces, the rest shall interpose as mediators. They shall assist each other with life and fortune against every foreign attempt upon any particular province, whether to establish sovereignty, the Catholic religion, arbitrary measures, or whatever else may appear inconsistent with the liberties of the provinces, and the intention of the alliance. All frontier towns belonging to the United Provinces, shall, if old, be fortified at the expence of the provinces; if new, at the joint expence of the union. The public imposts and duties shall be farmed for three months to the highest bidder, and employed with the king's taxes in the public service. No province, city, or member of the union, shall contract an alliance with any foreign prince or power, without the concurrence of all the other members. Foreign powers shall be admitted into the alliance, only by consent of all the contracting parties. As to religion, the provinces of Holland and Zealand shall act in that particular as they think advisable; the rest shall adhere to the purport of the edict published by the archduke Matthias, which prescribed, that no man should be oppressed on account of conscience. All the inhabitants, from the age of 18 to 60, shall be trained and disciplined to war. Peace and war shall be declared by the unanimous voice of all the provinces; other matters that concern the internal policy shall be regulated by a majority. The states shall be held in the usual constitutional manner, and coinage shall be deferred to future determination. Finally, the parties agreed, that the interpretation of these articles shall remain in the states-general; but in case of their failing, to decide in the stadtholder. In this grand alliance, sketched out by the prince of Orange, may be discerned the judicious steady counsel

of the master and true patriot. It was so universally approved, that in a short time the cities of Ghent, Nimeguen, Arnhem, Leewarden, Venlo, Ypres, Antwerp, Breda, Bruges, with several other towns, noblemen and persons of distinction, embraced and signed the union. The first coin struck after the alliance is expressive of the situation of the infant republic. It represented a ship labouring amidst the waves, unassisted by sails or oars, with this motto, "INCERTUM QUO FATATA FERANT." The history of this interesting struggle, says Pinkerton, has been depicted in glaring colours by the celebrated Grotius, who in this work sometimes rivals the acute brevity of Tacitus. At the end of this century the Dutch had established colonies at the Cape of Good Hope, and in the East Indies; and settlements were afterwards gained in South America. During the 17th century they rivalled the English in the empire of the sea; and greatly exceeded them in commercial advantages. After the obstinate naval conflicts in the reign of Charles II. their power began to decline. In 1672, Louis XIV. invaded Holland; and Amsterdam was saved merely by opening the sluices. In 1688, William, the stadtholder of Holland, ascended the throne of England; and a stricter intercourse subsisting between the countries, Holland became the grand channel of the commerce of England with the continent. The stadtholder was declared hereditary in 1747. By the war in 1756, Holland and France became intimately connected, and a French party arose in the country, which opposed the stadtholder; but he was supported by the English. In 1780, a war occurred between Great Britain and Holland, which terminated in 1784, after exposing to Europe the decline and weakness of the United Provinces, still further displayed by the entrance of the duke of Brunswick in 1788, who may be said to have subdued them (says Pinkerton) without a blow. As the Dutch joined the coalition against the French, their country fell a prey to the invaders, during the hard frost of the winter of 1794-5; and the stadtholder took refuge in England in 1795. The country was then denominated the Batavian republic; and divided into eight departments, &c. However, these provinces were soon afterwards erected into a kingdom, and assigned by Napoleon the French emperor to his brother Louis. On the 1st of July 1810, Louis Napoleon abdicated his throne, and it was decreed on the ninth instant, by Napoleon, that it should be united to France; that the city of Amsterdam should be the third city of the empire; that Holland should have six senators, six deputies to the council of state, 25 deputies to the legislative body, and two judges in the court of cassation; and that the officers by sea and land, of whatever rank, should be confirmed in their employments, under commissions to be delivered to them, signed under the emperor's hand, the royal guard being united to the imperial guard. The emperor's decree announces other provisional enactments for the management of the administration, finances, &c. The imperial decree has been since executed.

Under their former government, the United Provinces were composed of seven republics, each retaining its own states, consisting of nobles and burghers. The provincial states sent deputies to the States-general, each republic having only one vote, though its deputies may be numerous. But the States-general seldom exceeded twenty-six persons, who used to assemble in a small room at the Hague, enjoying the right of peace and war, appointing and receiving ambassadors, naming the greffier, or secretary of state, and all the staff-officers. The council of state directed the army and finances; and what was called the council of deputies considered the troops and finances of each province. The grand

HOLLAND.

penionary of Holland presided in the provincial states, and council of deputies of that country. The stadtholder was, originally, a kind of dictator, appointed, from the necessity of the times, to conduct the emancipation of the state. When that necessity vanished, the office became of dubious authority, till William III., in 1672, procured it to be declared hereditary. As he died without children, the states revoked this power; but in 1747, it was again made hereditary in favour of William IV.

The new constitutional code, under the sovereignty of Louis, consisted of five parts, or rather short chapters. The civil, religious, and political institutions were continued; and the public debt guaranteed. The council of state was composed of thirteen members. All forms of religion were tolerated, even that of the king; to whom it pertained to nominate to all offices and places, formerly in the gift of the grand pensionary; for the code takes no notice of the stadtholder. The coin was to be stamped with his effigy; and, with the advice of the privy council, he had the prerogative of pardoning offences. The government of the colonies was specially and exclusively vested in him; but the general administration of the kingdom was committed to four ministers of state. The legislative body was appointed to consist of thirty-eight members, chosen for five years, in a certain proportion for the several provinces; those for Holland being seventeen. The title of high-mightiness was retained for the assembled members of the legislative body, the late grand pensionary being declared president for life. This assembly was appointed to meet twice in the year, in April and November; but extraordinary assemblies might be summoned by the king. Justice was directed to be administered according to the local customs and statutes of each province and city, the ordinances of the States-general, and in defect of all these, the Roman code. Each province has a supreme court, to which appeals lie from the lower courts of justice, except in criminal causes, in which the stadtholder might pardon, by the consent of the president and superior court of each province, except in cases of murder and other flagrant crimes.

The army was formerly comprised at about 36,000, but it has been since the revolution incorporated with that of France. The navy, which used to consist of forty ships of the line, has now almost totally disappeared. The revenue was about 3½ millions sterling; but the expenditure far exceeded it, so that the national debt was computed at about 130,000,000*l.* sterling; but 2,800,000*l.* were annually received as the interest of loans to foreign powers. The dilapidation of the revenue and the increase of the debt have been very sensible since the establishment of a nominal monarchy. The political importance of the United Provinces is altogether consolidated with that of France, of which empire it is become a part, and to which it is absolutely subject. What changes farther await it the wisest politician cannot conjecture. We refer to the article UNITED PROVINCES. Pukerton's Geogr. vol. i. Mod. Un. Hist. vols. xxvii. xxviii.

HOLLAND, a town of Prussia, in the province of Oberland, situated near the river Weeske, and strongly fortified; 40 miles S.E. of Dantzic. N. lat. 54° 2'. E. long. 19° 37'.

HOLLAND, *New Notasia*, or, as Cook called the eastern part of it, "*New South Wales*," is an island in that part of the globe lately distinguished by the name of Australasia, so large as to be entitled to the appellation of a continent. Its length from E. to W. is about 43 degrees of longitude, in the medial latitude of 25°, that is, about 2340 geographical miles, or 2730 British. The breadth from N. to S. extends

from 11° to 39°, being 28°, 1680 geographical, or 1960 British miles. In the account of Cook's voyage, its square surface is stated to be more than equal to the whole of Europe. This, however, is an exaggerated estimate; because Europe is supposed to be about 3300 British miles in its utmost length, and its greatest breadth 2350. This defect is, indeed, compensated by the proximity of many large islands; and the whole of Australasia will probably be found greatly to exceed the European continent. This immense territory was first discovered in the beginning of the seventeenth century, and then called "*Terra Australis Incognita*." The first discovery is dated by De Brosses in October 1616, when the western part was explored by Hartog. In 1628, the western part was discovered by some vessels belonging to the Dutch East India company, and called "*De Witt's Land*," from the name of the commodore who commanded the squadron; and in the following year, a Dutch ship, commanded by Capt. Pelsart, was wrecked on this coast. In 1642 Capt. Tasman was sent by the Dutch East India company to survey the coast, who visited the southern part, which he called "*Anthony Van Diemen's Land*," by way of contradistinction to "*Diemen's Land*," on the north coast. (See *DIEMEN'S Land*.) Capt. Dampier fell in with this island in 1688, and visited it again in 1699. He describes the wretched condition of the inhabitants, as destitute of houses and clothes; he represents them as black, tall, thin, straight-bodied with small limbs, great heads, heavy brows, and eyelids half closed for guarding their eyes against the flies, which were numerous and troublesome. He further describes them as having large bottle-noses, full lips and wide mouths, without the two fore-teeth of their upper jaws, and without beards; long-visaged, and destitute of every graceful feature in their faces. The next person who visited this island was Capt. Cook, in 1770, who by his extensive operations on its E. side, left little to be done towards completing the full circuit of it. Between Cape Hicks, in latitude 38°, where his examination of this coast began, and that part of Van Diemen's Land, whence Tasman took his departure, the distance was not above 55 leagues. It was highly probable, therefore, that they were connected; though Capt. Cook cautiously says, that he could not determine whether his *New South Wales*, (that is, the east coast of New Holland,) joins to Van Diemen's Land, or not. But what was thus left undetermined by the operations of his first voyage, was, in the course of his second, soon cleared up. Capt. Furneaux, in the *Adventure*, during his separation from the *Resolution* in 1773, having explored Van Diemen's Land, from its southern point, along the E. coast, far beyond Tasman's station, and on to the latitude 38°, where Capt. Cook's examination of it in 1770 had commenced. We have now, therefore, a full knowledge of the whole circumference of this vast body of land, though most of its interior parts remain still unknown. To the southward of lat. 33° or 34°, the land in general is low and level; far northward it is hilly, but in no part can be called mountainous: and the hills, and mountains, taken together, form but a small part of the surface, in comparison with the vallies and plains. It is rather barren than fertile, though the rising ground is chequered by woods and lawns, and the plains and vallies are in many places covered with herbage: the soil, however, is frequently sandy, and many of the lawns, or savannahs, are rocky and barren, especially towards the northern part, where vegetation is less vigorous than towards the south. The inland country appeared to be better clothed than the sea-coast. The banks of the bays are covered with mangroves, to the distance of a mile within the beach, under which the soil is a rank mud, always overflowed by a spring

HOLLAND.

Spring tide; farther within the country, a bog was occasionally found, upon which the grass was very thick and luxuriant, and sometimes a valley occurs, that was clothed with under-wood; but the soil in general did not seem to admit of cultivation. In the interior of the country immense strata of coal have been discovered. The coast, especially to the northward of 25° S. lat. abounds with fine bays and harbours, where vessels may be secure from all winds. The country appeared to be well watered by springs and small brooks, but it has no large rivers. Of timber-trees there are but two sorts; the largest is the gum-tree, which grows over the whole country, the gum of which is a deep red, and resembles the sanguis draconis, if it be not the same; the other grows somewhat like our pines. The wood of both is extremely hard and heavy. Others are covered with a soft bark, which is the same that is used in the East Indies for caulking of ships. The country furnishes three sorts of palms; the nuts of one of which operated both as an emetic and cathartic with great violence. The quadrupeds of this island are the dog, of the chacal kind, which never barks, the kangaroo, an animal of the opossum kind, resembling the phalanger of Buffon, and another like the pole-cat, called by the natives Quoll. Here are many kinds of bats. The sea and other water-fowl are gulls, shaggs, inland geese or gannets, boobies, noddies, curlews, ducks, pelicans of an enormous size, black swans, the *mœnura superba*, having its tail expanded in the form of a lyre, and many others. The land birds are crows, parrots, paroquets, cockatoos, and others of the same kind, exquisitely beautiful, pigeons, doves, quails, bustards, herons, cranes, hawks, and eagles. Among other reptiles, here are various kinds of serpents, some noxious and some harmless, scorpions, centipeds, and lizards. Of the insect tribe the principal are the musquitoe and ant, some of the latter of which are green, and form their nests in a curious manner upon the trees. The ants are of several kinds. The sea abounds with fish of various sorts: upon the shoals and reef are incredible numbers of the finest green turtle in the world, and oysters of various kinds, particularly the rock oyster and the pearl oyster. Here are very large cockles, lobsters, and crabs. In the rivers and salt creeks there are alligators.

The number of inhabitants in this country seems to be very small in proportion to its extent. The immense tract of the interior country remains unexplored, but there is reason to believe that it is either wholly desolate, or more thinly inhabited than the parts visited by Cook and his companions. The presumption against its being much inhabited is strengthened by the total want of cultivation. The men were of a middle size, and in general well made, clean-limbed, and remarkably vigorous, active, and nimble: their countenances were not wholly without expression, and their voices remarkably soft and effeminate. The colour of the skin could not be well ascertained, on account of the dirt which uniformly covered it: with the dirt it was as black as that of a negro, and without it supposed to be of a chocolate colour. In other respects the accounts of our navigators materially differ from that of Dampier. They inform us that the features are not disagreeable, that their noses are not flat, and that their lips are not thick: their teeth are white and even, and their hair naturally long and black, though universally cropped short, and always matted and filthy; their beards are bushy and thick, but not suffered to grow long; both the hair and beard seemed to be kept short by singeing them. Both sexes go stark naked, without any apparent sense of indecency. Their principal ornament is the bone which they thrust through the cartilage that separates the nostrils: it is as thick as a man's finger, and being five or six inches long,

reaches quite across the face, and is an impediment both to their breathing and speaking. They had also necklaces made of shells, neatly cut and strung together: bracelets of small cord, twilled two or three times round the arm, and a string of plaited human hairs round the waist. They paint their bodies both white and red, the latter forming broad patches upon the shoulders and breast, and the former being drawn in stripes over various parts of their bodies. These people had no idea of traffic: they received what was given them, but had no idea of making a return, nor did they seem to have any disposition to steal: but if they were refused what they asked for, *e. g.* a turtle, they were enraged, and endeavoured to take it by force. On their bodies were visible scars, inflicted by blunt instruments, and which were understood to be memorials of grief for the dead. They appeared to have no fixed habitations, nor was there any trace of a town or village in the country. Their houses, when they had any, were mere hovels, constructed with pliable rods and covered with leaves of palm or broad pieces of bark: but in general they slept without any shelter, except the bushes, or grass, which is here near two feet high. Their fish-hooks are neatly made; and their lines, made of some vegetable substance, are from the thickness of a half-inch rope to the fineness of a hair. Their chief food is fish, and they occasionally kill a kangaroo and some birds: the only vegetable that forms an article of food is the yam. They dress their animal food by boiling, broiling, or baking it. As they have no nets, they catch fish only by sticking with an instrument of wood adapted to the purpose, or with a hook and line. They produce fire with facility, and spread it in a wonderful manner. To produce it they take two pieces of dry soft wood, one being a stick about eight or nine inches long, and the other a flat piece: the former is shaped into an obtuse point at one end, and pressing it upon the other, they turn it nimbly by holding it between both their hands, as we do a chocolate mill, often shifting their hands up and down, to increase the pressure. By this method they get fire in less than two minutes; and then spread it by means of the dry grass. The weapons of this people are spears, or lances, of different kinds, pointed with bone or shells, and barbed; and they throw them with great force and dexterity, either by the hand for short distances, or with an instrument contrived for that purpose: they have also shields or targets made of the bark of a tree. Their canoes are as rudely constructed as their houses, of bark or the trunk of a tree hollowed, probably by fire. They are moved with a pole or paddles, and some of them are fitted with an outrigger to prevent their upsetting: they are of different lengths and very narrow. The only tools which they seemed to possess was an adze made of stone, wedges of the same material, a wooden mallet, and some shells, and fragments of coral. For polishing the points of their lances, &c. they use the leaves of a kind of wild fig-tree. Each of their canoes carries four people.

The eastern coast of New Holland was carefully examined by Capt. Cook, and formally taken possession of in the name of the king of Great Britain in 1770. At the close of the American war, it was determined by the British government to make a settlement on this coast for the accommodation of transported felons. (See *Botany-bay*.) It appears from some further discoveries and reports, pertaining to this country, that it is peopled by three or four distinct races of men; those in the S.W. being different from those in the N., and both from those in the E. above described. They are merely divided into families, the former being styled Be-ana, or father, which is a title of respect; and each family or tribe has a distinct place of residence, distinguished by adding "gal" to the name of the place; *e. g.*, the southern shore of Bo-

tany-bay being called "Gwea;" the tribe inhabiting it is denominated "Gwea-gal." Those who live on the north shores of Port Jackson are called "Cam-mer-ny-gal," Cam-mer-rhy being the name of that part of the harbour. This tribe, which is numerous and muscular, exercise the prerogative of exacting a tooth from young men of other families, in token of government or subordination. This tribute of teeth is paid in a solemn manner, and it is performed every four years. They manifest but very obscure traces of religion, though they have some faint ideas of a future existence in the clouds, whence they originally fell. They seem raised but one degree above the brute creation; and, like monkeys, they are great mimics. The deformity of their appearance, occasioned by their low stature and thin limbs, their black bushy beards, and the bone stuck in the cartilage of the nose, by an operation performed between the ages of eight and sixteen, is farther increased by their practice of rubbing fish oil into their skins as a protection from the air and musquitoes, and of colouring their faces with white or red clay. The women are marked by the loss of the two first joints of the little finger of the left hand, which, as well as the extraction of a tooth from the boys, is supposed to inure them to bear pain with apathy. It is said, however, that these joints of the little finger are parted with because they are in the way when they wind their fishing lines over the hands. Few instances of deformed persons occur. Their huts are commonly constructed of the bark of trees, in the form of an oven, having the fire at the entrance, and filled with smoke and natinefs, in which they sleep promiscuously. Their mode of courtship is not very gallant; as it consists in watching the lady's retirement, and then knocking her down with repeated blows of a club, or a wooden sword; after which the matrimonial victim is led, streaming with blood, to her future husband's party, when a scene ensues too shocking to relate. The men of one tribe seek wives among the women of another. The woman thus ravished is called a wife; and polygamy is common. Parturition is easy, and a few hours after the mother walks about her usual business. The infant is placed for a few days on a piece of soft bark; but is soon removed to the mother's shoulders with its legs across her neck, securing itself by catching hold of her hair. Superstition is very prevalent among these poor savages; they believe in magic, witchcraft, and ghosts, the latter being the night-mare. They have also spells against thunder and lightning, and pretend to foretel future events by the meteors called falling stars. They are subject to a disease resembling a violent itch; but for their venereal complaints they seem to have been indebted to Europeans. They have not only personal property in their weapons, and fishing tackle, but some are supposed hereditary properties of certain spots, perhaps assigned as rewards for public services, or acts of great bravery. They are represented, with regard to their habitual disposition, as revengeful, jealous, courageous, and cunning. If they were honest, when first visited by Europeans, they have since acquired the art of stealing; and they are said to be adepts in the arts of evasion and lying. Savage, as their state is, they are susceptible of friendship, and capable of feeling sorrow. They have names for the sun and moon, some few stars, the magellanic clouds, and the milky way. Young people are buried; but those who have passed the middle age are burnt; a rude tumulus being erected as a tomb. Mr. Collins, in his account of this island, has given an ample vocabulary of the language; which is said to be grateful to the ear, expressive, and sonorous, and to have no analogy with any other known language; but the dialects of the various regions seem to be entirely different. The seasons are like those of the southern part of

Africa and America; and as the country lies on the southern side of the equator, they are the reverse of those in Europe. The climate, however, is allowed to be very fine and salubrious. The rains are heavy, falling chiefly about the full and change of the moon, and at intervals there are storms of thunder and lightning. Of the lakes, rivers, and mountains of this extensive country, our information is hitherto very imperfect; but they may probably be found to be on a large scale. A chain of mountains is said to run N. and S. between 50 and 60 miles inland, but not easily accessible, on account of numerous deep ravines. Basaltic columns often appear; and in Howe's island they are said to rise so high, as to be visible at the distance of twelve leagues.

The whole of the S.W. coast of New Holland has been explored by D'Entrecasteaux; who has made correct charts of it, and other parts have also been investigated, so that in due time we shall have a more complete account of this extensive island, or group of islands, if, indeed, it consist, as some have suggested, of several. S. lat. about 11° to 39° . E. long. 113 to 156 .

HOLLAND, a township of America, in Hampshire county, Massachusetts, bounded S. by Holland county in Connecticut, E. by Worcester county, and northward by Brimfield, incorporated in 1785, and containing 445 inhabitants; 75 miles S.W. by W. of Boston.

HOLLAND, *Cape*, a cape in the straits of Magellan. S. lat. $53^{\circ} 57'$. W. long. $72^{\circ} 34'$.

HOLLAND'S *Islands*, islands of America, near to the S. of Hooper's island, in Chesapeake bay.

HOLLAND'S *Point*, a cape on the W. side of Chesapeake bay, which, together with Parker's island, forms the mouth of Herring bay.

HOLLAND *River*, a river of Upper Canada, running from the S.W., and discharging itself into Cook's bay, lake Simcoe.

HOLLANDEROCCELLER IRSCHEAT, a small island in the North sea, near the W. coast of East Greenland. N. lat. $60^{\circ} 38'$. W. long. $46^{\circ} 25'$.

HOLLATT, a town of Austria, on the Danube; six miles N.N.W. of Bruck.

HOLLEMOPPO, a town on the N.W. coast of the island of Timor. S. lat. 9° . E. long. $124^{\circ} 50'$.

HOLLENBACH, a town of Germany, in the principality of Hohenloe; 17 miles N.E. of Ohringen.

HOLLERIIUS, JAMES, or, in his native language, HOULLIER, in *Biography*, a French physician and surgeon, of some eminence in the sixteenth century, was born at Estampes, and took his doctor's degree in the faculty of Paris, of which he was elected dean in 1546. He obtained great reputation by the success of his practice both in medicine and surgery, and is said to have paid particular attention to render the mind cheerful under illness, with a view to facilitate the cure of corporeal diseases. He was the author of several works, none of which he published himself. Some were printed during his life under the superintendance of his pupils, and some after his death, which happened in 1562. Among his works were commentaries on the books of Galen "De Compositione Medicamentorum," and on the Aphorisms of Hippocrates; likewise a treatise "De Materia Chirurgica," in three books, which went through numerous editions, in some of which the title of "Institutiones Chirurgicae" was adopted; "De Morborum curatione, &c." 1565; and "De Morbis internis Libri duo," 1571, which was frequently reprinted. Eloy. Dict. Hist.

HOLLES, DENZIL, *lord*, second son of the first Holles, earl of Clare, was born in 1597. He was liberally educated,

ated, and when his father had a place at court he was for a time companion and bed-fellow to prince Charles, then duke of York. When he attained to a proper age he sat in parliament as member for St. Michael's, Cornwall, and sided with the opposition party. At the accession of Charles I. he refused the offer of a knighthood of the Bath, and in the parliament of 1627 he was, owing to the interest which he had acquired by his marriage, returned for Dorchester, and took a leading part in favour of liberty. When the three resolutions of the commons against Popery, Arminianism, and the levying of tonnage and poundage by the king's prerogative, were drawn up, he was one of the two who forcibly held the speaker in his chair till they were passed. For his conduct on this occasion he was prosecuted, and condemned to a fine and imprisonment in the Tower, where he remained twelve months. Irritated by this treatment, and fixed in his principles, he entered the long parliament in 1640, a determined foe to the court, and by the vigour and abilities which he manifested, he was placed at the head of the Presbyterian party. His relationship with the earl of Strafford preventing him from taking a part against that nobleman, he carried up the impeachment of archbishop Laud. He was one of five members accused by the king of high treason in 1641, and the attempt at seizing them was the immediate cause of taking up arms. In the ensuing war the parliament gave him the command of a regiment, and appointed him lieutenant of Britol. Mr. Hollis, however, soon saw through the designs of the independent party, and with the view of frustrating them he endeavoured to promote a treaty with the king. At length he was obliged to escape to France to avoid a prosecution for high treason from the party with whom he had acted. By the interposition of his friends he was allowed to return in 1648, when he resumed his seat in parliament, and was one of the persons appointed to treat with the king in the Isle of Wight. He was not prepared to go to all the lengths of his party, and was again obliged to quit the country to ensure the safety of his person. He took up his abode in Brittany, where he continued till the year preceding the restoration, which event he had used all his influence to promote. On the restoration he was advanced to the peerage by the style of lord Holles of Isfield, in the county of Suffex. He was now employed by the court in various negotiations, but his attachment to the principles of liberty remained unabated, and when the politics of the reign tended to render the king absolute, he appeared as a leader in opposition. No man had a more disinterested love of his country than lord Holles, a proof of which was exhibited, when offered by parliament 5000*l.* as a reparation for the losses which he had sustained in the civil war: "I will not," says he, "receive a penny till the public debts are paid." He died in 1679, in the 82*d* year of his age. He was buried in Dorchester church, where a monument was raised by his great nephew John duke of Newcastle. Biog. Brit. Hume.

HOLLES, in *Geography*, the *Nisistiffet* of the Indians, a township of America, in Hillsborough county, New Hampshire, on the Massachusetts's line, incorporated in 1746; about 70 miles S.W. of Portsmouth, and containing 1557 inhabitants.

HOLLFELD, a town of Bavaria, in the bishopric of Bamberg, in the Wisent; 15 miles E. of Bamberg.

HOLLI, the Indian name for what the Spaniards call *ulli*; a resinous liquor, which flows spontaneously from the tree *bolquazbuyl*, or *chilli*. It is often mixed with chocolate in the making, in the proportion of one fourth part; it gives the chocolate in this case no very disagreeable flavour; and becomes a very powerful medicine in dysenteries. It is

usual, however, before the making it, to mix the cacao and bolli on an iron plate, and torrify them thoroughly together.

HOLLIS, THOMAS, in *Biography*, was born at London in April, 1720. Being designed for commercial life, he was sent, when about 14 years of age, to Amsterdam, for the purpose of learning the French and Dutch languages, and merchants' accounts. Soon after his return, in 1735, his father died, and as he was now heir to a large estate, it was resolved to complete his education on a liberal plan. With this view he was placed under the care of Dr. Ward, professor of rhetoric in Gresham college, with whom he studied the learned languages, and other branches of literature. In 1740 he took chambers in Lincoln's Inn as a law student, and probably with some view of following the profession, but though he lived there eight years, it does not appear that he applied himself, professedly, to the study of the law. He did not, however, waste his time in idle amusements and dissipation; he had already formed an acquaintance with persons eminent for their attachment to liberty; and had imbibed their principles, which strongly marked his character through life. Even when a boy at school, he was interested in the noble deeds of the heroes of antiquity, "I used," said he, "to rob nature of her rest to read Plutarch, honest Plutarch, and read again the lives of his heroes. To him, I owe, I willingly confess, the finest dispositions of my mind." In 1748 he set out on a tour upon the continent, and the journal which he kept while he was absent proves that he suffered nothing worthy of observation to escape his notice. In 1750 he made a second tour, and finding on his return that he could not gratify his wish of serving his country, by entering into parliament, without compliances which were contrary to his principles, he began to make a collection of books and medals for the purpose of preserving the memory of the champions of liberty; and, in general, for the service of science and art. It was also one of his leading objects to print, and present to his friends, books favourable to the popular principles of government. Milton and Algernon Sidney were the authors that attracted his principal admiration. He investigated with great minuteness the history of Milton and his works, and caused engravings to be made of his portrait taken at different periods. The particulars of Mr. Hollis's life are little more than a list of generous and public spirited actions, either for the relief and encouragement of individuals, or for the promotion of what he considered the most important interests of mankind. There were few useful and benevolent institutions of which he was not a member, and a liberal patron. The books which he published, or procured to be published, were "Wallis's Grammar of the English Language;" "Locke on Toleration and Government;" "Sydney on Government;" "Needham's Excellency of a free State;" "Neville's Plato Redivivus;" and "Staveley's Romish Horfeleach." He like wise caused several pamphlets from America to be reprinted at his own expence. He encouraged the printing of other works favourable to liberty, by taking large numbers of copies and distributing them as presents. His munificence in this respect contributed very much to extend the knowledge of English literature and English generosity through foreign countries. In 1770 he retired into the country, where he employed himself in improving his estate at Corcombe in Dorsetshire. He kept many workmen constantly employed in his service, to some of whom he was giving directions on New Year's day 1774, when he dropt down in a fit and immediately expired. Mr. Hollis, says one of his biographers, was of an athletic make, inclined to corpulence, which he counteracted by great abstemiousness of diet, and strong exercise. He allowed

allowed himself scarcely any of the indulgencies of a man of fortune, and opposed the growing luxury of the age, as well by his example as by his precepts. His particular sentiments with regard to religion were known to himself only. He joined no sect, and attended no place of worship, but his diary contains a multitude of proofs of his veneration and gratitude to the Supreme Being. He was, in every respect, an universal philanthropist, and it was said of him, "that in his death Liberty lost her champion, Humanity her treasurer, and Charity her steward." *Hollis Memoirs*, 2 vols. 4to. 1780.

HOLLISTON, in *Geography*, a township of America, the most southerly in Middlesex county, Massachusetts; 28 miles S. by W. of Bolton; incorporated in 1724, and named in honour of Thomas Hollis, esq., of London, and now containing 783 inhabitants.

HOLLMAN, SAMUEL CHRISTIAN, in *Biography*, was born at Stettin in 1696, where he received the elementary principles of a learned education. His maturer studies he pursued at Wittenburg, took his degree of M. A. in 1720, and for a short time he read lectures at Greifswald and Jena. In 1734 he was invited to be public professor of philosophy in the university of Gottingen, then lately founded, and upon the establishment of the society of the sciences he was the first regular member of the philosophical class. Here he continued his lectures till the year 1784, when he resigned the duties of his office. He died in 1787. The university of Gottingen was under vast obligations to this learned man, who with Haller contributed to diffuse through Germany a taste for natural philosophy and natural history. On these subjects he published several excellent papers in the transactions of the royal societies of Gottingen and London. He likewise distinguished himself by various elementary works and dissertations, which are enumerated in the *General Biography*, to which the reader is referred.

HOLLOA, in *Sea Language*, is an exclamation of answer to any person who calls to another to ask some question, or to give a particular order. It is also the first answer in hailing a ship at a distance.

HOLLOLA, in *Geography*, a town of Sweden, in the province of Tavastland; 30 miles E. of Tavasthus.

HOLLOW, in *Architecture*, a concave moulding, about a quadrant of a circle, by some called a *casement*, by others an *abacus*.

HOLLOW-quoins, in *Engineering*, are piers of stone or large bricks made on purpose behind each lock-gate of a canal, which are formed into a hollow from top to bottom to receive the rounded head of the lock-gates: in some instances the hollow-quin is formed of one piece of oak cut to the proper shape and fixed vertically against the wall, and even cast iron has been used, on some recent occasions, for forming the hollow-quin or hinge for the lock-gates of large canals, or the entrance basons to docks. See our article **CANAL**.

HOLLOW Roots, in *Botany and Gardening*. See **FUMARIA**.

HOLLOW Square, in *Military Language*, is a body of foot, drawn up with an empty space in the middle, for the colours, drums, and baggage; facing and covered by the pikes every way, to oppose the horse.

HOLLOW Tower, in *Fortification*, is a rounding made of the remainder of two brisures, to join the curtain to the orillon, where the small shot are played, that they may not be so much exposed to the view of the enemy.

HOLLOW-toothed Horse, in the *Manège*. See **SHELL-toothed**.

HOLLOWS, in *Mining*, denote the wastes, gobbins, or

old hollows in coal-pits, from whence the coals have been wrought or gotten. The old hollows in many coal works generate *Damps* (see that article), or foul air, which is very prejudicial to the works; and, in some instances, the waste coals in them are fired by the pyrites, dums, and other self-inflaming substances among them, if the air be not excluded from these hollows; as at Donithorpe colliery, in Derbyshire, and others near Dudley, in Staffordshire. See *Farey's Derbyshire Report*, vol. i.

HOLLOWNESS of TREES. This is one of the most mischievous distemperatures to which trees are subject. It is generally occasioned by the lopping of them in an improper manner, and leaving the wet to fall in upon them, especially on their heads. When this mischief is found out in its beginning, the only method is to cut the trunk off to the quick, sacrificing the whole hollow part; it is, in this case, to be cut off sloping, that the wet may run off from it. All soft woods are liable to this mischief, after the lopping, particularly the elm; and when it takes hold of any tree, it grows upon it daily, till the whole substance of the tree is at length eaten away, and only a coat of bark is left. The best way of preventing it in the elm, is never to cut off the head or top of the tree at all, but only to lop the side branches: these will yield a very large quantity, and the body of the tree will thrive the better for their being often cut off, and will be good timber at last. These tall elms sometimes grow hollow from another cause, that is, from the decay of some of the large roots; but the starving condition of its branches will shew this, though there be no external mark of it. This sort of hollowness always begins at the bottom of the tree. Blasted parts of the trees are to be cut away to the quick, in the same manner as the hollow ones, and the wounds will heal in the same manner.

HOLLS, in *Geography*, a lake of Norway, in the diocese of Aggerhuus; 70 miles N. of Christiania.

HOLLY, in *Botany and Gardening*. See **ILEX**.

The common holly is often found useful as a hedge plant. It is a plant which on good, dry, loamy soils, grows to a considerable size; but which on poor wet soils seldom becomes more than a low shrub. It has been recommended as making an impenetrable fence, and as bearing to be cropped with but little injury; and that sheep are capable of being fed in the winter with the croppings; while birds consume the berries. The bark, when fermented, and then washed from the woody fibres, constitutes the common bird-lime. And the beauty of its scarlet berries are asserted never to suffer from the severest of our winters. The wood is found excellent for veneering; being occasionally stained black in imitation of ebony. (See **MARQUETRY**.) It is useful for the handles of knives, as well as the cogs of mill-wheels. Provincially it is not unfrequently denominated *Hollin*.

A late writer contends, that "no plant makes so good a hedge as holly; if preserved with any attention in its infancy it will, in a few years, be impenetrable to man or beast. It often fails from being planted at an improper season; for there is not the least certainty of any success, except by planting about Midsummer. The plants should be from six to nine inches high, and well rooted: they should not be let into the sloping face of a bank, but on a level tablet left for that purpose, and well defended on both sides, to keep both sheep and hogs from it." This is one of those plants that may likewise be intermixed with the white thorn in the constituting of hedge fences, and which by its mixture renders them still more beautiful. See **FENCE** and **HEDGE**.

HOLLY,

HOLLY, *Knee*, in *Botany and Gardening*, and the *Materia Medica*. See **RUSCUS**.

HOLLY, *Sea*, the name by which some call the *eryngium* of botanical writers. See **ERYNGO**.

HOLLY-wood, *Petrified*, in *Natural History*. In the accounts which are given in the Philosophical Transactions, N^o 158, of the supposed petrifying qualities of the waters of Lough Neagh in Ireland, some of the pieces of petrified wood found in its banks are denominated *holly*; but apparently for no better reason, than because they were white: correct observations have never, we believe, detected holly or any other recent species of wood in the strata: the leaves and twigs of holly observed by Dr. Correa de Serra, on the coast of Lincolnshire, evidently belong to the recent or peat fossils, and not to those of the strata.

HOLLY-HOCK, in *Botany and Gardening*. See **ALCEA**.

HOLLYMOUNT, in *Geography*, a small post-town of the county of Mayo, province of Connaught, Ireland, situated on the river Robe. It is on the road from Dublin to Castlebar through Tuam, and is 107 miles W. by N. from Dublin, and 14 from Castlebar.

HOLM, **HULMUS**, signifies as much as *insula amnica*, a river island, according to Bede; or a plain, grassy ground, upon the water-side, or in the water, according to Camden.

Where any place is called by the name holm, or where this syllable is joined with any other in the name of a place, it signifies it to be surrounded with waters. As the *flatholmes*, the *stepholmes*, near Bristol. If the situation of the place be not near the water, it may signify a hilly place; for holm, in Saxon, also signifies a *hill*, or *cliff*.

HOLM, or *Holme*, in *Agriculture*, the common name of a low, flat, rich tract of land, which usually lies on the border of a large river. This sort of land is fit for almost any sort of culture, but particularly so for those of pasture, feeding, and hay. See **HOLM Land**.

HOLM Land, that description of rich ground which is met with on the sides of large streams of water. This is obviously a water-formed kind of land, being gradually constituted by time from the frequent depositions of the rivers or streams during the periods of their being covered by the floods proceeding from them. This is very clear from the circumstance of such sorts of land being uniformly found on the banks of such streams as have a slow, smooth course, and which are liable to be overflowed by them. Where such streams are usually discharged into larger and more expanded spaces of water, it is common to find the more valuable kinds of this sort of land. In some particular cases of this description of land, it is not unusual to find the soil approaching, in some measure, to that of a clayey quality; but which, when properly freed from water, and subjected to good cultivation, speedily becomes excellent land. Indeed all these sorts of lands are in general well suited either for the growth of grass or grain, mostly producing heavy crops of the latter as well as the former; but from their being in moil instances subject to be overflowed, they are probably more proper for being kept under the grass system.

HOLM Oak. See **QUERCUS**.

HOLM, in *Geography*, one of the smaller Orkney islands, one mile E. of Westra.—Also, a small island between Pomona and Hoy.—Also, a small island, two miles W. of Eda.—Also, a small island, on the coast of Essex, in a large bay. N. lat. 51° 53'. E. long. 1° 10'.—Also, a town of Sweden, in the province of Angermannland; 40 miles N.N.W. of Hernösand,

HOLM Kirk, a town of the island of Pomona; nine miles S.E. of Kirkwall.

HOLME. See **HOLM**.

HOLMES, *Flat and Steep*, in *Geography*, two small islands situated in the British channel, between Glamorganshire and Somersetshire. The former contains about 60 acres of land, and is distinguished for its light-house. Several pilots reside on it. The Steep Holmes is a small rocky island, the highest point of which rises 400 feet above the level of the sea. It is almost divested of vegetation, but is the resort of large flocks of sea fowls during the summer season. This solitary and inhospitable spot is said to have been a place of refuge to the ancient British historian, Gildas, who hoped thus to preserve his life from the marauding Picts and Scots. He afterwards retired to Glaslonbury.

HOLMES's Hole, a commodious and safe American harbour, in Duke's county, Massachusetts, on the N. side of Martha's Vineyard; 98 miles S.E. of Boston.

HOLMESTRAND, a town of Norway, in the province of Aggerhuus; 30 miles S. of Christiania. N. lat. 59° 30'. E. long. 10° 30'.

HOLMON, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 48'. E. long. 20° 37'.

HOLMSKIOLDIA, in *Botany*, was named by professor Retzius of Lund, in honour of a Danish nobleman, Theodore Holm, afterwards Holmskiöld, who wrote a treatise in Danish on *Anagallis*, in 1761, and a splendid folio in Latin and Danish on Fungi, explaining the structure of the *Clavaria* and some of their allies, published at Copenhagen in 1790. He was born in 1732 and died in 1794, according to Dryander's *Bibl. Banks*, v. 5. 287.—Retz. *Obs. fasc.* 6. 31. Willd. *Sp. Pl.* v. 3. 360. (Hastlingia; Sm. *Exot. Bot.* v. 2. 41. *Intr. to Bot.* 403. See **HASTINGIA**.)—Class and order, *Didymia Gymnospermia*. Nat. Ord. *Verticillatae*, Linn. *Labiatae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, very large, coloured, turbinate, gradually expanding into a wide bell-shaped limb, with five shallow, equal, unarmed lobes. *Cor.* of one petal; ringent, tubular; tube longer than the calyx, swelling upwards; upper lip shortest, ascending, cloven, obtuse; lower in three rounded lobes, the middle one largest, entire. *Stam.* Filaments four, thread-shaped, rather longer than the upper lip, two of them shorter than the rest; anthers incumbent, roundish, simple. *Pist.* Germen superior, four-cleft; style the size of the stamens and situated between them, its summit bent downward; stigma in two sharp lobes. *Peric.* none, except the faded, scariose, permanent calyx. *Seeds* four, naked, in the bottom of the calyx, somewhat obovate, rugged.

Ess. Ch. Calyx bell-shaped, dilated, much wider than the corolla, coloured, in five shallow, equal, unarmed lobes.

1. *H. sanguinea*. Retz. and Willd. as above. (Hastlingia coccinea; Sm. *Exot. Bot.* v. 2. 41. t. 80.)—Gathered by Koenig and by lieutenant-colonel Thomas Hardwicke, in vallies among the mountains of the north part of Bengal, flowering in February or March, and ripening seed in April. It is called by the people of the country *Gkurbulpabaria*, a name almost as difficult of pronunciation as *Holmskiöldia*, which we are told is spoken as if it were written *Holmsbulldia*, to the no small comfort of those who, like us, are forced to adopt it, in justice to its meritorious prototype, and those who have delighted to honour him. The original appellation of this new and curious genus, given by Koenig, *Hastlingia*, was retained in the Exotic Botany, because the writer of that work could have no suspicion of any one's having committed so great an error as to place this plant in the order

Angiospermia, its characters and affinity being so manifestly near *Phlomis* and *Moluccella* in the *Gymnospermia*. It was, therefore, concluded to be unpublished.

The only known species of this genus is a very handsome shrub, whose stem is smooth, roundish, with many opposite branches. *Leaves* opposite, on furrowed stalks, without stipulas, ovate, pointed, veiny, two or three inches long, slightly serrated, almost perfectly smooth, dotted on both sides, paler beneath. *Flowers* in terminal, loose, bracteated bunches, of a vivid scarlet. *Flower-stalks* downy. *Calyx* an inch wide, veiny, slightly downy, as richly coloured as the corolla, which is also pubescent, longer than the calyx, but much narrower, as in *Moluccella*. *Seeds* black.—This plant would be a great ornament to our stoves, and might probably succeed in a conservatory with less heat than tropical vegetables generally require.

What the worthy Retzius saw when he examined "a half-ripe capsule" of this shrub, in which he "manifestly observed several seeds, but could not absolutely judge whether it were unilocular (meaning unilocular) or not," we are utterly unable to imagine.

HOLO, in *Geography*, a town of Sweden, in Sudermanland; 24 miles S. W. of Stockholm.

HOLOCAUST, ὁλοκαυστος, formed from ὅλος, whole, and καίω, I consume with fire, a kind of sacrifice, wherein the whole offering is burnt or consumed by fire; as an acknowledgment that God, the Creator, Preserver, and Lord of all, was worthy of all honour and worship, and as a token of men's giving themselves entirely up to him. It is called also, in scripture, a burnt-offering.

Sacrifices of this sort are often mentioned by the Heathens as well as Jews; particularly by Xenophon, *Cyropæd.* lib. viii. p. 464. ed. Hutchins. 1738, who speaks of sacrificing holocausts of oxen to Jupiter, and of horses to the sun; and they appear to have been in use long before the institution of the other Jewish sacrifices by the law of Moses. Accordingly, we find this kind of sacrifice was offered by Noah and Abraham, and also by Job, and Jethro, the father-in-law of Moses. See Job, i. 5. chap. xlii. 8. Gen. xxii. 13. chap. viii. 20. On this account, the Jews, who would not allow the Gentiles to offer on their altar any other sacrifices peculiarly enjoined by the law of Moses, admitted them by the Jewish priests to offer holocausts; because these were a sort of sacrifices prior to the law, and common to all nations. During their subjection to the Romans, it was no uncommon thing for those Gentiles to offer sacrifices to the God of Israel at Jerusalem. Vide Philo. Opera. p. 801. E. Ed. Colon. Allobr. 1613. Tertullian. Apolog. § 26. p. 26 ed. Rigalt. 1675.

Holocausts were deemed by the Jews the most excellent of all their sacrifices. It is said, that this kind of sacrifice was in common use among the heathens, till Prometheus introduced the custom of burning only a part, and reserving the remainder for his own use.

HOLOGNE-AUX-PIERRES, in *Geography*, a town of France, in the department of the Ourte, and chief place of a canton, in the district of Liege. The place contains 678, and the canton 17,815 inhabitants, on a territory of 147½ kilometres, and 30 communes.

HOLOGRAPHUM, composed of ὅλος, all, and γραφω, I write, in the *Civil Law*, something written wholly in the hand-writing of the person who signs it.

The word is chiefly used in speaking of a testament, written wholly in the testator's own hand. See TESTAMENT.

The Romans did not approve of holographic testaments; and, though Valentinian authorized them by a novel, they are not used where the civil law is in full force.

HOLOKLUB, in *Geography*, a small island on the W. side of the gulf of Bothnia. N. lat. 60° 51'. E. long. 17° 7'.

HOLOMETER, composed of ὅλος, all, and μέτρον, I measure, a mathematical instrument serving universally for the taking of all sorts of measures, both on the earth and in the heavens.

The holometer is the same with what is otherwise denominated *pantometer*; which see.

HOLOMIN, in *Geography*, a small island of Scotland, near the W. coast of the island of Mull.

HOLOSERICA VESTIS, a garment entirely of silk, as the name imports, which was not used at Rome till the time of Heliogabalus.

HOLOSIE, in *Geography*, a town of Austrian Poland, in Galicia; 40 miles W. N. W. of Lemberg.

HOLOSTEMMA, in *Botany*, from ὅλος, entire, and στεμα, a crown, because the crown of the stamens is a simply annular undivided body. Brown Aselep. (from Tr. of the Wernerian Society, v. 1) p. 31.—Class and order, *Pentandria Digynia*. Nat. Ord. *Compositæ*, Linn. *Aspocinea*, Juss. *Astelepiadææ*, Brown.

Ess. Ch. Corolla somewhat wheel-shaped, five-cleft. Crown of the stamens inserted at the bottom of their tube, simple, annular, entire. Anthers terminated by a membrane; masses of pollen pendulous, compressed, attached by their slender summits. Stigma pointless. Follicles swelling, smooth. Seeds with a hairy crown.

The only species indicated by the author is the *Alukodien*, Rheede Hort. Malab. v. 9. t. 7, found in the East Indies. This is a twining smooth shrub. The leaves are opposite (erroneously drawn alternate in the figure), stalked, crossing each other in pairs, heart-shaped, three or four inches long, entire, soft, smooth, milky, but not acrid. *Flowers* inodorous, in sessile axillary umbels, large and handsome, variegated with green and white, streaked with purplish red. *Follicles* three or four inches long, half-ovate, pointed, filled with innumerable imbricated seeds.

HOLOSTEUM, has been supposed by some authors to have been derived from ὅλος, the whole, and ὀστέον, bony, thus, by antiphrasis, alluding to its extreme delicacy and tenderness of its structure. An attentive perusal of Dioscorides seems rather to favour a different explanation, for he speaks of his ὀστεον as a consolidating herb, which its name, from ὀστέον, or ὀστέον, entire, sane, or perfect, might possibly imply. Linn. Gen. 42. Schreb. 57. Willd. Sp. Pl. v. 1. 488. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. v. 1. 161. Juss. 299 Lamarck. Dict. v. 3. 135. Illustr. t. 51. Gærtn. t. 130.—Class and order, *Triandria Trigynia*. Nat. Ord. *Caryophylli*, Linn. *Caryophyllææ*, Juss.

Gen. Ch. Cal. Perianth of five, ovate, permanent leaves. Cor. Petals five, unequally jagged, obtuse, all equal in length. Stam. Filaments three, thread-shaped, shorter than the corolla; anthers roundish. Pist. Germen nearly round; styles three, thread-shaped; stigmas rather obtuse. Peric. Capsule of one cell, somewhat cylindrical, gaping at the top. Seeds six, or more, roundish.

Ess. Ch. Calyx five-leaved. Corolla of five unequally-jagged petals. Capsule nearly cylindrical, bursting at the top.

Obs. The petals of *Holosteum* are described by authors in general as bipartite, or deeply cloven, and sometimes trifid; but Dr. Smith has suggested (in his *Prodrômus Floræ Græcæ*, v. 1. 303.), that the petals *erecta*, if constant to this genus, as he suspects they are, may afford an excellent essential mark. Schreber has observed, that in *Holosteum umbellatum* the petals are doubly or triply toothed, and in

succu-

fucculentum they are described as subtrifid. In *cordatum* we find them sometimes slightly emarginate, sometimes entire, in the same flower. In Swartz's *diandrum* they are said to be deeply divided.

1. *H. cordatum*. Linn. Sp. Pl. 130. (Alfina americana, nummularie folio; Herm. Parad. Batav. t. 11.)—Leaves nearly heart-shaped. Stipulas four on each side.—Native of Jamaica and Surinam.—Stems decumbent, creeping, roughish at the lower part. Leaves opposite, roundly cordate, smooth, almost sessile. Stipulas membranaceous. Peduncles lateral, elongated, ascending, about seven-flowered, the partial stalks falling with the fruit when ripe.

2. *H. diandrum*. Willd. n. 2. Swartz. Prod. 27. Ic. t. 7.—Stems procumbent, rather rigid. Leaves roundish. Flowers diandrous. An inhabitant of Jamaica.—Radicles capillary, whitish. Stem much branched, straight, smooth. Leaves opposite, entire. Stipulas hairy, at the base of the flower-stalks. Capsule roundish, or slightly triangular.—Professor Swartz remarks that this is distinct from the last species, being altogether a much smaller plant; but upon comparing his plate with the Linnæan specimen of *H. cordatum*, it appears that the latter is extremely variable in size, and therefore this circumstance is not sufficient to make them distinct species. Neither are the diandrous flowers a proper distinctive mark, because *H. umbellatum* frequently varies in having from three to ten stamens.—We, therefore, only adopt this species on the authority of Swartz. The petals of *H. cordatum* are often as deeply divided as those of *diandrum* are represented.

3. *H. fucculentum*. Linn. Sp. Pl. 130. Amœn. Acad. v. 3. 21.—“Leaves elliptical, fleshy.”—Native of New York.—Flowers white; petals subtrifid, smaller than the calyx.

4. *H. bifutum*. Linn. Sp. Pl. 130. Amœn. Acad. v. 3. 21.—“Leaves orbicular, hairy.”—A native of Malabar.—There are no specimens either of this or the last species in the Linnæan Herbarium, nor are they any where figured.

5. *H. umbellatum*. Linn. Sp. Pl. 130. Engl. Bot. t. 27.—“Flowers in umbels.”—This is rather a scarce plant, found on old walls, flowering early in the spring.—It was first detected in England by Mr. Pitchford in the year 1765, on walls in the neighbourhood of Norwich.—The plant is in general smooth, somewhat glaucous. Stem branching at the base, towards the top hairy and viscid. Leaves opposite, ovate, acute. Umbel simple, terminal. Peduncles bracteated, divaricated when the fruit is ripe. Flowers white or bluish-coloured. Capsule six-toothed. Stamens varying from three to ten in number.

This is the only British species of *Holothium*. It approaches very closely in habit to *Cerastium*, and was placed in that genus by Mr. Hudson; but its petals being unequally jagged, and not bifid, warrant its continuance in *Holothium*.

HOLOTHURIA, in *Zoology*, a Linnæan genus of the Mollusca tribe of worms, the body of which is detached, cylindrical, thick, naked, open at the extremity, and the mouth surrounded by fleshy tentacula or feelers.

This character associates in the same family a number of animals so different in form, that it appears scarcely possible to admit the genus without some further modification. It is true that all the species referred to it by Linnæus and Gmelin are not described with equal accuracy by their respective observers, and this consideration should induce us to speak with caution as to the propriety of reducing some particular kinds to the new genera proposed by subsequent authorities. This is not, however, the case with all; many have been examined in their native element, and in a living state with unquestionable care, and their organization ex-

plained in a satisfactory manner; upon these, therefore, we are enabled to pronounce an opinion, and confining our attention to these only we cannot hesitate to believe that the Linnæan holothuriæ are divisible in a natural arrangement into three, if not a greater number, of distinct genera.

The last edition of the “*Systema Naturæ*” contains altogether twenty-three supposed species of the holothuria, but it is to be observed that Gmelin himself affixes some mark of doubt as to the identity of the true genus to which certain kinds belong; and this not without reason, since it is clear their essential character cannot be reconciled with the natural character of the holothuria tribe in general.

Perhaps Linnæus, in the establishment of his genus holothuria, rejected the ideas of Forsskal without sufficient consideration. Forsskal, we find from the result of his own observations on the vermes found in the Arabian seas, conceived he had discovered, among others, two natural families of these marine bodies, and proposed for their reception the institution of two new genera, to which he applied the significant appellatives of priapus and siltularia; these Linnæus conigned to his genus holothuria, and in consequence most probably of his example those genera have never been adopted.

Again, the thalia or thalis genus, suggested by Brown, is consolidated by Linnæus with the holothuria. It is probable we may not at present so clearly understand the thalis tribe as to be enabled to form a very positive conclusion as to its essential characters, though we may, nevertheless, observe, that it does not seem to appertain to the holothuria tribe, being more closely allied to that of salpa. The observations of Bose are calculated to prove the animals of the thalis kind to be truly salpæ, and which, if accurate, must occasion the removal of some Gmelinian species of the holothuria to that genus, as the thalia, caudata, and denudata. Lamarck, however, conceives them equally distinct from the holothuriæ and the salpæ, and for this reason re-established the genus thalis as originally proposed by Brown.

As to the propriety of adopting the genus physalidis there cannot, we imagine, be any difference of opinion; it is evidently distinct from the holothuria.

And, lastly, we should mention the genus velella, one of those newly instituted by the French naturalists, and which tends to unite the holothuriæ with the medusæ by forming an intermediate link between them, and still connecting both. The genus contains two species, namely, the *Velella nutica* referred by the Linnæan classification to the medusa tribe under the specific name of *velella*, and the holothuria *tentaculata* of Forsskal.

Having pointed out the number of new genera into which the Linnæan holothuriæ are divided by later naturalists, it will be proper to state in what material particulars their essential characters differ from each.

The true holothuriæ have the body detached, cylindrical, thick, very contractile, with a coriaceous skin, and having at the extremity a mouth armed with five calcareous teeth, and a radiation of ramose or pinnate tentacula. The genus thalis has the body detached, gelatinous, oval, or oblong, compressed at the sides, and the back either destitute of the crest, or furnished only with a very short one, and placed near one extremity; no tentacula under the belly. In the physalidis or physalia, the body is detached, membranaceous, or gelatinous, oval, compressed at the sides, the back furnished with a crest, and the under part of the belly with a great number of diversely formed articulated tentacula of different lengths, apparently suckers. The body of the velella is detached, elliptic, cartilaginous within, the exterior part gelatinous, and having upon the back an elevated

HOLOTHURIA.

truncated crest placed obliquely; the mouth beneath and situated in the centre. According to the above characters the Gmelinian species, *elegans*, *pentactes*, and *priapus*: *forcipata* of O. Fabricius; *zonaria* of Pallas; and *maxima* of Forskal are all of the holothuria genus. The three kinds described by Brown, *thalia*, *caudata*, and *denudata*, constitute the genus *thalis*. The Linnæan species *physalis* (*Physalis pelagica* of Osbeck) is the only example of the genus *physalidis*. And the holothuria tentacula of Forskal is the *velella*.

These animals are of the marine kind, and in general supposed to be viviparous; they live on small fishes, worms, seltaceous bodies, &c. and are usually distinguished by the splendour of their colours.

Species.

ELEGANS. With twenty branched tentacula; body papillose, reddish above, beneath white. Müll. Stroem. Sondm. &c.

Inhabits the seas of Denmark and Norway; the length from eight to eleven inches; body varied with red and white; papillæ pointed, and distant, those on the back disposed in six series; tentacula fleshy, and white, the tip furnished with a tuft of fibres which are tuberculated within. Squirts out water like a siphon from the lower orifice.

FRONDOSA. Tentacula frondose; body smooth. O. Fabr.

The body ovate; beneath flat, with ten retractile tentacula; the posterior part conic, perforated at the end. Found in the northern seas.

PHANTAPUS. Tentacula branched; posterior part of the body attenuated; beneath rough with dots. Müll. *Holothuria phantapus*, Linn. *Pudendum missum*, &c. Aldr. Gefn. &c.

Native of the Norway and Mediterranean seas. The body is ovate, beneath flat; behind conic, with the tip perforated, tentacula 10, and retractile.

TREMULA. Tentacula fasciculate; body covered above with numerous sub-conic papillæ, beneath with cylindrical ones. *Holothuria tremula*, Linn. *Holothuria tubulosa*, Gmel. *Holothurius Rond-letii*, Jonst. *Epipetro zoographi simile*, Aldr. *Genitale marinum*, Bell. *Pudendum regale piscatorium*, Column. *Mentula marina*, Plancus. *Fistularia*, Forsk.

Found in the Mediterranean and Adriatic seas. Length one foot; the body cylindrical when extended, and oblong when contracted, generally a beautiful mixture of red and white, but it varies in colour; the cylindrical tubes beneath the body act as suckers, by means of which it adheres to the rocks.

PHYSALIS. Cirri filiform, pendulous, and of different shapes. Linn. *Urtica marina*, Sloane. *Arctus cristata*, &c. Brown. *Physalis pelagica*, Osbeck.

Inhabits the Atlantic seas, where it is often seen floating in calm weather on the surface of the water, and is known to mariners by the name of the Portuguese man of war; the form ovate, somewhat triangular, and hyaline; back acute and dusky green; anterior part reddish; snout spiral and reddish; tentacula numerous, unequal, some round, thick and short; some capillary, with a globular yellow tip, others longer and filiform.

THALIA. Crest compressed; lateral lines entire. Gmel. *Thalia oblonga*, &c. Brown. Jam.

Native of the American and West India seas.

CAUDATA. Tailed; crest compressed; lateral lines interrupted. Gmel. *Thalia oblonga, caudata*, &c. Brown.

Inhabits the American seas.

DENUDATA. Destitute of crest and tail. Gmel. *Thalia*, &c. Brown.

The body of this species is oblong, rounded, and gradually tapering to both extremities; the length from three to four inches, diameter one inch; transparent, and hollow; the anterior opening triangular, the other rounded. Native of the American seas.

PENTACTES. With ten ramified tentacula; body with five rows of papillæ. Müll. *Cucumis marinus*, Gefn. *Cucumer marinus*, Vandell. *Aphrodita quarta*, Hill. *Brimbatas*, Olaff. *Fleurilarde*, Diqueemar.

Length six inches; the body greenish-brown; tentacula elegantly ramified, of a yellow and silver colour; the filaments with small retractile filaments issuing from them. Inhabits the seas of Europe.

PAPILLOSA. With ten frondose tentacula; body ovate, and covered every where with papillæ. Müll. Inhabits the bays of the North seas.

SPALLANZANI. With ninety-six filamentous tentacula. Spallanz. Native of the Mediterranean.

PRIAPUS. Mouth with fleshy papillæ; body with annular striæ, and longitudinal ones on the gland. O. Fabr. *Priapus*, Linn.

Inhabits the Indian and Mediterranean seas; the length six inches. One half of the body cylindrical, with numerous annular striæ, and terminated by the mouth; the other half obovate and gland-shaped, with twenty-four longitudinal parallel elevated, distant, rough striæ; the aperture concave, and surrounded by an excavated annular stria, and furnished within with numerous recurved spines.

SQUAMATA. With eight slightly branched tentacula; body rough above, beneath soft. O. Fabr., &c. *Aëniis squamata*, Nov. Act. Nat. Cur. *Aëniis squamata*, Pallas.

Native of the Norway and Greenland seas; the species varies in size, and adheres firmly to rocks.

PENICILLUS. With eight branched tentacula; body bony, and five-sided. Müll.

Lives in the mud in the deeps of the Northern seas; the body is immoveable, ventricose, smooth, white, with a brown collar black at the edges, and a parallel granulated pale ring behind the tentacula, which are carinated and blackish-yellow.

FUSUS. With ten tentacula; body fusiform and downy. Müll.

Like the last, inhabits the mud in the deeps of the Northern seas. The body is cinereous, rough with minute scales, and beset with very short fibres; protruding a cup-shaped hollow body, furnished beneath with a neck, and dilated above into an orb, perforated in the middle, with a black foramen, tentacula denticulated at the sides.

INHÆRENS. Body brown, with longitudinal whitish stripes, and twelve red tentacula. H. *Inhærens*, Müll. *Fistularia reciprocans*, Forsk.

Native of the North and Red seas; the body long, narrow, pellucid, and covered with innumerable viscid papillæ, by means of which it sticks to whatever it touches; tentacula fleshy, lanceolate, and denticulated, or slightly branched each side.

LÆVIS. Elongated, with white tentacula; body with five rows of lines and dots. O. Fabr.

Inhabits the Greenland seas, residing among rocks, and frequently hiding itself in the clay, from whence each alternate tentacula is protruded, while the rest are contracted; the body is soft, smooth, whitish and pellucid; the length from one to six inches; tentacula whitish, soft, and eight-cleft at the tip.

MINUTA.

MINUTA. Oblong, with twelve tentacula; body with five rows of warts. O. Fabr.

Found in the same seas as the latter, in sandy bottoms, and moves very slowly by means of its extended papillæ. The body four lines in length, glabrous, sub-membranaceous, whitish, and rarely red; each row of papillæ consisting of ten; tentacula yellowish and six-cleft at the tip.

FORCIPATA. Ventricose, both ends narrow and conic; the anterior one forcipated. O. Fabr.

Length five inches; the body soft, lubricous, with a thin skin covered with innumerable slightly raised dots; forceps rigid, ochrey yellow, with curved fangs. Inhabits clayey bottoms in the Greenland seas, and is often devoured by the sea scorpion, *Cottus scorpio*.

ZONARIA. Oblong, depressed, with a flesh-coloured sheath, and a whitish hyaline pouch; body encircled with five yellow zones. Pallas.

Mouth transverse, with prominent gaping lips; inhabits the seas about Antigua.

VITTATA. Body soft, lax, with white bands dotted with brown; tentacula linear-lanceolate, and toothed at the sides. Forsk.

The body with five white stripes dotted with black, and alternate narrow brown ones dotted with white; tentacula twelve, brown in the middle, and at the sides paler. Inhabits the Red sea, among zoileræ, and adheres to the hands by means of its viscid papillæ; length a span and a half.

MAXIMA. Body rigid and nearly square; above convex, beneath flat, and edged with white; tentacula filiform, and cut like petals at the tip. *Fistularia maxima*, Forsk.

The body about a foot in length, hard, and rough with papillæ; tentacula grey hyaline. Native of the Red sea.

IMPATIENS. Body rigid and cinereous; tentacula twenty, filiform, seven-cleft, and denticulated at the tip. *Fistularia impatiens*, Forsk.

Inhabits the shores of the Red sea under stones, or in the pores of *Spongia officinalis*. The body hardish, cinereous, varied with spots and bands, and rough with hemispherical warts, whitish in the middle, and contiguous; tentacula hyaline dotted with black, and obtusely toothed.

NUDA. Orbicular, blue, without crest; tentacula of the disk naked; of the rays beset with three rows of glands. Gmel. *Holothuria denudata*, Forsk.

About an inch in diameter; the body whitish in the disk above, and radiated with concentric striæ, the margin and border blue; tentacula filiform and blueish hyaline. Closely allied to the medusa.

SPIRANS. Oval, blue, with oblique divided crest or veil, and numerous tentacula beneath. Gmel. Forsk.

Native of the Mediterranean; the body thin, convex, and terminating in a whitish central protuberance above, blue with brown border; crest two-parted and striated; tentacula filiform. Length two inches.

TENTACULATA. Oval; tentacula surrounding the mouth white. Forsk. &c. An ambiguous species.

HOLOWNE, in *Geography*, a town of Poland, in the palatinate of Chelm; 28 miles N.E. of Chelm.

HOLQUAHVILT, in *Botany*, a name by which some authors have called the tree which produces the Jesuit's bark.

HOLRAS, in *Geography*, a town of Norway, in the diocese of Christianland; 12 miles S.W. of Christianland.

HOLRU, a town of Abyssinia; 65 miles S. of Miné.

HOLSANOE', a small island in the N. sea, near the coast of Norway. N. lat. 60° 32'.

HOLSMUNSDEN, or **HOLTZMUNDEN**, a town of the

principality of Wolfenbittel, on the Wefer; 21 miles W. of Eimbeck.

HOLSOM. A ship is said to be holsom at sea, when she will hull, try, and ride well, without rolling or labouring.

HOLSTABROC, in *Geography*, a town of Denmark, in North Jutland, situated on a river, which runs into the North sea. The trade of the inhabitants chiefly consists in corn, oxen, and horses; 24 miles W. of Wiborg. N. lat. 56° 22'. E. long. 9° 38'.

HOLSTEIN, DUCHY OF, a country of Germany, in the circle of Lower Saxony. Including the lordship of Pinneberg, it is bounded on the N. by the duchy of Sleswic and the Baltic, on the E. by the Baltic, on the S. by the duchy of Lauenberg, the territories of Lubeck and Hamburg, and the Elbe; and on the W. by the Elbe and the German sea. It is about 70 miles long from E. to W., and 48 broad from N. to S. Subject to frequent storms and consequent inundations from its situation between the Baltic and the German sea, its inhabitants are put to great expence in raising dykes, particularly in the districts bordering on the German sea and the Elbe. These districts consist of excellent marsh land, which produce wheat, barley, oats, beans, peas, and rape-seed in great plenty. The meadows and pastures feed great numbers of cattle. The other parts of the country are still more fertile.

Holstein is divided into four provinces, *viz.* Holstein Proper, Stormar, Ditmarsen, and Wagria; the three first of which were formerly called "Nordalbingia," or "Saxony beyond the Elbe." The Saxons of this country were a free people, till Charlemagne subdued them, and removed 10,000 families into Brabant, Flanders, and Holland. By a treaty between this sovereign and the king of Denmark, the river Eider was fixed as a common boundary of the two countries. The country on the S. of the river was called the Marche, and a marggrave was appointed to defend it. Holstein Proper and Stormar were erected into a county by Lotlario, duke of Saxony, in 1106, in favour of the count of Scauenburg; and his son Adolphus II. incorporated Wagria with Holstein, and peopled the territory with strangers from Holland and Westphalia. The territories were afterwards divided into separate principalities; and one of the princes who reigned here obtained from the king of Denmark the investiture of Sleswick. When this branch became extinct, and the people elected Christian I. king of Denmark, he became duke of Sleswick, and count of Holstein, which was soon afterwards erected into a duchy. His posterity reigned here as well as in Denmark. In 1720 the reigning prince of Holstein Gottorp, founded by the second son of Frederick I., was entirely dispossessed of his dominions. This prince had espoused Ann, the eldest daughter of Peter I. emperor of Russia. In 1743 his son, Charles Ulric was, by his mother's sister, Elizabeth, empress of Russia, declared grand duke of Russia. The king of Denmark, as duke of Holstein Gluckstadt, had formerly a seat and voice in the diet of the empire in the college of princes; and the emperor or empress of Russia possessed the same prerogatives for Holstein Gottorp. To the king of Denmark it belonged to appoint a governor over his part of Holstein, whose usual residence was Gluckstadt, whilst the regency court for Russian Holstein was held at Kiel. The principal trading towns are Altona, Gluckstadt, and Kiel. The exports of Holstein are wheat, barley, malt, starch, buck-wheat, peas, beans, rape-seed, horned cattle, sheep, rams, swine, horses, poultry, butter, cheese, venison, and fish. Lord Moltsworth observes, that Holstein very much resembles

resembles England; and another traveller has remarked, that the inhabitants are in their persons very like the English. Hence it has been inferred, that the English nation came first from this lower circle of Saxony; and in confirmation of this conjecture, it is alleged, that there is an ancient town near it, called Landen, and an island called Angles; which gave occasion to call our Britannia, Anglia. This remark is confirmed by the most diligent inquirers into this subject, who place the country of our Saxon ancestors in the Cimbric Chersonese, in the tracts of land since known by the names of Jutland, Angelen, and Holstein.

HOLSTON, a river of America, being a branch of the Tennessee, which rises in Virginia, and joins the Tennessee, 22 miles below Knoxville. At that town it is 300 yards wide, and in a course of about 200 miles in length it receives several considerable rivers and smaller streams. It is navigable for boats of 25 tons upwards of 100 miles, to the mouth of the N. Fork, where iron-works have been erected upon a large scale.—Also, a settlement on this river, in the state of Tennessee, containing, in 1790, 28,649 inhabitants. The land is generally fertile, and being situated between two mountains, it seldom suffers for want of rain. It abounds with iron ore. A capital furnace and forge have lately been erected in Holston, near the Virginia line, a bloomery below the mouth of Watawga, and another 25 miles above the mouth of the French Broad. There are several lead mines in the settlement, and one particularly on the French Broad, that produces 75 per cent. pure lead. Merse.

HOLSTENIUS, or **HOLSTEIN**, **LUKE**, in *Biography*, was born at Hamburg in 1596. Having received a liberal education in his own country he went to Paris, where he acquired a high reputation for learning, but was converted from the principles of Lutheranism, in which he had been brought up, to those of Popery. He went from Paris to Rome, where he obtained the patronage of cardinal Francis Barberini, and through his means received distinguished marks of favour from the popes Urban VIII., Innocent X., and Alexander VII. By the first he was made canon of St. Peter's; by the second librarian of the Vatican; and by Alexander VII. he was sent to Inspruck, where he received from queen Christina of Sweden her formal profession of the Christian faith. He died at Rome in the year 1661, leaving behind him a high character for deep learning, a sound and penetrating judgment, and a fine critical taste. He was editor of a number of very learned works which he illustrated with notes and dissertations; and he left behind him much valuable matter, which was given to the public after his death, by his friends, in their editions of authors, or in different collections. Among his other pieces was "The Life of Pythagoras, by Porphyry," in Greek and Latin, with a curious dissertation on the life and writings of Porphyry, and observations on the life of Pythagoras. Moreri.

HOLSTER, a café for a horseman's pistol.

HOLSWORTHY, in *Geography*. See **HOLDSWORTHY**.

HOLT, when it occurs at the beginning or end of a word, signifies that it is, or hath been woody, from the Saxon *holt*, a wood, or sometimes possibly from the Saxon *hol*, hollow. Johnson.

HOLT, *Sir JOHN*, an eminent lawyer and judge, son of *Sir John Holt*, serjeant at law, was born at Thame, in Oxfordshire, in 1642. He received the first principles of learning at Abingdon, of which town his father was at that time recorder: he afterwards went to Oriel college, Oxford, and from thence was entered a student at Gray's Inn. He soon became distinguished as a barrister, and in the reign of James II. he was made recorder of London, soon after which

he was called to the degree of a serjeant of the law. By refusing to give assistance to the arbitrary measures of the king, he was removed from the recordership of the city, but he retired with the approbation of an honest mind, and the regrets of the people, of whose cause he was always the advocate in spite of the authority and influence of the court. His principles were too well known for him to be forgotten in times of emergency, and he was chosen member of the convention parliament in 1688, and he was appointed one of the managers for the commons at the conferences held concerning the vacancy of the throne. In 1689 he was raised to the dignity of lord chief justice of the king's bench, and admitted to the honour of privy counsellor. He refused the post of chancellor offered him at the death of lord Somers, and continued as chief justice till his death in 1709. He is memorable among the English judges for a thorough knowledge of the law, joined to an invincible firmness and resolution in supporting its authority. He held in contempt the assumed powers of a house of commons, when those powers were evidently hostile to the common law of the land. He was the intrepid assertor of the rights and liberties of the subject, and was remarkably jealous of the interference of the military power in the execution of the laws: of which he gave a very signal proof when applied to sanction, by the presence of one of his people, the proceedings of the military sent to quell a riot excited by the infamous practice of crimping. The chief justice asked the officer what he intended to do if the populace refused to disperse, he replied, "we have orders to fire upon them:" "Have you so?" said the judge, "then observe, if one man is killed, I will take care that you and every soldier of your party shall be hanged. Sir, acquaint those who sent you, that no officer of mine shall attend soldiers, and let them know, likewise, that the laws of this land are not to be executed by the sword. These things belong to the civil power, and you have nothing to do with them." Such patriotic and virtuous conduct as this chief justice ever manifested, has not frequently been found in persons filling that high office. Few instances, indeed, have been found, in which judges have not acted the upright and honourable part in all causes of individuals brought before them; they have no motive to act otherwise: but the inflexible integrity of a judge is brought to the test when great political questions are to be decided: when one of the people, who is but as dust in the balance, is about to be borne down by a whole branch of the legislature, in such a case lord chief justice Holt was tried, and his decision has insured for him an undying immortality. *British Biog.*

HOLT, in *Geography*, a market town and parish in the hundred to which it gives name, in the county of Norfolk, England, is pleasantly situated on an eminence, 121 miles distant from London. Great part of the town was destroyed by fire in the year 1708, since which time many good houses have been erected. The enumeration under the late act of parliament was 215 houses, and 1004 inhabitants. The quarter-sessions of the peace are holden here, by adjournment from the city of Norwich. The sessions-house, which is a handsome building, is occasionally used for holding subscription assemblies. A considerable free-school was founded here, in the year 1556, by *Sir Thomas Gresham*, who was a native of this town, and whose memory is perpetuated by the building of the royal exchange, London. The school is well endowed for 30 scholars, and has annexed to it a scholarship and fellowship in Sydney college, Cambridge. The patronage and government of the school are, by the appointment of the founder, vested for ever in the company of fishmongers of London. Two fairs are annually held here; and

and a weekly market on Saturday. Blomefield's History and Antiquities of Norfolk.

HOLT, a township and chapelry in the parish of Greford, and hundred of Bromfield, Denbighshire, Wales, is seated on the banks of the river Dee, and was formerly a market town. At this place the river separates England from Wales, the county of Chester being on one side, and that of Denbigh on the other. These are united by a bridge of 10 arches, which is said to have been built in the year 1345. On the banks of the river formerly stood a strong castle, which is now nearly levelled to the ground. It was garrisoned for Charles I. in 1643, but, with other fortresses in this part of the country, was taken by the parliamentary forces. The inhabitants of Holt, Denbigh, and Ruthin, jointly send one member to parliament. In 1801 this township contained 161 houses and 804 inhabitants. Pennant's Tour in Wales, vol. i. 4to.

HOLT, a town of Norway, in the diocese of Christianfand; 32 miles N.N.E. of Christianfand.—Also, a town of Germany, in the duchy of Cleves; 27 miles S.E. of Cleves. N. lat. 51° 39'. E. long. 6° 26'.

HOLT, a village of England, in the county of Wilts, seven miles E. of Bath; it has a medicinal spring.

HOLT, in *Rural Economy*, the name of a morbid affection of the feet of different domestic animals. The hoof and feet in this case should be carefully examined, and the cause ascertained.

HOLT-waters. These have been found by experience to be of admirable efficacy in all scorbutic and scrophulous cases. An account of some very remarkable cures performed by them in these cases, was printed several years ago; and though known to be fact in the place, was disbelieved by almost every body beside.

Mr. Lewis, formerly minister of the place, confirms their efficacy from his own observation; and observes that they are of an attenuating, astringent, and drying nature. The first of these properties they possess in common with all waters which dilute, attenuate, and fit the juices for passing the proper vessels; their astringency they owe to the alum and iron which they contain; and their drying, absorbing, and healing qualities are probably owing to a quantity of sulphur, and a fine light ochre, which they are impregnated with. Phil. Trans. N° 403.

HOLT'S Creek, in *Geography*, a river of America, in the state of Kentucky, which runs into the river Kentucky, N. lat. 38° 37'. W. long. 84° 18'.

HOLTALLEN, a town of Norway, in the diocese of Drontheim; 54 miles S. of Drontheim.

HOLTEN, a town of Norway, in the government of Aggerhuus, remarkable for its church, which is cut out of a rock; it is very ancient, and supposed, by Olaus Wormius, to have been an heathen temple; 15 miles N.W. of Tongfberg.

HOLTZBAUER, in *Biography*, in 1772 maestro di cappella to the elector palatine at Manheim, when his electoral highness had the best instrumental band in Europe, and operas composed expressly for his theatre by the greatest masters of the time. Holtzbauer, who had been in Italy, was not only an excellent composer of symphonies on the model of the elder Stanitz, but the opera singing-master. The Danzi, afterwards Madame Le Brun, and the Alleganti, were his scholars.

HOLTZBOGN, an excellent performer on the violin in the service of the elector of Bavaria, in 1772. He was a scholar of Tartini, had a great hand, a clear tone, and more fire than was usual in performers of the Tartini school, which was rather remarkable for delicacy, expression, and high-

finishing, than for spirit and variety. Holtzbogn wrote well for his instrument, and we heard him play a very masterly concerto of his own composition.

HOLTZHAUSEN, in *Geography*, a town of Germany, in the bishopric of Munster; 8 miles N.W. of Munster.

HOLTZKIRCHEN, a town of Bavaria; 18 miles S.S.E. of Munich.

HOLUAN, **HOLWAN**, or *Hulwan*, a town of the Arabian Irak; 110 miles N.N.E. of Bagdad. N. lat. 34° 50'. E. long. 44° 54'.

HOLUAN, a town of Egypt, on the right bank of the Nile; 12 miles S. of Cairo.

HOLUM, or **HOALUM**, or *Hola*, a town of Iceland, at the mouth of a small river, the see of a bishop, founded about the year 1106, and since improved by Christiern III. Here are a school, cathedral, and printing office. N. lat. 65° 43'. W. long. 15°.

HOLWELL, **JOHN ZEPHANIAH**, in *Biography*, was born about the year 1709. He went out in early life as a writer in the service of the English East India company, and by his assiduity he gradually rose in office till the year 1756, when he was appointed second in council at Fort William. At this period, an offence having been given to the nabob of Bengal, induced him to lay siege to that fort with a powerful army. The governor fled, and the command devolved on Mr. Holwell, who, with a few men, was resolved to defend the place to the last extremity. He was, however, obliged to surrender, but on the promise of security to their persons, in violation of which he and his men were shut up in a small room, since denominated the *black-hole* of Calcutta, which see. Of the survivors who escaped this infernal charnel-house, Mr. Holwell was one, who became the historian of the sufferings which were endured on that occasion; and when Calcutta was brought under the British dominion he raised a monument on the spot, at his own expence, to the memory of the unhappy victims, and to record the infamy of him who could perpetrate so black a deed. On his return to England Mr. Holwell wrote various tracts upon the concerns of the India company, and he entered deeply into the history and mythology of the natives of Hindoostan, concerning which he gave the public some curious information in a work entitled "Interesting historical Events relative to the Provinces of Bengal and the Empire of Indostan." In this he gives a very particular account of the Gentoo Shaftah, which he represents as the oldest religious institute extant, and the genuine source of the mythology and cosmogony of the Egyptians, Greeks, and Romans. He published another work, in 1788, connected with this subject, entitled "Dissertations on the Origin, Nature, and Pursuits of Intelligent Beings," &c. The idea that men are fallen angels, condemned to suffer in human bodies for the sins of their former state, is the leading principle of this production. Mr. Holwell was author of several other pieces, one on inoculation for the small-pox in the East Indies, with the mode of treating the disease in that part of the world, and one entitled "A new Experiment for the Prevention of Crimes," which chiefly consists in proposed premiums for the practice of virtue. He died in 1798, much respected by all who knew him. His works display a benevolent heart, and a liberal way of thinking. There is still living, at a very advanced age, in the neighbourhood of London, Captain Mills, one of the fellow sufferers with Mr. Holwell in the *black-hole* of Calcutta.

HOLY, *haliz*, Saxon, or *heyleigh*, Dutch, from *hal*, *healby*, or in a state of salvation. The term is variously applied; sometimes in the same sense with good, or religious, or sacred, and sometimes for hallowed, or appropriated to religious

religious or sacred purposes. Thus, it is used in the same sense with sanctified, *i. e.* separated from ordinary use, and appropriated to pious or religious purposes. In this sense it has been applied to persons, places, and things. See HOLYNESS.

HOLY, Cape, in *Geography*, a cape in the Frozen ocean. N. lat. $72^{\circ} 32'$. E. long. $179^{\circ} 40'$.

HOLY Fire. See FIRE.

HOLY of Holies, called also the "most holy place," and the "oracle," because God here gave his answers to the high priest, when consulted by him, an apartment of the Jewish temple, which was divided, in the first temple, from the "holy place" by a partition of boards overlaid with gold, in which there was a door-place with a veil over it. It was 20 cubits in length. Although the "holy place" was reckoned very sacred, yet it was not to be compared in this respect with the "most holy," which was regarded as the palace of God. For this reason none but the high priest was permitted to go into it, and that but once a year, *viz.* on the great day of expiation (Exod. xxx. 10. Lev. xvi. 2. 15. 24. Heb. ix. 7.), on which day, as the Jews tell us, it was lawful for him to go in several times. This part of the temple, as well as the whole building, was surrounded with rooms and apartments for different uses. The roof of the "holy of holies" was not flat, as in the other parts of the temple, and in eastern houses in general, but sloping, as in our buildings; and, according to Josephus (*De Bell. Jud.* l. vi. c. 6.) it was covered and armed all over with pointed spikes of gold, to keep off the birds from nesting upon it. Although the roof was inaccessible to all, yet there was round it a kind of rail or balustrade, according to the law (*Deut.* xxii. 8.) to keep any one from falling down that should happen to go there. The "holy of holies" was at the west end of the temple, and the entrance into it toward the east, contrary to the practice of the heathens. The greatest ornament of the "holy of holies" was wanting in the second temple, *viz.* the ARK of the Covenant, or Testimony, which see.

HOLY Place, or *Sanctuary*, an apartment of the Jewish temple called by the Jews the "outer house" (it being such in respect of the "holy of holies"), was situated between the porch and the most holy place, being 20 cubits broad, and 40 in length and height. It had two gates, one of which was called the *lesser*, through which they passed in order to open the *great* gate, which had four folding doors. The sanctuary was divided from the holy of holies neither by a wall nor gate, but only by a double veil. This is supposed to have been the veil which was rent in twain at our Saviour's death (*Matt.* xxvii. 51.), because it was to be of no further use. It seems to be alluded to in *Rev.* xi. 19. xv. 5. See SANCTUARY.

HOLY Ghost, Order of the, is a military order in France; the principal in point of dignity in that kingdom.

It was instituted by king Henry III. in 1579, in memory of three great events happening on the same day, or Whitsunday: *viz.* his birth, accession to the crown of France, and election to that of Poland; the order was to consist of a hundred knights only, who, to be admitted, were to make proof of their nobility for three descents.

The king was the grand-master, or sovereign, and took the oath as such on his coronation day; whereby he solemnly vowed to maintain for ever the order of the Holy Ghost; and not to suffer it to shrink, fall, or diminish, so long as it should be in his power to hinder it; nor even to attempt to alter or dispense with any of the irrevocable statutes of the order.

The knights were all to wear a gold cross, hung

about the neck by a blue silk ribband, or collar, hanging scarfwise from the left shoulder; and the officers and commanders are also to wear the same cross, embroidered in silver, sewed on the left side of their cloaks, robes, and other upper garments.

Before they received the order of the Holy Ghost, that of St. Michael was conferred, as a necessary degree, for which reason their arms were surrounded with a double collar.

The collar of the order, at its first institution, was composed of fleurs-de-lis or, cantoned with flames of the same, enamelled gules, intermixed with three cyphers, or monograms, of gold, composed of the letters H and L, enamelled white; which letters were the initials of the institutor's name, and that of his wife Louisa of Lorraine. Henry IV. altered the cypher into a trophy of arms. Afterwards the collar was composed of fleurs-de-lis, cantoned with flames and trophies of arms; and at the bottom hung a gold cross of eight points, enamelled on the edges white, with a fleur-de-lis or, at each angle, and in the middle a dove. In an oval, on the back of the cross, was represented St. Michael trampling on the dragon, all proper.

HOLY Ghost, Order of. See DOVE.

HOLY Ghost, Cross of the, in *Heraldry*, consists of a circle in the middle of a cross, and on it the Holy Ghost, in figure of a dove: the four arms are drawn narrow from the centre, and widening to the ends, where the returning lines divide each of them into two sharp points; upon each of which is a pearl.

From the intervals of the circle between the arms issue four fleurs-de-lis. This was the cross worn by the knights of the order of the Holy Ghost in France.

HOLY Rood, in *Geography*, a bay in Newfoundland island, at the head of Conception bay.

HOLY Rose, or *Rock-Rose*, in *Botany*. See CISTUS.

HOLY Sepulchre of Jerusalem, Knights of the order of the, an order which, according to some, was instituted by Godfrey of Boulogne, on the seventeenth day of July, in the year 1099; and, according to others, by his brother Baldwin, second king of Jerusalem, in the year 1103. The badge of this order was a cross potent gold, cantoned with four crosses of the same, without any enamel, pendent at the breast to a black ribband; and a like cross embroidered on the left side of the white cloak or mantle, which the knights were constantly to wear.

HOLY Thistle, in *Botany*. See CENTAUREA *Benedicta*.

HOLY Thursday, is what we otherwise call *Ascension day*.

HOLY Week is the last week of Lent, called also *Passion Week*.

HOLY Year is sometimes used for the year of *jubilee* (which see); and sometimes for the ecclesiastical year of the Jews. See YEAR.

HOLYCROSS, in *Geography*, a village in the county of Tipperary, province of Munster, Ireland, remarkable for the ruins of an abbey which belonged to the Cistercian order of monks. The lands belonging to this abbey were an earldom, and the abbot, according to Archdall, was styled *earl of Holycross*: he was certainly a baron of parliament, and was usually vicar-general of the Cistercian order in Ireland. A particular account of the buildings may be found in Archdall's "Monasticon Hibernicum;" but it will suffice to observe here, that they appear to have been very unequal, some being built of marble and highly finished, whilst other parts are miserably mean. These ruins cover a considerable space, near the banks of the river Suire. A parish church and a few wretched cabins are the only remains

of a once celebrated place. It is seven miles from Cashel, on the road to Thurles and Nenagh.

HOLYHEAD, a sea-port, market-town, and parish in the island of Anglesea, North Wales, stands on a peninsula at the western end of the isle. In the British language it is called *Caer-Gybi*, or the fort or castle of Gybi. Having been for many years a station for vessels that sail between Ireland and England, it has thereby become a place of trade and public resort. The distance from Holyhead to Ireland is twenty leagues; and for the conveyance of letters, passengers, &c. between those places, one packet sails hence every day in the week excepting on Thursdays. It generally reaches the opposite coast in twelve hours; but in stormy or calm weather, the time of the passage is very uncertain: sometimes the vessel has remained at sea for two or three days, but when the wind is favourable, the voyage may be performed in six, seven, or eight hours. The church-yard at this place is a vast mass of rock, close to the sea, and is environed by a wall. Pennant described this to be seventeen feet high, and six thick on three sides of the inclosure, and on the other side it has only a parapet wall, the natural boundary being a precipitous rock. "At each corner of the wall is an oval tower. The masonry of the whole is evidently Roman: the mortar very hard, and mixed with much coarse pebble. Along the walls are two rows of round holes, about four inches in diameter, which penetrate them. The use of this harbour to the Romans, in the passage from various places to the ports of Lancashire and that of Chester, is very evident. They could not find a better place to run into, in case of hard weather, than this, as it projected farthest into the Vergivian sea; so that they could reach it with less danger of being embayed than in any other place." (Pennant's Tour in Wales, vol. ii.) In the vicinity of the town, this author visited and has left us accounts of other antiquities. On the summit of the hill called *Pen-Caer-Gybi*, are some remains of an ancient circular building, which Mr. Pennant conjectures was a Roman *Pharos*, or watch-tower. Remnants of a long wall, built without mortar, were found on the side of the hill; and some ruins of an edifice, called *Capel y Gorles*, were remaining between the town and the mountain. In the town was a religious house, said to have been erected in the latter part of the sixth century. A college was also founded here soon after the year 1137, by *Hwfa ap Cynddelw*, lord of *Llys-Llifon*. The present parish church belonged to the college; but the oldest parts of the architecture do not appear to be anterior to the reign of king Edward III. A public school was established here in 1745. A large inn and hotel, an assembly room, and some baths have been erected at Holyhead, within the present century, and various improvements have been lately made to the town and harbour. The former consists of one principal street, with several detached buildings, and according to the population report of 1801 then contained 503 houses, and 2132 inhabitants. Here is a weekly market on Saturdays. The harbour is formed by cliffs beneath the church-yard, and a small island called *Ynys-Gybi*, on which is a light-house. Pennant's Tour. Beauties of England and Wales, vol. xvii.

HOLYNESS, or **HOLINESS**, sanctity; the quality which constitutes or denominates a person or thing *holy*; *i. e.* pure or exempt from sin.

HOLYNESS is also used in respect of persons and things that are sacred; *i. e.* set apart to the service of God, and the uses of religion.

In this sense we say, holy days, holy ordinances, the holy Bible, holy Gospels, holy war, &c. The Roman Catholics

call the inquisition the holy tribunal; the see of Rome, the holy see, &c.

Holy oil, holy water, &c. See **UNCTION**, **WATER**, &c.

Palestine is particularly called the holy land; and Jerusalem the holy city. Princes formerly made a practice of going to signalize their religion in the Holy Land; who would have manifested the more genuine spirit of religion by staying at home. See **CROISADE**.

In Romish countries, one-third part of the year is taken up in holy days, saints days, &c. See **FEASTS**.

Urban VIII. issued out an edict in the year 1643 for diminishing the number of holy days.

In Scotland they observe no stated holy days, besides Sundays.

By a decree issued at Paris, April 9, 1802, the feasts to be celebrated in France, besides Sundays, are, the nativity of our Saviour Jesus Christ, Ascension day, the Assumption of the most blessed Virgin, and the feast of All-saints.

HOLYNESS is also a title of quality, attributed to the pope, as that of majesty is to kings.

Anciently the same title, holyness, was given to all bishops; as appears in St. Augustine, Fortunatus, Nicholas I., Cassiodore, &c. St. Gregory compliments some of his contemporary bishops with your beatitude and your holyness.

The Greek emperors of Constantinople were also addressed under the title of holyness, on account of their being anointed with holy oil at their coronation. Du Cange adds, that some of the kings of England have had the same attribute; and that the Orientals have frequently refused it to the pope.

HOLY-ROOD DAY, a festival observed by the Roman Catholics, in memory of the exaltation of our Saviour's cross. See **CROSS** and **EXALTATION**.

HOLY-WATER SPRINKLE, among *Hunters*, signifies the tail of a fox.

HOLYWELL, in *Geography*, a market town and parish in Flintshire, North Wales, derives its name from a copious spring, or well, which was much frequented in former times by religious devotees, who fancied that its waters were supernaturally efficacious in curing certain disorders and purifying the body. In the present day, the same stream is rendered more useful to mankind, by being applied to mechanical and manufacturing purposes. It is so highly important and singular, and its history so illustrative of ancient monastic superstition and craft, that it will be interesting to narrate a few particulars. The legendary origin of the well states, that Wenifred, or St. Wenifrede, was a beautiful and devout virgin, who lived in the early part of the seventh century. She was placed under the protection of a relation, who had founded a church here. A young prince, named Cradock, attempted to seduce her, but she fled towards the church for safety. In her road to this place of sanctuary, she was overtaken by the prince, who, enraged by disappointment, struck off her head. "This, like an elastic ball, bounded down the hill, through the door of the church, and up one of the aisles, directly to the altar, where her friends were assembled at prayers; resting here, a clear and copious fountain immediately gushed out. St. Beuno snatched up the head, and again joining it to the body, it was, to the surprise and admiration of all present, immediately reunited to the body." Such is the monkish origin of the well: and when such a miracle was industriously circulated, it would necessarily excite the astonishment and reverence of the credulous. Not satisfied with such fables, the present

age has assigned a natural and probable origin to the spring, by ascribing it to physical causes. At the foot of a steep hill, and from an aperture in a rock, rushes forth a torrent of water, which, from its quantity and regularity, is calculated to astonish the ignorant and interest the geologist. It has been ascertained that this spring discharges not less than eighty-four hogsheads of water in a minute. This is never known to freeze, and the current rarely ever varies in quantity; and from its rapid course and quantity, it becomes of inestimable value; for though the water has only a mile and 124 yards to flow in its progress to the sea, it turned, a few years ago, the machinery to eleven different extensive mills. These appertained to so many manufactories, &c. for cotton and twist, corn, brass-battery copper, copper wire, brass-milting, &c. Connected with these were nearly forty vessels, from thirty to fifty tons burthen each, to convey the several manufactures and the materials to and from Liverpool and other sea-ports. Over the well is a beautiful polygonal building, supported by pillars and arches. The roof, says Mr. Pennant, is most exquisitely carved in stone. Sculptured ornaments of grotesque animals, armorial insignia, &c. are attached to different parts of the building. Some of the latter relate to the Stanley family, by one of whom it was probably erected, either in the reign of Henry VI., or Henry VII. An apartment over the well was a free chapel.

Of Holywell town, Mr. Bingley observes, that he knows of none in North Wales that, in a commercial view, is of more importance. The numerous manufactures in its vicinity, and its easy access to the sea, have rendered it the great mart of this part of the kingdom. The town is spacious, but irregular, pleasantly situated on the slope of a mountain, which extends nearly to the water. Many of the houses are good, and give to it an air of considerable opulence. At the base of the hill, near the well, is the parish-church, which was built in the year 1769, on the site of a more ancient edifice. "It has only one bell," says Mr. Pennant, "and that not to be heard at any distance; so that the congregation is assembled by a walking-steeple, a man with a small bell who sounds the notice through the streets." At a short distance north of the town, in a narrow, retired vale, are some remains of Basingwerk or Greenfield abbey. Of this building the walls, and some pillars of the refectory, are the chief remnants. The knights templars had an elegant chapel here. Vestiges of Basingwerk castle remain on an eminence near the monastic ruins; also, some mounds called Watt's dyke: this was a bold rampart of earth, which extended from Holywell to Oswestry in Shropshire, and runs nearly parallel with the more noted Offa's dyke. Pennant's History of Whiteford and Holywell, 4to. 1796, and Bingley's North Wales, two vols. 8vo. 1804.

HOLZAPFEL, a town of Germany, and capital of a county of the same name, situated on the borders of the Lahn, erected into a principality of the empire by Ferdinand III. This town lies at the foot of a mountain, on which is the tower of an ancient castle, the original feat of the princes of Nassau; 4 miles N.E. of Nassau. N. lat. 50 20. E. long. 7 52.

HOLZKIRCHEN, a town of Germany, in the county of Wertheim; 9 miles E. of Wertheim.

HOMA, a town of South America, in the government of Buenos-Ayres; 15 miles S. of Corrientes.

HOMA, in *Surgery*, an anasarous or dropical swelling.

HOMAGE, in its general sense, denotes the reverence, respect, and submission, which a person yields his master, lord, prince, or other superior.

The word is formed of the Latin *homo, man*; because when the tenant takes his oath, he says, *Ego devenio homo vester, I become your man*; for the same reason homage is called *manhood*; so the homage of his tenant and the manhood of his tenant are the same. Coke on Littl. fol. 64.

HOMAGE, *Homagium, Hominium*, in *Law*, is an engagement or promise of fidelity; which the vassal, or tenant who holds a fee, renders to the lord, when admitted thereto.

In the original grants of lands and tenements, by way of fee, the lord did not only oblige his tenants to certain services, but also took a submission, with promise and oath, to be true and loyal to him, as their lord and benefactor.

This submission, &c. is called homage; the form whereof, as appointed by stat. 17 Edward II. is in these words; When a free man shall do homage to his lord, of whom he holdeth in chief, he shall hold his hands together, between the hands of his lord, and shall say thus: "I become your man from this day forth, for my life, for member, and for worldly honour; and shall owe you my faith for the land I hold of you; saving the faith that I owe unto our sovereign lord the king, and to mine other lords."

In this manner the lord of the fee, for which homage is due, takes homage of every tenant, as he comes to the land or fee. Glanvil, indeed, excepts some women; who only perform homage by their husbands; because homage is supposed to have a more immediate relation to service in war; but Fitzherbert denies this exception. Nat. Brev. fol. 157.

It is added, that bishops do no homage, but only fealty; and probably for the same reason as women. Yet do we read, that the archbishop of Canterbury does homage on his knees to our kings, at their coronation; and that the bishop of Man was homager to the earl of Derby.

Fulbeck reconciles this: by our law, says he, a religious man may do homage, but may not say to the lord, *Ego devenio homo vester*; because he has already professed himself to be only God's man; but he may say to him "I do unto you homage, and to you shall be faithful and loyal."

Homage and fealty, or faith, are two distinct things, and different duties. See **FEALTY**.

Originally homage was performed by the gentlemen, and fealty by the peasant. Others say, that homage was that performed to the lord himself, and fealty to his seneschal, or steward, for his lord. It is added, that he who holds lands for term of life, owes homage, but not fealty.

Bishops take the oath of fealty and loyalty to the king, for the temporalities they hold of him, or which are restored to them; and at the same time do homage to their sovereign.

HOMAGE Fee. See **FEE**.

HOMAGE-Service, a more extensive kind of homage, whereby the vassal held of the lord, not only for his land, but his person; so that the lord might use him against all mankind, whether within or without the kingdom; excepting against the king. See **LIEGE**.

This kind of homage was rendered bare-headed, with the hands joined on the Gospels, and one knee on the ground, and without sword, girdle, or spurs. By which it was distinguished from frank homage. See **ALLEGIANCE**.

There are also other distinctions of homage; as,

HOMAGE, Plain, or homage of a fee; where no oath of fidelity is taken.

HOMAGE of Devotion, which is a donation made to the church; and does not import any duty, or service at all.

HOMAGE of Peace, which a person makes to another after a reconciliation, as an assurance that he will no longer disturb his peace, &c.

HOMAGE, Simple. See ALLEGIANCE.

HOMAGE, again, is divided into *new*, or that performed upon the grant of the fee; and *ancestral*.

HOMAGE, Ancestral, is where a man and his ancestors, time out of mind, have held their land of the lord, and his ancestors, by homage.

If such lord have received homage, he is bound to acquit the tenant against all other lords above him, of every manner of service; and if the tenant has done homage to his lord, and is impleaded, and vouches the lord to warranty, the lord is bound to warrant him; and if the tenant lose, he shall recover in value against the lord so much of the lands as he had at the time of the voucher, or any time after.

HOMAGE is also used for a jury, in a court-baron, because commonly consisting of such as pay homage to the lord of the fee. See **JURY, COURT-BARON, and MAJOR**.

HOMAGE is also taken, in some cases, for the particular place, or district, where the services are to be performed.

HOMAGER, a person that does, or is bound to do, homage to another.

HOMAGIO RESPECTUANDO, a writ issued out to the escheator commanding him to deliver seisin of lands to the heir that is of full age, notwithstanding his homage not being done.

HOMAGIUM REDDERE has been used to signify, to renounce homage: as where the tenant or vassal, made a solemn declaration of disavowing his lord, for which there was a form prescribed by the feudatory laws.

HOMALIUM, in *Botany*, is a genus so named by Jacquin, as he informs us, from *ὁμοῦλον*, equality, because of the equal disposition of the stamens. Jacq. Amer. 170. Schreb. 366. Willd. Sp. Pl. v. 2. 1225. Mart. Mill. Dict. v. 2. Swartz. Ind. Occ. v. 2. 988. Prodr. 86. Juss. 343. Lamarck Illustr. t. 483. (*Racoubea*; Aubl. Guian. v. 1. 589. t. 236.) Class and order, *Polyandria Trigynia*. Nat. Ord. *Rosaceae*, or perhaps *Rhamnifera*, Juss.

Gen. Ch. Cal. Perianth of one leaf, divided into six or seven ovate-lanceolate, acute, widely-spreading segments. Cor. Petals six or seven, ovate, flat, a little longer than the calyx, spreading; nectary consisting of six or seven flat glands, which are alternate with the petals. Stam. Filaments varying from 18 to 28, awl-shaped, erect, the length of the corolla, three or four of them being inserted into the receptacle, between the glands, within the base of each petal; anthers roundish, small. Pist. Germen roundish, hairy, immersed in the base of the calyx; styles three or more, erect; stigmas simple. Peric. Capsule woody, ovate, of one cell. Seeds numerous, small.

Ess. Ch. Calyx six or seven-cleft. Corolla of six or seven petals. Stamens three in a bunch. Capsule of one cell, with many seeds.

Obs. All the parts of the flower are permanent. This genus is supposed to be akin to *Blackwellia* of Commerçon and Jussieu, (which is different from *Blackwellia* of Gærtner, t. 117), but the insertion of the stamens is thought to distinguish them; see Willd. Sp. Pl. v. 2. 930. Lamarck. Illustr. t. 412. Juss. 343. We feel a strong inclination to unite the two genera, but in deference to such authorities shall now only speak of undoubted species of *Homalium*.

VOL. XVIII.

1. *H. racemosum*. Willd. n. 1. Jacq. Amer. 170. t. 183. f. 72. Swartz. Ind. Occ. v. 2. 989. Lamarck Illustr. t. 483. f. 2.—Leaves elliptical, with shallow serratures. Partial flower-stalks longer than the calyx. Petals ovate.—Native of banks of rivers in Martinique and Jamaica, flowering late in the autumn.—A lofty tree, with a tufted head, in habit like an elm. Flowers in bunches. Stamens 18 or 21, so that three are placed together within each petal. Germen surrounded by the calyx. Seeds brownish.

2. *H. Racoubea*. Willd. n. 2. Swartz. Ind. Occ. v. 2. 991. Lamarck Illustr. t. 483. f. 1. (*Racoubea guianensis*; Aubl. Guian. 590. t. 236.)—“Leaves elliptical, with broad serratures. Partial flower-stalks shorter than the calyx. Petals ovate.—A native of the woods of Guiana, flowering and bearing fruit in May.—Stem about four feet high, bearing tortuous branches six or eight feet long. Leaves alternate, smooth, ovate, obtusely pointed. Flowers yellow. This species is very nearly allied to the last, but differs in having its leaves almost toothed and leathery, flowers larger, and fruit woody.

3. *H. angustifolium*. Sm. MSS. Leaves elliptic-lanceolate, slightly wavy. Partial flower-stalks very short. Petals obovate.—Native of Sierra Leone, communicated by Sir Joseph Banks in 1792.—The leaves are much smaller than in the last, narrower, and nearly entire. Chufers axillary, simple, scarcely so long as the leaves. Flowers nearly sessile, smaller than either of the preceding, and essentially distinguished by the obovate shape of their petals.

HOMALOCENCHRUS. See LEERSIA.

HOMAN, or OMAN, in *Geography*, a town of Fez, in the province of Habat, between Alcaçar-quiber, and Arzilla.

HOMBERG, WILLIAM, in *Biography*, a celebrated physician and chemist, was born at Batavia, in the island of Java, in 1652. His father was a Saxon gentleman, who had entered into the service of the Dutch East India company, and ultimately obtained the command of the arsenal of Batavia. He quitted that settlement however, and went to Amsterdam, where his son advanced rapidly in the course of his education, and became devoted to study. He went to Jena, Leipzig, and Magdeburg, where he pursued the study of the law, and was admitted to the bar in the last-mentioned place, in 1674. But without neglecting his profession, he began to take great interest in the study of natural history; and becoming acquainted with Otto Guericke, who had invented the air-pump, and was pursuing experimental philosophy with celebrity, he attached himself to this able man in order to be instructed in those sciences. His increasing desire for knowledge induced him to quit Magdeburg, and he set off to Italy, where he applied to the study of medicine, and particularly of anatomy and botany at Padua. When at Bologna, he discovered, by his experiments, the method of making the Bologna stone luminous, which had been almost lost. At Rome he formed an intimate acquaintance with Marc Anthony Cælio, a Roman nobleman, an able mathematician, astronomer, and mechanist, who was exceedingly dextrous in making large lenses. Homberg applied ardently to these studies, as well as to painting, sculpture, and music, in which he made great progress. Leaving Italy, he travelled through France, and visited England, where he laboured for some time with the celebrated Mr. Boyle. He then returned to Holland, and after improving himself in anatomy under De Graaf, rejoined his family, then residing at Quidlinburg. He had now decided on adopting the profession of medicine, and took the degree

of M.D. at Wittenberg; but he was still more inclined to the pursuit of his favourite sciences, than to settle in the practice of his profession. Accordingly, he travelled to the north, in order to visit Baldwin and Kunkel, the inventors of two sorts of phosphorus, which, at that time, made a considerable noise; and he obtained their methods of preparing it, in exchange for some other chemical secrets. He proceeded thence to the mines of Saxony, Hungary, Bohemia, and Sweden, in order to pursue his inquiries respecting the metals; and at Stockholm he laboured, together with M. Hierna, first physician to the king, in the laboratory recently established there by his majesty. He was still urged by the love of liberty and science to pursue his travels, notwithstanding the wishes of his family that he should settle in his own country, and he repeated his journey to Holland and France, where he was received by the scientific men with great favour. At the urgent request of his father, who was now impatient at his delay, he had fixed the day of his departure from Paris, when M. Colbert, in the name of the king, made him such advantageous offers, as induced him to remain in that metropolis. In 1682 he embraced the Catholic religion; but the next year he lost his patron Colbert, and was disinherited by his father for having changed his religion. In 1685 he was induced to pay a second visit to Rome, where he remained some years, practising medicine with great success. On his return, his extensive information, his phosphorus, his microscopes, an air-pump which he had invented, more perfect than those of Guericke and Boyle, and various operations and discoveries, soon acquired for him a distinguished rank among the most eminent philosophers. In 1691 he was admitted a member of the Academy of Sciences, and through the favour of the abbé Bignon, director, he obtained the uninterrupted use of the laboratory of the academy. In 1702 the duke of Orleans ordered a magnificent laboratory, fitted up in the completest manner, to be put under the direction of Homberg, to whom he also assigned a pension; and in 1704 the duke appointed him his first physician. Homberg married in 1708 the daughter of M. Dodart, an eminent physician, with whom he lived but a few years, being carried off by a dysentery, to returns of which he had been for some time liable, in September 1715, at the age of sixty-three. Homberg, although of a weak constitution, was exceedingly laborious. His acquirements were very extensive; for besides a thorough knowledge of every department of natural philosophy and chemistry, he was well acquainted with history and languages. His mind was capable of a degree of attention, which enabled him to make observations, that might have escaped others; and his method of explaining them was simple, accurate, and concise. He never published any large work, but he furnished a great number of curious and interesting memoirs to the Academy of Sciences, which were printed in their collections. Gen. Biog. Eloy. Dict. Hist.

HOMBERG, or *Homburg*, in *Geography*, a town of Germany, in the duchy of Berg; 24 miles E.S.E. of Cologne.—Also, a town of the principality of Hesse Cassel, situated on the Efze. It contains an iron-furnace and a glass-manufacture; 20 miles S. of Cassel. N. lat. $51^{\circ} 2'$. E. long. $9^{\circ} 20'$.

HOMBURG *vor der Höhe*, or *Homburg in the mountains*, a town of Germany, which gives title to a branch of the house of Hesse, called Hesse-Homburg; seven miles N. of Frankfort on the Maine. N. lat. $50^{\circ} 15'$. E. long. $8^{\circ} 32'$.

HOMBERG *an der Ohm*, a town of Upper Hesse, on the

Ohm, with a castle on an eminence; 11 miles S.E. of Marburg. N. lat. $50^{\circ} 43'$. E. long. $9^{\circ} 1'$.

HOMBERG, or *Homrig*, a town of Wurzburg; 14 miles W. of Wertheim.

HOMBURG, or *Hombourg*, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the district of Deux-Ponts: five miles N.N.W. of Deux-Ponts. N. lat. $49^{\circ} 11'$. E. long. $7^{\circ} 21'$. The place contains 1761, and the canton 4581 inhabitants, in 14 communes.

HOMBERG, or *Hockenbourg*, a town of the duchy of Wurzburg, situated on the Maine; 15 miles W.S.W. of Wurzburg.

HOME, HENRY, Lord KAMES, in *Biography*, eminent as a judge and writer, was born in the county of Berwick in 1696. He was educated at home till he was of a proper age to be sent to the university of Edinburgh, to study the law as his future profession. The acuteness of his genius, and the success with which he applied himself to professional studies, were displayed by a number of publications on the civil and Scotch law. The first of these, published in 1728, consisted of "Remarkable Decisions of the Court of Sessions," which he afterwards published, much enlarged, in the form of a dictionary in two volumes folio. Without enumerating all his works on legal subjects, we may mention, as the most curious of his productions in this class, "Historical Law Tracts," containing fourteen separate treatises upon interesting subjects connected with the judicial and constitutional history of the country. He gave a multitude of proofs of indefatigable industry, and profound knowledge, which raised him to the first rank in his profession, and in 1752 he was advanced to the bench of judges of the court of session, on which promotion he took, according to the custom of Scotland, the title of lord Kames, and his authority as a law writer is still quoted at the Scotch bar, with the same respect as is paid to the luminaries of law in the English courts. We are now to consider lord Kames in the character of a literary man; from his earliest days he had a decided turn for metaphysical discussions, and maintained a correspondence on these subjects with bishops Berkeley and Butler, Dr. Clarke, and other great men who have become illustrious, by their talents, in the annals of their country. In 1752 he published "Essays on the Principles of Morality and Natural Religion." In this work he endeavoured to establish several general principles of action. He also openly avowed the doctrine of philosophical necessity, which had become obnoxious by being adopted by some writers who rejected revealed religion; and though he closely allied it with the duties of morality and real religion, he underwent many attacks on its account. In 1761 he published for young persons his "Introduction to the Art of Thinking," which consists of maxims and general observations on human nature and the conduct of life illustrated by examples. His great work, the "Elements of Criticism," was given to the world in the year 1762, which is a truly original performance, and which discarding all arbitrary rules of literary composition derived from authority, establishes a new theory upon the principles of human nature. In 1773 he appeared again before the public in his "Sketches of the History of Man," in two volumes 4to. This work comprises many subjects of the greatest importance relative to human society. They are not all treated with equal accuracy, and some of the examples are taken from suspected sources. He published, in 1777, "The Gentleman Farmer, being an attempt to improve Agriculture by subjecting it to the Test of rational Principles." This work was the result of much

much observation and practical knowledge of the business of farming, which he acquired by the pursuit on a large scale, on his own estate, in Perthshire. In 1781 he published another work, entitled "Loose Hints upon Education, chiefly concerning the Culture of the Heart," and in the following year he died at the age of eighty-six. Lord Kames was as much distinguished by his vivacity in conversation, as the extent of his legal knowledge and literary labours. To a very advanced age he was the life and soul of all the parties with which he mixed: no topic could be started above or below his powers of discussion. Lord Kames was in the habit of rising very early, and he was a man of great regularity and order in the disposition of the several parts of his time: he seemed to know the value of each minute as it passed, and it was thus he rose to the high eminence which he possessed, in opposition to all the obstacles which the tumult of public business could throw in his way. In the friendships which he formed he was ardent, zealous, and sincere. He attained to constant habits of devotion, and a perpetual sense of the Deity, and a veneration for an over-ruling Providence ever dwelt upon his mind. From this source arose that propensity, which appears in all his writings, of investigating final causes, and tracing the wisdom of the Supreme Author of nature. A few days before his death he went to the court of session, addressed all the judges separately, told them he was speedily to depart, and took a solemn and affectionate farewell.

HOME, in *Sea Language*, denotes either the situation of some object, where it retains its full force of action; or where it is properly lodged for convenience or security. In the former sense it is applied to the sails, and signifies, that their clues or lower corners are close to the blocks upon the yard-arm, immediately beneath them: hence to haul home the top-sail-sheets, is to extend the bottom of the top-sail to the lower-yard, by means of the sheets. In the latter sense, it usually refers to the stowage of the hold; as a cask, &c. is said to be *home*, when it bears against and lies close to some other objects: or to the anchor, which is said to come home, when it loosens from the ground, by the effort of the cable, and approaches the place where the ship floated, at the length of her moorings.

HOME Breeds, in *Rural Economy*, a term signifying such breeds of cattle or other sorts of live-stock, as are bred and reared in the particular district or county.

HOME-District, *the*, in *Geography*, a district of Nassau, in the province of Quebec, Upper Canada, so constituted by a proclamation of lord Dorchester, in July 1788, and deriving its present name from an act of the provincial legislature. It is bounded E. by a meridian passing through the mouth of the river Trent; N. by the Ottawa river, into lake Tomiganning and the bounds of the Hudson's bay company, and also by part of lake Huron; W. by a meridian passing through the eastern extremity of Long point, or the N. Foreland; and S. by part of lake Ontario, and part of lake Erie.

HOME, *Harvest*. See HARVEST.

HOME-stall, in *Rural Economy*, a term frequently applied to the site or situation of the farm-house, and other buildings including the farm-yard. It cannot be disputed that farms are of greater or less value in proportion to the conveniencies which they possess, and the facility of the means of occupying them. It is well known that arable farms require an extent of buildings and other conveniencies adequate to the sizes and particular kinds of them. Tenants are not unfrequently seen much checked and confined in their operations and improvements, as well as subjected to great waste of produce, in consequence of the want of a sufficient

extent of farm offices. But on the contrary, it is occasionally to be noticed, that there is a prodigality of this sort of buildings, which incurs vast unnecessary expence, not only at first, but afterwards in the repairs that become requisite. The extent of buildings should consequently be well proportioned to that of the farm, and rarely extended much beyond it. All extremes must be most carefully avoided. See FARM, and FARM-YARD.

HOME-stead, the name of the situation or space of ground on which the farm-house, buildings, and offices are raised. The situations intended for this purpose should be chosen with much care and circumspection, regard being constantly had to convenience, water, and various other points of importance. See FARM-YARD, and HOME-stall.

HOMER, in *Biography*, justly celebrated as the prince of poets, flourished, according to Blair, about 900 years before the Christian era, though Priestley and others place this event half a century later. Seven cities disputed the glory of having given him birth, *viz.* Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, and Athens, but the probability is, that he was born either on the continent of Lesser Asia, or upon one of the islands near it. We have nothing certain respecting the life of this poet: critics have usually thrown aside as spurious and fabulous the life of Homer, said to have been written by Herodotus. The detail of circumstances contained in that piece is so circumstantial and minute, that it can deserve no credit whatever. There seems no doubt that, notwithstanding the high reputation and vast celebrity which he has enjoyed for nearly three thousand years, he spent his life in poverty, wandering about from city to city, and from the court of one prince to that of another, obtaining temporary patronage from the recital of his poems. If he were blind he probably became so in his old age. The origin and composition of the poems attributed to Homer, are involved in as much obscurity, as the facts relating to his birth-place and life. In his celebrated poems entitled the Iliad and Odyssey, the poet has displayed the most consummate knowledge of human nature, and rendered himself immortal by the sublimity, the fire, the sweetness, and elegance of his poetry. In his Iliad, Homer has described the resentment of Achilles, and its fatal consequences in the Grecian army before the walls of Troy. In the Odyssey, the poet has for his subject the return of Ulysses into his country, with the many misfortunes which attended his voyage after the fall of that city. These poems are each divided into 24 books, the same number as there are letters in the Greek alphabet, and, though the Iliad claims an uncontested superiority over the Odyssey, yet the same force, the same sublimity and elegance prevail, though divested of its more powerful fire: and the great author of the "Sublime," compares the Iliad to the mid-day, and the Odyssey to the setting-sun, and adds that the latter still preserves its original splendour and majesty, though deprived of its meridian heat. "Whether these were epic poems in the sense now attached to the word, primarily formed upon a determinate plan, and constituting a whole;—whether they were a fortuitous assemblage of detached parts, connected by some later hand, by means of an assumed subject, or, lastly, whether these rhapsodies were the work of one author or of several, are questions which have exercised, and which still continue to exercise, the ingenuity of critics. There is no doubt that the constituent parts of these poems long wandered separately through the principal cities of Greece, and the whole of them are said by Plutarch to have been brought from Asia to Greece by Lycurgus, and their first arrangement, in the order we now have them, is ascribed to Pisistratus. But whatever doubt these circumstances might throw upon the original plan of

their composition, it is contended that all the parts so manifestly conspire to that general purpose which is proposed in the exordium, that they must have flowed from uniform design. The difficulty of conceiving how such long works could be accurately transmitted by memory through ages, previously to the use of writing, increases the intricacy of the question; but in answer to this it has been observed, that the poetry of Homer was so universally admired, that, in ancient times, every man of learning could repeat with facility any passage in the Iliad and Odyssey. These poems, it appears, from the very earliest times, were consulted as authorities for local claims, and controversies were decided respecting boundaries and prerogatives, by lines from the catalogue of Homer's ships. Modern travellers have been astonished to behold the different scenes which the poems of Homer described 3000 years before, still existing in the same unvaried form, and the navigator, who steers his course along the Ægean sea, finds all the promontories and rocks which appeared to Nestor and Menelaus, when they returned victorious from the Trojan war. By the ancients Homer was venerated and worshipped as a god. The inhabitants of Chios celebrated festivals in his honour every fifth year: and the people of Cos considered it as their greatest glory that the poet of Greece was buried in their island. Alexander was so much attached to the works of Homer, that he usually placed them under his pillow, with his sword, and he deposited the Iliad in one of the richest and most valuable caskets of Darius, observing, that the most perfect work of human genius ought to be preserved in a box the most valuable and precious in the world. The best editions of the Iliad and Odyssey are that by Dr. Barnes with the Greek scholia, in two volumes 4to. : that by Dr. Clarke published in 4to. 1729, and that by the learned Heyne. The most elaborate commentary is that by Eustathius, bishop of Thessalonica, and the best English translation is that by Pope: though Cowper's, in blank verse, is thought to come nearer to the original.

HOMER, in *Geography*, a military township of America, in Onondago county, New York, on the head-waters of the N. W. branch of Chenengo river; containing 612 inhabitants.

HOMER, *Omer*, or *Chomer*, a Jewish measure, containing the tenth part of the epha. See CORN and MEASURE.

HOMESOKEN, or rather HAMSOKEN; sometimes also written *Hansfoka*, and *Hansfokna*, the privilege or protection which every man enjoys in his own house.

“Hansfokne, hoc est quietus esse de amercimentis pro ingressu hospitii violenter et sine licentia contra pacem regis, et quod teneatis placita de hujusmodi transgressione in curia vestra.” W. Thorn. 2030.

Hence, he who invades that freedom, is properly said, *frangere hominem*.

This crime seems to amount to what we now call burglary; which is a crime of a heinous nature, as being not only a breach of the king's peace, but a breach of that liberty which a man hath in his own house, which, as we commonly say, should be his castle, and therefore ought not to be invaded. Braeton. lib. iii.

HOMFELDS, in *Geography*, a town of Germany, in the county of Lippe; 9 miles E. of Lemgow.

HOMICIDE, of *homo*, a man, and *caedo*, I kill, in *Compositio Latæ*, the killing of a man.

Homicide is divided into three kinds: *viz.* justifiable, excusable, and felonious. The first has no guilt at all; the second very little; but the third is the highest crime against the law of nature, which man is capable of committing.

Justifiable homicide is such as is owing to some unavoidable

necessity, without any intention or negligence in the person that kills, and, therefore, without any shadow of blame. Of this kind is the act of a magistrate or officer, who puts a malefactor to death, in obedience to the law, and in the execution of public justice. Homicide is also justifiable for the advancement of public justice; as, where an officer, in the execution of his office, either in a civil or criminal case, kills a person that assaults or resists him (1 Hal. P. C. 494. 1 Hawk. P. C. 71.); where an officer, or any private person, attempts to take a man charged with felony, but is resisted, and in the endeavour to take him, kills him (1 Hal. P. C. 494.); where officers, in case of a riot or rebellious assembly, endeavouring to disperse the mob, kill them; such officers are justified both by common law (1 Hal. P. C. 495. 1 Hawk. P. C. 161), and by the riot act, 1 Geo. I. cap. 5. Where prisoners are killed by the gaoler or officer, in endeavouring to prevent their escape (1 Hal. P. C. 496.); where trespassers in forests, parks, chases, or warrens, refuse to surrender to the keepers, they may be slain; (21 Edw. I. stat. 2. 3 & 4 W. & M. cap. 10.) But in all these cases there must be an apparent necessity; so that the party could not be arrested or apprehended, the riot could not be suppressed, the prisoners could not be kept in hold, the deer-stealers could not but escape, unless such homicide were committed, without which this kind of homicide is not justifiable. When one champion killed another in battle, such homicide was justifiable, and was imputed to the just judgment of God (1 Hawk. P. C. 71.) Moreover, such homicide, as is committed for preventing any forcible and atrocious crime, is justifiable by the law of nature, and by the law of England. (24 Hen. VIII. cap. 5.) Thus, if any person attempts a robbery or murder, or endeavours to break open a house in the night-time, or to burn it (1 Hal. P. C. 488.), and should be killed in the attempt, the slayer shall be acquitted and discharged. This is agreeable to the Jewish law, Exod. xxii. 2. to the laws of Athens, and the Roman law of the Twelve Tables. The English law also justifies homicide in defence of chastity; which see.

Excusable homicide is such as the law excuses from the guilt of felony, though it implies some degree of fault and blame. This is either *per infortunium*, *i. e.* by misadventure, or *se defendendo*, upon a principle of self-preservation in a sudden fray. See CHANCE-MEDLEY.

The first is, where a man doing a lawful act, without any intention of hurt, unfortunately kills another; as where a man has a hatchet at work, the head of which flies off, and kills a stander-by, or where a person, qualified to keep a gun, is shooting at a mark, and undesignedly kills a man (1 Hawk. P. C. 73, 74). Thus also, when a parent is moderately correcting his child, a master his apprentice or scholar, or an officer punishing a criminal, and happens to occasion his death, it is only misadventure; but if he exceeds the bounds of moderation, in the manner, the instrument, or degree of punishment, and death ensues, it is at least manslaughter, and in some cases, according to circumstances, murder.

These two species of excusable homicide are similar in their blame and punishment. Among the Jews, the slaughter even of enemies required a solemn purgation, which implies that the death of a man, however it happens, will leave some stain behind it. And the Mosaic law (Numb. c. 35. and Deut. c. 10.) appointed certain cities of refuge for him who killed his neighbour unawares, &c. But he was not held wholly blameless, any more than in the English law; since the avenger of blood might slay him before he reached his asylum, or if he afterwards stirred out of it till the death of the high-priest. In the imperial law likewise

casual homicide was excused, by the indulgence of the emperor, signed with his own sign manual, "adnotatione principis:" otherwise the death of a man, however committed, was in some degree punishable. Among the Greeks homicide by misfortune was expiated by voluntary banishment for a year. (Plato de leg. l. ix.) In Saxony a fine is paid to the kindred of the slain: which also, among the western Goths, was little inferior to that of voluntary homicide (Stiern. de jure-Goth. l. iii. c. 4.): and in France no person was ever absolved in cases of this nature, without a largess to the poor, and the charge of certain masses for the soul of the party killed. By our laws these two species of homicide formerly incurred a forfeiture, as some say, of all the goods and chattels; according to others, only of part of them, by way of fine or *werregild*, which was probably disposed of, as in France, in *pious usus*, or for the benefit of his soul. But the delinquent has now a pardon, and writ of restitution of his goods, as a matter of course and right, only paying for suing out the same (2 Hawk. P. C. 381.); and in most cases the judge will grant a general verdict of acquittal. Folk. 289.

Felonious homicide is the act of killing a human creature without justification or excuse. This is either self-murder (see *FELo de se*); or the killing of another man, which is divided into *manslaughter* and *murder*; which see respectively. Blackit. Com. book iv. cap. 14.

HOMILY, Ὁμιλία, formed of ὁμιλος, *assembly*, originally signifies a conference, or conversation; but the word has since been applied to an exhortation, or sermon, delivered to the people.

The Greek *homilia*, says M. Fleury, signifies a familiar discourse, like the Latin *sermo*; and discourses delivered in the church took these denominations, to intimate, that they were not harangues, or matters of ostentation and flourish, like those of profane orators, but familiar and useful discourses, as of a master to his disciples, or a father to his children.

All the homilies of the Greek and Latin fathers are composed by bishops. We have none of Tertullian, Clemens Alexandrinus, and many other learned persons; because, in the first ages, none but bishops were admitted to preach.

The privilege was not ordinarily allowed to priests, till toward the fifth century. St. Chrysostom was the first presbyter that preached stately. Origen and St. Augustine also preached, but it was by a peculiar licence, or privilege.

Photius distinguishes homily from sermon; in that the homily was performed in a more familiar manner; the prelate interrogating and talking to the people, and they, in their turn, answering and interrogating him; so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators.

There are several fine homilies of the fathers still extant; and, particularly, of St. Chrysostom, St. Gregory, &c. The practice of compiling homilies, which were to be committed to memory, and recited by ignorant or indolent priests, commenced towards the close of the eighth century; when Charlemagne ordered Paul Deacon and Alcuin to form homilies or discourses upon the Gospels and Epistles, from the ancient doctors of the church. This gave rise to that famous collection, entitled the Homiliarium of Charlemagne, and which being followed as a model by many productions of the same kind, composed by private persons, from a principle of pious zeal, contributed much (says Mosheim,) to nourish the indolence, and to perpetuate the

ignorance of a worthless clergy. Eccles. Hist. vol. ii. p. 254. 8vo. ed.

At the time of the Reformation there were several of these homilies composed and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unsound doctrine being taught in remote country places. The homilies of the established church of England are contained in two books; the former of which was published in the reign of Edward VI., and the latter in the beginning of the reign of queen Elizabeth. Both these are pronounced by the 35th article of the church to "contain a godly and wholesome doctrine, and necessary for these times," *i. e.* for the times in which they were published. The authors of these homilies were the great reformers Cranmer, Ridley, Latimer, and Jewel. Bishop Tomline mentions, in his "Refutation of Calvinism, 8vo. 1811, that not one of the peculiar doctrines of Calvin is mentioned in either of these two books: the word Predestination does not occur from the beginning to the end of the homilies; the word Election occurs upon one occasion only, and then it is used in its true scriptural signification, very different from that in which it is used by Calvinists: the word Reprobation does not occur at all: nothing is said of absolute decrees, partial redemption, perseverance, or irrefragable grace.

HOMILIES, CLEMENTINE. See CLEMENTINA.

HOMINE captó in withernam, in *Law*, a writ for apprehending him that has taken any bondman or woman, and led him or her out of the country; so that he or she cannot be replevied according to law. See WITHERNAM.

HOMINE eligendo ad custodiendam peciam sigilli pro mercatoribus editi, a writ directed to a corporation for the choice of a new person to keep one part of the seal appointed for statutes merchant, when a former is dead according to the statute of Acton Burnel.

HOMINE replegiando, a writ for the bailing of a man out of prison, when he is confined without commandment of the king or his judges, or for any cause that is repleviable. But this writ is now seldom used; a writ of habeas corpus being sued out on the necessary occasions.

HOMINICOLÆ, formed of the Latin *homo, hominis, man, and colo, I worship*, in *Antiquity*, a name which the Apollinarians gave to the orthodox, to denote them worshippers of man.

As the orthodox maintained that Jesus Christ was God-man, the Apollinarians accused them of adoring a man, and therefore called them *hominicolæ*.

HOMMACKS, in *Engineery*, are used by Mr. Smeaton to denote sand hills thrown up by the tide; sometimes also they are called paddocks.

HOMMEDAL, in *Geography*, a town of Norway, in the diocese of Christianland; 19 miles N.N.E. of Christianland.

HOMMOC, in *Sea Language*, signifies a hillock, or small eminence of land resembling the figure of a cone, and appearing on the sea-coast of any country.

HOMNONA, in *Geography*, a town of Hungary; 14 miles N.E. of Matusfalva.

HOMO, MAN, in *Zoology*. See MAN.

HOMOCENTRIC, composed of ὁμοιός, *similar*, and κεντρος, *centre*, in *Astronomy*, a term of the same import with concentric.

HOMOCHROA, in *Natural History*, the name of a genus of pebbles.

The word is derived from the Greek ὁμοιός, *similar*, and χροια, *colour*, and expresses such pebbles as are not veined, but all of one simple and similar colour. These are bodies composed

composed of crystalline matter, considerably debased by earth, and this of various kinds in the different species, but only of one kind in the same species, which is thence always of one colour, and not subject to veins. Of this genus there are only five known species; the white, red, yellow, blueish, and greenish. All these are covered with external coats or crusts, like those of the common pebble. Hill's Hist. of Foss. p. 510.

HOMODROMUS VECTIS, in *Mechanics*, a lever, in which the weight is in the middle between the power and fulcrum, or the power in the middle between the weight and fulcrum. See **LEVER**.

The word homodromus is derived from ὁμοί, *same*, and δρόμος, *course*, because in this species of lever the weight and power move in the same direction; as in the heterodromus they move in contrary directions.

HOMOEOTELEUTON, ὁμοιοτελευτον, a figure in *Rhetoric*, whereby several verbs in a sentence are made to end alike; as, eos deduci, evehi quam deferi malui: or, ut vivis invidiose, delinquis studiose, loqueris odiose.

HOMOGENEOUS, or **HOMOGENEAL**, composed of the Greek ὅμοιος, *like*, and γένος, *kind*, is a term applied to various subjects, to denote that they consist of similar parts, or of parts of the same nature and kind; in contradistinction to heterogeneous, where the parts are of different natures, &c.

Natural bodies are generally composed of homogeneous parts, as a diamond, a metal, &c. Artificial bodies, on the contrary, are assemblages of heterogeneous parts, or parts of different qualities; as a building of stone, wood, &c.

HOMOGENEAL LIGHT, is that whose rays are all of one and the same colour, degree of refrangibility, and reflexivity. See **LIGHT**.

HOMOGENEAL Numbers and Plants, are those of the same kind and nature.

HOMOGENEAL Surds, are such as have one common radical sign; as $\sqrt[3]{27}$, and $\sqrt[3]{3}$. See **SURD**.

HOMOGENEUM COMPARATIONIS, in *Algebra*, the known quantity in an equation; called also *absolute number*.

It is called *homogeneous comparisonis*, of *comparison*, to distinguish it from the other terms; which, though homogeneous as well as this, *i. e.* always raised to the same degree of power, are not the quantities of which things are here compared or referred.

HOMOGRAMMI, ὁμογραμμί, among the ancients, an appellation given to the athlete who drew the same letter, and on that account were to engage together; for when any number of athletes were to enter the lists, in order to determine with whom every one should contend, they threw into an urn a number of letters equal to that of the athlete, but so that there were always two letters of a sort, as two *a*'s, or two *b*'s. After these had been shaken together, the athlete drew them out, and those who got the same letter were to fight each other.

HOMOIOCATALECTON, ὁμοιοκαταληκτον, in *Rhetoric*, a figure wherein the different parts of a sentence have the same termination.

Homoiocatalecton is used as a genus to denote similar terminations and words; and homoiopoton and homoioteleuton are made its species.

HOMOIOMERICAL PRINCIPLES, of ὅμοιος, *similar*, and μέρος, *part*, a peculiar kind of principle, supposed by Anaxagoras in all mixed bodies; being determinate numbers of such similar principles, as, when they came to be parts, *e. gr.* of an animal body, would there make such masses and combinations as their nature required; *viz.* the fan-

guinary particles would then meet together, and make blood, the urinous particles constitute urine, the ossaceous ones bones, the carneous flesh, &c. See **PRINCIPLE**.

HOMOIOPOTON, ὁμοιοπώτων, a figure in *Rhetoric*, whereby the several parts of a sentence end with the same case, or tense of a like sound; *e. gr.* *marentes, flentes, elachrymantas, & miserantes*. Isocrates is particularly celebrated for this figure. Some of the best orators have industriously avoided this figure, because it has too much the appearance of art.

HOMOLINON, a word used by some authors to express crude flax, and by others for a coarse sort of flaxen linen, made of the rough threads unwhitened, which was used by the ancients for towels to rub people after bathing.

HOMOLOGATION, in the *Civil Law*, the act of confirming or rendering a thing more valid and solemn, by publication, repetition, or recognition thereof.

The word comes from the Greek ὁμολογια, *consent, assent*, formed of ὁμος, *similar, like*, and λογος, of λεγειν, *dicere, to say*; *q. d.* *to say the same thing, to consent, agree*.

HOMOLOGOUS, in *Geometry*, is applied to the correspondent sides of similar figures, which are said to be homologous, or in proportion to each other.

The word is composed of ὁμος, *similar*, and λογος, *ratio, reason*; *q. d.* *quantities alike to each other in ratio*. So, if the ratio of A to B be the same as of C to D, here A is homologous to C, as B to D; because of the similitude between the antecedents and consequents. The two antecedents, and the two consequents, then, in any continued geometrical proportion, are homologous terms.

Thus, the base of one triangle is homologous to the base of another similar triangle: so in similar triangles, the sides opposite to equal angles are said to be homologous.

Equiangular, or similar triangles, have their homologous sides proportional.

All similar triangles, rectangles, and polygons, are to each other as the squares of their homologous sides.

HOMOLOGOUS Things, in *Logic*, are such as agree in name, but are of different natures. These coincide with what we otherwise call *equivocal* and *homonymous* terms.

HOMONOIA, in *Botany, from ὁμοιοια, *concord*, alluding to the union of the stamens into various tribes, all co-operating to one end. Lour. *Cochinell.* 636. Clafs and order, *Dioecia Polyadelphia*. Nat. Ord. *Tricocca*, Linn. *Euphorbia*, Juss.*

Gen. Ch. Male, *Cal.* Perianth of three ovate, concave, coloured leaves. *Cor.* none. *Stam.* Filaments about 200, equal to the calyx, united into 20 bundles; anthers roundish,

Female, on a separate plant, *Cal.* Perianth of one leaf, many-cleft, acute, permanent. *Cor.* none. *Pist.* Germen superior, roundish; style none; stigmas three, oblong, villos. *Peric.* Capsule three-lobed, with three cells, and three valves. *Seeds* roundish, solitary.

Ess. Ch. Male, Calyx of three coloured leaves. Corolla none. Stamens 200, in 10 bundles.

Female, Calyx inferior, many-cleft. Corolla none. Stigmas three. Capsule of three cells. Seeds solitary.

1. *H. riparia*. A native of the banks of rivers in Cochin-China, where it is called *Ri ri bô fong*. It is a tree, six feet high, with a thick, upright stem, much branched. The leaves are linear, lanceolate, alternate, entire, downy. Flowers small, in nearly terminal linear spikes, called by Loureiro *amenta*, or catkins; but as he describes the male catkin with three scales to each flower, and a three-leaved perianth besides, it is manifest the former must be bractæas. The whole of his description besides indicates one of the natural order of *Euphorbia*, which are not amentaceous plants.

HOMONOPAGIA, a word used by some medicinal authors for the head-ach.

HOMONYMIA, in *Logic*, an equivocation. See **HOMONYMON**, &c.

HOMONYMON, ὁμωνυμον, composed of ὅμοιος, *similis*, and the Ionic ὄνομα, for ὄνομα, *name*, a word which has different meanings, or which is used to express things of different nature and quality.

Homonyma are the same with what are otherwise called *polyfema*, *synonema*, and *equivocals*.

HOMOIOUSANS, **HOMOUSIANS**, *Homousianists*, *Homousiasts*, formed of ὁμοιοσις, or ὁμοιοσιος, signifying of the same substance, are names which the Arians anciently gave to the orthodox, because they held that God the Son is *homoioufios*, i. e. *con-substantial* with the Father. Hunneric, king of the Vandals, who was an Arian, published a rescript, directed to all the Homoioufian bishops. See **PERSON**, &c.

HOMOIOUSIOS, ὁμοιοσιος, among *Divines*, a being of the same substance or essence with another.

The divinity of Christ having been denied by the Ebionites and Cerinthians in the first century, by the Theodotians in the second, by the Artemonians at the beginning of the third, and by the Samosatensians, or Paulians, towards the close of the same, a council was assembled at Antioch in 269, wherein Paulus Samosatenus, head of this last sect, and bishop of Antioch, was condemned and deposed, and a decree published, as some have said, wherein Christ is asserted to be God of God, and ὁμοιοσιος, i. e. *consubstantial* with the Father.

It has been urged by several ancient writers of the fourth century, viz. Athanasius, Hilary of Poitiers, and Basil, that the council of Antioch rejected the word ὁμοιοσιος, or *consubstantial*, as improper: and if we consider that Eusebius, who has been called an Arian, speaks of Malechion, who directed and governed at this council, as a man of uncommon soundness in the faith of Christ, we may presume that the term was not introduced in this council. The council of Nice, however, assembled in 325, expressly established the Homoioufian doctrine. Many learned writers have taken pains to vindicate the orthodoxy of the council of Antioch, and to shew that both these councils held the same doctrine. See **ARIANS**.

HOMOPHAGI. See **OMOPHAGI**.

HOMOPHONI, in the *Ancient Greek Music*, implied unisons, contrasted with *Antiphoni*, which meant symphonies, or music in octaves. The word is derived from ὅμοιος, *alike*, and φωνή, *sound*.

HOMOPHONI, *Homophonous*, in *Greek Music*, was equivalent to *unifons*, or unisonous performance vocal or instrumental, in which the several parts were of the same pitch.

HOMORAN, or **HOMRAN**, in *Geography*, a town of Arabia, in the province of Yemen; between Sana and Beital-Fakih. In a hill in the vicinity of this town, there are said to be 360 reservoirs for water, cut in the rock. In its district is comprehended a large and fertile mountain, called Burra.

HOMORIUS, in *Mythology*, is an epithet given to Jupiter by the Greeks, answering to *Terminalis* among the Romans. Polyb. Hist. lib. ii.

HOMOROD, in *Geography*, a town of Transilvania; 15 miles N. of Fogaras.

HOMOTONOS, in *Medicine*, an epithet made the characteristic of a certain kind of fevers, which continue from the beginning to the end in one equable and uniform tenor, without exacerbation or relaxation.

HOMS, in *Geography*. See **EMESA**.

HOMUNCIONALES, in *Ecclesiastical History*, an ap-

pellation given by the Arians to the orthodox, who said there were two natures and substances in Christ.

HOMUNCIONISTS, **HOMUNCIONISTÆ**, formed of *homuncio*, a diminutive of *homo*, a man, q. d. *little man*, a sect of heretics, the followers of Photinus, and from him also called Photinians.

They had this appellation, because of their denying the two natures of Jesus Christ, and holding that he was only mere man.

HOMUNCIONITES, **HOMUNCIONITÆ**, were a sect of ancient heretics, whose distinguished dogma it was, that the image of God was impressed on the body, not on the soul or mind of man.

HO-NAN, in *Geography*, a most delightful province of China, situated near the centre of the country, and called by the Chinese Tong-hoa, or the Middle Flower. It is bounded on the N. by the provinces of Pe-tcheli and Chan-si, on the S. by Hou-quang, and on the E. by that of Chan-tong. Its capital is Cai-fong. The ancient emperors, invited by the mildness of the climate and the beauty of the country, fixed their residence here for some time. The abundance of its fruits, pastures, and corn, the effeminacy or rather voluptuousness of its inhabitants, and the cheapness of its provisions, have prevented trade from flourishing in this, as it has done in other provinces of the empire. The whole country is flat, except towards the west, where arises a long chain of mountains, covered with thick forests; and the land is in such high state of cultivation, that those who travel through it imagine they are walking in an immense garden. Besides the river Hoang-ho, which traverses this province, it is watered by a great number of springs and fountains; it has also a valuable lake, which invites to its banks a prodigious number of workmen, because its water has the property of communicating to silk a lustre, which cannot be imitated. Exclusively of forts, castles, and places of strength, this province contains eight *foi*, or cities of the first class, and 102 of the second and third. The population of this province, according to sir George Staunton, amounts to 27,000,000 persons.

HO-NAN, a city of the first class in the fore-mentioned province, situated amidst mountains and between three rivers. The Chinese formerly believed this city to be the centre of the earth, because it was the middle of their empire. Its jurisdiction is very extensive; for it comprehends one city of the second class, and 13 of the third. One of these cities named Teng-fong-hien, is famous on account of the tower erected by the celebrated Tcheou-kong for an observatory; in it is to be still seen an instrument which he made use of to find the shadow at noon, and to determine the latitude. This astronomer lived above 1000 years before the Christian era, and the Chinese pretend that he invented the mariner's compass. N. lat. 34° 44'. E. long. 112° 9'.

HONANELLA, a town of Hindoostan, in Sanore, on the Tungebadra; 15 miles E. of Sanore.

HONCKENYA, in *Botany*, named by professor Willdenow, in honour of his friend Gerard Augustus Honckeney, an able agriculturist. Willd. in Ust. Delect. v. 2. 200. Sp. Pl. v. 2. 325.—Class and order, *Oelandria Monogynia*. Nat. Ord. *Tiliaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of five coriaceous, linear leaves, hairy and coloured externally, deciduous. *Cor.* Petals five, oblong, obtuse, rather shorter than the calyx, deciduous. Nectaries very numerous, capillary, dilated at the top, resembling filaments, shorter than the petals, inserted into the receptacle. *Stam.* Filaments eight, rather longer than the nectaries, inserted into the receptacle, compressed, linear, slightly dilated at their base; anthers erect.

cre 3, oblong, of two cells. *Pist.* Germen superior, oblong, hispid; style thick, cylindrical, shorter than the stamens, erect; stigma with six teeth. *Peric.* Capsule oblong, clothed with very long thorns, of five cells and five valves, whose edges form the partitions. *Seeds* numerous, roundish, rather compressed, brown, rough with elevated points, half-clothed with a thin membranous tunic, and affixed to the central column.

Est. Ch. Calyx of five leaves, inferior. Petals five. Nectaries numerous, resembling stamens. Capsule thorny, with five cells and five valves. Seeds numerous, each with a membranous tunic.

1. *H. ficifolia*. Willd. in *Ust. Delect.* v. 2. 201. t. 4. Native of Guinea, where it was gathered by Mr. Isert. *Stem* woody; its branches round, clothed with short brown pubescence. *Leaves* alternate, on short stalks, toothed, or rather sharply serrated, two or three inches long; tawny and downy beneath: the upper ones oblong, obtuse, undivided; the lower palmate, with three or five blunt lobes. *Flowers* terminal, ternate, stalked, above an inch wide, of a blueish purple.—Nearly akin to *Aubletia* of Schreber and Willdenow, as the latter observes, but “distinguished by the form of its capsule, the stamen-like nectaries, and the tunicated seeds.”—The latter is indeed a good mark, but the supposed nectaries are probably only barren stamens.

HOND, in *Geography*, a town of Hungary, 10 miles N.W. of Tokay.

HONDA, a town of America, in New Granada, situated on the river Magdalena, in N. lat. $5^{\circ} 16'$, and long. E. of Quito $4^{\circ} 9'$. M. Bouguer represents it as a pleasant little town, and the chief mart of the commerce between Quito and the northern provinces.

HONDA, a bay on the N. coast of the island of Cuba; 70 miles W. of Havannah. N. lat. $22^{\circ} 58'$. W. long. $83^{\circ} 25'$.—Also, a bay on the E. coast of the province of Honduras, northward of Cape Gracias á Dios.—Also, a bay on the coast of South America, in the province of St. Martha. N. lat. 12° . W. long. $71^{\circ} 6'$.

HONDEKOETER, GILLES, in *Biography*, born at Utrecht in 1583, imitated the style of composition, and the manner of colouring, of Roland Savery, and David Vinckenbooms. He studied after nature those views which he intended for his landscapes, and in general made an agreeable choice. The forms and leafing of his trees are more in the taste of Vinckenbooms than Savery; but they are well handled, and firmly pencilled, though sometimes perhaps they are a little too brown, or too yellow.

He painted different kinds of fowls with singular truth and exactness, and frequently filled his small landscapes with no other objects; but those he finished highly, and with great transparency of colouring.

HONDEKOETER, GYSBRECHT, born at Utrecht in 1613, was son of the preceding, from whom he learned design and colouring. The subjects he painted were, cocks, hens, ducks, and other domestic fowls, which he described in a lively and strong manner, giving his objects agreeable attitudes, and colouring them exactly after nature. The works of this master are very often injudiciously ascribed to his son, although the paintings of Gysbrecht are in every respect abundantly inferior to those of Melchier Hondekoeter.

HONDEKOETER, MELCHIER, son of the preceding, was born at Utrecht in 1636, and from his infancy was carefully trained up to the profession by his father. He chose the same subjects; but, in his manner of painting them, he surpassed not only his master, but even the best of his contemporaries, in a very high degree. Till he was seventeen

years of age he practised under the direction of Gysbrecht and accustomed himself to paint several sorts of birds; but he was particularly pleased to represent cocks, hens, ducks, chickens, and peacocks, which he described in an elegant variety of actions and attitudes.

After the death of his father, which happened in 1653, he received some instructions from his uncle John Baptist Weeninx; but his principal and best instructor was nature, which he studied with intense application, and that enabled him to give to every animal he painted such truth, such a degree of force, expression, and life, as seemed to equal nature itself; nor did any artist take more pains to study every point that might conduce to the perfection of his art. His pencil was wonderfully neat and delicate; his touch light, his colouring exceedingly natural, lively, and remarkably transparent; and the feathers of his fowls were expressed with such a swelling softness, as might readily and agreeably deceive the eye of any spectator.

It is reported, that he had trained up a cock to stand in any attitude he wanted to describe, and that it was his custom to place that creature near his easel; so that, at the motion of his hand, the bird would fix itself in the proper posture, and would continue in that particular position, without the smallest perceptible alteration, for several hours at a time.

The landscapes which he introduces as the back grounds of his pictures, are adapted with peculiar judgment and skill, and admirably finished; they harmonize with his subject, and always increase the force and the beauty of his principal objects. His touch was very singular in imitating the natural plumage of the fowls he painted; which not only produced a charming effect, but also may prove serviceable to an intelligent observer, to assist him in determining which are the genuine pictures of this master, and which are impositions. The works of Hondekoeter are justly in very great request and estimation, and they generally afford a large price, almost in proportion to their value. He died 1659, aged 59.

HOND-HABEND. See HAND-HABEND.

HONDIUS, ABRAHAM, in *Biography*. This painter, who is well known in our kingdoms, was born at Rotterdam in 1638, according to the most authentic writers, though Descamps fixes his birth in 1650, twelve years later. He appears to have been an universal master, painting, with equal readiness, landscapes, animals of all kinds, particularly dogs, huntings of wild animals, boars, deer, wolves, and foxes, as also conversations and fowls; but his favourite subjects were huntings.

His manner seems peculiar to himself; it was bold and free; and, except Rubens and Snyders, few masters have painted animals in a greater style, or with more spirit. There is certainly a great deal of fire in his compositions; but his colouring is often extravagant, and his drawing extremely incorrect. In general his pencilling was harsh, and he delighted in a fiery tint; yet some of his small pictures are very neatly finished. There is a great inequality as to the merit of the works of Hondius, some of them being in every respect abundantly superior to others; but there is scarce any master whose compositions are so easily distinguishable as those of Hondius, by certain particularities in his touch, his taste of design, and his colouring.

Several of his pictures of dogs are much esteemed; and one especially is mentioned, in which he represented thirty different species of those animals, all being well designed, and every distinct animal being characterized with some peculiar air, action, expression, or attitude. As he was exceedingly harassed and tormented with the gout, the works of his latter

time are more negligently executed than those which he finished in his prime; and, therefore, they very much contribute to lessen the reputation he had acquired by some of his more studied and better finished performances.

His most capital picture is the burning of Troy, in which there are a variety of figures, many of them well designed and disposed with judgment. Houbraken also mentions a candle-light of this master's hand, in which appeared a fine opposition of light and shadow, and the figures were extremely well designed and well coloured. He died 1691, aged 53.

HONDO, in *Geography*, a kingdom of Africa, in the Sierra Leone country, bordering on Quoja, between the Grain Coast and the river Scherbro.

HONDTSCHOOTE, a town of France, in the department of the North, and chief place of a canton, in the district of Bergues; 10 miles S. E. of Dunkirk. The place contains 3168, and the canton 11,194 inhabitants, on a territory of 130 kilometres, in eight communes.

HONDURAS, a province of the domain or kingdom of Guatimala, in the Spanish dominions of North America, bounded on the N. by a bay of its own name, on the E. by the Mosquito shore and Caribbean sea, on the S. by Nicaragua, and on the W. by Guatimala and Vera Paz. The extent of this province is reckoned about 390 miles from E. to W., and 150 from N. to S. The country, which consists of mountains, vallies, and plains, is watered by many rivers, and the land is thus much enriched. It abounds with honey, wax, cotton, fine wool, and particularly dyeing woods, and has some gold and silver mines; the air is good except near low grounds and morasses; the soil is fertile, and in many parts produces Indian corn thrice in the year, together with wheat, peas, &c. Its pastures are excellent, and it furnishes all kinds of provisions. Its vineyards afford grapes twice in the year; for immediately after the vintage, the grapes are cut again; and the second grapes are ripe before Christmas. For want of cultivation, many parts of this rich country have become desert. Its chief towns are Valladolid the capital, Truxillo, Omoa, Gracias á Dios, and St. Jago. It derives its chief importance from those tracts on the bay which furnish logwood. (See *Bay of HONDURAS*.) The Mosquito Indians have entered into treaties with the English, who carry on the trade of mahogany and dyeing-woods.

HONDURAS, *Bay of*, a bay of the Caribbean sea, adjoining the province of the same, and situated between Cape Honduras and Cape Catoche, the north-easternmost point of Yucatan, in lat. $21^{\circ} 14'$. The country, adjacent to this bay, is chiefly inhabited by the Mosquito Indians, who were formerly more numerous, but their population has been diminished by the prevalence of the small-pox. A nation, still populous, has been fixed in the environs of Cape Gracias á Dios. This consists of the Sambocs, said to be the descendants of the crew of a Guinea-ship, which was formerly wrecked in these latitudes. Their complexion, their features, their hair, and their propensities, will scarcely allow us to trace them to any other origin. The first establishment of the English in these regions was formed about the year 1730, at the distance of 26 leagues from Cape Honduras. At the distance of 54 leagues from this colony is Gracias á Dios, the harbour of which, formed by an arm of the sea, is immense, and tolerably safe. It was near this famous cape that the English fixed themselves, upon a navigable river, the borders of which are very fertile. Seventy leagues beyond this, these people found at Bluefield some spacious and fruitful plains, an accessible river, a convenient harbour, and a rock which might be easily made impregnable. In

1769 the three factories did not employ more than 206 white men, as many mulattoes, and 900 slaves. Exclusively of the mules and other articles sent to Jamaica, they sent this year to Europe 800,000 feet of mahogany, 200,000 pounds weight of farfaparilla, and 10,000 pounds of tortoise-shell. This commerce had been very much carried on by smugglers; but in 1763 the liberty of felling logwood was secured to Great Britain; however, she was not permitted to raise forts, and was even obliged to destroy those which had been built. The abbé Raynal observes, that the wood which grows upon the dry soil at Campeachy, is much superior to that which is cut in the marshes of Honduras; though the last-mentioned wood was most in use, because the price of the former had for a long time past exceeded all bounds. Captain Henderson has lately (*viz.* in 1809,) published "An Account of the British Settlement of Honduras," the result of his own observations and inquiries. The climate, he says, is better than that of most of our West India islands; the air being refreshed with regular sea-breezes at all seasons, except during the early part of summer, *viz.* the months of April, May, and June. The average heat is 30° . The only settlement formed by the English, which deserves the appellation of a town, is called Balize, lying at the mouth of a river of the same name; which contains about 200 houses, all built of wood, and raised on pillars eight or ten feet from the ground. The stores and offices occupy the first floor, and the dining and sleeping rooms are placed on the second. Each house has, likewise, its upper and lower piazzas, which form the coolest retreats in the building. The river Balize is navigable above 200 miles up the country; and several of our settlers have proceeded to that distance in quest of wood. The bay of Honduras is sprinkled with a great number of shoals, rocks, and clusters of drowned islands, which render the navigation dangerous, and which, without skilful pilots, has occasioned many wrecks. The danger is increased during the prevalence of the northerly winds, when the weather is generally hazy, and the currents are subject to the influence of the winds. The vicinity of Honduras to several of the Spanish settlements renders it an appropriate station for the introduction of our manufactures, which has been hitherto subject to considerable impediments. The industry of our settlers has been so exclusively directed to the wood-trade, that agricultural cultivation has been neglected; though the soil is admirably rich, and fitted to produce either the sugar, coffee, and cotton of our West India islands, or the rice and maize of the continent. The fisheries might also be rendered very productive; that which is most regarded is the turtle-fishery. Some few of the turtle caught here find their way to London; but most of them, especially the species called "Hawk's bill," which yield the tortoise-shell, are consumed on the spot. The country still remains almost wholly covered with wood. The cutting of mahogany takes place twice in the course of the year; *viz.* at Christmas and in autumn. The labour is performed by negroes, each gang of whom has a "hunter," whose business it is to search the woods and discover the spot where the exertions of his fellow-labourers may be most profitably employed. In order to effect his purpose, he cuts his way through the woods, and climbs the tallest trees, in order to survey the surrounding country. The colour of the mahogany leaves aids his eye in tracing the most abundant spot. The mahogany tree is cut about twelve feet from the ground, the axe-man standing on a stage. The trunk of the tree furnishes, of course, the wood of largest dimensions; but for ornamental purposes the branches are preferable, the grain in them being closer, and the veins more variegated. As these trees are generally found separate and

disperfed, a mahogany-walk comprehends an extent of feveral miles. Their growth is rapid, but lefs fo than that of the logwood-tree, which is laid to attain maturity in five years. The trunks and branches are dragged to the river-side, put together in rafts, and floated to the coast. Moft of the negroes employed here have been brought from Jamaica, or have accompanied their owners from the United States; no direct importation from Africa having taken place, they are fubjected to much lefs labour than the flaves in our fugar colonies. The protection afforded by government to the Honduras trade, confifts in a convoy being appointed from Jamaica twice in the year, *viz.* in January and July. The annual revenue of the fettlement is about 5000*l.* fterling.

Of the aquatic fpecies of birds around the bay of Honduras, the pelican and cormorant are the moft predominant, induced to refort thither for prey by the transparency of the fea on this coast. Swallows alfo appear in great numbers in the rainy feafon. They are obferved to quit in a body, as foon as the dawn appears, the Savannah, in which they have refted during the night, and to afcend into the air in a compact fpiral form, like a water-fpout or column of fmoke. Having attained a certain height they difperfe in queft of food, which forms the occupation of the day. At fun-fet their defcent takes place in the fame manner, with inconceivable rapidity, and with a noife which can be compared only to the ruftling of a blaft or the fall of a torrent. On the Mofquito coast the flies are fo troublefome that the natives are obliged to quit their dwellings in certain feafons, and to pafs their nights in little barks upon the water. Thefe people feem to have arrived at that ftage of favage fociety which belongs to the clafs of "small defpotifms." All the affairs of domeftic life are performed by women; the fucceffion to the crown is hereditary; and the royal power is completely defpotic, abforbing within itfelf the executive, the legislative, and the judicial functions. They manifelt no trace of religion except the adoration of evil fpirits; and they have among them neither phyfician nor lawyer, but abound in conjurors. Polygamy is freely allowed; but adultery is punifhed, though not capitally. They can fupport long abftinence from food, but they indulge in the customary exceffes of favages when they get poffeffion of provifions, continuing their repaft day and night, except in the fhort intervals of fleep, until they have confumed their whole ftock. The warriors of the Mofquito tribe may amount to the number of 1500; and fmall as this force is, they are able to keep their inland neighbours, whofe manners are much ruder, in a ftate of dependence. The Mofquitos have an hereditary averfion to the Spaniards, and profefs great attachment to our countrymen.

HONDURAS, Cape, called alfo *Punta de Cafilla*, a cape of North America, at the eaftern fide of the bay of Honduras. N. lat. 16'. W. long. 86 16'.

HONDURAS, Sea of, is that part of the North fea bounded N. by the ifland of Cuba, S. by the Mofquito fhore, S.W. by the bay of Honduras, W. by the peninsula of Yucatan, N.W. by the gulf of Mexico, E.N.E. by Jamaica, and the Caribbean fea.

HONDUROS, a town of the ifland of Cuba, 63 miles N.E. of Bayamo. N. lat. 21 21'. W. long. 76° 4'.

HONE, NATHANIEL, in *Biography*, a portrait painter, who praftifed in London, with confiderable reputation, in oil and miniature, and more particularly in enamel. He was one of thofe artifts who were created members of the Royal Academy at its foundation. He died in 1784.

HONE, Cape, in *Geography*, a cape on the coast of Algiers, called by the natives "Ras Hunneins," and by the ancients

"Promontorium Magnum," fituated, according to Dr. Shaw, in N. lat. 35° 24'. W. long. 1° 0'.

HONE Key, a fmall ifland in the Spanifh main, at the entrance of Bluefield's bay. N. lat. 11' 30'. W. long. 83° 1'.

HONE, a fine fort of whet-ftone, ufed for fetting razors, pen-knives, &c. (See *WHET-ftone*.) This is the *cos novacula* of Linnæus, with fmall gritty particles. See *Cos Novacula* and *Oil-ftone*.

It is of a yellowifh colour, and is vulgarly, but erroneoufly, fuppofed to be holly-wood petrified or changed into ftone, by lying in a petrifying water for a certain feafon.

Of thefe waters there are laid to be fome in Oxfordfhire, that will thus petrify in a very fhort time.

A fort of hones is dug near Drogheda in Ireland: fome have defcribed thefe as petrified wood, from the vicinity of Lough Neagh.

At Woodthorp, Codnor upper park, and other iron-ftone mines in Derbyfhire, thin beds of iron-ftone are found in the binds belonging to the coal-meafures, which make pretty good hones when cut and ground to a face. See *Farey's Derbyfhire Report*, vol. i.

HONES, bed of, or **HONE-plate**, is one of the tools ufed in the operation of grinding fpecula for telefcopes. This is formed of pieces of the fineft blue hone or whet-ftone, which are nearly of the fame breadth and thicknefs, and which, when whetted, appear moll even and uniform in their colour and grain. Thefe pieces are to be cut into fquare bits, and having ground one fide of each concave on the convex marble, to which they are to be applied, with emery or fine fand, they are to be cemented upon this thick round piece of marble in a kind of pavement, leaving a fpace of a fmall ftraw's breadth between each, and placing their grain in an alternate direftion. Mr. Mudge, inftead of marble, ufes metal made of lead and tin, on which the hones are to be fo difpofed that the lines between them may run ftraight from one fide to the other; and by this difpofition, the teeth of a fine faw, moved along each of the divifions, will clear away the cement which rifes between the ftones. This bed of hones fhould be at leaft a fourth part larger than the metal which is to be ground upon it. The furface of the metal, upon which it is to be cemented, may or may not, at the pleafure of the workman, be turned of a convexity fuitable to the gage. As foon as the hones are cemented down, and the joints cleared by the faw, the tool muft be fixed in the lathe, and turned as exactly true to the gage as poffible. By this inftrument the fpherical figure of the fpeculum is completed, and its furface rendered fit for the polifher. See *Plate VI. Optics*, fig. 2. *Smith's Optics*, book iii. chap. ii. art. 791. *Phil. Trans.* vol. lxxvii. part i. p. 307. See *GRINDING*.

HONE-wort, in *Botany*. See *SISON*.

HONESTY. See *LUNARIA*.

HONEY, MEL, is a fweet vegetable juice, collected by the bee from the flowers of different plants, and deposited in the cells of the combs. See *BEE*.

It has been long known, that the bees collect their honey as well as their wax from the flowers of plants; but former writers had no diftinct knowledge of the feveral parts of the flowers which furnifhed thefe induftrious infefts with two fuch different fubftances. It is now known that the honey is procured from thofe parts of the flowers which were firft difcovered by Linnæus, and to which he has given the name of *nectaria*: thefe are certain veficles or glands fituated near the bafis of every petal, and continually fecreting a nectareous or melleous juice. It is not yet afcertained from what part of the flower or plant the bees collect the wax; fome have fuppofed that it is furnifhed by the farina contained in the apices

HONEY.

of the flowers; but N. Polhill, esq. an ingenious friend of the editor, of whose extensive and accurate acquaintance with the economy of the bees he has availed himself in articles pertaining to this subject, assures him that this is not the case; and that it is still undiscovered from whence they procure the wax. See WAX.

The bee seizes upon this part of the flower, and sucks from it their honey, or a juice of that nature, which will become honey under her management. She receives this into her body, and carries it home to the hive, where she unloads herself by emptying it into the cells which were before prepared to receive it. The bee does not receive the honey in collecting it from the flowers into the body, by means of her trunk, as many have supposed; for this trunk serves only to collect the sweet juice, in small drops, from the nectaria of flowers. When the trunk is thus loaded with the juice or honey, it deposits it on the tongue, which is exerted for that purpose, and being drawn back into the mouth, conveys it into the œsophagus. The œsophagus of the bee is a long and slender canal, passing from the mouth into the thorax; towards its termination in that part it is distended into a sort of bag, which forms the first stomach of the bee. Maraldi supposed the receptacle of the honey to be a bag, closed at the lower end, and only destined to receive the honey, and disgorge it again upon occasion; but Swammerdam, on a more accurate dissection of this insect, found it to be a real stomach, opening into another or second ventricle. The first stomach, when empty, is no more than a white filament, which, being hollow, is capable of receiving the honey; and, when received, it becomes swelled and distended in proportion to the quantity it contains, and is very narrow at its lower part, where it is joined to the second stomach. This is a sort of white transparent bladder, and is usually much distended, and so covered with large and broad circular muscles, that it seems to resemble a tub with many hoops. This stomach becomes again very slender and narrow at its lower end, where it is joined to the intestines. The second stomach and the intestines of the bee are often found to contain a great quantity of the farina; but the first stomach contains only honey, and is seen, by dissection, to be furnished with all the organs of contraction and distension which are necessary for throwing out its contents. When the honey has undergone a kind of concoction in the stomach, and is become much thicker than in its undigested state (though the gentleman already referred to apprehends that it undergoes no kind of change in the stomach of the bee), it is disgorged again through the mouth, and not as Swammerdam erroneously imagined, through a small orifice in the end of the trunk. The process of this operation may be easily discovered in glass hives, where the cells reach to the glass, and have only four sides of wax, the glass serving for the other two sides.

The bee that comes loaded to the cell thrusts its head very deep into it, and discharges the honey from its stomach in a very little time, and seemingly with very little trouble, by the mouth. One bee succeeds another till the whole cell is filled. In this work, it has been often observed, that what appears to be the last quantity of honey disgorged into the cell is always of a different appearance from the rest: this is of the nature of a cream, and is always much thicker than the rest of the honey, which appears of one colour and consistence; it seems to be very useful in the economy of the work, serving at once to keep the honey moist, and to prevent its running out by any accident. Though this cream or crust appears to be the last voided quantity, it is not so in reality, for it seems to have been gathered together from the first; and every fresh quantity of honey is added under, not upon its surface. To this purpose it is always observed, that the

bee which comes loaded to the cell does not at once discharge its honey into it, but entering into the cell as deep as possible, it puts forward the anterior pair of legs, and with them pierces a hole through the crust or cream. While this hole is kept open by the feet, the bee disgorges the honey in large drops from the mouth; these, falling into the hole made by the feet, mix with the mass below, and the bee, before it flies off, remodels the crust, and closes up the hole; and this is regularly done by every bee that contributes to the general store of the cell.

The several cells of the combs in every hive are differently filled with honey, and for different purposes: some is laid up for immediate consumption, on occasions of bad weather and the like accidents, or for the use of those bees that in good weather stay at home to work, and are not supplied in any other way by those which have been abroad collecting honey; and some is more carefully preserved and destined for the support of the swarm in the winter. Whenever any cell is filled with honey, it is always closed up, and never opened again, till all the honey in the cells which were not full is expended. The manner in which the bees make the lids or covers of the cells is this: they form a circle or ring of wax just within the verge of the cell; to this they add another such ring, and then another within that; and thus the aperture is rendered smaller and smaller, and by a continuance of the same operation is finally closed, the lid being composed of a vast number of concentric circles. This covering is designed for preserving the inclosed honey in a state of proper consistence, for a winter store.

Honey has been supposed by many to be the only food of the bees who collect it; but this is evidently erroneous. The farina of flowers serves as food for young bees, whilst they are in the form of maggots, but it is not so certain whether the old bees eat it or not; after which some say it is again thrown out of their mouths in form of wax, and used in the structure of their cells; but others absolutely deny this, because the farina of different flowers varies in colour, whereas the wax is uniformly white.

Honey and wax form so considerable an article in the riches of a kingdom, that M. Reaumur strongly recommended to the court of France, the encouragement of those who raise swarms of bees, by deducting something from their taxes in proportion to every hive of bees kept by them above a certain number. And as bees are so easily raised, and kept with so little expence and trouble, it is a wonder that they are not more generally propagated in the kingdom. One great means of preserving and multiplying the bees would be the abolishing of that barbarous as well as prejudicial custom, which has hitherto very generally prevailed, of destroying the whole hive of bees in order to obtain the honey. Reaumur's Hist. Inf. vol. x. p. 89, &c. See HIVE.

Honey is an article from which the cottage labourer frequently derives a very beneficial profit; and this would still be considerably larger, if greater care was taken to have a more abundant supply of flowers in or near the situations in which the bees are kept.

There are many circumstances necessary to the forming of good honey, such as a warm and clear air, a good state of health of the bees, and a quantity of aromatic and sweet flowers in the neighbourhood of their hives. Some naturalists suppose that honey is of a different colour, according to the difference of the flowers or plants from which the bees suck it. The ancients esteemed that of lilies and roses to be the best; and Strabo relates, that there is a kind of honey in Pontus which is a strong poison, being procured

HONEY.

by bees which feed upon aconite and hemlock. F. Lambert, however, assures us of the contrary, and affirms it to be the best honey in the world, on account of the great quantity of baum that grows there. He adds, that there is another very white kind of honey, hard as sugar, which does not stick to the hands. At present, the honey of Narbonne, in France, is held to excel all others, on account of the rosemary which abounds there. Bees are uncommonly fond of the lime-tree, the privet, and phillyrea; and in Lithuania, there are large quantities of wild bees, who lodge in hollow trees in woods, and collect their honey chiefly from the lime; so that when the season happens to be unfavourable at the time of the blowing of the lime, it is succeeded by a scarcity of honey. However, it is not to be supposed, that the bee confines itself to one particular flower; nor does it appear that the honey collected from one kind of flower differs essentially from that which is the produce of another; the only difference being in the quantity, colour, or some slight flavour from the flower. Excellent honey has been produced where nothing grew but nettles and other weeds.

The honey taken out of the hives in the beginning of summer is preferable to that gathered in autumn, since the first is the season in which the bees are most vigorous, and the plants in their flowering state.

We have two kinds of honey, the *white* and *yellow*.

The *white*, *mel album*, called also *virgin* honey, is that deposited in clean new cells, which, when first formed, are of a pure white colour; but when the combs are old, especially if bees have been bred in them, they become foul and discoloured, and vitiate the honey lodged in them. New honey is nearly as fluid as water, by age it acquires a greater degree of consistence, and the cold of winter frequently congeals it. The second kind, or *mel flavum*, is squeezed from the combs in a press, after having first softened them with a little water over the fire. There is also an intermediate sort of a yellowish white colour, drawn by expression, without fire. That which runs spontaneously is purer than the expressed; a quantity of the wax and other impurities being forced out along with it by the pressure, especially when the combs are previously heated. The best sort of honey is of a thick consistence, easily and totally soluble in cold water, of a whitish colour, an agreeable smell, and a very pleasant taste.

Honey, exposed to a gentle heat, as that of a water-bath, becomes thin, and throws up to its surface its waxy impurities, together with the meal or flower sometimes fraudulently mingled with it, which may be thus separated by despumation, so as to leave the honey pure, and to form the *mel despumatum* or clarified honey. On continuing the heat, there rises a considerable quantity of aqueous fluid, impregnated with the fine smell of the honey; the inspissated residuum, like the honey at first, dissolves both in water and in rectified spirit, and promotes the union of oily and resinous substances with watery liquors. By treating the inspissated mass with moist clay, as practised by the sugar-baker for purifying sugar from its unctuous treacly matter, the unctuous parts of honey may in like manner be separated, and its pure sweet matter obtained in the form of a solid, saline, white concrete.

The specific gravity of clarified honey has been fixed at 1.31; but the tenacity of medicated honeys in general is the more usual test of the proper consistence. If a portion of it, when cold, be divided by the edge of a spoon, it ought to unite again very slowly.

It is observed, that the boiling of honey, though it dissipates great part of its odorous matter, and thus proves in

some cases injurious to it, is nevertheless in other cases of advantage. There are particular constitutions with which honey disagrees, and in which very small quantities occasion gripes, purging, and great disorders; but boiling deprives it of that quality which produces these effects. Neumann's Chem. by Lewis, p. 330. Lewis's Mat. Med. p. 376.

This juice is an useful sweet for medicinal as well as domestic purposes: it is more aperient and detergent than the simple sweet prepared from the sugar-cane; and particularly serviceable for promoting expectoration in disorders of the breast, and as an ingredient in cooling and detergent gargarisms. For these and other similar intentions it is sometimes mixed with vinegar in the proportion of two pounds of clarified honey to one pint of the acetic acid, boiled down to a proper consistence in a glass vessel over a slow fire, and thus forms the oxymel simple of the shops; it is also impregnated with the virtues of different vegetables, by boiling it in the same manner with their juice or infusions, till the watery parts of the juice or infusion have exhales and left the active matter incorporated with the honey. See OXYMEL.

Honey contains a quantity of fixed air, and is antiseptic as well as detergent and diuretic. Sir John Pringle recommends one pound and a quarter to be taken regularly every week in cases of the gravel, or when the kidneys are loaded with sand.

Honey is the basis of several compositions in pharmacy, though in this respect it is less used than formerly. Of honey, with the addition of roses or violets, mercurialis, &c. (see OXYMEL), was made *mel rosatum*, *mercuriale*, *bel-leboratum*, &c. There is also a *mel scilliticum*, or a preparation of squills; *mel passulatum*, made with raisins boiled in hot water; and *mel anthosatum*, made with rosemary-flowers.

Rose honey, *mel rose*, *rosaceum*, or *rosatum*, is prepared by macerating four ounces of red rose petals dried in three pints of boiling water for six hours, and then straining, and afterwards adding five pounds of clarified honey to the strained liquor, and by means of a water-bath, boiling it closely down to a proper consistence.

Honey of *borax*, *mel boracis*, is prepared by mixing a dram of borate of soda powdered with an ounce of clarified honey. This combination is usefully employed as a detergent in apthous affections of the fauces.

Honey is also an ingredient in several drinks, as mum, metheglin, &c.

The chemists also draw a water, a spirit, an oil, &c. from honey.

Mr. Lemery, in his analysis of honey, observes, that two pounds of fine honey distilled in balneo Mariæ, afford six ounces of clear water of an insipid taste and of the smell of honey: this is commonly called the *dew* of honey. A larger quantity of phlegm may be procured by continuing the distillation, but it becomes foul. This liquor, though insipid to the taste, yet contains a latent acid, for it reddens the turnsole; but it neither ferments with the volatile nor fixed alkalies. The cucurbit being now placed in the sand heat, there come over four ounces of a yellowish pellucid water of an acrid taste, of a strong smell of honey, and somewhat empyreumatic: this liquor reddens the turnsole colour more than the former. The fire being increased, there arise white clouds, which fill the head of the cucurbit and the receiver, and these finally condense into a third liquor, which is called the spirit of honey. This will be about three ounces in quantity, and of a red colour and empyreumatic smell, yet with an agreeable flavour, and of

an acrid and burning taste. This is a stronger acid than either of the former, and ferments with an alkali.

The fire being again increased, more clouds arise, and, in fine, there is a fourth liquor produced; this is in quantity about two ounces, of an orange colour, and of an acid taste, but less acrid than the third liquor, as it contains more oil, which softens and sweetens it. Like the former, it ferments with alkalies, and reddens the colour of turnsole. When the distillation is thus finished, there will remain in the cucurbit fifteen ounces and a half of a light spongy black coal. (Mem. Acad. Par. 1706.) This is to be then put under a retort for a fresh distillation, and a strong fire under this vessel will raise from it seven ounces of a reddish brown liquor, which stains the fingers to an orange colour, of a burnt smell, yet with something agreeable in it, and of an acid and very acrid pungent taste. Besides this, there come over two drams of a thick black oil, looking like tar; this also was of an acrid taste, which was owing to some of the salts of the honey being blended with it. There is much more oil contained in the honey, but it does not come over separate but blended with the other liquors; and after they have stood some days precipitates itself from them, and is found sticking to the sides and bottom of the vessel. The matter remaining in the retort is about seven ounces of a black coal, of a light spongy texture, and of a taste almost insipid, and only seeming to contain a little salt. We see by this process, that thirty-two ounces of honey yield twenty-four ounces and two drams of liquor, that being the difference in weight, between the honey when first put in, and the last *caput mortuum*. Twenty-two ounces and six drams are the quantity here preserved of the several liquors, the rest having escaped through the junctures of the vessels, as will always be the case in such distillations. Id. *ibid*.

The *caput mortuum* of this, and several other distillations of honey, the whole making three pounds and a half, were put into an unglazed earthen pot, and calcined over the fire for ten hours; this readily took fire like common charcoal, and burnt till it lost ten ounces in weight, but without falling into ashes. The remaining coal had then a more saline taste than before. Any acid liquor poured upon this fermented, as with the common alkalies; and when thrown into water to make a *lixivium*, it bubbled in the manner of quick-lime thrown into water; and in the common way of making the *lixivial* salts, this yielded a dram and a half of an acrid alkaline one.

It is remarkable, that the calcined *caput mortuum* of honey contains, like other vegetable ashes, true particles of iron, which adhere to a knife touched with a magnet.

HONEY, *Wild*. St. Adaman, abbot of Hii, in his description of the holy places, observes, that in the place where St. John the Baptist lived in the Desert, there are locusts which the poor people boil with oil, and a sort of herbs with large, long leaves of a milk colour, and a taste like that of honey; and that this is what in scripture is called *wild* honey. See ACRIDOPHAGI.

HONEY-bird, in *Ornithology*. See TROCHILUS.

HONEY-buzzard, the English name of the *Buteo apivorus*. See FALCO *Apivorus*.

HONEY of Roses. See ROSE, and HONEY, *supra*.

HONEY-comb, a waxy structure, full of cells, framed by the bees to deposit their honey, eggs, &c. in.

The construction of the honey-comb seems one of the most surprising parts of the work of insects, and the materials of which it is composed, which though evidently collect-

ed from flowers of plants, yet do not, that we know of, exist in them in that form, have given great cause of speculation to the curious. The regular structure of the comb is also equally wonderful. When the several cells in it are examined, it should seem that the nicest rules of geometry had been consulted for its composition, and all the advantages that could be wished or desired in a thing of that kind are evidently found in it.

The bees, in the structure of this receptacle of their honey, seem to have resolved a geometrical problem, far from an easy one, and indeed clogged with so many conditions, that it might have puzzled able proficients in that science. This may be expressed in these words: a quantity of wax being given, to form it into a number of angular and equal cells, of a determinate capacity, but the greatest that can be made with that quantity of wax, and, at the same time, that these cells shall be so disposed as to take up as little room as possible in the hive. In order to this last condition, it is necessary that the cells touch one another, in such a manner, that there be no angular space nor cavity between them. The bees have effected all this by making the cells all hexangular, or tubes of six equal sides; triangular, quadrangular, and some other figures; for the cells might have been indeed so disposed between one another as to leave no space; but then an equal number of them could not be made with the same quantity of wax. The body of the bee being rounded, it will also be received into an hexangular cell, without leaving such large spaces as it must if received into a triangular or square one.

The method of making two sets of cells in each comb, is also admirably contrived to save the expence of wax, since, had they been made single, every comb must have had its peculiar base, and every set of cells their bottom of wax; whereas one bottom now serves to two cells, and there is but one plate of wax in the centre of a double comb. There is, however, this farther difficulty attending it, that the several cells are not so many hexagonal tubes with flat and broad bases, or tubes of an equal breadth all the way; but they are truly pointed at the bottom, being every one of them a hexangular cell, with a pyramidal base, and forming that kind of figure, as Maraldi and Reaumur first discovered, which requires at least wax for containing the same quantity of honey. Each of these bases is composed of three equal rhombuses, and each base, in this manner, becomes the base of three other cells on the opposite side of the comb.

This is easily demonstrated to those who understand geometry, by means of the several figures and positions of the opposite bases of the cells of the two sides of the comb; but the most familiar explication of it to a common observer, is to stick three small pins through the base of any one cell, each in the centre of the rhomb that makes one side of that base: if, after this, the comb be turned, the three pins will be found in the centres of three different cells of the opposite side.

The obtuse angles of the three equal rhombuses that form the base, are found to be the doubles of an angle, (which often comes under consideration in questions relating to *maxima* and *minima*), whose tangent is to the radius as the diagonal is to the side of the square. By this construction, three of the six solid angles at the base, that correspond to the angles of the hexagon, are equal to each other, and also to the solid angle at the apex of the figure, each of which solid angles is respectively formed from three equal, plane, obtuse angles; and the other three solid angles are also equal to each other, but each of them is formed by four equal, plane,

plane, acute angles, which are the supplements of the former obtuse angles. Monf Maraldi found, by mensuration, that the obtuse angles of the rhombuses were nearly 110°, and observed, that if they were supposed equal to each other, each of them must be 109° 28'; and Mr. Koenig, by the method of infinitesimals, found, that this angle, in order to employ the least wax possible in a cell of the same capacity, ought to be 109° 26'. Mr. Maclaurin has also demonstrated, from the principles of common geometry, that the most advantageous angle is that which results from the supposed equality of the three plane angles forming the solid angle. We shall subjoin the demonstration for the sake of the mathematical reader.

Let GN and NM (*Plate VIII. Geometry, figs. 98 and 99.*) represent any two adjoining sides of the hexagon, or the section of the cell perpendicular to its length. The sides of the cell are not complete parallelograms, as CGNK, BMNK, but trapezia, CGNE, BMNE, to which a rhombus CEBε is fitted at OE, that has the opposite point ε in the apex of the figure; so that three rhombuses of this kind, with six trapezia, may complete the figure of the cell. Let O be the centre of the hexagon, of which CK and KB are adjoining sides; join CB and KO intersecting in A; and, because COB is equal to CKB, and KE equal to Oε, the solid EBCK is equal to the solid εBCO; whence it follows, that the solid content of the cell will be the same, wherever the point E is taken in the right line KN, the points C, K, B, G, N, and M, being given. It is, therefore, necessary to enquire, where the point E is to be taken in KN, so that the area of the rhombus CEBε, together with that of the two trapezia CGNE, ENMB, may form the least superficies. Because Eε is perpendicular to BC in A, the area of the rhombus is AE × BC, and that of the trapezia CG + EN × KC; the sum of these is AE × BC + 2KN × KC - KE × KC; and because 2KN × KC is invariable, we are to enquire when AE × BC - KE × KC is a minimum?

Suppose the point L to be so taken upon KN, that KL may be to AL as KC is to BC. From the centre A describe in the plane AKE, with the radius AE, an arc ER meeting AL, produced, if necessary, in R: let EV be perpendicular to AR in V, and KH be perpendicular to the same in H; then the triangles LEV, LKH, LAK, being similar, we have LV : LE :: LH : LK :: LK : LA :: KC : BC by the supposition. Hence, when E is between L and N, we have LH + LV (= VH) : LK + LE (= KE) :: KC : BC; and when E is between K and L, we have LH - LV (= VH) : LK - LE (= KE) :: KC : BC; that is, in both cases we have KE × KC = VH × BC; and consequently AE × BC - KE × KC = AE × BC - VH × BC = AE - VH × BC = AR - VH × BC = AH + VR × BC: which expression, because AH and BC do not vary, is evidently least when VR vanishes, *i. e.* when E is upon L. Therefore CLB is the rhombus of the most advantageous form in respect of frugality, when KL is to AL as KC is to BC. But as OK is bisected in A, KC² = OK² = 4AK², and AC² = 3AK², or BC = 2AC = 2√3 × AK; consequently, KC : BC :: 2AK : 2√3 × AK :: 1 : √3; and KL : AL :: (KC : BC ::) 1 : √3; or AL : AK :: √3 : √2; and (because AK : AC :: 1 : √3) AL : AC :: 1 : √2; *i. e.* the angle CLA is that, whose tangent is to the radius as √2 to 1, or as 14142135 to 1000000; and therefore it

is 54° 44' 8", and consequently the angle of the rhombus of the best form is that of 109° 28' 16'.

By this solution it is easy to estimate what saving is obtained by means of this construction.

If the base were flat, and not of the pyramidal form above described, then, besides completing the parallelograms CGNK and BMNK, the surface of the base had would be 3CB × AK; what they really do form amounts in surface to the same parallelograms, and 3CB × AH; the savings therefore amount to 3CB × AK - AH = 3CB × AH × $\frac{\sqrt{3} - \sqrt{2}}{\sqrt{2}}$, which is almost a fourth

part of the pains and expence of wax they bestow above what was necessary for completing the parallelogram sides of the cells.

Mr. Maclaurin has also demonstrated, that the plane angles CLB, CLN, and BLN, which form the solid angle at L or the apex at l, are equal to each other; from which it is obvious, that the four acute, plane angles, which form the solid angle at C or B, are likewise mutually equal. It may be also added, that if the cells had been of any other form than hexagonal, and the bases had still been pyramidal, these must have been terminated by trapezia, and not by rhombuses, and therefore they would have been less regular, because OA and AK would have been unequal. Nor could there have been room for such an advantageous or frugal construction as that we have described, because the solid contents of the cell would have increased with the right line KE. See *Phil. Trans. abr. vol. ix. p. 2, &c.*

This construction not only occasions a very great saving of the wax or matter of the comb; but besides this, there is another great advantage, which is, that the angles, resulting from this combination of the bases, greatly strengthen the whole work.

The matter of which the comb is made, costs the bees so much pains and labour in collecting, that it is no wonder they are careful and sparing of it in the work. The sides of the cells are all much thinner than the finest paper, and yet they are so strengthened by their disposition, that they are able to resist all the motions of the bee when within them, as they are very frequently obliged to be. The effect of their thrusting their bodies into the cells, would be the burling of those cells at the top, were not this well guarded against. But to prevent this, the creatures extend a cord or roll of wax round the verge of every cell, in such a manner, that it is scarcely possible they should split in that particular part. This cord or roll is at least three times as thick as the sides of the cell, and is even much thicker and stronger at the angles of the cell than elsewhere; so that the aperture of each cell is not regularly hexagonal, though its inner cavity be perfectly so.

The bases of the cells are not always perfectly triliteral; sometimes, instead of the three rhombs they should be composed of, they consist of four pieces, the bee having begun her work wrong; but then it is admirable to observe, how nicely the two smaller pieces are afterwards joined, that the angle they make may be as nearly as possible equal to that of one of the rhombs, so that the base of the cell still remains very nearly triliteral.

It would be a most desirable thing to see the bees at work in their making these elegant and regular fabrics; but it is scarcely possible to see any thing of this kind distinctly, even with the advantages of glass hives; for no bee ever works singly on this occasion, but wherever the fabric is erecting, there are numbers together, all trying to assist one another; and their motions are so swift, and so hid by their standing

before

before one another, that very little is to be seen of them. New bees are every moment coming to the place, and old ones going away; and very frequently those which arrive late are dispatched away immediately after they arrive. There are only some very short moments in which the glasses of the hives can give a view of the creatures regularly employed in their work, for the moment that one sees a bee at work in building, that moment we see one either fly off, or some other bee get before her, so as to hinder the view.

These momentary sights, however, are sufficient to make it plain, that the bee uses her teeth in modelling and fashioning the wax. The side of a cell is always received between the two teeth on this occasion, and by means of repeated blows on each side from each tooth, the side is brought to a proper thinness, and the wax is by the same means wrought up to a proper consistence and firmness.

The celerity with which a swarm of bees received into a hive, where they find themselves lodged to their minds, bring their works of the combs to perfection, is amazing. In a week's time, when the weather favours, the half or two-thirds of a hive will be filled with combs. There are vast numbers at work all at once, and that they may not incommode one another, they do not work upon the first comb till it is finished; but when the foundation of that is laid, they go to work upon another; so that there are often the beginnings of three or four stories made at once, and so many swarms allotted to the carrying on the work of each.

The several combs are all placed parallel one to another, and hang perpendicularly from the top of the hive to the bottom; they begin each comb at the top or upper part of the hive, and carry it down to the floor, from side to side; and there is such a space left between them, that the bees can easily pass between: there are also holes made through the substances of the several combs, by which they pass from the space that lies between one pair of combs and another. They often place a part of the combs in a contrary direction to the rest; so that while the others are placed horizontally, these stand perpendicular: there are also several other directions, in which they are disposed, which are easily accounted for from the nature of the place, and are always found to be the very best that could be used for the occasion.

Though the sides of all the cells are extremely thin, yet the combs are very heavy when full of honey. This might endanger their breaking their hold, if only sustained from the top; and for this reason, the bees give them several additional supports in whatever places they can, often fastening them in many places one to another, and often fixing them to the sides of the edifice by large and solid lumps of wax.

It has generally been supposed that every bee of a swarm has its particular cell in some comb which was its own, and contained honey for its peculiar food; but the use of the glass hives has shewn us that all the cells are used in common. Reaumur, *Hist. Inf.* vol. ix. p. 282. vol. x. p. 21, &c.

HONEY-comb, in *Gunnery*, is a flaw in the metal of a piece of ordnance, when it is ill cast and spongy.

HONEY-comb-stone, in *Natural History*, the name given by many authors to a species of fossil coral, which is usually found in large masses, and those full of large hexagonal cells, resembling those of a honey-comb. These are but lightly striated, and usually run deep into the stone.

HONEY-comb-stone, or *Lapis favaginofus*, is enumerated by Dr. Woodward in his *Method of Fossils*, and is mentioned by Dr. Plot as found in the north-east part of Staf-

fordshire, which refer, it seems, to a species of coralline in the lime-stone rocks.

HONEY-dew, a term frequently applied to a clammy saccharine substance, which is often seen covering the leaves and other parts of different kinds of trees and plants, at some particular seasons of the year. It does not appear that the cause of this extraordinary appearance is yet fully understood, as it has not, by any means, been well ascertained, whether it derives its origin from external circumstances, or some morbid affection of the vegetables themselves. The author of *Phytologia* appears to incline to the latter supposition, and conceives it to be an excretion from the parts of the plants which are affected with it. Indeed, it seems not improbable but that there may be some local de- rangement in the parts of the plants which are covered with this sticky material.

Gassendus holds, that a viscid juice, transpiring out of the leaves, helps to compose this honey; or to convert the dew, falling on them, into a honey substance, which before had nothing of it: hence he accounts for the reason why we find it on some trees and not on others.

This honey-dew, falling on the ears and stalks of wheat, besmears them with a different colour from the natural; and, being of a clammy substance, so binds up the young, tender, and close ears of the wheat, by the heat of the sun, that it prevents the growth and completing of the perfect grain therein.

Hops, when in flower, are subject to the distemper called the honey-dew, which appears in the form of a meal, and is found by the microscope to contain the eggs of small insects, which fly about in swarms near the time when the hop is in flower, and gnaw the leaves and shoots. Several methods have been proposed for preventing the damage arising from this dew; particularly by surrounding the hop-hills with hot dung, or causing wood-ashes to be scattered with the wind over the hops at the time when the mealy dew falls. But the most effectual way of preventing its ill effects is to strip off the leaves, whereby the small insects contained in it perish at once, and before fresh leaves spring forth, their season of breeding is past.

A shower of rain, succeeding presently after the fall thereof, or the wind blowing stiffly, are the only natural remedies against it. See **APIUS**, **DEW**, **MILDEW**, and **Perspiration of PLANTS**.

HONEY-flower, in *Botany*, &c. See **MELIANTHUS**.

HONEY-grass, the common name of a sort of grass that is occasionally found in shady situations, but which is not found of much utility as the food of domestic animals. See **MELLICA**.

HONEY-guide, in *Ornithology*. See **CUCULUS Indicator**.

HONEY-Island, in *Geography*, a small island in the Atlantic, near the coast of Guinea. N. lat. 10° 18'. W. long. 15°.

HONEY-locust, or *three-thorned Acacia*, in *Botany*. See **GLEDITSIA**.

HONEY-suckle, in *Botany and Gardening*. See **LONICERA**.

HONEY-suckle, *African-fly*. See **HALLERIA**.

HONEY-suckle, *American upright*. See **AZALEA**.

HONEY-suckle, *French*. See **HEDYSARUM**.

HONEY-suckle Clover, in *Agriculture*, a term not unfrequently made use of to signify white clover. It is likewise often simply termed honey-suckle. See **CLOVER**, and **White CLOVER**.

HONEY-suckle, *Trumpet*. See **HONEY-suckle**, *supra*.

HONEY-suckle Grass. See **TREFOIL**.

HONEY-wort. See CERINTHE.

HONEYYOE, in *Geography*, a lake of America, in the Genesee country, New York, W. of Canandarque lake, five miles long and three broad.

HONFLEUR, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont l'Evêque; seven miles N.N.E. of Pont l'Evêque. The place contains 9,600, and the canton 16,107 inhabitants, on a territory of 100 kilometres, in 16 communes. N. lat. $49^{\circ} 25'$. E. long. $0^{\circ} 19'$.

HONGIE, a town of Austrian Poland, in Galicia; 30 miles W.S.W. of Halicz.

HONGILAX, a town of Sweden, in the government of Abo; 35 miles S. of Biornborg.

HONG-TCHEOU, a town of the kingdom of Corea; 20 miles S.S.E. of Haimen.

HONG-TSE, a large lake of China, which discharges its waters into the Hoang; 60 miles from the sea.

HONHAY, a town of Bengal; nine miles S.S.E. of Ramgur.

HON-HOTOU, a lake of Chinese Tartary; 24 miles in circumference. N. lat. $48^{\circ} 29'$. E. long. $92^{\circ} 46'$.

HONI *soit qui mal y pense*, q. d. *evil to him that thinks evil*; the motto of the most noble order of the knights of the Garter. See GARTER and MOTTO.

HONIDA, in *Geography*, a town of Persia, in the province of Irak; 45 miles E.N.E. of Gnerden.

HONIGFELTZ, a town of Prussia, in Pomerelia; 15 miles S. of Marienburg.

HONIMAO, or ULIASSER, one of the Molucca islands, about 9 miles long, and from 3 to 5 wide. The land is fertile, and its chief productions are rice and cloves. S. lat. $3^{\circ} 30'$. E. long. $129^{\circ} 2'$.

HONINGDAEL, a town of Norway, in the diocese of Drontheim; 80 miles S.W. of Romfdal.

HONITON, is a borough, market town, and parish in the hundred of Axminster, and county of Devon, England. It consists principally of one broad handsome street, running from east to west, and another crossing it at right angles: through the former flows a small stream, from which the inhabitants are supplied by a dipping place opposite to almost every door. The buildings are mostly modern; the town having suffered considerably by fire at different times. In the year 1747, three-fourths of the houses were reduced to ashes, and several hundreds of the labouring inhabitants thrown out of employ. In 1765, nearly 180 dwellings, and other buildings, were destroyed: another fire, in 1790, consumed 30 more; and a fourth, in 1797, the same number, together with the bank. The town is now in a state of great improvement; and the buildings are in general covered with slate: the number of houses returned, under the late act, was 557; the inhabitants 2377. The chief article of manufacture is broad lace, and edgings, of which considerable quantities are disposed of in the metropolis. The parish church is situated on an eminence at the distance of about half a mile from the town. It was originally a small chapel for mendicant friars, but was enlarged about the year 1482, chiefly at the expence of Courtenay, bishop of Exeter; who also gave the curious screen which separates the chancel from the nave. The ancient parochial church is supposed to have stood in the town on the spot now occupied by Allhallow's chapel; which is a neat structure, with a square embattled tower of flint; and was erected by subscription, in place of an older edifice, about the year 1765. Besides these places of religious worship, here are three meeting-houses for the respective denominations of Independents, Baptists, and Presbyterians. The education of the poorer classes is partly

provided for in a small free-school for boys, and a school of industry for girls: the latter is supported by the subscription of females. This town possessed the privilege of a market previous to the reign of king John, by whose direction the day on which it was held was changed from Sunday to Saturday. Honiton sends two members to parliament; but, though an ancient borough by prescription, it was only twice represented prior to the time of Charles I.: the first return was made in the twenty-eighth year of Edward I. The right of election, which was formerly extended to every housekeeper not receiving alms, is now vested solely in the burgage holders paying scot and lot: the number of voters is about 350. The government of the town is under the direction of a portreeve and bailiff, who are annually chosen at the court of the lord of the manor. Honiton is 159 miles distant from London. Polwhele's History and Antiquities of Devonshire, fol.

HONNOCHETO LAKE, a lake of West Florida. N. lat. $31^{\circ} 22'$. W. long. $91^{\circ} 27'$.

HONOMINIES, a river of America, in the N.W. territory, which runs S.E. into Puan bay. Between the head of this river and lake Superior is a short portage.

HONOPOLOGAN, a town of the island of Ceylon; 55 miles N.N.W. of Parroah.

HONORAT, a small island in the Mediterranean, near the coast of France. N. lat. $43^{\circ} 30'$. E. long. $7^{\circ} 7'$.

HONORIACI, in *Antiquity*, a species or order of soldiery under the eastern empire, who introduced the Goths, Vandals, Alani, Suevi, &c., into Spain.

Didymus and Verinianus, two brothers, had, with great vigilance and valour, defended the passages of the Pyreneans against the Barbarians, for some time, at their own expence; but being at length killed, the emperor Constantius appointed the honoriaci to defend those passages, who, not contented to lay them open to all the nations of the North, then ravaging the Gauls, joined themselves to them.

HONORIS RESPECTUM, *Challenge propter*, in *Law*. See CHALLENGE.

HONORIUS, emperor of the West, in *Biography*, second son of the great Theodosius, was born in 384; obtained the title of Augustus, with his brother Arcadius, in 393, and succeeded to his portion of the empire at his father's death in 395. The reins of government were, during his minority, placed in the hands of the illustrious general Stilicho, whose daughter he married in 398. As his character opened he appeared ill adapted to his high station, and was addicted to puerile amusements, void alike of vigour and talents, and in every respect unfit to wield the sceptre of a mighty people. The times, however, wore a serious aspect; and the danger to which the empire was exposed required wisdom and fortitude. The revolt of the Goths, and an invasion of Italy by Alaric, with whom Stilicho had been obliged to make a kind of compromise, so alarmed the young emperor, that in 403 he fled from his palace, and was for a time besieged by the Goths in a town of Liguria, in which he had taken shelter. His faithful general Stilicho came to his release, and, by the defeat of Alaric, freed Italy from present danger. The pageant prince was led to Rome, and had the honour of a triumph, at which, for the last time, there was an exhibition of the inhuman combats of gladiators. After this the emperor fixed the seat of empire at Ravenna: he conquered his enemies by his generals, being resolved never more to expose his sacred person to any risk: he suffered himself to be governed by his ministers, who took advantage of their imperial master's indolence and inactivity. He died of a dropsy, in the 39th year of his age. Under Honorius and his brother the Roman power was divided

vided into two different empires. The successors of Honorius, who fixed their residence at Rome, were called emperors of the West, and the successors of Arcadius, who sat on the throne of Constantinople, were distinguished by the title of emperors of the Eastern Roman empire. Honorius was twice married, but left no issue. Gibbon. Univer. Hist.

HONORIUS I., pope, son of Petronius, a person of consular dignity, was chosen to fill the Roman see on the death of Boniface V., in the year 626. The most remarkable circumstance in the life of this pope was, his having been induced to give his sanction to the opinion of the Monothelites, who maintained that in Christ there was only one will, one operation, for which he was solemnly condemned by the sixth general council, in the pontificate of pope Agatho. Some account of the sects MONOTHELITES, and MONOPHYSITES, will be found under their respective articles. Honorius probably knew little about the matter, nor was able to attach any precise and definite meaning to the expressions which he was led to make use of. He died in 638, after a reign of nearly thirteen years. He is greatly praised for having employed diligence and zeal in embellishing churches, and other consecrated places, with the most pompous and magnificent ornaments. Some of his letters are extant in the fifth volume of the "Collect. Concil." He is author of an epigram on the apostles looking up towards heaven with astonishment at the ascension of Christ, which is to be found in the twelfth volume of the *Bibl. Patr.* Moreri. Bower.

HONORIUS II., pope, whose original name was Lambert, was a native of the province of Bologna. Having embraced the ecclesiastical life he was preferred by pope Paschal II. to the episcopal see of Veletri, and afterwards translated to that of Ostia. Upon the death of Calixtus in 1124, Honorius was elected to the popedom. Soon after his consecration he issued a sentence of excommunication against William, the son of Robert count of Normandy, for having married within the forbidden degree of consanguinity, and for having publicly burnt a letter sent to him by the pope's legate, in which his marriage was declared null. On the death of the emperor Henry V., in the year 1125, Honorius sent his legates into Germany, to assist at the election of a new king, in whose presence Lotharius was anointed with the usual ceremonies. In the following year the pope succeeded in persuading Henry I. of England to admit a legate into his kingdom, whose usurpations quickly provoked the spirited opposition of the clergy and laity. In 1127, upon the death of William, duke of Apulia, without leaving any issue, his uncle Roger, count of Sicily, passed over into Italy, and took possession of his nephew's dominions as his next heir. But Honorius having heard of his proceedings, pretended that the late duke had, by his last will, left his dominions, and whatever else he was possessed of, to St. Peter, and instantly denounced a sentence of excommunication against Roger. The question was disputed at the point of the sword, but the army of the prince prevailed against that of the pope, and his holiness was glad to grant him the investiture to the duchy. Honorius died in 1130. Twelve of his letters are preserved in the tenth volume of the *Collect. Concil.* Moreri. Bower.

HONORIUS III. pope, whose former name was Cencius Sabelli, was a descendant from an illustrious family, and a native of Rome, where he discharged several ecclesiastical employments with great reputation, and was held in high respect for his learning and probity. In 1216, having already filled the posts of cardinal-deacon and cardinal-priest, he was unanimously elected pope. The first act of his pontificate was to send letters to all Christian princes to acquaint them with his promotion, and to exhort them to send succours,

without delay, to the armies of the crusaders in the East. Their success was the object of his utmost solicitude; as was likewise the destruction of the Albigenses in France, which he instigated the Catholics to attempt, by every method of persuasion adapted to produce an effect on credulous or superstitious minds. In 1217, Henry, emperor of Constantinople, dying without issue, the princes of the crusade chose Peter, count of Auxerre, his brother-in-law, for his successor, who, as soon as he heard of his election, left France, together with his wife, and repaired to Rome, where they were crowned by Honorius. In the year 1219, Reginald, king of the Isle of Man, at that time an independent kingdom, apprehensive that it might be invaded and subdued by the kings of England, resolved to engage the protection of the sovereign pontiff by surrendering himself a vassal of the apostolic see. He accordingly made a donation of the whole island to Honorius as fief of the Roman church, and afterwards received the investiture of it, upon binding himself and his heirs to pay a yearly stipulated sum to the pope as an acknowledgment of vassalage. From this time the pope was eager in the attempt to dispossess the infidels of the Holy Land, and was particularly desirous of engaging in the cause the emperor Frederic II. But this prince excused himself from time to time by different pleas, which his holiness was obliged to admit, till at length, in 1227, he died, after a pontificate of nearly eleven years. Honorius was a man of considerable learning for the age in which he lived, and was author of several works, of which there are still extant, "Sermons;" the "Life of Pope Celestine III.;" "A Statement of all the Revenues of the Roman Church;" and many others of less moment. Several of his letters are inserted in the eleventh volume of the *Collect. Concil.* Moreri. Bower.

HONORIUS IV. pope, who, before his elevation to the popedom, was called James Sabelli, or Savelli, was descended from the same family with Honorius III., and was created cardinal deacon by pope Urban VI. in 1261. In 1285 he was elected pope, as successor to Martin IV., and on this occasion he assumed the name of Honorius IV. He was so much afflicted with the gout, that he was unable to solemnize the mass in a proper manner, and only in a sitting posture; but he had a mind equal to all the difficulties of his situation. One of his earliest acts was to renew the anathemas which his predecessor had fulminated against Peter of Arragon, and by causing a crusade to be preached against him in France, he raised a powerful army in that country, at the head of which king Philip entered Arragon, and gained a bloody victory over Peter. That prince died in a short time after the battle, and by his will devised the kingdom of Arragon to his son Alphonfus, and that of Sicily to his son James. Honorius no sooner heard of his death, and the distribution which he had made of his territories, than he issued his bull, commanding Alphonfus to release, without delay, Charles, prince of Salerno, who had been taken prisoner by his father's fleet, and, at the same time, ordering James to quit the island of Sicily, and to deliver it up to Charles as the lawful heir. As those princes paid no regard to his holiness's bull, he excommunicated them, at three different times, in the year 1286, and laid the whole island of Sicily under an interdict. Honorius condemned and suppressed a new sect founded by Gerhard Sagarelli, who styled themselves "The Order of the Apostles," or "The Apostolic Brethren." But the objects apparently nearest the heart of Honorius were the extension of the papal power against all daring opponents, and the triumph of the crusaders over the infidels. His first attention was devoted to the former; and in subserviency to it, he had projected a design of uniting all the Christian princes

in a holy league against the two kings of Arragon and Sicily. While, however, he was wholly intent upon carrying it into execution, he was cut off by death, in 1287, when he had but just completed the second year of his pontificate. He is said to have been eminent for wisdom, temperance, and a sound discretion; and as a proof of his regard to the interests of learning, he made provision for the establishment of a college at Paris, for the study of the Oriental languages, though he did not live to see the completion of such an institution. He confirmed the order of the hermits of St. Augustine, and that of the Carmelites, which had been only tolerated by the second council of Lyons. Some of his letters are preserved. Moreri. Bower.

HONOUR, among the *Ancients*, was worshipped as a divinity, and had a temple erected to it, which had no entry but through the temple of Virtue; in order to teach men that true honour was only to be acquired by the practice of virtue. In conformity to this wise maxim, Virtue was sometimes painted with wings, because she procured honour and victory to those who studied her. Plutarch also observes to the same purpose, that they sacrificed to Honour with the head uncovered; it being usual to uncover upon meeting with those who by their virtues have acquired honour in the world; and we learn from Pliny, that Fab. Rutilianus was the first who made a law, that on the Ides of July the Roman knights should march on horseback from the temple of Honour to the capitol.

Honour is represented on many medals under the figure of a man holding a pike, and sometimes an olive branch, in the right hand, and a cornucopia in the other.

Beside its literal sense, wherein it denotes a testimony or token of esteem or submission, honour is particularly applied in our customs to the more noble kind of feignories, or lordships, whereof other inferior lordships or manors hold or depend. See SEIGNORY.

As a manor consists of several tenements, services, customs, &c. so an honour contains divers manors, knights-fees, &c. See MANOR.

It was also formerly called *beneficium*, or *royal fee*, being always held of the king in capite. Spelman.

Anciently honour signified the same as *baronia*.

HONOUR, *Counsellors of*, or *Honorary Counsellors*, are such as have a right to enter or sit in assemblies, courts, &c. to deliberate or give judgment in the same, though they do not regularly and properly belong to them.

The French call *chevaliers d'honneur*, knights or gentlemen of honour, the gentlemen ushers of queens and princesses, who attend them, give them their hand, &c. See USHER.

HONOUR, *Court of*. See COURT of Chivalry.

HONOUR *Courts* are held within the honours, or feignories, above-mentioned.

HONOUR, *Mails of*, are young ladies in the queen's household, whose office is to attend the queen when she goes abroad, &c. In England they are six in number, and their salary 300*l.* per annum each.

HONOUR, *Pages of*, are officers both of the king's and queen's household, under the master of the horse. Of the former there are four, whose annual salary is 26*l.* each; and of the latter two, with a salary of 15*l.* each.

HONOUR of a Peer. See PEER.

HONOURS of the *Louvre*, among the *French*, are certain privileges annexed to divers dignities, or offices, particularly those of duke, peer, chancellor, &c. as to enter the Louvre in a coach, to have the tabouret, or stool, in the queen's presence, &c.

HONOURS of the *Church* are the rights belonging to the

patron, &c. as a seat and sepulchre in the chancel, to be first served with the consecrated bread and wine, &c.

HONOURS of the *City* are the public offices or employments thereof. He who has been constable, overseer of the poor, and churchwarden of his parish; common-councilman, alderman, and lastly mayor; has passed all the honours of the city.

HONOURS of the *House* are certain ceremonies observed in receiving visits, making entertainments, &c. performed either by the master himself, or by some person appointed for that purpose; as to go and receive the guests, to conduct them out again, to see they be well seated, and, in short, to perform all the civilities and ceremonials of polite hospitality.

HONOURS are also applied to the principal part of the apparatus of great ceremonies; as coronations, consecrations, christenings, &c. Such are the oil, tapers, &c.

In obsequies they anciently represented the honours, that is, the shield, crest, sword, gantlets, spurs, banner, horse, &c.

HONOURS, *Funeral*, are the ceremonies performed at the interment of great men; as hangings, hearfes, funeral harangues, &c.

HONOURS, *Military*. All armies salute crowned heads in the most respectful manner, colours and standards dropping and officers saluting. Their guards pay no compliment except to princes of the blood, and that by courtesy in the absence of crowned heads.

A field-marshal is to be saluted with the colours and standards of all the forces, except the horse and foot-guards, and excepting when any of the royal family shall be present; but in case a field-marshal is colonel of any regiment, or troop of horse, or foot guards, he is to be saluted by the colours or standards of the regiment or troop he commands.

Generals of cavalry and infantry, upon all occasions, are to have the march beat to them, and to be saluted by all officers, those bearing the colours excepted.

Lieutenant-generals of cavalry and infantry are, upon all occasions, to be saluted by all officers. They are to have three ruffles given them with presented arms.

Major-generals are to have two ruffles with presented arms.

Brigadier-generals are to have one ruffle with presented arms.

To colonels their own quarter-guards in camp turn out, and present their arms, once a day, after which they only turn out with ordered arms.

To majors their own guards turn out with ordered arms once a day; at other times they stand by their arms.

When a lieutenant-colonel or major commands a regiment, their own quarter-guards pay them the same compliment as is ordered for the colonel.

The master-general of the ordnance is to have the same respect and honours paid to him as the generals of horse and foot.

Honours to be paid by the Cavalry.—A general of cavalry or infantry is to be received with swords drawn, kettle-drums beating, trumpets sounding the march, and all the officers to salute, except the cornet bearing the standard.

A lieutenant-general is to be received with swords drawn, trumpets sounding twice the trumpet flourish, as in drawing swords, and all the officers to salute, except the cornet bearing the standard; but the kettle-drums are not to beat.

A major-general is to be received with swords drawn, one trumpet of each squadron sounding once the trumpet flourish, as in drawing swords; no officer to salute, nor kettle-drum to beat.

A brigadier-general is to be received with swords drawn ; no trumpet to sound, nor any officer to salute, nor kettle-drum to beat.

All officers in the command of forts or garrisons, have a right to the complimentary honours from the troops under their command, which are due to the rank one degree higher than the one they actually possess.

Manner of paying honours.—The king's standard, or colour in the guards, is never to be carried by any guard, except that which mounts on his majesty's person.

The first standard, guidon, or colour of regiments, which is the union colour, is not carried by any guard, but that on the king, queen, prince of Wales, or commander in chief, being of the royal family ; and, except in those cases, it shall always remain with the regiment.

When general officers, or persons entitled to a salute, pass in the rear of a guard, the officer is only to make his men stand shouldered, and not to face his guard to the right about, or beat his drum.

All sentries are to pay a due respect to every officer who passes by their posts, but are to keep their proper front while paying the compliment.

All governors, whose commissions in the army are under the degree of general officers, shall have, in their own garrisons, all the guards turn out with rested arms, and beat one ruffie ; and though the main guard turns out with rested arms every time he passes, yet they give him the compliment of the drum but once a day ; but all the other guards beat as often as he appears near them.

If they are general officers likewise, they are then to have the further compliments paid them, by the several beatings of the drum, as practised in the army.

Regulation of honours to be paid to admirals.—Admirals, with their flags on the maintop, are to have the same respect from the troops as generals of cavalry and infantry ; that is, upon all occasions to have a march beat to them, and to be saluted by all the officers, those bearing the colours excepted.

Vice-admirals are to have the same respect as lieutenant-generals of cavalry and infantry ; that is, upon all occasions to be saluted by all the officers in the garrison, the drummers beating three ruffles.

The rear-admirals are to have the same respect as major-generals, who have two ruffles, and not to be saluted by any officer.

Commodores with broad pendants have the same respect as brigadier-generals ; which is to have one ruffie.

Rank and precedence between sea and land officers.—The admiral, or commander-in-chief of his majesty's fleet, is to rank with a field-marshal of the army.

The admirals with their flags on the main-top-mast-head, are to have rank with generals.

Vice-admirals are to have rank as lieutenant-generals.

Rear-admirals are to have rank as major-generals.

Commodores with broad pendants are to have rank as brigadier-generals.

Captains commanding post-ships, after three years from the date of their first commission for a post-ship, are to have rank as colonels.

All other captains commanding post-ships, are to have rank as lieutenant-colonels.

Captains of his majesty's ships or vessels, not taking post, are to have rank as majors.

Lieutenants of his majesty's ships are to have rank as captains.

The rank and precedence of sea-officers, in the classes

above-mentioned, are to take place according to the seniority of their respective commissions.

Post-captains commanding ships or vessels that do not give post, rank only as majors during their commanding such vessels.

No land-officer is to command any of his majesty's squadrons or ships, nor any sea-officer to command at land ; nor shall either have a right to demand military honours due to their respective ranks, unless they are upon actual service.

All guards and centinels are to pay the same compliments to the officers of the royal navy, as are directed to be paid to the officers of the army, according to their relative ranks.

The compliments above directed are to be paid by the troops, to officers in the service of any power in alliance with his majesty, according to their respective ranks.

Turning out of the line.—The line turns out without arms, whenever any part of the royal family, or the general commanding in chief, comes along the front of the camp.

When the line turns out, the private men are to be drawn up in a line with the colours and standards ; the corporals on the right and left of their respective companies, the picquet forms behind the colours, accoutred, but without arms.

The officers and non-commissioned officers are to be drawn up with their respective companies. The field-officers in their proper posts in battalion, two ensigns taking hold of the colours.

When the commander-in-chief comes along the line, the camp-colours on the flanks of the parade are to be struck, and planted opposite to the bells of arms, and the drums piled up behind the colours ; the halberts are to be planted between, and on each side of the bells of arms, the hatchets turned from the colours. James.

HONOUR Point, in *Heraldry*, is that next above the centre of the escutcheon, dividing the upper part into two equal portions. See POINT and ESCUTCHEON.

HONOUR, Abatements of. See ABATEMENT.

HONOUR, Additions of. (See ADDITIONS.) These additions are said to be nine in number ; *viz.* a border, a quarter, a canton, a gyron, a pile, a fiasque, a flanche, a voider, and an escutcheon of pretence. (See each term respectively.) When additions of honour have been granted, fashion alone seems to have guided the choice of the particular ordinary. In the reign of king Henry VIII., the pile had the preference ; and was granted by that king, as an augmentation of honour, to the lady Jane Seymour, and also to the lady Catharine Parr. But of late years, when the sovereign grants an augmentation to the arms of a subject, it hath been usual to place it either on a quarter, or on a canton. The estimation in which these ordinaries were anciently held, on account of their being occasionally granted as additions of honour, hath been considerably diminished, since it has been customary for any person of property, wanting and applying at the college for a coat of arms, not only to obtain a grant of arms, to him and his heirs, on paying the fees, but to have the figures of any of the additions of honour, in case he requests it, placed in the coat, although neither he nor any of his ancestors ever had any particular merit to intitle him to marks of the royal favour.

HONOURABLE AMENDS, Amende honorable. See AMENDE.

HONOURABLE, or Honourable ordinaries, in Heraldry. See ORDINARY.

HONOURARY, or HONORARY, is understood of a person who bears or possesses some quality or title, only for the name's sake, without doing any of the functions thereto belonging.

belonging, or receiving any of the advantages thereof. See *Counsellors of Honour*.

In the College of Physicians, London, are honorary fellows. The Royal Academy of Sciences at Paris formerly consisted of four classes of members, viz. honorary, pensionary, associates, and adjuncts. See *ACADEMY*.

HONOURARY Feuds. See *FREE and DESCENT*.

HONOURARY Games. See *GAMES*.

HONOURARY Services are those incident to the tenure of grand serjeantry, and commonly annexed to honours.

HONOURARY Tutor is a person of quality appointed to have an eye over the administration of the affairs of a minor, while the onerary tutors have the real effective management thereof.

HONOURARY, Honorarium, is also used substantively for a lawyer's fee, or a salary given to public professors of any art or science.

HONRUBIA, in *Geography*, a town of Spain, in New Castile; 10 miles N.W. of Alarcon.

HONSDORF, a town of Prussia, in the palatinate of Culm; 27 miles N.E. of Culm.

HONTAN, LA, Baron, in *Biography*, was born in Gascogne, and served in Canada, first as a soldier, then as an officer. From Canada, he was sent to Newfoundland as king's lieutenant, where he quarrelled with the governor, and was cashiered. He retired, first to Portugal, then to Denmark. As an author he is known by "Voyages dans l'Amerique Septentrionale," two volumes 12mo. in which we have an account of the different tribes inhabiting North America, their government, laws, customs, religion, &c.

HONTFONGENETHEF, a thief taken hond-habend, i. e. having the thing stolen in hand.

HONTHORST, GERARD, in *Biography*, was born at Utrecht in 1592, and was placed as a disciple with Abraham Bloemart: but when he quitted that master, he travelled to Rome, and proceeded so happily in his studies as to be accounted one of the best artists of his time. He continued at Rome for several years, being employed there by persons of the first rank, and particularly by prince Justiniani, for whom he performed many considerable works.

His particular excellence was shewn in his night-pieces, representing figures by candle-light, which usually were as large as life. Even Rubens professed himself an admirer of his paintings in that style; and Sandrart highly commends a picture of the Decollation of St. John by torch-light, which he saw at Rome, in the church of Madonna della Scala. He also mentions another in the Justiniani gallery, of which the subject is, Christ brought bound before Pilate, in a white robe; and in that composition, the light proceeding from the flambeau and torches produced so uncommon a lustre, and so bold an effect, that no preceding artist had performed any thing in that style that could be compared with it. Sandrart also observes, that Honthorst was as much distinguished, while he resided at Rome, for his night-pieces in large, as Elsheimer was for his manner of designing the same subjects in small.

Soon after his returning to his own country he visited London, and obtained the favour of king Charles I. by several grand performances and portraits; especially by one allegorical picture, in which he represented the portraits of the king and queen, in the characters of two deities, and the portrait of the duke of Buckingham in the character of Mercury, introducing the liberal arts to that monarch and his consort. For that composition, which was well drawn and extremely well coloured, the king presented him with three thousand florins, a service of plate for twelve persons, and a beautiful horse; and he had afterwards the honour to

instruct the queen of Bohemia, and the princesses her children, in drawing.

His pencil is free and firm, and his colouring hath a great deal of force, although it often is not pleasing, by a predominancy of the yellow and brown tints; yet undoubtedly Honthorst would have been an excellent painter, if he had known how to give more grace, and more correctness to his figures.

At his return from London to Holland, he adorned the pleasure houses of the prince of Orange with many poetical subjects, which he executed in fresco as well as in oil; but he principally was employed in painting portraits, which are described as having good expression, and extraordinary life and force, by their broad masses of light being contratted by strong shadows. He died in 1660, aged 68.

HONTHORST, WILLIAM, brother to the preceding, was born at Utrecht in 1604, and learned the art of painting from Abraham Bloemart. The portraits which he painted were very much esteemed, and in reality those were his most commendable performances; for the historical subjects of his hand, which generally were painted in a large size, are in no degree equal to those of Gerard, either in respect of the composition, the handling, or the colour, although they are frequently sold for the works of that master. He died in 1683, aged 79.

HONTHY, or HONDDY, in *Geography*, a river of South Wales, which runs into the Uik, at Brecknock.

HONTORIA de Valdecarados, a town of Spain, in Old Castile; 22 miles W. of Osma.

HOOBARREE, a town of Africa, in the country of Sahara; 320 miles S.W. of Moorzouk. N. lat. 27° 12'. E. long. 9 25'.

HOOD. See *CHAPERON* and *CUCULUS*.

Hood, in *Falconry*, is a piece of leather, wherewith the head of a hawk, falcon, or the like, is covered.

After sealing or sewing up the eyelids of a young hawk, she is to be fitted with a large easy hood, which is to be taken off and put on very often, watching her two nights, and handling her frequently and gently about the head. When you perceive she has no aversion to the hood, unseal her in the evening by candle-light, continuing to handle hood, and unhood her, as before, till at last she takes no offence, but will patiently endure handling.

After unsealing, anoint with the finger and spittle the place where the sealing thread is drawn through; then hood her, and hold her on your fist.

As soon as she is well reclaimed, let her sit upon a perch; but every night keep her on the fist three or four hours, stroking, hooding, and unhooding, &c. And thus you may do in the day time, when she hath learnt to feed eagerly and without fear.

Hood, on *Ship-board*, is a copper frame, made to go on the top of the chimney, and to shift as the wind does, that the smoke may always fly to leeward.

Hood is also a sort of low wooden porch, placed over the stair-case or ladder, which leads into the steerage or apartments, where the crew generally reside in a merchant-ship. The use of the hood is to admit air and light, and at the same time to prevent the rain from falling into the steerage. The wooden porch over the entrance or stair-case of the master's cabin is called *companion*.

Hood's Bay, in *Geography*, a harbour on the W. coast of Admiralty island, in Chatham strait. N. lat. 57° 26'. E. long. 225° 36'.

Hood's Island, an island in the Southern Pacific ocean, the most northerly of the five Marquesas islands, discovered by captain Cook in April 1774, and so called after the name

of the young gentleman by whom it was first seen; about 48 miles in circumference. It is called by the natives Tebooa. S. lat. 9° 26'. W. long. 138° 52'. See MARQUESAS.

HOODS, in *Rural Economy*, the names of the sheaves which head or cover the shocks or stouks of corn.

HOOD Sheaves, another term employed to signify the same.

HOODED Milfoil, in *Botany*. See UTRICULARIA.

HOODED Willow-herb. See SCUTELLARIA.

HOODERS, a term given to the hood sheaves of corn hattocks in many districts.

HOOF, UNGULA, the horny part which covers the feet of divers animals, as horses, bullocks, &c.

The hoof serves much the same purposes as the nails of some animals and the claws of others.

The hoof of a horse surrounds the sole and the coffin-bone. To be good, it should be of a dark colour, somewhat shining, high, smooth, of a round shape, but a little larger below than above; short, that the horse may tread more on the toe than on the heel; and somewhat hollow within, having a narrow fruth and broad heels.

The hoof should not have circles, which are a sign of its being brittle, and that the horse, being often shod, has had his feet spoiled by the many pieces broke out of it. A white hoof also is commonly brittle.

To judge whether the hoof be good and stanch, lift up the foot, and consider if it have a shoe forged purposely for it, and be very much pierced, and the holes made in the unusual parts, as wanting horn enough to take hold by in those places where the nails are commonly driven. Sometimes they are forced to pierce the shoes nigh the heels, because the fore-part is bad; it being unusual to drive the nails near the heels, except the toe be so much split and broke as not to bear nails.

If the hoof be not round, but broad, and spreading out at the sides and quarters, the horse commonly has narrow heels, and, in time, will be flat-footed; which sort of foot is weak, and will not carry a shoe, nor travel far, but surlate; add, that treading more on his heels than his toes, will cause him to go low on his pasterns.

If the hoof be long, it will make him tread altogether on his heels. If crooked, *viz.* broad without and narrow within, so that the horse is splay-footed, it will cause him to tread too much inward, and cut or interfere. If the fruth be broad, the heels will be weak and soft. If the heel be narrow and tender, the horse will in time grow hoof-bound.

This sort of horny material, when ground or broken down in proper mills, has been found an extremely lalling manure, and capable of affording large crops. See MANURE.

HOOF, Bony, is a round bony swelling, growing on the top of a horse's hoof, which is always caused by some blow or bruise. This is first to be ripened and brought to supuration by digesting it with rotten litter, or hay boiled in stale urine, or with a plaster of stale wine- lees and wheat-flour boiled together. When it is come to a head, let it be lanced with a thin hot iron, and put a tent into it made of turpentine, deer's fat, and wax, boiled together in equal quantities, and lay a plaster of the same over the tent.

HOOF, Brittle, the name of an infirmity to which horses are subject. It comes sometimes naturally, and sometimes artificially. When it comes naturally, it is generally hereditary, the sire or dam having had the same complaint. When it comes on accidentally, it is sometimes owing to a distemper falling down into the feet; sometimes to the creature's being much foundered.

The hoof, in this distemper, is so friable and rotten, as it were, that it cracks and flakes off on every slight occasion. The cure is to be attempted in this manner: take wax, turpentine, suet, and hog's lard, of each four ounces; fallad oil, a quarter of a pint by measure; and of dog's greafe, half a pound; let the whole be melted together, and strained through a piece of canvas into a gallypot. The hoof is to be thoroughly anointed with this every day, morning and evening, especially at the root; and if there are any large cracks, they must be filled up at every dressing with a mixture of equal parts of cow-dung and hog's lard.

The other infirmities to which hoofs are liable, are, the casting of the hoof, hoof-bound, hoof-hard, hoof-hurt, loose hoof, false quarters, &c.

HOOF, Casting of the. A horse is said to *cast his hoof* when the whole coffin of the hoof becomes loosened, and falls off from the bone. This may be remedied by care, and proper application; a new hoof being procurable, if the coffin bone, &c. be not hurt.

Horses sometimes cast their hoofs, by reason of some prick, stub, foundering, surlating, or other accident, that causes an impostumation in the foot; so that the hoof, and sometimes the coffin bone, being spongy and easily broken, fall off in large pieces. The last, when it happens, is a desperate case.

HOOF-bound, is a shrinking in of a horse's hoof on the top and the heel, which makes the skin flare above the hoof, and grow over the same.

It befalls a horse divers ways, either by keeping him too dry in the stable, by straight shoeing, or by some unnatural heat after foundering.

HOOF-hurt. In labouring beasts, especially oxen, if the hoof be hurt with a coulter or share, it may be cured by a salve of pitch and greafe mixed with powder of brimstone, dissolved together, and with a hot iron melted in the cleft of the hoof.

HOOF-loosened, is a dissolution or dividing of the horn or coffin of a horse's hoof from the flesh, at the setting on of the coronet.

If the parting be round about the coronet, it comes by means of foundering; if in part, then by a prick of some channel nail, quitter-bone, retreat, graveling, cloying, or the like. The signs of being loosened by foundering, is its breaking first in the fore part of the coronet, right against the toes; because the humour always descends towards the toe. If it proceeds from pricking, graveling, or the like, the hoof will loosen round about equally even at first. If occasioned by a quitter-bone, or hurt on the coronet, it will break right above the grieved part, and rarely be seen to go any farther.

HOOF-swelled, is an infirmity that sometimes befalls young horses, when they are over-rid or wrought hard, which makes them swell in that part, because of the blood falling down and settling there; which, if not speedily removed, will usually beget a wet spavin.

For the cure, take the strongest aquafortis, and first file or draw away the old hoof to a considerable degree with a file or drawing iron; then touch what is left of the hoof for three or four dressings with the aquafortis; anoint the foot with an ointment made of one pound of hog's greafe, three quarters of a pound of patch greafe, five ounces of Venice turpentine, three ounces of new wax, and three ounces of fallad oil, melted together over the fire; and thus a new hoof will be made to grow on the foot.

Hoofs, in *Comparative Anatomy*, are the hard and insensible

sensible envelopes of the last phalanges of the toes in certain quadrupeds. They differ from nails in their form, being blunt, and broader at their termination than any other part, and being continued under the base of the phalanx and for some way behind. A hoof, when removed from the foot, has commonly the appearance of an irregular hollow pyramid; the anterior and lateral portions of the hoof are analogous in composition and mode of growth to the nails or claws. They are made of hard dense compact horn, grow chiefly from the upper edge, which corresponds to the root of the nail, and are moulded by fine thin laminae, which run downwards in the direction of the feet. These laminae are extremely numerous, and are very remarkable in the feet of the large quadrupeds, as the elephant, rhinoceros, &c.; are plain and distinct in the horse, but are less marked in the ruminant or cloven-footed quadrupeds. The structure of the laminae is membranous, or rather membrano-ligamentous; they are supplied with numerous blood-vessels and nerves, but appear to be rather less vascular and sensible, than the soft parts within the sole or inferior portion of the hoof. The sensible laminae are inserted between corresponding horny laminae, situated upon the internal surface of the anterior and lateral portions of the hoof, by which the surface of connection between the hoof and the foot is vastly extended: indeed, the union is so strong between these parts, that the whole weight of the large quadrupeds may be entirely sustained by it, as is proved by the operation of removing the horny sole of the foot in horses, and likewise by the sole descending when the adhesion of the laminae is destroyed. See *Veterinary ANATOMY and FEET*.

The inferior and posterior portion of the hoof is composed of a horny substance, but of a texture less firm and tough than the anterior and lateral parts. The surface by which it is produced is not in general laminated, but covered with villous processes. These are extremely vascular and sensible, and are analogous in situation and office to the villi of the cutis covering the extremities of the fingers and toes of the human subject, and of the digitated quadrupeds. It appears to be chiefly on the sensible sole of the foot in hoofed quadrupeds that impressions of touch are made, and although the extremities of these animals are incapable of surrounding small objects, and therefore cannot convey sensations of the figure or extent of foreign bodies, they are most admirably constructed to give the animal notice of the mere presence or the degree of resistance of external objects. The surface within the hoof is so acutely sensible, that slight impressions are felt by it, while, at the same time, by the interposition of a strong elastic substance, it is defended from the pain or injury that would ensue from more considerable impulse. Another use of the hoof is to protect the feet from the pressure and friction sustained in the exercise of walking or in standing. This is particularly necessary in the large quadrupeds, whose weight and almost constant erect position would otherwise bruise and wear their feet: the hoofs, therefore, may be considered as a sort of natural shoes, having the additional property of a continual growth to repair their waste. The process of reparation, however, is only in a proportion suited to the natural habits, situation, and mode of life of the animal, and hence the necessity of shoeing some quadrupeds, and of cutting away exuberances from the hoofs in others. See articles *ANATOMY of the Horse*, and *SHOEING*.

In several quadrupeds there are hoofs formed which never touch the ground; these grow upon the extremities of the imperfect toes, or those which do not enter into the composition of the foot of the animal, and furnish a striking example of the uniformity of nature, even where it cannot answer any purpose.

HOOGHE, PETER DE, in *Biography*, was born about the year 1643, but neither his native city, nor the master of this painter, are ascertained by any of the writers on this subject; but by his manner of painting, Descamps accounts him to have been one of the best disciples of Berchem. However, he seemed to admire and imitate the manner of Mieris, Metzcu, and Slingeland, although, in the finishing of his pictures he did not arrive at the perfection of those great artists.

The heads and hands of his figures have sometimes a degree of force scarcely unworthy of being compared to Vandyke; but his touch is more broad and free than either Metzcu or Mieris, and he falls far short of their exquisite neatness. His pencil is light and firm; his design correct and in a good taste, as if he had been instructed in some celebrated school. His usual subjects are conversations, in which the draperies of his figures are taken from the modes of the times; and as to his colouring, it is extremely good, natural, and strong.

HOOGHEVEEN, HENRY, a celebrated Dutch philologist, was born of parents in humble life at Leyden in 1712. He was sent to school at 10 years of age, when the severity of the master seemed to extinguish all his capacity for learning; but under a second tutor his powers expanded so rapidly, that at the age of 15 he was able to relieve his father from part of the expence of his education, by commencing a teacher of the lower classes. He after this followed the business of a schoolmaster at different places, and at Delft he ended his days in 1794. The works of this grammarian are, 1. An edition of "Vigerus de Idiomaticis Linguæ Græcæ," which has been frequently reprinted, the addition by Hoogheveen being reckoned very valuable: 2. Poems, Orations, and other occasional Pieces: 3. "Doctrina Particularum Linguæ Græcæ," in two volumes 4to. 1769. This procured the author a very high reputation among all the votaries of Greek learning throughout Europe. An abridgment of it has been made by Schütz. Since the death of Hoogheveen a posthumous work has been given to the world, entitled, "Dictionarium Analogicum Græcum." It was printed at the university press of Cambridge. Gen. Biog.

HOOGLEIDE, in *Geography*, a town of France, in the department of the Lys, and chief place of a canton, in the district of Ypres. The place contains 3529, and the canton 13,258 inhabitants, on a territory of 105 kilometres, in five communes.

HOOGLY, a circar or province of Bengal, about 80 miles in length from N. to S. and 48 in its medial breadth, much intersected, and formed into numerous islands by branches of the Hoogly and several other rivers—Also, a small but ancient city of Bengal, on the same river with Calcutta, but on the opposite side, and about 26 miles above it. In the time of the Mahometan government, it was the "bunder" or port of the western arm of the Ganges, where the customs or duties on merchandize were collected. The French, Dutch, Danes, and Portuguese, have each of them had a town and factory on this part of the river, between Hoogly and Calcutta; and all within the extent of ten miles along the river. In 1757 this town was taken by the British, and vast quantities of salt and provisions belonging to the nabob of Bengal burned and destroyed. N. lat. 25 54'. E. long. 88 29'.—Also, a river of Bengal, formed by the junction of the Cossimbuzar and Jellinghy, the two westernmost branches of the Ganges, which runs into Bengal bay. This is the port of Calcutta, and the only branch of the Ganges that is commonly navigated by ships. The Cossimbuzar river is almost dry from October to May; and the Jellinghy river, (although a stream runs in it the whole year,) is in some

some years unnavigable during two or three of the driest months; so that the only subordinate branch of the Ganges, that is at all times navigable, is the Chundnah river, which separates at Moddapour, and terminates in the Hooringotta. The Hoogly river, which is the most westerly branch of the Ganges, has a much deeper outlet into the sea than the principal branch. This may probably be owing to its precipitating a less quantity of mud than the other; the quantity of the Ganges water discharged here being less than in the other, in the proportion of one to six. From the difficulties that occur in navigating the entrance of the Hoogly river, many are led to suppose that the channels are shallow. The difficulties, however, arise from bringing the ships *across* some of the sand-banks, which project so far into the sea, that the channels between them cannot easily be traced from without. Rennell's Mem.

HOOGSTRATEM, a town of France, in the department of the Two Nethes, and chief place of a canton, in the district of Turnhout; 15 miles N. of Herenthals. The place contains 1360, and the canton 7227 inhabitants, on a territory of 202½ kilometres, in eight communes.

HOOK, in *Angling*, &c. See *FISHING-book*.

HOOKS, in *Building*, &c. are of various sorts; some of iron and others of brass, *viz.* 1. Armour-hooks, which are generally of brass, and are to lay up arms upon; as guns, muskets, half-pikes, pikes, javelins, &c. 2. Casement-hooks. 3. Chimney-hooks, which are made both of brass and iron, and of different fashions; their use is to set the tongs and fire-shovel against. 4. Curtain-hooks. 5. Hooks for doors, gates, &c. 6. Double line-hooks, large and small. 7. Single line-hooks, large and small. 8. Tenter-hooks, of various sorts. See *TENTER*.

HOOKS of a Ship, are all those forked timbers which are placed directly upon the keel, as well in her run as in her rake. See *BREAST-hooks*.

HOOK, Boat, in a *Ship*. See *BOAT*.

HOOKS, Can, those which being made fast to the end of a rope, with a noose (like that which brewers use to sling or carry their barrels on), are made use of for slings. See *CAN-book*.

HOOKS, Foot, in a *Ship*, the same with futtocks.

HOOK-land, or *Ope-land*, land ploughed and sowed every year. *Diët. Russ.*

HOOKS, Loof, in a *Ship*, a tackle with two hooks; one to hitch into a cringle of the main or fore-sail, in the bolt-rope at the leech of the sail by the clew; and the other is to hitch into a strap, which is spliced to the chefs-tree.

Their use is to pull down the sail, and succour the tackles in a large sail and stiff gale, that all strefs may not bear upon the tack. It is also used when the tack is to be seized more secure, and to take off or put on a bonnet or drabber.

HOOK-pins, in *Architecture*, are taper iron pins, only with a hook-head, to pin the frame of a roof or floor together.

HOOKS, Sheer, in a *Ship*, hooks like sickles fixed in the ends of the yard-arms, that if a ship under sail come to board her, those sheers may cut her shrouds, and so spoil her tackling. But as those sheer-hooks are subject to break their own yards, and cut the ropes that come from the top-sails, they are now very seldom used.

HOOKS, Trill. See *TRILL-hooks*.

HOOKS, Draught. See *DRAUGHT-hooks*.

HOOKAH, a pipe for smoking, used in India and among the nations of the East; consisting of a glass-vessel of a globular form, nearly filled with water, from which issue two tubes, one perpendicular, on which the tobacco is placed, and the other oblique from the side of the vessel, to

which the mouth is applied. The advantage of this construction is, that the smoke, in passing through the water, is cooled and rendered more agreeable. In company this instrument is circulated from one to the other, but among persons of superior rank and refinement, each person has a hookah appropriate to himself, which is often made of silver and set with precious stones; the tube, which is applied to the mouth, is long and pliant, and on this account denominated the snake; and the vessel through which the smoke passes is filled with rose water, and thus receives some of the fragrant quality of that fluid. The preparation of the hookah is the peculiar province of one of the domestics, and the use of it is reckoned among the luxuries of the East.

HOOKE, NATHANIEL, in *Biography*, author of a Roman history, was a Roman Catholic by profession, and much attached to the mystical doctrines taught by Fenelon. Few biographical facts are known relating to this person. He is said to have enjoyed the confidence and patronage of persons distinguished as well by their virtue as their rank. He appears to have lost the property which he possessed in the fatal South-sea bubble. Not long after, he was recommended to Sarah, duchess of Marlborough, as a proper person to assist in compiling the memoirs of her own life, for which literary service she presented him with the magnificent sum of five thousand pounds. The book, entitled "An Account of the Conduct of the Duchess of Marlborough, from her first coming to Court to the Year 1710," was published in 1742, but she quarrelled with Hooke soon after, on account, as she affirmed, of his wish to convert her to popery. The great work of Mr. Hooke was "The Roman History," from its earliest periods to the settlement of the empire under Octavius. It was published at first in 4 vols. 4to., but it has since been published in 8vo., and a new edition of it was given to the world a few weeks since in 11 vols. 8vo. Another work of this historian upon Roman affairs, was "Observations on Four Pieces upon the Roman Senate." He also published a translation of "Rampsey's Travels of Cyrus." *Gen. Biog.*

HOOKE, ROBERT, an eminent mathematician, who flourished in the 17th century, was born at Freshwater, in the Isle of Wight, where his father was minister, in the year 1635. The brightness of his parts led his parents to intend him for the church, but the weak state of health of the child, and his being subject to almost perpetual head-ache, made them despair of rendering their son a scholar. The youth being, in a good measure, left to himself, and to the bent of his own genius, turned his attention to mechanics, and employed himself in making toys, some of which discovered much ingenuity. At length he made a clock in wood, that would perform all the motions, and mark out in a rough manner the hours of the day. He displayed a taste likewise for drawing, and soon after the death of his father he was placed under the celebrated painter sir Peter Lely. To the profession of painting he could not apply himself on account of his health. He therefore was placed first in Westminster school, and afterwards was sent to Oxford. In 1655 he had made such progress in the sciences, that he was elected a member of a philosophical society at Oxford, and became an assistant to the honourable Mr. Boyle, in his experiments and pursuits, to whom he was particularly useful in the construction of the air-pump. He was, likewise, an adept in astronomy, and constructed some instruments well adapted to the making of observations. In 1662, Mr. Hooke was appointed curator of experiments for the Royal Society, which met at that period at Gresham college; he engaged to furnish the members, at every time of their meeting, with two or three new experiments of his own, and to

perform

pursue such others as they should recommend to him. This business led him to make several important discoveries relating to the nature and properties of the air. In 1663, when the Royal Society was established by charter, Mr. Hooke was nominated one of the members who were appointed on the first council. The repository of the society was committed to his care, and a gallery in the Gresham college was appointed for its reception. In the following year he was made professor of mechanics to the Royal Society, by sir John Cutler, with a salary of 50*l.* per annum settled upon him for life, and in the same year he read astronomical lectures at Gresham college. He published, in 1665, his "Micrographia, or some physiological Descriptions of minute Bodies, made by magnifying Glasses, &c." This work he dedicated to the king, who had been instrumental in founding the society, and who had shewn himself friendly to experimental pursuits, for all which he is applauded by Mr. Hooke in terms approaching to fulsome flattery. The meetings of the society being now discontinued on account of the ravages of the plague, Mr. Hooke, accompanied by other persons, among whom was doctor, afterwards bishop, Wilkins, and sir W. Petty, retired to the seat of the earl of Berkeley, where they diligently pursued their experiments, an account of which they afterwards communicated to the Royal Society when its meetings were resumed. After the fire of London in 1666, Mr. Hooke offered to the court of aldermen a plan for re-building the city, which, though not followed, led to his appointment to the office of one of the city surveyors, in which he acquired considerable property. We shall not enter into the disputes and controversies in which Mr. Hooke engaged, in some of which he shewed a temper unworthy of a true philosopher. In 1673 he proposed a "Theory of the Variation of the Compass," and in the following year he published "An Attempt to prove the Motion of the Earth from Observations;" his next publications were "A Description of Helioscopes, &c." and "Descriptions of some mechanical Improvements of Lamps and Water-pipes, together with physical and mechanical Discoveries." Upon the death of Mr. Oldenburgh, Mr. Hooke was appointed to supply his place in the office of secretary to the Royal Society; this was only a temporary appointment, as the office was in a few months given to Mr. Nehemiah Grew. Mr. Hooke was not contented with the reputation which he had acquired, though considerable, but on the publication of sir Isaac Newton's Principia, he laid claim to that great man's discovery concerning the force and action of gravity, his pretensions to which were most satisfactorily refuted. In 1691 he was employed in forming the plan of the hospital near Hoxton, which was founded by alderman Aike, who appointed archbishop Tillotson one of his executors, and in the same year Mr. Hooke was by that prelate created M. D. In 1696 the Royal Society would gladly have employed him in a repetition of his experiments at their expence, but his ill state of health prevented him from engaging in the business. He died at his apartments in Gresham college in 1702, in the sixty-eighth year of his age. Several of his papers may be seen in the Transactions of the Royal Society: and after his death, in 1705, his posthumous works were published. He was a man of great mechanical genius, and the sciences are indebted to him for several improvements, and for instruments adapted to the discovery of other new and useful facts. He was well acquainted with the ancient languages, and all the branches of the mathematics. He always maintained a great veneration for the Deity, and seldom received any signal benefit in life, or made any valuable discovery in nature, or invented any useful contrivance, or found out any

considerable problem, without expressing his gratitude to Divine Providence. Biog. Brit.

HOOKER, JOHN, a learned antiquary, was born at Exeter in 1524, and educated at Oxford, after which he travelled into Germany. Upon his return he was elected a representative in parliament for his native city in 1572. He wrote a description of Exeter, and was author of some part of Holingshed's Chronicle, besides other pieces. He died in 1601.

HOOKER, RICHARD, nephew of the above, was born at Heavitree, near Exeter, in 1553; he was educated at the grammar school of Exeter, from which place he was sent to Corpus Christi college, Oxford, of which he was chosen fellow in 1577. He was indebted to the patronage of bishop Jewel for a learned education, and calling once on the prelate in his way to Oxford, the bishop gave him much good advice and his benediction, but forgot to give him any money; quickly, however, recollecting himself, he sent his servant to call him back, and on his return he said, "Richard, I have sent for you to lend you a horse, which hath carried me many a mile, and I thank God with much ease." He then gave him a walking staff, with which he had himself travelled through many parts of Germany, and added, "Richard, I do not give but lend you my horse; be sure you be honest and bring my horse back to me at your return from Oxford. I do now give you ten groats to bear your charges to Exeter (whither he was going to see his mother), and here are ten groats more, which I charge you to deliver to your mother, and tell her I send a bishop's benediction with it, and beg the continuance of her prayers for me. And if you bring my horse back to me, I will give you ten groats more to carry you on foot to the college, and so God bless you Richard." Shortly after this, young Hooker lost his patron by the death of the good bishop; he had, however, those talents and that excellent disposition which soon procured him other friends in Dr. Cole, then president in his college, and Dr. Edwin Sandys, bishop of London, by whose interest he was elected scholar of his college in 1573. At the same moment almost, the bishop placed his own son under the care of Mr. Hooker for college instruction, though he had not at that time attained to his twentieth year, but said Dr. Sandys, "I will have for my son a tutor that may teach him learning by instruction, and virtue by example, and my greatest care shall be the last." Mr. Hooker, while at college, was greatly distinguished among his contemporaries, for the piety, regularity, and exemplariness of his life. In 1577 he took his degree of M. A., and was in the same year elected fellow of his college. In 1579 he was appointed deputy-professor of the Hebrew tongue in the university, and for a cause, not known, but which was probably of a very trifling nature, he and some others were expelled the college by the vice-president, to which they were again restored in the course of two or three weeks. Mr. Hooker took orders in 1581, and very shortly after was appointed to preach at St. Paul's Cross in London. This appointment, which was esteemed an high honour, produced a train of circumstances, by which the young divine was, through the great simplicity of his character, entrapped into an unfortunate marriage with a woman who brought him neither beauty nor portion, and who has been represented as "a silly clownish woman, and withal a mere Xantippe." In consequence of this step Mr. Hooker lost his fellowship, and was obliged to quit the university before he had obtained any preferment. In 1584 he was presented to the rectory of Drayton-Beauchamp, in Buckinghamshire, where he lived a miserable life with his spouse. Here he was visited by his friend and pupil Mr. Sandys in company with

with another pupil, Mr. Cranmer, a grand-nephew of the celebrated archbishop. The young man found their respected and very learned tutor tending a small flock of sheep, during the absence of his servant, called away to perform some domestic employment. When he was released from this duty, his friends accompanied him to the house, where they had the more serious mortification of witnessing the churlishness of a wife, who took every opportunity of rendering one of the best of men wretched by her caprice and vexatious manners. They felt for the situation of their friend, and Mr. Cranmer, before he left the house, expressed his surprize that he could possibly endure the miseries and insults to which he was subjected; to this Mr. Hooker replied, "My dear George, if saints have usually a double share in the miseries of this life, I that am none, ought not to repine at what my wife Creator hath appointed for me, but labour (as indeed I do) to submit mine to his will and possess my soul in peace." Upon the return of Mr. Sandys, he prevailed on his father to obtain some better situation for Mr. Hooker, and he was, accordingly, by his interell, made master of the Temple. He soon found that London was not adapted to his mind; he loved a rural retirement, in order, as he said, "that he might see God's blessings spring out of the earth, and be free from noise and bustle, and eat that bread, which he might call his own, in privacy and quietness." He was, therefore, desirous of exchanging his preferment for a more retired and tranquil scene, and the more so, as he had begun and had made some progress in his celebrated work "Of the Laws of Ecclesiastical Polity," which he found himself incapable of carrying on to his own satisfaction in the Temple. Upon making known his wishes to archbishop Whitgift, and apprising him of the undertaking on which he was employed, Mr. Hooker was presented, in 1591, to the rectory of Bosecomb, in Wiltshire; and in the same year he had other valuable preferments in the cathedral of Salisbury. At Bosecomb he finished four books of his great work, which were printed in 1594, and in the following year he was presented by the queen to the rectory of Bishop's Bourne, in Kent, where he resided the remainder of his life, discharging the duties of his office in the most exemplary and conscientious manner. Here he finished his work, but he did not live to publish the sixth, seventh, and eighth books. Of this very valuable piece pope Clement VIII. said, "that there were in it such seeds of eternity as will continue till the last fire shall devour all learning." In the year 1600, Mr. Hooker, in consequence of a cold that he caught on a passage by water between London and Gravesend, was afflicted with a long and very severe illness, which, in the end, proved fatal to him. He died in November of the same year, when he was only in the forty-seventh year of his age. His treatise on "Ecclesiastical Polity," procured for him a very great and extensive reputation both at home and abroad. When king James I. came out of Scotland, on his accession to the throne of England, he enquired of archbishop Whitgift for his friend Mr. Hooker, and being answered that he had died before the queen, who received the news of his death with great regret, he replied, "And I receive it with no less, as I shall want the desired happiness of seeing and discoursing with that man from whose books of church polity I have received such satisfaction. Indeed, my lord, I have received more satisfaction in reading a leaf or paragraph in Mr. Hooker, though it were but about the fashion of churches, or church-music, or the like, but especially of the sacraments, than I have had in the reading particular large treatises but of one of those subjects by others, though very learned men; and though many others write well, yet in the next age they will be forgotten; but,

Vol. XVIII.

doubtless, there is in every page of Mr. Hooker's book the picture of a divine soul, such pictures of truth and reason, and drawn in so sacred colours, that they shall never fade, but give an immortal memory to the author." This work, so highly applauded by a pope, and a king, who considered himself much wiser and more learned in theology than all the popes, contains the most profound and ablest defence of ecclesiastical establishments that has ever appeared. Biog. Brit. Teulmin's Neal.

HOOKER is the name of a vessel built like a pink, but rigged and masted like a boy; much used by the Dutch.

HOOKERIA, in Botany, so called by Dr. Smith, in honour of his friend Mr. William Jackson Hooker, F. L. S. a most assiduous and intelligent botanist, celebrated as the discoverer of the *Buxbaumia aphylla* in England, and particularly skilled in the knowledge of cryptogamic plants, especially *Jungermannia*, with the reticulated habit of which that of the *Hookeria* accords. The interesting journal of a tour to Iceland, which Mr. Hooker has lately printed for the use of his friends, gives a foretaste of what the world may expect from his labours in a more promising and more extensive undertaking. Sm. Tr. of Linn. Soc. v. 9. 275.—Class and order, *Cryptogamia Musci*. Nat. Ord. *Musci*.

Ess. Ch. Capsule ovate, with dot-like reticulations, from a lateral scaly sheath. Outer fringe of sixteen teeth; inner a sixteen-toothed membrane. Veil reticulated and cellular, undivided.

Ten species are described in the Linnæan Transactions, four of which, not previously figured, are there engraved. The only British one is

H. lucens. Engl. Bot. t. 1902. (*Hypnum lucens*; Linn. Sp. Pl. 1589. Sm. Fl. Brit. 1295. Hedw. Fund. v. 1. 13. t. 1. f. 4—6. *H. pennatum aquaticum lucens*, longis laticifolii; Dill. Musc. 270. t. 34. f. 10.)—Leaves three-ranked, elliptical, uniform, entire, without ribs.—Found in moist shady situations, in various parts of England, especially in the northern counties, as well as in Germany and North America. Mr. Hooker gathered it on Holt heath, Norfolk, in wet places among grass, bearing fruit in February. This is one of the most elegant of mosses, distinguished by its broad, pellucid, finely reticulated, succulent, pale green leaves, which stand upright, apparently in two rows, but mostly disposed in three; they sometimes take root at their blunt points. *Sheaths* lateral, solitary or in pairs, of several ovate, pointed, ribless scales. *Fruit-stalks* solitary, erect, five times the length of the leaves, rather stout, deep red and shining, butious at the base. *Capsule* more or less drooping, ovate, short, dark brown, shining, all over most beautifully and regularly marked with dot-like reticulations, which by a mistake in the engraver of English Botany (for the drawing was correct), are represented like furrows only. Every other part of that plate, however, is correct. The singularly cellular white veil, which falls off entire, without splitting, is perhaps as good a mark of the genus as any. The lid is conical, as long as the capsule.

Among the exotic species the most remarkable for its history is

H. pennata (*Leikea pennata*; Labillard. Nov. Holl. v. 2. 106. t. 253. f. 1. *Amictangium bulbosum*; Hedw. Sp. Musc. 43. t. 6. f. 1—5.)—Leaves three-ranked, somewhat pointed, finely serrated; the intermediate row orbicular, half the length of the rest, which are lanceolate, and longer than the fruit-stalks.—Gathered by M. Labillardière, and Mr. R. Brown, in New Holland; at Dusky bay, New Zealand, by M. A. Menzies.—Larger than the foregoing, with creeping, densely tufted, black roots. Hedwig mistook them for bulbous ones, and seeing only half-ripe cap-

fules, did not detect the fringe, which caused him to refer this moss to his *Aniëangium*. Mr. Brown found its *vil* to agree with that of *H. lucens*, which confirms the character of the genus. The simple fern-like form of the stem and flat leaves is peculiarly elegant. The height of the plant is from three to five inches.

The eight remaining species of *Hoskeria* are *quadrifaria*, Tr. of Lin. Soc. v. 9. t. 23. f. 1.; *filiculiformis*, Hedw. Sp. Musc. t. 50.; *tamarifera*, *ibid.* t. 51. f. 1—7.; *rotulata*, *ibid.* f. 8—13.; *flabellata*, Tr. of Lin. Soc. v. 9. t. 23. f. 2.; *Arbuscula*, *ibid.* f. 3.; *flexilis*, Hedw. Sp. Musc. t. 58.; and *uncinata*, Tr. of Lin. Soc. v. 9. t. 23. f. 4.

HOOKETOWER, in *Geography*, a cape on the south of Ireland, at the extremity of a tongue of land in the county of Wexford, which forms the eastern side of Waterford harbour. On this cape is a light house. N. lat. 52° 6'. W. long. 6° 58'.

HOOLA, a town of Norway, in the diocese of Aggerhuus; 32 miles N.W. of Christiania.

HOOLDEAH, a town of Bengal; 21 miles S. of Calcutta.

HOOLE, CHARLES, in *Biography*, who flourished in the 17th century, was born at Wakefield, in Yorkshire, and educated at Lincoln college, Oxford, after which he became master of the free-school at Rotherham; but at the beginning of the civil wars he removed to London, where he gained great reputation as a school-master. He was author of many useful school books, an excellent edition of the Greek Testament, and a translation of Terence's plays. He died in the year 1666.

HOOLE, JOHN, a very ingenious man, was born in London in 1727. His father was a watch-maker, and a very able mechanic. He gave his son a very good education, and obtained for him a clerkship in the India House. During his engagements in this situation he devoted his leisure hours to literary pursuits, particularly to the study of the Italian language, of which he acquired an extensive and very deep knowledge, as appears by his translations of Ariosto's Orlando Furioso, and Tasso's Jerusalem. He also published two volumes of the dramas of Metastasio, and was author of three tragedies, some poems, and the life of Mr. Scott of Amwell. He died in the year 1803.

HOOLI, the name of a cheerful festival, celebrating the arrival of the vernal equinox, as the "Dussera," at the end of summer, is appropriate to the autumnal equinox. It is observed in honour of Narrain, or the favourite god Krishna, of the Hindoo mythology, who is the Apollo of the Hindoos, the god of dance and music, of pleasure and of sport. This festival takes place the first full-moon after the sun has passed the vernal equinox, and is calculated to hail the approach of spring. Its ceremonies consist entirely of the most frolicksome and playful sports. All ranks and ages mix in its celebration; and among other acts, during its continuance, cast at each other handfuls of a pulverized scarlet flower, the jubba (*ivora Linnæi*), and thin elastic balls, filled with a liquid coloured by the same plant; these burst on the slightest resistance, and cover the whole dress and person of him who is struck by it with a crimson stain. It is deemed no disgrace on this occasion to bear the most obvious traces of the deepest dye; for when once the barrier of the "Zennara" (the apartments of the females), is broken down, the sovereign himself sets aside his high despotic character, and unbends in frolicksome festivity. Unrestrained liberty of speech and repartee prevails; and the females of every family particularly delight in giving free indulgence to these romping sports, which are equally kept

up by the Mahometans and the Hindoos. Turner's Tibet, p. 144, &c.

HOOLSOVRY, in *Geography*, a town of Hindoostan, in Dowlatabad; 15 miles from Balkee.

HOOLY-ONORE, a town of Hindoostan, in the Myfore country, situated at the conflux of the Toom and the Badra, where they form the Tungebadra; taken by the British troops in December, 1791; 56 miles N.W. of Seringapatam.

HOONGA-HAPAE, and **HOONGA-TONGA**, small islands in the S. Pacific ocean, belonging to the group of Friendly islands; 30 miles N. of Tongataboo. S. lat. 20° 36', and 10 or 11 leagues from the W. point of Annamooka. On the former five men reside, and the latter is uninhabited. Both abound with sea-fowl.

HOONLA, a town of Hindoostan, in the circle of Cicacole; 11 miles W. of Ganjam.

HOOP, a town of Norway, in the government of Wardhuys; 76 miles W. of Wardhuys.

HOOP, in *Rural Economy*, a name frequently applied to a high sort of cheese-vat, such as that used in making Stilton and other kinds of small rich cheeses. See **CHEESE** and **DAIRYING**.

HOOP, in *Agriculture*, the name of a dry measure of grain, which is equivalent to a peck, or a quarter of a bushel. See **WEIGHTS** and **MEASURES**.

HOOP Wheel. See **DETENT-wheel**.

HOOPER, EDMUND, in *Biography*, organist of Westminster Abbey, and a gentleman of the Chapel Royal, where he performed the duty of organist. He was one of the authors of the Psalms in four parts, published in 1594, and of several anthems in Barnard's Collection. His full anthems and services used to be performed in our provincial cathedrals within our own memory. He died July 14th, 1621.

HOOPER, JOHN, was born in Somersetshire in 1495, and educated in Merton college, Oxford. He was for some time a member of the order of Cistercians, but having imbibed the principles of the reformers, he quitted a monastic life, and went to Swisserland, where he was married. On the accession of Edward VI. he returned to England, and was made bishop of Gloucester, to which was added the bishopric of Worcester in commendam. Here he laboured with great zeal till the restoration of popery under Mary. Bishop Hooper was now thrown into prison, whither the good old Latimer also was sent soon after. Here he was exceedingly ill treated, underwent a mock trial, and was condemned to the flames through the means of the infamous Gardiner. Though tried at the same time with Rogers, who was burnt at Smithfield, he was sent into his own diocese to be executed. This circumstance was intended to strike the greater terror into the breasts of those among whom he had laboured in the gospel ministry, but it was to the bishop a source of consolation, who rejoiced in giving testimony, by his death, to the doctrine which he had formerly preached. When he was chained to the stake, a stool was set before him, on which was laid the queen's pardon if he would merit it by recanting his opinions. But he had made up his mind to the worst that bigotry could inflict, and was prepared for the savage punishment to which he was sentenced. He suffered it in its full severity; the wood was green, and could not easily be kindled; his lower parts were literally consumed before his vitals were attacked. One of his hands dropped off; with the other he continued to exhibit his fortitude and pious resignation to the will of God. He was three quarters of an hour in torture, which he bore with inflexible constancy.

fancy. This brutal act was perpetrated in the year 1555. Hume.

HOOPER, GEORGE, was born at Grimley, in Worcester-shire, in the year 1640. He was educated at Westminster school, and from thence he was sent to Christ's college, Oxford in 1656. Here he distinguished himself by his talents and assiduous industry, and became very conversant in the knowledge of the mathematics and the ancient languages, including the oriental tongues, and particularly the Arabic. He took his degrees, and became chaplain first to Dr. Morley, bishop of Winchester, and then to Dr. Sheldon, arch-bishop of Canterbury. He was shortly after presented with the rectory of Lambeth, and the precentorship of Exeter. In 1677 he took his degree of D D. and was sent into Holland to attend the princess of Orange as her almoner. When he returned from the continent he was offered the professorship of divinity at Oxford, which he declined, and in 1680 was appointed chaplain to the king. Little more is known of him from this time till 1691, excepting that he was commissioned by James II. to attend the duke of Monmouth in the Tower, on the evening before his execution. In the year already mentioned, during the absence of king William in Holland, queen Mary, without any application on his part, promoted Dr. Hooper to the deanery of Canterbury. In 1701 he was chosen prolocutor to the lower house of Convocation, and was offered the primacy of Ireland by the earl of Rochester, then lord lieutenant. In 1702 Dr. Hooper was promoted to the bishopric of St. Asaph, in which see he continued only six months, when he was removed to the see of Bath and Wells. This change he very much objected to, and absolutely refused farther promotion, though the bishopric of London and the archbishopric of York were successively offered him. It is said of him that he considered himself as married to his diocese, and he uniformly promoted his own clergy to all the instances of preferment that fell into his disposal. He regarded no interest, but made those the objects of his favour who were most attentive to the duties of their situation. The care of his parish was the best recommendation of a pastor to this vigilant prelate, and the continuance in his duty the most satisfactory requital that could be made him. Bishop Hooper died at Barkley, in Somersetshire, in 1727, having presided over his see nearly 25 years. He was author of a learned "Discourse on Lent, in two Parts: the First, an Historical Account of its Observation; and the Second, an Essay concerning its Original;" of "A Calculation of the Credibility of human Testimony," published in the "Philosophical Transactions;" of "An Inquiry into the State of ancient Measures, with an Appendix concerning our old English Money;" and various other works. They were all collected and printed at Oxford in 1757, in one volume folio. Gen. Biog.

HOOPER, in *Ornithology*, a name by which several have called the cygnus ferus, or wild swan.

HOOPING COUGH, in *Medicine*. See PERTUSSIS.

HOOPOE, in *Ornithology*. See UPUPA.

HOORELL, in *Geography*, a town of Hindoostan, in Mewat; 24 miles N. of Dig.

HOORINGOTTA, a river in Bengal, formed by the union of several others, which runs into the bay of Bengal, N. lat 20° 50'. E. long. 90° 6'.

HOORN, a sea-port town of Holland, situated on the Zuyder see. The town is fortified, as well as guarded by dams, has five gates, and contains some handsome buildings, churches, and hospitals. The adjacent land is very rich, and produces great quantities of butter and cheese, besides fattening lean cattle, brought hither from the more northern

parts of Europe; 11 miles E. of Alcmæer. N. lat. 52° 39'. E. long. 4° 54'.

HOORN, or *Horn*, a town of France, in the department of the Lower Meuse, giving name to a small county in the bishopric of Liege; 3 miles W. of Ruremond.—Also, a small island in a bay on the N. coast of New Guinea. S. lat. 3° 42'. E. long. 135° 42'.

HOORN *Islands*, two islands in the South Pacific ocean, discovered in 1616, by Le Maire and Schouten; each of which was governed by a king. The inhabitants are described as large and tall, strong and well made, excellent runners and swimmers, of a yellowish brown complexion. Their hair was dressed in a singular manner, forming several tails, or erect, like hogs' bristles. The different ranks seemed to be distinguished by the number of these tails. Both men and women were naked, except a small covering round the middle. The women were very deformed, having long breasts that hung down below their stomachs like leather sacks. These people seemed to have no notion of a God or religious worship. S. lat. 15°. E. long. 171° 30'.

HOORN'S *Island*, a small island at the E. entrance of the straits of Sunda. S. lat. 5° 44'. E. long. 106° 24'.

HOORNBECK, JOHN, in *Biography*, a learned Dutch Protestant, was born at Haerlem in 1517. He was divinity professor at Utrecht, and afterwards at Leyden, where he died in 1666. His application was very intense, and his learning various and solid. He understood many languages, both ancient and modern, as, the Latin, Greek, Hebrew, Chaldee, Syriac, Dutch, German, English, French, and Italian. He was author of very many works, which are enumerated by Bayle. He left two sons, of whom one, Isaac, was an eminent advocate at the Hague, and afterwards counsellor pensionary, keeper of the seals, and stadtholder of the siefs of Holland and West Friesland. Bayle.

HOORNE, JOHN VAN, a distinguished anatomist and physician, was born at Amsterdam in 1621. After the completion of his grammar education he was sent to the university of Utrecht for the purpose of entering on the study of medicine, and went through his course with honour. With a view to farther improvement he visited Italy; but on his arrival in that country he entered the Venetian army, in which he served for some time. Subsequently, however, his taste for science returned; and having studied under the most eminent professors of Italy he went to the universities of Basil, Montpellier, and Orleans, in the first of which he received the degree of M.D. with some very honourable testimonies of his abilities. In consequence of these he was appointed professor of anatomy and surgery at Amsterdam soon after his return; and in 1653 he was made professor of the same sciences in the university of Leyden, an appointment which he accepted with extreme pleasure, and which he fulfilled with much celebrity until his death, in January, 1670.

Van Hoorne was a man of considerable literary attainments, being master of eight languages. His reputation with posterity, however, rests principally on his anatomical knowledge. He had great reputation as a teacher of anatomy, and seems to have been the first to describe the thoracic duct in the human body, which Pecquet had already demonstrated in other animals. He is said to have been the first, likewise, to shew the intimate structure of the testes. He drew a great number of anatomical figures, with great elegance, which were never published, but which, according to Haller, were in the library of the celebrated Boerhaave, at Leyden. Besides having edited the works of Botallus, in 1660, and the book of Galen, "De Offibus," with the commentaries of Vesalius, Sylvius, &c. in 1665, Van Hoorne

was the author of several works, almost entirely relating to anatomy, viz. "Exercitationes Anatomicæ I & II ad Observationes Fallopii anatomicas," &c. Liege, 1649, 4to.; "Novus ductus chyliiferus, nunc primum delineatus, descriptus, et eruditorum examini propositus," *ibid.* 1652; "Microcosmus, seu brevis manufactio ad historiam corporis humani in gratiam discipulorum," *ibid.* 1660, and several subsequent editions; "Microtechnæ, id est, brevissima Chirurgiæ Methodus," *ibid.* 1663, 1668, Lipsiæ, 1675; "Prodromus Observationum suarum circa partes genitales in utroque sexu," Leyden, 1668. This work was afterwards published by Swammerdam, who had made the greater part of the experiments there recorded, of which Van Hoorne only paid the expences. Swammerdam entitled it "Miraculum Naturæ," 1672, 4to.; "Observationes Anatomico-Medicæ," &c. Amst. 1674, 12mo.; a posthumous collection, under the title of "Opuscula Anatomico-Chirurgica," was published by professor Pauli, at Leipzig, 1707, 8vo. with annotations. Eloy. Dict. Hist.

HOOSACK, in *Geography*, a township of America, in Rensselaer county, New York, opposite Bensington, in Vermont, having 3141 inhabitants.

HOOSE, in *Rural Economy*, a term applied to an affection of the lungs, which is often met with in cows, pigs, and some other animals. In order to the removal of the complaint it has been lately advised to have recourse to equal quantities of vinegar of squills and balsam of copaiva, as one ounce of each, adding double the same proportion of balsam of sulphur, and four times as much honey, preparing it for one dose, by means of a quart of penny-royal tea, and giving it to the beast immediately, which should fast two hours before, and as long afterwards. It should be repeated every third day. Or, two ounces of powdered elecampane root, one each of salt of wormwood and powdered licorice root, with the same quantity of the sweet spirits of nitre, and half an ounce of sulphurated quicksilver, may be given in the same way as above, and repeated every 24 hours.

While under these medicines, it is recommended that the beast should be kept in the house, except in very fine weather, and when the grass is quite dry. The drinking of cold water should likewise be avoided.

HOOST, PETER CORNELIUS VAN, in *Biography*, was born at Amsterdam in 1581, of respectable parents, who gave him a good education. He attached himself to writing in his native language, and obtained the highest reputation both in poetry and history, so that his works were considered as a model of style. His principal piece was the History of the Low Countries, commencing with the resignation of Charles V. and reaching to 1588. This is much valued for the accuracy of its political and military statements. It was first printed at Amsterdam in 1642, and has been several times reprinted. He was author also of a history of Henry IV. written in the Latin language; and in it is given a relation of the destiny of the house of Medici. His miscellaneous works were printed in four volumes, consisting of epistles, comedies, and poems. Hoost received the order of St. Michael from Lewis XIII. He died at the Hague in 1647. Moreri.

HOP, in *Botany*. See HUMULUS and LUMULUS.

We have but one species of this genus, which is distinguished into the male and female hop.

The male hop grows wild by the side of hedges and upon banks, in many parts of England. The young shoots of these plants are often gathered by the poor people, and boiled as an esculent herb; but these must be taken very young, otherwise they are tough and stringy. This is easily distinguished by the flowers, which are small, and hang in

long loose bunches from the side of the stalks, abounding with farina on their summits, and have no hops succeeding to the flowers.

Hops were first brought into England from the Netherlands in the year 1524. (15 Hen. VIII.) But they were known and used long before. They are first mentioned in the English statute-book in the year 1552, viz. in the fifth and sixth of Edw. VI. cap. 5. And by an act of parliament of the first year of king James I. anno 1603, cap. 18. it appears that hops were then produced in abundance in England.

Hop, in *Agriculture*, the name commonly given to a well known plant of the fibrous-rooted, perennial, climbing kind, which is chiefly grown for the use of the flower-bud, in affording an agreeable aromatic bitter to beer, and other sorts of malt liquor. There is only one species of this useful plant in cultivation, but it has a number of varieties, which are made use of in different circumstances and situations; such as the red bind, the green bind, the white bind, and some others. The first of these affords but a very small hop, yet, from its hardy qualities and habits of growth, it is capable of being employed with advantage in cold, exposed situations, where the climate and soils are not so favourable as might be wished, or improper for being planted with the other kinds. It is considered by many as resisting the fly more effectually than the other varieties, frequently showing health and vigour where the other sorts are greatly affected by the fly and the louse, as well as less exposed during the season of picking to the injurious effects of the sun and rain.

The green-kind variety, although much less hardy in its nature than the above sort, is a much more productive bearer, and not unfrequently succeeds admirably in the medium descriptions of hop-soils, even where the exposures are by no means the most favourable. The white-bind sort, however, which is still more tender and delicate in its habits, is in general held in the highest estimation by the hop planter, in consequence of its being more early, and the produce of much higher value in the market.

Hops are likewise frequently distinguished by the planters under the names of the Flemish, the Canterbury, the Goldings, the Farnham, and other similar titles. The Flemish sort is commonly supposed the most inferior in its qualities, being of the red-bind description. It is the female hop-plant which affords the produce which is the object of the planter. Where the male plant is met with, it should of course be removed, as of no utility.

As the different varieties of the hop become in a state of maturity at different periods, and are proper for very different kinds of soil, the planter should be careful that plants of the several sorts be not intermixed, in setting them out, upon the same plantation or hop-ground; as where there is an inattention in this respect, it causes much trouble in the culture of the crop afterwards, especially in extensive concerns of this kind, on account of the scarcity of the labourers for getting on sufficiently fast with the necessary work.

But where the different sorts are planted out in separate plantations, this difficulty is wholly obviated, and the business of securing and preserving the crops rendered much more easy and convenient in its accomplishment, by their becoming in a state of maturity at different times.

Situations for Hop-grounds.—The most suitable situations and exposures for the cultivation of hops are such as slope gently to the south, or which are level, and have a south-westerly exposure, but which have the benefit of being protected from the effects of the north and north-easterly winds by some sort of screen or shelter, as those of high grounds behind, &c. The plantations themselves should, however,

be pretty free and open, as the plants rise to considerable heights, and should not be too much confined, but have a full circulation of air about them, and the perfect admission of light, as well as the influence of the sun, amongst them; and, by such means, the healthy vigour and growth of the binds may be not only promoted, but the too abundant moisture that hangs upon them be speedily dissipated, and thereby the crops rendered less liable to be injured by the effects of the *light* or *dew*, and the *mildew*, to all of which they are much exposed. Situations contiguous to the sea-coast, or in marshy and fenny tracts that are level, are seldom suitable to the cultivation of the hop, as crops on them mostly miscarry in unfavourable seasons for such produce.

Soil and Preparation.—The sorts of land which are the most proper for the growth of this kind of plant, are all those of the more deep, strong, friable, loamy, sandy, or clayey descriptions. They should have a disposition to dryness, without being too destitute of a proper degree of moisture, and be possessed of a good depth of mould of the rich vegetable kind. Soils of the thin, gravelly, and chalky sorts are quite improper for the culture of this sort of crop, as the former is not sufficiently retentive of moisture for the strong, healthy growth of the plants, and the latter imparts its humidity too sparingly to their fibrous roots, in consequence of its great absorbing quality.

Experience has, however, shewn that a thin, stony soil, which rests upon a sub-soil of the stony kind, and which is greatly intermixed with rich mould, is well adapted to the hop culture, and affords equally full crops with those of the rich deep kinds. The soil near Maidstone, in Kent, on which hops are extensively grown, is chiefly of this nature.

Such lands as have been long in the state of pasture, and which of course are much intermixed with vegetable matter, as those of old orchards, rich dry meadows, and other fertile pasture grounds, are in general the most proper for this use; but the hop may be grown on lands which have been under the plough, provided a sufficient quantity of manure be employed to afford a proper degree of fertility for the due support of the plants.

Whatever the state of the land may be, on which this sort of plant is grown, it should be perfectly reduced and broken down into a fine state of mould, to a considerable depth, by the repeated operations of the plough and harrow, or by being well trenched over by spade labour. The last is a very effectual method, where the land is to be broken up from the state of sward, though at present too expensive, in most situations, to be employed; but wherever it is had recourse to, the work should be performed in the early part of autumn, in order that the grounds may have the full operation and influence of the frosts, during the winter, upon them. These modes are both of them perfectly effectual in bringing hop-plantations into a fine state of mould, and at the same time, in clearing them of every description of weed that is injurious. During the concluding operations, where the plough method is practised, the land, if it be sufficiently dry, should be left in as regular and even a state as possible upon the surface; but where it inclines to be wet, it is better to have it ridged up, as by that means the superabundant moisture may be in a great measure discharged.

In all cases, just before the time of planting, a portion of compost, constituted of well rotted dung, and rich fresh vegetable mould, in the proportion of one of the former to two parts of the latter, well blended together for a considerable length of time, should be applied in the holes where the hops are to grow, in the quantity of about a bushel in each. This compost is usually set out over the whole of the

grounds first, and, after the holes have been formed, put into them.

The Sets and Methods of planting them out.—There are two sorts of sets occasionally made use of in forming new hop-plantations, as those made from the cuttings of the old binds, and root or bedded sets, which are taken off from the vines in breaking up old hop-grounds. The first sort is, however, most commonly made use of in the planting of new grounds, being formed in the early spring season. The latter sort is procured in the autumn from the old roots, in destroying former plantations. The cuttings should be made from the best and most healthy plants, each being cut to the length of about five or six inches, leaving two or three eyes or joints in it, as the buds from which the new plants are to take their origin. It is usual for them to be sold by the hundred of six score, at the rate of from sixpence to a shilling.

The work of planting is executed at different seasons, according to the kinds of plants or sets which are employed. Where root sets are made use of, the planting is generally performed in the autumn, about the end of October or the beginning of the following month, this being the period at which the former grounds are commonly dug up.

But where the cuttings of the binds are employed, the best season of planting is usually in the spring months, as from the end of February to the beginning of April, as the season may be suitable; this being the time of cutting over and dressing the old binds, when the sets can be most readily provided.

In the business of planting there are different forms and distances preferred by different planters, according to the method in which the culture of the crops is afterwards to be performed. In cases where it is to be executed by means of horse labour, which is the least expensive method, the best plan is that of setting them out in rows, at suitable distances, so as to form straight lines in all the different directions. But where the work is to be done by means of hand-labour, this is not of so much importance, if proper care be taken to allow sufficient space for the perfect growth of the plants. Some, in this case, practise the row plan, while others have recourse to what they call a triangular plan. It is plain, however, that the planting in rows at equal distances, in such way as to admit of the ground between the plants being kept clean and in order by the harrow and ridget, must be far less expensive than that of the irregular mode, in which hand labour can only be employed.

The different distances at which the holes and kills are formed, on which the plants are to be set out, vary greatly according to circumstances. Some good planters recommend six feet and a half, or seven feet; while others are in the habit of giving preference to a five or six feet plant. In consequence of plants of this sort growing with great luxuriance and rising to great heights, of course sending forth much bind and foliage, they necessarily require a large space, as where they stand too closely together, they are not only more apt to become infected with disease, but to *haul* or *twist* together above the tops of the poles, by means of which, such a degree of shade is given as prevents the hops below from completing their growth, and thereby lessens the quantity of produce in the crop. For these reasons it would appear, that the hop cannot be beneficially cultivated in a smaller space than six or seven feet; on rich good soils the latter distance may be the more proper, but on others of inferior quality, the former.

There is a method of planting practised in some districts on
soils

soils that are inclined to a moist boggy state; which is that of forming the plantations in the bed-method, by digging them sixteen feet in width, and taking out the trenches three feet in breadth, and from two to two and a half in depth, the earth which is removed being evenly spread out over the large previously prepared beds. On these, after the holes have been formed a spit in depth, twelve inches in diameter, and six feet distant in each direction, the sets are put into the soil, in three rows on each large bed, in the manner that is usual in other cases.

Making the Holes and forming the Hills.—The holes for the reception of the manure are marked out in various modes, according to the particular practice of the district, and the taste of the planter; with some it is the custom to have recourse to a line with knots formed in it, at the spaces which are intended for the holes; but others mark off at once the places for the holes, by driving short stakes into the ground at proper distances in each direction. There is, however, a more expeditious mode of proceeding than either of the above ones, which is that of striking furrows by the plough in different directions of the hop-grounds, at the necessary distances, in such a way as to constitute a kind of squares, the holes being formed in the angles where the furrows cross each other. Whichever method is followed, the holes are made by taking out the mould, to the depth of about twelve inches, by a spade, or, what is much better, by the tool termed a *spud*; always forming them in a circular manner, with the diameters of about eighteen inches; the bottom mould or soil being a little stirred or loosened at the time. These holes are then to be filled partially with some of the compost already noticed, the mould that was taken out of them being replaced upon the compost, in such a way as to form small risings or forts of hills. The sets or roots are afterwards planted out upon these hills, to the number of seven upon each, by means of a proper dibbling stick, one being placed exactly in the middle or top of each of them, and the rest at equal distances round it, at the distance of about four or five inches from the sides of the holes. It is usual to put the sets or cuttings into the depth of about two inches in the compost, in such a manner as to have the tops wholly covered by the mould on the surface part of the hills. It is thought better, however, by some planters, to have them covered lightly by the fine mould from the holes, after they have been planted out in the compost to nearly the above depth.

In setting out the plants on the large ridges, on the boggy forts of land just noticed, the work of hoeing and hilling is commonly performed towards the latter end of July, or beginning of the following month.

After the business of hoeing, hilling, and setting out the plants has been thus executed, nothing further is necessary to be done, until about the middle of May, except that of keeping the land about the plants well loosened, and perfectly clear from all sorts of weeds, at which time, in consequence of the growth of the young plants, it will be requisite to apply an additional quantity of fine mould about them on the hills, which should be scraped up from the intervals, with the view of checking the too luxuriant growth of the young shoots, and thereby promoting the vigour of the shoots; some likewise twist the shoots together into a kind of knot. Others, however, think it better to make use of two small sticks, about a couple of yards each in length, which are set firmly into each hill, so as to direct the climbing of the shoots, two or three, or more, being led up each stick, and occasionally tied with bafs or sedge during the summer season. There

will be a second moulding necessary, in the same way, about the end of July, or beginning of the following month.

Where the planting is done on the boggy descriptions of land noticed above, the plants are poled in about three weeks with old short poles, to each of which two or more of the binds are tied, the land being kept clean by hoeing and raking over occasionally. This method is however more tedious and expensive than the others, without much superiority. By the whole process the ground may probably be kept somewhat more dry and free from injurious moisture.

Other sorts of crops are by some grown along with those of the hop kind, such as those of the common bean, French bean, cabbage, and onion kinds; but this is a practice that should seldom be had recourse to, as injury may be done by it to the hop-plants, by their affording too much shade, and thereby preventing the free admission of air, light, and sun to the young binds. Onions are the least exceptionable sort of crop for this purpose, in consequence of their low growth, and their requiring to be sown at the time the hop sets are put into the soil. For the first year or two after the hops are put into the soil they may therefore be employed in some cases with benefit. All sorts of tall growing crops should, however, be carefully avoided.

Hop-plantations, though they require some years to come to perfection, should rarely, if ever, have any produce taken from them the first after they are formed, as by such means great detriment is often done to the future produce which they should afford. The Suffolk planters, in the mode of planting which they make use of, however, not unfrequently take a produce of from three to five hundred weight of hops, even the first year. Where bedded or root sets are used in planting, a small produce is even capable of being taken the first season, as the plants or binds are nearly as forward at that period as those from cuttings are in the second.

In cases where hop-grounds have been formed with care in these methods, and where the soils are well suited to the growth of the plants, they are capable of continuing in bearing for a great number of years, as twenty or more, the defects that take place in the hills being carefully supplied as they may occur. However, though this may be done, it is suggested as a better practice in most cases to renew the plantations at considerably shorter distances of time, or to occasionally renew certain portions as they may be found necessary and convenient. And, in all cases, to render such plantations as productive as possible, whether cultivated in the spade, plough, or hoe methods, the land in the intervals should be well stirred two or three times in favourable periods, and in particular cases more frequently.

It is rarely necessary, in the second year of the plantations, to apply any manure to the hills; but the ground in the intervals should be well loosened and stirred in the autumnal season, in the same way as in the first year; however, in the early spring months, in suitable weather, as at about the middle of March, the hills should be opened, and the earthy mould well cleared away from the chief roots by a tool which is denominated a picker, in the view that the stocks may be properly pruned and dressed over; in which, all the bearing stems of the preceding year are cut off within a joint or two of the roots; and all such shoots or suckers as were not permitted to be attached to the poles, or which have proceeded from the edges of the hills, completely cleared away, nothing being suffered to continue that can possibly injure or retard the healthy growth of the young plants or binds. Care should

Should be taken in the execution of this sort of work, that the various stalks and roots be fully laid bare and open to such a depth, that every thing that is prejudicial may be seen and eradicated. In the work of cutting over, experienced labourers should constantly be employed as much as possible, as a great deal depends upon this sort of work being properly executed, much injury being capable of being sustained by the leaving too much length of bind, or by too closely cutting the stalks. By the former the crops are liable to be exposed to *canker*; and by the latter, the hills to be so much weakened as not to afford shoots in sufficient abundance. Consequently, this sort of work should always be carefully overlooked. When the business of pruning and dressing has been finished, the mould should be raked and returned back again to the plants, so as to constitute as before a sort of hills.

It is necessary likewise at this period that all such plants as appear weak and unhealthy should have others put in their places, that the hop-grounds may be kept quite perfect. Such prunings as are made from the most healthy and strongest plants may be reserved for being employed in forming new plantation grounds. And in this season likewise, as well as the preceding, three hoeings and one good moulding up should be given, the first at the beginning of May, the next about June, and the last in the succeeding month; a little fine mould being each time drawn up to the roots of the plants on the hills, so as to keep them in a properly moist situation. The mouldings up should be performed about the beginning of August, the earth being well laid up over the hills, round the root-stems of the plants. It is the best done as soon as possible after rain has fallen.

Peeling the Plants.—This is the next operation which becomes necessary, and the usual rule in its execution is to begin the work as soon as the binds have sprung up to the height of two or three inches above the surface of the land, which is usually about the end of April or beginning of the following month. The most advantageous number of poles to each hill has not yet been fully ascertained, but as a full and free admission of air, light, and sun is essential to the healthy growth of the plants, it should evidently not be too great, so as to produce much closeness. Three are the most general allowance, though more are frequently made use of in the business. These should be placed in such a manner as to leave the largest spaces or openings towards the south or south-west, in order that the plants may derive the more full influence of air, light, and heat, and those which are the strongest on the side towards the north, that they may the more effectually resist the effects of winds from these quarters. The poles are fixed in the earth in general by means of a tool termed a crow, which is made of iron, and which forms the holes to the depth of eighteen or twenty inches, the sharpened root ends of which being forced into them, the earth is afterwards immediately closed and rammed in about them. The chief difficulty of this business depends upon pitching the holes to proper depths, on setting the poles down with such force as that they may be firmly fixed at the bottoms, and on their upper parts having a direction outwards so as to prevent the housing of the binds above them. If these objects be not attended to, there may be great loss from the destruction of the plants. After the poles are set down, two or three binds may be trained up, each of them being tied in the manner already noticed in several places, by labourers accustomed to the work, and repeated as there may be occasion. In cases where the poles are tall, and the binds strong, standing-ladders may be necessary in executing the work near the tops of the poles.

It is found that this business requires particular regard in the early part of the summer. When the binds prove unexpectedly strong and vigorous in their growth, and the hills have been polled with short slender poles, it may occasionally repay the trouble and expence, to have them repolled with those of taller and stronger kinds, and the short ones removed. In some instances great advantage has been gained in this way.

In the more early growth of the plants, the superfluous binds of every sort should be repeatedly removed during the summer season, as they show themselves, merely reserving one or two on each hill, to supply the situations of such as may have been injured in their first training to the poles, as such accidents not unfrequently occur, from the tender buds being bruised or twisted off by the great agitation caused by the action of the winds and other causes. These are the whole of the necessary operations in the culture of the hop, previously to the season at which the produce becomes ripe and ready for the hop-picker, which is known by the fragrant smell that is emitted from them, and their becoming firm, and of a brown colour. This usually takes place about the middle of September, but sometimes earlier.

Picking the Hops.—This is a business that requires much care and attention to see that every thing proceeds with propriety and dispatch, as there is constantly much danger to be apprehended from delay, the crops being equally exposed to mischief from the effects of the winds as those of continued rains. Preparatory to this work it is necessary to have proper baskets, and bins or cribs in readiness, and sufficient in number to the extent of hop-ground and pickers which it may be requisite to employ. These things being in due order, the hop binds are cut over close to the surface of the ground by persons used to the business, and the poles drawn up; and then placed upon the frame of the bins with the binds upon them, generally to the number of two or three, in order to the hops being picked from them. It is common to employ three or four pickers, or more, on each side of a frame, for clearing the hops from the binds, which, with the person whose business it is to sort the poles, are termed a set. But several sets are engaged in the same grounds, where they are large. And it is not unfrequent to employ women and children in this sort of work. When carefully separated from the binds and leaves, the hops are dropt into cloths hung upon tenter hooks underneath, within the frame. As soon as this is filled, the hops are removed into a large sack, in order to their being taken home to be dried on a kiln for the purpose. It is constantly necessary that this should be performed as quickly as possible after the picking is done, that the hops may not sustain any damage by continuing together in their damp or moist green condition; as where this is the case, they are frequently liable, particularly in warm seasons, to be much hurt both in colour and flavour, even in a few hours, by the slight fermentation which comes on. The kiln is of course kept constantly in readiness, and at work day and night during the picking season. The pickers should consequently be well proportioned to the quantity of hops that can be dried off. Where the hops are suffered to accumulate, they should be put in small parcels loosely placed together. See *Hop-basket*, *Hop-bin*, *Hop-crib*, and *OAST*.

Where crops of this sort are tolerably full, a good picker will separate from eight to ten bushels of hops from the binds in the course of the day, which after being stoved or dried, mostly weigh about one hundred weight. It is not unfrequent to let the picking of hops, in some places, by the bushel, at prices varying according to the case, or difficulty

H O P S.

of providing labourers. It will be necessary to have from sixteen to twenty expert pickers, in favourable seasons, where the produce is good, and where the oak is capable of drying off about eighty bushels at each measuring. In addition to the pole puller and pickers it will be necessary to have another person in the plantation, in order to pick up the scattered and straggling branches of the binds, and convey the hops to the oak or kiln. For this purpose a boy is sufficient, who, from the nature of his employment, is usually denominated the poke-boy. Horse or hand labour is employed in the conveyance of the hops, according to the distance from the kiln. The dryer should be perfectly steady and regular, and have a full knowledge of the business, as the profits of the planter greatly depend upon it; but the hop-grower should never be inattentive to these matters himself. The wages of the different people who are engaged in these operations vary much in different places, according to particular circumstances, but the Kentish hop-farmers formerly paid the pole pullers from eighteen pence to two shillings the day, with small beer, the dryers half-a-crown, with an unlimited allowance of beer and spirits, and the pickers from three half-pence to two-pence the bushel, with allowances of spirits, &c.; but these prices are pretty nearly doubled at present.

After the business of drying has been executed, the hops are taken away from the kiln by a shovel, and put in a room close at hand, formed for the purpose, and termed the stowage-room. Here they are kept for five, six, or a greater number of days, as there may be occasion, before they are become in a state proper for being put in the bags; as, when bagged too soon, they are brittle, and neither draw so good a sample, or weigh so heavy, as is otherwise the case. The best criterion is for them to remain until they have attained a tolerable degree of toughness, which is readily known by the feel. See OAST.

Bagging the Hops.—In order to render the bagging of hops easy and convenient, a round hole or trap is cut out and formed in the floor of the stowage room, exactly equal in dimensions to that of the mouth of the bag, on which a frame of wood is fastened, to which the edges of the opening of the bag are securely fixed quite round. Then in each of the lower corners of the bag a small handful of hops is firmly tied, when it is let fall through the hole to below, and the person termed the packer places himself in it, and by means of a heavy weight which he keeps constantly moving round in the places where he is not treading, presses and forces the hops down in a very close manner into the bags, as fast as they are thrown into them, in small quantities at a time, by another labourer. The work proceeds in this way until the bag is quite full, when each of the upper corners have a few hops tied in them in the same manner as those at the bottom, which serve as handles for removing them by. The bag is then taken up, and its mouth properly secured, after being taken from the frame. The closer the hops can be stowed into the bags, the better they keep both in their colour, smell, and taste. Some loss in the weight constantly takes place in the operations of drying, stowing, and rendering the hops proper for being bagged; it being the opinion of some that sixty bushels of well ripened fresh gathered hops, that have not been infested with the fly, will not, when dried and bagged, produce more than about one hundred weight. See HOP-LAG.

Sample.—The goodness of samples of hops depends upon several different circumstances, but principally on the clammy feel of the yellow farinaceous powdery matter which is sprinkled over them, and their colour; the former of which,

in the language of the hop planter and dealer, is termed the condition, and the sample considered the more or less valuable by those who are purchasers, the more or less clammy it is in its feel; while it is of the greatest consequence in relation to the latter, that it should be preserved as bright as possible; yet it does not always follow that the brightest samples are the strongest in their flavour. These properties are likewise the cause of the planters making a distinction in the bagging of the hops, as well as in the stuff in which it is performed. See HOP-BAG.

Stacking the Poles.—As soon as the picking and other operations have been executed, the poles should constantly be collected together, cleared from the binds that may be upon them, and set up in proper racks; if the work has not been done already, while the business of picking was going on. The poles are liable to be much damaged by remaining on the ground when surrounded with bind. This sort of work is often done by the acre, which is probably the best method. The old short improper poles are at this time separated and reserved for the new plantations, so that the planter is enabled to ascertain the quantity of new poles that will be wanted for the next season, which it is highly advantageous to have provided and prepared during the leisure of the winter months. It is the custom to have the bark from all the sorts of poles, except those of the ash kind, in which it separates naturally the second season, that they may not be destroyed by the lodging of the worm in them. See HOP-POLE.

Clearing away the Bind.—Immediately after the business of stripping and stacking the poles has been completed, the bind should be cleared away, which in some places is done by tying it up into faggots, bays, or small bundles, when in a perfectly dry state, being then either stacked up or placed in sheds or other situations, in order to be used as fuel in ovens or other ways. The work is usually executed at the rate of about sixpence the hundred. Some planters however burn it upon the land, while others again permit it to be taken away by the labourers, for their own use. But the first is the best method. Whatever mode is in use, it should not be neglected to be removed from the ground as speedily as possible, in order that it may not interfere with the future culture of the plantations, such as the winter diggings of it, the applications of manure of the compost kind, and the taking up of the old stocks of the plants when they become in a declining state.

Produce.—Hop crops vary more than most other sorts in the quantity of produce, being capable of affording, under different states of soils and seasons, from two hundred to more than twenty hundred weight per acre. Upon the middling descriptions of soil, in pretty favourable years, it may be reckoned from six to eight or nine hundred weight, from ten to fourteen being mostly supposed good crops. So large a produce as twenty hundred weight but rarely happens, and cannot be much expected by the planter.

Expence of cultivating Hop Crops.—In the county of Kent, the price that was formerly paid for the several different operations that become necessary in their culture, such as hilling, winter digging, cutting, preparing poles, poling, tying, nidgeting, hoeing, picking and stripping, and stacking the poles, was about 4*l.* 11*s.* 4*d.* per acre. And the whole of the annual expence, supposing the growth to be ten hundred weight per acre, and the different operations executed at stipulated prices, by known neighbouring workmen who can be depended upon, to be 28*l.* 12*s.* 6*d.* including the undertaker for overlooking the plantation, who pays the workmen

H O P S.

workmen for the different operations, picking, drying, duty, rent, poles, manure, tythe, bagging, and nidgeting.

But where the planter pays the several labourers himself, the expences will amount to 29*l.* 11*s.* 4*d.* which leaves a profit of 19*s.* 4*d.* in favour of the former method of having the work performed.

These expences at present stand a great deal higher, perhaps nearly one-half.

In the Hints to Gentlemen Farmers, the expences and profits of cultivating hops are stated in this way.

Expences per Acre.

	<i>£.</i>	<i>s.</i>	<i>d.</i>
Medium price of hop land, per acre,	1	10	0
Digging the ground	0	13	0
Dressing and pruning	0	8	0
Poling	0	15	0
Hoeing three times	0	9	0
Moulding once	0	3	6
Tying binds to poles	0	12	0
Stripping binds from poles	0	3	0
Stacking poles	0	4	0
Sharpening poles	0	10	10
Manuring	2	0	0
Picking, drying, and duty, at 1 <i>l.</i> 10 <i>s.</i> 0 <i>d.</i> } the hundred, crop supposed 12 cwt. } the acre. }	18	0	0
Bagging, with occasional expence of new } bags, about }	0	16	0
Ash poles, estimated at 30,250 the acre, } and supposed to last eight years, me- } dium price 18 <i>s.</i> the 100 at the stub, the } eighth part of which is nearly }	3	13	0
Carriage of them	1	5	0
	£ 31	2	4

These expences have since increased in a very great degree, probably not much less than one half.

Produce per Acre.

	<i>£.</i>	<i>s.</i>	<i>d.</i>
Supposing 1,200 cwt. per acre, and the } medium price 4 <i>l.</i> per cwt. the amount } will be }	48	0	0
The expence deducted from the produce } leaves a medium profit of }	16	17	8

The profit, from the expences being lately so much augmented, must now be placed much higher.

The expence of forming new hop grounds is commonly very great, in many districts being found to be not less than from sixty or seventy, to one hundred pounds the acre. In some cases they now stand much higher.

The most favourable seasons for the growth of this sort of crops in the whole of their different stages, are such as are warm without too much wet, and where the south and south-westerly winds predominate, as they never answer well where there is continued wet weather, or when northerly or easterly winds prevail for any length of time in the summer season. Other causes of great injury to these crops are likewise found in hot gleams of sun-shine after falls of rain, or succeeding foggy mornings in the more late summer months. Great mischief is also produced by high winds towards the time of picking, in consequence of the hops being much bruised and otherwise injured. The produce of such crops is rarely either good or abundant, where unsuitable weather occurs about the time the hops are in blossom,

as a number of the *bars* never become perfect hops. Forward and luxuriant crops almost invariably suffer more from all the lustful causes which affect the hop plant, than such as are later and of less strong growth. It may consequently be very useful in particular exposed situations to remove all the more forward binds.

To ascertain the duty of this sort of produce, it is necessary for the planter to be in possession of the different acts concerning it. However, every grower of hops is bound to give notice, on or before the first day of September, of the number of acres he has in this sort of cultivation; the number and situation of his oasts; and the place or places of bagging; which together with the store rooms, warehouses, &c. in which the packages are designed to be lodged are entered. And no hops can be removed from the rooms so entered until they have been weighed and marked by the proper officer; who marks, or ought to mark, on each package not only the weight, but the name and residence of the person by whom the hops are grown.

It may be noticed that the original duty was a penny on every pound weight, but the percentages that have since been added have raised it to about twenty-four shillings a bag, or thirteen shillings and fourpence the pocket, which is nearly ten pounds the ton. These were the duties in 1790, but they have since that time been still further increased in a high degree. This large duty is usually paid to the collector of the excise for the particular district, and the grower has six months credit given him.

Hop crops are upon the whole both expensive and uncertain, and the cultivation of which should be well weighed before it is began. Where the soils are quite suitable for them; and there are poles ready at hand upon the land, with a sufficient capital in the pocket of the planter, the hop culture is perhaps a kind of husbandry that may be practised with benefit; but under other circumstances it will seldom be found profitable. Where hops are grown in connection with a farm, it is necessary to attend to the extent of land that can be manured without injury being done to the other grounds under tillage husbandry.

There are few field crops more exposed to injurious affections than that of the hop. In its more early growth it is liable to the ravages of an insect of the *flea* kind, just as it proceeds from the surface of the soil. When at a more advanced stage of its growth, it is exposed to the more destructive attacks of the *green long-winged fly* , the *red spider* , and the *otter moth* . Lice are produced in large quantities by the former, in consequence of their depositing their *ova* about the bottom parts of the plants, by which they are not unfrequently in a great measure destroyed; while the *larvae* of the latter prey upon the roots from which the plants become weakly in their growth, and unhealthy. About the same time the *honey dew* is another morbid state to which the hop-plant is exposed, and by which it frequently suffers greatly. The *mould* or *fen* generally takes place at a rather later period, but is not less prejudicial in its attacks. The *blight* and *fire-blast* , to which hop crops are likewise subject, occur at different periods, but commonly towards the more late stages of the growth of the crops. All these different causes are extremely detrimental to the hop-planter, frequently proving suddenly destructive to his most promising crops. See **BLAST AND LIGHT, FLEA, HONEY-Dew, LONG-WINGED FLY, MOULD, MILDEW, RED SPIDER, and OTTER-MOTH.**

Hops, Diseases of. See **FIRE-BLAST, FEN, HONEY-Dew, &c.**

Hops, Use of. In the spring time, while the bud is yet tender, the tops of the plant being cut off, and boiled, are

eaten like asparagus, and found very wholesome and effectual to loosen the body; the heads and tendrils are good to purify the blood in the scurvy, and most cutaneous diseases; decoctions of the flowers, and syrups thereof, are of use against pestilential fevers; juleps and apozeims are also prepared with hops, for hypochondriacal and hysterical affections, and to promote the menses.

Extract of hops, *extractum humuli*, is made by boiling down half a pound of hops in a gallon of boiling water to four pints, straining the hot liquor, and evaporating it to a proper consistence. It is introduced into the London Pharmacopœia, because it is supposed to possess both a tonic and sedative power combined.

A pillow stuffed with hops, and laid under the head, is said to procure sleep in fevers, attended with a delirium. But the principal use of hops is in the brewery, for the preservation of malt liquors; which by the superaddition of this balsamic, aperient, and diuretic bitter, become less viscid, less apt to turn sour, more detergent, more disposed to pass off by urine, and in general more salubrious. They are said to contain an agreeable odorous principle, which promotes the vinous fermentation. When slightly boiled or infused in warm water, they increase its spirituousity.

Hops, *Laws relating to*. By 43 Geo. III. c. 68. for every hundred weight of hops imported, shall be paid a duty of 3*l*. 5*s*.; and on exportation there shall be allowed a drawback of 4*l*. 4*s*.; and for every pound of Irish hops imported a duty of 2½*d*. (43 Geo. III. c. 69.) And foreign hops, landed before entry and payment of duty, or without warrant for landing, shall be forfeited and burnt; the ship also shall be forfeited, and the person concerned in importing or landing shall forfeit 5*l*. a hundred weight. (7 Geo. II. cap. 19.) Hops of British growth may be exported to Ireland; bond being first given to the commissioners of excise, that the said hops shall not be reloaded, and oath made before such person as they shall appoint, that the duties have been duly charged; upon which the person exporting the same shall have a drawback of the duties before paid; and provided that such hops shall be reloaded, or put into any ship in Great Britain (except in case of shipwreck, or unavoidable accident), the same, or the value thereof, shall be forfeited, over and above the penalty of such bond; and may be seized by any officer of the customs or excise. (26 Geo. III. c. 5.) And for every hundred weight of hops, grown in Great Britain, which shall be cured, and made fit for use, shall be paid by the owner or possessor thereof, a duty of 2½*d*. (43 Geo. III. c. 69.) By 9 Anne, cap. 12. hop-grounds are required to be entered, on pain of 4*s*. an acre. Places of curing and keeping are also to be entered, on pain of 5*l*. which may be visited by an officer at any time without obstruction, under the penalty of 2*l*. All hops shall, within six weeks after gathering, be brought to such places to be cured and bagged, on pain of 5*s*. a pound. The rebagging of foreign hops in British bagging for sale or exportation, incurs a forfeiture of 1*l*. a hundred weight; and defrauding the king of his duty by using twice or oftener the same bag, with the officer's mark upon it, is liable to a penalty of 4*l*. The removal of hops before they have been cured, bagged, and weighed, and the duties ascertained, incurs a penalty of 5*l*. Concealment of hops subjects to the forfeiture of 2*l*. and the concealed hops; and any person who shall privately convey away any hops, with intent to defraud the king and owner, shall forfeit 5*s*. a pound. And the duties are required to be paid within six months after curing, bagging, and weighing, on pain of double duty, two-thirds to the king, and one-third to the informer. No common brewer,

shall use any bitter ingredient instead of hops, on pain of 2*l*. Notice of bagging and weighing shall be sent in writing to the officer, on pain of 5*l*. (6 Geo. cap. 21.) And twenty-four hours' notice shall be sufficient, by 39 & 40 Geo. III. cap. 81. Officers shall make due returns to the commissioners, and leave a true copy with the planter, or owner, or forfeit 5*l*. 9 Anne, c. 12.

The owners of hops shall keep at their oasts, &c., just weights and scales, permit the officer to use them, and assist in weighing, if required, on pain of 5*l*. A penalty of 100*l*. is inflicted for false scales and weights. No officer inferior to a supervisor shall weigh hops between five in the evening and four in the morning, on forfeiture of 2*l*. (39 & 40 Geo. III. c. 81.) By the same, repealing the 14 Geo. III. c. 68. the owner or grower, before he begins to put any hops into a bag or pocket, shall mark on the outside, in large legible characters, with durable ink or paint, his name and place of abode, on pain of forfeiting 5*l*. nor shall hops be bagged into any bag of greater weight than in the proportion of 10*lb*. for every 112*lb*. of the gross weight of bag and hops, on pain of forfeiting 2*l*. The officer, after weighing, &c., hops for the purpose of charging the duty, shall mark in like manner on every bag or pocket the gross weight, together with the year of growth, and the progressive number according to the number of bags charged to each owner or grower in each such current year; counterfeiting such marks incurs a penalty of 100*l*.; and wilfully defacing or obliterating them, or causing the same to be done, subjects to a forfeiture of 2*l*. The owners are allowed to use casks instead of bags, under the same regulations. (6 Geo. cap. 21.) No hops shall be removed from the place of weighing, until twelve hours next after bagging, weighing, &c., unless the same shall have been reweighed by the supervisor; and if any additional weight shall be found, the same shall be charged with the duty; and if any owner or grower shall convey away any such hops, contrary to the meaning thereof, he shall forfeit 5*l*. for every such offence. (39 & 40 Geo. III. c. 81.) If any person shall mix with hops any drug to alter the colour or scent, he shall forfeit 5*l*. a hundred weight. If any person shall unlawfully and maliciously cut hop-binds growing on poles, in any plantation, he shall be guilty of felony, without benefit of clergy. 6 Geo. II. cap. 37.

HOP-bag, in *Agriculture*, the name of the sack-cloth bag in which the stoved and dried hops are stuffed in order to their being sold. There are two sorts of cloth employed in this intention, according to the nature and quality of the hops; such as are of a bright fine colour and a good sample, being put into such bagging as is of a fine kind, under the denomination of *pockets*; but those which have a dark colour into a coarse heavy kind, termed *bags*: the former of these sorts of hops is employed for ales, and all the finer kinds of malt-liquors, but the latter chiefly for the brewing of porter. It is suggested that the coarse sort of bagging-stuff is the best, where the hops are to be kept for some length of time.

The necessary lengths of these sorts of bagging are about two ells and a quarter for the *bag*, and nearly the same for the *pocket*, each of them having an ell in width. The first, or *bags*, when the hops are of a prime quality, well cured, and trodden into them with tightness, will weigh about two and a half hundred weight; but the latter, or *pockets*, when of Canterbury pocketing, only about one and a half hundred weight.

In cases where the variations from these standards are in any degree considerable, the preparation or sample may be suspected with propriety.

Hop-basket, the name of a kind of large flat basket employed for carrying the hops in, during the period in which they are picked.

Hop-bin, the name of the crib or bin, into which the hops, after being picked from the bind, are thrown. It is mostly constructed merely in a temporary way, by fixing four or more pieces of boards upon as many upright posts let firmly into the ground as a frame, by means of nails. When finished, they should be full seven or eight feet in length, three feet in breadth, and the same in height, the side pieces at the ends projecting as a sort of handles. Each end has a support, which rises two feet above the top of the frame; on the tops of which rests a straight pole, the whole length of the frame, or rather more; the whole structure having somewhat the resemblance of a small market-booth, without a covering; only that, in the place of the flat surface for the reception of the wares, there is a canvas bag adapted to the size of the frame, hung within, so as nearly to reach the ground, in order to receive the hops as they are picked from the stems. Such as are formed eight feet in length are usually termed *bins*, and those of four feet in length *half-bins*. The contrivances of this nature should constantly be well proportioned to the number of pickers that are employed, in order to prevent the loss of labour, which would otherwise take place.

Hop-clover, the common name of a plant of the clover kind, which grows naturally in most meadows and pasture lands of the more dry descriptions, commonly flowering towards June, or the following month. It has been advised of late as beneficial in laying lands down to sward, when combined with other seeds of the grass kind; and is asserted to afford an excellent fodder, when sown on the lighter sorts of soils. See CLOVER.

Hop-dag, a name given to a sort of lever formed from a long piece of strong round timber, having a kind of fixed fulcrum or rest at the lower part, the end of which is set or shod with a strong piece of toothed iron, which firmly grasps and holds the bottom end of the hop-pole, when, by the action of the lever, the hop-pole is wrenched up from the ground, and much labour saved.

Hop-harrow, a name given to a sort of harrow that is employed after the nidget by different hop cultivators, in order to bring the soil into a very fine state of mould. It is constructed pretty much in the form and on the principle of the nidget, having only a small wheel fixed in the front of it, in order to turn round at the ends of the rows, with more facility than would otherwise be the case. It is guided in the intervals or alleys, and the bruising of the binds prevented, by having a pair of handles fastened on behind, and held by a man. The tool complete costs about two guineas. An implement of this sort is stated in the Middlesex Report to have there been found highly beneficial in the practice of Mr. Maynard; it is so constructed as to have somewhat the form of the snow-plough, being an equilateral triangle, the sides of which are four feet in length, and the front ones shod with old scythes; the whole being strongly framed and put together, that it may bear to be loaded when it is made use of in the work.

It is suggested that, by drawing this tool once in a place in the intervals between the rows of plants, it is capable of rendering them "perfectly clean, and as smooth as the well rolled walk of a pleasure ground," besides, earthing up the rows in the same operation, which, in about ten days or a fortnight afterwards, may be readily formed by means of spades, into hills for the reception of the plants.

Hop-hovel, a term applied to a small building or place of shelter, in which the business of picking the hops from the

binds may be executed with convenience, in cases in which the plantations are at some considerable distances from the houses of the proprietors. In this way labour and expence may often be saved to the hop farmer.

Hop-horn-beam, in Gardening. See CARPINUS.

Hop-nidget, a name given to a tool formed in a somewhat triangular manner, but of different dimensions according to the distances of the alleys or intervals in which it is to be employed, having cross bars or beams into which are fixed a number of hoes, proportioned to the breadths of the intervals in which they are to work, in such a manner that the hinder part, which is the widest, may pass along without doing any sort of mischief to the binds on the different sides of it. A pair of handles is fixed to it behind by means of which it is directed in the execution of its work. It is usually drawn by a single horse and managed by a boy; and in this state is capable of cleaning two acres in the course of the day. In making use of it, care should be taken that in completing the labour, the intervals or alleys be all gone over or crossed in the same line of direction; as by this means every part of the surface, except the portions occupied by the hills, may be effectually cut over. The spaces forming the hills must afterwards be cleaned and rendered free from weeds by hand-hoeing. This tool should continue to be made use of occasionally as there may be necessity, until the hop plants begin to branch out in such a way as to impede the passage of the horse in the alleys or intervals of the rows. In this mode hop-plantations are capable of being kept in a clean condition and perfect order, at much less expence than by means of hand labour, either by the hoe, or digging over in the summer season. The principal circumstance that requires to be attended to in the nidget management of hop-grounds is that of preventing the binds from being injured, by the tool coming too much in contact with the poles during the performance of the work.

Hop-oven, the name of a sort of oven or kiln in which the hops, after being separated from the binds, are stoved or dried by being exposed to proper degrees of heat under the direction of a person who has the exclusive management of the business. See OAST.

Hop-peeler, a term applied to a tool contrived for the purpose of forming the holes for setting the hop-poles in, in grounds of this kind; and which is a sort of strong iron crow, with a firm wooden handle placed crossways at the top, and made thick and tapering to a point at the bottom part, so as to readily remove the earth and make way for the insertion of the lower ends of the hop-poles, into the solid ground, in order to their standing firmly for the support of the binds.

Hop-picker, a term applied to the person who is employed in picking the hops from the binds, as soon as they are in a state of maturity for the purpose. Numbers of people are engaged in this sort of work in large hop-grounds.

Hop-poles, the name of the poles or strong stakes which are forced into the firm ground for the purpose of the hop binds climbing up and twisting round them, in order to their being supported and kept from trailing upon the ground. Poles of this kind are daily becoming more scarce and expensive. In the account of the rural economy of the southern counties of the kingdom, it is stated, that "the species of woods in use for hop poles are various. Formerly they depended much on the natural growth of the coppice woods of the country. But of late years, it has been the practice to make plantations for the especial purpose of hop poles."

They are asserted to be held in esteem by the planters of these districts, somewhat in this order :

1st Chestnut,	6th Maple,
2d Ash,	7th Oak,
3d Sallow,	8th Hornbeam,
4th Red-willow,	9th Beech.
5th Birch,	

Besides these the alder, or œwler, the brown willow, and some other simlar sorts of light woods, make excellent hop poles.

It has been hinted, by an intelligent hop cultivator, that the hop, as well as other climbing plants, may have a predilection or choice of particular woods as supporters; and that a rough soft bark may be preferred by them, to one which is more smooth and polished. That of the maple is particularized, as its bark is peculiarly "soft and warm;" it being noticed that when the morning has been cold, the sensitive leader of a tender or fresh-poled vine has reclined its head against the velvet bark of the maple, while others held their's aloof, from chilly smooth barked poles. It is probable, that this may be a general law or ordinance of nature, among climbing plants, and may be essential to their preservation, exhibiting, in a most palpable way, "the perception and strength of vegetable instinct." These plants, it is likewise well known, have their instinctive choice or predilection with regard to the thickness of the articles of their support; being found to embrace with greater readiness a pole that is not of too great thickness, than one which is of much thickness towards the bottom part. The usual circumference of poles, at the butt-ends, may be rated at from about six to nine inches, tapering up to the top, where they are mostly about the size of a strong walking stick. The length is commonly about fifteen or twenty feet, but sometimes more different sorts of ground require poles of very different lengths. In the rich fertile hop grounds in the vicinity of Maidstone, in Kent, the poles of grown hops usually stand from about fourteen to sixteen feet above the surface of the hills, and have from eighteen inches to two feet below the surface of the ground. But on grounds of less strength, the poles are not found to rise more than ten or twelve feet in height. For this reason, a variation of the quality of the ground is beneficial, as the poles, by rotting and decaying at the bottom parts, become shorter, and, after a few years, get too short for strong vines in rich strong land. Yet it is not the custom for them to be sold or removed to less productive hop grounds for the support of vines which have an inferior growth and luxuriance.

In these districts it was found that the prices of hop poles varied, in 1799, from fourteen to forty shillings the hundred, in proportion to the size and quality of them; being commonly sorted under three divisions; *firsts*, *seconds* and *thirds*: but in 1797 they became considerably lower, "prime poles being then thirty shillings." They have, however, been constantly upon the advance since that period, and are at present become both extremely scarce and dear. The custom with the new poles is occasionally to have the bark shaved off, under the notion that it saves them from the worm; but some hop planters suppose that there is a warmth in the bark which is agreeable to the young vines; and though in two or three years the bark may drop off naturally, the surface of the wood, in the course of that time, has acquired a degree of softness. Allowing a hard, smooth polished pole to be unfriendly to the hop, it would obviously be improper to peel the poles.

In sharpening or pointing the bottom ends of hop poles, it is usual for the light short ones to be done in the hand without any support being required; but such as are tall and heavy stand in need of some sort of contrivance to keep them steady and upright. This is generally afforded by the simple contrivance of tying three poles of equal lengths together, at two or three feet distance from their tops, and then setting them up in the form of a sort of triangle. This receives the top of the pole which is to be sharpened between the points or horns of the triangle, and affords the necessary stay to it; there being a block of wood placed suitably below to work upon. It is common for this sort of labour to be performed on new as well as old poles, before they are *stacked* up or set in piles; though occasionally only just before the time of using them. It is usual, in pointing such poles as have been already in use, to strike off the portions which have stood in the ground where they appear much decayed, and point the sound parts above. But where such bottom parts continue firm and sound, they are re-sharpened for another crop.

The stacking up of the poles is a business that is best performed immediately after the picking of the hops has been finished. It is universally the practice, in the district of West Kent, to set up the poles in a kind of conical piles containing from two to five hundred each. This is effected by three stout poles of equal lengths, being bound together a few feet from their tops, and their legs spread out so as to stand firmly. This forms the support and stay of the pile while it is building, and afterwards; the poles being regularly dropped in on each side between the points of the three poles first set up, so as to be equal on every side, as on this the stability of the stack depends. The slope and diameter of the base of a pile is variable according to the length and number of poles which are set up together. A stack of three or four hundred of the long poles, met with about Maidstone, will take up a circle of near twenty feet in diameter. It should, however, be noticed, that the bottoms of the poles do not form one entire ring; but are collected into a sort of bundles or distinct parcels, mostly from three to six or eight in number; each portion being bound tightly together a few feet distant from the ground, by means of a strong band formed from the twisted vines, by which the wind is prevented from separating the poles; and at the same time the openings between the several parcels give passage to violent blasts, and prevent in some measure the piles from being wholly thrown down; an accident, however, which rarely occurs in such grounds as are tolerably screened. But, in high exposed situations, where quantities of these poles are often piled up for sale amongst the planters, it is no unusual thing for the piles to be blown down, to the utter destruction of sheep and other animals sheltering underneath them.

The continuance or lasting of hop poles depends greatly on the sort of wood which is in use and the time of its growth, as well as in some measure the quality of the soil, and the exposure in which it has grown. Chestnut poles of eighteen or twenty years growth, are in general esteemed the most durable of any. It has been confidently asserted, that a hop pole of this sort has been employed in a hop ground for upwards of thirty years; but the usual duration of poles is from about five to twelve years; or thereabouts. When the poles become no longer useful for the strong growing plants, they are mostly either transferred to those of less growths, or laid by for use in young plantations, being ultimately converted to the purposes of fire wood, or the making of charcoal for being mixed with the coke of coal in drying the produce. They are worth

about five or six shillings the hundred in each of these views.

The annual expence of poles, taking the new ones at thirty shillings, the number made use of at three thousand per acre, their duration eight years, and the value of the old refuse ones at five shillings the hundred, was formerly about five pounds the acre; but at present it is in all probability nearly, if not quite, double that sum. On account of this great expence of poles, and its chiefly arising from the decay of the parts inserted into the ground, and the mischief that frequently happens on their being broken off at the surface of the ground, in the time the crop is ripening, it would seem to be a desirable object to prevent the destruction of that part as much as possible. In order to effect this, *charring* the parts has been recommended as a desirable plan, especially those parts which are exposed between the air and moisture close to the surface of the ground, as the decay generally commences in these places the first. See *CHARRING Posts*.

HOP-shim, the name of an implement of the shim kind used in hop-grounds, and constructed with a strong frame, somewhat in the way of the common wheel-barrow, having feet or teeth which cut up or drag out all such weeds as may infest the land, while they break it down and render it fine at the same time. According to the Report of Kent, this is a sort of tool that may be also beneficially employed in clearing summer fallows from weeds. When properly constructed it costs about a couple of guineas. It has great power in working-over land when well managed. See *SUIT*.

HOP-tree. See *HOLLY*.

HOP-trefoil, a common name often applied to a plant of the trefoil kind, and sometimes to that of hop-clover. See *TREFOIL*.

HOP, Wild. See *Shrub TREFOIL*.

HOPE, in *Ethics*, is the desire of some good, attended with a belief of the possibility, at least, of obtaining it, and enlivened with joy, greater or less, according to the greater or less probability of our possessing the object of our hope. Alexander, preparing for his Asian expedition, distributed his hereditary dominions among his friends; allotting to some villages, to others boroughs, to others cities; and being asked what he had reserved for himself, replied, *Hope*.

Pindar, as cited by Plato (*De Repub.* l. 5) calls hope the nurse of old age. It was virtue, according to Cicero, that inspired the hope of immortality, and that same immortality animated hope. There is nothing melancholy, says he, (*De Senect.* c. 1.) in death, which leads to immortality. The heathens deified hope. Cicero (*De Leg.*) speaks of one of the temples of this goddess. Livy mentions that which stood in the market for herbs, and of another which Publius Victor erected to her in the seventh region. M. Fullius, the censor, erected another to her near the Tiber. The Greeks also worshipped this divinity under the appellation *Ἐλπίς*, *Elpis*. Hope is represented upon some ancient monuments, but oftener upon the medals of the emperors, sometimes with these words, "Spes publica," "Spes populi Romani;" sometimes with a cornucopia, or with flowers and fruits, or a bee-hive. We find her often with one hand resting upon the altar, which M. Aurelius Pacorus dedicated to her. As she had her temples and altars, she had also, without doubt, her sacrifices; but antiquity gives us no account of the victims that were offered to her.

HOPE, in *Geography*, a river of Jamaica, which runs into the sea; five miles S. of Kingston.—Also, a large bay at the N.E. corner of Nootka sound, between "Point Breakers," N. lat. 49° 15'. E. long. 233° 20', and "Woody Point,"

N. lat. 50°. E. long. 232°.—Also, a bay in the English channel, on the coast of Kent, between Sandwich and Ramsgate.—Also, a harbour on the W. coast of Quadra and Vancouver's island, in the N. Pacific ocean.—Also, a small island near the coast of Rhode island, in America.—Also, two small islands, near the N.E. coast of New Holland, so called by captain Cook, when his ship was rescued from its imminently perilous situation off cape Tribulation. S. lat. 15° 41'. W. long. 214° 36'.—Also, a Moravian settlement in Wachovia, North Carolina, in Surry county, where the united brethren have a meeting.—Also, a township in the county of Durham, Upper Canada, W. of Hamilton, and fronting lake Ontario.

HOPE's Advance Bay, a bay in Hudson's strait; 100 miles W. of Cludley.

HOPE's Nose, a cape in the English channel, on the coast of Devonshire. N. lat. 50° 28'. W. long. 3° 27'.

HOPEA, in *Botany*, so named by Dr. Garden, and adopted by Linnæus, in honour of their mutual friend the late Dr. John Hope, professor of botany at Edinburgh, who died in 1786. This gentleman richly deserves commemoration, as being one of the earliest lecturers on the vegetable physiology, as well as an experienced practical botanist. Those who knew his personal merits, will readily accede to any thing that may serve to embalm so worthy a name. The genus originally chosen for this purpose has proved unfortunate, being now, justly we believe, referred by L'Heritier to *Symplocos*. See *Tr. of Linn. Soc.* v. 1. 176, and Willd. *Sp. Pl.* v. 3. 1436. It is singular that the Linnæan *Alstonia*, named by Mutis after Dr. Hope's predecessor, should have precisely the same fate, being also a *Symplocos*. We are therefore obliged to admit as *Hopea* a little inconsiderable East Indian plant, which Willdenow and Vahl have so denominated, though we are by no means satisfied of its being distinct from *Exacum*. Dr. Buchanan had destined the *Dipterospermum* of the younger Gærtner to commemorate his friend and preceptor, and it is much to be wished that so fine a genus had been adopted as *Hopea*.—Vahl. *Enum.* v. 1. 3. Willd. in *Nov. Act. Soc. Amic. Hist. Nat. Berol.* v. 3. 435. *Vahl*—Class and order, *Monandria Monogynia*. Nat. Ord. *Rotaceæ*, Linn. *Gentianeæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in four deep, lanceolate, spreading, equal segments. *Cor.* of one petal, funnel-shaped; tube short inflated; limb in four equal, spreading, or reflexed, ovate segments. *Stam.* Filaments two, inserted into the tube, very short, linear, opposite, one of them shortest and barren; anther solitary, globose, two-lobed. *Pistl.* Germen superior, roundish; style cylindrical, very short; stigma capitate, globose. *Peric.* Capsule roundish, of two valves and one cell. *Seeds* numerous, minute.

Ess. Ch. Calyx in four deep equal segments. Corolla of one petal, funnel-shaped, four-cleft, equal. One barren stamen. Capsule with two valves, one cell, and many seeds.

1. *H. dichotoma*. The only species gathered by the Rev. Dr. Rottler at Tranquebar. We have never seen a specimen, but a drawing communicated by Lieut. Col. Hardwicke, as the *Exacum pusillum* of Roxburgh, answers so well to the description in Vahl, that we have no doubt concerning it. This is a small, smooth, pale, annual, fibrous-rooted plant, flowering in December. The stem is from one to three inches high, branched, forked, leafy, slender, square, with membranous angles. Branches alternate or opposite, spreading. Leaves opposite, sessile, small, acute, entire, three-ribbed; the lower ones ovate, upper ones gradually narrower, and uppermost awl-shaped. Flower-stalks very short, solitary in the forks of the branches, three together at the extremities. Flowers small, yellow, with a pale tube. Seeds red.

If the capsule be really of one cell, and the stamens constantly two, one of them barren, this plant may possibly constitute a good genus; but in our drawing the capsule appears of two cells, and on the whole we are more disposed to think it an *Exacum*, notwithstanding the peculiarity of the stamens.

HOPEWELL, in *Geography*, a township of America, in Cumberland county, New Brunswick, on Chepodil river, which runs into a northern arm of the bay of Fundy, and is navigable for four or five miles.—Also, the name of three townships in Pennsylvania; viz. in York, Huntingdon, and Washington counties.—Also, a township in Hunterdon county, New Jersey, on Delaware river, 14 miles W. of Princeton, and 11 above Trenton. In 1790 it contained 2320 inhabitants.—Also, a township in Cumberland county, New Jersey.

HOPEWELL Head, a cape in Hudson's bay. N. lat. 58° 10'. W. long. 78°.

HOPFGARTEN, a town of Germany, in the archbishopric of Salzburg; 38 miles S.W. of Salzburg.

HOPITAL, L', a town of France, in the department of Mont Blanc, and chief place of a canton, in the district of Chambéry. The place contains 662, and the canton 8346 inhabitants, on a territory of 157½ kilometres, in 15 communes.—Also, a town of France, in the department of the Rhône and Loire; 17 miles S. of Roanne.—Also, a town of France, in the department of the Lot; 24 miles N.E. of Cahors.

HOPKINS, JOHN, in *Biography*, one of the principal versifiers of the psalms at the time of the Reformation, with Sternhold. These were the fathers of metrical psalmody in our country, equally injurious to the divine poetry of the psalmist, and to the composition of sacred music. The melodies to which these versions are sung, were chiefly German. See **PSALMODY**.

HOPKINS, EZEKIEL, was born at Sandford, in Devonshire, about the year 1633. In 1649, he became a chorister of Magdalen college, Oxford, and after he had taken his degree of B.A. in 1653, he was appointed usher of the adjoining school. In 1669, he went to Ireland as chaplain to lord Roberts, afterwards earl of Tyrone, who was appointed lord lieutenant. He married his lordship's daughter, and was made dean of Raphoe. Upon his return to England, lord Roberts recommended him so strongly to his successor lord Berkley, that, in 1671, he was consecrated bishop of Raphoe, from which see he was translated, in 1681, to that of Londonderry, where he continued till the war which broke out between the supporters of the revolution, under king William, and the partisans of king James, headed by the earl of Tyrconnel, when he retired to England. He was now chosen minister of Aldermanbury, where he shortly after died, at the age of fifty-seven. After his death, his posthumous works were published in one volume folio. His most valuable piece is "An Exposition of the Lord's Prayer," first printed in 4to. in 1692, to which were afterwards added sermons on Providence, and the advantage of reading and studying the holy scriptures. Gen. Biog.

HOPKINS, WILLIAM, a learned divine of the church of England, was born at Monmouth in the year 1706. He received the elements of a learned education at his native town, whence he was sent to All-Souls, Oxford, in the year 1724. He was admitted to deacon's orders in 1728, and in the following year undertook the curacy of Waldron, in Suffex. In 1731, he was presented to the vicarage of Bolney, in the same county. In 1753, he published anonymously, "An Appeal to the Common Sense of all Christian People, more particularly the Members of the Church of England, with regard to an important Point of Faith and Practice, imposed upon their Consciences." This piece ex-

cited much attention, and created no little alarm among the believers in the doctrine of the Trinity. Many answers were written, but at length Dr. Thomas McDonnell wrote an octavo volume against the principles contained in the "Appeal," to which Mr. Hopkins replied. The controversy was carried on many years, and our author published other tracts on the same subject. In 1756, he was elected master of the grammar school of Cuckfield, without any other conditions than that of taking the oaths to government. In the year 1766, Mr. Hopkins undertook the curacy of Slaugham, and continued to officiate there many years, and in his own parish of Bolney, upon what he judged to be the gospel plan. He was an active and zealous promoter of a petition to parliament for relief, in the matter of subscription to the liturgy and thirty-nine articles of the church, and put forth some able works in defence of the cause. The last piece which he sent to the press was "Exodus, a corrected Translation, with Notes critical and explanatory." This was in the year 1784; almost immediately after this, Mr. Hopkins's health began to decline, and his mental faculties were greatly impaired before his decease, which happened in 1786, when he had attained to his eightieth year. Mr. Hopkins was an Arian in his religious faith, and admitted the lawfulness of praying to Jesus Christ, but he could not join in the invocations to him as being himself God. Mr. Hopkins was possessed of great knowledge in the original languages of the scriptures, and was a most diligent student in theology.

HOPKINS, or *Hopkinsville*, in *Geography*, a township of Caledonia county, in Vermont.

HOPKINTON, a township of Middlesex county, Massachusetts, incorporated in 1715, and containing 1372 inhabitants. The rivers Concord and Providence receive each a branch from this township; and these streams furnish seats for seven or eight grist-mills, a number of saw-mills, iron-works, &c.—Also, a township in Washington county, Rhode island, on the W. line of the state, on several branches of Pawcatuck river; containing 227 inhabitants.

HOPLITES, **HOPLITÆ**, formed of ἔπλον, *armour*, in *Antiquity*, were such of the candidates at the Olympic and other sacred games as ran races in armour.

One of the finest pieces of the famous Parrhasius, was a painting which represented two hoplites; the one running, and seeming to sweat large drops; the other laying his arms down, as quite spent, and out of breath. Pliny, lib. xxxv. cap. 10. and Paschal De Coronis, lib. vi. cap. 14.

HOPLITIS LAPIS, in *Natural History*, a name given by some of the writers among the ancients to a stone of a shining brass-like appearance, looking like the surface of a polished brass armour worn in those times. It is easy to conclude, from this account, that the hoplites was one of our mundics.

HOPLITODROMOS, formed of ἔπλον, *armour*, and δρεμων, *I run*, in the ancient gymnastic sports, a term applied to such persons as went through those toilsome and robust exercises, in complete armour; by which the exercise became much more violent, and the wearing of armour, in the time of battle, much more easy.

HOPLOCHRISMA, a term used, by the ancient writers in *Medicine*, for the anointing a sword, or other weapon, with which a person had been wounded, in order to the curing of the wound; so early was the idle notion of curing by sympathetic remedies received into the world. Some late authors have also used the word in a very different sense, namely, for the anointing the points of darts or swords with poisonous ingredients in order to render the least

least wound given with them fatal; a practice most known, as it is said, among the savage inhabitants of America.

HOPLOMACHI, ὀπλομαχοί, composed of ἵπλοι, *armour*, and μάχουμι, *I fight*, in *Antiquity*, were a species of gladiators, who fought in armour; either completely armed from head to foot, or only with a casque and cuirass.

HOPPER, a vessel wherein seed-corn is carried at the time of sowing.

The word is also used for that wooden trough in a mill, into which the corn is put to be ground.

HOPPET, in *Mining*, is a small hand-basket or whisket used for holding and carrying ore, &c. It also means a square or oblong dish or box of wood, narrowest at the bottom, holding 14 or 16 pints, which is used, level full, in the measuring of lead ore by the bar-masters, in the low and high peaks or hundreds of Derbyshire.

HOPPLE, a term applied to different animals, as the horse, sheep, &c which signifies the fettering or restraining of them, by tying their two fore legs together with a short strong ligature or band of some sort or other.

HOPTON, ARTHUR, in *Biography*, an English mathematician, was son of sir Arthur Hopton, and born in Somersetshire. He was educated at Lincoln college, Oxford, and after taking his degree of B.A., removed to the Temple, where he lived in habits of friendship with the learned Selden. He died in 1614, a very young man, not having attained to more than his twenty-sixth year. He wrote a treatise on the "Geodetical Staff"; "The Topographical Glass, containing the Uses of that Instrument, the Theodolite, Plane Table, and Circumferentor"; "A Concordance of Years, containing a new and a most exact Computation of Time, according to the English Account;" "Prognostications for the Year 1607 and and 1614."

HOPTON, SUSANNA, an ingenious lady, was descended from an ancient family in Staffordshire, and was born in 1627. In her youth she was drawn over to the church of Rome, but subsequent enquiry restored her to the Protestant communion. She died at Hereford in 1709; as an author, she is known by several books on practical piety, and by an hexameron or meditations on the six days of the Creation, &c.

HOUQUETUS, HOCHETUS, or *Hocetus*, a term used in the old Latin tracts, and in the censures of music by the heads of the church and grave divines, seems to imply a fantastical division, which by the sudden leaps and breaks, or discontinuity of voice, resembled a hiccup, in French *hoquet*. "They interfect the melodies with hoquets, slide about in discant, and sometimes even crowd and load the chants with vile third and fourth parts, triplis et motetis vulgaribus."

HOR, in *Scripture Geography*, a mountain of Arabia Petraea, on the confines of Iudæa. Here Aaron died and was buried. See AARON.

HORACE, QUINTUS HORATIUS FLACCUS, in *Biography*, one of the most celebrated of the Roman poets, was born at Venusium in the year 65, B.C. His father was the son of a freed-man, and followed the employment of a tax-gatherer; but notwithstanding the meanness of his origin, he felt the importance of a good education, the advantages of which he resolved his son should enjoy. He accordingly took him to Rome, and caused him to be instructed in all the branches of knowledge which were taught to young people at that time. At the age of eighteen he was sent to Athens for the purpose of pursuing philosophy and Greek literature, which was become fashionable among the Romans. While he was in that city he was noticed by Brutus, who took him into his army and made him tribune: but Horace was more distinguished by his wit than illustrious for his valour, and at the battle of Philippi he is said to

have thrown away his shield and fled. He was now reduced to great difficulties, even to a state of indigence, having nothing to depend on but his literary talents. He recommended himself to Virgil, who obtained for him the patronage of Mecænas. To this patron of letters he rendered himself so agreeable that he made him his familiar companion, and took him to Brundisium, in that journey which he has so well described in verse. Mecænas procured from Augustus the restitution of Horace's estate, which he had forfeited by the part that he took in the war under Brutus, and introduced him to the emperor, who became greatly attached to him, and would have made him his private secretary, but the poet declined this high honour, preferring the independence of a private life to the business of a court. Having no ambitious views, and detesting parade and splendour, he determined to remain his own master. In the latter part of his life he retired to the country, where he indulged himself in philosophical ease, which he has admirably described in his odes. He died eight years before the Christian era, and was buried near his friend and patron Mecænas, whose death is said to have hastened his own. He appears to have had many friends among persons of rank, whom he addressed with easy familiarity, and he was ready to do friendly offices in the way of advice and recommendation. No ancient writer has been so popular as Horace: the variety of his manner, and of the subjects treated of, has rendered him the favourite of the most different tastes. His odes are models of that kind of composition in the Latin language. His *Epistles* and *Satires* abound in moral maxims expressed with vigour; in acute observations on human life, and in pleasant stories related with ease and vivacity. The *Art of Poetry* displays much sound sense and good taste, but the precepts contained in it are desultory and without method. The best editions of this author are those of Lips. 1752; and of Glasgow in 1744: but the impressions of Horace are so numerous as to defy enumeration. The translation by Francis is highly esteemed.

HORADADA, in *Geography*, a river of South America, which runs into the Caribbæan sea; 50 miles E. of Cape Aguja.

HORADNIC, a town of Austrian Poland, in Galicia; 60 miles N.W. of Zydomiers.

HORÆA, Ὠραία, in *Antiquity*, solemn sacrifices, consisting of fruits, &c. offered in spring, summer, autumn, and winter, that heaven might grant mild and temperate weather. These, according to Meursius, were offered to the goddesses, called Ὠραίαι, i. e. *Hours*, who were three in number, attended upon the sun, presided over the four seasons of the year, and had divine worship paid them at Athens. Potter, Archæol. Græc. lib. ii. cap. 20, tom. i. p. 430.

HORAIDAN, in *Geography*, a town of Perlia, in Farsistan; 84 miles N.W. of Schiras.

HORAPOLLO, or HORUS APOLLO, in *Biography*, an Egyptian grammarian, who taught first at Alexandria, and afterwards at Constantinople in the time of Theodosius. There remain of his, two books on the Egyptian Hieroglyphics, printed by Aldus in Greek, in 1505. They were afterwards translated into Latin, and several times reprinted. The best edition is that of de Pauw, Gr. and Lat. with notes, Utrecht, 1727, 4to.

HORARY, something relating to *horæ*, *hours*. See HOUR.

HORARY Circle of the globe. See CIRCLE.

HORARY Circles. See HOUR-CIRCLES and CIRCLE.

HORARY Circles, or *lines*, in *Dialling*, are the lines or circles which mark the hours on sun-dials.

HORARY Motion of the earth, is the arc it describes in the space of an hour.

This is nearly fifteen degrees; for the earth completes its revolution through 360° in a day, or twenty-four hours, and the twenty-fourth part of 360 is 15 ; though this is not the exact measure of the horary arc, because the earth moves with different velocity, according to its greater or lesser distance from the sun; but it is near enough for ordinary computations. See *EQUATION of time*.

HORATII, in *Biography*, the name of three brothers who distinguished themselves in the Roman history, and who fought against the three Curatii of Alba in the year 667 B.C. Two of them were slain, but the third slew all his antagonists. On his return to Rome he met his sister, who had been betrothed to one of the Curatii, and reproaching him for what he had done, he slew her also. His great services to his country were considered as an extenuation of his crime. *Univer. Hist.* See **CURIATII**.

HORAWER, in *Geography*, a town of Hindooftan, in Bahar; 42 miles S.W. of Arrah.

HORAZDIOWITZ, a town of Bohemia, in the circle of Prachatiz, situated on the river Ottawa; 22 miles N.W. of Prachatiz.

HORB, a town of Germany, in the county of Hohenberg, situated on the Neckar, having a considerable trade in woollen goods; 28 miles S.W. of Stuttgart.

HORBY, a town of Sweden, in the province of Skone; 24 miles S.W. of Chrillianstadt.

HORCA, a river of Sweden, rising in the mountains bordering on Norway, and running into the Regunda at Lit, in Jamtland.

HORCAJADA, a town of Spain, in the province of Leon; 40 miles E. of Ciudad Rodrigo.

HORCAJO, a town of Spain, in New Castile; 27 miles S.S.W. of Hueta.

HORCAN, a mountain of Grand Bukharia, S. of Balk.

HORCUS LAPIS, the name of a stone mentioned by the writers of the middle ages as useful in folding silver and other metals. All the description they give of it is, that it was black, and was easily reduced to powder. It was called also catemia.

HORD, **HORDA**, a Tartarian term, and literally denoting a *multitude*, in *Geography*, is used for a company or tribe of wandering people, which have no settled abode or habitation, but stroll about, dwelling in chariots, or under tents, to be ready to shift as soon as herbage, fruits, and the present province is eaten bare.

HORD is more properly the name which the Tartars, who inhabit beyond the Wolga, in the kingdoms of Astracan and Bulgaria, give to their villages.

A **hord** consists of fifty or sixty tents ranged in a circle, leaving an open place in the middle. The inhabitants of each hord usually form a military company or troop; the eldest whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEATEM, a liquid medicine, made of barley, boiled till it bursts.

Sometimes other ingredients are added, as the cold seeds, almonds, and the like.

HORDEOLUM, or **STYE**, signifies, in *Surgery*, a small tumour situated upon the edge of the eye-lid, and seldom exceeding a barley corn in size, from which last circumstance the former appellation has been derived. According to Scarpa, styes originate particularly, often towards the inner canthus. A swelling of this sort is very circumscribed, and presents itself either in an inflamed, or a suppurating state,

or else as a mere indurated tumour, unaccompanied by inflammation.

An inflamed stye is commonly very red and painful, and bears a close resemblance to a little boil, or an inflamed encysted tumour. Richter suspects, that a stye is sometimes one of the glands of Meibomius in a state of inflammation. The disease is in general quite of a local nature, although the circumstance of some persons being particularly often troubled with the complaint has given rise to suspicions of there being occasionally a constitutional or internal cause. Both Richter and Scarpa concur in imputing the frequency of styes in particular subjects to a foul disordered state of the alimentary canal, induced by improper food, the abuse of spirits, &c. We will not pretend to decide concerning the truth of this statement, nor about the connection, which the first of these writers describes, as occasionally existing between the menes, the cure of the tinea capitis in children, &c. and the origin of styes.

The cure of an inflamed stye requires the employment of external emollient applications, or such as promote suppuration. The tumour always suppurates, and the sooner it is made to do so, the more quickly is the patient freed from all inconvenience. Attempts to disperse the swelling are, for the most part, unavailing, or if the inflammation is resolved, the stye is still left in an indurated state. When the tumour has already suppurated, it is also advisable to persist in the use of emollient remedies, and promote the discharge until all the hardness is removed. An exceedingly troublesome induration is apt to remain when the suppuration has been checked too soon, especially if the stye has been of large size. After the suppurative stage, a weak solution of acetite of lead will commonly serve for the dispersion of the remaining redness and swelling.

The indurated stye is usually nothing more than the remains of one, that has passed through the inflammatory stage, the suppuration having either been checked too soon, or prevented altogether by means put in practice for the resolution of the inflammation. The tumour becomes a cause of serious annoyance, partly because it often falls into a painful inflamed state, and partly because it obstructs the motions of the eye and eye-lids. It is even alleged, that the indurated stye may assume a malignant character, whence the swelling has been sometimes called scirrhus. Richter states, that in this stage emollients and other applications do no good, and he advises the surgeon to wait till the tumour spontaneously inflames, when suppuration is to be excited by some stimulating dressing, and kept up until the hardness subsides. Perhaps it is preferable (and we prefer the plan) to dip the point of a camel hair pencil in sulphuric acid, and touch the stye with it a few times, until the cure is effected.

Scarpa has made some excellent observations on this disease. Among other things, we learn from him, that the inflammation of the stye, like that of boils, has a tendency to destroy a part of the cellular membrane, which is the reason why the tumour can hardly ever be completely resolved. He states, that resolution can only be accomplished, when the inflammation is confined to the skin, a case where cold applications, especially ice, may prove successful. But when any of the cellular membrane is destroyed, Scarpa recommends the bread and milk poultice, which is to be changed very often. When a white point makes its appearance on the apex of the tumour, this author disapproves of being in a hurry to let out the small quantity of serum which lies between the skin and spongy cellular membrane. He prefers waiting till the skin has become as thin as possible, and breaks of itself, so as to give vent not only to the serous fluid, but also to the dead cellular substance, which constitutes

tutes

tutes the chief part of the disease. When the contents are slow in making their escape, Scarpa advises pressing them out.

Should a portion of sloughy matter remain in the swelling a long while undetached, this eminent surgeon recommends touching the inside of the itye with sulphuric acid a few times, by means of a camel-hair pencil.

HORDEUM, in *Botany*, an ancient Latin name, of whose meaning or etymology we find no account or conjecture worth transcribing. Barley.—Linn. Gen. 39 Schreb. 54. Willd. Sp. Pl. v. 1. 472. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 155. Juss. 32. Tourn. t. 295. Lamarck. Illustr. t. 499. Gært. t. 81.—Class and order, *Triandria Digenia*. Nat. Ord. *Gramina*.

Gen. Ch. *Common Receptacle* elongated into a spike, jointed, brittle, compressed. *Cal.* Glumes lateral, three together, each of two narrow, pointed valves, containing one sessile flower. *Cor.* of two valves; the lower one swelling, angular, ovate, pointed, longer than the calyx, ending in a long straight awn; the inner valve lanceolate, flat, smallest. *Stam.* Filaments three, capillary, shorter than the corolla; anthers oblong. *Pist.* Germen turbinate, somewhat ovate; styles two, villose, reflexed; stigmas feathery. *Peric.* none, except the permanent corolla, falling off with and containing the seed. *Seed* oblong, swelling, angular, pointed at each end, above marked with a longitudinal furrow.

Obf. In some species all the three flowers are perfect in all their parts, and fertile; in others the lateral ones are male, the central one only being hermaphrodite and fertile.

Ess. Ch. *Common receptacle* toothed and excavated. *Calyx* lateral, ternate, two-valved, single-flowered.

The species of *Hordeum*, ten in Willdenow, may be divided into such as come under the popular denomination of corn, and such as are generally reckoned grasses. The former are four; the latter six, and these last are of little or no value, but rather detrimental to the farmer.

H. vulgare. Linn. Sp. Pl. 125. Ehrh. Pl. Off. 421. Lob. Ic. 28. (*H. polytrichum vernum*; Ger. em. 70.)—Flowers all perfect, awned; two of the rows more erect than the rest.—This is our common cultivated Barley, said to have been found wild in Sicily and Russia. It is annual. The *flowers* and *seeds* are disposed indistinctly in several rows, with very long, compressed, rough awns. There is a supposed variety, termed *Hordeum celeste*, in which the husk, or corolla, does not stick to the seed; and another with black seeds, said by Willdenow to be biennial.

H. hexastichum. Linn. Sp. Pl. 125, has six rows of seeds; *H. distichum*, *ibid.* but two. The latter is figured in Ger. em. 70. f. 1. It is much to be doubted whether these are more than varieties.

H. Zeoriton. Linn. Sp. Pl. 125. Schreb. Gram. t. 17. Ehrh. Herb. Exsicc. 13; has two rows of more crowded, spreading, and longer seeds, which give it a peculiar aspect.

Of the grassy species are

H. murinum, so called from *mus*, *muris*, a mouse, and not from *murus*, a wall, though it is usually named Wall Barley in English, is very common by way-sides. See its figure in Curt. Lond. fasc. 5. t. 9. Mart. Rust. t. 43. Engl. Bot. t. 1971.

H. pratense. Mart. Rust. t. 108. Sm. Rel. Rudb. 12. f. 1. Engl. Bot. t. 409, is known from the last by its perennial root, taller upright stem, and by having all the calyx-glumes narrow and brittle-shaped.

H. maritimum. Mart. Rust. t. 44. Knapp. t. 106. Engl. Bot. t. 1205. (*H. marinum*; Hudf. 57.)—A sea-side grass, very curiously distinguished by Hudson from *H. mu-*

rinum by the internal glumes of the lateral flowers being dilated and half ovate. It is also a more glaucous and smoother plant, with more compact spikes. Curtis confounded it with *murinum*, and yet mentions it as known by the name of Squirrel-tail grass in the Isle of Thanet, where it is found very pernicious, by sticking into the gums of horses, and rendering them so sore as to prevent the animal's feeding.—These three are the only British species of *Hordeum*; the second of them, *pratense*, is the *nodosum* of Linnæus, but he quotes for it a synonym of Dillenius in Ray's Synopsis, t. 20. f. 2, which belongs to *Alopecurus bulbosus*.

H. bulbosum. Linn. Sp. Pl. 125. Sm. Prodr. Fl. Græc. Sibth. v. 1. 73. Fl. Græc. t. 98, a native of the Levant, has been by some confounded with the Linnæan *nodosum*, but is a larger and very distinct species. This is *H. strictum*, Desfont. Atlant. v. 1. 113. t. 37; and is also well figured in Barrel. Ic. t. 112. f. 2.

For the culture and produce, &c. of barley, see **BARLEY**. For the regulation of the price, see **CORN**.

HORDICALIA, or **HORDICIDIA**, in *Antiquity*, a religious feast held among the Romans, wherein they sacrificed cattle big with young.

The word hordicidia is formed of *borda*; which Festus explains by *prægnans*, *pregnant*; and *caedo*, *I sacrifice*. Ovid, in his Fasti, lib. iv. ver. 631. describes *borda* or *forda*, to be *bos prægnans*; of $\zeta\omicron\zeta\omicron$, *gravidu*.

This feast fell on the fifteenth of April; on which day they sacrificed thirty cows, big with calf, to the goddess Tellus, or Terra, Earth: some of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes first, by the pontifices; afterwards by the eldest of the vestal virgins.

Alexander ab Alexandro, Genial. Dier. writes *bordalis dies*; and from him, some of the moderns call the feast *bordalia*; but Varro writes it *hordicalia*, and Festus, *hordicidia*.

HORDY, in *Geography*, a town of Hindoostan, in Dowlatabad; 28 miles N. of Darore.

HOREB, in *Scripture Geography*, a mountain of Arabia Petræa, so near to mount Sinai that Horeb and Sinai seem to be two eminences of the same mountain. Sinai lies east, and Horeb west; so that when the sun rises, the latter is covered with the shadow of Sinai. On Horeb there are springs and fruit-trees, but only rain-water on Sinai. At Horeb God appeared to Moses in the burning-bush. (Exod. iii. 1, 2, 3.) At the foot of this mountain Moses struck the rock, and drew water from it. (Exod. xvii. 6.) Elijah retired hither to avoid the persecution of Jezebel. (1 Kings, xix. x.) It is frequently said that God gave the law at Horeb, though in other places Sinai is named; because Horeb and Sinai formed, as it were, one and the same mountain.

HOREHOUND, in *Botany*. See **MARRUBIUM**.

HOREHOUND, *Common white, Marrubium vulgare*, in the *Materia Medica*, is a plant which grows near the sides of roads and rubbish, and flowers in June. The leaves have a moderately strong smell of the aromatic kind, but not agreeable; which is improved by drying, and by keeping for some months in a great part dissipated; their taste is very bitter, penetrating, diffusible, and durable in the mouth. The dry herb gives out its virtue both to watery and spirituous menstrua. The remaining extract, after inspissating the watery infusion, proves a strong bitter, without flavour; and that of the spirituous infusion is less in quantity, but of more penetrating bitterness. This plant is the $\pi\epsilon\pi\omicron\tau\omicron\upsilon$ of the ancients, who have extolled it much for its efficacy in removing obstructions of the lungs and other viscera. It has been chiefly employed in humoral asthmas, obstinate coughs, and

pulmonary consumptions; instances also occur of its beneficial use in scirrhus affections of the liver, jaundice, cachexies, and menstrial suppressions. However, though horehound possesses some share of medicinal power, as may be inferred from its sensible qualities, its virtues do not appear to be clearly ascertained, and it is now rarely prescribed by physicians. A dram of the dry leaves in powder, or two or three ounces of the expressed juices, or an infusion of half an handful of the fresh leaves, have been directed for a dose. The last mode is usually practised by the common people, who still recur to it as a favourite remedy in coughs and asthmas. Taken in considerable quantities, it is said to loosen the body. Although, says Cullen, it has had the reputation of a pectoral, its virtues, in many trials, have not been observed, and in several cases it has been judged hurtful. Lewis Mat. Med. Woodv. Med. Bot.

HOREHOUND, *Bafe*, in Botany. See STACHYS.

HOREHOUND, *Bastard*. See SIDERITIS.

HOREHOUND, *Black*, or *Stinking*. See BALLOTE.

HOREHOUND, *Stinking marsh bastard*. See GLECHOMA.

HOREHOUND, *Water*. See LYCOPUS.

HOREM, in *Scripture Geography*, a city of Naphtali. Josh. xix. 38.

HORESTI, in *Ancient Geography*, a people of Scotland, mentioned by Tacitus, in Agricola's time, the inhabitants of Angus, but probably incorporated with, or subdued by, the Vacomagi, before Ptolemy wrote his geography.

HORGEN, in *Geography*, a town of Switzerland, in the canton of Zurich; 10 miles S.S.E. of Zurich.

HORIA, in *Entomology*, a Fabrician genus of coleopterous insects, possessing the following character. The antennæ are moniliform; feelers four, thicker towards the tip; lip linear, and rounded at the end.

The body of the horia is long and cylindrical; the head large and inclined, scutell small and triangular; wing-cases coriaceous and flexible; wings membranaceous, and all the feet armed with four claws. The horiæ are allied to the cantharis, mylabris, and meloe genera, and also to the new genera cucujus and lymexylon. The genus was first established in the Fabrician Mantissa Insectorum for the reception of the Linnæan cantharis demestoides, that insect being esteemed distinct from the cantharides. His horia demestoides, for that is the name under which it appears in the work above mentioned, was afterwards assigned to the lymexylons (see Ent. Syst.), and the same generic name given to another family; that denominated horia by later writers. The genus horia, thus established, contains only two species, one of which (testacea) Fabricius had himself described in his Mantissa, under the title of cucujus flavipes, and the other is the cucujus maculatus of professor Swederus, an account of which is inserted by that author in the Transactions of the Royal Society of Stockholm.

Horia is a genus adopted by Olivier, who describes the species maculata. Latreille, however, seems to think the two Fabrician species are not generically the same, the head and thorax in one being much larger in proportion to the rest of the body in the species maculata than testacea. Upon this opinion, suggested by Latreille, it is remarked by Olivier that we are not at present sufficiently acquainted with the structure of the mouth, to speak with certainty, and he himself forbears from offering any opinion; and we further observe that in the latest publication of Latreille, he admits the first at least of the Fabrician species under the generic name of horia. The transformations of the insects of this family are entirely unknown.

Species.

MACULATA. Yellowish; wing-cases with seven black spots. Fabr. *Horia maculata*, Olivier. *Cucujus maculatus*, Swederus.

Length about an inch and a half. The species inhabits South America.

TESTACEA. Rufous; antennæ and legs black. Fabr. Native of Tranquebar. The posterior thighs of the male insect thick.

HORJA, in *Geography*, a town of Sweden, in the province of Schonon, 22 miles N. of Christianitadt.—Also, a town of Sweden, in West Gothland; 20 miles N.N.W. of Jonkioping.

HORITES, in *Scripture Geography*, an ancient people, who dwelt in the mountains of Seir, beyond Jordan, Gen. xiv. 6. They were powerful, and had princes of their own, before Esau conquered their country. Afterwards they and the Edomites seem to have formed one people. They dwelt in Arabia Petræa and Arabia Deserta, S.E. of Judæa. Deut. ii. 1. xxiii. Judg. v. 4. The Hebrew חֲרִיתִים, Chorim, translated Horites in Genesis, is used appellatively in other passages of scripture, to denote heroes, or great and powerful men; and probably the Greeks derived from this term their heroes, as they derivedanax, a king, from the sons of Anak. See 1 Kings, xxi. 8. 11. Neh. ii. 16. iv. 14. v. 7. vi. 17. vii. 5. xiii. 17. Eccl. x. 17. If. xxxiv. 21.

HORIZON, or HORIZON, in *Astronomy*, a great circle of the sphere, dividing the world into two parts, or hemispheres; the one upper, and visible; the other lower, and hid.

The word is ὁρίζων, which literally signifies bounding, or terminating the sight; being formed of ὅριζω, termino, definio, I bound, I limit; whence it is also called finitor, finisher.

The horizon is either rational or sensible.

HORIZON, Rational, True, or Astronomical, which is also called simply and absolutely the horizon, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts or hemispheres.

Such is the circle H R (*Plate XVI. Astronomy, fig. 141.*) whose poles are the zenith and nadir; whence it follows, that the several points of the horizon are a quadrant distant from the zenith and nadir.

The meridian and vertical circles cut the rational horizon at right angles, and into equal parts.

HORIZON, Sensible, Visible, or Apparent, is a lesser circle of the sphere, as h r, which divides the visible part of the sphere from the invisible, and whose plane touches the spherical surface of the earth.

Its poles, too, are the zenith and nadir; and consequently, the sensible horizon is parallel to the rational; and it is cut at right angles, and into two equal parts, by the verticals.

The sensible horizon is divided into eastern and western.

HORIZON, the Eastern, or Ortive, is that part of the horizon wherein the heavenly bodies rise.

HORIZON, the Western, or Occidial, is that wherein the stars set.

HORIZON, in *Geography*, is a circle passing over the earth, and dividing the visible part of the earth and heavens from that which is invisible.

The altitude or elevation of any point of the sphere, is an arc of a vertical circle, intercepted between it and the sensible horizon.

This is peculiarly denominated sensible or apparent horizon, to distinguish it from the rational, or true, which passes

passes through the centre of the earth; as already observed.

These two horizons, though distant from one another by the semidiameter of the earth, will appear to coincide, when continued to the sphere of the fixed stars; because the earth compared with this sphere is but a point.

By *sensible* horizon is also frequently meant a circle, which determines the segment of the surface of the earth, over which the eye can reach; called also the *physical* horizon. In this sense we say, a spacious horizon; a narrow, scanty horizon.

It is evident, that the higher the eye is, the farther is the visible horizon extended. Thus, let *H b r R* (*Plate I. Geography, fig. 2.*) represent a part of the spherical surface of the earth; if the eye be at *A*, draw *A b* and *A r* tangents to the globe of the earth; and let one of these lines *A b*, the point *A* continuing immovable, be carried round, and in its revolution always touch the surface of the earth; the point *b* will touch the visible horizon, part of which is represented by the curve *b o r*. But if the eye be placed higher, as at *B*, the tangents *B H* and *B R* will reach farther, and the visible horizon will be larger, *viz.* *H O R*. The visible horizon is most accurately observed upon the sea, and is, therefore, sometimes called the *horizon of the sea*. In observing this horizon, the visual rays *A b* and *A r* will, on account of the spherical surface of the sea, always point a little below the true sensible horizon *S S*, and consequently below the rational horizon *T T*, which is parallel to it.

To find the depression of the horizon of the sea, below the true horizon, which varies with the height of the eye, and in a small degree with the variation of the refractive power of the atmosphere, see *DEPRESSION*.

The semidiameter of the earth, and the height of the eye being given, the extent of the visible horizon is thus found.

Let *A D E* (*fig. 3.*) be an arc of a great circle upon the earth, *C* the centre of the earth, *B* the eye of the observer, *B D* the height of the eye, *B A* and *B E* lines drawn from the eye, touching the surface of the earth at *A* and *E*, and terminating the visible horizon: in order to find *A D*, draw *C A*, and in the triangle *B A C*, right-angled at *A*, we have *C B* to *C A* as the whole sine or radius is to the sine of the angle *A B C*, whose complement is the angle *C*, measured by the arc *A D*. *E. gr.* let *D B*, the height of the eye, be five feet, *D C* or *C A*, the semi-diameter of the earth, be 20949655 feet, and *C B* will be 20949660 feet; then will the logarithm of *C B* be to that of *C A*, or 7.3201769 to 7.3201768 as 10.0000000 to 9.9999999 the sine of *A B C* = 89° 58'; therefore the angle *C* is = 2' or 12188 feet = 2.308 miles, or two miles 532 yards, nearly. *B A*, or the right-lined distance of the farthest point of sight from the eye, may easily be found, as the angles and other sides are known: thus, radius or sine of the angle *A* is to *C B* as the sine *C* is to *B A*: or, since *B A* = $\frac{C B - C A}{2} = \frac{C B + C A \times C B - C A}{2}$: if the logarithm of the sum of the two given sides be added to that of their difference, the half of these two logarithms will be equal to the logarithm of *B A*, nearly, *i. e.* $\frac{7.6222069 + 0.6989700}{2} = 4.1605884$, the logarithm of 14474 feet = *B A*, nearly. See *DISTANCE*.

The depression of the horizon of the sea, at a given height of the eye, may be thus found by calculation: for if the eye be at *B*, the sensible horizon is *F G*, the depression is the angle *F B A*, which being the complement of *A B C*, is equal to *A C D*. See *DEPRESSION*.

The distance on a perfect globe, if the visual rays came to the eye in a straight line, would be as it has been now stated; but by means of the refraction of the atmosphere, distant objects on the horizon appear higher than they really are, and may be seen at a greater distance, especially on the sea. Thus, without refraction, the most distant part of the sea visible to the eye at *B* would be *A*; but refraction elevates the parts of the sea, which are farther from the eye than *A*, so that the tangent or visual ray shall fall upon a more distant point, as *H*, and consequently the extent of the visible horizon is enlarged by refraction: for it is *D H* instead of *D A*; and refraction makes the angle of depression less than it would be, *viz.* *H B F*, instead of *A B F*.

Father Laval, professor of hydrography at Marseilles, found, that the horizon of his observatory toward the sea was never more than 15 minutes, nor less than 13½; that is, the arc of the circumference of the earth, intercepted between the observatory and the horizon, fluctuated between those two quantities; whence *M. Cassini* deduces, that the extent of the horizon is seven French leagues, of three miles each; and that the observatory is 175 feet high.

The height of the horizon, at the same place, and the same elevation above it, is very subject to vary, by means of differences in the atmosphere, which occasion others in the refractions.

When the sea was full, or the north-west or south-west wind blew, and the air hazy about the horizon, *F. Laval* always found his horizon depressed, or lower, *i. e.* the refraction which should raise it in that case was less than ordinary. And yet, on the common principles, the air being now much charged with vapours, the very contrary was rather to be expected. This makes *M. Cassini* suspect that there is some other refractive matter in the atmosphere, beside the air itself.

The same author observes, that at a height ten times greater than that of *F. Laval's* observatory, he found the arc terminated by the horizon toward the sea, 42', without any sensible variation; whence he concludes, that the variations are the greater, as the height is the less; which may seem contrary to what he had asserted in another place, *viz.* that the variations in the apparent altitudes of bodies are greater, as these objects are more remote, because they are seen through the larger quantity of air, which is liable to be varied. But the contradiction may be solved.

HORIZON of the Globe. See *GLOBE*.

HORIZONTAL, something that relates to the horizon, or that is taken in the horizon, or on a level with the horizon.

HORIZONTAL Dial, is that drawn on a plane parallel to the horizon; having its gnomon, or style, elevated according to the altitude of the pole of the place it is designed for.

Horizontal dials are of all others the most simple and easy. The manner of describing them, see under the article *DIAL*.

HORIZONTAL Distance. See *DISTANCE*.

HORIZONTAL Line, in *Perspective*, is a right line drawn through the principal point, parallel to the horizon; or it is the intersection of the horizontal and perspective planes.

Such is the line *P L* (*Plate I. Perspective, fig. 3.*) passing through the principal point *F*.

HORIZONTAL Line, or base of a hill, in *Surveying*, a line drawn on the horizontal plane of the hill, or that on which it stands.

HORIZONTAL Moon. See *APPARENT MAGNITUDE*.

HORIZONTAL Parallax. See *PARALLAX*.

HORIZONTAL Plane, is that which is parallel to the horizon of the place, or not inclined to it.

The business of levelling is, to find whether two points be in the horizontal plane; or how much the deviation is. See **LEVELLING**.

HORIZONTAL Plane, in *Perspective*. See **PLANE**.

HORIZONTAL Projection. See **PROJECTION** and **MAP**.

HORIZONTAL Range, or *level range*, of a piece of ordnance, is the line it describes, when directed parallel to the horizon, or horizontal line.

Dr. Halley gives two very ready theorems: the one, to find the greatest horizontal range at 45 degrees elevation, in any shot made upon any inclined plane, with any elevation of the piece whatsoever; and the other, to find elevations proper to strike a given object with any force, greater than what is sufficient to reach it with the middle elevation.

1. A shot being made on an inclined plane; having the horizontal distance of the object it strikes, with the elevation of the piece, and the angle at the gun between the object and the perpendicular; to find the greatest horizontal range of that piece laden with the same charge; that is, half the latus rectum of all the parabolæ made with the same impetus. Take half the distance of the object from the nadir, and the difference of the given elevation from that half; subtract the versed sine of that difference from the versed sine of the distance of the object from the zenith; the difference of those versed sines will be to the sine of the distance of the object from the zenith, as the horizontal distance of the object struck, to the greatest range at 45 degrees.

2. Having the greatest horizontal range of a gun, the horizontal distance and angle of inclination of an object to the perpendicular: to find the two elevations necessary to strike that object. Halve the distance of the object from the nadir; this half is equal to the half sum of the two elevations sought; then say, as the greatest horizontal range is to the horizontal distance of the object, so is the sine of the angle of inclination, or distance of the object from the perpendicular to a fourth proportional; which fourth being subtracted from the versed sine of the distance of the object from the zenith, leaves the versed sine of half the difference of the elevations sought; which elevations are therefore had, by adding and subtracting that half of the difference to and from the aforesaid sum. See **PROJECTILE** and **GUNNERY**.

HORIZONTAL Refraction. See **REFRACTION**.

HORIZONTAL Roots. See **FIBROSE roots**.

HORIZONTAL Shelters, among *Gardeners*, are defences, disposed parallel to the horizon, for tender plants, blossoms, and fruits, in the spring, to defend them against blasts, and pinching nights.

The usual shelters that have obtained are bafs mats, and other warm coverings, which are rolled up in the day-time, and let down in the night. It was the reverend Mr. Lawrence who first proposed horizontal shelters, chiefly on this principle; that most of our frosts and blasts fall perpendicularly, i. e. the condensed vapours, falling from the upper region, do at night form themselves, toward the surface of the earth, into drops of dew, subject to be frozen by the coldness of the air.

Horizontal shelters are to be made by laying rows of tiles, at certain distances one above another, in the structure of the wall, so as to project or hang over the plane of the wall, to carry off the dew, wet, &c. It is an inconvenience, objected to this method, that it is difficult to lead a tree rightly among the tiles, or to keep its figure duly filled up.

But the principal objection against these tiles is this, that they prevent vegetables from receiving the advantage of dews, rains, &c. in consequence of which they become weak and languid, and at last entirely decay. The only sort of horizontal shelters, which Mr. Miller has ever observed to be useful for fruit-trees, are made with two leaves of slit-deal, joined over each other, and painted. This kind of shelter, being fixed upon the top of the wall with pulleys, to draw up and down at pleasure, forms a sort of pent-house, which being let down in great rains or cold nights, whilst the trees are in flower, or the fruit is setting, proves serviceable; but it must be removed soon after the fruit is set, so that the trees may enjoy all the advantages of rain, dew, &c. in the summer, which are absolutely necessary for producing healthy trees, or good fruit.

HORIZONTAL Speculum. One of the great inconveniences mariners have to struggle with, is the frequent want of a horizon; for though the atmosphere may, at the height of 10 or 12 degrees and upwards, be clear enough to give a view of the sun and other objects, yet all below that height is often so hazy, as to hinder a distinct sight of the horizon, and consequently to prevent observations from having the requisite correctness. This inconvenience is removed by a horizontal speculum, invented by Mr. Serfon, who was lost in the *Victory* man of war, in which ship he was sent out to make trial of his machine.

The principle on which this machine was constructed, was derived from the consideration of a top while spinning: for this author observing that the top had a considerable degree of steadiness in, and force to acquire, an upright motion, whether the body which sustained it was in motion or at rest: he therefore concluded, that if a circular machine, whose upper face was a flat polished speculum, was to have a swift circular motion communicated to it, that speculum, by acquiring a horizontal situation, would shew all objects which it reflected, as much below the horizon, as they really are above it. Consequently, if the image of the sun, as seen reflected from the speculum, were made to coincide with the sun's image seen in a Hadley's quadrant, the angle given by the quadrant would in all cases be double the real altitude. Mr. Serfon also found, that to confine the speculum to one place, it was necessary to let the point spin in a cup; for the horizontality of the speculum would not be altered, whatever position might be given to the cup; provided it touched only at the point on which it spun. This curious and useful instrument, as it is now improved by Mr. Smeaton, consists in a well polished metal speculum, of about three inches and a half in diameter, inclosed within a circular rim of brass; so fitted that the centre of gravity of the whole shall fall near the point whereon it spins. This is the end of a steel axis running through the centre of the speculum, above which it finishes in a square, for the convenience of fitting a roller on it, by which it is set in motion by means of a piece of tape wound round the roller. The cup in which it spins is made of agate, flint, or other hard substance; and a pyramidal cover may be made to the whole, composed of glass panes: by this means an observation may be made with it as well covered as open, and it will thereby be prevented from tarnishing by the moist air and spray of the sea.

If the box be placed steadily, and as level as may be, after the tape is untwined, the speculum will be fit for observation in less than two minutes, and will generally continue so for twelve or fifteen. When it is to be used for a meridian observation, it may be convenient to know what time to set it up; and this may be had near enough by taking the sun's bearing from the meridian with an azimuth compass, allowing for the variation; and if it has about five degrees to run before
it

it culminates, it is then time to spin the speculum. The observer is to place himself as near the box as he conveniently can, and look down on the sun's image in the speculum, and bring the sun's image seen in the quadrant to agree with it, so that their centres coincide; the quadrant will then give the double altitude, without any allowance for the height of the ship, or the sun's semi-diameter.

When the sun is about 45 high, the observer must look through that sight of the quadrant, which is used for a back observation: but he must look down on the horizontal image, or that in the speculum, as if it was the back horizon; and then making the solar images to agree, the quadrant, according as it is numbered, will give the double altitude, or double zenith distance.

These speculums are as useful by night as by day; for as the images of the smallest stars may be seen in the speculum, consequently any object that can be seen reflected from the glasses of the quadrant, may be observed by the speculum; and there are all the stars of the first magnitude, the planets Venus, Mars, Jupiter, Saturn, and the moon. So that by having the declinations of these bodies in an ephemeris, they may be used in observations as well as the sun.

As the great distresses to which ships are sometimes driven in several parts of the world, for want of a horizon to observe by, are by this ingenious contrivance quite removed, it is hoped the use of this instrument may become general. See HADLEY'S QUADRANT.

HORIZONTAL Diffipiments, in *Natural History*, are terms applied to the thin plates which cross the tubes or stirpents of some corals at right angles, and connect them together, of which the tubipora musica (figured in Ellis, tab. 27.) is an instance.

HORIZONTAL Face, in *Crystallography*, is used by Haiiy in describing secondary forms of crystals, the axes of which are supposed vertical, and then the faces perpendicular to these will be called horizontal faces, those parallel to the axes being called vertical faces.

HORIZONTAL Strata, in *Geology*. It seems best to agree with the phenomena of the strata of the earth, as well as with the opinions of the greater number and most able of the writers on the subject, to consider the strata as having been originally concentric with the earth, and entire, and, of course, horizontal in every part. (See *CONCENTRICITY of Strata*.) Considerable tracts of strata are found yet in nearly a horizontal position, the red marle, for instance, on the south and south-west of Derbyshire. (See Mr. Farey's Report to the Board of Agriculture, vol. i. p. 147.) Dr. Charles Anderson, in his "Appendix to the Translation of Werner's New Theory of Veins," p. 256, remarks, that the widest mineral veins occur in horizontal strata, which seem confirmed in Derbyshire, by the very wide veins of spar, void of metallic ores, which obliquely cross Dove-dale on the confines of Staffordshire, in the fourth lime-stone rock, which lies horizontal, or very near it, in these parts.

HORLA, in *Geography*, a town of Norway, in the diocese of Drontheim; 48 miles W.S.W. of Romfald.

HORLOFA, a town of Sweden, in the province of Skone; 11 miles E. of Lund.

HORMAH, or **CHORMA**, from חרם, signifying the same with *Anathema*, in *Scripture Geography*, a town of Palestine, belonging to the tribe of Simeon. It was called *Zepath* before the Hebrews called it Hormah, the occasion of which appellation was, that the king of Arad, a Canaanite, S. of the land of promise, attacked the Hebrews, put them to flight, and despoiled them of a rich booty; upon which the Israelites engaged themselves by vow to destroy every thing belonging to the king of Arad; a purpose which pro-

ably was not executed till after Joshua entered the land of promise. See Josh. xv. 30.

HORMEZION, or **HORMESION**, in *Natural History*, the name of a gem described by Pliny, and seeming to have been a species of hyacinth. He says it was very bright, and of a yellowish-red, or flame colour, with a whitish cast at the edges.

HORMILLOS, **Los**, in *Geography*, a small island in the Pacific ocean, near the coast of Peru. S. lat. 16 45'.

HORMINODES, in *Natural History*, the name of a gem described by Pliny, and others of the ancient writers. The stone itself, they tell us, was either black or white, but had in it a green speck surrounded by a circle of a bright yellow. It seems to have been no other than one of the oculus belis of our jewellers.

HORMINUM, in *Botany*. See *MELISSA* and *SALVIA*.

HORMISDAS, or **HORMOUZ**, king of Persia, in *Biography*, succeeded to the throne A. D. 579, after the death of his father, the great Chosroes. He had, during the life of his parent, obtained some military reputation, and while directed by the influence of prudent counsellors, he governed his dominions wisely, but when left to himself he exhibited in his character and conduct a number of vices, and displayed the utmost folly and tyranny. Not fewer than 13,000 victims of all ranks are said to have fallen, by his order or connivance, under the sword of the executioner. His cruelty produced hatred, and hatred terminated in rebellion. In this state of things, the khan of the Turks invaded the eastern provinces with a vast army, while the Romans renewed hostilities on the opposite side. The Persian empire would have been subverted had it not been for the valour and talents of Bahran, or Varanes, who gave the Turks a signal defeat. The successful general, in one instance, was himself defeated by the lieutenant of the emperor Maurice, and Hormisdas had the folly and injustice mortally to affront him by the present of a distaff and a suit of women's apparel. He was bent on revenge, appeared before his troops in this garb, and found no difficulty in rousing them to rebellion; the revolt became general, and, in the confusion, Bindoes, a prince of the blood, who had been imprisoned by Hormisdas, was liberated by his brother. He came to the royal palace at Ctesiphon, where the monarch was sitting in all the pomp of royalty, and began to upbraid him for his tyranny and misconduct. Hormisdas ordered his attendants to seize him; but, overawed by the presence of Bindoes, they were inattentive to the royal command, and stood patiently by and saw the king dragged from his throne into prison, where he was first deprived of his sight, and then of his life. Whether the king was assassinated, or died by less violent means, is not easy to ascertain. He died in the year 599, after a reign of twenty-one years.

HORMISDAS, pope, son of a person named Julius, and a native of Frusino, in Campania, was elected to the pontificate upon the death of pope Symmachus, in the year 514. One of the most prominent circumstances that occurred during his elevation to the popedom was the death of Anastasius, who was succeeded by Justin. The new emperor, though perfectly illiterate, was most zealously attached to the doctrine of the two natures. His promotion, therefore, gave the highest satisfaction to the orthodox throughout the empire. In Constantinople the populace distinguished themselves for their zeal in the Catholic cause, by compelling the patriarch to receive the council of Chalcedon, and to anathematize publicly all those who had rejected the decrees of the synod. He also promised to have what he had done confirmed by a council. A council was accordingly assembled, in great haste, to gratify the impatient and riotous multitude.

The

The acts of this body in behalf of the Catholic faith were approved and confirmed by the emperor, who issued out an edict, commanding all bishops within his dominions to conform to them, on pain of forfeiting their sees. This decree was soon followed by the execution of such of the Eutychians as were most obnoxious to the orthodox party. By these means of conviction, the bishops of the East were speedily brought to unite in the profession of the Catholic faith, and the emperor undertook, in the next place, to unite them with their brethren in the West. This subject occupied the pope till his death, in the year 523, after a pontificate of nine years. Many of his letters are extant. Bower.

HORMONT, in *Geography*, a town of Persia, in the province of Laristan; 33 miles E.N.E. of Lar.

HORMUS, in *Ancient Music*, was a dance of a gay kind for girls and boys, in which the boys took the lead, putting themselves in manly and military attitudes, the girls following in gentle and modest steps, harmonizing the two virtues of force and temperance.

The Grecian girls of good families assembled in troops, ornamented with nosegays, garlands, and chaplets of flowers; they afterwards went to the temples, singing hymns at the solemn festivals, or at the nuptials of some one of their companions.

The Lacedæmonian dance consisted of three parts, representing the three ages of human life. All singing at the same time.

Age	-	We have been valiant.
Youth	-	We are so at present.
Infancy	-	We shall be so in our turn.

HORN, **CORNU**, a hard, callous substance, growing on the head of divers cattle, and serving them as weapons of offence and defence.

HORNS, in *Comparative Anatomy*. The parts which receive the name of horns are dissimilar in form and structure. They admit of being divided into four kinds at least: the 1st are found on the *rhinoceros*; the 2d are those of the *ox*, *antelope*, *goat*, and *sheep*; the 3d belong to the *camelopard*, and the 4th to the *deer* kind.

The horns of the *rhinoceros* are those most properly so called, being entirely composed of a horny substance. They are situated not upon the os frontis, but the nasal bones. They are of a pyramidal shape, and have no attachment to the skull but at the surface of their basis. They appear to be made up of a number of fibres resembling strong hairs consolidated together, and rendered smooth upon the surface, except around the base, where the external fibres, being broken off, present the appearance of a brush.

A number of pores, or foramina, are to be seen upon the basis of the horn, into which fine vascular processes are probably received; for, from the structure of the horn of the *rhinoceros*, there is every reason to suppose it is formed upon pulps, in the manner of hair. (See **H.A.I.R.**) These foramina are the orifices of fine canals, or grooves, which pass longitudinally throughout the horn. Cuvier states, that in the *rhinoceros unicornis* there is a thick mucus interposed between the horn and the bone on which it is situated, and that in the *rhinoceros bicornis* the horns are connected with the skin only, and, therefore, they are in some degree moveable. The horns of the *rhinoceros* are not deciduous, but continue to increase from the root, or base, in proportion as they wear.

Horns of the 2d sort are the most common; they belong to many of the ruminating quadrupeds, and some birds have similar processes upon their heads. They consist of three parts, an osseous substance, a vascular investment, and the external sheath. The bone is the part which is first formed: it may be discovered at a very early period as a knob, or

round protuberance, moveable upon the os frontis, and covered with the common integuments: as it elongates, the skin covering it becomes callous, and appears to wear off when the osseous process is found to be clothed in a real case of horn. It then becomes fixed to the os frontis by anchylosis. The original periosteum of the knobs becomes thicker and softer, and its vessels increase in size and number, preparatory both to the growth of the osseous, and the external parts of the horn between which it is interposed, and to both of which it serves as the organ of nutrition. The internal or osseous portion of the horn, even when fully formed, is irregular in its texture, resembling more an osseous deposit from inflammation than natural bone.

The external case of the horns in the *goat* and *sheep* is somewhat different from that of the *ox* and *antelope*: in the latter the horny fibres appear long and continuous, and form close compact layers, incased the one within the other; but in the *goat* and *sheep* they are interrupted by many transverse grooves, are shorter, and have the appearance of imbricated layers of horn.

The growth of the horny cases is from the roots, in the manner of hairs, but it does not appear to go on continually, or without interruption; for the increase in each year is marked by a circular groove near the root of the horn, by which means the age of the animal can be often determined.

Horns of the 3d sort are the short straight processes upon the head of the *camelopard*; these consist of bone, which is of a porous spongy texture; they are united to the os frontis by anchylosis at their base, and the other extremities produce a regular convex knob: the stem or pedicle of these horns is merely covered by the common integuments; but the bulb on the ends sustains a number of strong short hairs, which no doubt grow in a similar manner, and are every way analogous to the fibres composing the horns of the *rhinoceros*.

Horns of the 4th kind are peculiar to the *deer g nus*, (*ceruus*): these are composed entirely of bone, and have, therefore, been described, along with the other bones, by Cuvier and other anatomists; we shall, however, find from their history, as well as situation, that they distinctly belong to that class of bones which enter into the composition of horns in general.

The horns of *deer* are shed and reproduced annually, their growth therefore is exceedingly rapid. Their first appearance is in the form of two small cartilaginous knobs or buttons under the skin. These proceed to develop their different branches or divisions in succession, still clothed with what has been called their *velvet* coat. This integument consists of the skin covered with a delicate soft hair, and the periosteum closely united together. The velvet covering is extremely vascular; many of its vessels acquire an extraordinary magnitude. We have seen them in the *stag* during the growth of the horn as large as the quills of a goose, and Cuvier states them to equal the size of the little finger. When the horns are completely formed, the velvet coat loses its vascularity, becomes insensible and dry, and is rubbed off by the deer, leaving the horns, in the hunters' phrase, *burnished*.

The horns of *deer* acquire from friction a degree of polish upon the surface towards the top, but nearer the root, they still retain the impressions of the large vessels that were employed in their secretion. The bone of which they are composed is dense and hard upon the external part, and more light and porous in the interior, although it is without cavity or medullary cells.

The original cartilaginous buttons or rudiments of the horns are sustained upon eminences of the os frontis, with which they form the same sort of union that exists with respect

respect to the epiphysis of bones, being at first loose and afterwards firm. The line of their union is indicated by a circular notched protuberance upon the base of the horn, which is called the *burr*.

When the horns are about to be cast, there appears, upon sawing them in a longitudinal direction, a reddish mark of separation between them, and the eminences of the frontal bone on which they are sustained. This mark becomes more apparent, and at last the cohesion between the horns and the skull is so much destroyed, that the least shock makes them fall after the horn is shed. The eminence of the os frontis presents the appearance of a bone sawed or broken across. Its proper substance is actually exposed, but it very soon becomes covered by the integuments.

The bones which constitute the horns of the *deer* appear to be entirely analogous to the osseous parts of the horns of the other ruminant quadrupeds, and only differ from them in the circumstance of being deciduous. The horns of the *rhinoceros*, and those of the *deer*, should be considered as the two extremes in the history of these organs. The one wants the osseous basis, the other the corneous covering. The horns of the *camelopard* and *ox*, &c. exhibit the examples of intermediate structure.

The formation of the horns has been long known to be much influenced by the condition of the organs of generation. They are sometimes peculiar to the male animal, and in the *deer* kind acquire their full bulk and complete form just before the season of *rutting*, after which they are shed. Doctor Richard Ruffel, in his "Economy of Nature in Diseases of the Glands," relates some curious effects on the growth of *deer's* horns from castration. He castrated a very young *deer*, the consequence was, the horns did not grow. He then took another *deer*, some months older, and castrated it. A little velvet bud arose on one side of the head instead of a horn, and an irregular velvet horn about six inches long grew on the other: both were cartilaginous, and neither had stability enough to stand upright. He next had a *deer* somewhat older than the last castrated, but not cut *clean*, as they term it. The event was this; he had two most irregular horns, that never cast their velvet, and the left testicle and spermatic cord being least spoiled, the left horn was one-third longer than the right. Nature, not being able to carry on the growth in the regular way, threw out from the sides of the horns some bony knots, from which hung soft penile glands, (as he termed them,) that were covered with velvet, and resembled bunches of grapes. Lastly, he castrated two old *bucks* at the end of February, and their horns dropt off the 21st of March following, so that this event was anticipated five weeks at least. Their horns were however renewed the next year, and were longer than those of the other *bucks* of the same age; but the branches were less in length and size, and neither the velvet covering or the horns themselves were ever cast afterwards. See *Economy of Nature in Acute and Chronical Diseases of the Glands*, by Doctor Richard Ruffel, p. 21.

The effect of castration is also strikingly to be seen in the different kind of horns in the *bull* and *bullock*. In the latter, the growth of the horn seems to be unlimited, but this depends upon the increase of the osseous part, for the corneous sheaths are so thin and imperfectly formed, that they are only fit for the coarser articles of manufacture. It is probable, that if castration could be performed early enough in these animals, it would prevent the growth of horns entirely, as in other cases.

For the explanation of the structure and mode of growth of horns, see the plate on *Comparative Anatomy*, including the representations of *hair*, *horns*, *spines*, &c. Fig. 9. is

a view of the horn of the *rhinoceros unicornis*: *a*, the body of the horn; *b*, the bristled appearance around the root; *c*, the surface by which it is connected with the head covered with minute hairs. Fig. 10. is the button or rudiment of the *stag's* horn, after a fortnight or three weeks growth. Fig. 11. is the horn some weeks farther advanced with several of the branches forming. The horn is still soft and cartilaginous, and covered by its velvet coat. Fig. 12. is a dissected view of a portion of the horn in an early state, to shew the nature of the velvet coat: *a*, the skin clothed with thick close hair; *b*, the periosteum thickened and vascular, and not closely adhering to the bone; *c, c*, some of the large branches of the blood-vessels that nourish the horn unremoved. Fig. 13. is the *deer's* horn fully grown; the remains of the velvet coat are seen hanging in shreds, which the animal rubs off against the trees in the course of a day or two. Fig. 14. exhibits the socket upon the eminence of the os frontis, left by the separation or casting of the horn. Fig. 15. shews the effect produced upon the horns from imperfect castration in a young *deer*, as described and delineated by Dr. Ruffel.

The horns of a *deer* are by huntsmen called his *head*. See *HEAD*.

In the History of the French Academy of Sciences, we have an account of a bullock's horn dug out of the ground in ploughing, which had shot forth fibrous roots, and appeared to have grown, or vegetated after the manner of a plant.

Horns make a considerable article in the arts and manufactures. Bullocks' horns, softened by the fire, serve to make lanthorns, combs, knives, ink-horns, tobacco-boxes, &c.

Horns, when properly reduced by mills or other means, are also found to be excellent as a manure for some sorts of land, where they can be procured in sufficient quantity for the purpose. They are used occasionally in Hertfordshire, and some of the other counties in the vicinity of the metropolis, on the tillage as well as the grass lands, with considerable success. See *HORN Shavings*.

HORNS, in *Chemistry*: these have been analyzed, and found to contain a very small quantity of earthy matter. Mr. Hatchett burnt 500 grains of ox horn, and the residuum was only $1\frac{1}{2}$ grain, and not half of this was phosphate of lime. Horns chiefly consist of a membranous substance, which possesses the properties of coagulated albumen, and they probably contain a little gelatine. The horns of the hart and buck are exceptions, as they possess the properties of bone, and are composed of the same constituents. See *BONE*.

HORNS, in *Rural Economy*, the well known ornaments which spring out from the heads of different sorts of cattle, sheep, and some other sorts of live stock. It is by the horns that the breeds of many of these sorts of animals are known and ascertained. As the nature of such excrescences must obviously be productive of much offal and waste about the parts in which they are situated, it must of course be a great object of the breeder to get quit of them as much as possible, by the encouragement of the polled kinds, and the proper crossing of them with the other sorts where necessary. See *BRED* and *BREEDING*.

HORN, in *Geography*, a town of Sweden, in East Gothland; 32 miles S. of Linköping.

HORN, or *Hooren*, a town of Austria, famous for its beer made of oats, which supplies all the principal towns of Austria; 40 miles N.W. of Vienna. N. lat. $48^{\circ} 37'$. E. long. $15^{\circ} 32'$.

HORN, a town of Westphalia, in the county of Lippe, near

near which is a plain, called "Vinfeld, or the Field of Victory," supposed to be the place where Varus perished. N. lat. $51^{\circ} 50'$. E. long. $8^{\circ} 52'$.

HORN, an island on the coast of West Florida, between Ship and Massacre islands; nearly 17 miles long, and about half a mile wide.

HORN'S *Island*, a small island near the coast of South Carolina. N. lat. $33^{\circ} 7'$. W. long. $79^{\circ} 17'$.

HORN, *Cape*, a cape on the south coast of Terra del Fuego, or the most southern extremity on a group of islands of unequal extent, lying before Nassau bay, known by the name of Hermite islands, and situated in S. lat. $55^{\circ} 58'$, and W. long. $67^{\circ} 46'$. This cape is known at a distance by a high round hill over it. On the N.W. side are two peaked rocks like sugar-loaves; they lie N.W. by N. and S.E. by S. by the compass, of each other. Some other straggling low rocks lie W. of the Cape, and one S. of it; but they are all near the shore. From Christmas Sound to Cape Horn, the course is E.S.E. $\frac{1}{4}$ E. distant 31 leagues. Between this cape and another called "False or Mistaken Cape," by Captain Cook, there seemed to be a passage directly into Nassau-bay; some small isles were seen in the passage; and the coast, on the W. side, had the appearance of forming good bays or harbours. Captain Cook observes, though the doubling of Cape Horn is so much dreaded, so that, in the general opinion, it is more eligible to pass through the strait of Magellan, we were not once brought under our close reefed topsails, after we left the strait of Le Maire. He doubled the cape in 33 days, whereas it would have taken much longer time to have failed through the strait of Magellan, with greater fatigue to the sailors, and greater damage to the anchors, cables, sails, and rigging of the ship. He thinks, that different circumstances may at one time render it eligible to pass through the strait of Le Maire, and to keep to the eastward of Staten-Land at another. He also recommends, if neither wood nor water be wanted, to make no port and not to come near the land at all; for by keeping out at sea, you avoid the currents, which, in his opinion, lose their force at 30 or 36 miles from the land, and at a greater distance there are none.

HORN, *Cape*, (*False*), a rocky point, which is the southern point of the easternmost of Hermite isles, three leagues E.N.E. from Cape Horn. Off this cape lie rocks that are white with the dung of fowls; and vast numbers were seen about them.

HORN, in the *Manege*; to give a stroke with the horn, is to bleed a horse in the roof of the mouth, with the horn of a stag or roebuck, the tip or end of which is so sharp and pointed, as to produce the same effect as a lancet. They strike with the horn in the middle of the fourth notch or ridge of the upper jaw.

HORN is also a sort of musical instrument, of the wind kind; chiefly used in hunting, to animate and bring together the dogs and the hunters.

The horn may have all the extent of the trumpet.

The term for sounding anciently was, wind a horn; all horns being in those times compassed; but since straight horns are come in fashion, they say, blow a horn; and sometimes, plainly sound a horn.

There are various lessons on a horn; as the recheat, double recheat, royal recheat, running or farewell recheat, &c. See RECHEAT.

Wind instruments of this name and form are as numerous and various, as the animals that nature has armed with this weapon. The principal instrument, however, under that denomination, is the French horn, *cqr de chasse*, hunting

horn, or *cornu da caccia*, which is not only useful in the field, but of capital utility in full pieces, sacred and secular, in every orchestra.

The horn is a long tube, narrow at the top, and encreasing in diameter to the end, where its mouth is very wide. It is curled up in a ring or rings, for the convenience of carriage and performance.

It has no holes or keys with which to form different tones; the whole scale is produced by different modifications of the breath at the mouth-piece, by the lips and tongue.

It has the same series of notes as the trumpet, only an octave lower. All the music that is composed for it, is written in the key of C, and its pitch is altered now to any other key by crooks. At the beginning of a movement, the key is indicated by one of the seven letters of the gammut; as D horn, E \flat , F, or G horn, &c. Its natural scale is a regular series of eight notes with the addition of an occasional sharp 4th, and the harmonics of the key below.

Attempts at *chromatic* horns have been made early in the last century, in Germany; the Messings were the first who pretended to perform in all keys in England, about the year 1740. Spandau, from Holland, was the first that was able to make the artificial notes agreeable, about 1772, and soon after, Ponto did wonders on this instrument. We have now (1803) four excellent performers on the horn, the Leanders and Petrides. These last have the art of echoing passages in such a manner as to seem at a great distance without quitting their place in the orchestra. It must, however, be discovered, by every discriminating hearer, that the factitious half notes, that are made by the hand in the mouth of the instrument, are sounds of a different quality from the natural tones of the instrument. We have often thought that Ponto, with all his dexterity, produced some of these new notes with similar difficulty, to a person ridden by the *night mare*, who tries to cry out, but cannot.

The Hebrews made use of horns, formed of rams' horns, to proclaim the jubilee; whence the name *jubilee*; which see.

The French horns used in concerts are usually tuned an octave lower than the trumpets, to which they are closely allied in their principles. The whole length of tube yielding the fundamental note is often about ten feet, but it is the octave of this that performers in general are able to reach, in which the column of air in the tube vibrates in two equal parts: by blowing a little harder, the performer has it in his power to cause the column of air in the tube to divide itself into three equal parts, and whose vibrations consequently have the ratio of $\frac{2}{3}$ to the fundamental, or VIII + V; a little harder blowing will occasion three nodes or quiescent points in the tube, and the ratio of the sound will be $\frac{1}{3}$, or 2 VIII: harder still produces $\frac{1}{4}$, or 2 VIII + III: the next note is $\frac{1}{5}$, or 2 VIII + V, a repetition of $\frac{1}{5}$ an octave higher: then $\frac{1}{6}$, which is a false or unnatural note, less than the minor 7th ($\frac{5}{6}$) by $24.9472 \Sigma + 2 m$, the note being 2 VIII + this false 7th above the fundamental tone of the instrument. By blowing still harder each $\frac{1}{4}$ th part of the tube's length yields its sound, which has the ratio $\frac{1}{6}$, or 3 VIII: the next is $\frac{1}{7}$, and gives 3 VIII + II, or the true major tone: then $\frac{1}{8}$, or 3 VIII + III, a repetition of $\frac{1}{8}$ th: then comes $\frac{1}{9}$, which is $27.25171 \Sigma + 2 m$ sharper than a true minor fourth, being 3 VIII + this false 4th: the next note is $\frac{1}{10}$, or 3 VIII + V, another repetition of $\frac{1}{10}$: then $\frac{1}{11}$, which also is a false note, $22.58107 \Sigma + 2 m$ lower than a true major sixth, or 3 VIII + this false Vth: then $\frac{1}{12}$, which is a repetition of the false 7th, or $\frac{1}{7}$, but an octave higher: then $\frac{1}{13}$, or 3 VIII + VII or true major seventh, 13° : then $\frac{1}{14}$, or 4 VIII: then $\frac{1}{15}$, which is a false minor second,

second, 3.46819 less than the major semitone, $\frac{1}{2}$, or 4 VIII + this false 2d: then $\frac{1}{2}$, or 4 VIII + II, a repetition of $\frac{1}{2}$ above: then $\frac{1}{3}$ which is a false minor third, less by 9.27098 Σ + m than the true minor third, $\frac{1}{3}$, or 4 VIII + this false 3d: then $\frac{1}{4}$, or 4 VIII + III a repetition of $\frac{1}{4}$, two octaves higher: then $\frac{1}{5}$, or 3 VIII + V + the false 7th arising from $\frac{1}{5}$, or another false minor fourth (differing 41.1989 Σ + 3 m , from $\frac{1}{4}$ above), which is 13.9472 Σ m flatter than the true 4th. Next, by increasing the length of the blast, will arise $\frac{1}{6}$, which is a repetition of the false former fourth $\frac{1}{6}$ as above, an octave higher: then $\frac{1}{7}$, which is a false minor fifth, 9.460262 + m sharper than the semidiapente or flat fifth, $\frac{1}{6}$, or 4 VIII + this false 5th, which is 19.46026 Σ + 2 m sharper than the major fourth or tritone, $\frac{1}{3}$: then $\frac{1}{8}$, or 4 VIII + V, a repetition of $\frac{1}{8}$ three octaves higher: then $\frac{1}{9}$, or 4 VIII + 2 III, the double (or square) of $\frac{1}{9}$, and is 21 Σ + 2 m flatter than the true minor sixth, or 4 VIII + this false 6th: then $\frac{1}{10}$, which is the repetition of the false major sixth $\frac{1}{10}$ above: then $\frac{1}{11}$, or 3 VIII + 3 V the triple of $\frac{1}{11}$ is another false major sixth (differing 23.58107 Σ + 3 m from $\frac{1}{10}$ above), or 4 VIII + a comma-redundant major sixth, instead of the true VI: then $\frac{1}{12}$, which is a repetition of the false minor seventh or $\frac{1}{2}$ as above, but two octaves higher: then $\frac{1}{13}$, which is another false minor seventh (differing 31.0707 Σ + 3 m from $\frac{1}{12}$ above) and being 6.12449 Σ + m sharper than the minor seventh, $\frac{1}{7}$, or 4 VIII + this false 7th: then $\frac{1}{14}$, or 4 VIII + VII, a repetition of $\frac{1}{14}$, an octave higher: and lastly, $\frac{1}{15}$ is a false eighth less than the octave by 28.11748 Σ + 2 m , or 4 VIII + this imperfect VIII.

And thus we have all the natural horn or trumpet notes within the compass of five octaves, of which it may be observed, that the IIIrd, Vth, and VIIIth are the only *concord*s found among these horn notes, which explains the reason of these being the only *Acute HARMONICS* (see that article) which accompany a note: the IIrd and 6th composed by doubling these harmonics, the XIIth and the XVIIth; the VIth by tripling the XIIth; and the VIIth by combining the XIIth and XVIIth together, are the only other notes of the horn or trumpet which belong to the diatonic scale, this diesis-deficient minor sixth, and the comma-redundant major six, being however inapplicable to practice, and all the remaining ten notes, enumerated above, are anomalous, and have the effect of highly tempered notes or wolves in the practice of diatonic music, which is alone used at this day. Composers for the horn contrive to introduce as few of these false notes into their pieces as possible, and modern horn players also, by introducing their hand, or a block of wood, into the broad end of the horn, contrive, by habit, to correct many of the false intervals when playing in concert; but this is often done at the expence of clearness and fulness of tone.

The late Mr. Charles Claggett, by combining two horns or trumpets of different pitches together, so that the same mouth-piece, by means of a slide, acted on by the finger, could instantly be made to sound either tube, which he called his *chromatic French-horns* and trumpets, pretended, that by this means all the false notes were corrected: which of course supposed, that they were all alike tempered or defective, and that these lay all the same way, but which is far from being the case, as will appear from the recapitulation of the temperaments in the margin, where, however, the flat fifth is omitted, being sharpened + 9.460 Σ , and consequently it would be further injured by a new tube, sharper than the first, either

15.836 Σ (which is the mean among the above *flat* temperaments), or by any other difference of pitch in the two tubes, which might be adopted. We shall resume the curious theory of this instrument in the article TRUMPET. Horns are *tuned*, or brought to the proper pitch for playing in concert with other instruments, by means of short pieces of tube of different lengths called *crooks*, which are put on or taken off below the mouth-piece, so as to lengthen or shorten the entire length of the tube, according as the pitch wants lowering or raising.

HORN, in *Architecture*, is sometimes used for volute.

HORN is sometimes also used for the hoof of a horse, &c.

HORNS, in *Botany*. See MEDICAGO.

HORNS and Hedgehog. See MEDICAGO.

HORNS of the Altar. See ALTAR.

HORN, Ammon's. See CORNU Ammonis.

HORN-beech Tree, in *Gardening*. See CARPINUS.

HORN-bill, in *Ornithology*, the genus buceros of Latin authors, calao of the French. This genus is distinguished by having the bill convex, curved, and sharp at the edge, large, ferrated outwardly, and furnished with a horny protuberance or excrescence on the upper mandible near the base; the nostrils behind the base of the bill; tongue short, and sharp at the point; legs scaly; toes, three forward and one backward, the middle one connected to the outer as far as the third joint, and to the inner as far as the first.

These birds subsist, for the most part, on fruits of various kinds, generally inhabit woods, and with few exceptions are natives of the old continent.

Species.

BICORNIS. Front bony, flat, and bicornuted at the fore part. Linn. Amoen. Acad. *Hydrocorax Philippensis*, Briff. *Rhinoceros avis prima varietas*, Will. *Calao*, Petiver. *Philippine horn-bill*.

Native of the Philippine islands; size of a common hen; the plumage above black, beneath white; quill-feathers with a white spot; tail rather long and black; tail-feathers ten in number, of which the exterior four on each side are white and those in the middle black; legs greenish. A supposed variety is described in the 23d volume of the Philosophical Transactions under the name of *cayao vel calao*, the bill of which is red, the belly black; and the back and rump brown-ash; the legs scaly and reddish, and the claws black.

This species does not frequent watery places, but inhabits the higher lands, and is most common in mountainous situations. It feeds on fruits, among which it prefers the fig, almond, and pistachia; these it swallows whole, and after digesting the pulp casts up the stones entire. Its voice is said to resemble the bellowing of a calf. The Indians worship this species as a deity.

ABYSSINICUS. Black; bony protuberance semicircular on the fore part; orbits, chin, and part of the throat naked, and violet brown; greater quill-feathers white. Gmel. *Grand calao d'Abyssinia*, Buff. *Abyssinian horn-bill*.

Resembles a raven in shape, but is larger and more robust; it inhabits Abyssinia, and subsists chiefly on the large green beetles which infest the plantations of grain. The flesh has a foetid odour. According to Bruce it lodges in thick trees, and is known by the name of "teir el naciba," or bird of destiny, on the frontiers of Sennaar. In the eastern parts it is called *abba gumba*, and in the west *erkooms*. The bill is black, edged with white, and about the base of the upper mandible each side is a tuft of bristly feathers.

HORN-BILL.

AFRICANUS. Black; protuberance on the bill like a horn, straight and pointed. Gmel. &c. *Hydrocorax Africanus*, Briff. *Rhinoceros avis secunda varietas*, Will. *Brac ou calao d'Afrique*, Buff. *Trompette de Brac ou oiseau trompette*, Labat. *African horn-bill*.

Described on the authority of Labat, who tells us it is the size of a turkey, with the plumage wholly black; the bill and head measured together were equal to eighteen inches; the figure of the bill not unlike that of the Philippine horn-bill, but having the appendage on the top of the upper mandible almost straight at the point; the colour partly red, and partly yellow, and the edges and base of both mandibles black. This description is adopted from father Labat by Buffon, nor does it appear to be better known since that time, as Sonnini, in the latest edition of Buffon, adds nothing to the description that was previously given by that author. There is or was formerly a specimen of this bird in the Leyden museum.

MALARARICUS. Black, beneath white; protuberance rounded above, acute towards the front, and reaching behind the eyes. Gmel. *Calao de Malabar*, Buff. *Pied horn-bill*.

The length two feet six inches, or three feet; both mandibles curved downwards, and sharp at the tip; protuberance four inches and a half long, the greater part black, the middle, both of the protuberance and the bill, dirty yellowish-white; vent, quill, and outer tail-feathers tipped with white; legs strong and black; claws long, hooked, and rather blunt. This species is known to devour rats, mice, and small birds, raw flesh, and vegetables; its motions are not dissimilar to those of the magpie, leaping forwards or sideways with both legs at once; its note is various, being sometimes hoarse, or like the clucking of a turkey, and sometimes weaker.

Sonnerat describes a variety of this bird under the name of *Calao de la côte de Coromandel*, from its being found on the coast of Coromandel; the bill of this kind is curved, the protuberance egg-shaped; quill-feathers and tail, except the two middle feathers, which have their bases black, are white. Dr. Latham is inclined to believe the *calao des Philippines* of Pl. Enl. is also a variety of this bird.

ALBIROSTRIS. Bill white.

This kind, which is recently described by Sonnini under the title of *le calao à bec blanc*, is nearly allied to the former species, *B. malabaricus*.

HYDROCORAX. Protuberance flattened forwards; the belly tawny. Gmel. *Hydrocorax*, Briff. *Corvi marini* genus, Cluf. *Corvus indicus*, Bont. *Corbeau Indien*, Salerne. *Calao des Moluques*, Buff. *Indian horn-bill*.

A native of the Molucca isles; its length two feet four inches; the protuberance cinereous, and behind whitish; crown blackish; cheeks and chin black; hind head and neck pale chestnut; back, shoulders, and rump, with the wing and tail-coverts, brown; breast and belly blackish, the latter yellowish on the hind part; tail ash or dirty white; legs grey brown; claws black. Feeds on the wild nutmeg, which renders its flesh pleasantly aromatic. This bird is frequently tamed to destroy rats and mice.

RHINOCEROS. Protuberance recurvate and pointed. Gmel. *Hydrocorax indicus*, Briff. *Rhinoceros*, Bontius. *Horaed Indian raven, or rhinoceros bird*, Will. *Calao rhinoceros*, Buff. *Bec de Poiseau rhinoceros, (the bill)*, Buff.

Length three feet. This species inhabits India, preys on rats, mice, and carrion, and often follows the hunters for the entrails of their game. The bill is ten inches long, the protuberance eight inches. Inhabits India.

COLLARIS. Protuberance of the bill flat, grooved, and

yellow; body and wings black; space of the neck bright red; tail white. *Le calao de Waygiou*, Sonnini.

A species found in Waygiou, one of the Molucca isles; its length is two feet and a half; and the bill seven inches and a half long.

VIOLACEUS. Protuberance large, and much elevated above the upper mandible, flat at the sides, and marked with two longitudinal furrows; plumage above black, glossed with green, beneath white. *Le calao violet*, Levaillant.

Found in the isle of Ceylon, and on the coasts of Coromandel.

CORONATUS. Protuberance sub-coronated, the bill large and yellow, or reddish; body above blackish, glossed with blue; abdomen and thighs yellowish white; tail rounded, white, and in the middle, black. *Le calao à casque en croissant*, Sonnini.

Size of the rhinoceros horn-bill. This species is common in the Molucca isles, where it inhabits great woods, is very savage, and feeds on carcases. The legs are blackish brown.

GALEATUS. Bill straightish; protuberance nearly square, the posterior part rounded, the anterior flat. Gmel. *Calao à casque rond*, Buff. *Helmet horn-bill*.

Nothing more is known of this curious species than the bill and head, the structure of which sufficiently distinguishes it, and announces it to be of a larger size, and possessed of greater strength than the generality of other birds in the same tribe. Specimens of the bill are not unfrequent in museums, and these vary in length from six to eight inches; the colour is usually red, and the feathers, sometimes attached at the base, are black.

PANAYENSIS. Greenish-black, beneath reddish-brown; protuberance sharp above, and flat at the sides. Gmel. *Calao à bec cizelé de l'isle de Panay*, Sonnerat. *Panayan horn-bill*.

Size of a raven; the bill very long, arched, brown, with transverse lateral wrinkles, and longitudinal orange furrows; orbits naked and brown; irides whitish. The head and neck of the female is white, with a large triangular greenish-black spot; legs lead colour. Inhabits the isle of Panay.

MANILLENSIS. Above blackish-brown, beneath dirty-white; bill not ferrated; protuberance small. Gmel. *Calao de Manille*, Buff. *Manilla horn-bill*.

Native of Manilla; length twenty inches. The bill rather curved and acute at the tip; head and neck white, waved with brown; temples with a black spot; tail with a fulvous band across.

NASUTUS. Front smooth; tail-feathers white at the base and tip. Gmel. *Crotophaga*, Forkal. *Hydrocorax senegalensis melanorhynchus*, Briff. *Calao à bec noir du Senegal*, Buff. *Black-billed horn-bill*.

Inhabits Africa, near the river Senegal; its size is about that of the common wood-pecker; it feeds on fruits, and, when young, is easily tamed. When young the bill of this bird is black, the colour changing gradually to red as the bird grows older; the body above is fordid greyish, and white beneath; claws black. The bird called by Buffon *le tock* is considered as a variety of this bird; its size is nearly the same, except that its length is half an inch less; the body varied with grey and black, beneath and collar whitish; head and throat lined with black; two middle tail-feathers grey, the rest blackish, with the tip white.

ALBUS. Snowy-white; bills and legs black. Gmel. *White toucan*, Hawkesworth It. *White horn-bill*, Lath.

A species described from a specimen caught between the island of Tinian and Pulotimoen. Size of a small goose; the bill

bill narrow, and bent down; neck a foot long, and as small as that of the crane.

LOBATUS. Protuberance on the bill divided transversely into several lobes; plumage black glossed with blue; on the shoulders a red brown spot; tail whitish. *Le calao a casque fessonné*, Levaillant.

Inhabits Batavia; length thirty inches, the bill five inches long and two thick, and the margin not denticulated; colour yellowish-white, with the base brown; eyes surrounded by a naked wrinkled skin which covers the base of the mandible, and descends upon the throat; the feathers on the back of the head are long; great quill-feathers deep black. The female is rather smaller than the male, and has no space of red brown about the shoulders.

OBSCURUS. Protuberance rounded above, and divided into seven or eight lobes; body black; tail-feathers white. *Buceros plicatus*, Latham. *Indian raven*, Will. *Wreathed horn-bill*.

Native of New Guinea; the bill bent, and five or six inches in length. A supposed variety of this bird, found in Ceylon, has the protuberance on the bill divided into no more than five lobes.

GINGINIANUS. Bill bent, compressed laterally; protuberance pointed; body above green, beneath white; two middle tail-feathers dirty, rufous grey, with a band of black at the end; the rest black rufous near the end, and white at the tip. *Buceros ginginianus*, Lath. *Le calao de Gingi*, Sonnerat. *Gingi horn-bill*.

Length two feet; the bill from the base to the middle with the protuberance black, the rest white, the edges serrated; cheeks with an oval black bar under the orbits; legs black. Inhabits the coast of Coromandel.

ORIENTALIS. Bill convex, above carinated, at the base protuberant; orbits naked, wrinkled, and cinereous; body blackish. Lath. *New Holland horn-bill*.

Inhabits New Holland; size nearly as large as the jay; the nostrils open near the base of the bill.

GRISEUS. Protuberance sloping before, abrupt behind; body grey. Lath. *Grey horn-bill*.

Native of New Holland; the crown black; bill yellow, with a black spot at the base; at the corner of each eye a tuft of bristles, and behind a naked blue spot; wing-coverts variegated with black; quill-feathers white at the tip.

VRIDIS. Protuberance abrupt; body black; wings greenish. Lath. *Green-winged hornbill*.

The bill in this species is yellowish, at the base of the under mandible is a whitish blue spot; the outer tail-feathers, with the base of the quill-feathers, and the belly, white; legs blueish. Country unknown.

CEYLONENSIS. Bill denticulated, and without protuberance, black and white; head above, crest, hind part of the neck, back, and coverts of the tail brown, blended with blueish grey. *Le calao gingala*, Levaillant.

Inhabits the isle of Ceylon.

JAVANICUS. Bill not denticulated and without protuberance, brown with the base yellow; front, head above, and long feathers of the crest red brown; body above and beneath black; neck and tail white. *Le calao javan*, Levaillant.

Length thirty inches; bill four inches and a half long; skin under the eyes, and chin down to the throat, deeply wrinkled; plumage finely glossed with greenish; legs brownish, and the claws yellowish white. This species inhabits Batavia, where it is called *jaar vogel*.

Levaillant, to whose costly work on American and Indian ornithology, we are indebted for an account of the two preceding birds, has placed them in the calao or horn-bill tribe,

and in this respect we follow his example, though not entirely satisfied with such an arrangement. The absence of a protuberance on the bill in both kinds seem clearly to remove them from the calao tribe, notwithstanding they accord with that genus in some other particulars; in the denticulation of the bill and structure of the claws *le calao gingala* agrees with the horn-bill, but *le calao javan* is still less nearly allied, the bill in this kind being neither denticulated nor serrated at the margin, and it has only the claws of the true horn-bill to justify its reference to that genus. The last mentioned kind, from the form of the bill, appears in some degree connected with the corvus tribe.

HORN-blend, is a black or green indurated bole or clay, consisting of scaly particles, which are distinguishable from those of mica, by being less shining, thicker, and rectangular. It is generally found among iron ores, and sometimes intermixed with mica, forming a compact stone.

HORN-coal, in *Mining*, is applied to such coal as dips almost equally on the *face* and the *end*, or in which the *flines* or lengthway joints of the coal cross the water level diagonally, such coal being often worked with saliant and re-entering angles, like the horn-works of a fortification, whence probably the name was derived; such are often called half-workings of coal.

HORN-coot, a name given by fowlers to the great horn-owl. (See *STRIX Bubo*.) A sportsman who has got one of these birds, has a constant lure to draw together almost what numbers of others he pleases. The method of taking other birds by it is thus: the sportsman fixes upon some single tree which stands in the middle of an open field, and cutting the boughs of this into a regularity, he spreads nets all about it, and then places his owl within them, with a string fastened to its leg, by means of which the bird may be put in motion by the sportsman as he stands at the distance under covert. There are to be two perches placed near one another, so that the owl can easily go from the one to the other. It is the nature of this bird to fly only by night, and therefore whenever it is seen by day-light, all the other birds quarrel with it, and abuse it; even the hawks will make at it wherever it comes in their way. The sportsman depends upon this; and as soon as he sees any bird approach, or as soon as the owl, who sees farther than he can, gives him the signal that some bird is in sight, he pulls the string, on which the owl, being disturbed, flies from one perch to the other. This draws the strange bird to her; and flying violently at her, it is entangled in the net placed with that intent, and the sportsman must immediately run up and take it out, and replace the net for the next.

HORN-fish, an English name for the fish which we also call the gar-fish. It is properly a species of pike or esox. See *ESOX Belone*.

HORN-fish, in *Ichthyology*. See *CORNUTUS piscis* and *BRACULEATUS*.

HORN, harts, cornu cervi. The scrapings or raspings of the horn of this animal are medicinal, and used in decoctions, ptisans, &c.

Hartshorn is too expensive an animal bone to be employed for the common preparations of ammonia, for which purpose the bones, that are the refuse of the streets, are used; and if, after distillation, they be further burnt in an open fire, the residue in each instance will be the same, and chiefly phosphate of lime. Hartshorn, however, affords that particular modification of bone to which the preference is given for the purposes of pharmacy, and the consumption is not so great, as to render the direction either too expensive or difficult to be complied with. The phosphate of lime left

amounts to 57.5 of the bones employed; they appear also to contain a small quantity of carbonate of lime and phosphate of magnesia, and the remainder is animal matter, which passes away in various compound gasses under the circumstances in which it is in this preparation directed to be placed.

Hartshorn *jelly* is nutritive and strengthening, and is sometimes given in diarrhœas; but a decoction of burnt hartshorn in water is more frequently used for this purpose, and is called hartshorn *drink*. See *JELLY*.

The coal of hartshorn, by being calcined with a long continued and strong fire, is changed into a very white earth, called hartshorn calcined to whiteness, or *cornu ustum*. This earth is employed in medicine as an absorbent, and administered in dysenteries and labour-pains, which are supposed to be caused by acrid and ill-digested matters. This earth levigated is the basis of Sydenham's white decoction, which is commonly prescribed in these diseases.

The white decoction or mixture of burnt hartshorn is prepared by boiling down two ounces of hartshorn burnt and prepared, and one ounce of Acacia gum, in three pints of water to two, constantly stirring, and afterwards straining it. As burnt hartshorn consists entirely of phosphate of lime, which is insoluble in the preparation above directed: it is only brought into the state of a very fine powder, and is kept mechanically suspended in a mucilaginous liquor, on which account the gum is an useful addition, to the original formula in Bates's Pharmacopœia, which contains none. This is retained in the last pharmacopœia as one of those established forms which are in use with many practitioners. The *pulvis opiatus*, or powder of burnt hartshorn with opium, is a composition of hard opium powdered, a drachm, hartshorn burnt and prepared, an ounce, and cochineal powdered, a drachm, well mixed. This preparation affords a convenient mode of exhibiting small quantities of opium, ten grains containing one of the opium. As the article by which it was divided is of no other consequence, a small quantity of cochineal is added to give it a colour, and thus to prevent it from being accidentally confounded with any of the numerous white powders kept in the shops. The former name of *pulvis opiatus* was particularly exceptionable, as sometimes in the abbreviation of prescriptions it was found to be mistaken for *pulvis opii*. The salt of hartshorn is a great sudorific, and given in fevers with success; and hartshorn also yields, by distillation, a very penetrative volatile spirit.

HORN-hipped. A horse is said to be so, when the tops of the two haunch-bones appear too high.

HORN-owl. See *STRIX bubo*.

HORN of Plenty. See *CORNUCOPIA*.

HORN with horn, or *HORN under horn* (*cornutum cum cornuto*), is when there is common *per cause de vicinage*, inter-commoning of horned beasts. See *COMMON* and *INTER-COMMONING*.

HORNS of Insects. See *FEELERS* and *ENTOMOLOGY*.

HORN Shavings, a term applied to the small thin pieces of waste horny matters which are formed in the preparation of different articles from this substance, in extensive manufactories. Every sort of refuse material of this description has been found beneficial upon land, when employed in the way of a manure, either as a top-dressing, or when turned into the soil. In the county of Hereford they make use of two descriptions of these sorts of matters, the *small* sort, or turner's shavings, and the *large*, or refuse pieces of horn, which are cut off by the saw or any other tool. The farmers purchase the first of these sorts in London, at from about thirteen or fourteen shillings the quarter, or ten-bushel sack

stuffed quite full, mostly weighing about two hundred and a half. They are generally employed exactly in the same way and proportions per acre as the clippings of farriers, only they do not stand in need of being pricked into the soil when used upon the surface of the tillage lands. And it is the usual practice with the large sort to have them ploughed into the soil, about three months before the time of sowing either wheat or barley. Shavings of these kinds are found, from actual trials, to answer well in most soils and seasons, with the exception of such as are very dry and parching, when they are said not to work, by the farmers. The small shavings should be preferred, as being the most useful and advantageous when employed in the way of a dressing for land. See *MANURE*.

HORN, Staining of. See *BONES*, *DYEING*, *IVORY*, *TORTOISE-shell*, and *WOOD*.

HORNS, Fossil, in Natural History. The horns of animals, accompanied by their skulls and bones, or otherwise, are frequently found in the earth, but always in loose and alluvial earth, or in caverns and fissures, near the surface, as was remarked by Dr. Woodward, and has been confirmed by subsequent observers. The fossil horns which have been described are said to be those of

A Calf, described to be conic, crooked, with a pith and ray, not unlike a young budded horn. Dr. Grew's *Rarities*, p. 274.

Deer.—Horns resembling those of deer are said to be frequently met with in the peat-pits in Ireland. *Phil. Transf. Abr.* by Lowth, vol. ii. p. 434.

Some of these are very large, and have very broad palms above the brow antlers, which are palmated also. (*Gent. Mag.* vol. lxxv. p. 1133.) Parts of a large deer's horn were found in a pit at Hutton Hill, in Somersetshire. (*Jones's Phys. Disq.* p. 425.) In digging the West India Docks, in the Isle of Dogs, and also in the peat-pits near Newbury, in Berkshire, deer's horns are met with. *Parkinson's Org. Remains*, p. 95 and 98.

Horns of the fallow-deer are said to have been found by M. Cuvier, in loose strata, in France. *Phil. Mag.* vol. xxxv. p. 387.

The horns of the moose-deer, very large, were dug up in 1781, at Beline, N. E. of Carrick, in Kilkenny, in Ireland, which are preserved in Besborough hall, near that place. (*Tigh's Survey of Kilkenny*, p. 98.) Others are mentioned by Mr. Jamefon, Shetland Isles, p. 158. Horns of this kind of deer are also mentioned to be found in America. *Jones's Phys. Disq.* p. 420.

The horns of a rein-deer were preserved at Chester, which were dug up there. *Benj. Martin's Nat. Hist.* vol. ii. p. 245.

Elks.—Among the remains of ruminating animals in loose strata, M. Cuvier found the horns of a species of elk, now extinct. In Hardwick hall, near Alt Hacknal, in Derbyshire, horns of a prodigious size are preserved, which, it is said, were found many years ago in peat, in the northern parts of Derbyshire, and to be those of an elk.

Goats.—The horns of goats are among those enumerated by M. Cuvier, as found in the recent alluvial soils near Paris. *Phil. Mag.* vol. xxxv. p. 387.

Oxen.—The horns of different species of these, are stated by M. Cuvier to be found in the loose recent soils of some vallies in France.

Stags.—The head and horns of a stag were dug up at Watlington park, in Oxfordshire, mentioned by Dr. Plott, *Staffordshire*, p. 161. In the peat of Plumlead level, by the Thames. (*Phil. Transf.* vol. i. p. 109.) They have also occurred

occurred to M. Cuvier in the alluvia and putrid marshes of France. *Phil. Mag.* vol. xxxv. p. 387.

In the accumulations of tufa from the petrifying springs at Matlock Bath, and formerly at Alport, near Yolgrave, in Derbyshire, very large stags' horns have been found at different periods.

Urus.—The horns of this large animal have been found in the peat-pits of Ireland (Jamefon's *Shetland Isles*, p. 158.); and according to M. Cuvier they have been found in the valley of the Somme, also in Suabia, Prussia, Italy, and England. *Phil. Mag.* vol. xxxv. p. 387.

The horns of very large unknown animals were found at St. Martins, near Commercy (*Nicholson's Journ.* 8vo. xxiii. p. 159.); and others with the teeth and skull at Oelte, near Ninava, in Russia, (*Phil. Mag.* vol. xxxv. p. 318.) At Hop-ton hall, in Derbyshire, the pith of a horn $5\frac{1}{2}$ inches diameter above the bone of the skull, and 16 inches long, is preserved, which was found near Padley hall, 15 feet beneath the surface, in the deep-cutting at the W. end of the Butterly tunnel for the Cromford canal.

We have selected the above, in order to shew, that the horns found in a fossil state in the earth are of various kinds; and from the details which are preserved respecting them, there seems no reason to think that horned animals existed, while the strata were depositing, the most ancient of these horns being found in the alluvial flats or marshes in the vallies, and no inconsiderable portion of them in peat, which proves their recent origin.

Sometimes extraneous fossils have been called horns, which have no pretensions to that character, an instance of which occurs in Derbyshire, where the quarrymen and colliers find a conical and slightly bent fossil, which they say is the bony core of a horn, or harn as they pronounce it; these are found, with some variations in the shape, in grit stone at Overton quarry, at Wickersley quarry in Yorkshire, in Wingesworth, Chesterfield, Alfreton, &c. In bind at Brethby, &c. Mr. William Martin, in his *Petrificata Derbiensia*, plate 8, shews them to be of vegetable origin, and denominates them *Graminis fulcatus*. Some have supposed these horn-like fossils to be a kind of cupped coralloid.

HORNS of the uterus, two processes arising from the sides of the fund. See *UTERUS*.

HORN-work, in *Fortification*, a sort of out-work, advancing toward the field, to cover and defend a curtain, bastion, or other place, suspected to be weaker than the rest: as also to possess a height, &c.

It consists of a front and two branches; the front is made into two demi-bastions and a curtain; its sides, or flanks, are usually parallel; though sometimes they approach or contract towards the place, forming what they call a *queue d'aronde*, or swallow's tail.

When the flanks are too long, they sometimes make epaulements to flank them. The parts of the horn-work next the country are to be defended by a parapet.

For the construction of horn-works, produce the capital of the ravelin beyond the salient angle A (*Plate VI. Fortification*, fig. 1.) to the distance AB, of about eighty toises; draw DBE at right angles to AB, in which take BD, BE, each equal to fifty-five toises; and on the outward side DE, trace the front of a polygon in the same manner as that of the body of the place, making the perpendicular BF eighteen toises, and the faces thirty. The branches Da, Eb, of the horn-work, when produced, terminate on the faces of the bastions, within five toises of the shoulders. The ditch of the horn-work is twelve toises,

and its counterescarp parallel to the branches, and in the front terminates at the shoulders. The capital of the ravelin before the front of the horn-work is thirty-five toises, and the faces terminate on the shoulders, or rather two or three toises beyond them; and the ditch before the ravelin is eight toises. There are sometimes made retrenchments within the horn-work, such as S, S; which are constructed by erecting perpendiculars to the faces of the ravelins, within twenty-five toises of their extremities. This retrenchment, like all others, has a parapet turfed only with a beam of eight feet before it, and likewise a ditch from three to five toises broad. When a horn-work is made before the bastion, the distance of the front from the salient angle of the bastion is a hundred toises; and the branches terminate on the faces of the adjacent ravelins within five toises from their extremities; the rest of the construction is as before.

Two horn-works joined together make a crown-work, which is constructed by describing from the salient angle A (*fig. 2.*) of the ravelin, as a centre, an arc of a circle, with a radius of about 120 toises, cutting the capital of the ravelin produced at C; from the point C set off the chords CB, CF, each equal to a hundred and ten toises, and on each of these construct the front of a polygon of the same dimensions, as in the horn-work, that is, the perpendicular should be eighteen toises, the faces thirty, and the branches terminate on the faces of the bastions, within twenty-five toises of the shoulders. The ditch is twelve toises; the capital of the ravelin thirty-five, and its ditch eight. When the crown-work is made before the bastion, the arc is described from the salient angle of the bastion with a radius of a hundred and twenty toises, and the branches terminate on the faces of the adjacent ravelins, within twenty-five toises of their extremities, &c. as before. Muller's *Elem. of Fortif.* p. 39, &c. See *Military CONSTRUCTION*.

HORN-wrack, in *Zoology*, the trivial English name of the genus *Flustra*, a tribe of *Vermes* in the *Zoophyta* order. See *FLUSTRA*.

HORNAGIUM, *HORNAGE*, in our ancient *Laws Books*, seems to import the same with *horngeld*.

HORNBEAM, in *Botany*, &c. See *CARPINUS*.

HORNBEAM, in *Rural Economy*, a name commonly given to a tree of the deciduous sort, which is occasionally grown as timber, being made use of in turnery, as well as for the cogs of mills and other similar purposes.

There are two species of this tree, the common hornbeam, and the hop hornbeam, but which afford the following varieties; as the eastern hornbeam, the flowering hornbeam, the Virginia flowering hop hornbeam, and the American hornbeam. The common hornbeam is a native of Europe and America, while the hop hornbeam is met with in Italy and Virginia. The common sort grows to the largest size, and is probably the best kind for the purposes of timber.

All the sorts of these trees are capable of being increased, either by seeds or from layers. The layer method succeeds at almost any season of the year. The seeds may be sown in the seed part of the nursery any time in the autumn, after they have been a little dried upon a mat, or otherwise, for the purpose. This is best done in narrow beds to the depth of about two inches, which should be kept perfectly clean and free from weeds. They must continue in these beds until the second spring, when they come up, and require to be kept free from every sort of annoyance, being watered in very hot seasons. About the third spring the young plants may be set out in the nursery ground, where they may continue

tinue

tinue until they are wanted for being planted as standard trees.

In the layer method, a few good plants should be provided for the purpose of stools; which in the Eastern fort may be planted at a yard distant, but with the others a yard and a half, or even two yards apart. As soon as these plants have made a proper number of shoots, they should be layered or laid down into the ground in the autumnal months, and in the course of about a twelvemonth they will generally become well rooted; at which time, or in the winter or early spring, they may be taken off, and planted out in the nursery manner, taking care to brush up or mould the stool well, for the future produce of young shoots for additional supplies of layers. The plants in the nursery should be allowed about a foot or a foot and a half, the rows being at the distance of two feet. They may continue in this situation until they are wanted for being finally planted out, being carefully weeded, and the mould well stirred about them in the rows, by winter digging, &c. The Virginia hornbeam frequently throws out two leading shoots, which afterwards contend for the mastery. Where this is the case, that which appears the best should be preserved, the other being removed by means of the knife. If this be neglected the trees will be liable to become forked in most cases, and of course less valuable to the planter.

The common hornbeam affords excellent stakes and edders, besides fuel wood and charcoal. The timber produced by it may be ranked with those of the beech and sycamore; but its principal superiority consists in its excellence for the purposes of *screen fences* for sheltering gardens, nursery grounds, and different sorts of young plantations, from the severity of bad seasons, &c. It bears cutting in, pruning, and clipping, extremely well, and, from its retaining its leaves during the winter season, becomes particularly close and impenetrable to the winds and storms, keeping up a very steady temperature of the atmosphere about the plants which it shelters. On this account also, it is found beneficial to be planted in mixture, or in occasional rows, with many tender sorts of trees in high exposed aspects, in the manner of the birch, to which it is preferable, as affording greater warmth in the winter. This sort of tree should perhaps be more attended to as a nurse for young exposed plantations of trees, than has hitherto been the case, in consequence of its qualities in this way being but imperfectly known.

The eastern fort is particularly valuable where low hedges of deciduous trees are wanted, from its inferior growth, and the smallness of its leaves and closeness of the branches.

HORNBEAM *Pollengers*, a denomination given by some to trees of this species, which have been lopped, and are of about twenty years growth. See **TREE**.

HORNBEAM *Wood, Petrified*, in *Natural History*. In a breach of the embankments or tide walls of the Thames, which happened near Purfleet, as described in the Philosophical Transactions, N^o 325, the Rev. W. Derham distinguished hornbeam among the other woods and vegetable products found a great way below the surface of the marshes; belonging, however, to the class of recent or peat fossils, and not to those of the strata.

HORNBERG, in *Geography*, a town of Wurtemberg, in the Schwartzwalde; 38 miles S.W. of Stuttgart.—Also, a town of Germany, belonging to the Teutonic knights, near the Neckar; 18 miles E. of Heidelberg.

HORNBURG, a town of Westphalia, in the principality of Halberstadt, on the Ilfe; 10 miles N.E. of Goslar.

HORNBY, is a small market town and chapelry in the parish of Melling, hundred of Lonsdale, Lancashire, England. It is seated on the eastern banks of the river Loyne or Lune, over which is a stone bridge of three arches. A religious hospital, or priory, was established here at an early period; and at the dissolution was granted to the Monteagle family, who also possessed an old baronial mansion called Hornby castle, which stands on an eminence about half a mile from the town. According to Camden, this "noble castle was founded by N. de Mont Begon, and owned by the Harringtons and Stanleys, barons of Monteagle, descended from Thomas Stanley, first earl of Derby." It has a large square tower, and a lofty round one; has lately undergone a complete repair; and is now the property and residence of John Marsden, esq. Hornby church, which is subordinate to that of Melling, is a neat edifice, and distinguished by an octagonal tower. Hornby is distant from London 248 miles, and contained, according to the late return, 87 houses, and 414 inhabitants. The cotton manufactures constitute the chief business of the place. A fair or market is held every alternate Tuesday for cattle; here is also an annual fair of two days. *Beauties of England and Wales*, vol. ix.

HORNCASTLE, a market town and parish in a foke of that name, in Lindsey division of the county of Lincoln, England, is situated upon an angular piece of land formed by a small rivulet named Waring, and the river Bain. The latter is navigable from the Witham to this place. The town derives its name from *horn* or *byrn*, in Saxon signifying an angle or corner, and a castle or fortification. Traces of the castle are yet visible; the whole formerly occupied an area of nearly twenty acres. The foundations shew that it was in the form of a parallelogram, and inclosed a great part of the present town. Numbers of Roman coins have been found here; and there lately existed, near the river, one of those intricate circles called Julian's bower. These circumstances, and its situation on a lingula or tongue of land, induced Stukely to consider it a Roman station, and to place here the Bannovallum of the geographer Ravennas. The town was incorporated in the time of queen Elizabeth, with the privilege of holding a weekly market on Saturdays, and an annual fair; two other fairs have been since established. A considerable trade in leather is carried on here; the place being principally occupied by tanners. Horncastle is 139 miles N. from London, and in the year 1801 contained 403 houses, and 2015 inhabitants. Here are a good grammar, and a charity school. *Beauties of England and Wales*, vol. ix.

HORNCASTLE *Navigaton*, was made, in pursuance of acts of parliament obtained in 1792 and 1800, from the old Witham river near Tattershall, to the bridge in the town of Horncastle, a distance of about 11 miles, in the county of Lincoln. See **CANAL**.

HORNE, in *Biography*. See **HOORNE**.

HORNE, GEORGE, a prelate in the church of England, was born at Otham, near Maidstone, in Kent, in the year 1730. His father, who was rector of Otham, undertook the early classical education of his son, for which he was perfectly qualified. When he was thirteen years of age, he was sent to the Maidstone grammar school, then under the care of a master eminent for his knowledge in ancient literature. A Maidstone scholarship in the university of Oxford becoming vacant, he was, when he was about fifteen years of age, sent to the University college, where he applied himself with so much diligence and assiduity to his studies, that he was greatly distinguished among his contemporaries, as well for

his attainments in polite literature, as for that species of knowledge which is subservient to the illustration of the scriptures. In the year 1749 he took his degree of B.A.; and in the following year, upon a vacancy taking place in a Kentish fellowship at Magdalen college, he was elected to fill it. Mr. Horne at this time had been deeply tinctured with the mysteries of Hutchinsonianism, which led him to do his utmost to bring discredit on the system of the immortal Sir Isaac Newton. What he published on this occasion, without his name, he was sincerely ashamed of afterwards, and never suffered it to be reprinted. In 1752 he took his degree of M.A., and in the same year engaged in a controversy on the subject of the Cherubim, in the Gentleman's Magazine. His object was to prove that the Cherubim were a representation of the Trinity. In 1753 he entered into orders, and soon obtained a high reputation as a preacher, on account of the excellence of his compositions and the gracefulness of his elocution. In 1764 Mr. Horne was admitted to the degree of doctor in divinity, and in 1768 he was elected president of Magdalen college, and in 1771 he was appointed chaplain in ordinary to his majesty, in which capacity he officiated for ten years. In the following year, when a number of the clergy were about to apply to parliament for relief in the matter of subscription to the liturgy and the thirty-nine articles of the church of England, Dr. Horne did all in his power to defeat their object. He was next appointed vice-chancellor of the University, in which station he continued till the month of October 1780, and no one ever presided in that post with a more conscientious attention to its duties, or a greater share of popularity. The vice-chancellorship introduced him to the acquaintance of Lord North, by whose interest he was promoted to the deanery of Canterbury, in which situation he acquired the respect and esteem of all, and frequently gratified the public by preaching in the cathedral. In 1790 Dr. Horne was advanced to the episcopal see, by being nominated to the bishopric of Norwich, soon after which he resigned his presidency of Magdalen college. At this period, his health, which had ever been delicate, was in a precarious state, and after he had taken possession of his see, his friends saw, with extreme sorrow and regret, that he declined very rapidly. From two visits to Bath he received sensible benefit, and in the autumn of 1791 he set out on a third visit to the same place. During his journey he was attacked with a paralytic stroke, from the effects of which he never recovered, though he was enabled to reach to the end of his journey. After lingering for some weeks, during which he retained the full possession of his faculties, and displayed exemplary patience, composure, and cheerfulness; he died at Bath on the 17th of January 1792, in the sixty-second year of his age, animated by those hopes which spring from the consciousness of a well spent life, and the promises of the gospel. The works of this excellent divine were numerous, and many of them valuable. His principal piece was a "Commentary on the Book of Psalms, &c." which made its appearance in 1776, in two volumes 4to. It was his favourite performance, and had cost him the best part of twenty years in the composition. Dr. Horne was distinguished by a considerable share of various learning, which he consecrated, according to his judgment, to the cause of truth, and the best interests of mankind. His virtue was sincere and ardent, and his life exemplarily virtuous.

HORNECK, ANTHONY, a learned divine, was born in the lower Palatinate in 1641, and educated at Heidelberg under Spanheim. At the age of 19 he came to England, and entered himself of Queen's college, Oxford, of which

he was afterwards the chaplain. He was now incorporated M.A. from the university of Wittemberg, and not long afterwards obtained the vicarage of Allhallows in Oxford. He retained this living only about two years, and in 1665 removed into the family of the duke of Albemarle, in the capacity of tutor to his son Lord Torrington. The duke presented him with the rectory of Doulton in Devon, to which was afterwards added a prebend in the cathedral of Exeter. In 1671 he became preacher at the Savoy, and in 1693 prebendary of Westminster. He was also honoured with the appointment of chaplain to king William and queen Mary. He died in 1696 of a severe attack of the stone in the fifty-sixth year of his age. He was a man of very extensive learning, and particularly conversant in the Oriental languages, ecclesiastical history, controversial theology, and casuistry. Few men, it is said, were so frequently consulted in cases of conscience as Dr. Horneck. He was author of several pious and learned works, which are as judicious as they are learned, and which are still known and admired. Gen. Biog.

HORNED, a term employed, in some districts, to signify the goring or wounding with the horns of cattle.

HORNED Cattle, a term often made use of by farmers to signify neat-cattle, or animals of the low kind.

HORNED Poppy. See **POPPY**.

HORNET, **CRABRO**, in *Entomology*, a species of *Vespa*; which see.

HORNET-fly, a very large two-winged fly, which has the shape and colours of the hornet, and is, at first sight, scarce to be distinguished from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed transversely on it, and has a black corcelet, and a yellow head.

These lay, at a proper season, a large number of oblong white eggs, which hatch into large and long worms, whose chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the nests of these bees, where it never meddles either with the wax or honey, but preys only on the young offspring of the creature.

HORNGELD signifies a tax, within the forest, to be paid for the feeding of horned beasts. See **GELD**.

"Quietum esse omni collectione in foresta de bestiis cornutis, &c. Et sint quieti de omnibus geldis, et danegeldis, et wodgeldis, et senegeldis, et horngeldis, &c."

To be free of horngeld, is a privilege granted by the king to such as he thinks good.

HORNHEAD, in *Geography*, a promontory on the north-western coast of Ireland, at the extremity of a small peninsula, called by the same name, in the county of Donegal, province of Ulster. It is supposed to have been mentioned by Ptolemy under the name of Boreum promontorium, and it is still sometimes called North Cape. Hornhead is the western point of Sheephaven, a harbour little frequented, and was probably called from two sharp summits like horns at the top of the cliff, which are a good object for the mariner. The peninsula of Hornhead has been pointed out by Dr. Hamilton (Transactions of the Irish Academy) as exhibiting the effects of drifting sands in a striking manner. In 1787 it contained vestiges of enclosures so small and so numerous, as to mark the former residence of a number of families in a spot which then exhibited nothing but

"————— A desert, salt and bare

The haunt of seals, and orcs, and seamews' clang."

Near Hornhead is a curious and frightful phenomenon called M'Swine's gun. By decomposition of part of the rock,

rock, the waves have perforated a cave many yards in diameter, which extends about sixty feet into a rock, making part of the mainland, and nearly horizontal with the level of the sea at high and low water-marks. When the wind blows due north and the tide is half in, this gun of Mr. Swine's is seen to spout sea-water far higher than the eye can reach, with an explosion that may be heard at a distance of above twenty miles. Hornhead is near Dunfanaghy. N. lat. $55^{\circ} 13'$. W. long. $7^{\circ} 51'$.

HORNING, in *Scots Law*, a writ issuing from the signet, in his majesty's name, at the instance of a creditor against his debtor, commanding him to pay or perform within a certain time, under pain of being declared a rebel, and by a caption put in prison.

HORNIUS, GEORGE, in *Biography*, was born in the Palatinate about the close of the 17th century. He was in high estimation as a writer of history; and his chief works are "Hitoria Ecclesiastica ad ann. 1666:" "De originibus Americanis:" "Geographia vetus et nova:" "Historia Philosophica." He visited England, and attached himself to the Presbyterian party; and on his return he occupied the chair of history in the universities of Harderwyck and Leyden. He died in 1750.

HORNOS, in *Geography*, a town of Sweden, in West Bothnia; 15 miles S. W. of Umea.

HORNOY, a town of France, in the department of the Somme, and chief place of a canton, in the district of Amiens; 15 miles W. S. W. of Amiens. The place contains 1190, and the canton 10,661 inhabitants, on a territory of $152\frac{1}{2}$ kilometres, in 24 communes.

HORNPIPE, in *Music*, the name of an instrument, and of a tune. The hornpipe air, so frequently danced by our sailors and active stage dancers, is perhaps the only national tune, or melody, which we can call our own. It is of high antiquity, and can be traced to the ancient Britons, perhaps before the invasion of Julius Cæsar, or the Saxons. The instrument, in our old authors, is called the *Pip-corn*, or pipe of Cornwall. And when the Britons were driven by the Saxons, some into Wales, some into Armorica, or Brittany, and some into Cornwall, we may suppose the instrument and tune to have been preserved in the last mentioned province, and to have retained its name. The instrument called a hornpipe, though unknown in England, was a few years ago so common in Wales, according to the late honourable Danes Barrington, that even the shepherd's boys used to play on it. It consists, says Mr. B., of a wooden pipe with holes, at proportional distances, and a horn at each end, the one to receive the wind from the mouth of the player, and the other to produce the sounds, as modulated by the performer. Mr. Barrington communicated to the Antiquarian Society a delineation and description of this rustic instrument (*Archæologia*, vol. iii. p. 33.), and conjectured that it originally gave the name to the tune called a hornpipe.

Chaucer, in his *Romant of the Rose*, fol. 135, mentions this instrument.

**Centrouc he Would, and foule faile
With HORNPIPES of CORNEWAILE.**

Mr. Jones, in one of his tracts, says that the pibgorn, or hornpipe, is peculiar to the isle of Anglesea; but the word, in old English and French authors, implies a tune as well as an instrument.

The Lancashire hornpipes, Cheshire rounds, and some of our very old country dances, are, perhaps, genuine English melodies; but melody, till after the invention of the opera at Florence in 1600, was little cultivated in any part of

Europe. We had very good church music in our cathedrals, from the time of Tallis and Bird, to the arrival of Handel, in 1710; but being set to English words, it never reached the continent.

HORNSEY, or HORNSEA, in *Geography*, a market town and parish in the division of Holderness, and East Riding of the county of York, England, is seated near a mire, or lake, on the coast. Of this town our topographers have not recorded any historical particulars. Gough, in his addition to Camden's *Britannia*, merely states that Hornsey "has a high spire, formerly a sea mark, but now much ruined through the inability of the inhabitants to repair it. An inscription in the town says that it was once ten miles from the sea; though at present only one. Not many years ago a small street, called Hornsey-bek, adjoined to the sea, was washed away, except two or three houses; and about Skipsie, a few miles north of Hornsey, they have a tradition of a town called Hide being devoured by the sea. Amber is found in large masses on this coast." There are a small weekly market on Mondays, and two annual fairs. In 1800 the town consisted of 133 houses, and 533 inhabitants.

HORNSEY, a parish in the hundred of Ossulston, and county of Middlesex, England. The village is five miles north of Holborn-bars, London, and is pleasantly seated in a valley, through which the New river is conducted in its artificial channel. The parish consists of about 2200 acres of land, of which 50 only are arable, about 120 wood, 150 waste, or common, and the remainder meadow and pasture. Besides the village of Hornsey, the following hamlets are within the parish: Crouch-end, Muswell-hill, Stroud-green, and a considerable part of Highgate.

The manor of Hornsey has belonged, from time immemorial, to the bishops of London, who had formerly a palace here. This is supposed to have stood on a spot called Lodge-hill, where are still to be seen the remains of a moat. In this parish, between Highgate and Hornsey, the New river was formerly carried over a valley by a wooden aqueduct, 178 yards in length. A more lasting channel, of clay, &c. was made for it in 1776. Many of the houses here are the residences of London merchants. From the boldness of the hills around, and finely wooded character of the country, Hornsey may be justly considered a very delightful and eligible place of residence. In the year 1801, the parish was estimated to contain 458 houses, and 2716 inhabitants. Lyons's *Environs of London*, 4to. vol. iii.

HORNSTANDET, a peninsula on the coast of Sweden, in the gulf of Bothnia, about 30 miles in circumference. N. lat. $61^{\circ} 39'$. E. long. $17^{\circ} 16'$.

HORNSTEDTIA, in *Botany*, is a genus named by Retzius in honour of Dr. Clas Frederick Hornstedt, lecturer on natural history and medicine at Lincopin in Sweden, and Fellow of the Academy of Sciences at Stockholm. Retz. *Obs. fasc.* 6. 18. Willd. *Sp. Pl.* v. 1. 9.—Class and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. *Cannæ*, Juss.

Gen. Ch. *Inflorescence* a conical spike, gaping at the top, nearly radical. *Calyx* two-cleft. Tube of the *corolla* long, thread-shaped; limb double; the exterior coat three-cleft; nectary tubular. *Capful* of three cells, oblong. *Retzius*.

Obs. The two species of this genus described by Retzius, and which we are about to mention, are supposed by Dr. Smith to belong to different genera. He imagines that *H. Scyphus* is an *Amomum*, and *H. Leonurus*, a *Kempferia*, but as this is merely a suggestion, we retain the genus till we learn further particulars concerning it from Dr. Roxburgh.

1. *H. Scyphus*, Retz. Willd. n. 1. (*Amomum scyphiferum*; Retz. Obs. fasc. 3. 68.)—"Leaves downy underneath."—A native of groves at the foot of the mountains near Malacca—*Roots* spreading horizontally. *Stems* about eight feet high, very tough. *Leaves* sessile, smooth above. *Flowers* in clusters, monopetalous, of a fine scarlet colour. *Seeds* numerous, club-shaped, oblong. The plant has scarcely any smell.

2. *H. Leonurus*. Retz. Willd. n. 2. (*Amomum Leonurus*; Retz. Obs. fasc. 3. 69.)—"Leaves smooth, fringed."—Found in the thickest recesses of groves in Malacca.—*Root* simple, having a hot aromatic taste. *Stems* simple, solitary, nodding towards the top. *Leaves* alternate, fringed, with golden-coloured bristles, smooth on both sides, smelling like cloves. *Calyx* shorter than the tube of the flower. *Germen* inferior, nearly globose, small, covered with dark ferruginous hairs. *Seeds* numerous.

Neither of these species appear to have been known to Rumphius, Rheede, Plunkenet, nor any other author who has applied himself to the description of Oriental plants.

HORNSTEIN, in *Natural History*, is a name given in Germany to the siliceous stone, called in England chert, or chert.

HORNY EXCRESCENCES, in *Surgery*. It appears, from some instances on record, that excrescences of a horny nature have been met with on the human subject, which, although they have much excited the attention of naturalists, might be considered entirely as *Lusus Nature*.

A remarkable case of this description is that of a female who had two complete horns growing on her head, one of which, with the portrait of the woman, is preserved in the British Museum, and the other at Oxford.

A far more recent instance, however, has been obligingly communicated to us by Dr. William Roots of Kingdon on Thames, who, in February 1811, amputated an excrescence of this sort, exactly resembling a *ram's horn*, from the head of a man, between fifty and sixty years of age, a drawing of which in its growing state, as well as the horn itself, he has presented to the collection of Mr. Atley Cooper.

The account given by Dr. Roots of this extraordinary case is, that John Kennedy, a gardener at Thames Ditton in Surrey, in the year 1796 had a tumour growing on the superior part of the occiput, which was taken off with the knife by the doctor's father in about three years from its commencement. Soon after its removal, a horny substance began to make its appearance on the same place, which continued growing for four years, till it accidentally fell off in a most unexpected manner, being at that time not more than three inches in length; and it should be observed, that the surface of the part it grew from, on its dropping off, was perfectly smooth, without any the slightest hemorrhage, and resembling the superficies of the stag's head, when his horns have recently dropped. In a short time after a new horny sprout shot forth, which, as it grew, took on the exact form and crooked figure of a *ram's horn*, and having increased during seven years, without any disposition to fall off, to the great inconvenience of the poor man, he consented at length to its removal; in the performance of which, from the parts underneath being very vascular, a considerable hemorrhage ensued.

Now it appears probable from this, says the doctor, that the horn, had it been suffered to remain longer on the head, would have attained a much larger size, nature having in a playful mood most abundantly supplied it with vessels for that purpose. Its having likewise been shed in the former in-

stance without bleeding, induces Dr. Roots to conclude, that as the sources of its nutriment continued open, it had not arrived at that state of perfection, when the gradual closing of the vessels would occasion a spontaneous removal, without any hemorrhage taking place, as is always observed to be the case with animals who drop their horns at regular and stated periods. Some years since we saw Sir James Earle remove a complete horn, about three inches long, from the forehead of a patient in St. Bartholomew's hospital. We have always believed, that all horny excrescences, which are occasionally formed on the skin of the human subject, are originally encysted tumours, the cyst of which very curiously assumes the power of secreting horn, instead of fat, a pappy substance, or a fluid like honey, as commonly happens in the respective cases of steatoma, atheroma, and meliceris. We think that the particulars of the case, communicated to us by Dr. Roots, tend to corroborate this opinion, since, before any horn made its appearance, there was a tumour, and, after the first horn dropped off, a surface, which was quite smooth, which did not bleed at all, and which, in fact, must have been a part of the cyst, presented itself to notice. In the case of the horn, which was cut off in St. Bartholomew's hospital, the truth of the preceding sentiment, concerning the formation of horny excrescences on the human race, was almost demonstrated. There was at first a tumour, which burst, and from the inside of which the horny matter was gradually protruded.

HORNYGOLD'S KEYS, in *Geography*, islets and rocks on the Spanish main, near the Mosquito shore. N. lat. 15° 40'. W. long. 82° 18'.

HOROCHAW, a town of Poland, in Volhynia; 32 miles S.W. of Lucko.

HORODEK, a town of Russian Lithuania, in the palatinate of Wilna; 68 miles S.E. of Wilna.—Also, a town in the palatinate of Brzesc; 38 miles S.E. of Brzesc.

HORODICTIC QUADRANT. See QUADRANT.

HORODISCZE, in *Geography*, a town of Austrian Poland, in Galicia; 60 miles E. of Lemberg.—Also, a town of Lithuania, in the palatinate of Minsk; eight miles S.E. of Minsk.

HORODLA, a town of Austrian Poland, in the palatinate of Belz, on the Bug; 32 miles N. of Belz.

HOROGRAPHY, compounded of $\omega\rho\alpha$, *hour*, and $\gamma\rho\alpha\gamma\mu\alpha$, *I write*, the art of making or constructing dials; called also, *horologiography*, *gnomonica*, *sciatherica*, *photosciatherica*, &c. See DIALLING.

HOROLOGIOGRAPHY, the art of making or constructing dials. See DIALLING.

HOROLOGIUM, $\omega\rho\omega\lambda\omicron\gamma\iota\omicron\upsilon\mu$, composed of $\omega\rho\alpha$, *hora*, *time*, *hour*, and $\lambda\omicron\gamma\omicron$, *speech*, *discourse*, a common name, among ancient writers, for any instrument or machine for measuring the hours. See CHRONOMETER.

Such are our clocks, watches, sun-dials, &c. See CLOCK, WATCH, DIAL, and CLEPSYDRA.

Modern inventions, and gradual improvements, have given birth to some new terms that come properly under this head, and annexed new meanings to others totally different to what they had originally. All chronometers that announced the hour by striking on a bell were called clocks; thus, we read of pocket-clocks, though nothing could seem more absurd than to suppose that a clock, according to the modern idea, should be carried in the pocket. In like manner, all clocks that did not strike the hour were called watches, or time-pieces; and the different parts of a striking clock were distinguished by the watch-part, and the clock-part; the former, meaning that part which measures the time, and the latter, the part which proclaims the hours. In the report of Sir

Isaac Newton to the house of commons, anno 1713, relative to the longitude act, he states the difficulties of ascertaining the longitude by means of a watch; yet it is obvious, from several circumstances, that his remarks were directly to be understood of a time-piece regulated by a pendulum; for his objections are founded on the known properties of the pendulum, some of which differ essentially from the properties of the balance and spring. It is also to be remembered, that all the attempts of Huygens for finding the longitude were by means of pendulum clocks, that did not strike the hour, and consequently, according to the language of the times, were called watches. At this time such machines for measuring time as are fixed in their place, are called clocks if they strike the hour; if they do not strike the hour, they are called time-pieces; and when constructed with more care, for a more accurate measure of time, they are called regulators. Some artists of late have affected to call such watches as were constructed for astronomical and nautical observations, by the name of *time-pieces*, probably to intimate that they possess the advantages of those constructed with a pendulum.

Mr. John Harrison first gave the name of time-keeper to his watch, for the performance of which he received from parliament the sum of twenty thousand pounds. See CHRONOMETER.

HOROLOGIUM, *Horologion*, is also a name the Greeks give to their liturgy, or breviary; because it contains the daily hours, or the several offices to be rehearsed each day.

The Greeks call it *ωρολογιον*, which answers to what in Latin and English we call *diurnum*, or *diurnal*.

The *ωρολογιον* is the breviary of the Greeks.

HOROMETRY, the art of measuring or dividing the hours, and keeping an account of time.

HOROPTER, in *Optics*, is a right line drawn through the point where the two optic axes meet, parallel to that which joins the centres of the two eyes, or the two pupils.

Such is the line A B (*Plate VI. Optics, fig. 3.*) drawn through the point of concurrence C, of the optic axes of the eyes D and E, parallel to H I, which joins the centres of the eyes H and I.

It is called horopter; as being found, by experience, to be the limit of distinct vision.

The horopter has several properties in optics, which are described at large in Aguillonius, *Opt. lib. ii. Diff. 10.*

HOROPTER, *Plane of the*. See *PLANE of the Horopter*.

HOROSCOPE, in *Astrology*, the degree or point of the heavens rising above the eastern point of the horizon, at any given time when a prediction is to be made of a future event; as, the fortune of a person then born, the success of a design then laid, the weather, &c.

The word is composed of *ώρα*, *hora*, *hour*, and the verb *σπειρομαι*, *speiro*, *considero*, *I consider*. The Latins call it *cardo orientalis*; sometimes *ascendens*. See *ASCENDANT*.

They were formerly so infatuated with horoscopes, that Albertus Magnus, Cardan, and others, are said to have had the temerity to draw that of Jesus Christ.

HOROSCOPE is also used for a scheme, or figure, of the twelve houses; *i. e.* the twelve signs of the zodiac, wherein is marked the disposition of the heavens for any given time.

Thus we say, to draw a horoscope, construct a horoscope, &c. We call it, more peculiarly, *calculating* a nativity, when the life and fortune of a person are the subject of the prediction; for they draw horoscopes of cities, great enterprizes, &c. See *HOUSE*.

HOROSCOPE. *Lunar*, is the point which the moon issues out of, when the sun is in the ascending point of the east.

This is also called the *part of fortune*.

HOROSCOPE is also a mathematical instrument, in manner of a planisphere; but now disused.

It was invented by J. Paduanus, who composed a special treatise thereon.

HORPS, LE, in *Geography*, a town of France, in the department of Mayenne, and chief place of a canton, in the district of Mayenne; eight miles N. W. of Vilaine. The place contains 1618, and the canton 8793 inhabitants, on a territory of 182½ kilometres, in 10 communes.

HORREA, in *Roman Antiquity*, were public magazines of corn and salt meat, out of which the soldiers were furnished on their march in the military roads of the empire.

Horrea was also the name which they gave to their *granaries*; which see.

HORREBOW, PETER, in *Biography*, a celebrated Danish astronomer, and professor of that science at Copenhagen, was born at Læsgilt, in Jutland. He studied at Aalborg under very unfavourable circumstances, being obliged, at the same period, to submit to various kinds of labour. In 1714, he was appointed professor of mathematics at Copenhagen, and in 1725 he was elected a member of the Danish Academy of Sciences. He died in 1764, at the great age of 85. He was author of many works connected with his favourite pursuits, among which were "Copernicus Triumphans, five de Parallaxi Orbis Annui;" "The Elements of Astronomy;" "The Elements of Mathematics;" &c. &c.

HORROR, HORROUR, strictly signifies such an excess of fear as makes a person tremble. It is a compound of admiration and fear, not without an occasional mixture of pleasure, from which, when predominant, it is denominated a pleasing horror.

HORROR, in *Medicine*, nearly synonymous with *rigor*, is used to denote that transient *shivering*, accompanied by a sensation of cold, which is among the first symptoms of febrile diseases in general. Hippocrates considers it as expressive of a lesser degree of shivering than the term *rigor*; but a few persons, he says, employ the word to denote a greater degree of chilliness than *rigour*. (See his *Treatise de Flatibus*.) Celsus considers the *horror* as a general shaking, such as often occurs in the outset of a paroxysm of ague. "Frigus voco, ubi extremæ partes membrorum inalescunt; *horrorem* ubi totum corpus intremis." (*De Medicina*, lib. iii. cap. 3.) Sennertus again tells us, that horror implies an agitation of skin only; while *rigor* signifies a shaking of the whole body; and this appears to be the sense in which the two words are most commonly understood. Sennertus *Opera*, vol. i. p. 387.

HORROR of a *Vacuum*, was an imaginary principle among the ancient philosophers, to which they ascribed the ascent of water in pumps, and other similar phenomena, which are now known to be occasioned by the weight of the air. See *AIR*.

HORROX, JEREMIAH, in *Biography*, was born at Toxteth, near Liverpool, about the year 1619. He received his academical education at Emanuel college, Cambridge, after which he began to apply himself very diligently to the study of astronomy, but as at this period his circumstances were very moderate, and as he could have no access neither to books nor instruments, he was unable to make any considerable progress in the pursuit. About the year 1635 he became acquainted with Mr. Crabtree, whose genius led him to the same kind of studies, and with whom Mr. Horrox corresponded, and they both communicated their discoveries to Mr. Foster, professor of Gresham college. Mr. Horrox, by the countenance and assistance of his friend, pursued his studies with renewed vigour, and having procured instru-

ments and the necessary books for the purpose, applied with great diligence to the making of observations. Scarcely, however, had he entered the career of discoveries, before he was suddenly cut off by death in the year 1640-1, when he was only 22 years of age. Of the loss which the world sustained by this melancholy event, some notion may be formed from the writings which he left behind him. He had just completed his "Venus in Sole visa," which was published at Dantzic in 1662, by Hevelius, together with his own "Mercurius in Sole visus," and illustrated with that astronomer's notes. The remaining papers of our young astronomer were digested and published by Dr. Wallis in 1673, under the title of "Opera Posthuma," &c. Two things are deserving notice, and will perpetuate the memory of this very extraordinary young man. He was the first who ever predicted or even saw with a scientific eye the passage of Venus over the sun's disk, and though he was not aware of the great use that was to be made of it, in discovering the parallax and distance of the sun and planets, yet he made from it many useful observations and improvements on the theory of Venus. The other circumstance was his new theory of lunar motion, which Newton himself made the ground-work of his astronomy relating to the moon; ever speaking of Mr. Horrox as a genius of the first rank.

HORS de son fee, q. d. out of his fee, in Law, is an exception to avoid an action brought for rent, or other service, issuing out of certain lands, by him that pretends to be the lord. For if the defendant can prove the land to be without the compass of his fee, the action fails.

HORSE, in *Zoology*. See *EQUUS*.

The horse makes the subject of a very extensive art called horsemanship, consisting of divers subordinate arts or branches.

From the same beast also arise the professions of chivalry, knighthood, &c.

Authors are divided as to the time when men first began to mount horses. The scholiast of Euripides, and Eustathius on the second book of the Iliad, speak as if the ancients had been unacquainted with the use of saddle horses, and had only used them to draw chariots, &c. They add, that courses on horse-back were not introduced at the olympic games before the fifteenth Olympiad. But this can scarcely be; because the centaurs, to whom the invention is attributed, lived long before that time. Besides, Homer, though he mentions only chariots in his account of the siege of Troy, speaks of riding so familiarly in some parts of his Iliad and Odyssey, that it must have been practised among the Greeks before he composed either of these poems. In the fifteenth book of the Iliad he represents the strength and activity of Ajax, when he fought in defence of the Grecian ships that were attacked by the Trojans, and leaped from one ship to another, by the readiness and address with which a skilful horseman would vault from the back of one horse to that of another; and his ability to defend many ships at once by that of the accomplished rider, who is capable of managing and controuling several horses at the same time. This comparison proves, not only that riding was commonly known at the time when Homer wrote, but that it must have been studied and cultivated with great care and attention. In the fifth book of the Odyssey, the poet compares Ulysses, shipwrecked and sitting astride a plank which was floating on the waves, to a man bestriding a horse, and keeping his seat in spite of the motions which the animal could make. Herodotus, in Thalia, speaks of hunting on horseback, as an exercise practised in the time of Darius; in Melpomene, likewise, he says, the Amazons hunted on horse-back, with their husbands, the Sarmatians. Xenophon says, that Cyrus

hunted on horse-back, when he had a mind to exercise himself and his horses.

It appears, likewise, from Pausanias, that there were horse-courses even in the time of Hercules, the institutor of the Olympic games.

It also appears, from the most ancient history extant, viz. the history of the Bible, that the horse was made subservient to the will of man in the earliest times, and therefore the use of this animal is probably almost coeval with mankind. See Gen. ch. xlvii. 17. Job, xxxix. 18, 19. Gen. l. 9. Exodus, xiv. 9.

From the two last cited passages, in which chariots and horsemen are named together, it appears probable, that the use of chariots and the art of riding were introduced about the same time, the latter being a little prior to the former; and Egypt seems to have been the country to which mankind are indebted for the equestrian art, though the precise period of time in which it was first practised cannot so easily be ascertained. It is certain, however, that when Jacob came into Egypt, he found the inhabitants perfectly acquainted with the horse, and using it in its two-fold capacity of carrying and drawing. From hence it was conveyed to the Ethiopians, Arabs, Indians, Persians, Parthians, Armenians, Scythians, &c.

The Ethiopians, as we learn from Herodotus, possessed a breed of horses, and were acquainted with the art of riding; accordingly he describes them as a nation of cavalry that attended Xerxes in his expedition against Greece. We have no information with respect to the equestrian history of the ancient Arabs; although in later times they have become so famous for riding, that they may be stiled a nation of horsemen. The inhabitants of India were accustomed to use horses from the earliest times; and Herodotus asserts, that the troops of this country, which attended Xerxes in his famous march against Greece, fought on horse-back, as well as employed chariots in war.

The Persian horses have been always famous for beauty, vigour, fire, and other eminent qualities, and so celebrated for speed, that their very name in the language of the country signifies what may be rendered by the word "wind-foot," a term emphatically expressive of their swiftness. The ancient Persians were so fond of them, and thought the act of managing them so becoming and necessary a duty, that they taught their children to ride at the age of five years, as Herodotus relates. Vegetius describes the horses of this country as most valuable for the saddle, being safe, gentle, and very agreeable to the rider, constituting a very considerable part of the revenue of their owners, and very profitable to those who could support a fine breed. Their paces were singularly graceful, as well as fast and easy, so as to relieve rather than fatigue the rider. They were quick and nimble, but subject to tire on a long march or journey; inclined to obstinacy and rebellion, unless curbed and subdued by discipline and exercise; but notwithstanding their heat and anger, not difficult to be pacified; always maintaining a graceful carriage, arching their neck, and bending it to such a degree as almost to make their chins lean upon their breasts; while their pace was something between a gallop and amble, answering to what the French call "aubin," and we a "rack."

The Parthians were very eminent for the skill with which they managed their horses, and their manner of fighting upon them; and they are described as having such dexterity and suppleness of body, and such a command over their horses, that they could turn themselves round upon their backs with so much ease and readiness as to be able to draw their bows with the surest aim, and wound their enemies

even whilst they were flying from them; this manner of fighting being peculiar to them. The name of "Parthus" is derived from a Chaldean word which signifies "horseman." Their horses are said to have been very active and easy in their paces, which they formed by attention and practice. (See *PACE*.) The Parthian horses were very hardy, and inured to incredible fatigue, as well as to travel a long time without food or water. Thus Propertius describes them (*lib. iv. eleg. 3.*).

"Quot sine aqua Parthus millia currat equus."

"How many miles can run the Parthian horse,
Nor quench his thirst in the fatiguing course?"

Armenia boasted of its breed of horses, hardly inferior to the Persian race. Vegetius spoke of the inhabitants of this country as being very careful in trimming and adjusting the manes of their horses. (See *MANE*.) Nisæa, a district of Armenia, boasted of its breed of very large and beautiful horses. The chariot of Xerxes, in his famous expedition, was drawn by horses of that country, which were chosen for the task, because they were the noblest that could be procured. Media was also a region eminent for its horses, and from its situation and properties, produced them of equal value with the neighbouring countries. The Scythians were proverbially famous, as in the terms "Scythæ equum," for their attention to horses. They preferred mares to horses, conceiving them to be more capable of service, and accordingly used them more than horses in war. The Sarmatians, both Asiatic and European, were distinguished horsemen, and had large breeds of horses. They used horses not only for riding, but offered them in sacrifice to their gods; they also eat their flesh, and drank their blood. Lucan (*l. iii.*) and Virgil (*Georg. iii.*) record this custom. The horses of Cappadocia have been much celebrated both by historians and poets, both for their swiftness and the stateliness of their action. The inhabitants of Numidia, Mauritania, Nafamonia, Massilia, and other adjacent tracts of the same region, are highly commended for having had horses of great swiftness and vigour; and more particularly for their peculiar manner of riding them, without a bridle or saddle, using a wand only, or switch to guide and command them. This breed of horses seems to have been the same with that of Lybia, or, as that tract is now called, Barbary, famous for its excellent horses, which were extolled for their speed, wind, and patience of fatigue. Xenophon, Oppian, and Ælian concur in commending them. The method above-mentioned, of guiding and governing horses by a wand or switch, is still practised in Barbary by the lower sort of people. The horses of Lybia are proverbially swift.

The colonies which came from Phœnicia and Egypt, in which equitation flourished, brought this art with them, and established it in Greece long before the siege of Troy, and with the art transplanted thither the horse, which was not originally a native of Greece. The Thessalian horses were the most famous of ancient Greece, and valued and admired not only by the inhabitants of that country, but by the most judicious and experienced of other nations. Mycenæ, Epirus, Lacedæmon, Argolis, Arcadia, Magnesia, Dalmatia, Ionia, the island Scyros, the Attic territories, and Elis in particular, were all distinguished by their breeds of horses. From Greece the art of horsemanship was transmitted to the Romans, who cultivated it with such diligence and zeal, that they were soon able to excel their masters. The Etrurian or Tuscan breed is praised by Oppian; and the Sardinian, Corsican, and Venetian horses are much commended. Agragas in Sicily, and Calpe and Tartessus

in Spain, are also celebrated for their horses. Asturias, Gallicia, and Andalusia, then called Bœtica, were known to produce the finest of their kind. The horses of Gaul were also held in considerable esteem by the Romans; and they were not unacquainted with those of the Germans, which are mentioned by Cæsar and Tacitus, but by the latter not much to their credit. Like the Armenians, the Romans always turned the mane on the right side. Varro and Virgil direct it to be so placed.

It was the custom, among the ancients, to impress some mark on their horses: the most common were, Σ, *sigma*, a κ, *kappa*, and a bullock's head. Hence those marked with Σ's were called Σαυλοροι; those with a κ, *Καππαριαι*; and those with a bull's head, Βουκεφαλοι, *Bucephali*. It is, however, more probable that the famous horse Bucephalus owes his appellation to the resemblance which his head bore to that of a bull, and not to the impression of one which was burnt into his flesh, and was a mark in no wise peculiar to him, but common to all horses, so that he could not have been particularly distinguished by it. And Aulus Gellius, *lib. v. cap. 2.* expressly tells us that this was the fact; and that the head exactly resembled, in shape and figure, the head of a bull. This mark was stamped on the horse's buttocks and his harness, as appears from the scholiast in Aristophanes's *Clouds*, Hefychius, &c.

The Romans, as well as the Greeks, distinguished their horses by certain marks, which were burnt into the flesh: these were the initial letters of the owners' names, figures of animals and other devices, by which the horses were known and appropriated, frauds prevented, and the breeds and pedigrees, of which they were very careful, preserved and distinguished. It was also usual for them to give names to their horses, expressive of their country, qualities, or colour. The Sybarites, a voluptuous people of Calabria, are said to have taught the horses in their troops to move or dance in exact time to the sounds of musical instruments.

In modern times, Arabia is most distinguished for the excellence of its horses, and the address of its inhabitants in riding them.

The Arabians breed their horses for sale, and there is a considerable revenue arising from those that are sent out of the country, the tax being about ten pounds sterling for each horse. These people are scrupulously exact in preserving the pedigree of their horses for several ages; so that they know their parentage, alliances, and genealogy, distinguishing each breed by different appellations, and dividing the whole kind into three classes. The first class is called *noble*, being the most pure and ancient, without any mixture, on the side of the sire or dams. The second class is composed of horses, whose race, though ancient, has been mixed with plebeian blood, either on the male or female side, which nevertheless is deemed noble, but misallied. The last class comprehends the common horses, which are sold at a low price; but the two former sorts are extremely dear, the lowest-priced mares of the first class being worth five hundred French crowns, and some fetching even four, five, or six thousand livres.

When a stallion covers a mare among the Arabs, both being of equal quality, witnesses are called to be present on the occasion, who sign a certificate in the presence of a magistrate, in which the names of the horse and mare are mentioned, with their pedigrees. When the mare drops her foal, witnesses are called again, and another certificate is drawn up and signed; and these vouchers are given with the animal, like the deeds of an estate, when it is sold.

The Arabian horses are generally of a middling size, neat
and

H O R S E .

and clean in their shape and limbs, and of a thin and slender figure. Their keepers curry and feed them morning and evening, and only let them drink two or three times in the day. About March, when the grass is strong and plentiful, they foil them, and devote this season likewise to procreation; observing the custom, which we have probably derived from them, of throwing cold water upon the mare as soon as the stallion descends from her back. When the spring is past, the horses are taken from the pastures, and kept for the rest of the year without grass or hay, solely upon barley, with a certain portion of straw. When the colts are about eighteen months old, they shear the hair of their tails, in order to make it grow thicker and stronger. They begin to ride their colts at the age of two years, or two and a half at most.

The best breeds of this country are said to be sprung from the wild horses of the Desert, of which, many ages ago, a stud was composed, which increased the breed, and furnished Europe, Asia, and Africa with these noble animals. The best horses are, therefore, immediately or remotely descended from Barbs, descended from Arabians, whose climate is peculiarly favourable to the breed of horses.

The Arabian breed is propagated in Barbary, among the Moors, and even among the negroes on the banks of Gambia and Senegal, where they are fed with Indian corn, bruised and mixed with milk. Egypt, Turkey, and Persia are supplied with horses from Arabia. The Barbary horses are to be found in most countries of Europe.

The foreheads of these horses are generally long, slender, and ill furnished with mane, but rising distinctly and boldly out of their withers; their heads lean and small, and resembling that of a sheep; the ears handsome and well placed; the shoulders light, sloping backwards, and flat; their withers fine, and standing high; loins short and straight; flanks and ribs round and full, without having too large a barrel; their haunches strong and elastic; the croup often somewhat too long; the tail placed high; thighs well turned and rounded; legs clean, well made, and thin of hair; the sinews detached from the bone, but the pastern generally too long and bending; the foot good and sound. These horses are of all colours; but the most common sort is grey; they are generally cold and slow in their paces, and require to be roused and animated by the rider, when they will discover a great fund of vigour, wind, and speed. They are very light and nimble, formed for running, and are more valued in their offspring than for their own merit, being thought, when transported into foreign countries, to get colts which excel their sires in goodness; on which account they are valuable in studs.

The Algerines are said not to like to castrate their horses, but only squeeze their testicles when they are about three months old, and thus render them incapable of propagation.

It is thought that the horses of the kingdom of Morocco are the best, and next to them a breed called the mountain barbs, which are sure-footed, of a gentle disposition, and very attentive and docile. Their walk is free and bold, and their gallop very rapid.

In Turkey, Arabia, and Persia, they expose the dung of their horses in the sun, and when it is capable of being finely powdered, they spread it under them instead of litter, which gives their coat a beautiful gloss and lustre. The Persian horses are reckoned next in value to those of the Arabians.

The climate of India is unfriendly to horses, which are generally very small, and fed in the day-time with a little hay,

and at night with peas boiled with sugar and butter. They sometimes feed them in the rice-fields, and when flesh is plentiful, boil the offal to rags, and, mixing it with butter and some sorts of grain, form balls, which they thrust down the throats of horses. In a scarcity of provision, they give them opium. The horses of the country are naturally very vicious; and the Persian horses, being more gentle and tractable, are often valued at a thousand guineas each, while those of India sell for fifty or one hundred.

The Tartar horses are of a moderate size; but they are strong, nervous, proud, full of spirit, bold, and active. They are of a good size for the saddle, and are pacers by nature. Their owners, like the ancient Geloni and Sarmatians, make the animals supply them with food; for they eat their flesh at this day, as well as the curds, or "lac concretum" of the mare's milk, mentioned by many ancient writers. The Tartars have been famous in all ages, under different names, for their love of horses and skill in riding. The district, called Little Tartary, has a breed of small horses, which the inhabitants value so much, as never to permit them to pass into the hands of strangers.

Circassia, Mingrelia, and the adjacent parts, abound with horses of a better mould, and juster proportions than those of Tartary, and they are consequently admired and valued, more especially as they are equal to the greatest fatigue. Some of the islands in the Archipelago are furnished with good and valuable horses, especially Crete; but they are not entitled to any farther notice. The horses of Russia are not much regarded by other nations. They are small but hardy, and capable of enduring great fatigue. Those of the Turkish breed are handsome, and finely shaped, but too slight and weak for heavy cavalry. The Kalmuck horses are somewhat higher than the Russian common horses, and so tough and strong in their constitution, as to be able to run three or four hundred English miles in three days. They subsist, summer and winter, solely upon grass in the great deserts, which are between the rivers Don, Volga, and Yaik. They are collected in great herds of four hundred, five hundred, or even a thousand. They are excellent swimmers, and pass the river Volga, where it is from one to two miles broad, with great ease. The Nogay horses are a hardy breed belonging to the Tartars of that tribe, subject to the Kalmuck khan. The Turcomans, a free nation, living between the Caspian sea and the lake Aral, have horses of the same nature with those of the Nogay Tartars; and the horses of the Bashkirs are stouter and better than those of the Nogay tribe. The "step," or wild horse, is an horse of the Desert, of which there are three different kinds, which feed respectively together, in herds, or taboons, of thousands. All kinds of horses are eaten by the Tartars and Kalmucks; and a foal is reputed a great dainty. Mare's milk is a frequent drink, which, when kept and fermented, becomes inebriating. The Tartars of the Crim never undertake an excursion without allowing three horses to one rider. The Polish horses are very hardy, strong, and useful, but they are generally of a middling size. In the marshy parts of Prussia, and towards the mouth of the Vistula, there is a breed of good, tall, strong, horses, resembling those of Friesland, but of inferior value.

The horses of Sweden are low and small, and the Norway breed may be comprehended under the same description, but they are nervous, hardy, and active. Denmark, and also Holstein and Oldenburg, boast a large variety of horses, which have so much vigour, pride, courage, and grace, that for the coach, the services of war, and the manege, they can be surpassed by few, though they often fail with respect to elegance of limb and symmetry of parts; having thick fore-

heads,

H O R S E.

heads, shoulders somewhat heavy, backs rather long, and croups too narrow to correspond with the foreparts. In the islands of Ferroe there is a race of horses of small growth, but strong, swift, and sure of foot, passing with ease and safety over high hills. They are never thod, and feed abroad without shelter both summer and winter. In Suderoë, one of these islands, they have a lighter and swifter breed than in any of the rest; the inhabitants catch their sheep, which are wild, by hunting them with a dog, and pursue them with their horses. The horses of Lapland are small of stature, but active and willing; they are used only in the winter season, in drawing sledges over the snow, and transporting wood, forage, and other necessaries; but in summer they are turned into the forests, where they form separate troops, strictly confined to their own quarters.

The Spanish horses are much commended: some make them second to the Arabians, and place them before the Barb. Those of the finest breeds are generally well trussed, and well knit horses, active and ready in their paces, of a quick apprehension and retentive memory, wonderfully docile and affectionate to man; full of spirit and courage, tempered with mildness and good nature, and generally very easy in all their paces; for the most part of a moderate size. Those which are bred in Upper Andalusia are deemed the most valuable. The Portugal horses, or rather mares, were famous of old for being very fleet and long-winded; but of late it is said they are much degenerated. The Italian horses were formerly more beautiful, and of greater fame, than the present race. Although this country is not now destitute of many generous and beautiful breeds, dispersed in studs, which are formed in different states or districts, the Neapolitan horses have always been renowned, and shine both under the saddle and in the traces. Great numbers are bred in Sicily, which has always been extolled for the superior excellence of its horses. Those of Sardinia and Corsica are small, but nimble, bold, and full of spirit. The Swiss horses partake of these qualities, and were formerly accounted serviceable in war. Germany is not destitute of generous and noble horses, useful for many purposes: but they are reckoned to be heavy and not good-winded. They have, however, finer breeds obtained from Turks and Barbs, which are kept as stallions, and also from Italians and Spaniards. In the chace and running they are inferior to the Hungarian and Transylvanian horses. The horses of Bohemia are not distinguished by any eminent qualities. The Hussars and Transylvanians are accustomed to slit the nostrils of their horses, under a notion of giving their breath a free passage, and improving their wind, as well as to render them incapable of neighing, which in war would be often inconvenient. The Croatian horses are nearly allied in qualities and character to the Hungarian and Bohemian: these, as well as the Poles, are remarkable for being, as the French term it, "Be-gut," or keeping the mark in their teeth as long as they live.

Holland furnishes a race of horses, which are principally serviceable in the coach: the best come from Friesland. The Flemish horses are inferior in value to the Dutch, having big heads with a channel towards the nostrils; their feet are immoderately large and flat, and their legs subject to watery humours and swellings in the heels. France abounds in horses of all kinds, but by no means excels. The best of those fit for the saddle come from Limousin: they resemble the Barbs in many particulars, and like them are fittest for hunting, but they are not ripe for work till they are eight years old. There are also very good "Bidets" or ponies in Auvergne, Poitou, and Burgundy. Next to those of Limousin, Normandy claims precedence, for its handsome, generous, and useful breed. Lower Normandy, and the district of

Cotentin, furnish a very good sort for the coach, which are nimbler, and have more elasticity in their motions than the Dutch horses. The French horses are apt to have their shoulders too loose and open, as those of the Barbs are too confined and narrow.

The finer and better sort of the more modern English horses are descended from Arabians and Barbs, and frequently resemble their fires in looks and appearance; but differ from them considerably in size and mould, being more furnished, stout, and lusty. In general they are strong, nimble, of good courage, capable of enduring much fatigue, and both in perseverance and speed surpass all horses in the world. However, it is objected to English horses, that they want grace or expression in their figure and carriage; that they are obstinate and sullen; that they have bluff shoulders, and want suppleness in their limbs, which render them unfit for the manege. England has at all times, even in its rudest state, been possessed of a breed of horses sufficient to answer every necessary purpose. But it is probable, that those now used in the service of war, as well as for draught, are an offspring of the German or Flemish breed, meliorated by our soil, and a judicious culture; as our race horses derive their origin from Arabia. The venerable Bede says, that the English began to use saddle horses about the year 631, when prelates and others rode on horse-back, who till that time were accustomed to walk. In the reign of Athelstan the English became so jealous of their horses, which were also held in high esteem by foreigners, that a law was made by that monarch to prohibit the exportation of them, unless they were designed for presents; and in the reign of this prince many foreign horses were introduced into this kingdom. The variety of breeds in this island was farther augmented by William the Conqueror, and particularly by Roger de Bellesme, earl of Shrewsbury, in his time, who introduced the Spanish stallions into his estate in Powis Land, from which that part of Wales was for many years celebrated for a swift and generous race of horses. (See on this subject Berenger's History and Art of Horsemanship, vol. i. passim; Buffon's Nat. Hist. by Smellie, vol. iii. p. 306, &c. Pennant's British Zoology, v. l. i. p. 1, &c.) The importation and breed of horses were much promoted by Edward II. and Edward III. Polydore Virgil informs us, that in the reign of Henry VII. the English were wont to keep large herds of horses in their pastures and common fields; and by 11 Hen. VII. cap. 13. it was prohibited to convey horses out of the realm without the king's licence, on pain of forfeiture. In the reign of the succeeding prince, a particular regard was paid to the raising of a breed of good and strong horses; and accordingly several laws were made, enjoining those who had parks, inclosures, &c. to keep at least two brood mares, of a certain size, &c. and prohibiting stoned horses from being put into forests or commons where mares were kept within certain counties, which were above the age of two years, but not fifteen hands high, on pain of forfeiture; and scabbed horses from being kept in such places, on pain of 10s. 27 Hen. VIII. cap. 6. 32 Hen. VIII. cap. 13.

By 1 Ed. VI. cap. 12., and 2 & 3 Ed. VI. cap. 33. horse-stealers are excluded from the benefit of clergy. By these prudent and judicious measures, the English breed of horses was not only improved in strength and size, but also greatly increased in number. Till the use of coaches (see COACH) was introduced in the reign of queen Elizabeth, saddle horses and carts were the only methods of conveyance for all sorts of people; and the queen rode behind her master of the horse, when she went in state

HORSE.

to St. Paul's. By the 2 & 3 Ph. and M. cap. 7. and 31 Eliz. cap. 12. it is enacted, in order to prevent horses from being stolen or sold in private places, that owners of fairs and markets shall appoint toll-takers or book-keepers, who are to enter the names of buyers and sellers of horses, &c. And to alter the property, the horses must be rid or stand in the open fair one hour; and all the parties to the contract must be present with the horse. Sellers of horses are to procure vouchers of the sale; and the names of the buyer, seller, and voucher, price of the horse, the colour, and one special mark at least, are to be entered in the toll-taker's books, and a note of the same delivered to the buyer; and if any person shall sell a horse without being known to the book-keeper, or bring in a voucher; or if any one shall vouch, without knowing the seller, or the book-keeper shall make an entry, without knowing either; in each of these cases the sale is void, and a forfeiture is incurred of 5*l*. The owner may seize and take his horse again, or have an action of detinue, &c. A stolen horse, though sold according to the direction of the act, may be redeemed and taken by the owner within six months, repaying the buyer what he shall swear he gave for the same. Any person killing a horse in the night-time is guilty of felony, and liable to transportation for seven years; and maiming a horse incurs the penalty of treble damages. 22 & 23 Car. II. cap. 7.

Horses in hackney-coaches are to be 14 hands high. (9 Anne, cap. 23.) If hired horses are abused by immoderate riding, &c. there lies an action of trespass on the case. The act 26 Geo. III. c. 71. requires every person who keeps or uses any horse, or place for the purpose of slaughtering any horse, &c. or cattle which shall not be killed for butcher's meat, to take out a licence at the quarter sessions, and to cause his name and the words "Licensed for slaughtering horses pursuant to an act passed in the 26th year of his majesty king George III." to be painted or fixed over the door of such house or place; and an inspector shall be appointed by parish officers, whose duty is specified by the said act. Slaughtering horses, &c. without a licence and conformity to the requisitions of the said act, incurs the guilt and punishment of felony.

The duties imposed by 43 Geo. III. c. 161. and 45 Geo. III. c. 13. on all horses, mares, and geldings, kept by any person for riding, or drawing any carriage, chargeable with the duty on carriages, appear in the following schedule.

Number thereof.	Amount of Duty for each Horse, Mare, or Gelding.		
	£.	s.	d.
For 1 such horse, mare, or gelding	2	8	0
2	4	0	0
3	4	8	0
4	4	11	0
5	4	12	0
6	4	16	0
7	4	18	0
8	4	18	0
9	5	0	0
10	5	5	0
11	5	5	0
12	5	5	0
13	5	5	0
14	5	5	6
15	5	5	6
16	5	5	6
17	5	6	0
18	5	6	6
19	5	7	0
20 and upwards	5	8	0

The said duties are payable annually, subject to the following exemptions:

1. Any person who shall keep any horse, mare, or gelding, which shall be used without fraud for the purpose of husbandry, or of drawing any carriages (except such as are liable to any duty by this act), or carrying burdens in the course of the trade or occupation of the person or persons to whom such horse, mare, or gelding shall belong, although such horse, mare, or gelding shall be used for riding on the occasions and in manner hereinafter-mentioned; that is to say, when returning from any place to which any load or burden shall have by such horse, mare, or gelding, been drawn or carried, or in going to any place from whence any load or burden shall be to be brought back by any such horse, mare, or gelding, or on account of such horse, mare, or gelding having been used for the purpose of riding to procure medical assistance, or for the purpose of riding to or from market, or to or from any place of public worship, or to or from any election of members to serve in parliament, or to or from any courts of justice, or to or from any meeting of the commissioners of taxes.

2. Any person occupying a farm as tenant at rack-rent, the rent of which shall be less than 70*l*. a year, and making a livelihood solely thereby; or any person occupying any estate on any other tenure than as tenant at rack-rent solely, or such estate, together with a farm at rack-rent, the whole value of which shall be less than equivalent to a farm at the rack-rent of 70*l*. a year (reckoning the value of every estate occupied by the owner thereof, or on any tenure other than rack-rent, as equivalent to double the amount of the like farm at rack-rent), and making a livelihood solely by such his own estate, or by such estate and farm jointly, and using occasionally for the purpose of riding, any horse, mare, or gelding, which shall be *bonâ fide* kept and usually employed for the purposes of husbandry.

3. Any person occupying a farm, and making a livelihood solely thereby; or any person carrying on a trade, and making a livelihood solely thereby; or making a livelihood by such occupation and trade jointly: or any ecclesiastical person, not possessed of an annual income of 100*l*. or upwards, whether arising from any ecclesiastical preferment or otherwise, for one horse, mare, or gelding, used only for the purpose of drawing any carriage with less than four wheels, liable to the duty hereby made payable on taxed carts.

The duties on horses let to hire are as follow: For every horse, mare, or gelding, let to hire for the purpose of riding, or of drawing any such carriage as aforesaid, for any period of time less than one year, in any manner so that the stamp-office duty, payable by law on horses let to hire, shall not be payable, the sum of 2*l*. 8*s*.

To be charged annually on the person or persons letting the same; provided, if a due return thereof shall not be made by the hirer or hirers, according to this act, the progressive duty, as set forth in the former schedule, shall be chargeable in respect of every such horse, mare, or gelding, on the person or persons hiring the same, and making such default as aforesaid.

The duties payable on race-horses are as follow: For every horse, mare, or gelding, *bonâ fide* kept for the purpose of racing or running for any plate, prize, or sum of money, or other thing, or kept in training for any of the said purposes, whether in the stables of the proprietor or proprietors, or of any other person or persons, the sum of 2*l*. 8*s*.

The said duty to be charged annually on the person or persons having the custody, charge, or management of such horses, mares, or geldings.

The duties charged on horses not otherwise charged, and

HORSE.

on mules, are as follow: For every horse, mare, or gelding, not chargeable with any duty according to the preceding schedule, and for every mule, except in the cases hereinafter mentioned wherein other duties are made payable, the sum of 12s. 6d.

The duties on husbandry horses are as here stated: Any person occupying a farm at rack-rent, the rent of which shall be less than 20*l.* (in Wales 10*l.* sterling) a year, and making a livelihood (or in Wales principally) solely thereby, or occupying any estate on any other tenure at rack-rent solely, or such other estate, together with a farm at rack-rent, the value of which in the whole shall be less than equivalent to a farm at the rack-rent of 20*l.* (in Wales 10*l.* sterling) a year, (reckoning the value of every estate occupied by the owner thereof, or on any tenure other than at rack-rent, as equivalent to double the amount of the like farm at rack-rent) and making a livelihood solely by such his own estate, or by such estate and farm jointly or principally thereby, and likewise a profit by any trade or employment, and keeping not more than two horses, mares, geldings, or mules, *bonâ fide* for the purpose of such occupation, shall be charged for each of such two horses, mares, geldings, or mules, the sum of 2s. 6*l.*

The exemptions to the several duties above specified are,

1. Any horse, mare, or gelding, belonging to his majesty, or any of the royal family.

2. Any post-master, inn-keeper, or other person duly licensed by the commissioners of stamps, in respect of any horse, mare, or gelding, let to hire by him, in any manner where the stamp-office duty payable on horses let to hire shall be duly satisfied and paid on each letting, and which shall not, on any occasion, be used for any other purpose.

3. Any person duly licensed to keep any public stage coach or carriage for conveying passengers for hire from different places in Great Britain, in any respect of any horse, mare, or gelding, which shall be actually and solely employed for that purpose.

4. Any person licensed by the commissioners for hackney coaches within London and Westminster, and the suburbs thereof, to keep any hackney coaches, for any horses, mares, or geldings, kept for the purpose of drawing such coach, in respect of the duties before mentioned, and for two horses, mares, or geldings, and no more, kept for the purpose of drawing each coach so licensed in respect to the duties in the former schedule.

5. Any dealer in horses, assessed to the duties hereby made payable on such dealers, for any horse, mare, or gelding belonging to such dealer, and kept *bonâ fide* for sale, and not kept or used for any other purpose, or in any other manner.

6. Any person who, on account of poverty, shall be discharged from the assessment made in respect of his dwelling house, in pursuance of the regulations of this act, for any horse, mare, or gelding, provided such person shall not keep more than one such horse, mare, or gelding, and the same shall not be let to hire.

7. Any rector, vicar, or curate, actually doing duty in the church or chapel of which he is incumbent, who shall not be possessed of an income of 60*l.* per annum or upwards, whether arising from ecclesiastical preferment or otherwise; and who shall not keep more than one horse, mare, or gelding, for the purpose of riding, which otherwise would be chargeable with duty according to this act, except such person who shall occasionally perform the duty appertaining to any rector, vicar, or curate, without being the regular officiating minister of the parish or place in which such duty shall be performed.

8. Every person inrolled, or to be inrolled, and serving in

any corps of yeomanry or volunteers, which shall hereafter be continued or formed, with the approbation of his majesty, under officers commissioned by his majesty or lieutenants of counties, or others who may be specially authorized by his majesty for that purpose, who shall have attended the exercise of such corps, five days of muster and exercise at the least in the course of the preceding year, and who shall be returned in the muster rolls of the said corps, as required by law, and certified to have so attended, unless prevented by actual sickness (such sickness to be certified by some medical practitioner to the commanding officer of such corps), and who shall be returned in the said muster-roll of such corps, as having used any horse, mare, or gelding, for service during such days of muster and exercise, shall be exempted from the payment of the duties set forth in the preceding schedules in respect of such one horse, mare, or gelding; such exemption to be returned and claimed in the manner in which exemptions are directed to be returned and claimed by this act: but every claim of such last mentioned exemption shall be proved by the certificate under the hand of the officer commanding the corps in which such person shall be inrolled, which certificate shall, between the 5th April and the 5th May in every year, be delivered to the assessors of the parish where he shall reside; and every person claiming to be so exempted, shall be chargeable thereto, unless such certificate shall have been delivered pursuant to this act; which certificates made up, returned, and certified, shall be deemed sufficient and valid for the purposes aforesaid; but if from any variation of circumstances, or other reason, the said form cannot be strictly adhered to, instruments of a similar import may nevertheless be received in proof, at the discretion of the commissioners executing this act for the district.

9. Any non-commissioned officer or private of any of the regiments of cavalry, or in the artillery, for any horse used in his majesty's service.

Horse-dealers are chargeable as below stated:

Every person who shall use or exercise the trade and business of a horse-dealer within the cities of London and Westminster, and the liberties of the same respectively, the parishes of St. Mary-le-bone and St. Pancras, in the county of Middlesex, the weekly bills of mortality, or the borough of Southwark, in the county of Surry, the annual duty of 20*l.*

Every person who shall use or exercise the trade and business of a horse-dealer in any other part of England, or in Wales, or the town of Berwick-upon-Tweed, the annual duty of 10*l.*

For the duties of post-horses, see the article Post.

A horse is usually divided into three principal parts, *viz.* the *fore-hand*, the *body* or *carcase*, and the *hind-hand*. The *fore-hand* includes the head, neck, withers, breast, and fore-legs. The *body* is composed of the back, kidneys, ribs, belly and flanks. The *hind-hand* comprehends the rump, haunches, tail, buttocks, stifle, thighs, hocks, and the other parts of the hind legs. By another mode of division, the horse is distinguished into four parts, *viz.* the head, the body, and the fore and hind trains. The *body* is composed of the back, the kidneys, the belly, the ribs, and the flanks. The *fore-train* consists of the neck, the shoulders, the breast, and the fore-legs; and the *hind-train* of the rump, the tail, the haunches, and the hind legs. These several parts may be more distinctly understood by means of the subjoined detail, and a reference to the *Plate of Horses*. A, the two bones corresponding to the *temples* of a man, and called by the same name: B, the *eye-pits*, or two cavities between the eye and ear, above the eye brows: C, the *vivæ*; the parotid glands, situated between the ear, and the locking

H O R S E.

of the under jaw : D, the *sacc* or *chanfrin* ; the fore part of the head from the eyes to the nostrils : E, the *rim of the nostrils* ; the cartilage which forms the circular aperture of the nostrils, and terminates them above and below : F, *tip of the nose* ; the partition which divides the nostrils, terminating at the upper lip : G to H, the bones of the lower jaw : H, the *chin* : I, the beard.

Gatherers. The two fore teeth.

Middle teeth. Those adjoining to the gatherers.

Corner teeth. The last on each side.

Tusks. The two canine teeth on each side, and in each jaw.

Bars. The spaces between the cutting teeth and grinders, filled with ridges, which run across the palate.

K, the *neck*, which is bounded above by the mane, and below by the throat, extending from the shoulders to the head : L, the *tuft* or *toppet* ; that part of the mane which lies between the two ears, and hangs down on the front : M, the *withers* ; the place where the two shoulders approach each other between the neck and back : N, the *shoulders*, extending from the withers M, to the top of the *fore band*, or fore-leg O : P, the *chest* or breast : Q, the *back*, reaching from the withers M, to the reins S : R, the *navel* ; the part between the back and reins ; a very absurd term, as the *navel* is in the lower part of the belly : S, the *reins* ; this term is often used, though improperly, to express the whole spine of the horse : T, the *rides*, which are formed and limited by the ribs : V, the *coffer* ; the hollow formed by the contour of the ribs. The name *belly* is given to the part extending from V to the flank : X, the *flanks* ; the extremity of the belly, at the termination of the ribs, below the kidneys, and reaching to the haunch-bones : Y, the *haunch*, formed, as in man, by the haunch-bone : Z, the *crupper*, which is round, and reaches to the kidneys to the tail. The *tail* is distinguished by two parts, the *base* and the *knob* : a, the *buttocks*, are situated below the crupper and the origin of the tail, and extend to the place where the hind-leg joins the body : b, the *shoulder-blade* : c, the *humerus* ; both of these are included by horsemen under the name of *shoulder* : d, the *elbow* : e, the *arm* : f, the *knee*, or joint situated below the arm, a term improperly applied to a horse, as it corresponds to the wrist in man : g, the *shank* or *canon* ; the second part of the fore-leg. It begins at the articulation of the knee, terminates at the fetlock joint i, and answers to the metacarpus in man : h, the *tendon*, commonly called the back-sinew : i, the *fetlock* joint : k, the *tuft* of hair which furrounds a kind of soft horn situated behind the shank : l, the *pasterns* ; the part of the leg which extends from the fetlock-joint to the hoof : m, the *coronet* ; the place where the hoof joins the leg, and is decorated with long hair falling down all around the hoof : n, the *hoof* represents the nail in man ; the fore-part of it, o, is called the *toe*, and the sides, p, the *quarters*. The hind-part of the hoof is a little raised, and divided into two parts, both included under the name *heel* ; they extend to the middle of the under part of the foot, and uniting again under the sole, or bottom of the foot, form the *frog* : q, the *stifle*, is properly the articulation of the knee, and contains the knee-pan : r, the *thigh* ; it extends from the stifle and extremity of the buttocks to the ham s, and answers to the leg in man. Accordingly, the horse's thigh has a fleshy part s, resembling the calf of a human leg : t, the *hock* or *ham*, is the joint at the extremity of the thigh, and bends forwards. This articulation corresponds with the *tarsus* in man. The hinder-part of the joint, called the *hock*, is properly the *heel*. What is commonly called the *great sinew*, which arises from the point of the hock, and

terminates in the foot, is a tendon, answering to the *tendo Achillis* inserted into the human heel : u, the *shank* : x, the *pastern joint* : y, the *pasterns* : z, the *foot*, as in the fore-leg. (Buffon's Nat. Hist. by Smellie, vol. iii.) Of most of these parts a further account will be found under the respective articles.

The masters of this art lay it down, that a horse, to be good and well-made, must have three parts like those of a woman ; *viz.* the breast, which is to be broad, the hips round, and the mane long ; three of a lion, *viz.* countenance, intrepidity, and fire ; three of a bullock, *viz.* the eye, nostril, and joint ; three of a sheep, *viz.* the nose, gentleness, and patience ; three of a mule, strength, constancy, and foot ; three of a deer, head, leg, and hair short ; three of a wolf, throat, neck, and hearing ; three of a fox, ear, tail, and trot ; three of a serpent, memory, fight, and turning ; three of a hare or cat, running, walking, and suppleness.

Of all quadrupeds, says M. Buffon, the horse possesses, along with grandeur of stature, the greatest elegance and proportion of parts. By comparing him with the animals immediately above or below him, we find that the ass is ill made ; that the head of the lion is too large ; that the limbs of the ox are too slender and too short, in proportion to the size of his body ; that the camel is deformed ; and that the grosser animals, as the rhinoceros and elephant, may be considered as rude and shapeless masses. The great difference between the head of man and that of the quadrupeds, consists in the length of their jaws, which is the most ignoble of all characters. But, though the jaws of the horse be very long, he has not, like the ass, an air of imbecility, nor, like the ox, of stupidity. The regularity and proportion of the parts of his head give him a light and sprightly aspect, which is well supported by the beauty of his chest. He elevates his head, as if anxious to exalt himself above the condition of quadrupeds. In this noble attitude, he regards man face to face. His eyes are open and lively, his ears handsome and of a proper height, being neither too long, like those of the ass, nor too short, like those of the bull. His mane adorns his neck, and gives him the appearance of strength and of courage. His long bushy tail covers and terminates with advantage the extremity of his body. His tail, very different from the short tails of the deer, elephant, &c. and from the naked tails of the ass, camel, rhinoceros, &c. is formed of long thick hairs which seem to arise from his crupper, because the trunk from which they proceed is very short. He cannot, like the lion, elevate his tail, but, though pendulous, it becomes him better ; and, as he can move it from side to side, it serves him to drive off the flies which incommode him ; for, though his skin be very firm, and well garnished with close hair, it is extremely sensible.

The attitude of the head and neck contributes more than all the other parts of his body, to give him a graceful aspect. The superior part of the neck from which the mane issues, should first rise in a straight line from the withers, and then, as it approaches the head, form a curve nearly similar to that of a swan's neck. The inferior part of the neck should have no curvature, but rise in a straight line from the poutrel, or breast, to the under jaw, with a small inclination forward. If it rose in a perpendicular direction, its symmetry and gracefulness would be diminished. The superior part of the neck should be thin, with little flesh near the mane, which ought to be garnished with long delicate hair. A fine neck should be long and elevated, but proportioned to the general size of the animal. When too long, the horse commonly throws back his head ; and, when too short and

HORSE.

fleshy, the head is heavy to the hand. The most advantageous position of the head is, when the front is perpendicular to the horizon.

The head of a horse should be thin and meagre, and not too long. The ears should be small, erect, but not too stiff, narrow, and placed on the upper part of the head, at a proper distance from each other. The front should be narrow and a little convex, the eye-pits, or hollows between the eyes and ears, well filled, and the eye-lids thin; the eyes should be pretty large and prominent, clear, lively, and full of fire; the pupil should be rather large, the under jaw a little thick, but not fleshy, the nose somewhat arched, the nostrils open and deep, and divided by a thin septum or partition. The mouth should be delicate and moderately split, lips thin, withers sharp and elevated, the shoulders flat, and not confined; the back equal, a little arched lengthwise, and raised on each side of the back-bone, which ought to have the appearance of being sunk; the flanks should be short and full, the crupper round and plump, the haunches well furnished with muscular flesh, the dock or fleshy part of the tail firm and thick, the thighs large and fleshy, the hock round before, broad on the sides, and tendinous behind; the shank thin before, and broad on the sides; the tendon (or tendo Achillis) prominent, strong, and well detached from the leg-bone, and the fetlock somewhat prominent, and garnished with a small tuft of long hair behind; the pasterns should be of a middling length, and pretty large; the coronet a little elevated, the hoof black, solid, and shining, the insep high, the quarters round, the heels broad, and a little prominent, the frog thin and small, and the sole thick and concave. We should here add, that few horses possess all these perfections.

The three natural and ordinary movements of horses are walking, trotting, and galloping. In walking, the horse raises his feet very little above the surface; in trotting, he elevates them a little more; and in galloping, still higher. The walk ought to be smart, light, and sure; the trot should be firm, quick, and equally supported; and the fore-legs pushed with rapidity by the hind ones. The trotting-horse should carry his head pretty high, and keep his body straight; for if the haunches rise and fall alternately, at every movement, and if the crupper rocks, the animal is too weak for this motion. Besides the three movements of walking, trotting, and galloping, some horses have another natural motion, which is known by the name of "ambling" or "pacing;" this motion, though less quick than the hard trot or gallop, appears, at first sight, to be extremely fatiguing to the animal. The trot is, perhaps, the most natural motion of a horse; but the pace, and even the gallop, are most easy to the rider.

Horses are distinguished into divers kinds, and are differently denominated, with regard to their strain or country. As the Neapolitan, known by his hawk nose; the Spanish genet, by his small limbs; the Barb, by his fine head and deep hoof; the Dutch, by the roughness of his legs; the English, by a strong knitting together, &c. the Flandrin, &c.

Horses are also distinguished, with regard to the uses or offices they are reserved for, as the coach-horse, war-horse, hunting-horse, running-horse, pack-horse, &c.

Horses are also distinguished with regard to their colours; as a bay, which admits of divers shades or casts; viz. a black-bay, brown-bay, dapple-bay; all which have constantly black manes and tails. *Dun* and *moufe-dun*, having frequently a black list along the back, which denominates them *flea-backed*. *Flea-bitten*, which is white spotted with red.

Grey, dapple-grey, silver-grey, sad or powdered grey, black-grey, branded-grey, sandy-grey, and iron-grey. *Griffel*, or *rout*, a light flesh-colour, intermixed with white. *Peach-colour*, or *blaffom-colour*. *Pye-bald*, which consists of two colours, one of them white. *Roan*, a bay, black, or sorrel, intermixed with white hairs. *Rubican*, black or sorrel, with a few white hairs scattered about his body. *Sorrel*, common sorrel, red or cow-coloured sorrel; bright, or light-coloured sorrel; burnt-sorrel, all chiefly distinguished by the colour of their mane. *Starling-colour*, resembling a brownish or blackish-grey, only more freckled, or intermixed with white. *Tyger-colour*, much the same with the branded-grey, only the spots smaller. *Wolf-colour*, *deer-colour*, *black*, *white*, &c.

These colours are generally considered as symbolical of the nature, qualities, &c. of the beasts, and accordingly their value is much influenced hereby. The dapple-grey is prized for beauty; the brown-bay for service; the black, with silver hair, for courage; the roan for countenance; the sorrel, black without white, and iron-grey, are reputed hot and fiery; the bright-grey, flea-bitten, and black with white spots, are sanguine; the white, dun, and pye-bald phlegmatic and heavy; the mouse-dun, red-bay, and blue-grey are dull; the peach-colour rarely prove obedient to the spur; the sorrel seldom fail of being good, especially if their legs, tails, and manes be black; and the same may be said of the flea-bitten, at least those so marked in the fore-parts, or over the whole body; or, when only behind, it is an ill sign.

Indeed, it is hard to lay down any universal rules in this case. The white, which promise the least, often prove good, when black about the eyes and nostrils; and there are excellent iron-greys, though that is not reputed a good colour. The white colour was anciently the most admired, and considered as a mark of pre-eminence and sovereignty. Herodotus reports, that the Cilicians paid an annual tribute of three hundred and sixty white horses to Darius, king of Persia; and in Xerxes' march against Greece, the chariot of Jupiter was drawn by eight white Nyxæan horses, the colour being appropriated religiously to the deity. We read likewise, in the book of Kings, that the kings of Judah were used to dedicate horses to the sun. Tacitus says, the ancient Germans had certain horses, which were white, that were consecrated to their gods. We learn also from Livy and Diodorus Siculus, that white horses were held in high estimation in Sicily and at Rome. This was also the case at Naples; and also anciently in our own country. Nevertheless, if we may believe Virgil and others, who pretended to prognosticate the innate properties of horses by the colour of their skins, and other marks, the white should be always rejected, as having few qualities which can render them pleasing or serviceable. Virgil evidently means, not white milk-horses, but those of a faint pale colour, somewhat bordering upon the cream-colour, or whitish dun; for he elsewhere commends the whiteness of the coats of Turnus's horses. Claudian, also Plautus, Horace, Statius, and Palladius join in celebrating it; and we may reasonably suppose that they spoke according to the fancy and opinion of the times in which they wrote.

The common marks of a dull, stupid horse, are white spots round the eye, and on the tip of the nose, upon any general colour whatever. Though the vulgar take these spots for signs of stupidity, yet it is certain they are marks of the goodness of a horse; and such horses as have them are very sensible and quick upon the spur. The French call these spots *marques de ladre*.

Our dealers in horses use the term mettled horse to express

presents a creature of that species which has a great deal of vigour and heart, as they call it. Otherwise, there is a great difference between a mettled horse, a horse of vigour, and a fiery horse; but as this is not sufficiently attended to by gentlemen in their purchases of this animal, some general rules for the distinguishing real vigour in a horse, may be acceptable in a work of this general kind.

When a horse is standing still, the rider who has a mind to try whether he has vigour in him, should keep him fast with the bridle-hand, and apply the spurs to the hair of his sides; this is called by horsemen pinching. If the horse is impatient under this, gathering himself up, and endeavouring to go forwards, and champs upon the bit, without thrusting out his nose, it is a sign of vigour and right mettle in him. Some caution is to be used, however, in judging by this, to distinguish between a horse that has vigour really in him, and one that has only a fine skin, and is rather ticklish than mettled. This is the case with a great many horses, and is found by their being very sensible of the touch of the spur, and shewing the appearance of a great deal of mettle and vigour when touched, but immediately losing the apprehension of it. These are of a dull disposition, but only have a tender skin.

Pliny tells us, that if a horse, in drinking, plunged his nose deep into the water, it was reckoned a sign of spirit and courage; and this notion prevails even at present in this country.

The mettled horse is to be highly valued, but the fiery one is good for nothing; a horse that is truly vigorous should be calm and cool; he should in general move on patiently, and only shew his mettle when it is required of him. The surest method is to choose such horses as are extremely apprehensive of strokes, and are afraid at the least appearance of their coming. These, at the only closing of the legs and thighs, seem to be seized with fear, and alarmed, but without fretting or fierceness. A horse that walks deliberately and securely, and that without requiring the whip too often, will go on briskly and without fretting, will go from the walk to the gallop, and as easily from the gallop to the walk again, and continually champs upon the bit, and trots with glibness, upon the shoulder easily, and snorting a little through his nostrils; this is generally a creature of true metal and vigour, though it does not rise to such a fierceness as is troublesome or dangerous. If to these good qualities a horse be well upon his haunches, and have a light and easy stop, his head well placed and firm, and the feeling of his bit equal and just, the gentleman who loves riding will seldom need to complain of the price. All the good qualities of a horse should, however, never recommend him, unless he has a good mouth, and a sensible obedience to the spur.

HORSES, *For the Age, Height, Teeth, &c. of,* see AGE, HEIGHT, &c.

HORSE, in *Agriculture*, the general name of a well known animal employed in various sorts of team labour. There are two principal breeds of horses in this country; the *race* or *blood* kind, and the *cart, plough, or team* sort. It is the latter description that is chiefly useful in the business of cultivating the soil. The most beneficial varieties of these kinds, in this view, would seem to be the improved black cart-horse; the Suffolk punch-horse, the Cleveland bay-horse, and the Clydesdale horse. The first, or black cart-horse, is the common sort, met with in particular parts of the counties of Lincoln and York, becoming pretty general in those of Leicesters, Stafford, Derby, and Warwick; being, in point of size, larger than any others in the kingdom; but by nature inactive and slow in their movements; besides being clumsy, and not unfrequently badly proportioned.

They are in general more adapted to heavy draughts upon paved roads or streets, than for the purposes of ploughing and harrowing the ground, or any other description of farm-labour. The largest horses of this kind are mostly made use of in the drawing of drays, and other sorts of heavy work, in large towns. The size below this is that which is commonly employed in the business of the field, as well as occasionally in carriages. The smallest description of them are usually bought up for being trained to military uses. It has been justly noticed that the large black dray-horses, in point of size and fatness, do not admit of any equal; while in relation to hardiness, vivacity, and nervous energy, they rank probably amongst the lowest of their kind.

The Suffolk punch, or second variety of team-horse, when of the genuine description, is but a short, plain-looking horse, though very compact, and more active and hardy than any of the others that are met with in the southern parts of the kingdom. It is a sort that has, however, lately been much improved. When compared with the above breed, and that of the Cleveland, these horses are of but small sizes, rarely exceeding fifteen or sixteen and a half hands in height; they are, however, so active, that the cultivators in that district, as well as in Norfolk, very generally plough two acres a day in the busy seasons with a pair of these horses, without any driver. This sort of horse is very commonly employed in the business of farming in the southern districts of the island. They require to be well kept in regard to food, but amply repay the expence under proper management, by the value of their labour.

The Cleveland bay-horse, or third variety, is generally clean and well made in most of the parts; being very strong and active, answering perfectly both for the team, coach, and saddle. There are few horses capable of greater, or longer continued exertion in any of these intentions, than these. It is usual for great numbers of these horses to be sold in the various fairs and markets of the district in which they are met with, such as are the strongest and most perfectly formed for the purpose of carriage-horses, those which are lighter in the bone, for the purpose of riding, and the others for their use in the different operations of husbandry, &c.

The fourth, or Clydesdale horse, is a strong, active, steady animal, generally from fifteen to sixteen hands and a half in height; and probably, for the purposes of the cart and the plough, inferior to few in this country. It is supposed that we are indebted to the accidental circumstance of some of the dukes of Hamilton for this variety, who brought from Flanders six coach stallions, some time about the close of the seventeenth century; which, by being crossed with the best mares of the kind found in the Lanark district, this sort of horse was produced. The farmers in the south and south-eastern parts of Scotland, are now even principally supplied with their team horses from this and the neighbouring districts. Some are sold for their use as coach and saddle-horses, and taken into the southern parts of the kingdom, as well as for team-labour.

It is stated by a late writer, that this horse "is lighter in the body than the Suffolk punch, and more elegantly formed in all respects. His limbs are clean and sinewy, his neck longer, his head of a finer form, and his eye more sprightly, and animated than in either of the two former kinds. His tread is firm though tending towards the nimble; and he is capable of exerting a wonderful degree of muscular strength for a short push without being hurt by it, which makes him particularly valuable for that hilly country, where there is a necessity for calling forth such exertions on innumerable oc-

casions. He is hardy, can live upon any food, and is, perhaps, the thriftiest horse for the cart or the plough that is to be found in the island, perhaps on the globe itself. For these purposes he is peculiarly adapted by the evenness of his temper and the steadiness of his movements. For the plough he is, perhaps, every-thing that could be wished; being, in point of size, neither so large nor so unwieldy as to render him a burden to the soil; two of these horses in the softest soil, under good management, being perfectly able to draw a full furrow with ease; and for horse-hoeing, or ploughing a light soil in good order, one of the lightest sort performs the work with alacrity and ease. What a benefit, says the writer, would result to the nation, were a set of judicious experiments to be conducted for a sufficient length of time, for the purpose of ascertaining the comparative powers and expence of keep of these last three different varieties of horses, so that any one might know who chose it, with certainty, the profit or the loss that would result to him from employing the one or the other, for any particular purpose that he had in view."

Besides these different varieties of farm-horses, there are several horses of a still smaller description, usually known under the denominations of Galloways, ponies, &c. which may be occasionally found useful in the business of husbandry, though mostly too small in size for the forming of plough teams.

Whatever the variety of the breed of a horse may be, in order to be well formed, it should have the following shapes of the different parts: the head as small as the proportion of the animal will admit; the nostrils expanded, with a fine muzzle; the eyes cheerful and prominent; the ears small, upright, and placed near together; the neck, rising out from between the shoulders, with an easy tapering curve, should join gracefully to the head; the shoulders, being well thrown back, should also fall into the neck, at what is termed the points, without being perceived, which probably facilitates the going much more than the narrow shoulder; the arm or fore-thigh should be muscular, tapering from the shoulder so as to meet a fine straight finery and bony leg; the hoof circular and wide at the heel; the chest deep and full at the girth; the loin or fillets broad and straight, and the body round; the hips or hooks by no means wide, but the quarters long, and the tail set on so as to be nearly in the same right line as the back; the thighs strong and muscular; the legs clean and fine-boned; the bones of them not round but flat, or what is frequently termed lathy. But for the team of the farmer, the principal points to be attended to should be those of not having the neck either too long or too thick; the legs rather short and flat than round and clumsy; the fore-feet even, but not too distant; the chest wide; the shoulders strong but not high; good length of waist supported by a wide loin; the quarters full and somewhat raised; the legs strong, firm, and muscular, and the size from 15 to 16 hands in height.

It has been noticed, that horses being somewhat forelow affords them an advantage in the draught, and that a tolerable length of waist gives them speed in the walk, which is not unfrequently a point of importance in farm work. Some suppose that horses for the purpose of farming should be similar to those used in riding, only of larger sizes; and in place of being capable of walking merely two or three miles in the hour, to be able to travel at the rate of four or five; as by that means the farmer would be enabled to plough more land in a given time; and to use more dispatch in the work of the cart or waggon when necessary. The utility of a strong active horse at harvest time is well known to every one; and in the business of conveying manure to

the field and market work, such properties are not less valuable.

By taking care in breeding to have the heads of horses light, handsome, and well set on, and by proper attention in crossing stallions and mares, coach and cavalry horses of high value may be produced, which, if for sale by the farmer, would, without doubt, pay him well for his trouble and expence. The breeding of good horses is not more expensive than that of bad ones, except in the attention which is necessary, though the difference in the price at the market is very great. And it is known to every one, that cart-colts become ready for sale at an early period. There can be no doubt but that coach-horses may be bred from mares of the Suffolk kind when covered by horses of the strong race or hunter sorts, or the contrary. And should it be the wish to rear horses for sale as hackneys, it will probably be the best method to select both the mare and horse of the blood sort, or at least with each some blood, which is perhaps better than making use of full blood horses. These should be bred with well set on light heads, even and good feet, close before and wide behind; plenty of bone below the knee, and high deep and slanting shoulders; deep in the girth, handsomely rounded in the barrel, as well as on the hip-bones; straight in the back, but the waist long enough to give speed, with the loins and fillets proportionately strong; the tail even with the back-bone. But instead of breeding, such farmers as intend to derive a profit from this description of stock, may constantly find both colts and fillies for his purpose in the different fairs, markets, and other places.

Mares, for the purpose of breeding, should always be well shaped in their different parts; have a gentle and easy disposition; be possessed of a large carcass in proportion to their heights; being pretty full in their bellies, and appearing likely to form good nurses and have plenty of milk. Those intended for supplying the teams of the farmer with draught horses should, according to some, be large limbed, close jointed, short necked, wide chested, home ribbed with a capacious body; the eyes should be perfectly clear, full, and pellucid, and the nostrils large and open; the disposition ought to be gentle and tractable, the constitution healthy and vigorous, free from blemishes of any kind.

The horse, in this case, should be bold and spirited, well made, and of a kindly disposition; the constitution strong and healthy, the temper good, and wholly free from any sort of vice and contamination; as upon the good properties and healthy condition of the parents, in a great measure depend the future utility and advantage of their offspring. Since general experience has fully shewn that in what relates to form and other good qualities in the progeny, more depends on the mare than the horse; the usual practice of regarding the horse more than the mare is highly improper, as being disadvantageous. The form and other properties of the horse should always have as much similarity as possible to those of the mare, as in this way their joint properties may be more reasonably expected in the young which they produce, than by violent unnatural crossing. Where a half-bred mare, for instance, is put to a large heavy awkward cart horse, or the contrary, the offspring must naturally turn out an indifferently mungrel breed that has rarely the size and strength of the one, or the spirit, activity, and fine bone of the other. See BREEDING, LIVE-STOCK, and TEAM.

In breeding the dray-horse, less movement or activity is requisite, but more power; and the same principles are applicable in some measure to those for the waggon, though in a far inferior degree. For these uses it is important that they be very broad-breasted, and thick in the shoulders, without

without their lying so much backward, or rising so much in the fore-hand, as is the case in saddle-horses.

Mares in general are not suffered to take the horse in this country until they are from two and a half to three or four years of age, but continue to breed till they reach a good age, as 12 years and upwards.

The horse may be permitted to cover from the age of three or four years until he becomes unfit for the purpose by age. Stallions should constantly be kept high with the best sorts of food, and be well dressed and taken care of, as without this attention they never answer well.

The season at which the mare commonly takes the horse is mostly from about the beginning of April until the end of June, the last month being generally supposed the best period. An early foal is, however, constantly to be preferred to such as are late.

The mare goes with foal usually about eleven months, but sometimes exceeds it a few days. It is commonly the main object with farmers, where possible, to have their mares covered at such times, as that there may be plenty of grafs at the period of foaling, as well as warm favourable weather, as both are highly beneficial to the new dropped foal.

Mares are in some places wholly taken from work some weeks before the time of foaling; but this is by no means the general practice of the country. In the eastern and midland counties that adjoin them, in which the breeding and rearing of horses are more perfectly understood than in most other parts of the kingdom, it is not unfrequently the custom to work them to the very period of foaling. But there are certainly much care and attention necessary in working mares that are so heavy with foal; as an over heat, too hard labour, a fright, or sudden jerk, or any other similar cause, may endanger not only the loss of the foal, but also that of the mother.

It is the custom in most of the improved districts of the kingdom where the breeding and rearing of horses are practised, after foaling to turn the mare and her foal out into a pasture field, where they remain for two or three weeks before the mare is again put to work either in the plough or cart, the foal during the time being suffered to suckle at pleasure. After having had this rest, she is again suffered to work in the usual way, the foal being confined in some proper place during the time. In the intention of avoiding the evils arising to the foals from bad or over-heated milk, some of the Yorkshire breeders are extremely careful not to suffer the mares to go near their foals, after their return from work, until their udders have been well bathed with cold water, and the greatest part of the milk drawn from them. There is likewise another practice which has, perhaps, a superiority to the above, in the same district as well as some others; which is, as soon as the foal has acquired strength sufficient, and is fully capable of following its mother, to permit it to accompany her to the field during the time of working, and to suckle there as there may be occasion. In this way the foal has full exercise, without incurring any danger from the over-heated milk, it being drawn off so frequently. These are the common modes in use while the foal is suffered to suck, which is mostly about six months, as from the time of foaling to Michaelmas, the period at which they are usually weaned.

In the business of weaning foals it is a good practice to confine them at a distance from their mothers in some small stable or shed for the purpose, where there is a rack and manger, in which they may be fed with clean shaken hay, and well sifted oats, bruised in a mill. Under this treatment they speedily forget their mothers, and become quite tractable and reconciled to the keeper. They should be per-

mitted to exercise and enjoy themselves in a pasture field or paddock, contiguous to the place of confinement, during the funny parts of the middle of the day, it being dangerous to keep them out during the night, on account of their tenderness.

When the foals have been weaned, the usual custom is to put them directly into some good fresh pasture, where they may continue so long as the weather proves mild and temperate, when, on the approach of winter, they are to be fed with a sufficient quantity of hay, placed in the shed or hovel in the field for the purpose, into which they can freely enter at pleasure. The year following, in the summer, they are removed into other pastures, often the most inferior on the farm, where they continue until the commencement of the ensuing winter; when they are either permitted to range in the common pasture fields, or brought home to the yards. It is advised by some to have the foals fed during the winter season with a little corn twice in the course of the day; or carrots, with hay, oat-straw, &c., letting them have a well littered shed or yard that is perfectly sheltered. Such colts as are fed at home with green meat cut fresh for them daily during the summer season, should have a range daily upon a field or adjoining common, for the purpose of exercise. And the yearling colts should be kept quite separate from the mares with their foals.

In the management of young horses, those of the cart colt kind are often begun with at about two years of age; and one great object in this business is first to teach them docility, by frequent leading in the halter, as well as to back and go in the shafts or traces. But this is better delayed in saddle colts till the third year, or the autumn preceding it; and they should now be carefully attended to, and have a good mouth given them, though some think but little of it. They should likewise be taught to canter handsomely; and when they are of proper size, they may be gently wrought in the plough or other sort of team labour. Their going well, and being quiet in harness, render them of more value as well as utility in the opinion of many.

The field work such horses are at first inured to, is generally that of harrowing, to which they should seldom be kept more than one-half of the day, when they commence it, and afterwards only very gently, for the remainder of the season.

It is the usual practice of the northern horse-breeding farmers to dispose of their young stock, at two or three years old, to those in the more southern parts of the kingdom, who, after keeping and working them about the same length of time, dispose of them to the dealers in the metropolis and other large places. This custom is very common, and extremely convenient to all the different parties engaged in it; as the breeder meets a ready and constant market for his young horses at the times when he wants to be quit of them, and is thereby enabled to carry on the breeding system without the danger of being overstocked. And those who are the first purchasers are able to dispose of them to the dealers in the large cities and other places in the south, as proper opportunities may be afforded, as they are fully aware that a supply of young horses will reach them in proper time to answer their intentions. Besides, the dealers in the metropolis can, without the expence and trouble of travelling into the more northern districts, where the largest proportion of young horses is bred and reared, supply themselves with such as are proper for their uses in the different counties in their own vicinity. In the carrying on of this business, besides the principals, there are generally two agents or more who derive their living from it, the jobber or middle-man, who procures the horses from the breeders and
sells

sells them to the farmers in the south; and the dealer in the vicinity of the metropolis, who makes the purchases from the farmers in the south, at his own risk, standing the chance of sale to the buyers in the above place; or who provides them on commission for such dealers. The young horses are mostly sold with their full tails to the dealers; who afterwards make them up by art, so as to suit their different views. They usually undergo the processes of docking and nicking, and often various other operations performed upon them. After being kept, or what is often termed made up, by having bran washes, or those of coarse ground oats, and boiled grain, given them for two or three months, they are disposed of by the dealers to their customers in the metropolis.

The usual periods of cutting or gelding colts, is either while they are quite young, or when they have attained the age of two years. This is particularly the case when it is the intention to keep them, without making use of them in labour until the ensuing spring. The most proper season for performing this operation is in the early spring months, before the weather begins to get too warm. See CASTRATING and GELDING.

For farming purposes it becomes the business of the cultivator to suit the horses in their strength and size, to the nature of the work that is to be done, as where they are disproportioned in either of these respects, or in their number, the profits of the farmer must be lessened. And where the stable economy is not so correct or proper as it ought to be, and the horses of course become diseased, or where they are wrought too hard, or not kept sufficiently to their labour, as well as where they are fed without regularity; the same thing must be the consequence. In the best arable districts in the northern parts of the kingdom, the methods of working and treating the labouring horses are, at the time of the feeding, to increase the length of the time of working in the day, and to have recourse to such food as is of a better quality, than that which is usually allowed during the winter season. They are at this busy period commonly foddered with hay or pea-straw, with each half a peck at least of dry clean oats, or these in mixture with peas or beans, as soon as they return from the field in the morning and evening; and a certain portion of the dressings of the corn in mixture with common or cut chaff, either well soaked in cold water, or boiled, is also given every forenoon and afternoon before the work is begun again. They are consequently, during the laborious part of this interesting season, fed regularly four times in the day with corn. But in these northern parts of the island, instead of executing the whole of the diurnal labour constantly, in what is termed, in the south, one journey; the farm horses, from the middle of March to the end of September, make two journeys. This is considered by some as being a superior mode of proceeding, in consequence of the work being more divided, and the horses resting some hours in the most hot parts of the day.

During the summer, except in the time of labour, the team horses are kept in the stable, and permitted to have as much cut clover as they can eat. But in the wheat seed season, and at the time the grain is conveyed to the stack yard, a portion of corn is allowed, and which is continued in more full quantities, as long as the weather keeps suitable for the operations of the plough. In the winter season, when the labour of the team is greatly diminished, the horses have straw with about half a peck of corn in the day. But on some farms the allowance of corn is wholly withdrawn, and properly cleaned potatoes made use of in its place. It is constantly the practice to have these horses carefully cleaned and dressed, and as much under the eye

of the farmer as possible. See HORSE-KEEPER and TEAM.

It is necessary likewise to be very attentive to the feet and shoes of team horses; and the improved methods of fixing and forming them should be had recourse to. Nothing should be pared from the sole or other parts except the rotten loose matters. See SHOEING of Horses.

Some attention is likewise necessary on first turning out horses to graze. It is probably the best practice to inure them to the change gradually, by only letting them remain in the field for a little while on their being newly put to the graze; afterwards increasing the length of their stay, as there may be occasion. It is probably the best time to turn them out in the evening, though the usual time is in the morning. See GRAZING and PASTURE.

HORSE, *Airing of a*. See AIRING.

HORSES, *Backing of*. The first backing of a horse is a thing of great consequence, as his value afterwards very much depends on it. After a colt has been exercised some time, morning and evening, and becomes somewhat obedient, he is to be taken to some ploughed lands, the lighter the better; he must be made to trot over these in the hand, by that means to tire him and abate his wantonness. When this is done, care must be taken that all the tackling be good and firm, and every thing in its due and proper place; then a person is to hold his head, and another to mount him; but this must not be done suddenly, or at a jerk, but very gradually and slowly, by several half risings and heavings. If he bears this patiently, the person is to seat himself firmly on his back; but if he be troublesome, and not tamed enough, the person is to forbear the attempt to mount, and he is to be trotted hard in the hand over the same ploughed lands again, till he is willing to receive the rider quietly on his back. When this is done, the person who is on his back must cherish him, and the man who has his head must lead him a few paces forward; then he is to be cherished again. The feet are to be fitted well in the stirrups, and the toes turned out; afterwards the rider is to shrink and move himself in the saddle, and the person who holds his head is to withdraw his hand a little farther from the mouth. As the rider moves his toes forward, the holder must move him forward with the rein, till he is made to apprehend the rider's motion of body and foot, which must always go together, and with spirit, and will go forward without the other's assistance, and stay upon the restraint of the rider's hands.

When this is accomplished, let him be cherished, and have graze and bread to eat; and then let the rider mount and alight several times, cherishing him between each time: and thus he is to be managed till he will go on, or stand still at pleasure. This being done the long rein may be laid aside, and the band about the neck, which are always used on this occasion, and nothing will be necessary but the trenches and cavesson, with the martingal. A groom must lead the way before; or another horse going only straight forwards, and making him stand still when desired. In this manner, by sometimes following, and sometimes going before another horse on the trot, the creature will by degrees be brought to know that it is his business to be quiet and governable. See FOAL.

HORSES, *Breeding of*. In order to have a good and beautiful race of horses, it is necessary to choose for a stallion a fine barb, free from hereditary infirmities; such as weak eyes, bad feet, spavins, purfines, or the like. Disorders that arise from accidents are of no consequence; nor is the horse to be at all the less valued for them as a stallion. Three months before this horse is to cover a mare, he should be fed with sound oats, peas, or beans, or with coarse bread, and a little hay, but a good quantity of wheat straw; he should be led

out twice a day to water all this time, and after every watering walked about an hour, but not over-heated. If he be not prepared and put in heart in this manner, the colts will be weakly, and the horse himself will be spoiled, growing purfy and broken-winded.

If he is put to too many mares, he will not last long; his mane and tail will begin to fall off through weakness, and it will be difficult to get up his flesh again by the next year. The number of mares should be proportioned to his strength, and twelve, fifteen, or at the most twenty, are as many as a horse will well serve for in a season. Mares go with foal eleven months, and as many days over as they are years old. This being certainly known, it is easy to contrive so that all the foals may be brought forth at a time when there is plenty of grafs. About the end of May the mares are to be put into an inclosure capable of feeding them as long as the stallion is to be with them, or that they are in season. In this inclosure all the mares to be put together, as well those which are barren as others. The stallion's hind shoes are to be taken off, but the fore-shoes should be left on to preserve his feet; then lead him forth, and let him cover a mare twice in hand, to render him more tame and gentle. After this take off the bridle and turn him loose among the rest, where he will become familiar with them, and not one of them will be horsed but when they are in season. There should be a little lodge built up in some part of the inclosure, and peas, beans, oats, bread, and other good food, put into the manger in it, that the horse may retire into it in the scorching heats, and eat what he likes best. He must be thus entertained during the whole time he is with the mares, which is to be about six or seven weeks.

Mares that are very fat and gross do not hold well; but those which are moderately fat conceive with the greatest success and ease. To bring a mare in season, it is a common thing to give her a quart of hemp-seed, or twice that quantity, night and morning, for eight days before she is brought to the horse. If she refuse it alone, it may be mixed with beans or oats, and will go down; and if the stallion eat of it also, it will make him the better.

The stallion should not cover before he is six years old, nor after he is fifteen. A mare should never be covered before she is three years old; they should be always sound and healthful, and of a good breed; such as these will bring forth better and finer foals than any others. The colts produced from these, are not to be used for stallions; for they will degenerate, and the race will soon become exactly our own country breed. If a barb is not to be had, a Spanish horse is to be chosen. See MARE, and STALLION.

HORSES, *Diseases of.* See BOTTS, CONSUMPTION, COUGH, FARCY, FEVER, GLANDERS, GRIPES, HORSE-WORM, &c.

The horse is likewise in some cases subject to the stone.

HORSES, *Eyes of.* See EYES of Horses.

HORSES, *Fattening of.* The being able to do this speedily is one of the greatest arts our dealers have, and indeed is one of the greatest niceties in the whole management of these animals. Many methods have been prescribed; but the following seems most to be depended on; take elecampane, cummin-seed, tamarisk, and aniseed, of each two ounces; common groundsel, one handful; boil all these very well, with two handfuls of garlic, scraped and cleaned, in a gallon of good ale; strain the liquor well off, and give the horse a quart of it every morning made hot; keep him warm after it. After he has taken this for four or five mornings, he may be turned out to grafs, or kept in the house, as the season will permit. But whenever provender is given him, a quantity of powder is to be prepared of equal parts of cummin-seeds and elecampane, and give him half an ounce of it every

time, sprinkling it in by degrees as he eats, that he may not naufeate the whole.

If this method does not succeed in a short time, then take two spoonfuls of diapente; brew it in a pint of sweet wine, and give it the horse for three mornings. This will take off any inward sickness, and make the other things take effect. After this feed him with good provender three times a day; that is, after his watering in the morning, after his watering in the evening, and at nine o'clock at night. If he does not eat the provender well and freely, it must be changed for some other kind. If all this does not succeed, let the horse be blooded; and then take half a bushel of coarse barley meal, put it into a pail-full of water, and stir the whole together very well; then let it fettle by standing. Pour off the clear liquor into another vessel, and let him drink it for his common drink, and eat the remainder, which falls to the bottom of the pail. If he refuse to eat this alone, there may be some bran mixed among it. This should be given him three times a day, morning, noon, and night. If he does not rightly take to the meal with the bran, some oats must be mixed with it, and this will readily bring him to feed on it. But whichever way is used, they must be by degrees diminished in quantity, till at length he is brought to eat the meal alone; for that is the thing that must fatten him up. Care must be taken that the barley is ground fresh every day as it is used, for it quickly grows sour; and when this has once been the case with one parcel, no art will ever bring the horse to touch any of it afterwards. Scarce any horse but will be well fattened by keeping him to this diet for about twenty days.

Barley ground in this manner cools and purges the creature; but the greatest efficacy, as to the fattening of him, lies in the water, which by this management takes up all the rich part of the barley into itself. When the horse grows lusty on this diet, it must be taken from him by degrees, giving him at first oats once, and barley-meal twice a day; and then oats twice, and the barley-meal once, till he is perfectly weaned from it. In the mean time he must have good hay, and he must not be ridden; only it will be proper to walk him gently about an hour or two in the heat of the day. If it be found that the horse wants a good smart purging during the time of his continuing on the barley-diet, the best time to give it him is after the first eight days, and the following is a very proper sort of plyphic; take of the finest aloes one ounce, agaric, in powder, half an ounce; the powder of Florentine orrice, one ounce; let all these be mixed together, and put into a quart of milk, warm from the cow. This will work very briskly; and after it is over, the usual diet is to be continued. If horses of value were to be kept to this diet once a year, it would make them less hot and dry, and not subject to many diseases which they are troubled with at present, and would be particularly useful after campaigns and long journeys. If the horse loses his appetite by this diet, it will be proper to tie a chewing-ball to his bit, renewing it so often, till at length he begins to feed heartily on the barley; for these balls at once restore appetite, and are themselves of a fattening nature. See CHEWING-BALLS.

HORSE on a journey, *Management of.* The common method of travelling in England being on horseback, it may be proper to give some general rules for keeping the creature sound, and doing the business agreeably, without many of the accidents which usually attend it.

Care must be taken that the shoes be not too straight, and do not pinch the horse's feet any way; but be well shaped, and sit easy. It is proper to have them put on fresh a few days before the journey, that they may last well, and that they

They may be fettled to the feet before the setting out. The bridle is next to be examined; that the bit of it be proper, and not too heavy; for if it be, it will incline him to carry low when he grows tired, and rest upon the rider's hand; this is what they call the using a fifth leg. It is a very disagreeable thing, but may often be avoided, only by taking a proper care of the bit. The mouth of the bit should rest upon his bars, about a finger's breadth from his tushes, so as not to make his lips uneasy. The curb should rest in the hollow of his head, a little above the chin; and if it gall him, the place must be defended with a piece of buff or other sort of leather.

The next thing to be regarded is the saddle; and proper care must be taken as to this, that it do not rest either upon the withers, reins, or back-bone; and that one part of it do not press upon the back, any more than another. Some riders gall a horse's sides below the saddle with their stirrup-leathers. This is most likely to happen to a lean horse; and to prevent it a leather strap should be fixed between the points of the fore and hinder bow, of the saddle, and the stirrup-leathers should be made to pass over these leathers.

It is always best to begin a long journey by short stages; and this is the more necessary, if the horse has not been exercised for some time before. If it be a horse that is ridden, he should be suffered to stale as often as he likes, and even invited to it; but, if a mare, she is to be less indulged in it as less necessary, and often diminishing her strength. It is always advisable to ride very softly for a quarter of an hour, or half an hour before coming in to the inn at night, that the horse may not be over-hot when put into the stable; but if the haste of the journey will not admit of this, the horse should be walked in some person's hands, to cool him gently before he is put up.

If the weather is cold, a cloth should be laid over him while he is walked; and when taken in, his whole body should be rubbed and dried with straw. Some have a custom of ordering their horses' legs to be rubbed well down, on their first coming in; but this is very prejudicial while the horse is hot, and should always be let alone till he is perfectly cooled.

As soon as the horse is cooled, and ceases to beat in the flanks, the bridle is to be taken off, the bit washed, and hay given him, that he may eat at pleasure. The dust in very dry weather will sometimes clog up the tongue of the horse in such a manner, that he cannot eat without great difficulty; in this case some bran and water should be first given him to wash his mouth, or the servant should do it with a wetted sponge.

These are the proper methods when the horse has been rode moderately; but when he has been hurried at a great rate, the saddle is to be taken off as soon as he is put up, and the sweat rubbed off with a sweat-knife; and then the whole body and legs are to be rubbed carefully down, and the head is to be wiped with a cloth, as also the back under the saddle, and the thighs; then the saddle should be clapped on again, and the horse gently led up and down, till cool and dry. The feet are also to be examined, to see if a shoe be wanting, or if any of them press upon the sole; and the dirt, gravel, or other foulness, is to be picked out from between the shoe and the foot. The openings of the feet may be stopped with cow-dung, and the hoofs, if brittle, should be anointed with some fatty substance just at the setting on; and in dry weather they should be greased, not only at night, but noon. Many horses, as soon as unbridled, will lay themselves down, instead of eating.

Many are apt on this to suppose the horse sick; but it is generally owing only to the heat and pain they find in their

feet, which renders them unable to stand upon them. In this case, if their eyes are examined, they will be found brisk and good; and the hay being offered them as they lie, they will eat it greedily. This shews there is no inward disorder, and the heat and tenderness of the feet, if examined, will shew that they are the parts in pain. The principal thing to be done in this case, is taking care that the shoes do not rest upon the soles. This is not easily known, but by taking off the shoes, which in cases of extremity should always be done; it will then be found where the sole is touched by the shoe, being in that part more smooth and shining than elsewhere. In this case the feet are to be pared in those parts, and then the shoes are to be fixed on again, anointing the hoofs, and dopping the soles with hot black pitch or tar.

These are the means by which travelling will be rendered easy and commodious both to the rider and the horse; but there is some care also to be taken of the creature, after he comes off from a long journey. The first thing to be done is to draw the two heel-nails of the fore-feet, and if the shoe be large, then four should be drawn; two or three days after the horse should be blooded, and for ten or twelve days after this he should be fed with wet bran, without any oats; but he is to be kept well littered. The reason of drawing the heel-nails is, that the feet are apt to swell after journeys; and if this is not done, the shoes press upon them in that part, and become very uneasy to them. It is advisable to stop them also with cow-dung for some time; but they are in the wrong who pare them down after taking off the shoes, for the humours being all in motion after this, they are apt to fall into the feet.

If there appear any danger of the creature's legs swelling after the journey, it may be easily prevented by this means: take a quantity of the dung of an ox or cow fresh made; mix it with so much vinegar as will reduce it to a soft paste, and add to it a handful of salt; with this rub all the hips thoroughly up to the knees, and let it dry on; give the water in a pail that evening, that the legs may not be wetted, and the next morning the horse is to be led to water, and the whole remaining matter washed off. The jockies have a very cunning trick to recover the hoofs of a horse injured by a long journey: they make a hole in the foot, and fill it with moistened cow-dung; they keep this in it a month, and the continual moisture occasioned by it makes the hoof grow very quick, and soon recover the proper dimensions; but it soon after dries and shrinks so, that the foot is straightened, and the whole hoof becomes brittle.

Cow-dung, applied to a horse's foot, always moistens the sole; but it dries up the hoof if continued any length of time to it. The best method of recovering a horse's hoofs, is to make a hole in the stable floor, filled with blue clay a little wetted; in this the horse should keep his fore-feet a month; this will have more effect than a small portion of cow-dung in the foot; and the effect will be of so different a nature, that the hoof will be rendered more tough than before, instead of being made brittle by it.

Most horses that are fatigued, or overworked by long journeys, have the flanks altered by it, without being purfy; especially horses naturally vigorous, which have been worked too violently. The best remedy in this case, is to give the horse half a pound of honey in the morning, mixed among a feed of scalded bran: if he eats the half pound readily, give him a pound the next morning; continue this till the honey ceases to purge the creature; after this, powder of liquorice may be added to the scalded bran, and this continued some time, and two or three glysters, at convenient distances of time, will be found very serviceable. If the horse

be very lean, it will be proper to give him some wet bran over and above his proportion of oats; and grafs is also very proper, if the creature be not inclined to be purly. This caution, however, is to be had at all times, that excessive feeding may be bad, by subjeſting the horſe to the farcy. When the horſe begins to drink heartily, it is a ſign that he will ſoon recover. Though this ſometimes fails, it is a good general rule.

When a horſe comes tired into a ſtable, freſh litter has the virtue always to ocaſion him immediately to ſtale. This is known to be a very great advantage to a horſe in a tired ſtate; and when the litter is old and dirty, it never has any ſuch effect upon him. If the owners knew how refreshing it is to a horſe to diſcharge his urine on his return from labour, they would be more careful in giving him all means and ocaſions of it than they are. This ſtaling after fatigue prevents thoſe obſtructions in the neck of the bladder or urinary paſſages, which horſes are too ſubject to; the bladder being often inflamed by the long retention of the heated urine in it, and the creature periſhing by it. Some of our farmers act wrong in this caſe of the litter, not through careleſſneſs or accident, but by principle; they order the old litter to be left a long time in the ſtables, that it may be impregnated with more and more of the urine, &c. of the animal, and be made richer for the fields. It is not to be doubted but the manure is greatly improved by this; but the damage done to the horſe by it, is greatly over-proportioned to the benefit. The heat which the dung acquires, by thus lying together, ſpoils the feet of the creature, and makes it unfit for any ſervice, and ocaſions many diſtempers, which are ignorantly continued and increaſed by the continual addition of heat in the fermenting dung, till at length the horſe periſhes.

Thoſe who have any concern with horſes know, that it is ſometimes very difficult to make them lie down in the ſtable. The following ſimple method is propoſed for this purpoſe by a noted dealer. When you have a mind to make him lie down, take a piece of ſtrong pack-thread, or a cord, and tie it as tight round the horſe's tail as poſſible, without breaking the ſkin, and as near as you can to the rump-bone: this will give him a pain in the back, and he will be glad to change his poſture, to get eaſe; and when he finds he cannot in any other way procure it, he will lie down, which he will find the moſt eaſy poſture, and he will of courſe take a liking to it.

HORSES, Watering of. Whilſt a perſon is on a journey, the horſe ſhould always be ſuffered to drink of the firſt good water he comes to after ſeven o'clock in the morning in ſummer, and after nine or ten in the winter. Moderately pure water is to be preferred, that being beſt of all which is neither too clear nor penetrating, nor muddy and ſtinking.

Though it is the cuſtom in England to run and gallop horſes after drinking, which we call *watering courſes*, and which we ſuppoſe brings them into wind, yet Sollyſel, and many other of the beſt judges of horſes, tell us, that it is one of the worſt and moſt pernicious practices that we can be guilty of; no good can accrue from it, and many horſes are rendered purly by it.

While a horſe is drinking, the rider ſhould draw up his head five or ſix times, making him move a little between every draught. The rider need not be afraid of giving him water, with proper moderation, even in almoſt any circumſtances. If he be warm and ſweat very much, yet if he is not quite out of breath, and there are four or five miles to ride, he will be better after drinking a little, than if he had drank none at all; only obſerving, that if the horſe were very warm at his going into the water, his pace muſt not be

leſs than a moderate trot when he comes out, that he may not be chilled.

In the time of a journey the horſe ought to be ſuffered to drink in this manner of the waters that come in the way, as often as may be; for if the rider happens to bait when he is hot and ſweaty, he muſt not be ſuffered to drink for a long time, as it would endanger his life; and if he has not been watered in this manner on the road, his exceſſive thirſt will often prevent his eating, and he will not be able to touch any ſort of food for an hour or two, which is uſually more time than the rider can ſtay: and yet without eating at baiting times, he will not have ſtrength to go on. The giving him water on the road will, on the contrary, keep him ready for food whenever it is offered him, and the rider need ſtay no longer than his own reſreſhment requires, the horſe eating immediately, and being readily qualified to go on again.

If there be any ſhallow water in the way a little before the coming to the inn where the horſe is to reſt all night, it is always proper to ride him in, and not only give him a little drink, but ride him about ſeveral times, not quite up to the belly; this will clean his legs, and prevent humours from falling down into them. If the horſe be very warm, and there has been no convenience of watering him upon the road, the oats that are given him ſhould be firſt ſteeped a-while in ale; this will induce him to eat, though he could not have touched any that were wholly dry.

Many are of opinion that horſes are ſometimes ſpoiled by giving them oats before their water; but Mr. Sollyſel affirms, that though it be not the cuſtom to give oats till afterwards, yet it never does any harm to feed the horſe with them both before and after drinking; and that it is often proper and neceſſary, eſpecially when the horſe has been hard rid, and is warm.

HORSE, Draught, in Farming, a ſort of coarſe-made horſe deſtined for the ſervice of the cart or plough. In the choice, of theſe horſes for what is called the ſlow draught, they are to be ſelected of an ordinary height, for otherwiſe when put into the cart one draws unequally with the other. The draught-houſe ſhould be large bodied and ſtrong-joined, and of ſuch a diſpoſition, as rather to be too dull than too brisk, and rather to crave the whip than to draw more than is needful. Mares are the fitteſt for this uſe for the farmer, as as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increaſe of a foal. They ſhould have a good head; neck, brealt, and ſhoulders; for the reſt of the ſhape it is not of much conſequence. Only, for breeding, the mare ſhould have a large belly; for the more room a foal has in the dam, the better proportioned it will be. Draught-horſes ſhould be always kept to that employ. Some put them to the ſaddle on ocaſion, but it does them great harm, alters their pace, and ſpoils them for labour. The draught-horſe ought to have a large broad head, becauſe horſes of this ſhaped head are leſs ſubject than others to diſeaſes of the eyes. The ears ſhould be ſmall, ſtraight, and upright; the noſtrils large and open, that he may breathe with the more freedom. A horſe with a full and bold eye always promiſes well. On the other hand, a ſunk eye and an elevated brow are bad ſigns. The horſe is eſteemed fitteſt for this purpoſe alſo, that has a large and round buttock, which neither ſinks down nor cuts. He muſt have a firm and ſtrong tail, and the dock muſt be thick and well furniſhed with hair, and placed neither very high nor very low. The legs ſhould be rather flat and broad than round: the roundneſs of the leg being a fault in a horſe deſtined to labour, that will ſoon ruin him. As to the hinder legs, the thighs ſhould be ſeſhy and long, and the

whole muscle which shews itself on the outside of the thigh should be large and very thick. No country can bring a parallel to the size and strength of our horses destined for the draught. In London there are instances of single horses that are able to draw on a plain, for a small space, the weight of three tons, and which can with ease, and for continuance, draw half that weight. The pack horses of Yorkshire usually carry a burden of four hundred and twenty pounds, over the highest hills of the north, as well as the most level roads: but the most remarkable proof of the strength of our British horses is derived from that of our mill-horses; some of which will, at one load, carry thirteen measures, which, at a moderate computation of seventy pounds each, will amount to nine hundred and ten pounds. Nothing is so essential to the health of these serviceable creatures as cleanliness; if they are fed ever so well, and not kept clean, they will be subject to numerous diseases.

The servant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The currying of them ought to be carefully performed every morning, but not in the stable, for the dust to fall upon the other horses, as is too often done. After the horses are dusted, they should daily twist a whisp of straw hard up, and wetting it in water, rub the legs, shoulders, and body with it. Many of the diseases of draught-horses, which are not owing to nastiness, are owing to bad water; such as is too raw, too muddy, or too cold, being all improper. If there be any running stream in the neighbourhood, they should always be led to that to water, every day in summer, but in winter, well-water is warmish, and is better for them. If there be a necessity of giving them well-water in summer, it must be drawn up some hours before the time, and exposed to the sun-beams in tubs or troughs; marsh-water, or that of lowland ditches, is worst of all. When the labouring horse has drank his water, he should have his oats given him, and these should be carefully sifted, and the manger dusted first. It is a common practice as soon as a horse is come in from his work, to rub down his legs with a hard whisp of hay, but the best judges of horses absolutely condemn this, and observe, that this rubbing of the legs after hard labour, brings down humours into them, and makes them stiff.

The rubbing itself is wholesome, but the doing it when the creature is hot is the mischief; while a horse is in a sweat it is a great relief and refreshment to him to have his body rubbed down, but when he is cold is the proper time to rub his legs. The racks are to be well supplied with hay, and the horses should be left to rest and eat, about two hours, and then led to water; after this their oats should be given them, and they should then go to work again.

In the evening, when the labour of the day is over, the first thing to be done, is to examine the feet, and see if any thing is amiss about the shoes, and what earth or gravel is lodged in the foot, between the shoe and the sole, is to be picked out, and some fresh cow-dung put in its place, which will cool and refresh the part.

A very material thing for the preservation of all sorts of cattle, but of none so much as draught-horses, is fresh and clean litter.

HORSE, *Hunting*. See HUNTER.

HORSE, *Race*. See RACING.

HORSE, *Stone*. See STALLION.

HORSE, *War*. The proper rules for chusing a horse for service in war are these; he should be tall in stature; with a comely head, and outswelling forehead. His eye should be bright and sparkling, and the white part of it covered by the eye-brow. The ears should be small, thin,

short, and pricking; or, if long, they should be moveable with ease, and well carried. The neck should be deep, and the breast large and swelling. The ribs bending, the chine broad and straight, and the buttocks round and full. The tail should be high and broad, neither too thick nor too thin; the thigh swelling; the leg broad and flat, and the pastern short. When such a horse is chosen, he must be kept high during the time of his teaching, that he may be full of vigour. His food must be sweet hay, and good clean oats, or two parts of oats, and one part of beans or peas, well dried and hardened. The quantity should be half a peck in the morning, and the same quantity at noon, and in the evening. Upon his resting days he is to be dressed between five and six in the morning, and watered at seven or eight. In the evening he is to be dressed at four, and watered about five, and he must always have provender given him after watering; he must be littered about eight, and then must have food given him for all night.

The night before he is ridden all his hay is to be taken away about nine o'clock, and he must have a handful or two of oats about four in the morning; when he has eaten these, he is to be turned upon the snaffle, and rubbed very well with dry cloths; then saddled, and made fit for his exercise. When he has performed this, he is to be brought sweating into the stable, and rubbed down with dry whisks. When this has been done, the saddle is to be taken off, and he is to be rubbed down with dry cloths; the housing-cloth is then to be laid on, and the saddle being again laid on, he is to be walked gently about till thoroughly cool. After this, he must stand without meat two or three hours, then he must be fed; and in the afternoon he is to be rubbed and dressed as before, and watered in the usual manner.

HORSE, *River*, in *Zoology*. See HIPPOPOTAMUS.

HORSE, *Sea*. See HIPPOCAMPUS.

HORSE is also used, in the *Military Language*, to express the cavalry (see CAVALRY); or the body of soldiers who serve on horseback.

The horse includes horse guards, horse grenadiers, and troopers. Dragoons are also frequently comprehended under this name, though they fight on foot as well as on horseback. See DRAGOONS, GRENADIERS, and GUARDS.

Horse guards, by the Spaniards called *guardas a cavallo*; by the French, *gardes de corps*; by the English usually *life-guards*; are the guards of the king's person and body.

The duty is, by parties from the guard, to attend the king's person when he goes out near home; an honour which has been lately appropriated to the *light-horse*. On state-days he is attended by detachments out of the horse and grenadier guards.

One of three captains of the horse-guards attends on the king when he walks on foot, immediately next his person; carrying in his hand an ebony staff, or truncheon, with a gold head.

HORSE-ARTILLERY, a comparatively novel institution in the *Military Art*, by which the force of cavalry and ordnance is united with the most rapid movements, executed with machines that were once so cumbrous. This new artillery is organized on such principles as to perform movements the most rapid and the most unexpected. Thus it can proceed with celerity either to a point threatened by the enemy, or a post which, by a decisive attack, it is intended to carry; follow the horse every where, if needful, and brush the enemy by the combined effect of all the means of attack and defence which the theory of the military art, judgment, and experience can suggest.

In the campaigns of 1757-8-9 against the Russians, it often

often happened that the Prussian light-horse, at the very moment when they imagined themselves to be sure of success, met with a battery of cannon, though no infantry were present, which led them to suppose that the Russians had horse-artillery, able to follow all the movements of the horse. The fact being ascertained, Frederic the Great introduced this artillery into his army in the spring of 1759, at his headquarters at Reichenendorff, near Landshut, where every morning he exercised this new corps himself, and directed its manœuvres. The king also made a successful trial with his horse-artillery before he left that camp, by covering it with a reconnoitring party beyond Liebau, on the retreat of his dragoons, in a manner so effectual, that all the attacks of the enemy's horse, though far superior in number, completely failed. The Austrians were the first who instituted this new military establishment: in 1783 they manœuvred with horse-artillery near Prague; and since that time, it has been introduced into the British, Swedish, Saxon, and Hanoverian armies; yet with considerable difference as to the calibre of the ordnance, and the way of mounting the artillery-men. The Prussian horse artillery consists of six-pounders, the Austrian of light three-pounders, the Hanoverian of heavy three-pounders, the Danish of one-pounders, &c. The Prussian artillery-men are on horse-back; the Austrians ride on the carriages of the guns; the Hanoverian party ride partly on horse-back, partly on the gun-carriages, wursts, &c. But no European power has hitherto derived such important advantages from this new artillery as France, where it was introduced in the year 1792, and soon carried to great perfection. In order to give it the advantage of a superior fire, the French flying, or horse artillery consists of eight-pounders, and six-inch howitzers; the ammunition is carried in light caissons, and most of the artillery-men are mounted, whilst others ride on the wursts. By this arrangement, in addition to the known abilities of the French cannoneers, the Republican horse-artillery soon acquired a decided superiority over that of the Austrians, and maintained it during the whole war. The formation of the horse-artillery in France took place in the year 1791, under royal orders carried into effect by M. Duportail, minister at war, who directed that two companies of artillery-men should be established by the commandant of the military division at Mentz: and a short time before the declaration of war in 1792, M. de Narbonne, who had succeeded M. Duportail, assembled a military committee, consisting of the most experienced officers in the artillery and engineer departments, aided by the advice of the generals commanding the three grand divisions of the whole French army, and issued a number of resolutions for giving effect to this institution. It was determined, that with respect to the mode of being armed, equipped, accoutred, &c. the mounted artillery was to differ from the field ordnance only by the rapidity of its movement; on this account the horses were to be strong and active; and moreover it was considered most advantageous to the service to mount the cannoneers on horse-back, in preference to artillery carts; and that without absolutely excluding pieces of larger calibre, eight or twelve pounders and howitzers seemed best adapted to the nature of this service. It was also resolved that it would be superfluous to drill the mounted artillery-man, so as to make him master of all the cavalry manœuvres; it being thought fully sufficient for him to sit his horse well, to be able to mount and dismount with ease and celerity, to guide his horse according to the position of his piece, and to leave it entirely to his own judgment to act with the cavalry, should he find himself involved in their manœuvres.

The British government, which was among the first in

adopting this military institution, established a Brigade of six troops of horse-artillery, consisting of a colonel, two lieutenant-colonels, one major, six captains, six captain-lieutenants, twelve first lieutenants, six second lieutenants, one adjutant, one quarter-master, one surgeon, four assistant-surgeons, one riding-master, six serjeant-majors, seven quarter-master-serjeants, eighteen serjeants, eighteen corporals, forty-two bombardiers, five hundred and eighty-two gunners, four hundred and twenty-six gunner-drivers, twenty-four farriers, six smiths, twelve collar-makers, six wheelers, six trumpeters, six hundred and eighteen riding-horses, and eight hundred and fifty-eight dratt-horses.

HORSE, *Hungarian*. See CAVALRY and HUSSARS.

HORSE, *Light*. See CAVALRY.

HORSE, *Master of the*. See MASTER of the Horse.

HORSE is also a term used in various arts and manufactories, for something that helps to sustain their work from the ground, for the more commodious working at it.

The horse used by tanners and skinners, also called the *leg*, is a piece of wood cut hollow and roundish, four or five feet long, and placed aslope; upon which they pare their skins to get off the dirt, hair, flesh, &c.

HORSE is also used, in *Carpentry*, for a piece of wood jointed across two other perpendicular ones, to sustain the boards, planks, &c. which make bridges over small rivers; and on divers other occasions.

HORSE, in *Mining*, is one of the very numerous designations which have been given by practical men to the fissures and dislocations of the strata met with in coal-pits and other mines. See FAULT.

HORSE, in *Rural Economy*, the name of a sort of wooden frame strongly put together, for the purpose of sawing and cutting wood upon.

HORSE, in *Sea Language*, is the name of a rope reaching from the middle of a yard to its extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the sailors to tread upon, whilst they are loosing, reefing, or furling the sails, rigging out the fludding-sail-booms, &c. In order, therefore, to keep the horse more parallel to the yard, it is usually suspended to it, at proper distances by certain ropes called *stirrups*, which hang about two feet under the yard, having an eye in their lower ends through which the horse passes.

HORSE is also a thick rope extended in a perpendicular direction near the fore or after-side of a mast, for the purpose of hoisting or extending some sail upon it. When it is fixed before a mast, it is calculated for the use of a sail called the square-sail, whose yard being attached to the horse, by means of a traveller, or bull's eye, which slides up and down occasionally, is retained in a steady position; either when the sail is set, or whilst it is hoisting or lowering. When the horse is placed abaft or behind a mast, it is intended for the try-sail of a snow, and is accordingly very rarely fixed in this position, except in those sloops of war which occasionally assume the form of snows, in order to deceive the enemy. Falconer's *Mar. Dict.*

HORSE is also a cant name introduced into the management of lotteries, for the chance or benefit of a ticket, or number, for one or more days, upon condition, if it be drawn a prize within the time covenanted for, of returning to the seller an undrawn ticket.

To determine the value of a horse.—Multiply the amount of the prizes in the lottery by the time the horse is hired for; and from the product subtract the amount of the number of prizes by the value of an undrawn ticket into the time of the horse: the remainder being divided by the number of tickets

into the whole time of drawing, the quotient is the value of the horse. See **LOTTERY**

HOSE-back, in *Mining*, is applied to the humps or swellings on the top of some particular strata, which are subject to such anomalies, and which are also called bumps, ridges &c.

HORSE Bean, in *Gardening*. See **BEAN**.

HORSE Beech. See **CARPINUS**.

HORSE Bones, Fossil, in *Natural History*. In digging in the peat and silt of fens and marshes, it is not very uncommon to meet with the skulls and bones of horses, as in Hatfield chace, in Yorkshire, and the Isle of Dogs, in Middlesex. (Parkinson's *Organic Remains*, vol. i. p. 67 and 95.) The great comparative anatomist, M. Cuvier, in a Memoir on this subject, in the *Ann. de Muséum*, tome xiv. page 33, or *Philosophical Magazine*, vol. xxxv. p. 216, after mentioning a great number of instances and specimens preserved, of the bones of horses which had been dug up, both in modern alluvial flats, and also in quarries accompanied by the bones of unknown and extinct animals, gives the osteological characters of the horse, and confesses that though they may serve to distinguish the modern or peat fossils, they are insufficient for determining, in most instances which occur, to what species, or whether to any of the known species of the genus *equus*, the fossil remains in the strata are to be referred. (See *Phil. Mag.* vol. xxxv. p. 388.) The pretended bones of a horse found in the alum-works of Saltwick, and mentioned by Mr. Charlton in his "*History of Whitby*," p. 355, were probably those of an extinct animal.

HORSE bramble, in *Agriculture*, a common name often applied to the briar or wild rose of the field.

HORSE-bread. Bread of a proper kind is often given to horses to hearten and strengthen them when they have gone through great fatigues, or are to prepare for such. Common household-bread will answer the purpose, but the more common way is to prepare a kind of bread on purpose. There are two different receipts for making this sort of bread, each of which has its admirers. The first method is this: take wheat-meal, oat-meal, and beans ground fine, of each half a peck; aniseed, two ounces; gentian and fenugreek-feed, of each an ounce; liquorice, two ounces: let all these be made into a fine powder, and sifted together, that they may be perfectly mixed; then add the whites of twenty new-laid eggs, and as much fine ale as will knead the whole into dough. This is to be made into loaves, and well baked, but not burnt; and the horse is to have a good quantity of it every morning for five or six days, without any other provender.

The other method is much nicer, but perhaps does not any way better answer the intended purpose of heartening up the creature. It is this: take wheat-meal, rye-meal, bean-meal, and oat-meal, of each half a peck; aniseed and liquorice, of each an ounce; white sugar-candy, four ounces: beat all these into powder, and sift them together; then add the whites and yolks of twenty new-laid eggs, and as much white-wine as will make the whole into a dough. Let this be made into great loaves, and well baked; it must not be given the horse too new, but when it has stood about three days it may begin to be used; the outside is always to be chipped off when any of it is given. These are the two sorts of bread usually given to prepare horses for long journeys. But there are three other receipts for making bread for race-horses, which are as much esteemed, and are given by our expert jockies for the second, third, and fourth fortnight's feed. The first kind is made in this manner: take three pecks of clean beans, and one peck of fine wheat; let these be ground together, and kneaded into

dough, with a large quantity of fresh barm or yeast, but with as little water as may be: when this has heaved and worked up a little, let it be kneaded again, and then made into large loaves and carefully baked; when three days old it may be given to the horse, but not sooner.

The second sort is to be made as the other, only with equal quantities of beans and wheat, and the crust of this is to be cut quite away before it is eat. This is to be given to the horse at his usual meals, either alone, or mixed with oats and split beans.

The third sort of bread is stronger than either of the others, and is to be made thus: take three pecks of wheat, and one of beans; let them be ground together, and made into very fine flour; knead this up into dough with a good quantity of yeast dissolved in as much strong ale as is necessary; add the whites of twenty eggs, and make the whole into large loaves. These must be thoroughly baked, and when they have stood three days, the crust must be cut off, and the crumb only given, either alone, or mixed with oats or split beans. This is to be the food for the last fortnight.

HORSE Chestnut, in *Gardening*. See **ÆSCULUS** and **CHES-NUT Tree**.

HORSE Chestnut, Petrified, in *Natural History*. In that fruitful soil for vegetable resemblances, the pyritic cliffs of the upper part of the London clay in Sheppy island, in the Thames, Mr. Jacob mentions a nut resembling the horse-chestnut of America: the reality of its being a nut of any kind is much to be questioned, from the circumstances attending it.

HORSE Course. See **HIPPODROME**.

HORSE-dung, in *Agriculture* and *Gardening*, the name of that sort which is produced by the horse in the stable or other place. As it exists in these situations it is generally much blended and intermixed with different sorts of strawy materials, which, from their disposing the dung to take on heat more readily, render it of great utility in different views of field and garden culture. It is this property of running speedily into the state of fermentation that makes it so useful in the forming of hot-beds in the gardens, in order to raise several different early productions of the culinary kind, as well as many tender plants of other descriptions.

That which is the most proper for this use, in general, is such as has continued together in the common dung-hill until a considerable heap has been formed; and where it has already commenced the incipient stage of fermentation, and is become either wholly or partially moist warm, and capable of sending forth some degree of steam, it is still more suitable for the purpose. When, on turning it up with the fork, it puts on a sort of blackish appearance, and is dry without being rotten or exhausted, and abounds with a fresh substantial material that has a lively, moist, steamy warmth, it is in the most proper condition for the construction of hot-beds. But dung that is of a fresher quality, yet moist and full of steamy litter, is highly desirable, as it is readily capable of being brought into the proper state. With this raw sort, the best plan is to have it thrown up and well mixed together, before it be employed in constituting the hot-beds.

Where it is intended to be used merely as manure, whether in the field, or the garden, it is the most proper for almost every kind of crop, when it has passed into a considerably more reduced state, and is become more soft and more imbued with moisture. On this account, it is found extremely useful in raising various sorts of culinary vegetables in the open ground, after it has been employed

ployed in the forcing-frames, or other hot-bed culture. It is essential, in all large gardens, to have full supplies of this sort of materials always at hand during the seasons at which it is likely to be wanted. See *DUNG*, *HOT-bed*, and *MANURE*.

HORSE-engine, in *Mining*, is applied to the gins which are used at some of the lead-mines, similar to those of the coal-mines for drawing their ore and vein-stuff, and their water also, in barrels, in some few instances. See *WINDING Engine*.

HORSE-fly, in *Entomology*. See *HIPPOBOSCA Equina*.

HORSE-gin is a vertical axle and large cylinder or drum, turned by horses, for drawing coals or ores from pits or mines, &c. See *WINDING Engine*.

HORSE-gold, in *Mining*, is in some districts used to denote the hematites, or yellow pyrites.

HORSE-hairs, animated, a term used to express a sort of long and slender water-worm, of a blackish colour, and so much resembling a horse-hair, that it is generally, by the vulgar, supposed to be the hair fallen from a horse's mane into the water as he drinks, and there animated by some strange power. Dr. Lister has at large confuted this absurd opinion, in the *Philosophical Transactions*. See *AMPHIBÆNA aquatica*.

HORSE-hair-worms. See *AMPHIBÆNA*.

HORSE-hoe, in *Botany*. See *STAR wort*.

HORSE-hoe, in *Rural Economy*, a name given to that sort of hoe, which is drawn by the labour of the horse. See *HOE*.

HORSE-hoeing, a term signifying the operation of stirring, breaking down, and cultivating the soil, between the rows of grain, and other kinds of crops, by the use of the horse-hoe. See *HOEING*.

HORSE-island, in *Geography*, a small island of Scotland, in the Frith of Clyde, near the coast of Ayrshire. N. lat. 55° 41'. W. long. 4° 52'.

HORSE-islands, a cluster of small islands near the E. coast of Newfoundland. N. lat. 50° 25'. W. long. 55° 30'.

HORSE-keeper, in *Agriculture*, a name applied to the person, or servant, who has the charge of keeping, and looking after, team or other horses. It is necessary he should be well qualified for his business, as without a steady regular horse-keeper, the farmer may sustain great injury and loss in various ways; while, with a proper manager, his savings may be considerable, without the condition of the animals being in the least impaired. It forms part of the constant attention of the horse-keeper to see that the horses of which he has the charge, are properly cleaned, watered, and fed as soon as they return from their labour, and that their feet be well cleared beneath the shoe, by the picker, from all sorts of little stones and earthy matters. The shoes should likewise be carefully examined, to see that they are perfectly fast and in order. Good shoes usually last something more than a month. It is also proper for this person to take care that they have plenty of litter, and that it be properly applied, as well as that their feeds of oats and cut meat be given them in a regular manner, and in sufficient quantities. The usual periods of feeding with grain are morning, noon, and night, and the proportion for each horse, each time, from a quarter to half a peck, with frequently about two handfuls of beans, and sometimes cut chaff. The oats should be well sifted, to clear them from dunt, sand, &c. It is necessary, in addition, to let them have water twice, or oftener in the course of the day. See *TEAM*.

Another part of the duty of the horse keeper is, that of taking care of, and keeping the harness, &c. in proper order. This is done by preserving them constantly clean

and well oiled. When not in use, they should always be hung up carefully in their proper room or place after having the dirt, &c. well cleaned from them.

HORSE-knobs, a common name frequently applied to knob or knap weed.

HORSE-leech, in *Zoology*. See *HIRUDO sanguifuga*.

HORSE-line, in *Nautical Affairs*, signifies the long line or rope used for towing or dragging of barges or boats on navigable rivers and canals; it is usually fastened to the top of the mast on wide rivers, and to the top of a short mast in canal-boats, called the chock, which can pass under the bridges, and from which the line can readily be unhooked or cast off by the boat man, to pass bridges which have no towing path under them. See *CANAL*.

HORSE-load, is a denomination of a measure or quantity in several different counties, chiefly of corn or lime. At Lancaster the load of barley is 6 bushels, of oats 7½ bushels, and of wheat, beans, or peas 4½ bushels; at Manchester the load of beans is 5 bushels, and of oats 9 bushels; at Ulverstone a load of oats is 6 bushels, and of wheat 4½. In most parts of Derbyshire a load of corn is 8 bushels; in many places the load or weight is five bushels. A load of lime in Derbyshire is 3 heaped bushels.

HORSE-mackarel, in *Ichthyology*. See *SCOMBER trachurus*, or *SCAD*.

HORSE-measure, that sort of measure which is employed to ascertain the heights of horses, which is done by a sort of box rod, so contrived as to slide out of a cane, having a square at the end, which is divided into hands and inches, by which a horse, or any other animal, may be measured.

HORSE-mint. See *MINT*.

HORSE-muscle. See *MUSCLE*.

HORSE-muscle Shells, in *Natural History*. The late Mr. Whitehurst, in describing the strata of Derbyshire, Inquiry concerning the Earth, p. 208. 2d edit., mentions the shells of fresh water horse muscles, as found in abundance in a thin stratum of iron-stone. Mr. William Martin, in his *Petrificata Derbientia*, plate 27, figures and describes this shell, and denominates it the *mya ovata* of Dr. Maton; it has been said, however, by competent judges, that the above authors were influenced too much by their theory of the coal-measures being formed in *fresh water*, and that the resemblance is not exact between the shells of the muscle-band iron-stone, or iron-stone marble, (the course of which, through Derbyshire and into Yorkshire, is described in Mr. Farey's Report, vol. i.) and any recent or known shells whatever.

HORSE-path, in *Engineering*, is sometimes applied to the towing-path which is constructed by the side of all canals, and by narrow navigable rivers, for the use of the towing or track horses. See *HAULING way*.

HORSE power, in *Mechanics*. Among practical mechanics it has been usual, of late years, to estimate the power of large machines and engines by the number of horses to whose work they are equivalent, applied to a horse-wheel, during a given time. This term was introduced when steam-engines first began to supersede horse-mills, in such numerous branches of English manufactures, and when it was natural for the manufacturer to enquire how many horses a steam engine would dispense with in his works, and at what first cost of erection, and per annum in coals, attendance, and repairs afterwards. Messrs. Bolton and Watt's present estimate of this power is, as we are informed, 32,000lb. raised one foot per minute; the late Mr. Francis Thompson of Althover, Derbyshire, who erected a good many engines, used to estimate it at 33,000lb. Defagulier's experiments, when thus reduced, give 22,000lb.; and another experi-

ment 27,500lb. ; those of Mr. Samuel Moor, the late secretary to the Society of Arts, give 21,120lb. ; Mr. Olinthus Gregory, in his *Mechanics*, states 18,480lb. ; Mr. James Watt 20,000lb. ; and the experiments of Mr. Smeaton give 22,750lb. raised one foot high in one minute, as above : perhaps 22,000lb. may be a proper mean for the actual work of a horse, and is equivalent to 100lb. $2\frac{1}{2}$ miles per hour. See **FORCE**.

HORSE-radish, in *Gardening*. See **COCHELEARIA**.

HORSE-rake, in *Agriculture*, a name applied to a large sort of rake which is usually drawn by a horse, and frequently in use in the more southern parts of the kingdom. It answers well for stubbles, and large horse-rakes for hay are now likewise found very beneficial. See **RAKE**.

HORSE-river, or *Rio de Cavallos*, in *Geography*, a river of Mexico, which runs into the bay of Honduras, N. lat. $15^{\circ} 48'$. W. long. $86^{\circ} 45'$.

HORSE-run, in *Engineering*, is a simple and useful modern contrivance, for drawing up loaded wheel-barrow of soil from the deep-cuttings of canals, docks, &c. by the help of a horse which goes backwards and forwards, instead of round, as in a horse-gin, which we have fully described in our article **CANAL**.

HORSE Stealing, the taking of horses from the pasture grounds or other places, by persons who have no claim or right to them whatever.

It is a practice which is very prevalent, notwithstanding the very heavy punishments and severe penalties that are inflicted in cases of detection. There is much difficulty in providing any full and adequate remedy for this nefarious practice ; it has, however, been suggested as the best mode of security to lock "upon the shank or pattern of the horse, a case hardened, and fire proof iron ring, lined with some soft material to prevent chafing, and bearing the owner's name and place of abode," though "some have preferred the fixing a collar upon the neck," but "which is rather more expensive, and perhaps less secure from the fire," yet "in either case the price would not be any great object. It is granted, there would be no absolute security in this plan, since thieves get their bread by their ingenuity ; but it would certainly place a very great and formidable difficulty in the way of the exercise of their calling. There are few thieves, but who, on inspection, would prefer a horse without this troublesome mark upon him. Granting a man did his business at random, and blundered upon a horse in the dark bearing the aforesaid mark, as soon as the light should enable him to discover it, he would, no doubt, run away from his new and dangerous bargain as fast as he would from a thief-taker. Suppose even a man went prepared with tools proper to destroy the iron, he must have an assistant, and the operation would require some time, which would risk a discovery. In cases of strays, the security is complete. But, in all cases, it seems the present trouble is supposed to outweigh the eventual benefit of precaution." But this is left to the attentive calculation of such as are interested in the matter. Where the horses are of the more valuable kinds, no methods of precaution which have any chance of being useful should be neglected.

HORSE-tail, *Shrubby*, in *Gardening*. See **EPHEDRA**.

HORSE-tail plant, *Petrified*, in *Natural History*. In that fruitful repository of extraneous fossils, the cliffs of the upper part of the London clay strata in Sheppy island, in the Thames river, the strata of which seem to answer to those just now exposed by the tunnel and deep-cutting for the new road on the east side of Highgate town, Mr. Jacobs describes (*Plantæ Favershambienfes*, p. 138.) joints of the equisetum or horse-tail plant, as sometimes found, of the

naked species, three inches long. Dr. Grew, in his catalogue of "Rarities" of Gresham college, p. 268. mentions a horse-tail plant or hippurites, a stone with the impressed figure of three stalks, elegantly rising up from one root, preserved in that collection.

HORSE-tree, a common name signifying the same thing as whippin, whipple, or swingle tree, when applied to the draught of tools of different kinds.

HORSE, Wooden, an instrument of military punishment, formerly much in use in different services. The wooden horse was formed of planks nailed together, so as to form a sharp ridge or angle about eight or nine feet long, which ridge represented the back of a horse. It was supported by four posts or legs, about six or seven feet long, placed on a stand made moveable by trucks ; and in order to complete the resemblance, a head and tail were added. When a soldier or soldiers were sentenced by a court-martial, or ordered by the commanding officer of the corps to ride this horse, they were placed on the back with their hands tied behind them, and frequently, as an increase of the punishment, had muskets tied to their legs, to prevent, as it was jocularly said, their horse from kicking them off ; this punishment being chiefly inflicted on the infantry, who were supposed to be unused to ride. At length, riding the wooden horse having been found to injure the men materially, and sometimes to rupture them, it was left off.

HORSE Worm, in *Natural History*, a species of fly-worm called also *bott*, produced of eggs deposited by a two-winged fly, of the shape and size of the humble-bee, in the intestines of horses. See **BOTTS**.

HORSERS, in *Engineering*, is applied in some maritime districts to the jetties or erections of wood or fascinery, made to protect the sea walls from the waves.

HORSE-BLOCK See **ANABATHRA**.

HORSE-MAN, the name given to a particular species of pigeon, called by Moore the *columba tabellaria minor*. It very much resembles in shape the carrier-pigeon, but it is smaller, and shorter necked ; the protuberant flesh on the beak, and round the eye, is also less in quantity ; it is more barrel-headed also, and the eye is somewhat pinched. It is a matter of dispute whether this be an original species of pigeon, or a bastard between the carrier and tumbler pigeons.

There are of this species of all sorts of feathers, but the blue and blue-pieds are the most valued. These are one of the sort of pigeons made use of in England for carrying letters, and flying for wagers ; for the true original carriers are now very scarce, and not risked on every trifling occasion.

HORSEMANSHIP, the art of breaking, disciplining, and managing horses.

Horse-anship, in its latitude, includes what relates to the knowledge of the make, colour, age, temper, and qualities, of horses ; their respective countries and climates, with the manner of breeding, propagating, &c. the discovery of the uses or service they are fitted for ; whether the wars, the race, the saddle, or labour ; and forwarding and accommodating them for this purpose.

In this general sense it also includes the knowledge of the defects and diseases of horses, and the remedies proper for the same, with the several operations requisite thereto, as *docking*, *gelding*, *shoeing*, &c. and thus takes in the farrier's province.

But the word is in a more peculiar manner understood of the art of riding, or of directing a horse to advantage ; not only in the ordinary motions, but more especially in the managing, or making him work upon voltes, airs, &c. See **MANEGE**.

HORSHAM, in *Geography*, a market and borough town in the rape of Bramber, and county of Suffex, England, is traditionally said to derive its name from Horsh, a Saxon chieftain, who is supposed to have had either a place of residence here, or to have achieved some victory in this part of the country. There is no record preserved, however, of either event, and the origin of the place may be as rationally referred to some other person or circumstance. In the county of Norfolk is another parish of the same name, which has equal claims to the same etymology. Of the present Horsham, we do not find any early records; though it is stated to have returned two members to parliament in the reign of king Edward I. This privilege it still retains, as a prescription borough. Its civil government is vested in a steward, two bailiffs, and two constables; whilst its election franchise is confined to 25 burghage holders, *i. e.* persons occupying, or possessing burghage houses, or lands within the borough. These are now wholly the property of the duke of Norfolk; who, consequently, has the unrestrained power of nominating and appointing the members. The county gaol, for Suffex, stands near the south-eastern extremity of this town. It is a large convenient edifice, and is built conformably to the plan recommended by Howard. From ancient custom, the assizes for the county of Suffex are alternately held here, and at Lewes; at this place, the petty sessions are also held. The church, a large irregular building, contains two old tombs, besides mural tablets of modern date. In the town are four other places of worship, belonging to different sects of dissenters. Here is a free-school, which was originally endowed with 30*l.* a year for a master, and 20*l.* for an usher. In 1801 the town contained 573 houses, and 3204 inhabitants. Here is a weekly market on Saturdays, which is noted for its poultry; and the last Tuesday of every month is appropriated for a cattle market. Here are four annual fairs. Horsham is 41 miles S. of London, and 20 miles N.W. of Brighton.

In the vicinity of the town are the following seats: Hills, lately belonging to lady Irving. Field Place, the seat of Timothy Shelley, esq. New Lodge, the seat of I. Aldridge, esq. Coolhurst, Edward Carter, esq. Den Park.

HORSHAM, a township of America, in Montgomery county, Pennsylvania, containing 781 inhabitants.

HORSHAM Stone is a kind of thin broad slate, of a greyish colour; formerly much used, especially in Suffex, to heal or cover churches and chaucels, great houses, &c. but on account of its weight very unfit for the purpose.

It is called Horsham stone, because chiefly brought from the town of Horsham in Suffex.

HORSEHEAD, in *Mining*, is a large hopper of wood, the small end of which is close joined to the air-pipes, or fangs, which are used in the lead mines of Derbyshire subject to foul air: the horsehead being turned towards the wind from time to time, a current of air is by that means directed down the fangs into the mine.

HORSEHEAD Cockle, or *Hippocephaloides*, in *Natural History*, depressed on one side and having the future or joint in the middle of the depressed part, is found in the limestone strata of Buckinghamshire. Jones's *Phys. Dissq.* p. 404. Sometimes these are called horsehead muscles by the quarrymen and others.

HORSEHEAD Flints, in *Geology*, is a name pretty generally known in the chalk districts of England, and adopted by Mr. Smith and his pupils, for the large and irregular black flints with white surfaces, resembling in size, and somewhat in outward shape, the heads or skulls of horses, which being

curiously locked into each other, almost like the sutures of a skull, form a stratum of flints of six to ten inches thick on the very top of the chalk series, and of which these horsehead flints are very characteristic. These flints are very commonly found in the alluvial clays of Woburn, in Bedfordshire, and other places still more distant from the chalk; and what among other circumstances prove these clays, &c. to have been moved in mass and not rolled along the surface by water, is, that the horsehead flints, though exceedingly brittle, often have large holes through them near their edges, so as to form handles to them, which are entire and unbroken, though a slight blow would detach them as the handle of an earthen pitcher or mug; by means of these holes they are very often suspended as jack-weights, and for other similar purposes, in the districts where they are found.

HORSELEY, JOHN, in *Biography*, a learned antiquarian, was a native of Northumberland, and was educated at the grammar school of Newcastle-upon-Tyne; he studied for some time at one of the northern universities, where he took a degree, and then settled at Morpeth as pastor to a congregation of Dissenters. He died in December 1731, at the age of 46. His great work did not appear till 1732, some time after his death. It is entitled "Britannia Romana," and contains a large account of all the vestiges of the connection of the Romans with this island. It consists (1) of an historical relation of all the Roman transactions in Britain; (2) of a collection of all the Roman inscriptions which have been discovered in Britain; (3) of the geography of the island, as laid down by Ptolemy, &c. Mr. Horseley was a considerable mathematician, and gave lectures in several branches of natural philosophy, both at Newcastle and Morpeth. *Gen. Biog.*

HORSENS, in *Geography*, a sea-port town of Denmark, situated on the Baltic, in Jutland, in the diocese of Aarhus; having a harbour with the water too shallow for admitting any vessels besides lighters. It is a place of considerable trade, with manufactures of flannel and other woollen stuffs, and contains two churches; 19 miles S.S.W. of Aarhus. N. lat. 55 52'. E. long. 9 52'.

HORSE-SHOE, in *Fortification*, is a work sometimes of a round, sometimes of an oval figure, inclosed with a parapet, raised in the ditch of a marshy place, or in low grounds; sometimes also to cover a gate; or to serve as a lodgment for soldiers, to prevent surprizes, or relieve an over-tedious defence.

HORSE-SHOE Head, a disease in infants, wherein the sutures of the skull are too open, or too great a vacancy is left between them; so that the aperture shall not be totally closed up, or the cranium in that part not be so hard as the rest for some years after.

This openness is found to be increased upon the child's catching cold. When the disease continues long, it is reputed a sign of weakness and short life. In this case, it is usual to rub the head now and then with warm rum, or brandy, mixed with the white of an egg, and palm-oil.

Sometimes the disorder arises from a collection of waters in the head, called an hydrocephalus.

HORSE-SHOE, in *Mining*, is used by Mr. Kirwan (*Geol. Ess.* p. 337.) to express a depression of strata in a trough, such, probably, as the vale of the goyte between Derbyshire and Cheshire presents a striking instance of, according to Mr. Farey's Report, vol. i. p. 172; in this case the edges of the strata present the form of a lengthened horse-shoe dipping inwards; but a more remarkable and larger case of a horse-shoe, of the edges of strata, dipping outwards, is there described as presented by the edges of the first or millstone

millstone grit rock, from Little Eaton, near Derby, northward to the Woodlands of Hope, and then again southward near to Dilhorn in Staffordshire.

HORSE-SHOE, in *Rural Economy*, the well-known iron cover or defence which is fastened by means of nails upon the foot of the horse. It requires much care and attention to shoe horses in a safe and proper manner. See *SHOEING of Horses*.

HORSE-SHOE Point, in *Geography*, the most southerly point of land, near the E. end of the island of St. Christopher. N. lat. $17^{\circ} 19'$. W. long. $63^{\circ} 32'$.

HORSE-SHOE Vetch, in *Botany*. See *VETCH*.

HORSING-BLOCK, in *Engineering*, is a square frame of strong boards used by canal diggers, to elevate the ends of their wheeling-planks upon. See *Plate VII. of CANALS*, fig. 49.

HORSLEY, SAMUEL, in *Biography*, eldest of the three sons of the Rev. Mr. Horsley, formerly minister of St. Martin's in the Fields, was born about the year 1737. He was educated at Westminster school, whence he was removed to the university of Cambridge. Here he applied himself chiefly to the study of the mathematics, and not content with reading modern authors, he went back to the profoundest of the ancients, and made himself master of their works. When he had taken his degree of M. A. he went to Oxford as private tutor to the earl of Aylesford. He received at this university the degree of doctor of laws, and in 1769 he printed at the Clarendon press his edition of Apollonius, a work of great value, but exceedingly abstruse. Here he conceived the design of publishing a complete edition of the works of sir Isaac Newton, for which he began to collect the necessary materials. On leaving the university, Dr. Horsley came to London, where he was elected a fellow of the Royal Society, of which he was chosen secretary in 1773. He continued to serve that office with the greatest credit to himself, as well as benefit to the interests of science, till the resignation of the then president, sir John Pringle. Soon after his settling in London, he accepted of the office of chaplain to bishop Lowth, who presented him to the rectories of St. Mary Newington and Albury, both in the county of Surry, and in the course of the year he married Miss Botham. In 1776 he published proposals for his edition of Newton, which appeared in 1779 in five volumes, royal quarto. To this edition is prefixed a dedication to the king, written by the doctor in excellent Latin, which concludes with these words, "Te, Pater, tantum Doctrinarum Artiumque omnium Patronum, diu nobis sospitet, tueatur, custodiat. Tibi vero gratum precor sit Munus, quod reverentiæ et officii causâ Tibi dicat, qui in subditorum Tuorum fidelissimorum numero nomen suum profiteri gestit, unus idem ex humillimis." In 1778, when the controversy was on foot between Drs. Priestley, Price, and others, respecting materialism and philosophical necessity, Dr. Horsley preached a sermon on Good Friday at St. Paul's cathedral, which he afterwards published. In this discourse he endeavours to reconcile the doctrine of divine providence with the free agency of man, and combats the necessarian hypothesis with much ability. About this period he was appointed archdeacon of St. Alban's by his patron bishop Lowth, who, in 1782, presented him to the valuable living of South Weald, in Essex. From this time he entered avowedly and zealously into the controversy of the Unitarian doctrine with Dr. Priestley; the latter maintaining the simple humanity of Christ, in opposition to the creed of the established church, which admits of three Gods in every respect equal. The controversy was carried on with some bitterness, till at length the archdeacon signified his intention to proceed no farther, saying, that it was an endless task to

contend upon an exhausted topic with one who was never disposed to cease disputing without having the last word. In 1789, Dr. Horsley collected the tracts which he had written on the occasion, and printed them in one volume octavo, with additions, particularly a sermon on the Incarnation, which had a material relation to the controversy in question. He had, in the year 1788, been raised to the bishopric of St. David's by the interest of lord Thurlow, who said, that those who defended the church and its doctrines were justly entitled to the honours and emoluments it had to confer. In the year 1790, when the Protestant Dissenters were struggling for relief from the test and corporation acts, the bishop published a pamphlet without his name, entitled "A Review of the Case of the Protestant Dissenters." This piece excited much attention, its style was nervous, but it was accused of illiberality and unfairness in the argument. It was a justification of high church principles, and brought forth a number of answers from persons in and out of the church. In the year 1794, bishop Horsley was translated to the see of Rochester, which he held with the deanery of Westminster. In 1796 he gave the public a very learned dissertation on "The Latin and Greek Prologies," which he dedicated to lord Thurlow; and in the year 1800 appeared in quarto his *Critical Disquisitions on the Eighteenth Chapter of Isaiah*, in a letter to lord King. Two years after this he published a new translation of the prophet Hosea, with notes critical and explanatory. He was in the same year translated to the rich see of St. Asaph; after this, the principal work that came from his lordship's pen was a critical essay "On Virgil's two Seasons of Honey, and his Season of sowing Wheat; with a New and Compensious Method of Investigating the Risings and Settings of the fixed Stars." Dr. Horsley died at Brighton on the 4th of October, 1806. No man of the age, perhaps, possessed more of what is generally understood by the idea of recondite learning. As a senator he was considered in the first class; there were few important discussions in the house of peers, especially when the topics referred to the hierarchical establishments of the country, to the French revolution, or to the slave trade, of which he was a systematic and eloquent opponent, in which his lordship did not participate. As an orator, his voice was deep, full-toned, and commanding, his enunciation distinct, and his delivery highly advantageous. As an author, besides the works already referred to, he published many smaller pieces, and also three volumes entitled "Elementary Treatises on the Fundamental Principles of Practical Mathematics for the Use of Students." As a bishop, an overseer of his diocese, his conduct was exemplary and very praise-worthy. In the see of St. David's, which was said to exhibit more of ignorance and poverty than that of any other in the kingdom, he carried through a regular system of reform. He regulated the condition of the clergy, and proceeded to a stricter course with respect to the candidates for holy orders, admitting none without personally examining them himself, and looking very narrowly into the titles which they produced. With all this vigilance, his lordship acted to them as a tender father, encouraging them to visit him during his stay in the country, which was usually for several months in the year, assisting them with advice, and ministering to their temporal necessities with a liberal hand. In his progress through the diocese, he frequently preached in the parish churches, and bestowed considerable largesses on the poor. "He was," says his biographer, "a blessing to his people, and they followed him with grateful hearts, and parted from him with infinite reluctance." Since the death of the bishop, two volumes of his sermons have been given to the world by his son,

fon, who propofes, "if it please God to spare him a few years," to publish an uniform edition of all his father's works, with a biographical account of the author. The bifhop has left behind him in MS., but ready for the prefs, a Tranflation of the Book of Pfalms, with Notes; a Treatife on the Pentateuch, and on the Historical Books of the Old Testament; a Treatife on the Prophets; containing Notes on Ifaiah, Jeremiah, Ezekiel, Joel, Amos, and Obadiah; which will be publifhed, if the demand for them be fuch as to juftify the undertaking. Monthly Magazine, vol. xxii. Preface to Sermons, by Samuel Horfley, LL.D. F.R.S F.A.S. late lord bifhop of St. Afaph.

HORST, in *Geography*, a town of Weftphalia, in the bifhopric of Paderborn; 10 miles W.S.W. of Paderborn.—Alfo, a town of Germany, in the county of Marks; fix miles N.N.W. of Hattingen.—Alfo, a town of the duchy of Holftain; four miles E. of Krempe.

HORSTIUS, JAMES, in *Biography*, a phyfician and botanift, was born at Torgau, in May 1537, and took the degree of M.D. at Francfort on the Oder in 1562. After having praftifed his profefion for feveral years, he was appointed ordinary phyfician of the archduke of Austria in 1580; a poft which he occupied about four years, and then was elected to a chair in the univerfity of Helmftadt, in which he pronounced an inaugural oration, "De remoris difcentium medicinam, et earum caufis." He is faid to have been dean of the faculty and vice-rector of that univerfity in 1595, and to have died in May 1600; but others believe that his death occurred earlier. His works are as follows: "Precationes Medicorum Pix," Helmftadt, 1585, 12mo. "De vite vinifera ejuſque partibus opufculum," ibid. 1587, 8vo. Marburg, 1630, with the following: "Herbarium Horftianum, ſeu, de felectis plantis et radicibus libri duo," Helmft. 1587. "De natura, differentiis, et caufis eorum qui dormientes ambulant," Lipſiæ, 1593, 8vo. "De aureo dente maxillari pueri Sileſii," Lipſ. 1595. "Epiſtolæ Philoſophicæ et Medicinales," ibid. 1596. "Diſputationes Catholicæ de rebus ſecundum et præter naturam," Wittemberg, 1609. Eloy. Diët. Hiſt.

HORSTIUS, GREGORY, an able and learned phyfician, nephew of the preceding, was born at Torgau, where his father was one of the chief magiſtrates, in the year 1578. After having received the rudiments of his education in the ſchools of Torgau and Halberftadt, in which he far outſtripped his equals in age, he went to the univerfity of Wittemberg, and commenced the ſtudy of medicine; and afterwards travelled through the principal ſtates of Germany, and into Switzerland, being introduced not only in the ſchools of ſcience, but to men of literature in general. At Baſil he received the degree of M.D. in March 1606; and on his return, in the ſame year, to his native place, he was immediately appointed to a medical profefſorſhip, in the univerfity of Wittemberg, by the elector of Saxony. Two years afterwards he was promoted by the Landgrave of Heſſe to a medical chair in the college at Gießen, and in 1609 was honoured with the title of Archiater of Heſſe. At this time his professional character had riſen in the public eſtimation, and he numbered among his patients the principal nobility of the diſtrict. In 1622, he received a public invitation from the magiſtracy of Ulm to ſettle there as phyfician to that city, and as preſident of the college. He fulfilled his duties in both theſe offices with great reputation; and his integrity and humanity, not leſs than his extenſive erudition, and his ſucceſſful practice, endeared him to his fellow-citizens, and claimed the reſpect and admiration of the ſurrounding ſtates. He died in the month of Auguſt 1636, aged 58 years. During his reſidence at Gießen and at Ulm he employed his

leisure in active ſtudy, and he left a conſiderable number of works, of which it will be ſufficient to enumerate the titles of the principal. The whole of his works were collected and publifhed, under the title of "Opera Medica," in 1660, 3 vols. folio, at Nuremberg, by his youngeſt ſon, Gregory. Among his ſeparate publications are "De Natura Humana Libri duo," Wittemberg, 1607. "Tractatus de Scorbuto, ſive, de magnis Hippocratis Lienibus, Pliniique Stomacæ et Scelotybe," Gießen, 1609, 1615. "Centuria problematum Medicorum," 1610. "De morbis eorumque caufis Liber," ibid. 1612, in 4to. "De tuenda ſanitate Studioſorum et Literatorum Libri duo," ibid. 1615, in 8vo. "De natura Thermarum Diſſertatio," 1618, in 4to. with ſome other tracts. He publifhed alſo two volumes in quarto, at Ulm, 1625—28, "Observationum Medicarum ſingularium Libri quatuor," with a ſupplement, in 1631; and an abridgment of his uncle's "Herbarium Horftianum," 1630; and ſome ſmaller tracts, entitled "De natura amoris;" "De natura motus animalis et voluntarii;" "De caufis ſimilitudinis et diſſimilitudinis in factu reſpectu parentum," &c. See Gr. Horſtii Oratio funebris à J. D. Dieterich, ſubjoined to his works. Eloy. Diët. Hiſt.

HORSTIUS, JOHN-DANIEL, and GREGORY, two ſons of the preceding, were alſo phyſicians and profefſors of medicine; the latter of whom died at the age of 35; but John-Daniel lived to his 65th year, and was the author of ſeveral works, chiefly anatomical, and of little value at preſent. He was concerned with his brother Gregory in editing the collection of his father's works; and likewiſe publifhed an edition of the "Queſtiones Medico-legales" of Paul Zacchias, Francfort, 1666, in folio; and an edition of the "Opera Medica" of Riverius, at the ſame place, in 1674, in folio. Eloy.

HORSTMAR, in *Geography*, a town of Germany, in the bifhopric of Munſter; 15 miles N.W. of Munſter. N. lat. 52° 9'. E. long. 7° 17'.

HORSZCZYK, a town of Poland, in the palatinate of Volhynia; 48 miles N. of Zytomiers.

HORTA, in *Mythology*, a goddeſs among the Romans, who preſided over youth and excited them to virtue by her exhortations. Her temple is never ſhut, to admoniſh youth, ſo liable to be ſeduced, *cerea in vitrum ſteſi*, that they ſhould be always diſpoſed with particular vigilance over themſelves to the practice of virtue.

HORTAGILERS, in the grand ſeignior's court, are upholſterers, or tapeſtry-hangers.

There is no city better or more orderly regulated than the grand ſeignior's camp; and to have a notion of the magnificence of that prince, he muſt be ſeen in that equipage; as he is much better lodged and accommodated there than at Conſtantinople, or any other city of his dominions.

He has always two tents or pavilions, and two ſets of furniture entire; that, while he is in one, they may pitch or ſpread the other.

In order to this, he has conſtantly 400 hortagilers, or upholſterers in his retinue, who go a day's journey before him to fix on a proper place. They firſt prepare the ſultan's tent, and then thoſe of the officers of the Porte; and the beglerbeks, according to their rank.

HORTATOR, in the *Roman Navigation*, an officer whoſe buſineſs it was to give the word of command to the rowers, and to direct them when to ſtop, and when to ply their oars.

The Greeks gave the name of celeuſtes to this officer.

HORTE, JOHN, in *Biography*, a learned prelate, who was educated for a diſſenting miniſter under Mr. Thomas Rowe, and had for a fellow-pupil the celebrated Dr. Iſaac

HOSE-Husk, a long round husk; as in pinks, july-flowers, &c.

HOSEA, in *Scripture History*, a canonical book of the Old Testament; so called from the prophet of that name, its author; the first in order of the lesser prophets, and perhaps, Jonah excepted, the most ancient of them all. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatry of the people of Judah and Israel, to denounce the divine vengeance against them, and to foretel the captivity in Assyria. His style, says bishop Lowth, exhibits the appearance of very remote antiquity; it is pointed, energetic, and concise. It bears a distinguished mark of poetical composition, in that pristine brevity and condensation, which are observable in the sentences, and which later writers have in some measure neglected. This peculiarity has not escaped the observation of Jerom. "He is altogether," says he, speaking of this prophet, "laconic and sententious." But this very circumstance, which was anciently supposed, without doubt, to impart uncommon force and elegance, in the present ruinous state of Hebrew literature, is productive of so much obscurity, that although the general subject of this writer be sufficiently obvious, he is the most difficult and perplexed of all the prophets. Besides, the duration of his ministry must include a very considerable space of time; but we have now only a small volume of his remaining, which, it seems, contains his principal prophecies: and these are extant in a continued series, with no marks of distinction as to the times in which they were published, or the subjects of which they treat. We need not therefore be surpris'd, if, in perusing the prophecies of Hosea, we sometimes find ourselves in a similar predicament with those who consulted the scattered leaves of the Sibyl. Lowth's *Lect.* on the sacred poetry of the Hebrews, by Gregory, vol. ii. See **HEBREW Poetry**.

HOSEPOUR, in *Geography*, a town of Hindoostan, in Bahar; 50 miles N.W. of Chuprah. N. lat. 26° 25'. E. long. 84° 18'.

HOSHEARPORUM, a town of Hindoostan, in Lahore; 40 miles E. of Jallindar.

HOSIUS, STANISLAUS, *Cardinal*, in *Biography*, one of the most illustrious Catholic prelates in the 16th century, was a native of Cracow, and born in the year 1504. He received his early education at the place of his birth, and was sent to pursue his academical studies at the university of Padua. After continuing there some time, he removed to Bologna, where he was admitted to the degree of doctor of laws. The superiority of his talents brought him to the notice of the king, who made him his secretary, and afterwards employed him in the chancery, in the management of the most important state affairs. Shortly after this he was nominated to the bishopric of Culm, from whence he was translated to the see of Walmia. He was now employed on missions of importance by the pope Pius IV. to the emperor Ferdinand, and to the king of Bohemia, to negotiate for the continuation of the council of Trent. Having proved successful in his negotiations, Pius sent him, in 1561, a cardinal's hat, which he declined, till the pope obliged him to accept it. He was a learned and zealous champion for the Roman church. His works make two volumes folio: they have gone through many impressions. He wrote elegantly, and was an able opponent of the Protestants. He died in 1579. The best edition of his works is that of 1584. *Univer. Hist.*

HOSLUNDIA, in *Botany*, so named by Mr. Peter Thonning, in commemoration of Olaus Hoslund Smith.

These two young Danes undertook an expedition to the coast of Guinea, in search of natural productions, where unfortunately the latter, a most ardent and intelligent botanist, from whose researches much was expected, met with a premature death.—Vahl. *Enum.* v. 1. 212.—Class and order, *Diandria Monogynia*. Nat. Ord. *Verticillate*, Linn. *Labiata*, Juss.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, five-toothed, striated. *Cor.* ringent, almost twice as long as the calyx; throat compressed: upper lip of the limb erect, ovate, gibbous; lower one gaping, trifid, recurved. *Stam.* Filaments four, growing to the tube; the two barren ones very short; anthers kidney-shaped. *Pist.* Germen superior, four-cleft; style thread-shaped, the length of the perfect stamens; stigma bifid. *Peric.* Berry spurious, formed out of the calyx; roundish and slightly ten-cornered, umbilicated by the teeth of the calyx, hollow within. *Seeds* four, ovate, in the bottom of the calyx.

Ess. Ch. Calyx tubular, five-toothed. Corolla ringent, its upper lip concave. Stamens four, two of which are barren. Seeds four, within the pulpy calyx.

1. *H. opposita*. Vahl. *Enum.* n. 1.—"Leaves opposite, oblong-ovate."—Native of bushy places in Guinea. This *shrub* is about six feet high, having numerous opposite branches crossing each other, with a hairy line between the insertion of the leaves; these are two inches or more in length, serrated towards the end, entire at the base, aromatic. *Flowers* white. *Berry* the size of a currant, orange-coloured, downy.

2. *H. verticillata*. Vahl. *Enum.* n. 2.—"Leaves lanceolate, ternate."—Native of Senegal, and first discovered by M. Dupuis, formerly superintendent of the garden of the Thuilleries.—*Stem* shrubby, branched. *Branches* square, striated, slightly downy, hoary at the top. *Leaves* an inch and half long, serrated, but entire both at the top and base, interspersed with resinous, bright spots, which are discernible by the help of a lens. The parts of fructification in this species are very similar to those of the last. *Panicle* terminal. *Bractees* minute, awl-shaped. *Flowers* small, clothed outwardly with whitish hairs.

HOSPINIAN, RODOLPHUS, in *Biography*, a learned Swiss divine, was born at Altdorf, near Zurich, in 1547. From a very early period he was distinguished for excellent talents, which his friends encouraged and cultivated, by giving him a good education. In 1568 he was admitted into the ministry, the duties of which he performed with much diligence and assiduity at a country church a few miles from Zurich. After this he had the superintendance first of the abbey-school at Zurich, and then of the Caroline school. Amidst the various occupations of his life he was enabled to compose some valuable works, of which the principal are, "De Templis, i. e. de origine, usu, et abusu Templorum:" "De monachis:" "De felis Judæorum et Ethnorum:" "Festa Christianorum:" "Historia Sacramentaria:" "Historia Jesuitica." He was nearly a year deprived of his sight, notwithstanding which he continued to preach as usual, and in 1613 he submitted to the operation of couching, which succeeded to his wishes. In 1623 his faculties became so much impaired, that he was reduced to a second childhood, in which he continued till his death in 1626. His works, which are enumerated by Bayle, were collected and printed in seven volumes folio.

HOSPIDALETTO, in *Geography*, a town of the bishopric of Trent; 35 miles N.W. of Trent.

HOSPITA, in *Mythology*, a surname of Venus, under which appellation she was worshipped, and had a temple at Memphis, in Egypt.

HOSPITAL, MICHAEL DE L', in *Biography*, chancellor of France, was born at Auvergne in 1505. He was educated for the law in the most celebrated universities of France and Italy, and at the same time he greatly distinguished himself by his proficiency in polite literature. He was in early life made one of the auditors of the rota at Rome, the duties of which he quitted, to follow the law court at Paris. Here he passed through various high offices, continually rising in esteem for his ability and integrity. In 1560, he was elevated to the dignity of chancellor of France. At this period the kingdom was divided between the factions of contending interests. L'Hospital was a true patriot, and preferred the honour of the crown and country, to that of any interest supported by the great. To carry his point he was sometimes obliged to give way, and even to consent to a severe edict against the Protestants; this he did with much regret, and he never ceased to advocate the cause of toleration. In 1562, he was the champion of the decree which allowed freedom of worship to the Protestants. He was more than once accused of being himself a Protestant, and was excluded from those councils in which the bloody massacre was planned. The papal legate would gladly have removed him from office, which he was unable to do, till at length the whole influence of the court was bent on exterminating by violence the reformed religion. He now resigned his seals, and retired into the country to spend the remainder of his days, with his books and his friends, and in this retreat he declared that he enjoyed more happiness than he had ever done in public life. The felicity of privacy was cruelly interrupted by the detestable massacre of St. Bartholomew in 1572. It was imagined that he might, on account of his great integrity, be included among the number of victims, and when a troop of horse approached his house, he was asked if he would defend himself with fire-arms; "By no means," said he, "and if the wicket is not wide enough to admit the assassins, let open the great gates." The men, who were sent on the bloody errand, were overtaken by a message from the king, announcing that L'Hospital was not among the proscribed, and was told that the authors of the deed had pardoned him his constant opposition to their plans; "I did not indeed know," said the excellent man, "that I had merited either death or pardon." He survived this shock but a short time, dying in the year 1573, in the sixty-eighth year of his age. He was author of "Latin poems," which have gone through many editions, and which are grave, but easy and energetic; also of "Harangues before the States of Orleans;" "Memoirs containing treaties of Peace, &c.;" "A Discourse in favour of Peace," and other tracts. His eulogy, in better times, was made a prize subject by the French academy in 1777, and his statue was erected in marble by Lewis XVI., but his noble and manly conduct has erected to his memory a statue more durable than marble. "No one," says his biographer, "was more determined in resistance to injustice, and if ever he acceded to measures which he disapproved, it was only to prevent worse." Bayle. Moreri.

HOSPITAL, WILLIAM-FRANCIS-ANTHONY, marquis de St. Merne, a celebrated mathematician, of the same family as the preceding, was born in 1661. His genius for mathematical pursuits discovered itself at a very early period; for, being present one day at the duke de Rohan's, where some able geometers were speaking of a problem of M. Pascal's, which appeared very difficult, he ventured to say that he believed he could solve it. They smiled at the assertion, and probably regarded the supposed forwardness of a youth of fifteen with contempt; however, in a few days, he sent them a very neat solution, which gave them a very different idea of his talents.

He entered the army, and rose to the post of captain of horse, but still retained his passion for mathematics, which he studied at the hours of leisure from military duty, though he was forced to do it in concealment, as an attachment to the sciences was thought unbecoming the dignity of a soldier. Disgusted with this idea he quitted the army, and devoted his whole time to study. When he was little more than thirty years of age, he distinguished himself by the solution of problems drawn from the sublimest geometry, which had been proposed to the mathematical world by John Bernoulli. In the year 1693 he was admitted an honorary member of the Academy of Sciences at Paris, and from this period the philosophical transactions of France, and those of other countries, were enriched by his papers. He published a work on Sir Isaac Newton's fluxions, entitled "Analyse des infinimens petits," being the first Frenchman that ever wrote on this subject. He died at the age of 43, in the year 1704, and after his death was published another mathematical work which he had left in a finished state, and which included "Les Sections Coniques, les Lieux Geometriques, la Construction des Equations, et une Theorie des Courbes Mechaniques."

HOSPITAL, popularly *Spital*, a place or building erected, endowed, or supported by charitable contributions, for the reception and relief of the poor, aged, infirm, sick, and otherwise helpless.

The word is formed of the Latin *hospes*, *host* or *stranger*. In the first ages of the church, the bishop had immediate charge of all the poor, both sound and diseased; also of widows, orphans, strangers, &c. When the churches came to have fixed revenues allotted them, it was decreed, that, at least, one-fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated hospitals.

They were governed wholly by the priests and deacons, under the inspection of the bishop.

In course of time, separate revenues were assigned for the hospitals; and particular persons, out of motives of piety and charity, gave lands and money for erecting of hospitals.

When the church-discipline began to relax, the priests, who, till then, had been the administrators of hospitals, converted them into a sort of benefices, which they held at pleasure, without giving an account thereof to any body, reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated. To remove this abuse, the council of Vienne expressly prohibited the giving any hospital to secular priests in the way of benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof; and be accountable to the ordinaries. This decree was executed, and confirmed by the council of Trent.

In England, hospitals, founded for the mere relief of the indigent and necessitous, are peculiarly called *alms-houses*; the name hospital being reserved to those destined for the sick, aged, young, &c. See CORPORATION.

Any person seized of an estate in fee simple, may, by deed enrolled in chancery, erect and found an hospital for the sustenance and relief of the poor, to continue for ever; and place such heads, &c. therein as he shall think fit; and such hospital shall be incorporated, and subject to such visitors, &c. as the founder shall nominate. Also such corporations shall have power to take and purchase lands not exceeding two hundred pounds per annum, so as the same be not holden of the king, &c. and to make leases for twenty-one years,

HOSPITAL.

years, reserving the accustomed yearly rent; but no hospital is to be erected, unless upon the foundation it be endowed with lands or hereditaments of the clear yearly value of ten pounds per annum. Stat. 39 Eliz. cap. 5.

This act was made perpetual by the 21 Jac. cap. 1. It is understood, in consequence of this statute, that if the lands given to an hospital be afterwards improved, they shall be enjoyed by the hospital, though they should be above the yearly value of two hundred pounds. And goods and chattels, real or personal, may be taken of what value soever. (2 Inst. 722.) But by 9 Geo. II. cap. 39. no lands nor money shall be conveyed or settled in trust, for the benefit of any charitable foundations, unless the appointment of lands, money, or personal estate, stocks in the public funds excepted, be made by deed indented, sealed, and delivered in the presence of two witnesses, at least twelve calendar months before the death of the donor, and be enrolled in chancery within six calendar months next after the execution thereof; and unless such stock in the public funds be transferred in the public books usually kept for the transfer of stocks, at least six calendar months before the death of the donor, and take effect immediately and without the power of revocation. By 43 Eliz. cap. 4. the lord chancellor may issue commissions to take account of misapplication of lands and goods, given to hospitals, which have no special visitors or governors. By 31 Eliz. cap. 6. the place of any person, taking reward for nominating to an hospital, shall be void. By the aforefaid stat. of the 39 Eliz. cap. 5. it is provided, that all leases of estates for a term exceeding the number of twenty-one years, in possession, and on which the accustomed yearly rent or more, by the greater part of twenty-one years next before the taking of such lease shall not be reserved and yearly payable, shall be void. By 43 Eliz. cap. 2. all lands within the parish are to be assessed to the poor's rate, and it has been determined by courts of law, particularly by Holt, in 1 Anne, that hospital lands are chargeable to the poor as well as others. (2 Salk. 527.) In the case of St. Luke's hospital, by 1 Geo. III. it was determined in general, that no hospital is chargeable to the parish rates, with respect to the site thereof, except those parts of it which are inhabited by the officers, whose apartments are to be rated as single tenements, of which the said officers are the occupiers. By the annual acts for the land-tax, it is provided, that the same shall not extend to charge any hospital, for or in respect to the site of such hospital, or any of the buildings within the walls or limits thereof; or to charge any of the houses or lands, which on or before Mar. 25, 1693, did belong to Christ's hospital, St. Bartholomew, Bridewell, St. Thomas, and Bethlehem hospital; or to charge any other hospitals or alms-houses for or in respect of any rents or revenues, which, on or before March 25, 1693, were payable to the said hospitals or alms-houses, for the immediate relief of the poor. But all such lands &c. belonging to any hospital or alms-house, or settled to any charitable or pious use, as were assessed in the fourth year of W. and M. shall be liable to be charged. The principal English hospitals are the following:

HOSPITAL, *Aske's* or *Haberdashers*, is an hospital situated at Hoxton, and erected in 1692, by the company of Haberdashers, in pursuance of the will of Robert Aske, esq. who left for building and endowing it 30,000*l.* This hospital is established for the maintenance of twenty poor haberdashers, and the support and education of twenty boys. Each of the pensioners in this hospital has convenient apartments, is provided with proper diet and firing, three pounds yearly in money, and a gown every second year. There are also

established salaries, &c. for chaplain, clerk, butler, porters, and other domestics.

HOSPITAL, *St. Bartholomew's*, is situated on the fourth-east side of Smithfield, and incorporated in the last year of the reign of Henry VIII. by the name of the hospital of the mayor, commonalty, and citizens of London, governors for the poor, called Little St. Bartholomew's, near West-Smithfield. This hospital formerly belonged to the priory of St. Bartholomew, in Smithfield, founded by one Rahere, about the year 1102.

At the dissolution of the monasteries, Henry VIII. left five hundred marks a-year to it, on condition that the city should add five hundred marks per annum for the relief of sick and poor people; but it was more largely endowed, for the use of sick and lame persons only, by Edward VI. by the munificence of the city and private benefactors. This hospital, having escaped the dreadful fire in 1666, was repaired and beautified by the governors in the year 1691. But the buildings became by length of time so ruinous and dangerous, that a subscription was entered into in 1729, for defraying the expence of rebuilding it, on a plan comprehending four detached piles of building to be joined by stone gate-ways, about a court or area. Four piles have been erected and finished; one of these piles contains a large hall for the resort of the governors at general courts, a counting-house for the committees, and other necessary offices; the other three piles contain wards for the reception of the patients, &c.

It is governed by a president, treasurer, &c. It is furnished with three physicians, and three master surgeons, besides as many assistant surgeons, an apothecary, and vicar. The officers of this hospital, are a cook, steward, renter, matron, and porter. This hospital, since its enlargement, is capable of accommodating four hundred and twenty patients. It extends relief also to a great number of out-patients. By the report of 1811, it appears that this hospital administered relief to 9746 patients in the course of the preceding year.

HOSPITAL, *Bethlehem*, or *Bedlam*, was originally a priory, founded by Simon Fitzmary, sheriff of London, in the year 1247, the 31st of Henry III.; but in the year 1547, king Henry VIII. gave this hospital to the city, who employed it for the accommodation of lunatics. The present stately fabric was erected in the city of London in the year 1676, at a charge of about seventeen thousand pounds. It was in length five hundred and forty feet, and forty feet broad, and contained a great number of cells, or rooms for the accommodation of the unfortunate, who are maintained without any expence to their friends; except an allowance for bedding. At each end of this stately edifice were erected, in 1733, by the charitable contributions of the citizens, two wings, or spacious buildings, for the reception of poor incurable lunatics. But it became necessary very lately to take down the east wing, on account of its decay. The report of the number of incurables was, a short time since, 82, being 37 men, and 45 women; who, by an order of court in July 1807, pay each 7*s.* per week if sent by parishes, but if sent by friends, 5*s.* The number of patients capable of relief amount upon an average to 170; and it has been found, at a mean computation, that nearly two out of three are restored to mental sanity. Before this magnificent structure there was a pleasant garden, inclosed by a stately wall about seven hundred feet in length. This hospital, being united by the charter of Edward VI. to that of Bridewell, has the same president, governors, who consist of members of the corporation, and of others, who are made governors

by

HOSPITAL.

by benefactions of 50*l.* each, treasurer, clerk, auditor, physician, surgeon, and apothecary; but each hospital has a steward, and inferior officers peculiar to itself. The management is entrusted to a committee of 42 governors, seven of whom, with the treasurer, physician, and other officers, attend every Saturday in monthly rotation for the admission of patients, and other concerns of the hospital. The income of this hospital, appropriated to curables and incurables, and arising from rents, &c. and dividends on government securities, amounts to 7412*l.* 16*s.* 10*d.* The number of patients in this hospital, on the 31st of December 1807, was 126, and of those admitted during the year 1808, was 85, the total 211; the number of those cured and discharged 52, of buried 12, and of patients in the hospital December 31st, 1808, 147. By the report of 1811, the number of cured and discharged in the preceding year was 81, of buried 7, and of patients remaining 147.

The decay of the buildings of this hospital has made it necessary to rebuild it; and the committee, upon mature deliberation, have determined to remove it to another situation. Accordingly, as the leases of the Bridge-house estates in St. George's fields and Lambeth-marsh fell in at Lady-day 1810, the corporation have agreed with the commissioners of those estates for a ground plot of nearly twelve acres, fronting the road leading from Newington to Westminster-bridge, part of which was formerly the site of the house and gardens called the Dog and Duck; and on this spot it is proposed to erect a new edifice, capable of accommodating a greater number of patients than the present building can contain, and suitable to the munificence of the city of London. The statues of the two lunatics upon the pillars of the front gates of Old Bethlehem, which have been very much admired as monuments of art, were the work of Caius Gabriel Cibber, a native of Holstein, who came into England at some period previous to the restoration of Charles II. to follow his profession as a statuary.

HOSPITAL, *Bridewell*, is situated in Bridge-street, Blackfriars, on a spot near the ancient river Fleet, where stood the palace in which king John held his court, and within the walls of which was a well dedicated to St. Bridget, or Bride, whence the palace, &c. derived its appellation. This palace had been variously occupied; it was the residence of cardinal Wolsey during his prosperity, and after his fall of Henry VIII. particularly in 1529. After this time it was suffered to decay, and bishop Ridley begged it of Edward VI., to be converted to some charitable use. The citizens of London addressed the king's council in 1552; and Edward VI., in the same year, by a deed between himself and the mayor, commonalty, and citizens of London, granted to them all the manor-house and parish of Bridewell, with the appurtenances in the parish of St. Bridget, Fleet-street, with other lands, and licence to purchase four thousand mark lands, besides the lands given them by his majesty in London and elsewhere, and to purchase so much land, and that the lands so given them should be discharged of all tithes and first-fruits. And out of the suppressed hospital of the Savoy, he gave a great part (whose revenue was 700 mark land), besides bedding and furniture for the maintenance and employment of vagrants and idle persons, and of poor boys; uniting it with Bethlehem hospital. The king was so desirous that this grant should be carried into effect, that he directed by his will that it should be performed, and died soon after, on July 6, 1553. In 1557 the citizens of London prescribed certain rules for the government of this hospital, and for the power of its governors and officers. (See BRIDEWELL.) By an act passed in 1782, the union of Bridewell and Bethlehem was recognized, and the present me-

thod of appointing corporation governors was established or confirmed. The revenues of Bridewell hospital, at that time, May 1792, amounted to 4505*l.* 13*s.* 1*d.* and of Bethlehem hospital, to 7881*l.* 19*s.* 10*d.*, of which 2284*l.* 17*s.* belonged to the fund for incurables.

The front of this building, situated on the west side of Bridge-street, Blackfriars, has not for many years exhibited any part of the original palace. At present there is one vast quadrangle. The chapel is a plain edifice; the prison's gloomy front occupies the fourth-west corner; and the hall the greater part of the fourth side. The ceiling of this large room, thirty-nine paces in length and fifteen in breadth, is horizontal, without any other ornament besides two flowers, where the lustres are suspended. At the west end, and over the chimney, is a large picture by Holbein, representing Edward VI. in the act of delivering the charter for this hospital to the mayor and citizens of London. There are some other pictures which we have not room to particularize. It appears (see BRIDEWELL), that this institution is of a mixed nature, partaking of the hospital, the school of industry, the work-house, and the prison for correction. The school is conducted by six masters of different arts, who are elected by the governors, *viz.* a printer, book-binder, ferris, orris, and galloon weavers, and a silver-smith, to whom twenty-eight youths are bound from Christ's hospital, as apprentices, who are clothed at the charge of Bridewell hospital, but maintained by their masters, who receive the whole profit of their work. They were formerly habited in a blue jacket and trowsers, with a white hat; but this singularity has been of late judiciously abolished in favour of the common clothing of other persons: when they have served their apprenticeship of seven years, they receive their freedom, and a gift of ten pounds towards establishing themselves in business. The workhouse, and the prison for vagrants, idle and disorderly persons of both sexes, are separated into solitary rooms, where employments are provided, which it is a part of their punishment to execute, and which are exercised by their task-masters, and sometimes accompanied with coercion. Although Bethlehem and Bridewell hospitals are united, and they are governed by the same members, distinct accounts of their respective revenues are kept. The accounts exhibited at Christmas 1808, stated a net income of 6201*l.* 6*s.* 11*d.*, arising from net rents of the estates and the dividends on 3000*l.* 3 per cents., to which legacies and donations are to be subjoined. The expences attending the arts-masters and apprentices amounted to 645*l.* 4*s.* 6*d.*; the charges attending the vagrants to 706*l.* 19*s.*, and the salaries and gratuities to the several officers and servants, &c. amounted to 1586*l.* 14*s.* 2*d.*, making a total of 2938*l.* 17*s.* 8*d.*, which exceeded the receipt by 3262*l.* 7*s.* 3*d.* The qualification of a governor is a donation of 50*l.* paid upon election, which is in the general court. This hospital is under the immediate management of a president, treasurer, chaplain, physician, clerk, steward, and other inferior officers. The number of persons received into this hospital, during the year 1809, amounted to 1261, including 279 vagrants or disorderly persons, committed by the lord mayor and aldermen, and ordered for hard labour or correction, 917 persons to be forwarded to their respective parishes, and 35 apprentices.

HOSPITAL, *Charter-House*, or *Sutton's*. See CHAR-TRUSE.

HOSPITAL, *Christ's*, popularly called the *Blue-coat Hospital*, was anciently a monastery of Grey friars, founded by Rahere, the first prior thereof in the time of Henry I., or, as others say, by John Ewin, citizen and mercer. It was dissolved by Henry VIII. and granted by him to the city

HOSPITAL.

city in 1547, and the grant to the citizens was confirmed in 1552, by charter of Edward VI., who converted it into an hospital for poor children; who are supplied with all necessaries and conveniences, clothed, dieted, and taught.

Since its first endowment, it has received abundance of new donations. Besides the numerous benefactions of private persons, the city allows this house the benefit of superintending and licensing the carts of London; and a duty of about $\frac{1}{3}$ th upon every cloth brought to Blackwell-hall, where clerks are kept to receive it. The citizens, by king Edward's charter, are incorporated governors of his several foundations in the city and liberties of London by the name of the mayor, commonalty, and citizens of the city of London, governors of the possessions, revenues, and goods of the hospitals of Edward VI., &c. A great part of it was burnt down by the great fire in 1666; but is again rebuilt by the care of the governors; though not without incurring a great debt, and anticipating the revenues of the hospital; all which incumbrances have been long since discharged.

Formerly, a thousand poor children, most of them orphans, were maintained on this foundation; eight or nine score yearly put out apprentices, and the girls to service; but the number has fluctuated from various causes.

Besides the children that are maintained within the walls of this hospital, there is a considerable number of the least and youngest provided for in the country, *viz.* at Hertford, in Hertfordshire, where there are a school-house, a master's house, and several houses for nurses employed in taking care of the children. The number of children under the care and charge of this hospital, in 1810-11, was one thousand two hundred and thirty-two; one hundred and seventy-two were put out apprentices, and eight buried.

Here were two mathematical schools; the first founded by king Charles II. Aug. 19th, 1674, but they are now united. Youths are there taught several parts of practical mathematics, particularly navigation, to fit them for apprentices to masters of ships; there is also a grammar-school (whence the most improved boys are yearly sent to the university), a writing-school, and a school for the girls, where they learn to read, to sew, and to mark.

In the mathematical school, called the new royal foundation of king Charles II., forty boys are qualified for the sea; who wear appropriate badges, and whose classes are examined by the elder brethren of the Trinity-house, ten of whom are yearly appointed to ship-masters, and ten others received into their places, who have attained a competency in writing and Latin; and the governors appoint forty more. All the other scholars are bound apprentices at fourteen or fifteen years of age for seven years; or, if properly qualified, are sent to either university of Oxford or Cambridge, where they are maintained for a like term: one scholar is sent every year, except on the return of every seventh year, when two scholars are sent; the scholars have their choice of the college to which they are to go, but Pembroke-hall, in Cambridge, is generally preferred, as most advantageous to them; and one scholar is also sent to Oxford in eight years. The allowance paid to each of them during the first seven years is 6*l.* per annum. On St. Matthew's day, 21st of September, yearly, the lord mayor in state, with the president, aldermen, sheriffs, treasurer, and governors, and other company, assemble in the great hall after divine service at Christ's church, to hear orations from the elder scholars; one of whom speaks in Latin, and the other in English, the latter of these having spoken in Latin in the preceding year, is now elected off to college, and leaves the school in about a month afterwards;

on this occasion a glove is handed about among the audience for their contribution.

The masters of these schools are, a grammar master, who is assisted by an under master, a mathematical master, and two writing masters, who have 100*l.* per annum each, for their salaries, besides houses. There are also two school-mistresses. The grammar master hath an addition of 20*l.* yearly for catechising the boys, and his usher is allowed 50*l.* a year. There are likewise a drawing master and music master.

The children are admitted by an order of committee and treasurer, signed by the chief clerk. Their education consists of arithmetic, writing, reading, navigation, Latin, and Greek. Their dress is the same as that used in the time of Edward VI., being a blue cloth coat or tunic, reaching to the feet, with yellow breeches and stockings, and a round bonnet or cap too small to cover the head, and it is therefore generally taken in the hand. An examination of the children in the grammar school takes place in the months of March and September by an experienced person, appointed by the governors. The upper master examines the under master's highest form twice in the year, and takes such as he judges ready for his instruction. The holidays allowed are eleven days at Easter, including Sundays; one week at Whitsuntide; and at Bartholomew-tide three weeks; and at Christmas 15 days, and the usual Saint's days, &c. The catechiser teaches the children the fundamental points of religion three times in each week, and at other times visits the wards for the instruction of the inmates. The English reading-master is authorized to assemble all the children belonging to any two wards in the grammar school, from 11 to 12, three times in a week, in order to obtain a knowledge of their progress. Thus every child in the 12 wards is examined once in 14 days. He may substitute for this purpose under his own observation any boy intended for the university, and he appoints a marker in the several wards, who is to observe and correct mistakes in the reading of prayers, &c. and he reads himself occasionally for example. If the marker's diligence is approved, he receives a silver medal of the founder. The two writing masters have two ushers. An exhibition of drawing and specimens of writing takes place in the hall the 31st of March and 30th of September; and the writing is said to be of such superlative excellence, that the world would procure the writer a situation in the most fastidious merchant's counting-house.

Among the peculiarities of Christ's hospital, a fight is exhibited from Christmas to Easter every year, which no other institution, lay, civil, ecclesiastical, or eleemosynary, has ever equalled in their grand ceremonies, or which is more calculated to impress the heart of a spectator with the liveliest sentiments of sympathetic pleasure; we mean the supper of all the children on Sunday evenings at six o'clock, to which strangers are admitted by tickets.

The great hall, which was rebuilt after the fire of London, contains several tables, which are covered with table-cloths, wooden platters, and buckets of beer, with bread and cheese. The treasurer and governors take their seats at the upper end, at a semi-circular table; the boys, attended by the nurses of their several wards, enter in order, and arrange themselves on each side of the hall; strangers are then admitted, who go along the centre of the hall to the upper end; the masters of the school, the steward, and the matron, take their places there also; and the nurses preside at each table, on which a great number of candles are placed, and these, with many lamps and a large lustre, illuminate the room. The ceremony then commences by the steward striking upon

HOSPITAL.

one of the tables three strokes with a mallet, which produces a profound silence; one of the boys intended for the church, having ascended a pulpit on one side of the hall, then reads the second lesson for the afternoon service of the day, and an evening prayer composed for the occasion, at the close of which the response of "Amen," from about eight hundred youthful voices, has a very interesting effect; a psalm or hymn is next sung by the whole assembly, accompanied by the organ: the same youth then delivers the grace, after which the boys take their seats, and the supper proceeds. When the repast is concluded, the steward again strikes the table as before, and the boys instantly arrange themselves again on each side of the hall, and a grace is said from the pulpit: an anthem is then sung, after which the boys collect all the fragments into small baskets; and each ward, preceded by its nurse with lighted candles, marches in order past the upper table, where they bow to the governors, and file off to an adjoining school-room, the doors of which are thrown open to receive them, and the ceremony is closed.

There is no person who has ever witnessed this ceremony that does not feel the sublimest and the tenderest emotions: it is a combined offering of the gratitude of hundreds to the throne of Divine Mercy!

The officers of this hospital are, a president, treasurer, physician, chief-clerk, under clerk and receiver, surgeon, apothecary, wardrobe-keeper, and assistant clerk, steward, matron, &c. The number of governors, some of whom superintend this hospital, in their several appropriate departments, is very considerable; and it must be allowed that no institution of such magnitude is, upon the whole, better conducted: though some have thought that the diet, which is plain and simple, might admit of useful alterations, particularly with regard to vegetables, &c., without any material addition of expence. The qualifications of governors are 200*l.* and a present of 200*l.* more, which is expected upon election. This institution is supported by the revenues of its establishments and funds, and also by legacies and benefactions.

HOSPITAL, Emanuel, is situated in Tothill-fields, in Westminster, and was founded by lady Dacres in 1601, for 20 aged single men and women, each of whom have an allowance of 10*l.* per annum, with the liberty of bringing up a poor child. The city of London has this charity in trust, with 200*l.* a-year for its support, issuing from a lease of 199 years, at the expiration of which, the whole manor of Brainsburton, in the county of York, amounting to above 600*l.* per annum, is devised for the augmentation of this foundation. In 1735 the court of lord mayor and aldermen erected a school-house and dormitory adjoining to this hospital, for the reception of twenty poor boys and girls, to be elected out of the parishes of St. Margaret, Westminster, and of Chelsea and Hayes in Middlesex, to which the parish of St. John, Westminster, has since been added, by the court of aldermen, none of the children being admissible under seven years of age, nor to be maintained there after 14, who are supplied with all the necessaries of life; the boys are taught to read, write, and accompt, and the girls to read, write, and do plain-work.

In consequence of the increased value of the lands appropriated to the support of this institution, the governors obtained an act of parliament in 1795 for augmenting the number of objects of this charity: and after obtaining this act, five men and five women were admitted as out-pensioners, with such allowance as the court should think fit. And also besides the 20 children in the hospital, eight other poor boys are clothed and educated at the hospital's expence, their ages being at the time of election from seven to ten. The

number of girls in the hospital has been increased from 10 to 12. In consequence of this act the 10 out-pensioners are allowed 10*l.* per annum, till houses in the hospital become vacant, when they are admitted, and other out-pensioners appointed in their room.

A school was opened at Brainsburton, to which eight poor boys were sent, and there clothed, maintained, and educated at an easy expence, compared with that of the hospital in town. In the year 1802 the court of aldermen issued new ordinances and regulations, similar to those of the year 1795. The salaries and allowances to the master and mistresses, and to the warden and steward, matron, and poor men and women in the hospital, and also to the out-pensioners, were settled during the pleasure of the court, and have since been increased; and the court undertook to pay all the bills of expenture. The charges are as follows:

The master, with the house and garden free of taxes,	}	£
The mistress, do.	}	110
The poor men and women, in-pensioners with a chaldron of coals,	}	18
The poor men and women, out-pensioners,	}	10
The warden and steward, in addition to the 18 <i>l.</i> as in-pensioners,	}	10
The matron, do.	}	20

All these allowance are payable quarterly, and the coals delivered at Michaelmas. A diet table is also prescribed. The whole charity now consists of a master and mistress, and 20 in-pensioners, *viz.* 10 men, of whom one is the warden, and 10 women, of whom one is the matron, whose allowances have been lately increased; five men and five women, as out-pensioners: also ten boys and ten girls, who are in-pensioners, and have a school-room, who are all apprenticed to trades, with a premium of 10*l.* half paid at the time of binding, and the other moiety when they have served half their apprenticeship.

HOSPITAL, Fever. See *HOUSE of Recovery.*

HOSPITAL, Foundling, was established, at the solicitation of Thomas Coram, esq. by royal charter, in the 13th year of George II. and incorporated by the name of "The governors and guardians of the hospital for the maintenance and education of exposed and deserted young children:" and the powers granted by charter were enlarged and confirmed by a statute of the same year. The corporation of this hospital is allowed to purchase lands or tenements to the yearly value of 4000*l.* This charity is under the management of a president, the king being patron; six vice-presidents, treasurer, and governors. The subordinate officers are a chaplain, morning preacher, evening preacher, secretary, solicitor, matron, school-master, treasurer's clerk, and organist. This hospital has two physicians, a surgeon, and apothecary. In 1742 the noble building in Lambs-conduit fields for the use of this hospital was begun to be erected; one wing was finished in 1745; the chapel was begun in 1747; and in 1749 orders were given for building the other wing of the hospital, which, together with the treasurer's house, was ready for habitation in 1752. The whole building was originally calculated to hold 400 children; and the talents of several eminent artists were employed in contributing to its embellishments; among whom were Mr. Hogarth, Mr. Hayman, Mr. Highmore, Rybrack, &c. Mr. Handel, upon the building of the chapel, gave an organ, and the benefit of his oratorio of the Messiah, the performance of which was conducted by himself: this he repeated several years, which produced to the charity 6700*l.* and by his will he bequeathed to it his property in the music. Before the end of the year 1752 the hospital

HOSPITAL.

Wednesday next before Easter for the benefit of the hospital. The number of beds is 200, but that of patients is much less considerable.

HOSPITAL, *St. George's*, near Hyde-park Corner, was instituted in 1733 for the relief of the poor sick and lame, who are supplied with advice, medicine, diet, washing, lodging, and some of them also with cloaths. This hospital is under the direction of a general board of the governors, now amounting to about 350, who meet regularly five times a year, and a committee of which meets every Wednesday to admit and discharge patients, and transact the business of the hospital. The qualification for a governor is 5*l.* 5*s.* as an annual subscription, or 50*l.* as a single benefaction. The king is president, there are six vice-presidents, two treasurers, four physicians, four surgeons, and two assistant surgeons, six visiting apothecaries; the domestic officers are a chaplain, apothecary, secretary, matron, and messenger. Besides the patients that are admitted into the house, relief is afforded to a considerable number of out-patients. By the account of the year 1808, it appears that from the first institution the patients discharged amounted to 209,430, and the number of patients relieved in that year was 2717; 1596 being in-patients, and 1121 out-patients. The whole expence during the same year amounted to 5880*l.* 0*s.* 8*d.* The annual subscriptions are stated at 2378*l.* 9*s.* To this hospital is annexed another institution denominated "The Charity for Convalescents of St. George's Hospital," and established in the year 1809.

HOSPITAL, *Greenwich*, is a retreat for seamen, who, by age, wounds, or other accidents, are disabled from service; and for the widows and children of such as are slain in the service.

This, in point of magnificence and spaciousness, greatly excels even Chelsea hospital. King William and queen Mary had the benevolent design of establishing this hospital much at heart; and they accordingly made a grant of the royal palace at Greenwich, a part of which, on the west side, had been begun to be rebuilt for a royal palace by king Charles II., and also of a large adjoining space of ground, for this purpose. King William, after queen Mary's death, on the 25th of October 1695, appointed by patent a number of commissioners for directing the building and endowing of this intended hospital, and granted a large sum out of his civil list for that end, and his royal successors were also considerable benefactors to it. At length annual sums were granted by parliament for finishing this truly magnificent ornament and glory of Great Britain: and it was fully completed in the reign of George II. By an act of the 7th and 8th of king William, cap. 21. the privilege of admission into this hospital was granted to registered seamen, when maimed or superannuated, and to the widows and children of those who were killed in the service. This act for registering seamen was enforced by 8 and 9 W. III. cap. 22. but repealed by 9 Anne. Every seaman is required to allow out of his wages sixpence a month, for the better support of the said hospital; for which duty receivers are appointed, &c. The money is paid into a receiver's office on Tower-hill, which is under the management of three commissioners and their clerks. (8 and 9 W. III. cap. 23. 10 Anne. 2 Geo. II. cap. 7.) By the last act a seaman, absenting himself from his ship without leave, shall forfeit for every day's absence two days' pay to Greenwich hospital to be deducted out of his wages: and a seaman, not entering into the king's service, who shall leave his ship before he hath a discharge in writing, shall forfeit one month's pay in like manner.

By 8 Geo. II. cap. 29, the net rents and profits of the estates forfeited by the attainder of James late earl of Derwentwater, and of Charles Radcliff, were applied in the first place to the completing of the building of Greenwich hospital; and it is hereby enacted, that all seamen in the merchant's service who shall happen to be maimed in fighting, not only against pirates, but against an enemy of his majesty, &c. shall be admitted into and provided for in the said hospital, as well as seamen maimed or disabled in the king's actual service: and in the next place, the whole net rents of those forfeited estates shall be for ever applicable for the support of the said royal hospital, for the better maintenance of the seamen therein, worn out and become decrepit in the service of their country. This law was farther explained and amended by 11 Geo. II. cap. 30.

Provision is made for securing the payment of the sixpence per month from privateers by 18 Geo. II. cap. 21. and for securing prize money belonging to the hospital by 20 Geo. II. cap. 24. The governors are empowered to grant out-pensions to decrepit seamen, by 3 Geo. III. cap. 16.; and persons personating or falsely assuming the name and character of out-pensioners, shall be guilty of felony without benefit of clergy: and those who receive half-yearly pensions shall, together with the printed bill delivered to them by the commissioners, produce a certificate under the hand of the minister and church-wardens, where they reside, testifying that they are the persons named in such bill.

The pensioners belonging to this hospital are clothed in blue, and allowed stockings, shoes, linen, and a shilling a week for other necessaries. The victualling is according to the allowance of Chelsea hospital, *viz.* four men to a mess, each mess to contain four pounds of flesh, a gallon of beer, &c.

The governors of this hospital are the great officers of state, and persons in high posts under the king; and it is under the more particular inspection and government of twenty-four commissioners, a governor with an annual salary of 1000*l.* and clerk; a lieutenant-governor, whose salary is 400*l.* a-year; four captains, allowed 230*l.* a-year each; and seven lieutenants, with 115*l.* a-year each; a treasurer, whose salary is 200*l.* with two clerks; secretary with 160*l.* a-year and clerk, auditor, whose annual salary is 100*l.* and clerk, surveyor with 200*l.* salary, clerk of works at five shillings a day, a physician at ten shillings a day, a surgeon with an annual salary of 150*l.* a servant and two assistants, dispenser with 50*l.* a-year and his assistants, two chaplains with a salary of 130*l.* each, steward with a salary of 160*l.* and three clerks; clerk of cheque with 100*l.* salary and three clerks; brewer, three matrons, organist, messenger, two chief cooks and four mates, scullery man and two mates, butler and two mates, porter and barber. For a particular account of the building and its establishment, see GREENWICH. The chest at Chatham is now under the management of the governors of this hospital. See CHEST.

HOSPITAL, *Guy's*, situated in the parish of St. Thomas, Southwark, was founded in his life-time, by Thomas Guy, esq. a very wealthy citizen and bookseller of London. For this purpose he took a lease of a piece of ground belonging to St. Thomas's hospital, for the term of 999 years, at a ground-rent of 30*l.* per annum; the foundation of the intended hospital was laid in 1722, and the fabric was roofed before the death of the founder, which happened in the year 1724. The charge of erecting and furnishing this hospital

HOSPITAL.

amounted to the sum of 18,793*l.* 16*s.* 1*d.* and the sum left to endow it was 219,499*l.* 6*s.* 4*d.* and upwards. The governors of this hospital were incorporated by act of parliament, made in the 11th year of Geo. I. anno 1725, under the title of "The President and Governors of the Hospital founded at the sole cost and charges of Thomas Guy, esq." and under this title they are empowered to purchase, either in perpetuity or for a term of years, any estate not exceeding 12,000*l.* per annum. The number of governors appointed to be chosen from those of St. Thomas's hospital, by the founder, is 60; and it is enacted that if the number does not exceed 40, the vacancies shall be supplied by the lord chancellor, lord keeper, or commissioners of the great seal, lords chief justices of the king's bench and common pleas, and lord chief baron of the exchequer, so as to make up the number of 50. It is also enacted, that the management of the hospital be referred to a president, treasurer and 21 governors; forming a committee appointed by a general court, seven of whom are annually changed; this committee is empowered to chuse, and at pleasure to remove, all officers and servants employed in the hospital, except the physicians, surgeons, clerk, and chaplain, who are elected by the general court, to appoint their salaries, to admit objects of charity, and in general to transact the affairs of the hospital subject to the inspection and controul of a general court; and this general court has power to make any by-laws for the better government of the corporation. This hospital, so liberally endowed by its founder, was established for the reception and relief of upwards of 400 sick and diseased poor objects; besides twenty incurable lunatics, who are provided for in a separate building. Since the decease of Mr. Guy, the governors have taken a lease of an additional spot of ground, for which, with the former, they annually pay to St. Thomas's hospital the sum of 100*l.* On this ground they have erected two handsome wings; in the centre of one wing there is a spacious hall and rooms for public business, and opposite to it in the other a neat and elegant chapel, in which there is a finely executed statue of the founder by Mr. Bacon. The corner house in one wing is for the residence of the treasurer, and the other houses are for the chaplain, steward, and apothecary. This hospital is under the medical inspection of three physicians and three surgeons, who are allowed 40*l.* a-year each, an apothecary, who has 90*l.* a-year for himself and assistant, and a house. The officers are a clerk, chaplain, steward, accomptant, matron, butler, and assistant; surgery man, porter, beadle, keeper of the lunatic men, and a keeper of the lunatic women. It contains 13 wards and 411 beds; and the number of patients admitted into this hospital, at an average of ten years, has been 2244 yearly; of whom 2014 have been discharged, and 230 have died: under the prudent conduct of the treasurer and governors, it does great honour to the liberality of its founder. The day of admission to this hospital is Wednesday. To this hospital belongs a theatre for chemical, medical, and anatomical lectures. On one evening in the week medical subjects are debated for the improvement of the science and practice. A library is also a part of this establishment, well furnished with professional works, and a collection of anatomical preparations. We shall add under this article, that Mr. Guy (see Guy) has bequeathed to the president and governors of Christ's hospital, a perpetual annuity of 400*l.* for taking into the said hospital four children yearly, at the nomination of the governors of his hospital: preference being always given to his own relations, who have never failed to offer themselves. To his poor aged relations he gave annuities during life to the amount of 870*l.* and among his younger relations and executors the sum of 75,589*l.* together with

the sum of 1000*l.* for discharging poor prisoners, within the city of London, and counties of Middlesex and Surry, who could be released for the sum of five pounds.

He likewise erected an alms-house, with a library at Tamworth, where his mother resided, and which he represented in several parliaments, for the use of 14 poor men and women; to whom he allowed certain pensions during life, and at his death, for their future support and putting out children apprentices, &c. he bequeathed a perpetual annual sum of 115*l.* Mr. Guy also built and furnished, at his own expence, in the year 1707, three wards on the north side of the outer court of St. Thomas's hospital; and gave to the same 100*l.* per annum, for eleven years immediately preceding the foundation of his hospital. Some time before his death, he removed the frontispiece of the said hospital of St. Thomas, which stood over the gate-way in the borough, and erected the same in the place where it now stands, fronting the street; and having enlarged the gate-way, rebuilt the two large houses on the sides thereof, and erected the stately iron-gate between them, at an expence of between 2 and 3000*l.* To many of his relations he gave stated allowances of 10 or 20*l.* per annum, and to others, money for advancing them in the world.

HOSPITAL of Jerusalem. See HOSPITALER.

HOSPITAL, *Jews*, called *בית הולים*, *Beth-holem*, or house for relief of the sick, was founded by subscription in 1748. It was first established in Leman-street, Goodman's-fields. This charity, which administers medicines and advice gratis, was maintained by a certain sum allowed by the synagogue, and private contributions, amounting, soon after its first establishment, to about 500*l.* a-year. An enlargement becoming necessary, a more commodious building was erected in 1792 at Mile-end, Old-town, which contains accommodation for 14 sick men, and as many sick women, and for eight lying-in women; besides 21 beds for the old and indigent. The beds for the sick are in four wards, those for lying-in women in a separate apartment, and those for the old and indigent in ten rooms, with a long-sitting room, which has two fire-places. The contributions for the support of this charitable institution are general throughout the Portuguese congregations by offerings made at the synagogue, and their elders grant from their general charity fund from 270 to 300*l.* annually towards its support; they have also a small capital in the funds. This hospital dispenses medicines to all persons who hold any employment under their synagogue, and to all the poor of their congregation.

HOSPITAL, *German and Dutch Jews*, *נורה זדק*, *Navay Tzadek*, i. e. dwelling-place of justice or of charity, an establishment situated in Mile-end, Old-town, of wider extent than that of Beth-holem, which arose from the philanthropic exertions of Benjamin and Abraham Goldsmid, esqrs. who, in 1795, commenced a collection among their friends for the purpose of relieving the poor of the class denominated German Jews. The sums contributed by Jewish and Christian benevolence enabled them, in 1797, to purchase 20,000*l.* imperial annuities of three per cent. and by accumulation of interest and increase of donations, the aggregate sum, in 1806, amounted to the value of 22,000*l.* stock, at the current price of that period. After previous deliberation it was agreed to erect an hospital for the reception and support of the aged poor, as well as for the education and industrious employment of both sexes. Ten thousand pounds of three per cent. consols bank-annuities were purchased, and this sum, together with the former stock, was transferred to trustees as an inviolable fund for its endowment, yielding 900*l.* per annum. In February, A.D. 1806, the freehold on which the hospital was afterwards erected, was purchased

HOSPITAL.

for 2300*l.*; the house was completed and opened in June, 1807, for the reception of five aged men, five aged women, 10 boys, and eight girls. The adjoining freehold was also purchased for 2000*l.* in which it is further proposed to erect an enlargement of the hospital for the admission of an additional number of patients. Two gentlemen, *viz.* Dr. Myers, and Mr. Van Oven, offered to fulfil the duties of physician and surgeon gratis: 25 guineas constitute a governor for life: 10 governors are competent for business; and at general meetings held in March, officers are elected, and also a house-committee of 24, and two auditors. This institution is under the management of a general committee of 12 governors, which attends at the hospital on Sunday, weekly. None are considered as proper objects of this charity who do not belong to one of the three established synagogues of German Jews in London; nor can any be admitted under 55 years of age. The boys are admitted from 10 to 13 years of age, and maintained till the expiration of their apprenticeship. The girls are admitted from 7 to 10 years of age. The present officers are, a patron, president, two vice-presidents, two treasurers, a physician, surgeon, solicitor, and secretary.

HOSPITAL, *Lock*, (*lock* being derived from *loke*, a house for lepers,) near Hyde-park corner, was instituted in the year 1746, for the relief of venereal patients only. Every gentleman subscribing five guineas a year, or upwards, shall be a governor of this hospital, and whoever gives a benefaction of fifty-pounds at one time becomes a governor for life. This hospital is under the direction of a president, seven vice-presidents, two treasurers, and a committee of the governors, who meet every Thursday for the business of the institution. It is attended by a physician, two surgeons, and two visiting apothecaries. The officers are a chaplain, house-surgeon, secretary, collector, and matron. By a report circulated in November 1809, it appears that the number of patients perfectly cured to that time amounted to 30,577; many persons of both sexes were thus restored to their families, who might otherwise have lingered out a loathsome and miserable existence; many abandoned characters were reclaimed by the religious instructions afforded them; and the progress of the contagious disease, dreadful to the sufferer and destructive to posterity, was materially arrested. The *Lock Asylum* is an appendage to the hospital, which provides for females after cure, who have no means of accommodation and support when they leave the hospital, and who might otherwise be urged by necessity to return to that course of vice and infamy which they have abandoned. This institution has been found of singular utility. The number of women admitted to this asylum from July 1787 to Lady-day 1809, has been five hundred, many of whom have been preserved from ruin, and rendered useful members of the community. The asylum is under the superintendance of a patron, president, three vice-presidents, a chaplain, and secretary.

HOSPITAL, *London*, in Mile-end road, was instituted in 1740, principally by the instrumentality of John Harrison, *esq.*, its first surgeon, and incorporated in 1759, 32 Geo. II. This hospital, which was first founded in Precott-street, Goodman's fields, is now supported, in a very large and commodious building, by voluntary contributions, for the relief of all sick and wounded persons.

The in-patients are supplied with advice, medicine, diet, lodging, washing, and every other kind of comfortable assistance: the out-patients receive medicines and advice daily. None are admitted into the hospital with infectious distempers, or the venereal disease, or who are athmatic or consumptive, or deemed incurable or improper for admission by

the physicians or surgeons; but such persons may be relieved as out-patients. The average number of patients in this hospital at any one time is about 180, but its wards are 18 in number, and would contain nearly 400. This hospital has subsisted during a period of 68 years, and in that time has relieved 507,802 to Jan. 1, 1809, which is an average of 7466 persons in each year. During the year 1809, the in-patients amounted to 1406, and the out-patients to 877. The governors, in 1807, made an interesting appeal to the benevolence of the public, and with such success, that the committee were enabled immediately to discharge the hospital debts, amounting to 3824*l.* 10*s.* 11*d.* In consequence of farther liberal contributions, they began with the admission of 37 in-patients, and they have since been progressively augmenting the establishment, according to the extent of their power. The funds of the hospital, at the close of the year 1808, consisted of 3000*l.* bank-stock, 22*5l.* 5 per cent. navy subscription of bank on bank-stock, 1804; 200*l.* 4 per cent., 65,292*l.* 12*s.* 2*d.* 3 per cent. consols; 9779*l.* 9*s.* 8*d.* 3 per cent. reduced; 400*l.* 3 per cent. O.S.S. ann.; 45*cl.* 3 per cent. New ditto.; 310*l.* India stock; 571*l.* 16*s.* South Sea stock; 500*l.* 3 per cent. 1726; 50*l.* bond; 338*l.* 8*s.* 8*d.* cash; land and houses near the hospital *ad valorem*.

The charity is under the government and direction of a president, five vice-presidents, a treasurer, and of such persons, who, by giving a benefaction of thirty guineas or more at one time become governors for life; or who subscribe five guineas or more per annum. A house-committee of thirty governors is annually appointed at the quarterly court, in December, one of whom is chosen chairman; and they meet every week at the hospital to transact the necessary business.

There is also a committee of accounts, consisting of twelve governors, appointed at the quarterly court in June for one year, who meet there quarterly to examine and audit the bills and accounts, and a medical committee also consisting of twelve governors, elected annually at the court in December, who examine all the medicines and drugs. The management of the house is inspected by two governors, appointed visitors by the house-committee. Three physicians and three surgeons attend this hospital: the officers are a chaplain, apothecary, secretary and receiver, steward and matron. Every governor is entitled to send one in-patient at a time, and four out-patients. Subscribers, that are not governors, may send out-patients; the day of admission is Tuesday.

The "Samaritan Society" is an appendage to the London Hospital, instituted A.D. 1791, for the relief and prevention of various circumstances of distress, not within the provision of public hospitals, and depending upon donations and bequests. Annual members contribute one guinea, and benefactions of five guineas constitute members for life. The affairs of this society are conducted in the consulting-room of the hospital, allotted in 1792 for its meetings and business, by a committee of nineteen for general purposes; a committee of seven for public communications and correspondence; seven auditors, a treasurer, an almoner, a secretary, and collector.

HOSPITAL, *St. Luke's, for Lunatics*, in Old-street Road, was instituted in 1751. The new extensive building for this hospital was erected at an expence of 5000*l.* raised by voluntary contributions, upon leasehold ground belonging to St. Bartholomew's hospital: the lease is held for a term of 40 years, renewable every fourteen years, on payment of a fine of 200*l.* and at the yearly rent of 200*l.* It was completely finished at the close of the year 1786; and on the 1st of January, 1787, the

HOSPITAL:

the patients were removed into it. The house accommodates 300 patients, who are distinguished by two lists or classes, 200 on the curable list, and 100 on the incurable list.

It appears, from the printed state of this hospital, that the number of patients received into it from the opening on the 30th of July, 1751, to the 21st of April, 1809, inclusive, amounted to 9042, of whom those discharged uncured and received again at 7s. a week, are 323. Of these 3915 have been discharged cured, and 3101 discharged uncured, 783 discharged as idiots, 748 died, and 251 taken away at the desire of friends. Of the incurable, 56 were taken away at the desire of friends, 145 died, and 18 were cured.

The property of the hospital consists of the building and premises in Old-street; 64,000*l.* consol. 3 per cent. annuities; 38,100*l.* reduced annuities; 22,500*l.* Old South Sea annuities; 5000*l.* 4 per cent. annuities; 220*l.* New South Sea annuities; 1000*l.* reduced annuities; divers legacies unreceived, besides contingent and reversionary legacies; an annuity of 5*l.* 5s. and another of 100 guineas by the late Samuel Whitbread, esq. The income of this property is considerably increased by casual benefactions and legacies, and by cash received from the board of incurables, all which, with a balance in hand, amounted, in 1808, to 9053*l.* 16s. 3d., and the expenditure amounted in the whole to 7934*l.* 17s. 3d.

Persons paying the entire sum of twenty-guineas or upwards, or paying seven guineas at least, and signing an agreement to pay 3*l.* 18s. yearly, for the four next succeeding years, are admitted governors of this hospital; nine of whom constitute a general court, held on the third Wednesday in February, every year. At this court one president, four vice-presidents, a treasurer, a general committee, physician, surgeon, resident, apothecary, secretary, master, matron, and accountant, shall be elected for the ensuing year. The general committee consists of the president, vice-presidents, and treasurer, and of five governors, named as lessees in the lease of the ground on which the hospital is built, and of all persons who pay in their own right 100*l.* or upwards, who are standing members of it, and of such other thirty governors resident in the bills of mortality as are elected at the court in February.

The general committee meets monthly or oftener, if necessary, and is empowered to transact all the necessary business of this hospital, and to appoint a house-committee and sub-committees. The physician and surgeon attend on every committee day, and one other day in the week, and as often as occasion requires. The resident apothecary is precluded from any other practice. No fees are taken by any officer. Patients are admitted into this hospital according to the order of time in which their petitions, previously signed by a governor, have been delivered to the secretary, and without any expence, except that the parish poor shall provide their bedding, which they may take away at their discharge. But no person can be admitted into this hospital who is not poor and mad; or who hath been a lunatic more than twelve calendar months; or who hath been discharged uncured from any other hospital for the reception of lunatics, or who is troubled with epileptic or convulsive fits; or who is deemed an idiot; or who is infected with the venereal disease; nor any woman with child; nor any child under the age of twelve, nor any person above the age of seventy years. Besides a petition, the governors require two printed certificates; one testifying the above particulars, signed by the minister and churchwardens, or overseers of the poor of the parish or place where the proposed patient resides; and the other to the same purpose, signed by some physician, surgeon, or apothecary, who hath visited such patient; which signatures must be attested upon oath.

Upon notice being sent from the committee for the patient to be brought for examination, there must be left in writing with the secretary, within three days afterwards, the names, business, and place of abode of two substantial housekeepers, residing within the bills of mortality, who must be present precisely at the hour when the patient (not being parish-poor, or receiving alms or support from any public body or community) is to be admitted upon the payment of three pounds; and if such patient be parish-poor, or has received alms or support from any public body or community, then upon the payment of six pounds, and to enter into a bond of one hundred pounds to take away the patient when discharged by the committee; which sums of three pounds and six pounds are not returnable unless the patient dies or is discharged within one month after admission.

It is also provided, that the general committee may receive immediately into this hospital any patient who shall have been discharged cured, in case such patient relapse within two months; and that such patients who have been discharged uncured, not exceeding 100, shall be admitted by rotation; on condition of the payment of seven shillings per week for each, till the charity shall be enabled to lessen that expence. The patients are not exposed to view; but their friends are allowed to visit them every Wednesday morning.

HOSPITAL, Lying-in. There are several hospitals of this kind in the cities or suburbs of London and Westminster.

The *Queen's lying-in hospital* was founded in 1752 for the purpose of receiving poor pregnant women, as well married as unmarried, in separate wards, and also of attending them at their own habitations, within a limited circuit. It is now fixed at a house in Baywater; and the government of the charity has been vested in a president, four vice-presidents, a treasurer, and a committee of eighteen governors. An annual subscription of three guineas constitutes a governor, entitled to recommend one in-patient, two to be delivered at their own habitations, and six for advice; and a subscription of 31 guineas at one payment, entitles to the recommendation of one in-patient, six at their own habitations, and twelve for advice, yearly. It is computed that upwards of 45,000 women have received the benefit of this hospital in its respective branches.

Quarterly meetings are held at the hospital; and the committee meet every Tuesday. This hospital was renovated in October 1809, and under the active exertions of its president the duke of Suffex, has now a fair prospect of permanent utility. Her majesty is patroness, and it is under the care of a consulting physician, and physician in ordinary, a surgeon and man-midwife, an apothecary and secretary, a matron, nurses, and collector.

The *Middlesex hospital* for sick and lame, and lying-in married women, in Mary-le-bone Fields, was instituted for the first description of patients in 1745, and for the second in 1747; and for patients afflicted with cancer in 1792. It is under the direction of a patron, a president, 12 vice-presidents, two treasurers, and a committee of the governors; the qualification for a governor is an annual subscription of three guineas, and of a governor for life 30 guineas at one payment. A quarterly general court is held four times in the year. All general courts and weekly boards may appoint committees for carrying on the business: 24 governors are appointed for a weekly board to meet every Tuesday; and 12 for a medical committee, including the physicians, man-midwife, and surgeons, to meet every Saturday. The president, vice-presidents, treasurers, chaplain, physicians, man-midwife, surgeons, apothecary, secretary, collector, and matron, are elected at a quarterly or special
general

HOSPITAL.

general court. The lying-in ward in this hospital has no communication with those of the sick and lame. The patients are visited by three physicians, an accoucheur, and three surgeons, besides the physician and surgeon of the cancer-ward. The domestic officers are a chaplain, secretary, apothecary, and matron, who reside in the house, have salaries, and are provided with lodging, washing, and board. The house-surgeon also resides in the hospital, under certain stipulated regulations. A sufficient number of midwives to attend women at their own habitations is provided. The day for admission of patients is Tuesday.

The *British* lying-in hospital for married women, in Brownlow-street, Long-acre, was instituted in 1749. This hospital is governed by a president, four vice-presidents, a treasurer, and a committee of 15 governors, who meet every Friday to receive the women recommended, and to direct the ordinary affairs of the house. The qualification of an annual governor is a subscription of five guineas or upwards per annum, and of a perpetual governor a single payment of 40 guineas, each of whom may present two women in the year. This hospital is occasionally visited by three physicians, and one surgeon; and it is provided with an apothecary, chaplain, secretary, matron, and midwife, six nurses, and 62 beds. Female pupils, being widows or married women, not less than 25 years of age, and of approved character, are permitted to attend this hospital, for instruction in midwifery, and have a right to stay in the hospital six months. They are to board in the hospital, and dine at the steward and matron's table; and on leaving the hospital to receive certificates of their qualification. The expences of instruction and board are settled by a general court. The stock of this charity in the public funds amounts to 2092*l.* 10*s.* and its expenditure is about 1100*l.* a-year, for which they have the dividends of the above-mentioned stock, and annual subscriptions of about 900*l.* per annum, besides benefactions and legacies, and board of women, who reside in the hospital before and after the period of three weeks, allowed for their lying in and recovery, and pupils. The committee of this hospital have preserved an account of those who have died, from which it appears that in the first 10 years of the institution one woman died in 42; in the fifth 10 years, one died in 288; in the sixth and last 10 years, one in 216; and from the 20th of September, 1806, to the 25th of March, 1808, not one woman died out of 501. In the first 10 years one child died in 15; in the fifth 10 years one died in 77; and in the last nine years and a quarter, one died in 92. The proportion of boys to girls born is about 18 to 17; of still-born, about one to 25; of women bearing twins, one to 84, the whole number being 342. If similar tables were preserved by other institutions of a like kind, they would furnish useful data in calculations relating to population and political economy.

The *city of London* lying-in hospital for married women, in the City road, was instituted in 1750. The government of this hospital is referred to a president, 12 vice-presidents, and a treasurer, chosen annually from among the governors and select committees. The subscription of 30 guineas constitutes a governor for life; those who subscribe five guineas, or three guineas per annum, are governors so long as they continue their subscription. Each governor for life has the privilege of relieving eight patients in a year, and of having two of them on the books at a time. Subscribers of five guineas may relieve five patients, and those who subscribe three guineas may relieve two patients. A double subscription acquires a double privilege. The affairs of the hospital are conducted by a committee of 24, of whom the treasurer is one, who meet at the hospital every Wednesday.

Four of them preside, by rotation, for two successive months, at the public baptisms; and at the Midsummer court six retire, and six are elected to supply their places. The officers, besides the president, vice-presidents, and treasurer, are a preacher and a chaplain, four physicians, two of whom practise more particularly in midwifery, a surgeon, an apothecary, a secretary, and a matron, who is a skilful midwife, and resides in the house, superintending the nurses and servants, and the whole domestic economy. The property of this hospital consists, besides its leasehold premises, of 11,000*l.* three per cent. consol. bank annuities, and 10,000*l.* reduced annuities, and two annuities of 5*l.* and another, during the life of the duke of York, of 25*l.* The whole annual expenditure amounts in general to about 1500*l.* supplied by the dividends on its capital, legacies, subscriptions, and collections at the chapel, and at the anniversary meeting. Pupils are allowed to be received who pay to the charity for their lodging and board during their stay in the hospital, besides some fees to the matron and medical officers. The present building, at the entrance of the City-road, was begun in October, 1770, and completed at an estimated charge of 3500*l.* so as to be open for the reception of patients in April, 1773. It was licensed for the public reception of pregnant women, pursuant to an act of parliament, passed in the 13th year of the reign of George III. (13 Geo. III. c. 82.) This hospital, which in 1809 had subsisted 59 years, has relieved, in that time, 24,902 poor married women, of whom 25,196 children have been born. During the year, ending Lady-day, 1809, their number was 413, and the male children born were 227, and the females 186. Out of the whole number, 292 women have been delivered of twins, and two women had three children at the birth.

The *Westminster* new lying-in hospital, on the Surrey side of Westminster-bridge, was instituted by subscription in the year 1765. It is governed by a president, four vice-presidents, a treasurer, and a committee of governors. The qualifications of governors are various. An annual subscription of three guineas entitles to recommend three in-patients, three out-patients at their own habitations, and any number for advice, and to vote at elections. An annual subscription of five guineas entitles to recommend five in-patients, five at their own habitations, and any number for advice, with a vote at elections, &c. A subscription of 30 guineas constitutes a governor for life, entitled to recommend yearly three in-patients, three at their own habitations, and any number for advice, and to vote at elections, &c. The privilege of recommending patients is extended in proportion to the subscription. There are four quarterly meetings at the hospital in the year; and a weekly board, consisting of any number of the committee annually appointed in January, is held at the hospital every Tuesday, for the general affairs of the institution. The physicians practising midwifery are allowed to take pupils, two of whom may reside in the house for three months, and board for a stipulated price, at the matron's table: female pupils are also allowed upon the same terms. One of the physicians attends at the hospital every Tuesday and Friday, from 11 till 12 o'clock, to give advice in the several disorders incident to child-bearing and infancy. It is attended by two physicians and accoucheurs, a physician extraordinary, an apothecary, and a surgeon. The officers are a secretary, chaplain, and matron or midwife, constantly resident in the hospital, superintending the nurses and servants, &c.

In connection with lying-in hospitals, we may mention two or three institutions for the purpose of delivering poor married women at their own habitations. An useful institution of
this

HOSPITAL.

this kind dates its rise in the year 1757, and is under the direction of a president, six vice-presidents, a treasurer, secretary, and governors. An annual subscription of one guinea, or more, or a benefaction of 10 guineas or upwards, constitutes a governor. An annual governor for one guinea may recommend eight objects within the year, and in proportion for a larger sum, and the governor for life recommends the same number annually. This institution is under the direction of a president, six vice-presidents, a treasurer, a consulting physician, three physicians and accoucheurs. The subordinate officers are a secretary and collector. The midwives are 27 in number, who reside in all parts of the town. During the first 50 years of this society the deliveries amounted to 178,983; and in the year 1808 to 4100. Another institution of the same kind, called the "Benevolent institution, for the sole purpose of delivering poor married women at their own habitations," was established in January, 1780. It is supported and conducted on a plan similar to that of the institution last mentioned. The officers are a president, seven vice-presidents, a treasurer, a physician, secretary, and 40 midwives. Another society of a like kind was formed at Tottenham, near London, in August, 1791.

HOSPITAL, *Magdalen*, in St. George's Fields, was instituted in the year 1758, for the relief and reformation of prostitutes. The queen is patroness of this charity; it is under the direction of a president, six vice-presidents, treasurer, and committee of 32 governors. It is attended by a physician, two surgeons, and two apothecaries. The domestic officers are a chaplain, steward, secretary, matron and assistant, and messenger and assistant. Twenty guineas constitute a governor for life, and an annual subscription of five guineas is a qualification for a governor for one year, which subscription, when it amounts to 25 guineas, qualifies a governor for life. Four general courts are held in every year; and at the general court in April, the committee, and all officers, except the president, are elected. The committee, consisting of 32 governors, meet at the hospital every Thursday; and two of them, in rotation, attend at the chapel every Sunday at morning and evening service, when a collection is made previously to admission. This hospital was first established in Prescott-street, Goodman's-fields; and the new building in Blackfriars' road, St. George's-fields, was opened in the year 1758. An act of incorporation was granted by parliament in 1769. The new hospital is calculated to receive about 80 penitents every year; and during the period of its subsistence more than two-thirds of the women who have been admitted have been reconciled to their friends, or placed in honest employments or reputable services. A very considerable number have been married, and have become respectable members of society; but some, as might naturally be expected, have relapsed into their former errors. A probationary ward has been instituted for the young women on their first admission; a separation of those of different descriptions and qualifications has been established; and apartments have been fitted up in the lodge for the residence of the chaplain and his family, that he may with the greater facility continue to devote his time and attention to the instruction of the women. Each class is entrusted to its particular assistant, and the whole is under the inspection of the matron. It appears by a statement, extracted from the books of the hospital, that from the 10th of August, 1758, to the 7th of January, 1808, 3865 women have been admitted, and that of these 2532 have been reconciled to their friends, or placed in situations of reputable service or employment; 102 have been lunatic, or troubled with fits or incurable disorders; 72

have died; 573 have been discharged at their own request; and 506 discharged for improper behaviour.

An institution, in aid of the Magdalen hospital, was founded in the year 1807, under the appellation of the "Female Penitentiary," the external management of which was confided to a committee of 24 gentlemen, together with a treasurer, a secretary, and assistant; and the interior to a committee of 24 married ladies. The establishment was fixed at Cumming-house, Pentonville, Islington, by the purchase of a long lease of the house and adjoining ground, to which has been since added a contiguous building for a temporary infirmary. The penitentiary-house is divided into six apartments; a temporary ward for cases of emergency, two probationary wards, wards for persons fully admitted after probation, a ward for diseased subjects, a sick ward, and a refractory ward: a part of the house is appropriated to divine service. This institution is attended gratis by a physician, surgeon, and apothecary. The matron resides in the house.

HOSPITAL, *St. Peter's*, at *Newington Butts*, was erected by the company of Fishmongers, by virtue of letters patent of king James I. in 1618, for the reception of divers of their poor members, who had pensions bequeathed them by the wills of some of their company.

HOSPITAL, *Royal*, for disabled soldiers, commonly called *Chelsea-College*.

The building was originally begun by king James I., in the 5th year of his reign, for a college to consist of a number of learned divines, who, being furnished with books and all means of subsistence, might devote their time to the study and teaching of controversial divinity, especially those points in dispute between the churches of England and Rome. Accordingly he incorporated a provost and fellows, by the title of king James's college, in Chelsea. The corporation was endowed by his letters patent, with the reversion of certain lands in Chelsea, and authorized also to receive of his loving subjects lands not exceeding, in the whole, the yearly value of 3000*l*. Every thing being previously settled, king James laid the first stone of the intended college; but for want of money the building went on slowly; and, at length, before an eighth part of the model was executed, it stood still. In this state it remained for several years: but in the year 1616 the king sent letters to the archbishop of Canterbury, requiring him to stir up the clergy in his province to contribute towards it; in consequence of which collections were made in several parishes of England, but their produce was small, and was swallowed by the fees and collectors. The corporation, however, though the building was stopped, was nominally kept up during the life of king James I. The troubles under king Charles I. occasioned all thoughts of completing the work to be laid aside. After the restoration, king Charles II. erecting a convenient hospital for the reception of sick, maimed, and superannuated soldiers; converted the unfinished buildings of this college to that use; whence the hospital has retained the title of the "College." It was founded by king Charles II., carried on by king James II., and finished in the reign of king William and queen Mary, by sir Christopher Wren. The whole expence of this structure amounted, as it is said, to 150,000*l*., and the extent of the ground is above forty acres.

The building is very spacious and magnificent: its figure is a *Π*; the middle or front part whereof consists of a chapel and hall; the other two lines, being four stories high, are divided into wards or galleries, two in each story; containing each twenty-six distinct apartments for the foot soldiers. At each of the four corners of the main building, there is a pavilion, in one whereof is the governor's lodging, and the council-

HOSPITAL.

council-chamber; the other being lodgings for several of the officers of the house. Beside the main building, there are four wings or out-buildings; one for the infirmary, another for several officers of the house, another for old maimed officers of horse and foot; and the fourth for the baker, laundress, &c. The number of pensioners in the house is, in general, estimated at about 400, besides the officers and servants in the house: the out, or extraordinary pensioners, are also very numerous; and these, upon occasion, do duty in the several garrisons, from whence draughts are made for the army, &c. Their allowance is *7l. 12s. 6d.* a year each.

The pensioners are all provided with cloaths, diet, washing, lodging, and firing; and have a weekly allowance of *8d.* for their pocket-money.

The qualifications required to be admitted of this body, are, that the candidate bring a certificate from his superior officer that he has been maimed or disabled in the service of the crown; or that he has served the crown twenty years, which must be made appear by muster-rolls.

To defray the charges of this hospital, there is a considerable sum paid yearly out of the poundage of the army; beside one day's pay of each officer, and each common soldier, every year, which, in time of war, amounts to a very considerable sum. In case of a deficiency, it is supplied by parliament.

For the administration of this hospital there are commissioners, a governor, whose salary is *500l. per annum*, a lieutenant-governor with *400l.*, a major with *270l.*, an adjutant with *100l.*, two chaplains with *100l.* a-year each, a physician and surgeon, whose salaries are *100l.* a-year each, besides surgeoons mates and apothecary, a treasurer, who is the pay-matter-general of the land-forces for the time being; and his deputy and clerk, secretary and register and clerks, agent and pay-master to the out-pensioners and his clerks, comptroller, steward, house-keeper, organist, clerk of the works, &c. &c.

HOSPITAL, or Corporation, Scots, a charitable institution which commenced in 1665 by the voluntary association of respectable merchants, tradesmen and others, and which obtained a charter of incorporation by letters patent under the great seal of England, bearing date the 30th of June 1665. By these, the persons described in the charter were empowered to erect an hospital in the city and liberty of Westminster, for the maintenance of old or decayed artificers of the Scottish nation, and for training up their children to handicraft employments. In 1673 this corporation was enabled to erect a hall, with six adjoining tenements, for fulfilling the purpose of the charity, in Blackfriars. Afterwards it became necessary to apply to the crown for an enlargement of the numbers, powers, and privileges of the corporation. Accordingly new letters patent were issued, bearing date the 16th of November, 1676, by which 33 assistants were added to the former eight governors; liberty was granted to establish their hospital either in London or Westminster; and they were empowered to purchase and to hold lands to the yearly value of *500l.*, by the name and style of "The Master, Governors, and Assistants of the Scottish Hospital, of the Foundation of king Charles II." The design of an hospital, however, was afterwards abandoned; and in its place was substituted the wiser mode of assisting and relieving the poor objects at their own habitations. The charter of 1676 having been found insufficient by its provisions, to render the institution sufficiently extensive in its beneficial effect, application was made to his present majesty for a new charter of incorporation, which was obtained, bearing date the 28th of November, 1775; by which the corporation is

re-established under the ancient name and style of "The Scottish Hospital of the Foundation of Charles II.;" and the government vested in a president, six vice-presidents and a treasurer, to be elected annually on St. Andrew's day, or the day after, and the number of governors left unlimited. A committee is also chosen on the same day, consisting of 20 governors, beside the president, vice-presidents, and treasurer, who are of the committee, for conducting the affairs of the corporation. The officers of the society are a chaplain and secretary. By the charter there must be five general courts held every year; and the committee meet on the second Wednesday in every month, at the hall of the corporation in Crane-court, Fleet-street, to receive the petitions of the patients recommended by the governors, and in order to distribute the charity. A donation of 10 guineas constitutes a governor for life; and a subscription of one guinea or upwards, annually, qualifies to be an annual governor. In conformity to a bye-law, it is the practice, in order to form a capital, to invest, in some one of the public funds, one-half of every donation of 10 guineas and upwards to 20, and the whole of every donation of this last amount, or beyond it. The annual subscriptions, and a moiety of the lower donations, are applied towards the regular monthly expenditure. Every governor, whether annual or for life, has the privilege of recommending one, and only one, distressed object for relief. This institution may be justly denominated an "Hospital of Out-Patients;" the objects of it being supported and relieved by weekly, monthly, or quarterly allowances in money, and with medical assistance and advice at their own habitations; and such of them as are desirous of returning to their native country for the benefit of their health, or to spend the remainder of their days with their relations and friends, have their passages by sea paid, and money advanced to supply their immediate wants, by which they have not only the benefit of an hospital and work-house, without the disagreeable circumstances attending them, but all the comforts of their families and friends reserved for them.

The number of poor, lame, and sickly persons relieved, and passages to Scotland paid for, by the hospital, annually for five years, have been as follows:

For the year 1803 to St. Andrew's day	- 1418
For ——— 1804 - to do. - -	- 1598
For ——— 1805 - to do. - -	- 1258
For ——— 1806 - to do. - -	- 1610
For ——— 1807 - to do. - -	- 1602

HOSPITAL, Small-Pox, or hospital for relieving poor people afflicted with the small-pox and for inoculation, was instituted by voluntary subscription in the year 1746. The object met with very general encouragement, and several houses remotely situated from one another, were engaged in subserviency to the design. This hospital afterwards consisted of two houses, at a due distance from each other, in airy situations. A house for preparing patients for inoculation was erected at Paneras, and that for receiving them when the disease appears, and for accommodating patients who have it in the natural way, was then in Cold-bath fields. The new building at Battle-bridge St. Pancras, was finished and opened at Michaelmas 1767, for the reception of patients before inoculation. The whole expence of the building, and its accidental charges, amounted to *8955l. 19s. 1d.* In December 1767 there were 300 patients for inoculation in the hospital. The hospital in Cold-bath fields requiring a general repair, and the governors being possessed of freehold ground at Paneras, on which the inoculation hospital stood, and where they had sufficient room for a new building, determined to erect a new edifice in the room of the other, which needed repair. Accordingly in

HOSPITAL.

1792 a plan was obtained, and a special committee was appointed to conduct the business. It was actually begun in May 1793, and completely finished in June 1794, and the patients were removed into it in under the direction of the medical officers. The whole subscription for this purpose amounted to 397*l.* 18*s.* 8*d.*; and the building charges amounted to 761*l.* 3*s.* 2*d.* beyond that sum. A new set of rules was framed, and one apothecary and one matron were constituted to take the direction of both houses, under the superintendance of the physician. Soon after the practice of vaccination became prevalent, Dr. Woodville, physician of the hospital, first introduced it Jan. 21st, 1799, and adopted it very generally during the following year, thus greatly assisting Dr. Jenner in his researches and experiments; and in the space of three years from that time, 9000 were vaccinated, without any complaint of unsuccessful practice. In 1801, their number increased to 11,800, of whom 2500 were afterwards tested by variolous inoculation; and the progress was so rapid that 4290 were vaccinated in 11 months. In 1802 the number of vaccinated patients had increased to 13,715; and no failure of success appeared. After this time the new practice seems to have declined in reputation, for in the following year only 2802 were vaccinated at the hospital. In 1806, Dr. Adams having succeeded the deceased Dr. Woodville in the office of physician, vaccination was slowly recovering from its depression, and from the monthly tables of the hospital in 1805 it appeared, that the in and out-patients vaccinated amounted to 2096, and those of variolous inoculation to 2638. In 1807 vaccination further declined; but there was no fatality in the hospital in the natural disease during five months. From the report communicated by Dr. Adams to the college of physicians, it appears, that 20,324 had been vaccinated by the institution since its commencement in 1799, of whom only 18 had afterwards taken the small-pox casually; and that three years were the critical period at which the greater part of them had taken it. The prejudice, however, against vaccination prevailed. During the year 1808, the patients relieved in the casual small-pox amounted to 132, those for inoculation to 1296, and those of vaccination to 1252; and the total number of these, since 1799, amounted to 23,197; of casual patients, since the first establishment, 21,868, and of variolated patients to 47,471; making together 92,536. Dr. Lettsom states, in favour of vaccination, that not more than four have died in 60 thousand vaccinated patients. (See *Cow-pox*.)

This society is supported without charter by voluntary contribution; their property consists of the freehold estate at Pancras, containing four acres of land; 8000*l.* in reduced bank annuities, and 9000*l.* consols, and 38*l.* 7*s.* 2*d.* imperial annuities. The receipts generally amount to about 1400*l.* per annum, and the expences generally exceed that sum. The king is the patron of this hospital; and the establishment is governed and conducted by a president, six vice-presidents, a treasurer, physician, secretary, resident surgeon and apothecary, and matron, a house committee of 13 governors, and a committee of seven auditors, chosen annually. Thirty guineas constitute a governor, and five guineas an annual subscriber; and any double subscription gives a double privilege. Smaller sums are gratefully received, but give no privilege. Every governor may recommend one patient into each house at a time. Two half-yearly courts are held before Midsummer and Christmas. The house-committee of 13 meet on the first Thursday in every month to manage the whole concerns of the institution. The physician prescribes, inoculates, and takes the general oversight and direction of the family; the secretary receives

legacies, donations, subscriptions, &c. and keeps all the accounts and minutes, &c.; the apothecary, who is also a steward, is resident at the hospital, and keeps an accurate register of the medical transactions, assists the matron respecting the provisions and household direction, and attends all the committees; the matron's office comprehends every thing which is commonly included in that of mistress of a family. No officer can receive any fee on pain of dismissal. Both hospitals are plain brick buildings, that for inoculation and the other for the natural small-pox, being contiguous, but entirely distinct from one another, and communicating only by a covered passage. The airiness of the situation, and the cleanliness which is preserved through both hospitals, and the good order maintained by the vigilance of the resident surgeon and the assiduous attention of the matron, render these hospitals well deserving the notice of every friend to humanity.

HOSPITAL, *Sutton's*. See CHARTREUSE.

HOSPITAL, *St. Thomas's*, in Southwark, is established for the same purposes as that of St. Bartholomew.

It was originally founded an hospital by Richard, prior of Bermondsey in 1213, and surrendered to king Henry VIII. in 1538; in the year 1551, the mayor and citizens of London, having purchased of king Edward VI. the manor of Southwark, including this hospital, repaired and enlarged it, and admitted into it 260 poor, sick and helpless objects; upon which the king, in 1553, incorporated it together with those of Christ, Bridewell, Bethlem, and St. Bartholomew. This ancient structure, much damaged by time and by fire, was rebuilt by voluntary subscription in the year 1693; and by additional buildings greatly enlarged; in consequence of which it consisted of three beautiful squares; to which the governors, in 1732, added a magnificent new building, consisting of several wards, a brew-house, and other necessary offices, at their own expence. It now consists of four quadrangular courts; in the first are wards for women; in the second two chapels, the lesser for the private use of the hospital, and the larger parochial; in the same court and adjoining to it, are the houses of the treasurer, and other officers; in the third court are several wards for men; the fourth hath also wards, hot and cold baths, a surgery, theatre, apothecary's shop, &c. The number of in and out patients relieved by this hospital, at an average of six or seven years, may be stated at 9000, at an expediture of about 10,000*l.* Those of the last year appear by the report of 1811 to have been 8318. The governors of this hospital are the lord mayor and court of aldermen, and the number of others, who, on receiving a governor's staff, give a benefaction of 50*l.* or upwards, is unlimited; but it is commonly between four and five hundred. They choose their officers and servants, who are, a president, treasurer, hospitaller or chaplain, besides the minister of the parish, who is paid by the hospital, three physicians, three surgeons, apothecary, clerk, receiver, steward, matron, butler, and brewer, baker, cook, assistant and servant, an assistant clerk in the compting-house, two porters, four beadles, nineteen sisters, nineteen nurses, nineteen watch-women, a chapel-clerk and sexton, and one watchman. The house contains eighteen wards, and about 485 beds.

HOSPITAL, *Westminster*, or *Public Infirmary*, was instituted in the year 1719, at the expence, and by the contribution of several benevolent individuals, "for the relief of the sick and needy from all parts." The patient is admitted by a recommendation signed by any governor, cases of accident excepted, which are admitted without recommendation at all hours of the day or night; and several beds are reserved for them. A benefaction of 30*l.* or upwards, or of three

guineas or more per annum, qualifies the donor to become a trustee. A board of trustees meets every Wednesday morning to transact the affairs of the charity; and four quarterly general boards are held for the supervision of its concerns. The capital of this hospital consists in several funds of 11,500*l.* 15*s.* 4*d.* three per cents. The inalienable capital for the incurables amounts to 21,368*l.* 18*s.* 1*d.* in several funds of three per cent., and the maintenance, cloathing, and medicines are charged at 20*s.* per week, which does not exhaust more than one-third of the income appropriated for them. The queen is the patroness of this hospital; and it is under the direction of a president, nine vice-presidents, a treasurer, a secretary and receiver, three physicians, three surgeons, and an assistant surgeon.

Besides the hospitals already enumerated, there are royal hospitals, such as that at Haslar, near Portsmouth, for sick and hurt seamen and marines, and the royal hospital at Plymouth, and many others, supported by the benefactions of private and voluntary contributors, which provide relief for almost every species of disease or injury. For a particular account of all hospitals in London, and all public charities and benevolent establishments, for the relief and instruction of the poor; see a work, the result of much investigation and labour, and written with the most laudable design by A. Highmore, esq. 1809; entitled, "Pietas Londinensis; or the History, Design, and Present State of the various Public Charities in and near London."

HOSPITALS, *Camp*, are either general or regimental.

The general hospitals are of two kinds, *viz.* the *flying* hospital, attending the camp at some convenient distance, and the *stationary* hospital, which is fixed to one place. In the choice of both, it will be better to have them in towns than villages, as the former will afford larger wards, besides more of other conveniences; these wards should be as airy as possible.

As to the disposition of hospitals, in regard to preserving the purity of the air, the best rule is to admit but few patients into each ward. It will also be found a good expedient, when the cielings are low, to remove some part of them, and to open the garret-story. The doors and windows may likewise be opened, and ventilators used to purify the air of every ward. In winter-hospitals, the wards are to be warmed with chimnies, and never by stoves; for though the latter may warm a large ward better, and at a less expence, yet by scarce making any draught of air, they will be apt to increase its putrid quality; whereas a fire, kept up in a chimney, acts like a constant ventilator.

The *general* hospital should receive only such sick as the regimental ones cannot conveniently contain, together with those who cannot be removed with the army. Without this dispersion of the sick, the general hospital, in bad seasons, would have a greater number than could be well attended; and what is equally, if not more pernicious, it would be too much crowded, by which means the contagion would spread, and the mortality be rendered more general.

Regimental hospitals are of the greatest importance, and therefore should be supplied with blankets and medicines from the public stores, with an allowance also for nurses and other necessaries. Nor are they to be maintained in the field only, but also in winter-quarters, as there will always be a great many more sick than can be taken care of in the general hospital.

Barns, stables, granaries, and other out-houses, but above all, churches, make the best hospitals, from the beginning of June to October; for as the greatest danger arises from foul air, which cannot be compensated by diet or medicine, we may lay it down as a rule, that the more airy and large the hospitals are, the less danger there is of the sickness

spreading. Pringle Observ. on the Diseases of the Army, p. 104, seq.

HOSPITAL, *Fever*, in *Medicine*. See FEVER and TYPHUS.

HOSPITAL *Ship*. See SHIP.

HOSPITAL, in *Geography*, an island in the river St. Lawrence, Upper Canada, in front of the township of Edwardburgh, containing about 100 acres.

HOSPITALER, one that entertains and provides for poor people, travellers, &c.

The appellation is chiefly given to certain communities of religious; as, the hospitalers of Elfort in Essex, instituted to take care of lepers; hospitalers of St. John Baptist, of Coventry; hospitalers of St. Julian; hospitalers of St. Leonard, at York, &c.

The religious hospitalers generally follow the rule of St. Augustine. Most of them pretend, that St. Martha was their first foundress, and chose her for their patron, because she entertained Jesus Christ at her house. Some of them go back to the patriarch Abraham for their founder.

There are also hospitalers among the military orders; such as the knights of St. Lazarus, and St. John of Jerusalem.

HOSPITALERS, *Hospitalarii*, more particularly denote an order of religious knights, who built an hospital at Jerusalem, wherein pilgrims were received. To these pope Clement V. transferred the effects and revenues of the Templars; whom, by a council held at Vienna, he suppressed, for their many and great misdemeanors.

These hospitalers were otherwise called *Knights of St. John of Jerusalem*; and are the same with those whom we now call the *Knights of Malta*.

HOSPITALER, in *Mythology*, is a name which the ancient Romans gave to Jupiter, calling him Jupiter Hospes, because they considered him as the guardian of hospitality.

HOSPITIUM, *Inn*; a term peculiarly used, in our law-books, for an inn of court.

HOSPITIUM is also used for a little convent, which the religious built for the reception of strangers and travellers of the same order, who had occasion to stay with them some time.

Most of these hospitia, or inns, in time became fixed convents.

In the middle ages there seem to have been no inns or houses of entertainment for the reception of travellers; and this circumstance affords a proof that little intercourse subsisted between different nations. And as hospitality is a virtue of the first rank among people whose manners are simple, and who are seldom visited by strangers, it was considered at the period to which we now refer as a very important and indispensable virtue; and not as one of those virtues which men may practise or not, according to the temper of their minds, and the generosity of their hearts. Hospitality was enforced by statutes, and those who neglected this duty were liable to punishment. "Quicumque hospiti venienti lectum, aut focum negaverit, trium solidorum in latrone mulctetur, Leg. Burgund. tit. 38. § 1. Si quis homini aliquo pergenti in itinere mansionem veteravit sexaginta solidos componet in publico." Capitul. l. vi § 82. The laws of the Slavi were still more rigorous; they ordained "that the moveables of an inhospitable person should be confiscated, and his house burnt." They were even so solicitous for the entertainment of strangers, that they permitted the landlord to steal for the support of his guest. "Quod noctu furatus fueris, eras appone, hospitibus." Rerum Meelburg, l. viii. a Mat. Jo. Beehr. Lips. 1751, p. 50. In consequence of these laws, or of that state of

society which made it proper to enact them, hospitality abounded while the intercourse among men was inconsiderable, and secured the stranger a kind reception under every roof where he chose to take shelter. As the intercourse among men increased, that which was a pleasure became a burden, and the entertaining of travellers was converted into a branch of commerce.

HOSPITIUM was likewise formerly used for procurement, or visitation money. See PROCURATION.

HOSPODAR, the title borne by the prince of Wallachia and Moldavia.

The Hospodars of Wallachia and Moldavia receive the investiture of those principalities from the grand seignior, by a vest, and a standard which he gives them.

They are sometimes deposed by him; though in other respects they have sovereign power within their states.

HOSSAINPORUM, in *Geography*, a principal town of Cotwally, in Bengal; 50 miles N. of Moorshedabad. N. lat. $24^{\circ} 57'$. E. long. $88^{\circ} 7'$.

HOSSAINPOUR, a town of Hindoostan, in Oude; 40 miles N.N.E. of Manickpour.

HOSSAMALLY, a town of Hindoostan, in Guzerat; 25 miles S. of Amedabad.

HOSSAREE, a town of Hindoostan, in Canara; 10 miles E.N.E. of Barcelore.

HOSSEFIN, or LONGROSSON, a town of Arabia, in the province of Oman, on the E. coast; 30 miles N.N.W. of Sohar. N. lat. $24^{\circ} 40'$.

HOST, HOSPES, which some will have thus called, *quasi hostium*, or *ostium petens*; for *ostium* was anciently written with an aspirate; a term of mutual relation applied both to a person who lodges and entertains another, and to the person thus lodged, &c.

Thus the innkeeper says, he has a good host, in speaking of the traveller who lodges with him; and the traveller again says, he has a kind host, in speaking of his landlord. It must be observed, then, that it was the custom among the ancients, when any stranger asked for lodgings, for the master of the house, and the stranger, each of them to set a foot on each side of the threshold, and swear they would neither of them do any harm to the other. It was this ceremony that raised so much horror against those who violated the law or right of hospitality on either side; inasmuch as they were looked on as perjured. Instead of hospes the ancient Latins called it *hostis*, as Cicero himself informs us; though, in course of time, *hostis* came to signify an *enemy*; so much was the notion of hospitality altered.

Host is also used by way of abbreviation for *hostia*, a victim, or sacrifice, offered to the Deity.

In this sense, host is more immediately understood of the person of the word incarnate, who was offered up a host, or *hostia*, to the Father on the cross, for the sins of mankind.

Host, or *Hostia*, is chiefly used, in the Romish church, for the body of Jesus Christ, contained under the species of bread and wine, which is offered up every day, a new host, or sacrifice in the mass.

Pope Gregory IX. first decreed a bell to be rung, as the signal for the people to betake themselves to the adoration of the host.

The vessels wherein the hosts are kept is called the *cibory* ; being a large kind of covered chalice.

HOSTAGE, formed of *host*, and that of *hospes*, a person left as surety for the performance of the articles of a treaty.

When two enemies are on the point of concluding a treaty,

or capitulation, it is frequent for them to give hostages on each side, as sureties for the execution of what is contained therein.

An hostage is either a principal, or an accessory, according to the state of the case. He is only an accessory, when, for instance, a prince promises fidelity to another, and gives up his son, or some other great lord, to assure his engagement, without any farther stipulation. For here, if the prince fail of his word, the hostage is no ways accountable for it.

But the hostage becomes a principal, when it is expressly stipulated, that he shall be answerable for the event: for instance, if a city engage to surrender, in case it be not relieved in so many days, and to secure the engagement, give hostages, these hostages are what a surety is to a creditor for the debt of his principal. So that if the relief do not come, and yet the citizens refuse to surrender, the hostages stand in their places, become principals, and are liable to be punished for the prevarication of those they are become sureties for.

A hostage given for another person becomes free when that person dies.

HOSTANA, in *Geography*, a town of Istria; 6 miles N. of Rovigno.

HOSTAUN, a town of Bohemia, in the circle of Pilsen; 9 miles N.W. of Teinitz.

HOSTE, or L'HOSTE, JOHN, in *Biography*, who flourished in the former part of the seventeenth century, was born at Nancy, in Lorraine. He was some time professor of civil and canon law in the university of Pont-à-Mousson; and afterwards occupied the mathematical chair. His talents and industry recommended him to the notice and favour of Henry, duke of Lorraine, who appointed him to the posts of intendant of fortifications, principal engineer, and counsellor of war. He was author of many valuable works connected with his profession, of which the following are the principal: "Le Sommaire et l'Usage de la Sphere Artificielle;" "Description et Usage des principaux Instrumens de Geometrie;" "Du Cadran et Quarrè." He died in the year 1631. Moreri.

HOSTE, or L'HOSTE, PAUL, was born at Pont-de-Veal, in France, in the year 1652. He entered into the order of the Jesuits in 1669, and afterwards took several voyages with the marshals D'Éstrées and De Tourville, and the duke de Mortemart, whom he accompanied, for twelve years, in their naval expeditions. He distinguished himself by his great skill in mathematics, and became professor of those sciences at Toulon, where he died in 1709. He was author of 1. "Traité des Evolutions Navales," folio, 1697. 2. "Traité de Mathématique les plus nécessaire à un Officier," 3 toms. 12mo. The treatise on naval evolutions was enlarged and reprinted in 1727; it is historical as well as didactic, and contains an account of the principal naval transactions during fifty years preceding the time of its first publication, illustrated with four hundred copper-plate engravings. Annexed to it is a treatise "On the Construction of Ships." Moreri.

HOSTEA, in *Botany*, was so called by professor Willdenow, in compliment to the highly meritorious Dr. Nicholas Thomas Host, author of a *Synopsis Plantarum in Austria crescentium*, octavo; and of a most superb work in three volumes, folio, with coloured plates in the style of Jacquin's publications, entitled *Gramina Austriaca*. Professor Jacquin has called a plant *Hostia*, with the same intention, in his *Hortus Schoenbrunnensis*, v. 1. p. 114, which appears to us the *Cornutia pyramidata* of Linnæus, notwithstanding the doubts and objections of Jacquin, and the disagreement of its fruit with

the descriptions of Plumier and Linnæus, which last seem to us erroneous. (See CORNUTIA.) The fruit of the Linnæan specimens at least exactly agrees with Jacquin's figure, as to the number of cells and seeds. The *Hoflea* of Willdenow, *Sp. Pl.* v. 1. 1274, is however the *Maclea* of Aublet, *Guian.* t. 1. 277. t. 109, under which appellation it is described by Mr. Brown in his *Aselepiadeæ*, 25; and though this name has received no explanation, and appears to be barbarous, it is sufficiently harmonious, and in compliance with a writer who has treated his subject so well as Mr. Brown, may perhaps be admissible. See MATRELA.

HOSTEL, or HOTEL, a French term, anciently signifying a house or dwelling-place.

It is now more commonly used for the palaces or houses of the king, princes, and great lords.

In this sense they say, the *hotel de Condé*, *hotel de Conti*, *hotel de Louvre*, &c.

The grand prévot de Photel was the first judge of the officers of the king's household, his jurisdiction was much like that of lord-steward of the household of the king of England.

The *hotel de ville* is what we call a *town-house*, or *town-hall*. *Hotel-dieu*, is a common name for the chief hospital for the reception of sick persons, in most of the cities of France. The *Hotel de Mars* is a hospital near Paris; of the same nature with Chelsea hospital.

HOSTEREN, in *Geography*, a small island in the N. sea, near the coast of Norway. N. lat. 60°.

HOSTERLITZ, a town of Moravia, in the circle of Znaim; 12 miles N.E. of Znaim.

HOSTIA, Host, in *Antiquity*, a victim offered in sacrifice to a deity.

The word is formed from *hostis*, *enemy*; it being the custom to offer up a sacrifice before they joined battle, to render the gods propitious; or, after the battle was over, to give them thanks. Some choose to derive the word from *hostis*, q. d. *ferio*, *I strike*. Isidore on this word remarks, that the name *hostia* was given to those sacrifices which they offered before they marched to attack an enemy; *Antequam*, says he, *ad hostem pergerent*, in contradistinction from *victims*, which were properly those offered after the victory. Ovid seems to distinguish otherwise, when he says,

“Victima quæ cecidit dextra victricæ, vocatur;
Hostibus a domitis hostia nomen habet.”

As if the *hostia* might be slain by any priest, but the victim only by the hands of the victor. Fronton makes another distinction: according to him, *victima* was a grand oblation, and *hostia* a smaller and less considerable one.

HOSTILINA, in *Mythology*, a goddess adored among the Romans, and invoked particularly for the fertility of the earth.

HOSTILITY, the action of an enemy. During a truce, all hostilities are to cease on both sides: such a city stands neuter, and commits no hostilities on either side.

The word is Latin, *hostilitas*, formed of the primitive *hostis*, which signifies *enemy*, and which anciently signified stranger, *hospes*.

HOSTILLERS, in our *Old Writers*, is used for inn-keepers; and in some old books the word *hostlers* is taken in the same sense. 3 Ed. III. cap. 2.

The word is French, *hosteliers*, of the same import.

HOSTIS, in *Antiquity*. See BISTOR.

HOSTOMITZ, in *Geography*, a town of Bohemia, in the circle of Beraun; six miles S.E. of Beraun. N. lat. 49 51'. E. long. 14° 11'.

HOSTORP, a town of Sweden, in the province of Skone; 10 miles N.W. of Lund.

HOT-BATH. See BATH and THERMÆ.

HOT-BED, in *Gardening*, a name given to a sort of bed constructed for the purpose of producing artificial heat, and the raising of different sorts of culinary and other vegetables and plants.

In this view these beds are mostly formed either of horse-dung or tanner's-bark, being raised two, three, or four feet high, and covered with garden-frames and glasses, &c. And in some cases the dung and bark are mixed or blended together.

It is chiefly by the aid of these beds also that various tender plants, flowers, and fruits, are raised in perfection, which, without such artificial heat, could not possibly be produced or continued in this climate. By this means, likewise, vast numbers of seeds, which would otherwise remain years in the earth, and some never grow at all, are made to generate, form plants, continue their growth, and produce their flowers and fruits as in their native soils. And the cuttings and slips of many sorts of trees and shrubs, which would otherwise remain inactive and perish, are also made soon to emit root-fibres and shoots, and become plants in due time.

By this means, too, many valuable esculent plants, that succeed in the full ground at one time of the year or other, are brought to perfection much sooner than they could otherwise be obtained, as the cucumber, asparagus, peas, beans, kidney-beans, radishes, carrots, strawberries, and various salad herbs, and other plants, which grow in the open ground of the garden departments.

And annual flowering plants, as well as those of the herbaceous and shrubby kinds, are also brought to more early perfection and flowering by them. They are therefore of great use in the practice of gardening, in numerous cases of forcing early productions.

Making Dung Hot-beds.—The proper situations for making these sorts of beds in are the forcing-ground, or other sheltered, warm, sunny exposures, either in or contiguous to the garden ground.

The hot-beds are sometimes made entirely on level ground, and sometimes in a trench or oblong cavity formed in the ground, the width and length of the intended bed, and from twelve inches to a foot and a half deep or more; but for early work in the winter or spring seasons, they should be mostly above ground, upon the level or rather elevated surface, that the bottom of the bed may stand dry, and not be liable to be chilled by wet, as, when made in this way in those seasons when the heat declines, both sides of the bed may be lined with hot dung quite to the bottom, so as the whole may have an equal benefit of the lining to revive its declining heat, which is essentially necessary during winter and spring, until the middle or latter end of May. But when hot-beds are made in trenches at an early season, where linings must be added to support a constant regular heat, all that part of the beds within the ground is deprived of the advantage of them. These beds are sometimes also inclosed by brick masonry, which is surrounded by hot dung on the outside. This is M'Phail's mode of early forcing.

With respect to the forms and dimensions of dung hot-beds, they should generally be those of long squares, ranging nearly east and west, to any length that may be convenient; about four feet and a half in breadth, if to be covered with common garden-frames; and three and a half or four feet if for hand-glasses; raising them, if in winter, or early in spring, three or four feet or more in height, allowing for set-
ting;

HOT-BEDS.

thing; as they will settle half a foot or more in the course of a week or two after making them.

The more early beds should be substantial, otherwise they will not support a durable uniform temperature of heat for continuing the plants in a regular free growth; which, by the aid of linings, must be effected till the arrival of warm weather. Those made in winter should be three feet and a half in height at least, when first made; or if four, so much the better; in March a yard in height, in April the same, or two feet and a half; and in May two feet or a little more, as without due substance they never answer well.

These beds may be made for a one-light, a two-light, or even a three-light frame; and for two, three, or more, three-light frames in a range, according to circumstances and the nature of the forcing to be done.

Manner of Forming the Beds.—After properly marking them out, some of the longest or most strawy dung should be shaken along the bottom, to begin the bed with; then the long and short together as it comes to hand, shaking it evenly in every part, raising the sides perfectly upright, straight, and firm as possible; forming the corners also full and very firm, keeping the middle well filled with the best dung; and, as the work advances, beating each layer of dung evenly and firmly down with the dung-fork; or, when it is very long, loose, strawy dung, treading it in to settle every part equally; proceeding in this manner till the bed is arrived to its designed height, raising that part intended for frames two or three inches higher in the back or north side than in front, to give the greater slope to the glasses to the sun, finishing the top even in every part; and when the bed is thus raised, trimming up all the short dung remaining at last round the bed, laying it on the top ridge-ways along the middle, which may either then, or rather, if a strong bed, in a few days afterwards, when the bed has settled a little, be levelled, to make good all inequalities, and smooth the surface. After this set the frames, &c. on, and earth the bed as directed below. See **FRAME** and **HAND GLASSES**.

The hot-bed being thus formed, when of considerable substance, it may be advisable to defer the framing and earthing it finally for several days, or even a week or more according to the strength of the bed, until it is a little settled, and the first violent heat has subsided; as the heat will be very strong, and frequently of a burning nature, for the first week or two after it is made. It may, however, often be proper to set the frames and glasses on, to defend the beds from excessive rains or snow, as well as to draw up the heat sooner, to form the bed to a proper temperature for the reception of the mould, and seeds or plants. The upper ends of the lights should be raised a hand's breadth high, or be shoved so much down in dry weather, that the great steam arising from the bed may pass freely off; as in strong hot-beds neither the earth, seed, nor plants, should be put in till the fierce heat and violent steam have a little abated. Hot-beds of slender substance may, however, be framed, earthed, &c. as soon as made, as no great danger is to be apprehended from burning, and more particularly those for small frames, hand-glasses, &c.

Where, in this mode of forcing, there is an extensive range of substantial hot-beds, the placing of the frames on them before they are fixed for good, is often inconvenient; in which case it is proper to have mats, or dry long litter ready to cover the tops in case of excessive rains or snow, which might chill and retard the beds greatly from becoming of a due temperature for the reception of the earth, &c. and sometimes occasion them to become of a burning description,

when they otherwise would be of only a regular heat and temperature for the purposes for which they are designed.

But in hot-beds designed for strength and duration, it will, as soon as they are made, be proper to provide some sharp pointed sticks, two feet long, to thrust down into the middle of the beds in different parts, that by pulling them out daily, and feeling their lower parts, a judgment may be formed of the working and temperature of the beds, and when in a proper state for the reception of the mould and plants.

Where the hot-bed is therefore of good substance, and for the large frames, it is proper to let it remain some days to settle, before it is framed for good, because, notwithstanding all the care in making, it will often settle unequally; and it should be levelled before it is earthed; in from about three to five, six, or eight days, according to the nature of the dung, or substance of the bed, it will have so far settled as to discover the inequalities, if any; when, if the frames and glasses were placed thereon, for the purposes above-mentioned, when the whole has settled, all the inequalities should be made even, by levelling the top, making the surface firm, and smoothing it off neatly with the back of the spade. Then the frame and glasses should be put on for good, opening the lights a little at top to give vent to the steam and rank heat.

Mode of Earthing the Beds.—As strong substantial dung hot-beds, after being covered with the frames, &c. sometimes heat violently the first week or fortnight; when the earth is put in during the fierce heat, by confining that and steam still more closely it is in danger of being burnt, and also of destroying the seed and roots of the plants, if any were sown or planted. When the earth is thus burnt by the heat of the dung, no seeds or plants can vegetate or thrive in it; it must therefore be taken out and replaced by fresh compost. Hot-beds of such considerable substance should of course be examined previously to moulding them, to ascertain the state of heat daily, by the sticks, and thrusting the hand into the dung. And when it is found of a due temperature, the mould should be put on. This is sometimes shewn to be the case by the appearance of a sort of mushroom spawn upon the more superficial parts.

But in slender hot-beds, as their heat is never so violent or durable, they may either be earthed as soon as made, or in two, three, or four days afterwards, as may be judged proper. In all cases care should, however, be taken that the beds do not lose any time for them to waste their heat ineffectually, without being earthed and properly prepared for the reception of the plants.

And for all sorts of hot-beds, the earth or mould should be rich, light, and of a dry quality, particularly for early work in winter and spring, and tender plants, such as cucumbers, melons, tender annuals, &c. as very moist earth rots such plants while young, binds too closely, and by its compactness confines the heat and steam, so as often to burn at bottom, and scorch the roots of the plants. Some light mould should therefore always be in readiness in some airy shed, for two or three weeks before it is wanted for this use. See **COMPOST**.

In regard to the depth of earth or mould which is necessary to be applied over hot-beds, it must be different according to the purposes for which they are designed, as for sowing seed on, or the reception of plants, and the nature of the plants, or chiefly for plunging pots in. In general, however, from about five or six, to ten or twelve inches, is the common depth. For sowing seeds to raise plants for transplantation, the depth of mould should be about six inches; and where they are to remain to acquire their full growth,

H O T - B E D .

not less than from six or eight to ten or twelve inches in depth. If for the immediate reception of plants to remain, or for striking cuttings of any sort in, &c. from six to eight, ten, or more inches of mould will be necessary, regulating the whole in some proportion to the nature or growth of the plants, and the substance of the beds. Thus, cucumbers and melons, which are not only extensive growers, but produce large fruit that requires much nourishment, need a greater depth of mould than small salad-herbs, &c. which only stand in need of a slight covering.

In the business of earthing the beds, every part of the dung within the frame should be carefully covered over, especially after the plants are come up, or any planted in them, that no steam may rise immediately from the dung upon them, and thereby prove injurious or destructive to them.

With regard to the sowing or planting seeds or plants in hot-beds of strong substance, under frames, care should constantly be taken not to do it till the danger of burning is over, unless performed in pots, that may be removed up as occasion requires; and at any rate, it is always better to wait a day or two, than to endanger the plants; time should not, however, be lost when the bed is ready, as it is necessary always to have a lively heat at first, to promote a quick germination in the seeds, or to strike and set the plants forward, so as to assume a free growth at first when they appear at the surface of the beds.

And in the management of hot-beds after being sown or planted, it must often be different, according as the different plants may require. In general, however, after the seeds or plants have been put in, the glasses are to be constantly continued on until the middle of summer, when the weather is become settled and warm, particularly for all the tender kinds of plants; fresh air being admitted daily, at all opportunities, in mild weather, by raising the upper ends of the lights; or, if hand-glasses, by propping up one side, from about half an inch to two or three inches high, according to the heat and steam in the bed, and temperature of the outward air, shutting all close in due time towards evening, and keeping them close every night during the cold weather, covering the glasses every night with mats until June, especially for the more tender sort of plants, flowers, &c.

As soon as the heat of the beds naturally declines or becomes of a weakly temperature, it must be renewed by adding fresh hot dung around the sides, which is called *lining* the bed, and is particularly necessary for all dung hot-beds, made any time in winter or spring, as already noticed. See **LININGS**.

And sometimes a repetition of new linings is required three or four times, especially for those made in winter, to continue them in an uniform heat; these linings should be made of the hottest dung, and be applied quite from the bottom to the top of the bed, and about fifteen or eighteen inches wide at bottom, drawing them into about a foot wide at top, raising them four or five inches up the frame to allow for settling, but not more; for the tops of the linings, when settled, should be but very little above the bottom of the frame, lest their heat burn the earth adjoining to the frame within; and to prevent steam from rising too copiously from the linings, a stratum of earth should be laid on the top two inches thick, continuing it close up to the bottom of the frame, that no steam may rise that way; for the rank steam immediately from dung, without first passing through a body of earth, is destructive to most plants. As the linings settle down lower than the tops of the bed, more fresh dung should be added, in order to preserve them of a proper height.

Forming Bark Hot-beds.—These are such hot-beds as

are formed of bark or tan, after having been used in tan-vats or pits, and which produces a regular, moderate, and steady durable heat. See **BARK** and **HOT-house**.

But hot-beds of this kind always require to be made in proper bark-pits formed for the purpose of brick-work, or post and planking, to confine the tan in its proper situation and direction. See **BARK-pit**.

In cases where there are proper conveniences of pits, in which to make the hot-beds furnished with frames and glasses suitable, they are superior in many cases to dung hot-beds, both in raising many early useful productions, and various curious flowers to early bloom, as well as in the propagation and raising many sorts of tender exotics, from seeds, layers, cuttings, &c. In bark hot-beds early strawberries and melons may be raised, which, by the regular, moderate, and durable heat which they produce, are generally in great perfection at an early season; likewise, small early crops of dwarf-peas and kidney-beans, &c. and of flowering plants, many sorts may be forced in great perfection of early bloom, both of the bulbous, tuberous, and fibrous-rooted kinds, such as hyacinths, dwarf-tulips, jonquils, narcissuses, anemones, ranunculuses, pinks, and many other moderate growing kinds; also roses, and some other small ornamental flowering shrubs of different descriptions.

And bark hot-beds are also of great utility in hot-houses, stoves, and forcing houses, as the principal and most proper, and effectual kind of beds for these different departments of the garden. See **BARK-beds**, and **HOT-house**.

Kinds of forced Crops.—The particular sorts of crops usually raised in these hot-beds are those of cucumbers, melons, asparagus, strawberries, kidney-beans, peas, dwarf-beans, radishes, small salad-herbs, and lettuces. But various sorts of seed plants are raised and preserved in this way, such as cauliflowers, early cabbages, red cabbages, early celery plants for pricking out, carrots, small white turnip-radishes, Dutch turnips, mint, tarragon, tansey, basil, capsicums, love-apples, coriander, purslane, early dwarf potatoes, and mushrooms in beds of peculiar sorts. But those for which these beds are more absolutely necessary, are all the first sort, and basil, capscium, love-apple, and mushrooms amongst those of the second description. See **MUSHROOM-house**.

HOT-bed, in *Agriculture*, a sort of earthy layer or stratum, under which horse and some other kinds of manure have been deposited in their more raw and imperfectly reduced conditions; by means of which a degree of heat is kept up for some length of time, and thereby vegetation brought forward, where the season or climate is not warm enough for effecting the purpose in a proper manner. This is a method of husbandry that can only be had recourse to in particular sorts of crops, such as those of potatoes and a few others, in which the sets or other seeds are capable of being put in upon littery or other hot dung in the drills or rows, by means of which a kind of hot-bed is prepared for the promotion of their growth, and the extension of their knobby, tuberous, or other roots.

HOT-bed Culture, a term applied to that kind of cultivation which in some measure approaches to that which takes place on hot beds. See **HOT-bed**.

HOT-house, in *Gardening*, a sort of garden erection, mostly formed of glass-work, in which a constant regular degree of artificial heat by fire and bark hot-beds is kept up and preserved.

The principal powers which assist in promoting the growth of vegetables, and which of course should be regarded in buildings of this nature, are those of heat, light, air, earth or soil, and water. The first of these is commonly afforded

HOT-HOUSE.

by the consumption of some sort of material as fuel, in a narrow fire-place or furnace, the heat and smoke being conveyed in a winding horizontal flue or pipe, which serves as a chimney to the different parts. This has, likewise, been occasionally done by the application of steam alone, as well as in combination with fire. This is, however, too expensive a method to be generally employed. It may be afforded also by different materials in the state of fermentation, such as dung, litter, leaves, and various other vegetable products of little value but for manure. And in particular situations it may be effected by the sun, being preserved by proper contrivances, as in the patent hot-house lately invented by Dr. Anderson, and described below. But though all these schemes may be occasionally had recourse to in particular cases, that by the consumption of fuel in furnaces and flues is the only practical method that can be generally adopted with benefit. As the principal difficulty in this business is the regulation and retention of the temperature, so as to suit the different habits and degrees of heat that are requisite for the growth of the different plants; various plans have been had recourse to in these intentions; in the latter partly by having the houses made in a great measure air-tight, and partly by the contrivance of an inner curtain, so as to be let down close under the glass during the night-time, and thereby prevent the heated air of the house from being brought in contact with it, and from escaping in any great proportion in that way. This curtain has been lately contrived by Mr. Loudon. In the former, the heat is also chiefly regulated and kept at the proper height by means of this curtain, which, as it keeps up the due temperature, does not render it necessary to have the heat raised so much in the early part of the night, in order to avoid its getting too low towards the morning. For though the house be quite air-tight, as glass from its porous nature is readily permeable by heat or cold, it must of necessity, in consequence of the ascension of the heated air to the top of the house, be continually given out to the surrounding atmosphere by the roof and sides of all glazed houses of this description. It is indeed principally on this account that such houses as have their sides of glass, are, without this sort of curtain, conducted with such trouble and difficulty.

Light is necessarily admitted by having the whole or a portion only of the roof of such houses; or all the roof and sides too, constructed with glass, in frames that have the convenience of sliding at pleasure. It is of very great importance in these buildings also, that the light should fall upon the plants, at but a small distance from the glass of their roofs, as by such means the plants are found to succeed in the most perfect manner.

Air is obviously inclosed within such houses, but is capable of being excluded, and that which is fresh admitted either in the whole or only in part, so as to be intermixed with it, by means of proper openings or apertures formed in different parts, so as to be opened or closed as there may be occasion for the due growth of the plants.

Earthy matter or soil proper for this purpose may be provided by means of inclosing a part of the surface of the ground within such houses, and putting it under a suitable state of preparation, as well as by depositing it after being properly prepared in pots or boxes made for the purpose, and which are capable of being put in any way that may be found beneficial for the plants or other things they may contain.

Water can readily be given in its state of fluidity to the plants or other crops simply by pouring it over the surface of the earth, or by the garden syringe, engine, and watering-pot, as rain; and by pouring it upon the heated flues or other

parts of the house by which it is converted into vapour, it is applied as dew, in consequence of its being deposited in fine particles as it loses its heat.

Besides these, the removal of stagnant air in these sorts of houses is of much consequence, which may in some measure be effected by affording motion to the plants by the admission of the external air in gentle currents. But as this can only be properly attempted when the air from without is nearly of the same temperature as that of the hot-house, it is plain that plants grown in such places can only have such admissions for a very small part of the year. This has led to different contrivances in order to remedy the defect, but these have hitherto been attended with but little success.

General Construction and Use.—The hot-house is used for procuring some sorts of fine fruits, such as the peach, the nectarine, the cherry, the fig, &c. also for the vine, the pine-apple, and for raising and preserving various other sorts of tender exotics from the hot parts of the world. Each of these sorts of fine fruits requires something particular in the construction of the hot-house.

Those which are intended for the peach, nectarine, cherry, and fig, &c. are in general with great propriety in cold situations constructed against walls, being made with glass on one side. But in climates that are less severe, such houses as are formed of glass on all the sides, having the trees so planted as to grow irregularly in the standard method, may be more beneficial as well as more ornamental.

For the forcing of vines, they may be of any kind of form as well as small or large, according to the season at which the trees are to be brought into fruit. But a double-roofed house, with an inner roofing, is advised by some as the most proper for general crops, as well as the most cheap in its nature.

It is usual for pines to be raised at very great expence, in consequence of the quantities of tan, leaves, and other similar substances that are necessary, and which stand in need of such frequent renewal, and cause so much labour and trouble in removing and replacing the plants, &c. in their situations. These, with the uncertainty that is naturally attendant on forcing with materials under the state of fermentation, have deterred many from attempting this sort of culture. Lately, however, plans have been suggested and put in practice, which in a great measure obviate these inconveniences, as may be seen in the section of a pinery given in the plate for this purpose.

But in the general construction of these houses, a wall of eight or ten feet in height or more, is raised behind, with a low wall in front and both ends, on which is placed upright glass-work, four, five, or six feet, and a sloping glass roof, extending from the top of the front to the back wall. Internal flues for fire-heat, in winter, are also contrived, and a capacious oblong or square pit in the bottom space, in which to have a constant bark-bed to furnish a continual regular heat at all seasons; so as in the whole to warm the inclosed internal air always to a certain proper high degree. Houses thus formed are mostly used in raising pines.

But besides the above, these houses are of great utility in forwarding many sorts of choice or desirable hardy plants, flowers, and fruits to early perfection, which being sown or planted in pots, and placed in them in winter, or early in spring, the constant heat thus produced forwards them to maturity two or three months or more before their natural season in the full ground, such as kidney-beans, strawberries, &c.; also, many sorts of flowering plants, both annuals and perennials, of moderate growth, are forwarded to early bloom; and vines planted in the outside close to the front, the stem of each introduced through a small hole above, and

.HOT-HOUSE.

the internal branches trained up under the glasses, produce grapes at an early period, as in May. In hot-houses, likewise, early cucumbers may be raised in good perfection; and the seeds, cuttings, slips, &c. of many curious tender plants forwarded exceedingly in their growth by plunging the pots containing them in the bark-beds of such houses.

Situation and Form.—These houses are mostly ranged lengthways, nearly east and west, that the glasses of the front and roof may have the full influence of the sun. This is the most convenient situation for common houses, either for pines or exotic plants.

But some houses of this sort, instead of being placed in this direction, have lately been ranged directly south and north, having a sloped roof to each side like the roof of a house; also to the front or south end; both sides and the south end front being of glass. These houses are made from ten or twelve to fifteen or twenty feet wide, the length at pleasure; and from ten to twelve feet high in the middle, both sides fully head height; being formed by a brick wall all round, raised only two or three feet on both sides, and south end; but at the north end like the gable of a house. Upon the top of the side and south end walling is erected the framing for the glass-work, which is sometimes formed two or three feet upright, immediately on the top of the wall, having the sloped glass-work above; and sometimes wholly of a continued slope on both sides, immediately from the top of the side walls to that of the middle ridge. They are furnished either with one or two bark-pits; but if of any considerable width, generally with two ranging parallel, one under each slope of the top glass, separated by a two-foot path running along the middle of the house, and sometimes continued all round each pit, with flues ranged along against the inside walls; the whole terminating in an upright funnel or chimney at the north end of the building.

There are other hot-houses which are formed entirely on the square, having a ten or twelve-foot brick wall behind; that of the front, and both sides, only two or three feet high for the support of the glass-work, placed nearly upright almost the same height, and sloped above on both sides and front, which are wholly of glass. These are furnished within with bark-pits and flues, as in the other sorts.

In particular cases they are likewise made semicircular, or entirely circular, being formed with a two or three-foot brick wall supporting the glass framing, which is continued quite round; having the bark-pit also circular, and flues carried all round the inside of the walling, terminating in a chimney on the northern side of the house. However, the first forms are probably the best for general purposes.

Dimensions.—Hot-houses on these plans are made of different dimensions, according to the size of the plants they are designed to contain; but for common purposes they should be only of a moderate height, not exceeding ten or twelve to fourteen feet behind, and five or six in front: some are, however, built much more lofty behind, to admit of the taller growing exotics placed toward the back part, to grow up accordingly in a lofty stature; but the above are best adapted to the culture of pines, and other moderate growing plants, as well as for forcing in; as very lofty houses require a greater force of heat, and by the glasses being so high, the plants receive less benefit from the sun, and are apt to draw up too fast into long slender leaves and stems, as they naturally tend towards the glasses. Where the top glasses are at a moderate distance from the plants, they receive the benefit of the sun's heat more fully, which is essential in winter, and become more stalky at bottom, and assume a more robust and firm growth, particularly the pine-apple, and are thereby more capable of producing large fruit in the season.

Constructing the Flues.—After having determined on the dimensions as to length and width, the foundations of the house should be set out accordingly of brick work, allowing due width at bottom to support the flues a foot wide, wholly on the brick basis; detached an inch or two from the main walls; then setting off the back or north wall a brick and a half or two bricks thick, and the front and end walls nine inches, carrying up the back wall from ten to fourteen feet high; but those of the front and ends only from about two feet to a yard; taking care in carrying up the walls to allot a proper space for a door-way, at one or both ends, towards the back part; setting out also the furnace or fire-place of the flues in the bottom foundation, towards one end of the back wall behind, formed also of brick work, made to communicate with the lowermost flue within. But when of great length, as forty feet or more, a fire-place at each end may be necessary; or, if more convenient, may have them in the back part of the end walls, or both in the middle way of the back wall; each communicating with a separate range of flues; in either case, forming them wholly on the outside of the walls, about twelve or fourteen inches wide in the clear, but more in lengthways inward; the inner end terminating in a funnel to communicate internally with the flues, fixing an iron-barred grate at bottom to support the fuel; calculated for coal, wood, peat, turf, &c. An ash-hole should be made underneath. The mouth or fuel-door should be about ten or twelve inches square, having an iron frame and door fixed to shut with an iron latch as close as possible. The whole furnace should be raised sixteen or eighteen inches in the clear, finishing the top archways. Then continue carrying up the walls of the building regularly, and on the inside erect the flues close along the walls.

It is sometimes advantageous to have the flues a little detached from the walls, one, two, or three inches, that, by being thus distinct, the heat may arise from both sides, which will be an advantage in more effectually diffusing the whole heat internally in the house; as, when they are attached close to the walls, a very considerable portion of the heat is ineffectually lost in the part of the wall behind. In contriving the flues, they should be continued along the front and both ends, in one range at least, in this order. But it is better if they are raised as high as the outward front and end walls, in one or two ranges, one over the other. On the tops of these may be placed pots of many small plants, both of the exotic and forcing kinds, with much convenience.

Thus proceed in the construction of the flues, making them generally about a foot wide in the whole, including six or eight inches in the clear, formed with a brick work, on edge; the first lower flue should communicate with the furnace or fire-place without and be raised a little above it, to promote the draught of heat more freely, continuing it along above the internal level of the floor of the back alley or walk of the house the above width, and three bricks, on edge, deep, returning it in two or three ranges over one another, next the back wall, and in one or two along the ends, and front wall as the height may admit; each return two bricks, an edge deep, and tiled or bricked over. In the beginning of the first bottom flue a sliding iron regulator may be fixed, to use occasionally, in admitting more or less heat, being careful that the brick-work of each flue is closely jointed with the best sort of mortar for that purpose, and well pointed within, that no smoke may break out; having each return closely covered with broad square paving tiles on the brick-work; covering the uppermost flues also with broad, thick, flat tiles the whole width, all very closely laid, and jointed in mortar. The uppermost or last range of flues should terminate in an upright vent or chimney at one end of the back wall;

wall; and where there are two separate sets of flues, there should be a chimney at each end. An iron slider in the termination of the last flue next the chimney may also be provided, to confine the heat more or less on particular occasions, as may be found necessary.

But sometimes, in very wide houses, in erecting the flues, to make all possible advantage of the fire-heat, one or more spare flues, for occasional use, is continued round the bark-pit, carried up against the surrounding wall, but detached an inch or two, to form a vacancy for the heat to come up more beneficially, and that, by having vent, it may not dry the tan of the bark-bed too much; and in the beginning a sliding iron regulator may be fixed, either to admit or exclude the heat, as expedient; so that the smoke, by running through a larger extent, may expend its heat wholly in the flues before it be discharged at the chimney. Great care must likewise be taken that neither the fire-place nor flues be carried too near any of the wood-work of the buildings.

Bark-pit.—After this work is done proceed to set out the cavity for the bark-pit, first allowing a space next the flues for an alley or walk, eighteen inches or two feet all round, and then in the middle space form the pit for the bark-bed six or seven feet wide, the length in proportion to that of the house, and a yard or more deep; inclosing it by a surrounding wall. It may either be sunk at bottom a little in the ground, raising the rest above by means of the parapet wall; or if there is danger of wet below, it should be raised mostly above the general surface. The surrounding wall should be nine inches, but a brick wide wall is often made to do, especially for that part which forms the parapet above ground. It should be coped all round with a timber plate or kirb, framed and mortised together, which effectually secures the brick-work in its proper situation.

The bottom of the pit should be levelled and well rammed, and if paved with any coarse material, it is an advantage in preserving the bark. And the path or alley round the pit must be neatly paved with brick or stone, as may be most convenient.

Glass-work.—The glass part for inclosing the whole should consist of a close-continued range of glass-fashes all along the front, both ends and roof, quite up to the back wall; each fash being a yard, or three feet six inches wide; and for the support of which, framings of timber must be erected in the brick-walling, conformable to the width and length of the fashes, the whole being neatly fixed.

And for the reception of the perpendicular glasses in the front and ends, a substantial timber plate must be placed along the top of the front and end walls, upon which should be erected uprights, at proper distances, framed to a plate or crown-piece above, of sufficient height to raise the whole front head high, both ends corresponding with the front and back; a plate of timber being also framed to the back wall above, to receive the sloping bars from the frame-work in front; proper grooves being formed in the front plates below and above, to receive the ends of the perpendicular fashes, sliding close against the outside of the uprights all the way along the front, or they may be contrived for only every other fash, to slide one on the side of the other, but the former is the better method.

And from the top of the upright framing in front should be carried substantial cross-bars or bearers, sloping to the back wall, where they are framed at both ends to the wood-work or plates, at regular distances, to receive and support the sloping glass fashes of the roof, when placed close together upon the cross bars or rafters, and generally ranging in two or more tiers, sliding one over the other, of sufficient length together to reach quite from the top of the upright

framing in front, to the top of the back wall. The cross bars should be grooved lengthways above, to carry off wet falling between the frames of the sloping lights: making the upper end of the tier of glasses shut close up to the plate in the wall behind, running under a proper coping of wood or lead, fixed along above close to the wall, and lapped down of due width to cover, and shoot off the wet sufficiently from the upper termination of the top fashes. Some wide houses have, exclusive of the main slope sliding glass fashes, a shorter upper tier of glass fixed; the upper ends being secured under a coping as above, and the lower ends lapping over the top ends of the upper sliding tier, and this over that below in the same manner, to shoot the wet clear over each upper end or termination; likewise along the under outer edge of the top plate, or crown piece in front, may be a small channel to receive the water from the sloping glass fashes, and convey it to one or both ends without running down upon the upright fashes, being careful that the top part behind be well framed and secured, water-tight, and the top of the back wall finished a little higher than the glasses, with a neat coping the whole length of the building.

And the bars of wood which support the glasses should be neatly formed, and made neither very broad nor thick to intercept the rays of the sun. Those however, at top, should be strong enough to support the glasses without bending under them. In wide houses, uprights are arranged within, at proper distances, to support the cross rafters more perfectly than could otherwise be the case.

Glazing.—But in respect to the glass work in the sloping fashes, the panes of glass should be laid in putty, with the ends lapping over each other about half an inch, the vacancies of which are, in some, closed up at bottom with putty, others leave each lapping of the panes open, in order for the air to enter moderately, and that the rancid vapours arising from the fermentation of the bark-bed, &c. within, may thereby be kept in constant motion, without condensing much, and also that such as condense against the glasses may discharge themselves at those places without dropping upon the plants. The upright fashes in front may either be glazed as above, or the panes laid in lead work; being very careful to have the glazing well performed, and proof against any wet that may happen to beat against them. The doors should have the upper parts fashed and glazed to correspond with the other glass-work of the house.

Painting.—And on the inside, the walls should be plastered,argeted, and white-washed; and all the wood-work within and without, painted white in oil colour. Some, however, have the back wall painted or coloured rather dark.

Shelves.—Ranges of narrow shelves for pots of small plants may be erected where most convenient, some behind over the flues, a single range near the top glasses towards the back part, supported either by brackets suspended from the cross bars above, or by uprights erected on the parapet wall of the bark-pit. A range or two of narrow ones may also be placed occasionally along both ends above the flues where there is a necessity for a very great number.

In wide houses, where the cross bars or bearers of the sloping or top glass fashes appear to want support, some neat uprights, either of wood or iron, may be erected upon the bark-bed walling, at convenient distances, and high enough to reach the bearers above. This is a neat mode of affording them support.

And on the outside, behind, should be erected a close shed, the whole length, or at least a small covered shed over each fire-place with a door to shut, for the convenience of

HOT-HOUSE.

attending the fires; but the former is much the best, as it will serve to defend the back of the house from the outward air, and to stow fuel for the general use of them, also for garden tools, and all garden utensils when not in use, to preserve them from the weather; as well as to lay portions of earth in occasionally, to have it dry, for particular purposes in winter and early spring, as in forcing frames, &c.

Sometimes hot-houses are furnished with top covers, to draw over the glass sashes occasionally, in time of severe frosts and storms; and sometimes by slight sliding shutters, fitted to the width of the separate sashes; but these are inconvenient, and require considerable time and trouble in their application. At other times they are formed of painted canvas, on long poles or rollers, fixed lengthways along the tops of the houses just above the upper ends of the top sashes, which, by means of lines and pullies, are readily let down and rolled up as there may be occasion.

In the plate of *Hot-house*, at *figs.* 1. and 2. are contained the front elevation and ground plan of an improved hot-house, which has been found to answer well in practice in different instances.

At *fig.* 3. is shewn the section of a hot-house for pines, in which the objections arising from the expence and risk attending their culture on the old plan are chiefly obviated. It is the invention of Mr. Loudon. In this, A, A, A, are the smoke flues; B, the air flue; C, a large vacuity of heated air; D, the rubble stone vacuity; E, the walk in the centre; F, earth in which the plants grow; G, steam and air tubes; H, the inner roofing; I, the surface of the ground. See London's Treatise on Hot-houses.

A plan for another kind of improved hot-house has been suggested by Dr. James Anderson, for which he has taken out a patent. It produces its effects chiefly by the heat of the sun, without the aid of flues, tan-bark, or steam. This improvement extends to every sort of hot-house; and the advantages of such hot-houses are, according to the statement the doctor has given, very considerable. They are,

1st That "in every kind of temperature, if the works are to be erected new; from the foundation, few cases can occur, in which they may not be so placed, as that the whole heat required may be obtained without occasioning the expenditure of one shilling for fuel; but in the most unfavourable cases that can occur, the expenditure of fuel will not amount to one-tenth part of what is now universally employed for producing similar effects."

2d. That "in a vinery, for example, where the grapes are not meant to be forced farther than to ripen from the middle of June to the end of July, as the season may be, no fuel will, in any case, be required, the whole effect being produced by the sun alone."

3d. That "where the grapes are to ripen in April or May, some artificial heat will be wanted; but the quantity of fuel, even in this case, will be so inconsiderable, that in a house which produces, on an average of years, under ordinary good management, not less than ten thousand full-sized bunches of grapes, and fifteen hundred pots of strawberries, or other such plants, the consumption of fuel will not exceed half a London chaldron of coals, and so in proportion for those of a larger extent."

4th. That "in the pinery and stove, the expenditure of fuel will be diminished in a proportionate degree; while, at the same time, the use of bark (or of steam, as a substitute for the heat of tan) will be entirely dispensed with; which, in many situations, will be the saving of much expence."

5th. That "these savings of expence will be effected not only without any detriment to the pines and other

plants, but with great advantage to them all; for, in consequence of these improvements, those diseases which so much weaken, and often destroy the most valuable plants, the damp in particular, will be entirely removed, and vermin, in a great measure, annihilated; the plants too, in consequence of the ventilation that may be at all times given them at pleasure, to any degree that shall be thought proper, (without varying the temperature from that degree which may be deemed most salutary to the plants, at the same time that it may be changed, at will, from moist to dry, or the reverse,) may be kept in a state of perpetual health and luxuriance that has been hitherto unknown in these repositories." And,

6th. That "all these effects will be produced by such a simple apparatus, and that so adapted as to moderate of itself extremes of every sort, that it will become a matter of much less nicety and trouble to the gardener than at present; as he may safely be absent for a much longer time; and thus the accidents which originate from negligence less frequently occur."

It may be noticed that these houses are made almost wholly of wood and glass. The base is a frame of wood, which rests horizontally upon posts fixed firm in the ground, to which the frame is screwed by strong iron screws; the whole being so constructed as to admit of being taken down and removed at pleasure without violence, merely by undoing the screws. They are capable of being formed of any dimensions. But a full explanation of their nature, and the principles on which they produce their effects, may be seen in the doctor's work on the "Patent Hot-house," lately published. Hot-houses on this plan are constructed by George Byfield, esq. architect, Craven street, Strand, London; and Mr. Samuel Butler, Hot-house-builder, Little Chelsea, near London.

Making Nursery and Succession Houses.—It must be observed, that in addition to these hot-houses, others of smaller dimensions, for striking and raising the young plants in, and as succession houses for receiving them into afterwards, when of a year's growth, to bring them forward to a proper size for being used as fruiting plants, are necessary, especially where the pine-apple is cultivated upon an extensive scale, in order to afford full room in the larger houses for the fruiting plants to grow properly in.

These houses may be erected either as appendages to the main house, or detached at a little distance, as most convenient. Where the situation admits, it is, however, more convenient and ornamental to join them in a line with the main house, one at each end. They are formed nearly on the same construction, only smaller both in length, width, and height, than the hot-house.

Form of Nursery House.—This is sometimes formed in the manner of a common detached bark-pit, without any upright glasses in front, having a wall all round, five or six feet behind, gradually sloping at each end, to about four feet in front, and with only sliding glasses at top. Its dimensions must vary according to the extent of plants. It is often termed simply the pit, as the whole internal space in length and width is allotted entirely as a pit for a bark-bed, without any walk within, or door for entrance, the necessary culture being performed by sliding up the glasses at top, the flues for the fires being formed in the upper part of the back wall, above the surface height of the bark-bed. They may, however, be formed in the manner of the hot house, with doors, &c. which is perhaps the best method. One on this principle, for general purposes, has lately been constructed on a small scale, by Mr. Loudon, which, merely by one fire, is capable of affording four different temperatures at the same

same time, and of course, of forcing most sorts of common vegetables, as well as growing vines, pines, and melons, each in their suitable climates, at little trouble or expence. A surface plan of it is given in the annexed plate, in which A shews the cover of the excavation, comprising the furnace; B, the air registers, which serve to form the different temperatures; C, the air and steam tubes, by which the heated air is admitted from the vacuity formed by the rubble stone, as well as by the steam afforded by pouring in water, &c. In the section of this pit in the same plate, A represents the smoke flue; B, the air flue; C, the chimney; D, the supports of the rubble vacuity; E, the rubble cavity; F, the earth and the plants; G, the inner roofing rolled up; H, the damper; I, the furnace hole; K, the cover of the fame; L, the surface of the ground, &c. There are many advantages derived from this mode of construction, as those of saving labour, expence, and littering the garden ground; and by slight alterations it will be found to answer cheaply for the business of forcing vines. See Loudon on Hot-houses.

Form of Succession House.—This sort of house should be constructed with erect glasses in front, and sloping sashes at top, with a door for entrance, and an alley or walk next the back wall; or, what is better, continued round the bark-pit. And where joined to the end of the hot-house, it may be divided from it by a sliding glass partition, having a separate furnace and flues, as the young pine plants do not at all times require the same degree of fire-heat as the older pines. The dimensions must vary according to circumstances, and the number of plants. See STOVE and GREEN-house.

Hot-house Plants, are all such of the tender, exotic, or other kinds, as require this sort of house for their growth, protection, and preservation, in this climate. This description of plants is very extensive, and of many different kinds. See STOVE Plants.

Hot-house, in the *Salt Works*, the place where they dry the salt after it is taken out of the boiling pan. In the Cheshire salt-works, this is situated between the furnace and the funnels of the chimney which convey up the smoke. Along the floor of this room there run two funnels, nearly in a horizontal direction. From the furnace, after this course along the floor, they rise perpendicularly. In these the flame and smoke running along, heat the room by the way.

Hot-shoots, or *Hovilses*, a sort of factitious, or compound fire, made of a third part of any coal, pit, sea, or charcoal, mixed with two-thirds of loam.

These ingredients are to be made up into balls, moistened with a little urine, round, or in any other form, at pleasure, and exposed to the air till thoroughly dry; then may they be burnt in the most orderly fire imaginable, affording a glowing, regular, and constant heat, for seven or eight hours, without stirring. This mixture is also used in some parts to slacken the impetuous devouring of the fire, and keep coals from consuming too fast.

Hot Springs, in *Geology*. A great part of the writers on thermal waters have ascribed their heat to subterranean fires, seated deep in the earth, and have supposed that the waters of hot and warm springs were all alike boiling hot, until by their passage through different masses of cool strata, they were reduced to the temperature at which they issue. Mr. Farey's recent examination and report on Derbyshire, vol. i. shews, that the hot or warm springs at Buxton, Matlock Bath, Stoney-Middleton, &c. are situated on or near the principal faults or vertical derangements of strata in these districts, and the probability that shale, brought in contact

with toadstone, in the faces of these faults, excites the fermentation, or decomposition, which develops the constant heat of these curious springs. See MINERAL Waters.

Hot Wall, in *Gardening*, a term applied to a range or extent of brick or stone walling, fronted with glass-work, so as to inclose a space of several feet in width, constructed with internal fire-flues, &c. designed for forcing fruit-trees to early production. It consists of two parts, the flues and furnace in the wall; and the contrivance of a covering of canvas or netting to protect the trees.

Situations of this nature are mostly ranged lengthways, east and west, to front the full sun; having the south side, or that exposed to the sun, covered by a frame-work of glass, the whole length and height, including a space of but moderate width, as four, five, six, or eight feet for one row of trees behind, trained in the wall-tree order, and extended from twenty or thirty, to forty, fifty, or a hundred feet in length; or of greater width, as ten, twelve, or fifteen feet, in the forcing-house manner, to admit of a range of trained trees behind, and others of lower growth forward; and, in either having internal flues for fire-heat in the main-wall, and continued round along towards the front glass, or sometimes ranged longitudinally along the middle space. Some hot-walls have likewise the front inclosure of glass-work, of sufficient width to admit of forming an internal pit, from four to five or six feet in width, the length of the erection; in which to make a bark-bed, or sometimes a dung hot-bed, or occasionally dung below and bark above, to assist, in conjunction with the fire-heat of the flues, in warming the internal air of them.

And in either method, a border of good mellow, loamy, or other fertile earth of proper width, is formed against the main-wall, in which to plant the trees. Where there is no bark-bed, the whole bottom space is formed with good earth, having a narrow inclosure of glass, four, five, or six feet, to have only a range of trees next the wall, trained as wall-trees, or espaliers; or sometimes made wider, to have wall-trees behind trained to the height of the wall, and others trained, in lower growth, in the internal space forward, either in the espalier manner, or as small dwarf-standards, or sometimes as horizontal dwarfs. See DWARF Trees.

When these are made of wide dimensions, either to admit of a bark-pit, or to have the whole bottom space of earth set with trees against the wall, and others planted forward between these and the glasses, they may properly be considered as forcing-houses.

But in proper hot-walls, as such as have narrow inclosures of glass from four to five or six feet in width, containing only one range of trees, they may be trained towards the wall upon a trellis-work, where there is a range of flues immediately next the wall; but where all the flues are ranged forward, the trees may be trained close to the wall. See FORCING-frame.

The flues in these walls should be formed in such a way as to distribute the heat equally over the wall, which is easily effected. The fronts of them should be made at least a brick in thickness, to preserve the heat more effectually. The most proper furnace for this use is that sold by Mr. Cook in London, and connected with a damper, which is very useful. The covering of canvas, gauze, or netting of the small kind, should be fixed to the wall top, by means of small rafters, and to the border, about three feet from the roots of the trees; the roller for containing this covering being fastened to the bottom parts of these rafters. By this means, and the use of cords and pullies, such coverings can easily be drawn up to the top of the wall, or be rolled down, as there may be occasion. This covering should never be neglected

in such walls, as it is of vast utility in preserving the heat, as well as in preventing the effects of destructive frosts and chilly dews at particular seasons. See *BARB-pit*, and *PIT*.

HOTAMBÆIA, in *Zoology*, the name of a species of serpent found in the East Indies, of a greyish-yellow colour, and very rank smell.

HOTCH, in *Agriculture*, a term provincially applied to a bad job of any sort of work, or to such bargains as do not turn out well.

HOTCH-POT, in *Law*, signifies a mixture or blending of lands, given in marriage, with other lands in fee accruing by descent. Thus, a man seized of thirty acres of land in fee, hath two daughters, and gives with one of them ten acres in frank-marriage, and dies seized of the other twenty. If now, she that is thus married will have any part of the twenty acres, she must put her lands given in frank-marriage in hotch-pot, that is, she must refuse to take the sole profits of the ten acres, but suffer them to be mingled with the other twenty, so that an equal division may be made of the whole thirty between her and her sister. Thus, for her ten acres she will be entitled to fifteen. Coke on Litt.

This was left to the choice of the donee in frank-marriage; and if she did not chuse to put her lands into hotch-pot, she was presumed to be sufficiently provided for, and the rest of the inheritance was divided among her other sisters. The law of hotch-pot took place only, when the other lands descending from the ancestor were fee-simple; for if they descended in tail, the donee in frank-marriage was entitled to her share, without bringing the lands so given into hotch-pot. (Litt. § 274.) And the reason is, because lands descending in fee-simple are distributed by the policy of law, for the maintenance of all the daughters; and if one has a sufficient provision out of the same inheritance, equal to the rest, it is not reasonable that she should have more; but lands descending in tail are not distributed by the operation of the law, but by the designation of the giver, *per formam doni*, however unequal the distribution may be.

Also no lands, but such as are given in frank-marriage, shall be brought into hotch-pot; for no others are looked upon in law as given for the advancement of the woman, or by way of marriage-portion. (Litt. 275.) But gifts in frank-marriage having fallen into disuse, it would have been needless to mention the law of hotch-pot, if this method of division had not been revived and copied by the statute for distribution of personal estates. See *FRANK-MARRIAGE*, and *CUSTOM of London*.

HOTCH-POTCH, or *HODGE-PODGE*, from the French *hache en poche*, or, according to Camden, *hachee en pot*, i. e. *boiled in a pot*, primarily denotes a Flemish medley dish, made of flesh cut in pieces, and foddren with herbs, roots, &c.

HOTMAN, FRANCIS, in *Biography*, a French civilian, was born at Paris in 1524: at the age of fifteen he was sent to study the law at Orleans, where his progress was so rapid, that within three years he received the doctor's degree. He read lectures at Paris, but quitting the religion in which he was educated, and embracing the Protestant system, he went to Switzerland, from whence he removed to Strasburg, where he obtained a professorship of the civil law. He afterwards engaged in the service of the king of Navarre, and took two journies into Germany, for the purpose of obtaining succours from the Protestant princes. On his return, he removed to Valence, where his law-lectures revived the credit of the university: after which he was induced to accept a professorship at Bourges; this he soon resigned, to partake in the councils of the heads of the Protestant party at Orleans; but at the time of the infamous massacre of St. Bartho-

lomew he retired to Basil, where he died, in the year 1590. His works were published, in 1599, in three volumes folio. He was a learned and profound jurist, an eloquent historian, an able politician, and an ingenious man. His works consist, for the most part, of tracts relative to the civil law, and to the Roman history and constitution. Bayle.

HOTOM, or *KOTAN*, in *Geography*, a town of Little Bucharia; 230 miles S.E. of Cashgar. N. lat. 37° 42'. E. long. 80°.

HOTORE, a town of Bengal; 22 miles E.S.E. of Doefa.

HOTOWACZYN, a town of Lithuania, in the palatinate of Troki; 16 miles E. of Grodno.

HOTTENPLOZ, a town of Moravia, in the circle of Prerau, insulated in Silesia; 12 miles N.N.E. of Jagern-dorf.

HOTTENTOT CHERRY, in *Botany*. See *CASSINE*.

HOTTENTOTS, *Country of*, in *Geography*, a large territory of Africa, and part of Cassaria, bounded on the N. by countries unknown, and on the S.E., S., and W. by the sea. The coast is mountainous, and abounds in capes and bays. The whole country, distinguished by this appellation, is inhabited by different tribes of Hottentots, governed by various chiefs, who have no fixed residence, but live in huts or portable houses, and remove their kraals, or villages, whenever the pasture fails to supply their cattle, or upon the death of an inhabitant. Ever since the establishment of the Dutch in the southern part of Africa, they have been separated and dispersed from the neighbourhood of the Cape of Good Hope; and those who from ill usage and oppression have been removed to a considerable distance, or to regions that have been inaccessible to their pursuers, have maintained some separate establishments, and retained, in a degree, their primitive habits and manners. The Hottentots are divided from the Caffres or Kaffers by the Great Fish river. The disposition and character of these people have been much misrepresented; and we are indebted principally to Mr. Barrow for a just account of them; who has rectified the mistakes and confirmed the more favourable representations of modern writers. Dr. Sparrman has given the following account of the Hottentots. With regard to their persons, he says, they are as tall as most Europeans, and if they are, in general, less corpulent, this is owing to their being more stinted in their food, and to their not being accustomed to hard labour. But that they have small hands and feet compared with the other parts of their bodies has been remarked by no one before, and may, perhaps, be regarded as a characteristic mark of this nation. The root of the nose is for the most part very low, by which means the distance of the eyes from each other appears to be greater than in Europeans. The tip of the nose likewise is pretty flat. The iris is scarcely ever of a light colour, but has a dark brown cast, which sometimes approaches to black. Their skin is of a yellowish-brown hue, resembling that of an European who has the jaundice in a high degree; however, their colour is not in the least observable in the whites of the eyes. One does not find such thick lips among the Hottentots as among their neighbours the Negroes, the Caffres, and the Mozambiques. Their mouths are of a middling size, and almost always furnished with a set of the finest teeth that can be seen, and taken together with the rest of their features, as well as their shape, carriage, and every motion, in short their "tout ensemble," indicate health and content, or at least an air of "sans souci." At the same time, this careless mien discovers marks of alacrity and resolution; qualities which the Hottentots can occasionally exhibit. Their heads one would suppose

HOTTENTOTS.

to be covered with a black, though not very close, frizzled kind of wool, if the natural harshness of it did not shew that it was hair, if possible, more woolly than that of the negroes. If, in other respects, there should, by great chance, be observed any traces of a beard, or of hair, on any other parts of the body, such as are seen on the Europeans, it is, however, very trifling, and generally of the same kind as that on the head. Dr. Sparrman refutes an opinion, which has represented the men as being different from others, and adds, that the women have no parts uncommon to the rest of their sex. With respect to their dress, and method of painting themselves, he remarks, the latter (if painting it may be called) consists in besmearing their bodies all over most copiously with fat, in which there is mixed up a little foot. This is never wiped off; on the contrary, he never saw them use any thing to clean their skins, excepting that, when in greasing the wheels of their waggons, their hands were besmeared with tar and pitch, they used to get it off very easily with cow dung, at the same time rubbing their arms up to the shoulders with this cosmetic; so that as the dust and other filth, together with their sooty ointment and the sweat of their bodies, must necessarily, though it is continually wearing off, in some measure adhere to the skin, it contributes not a little to conceal the natural hue of the latter, and at the same time to change it from a bright umber-brown to a brownish-yellow colour, obscured with filth and nastiness. Besides the pleasure the Hottentots find in besmearing their bodies from head to foot, they likewise perfume themselves with powder of herbs, with which they sprinkle both their heads and bodies, rubbing it all over them when they besmear themselves. The odour of it is at the same time rank and aromatic, and seems to come nearest to that of the poppy mixed with spices. The plants used for this purpose are different species of the *Diosma*, called by the Hottentots "Bucku," and considered by them as possessing great virtues in curing disorders. Some of these species are very common about the Cape; but one particular sort, which grows about "Goud's-Rivier," is said to be so valuable, that no more than a thimble full of it is given in exchange for a lamb.

The Hottentots, with their skins thus besmeared with grease and foot, and Bucku-powders, are in a great measure defended from the influence of the air, and may in a manner reckon themselves dressed. In other respects both men and women appear naked, excepting that a trifling covering always conceals part of their bodies. The covering of the men consists of a bag or purse made of skin, hanging quite open, and only fastened by a small part of its upper end to a narrow belt, so that it is an imperfect covering; and when the wearer of it is in motion, it is no concealment at all. This purse is called Jackall, from the name of the animal, of whose skin it is prepared, with the hairy side turned outward. As another covering which decency requires the men to use, we may also consider two leather straps, generally hanging from the bottom of the chine of the back down upon the thighs, each of them being in the form of an isosceles triangle, with the points or upper ends fastened to the belt already mentioned, and with their bases, about three fingers broad, hanging carelessly down. These straps make a kind of rattling noise, as the Hottentot runs along, and probably by fanning him, produce an agreeable coolness. Among the Hottentots, the fair sex appear to be the most modest, for the females cover themselves much more scrupulously than the men, using for this purpose two, and very often three coverings, made of a prepared and well-greased skin, which are fastened round their bodies with a thong, resembling the aprons of European females. The outermost is always the largest, measuring in breadth from about 6 to

12 inches. This is frequently adorned with glass-beads strung in different figures, thus indicating among the unpolished Hottentots not only a regard to neatness and decorum, but powers of invention, and a disposition to set off their persons to the best advantage. The outermost apron reaches about half way down the thighs, and is chiefly intended for ornament. The middle one is about a third or one-half less, and is regarded by them as an additional entrenchment of modesty, when their gala garment is laid aside. The third, or innermost, about the size of one's hand, is said to be useful at certain periods, which are much less troublesome to the fair sex here than in Europe. All these aprons, however, and even that which is decorated with beads, are not less besmeared and greasy than their bodies. The garment worn by the Hottentots for covering their bodies is a sheep-skin, with the woolly side turned inwards; this pelisse, or else a cloak made of some smaller fur, is tied forwards over the breast, and worn loose, or wrapped round them, as far as below the knees, according to the state of the weather. In general, the Hottentots do not burden themselves with many changes of their cloaks, or "krosses," (as they call them in broken Dutch), but are content with one, which serves them both for cloathing and bedding; and in this they lie on the bare ground, covered with this kross or karofs. The cloak, or karofs, of the woman differs little from that of the men, except that their's has a little hood or pouch, with the hairy side inwards, in which they carry their infants, to which they now and then throw the breast over their shoulders. The men have seldom any peculiar covering on their heads. The women likewise go bare-headed: but when they use any covering, it is a cap in form of a truncated cone, made of some animal's stomach, and as black as foot, mixed with fat, can make it. Over this they sometimes wear a kind of oval wreath, or a crown made of a buffalo's hide, with the brown hair upwards, about four fingers high, and surrounding the head so as to reach a little way down upon the forehead and the neck behind. The rims of this wreath, above and below, are ornamented with a row of small shells of the *Cypræa* kind, in number about 30, and placed quite close, so that their beautiful white enamel, together with their mouths, is turned outwards. Between these two rows of shells, there are others disposed as their fancy suggests. The ears of the Hottentots are never adorned with any pendant or ornament, any more than the nose, according to the custom of other savages: the latter, however, is sometimes marked with a black streak of foot, or a large spot of red lead; and on high days and holidays they put some of the latter on their cheeks. The necks of the men are bare; but those of the women are decked with an ornament, held in high estimation, which consists of a thong of undressed leather, upon which are strung eight or ten shells. These shells are commonly sold for not less than a sheep a-piece, as it is said they are procured no where else than on the most distant coast of Caffraria. On their arms and legs they wear rings, and this ornament is used by both sexes. These rings are made of leather straps, formed in a circular shape. This ornament has given occasion to the almost universally received report, that the Hottentots wrap guts about their legs, in order to eat them occasionally. The men wear from one to five or six of these rings on their arms, but seldom any on their legs. These rings are of various thickneses; and to the matrons of higher rank, who have them both on their arms and legs, they give great trouble both in the preparation and use of them. Rings of iron and copper, and especially of brass, of the size of a goose-quill, are considered as more handsome and more valuable than those of leather. The girls are not allowed to wear any rings till they are marriageable.

HOTTENTOTS.

marriageable. The Hottentots seldom wear any shoes: those in occasional use are made of undressed leather, with the hairy side outwards; which leather undergoes no other preparation besides that of being beaten and moistened with cow-dung and some kind of grease. The Hottentots who live within the boundaries of the Dutch colonies seldom make use of any weapons; here and there they furnish themselves with javelins, as a defence against the wolves: these are called "Hassagais." The habitations of the Hottentots are like their dress, adapted to the wandering pastoral life. They scarcely merit any other name than that of huts. In a Hottentot kraal or village the huts are built exactly alike, so that the equality of fortune and happiness among these people excludes mutual jealousy and envy. Some of these huts are circular, others of an oblong shape, resembling a rural bee-hive or a vault. The ground plot is from 18 to 24 feet in diameter: the highest of them are so low, that even in the centre of the hut, a middle-sized man cannot stand upright. The door is barely three feet high; but the Hottentot finds no difficulty in stooping and crawling on all fours, as he is always more inclined to lie down than to stand. The fireplace is in the middle of each hut, and therefore when they sit or rather lie in a circle round the fire, the whole company equally enjoy the benefit of its warmth. The door is the only part of the hut that lets in day-light, and it is the only outlet for smoke. The frame of the arched roof is composed of slender rods and sprays of trees, which, previously bent into a proper form, are laid, parallel to each other, or cross-wise; and these are strengthened by binding others round them in a circular form with withies. These withies, as well as the rods themselves, are taken chiefly from the "Cliffortia conoides," which grows plentifully in this country near the rivers. Large mats are then laid very neatly over this lattice-work, so as perfectly to cover the whole. The aperture of the door is closed when occasion requires, with a skin fitted to it, or a piece of matting. The mats are made of cane or reed, fastened together with sinews or catgut, or some kind of packthread procured from the Europeans. When a Hottentot has a mind to take down his house and remove his dwelling, he lays all his mats, skins, and sprays, on the backs of his cattle. The order or distribution of these tents in a kraal or clan is most frequently in the form of a circle, with the doors inwards; by these means a kind of yard or court is formed, where the cattle are kept at night. The milk, as soon as it is taken from the cow, is put to other milk which is curdled, and is kept in a leather sack; of this the hairy side, being considered as the cleaner, is turned inwards; so that the milk is never drunk while it is sweet. In certain northern districts, such as Roggeveld, or Bokkeveld, where the land is, as it is called, Karrow (which see), or dry and parched, the Hottentots, as well as the colonists, are shepherds.

From the account of the Hottentots given by Mr. Barrow it appears, that the neglect or oppression with which they have been treated by the colonists has contributed to corrupt and degrade them. Having first held out the irresistible charm which spirituous liquors and tobacco are found to possess among all people in a rude state of society, they took the advantage of exchanging those pernicious poisons for the only means the natives enjoyed of subsisting themselves and their families; and instead of instructing and encouraging a race of men of willing and intelligent mind to renew the means of subsistence of which they had deprived them, they imported at a vast expence a number of Malay slaves, not more expert and much less to be depended on than the Hottentots, to whom, indeed, they even preferred the stupid negroes of Mozambique and Madagascar. That they are capable of

instruction and improvement, both mental and moral, appears from the laudable establishment of the Herrnhüters or Moravian missionaries, who, by the protection afforded them under the British government, and its liberality, through general Dundas, in enabling them to enlarge their territory, had succeeded so far, in the object of their mission, as to bring together into one society not fewer, at the time of the evacuation of the colony, than 600 poor Hottentots; whom they not only instructed in the principles of the Christian religion, but by example as well as by precept taught to feel, that their value in society was in proportion to the benefit they were able to render to that society, by their labour and moral conduct. On the contrary, when they experienced a treatment less favourable than that of the meanest slaves, and were employed with a view merely to the benefit of those who had possession of their country, and were neither paid, clothed, nor fed, they exhibited on the same spot a scene of filth and wretchedness; they became a nuisance to the town, and of course it became necessary to disband them. Sir James Craig bears honourable testimony to the disposition and conduct of those Hottentots whom he formed into a corps. He represents them as contented and grateful, as intelligent and docile; no more addicted to drunkenness than our own people, nor invincibly disposed to rove and abandon the service assigned them. By degrees they became cleanly in their persons; the practice of besmearing themselves with grease being entirely left off; and they frequently washed themselves in a rivulet, where they could have in view no other object but cleanliness.

Other missionaries, says Mr. Barrow, but of different societies, have lately proceeded to very distant parts of the colony, and some even much beyond it, both among the Kaffers to the eastward, and the Bosjesman Hottentots to the northward: the latter they represent as a docile and tractable people, inexpressibly grateful to their benefactors; but they say, the Kaffers are a volatile race, extremely good humoured, and ridiculing all their attempts to convert them to Christianity. A Hottentot, says the same ingenious writer, among the many good qualities he possesses, has one which he is master of in an eminent degree; that is, a rigid adherence to truth. When accused of a crime of which he is always guilty, with native simplicity he always states the fact as it happened; but at the same time he is always ready with a justification of what he has done. From lying and stealing, the predominant and inseparable vices of the condition of slavery, the Hottentots may be considered as exempt. "In the whole course of my travels, and in the midst of the numerous attendants of this nation, with which I was constantly surrounded, I can with safety declare that I never was robbed nor deceived by any of them." Of the severity of the treatment which these poor people received from the savage boors of the country, we have many instances on record. We shall content ourselves with mentioning only one. A young Hottentot woman, with a child in her arms, was found lying stretched on the ground in a most deplorable condition; she had been cut from head to foot with one of those infernal whips made of the hide of a rhinoceros or sea-cow, known by the name of "Sambocs," in such a barbarous and unmerciful manner, that there was scarcely a spot on her whole body free from stripes; nor had the sides of the little infant, in clinging to its mother, escaped the strokes of the brutal monster. For several days after she was taken care of, there were little hopes of her recovery; though by means of a good constitution and tender treatment she did afterwards recover. And what does the reader suppose could have been the atrocious crime that demanded such chastisement? The only crime alleged against her was the attempt to follow her husband, who was among the number of those

of his countrymen that had determined to throw themselves upon the protection of the English. A Hottentot is capable of strong attachments; with a readiness to acknowledge, he possesses the mind to feel the force of a benevolent action. "I never found," says Mr. Barrow, "that any little act of kindness or attention was thrown away upon a Hottentot; but on the contrary, I have frequently had occasion to remark the joy that sparkled on his countenance, whenever an opportunity occurred to enable him to discharge his debt of gratitude. I give full credit to all that Monsieur le Vaillant has said with regard to the fidelity and attachment he experienced from this race of men; of whom the natural character and disposition seem to approach nearer to that of the Hindus than of any other nation."

Dr. Sparrman mentions a tribe of Hottentots, called "Bosmans," or "Bosheismen," who live round about Camdebo and Sneeuwberg, who are sworn enemies to the pastoral life, and who live on hunting and plunder. Their weapons are poisoned arrows, which, shot out of a small bow, will fly to the distance of 200 paces, and will hit a mark with a tolerable degree of certainty at the distance of 50 or even 100 paces. From this distance they can by stealth, as it were, kill the game they hunt for food, as well as their foes, and even so large and tremendous a beast as the lion. Their bows are hardly a yard long, and about an inch thick in the middle, and very much pointed at both ends. The strings of the bows are sinews, or a kind of hemp, or the inner bark of some vegetable. The arrows are a foot and a half long, made of reed, armed with a highly polished bone five or six inches long. At the distance of an inch or two from the tip of this bone, a piece of quill is bound very fast with sinews, so that the arrow may not be easily drawn out of the flesh, and thus the poison insinuates itself and infects the wound. Their quivers are two feet long, and four inches in diameter. Besides a dozen of arrows, every quiver contains a slender hone of sand-stone for whetting the iron head, and a brush for laying on the poison. The poison is taken from several different kinds of serpents, and the more venomous they are, the better. The dwellings of these foes to a pastoral life are generally not more agreeable than their manners. Like the wild beasts, bushes and clefts in rocks by turns serve them instead of houses; and some of them are said to be so far worse than beasts, that their foil has been found close to their habitations. Many of them are entirely naked; and others cover their bodies with such skins of animals as they are able to procure. As ignorant of agriculture as apes and monkeys, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants, which they eat raw. Their tables are sometimes covered with the larvæ of insects, snakes, and spiders. The capture of slaves from this race of men is easily effected. For this purpose, several farmers, who are in want of servants, join together, and take a journey to that part of the country where the Bosheismen live. They themselves, as well as their Lego-Hottentots, or such Bosheismen as have been caught some time before, and have been trained up to fidelity in their service, endeavour to spy out where the wild Bosheismen have their haunts, which is best discovered by the smoke of their fires. They are found in societies from 10 to 50 and 100. The farmers in a dark night set upon them, notwithstanding their numbers, with six or eight people, having previously stationed themselves at some distance round about the kraal. They then give the alarm by firing a gun or two. The savages are thus terrified; some of them make their escape by flight; others are stupid and timorous, and suffer themselves to be captured. These are treated at first kindly, and plentifully fed with various kinds of game;

supplied with tobacco, and induced to accompany the colonist to his place of abode. Their luxurious feasts of meat and fat are then exchanged for butter milk, frumenty, and hally-pudding. With this change of fare, and a corresponding alteration of usage, they very sensibly feel the hardship of their condition, and make every effort in their power to escape.

The language of the Hottentots is said to be a composition of strange and disagreeable sounds, resembling rather the noise of irritated turkeys, the chattering of magpies, hooting of owls, than human sound or articulation, and depending on extraordinary vibrations, inflections, and clappings of the tongue against the palate; and therefore it is no wonder that it should be understood by few, and that the knowledge of it can scarcely be acquired by persons of any other nation. As to their religion, it does not appear that they possess any, or that till of late any pains have been taken by their invaders and conquerors to afford them any instruction. Addicted to magic, they have among them abundance of witches and conjurers, and under bodily disorders they run to them for relief; and as their wizards employ both internal and external remedies, they are sometimes successful, but they more frequently fail in administering efficacious remedies. Destitute, as they are said to be, of any religious principles, they seem to have some ideas of a future state. Some have said that they worship a genus of insects called "Mantis," and others have affirmed that they pay a kind of adoration to the moon; but these reports have not been duly authenticated. See PATERSON'S Narrative of four Journeys into the Country of the Hottentots, &c. 4to. 1789. Barrow's Travels in Africa, vol. i. and ii. See BOOSHOOANAS, CAFFRARIA, KAFFERS, KOUSIS. See also CAPE OF GOOD HOPE.

HOTTENTOT *Holland*, a district of Southern Africa, which is a continuation of what is called the Sand Down, being a large tract of country lying between the Table bay, and bay False. Most of it is uninhabitable, on account of a white sand blown up by the S.E. winds in very large ridges. There are, however, many shrubs dispersed in different parts. It is the principal place whence they procure their fire-wood at the Cape. This territory is situated on the N.E. side of bay False, and surrounded on three sides by lofty mountains; but open to the S.W. where the bay is in view. The soil is not so good for vines as most other places on this side of the mountains, being wet and marshy; but it produces excellent corn. Here is one of the most difficult passes into the country, called "Hottentot Holland's Kloof;" *kloaf* or *kloof* denoting a narrow pass through the mountains. This high chain of mountains terminates the Cape isthmus, and at a few miles to the southward of the Kloof it forms the eastern boundary of the extensive bay False. This Kloof is a narrow road cut through the bill, the summit of which appears to be nearly of a height with the Table land. The chain of mountains, commencing at cape False, or the Hang-Lip, extends to the N.W. for nearly 300 miles; and from 20 to 40 miles from the sea. Several other branches from this chain extend to the interior parts of the country.

HOTTERRE, in *Biography*, born in Italy of French parents, was an excellent performer on the flute, and published an elementary work on that instrument that was much esteemed. He likewise published another work, entitled "L'Art de Preluder," the art of preluding.

There was a Mad. Hotterre, about the year 1740, who played well on the violin.

HOTTINGER, JOHN HENRY, was born at Zurich, in Switzerland, in the year 1620. His love of learning was

so remarkable, that he was sent to foreign countries for education at the public expence. He visited several parts of Europe, and at his return was made professor of ecclesiastical history and the Oriental languages. He was appointed chaplain to the embassy of the states-general to Constantinople in 1641; but the magistrates of Zurich would not permit him to accept of it, choosing rather to recal him home, that his learning, talents, and zeal might be employed for the glory and advantage of their own public schools. He was engaged by the elector palatine to restore the university of Heidelberg. While he was preparing for his journey to Holland, he was unfortunately drowned in the river which runs through Zurich, in consequence of the oversetting of a boat, in which he was proceeding to an estate that he had at the distance of two leagues from that city. This event took place in 1667, when he was little more than forty-seven years of age. He was author of forty volumes on different subjects, the titles of the most important are given by Bayle. His son John James was professor of theology at Zurich, and author of many practical pieces.

HOTTONIA, in *Botany*, a genus dedicated, by Boerhaave, to Peter Hotton, the predecessor of that illustrious physician in the botanical chair at Leyden. The successor of Hotton did not bestow this name upon the plant in question without setting forth in a brief though cordial manner the virtues and qualifications of its prototype.—Boerh. Hort. Lugd. v. 1. 206. Linn. Gen. 82. Schreb. 108. Willd. Sp. Pl. v. 1. 812. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. v. 1. 226. Ait. Hort. Kew. v. 1. 197. Juss. 95. Lamarck Dict. v. 3. 137. Illustr. t. 100.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Precia*, Linn. *Lysimachia*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five, linear, somewhat spreading segments. *Cor.* of one petal, salver-shaped; tube as long as the calyx; limb divided into five, flat, ovate-oblong, emarginate segments. *Stam.* Filaments five, awl-shaped, short, erect, opposite to the divisions of the corolla, and inserted into the tube; anthers oblong. *Pist.* Germen superior, globose, pointed; style thread-shaped, short; stigma globose. *Peric.* Capsule globular, pointed, of one cell, placed on the calyx. *Seeds* numerous; receptacle globose, large.

Ess. Ch. Corolla salver-shaped. Stamens inserted into the margin of the tube opposite to the segments. Capsule of one cell. Stigma globose. Calyx five-cleft.

Obs. The number of segments in the corolla, and consequently of the stamens, is often much greater than the generic character describes.

1. *H. palustris*. Featherfoil, or Water violet.—Linn. Sp. Pl. 208. Engl. Bot. t. 364. Curt. Lond. fac. 1. t. 11.—“Stalk bearing many flowers in whorls.”—A native of this country, found in clear streams and ditches, flowering in June and July. *Root* perennial, creeping. *Stems* erect, naked, many-flowered, leafy at the base. *Leaves* bright-green, elegantly and deeply pinnatifid or pectinated, smooth, growing under water. *Spike* dense, of several whorls, more or less distant, one above the other, rising nearly a foot above the surface; partial stalks single-flowered, bracteated. *Flowers* bluish-coloured, with six, seven, or eight segments and as many stamens. *Capsule* globular, with many seeds on a globose receptacle.—The beauty and elegance of this plant have been very justly commended both by Dr. Smith in his English Botany, and Mr. Curtis in the *Flora Londinensis*; indeed the former author says “that it may vie with many of the most admired exotics in elegance, having indeed, like some other European aquatics, very much the air of a tropical plant.”

A very beautiful variety of this, with flowers of a deep rose colour, was discovered near Kelmarsh in Northamptonshire by the late Mr. Hanbury, F.L.S.

It appears to us that the three other species mentioned by Willdenow are at best very doubtful. *H. indica*, a plant concerning which the most intelligent botanists have always had doubts, because of its habit, is made into a new genus under the name of *Limnophila* by Mr. R. Brown, *Prod.* v. 1. 442. We are unacquainted with the *ferrata* of Willdenow, or the *sessiliflora* of Vahl; but by their descriptions the former at least seems to be a *Limnophila*, and probably the latter also.

HOTTS, or **HUTTS**, pounces, and round balls of leather stuffed or tied on the sharp ends of fighting-cocks' spurs, to keep them from hurting one another in sparring or breathing themselves.

HOTY, in *Geography*, a town of Sweden, in the province of Blekingen; 21 miles W. of Carlscrona.

HOTZEMPLITZ, a town of Moravia, insulated in Silefia; 20 miles N. of Troppau. N. lat. 50° 12'. E. long. 17° 35'.

HOU, a village of Egypt, on the left bank of the Nile, situated upon the eminence, on which, as it is said, the ancient city of *Diopolis Parva* was built. (See *DIOSPOLIS*.) Rubbish, large bricks, and stones still larger, the remains of a dike, and an arcade, which forms an entrance to a subterraneous conduit, are the sole traces now remaining of the ancient works; 28 miles S. of Girgé. N. lat. 26° 2'. E. long. 31° 27'.

HOVA, a town of Sweden, in West Gothland; 18 miles N. of Mariestad.

HOUAC, or **HOUAT**, an island in the English channel, about eight miles in circumference, defended by a fort; seven miles N.E. of Belle-Isle. N. lat. 47° 24'. W. long. 2° 52'.

HOUAL, or **OUALO**, a kingdom of Africa, situated on the banks of the Senegal, and on the coast of the Atlantic, 90 miles from E. to W., and 18 from N. to S. The soil is rich and fertile, producing in the greatest abundance maize, rice, indigo, tobacco, and cotton; the meadows feed a great number of cattle, large and small, whose flesh is excellent; game is plentiful; birds are numerous and various; and the forests abound with palm-trees. The king of the country assumes the title of “brak” or emperor; and was formerly very powerful, but of late is reduced to a low state, being frequently in want of millet for his support. When he is occasionally roused from his natural indolence, he assembles his courtiers, travels with them through the villages of his kingdom, eats the provisions which he can find; drives away the cattle, and exposes the owners to public sale.

HOUARD DE LA MOTHE, ANTONY, in *Biography*, a law antiquary, was born at Dieppe in 1725, and died at Abbeville in 1803. He was member of the Academy of Inscriptions, and an associate of the National Institute. His works are, 1. “Anciennes Lois des François, conservées dans les Coutumes Angloises,” two vols. 4to. 2. “Traité sur les Coutumes Anglo-Normandes, &c.” four vols. 4to.

HOVAREIN, in *Geography*, a town of the desert of Syria; 70 miles S.W. of Palmyra.

HOUBIGANT, CHARLES FRANCIS, in *Biography*, was born at Paris in 1686, was educated for the church, and became a priest of the Oratory. He distinguished himself for his profound knowledge of the Hebrew scriptures, which he translated into the Latin language with notes, published at Paris in 4 vols. folio 1753. He died in 1783. He was author of many other pieces, among which are “A.

Dictionary,

Dictionary, French and Hebrew," 8vo.; "Examination of the Pfalter of the Capuchins;" and "A Translation of bishop Sherlock's Sermons."

HOUCHONG, in *Geography*, a town of Meckley; 18 miles W. of Munnypour.

HOUDAIN, a town of France, in the department of the straits of Calais, and chief place of a canton, in the district of Bethune; six miles S. of Bethune. The place contains 1000, and the canton 13,603 inhabitants, on a territory of 220 kilometres, in 31 communes.

HOUDAN, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Mantes; 10 miles S. of Mantes. The place contains 1700, and the canton 12,392 inhabitants, on a territory of 232½ kilometres, in 31 communes.

HOUDAN, a small island on the North sea, near the coast of Norway. N. lat. 61° 40'.

HOVE, in *Rural Economy*, a term employed to denote the rising or swelling which sometimes takes place in cheeses, soon after they are made, in consequence of their taking on a slight degree of fermentation. The chief remedy in this case is the frequent turning of such cheeses in order to get them dry as expeditiously as possible. See **CHEESE** and **DAIRYING**.

The term is likewise applied to the peculiar swelling in neat cattle and sheep, which proceeds from the feeding too greedily upon some sort of luxuriant green food, such as red clover, &c. See **HOVEN**.

HOVE, in *Geography*, a town of Norway, in the diocese of Drontheim; 25 miles N.W. of Drontheim.

HOUEILLES, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Nerac; seven miles S. of Castel-Jaloux. The place contains 607, and the canton 4001 inhabitants, on a territory of 335 kilometres, in nine communes.

HOVEL, a town of Westphalia, in the bishopric of Paderborn; six miles N.W. of Lippfpring.

HOVEL, in *Rural Economy*, the name of a kind of shed or low building, which has some part of it constantly open below; but which is covered above. It is useful for young animals of the horse, neat cattle and sheep kinds to run into, as there may be occasion, for protection, during the stormy winter months.

HOVELLING, in *Architecture*, is a method of working up the sides of a chimney, and covering the top with tiles or bricks, set up in a pyramidal form, so that the smoke may escape below the current, when the wind makes over the chimney, or against any one side of it. This is used to prevent the inconvenience arising from adjoining buildings higher than the chimney, or from its being in the eddy of any very lofty building, or in the vicinity of high trees: the covered side must in this case be kept towards the building which occasions the inconvenience.

HOVEN, in *Rural Economy*, a term applied to a peculiar sort of distention or swelling taking place in the stomachs of neat cattle, sheep, and some other animals, in consequence of the sudden extrication of air, proceeding from the decomposition of green succulent food, which they have consumed too greedily and in too large quantities; such, for instance, as red clover, fog, or rank-grass, &c. See **CLOVER**.

In this case, the chief remedy is evidently the discharge of the confined air from the stomach of the animal; which in slight affections may be often accomplished by the use of such substances as have a tendency to retard or stop the progress of the fermentative process, or to force off the *flatus*. Much benefit in these intentions has been ob-

tained from the giving of large doses of prepared ammonia in mixture with some sort of spirituous liquor; and other similar remedies.

This affection has been supposed, in an able paper in the twenty-ninth volume of Young's Annals, to principally proceed from the distention of the first stomach of the animals by the carbonic acid gas or fixed air that is disengaged from such tender juicy grasses, by their decomposition; the after discharge of it by the gullet being prevented by some sort of contraction occurring about the upper orifice of the stomach. It is added that the dangerous and frequently fatal effects that succeed the distention are not to be ascribed to the air, or juices of the fermented grass, acting as poisons upon the stomach, for moderate quantities of either of them produce no bad effects: besides, the reiterated experience of the grazier has clearly shewn, that cattle, in many instances, are immediately relieved and preserved by the properly stabbing them with a sharp-pointed knife, and letting the air escape in that way. It is, of course, concluded, that cattle may be saved with certainty, if the air be drawn off in due time, without injuring the stomach or bowels. This is suggested as capable of being done with facility, by passing a flexible tube through the gullet into the stomach. A tube of iron wire is advised as the most proper for the purpose, which has about one-sixteenth of an inch diameter, and formed by twisting it round a smooth iron rod three-eighths of an inch in diameter; being afterwards covered with smooth leather. That end of the tube which is to be passed into the stomach, should have a brass pipe of the same size, or rather larger, and two inches in length, firmly fastened to it, and pierced with large holes in sufficient number. In order to prevent the too much bending of the tube in the mouth or gullet in passing it down, an iron wire one-eighth of an inch in diameter, and of equal length with the tube, should be introduced into it; being withdrawn upon the tube entering the stomach. It is found, that the space from the fore teeth, to the bottom of the first stomach of a large sized ox, is about six feet; and a tube five feet nine inches in length has been passed into the gullet of a living ox. A proper tube should consequently be six feet in length to succeed perfectly in all cases. When the tube has been thus introduced it may remain for any length of time, as it does not inconvenience the breathing of the animal. By means of this tube, most part of the elastic and condensed air may be discharged from the stomach; and where necessary, ardent spirits, or any other fluid proper for checking fermentation, be thrown through it into the stomach. In this way, the air is not only more certainly discharged than by the practice of stabbing, but the danger which it causes is obviated; this danger does not arise so much from the irritation of the wound, as the air; and other contents of the stomach insinuating themselves into the cavity of the belly, betwixt the containing parts and the bowels, and thereby creating such a state of inflammation as may prove fatal to the animal.

This tube is equally applicable to sheep, when properly adapted in size; and not less beneficial in the removal of the affection. It is perfectly simple, and readily constructed by any common workman. Such tubes are however sold, ready for use, in London and other places.

Wooden tubes, somewhat of this nature, have been contrived, and brought forward under the encouragement of the Society of Arts, by Mr. Eager, for the purpose of removing this sort of distention in the stomachs of animals. They consist of knobs of wood firmly attached to portions of cane of different lengths, for suiting different sorts of animals, representations of which may be seen in the annexed

plate. It is directed by the inventor, that such beasts as are hoven, or swollen, should be laid hold of by a person by the nostril and one horn, while with one hand an assistant steadily secures the tongue, and with the other pushes the cane quite down into the stomach. Care should be had, not to let the animal get the knob of the tube between his grinders. Some resistance is generally afforded to the tube about the entrance of the stomach, which requires a little additional force in passing it; as soon as a fetid smell is found to be discharged, and the size of the body of the animal to be diminished, nothing further is requisite, as nature will effect the rest. The success of this method has been fully confirmed by different stock-farmers.

The common practice of attempting the removal of this affection by the making an incision or puncture by means of a pen-knife between the short ribs, and fixing a pipe of some sort in it to afford passage to the confined air, securing the whole by adhesive plaster from the effects of the atmosphere, is generally the result of real necessity, but often liable to be attended with fatal consequences, from the want of knowledge, or inexperience of the person who performs the operation. In order to succeed, it should be done on the left side, about the mid-way between the short ribs and the hip-bone, a long slender knife being employed for the purpose, and thrust to the depth of from four to five inches. The operation is sometimes denominated *paunching*, and should be always carefully executed.

Oily remedies have likewise been had recourse to in the view of removing these sorts of swellings in the stomachs of animals; such as olive oil, and butter, or lard, melted and blended together, but they can seldom be much depended upon, though asserted to produce relief in a speedy manner by some.

It is a good method to prevent the disease taking place as much as possible, by properly managing the stock in first turning them upon such luxuriant pastures. This should be done, when they are the least pressed by hunger, in order that they may be the soonest satisfied with food; and when there is the least dew upon the grasses. It is also a good practice, in this view, to only let the animals remain a short time at once upon such pastures; and some advise their being frequently driven about in them; though much injury must necessarily be done to the grass in this way. See CLOVER.

HOVEDEN, ROGER DE, in *Biography*, an English historian, who flourished in the reign of Henry II. was born at York. Having received an education suitable to the purpose, he became a professor of theology at Oxford. He was likewise a lawyer, and is said to have served the king in the capacity of chaplain, and also in other confidential offices. It was not till the death of Henry that he applied himself particularly to the compilation of English history. He wrote in the Latin language, commencing his annals with the year 731, the period at which Bede finishes, and coming down to the third year of John, A.D. 1201. His work was printed at London in 1595, in sir Henry Saville's "Collection of ancient English Historians," and at Frankfort in 1601. Of so much authority was it that Edward I. caused strict search to be made in all the libraries for copies of it, in order to ascertain the homage due to the crown of Scotland.

HOVENIA, in *Botany*, so named by Thunberg, in compliment to one of the patrons of his expedition to Japan, David ten Hoven, a senator of Amsterdam.—Thunb. Nov. Gen. 7. Japon. 7. Schreb. 148. Willd. Sp. Pl. v. 1. 1141. Mart. Mill. Dict. v. 2. Juss. 381. Lamarck. Illust. t. 131.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Dumosa*, Linn. *Rhamnii*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, hairy at the base within-side, permanent; its border in five deep, ovate, reflexed, deciduous segments. *Cor.* Petals five, inserted betwixt the segments of the calyx, and equal to them in length, obovate, very obtuse, convoluted, enfolding the stamens. *Stam.* Filaments five, inserted into the base of the calyx, and shorter than its border; anthers roundish, concealed by the petals. *Pist.* Germen superior, roundish; style erect, much shorter than the calyx; stigmas three, slightly ovate, with three furrows, three valves, and three cells. *Seeds* solitary, lenticular, very smooth.

Obs. Sometimes, though rarely, the flowers are four-cleft and tetrandrous.

Ess. Ch. Calyx with five deep deciduous teeth. Petals five, convoluted. Stigmas three. Capsule superior, with three valves and three cells. Seeds solitary.

1. *H. dulcis*. Thunb. Jap. 101. (Sicku, vulgò Ken, and Kenpokonas; Kämpf. Amœn. Exot. 8c8. t. 809) A tree, resembling a middle-sized pear-tree, found near Nagasaki in Japan, flowering from June to August, and ripening fruit in November and December. The branches are round, smooth, somewhat zig-zag. Leaves alternate, stalked, ovate, pointed, finely serrated, smooth, with a strong mid-rib, two smaller lateral ones, and many veins. Flowers small, white, in forked, terminal or axillary, panicles, whose stalks, after the flowers fade, become very remarkably juicy, with a sweet red flesh, which is eaten by the Japanese, and compared by Thunberg to the taste of a pear. The partial *flower-stalks*, immediately under the calyx, remain unchanged and slender, sustaining the drooping capsules, which are the size of a pepper-corn, with red seeds.

HOVER GROUND, in *Agriculture*, a term applied in many districts to land which has a light friable soil.

HOUFFALIZE, in *Geography*, a town of France, in the department of the Forests, and chief place of a canton, in the district of Neufchateau, seated on a small river which runs into the Ourte; 30 miles S. of Liege. The place contains 759, and the canton 6266 inhabitants, on a territory of 250 kilometres, in 16 communes.

HOUGH, JOHN, in *Biography*, an English prelate, was born in the year 1650. He received his classical education at the school of Birmingham, whence he was sent to Oxford, where he was elected a demy at Magdalen college in 1669. Here he took his degrees, and afterwards became fellow of his college. In 1676 he proceeded M.A. and having entered into holy orders, officiated some time at North Aston, in the diocese of Oxford. In 1681 he accompanied the duke of Ormond to Ireland, from whence he returned the following year, and in 1685 he was appointed prebendary of Worcester, which promotion was soon followed by his presentation to the rectory of Ternsford, in Bedfordshire. In 1687 he made a firm stand against James II.'s arbitrary attempt to impose a president upon his college. By his noble example the fellows were encouraged to reject his majesty's mandamus in favour of Antony Farmer, a convert to the Popish religion; they made choice of Mr. Hough to that office; and as a majority concurred in electing him, he had spirit enough to accept it, in defiance of the royal order. His election was regularly confirmed by the bishop of Winchester, visitor of the college; and in the same year he was admitted to the degree of doctor of divinity. This bold step of Dr. Hough may be regarded as the commencement of that clerical resistance to the tyrannical proceedings of king James, which contributed not a little to bring about the revolution. The worthy doctor was, however, almost instantly deprived of his presidentship, by the

order of James, who commanded the commissioners to install Dr. Parker, bishop of Oxford, in his room. Twenty-five of the fellows refused to sign a submission to their new president, who, on that account, were, with Dr. Hough, expelled the college, and declared incapable of being admitted to any ecclesiastical dignity or benefice. In the following year, the prince of Orange's declaration was received in England, and the king, with the hope of regaining the affections of the clergy, thought it prudent to recede from his illegal and arbitrary proceedings. An order was accordingly passed to restore Magdalen college to its rights; and Dr. Hough was replaced in his presidency by a commission for that purpose, directed by the king himself to the visitor. After the revolution, Dr. Hough was nominated by king William to the bishopric of Oxford, with which he was allowed to hold the presidency in commendam; in 1699 he was translated from the see of Oxford to that of Litchfield and Coventry; and in 1715 he was offered the archbishopric of Canterbury, which, through diffidence in himself, he declined. In 1717 he was raised to the see of Worcester; and, notwithstanding he was then 67 years of age, he presided over Worcester 26 years, constantly residing in his diocese, and discharging with fidelity and zeal all the episcopal functions. He died in 1743, without pain or sickness, but quite exhausted, full of days and honour. He was a very munificent prelate, and expended on his episcopal palaces upwards of 7000*l.* His private benefactions were very extensive, and his hospitality such as became his station as a father of his people. *Biog. Brit.*

HOUGH, in *Animals*, the name of the bending or ply of the hind leg, which also comprises the part behind but opposite to the ply, usually denominated the *hock*. This point or part, in the horse, should be full, and not too crooked, in order to constitute a well formed leg.

To **HOUGH**, or *cut the houghs*, is to ham-string, or to disable by cutting the sinews of the ham.

HOUGH, *Bony*, is a hard, round swelling, or tumour, growing upon the tip or elbow of the hough.

It generally proceeds from some stroke or bruise; and if neglected till the substance of the swelling becomes hard, like glue, it proves difficult to cure.

HOUGH, in *Nautical Affairs*, is a name for the square head of some sorts of barges, those, for instance, which are used for carrying coals on the Thames, at London.

HOULIERES, ANTONIETTE DU LIGER DE LA GARDE, *DES*, in *Biography*, a distinguished French poetess, was born at Paris in 1678. Her talents for writing French verse were first excited and cultivated by the president Henault. She married Lafon seigneur des Houlieres, soon after which she was arrested at Brussels by order of the Spanish government, and carried as a prisoner of state to the castle of Wilvorden, from thence she was released through the artifice of her husband. She came to Paris, and attracted round her a circle of admirers and men of wit. Becoming a widow she fell into indigent circumstances. At length she obtained a small pension, and solaced herself with study, and acquired the knowledge of the Latin, Italian, and Spanish languages, the best authors in which she read with facility. She died in 1694. Her poems were collected in two volumes in 1724, and reprinted in 1747, in two volumes 12mo. They consist of idylls, eclogues, odes, epigrams, and the tragedy of Genferic. The idylls are accounted the best compositions of the class in the French language. She has been charged with gross plagiarism.

HOULLIER. See **HOLLERIUS**.

HOUMA, in *Geography*, a town of Asiatic Turkey, in the province of Natolia; 21 miles S.E. of Kara-hiser.

HOU MIRI, in *Botany*, Aublet. *Guian.* v. 1. 564. t. 225. (*Houmiria*; Juss. 435.) Red-gum tree, or Red wood, of Guiana. See **MYRODENDRUM**.

HOUN, in *Geography*, a town of Africa, in Fezzan; 10 miles S. of Wadan.

HOUNA, a cape and village of Scotland, on the N. coast of the county of Caithness; two miles W. of Dun-cansby Head. N. lat. 58° 33'. W. long. 2° 57'.

HOUND, *canis venaticus*, a hunting-dog. See **DOG**.

Hounds may be distinguished, with regard to the manner of their hunting, into such as find out and pursue the game by sight, and the quickness and swiftness of their motion; of which kind are the *gaze-hound*, *agassus*; and *grey-hound*, *canis graius*; the *terrier*, &c. And those which find and pursue the game by the goodness of their smell.

The species of scenting-dogs may be divided further; into *hounds*, simply so called, and *blood-hounds*; each whereof admits of some diversities.

1. As to *hounds*, simply thus called, those which are all of one colour, as white, black, &c. are most valued; then those spotted with red; the white with black ears, and a black spot at the setting on of the tail, are generally esteemed the best for composing a kennel, and are of the best scent and condition; those spotted with dun are less prized, as usually wanting courage and boldness. The black-tanned, or the all liver-coloured, or all white, the true talbots, are best for the string or line; and the grizzled, whether mixed or unmixed, if their hairs are shagged, are usually the best runners. There should always be a couple of these in the pack. *Fallow-hounds* are of good scent, and hardy, not fearing the water; they keep the chace well, without change; but are not so swift as the white; they love the hart above any other chace, having little stomach for the hare, &c. whence they are not so fit for private gentlemen; besides that, they are apt to run at tame beasts.

The *dun hounds* are of a more general use, being fit for all chaces. Their sagacity and fidelity in knowing and sticking to their master's voice and horn, and to none else, are much admired; they also understand each other, and know which are babblers, which liars, &c. They are of different sizes and qualities in the several countries, &c. Mountainous and woodland parts breed a tall heavy sort, called *slow-hounds*; moderate soils, where the champain and covert share pretty equally, produce a middle-sized hound of a nimbler make. The ancients laid a greater stress on colour than the moderns, with whom it is a kind of fixed opinion, that the colour of a good hound, or a good horse, is unimportant.

The marks of a good and fair hound are to be of a middle proportion, rather long than round, the nostrils wide, back bowed, fillets great, haunches large, ham straight, tail big near the reins, and the rest slender to the end, the leg big, the sole dry, and claws large. See **DOG**.

The legs of a good fox-hound, says Mr. Daniel in his "Rural Sports," should be straight as arrows; his feet round, and not too large; his shoulders should lie back; his breast rather wide than narrow; his chest deep; his back broad; his neck thin; his head small; his tail thick and bushy; and if he carries it well, this circumstance will add to his comeliness. Although a small head is mentioned as one of the requisites of a fox-hound, this is to be understood merely in its relation to beauty: for as to goodness, large-headed hounds are in no respect inferior. The middle-sized hounds are reckoned the strongest and best able to endure fatigue. With regard to their shape, it is presumed that they must all agree; and in order to exhibit a good appearance, they should be nearly of a size; if they appear of the

HOUND.

same family it will be an addition, and if they are also handsome, they are deemed perfect as far as appearance is concerned. It is of great importance in the shape of a hound that it should exhibit a perfect symmetry: for if this be not the case, he will neither run fast nor bear hard work; much speed is required, and he should possess adequate strength. A prepossession will always occur in favour of that sort of hound to which the sportsmen have been most accustomed: those who have usually hunted with the sharp-nosed, will hardly allow a large-headed hound to be a fox-hound, although both are equally so. Speed and beauty are the chief excellencies of the former; whilst stoutness and tenderness of nose in hunting characterize the latter. Very good sport may be had with unseemly hounds, where a great difference in size and look is apparent, but a gentleman, anxious that his hounds should be complete, will not be satisfied with such a pack: hounds should run well together, and this cannot so well be attained as by uniting as early as possible, those of the same sort, size, and shape. Packs consisting of various kinds of hounds seldom run well together, although they may frequently kill their fox; but it is the "style" of killing which constitutes celebrity among sportsmen. The great excellence in a pack of fox-hounds is the "head" they carry, considered in a collective body: they go fast in proportion to the excellence of their noses and the head they carry, and that pack may be said to go the fastest, which can run ten miles the soonest, notwithstanding the hounds, separately, may not be so speedy as many others. Some hounds creep through the same hole, instead of *topping* the fence, and follow one another in a string, as true as a team of cart-horses. Mr. Beckford, with conciseness and neatness, has described in what manner they ought to be "like the horses of the Sun, *all abreast*." Five and twenty couple of hounds are sufficient at any time to be taken into the field, as being a match for any fox, supposing them steady, and their speed nearly equal. Too many hounds always do more mischief than service. When packs are very extensive, the hounds are seldom sufficiently hunted to be good. Where many hounds are kept, either a large pack must be taken out, or a great number of hounds be left behind: in the first case, too many hounds in the field will probably spoil the diversion, and, secondly, hounds long idle, always get out of wind, and not unfrequently become riotous. Forty couple of hunting hounds will admit of hunting three times a week, twenty-five couple being the usual allotment for the field. Hounds to be steady must be constantly hunted: young ones in particular should never be left at home while able to hunt: the lame, the old, those low in flesh, and such as idleness cannot injure, may be suffered to remain quiet. Hounds that are meant to run well together, should never have too many old hounds amongst them; five or six seasons generally destroying their speed.

The *breeding* of hounds is an object of great importance. In respect of the breed of hounds, no country equals our own; and it is remarkable, that the hounds procured from England should degenerate in another climate. In order to preserve this superiority, the size, shape, colour, constitution, and natural disposition, as well as the fineness of the nose, the stoutness and method of hunting of the dog, from which the breed is taken, should be duly considered.

Nothing is more essential to the having a good pack of hounds, than a proper care of the whelps, and of the parents from which they are to be bred.

The bitches, in particular, should be carefully chosen, and should be such as are the strongest and best proportioned; they must also have large ribs and flanks.

The best season for the coupling of hounds is in January, February, or March; for then they will litter in a good

time of the year, that is, in spring; so that they will be fit to enter in due course, without loss of time, or of the season; for if bitches litter in winter, it is very difficult to bring up the whelps, the cold killing them if there is not great care taken of them. If possible, have no whelps later than April, as late puppies seldom thrive. Of the early ones five or six should be kept; of the late ones, not more than half the number.

The dogs that line the bitches must not be above five years old; for if they are older than this, the young ones will be dull and heavy. Care should be taken to have a proper dog ready the first time of the bitch's going proud; for it is affirmed by many, who say they have experience for it, that whatever kind of dog lines a bitch the first time, there will be one puppy at least in all her succeeding litters that will have some resemblance of him.

On no account breed from a hound that is not stout, that is not tender-nosed, or that is either a blabler or a skirter. Babling is one of the worst faults of which a hound can be guilty; and skirting hounds, where game is plentiful, are always changing, and occasion the loss of more foxes than they kill. It is the judicious *cross* that renders the pack complete: the imperfection on one side may be rectified on the other, and if this be attended to, and a cross hit found, pursue it. The breeding from young dog-hounds after the first season, who have beauty and goodness to recommend them, to see what whelps they get, is a proper trial. Never put an old dog to an old bitch, and take care that those from which you breed be in good health. In breeding, the best bitches should be sent to the best dogs, wherever they may be; and thus those who breed only a few hounds may have a good pack, whilst those who breed many, (if at the same time they understand the business,) reduce it to a certainty.

The first litter of puppies that a bitch brings, are never esteemed so good as the second or third. When a bitch has been lined, and grows big with whelps, she is not to be suffered to hunt among the pack, nor to take any other violent exercise; for that would endanger her casting her whelps; she should be kept up and fed well, and a good place should be provided for her to litter in.

As soon as she has littered, those which are intended to be kept, should be selected out, and the rest immediately drowned. There is great difficulty in choosing the best at this early time; but the general opinion gives it for those which are the lightest, that they will be the swiftest and best as they grow up.

Others take all the whelps away; and having determined what number they will keep, they settle the choice on those which the bitch carries back first to the place where she littered. But all this seems very uncertain. Others select that which was pupped last.

Should one bitch have more whelps than she can rear, some of them may be put to another bitch, and thus a favourite sort may be preserved. In like manner, if only one or two are produced, by shifting those puppies to another bitch, the former will be soon fit to hunt again: but she should be first physicked, and her dugs washed with brandy and water. Should the bitch refuse to take the strange puppies, by killing one of her own, and rubbing the strangers with a little of the blood, she will lick and immediately receive them. The bitches should be well fed with flesh, and have also plenty of milk, nor should the puppies be taken from them till they are able to feed themselves. When the puppies are taken away, the bitches should have three purging balls given them, one every other morning, and plenty of whey the intermediate day.

The

H O U N D.

The whelps must have good fresh straw to lie in, and it must be often changed. They are to be kept in a place where neither the rain nor sun-shine can be troublesome to them; and once a week it will be proper to anoint them all over with a little nut-oil, with some saffron infused in it. This will prevent the flies from annoying them so much as they otherwise would, and will kill worms of all kinds. When they are fifteen days old, it is the custom to worm them, and a week after one joint of their stern should be twisted off. As soon as they can see, they should have milk given them to lap; and at six weeks or two months old they must be weaned, keeping them wholly from the bitch; they must at this time be well kept, but not too high fed; and it is proper to put some cumin seed into their food, to keep the wind out of their bellies.

Many let the whelps of their bounds suck three months, and then send them away to villages to be bred up till they are ten months old, cautioning those people who have the care of them, not to let them eat carrion, nor frequent warrens.

Rye-bread is a very common food for young hounds, and is particularly recommended by many, but wrongly; for it soon passes through them, and gives them very little nourishment. When they are fed constantly with this, in the time of their growing up, they always become narrow-backed; and this is a great fault in this sort of dog; a broad back being one of the greatest recommendations in a hound. Wheat-bread is greatly preferable on all accounts for the food of the young hound, giving him strength and firmness.

At ten months old they are to be taken home, and put into the company of the others, to live as they do, and after a few weeks keeping company with the rest, they are to be coupled, and to go out to hunt.

Hounds are commonly named when first put out, and the usual mode is to name all the whelps of one litter with the same initial letter as that of the dog that got them, or the bitch who bred them. Young hounds should be marked in the side (which is termed *branding* them) with the initial letter of their owner's name; and this will prevent their being stolen, or facilitate the recovery of them when they are lost. Young hounds ought to be fed twice a day, morning and evening. It is advisable not to round them till they are well settled in the kennel, nor in very hot weather, lest they bleed too freely. It may perhaps be better to round them, whilst at walk, when about six months old; if it were done sooner, it would make their ears tuck up. They should not be rounded whilst they have the distemper, as the loss of blood would too much weaken them. (See *Diseases of Dogs*.) If any of the young dogs be thin over the back, or more quarrelsome than others, it will be of use to cut them. Such bitches also as are ill loined, and that are not wanted for the purpose of breeding, should be spayed: they are then constantly serviceable, stouter, and always in better order. Besides, if a pack hunt late in the spring, it will be very short without hounds of the above description. The operation should be performed by a person of skill. There is a difference of opinion whether a bitch should be spayed *before* or *after* she has had a litter of puppies; both periods have answered: the best time is 14 or 15 days after she has taken the dog, and when the puppies just begin to be knotted within her: all the roots of the veins should not be taken away, as her strength and swiftness will be injured by so doing: they should be kept low for several days *before* the operation is performed, and fed on thin meat for some time *after*.

For the method of entering young hounds, see ENTRANCE.

For the terms used with respect to hounds, their noises, &c. see HUNTING.

The hounds mostly used for hare-hunting are the deep-tongued, thick-lipped, broad and long-hung southern hounds: the fleet (sharp-nosed dog, ears narrow, deep-chested, with thin shoulders, shewing a quarter cross of the fox-hound: the rough wire-haired hound, thick quartered, well hung, and not too much flesh on his shoulders: and the rough or smooth beagle. Each of these sorts has its excellencies, nor can one be justly commended as superior to the other; the preference must depend on the prevalent inclination of the sportsman.

He that delights in a six hours chace, and to be up with the dogs all the time, should breed from the Southern bounds first mentioned, or from that heavy sort which gentlemen use in the weald of Suffex; their cry is a good and deep bass music, and considering how dirty the country is, the diversion they afford to those who are on foot for a day together, renders them in high estimation; they generally pack well from their equality of speed, and at the least default, every nose is upon the ground in an instant to recover the scent.

In an open country, where there is good riding, the second sort is to be preferred; their tongues are harmonious, and at the same time they go so fast, as to prevent a hare from playing many tricks before them; they seldom allow her time to loiter and make much work; she must run and continue her foiling, or change her ground; if the latter she is soon killed, for fresh ground, especially on turf, is, in some degree, one continued view. It is difficult, however, to procure a pack of fast hounds that run evenly together; some are usually found to tail, and their exertions to keep up to the leading hounds, make them of little use, farther than enlarging the cry, unless when the scent is over-run, then hounds thrown out or tailed, often come up, and hit off the fault.

It is very common for the fleetest hound to be the greatest favourite, but let a hound be ever so good in his own nature, his excellence is obscured in that pack which is too slow for him. At most times there is work enough for every hound in the field, and each ought to bear a part; but this it is impossible for the heavy hounds to do, if run out of wind by the disproportionate speed of a leading hound; for it is not sufficient for hounds to run up, which a good hound will labour hard for, but they should be able to do so with ease, with retention of breath and spirits, and with their tongues at command; it can never be expected that any scent can be well followed by hounds that do not carry a *good head*. It is too frequent a practice in numerous kennels, to keep some for their music, others for their beauty, who at best are silly and trifling, without nose or sagacity; this is wrong, for it is a certain maxim, that every dog which does no good, serves only to foil the ground and confound the scent, by scampering before or interrupting their betters in the most difficult points. Five couple of trusty hounds will do more execution than thirty where half of them are eager and head-strong.

The third sort are scarce, and an entire kennel of them seldom seen; they are of Northern breed, and by many esteemed for the chace of the otter and marten, and in some places are encouraged for that of the fox; but they are bad to breed from, being subject to produce thick, heavy-shouldered dogs unfit for the chace. See BEAGLE.

In the choice of a hound the dog of a middling size is recommended, with his back broader than round: nose large with wide nostrils, chest deep and capacious, fillets great and high, haunches large, hams straight, feet round, the sole hard and dry,

H O U N D.

dry, claws large, ears wide, thin, and more round than sharp, eyes full, forehead prominent, and upper lips thick and deeper than the lower jaw.

Much may be said for or against the several kinds of harriers, but to sum up the whole concisely, staunch hounds of any sort are desirable; whoever has them of nearly equal age and speed, with the further requisites of packing and hunting well together, whether Southern, Northern, Foxtrain, or Beagle, can boast an advantage in the diversion, which few gentlemen (with every attention to their breed) ever attain, but at a great expence of both time and money.

As to the method of breeding hounds, too much care cannot be taken in the choice of the fires from which the whelps are wanted; a very little inattention spoils the litter, which sometimes proves degenerate, although from as high bred a dog and bitch as can be put together, and where every danger of a spurious cross has been completely guarded against.

Young hounds should be entered as near the time when they are a twelvemonth old as possible, and they should be entered at the game they are designed to hunt, as most dogs prefer that game they were first blooded with, and encouraged to pursue. See *Hare HUNTING*.

2. The *grey-hound*, or *leporarius*, or *canis venaticus graius*, might deserve the first place, on account of his swiftness, strength, and sagacity, in pursuing his game; such being the nature of this dog, that he is speedy and quick of foot to follow, fierce and strong to overcome, yet silent, coming upon his prey unawares.

Dr. Caius derives the name of the *grey-hound*, or *gre-hound*, from its being the first in rank among dogs; and that it was formerly so esteemed, appears from the *forest-laws* of King Canute, who enacted, that no one under the degree of a gentleman should presume to keep a grey-hound. The varieties of this species are the *Italian* grey-hound, which is small and smooth, and the *Oriental*, which is tall and slender, with very pendulous ears, and very long hairs on the tail, hanging down a great length. There was formerly a variety, called the *Highland* grey-hound, which is now become very scarce, of a very great size, strong, deep-chested, and covered with long and strong hair. See *DOG*.

The make and proportions required in a good grey-hound, arrived at the age of two years, when he is full grown, are, that he have a fine skin, a body neither too long nor too great, strong and pretty large, a long lean head, with a nose sharp from the eyes downwards, sparkling eyes, with large eye-lids, a long neck, bending like a drake, and sharp teeth, little ears, with thin grilles in them, a straight, broad, and strong breast, a back straight and square with a rising in the middle, his fore legs straight and short, his hind legs long and straight, a round foot with large clefts, broad shoulders, round ribs, with a long space between his hips, fleshy buttocks, but not fat, and a long tail, strong and full of sinews.

The old couplets that describe this species of dogs were exact in the points they recommended, as necessary to form a complete grey-hound.

“ Head like a *snake*,
Neck'd like a *drake*,
Back'd like a *beam*,
Sided like a *beam*,
Tailed like a *rat*,
And footed like a *cat*”

Of this kind, those are always fitted to be chosen among the whelps that weigh lightest; for they will be sooner at the game, and so hang upon it, hindering its swiftness, till the heavier and strong *bounds* come in to offer their assistance;

whence, besides what has been already said, it is requisite for a grey-hound to have large sides, and a broad midriff, that he may take his breath in and out the more easily; his belly should also be small, which otherwise would obstruct the swiftness of his course; and his hairs thin and soft.

The huntsman is to lead these hounds on his left hand, if he be on foot; and on the right, if on horseback. The best time to try and train them to the game, is at twelve months old, though some begin sooner, and enter and try the females at ten months old, which last are said to be generally more swift than the dogs; they should be kept in a slip while abroad, till they see their course; neither should you loosen a young dog till the game has been a considerable time on foot, he being apt, by over eagerness at the prey, to strain his limbs.

The grey-hound is the best used in open countries where there is little covert; in these places there will sometimes be a course after a hare of two miles or more, and both the dogs and the game in sight all the while. It is generally supposed, that the grey-hound bitch will beat the dog in running; but this seems to be an error, for the dog is both longer made, and considerably stronger than the bitch of the same kind.

In the breeding of these dogs the bitch is principally to be regarded; for it is found by experience, that the best dog with a bad bitch, will not get so good puppies as an indifferent dog with a good bitch. The dog and bitch should be as nearly as can be of the same age; and for the breeding of perfect and fine dogs, they should not be more than four years old; an old bitch may be used with a young dog, but the puppy of a young bitch and an old dog will never be good for any thing.

The general food of a grey-hound ought to be chippings or raspings of bread, with soft bones and gristles; and these chippings ought always to be soaked in beef or mutton broth; and when it is nearly cool, some milk should be added; this given the dog morning and evening will keep him in good heart and spirits; he must never have any hard bones given him, because they harden his mouth, and hurt his teeth. If the dog grows sick and weakly upon this diet, then take sheep's heads with the wool on, wash them clean, and boil them in a sufficient quantity of water, to make a very rich and strong broth, and add a large quantity of oat-meal to it. When the meat is very tender, and the broth rich, it is good and fit for the dog; and giving him sometimes the one, and sometimes the other, will very soon recover him. The kennel should be airy, and the door towards the south, the benches $2\frac{1}{2}$ feet, with holes bored to carry off the urine; the straw on the benches should be frequently changed, and the kennel kept extremely clean. See *KENNEL*.

If one of these dogs is to run for a wager, or on any particular occasion, he may be dieted with the following bread: take half a peck of good wheat, and the same quantity of the finest and driest oat-meal; grind these together, and let the meal be sifted very fine; then add as much liquorice and aniseeds, in powder, as will not give it too disagreeable a flavour; and knead the whole into dough with the whites of eggs and new ale. This should be baked in small loaves considerably hard; and when the dog is to be fed with it, it is to be soaked in beef or other broth. He is to be led out to walk half an hour after sun-rise every morning, and half an hour before sun-set every evening, and at his coming in fed with this soaked bread. The proper exercise for a grey-hound is the coursing him three times a week, and rewarding him with the blood of the hare, which will animate him in the highest degree, and encourage him to prosecute his game. But the hare also should ever have fair play; the

should

HOUND.

should have the law, as it is called, that is, have leave to run twelve score yards before the dog is slipped at her, that he may have some difficulty in the course, and not pick up the game too easily. If he kill the hare he must never be suffered to tear her, but she must be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet are to be washed with butter and beer, or rather with water and salt, and about an hour after he is to be fed. See ENTRANCE.

When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then he is to be kennelled till taken out to the field. The kennelling of these dogs is of great use, always giving them spirit and nimbleness when they are let loose; and the best way of managing a fine grey-hound is never to let him stir out of the kennel, except at the times of feeding, walking, or courting.

With respect to the swiftness of the grey-hound, the following questions were submitted to a gentleman, whose grey-hounds are known to be as swift as any in the kingdom. Whether the speed of a grey-hound is equal to that of a first rate horse for the distance of a mile, or for a greater or a smaller distance? and, whether the speed of any hare (supposing the dog and hare to be started without the law usually allowed to the hare in courting) is equal to that of the grey-hound, and to what distance, within that of a mile, the hare could exert that superiority of speed, supposing the hare to be the fastest animal of the two? His opinion was, that upon a flat, a first rate horse would be superior to the grey-hound, but in a hilly country, as in Wiltshire, a good grey-hound would have the advantage; on the second point, that although he had seen many hares go away from grey-hounds, laid close in with them, without a turn, yet he believes a capital grey-hound (so laid in) would not suffer a hare to run from him without turning her. An incident, however, occurred in December 1800, which brought the speed of the grey-hound and race horse into competition. A match was to have been run over Doncaster course for one hundred guineas, but one of the horses having been drawn, a mare started alone to make good the bet, and after having gone the distance of about a mile, a grey-hound bitch started from the side of the course, and ran with her the other three miles, keeping nearly head to head, which produced a singular race, and when they arrived at the distance-post, five to four was betted on the grey-hound; when they came to the stand it was even betting. The mare won by about a head.

In February 1800, a brace of grey-hounds in Lincolnshire ran a hare from her seat to where killed, a distance, measuring straight, upwards of four miles, in twelve minutes; during the course there was a great number of turns, which very considerably increased the space gone over; the hare ran herself dead before the grey-hounds touched her; this extensive course, in so short a time, is a strong proof of the strength and swiftness of the hare. Horses have been as much distressed in keeping up for their riders to see a course, as in much longer chaces with hounds. The compiler (says Mr. Daniel) recollects a hare being found close to the town of Bottisham, in Cambridgeshire, and which took away for the six mile bottom, twenty-two horses started, but only one could make a gallop at the conclusion of the course; the hare (who was within fifty paces of the cover) was dead some yards before the grey-hounds, who were obliged to be led to recover them.

The remark made during his troubles, by the unfortunate Charles I. upon the grey-hound's affability, was just as

applied to the animal, and a keen satire upon those that surrounded him; a discourse arose respecting what sort of dogs deserved pre-eminence, and every one allowed it to belong to the spaniel or the grey-hound. The monarch gave his opinion in the grey-hound's behalf, because (said he) it has all the good nature of the spaniel, without the *favouring*.

Many instances might be mentioned of the high spirit and courage, as well as uncommon ardour and velocity of grey-hounds. If it be asked, what is allowed at the present day to be the best breed of them? The blood of the late lord Orford's dogs engrafted into those of Wiltshire and Yorkshire has turned out the best grey-hounds. Allowing for some exceptions, it is generally imagined that grey-hounds crossed from the fore-mentioned blood have proved themselves superior to others.

3. The *gaze-hound*, or *beagle*, is a dog more beholden to the sharpness of his sight, than his nose or smelling; by virtue of which he makes excellent sport with the deer and hare. He is also noted as exquisite in choosing of one that is not lank or lean, but full, fat, and round, which, if it happen to return, and be mingled again with the residue of the herd, he will soon spy out, and leave the rest untouched, never ceasing, after he has separated it from its company, and till he has wearied it to death.

These dogs were much used in the north of England, and on champion ground; rather than bushy and woody places, and by horsemen more than footmen. If at any time he happen to take a wrong way, upon the usual sign made by his master, he immediately returns, takes the right and ready course, beginning his chace afresh, with a clear voice, and swift foot, following the game with as much courage as at first.

This species, which was the *agastus* of Dr. Caius, says Mr. Pennant, is now lost, or at least unknown to us; and it is very different from the *agastus* of Oppian, which is our *beagle*, which see. See also Dog.

4. The *blood-hound*, or *canis sagax* of Linnæus, differs nothing in quality from the *Scottish slut hound*, derived from the Saxon *slut*, the impression which a deer leaves of its foot in the mire, and *hund*, a dog, saving that it is longer shaped, and not always of the same colour, but sometimes red, fanded, black, white-spotted, &c. though most commonly either brown or red.

Their nature is, that being set on by the voice and words of their leader, to cast about for the fitting of the present game, and having found it, they will never cease pursuing it with full cry, till it be tired, without changing for any other.

They seldom bark, except in their chace, and are very obedient and attentive to the voice of their leader. Those that are really good, when they have found the hare, make show thereof to the huntsman by running more speedily, and with gesture of head, eyes, ears, and tail, winding to the form or hare's muse, never giving over prosecution, and running with a gallant noise.

They have good and hard feet, and stately stomachs, and are very properly denominated *sanguinary* or *blood-hounds*, on account of their extraordinary scent; for if their game be only wounded, so that it escape the huntsman's hands, or if it be killed, and never so cleanly carried away, these dogs, by their exquisite smell, will discover it, and not be wanting, either by nimbleness or greediness, to come at it, provided there be any stains of blood. Nay, though by all the cunning and foresight imaginable, a beast be conveyed away without spot or blood, yet through the roughest and most crooked ways and incanders, this dog will find out the deer.

deer-stealer, and, even in the thickest throng, will, by his smell, separate and pick him out.

The blood-hound was in great request on the confines of England and Scotland, where the borderers were continually preying on the herds and flocks of their neighbours. The true blood-hound, says Mr. Pennant, was large, strong, muscular, broad-breasted, of a stern countenance, of a deep tan-colour, and generally marked with a black spot above each eye. See Dog.

5. The *terrier*, or *tarrier*, only hunts the fox or badger; being thus called, because after the manner of a ferret in searching for coney he leaps into the ground, and affrights or attacks the bealts, either tearing them in pieces, or haling them out by force; or, at least, driving them out of their harbours to be taken in a net, or otherwise. See Dog.

The huntsmen have commonly a couple of terriers, that they may put in a fresh one, as occasion serves, to relieve the other.

The time of entering the terrier is when he is near a twelve-month old: if it be not done within that time, he will hardly be brought to take the earth. This entering and fleshing of them may be performed several ways. First when the foxes and badgers have young cubs, take an old terrier, set him into the ground, and when he begins to bay, hold the young one at the hole or mouth of the earth, that he may listen and hear the old one's bay. The old fox or badger being taken, so that nothing remains within but the cubs, couple up the old ones, and put in the young in their steads, encouraging them by crying *to him, to him*. If they take any cub within, let them do with it what they list; not forgetting to give the old terriers their reward, which is blood and livers, fried with cheese, and some of their grease; shewing them also heads and skins to encourage them.

HOUND-fish, in *Ichthyology*, (see *SQUALUS mustelus*.) the smooth hound-fish, or hound-shark.

HOUND Point, in *Geography*, a cape of Scotland in the Frith of Forth, and N. coast of the county of Linlithgow; seven miles W. N. W. of Leith.

HOUND'S Tongue, in *Botany*. See *CYNOGLOSSUM*.

HOUNDS, in a *Ship*, are those parts of a mast-head which gradually project on the right and left side, beyond the cylindrical or conical surface, which it preserves from the partners upwards. The hounds, whose upper parts are also called checks, are used as shoulders to support the frame of the top, together with the top-mast and rigging of the lower mast.

HOUNSLOW, in *Geography*, a town, partly belonging to the parish of Heston, and partly to that of Isleworth, in the hundred of Ossulston, and county of Middlesex, England. It is chiefly supported by its great thoroughfare, and abounds with inns and public-houses for the accommodation of travellers. Here was formerly a market, which is now discontinued: but a fair is held here every Trinity Monday. At the western extremity of the town is a chapel of ease, which formerly belonged to a priory, that was founded in the thirteenth century. The architecture, and some ornaments in the chapel, indicate the age of the building to have been coeval with the foundation of the priory. In the chancel is a monument for Whitelocke Bulstrode, esq. who died November 27, 1724. Adjoining the town is a large tract of waste land called Hounslow-heath. According to a survey made in the year 1546, this heath consisted of 4293 acres, nearly the whole of which was then waste, and almost useless. It continued in this state till within the last 20 years, but an act of parliament has been recently obtained to inclose and cultivate it. Many acres are

now under tillage, and will consequently be rendered beneficial to the community, and profitable to the proprietors. (See Middleton's *Agricultural Survey of Middlesex*.) This heath has been noted in the annals of military history, and also in those of Newgate. Vestiges of ancient encampments are still visible, and it is related that the military forces of the kingdom have frequently been assembled and brought to action here. In 1267, the earl of Gloucester, leading the Londoners against king Henry III. assembled them on Hounslow-heath. King Charles's army, after the memorable battle of Brentford in 1642, entrenched themselves here. On the 3d of August 1647, the parliamentary forces, amounting to 20,000 foot and horse, under sir Thomas Fairfax, were assembled on this heath, when the speakers of both houses of parliament were present. Several other instances might be cited. In the year 1793, barracks were erected here to contain above 400 soldiers, with horses, &c. Large gun-powder and oil mills are standing upon the banks of the old river. The former have several times taken fire, and several buildings have been blown up. Lysons's *Environs of London*, vol. iii.

HOU-QUANG, a province of China, occupying nearly the centre of the empire; bounded on the N. by Honan, on the E. by Kiang-si and Kiang-nan, on the S. by Quang-si and Quang-tong, and on the W. by Se-tchuen and Koei-tcheou, about 480 miles from N. to S. and 350 from E. to W. The river Yang-tseokiang traverses this province from W. to E., and divides it into two parts, the northern and southern. The greater part of the province is level, watered by lakes, canals, and rivers, and celebrated for its fertility. By the Chinese it is called the store-house of the empire, and among them it is a common saying, that "the abundance of Kiang-si could furnish all China with a breakfast; but the province of Hou-quang alone could supply enough to maintain all its inhabitants." The people boast much of their cotton cloths, simples, gold-mines, wax, and paper made of the bamboo-reed. The capital of the whole province is Vou-tchang, and its population, as stated by sir George Staunton, 27 millions. The northern part of the province contains eight cities of the first class, and sixty of the second and third. The southern comprehends seven of the first class and 54 of the second and third, exclusive of forts, towns, and villages, which every where occur.

HOURLY, *Ωρα*, *Hora*, in *Chronology*, an aliquot part of a natural day, usually a 24th, sometimes a 12th.

The origin of the word *hora*, or *ωρα*, comes, according to some authors, from a surname of the sun, the father of hours, whom the Egyptians call *Horus*. Others derive it from the Greek *ἐπιζωω*, to terminate, distinguish, &c. Others from the word *ουρα*, urine; pretending that Trismegistus was the first that settled the division of hours; which he did from observation of an animal consecrated to Serapis, named the *cynocephalus*, which makes water twelve times a day, and as often in the night, at equal intervals.

An hour with us is a measure or quantity of time, equal to a twenty-fourth part of the natural day, or nycthemeron; or it is the duration of the twenty-fourth part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an hour; though not precisely, but near enough for common use.

The hour is divided into sixty minutes, the minute into sixty seconds, &c.

The division of the day into hours is very ancient; as is shewn by Kircher, *Œdip. Egypt. tom. ii. part ii. class vii. cap. 8.* though the passages he quotes from scripture do not prove it. The most ancient hour is that of the twelfth part of the day. Herodotus, lib. ii. observes, that the Greeks learnt

learnt from the Egyptians, among other things, the method of dividing the day into twelve parts. The astronomers of Cathaya, &c. bishop Beveridge observes, still retain this division. They call the hour *chag*; and to each *chag* they give a peculiar name, taken from some animal: the first is called *æth*, *moufe*; the second *chiu*, *bullock*; the third *zem*, *leopard*; the fourth *mau*, *bare*; the fifth *chin*, the *crocodile*, &c.

The division of the day into twenty-four hours was not known to the Romans before the Punic war. Till that time they only regulated their days by the rising and setting of the sun.

They divided the twelve hours of their day into four; *viz.* *prime*, which commenced at six o'clock, *third* at nine, *sixth* at twelve, and *nine* at three. They also divided the night into four watches, each containing three hours.

There are divers kinds of hours, used by chronologers, astronomers, dialists, &c.

Sometimes hours are divided into *equal* and *unequal*.

HOURS, Equal, are the twenty-fourth parts of a day and night precisely; that is, the time wherein the fifteen degrees of the equator mount above the horizon.

These are also called *equinoctial* hours, because measured on the equinoctial; and *astronomical*, because used by astronomers.

They are also differently denominated, according to the manner of accounting them in different countries.

HOURS, Astronomical, are equal hours, reckoned from noon, or mid-day, in a continued series of twenty-four.

HOURS, Babylonish, are equal hours, reckoned from sunrise in a continued series of twenty-four.

HOURS, European, are equal hours, reckoned from midnight; twelve from thence till noon, and from noon till midnight twelve more.

HOURS, Jewish, or *Planetary*, or *Ancient*, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the hours of the day are equal to those of the night: at other times they will be always either increasing or decreasing.

They are called *ancient* or *Jewish* hours, because used by the ancients, and still among the Jews. They are called *planetary* hours, because the astrologers pretend, that a new planet comes to predominate every hour; and that the day takes its denomination from that which predominates the first hour thereof: as Monday from the moon, &c.

HOURS, Italian, are equal hours, reckoned from sun-set, in a continued series of twenty-four.

HOURS, Unequal, or *Temporary*, are twelfth parts of the artificial day or night. The obliquity of the sphere renders these more or less unequal at different times; so that they only agree with the equal hours at the times of the equinoxes.

To find the hour of the day, when the latitude of the place, the sun's declination, and his altitude, are given. Thus, suppose the latitude is $51^{\circ} 32'$, the sun's declination 18° north, and his altitude 40° , to find the hour of the day.

The geometrical solution of this problem is performed by projecting stereographically on the plane of the meridian the oblique-angled spherical triangle, which is made by the complement of the latitude, the complement of the sun's altitude, and the sun's distance from the elevated pole. Thus with the chord of 60° (*Plate XVI. Astronomy, fig. 142.*) draw the primitive circle $ZONH$; quarter it; also draw the axis PCP through the poles, and the equinoctial $ÆCQ$; likewise the parallel of declination $D \odot d$ equal 18° ; then draw parallel to the horizon HO , the almucanter or parallel of the sun's altitude $Aa = 40^{\circ}$, to cut the parallel of the sun's declination in \odot , the place of the sun at that time. Then through \odot draw two great circles, one through Z and N the poles of the horizon, and the other through P and P the poles of the equinoctial, as $Z \odot N$, and $P \odot P$; which form the oblique-angled spherical triangle $PZ \odot$; and the angle $ZP \odot$, measured on the line of half tangents, gives the hour of the day from twelve, *viz.* $47^{\circ} 20'$ equal to three hours nine minutes nearly, or to 51 minutes after eight in the morning, or 51 minutes before four in the afternoon. But by spherical trigonometry, having three sides given, that is, ZP , $38^{\circ} 28'$, the complement of the latitude, $Z \odot$, $50^{\circ} 00'$, the complement of the sun's altitude, and $P \odot$, $72^{\circ} 00'$, the sun's distance from the elevated pole (which is the declination added to 90° , when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle $ZP \odot$, the hour of the day, is found by case 11. of spherical trigonometry, as follows.

First add the complement of the latitude, complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Secondly, from half that sum subtract the complement of the sun's altitude, noting the half sum, and the remainder; then the complement arithmetical of the sines of the complement of the latitude, and the sun's distance from the pole, and the sines of the said half sum and remainder, added together; the sine of half this sum, doubled, and subtracted from 180 degrees, gives the hour from noon.

Side	{	Z P Co. lat.	$38^{\circ} 28'$	}
		\odot P Co. decl.	$72^{\circ} 00'$	
		Z \odot Co. alt.	$50^{\circ} 00'$	
		Sum is,	$160^{\circ} 28'$	
		Half is	$80^{\circ} 14'$	
		Co. alt.	$50^{\circ} 00'$	
		Remainder	$30^{\circ} 14'$	

containing sides	{	S. co. ar.	$- 0.206168$
		S. co. ar.	$- 0.021794$
half sum sides		$80^{\circ} 14'$ S.	$- 9.993660$
		remainder $30^{\circ} 14'$ S.	$- 9.702019$
		sum of the 4	$- 19.923641$
		sine half sum	$- 9.961820$
			$66^{\circ} 20'$
			$66^{\circ} 20'$
Which doubled gives			$132^{\circ} 40'$

This subtracted from $180^{\circ} 00'$ leaves $47^{\circ} 20'$ equal to three hours nine minutes nearly, the same as before.

By the same operation you may find the sun's azimuth PZ C, if instead of the complement of the sun's altitude you subtract the sun's distance from the pole, noting the half sum and remainder as before. And the rule will stand thus: to the complement arithmetical of the sines of the complement of the latitude, and complement of the sun's altitude, add the sines of the aforesaid half sum and remainder; then the sine of half the total of these four, doubled, and taken from 180 degrees, gives the sun's azimuth from the north, in north latitude; and from the south, in south latitude.

If the hour of the night is required, the height of some star must be taken. And it is found by adding to, or subtracting the right ascension of that star from that of the sun.

To find the hour of the day or night by the globe, see **GLOBE**.

Hour, in *Mining*, is used by several foreign writers to express $\frac{1}{24}$ th part of the circumference or horizon, or 15° of azimuth; the south and the north being called twelve hours, the east and west six hours; and in describing the course or range of a vein or stratum, they say, if N.W. and S.E., that it has a nine o'clock range, &c. In the same manner, English colliers, speaking of the prevailing dip of the strata, say, that the measures generally dip to the ten o'clock sun; and the collieries of Derbyshire are found by Mr. Farey generally to face the two o'clock sun, or the slines or length-way joints, at right angles to these, tend to the eight o'clock sun, which is either the deep end or the rise-end of the works, according as the strata dip towards the N.W. or S.W. or *vice versa*.

Hours, *Horæ*, in the *Ancient Mythology*, were certain goddesses, the daughters of Jupiter and Themis; at first only three in number, Eunomia, Dice, and Irene; to which were afterwards added two more, Carpo, and Thallote.

Homer makes them the door-keepers of heaven. Ovid allots them the employment of harnessing the horses of the sun:

“Jungens equos Titan velocibus imperat Horis.”

And speaks of them as standing, at equal distances, about the throne of Sol:

“—— et positæ spatiis equalibus, Horæ.”

The poets represent them as dressed in fine coloured, or embroidered robes, and gliding on with a quick and easy motion. Ovid. *Fast.* v. ver. 218. *Met.* ii. ver. 115. *Stat.* *Theb.* iii. ver. 410.

Hours, *Horæ*, in the *Romish Church*, are certain prayers performed at stated times of the day; as *matins*, *vespers*, *lauds*, &c.
