### K I L N.

**KILN**, in *Agriculture*, a kind of oven or stove for admitting heat, in order to dry substances of various kinds, as corn, malt, hops, &c. It also signifies a fabric or building constructed for the purpose of burning lime-stone, chalk, and other calcareous stones, into lime. Kilns are of different kinds, and formed in different ways, according to the purposes for which they are designed.

**KILN-Ashes**, the ashes made in kilns where wood, straw, furze, &c. are burnt. These ashes are useful as manure for almost any kind of soil, but especially such as possess much vegetable matter. In the western districts, the farmers sift them over their corn and grass; but this must not be done in windy weather, because they are so very light, that they would easily be blown away and lost. They are found to succeed best when laid on just before rain falls. See **ASHES**.

**KILN, Brick.** See **BRICK-Kiln** and **BRICK**.

**KILN, Hop**, a stove or kiln constructed for the purpose of drying or stoving hops. See **HOP** and **OAST**.

**KILN, Lime**, a sort of kiln constructed for the purpose of burning various kinds of calcareous substances, such as lime-stone, chalk, shells, &c. into lime. They are built of different forms or shapes, according to the manner in which they are to be wrought, and the kinds of fuel which are to be employed. It has been remarked, in a work on landed property, that, in places where materials are dear, from their being fetched from a distance, and where the fuel is coals, and also expensive, the form of a kiln is mostly that of an inverted cone, a form which has its inconveniences; but in districts where the art of burning lime is practised with superior attention and correctness, the form has of late years been gradually changing from conical to elliptical. But, in his opinion, "the best form of a lime furnace, in

the established practice of the present day, is that of the egg placed upon its narrower end, having part of its broader end struck off, and its sides somewhat compressed, especially towards the lower extremity; the ground plot or bottom of the kiln being nearly an oval, with an eye, or draft-hole, toward each end of it." It is supposed that "two advantages are gained, by this form, over that of the cone. By the upper part of the kiln being contracted, the heat does not fly off so freely as it does out of a spreading cone. On the contrary, it thereby receives a degree of reverberation, which adds to its intensity." But the other, and still more valuable effect is this: "when the cooled lime is drawn out at the bottom of the furnace, the ignited mass, in the upper parts of it, settles down, freely and evenly, into the central parts of the kiln; whereas, in a conical furnace, the regular contraction of its width, in the upper as well as the lower parts of it, prevents the burning materials from settling uniformly, and levelling downward. They "hang" upon the sides of the kiln, and either form a dome at the bottom of the burning mass, with a void space beneath it, thereby endangering the structure, if not the workmen employed; or, breaking down in the centre, form a funnel, down which the under-burnt stones find their way to the draft-holes." And "the contraction of the lower part of the kiln has not the same effect; for, after the fuel is exhausted, the adhesion ceases, the mass loosens, and, as the lime cools, the less room it requires: It therefore runs down freely to the draft-holes, notwithstanding the quick contraction of the bottom of the kiln or furnace."

And, lastly, that, "with respect to the lime-furnace (which is, he thinks, entitled to the most sedulous attention of agricultural chemistry), the fire requires to be furnished

with a regular supply of air. When a kiln is first lighted, the draft-holes afford the required supply. But after the fire becomes stationary, in the middle, or towards the upper part of the kiln (especially of a tall kiln), while the space below is occupied by burnt lime, the supply from ordinary draft-holes becomes insufficient. If the walls of the kiln have been carried up dry or without mortar, the air finds its way through them to the fire. In large deep kilns that are built with air-tight walls, it is common to form air-holes in their sides, especially in front, over the draft-holes. But these convey the air, in partial currents, to one side of the kiln only, whereas that which is admitted at the draft-holes passes regularly upward to the centre, as well as to every side of the burning mass; and, moreover, tends to cool the burnt lime in its passage downward, thereby contributing to the ease and health of the workmen. Hence he is of opinion, that the size of the draft-holes ought to be proportionate to that of the kiln, and the size of the stones taken jointly (air passing more freely among large than among small stones), and that the required supply of air should be wholly admitted at the draft-holes. By a sliding or a shifting valve, the supply might be regulated, and the degree of heat be encreased or diminished, at pleasure," according to circumstances.

The most ancient kind of lime-kiln is probably that which is made by excavating the earth in the form of a cone, of such a size as may be necessary; and afterwards building up the sides, or not, according to the circumstances of the case: the materials being then laid in, in alternate layers of fuel and stone, properly broken, until the whole is filled up. The top is then covered with sods, in order that the heat may be prevented from escaping; and the fire lighted at the bottom, and the whole of the contents burnt, in a greater or less space of time, in proportion to the nature of the stone, and the quantity that is contained in the kiln. From the circumstance of the top parts of these kilns, in some districts, being covered over, and the sides sometimes built up with sods, they are termed *sod-kilns*, in order to distinguish them from the other forts. When the whole of the contents of such kilns are grown cold, they are drawn or taken out from the bottom; and the kiln again filled, if necessary. These kilns are obviously intended for burning only one kiln-full at a time. But as the burning of lime in this way is tedious and uneconomical, other methods and forms of kilns have been had recourse to. Where lime is much wanted, either for agriculture or other purposes, they therefore use perpetual kilns, or what are more generally known by the name of *draw-kilns*. These, as all lime-kilns ought to be, are, the author of Modern Agriculture says, situated by the side of a rising bank, or sheltered by an artificial mound of earth. They are generally built either of stone or brick; but the latter, as being better adapted to stand excessive degrees of heat, is considered as preferable. The outside form of such kilns is sometimes cylindrical, but more generally square. The inside should be formed in the shape of a hoghead, or an egg, opened a little at both ends, and set on the smallest; being small in circumference at the bottom, gradually wider towards the middle, and then contracting again towards the top. In kilns constructed in this way, it is observed, fewer coals are necessary, in consequence of the great degree of reverberation which is created, above that which takes place in kilns formed in the shape of a sugar-loaf reversed. Near the bottom, in large kilns, two or more apertures are made: these are small at the inside of the kiln, but are sloped wider, both at the sides and the top, as they extend towards the outside of the building. The

uses of these apertures are for admitting the air necessary for supplying the fire, and also for permitting the labourers to approach with a drag and shovel, to draw out the calcined lime. From the bottom of the kiln within, in some cases, a small building, called a horse, is raised in the form of a wedge, and so constructed as to accelerate the operation of drawing out the burned lime-stone, by forcing it to fall into the apertures which have been mentioned above. In other kilns of this kind, in place of this building, there is an iron grate near the bottom, which comes close to the inside wall, except at the apertures where the lime is drawn out. When the kiln is to be filled, a parcel of furze or faggots is laid at the bottom; over this a layer of coals; then a layer of lime-stone, which is previously broken into pieces, about the size of a man's fist; and so on alternately, ending with a layer of coals, which is sometimes, though seldom, covered with sods or turf, in order to keep the heat as intense as possible. The fire is then lighted in the apertures; and when the lime-stone towards the bottom is completely calcined, the fuel being considerably exhausted, the lime-stone at the top subsides. The labourers then put in an addition of lime-stone and coal at top, and draw out at bottom as much as they find thoroughly burned; and thus go on, till any quantity required be calcined. When lime-stone is burned with coals from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  bushels, on a medium, 3 bushels of calcined lime-stone are produced for every bushel of coals used in the process.

A lime-kiln of this sort is described in count Rumford's Essays, which is in possession of the Dublin Society, as well as the principal objects that ought to be had in view in constructing of the kiln pointed out: the first of which is, "to cause the fuel to burn in such a manner as to consume the smoke, which has here been done by obliging the smoke to descend and pass through the fire, in order that as much heat as possible might be generated. Secondly, to cause the flame and hot vapour, which rise from the fire, to come in contact with the lime-stone by a very large surface, in order to economize the heat, and prevent its going off into the atmosphere; which was done by making the body of the kiln in the form of a hollow truncated cone, and very high in proportion to its diameter; and by filling it quite up to the top with lime-stone, the fire being made to enter near the bottom of the cone.

"Thirdly, to make the process of burning lime perpetual, in order to prevent the waste of heat which unavoidably attends the cooling of the kiln, in emptying and filling it, when, to perform that operation, it is necessary to put out the fire.

"And, fourthly, to contrive matters so, that the lime in which the process of burning is just finished, and which of course is still intensely hot, may, in cooling, be made to give off its heat in such a manner, as to assist in heating the fresh quantity of cold lime-stone with which the kiln is replenished, as often as a portion of lime is taken out of it.

"To effectuate these purposes, the fuel is not mixed with the lime-stone, but is burned in a close fire-place, which opens into one side of the kiln, some distance above the bottom of it. For large lime-kilns on these principles, there may be several fire-places all opening into the same cone, and situated on different sides of it; which fire-places may be constructed and regulated like the fire-places of the furnaces used for burning porcelain.

"At the bottom of the kiln there is a door, which is occasionally opened to take out the lime.

"When, in consequence of a portion of lime being drawn out of the kiln, its contents settle down or subside,  
the

the empty space in the upper part of the kiln, which is occasioned by this subtraction of the burned lime, is immediately filled up with fresh lime-stone.

“As soon as a portion of lime is taken away, the door by which it is removed must be immediately shut, and the joinings well closed with moist clay, to prevent a draft of cold air through the kiln. A small opening, however, must be left, for reasons which are explained below.

“As the fire enters the kiln at some distance from the bottom of it, and as the flame rises as soon as it comes into this cavity, the lower part of the kiln (that below the level of the bottom of the fire-place) is occupied by lime already burned; and as this lime is intensely hot, when, on a portion of lime from below being removed, it descends into this part of the kiln, and as the air in the kiln, to which it communicates its heat, must arise upwards in consequence of its being heated, and pass off through the top of the kiln, this lime, in cooling, is by this contrivance made to assist in heating the fresh portion of cold lime-stone, with which the kiln is charged. To facilitate this communication of heat from the red-hot lime just burned to the lime-stone above in the upper part of the kiln, a gentle draft of air through the kiln, from the bottom to the top of it, must be established, by leaving an opening in the door below, by which the cold air from without may be suffered to enter the kiln. This opening (which should be furnished with some kind of a register) must be very small, otherwise it will occasion too frequent a draft of cold air into the kiln, and do more harm than good; and it will probably be found best to close it entirely, after the lime in the lower part of the kiln has parted with a certain proportion of its heat.”

The height of the kiln, which is represented in *Plate (Kiln) Agriculture, fig. 1.* is on a scale of 15 feet: its internal diameter below, two feet; and above, nine inches. In order more effectually to confine the heat, its walls, which are of brick, and very thin, are double, and the cavity between them is filled with dry wood-ashes. To give greater strength to the fabric, these two walls are connected in different places by horizontal layers of brick, which unite them firmly: *a* is the opening by which the fuel is put into the fire-place: through this opening the air descends which feeds the fire. The fire-place is represented nearly full of coals, and the flame passing off laterally into the cavity of the kiln, by an opening made for that purpose at the bottom of the fire-place. The opening above, by which the fuel is introduced into the fire-place, is covered by a plate of iron, moveable on hinges; which plate, by being lifted up more or less by means of a chain, serves as a register for regulating the fire. A section of this plate, and of the chain by which it is supported, are shewn in the figure: *b* is an opening in the front wall of the fire-place, which serves occasionally for cleansing out the fire-place, and the opening by which the flame passes from the fire-place into the kiln. This opening, which must never be quite closed, serves likewise for admitting a small quantity of air to pass horizontally into the fire-place. A small proportion of air, admitted in this manner, has been found to be useful and even necessary in fire-places, in which, in order to consume the smoke, the flame is made to descend. Several small holes for this purpose, fitted with conical stoppers, may be made in different parts of the front wall of the fire-place.

The bottom of the fire-place is a grate constructed of bricks placed edgewise, and under this grate there is an asphalt; but as no air must be permitted to pass up through this grate into the fire-place, the ash-pit door, *c*, is kept constantly closed, being only opened occasionally to remove the ashes: *d* is the opening by which the lime is taken out

of the kiln; which opening must be kept well closed, in order to prevent a draught of cold air through the kiln. As only as much lime must be removed at once as is contained in that part of the kiln which lies below the level of the bottom of the fire-place, to be able to ascertain when the proper quantity is taken away, the lime, as it comes out of the kiln, may be directed into a pit sunk into the ground in front of the opening by which the lime is removed; this pit being made of a proper size to serve as a measure for it. And while the lime is removing from the bottom of the kiln, fresh lime-stone should be put into it above; and during this operation, the fire may be damped by closing the top of the fire-place with its iron-plate. Should it be found necessary, the fire, and the distribution of the heat may, in burning the lime, be further regulated by closing more or less the opening at the top of the lime-kiln with a flat piece of fire-stone, or a plate of cast-iron. The double walls of the kiln, and the void space between them, as also the horizontal layers of bricks by which they are united, are clearly and distinctly expressed in the figure in the plates.

This method of constructing lime-kilns, though ingenious and philosophical, is probably much too expensive for general use.

It is a common practice to burn lime-stone with furze in some places. The kilns which are made use of in these cases are commonly known by the denomination of *flame-kilns*, and are built of brick; the walls from four to five feet thick, when they are not supported by a bank or mound of earth. The inside is nearly square, being twelve feet by thirteen, and eleven or twelve feet high. In the front wall there are three arches, each about one foot ten inches wide, by three feet nine inches in height. When the kiln is to be filled, three arches are formed of the largest pieces of limestone, the whole breadth of the kiln, and opposite to the arches in the front wall. When these arches are formed, the lime-stone is thrown promiscuously into the kiln to the height of seven or eight feet, over which are frequently laid fifteen or twenty thousand bricks, which are burned at the same time with the lime-stone. When the filling of the kiln is completed, the three arches in the front wall are filled up with bricks almost to the top, room being left in each sufficient only for putting in the furze, which is done in small quantities, the object being to keep up a constant and regular flame. In the space of thirty-six or forty hours, the whole lime-stone, about one hundred and twenty, or one hundred and thirty quarters, together with the fifteen or twenty thousand bricks, are thoroughly calcined. Kilns constructed in this way may be seen near Wellingborough, in Northamptonshire, and other places in the northern parts of the kingdom. And in many of the northern counties of Scotland, which are situated at a great distance from coal, it is also a common practice to burn lime-stone with peat; and, considering the rude ill-constructed kilns which are used for the purpose, it is astonishing with what success the operations are performed. In some of these districts, it is stated that lime-stone is sufficiently calcined with peats, laid *stratum super stratum*, in kilns formed of turf; but, owing to the quantity of ashes which fall from the peat, the quality of the lime is considerably injured; and from the open and exposed situation of many of these kilns, the waste of fuel is immense. But the most common method of burning lime-stone with peat, is in kilns constructed somewhat similar to those in the districts where furze is used as the only fuel. There are in general only two arches, or fire-places, and the peats are thrown into the bottom of these arches, the fronts of which are seldom closed up, by which means the wind has

often great influence in retarding the operation, and frequently prevents the complete calcination of the lime-stone. An improvement might, it is supposed, be made on these kilns at a very trifling expence: if an iron grate were laid across the bottom of the arch, with a place below for the ashes to fall down, and the front of the arch closed up by a door made of cast-metal, one-third of the fuel might be saved, and the operation performed in a shorter time, and with a much greater certainty, than by the method now practised in such kilns.

In the Communications to the Board of Agriculture, Mr. Rawson asserts, that he has produced a considerable saving in the burning of lime, by constructing his kiln in the manner shewn at *fig. 2*. "It is made twenty feet in height; at the bottom a metal plate is placed one foot in height, intended to give air to the fire; over this plate the shovel that draws the lime runs. The sloped sides are six feet in height, the breadth at the top of the slope is eight feet, the sides are carried up perpendicular fourteen feet, so as that every part of the inside, for fourteen feet, to the mouth, is exactly of the same dimensions. On the mouth of the kiln a cap is placed, built of long stones, and expeditiously contracted, about seven or eight feet high. In the building of the cap, on one side of the slope, the mason is over the centre of the kiln, so that any thing dropping down will fall perpendicularly to the eye beneath. He is here to place an iron door of eighteen inches square, and the remainder of the building of the cap is to be carried up, until the hole at the top be contracted to fourteen inches. The kiln is to be fed through the iron door, and when filled, the door close shut. The outside wall must be three feet at the bottom to batter up to two feet at top, and made at such a distance from the inside wall of the kiln, that two feet of yellow clay may be well packed in between the walls, as every kiln built without this precaution will certainly split, and the strength of the fire be thereby exhausted. At eight feet high from the eye of the kiln, two flues should be carried through the front wall, through the packed clay, and to the opposite sides of the kiln, to give power to the fire." It is observed, that with this kiln, he has produced one-third more lime from a given quantity of fuel; and stones of bad quality will be here reduced into powder, and may be put into the kiln without the necessity of being broken so small as usual. As many situations will not admit of building a kiln twenty feet high, while other situations may allow of its being built thirty or even forty feet (for it cannot be made too high), the diameter of the kiln should be proportioned to the height to which it is carried up.

And it is further stated, as another application of this sort of contrivance, that "for several years he has made use of a small kiln in an outside kitchen, the height nine feet, the diameter three feet and a half. In the side of the kiln next the fire, he had three square boilers placed, one of them large, containing half a barrel, with a cock, which supplied the family with constant boiling water; for the two others, he had tin vessels made to fit the inside with close covers, in which meat and vegetables with water were placed and put into the two smaller boilers, which never had any water, but had close covers. The tin boilers were heated sooner than on the strongest fire, and when the meat, &c. were sufficiently dressed, the whole was taken out of the metal boilers. At one side he had an oven placed for roasting and boiling meat; the bottom was metal of twenty-six inches diameter, and one inch and a half thick, a flue from the fire went underneath. Even with the bottom of the oven, a grating nine inches square was placed, which opened a

communication between the oven and the hot fire of the kiln. The height of the oven was fourteen inches, shut close by a metal door of eighteen inches square, and the top, level with the mouth of the kiln, was covered by another metal plate of half an inch thick, on which was placed a second oven; the heat which escaped through the half-inch plate, though not near the fire, was sufficient to do all small puddings, pies, breakfast-cakes, &c. &c. The meat in the large oven was placed on an iron frame which turned on a pivot and stood on a dripping-pan, and was turned by the cook each half hour. And over the kiln he had a tiled stage for drying corn, and a chimney at one side, with a cawl on the top, which carried off all steam and sulphur: a large granary was attached to the building. It is added, that the lime, if sold, would more than pay for fuel and attendance; and he has frequently had dinner dressed for fifty men, without interfering with his family business in any great degree.

There is another form of lime-kiln, which answers extremely well for general use, represented at *fig. 3*, in the same plate. This is capable of being built without any very considerable expence.

It has been found, by experience, in some of the northern districts, that lime-kilns are rendered much less liable to crack and burst by having the outside walls carried up in a square manner, than on the usual circular plan.

**KILN, Malt,** a sort of kiln contrived for the purpose of drying malt or any kind of grain upon. In the construction of kilns of this sort many improvements have lately been made. A description of a kiln of this kind by Mr. Pepper, of Newcastle-under-Line, has been given, in which *fig. 4*, is the ground plan, supposed to be twenty feet square, but, if required larger or smaller, by following the same proportion, it may be made to any size or situation. The dark shaded walls rise four feet high, to put the reflector upon over the fire, and also what the side arches stand upon, the brick piers, that carry the spark-stone, and bearers that the tiles lie upon. Letter *a*, the fire-grate, which lies nine inches below the bottom edge of the reflector; *b*, bottom edge of the reflector; *c, c, c, c*, brick pillars nine inches square, that carry the spark-stone; *d, d, d, d, d, d*, brick pillars nine inches square, that carry the bearers for the floor tiles to lie upon; *e*, shews the bottom of the side arches on each side of the kiln; *f*, exhibits the space between the fire-place and the side arches, for the man to go round to clean the kiln; *g*, the wall on each side of the kiln, that the side arches stand upon. *Fig. 5*, is a section of it; *g*, shews the section of the wall which the side arches stand upon; *h*, the door to go to the fire-place; *i*, the reflector of cast iron that covers the fire; *k*, small door in the reflector to feed the fire; *l, l*, the ears of the reflector that the iron pipes are fitted upon, which convey the smoke, &c. from the reflector round the kiln, to the chimney; *m*, what is commonly called the spark-stone; it prevents the kiln from being too hot in the middle, and assists in spreading the heat to the outides; *n*, bearers of cast-iron or wood, that carry the kiln floor; *o, o*, shew the ends of the ribs that carry the tiles; *p*, the kiln tiles, that the malt lies upon; *q*, the steam-pipe that conveys the steam from the malt; *c, c*, brick pillars nine inches square, that carry the spark-stone; *d, d*, brick pillars nine inches square, that carry the bearers for the floor tiles to lie upon; *c, c*, shew the arches on each side the kiln; *u, u*, denotes the situation of the pipes under the floor. And *fig. 6*, is a plan of the kiln floor, and shews the ribs that the kiln-tiles lie upon; *o, o*, the cast iron or wood ribs that the tiles lie upon; *n, n*, the bearers that carry the ribs; *d, d*, the tops of the brick pillars

pillars that carry the bearers, &c.; *b*, the reflector that covers the fire, which is of cast iron, about an inch thick, hollow, and on a femicircular plan, as shewn in the figures; *r, r*, the iron pipes that convey the smoke and heat from the reflector, round the kiln, to the chimney, which lies about three feet under the kiln floor, and about the same distance from the side walls, which are supported by iron stays from the side arches; *f, f*, the ends of the iron pipes that go into the chimney; *t, t*, registers to regulate the draught and heat of the kiln; and *fig. 7.* is a section of the chimney.

It is noticed that in the plate the pillars, bearers, &c. that belong to the same thing, are marked with the same letters in all the different figures.

Another kiln of the same sort, invented by Mr. Joseph Coppinger, of Harbour View, near Cove, Ireland, is represented at *fig. 8.* This is stated to be particularly adapted to the use of farmers, who, in wet seasons, often lose quantities of grain for want of such convenience. The advantages it appears to possess above the kilns now in common use, are many; first, it may be erected for one-tenth of the expence, if the value of the separate buildings be taken in, which are now almost invariably allotted for this purpose; secondly, any kind of fuel may be used without prejudice to the malt or corn to be dried in it: thirdly, the heat (by the construction of the flues) will be more regularly and evenly distributed without any waste, as at present: fourthly, the health of the people attending, will not, as at present, be exposed to certain injury, by always breathing and sleeping in a heated and unwholesome atmosphere, as their beds will be placed in a shed on the outside of the building. This, in his mind, is the most important part of the plan, and highly worthy the attention of every humane and considerate employer in this way: fifthly, this construction of a kiln may be erected on a loft or ground floor. If in the latter situation, sufficient elevation should be given to the fire-place, so as not to impede the draught. These are the principal advantages that occur to the writer. If the experience of others confirm them, he will be highly gratified: *a*, the main walls; *b*, the flues; *c*, the chimnies; in each of which may be placed a metal damper to regulate the heat. It is recommended, in the case of a new building, to carry up the flues of the chimnies in the thickness of the walls. In a house already built, they may be carried up either inside or outside the building; *d*, the fire-place, which may be divided, or in one, just as desired, by which the half or the whole may be heated, as is most convenient.

It is stated that kiln tiles eighteen inches square, and two inches thick in the solid, with a lapping of half an inch broad and one inch deep round the edge of each tile, are proposed for covering the flues, which, if fairly cast, may be laid dry, without mortar. If it should be difficult, or too expensive, to procure tiles of eighteen inches, nine inches can be made to answer. The flues are proposed to be divided by a brick, on edge, so as that every eighteen-inch tile will cover two flues. The breadth of the flues may be six inches and a half, and ten inches high. This proportion, it is hoped, will be found to answer in most cases; but it may be varied according to the better judgment of the party erecting. The sides and bottoms of the flues should be plastered. The platform of this kiln should, in all cases, be well rammed with earth, and made perfectly level before laying out the flues. Iron grate-doors are intended to be hung on hinges, in a recess, at the mouth of each flue, to prevent them being choked with large pieces of cinder, or other substances. It is also intended that these doors should shut and open at pleasure, as may be found necessary in carrying on the business.

**KILN Tiles**, in *Rural Economy*, the name of that sort of tiles which are employed in malt and other similar sorts of kilns.

**KILNS for tin-ore.** The place where the tin-ore is roasted in order to burn away the mundic, and other sulphureous matters that are mixed with it, is called the *tin-kiln*. This is of a very plain structure; its hearth or floor is made of one large stone, and this is covered with another, supported at six inches height above it. The uppermost has a hole in the middle, through which the ore is poured on the under one; and when it is distributed over it in a bed of three or four inches thick, it is burnt by means of a fire of furze bushes kept underneath, and communicating with the space between the two stones by an aperture behind; the lower stone not reaching the wall by six inches.

When the sulphur is all burnt away by the fire, and the flame is no longer blue, the whole bed of roasted ore is thrust off the stone by the rake into the aperture behind, through which it falls into the open fire. The fire is kept up with new bushes, and there is a new bed of ore thrown in at the hole above. Thus the fire is kept up day and night, and supplies of fresh ore made through the hole by the black tin brought from the buddles of washing troughs. When the lower part of the furnace is filled up with the ore thrown into it, there is a hole behind the kiln, through which this ore, and the coals and ashes, are all raked out together, and left in the open air to cool; and the whole mass thus raked out, will sometimes be several days in cooling, the mixture of coals among it keeping it red-hot for a considerable time. When it is taken away from behind the furnace, it is washed again before it is put into the melting furnace. It is observed, that the different ores require for this last operation a different proportion, and different sort of fuel. The moor-tin, that is, such ore as is dug up in the moory countries, melts best with moor-charcoal charred; but that dug on the hills is found to run best with a mixture of charcoal and peat in equal quantities. The stones used for the kilns are always moor-stone. Phil. Trans. N<sup>o</sup> 60.

**KILN**, in *Ship Building*, a convenience for boiling or steaming planks to make them pliable. A boiler-kiln is either made of sheet-copper, bottom and sides rivetted together, or the bottom of sheet-copper and the sides of lead, rivetted and folded together. This is fixed in a body of brick-work, and under each end, or in the middle, are furnaces to cause the water to boil after the planks are in. The upper part, to preserve the steam and facilitate the boiling, is inclosed by shutters, opening by hinges and small tackles.

*Dimensions of a Copper Boiler.*

					feet.	in.
Long	-	-	-	-	40	0
Broad at the ends	-	-	-	-	4	3
	-	middle	-	-	6	0
Deep	-	-	-	-	2	10

And weighed 53cwt. 3lt. 14lb.

A steam-kiln is a trunk composed of deals grooved and tongued together edgeways, and is from three to four feet square, and from 40 to 60 feet long, and has a door at each end. It is confined together by bolts driven through the sides at certain distances, which answer the purpose of bearers, whereon the planks rest while steaming. It is supported, about four feet above the ground, upon a strong framing of wood. Underneath it, in the middle, is fixed, in brick-work, a large copper or iron boiler, or, which is better, one towards each end; the steam from the boilers, issuing into the trunk wherein it is confined, enters into the pores of the plank, and renders it very pliable.

**KILONDA**, in *Geography*, a town of Africa, in the kingdom of Benguela; 15 miles S. of Benguela.

**KILONGO**, a province of Loango, the foil of which is fertile. It was formerly an independent kingdom: the governor is absolute, and is elected by the people, without consulting the king of Loango. The chief article of trade is elephants' teeth. Kelingo, the capital, is situated on the coast; 30 miles N.W. of Loango. S. lat. 4° 25'.

**KILPATRICK**, *Old and New*, two parishes in the west of Scotland, and county of Dumbarton. Old Kilpatrick is situated on the banks of the river Clyde, about five miles east from Dumbarton, and within one mile of Bowling bay, where the great canal, or Forth and Clyde navigation, falls into the Clyde. It is one of the most pleasantly situated villages in Scotland, being directly opposite to the pleasure grounds of Erskine-house, the residence of lord Blantyre, the superior of the parish. The parochial stipend being paid in grain is considered to be one of the best in Scotland. The church is a very ancient building of the Gothic kind, and here are said to be deposited the remains of the tutelary saint of Ireland, from whence the village takes its name. There is an extensive manufactory of rolled and malleable iron conducted here, and there are two large cotton mills in the neighbourhood. The spinning of woollen by machinery was attempted, but did not succeed. Those engaged in the cotton manufacture are employed from Glasgow and Paisley. New Kilpatrick is about four miles distant from Old Kilpatrick. There is no manufacture of any importance about it, excepting some large flour mills upon the river Kelvin, which are the property of sir Ilay Campbell, of Garfeule, bart. lord president of the Court of Session.

**KILSYTH**, a town of Dumhartonshire, bordering on Stirlingshire, in Scotland, about thirteen miles north-east from Glasgow, upon the old or north road from Edinburgh to Glasgow, and near the banks of the great canal; or Forth and Clyde navigation. The country about Kilsyth is level to the south, east, and west, but very mountainous to the north. The valley is in general fine arable land, and the cultivation is now extremely good and most rapidly improving, for which there are the greatest facilities afforded by the inexhaustible supplies of coal and lime, which are found in every part of the neighbourhood. Kilsyth is of no importance as a commercial or manufacturing place, its chief manufacturing trade being confined to the labour of operative tradespeople in weaving, tambouring, and sewing muslins for the manufacturers of Glasgow. There are, however, some extensive printfields at no great distance. Kilsyth gave the title of an earl to an ancient and noble family of Scotland, but the title and estate were forfeited by the rebellion, in the year 1715. Cumbernauld-house, in the neighbourhood, is the residence of lord Elphinstone, the chief person of rank in this quarter, and lord lieutenant of the county. A very great proportion of the adjoining lands, formerly attached to the earldom, now belong to sir Charles Edmonstone, of Dunleath.

**KILTZESTI**, a town of Walachia, in the Tifmania; 12 miles S.S.W. of Tergofyl.

**KILWARA**, a town of Hindoostan, in the circar of Rantampour; 32 miles S. of Suifopour.

**KILWINNING**, a small town and parish in Ayrshire, upon the coast, about two or three miles from Irvine. It contains but little population, and is not remarkable for any particular art or manufacture. The lands around it are chiefly the property of the earl of Eglington, whose superb castle is in the immediate vicinity. Kilwinning is chiefly remarkable for the attention paid in it to the order of freemasonry, the lodge of Kilwinning claiming precedence, in point of

antiquity, to every other lodge in Scotland, which, in their turns, assert their antiquity to be greater than those of England; the Scottish mafons assuming the title of *ancient* as a mark of their priority, and refusing to acknowledge or receive those whom they denominate modern mafons until they have qualified themselves to be received, by undergoing certain ceremonies of initiation only known to the brethren. The claim of the Kilwinning mafons is so far admitted, that many of the lodges of Scotland receive charters of constitution from them in place of the grand lodge of Scotland. These lodges generally distinguish themselves by adding the word Kilwinning to the title which they have assumed. They are numerous through every part of the country, and the circumstance alluded to creates no kind of rivalry or dissention between them and those constituted by the authority of the grand lodge.

**KILY HARBOUR**, a bay on the W. coast of the island of Celeses. S. lat. 1° 33'. E. long. 119° 20'.

**KIMALISHA**, an island of Russian Lapland, lying between the mouths of the rivers Shuya and Soroka, off the coast of the White sea; where the granite veins of micaceous earth are richly mixed with a beautiful brown, frequently glandulous, with granites and green transparent shorl.

**KIMBOLTON**, a small market town in the hundred of Leightonstone and county of Huntingdon, England, is situated 10 miles from Huntingdon, and 63 from London. In the population return of 1800, the number of houses was stated to be 252; of inhabitants 1266. A weekly market is held on Fridays; and here are two annual fairs. The only object in the town of particular import is Kimbolton-castle, a feat of the duke of Manchester, which is of unknown, but very remote origin. Leland says, "the castle is double diked, and the building of it metely strong; it longed to the Mandevilles, erles of Essex. Sir Richard Wingfield built new, fair lodgyns and galleries upon the old foundation of the castle. There is a plotte now cleue desolated, not a mile by west from Kimbolton, called Castle-hill, where appear ditches and tokens of old buildings." This castle was the jointure, and became the retirement, of queen Catherine, after her divorce from Henry VIII. Henry, first earl of Manchester, expended large sums in making it a comfortable residence; and his grandson Robert, the third earl, made very considerable alterations and many additions. It is a quadrangular building; the inside is most superbly fitted up, and decorated with numerous paintings. Beauties of England, vol. viii.

**KIMBULA**, in *Zoology*, the name of a species of crocodile found in the island of Ceylon, and of a very beautiful variegation of colours, being mottled all over with extremely elegant black spots shining with the gloss of black velvet.

**KIMCHI**, **DAVID**, in *Biography*, a learned rabbi, who acquired high reputation as a scripture commentator, was a native of Spain, and flourished in the twelfth and thirteenth centuries. His father, Joseph, was a bitter enemy to Christians, and wrote some severe treatises against them, but the subject of the present article speaks of Christians with moderation, and he is highly celebrated for his philological labours, which reflect lustre on his name. His works are held in the highest estimation by the Jews, who maintain that there is no true science without Kimchi. Most of his commentaries have been incorporated in the great bibles of Venice and Basil; and Pfeiffer, in the "*Critica Sacra*," remarks, that his grammar is like the Trojan horse, from which crowds of Christian grammarians have issued forth, of whom those have shewn themselves most learned who

have been most perfectly acquainted with Kimchi. He took a decided part in the controversy concerning the writings of Maimonides, and so far moderated the temper of the contending parties, as to produce a revocation of the sentences of excommunication on both sides. It is not known at what particular period he died. His commentaries extend to the greater number of the books of the Old Testament, and from the bibles of Venice and Basil have been transplanted into the labours of Catholic and Protestant commentators, and have unquestionably afforded much valuable assistance in illustrating the true sense and meaning of the Hebrew text. Kimchi's philological works consist of a Hebrew Grammar, called "The Book of Perfection;" and of a Hebrew Dictionary, intitled "The Book of the Roots." They were first published at Constantinople, but have been several times reprinted. Buxtorf made these works the foundation of his "Thesaurus Linguae Hebraeae;" and his "Lexicon Linguae Hebraeae." Several of Kimchi's letters may be found in a volume of "The Letters of Maimonides," published at Venice in the year 1545.

KIMÉDY, in *Geography*, a town of Hindoostan, in the circar of Cicacole; 30 miles N.W. of Cicacole.

KIMI. See KEMI.

KIMITO, a town of Sweden, in the government of Abo; 23 miles S.E. of Abo.

KIMKIM, a town of Walachia; 55 miles N. of Bucharest.

KIMLASSA, a town of Hindoostan, in the country of Malwa; 35 miles S. of Chanderee. N. lat. 24° 15'. E. long. 78° 42'.

KIMMOO. See KEMMOO.

KIMMOUL, a town of Hindoostan, in Orissa; five miles N. of Sonepouur.

KIMNIK, a town of Walachia, on the Alaut; 44 miles E.S.E. of Tergovita.

KIMOS, a lake of Ruffia, in the government of Olonetz; eight miles N.W. from lake Nuk, which it communicates by a small river. N. lat. 64° 45'. E. long. 30° 14'.

KIMOSSES, or QUMOSSES, a name given in the language of Madagascar to a race of pigmies, or human beings of a diminutive size, who inhabit the interior parts of the island, and there form a considerable national body. M. de Commerçon, cited by M. Rochon in his "Voyage to Madagascar," gives the following account of them: "The natural and distinctive character of these little men is to be white, or, at least, of a paler complexion than all the different blacks ever known, to have very long arms, so that their hands reach below the knee, without bending the body; and that of the women, to have scarcely any breasts, except when they nurse their infant offspring; so that many of them are obliged to have recourse to cow's milk, for feeding their new-born infants. As to intellectual faculties, the Kimosses surpass all the rest of the Malegashes, who are known to be very ingenious and adroit, though abandoned to the greatest indolence; but the Kimosses are more active, and also more warlike; so that their courage being, as it were, double in proportion to their size, their neighbours have not been able to oppress them, they have attacked them by a superiority of number amounting to 10 to 1. Attacked as they have been by unequal weapons, (so that they do not use gunpowder and muskets, like their enemies,) they have always fought courageously, and supported their independence among their rocks, which being difficult of access, have, without doubt, contributed to their preservation. There they live upon rice, different fruits, vegetables, and roots, and rear great number of cattle, (bullocks with lunches on

their backs, and sheep with long, broad, fat tails,) which serve them as part of their food. They have no intercourse with the different tribes of Malegashes, who surround them, neither by trade, nor by any other method, because they derive all they want from the territory they inhabit. As all the little skirmishes or wars which take place between them and the other inhabitants of the island, have no other object than to carry off some cattle or slaves, the diminutive size of the Kimosses exempts them from the latter injury. In order to compromise the former, they contrive, when from the summits of their mountains they perceive preparations for war in the plain, to take all the superfluous cattle they can spare, and tie them to the openings of the defiles which must be passed by the enemy in penetrating into their mountains, of which, they say, they make a voluntary sacrifice to the indigence of their elder brethren; but they protest, at the same time, to fight to the last drop of blood, if they should penetrate further into their territories by force of arms. Their arms are the lance and the arrow, which they dart in the most masterly manner. At three days march from fort Dauphin, the natives shew, with great complaisance, little elevations of ground resembling graves, which owe their origin, as they affirm, to a great massacre of the Kimosses, who were defeated in the open field by their ancestors." M. de Commerçon says further, that he is able to certify, as an ocular witness, that in the voyage which he made to fort Dauphin, about the latter end of the year 1770, count de Modeve, the late governor, who communicated to him part of the preceding observations, gave him the satisfaction of shewing to him, among his slaves, a Kimoss woman, about 30 years of age, three feet seven inches high, whose complexion was one of the clearest and brightest he ever saw among the natives of the island. He remarked, that notwithstanding her low size, she was very strong-limbed, not resembling a slender diminutive person, but rather a woman of common proportion, her defect of height excepted; her arms were long, and reached, without flooping, the kneecap; her hair was short and woolly; her physiognomy tolerably good, and more like that of the Europeans than of the people of Madagascar. She seemed constantly to smile, her temper was sweet and complaisant, and she seemed, from the tenor of her conduct, to be possessed of much good sense. Her breasts were flat; but this circumstance of itself is far from being sufficient to establish an exception from the general law of nature. The desire of recovering her liberty, as much as the fear of instant embarkation, made the little slave escape by running away into the woods. This shortness of size, as Commerçon farther observes, compared with that of the Laplander, is almost graduated in both; the Laplander and the Kimoss inhabiting the most frigid zones, and the most elevated mountains on the globe. Those which form the retreat of the Kimosses at Madagascar, are from 16 to 18 hundred fathoms above the level of the sea. The productions of the vegetable kingdom, which naturally grow on these high mountains, seem to be abortive: e.g. the pine, the birch, and many other trees, appear like creeping bushes or shrubs. M. de Modeve also gives an account of this race of beings, who inhabit the centre of the island, in the 22d degree of latitude. The middling size of the men, he says, is three feet five inches, and they have a long round beard; the size of the women is somewhat shorter than that of the men. The Kimosses are thick and strong-limbed; the colour of their skin is less tawny than that of the other natives, and their hair short and woolly. They forge iron and steel, of which they make lances and arrows; which are the only arms they use. In other particulars he confirms the account already given of their mode of self-defence.

From

From other reports, he informs us, that the valley of the Kinoffes is rich in cattle and other provisions. Their dwarfs are laborious, and very good husbandmen. Their chief has an authority more absolute and more respected than that of the other chiefs of the different districts of Madagascar. The extent of the valley which they inhabit he was not able to ascertain; but he knew, that it was surrounded by very high mountains, and that its situation is 60 leagues N. W. from fort Dauphin, and westward it is bounded by the country of Mantanaa. Their villages are erected on little eminences, whose steep sides are the more inaccessible, since they have multiplied the obstacles which forbid approach to them.

**KIMOZERSKAIA**, a town of Russia, in the government of Olonetz, on the lake Kimos; 88 miles N. of Kemi.

**KIMPINA**, a town of Walachia; 36 miles S. of Cronstadt.

**KIMPOLUNG**, a town of European Turkey, in Moldavia; 116 miles W.N.W. of Jaffy. N. lat.  $47^{\circ} 42'$ . E. long.  $25^{\circ} 8'$ .

**KIMPOUR**, a town of Bengal; 27 miles E.N.E. of Purneah.

**KIMSLA**, a town of Sweden, in East Gothland; seven miles S.S.W. of Nordkioping.

**KIM-TCHA**, a town of Thibet; 15 miles W.N.W. of Tchaifiroong.

**KIM-TCHEOU**, a town of Chinese Tartary. N. lat.  $44^{\circ} 3'$ . E. long.  $126^{\circ} 26'$ .

**KIN**, a town of Persia, in the province of Segestan, situated at the foot of a chain of mountains near the lake Zurrah; the air is pure, and the soil of the environs fertile, especially in fruit; 127 miles W. of Candahar.—Also, a town of Arabia, in the province of Nedsjed; 153 miles N.E. of Hajar.

**KIN-bote**, compensation for the slaughter of a kinsman. See BOTE.

**KINAKINA AROMATICA**, in the *Materia Medica*, a name by which some authors have called the *cortex culebræ*.

**KINASKA**, in *Geography*, a town of Russia, in the government of Irkutsk; 28 miles W. of Nertchinsk.

**KINASSO**, a town of Africa, in Congo; 30 miles S.E. of Pango.

**KINATJURA**, a town of Japan, in the island of Nippon; 94 miles S.W. of Meaco.

**KINBURN**, a fortress of Russia, in the government of Ekaterinofslaf, on a bay of the Black sea, at the mouth of the Dnieper. It stands close to the frontiers, opposite the Turkish fortrefs Otchakov, which being a place of superior strength, must, while it continues in the hands of the Turks, obstruct, in case of a rupture, the navigation of the Dnieper. Kinburn was intended for the principal corporation of the merchandise sent from the provinces bordering on the Dnieper; but as the harbour, on account of its quick-sand, affords no security for anchorage, the town of Kherfon or Cherfon is at present the great emporium for trade; 16 miles S.E. of Otchakov. N. lat.  $46^{\circ} 35'$ . E. long.  $31^{\circ} 36'$ .

**KINCARDINE**, a town of Perthshire, Scotland, is seated on the banks of the river Forth, in a small tract of the county, which is nearly surrounded by Clackmannanshire. It was formerly called West-Pans, from the number of salt-pans used here. In 1780, there were 15, but at present these are reduced to two or three. The houses are mostly well built, and the streets assume a regular appearance. Here are two weekly markets, and several annual fairs. A valuable salmon-fishery is established on the Forth, at this place; and here is a commodious harbour: nearly opposite the town is an excellent roadstead, where 100

vessels, or more, may be anchored in safety. Ship building is carried on to a considerable extent, and vessels from 200 to 300 tons burden are often built here. In the year 1792, there were 75 vessels belonging to this port, to which were annexed 300 failors. In 1793, the town contained about 900 inhabitants.

**KINCARDINESHIRE**, or the county of Mearns, a district of Scotland, is surrounded by the counties of Aberdeen, Angus, and the British ocean. The area thus enclosed is nearly of a triangular form, and extends along the coast from the bay of Aberdeen, to the North-Elk river, an extent of about thirty miles; and from Dunnottar castle, to mount Batack, nearly 20 miles. The superficial contents of lands, are 191,575 Scottish, or 243,444 English miles. The sea-coast is partly flat, and partly rocky; at the north-eastern corner of the county, terminates the chain of Grampian hills. Here they run into the sea, and form what is called the Girdle-Neck, which present to the sea a bold face of rock, from 60 to 80 feet high. The northern part of this county consists of a mountainous territory formed by the tract of the Grampians, on the south of which is a low district, provincially termed the How or Hollow of the Mearns. On the southern side of the county, the surface is much diversified with hill and dale, particularly on the banks of the North-Elk, which separates this county from that of Angus, on the south. Here the continuation of the Sidlaw hills runs under different names, from the banks of the North-Elk, to the neighbourhood of Stonehaven, and bounds Strathmore on the south, or south-east. The line or valley of Strathmore, was the tract formerly pursued by all the invaders of Scotland, who, on account of the mountainous ridge between the two kingdoms, must either have entered by Berwick on the east, or by Dumfries on the west, where the mountains terminate before reaching the sea.

Among the Grampians, some are of very considerable height. That of the greatest altitude is mount Batack, in the parish of Strachan, which is said to be 1150 yards above the level of the sea. Kerlock, in the same parish, is 1890 feet high, and Kloachnabane 2370 feet. To the northward of the Grampians, only a small stripe, or spots and glens, of no great extent of cultivated land, are to be found in this county. The Grampian hills are either covered with heath or moss, and afford but very little pasturage. In the glacia and vallies, and on the sides and towards the bottoms of the hills, where cultivation has taken place, the soil is either light or gravelly, and full of small stones; but on the banks of the brooks and streams, loam commonly prevails. In the level part of the county, the soil is generally clay. That stripe of fine fertile land, lying along the sea-coast from North-Elk river, to Stonehaven, is chiefly a deep strong loam on a clay bottom, but in some places oblique clays occur. The soil in the valley of Strathmore is similar to that along the coast: but in practice it is found, that the clays in Strathmore do not carry beans, even after being properly limed; although the lands along the coast, when manured with lime, sea-weeds, or dung from the fishing towns, produce abundant crops; the reason of which seems to be, that in the interior part of the county the land is of a lighter nature, lying upon a cold clay. The coast land is a rich loam, fit for wheat and beans.

The mineralogy of this county is of no great importance. In many places, however, there are lime quarries; and as the stone is of the best quality, abundance of fuel only is wanting to render them of great value. They are wrought in the parishes of Ecclefraig, Laurencekirk, and others. In the parish of Arbuthnot, and on the sea-shore near St. Cyrus, beautiful pebbles and fine jaspers are found. A

great part of the coast, which is bold and dangerous, consists of rocks of that singular character called *Brecia*, or "plumb-pudding stone," having the appearance of loofe stones bound together by an artificial cement. In the north-easterly part of the county, near Aberdeen, granite quarries are wrought for exportation.

In this county is only one royal borough, Inverberrie, or Bervie; but there are several populous villages, of which Stonehaven, Johnhaven, and Laurencekirk, are the chief.

The principal rivers connected with this county, are those of the North-Esk on the west and south, and the Dee on the north. The other streams, which are but of little note, are called the Dye, the Cowie, the Carron, the Bervie, and the Luther.

The most remarkable remnant of antiquity in Kincardineshire, is Dunnotar castle. It stands on the eastern coast, on a rock projecting into the sea, accessible from the land on the west side, and that only by a narrow, steep, and winding path, over a deep gully, by which it is connected with the main land, and which serves as a kind of natural fosse or ditch, the adjacent rock having been scarped and rendered inaccessible by art. Here are various buildings and conveniences necessary for a garrison; such as chapel, barracks, a basin or cistern of water twenty feet in diameter, a bowling-green, and a forge, said to have been used for casting iron-bullets. On this rock, notwithstanding its difficulty of access, the church and burial-place of the parish were originally situated; the building now called the chapel being formerly the parish-church. In this castle, the regalia of Scotland, (the crown, sceptre, and sword,) were deposited in the year 1651, to preserve them from the English army, which overran this country during the civil wars of that period.

In the parish of Eccleferaig, are the ruins of a fortress, formerly a place of great strength, being erected on a perpendicular and peninsulated rock sixty feet above the sea. In the parish of Fettercairn is a ruined building, called Fenella's castle, said to be the place where Kenneth III. was assassinated. In Fordun parish a house still remains, called St. Palladius's chapel, where the image of the saint was kept, and to which pilgrimages were performed from the most distant parts of Scotland. In the parish of Arbuthnot, was born the celebrated Dr. Arbuthnot, physician to queen Anne. He formed a distinguished literary triumvirate with Mr. Pope and Dr. Swift.

In the population return to parliament in the year 1801, Kincardineshire was stated to contain 5990 houses, and 26,349 inhabitants.

**KINCHA**, a river of Asia, which rises in Thibet, passes through the Chinese province of Se-tchuen, and enters the province of Hou-quang, where it changes its name to Yang-tse, after which it crosses the province of Kiang-nan, and runs into the sea, N. lat.  $31^{\circ} 55'$ . E. long.  $112^{\circ} 44'$ .

**KINDELBRUCKEN**, a town of Saxony, in Thuringia, on the Wipper; 21 miles N.E. of Erfurt. N. lat.  $51^{\circ} 16'$ . E. long.  $11^{\circ} 10'$ .

**KINDERHOOK**, a post-town of America, in Columbia county, New York, on the E. side of Hudson's river, containing 50 dwelling-houses and a Dutch church; 13 miles N. of Hudson's city. The township contains 4248 inhabitants, of whom 483 are slaves. N. lat.  $42^{\circ} 25'$ . W. long.  $73^{\circ} 34'$ .

**KINDRED**, in *Law*, are a certain body of persons of kin, or related to each other. See ADMINISTRATION, AENATI, COGNATI, CONSANGUINITY, and DEGREES.

**KINE**, in *Zoology*. See BULL and COW.

**KINESCHMA**, in *Geography*, a town of Russia, in the government of Koltrom, on the Volga; 40 miles S.E. of Koltrom.

**KINETON**, or **KINGTON**, a market town and parish in a hundred of the same name, and county of Warwick, England, was formerly possessed by the kings of England, and it is said that Edward the Confessor, and William the Conqueror, held this town and manor. King John kept his court here, at a castle N.E. of the town. In the fourth year of king Henry III. Stephen de Legrave, obtained the king's charter for holding a weekly "Mercate," or market here on Tuesdays; and afterwards the same king granted an annual fair for two days. A church was built here about the beginning of Edward II.'s reign. In the year 1800, the town contained 165 houses, and 779 inhabitants. In the vicinity of Kineton, to the S.E. is Edge hill, where a signal battle was fought in the year 1642, between the armies of Charles I. and those of the parliament. Jago has commemorated the place, and the event, in an interesting poem, entitled, "Edge-hill." Dugdale's "Antiquities of Warwickshire illustrated," fol. 1656.

**KING**, a monarch, or potentate, who rules singly and sovereignly over a people,

Camden derives the word from the Saxon *cuning*, which signifies the fame; and that from *can*, *power*, or *ken*, *knowledge*, with which every monarch is supposed to be invested. The Latin *rex*, the Scythian *rex*, the Punic *resch*, the Spanish *rey*, the French *roy*, come all, according to Postel, from the Hebrew **מֶלֶךְ**, *resch*, *chief*, *head*.

Kings, both among the ancient Greeks and Romans, were priests as well as princes. Virgil, speaking of Anius, king of Delos, says,

"Rex Anius, rex idem hominum, Phæbique sacerdos."

As to the Romans, Livy and Dionysius are express; they say, that though Numa instituted a great number of orders of priesthood, yet some he discharged himself, and in person. After the expulsion of the kings, they were obliged to create a *rex sacrorum*, a king of the sacrifices, for the administration of the priestly part of the royalty.

Lawyers say, the king of England is a mixed person, a priest as well as a prince: at his coronation he is anointed with oil, as the priests and kings of Israel were, to intimate, that his person is sacred.

Among the Greeks, the king of Persia had anciently the appellation of the *great king*; the king of France lately had that of the *most Christian king*, and the king of Spain has that of *Catholic king*. See CATHOLIC.

The king of the Romans is a title formerly belonging to the emperor of Germany; but lately conferred on the infant son of Bonaparte.

The kings of England, by the Lateran council, under pope Julius II. had the title of *Christianissimus* conferred on them; and that of *defender of the faith* was added by pope Leo X. though it had been used by them some time before.

The title of *grace* was first given to our kings about the time of Henry IV. and that of *majesty* first to Henry VIII. before which time our kings were called grace, bigness, &c.

In all public instruments and letters, the king styles himself *nos, we*; though till the time of king John, he spoke in the singular number.

The Hungarians formerly gave the name king to their queen Mary, to avoid the infamy which the laws of that country cast upon those who are governed by women: accordingly she bore the title of king Mary, till her marriage

riage with Sigismund, at which time she took the title of queen.

By our laws the supreme executive power of these kingdoms is vested in a single person, the king or queen: for it matters not to which sex the crown descends: but the person entitled to it, whether male or female, is immediately invested with all the ensigns, rights, and prerogatives of sovereign power, as is declared by statute 1 Mar. tit. 3. c. 1. (See QUEEN.) As the executive power of the English nation is vested in a single person, by the general consent of the people, manifested by long and immemorial usage, it is become necessary to the freedom and peace of the state, that a rule, uniform, universal, and permanent, should be laid down, in order to make out, with precision, who is that single person, to whom are committed (in subservience to the law of the land) the care and protection of the community; and to whom, in return, the duty and allegiance of every individual are due. Accordingly our constitution has not left the decision of this important question dark or doubtful. It has marked out the right of succession in characters sufficiently obvious. See the article *Right of Crown*.

The king's title having been ascertained, the next point of principal importance is the assistance which the law has provided for him in the discharge of his duties, the maintenance of his dignity, and the exercise of his prerogative. For this purpose a diversity of councils has been established: for such are the high court of parliament, the peers of the realm, the judges of the courts of law, and more especially the privy council, generally called, by way of eminence, "the council." (See PARLIAMENT, PEERS, JUDGES, and PRIVY COUNCIL.) The next object of consideration will be the duties incumbent on the king by our constitution; with a view to which his dignity and prerogative are established by the laws of the land: it being a maxim in the law, that protection and subjection are reciprocal. (7 Rep. 5.) These reciprocal duties are, according to the statement of judge Blackstone, what were meant by the convention in 1688, when they declared that king James had broken the original contract between king and people. (See *Original Contract*.) The principal duty of the king is to govern his people according to law. "Nec regibus infinita aut libera potestas," was the constitution of our German ancestors on the continent. (Tac. de Mor. Germ. c. 7.) And this is not only consonant to the principles of nature, of liberty, of reason, and of society, but has always been esteemed an express part of the common law of England, even when prerogative was at the highest. "The king," says Bracton, (1. 1. c. 8.) who wrote under Henry III. "ought not to be subject to man, but to God, and to the law; for the law maketh the king. Let the king, therefore, render to the law what the law has invested in him with regard to others; dominion and power; for he is not truly king, where will and pleasure rule, and not the law." And again, (1. 2. c. 16. § 3.) "the king also hath a superior, namely, God, and also the law by which he was made a king." Fortescue, also having well distinguished between a monarchy absolutely and despotically regal, introduced by conquest and violence, and a political or civil monarchy, which arises from mutual consent, such as he supposes the government of England to be, lays it down as a principle, that "the king of England must rule his people according to the decrees of the laws thereof; inasmuch that he is bound by an oath at his coronation to the observance and keeping of his own laws." Moreover, it is expressly declared by statute 12 and 13 W. III. c. 2. "that the laws of England are the birth-right of the people thereof; and all the kings and queens who shall ascend the throne of this realm ought to admini-

ster the government of the same according to the said laws; and all their officers and ministers ought to serve them respectively according to the same; and therefore all the laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are ratified and confirmed accordingly." The terms of the original contract between king and people, the learned judge apprehends to be now couched in the *Coronation OATH*; which see.

In order to enable the king to maintain the executive power in due independence and vigour, and to discharge with honour to himself, and benefit to his subjects, the duties of his high station, the constitution and laws have invested him with a variety of prerogatives, some of which are *direct* and others *incidental*. (See PREROGATIVE.) The former, or direct and substantive prerogatives may be distributed into three kinds; such as regard, first, the king's royal character; secondly, his royal authority; and lastly, his royal income. These are necessary to secure reverence to his person, obedience to his commands, and an affluent supply for the ordinary expences of government. We shall refer to the article *Revenue*, what relates to the royal income; and here content ourselves with enumerating some particulars that pertain to the king's political character and authority; or, in other words, his dignity and regal power; to which last the term prerogative is frequently restricted. In order to exhibit and support the royal dignity, the law ascribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewise certain attributes of a high and transcendent nature; by which the people are led to consider him in the light of a superior being, and to pay him that awful respect, which may enable him with greater ease to carry on the business of government. *First* of all, the law ascribes to the king the attribute of *sovereignty*, or pre-eminence. "Rex est vicarius," says Bracton, "et minister Dei in terra. Omnis quidem sub eo est, ipse sub nullo nisi tantum sub Deo." He is said to have *imperial dignity*; and in charters before the conquest, is frequently styled *basileus* and *imperator*, the titles respectively assumed by the emperors of the East and West. His realm is declared to be an *empire*, and his crown *imperial*, by many acts of parliament, particularly the statutes 24 Hen. VIII. cap. 12. and 25 Hen. VIII. cap. 28, which at the same time declare the king to be the supreme head of the realm in matters both civil and ecclesiastical, and consequently inferior to no man upon earth, dependent on no man, and accountable to no man. (See also 24 Geo. II. cap. 24. 5 Geo. III. cap. 27.) Hence it is that no suit or action can be brought against the king, even in civil matters; because no court can have jurisdiction over him. Hence it is likewise, that by law the person of the king is sacred, even though the measures pursued in his reign be completely tyrannical and arbitrary; for no jurisdiction on earth has power to try him in a criminal way; much less to condemn him to punishment. If any foreign jurisdiction had this power, as was formerly claimed by the pope, the independence of the kingdom would cease; and if such a power were vested in any domestic tribunal, there would soon be an end of the constitution, by destroying the free agency of one of the constituent parts of the sovereign legislative power. It may be asked, however, are the subjects of England totally delitute of remedy, in case the crown should invade their rights, either by private injuries, or public oppression? To this, says judge Blackstone, we may answer, that the law has provided a remedy in both cases. As to private injuries; if any person has, in

point of property, a just demand upon the king, he must petition him in his court of chancery, where his chancellor will administer right as a matter of grace, though not upon compulsion. (Finch. L. 255.) And this is entirely consonant to what is laid down by the writers on natural law. See Puffendorff's Law of Nature, b. 8. c. 10. Locke on Gov. p. 2. § 205.

As to cases of ordinary public oppression, where the vitals of the constitution are not attacked, the law hath also assigned a remedy. For as a king cannot misuse his power, without the advice of evil counsellors, and the assistance of wicked ministers, these men may be examined and punished. The constitution has therefore provided, by means of indictments, and parliamentary impeachments, that no man shall dare to assault the crown in contradiction to the laws of the land. As to such public oppressions as tend to dissolve the constitution, and subvert the fundamentals of government, these are cases, which the law will not, out of decency, suppose; being incapable of distrusting those, whom it has invested with any part of the supreme power; since such distrust would render the exercise of that power precarious and impracticable. The supposition of law, says judge Blackstone, is, that neither the king nor either house of parliament (collectively taken) is capable of doing any wrong; since in such cases the law feels itself incapable of furnishing any adequate remedy. For which reason all oppressions, which may happen to spring from any branch of the sovereign power, must necessarily be out of the reach of any *statute rule*, or *express legal provision*; but, if ever they unfortunately happen, the prudence of the times must provide new remedies upon new emergencies. It is found, indeed, by experience, that whenever the unconstitutional oppressions, even of the sovereign power, advance with gigantic strides and threaten dissolution to a state, mankind will not be reasoned out of the feelings of humanity; nor will sacrifice their liberty by a servile adherence to those political maxims, which were originally established to preserve it. And therefore, though the positive laws are silent, experience will furnish us with a very remarkable case in which nature and reason prevailed. When king James II. invaded the fundamental constitution of the realm, the convention declared an abdication, by which the throne was rendered vacant, which induced a new settlement of the crown. After all, it must be left to future generations, whenever necessity and the safety of the whole shall require it, to exert those inherent (though latent) powers of society, which no climate, no time, no constitution, no contract, can ever destroy or diminish.

II. Besides the attribute of sovereignty, the law also ascribes to the king, in his political capacity, absolute *perfection*. The king can do no wrong; by which ancient and fundamental maxim we are not to understand, that every transaction of government is of course just and lawful, but that whatever is exceptionable in the conduct of public affairs is not to be imputed to the king, nor is he answerable for it personally to his people; and farther, that the prerogative of the crown extends not to do any injury; it is created for the benefit of the people, and therefore cannot be exerted to their prejudice. (Plowd. 487.) In the king there is no folly or weakness; no injustice or error; and, therefore, if the crown should be induced to make an improper grant of any franchise or privilege, the law declares that the king was deceived in his grant, and thereupon such grant is rendered void, merely upon the foundation of fraud and deception, either by or upon those agents whom the crown had employed. Yet, notwithstanding this personal perfection which the law ascribes to the sovereign,

the constitution has allowed a latitude of supposing the contrary, in respect to both houses of parliament; each of which, in its turn, hath exerted the right of remonstrating and complaining to the king even of those acts of royalty, which are most properly his own; such as messages signed by himself, and speeches delivered from the throne; nevertheless, for the sake of freedom of debate, these acts of state are usually supposed to proceed from the advice of the administration. In the king likewise there can be no negligence or *laches*, and, therefore, no delay will bar his right: *nullum tempus occurrit regi*. (Finch. L. 89. Co. Litt. 90.) In the king also there can be no insanity, stain, or corruption of blood. By his crown he is, *ipso facto*, cleared of all attainder; no non-age or minority is allowed in him; and his very grants of lands, though held in his natural capacity, cannot be avoided by non-age.

III. Nay more, the law ascribes a kind of *perpetuity*, or *immortality* to him. *Res Anglie non moritur*. Henry, Edward, or George, may die; but the king survives them all. His death is termed his *demise*, because the crown is thereby demised to another. He is said not to be liable to death, being a corporation of himself, that lives for ever. There is no interregnum, but the moment one king dies, his heir is king, fully and absolutely without any coronation, ceremony, &c.

IV. To these it may be added, that the law attributes a kind of *ubiquity* to the king; he is in a manner every where, in all courts of judicature, which he alone has the right of erecting, and therefore cannot be non-suited. In the exertion of lawful prerogative, says judge Blackstone, the king is and ought to be absolute; that is, so far absolute, that there is no legal authority that can either delay or resist him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences he pleases; unless where the constitution hath expressly, or by evident consequence, laid down some exception or boundary; declaring that thus far the prerogative shall go and no farther.

Some things there are which the king cannot do; *viz.* he cannot divest himself, or successors, of any part of his regal prerogative, authority, &c. There are several things also which he cannot do *salvo jure, salvo juramento, & salva conscientia sua*: in particular, there are two things which he cannot do without the consent of parliament; *viz.* make new laws, or raise new taxes.

In the exertion of those prerogatives, which the law has given him, the king is irrevocable, and absolute, according to the forms of the constitution, and yet, if the consequence of that exertion be manifestly to the grievance or dishonour of the kingdom, the parliament will call his advisers to a just and severe account. For prerogative confisting, as Mr. Locke has well defined it, (On Govern. 2. § 166.) in the discretionary power of acting for the public good, where the positive laws are silent, if that discretionary power be abused to the public detriment, such prerogative is exerted in an unconstitutional manner. Thus the king may make a treaty with a foreign state, which shall irrevocably bind the nation; and yet when such treaties have been judged pernicious, impeachments have pursued those ministers, by whose agency or advice they were concluded.

The king, with regard to foreign concerns, is the delegate or representative of his people; and as such, he has the sole power of sending ambassadors to foreign states, and receiving ambassadors at home. See EMBASSADOR.

The king has power, by his prerogative, without any act of parliament, to make war or peace, to conclude leagues, treaties, and alliances with foreign states, and to grant safe-conducts.

conducts. The king is considered as the generalissimo, or the first in military command, within the kingdom: and in this capacity he has the sole power to give commissions for raising and regulating fleets and armies, as well as for erecting, manning, and governing forts, and other places of strength, to appoint ports and havens, to erect beacons, light-houses, and sea-marks, to prohibit the exportation of arms or ammunition out of the kingdom, dispose of magazines, marts, ships, public moneys, &c. He convokes, adjourns, prorogues, and dissolves parliaments; and may refuse his assent to any bill passed by both houses, without giving his reasons for it.

In domestic affairs the king is considered as the fountain of justice and general conservator of the peace of the kingdom. However, by the fountain of justice the law does not mean the *author* or *original*, but only the *distributor*. Justice is not derived from the king, as from his *free gift*; but he is the steward of the public, to dispense it to whom it is *due*. (Bract. l. 3. tr. 1. c. 9.) In this capacity the king alone has the right of erecting courts of judicature; and all jurisdictions of courts are either mediately or immediately derived from the crown; their proceedings run generally in the king's name; they pass under his seal, and are executed by his officers. In early times, our kings, probably in person, often heard and determined causes between party and party. But by the uniform usage of many ages, they have delegated their whole judicial power to the judges of their several courts, which are the grand depositaries of the fundamental laws of the kingdom, and have gained a known and stated jurisdiction, regulated by certain and established rules, which the crown itself cannot now alter but by act of parliament. (2 Hawk. P. C. 2.) In criminal proceedings it would be in the highest degree absurd, if the king personally sat in judgment; because in regard to these he appears in another capacity, that of "prosecutor." But though the king is not personally present in his courts of law; yet he is understood to be virtually present; his judges are the mirror by which the king's image is reflected; so that it is the regal office, and not the royal person, that is always present in court, always ready to undertake prosecutions, or pronounce judgment, for the benefit and protection of the subject. See COURT and JUDGE.

As the king is the fountain of justice, the prerogative of issuing proclamations is vested in him alone. (See PROCLAMATION.) The king is likewise the fountain of honour, of office, and of privilege. Accordingly he is entrusted with the sole power of conferring dignities and honours, so that all degrees of nobility, knighthood, and other titles, are received by immediate grant from the crown; either expressed in writing, by writs or letters patent, as in the creation of peers and baronets; or by corporeal investiture, as in the creation of a simple knight. And as the king may create new titles, so he may create new offices, but with this restriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the subject, which cannot be imposed but by act of parliament. (2 Inst. 533.) The king has also the prerogative of conferring privileges upon private persons; such as granting place or precedence to any of his subjects (4 Inst. 361.); such is also the power to enfranchise an alien, and make him a denizen. Such is likewise the prerogative of erecting *corporations*; which see.

The king is also the arbiter of commerce. Under this branch of the prerogative he has power to establish public marts, or places of buying and selling; such as markets and fairs, with the tolls belonging to them; and likewise to regulate weights and measures; to give money, which is the

medium of commerce, authority, or to make it current; and the coining of money is the act of the sovereign power, and the settling of the denomination or value for which the coin is to pass current. The king may also at any time decay or cry down any coin of the kingdom, and make it no longer current. Among the incidental prerogatives belonging to the king, and which are exceptions, in favour of the crown, to those general rules that are established for the rest of the community, we may mention the following. Debts due to him are always to be satisfied in the first place, in case of executorialship, &c., and till his debt is discharged, he may protect the creditor from the arrears of others. He may diltrain for the whole debt on a tenant that holds but part of the land; is not obliged to demand his rent as others are; may sue in what court he pleases, and diltrain where he lists. In all doubtful cases, *semper presumetur pro rege*: no statute restrains him, unless he be particularly named. In all cases where the king is plaintiff, his officers may enter with an arrest; and, if entrance be denied, break open a house, and seize the party; though in other cases a man's house is his castle, and has a privilege to protect him against all arrests. Moreover no coils shall be recovered against the king; and the king can remove a joint-tenant.

He has also custody of the persons and estates of idiots and lunatics; he is *ultimus haeres regni*, and to him revert all estates, when no heir appears. All treasure-trove (*i. e.* money, plate, or bullion, found, and the owners not known) belongs to him; so all waifs, estrays, wrecks, lands recovered from the sea, gold and silver mines, royal fishes, &c. belong to him. See REVENUE.

The king is considered by the laws of England as the head and supreme governor of the national church. (26 Hen. VIII. cap. 1. 1 Eliz. cap. 1.) In virtue of this authority, he convenes, prorogues, restrains, regulates, and dissolves, all ecclesiastical synods or convocations. See CONVOCATION.

He has the supreme right of patronage, called *patronage paramount*, over all the ecclesiastical benefices in England.

From this prerogative of being the head of the church arises the king's right of nomination to vacant bishoprics, and certain other ecclesiastical preferments. As head of the church, the king is likewise the "dernier resort" in all ecclesiastical causes; an appeal lying ultimately to him in chancery from the sentence of every ecclesiastical judge; which right was restored to the crown by statute 25 Henry VIII. c. 19. The king can unite, separate, enlarge, or contract the limits of bishoprics, or ecclesiastical benefices, and by his letters erect new bishoprics, colleges, &c. See REGALIA.

He can dispense with the rigour of the ecclesiastical laws, except those which have been confirmed by act of parliament, or declared by the bill of rights; as, for a ballard to be a priest, for a bishop to hold a benefice in commendam, &c. He has also power to dispense with several acts of parliament and penal statutes, by a non-obstante, where himself alone is concerned; to moderate the rigour of the law, according to equity; to pardon a man condemned by law; except in appeals of murder, and in case of impeachments by the house of commons; and to interpret by his judges, in statutes and cases not defined by law.

**KING of the Quails.** See RALLUS *crex*.

**KING of the Sacrifices, rex sacrificulus, or sacrorum**, was a title of an ancient priest, or minister of religion, at Rome; who was superior to the *flamen dialis*; but inferior to the *pontifex maximus*.

He was created at the *comitia centuriata*, or assembly of the centuries, and was at first chosen out of the number of the patricians. He could not, during his office, hold any magistracy, nor harangue the people. He presided at all the sacrifices, proclaimed the feasts, &c.

His wife bore the title of *queen of the sacrifices, regina sacrorum*; and had herself a part in the sacred ceremonies.

**KING at Arms, or of Arms**, is an officer of great antiquity, and anciently he was of great authority; his business is to direct the heralds, preside at their chapters, and have the jurisdiction of armory.

The origin of this title is doubtful. Some of the French writers imagine that it was given to heralds because they attended upon and regulated military ceremonies. Others attribute to them the style of kings, because they governed and presided in ceremonies of tournaments, in like manner as the master of the ceremonies at Athens was styled *βουτλιας*. Others again ascribe the title to them, because in assigning arms, as expressions of honour to any person, they resembled the kingly prerogative. But this supposes that the custom of granting arms by the kings of heralds is as ancient as their titles: whereas Mr. Edmondson observes, in his "Complete Body of Heraldry," that it doth not any where appear that these kings had anciently the addition *armorum* given to them, they being then called, as they truly were, *reges heraldorum*; which for the most part continued till about the reign of Henry IV., when they began to be entitled *reges armorum*, although their primitive appellation was also used for some ages. The latter title of *reges armorum* was attributed to them before such times as those officers made any grant of arms.

Sir Henry Spelman is of opinion, that the title of king of arms was attributed to such officers in England as belonged immediately to the king's majesty; whilst those who appertained to princes of the blood royal, or to the nobility, were styled simply heralds. The most probable conjecture is, that this denomination "king of heralds," of later times called "king of arms," was given to that person who was the chief, or principal officer presiding over the heralds of any kingdom, or of any particular province, usually termed by heraldic writers "the marches," or of any order of knighthood; and owing its rise probably to the French dialect. Among the French, the word *roy*, or king, and from them in their and our histories and records, the Latin word *rex* hath been frequently referred to the principal, the governor, the judge, the visitor, the supreme, the president, or chief, of many professions, arts, or communities. In the most ancient writers, these officers are styled merely "kings of heralds," without the addition of any title of office; but

in course of time they became distinguished by the appellations of their different provinces.

In England we have three kings of arms; *viz.* Garter, Clarenceux, and Norroy.

**Garter, principal King at Arms.** See GARTER.

The two last are also called *provincial heralds*, because they divide the kingdom between them into two provinces, which are separated by the river Trent.

These, by charter, have power to visit noblemen's families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and, with *Garter*, to direct the other heralds.

Anciently the kings at arms were created, and solemnly crowned, by the kings of England themselves; but of later days the earl marshal has a special commission, at every creation, to perfonate the king. See CLARENCEUX, and NORROY.

To these may be added Lyon King at Arms, for Scotland, who is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To him belongs the publishing the king's proclamation, marshalling funerals, reversing arms, &c. And also Ulster, king of arms, in Ireland.

Ulster was substituted, as some say, in the room of Ireland king of arms, by Edward VI.; though the king himself in his journal takes notice of it as a new institution. "There was a king of arms made for Ireland," says he, "whose name was Ulster, and his province was all Ireland; and he was the fourth king of arms, and the first herald of Ireland." The patent passed under the great seal of England, with an ample testimony of the necessity and dignity of the office. Whether Ulster was substituted in the room of Ireland king of arms, or else was newly erected, such an officer of the crown of England, on which Ireland is dependent, still continues, and may execute his heraldic order in this kingdom, though out of his province, in as extensive a manner as either Clarenceux or Norroy may do without the limits of either of their marches. We here add, that each of the military orders of knighthood established in England, *viz.* the *Garter* and the *Bath*, give titles to kings of arms. Garter has been already mentioned. (See GARTER.) *Bath* king of arms was created in the eleventh year of king George I. for the government of the order of the "Bath," then newly created, by virtue of letters patent, bearing date at Westminster, May the 18th, in that year. In conformity to the statutes pertaining to this order, he was nominated and created, by the great master of the order, with the ceremonies usually observed in the creation of other kings of arms, to continue in his said office during good behaviour, denominated *Bath*, and enjoined sedulously to attend the service of the order. His habit and service are particularly prescribed. In the year 1725, his majesty, by sign manual, constituted and ordained, the then Bath king of arms, "Gloucester king of arms, and principal herald of the parts of Wales;" and letters patent passed the great seal, granting to him the said office of "Gloucester," empowering him to grant arms and crests to persons residing within the dominions of Wales; and also perpetually consolidating the office of "Gloucester" with that of "Bath" king of arms: ordering, moreover, that in all assemblies, and at all times, he should take precedence above and before all other provincial kings of arms. See COLLEGE of Heraldry, and HERALD.

**KING'S Band, in Musical History**, a royal household establishment. In the reign of king Edward IV. Music, after leading a vagrant life in our country, and being passed from parish to parish, seems at length, by the favour of this mo-

narch, to have acquired a settlement; for it appears by his letters patent, under the great seal of his realm of England, bearing date the 24th of April, 1469, in the ninth year of his reign, that this prince did incorporate certain minstrels, and give them a charter.

The original charter is preserved in Rymer's *Fœdera*: and in the eleventh year of Charles I., when that monarch was petitioned to grant a new patent to the professors of the art and science of music, the form of that which had been from Edward IV. was made the ground-work of the new charter. For a further account of this institution, see *CHAPEL Royal Establishment*.

The splendid robes and gorgeous attire of bards and minstrels at all times are upon record. The flowing vest of Orpheus in the triple capacity of priest, legislator, and musician, is specified by Virgil; Arion is related by Herodotus to have leaped into the sea in the rich vestments he usually wore in public; Suidas speaks of the saffron robe and Milesian slippers worn by Antigenides; and the performers in the tragic chorus, which used to be furnished at the expence of some wealthy citizen of Athens, wore also a splendid and costly uniform.

Indeed the custom of presenting state musicians with superb and expensive dresses during the fourteenth century, seems to have travelled into England from the continent, and to have continued here till after the establishment of the king's band of four-and-twenty performers; part of their present salary being still paid at the wardrobe-office, as an equivalent for the annual dress with which they used to be furnished at his majesty's expence. The children of the king's chapel still continue to wear the scarlet uniform of the original establishment. And the waits, or musicians who attend the mayor and aldermen of our cities and incorporate boroughs, are still furnished with splendid cloaks. See *MINSTRELS* and *WAITS*.

*King of the Minstrels, in Musical History.* Dr. Plot, in his History of Staffordshire, has minutely related the origin of an ancient and curious, though barbarous, privilege in favour of English minstrels, granted by John of Gaunt, duke of Lancaster, at his castle of Tutbury, in the year 1381, at the inauguration of the first king of the minstrels.

Du Cange gives several more early instances of minstrels having arrived at the honour of sovereignty in France: particularly Jean Charnillons, rex juglatorum at Troyes, in Champagne, 1296. Robert Cavaron, roi des menestriers du royaume de France, 1338; and others in 1357, and 1362. Copin de Brequin, roi des menestriers du royaume de France. *Computum de auxiliis pro redemptione regis Johannis, A. D. 1367.* Pour une couronne d'argent quil donna le jour de la tiphane au roi des menestriers. And one about six years later than John of Gaunt's institution is mentioned in Rymer, tom. vii. p. 555, where John Caunz, king of the minstrels, condescends to supplicate for leave to visit foreign countries.

“During the time in which ancient earls and dukes of Lancaster, who were ever of the blood royal, great men in their time, and had their abode, and kept a liberal hospitality here, at their honour of Tutbury, there could not but be a general concourse of people from all parts hither; for whose diversion all sorts of musicians were permitted likewise to come to pay their services; amongst whom, being numerous, some

quarrels and disorders now and then arising, it was found necessary, after a while, they should be brought under rules, divers laws being made for the better regulating of them, and a governor appointed them by the name of a *king*, who had several officers under him to see to the execution of those laws, full power being granted them to apprehend and arrest any such minstrels appertaining to the said honour, as should refuse to do their services in due manner, and to constrain them to do them; as appears by the charter granted to the said king of the minstrels, by John of Gaunt, king of Castile and Leon, and duke of Lancaster, bearing date the 22d of August, in the fourth year of the reign of king Richard II., entitled “*Carta le Roy de Minstrales*,” which is as follows:

“John, by the grace of God, king of Castile and Leon, duke of Lancaster, to all them who shall see or here these our letters, greeting—Know ye, we have ordained, constituted, and assigned to our well-beloved the king of the minstrels in our honour of Tutbury, who is, or for the time shall be, to apprehend and arrest all the minstrels in our said honour and franchise, that refuse to do the services and minstrelly as appertain to them to do from ancient times at Tutbury aforesaid, yearly on the days of the Assumption of our Lady; giving and granting to the said king of the minstrels, for the time being, full power and commandment to make them reasonably to justify, and to constrain them to do their services, and minstrelries, in manner as belongeth to them, and as it hath been there, and of ancient times accustomed. In witness of which thing we have caused these our letters to be made patent. Given under our privy seal, at our castle of Tutbury, the 22d day of August, in the fourth year of the reign of the most sweet king Richard II.” For a further account of this establishment, see *BURNEY'S General History of Music*, vol. ii. p. 361, &c. and the article *MINSTRELS*.

*King's Palace.* The limits of the king's palace at Westminster, extend from Charing Cross to Westminster Hall, and shall have such privileges as the ancient palaces. (23 Henry VIII.) If any person shall strike another in the king's palace, he shall have his right hand cut off, be imprisoned during life, and also be fined. 32 Henry VIII. cap. 12.

*King's Prerogative.* See *PREROGATIVE*, and *KING*.

*King's Privy-council.* See *PRIVY-COUNCIL*.

*King's Seal.* See *SEAL*.

*King's Silver,* the money due to the king in the court of common pleas, *pro licentia concordandi*, in respect of a licence there granted to any man for levying a fine of lands, or tenements, to another person. See *FINE*.

*King's Spear,* in *Botany.* See *ASPHODELUS*.

*King's Thanes.* See *THANES*.

*King's War.* See *WAR*.

*King's Wardrobe.* See *WARDROBE*.

*King-fish,* in *Ichthyology.* See *OPAH*.

*King-fisher,* *ispida,* in *Ornithology.* See *ALCEDO ispida*.

*King-piece,* in any *Buildings,* is a piece of timber standing upright in the middle, between two principal rafters, and having struts or braces going from it to the middle of each rafter.

*KING CHARLES I.* in *Biography.* See *CHARLES*.

*KING CHARLES II.* See *CHARLES*.

*KING of Prussia,* *FREDERIC.* Among German dilettanti in music, his late Prussian majesty is entitled to the first place, in talents as well as rank. This heroic and accomplished prince having had Quantz early in life for his matter on the German flute and in composition, played no other pieces than his own and those of his matter, which were never allowed

allowed to be printed. His majesty, during more than forty years of his busy reign, when not in the field, allotted four hours a day to the study, practice, and performance of music. All the German masters allowed him the first place among dilettanti composers, as well as performers on the flute. Fischer, however, who was some time in his service before he first came to England, did not seem to like his musical productions, thinking them, even then, somewhat dry and old fashioned. This prince had certainly great professors in his service, though he was never partial to Emanuel Bach, the greatest of them all. His majesty, besides a great number of pieces for the flute, and some for the harpsichord, composed sometimes for the voice; particularly in the pastoral opera of "Galatea et Alcides," in 1747, of which the overture and recitatives were Graun's, and the airs by the king jointly with Quantz and Nibelmann. Sometimes, the day before performance, his majesty would send a new song to the maestro di cappella to be introduced in an opera, and this was universally believed to be his own production in all its parts. During the last years of his life, according to his chapel-master, Reichardt, his Prussian majesty having lost some of his front teeth, not only discontinued the practice of the flute, but his evening concerts, and became totally indifferent to music: a proof that his majesty's chief pleasure in the art was derived from his own performance.

**KING, CHARLES.** Of this choral musician, sir John Hawkins, who seems to have known him personally, gives the following account in the fifth volume of his history:

"Charles King, bred up in the choir of St. Paul's under Dr. Blow, was at first a supernumerary singer in that cathedral, for the small stipend of 1*l.* a-year. In the year 1704, he was admitted to the degree of bachelor in music in the university of Oxford; and upon the death of Jeremiah Clark, whose sister was his first wife, was appointed almoner and master of the children of St. Paul's, continuing to sing for his original stipend until the 31st of October, 1730, when he was admitted a vicar choral of that cathedral, according to the customs and statutes thereof. Besides his places in the cathedral, he was permitted to hold one in a parish church in the city, being organist of St. Bennet Fink, London; in which several stations he continued till the time of his death, which happened on the 17th of March, 1745. With his second wife he had a fortune of seven or eight thousand pounds, which was left her by the widow of Mr. Primatt, the chemist, who lived in Smithfield, and also in that house at Hampton, which is now Mr. Garrick's. But notwithstanding this accession of wealth, he left his family in but indifferent circumstances. King composed some anthems, and also services to a great number, and thereby gave occasion to Dr. Greene to say, and indeed he was very fond of saying it, as he thought it a witty sentiment, that "Mr. King was a very serviceable man." As a musician he is but little esteemed. His compositions are uniformly restrained within the bounds of mediocrity; they are well known, as being frequently performed, yet no one cares to censure or commend them, and they leave the mind just as they found it. Some who were intimate with him say, he was not void of genius, but averse to study; which character seems to agree with that general indolence and apathy which were visible in his look and behaviour at church, where he seemed to be as little affected by the service as the organ-blower."

**KING, WILLIAM,** organist of New college, Oxford, set to music Cowley's "Mistress," and published it with the following title, "Poems of Cowley and others, composed into Songs and Ayrs, with a Thorough-bass to

the Theorbo, Harpsicon, or Base-viol," fol. Oxford, 1668.

**KING, ROBERT,** bachelor in music, of Cambridge, 1696, one of the royal band of William and Mary. He composed several of the airs that were printed in the "Tripla Concordia;" as well as many of the songs that were published in the "Theatre of Music."

**KING, JOHN GLEN,** an English divine, was born in the county of Norfolk about the year 1732. He completed his youthful studies at Caius college, Cambridge, where he took his degrees of B. A. and M. A. in the years 1752 and 1763, and at subsequent periods he was admitted to the degree of D. D., and received a member of the Royal Society, and of the Society of Antiquaries. In 1764, he obtained the appointment of chaplain to the English factory at Peterburg. In this situation he was led to inquire into the ceremonies of the Russian church, which he continually saw practised, and determined to give a faithful description of the same in his own language. He accordingly published, in 1772, in a handsome quarto, illustrated with engravings, a work, entitled "The Rites and Ceremonies of the Greek Church in Russia; containing an Account of its Doctrine, Worship, and Discipline." In 1778, he wrote and published a letter to the bishop of Durham, containing some observations on the climate of Russia, and the northern countries, with a view of the flying-mountains at Zarsko Sello, near St. Petersburg. Soon after his return to his native country, he was presented to the rectory of Wormley, in Hertfordshire, in 1783, and 1786 he purchased the chapelry of Spring Garden, in which he officiated as preacher. While he resided at Peterburg, the empress of Russia had appointed him her medalist, and he was engaged in a medallic work at the time of his death, which happened Nov. 3, 1787, when he was about fifty-five years of age. Besides the works already mentioned, Dr. King was author of "Observations on the Barberini Vase," which are printed in the eighth volume of the Transactions of the Antiquarian Society. Gen. Biog.

**KING, PETER,** baron of Ockham, was born in the year 1669, at Exeter, of which city his father was a considerable tradesman. He was intended to succeed in the business, but having a strong inclination for reading, he purchased books, and spent all the time he could command in improving his mind. He was related to the celebrated John Locke, who, discovering the bent of his inclinations, advised that he should be sent to Leyden for literary improvement. At this period his attention was chiefly turned to theology, and in 1691 he published "An Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church, that flourished three hundred Years after Christ; faithfully collected out of the extant Writings of those Ages." In the first volume, only three of the subjects were treated on, and he afterwards published a second part on worship. The chief object of this work was to prepare the way for that comprehension of the dissenters within the pale of the established church, which the revolution was supposed likely to effect. After his return from Leyden, he was persuaded by Mr. Locke to make choice of the law for his profession, and he accordingly entered himself of the Inner Temple. He now employed all his powers in acquiring an extensive knowledge of the laws and constitution of his country, and obtained a reputation which introduced him into the house of commons in 1699. This situation he held during six successive parliaments, but his legal and political avocations did not allow him to abandon his former theological studies; but having been led by his inquiries to examine the origin of the Apostles' Creed, he published, in 1702, a volume, intitled "The History of the Apostles' Creed, with critical Observations

on its several Articles." Mr. King's employment as a lawyer increased with his general reputation, and in 1708 he was chosen recorder of London, and about the same time he received the honour of knighthood: in the following year he was appointed by the house of commons to be one of the managers on the trial of Dr. Sacheverel, and in 1712 he boldly appeared as gratuitous counsel for Mr. Whiston, on his prosecution for heresy before the court of delegates, and, in the end, obliged the bishops and civilians to desist. On the accession of George I. he was appointed to the lord chief justiceship of the common pleas, and was sworn of the privy council. In 1725, the judge was raised to the peerage by the style and title of lord King, baron of Ockham, in Surrey, and was created lord-chancellor in the room of the earl of Macclesfield: the labours of this high office being too great for his strength, in 1733 he resigned the seals, and in a few months afterwards, viz. July 1734, departed this life, leaving behind him a character of great virtue and humanity, and of steady attachment to civil and religious liberty. Biog. Brit.

KING, WILLIAM, a miscellaneous writer, born in London about the year 1663, was educated at Westminster school under Dr. Busby, whence he was removed to Christ-church college in Oxford. He took his degree of M. A. in 1688, and in that year made his appearance as an author in a refutation of Varilla's account of Wickliffe, in his "History of Heresies." About this time he began the professional study of the civil law, in which he took a doctor's degree, and obtained a large practice as advocate in Doctor's Commons. In 1694, he published, in answer to lord Moleworth's account of Denmark, his "Animadversions upon the pretended Account of Denmark," which were to highly approved by prince George of Denmark, that he was appointed secretary to the prince, afterwards queen Anne. In some subsequent years he published several works of the humorous kind, such as "A Journey to London," intended as a burlesque on Dr. Martin Lister's journey to Paris; and a satire on sir Hans Sloane and the Royal Society. His habits were now become adverse to every exertion of regular industry, he deserted all his professional prospects, and, in 1702, he accepted an offer to go to Ireland, where he had several appointments under government, by which he might have been fully employed, and derived wealth and even affluence. He returned to England in 1708, but by no means improved in his fortune, and retired to his student's place in Christ-church college, where he finished his largest poem in imitation of Ovid's Art of Love, and composed several other pieces. He closely connected himself with the Tory party, and wrote in defence of Sacheverel. He was concerned in the periodical paper, intitled "The Examiner;" and such were his services to his party, that he obtained the place of gazetteer; but the duties attached to the office were more than he liked to perform, and he resigned it in a short time. He died on Christmas-day, 1712. As a prose writer he is forgotten, but his account of ancient mythology was long a popular book in the schools. His works have been collected and published in three vols. 8vo., under the title of "Original Works in Prose and Verse." Biog. Brit. Johnson's Lives of the Poets.

KING, WILLIAM, a learned Irish prelate, was born at Antrim, in the province of Ulster, in the year 1650. From the grammar school, in which he had made great progress, he was sent to Trinity-college, Dublin, in 1667; here he was remarkable for his attention to the studies of the place, and took his degrees in 1670 and 1673, and in the latter of these years he was ordained deacon. In the following year he was admitted to priest's orders, and was patronized by Dr.

Parker, archbishop of Tuam, who appointed him his chaplain in 1676. From this period ecclesiastical honours and preferments began to flow rapidly upon him, till at length, in 1688, he was elected dean of St. Patrick's. He had already published three treatises on the controversy between the Papists and Protestants, and no sooner had the revolution taken place in England, than the dean became active in promoting the same establishment in Ireland, both before and after the landing of king James there in 1689. That prince, fully sensible of the dean's influence, and of the weight of his opposition, confined him twice in the tower of Dublin castle on that account. This did not prevent him taking the degree of D. D. the same year; but the Jacobite party continued to inveterate against him, that they threatened to take away his life, and actually made two or three unsuccessful attempts for the purpose. Upon the flight of king James into France, after the battle of Boyne, in the year 1690, and the appointment of a day of thanksgiving for the preservation of king William's person, the dean preached the sermon on the occasion, at St. Patrick's cathedral, and, in 1691, his zeal and activity in favour of the revolution were rewarded with the bishopric of Derry. He now published "The State of the Protestants in Ireland under the late King James's Government, &c." This treatise was so well received, that a third edition of it was called for in a few months, and bishop Burnet observes, that it was universally acknowledged to be as truly as it was finely written, referring to it, in the "History of his own Time," as a full and faithful account. When public tranquillity was restored, the bishop applied himself very diligently to the immediate duties of his pastoral care, and was exceedingly desirous of converting the Presbyterian party to the episcopal forms. With this view, he published, in 1694, a treatise, entitled "The Inventions of Men in the Worship of God:" this drew him into a controversy with Mr. Joseph Boyse, a dissenting minister of Dublin, which terminated without effecting the object which the learned prelate had at heart. In 1702, bishop King published at Dublin his celebrated work, entitled "De Origine Mali," which was reprinted the same year at London. The object of this work is to shew in what way the several kinds of evil with which the world abounds, are consistent with the goodness of God, and may be accounted for without the supposition of an evil principle. The bishop was attacked by Bayle, Leibnitz, and others, upon different parts of his work; but he did not make any public reply during his life-time, being unwilling to enter again into the lists of controversy. He was not, however, an inattentive observer of the arguments adduced against him, but left behind him a great number of MSS., in which he considered their several objections to his system, and laboured to vindicate it from the least cavil: the substance was afterwards given to the public. In 1702, Dr. King was translated to the archbishopric of Dublin, and, in 1709, he published a sermon, preached before the Irish house of peers, entitled "Divine Predestination and Fore-knowledge consistent with the Freedom of Man's Will," in which he maintained that the moral attributes of God were different from the moral qualities of the same name in man. This doctrine was attacked by Dr. John Edwards and Mr. Anthony Collins, to neither of whom did the archbishop reply, though he had prepared answers, which were found among his MSS. at his death. In the year 1717, archbishop King was appointed one of the lords justices of Ireland, and he held the same office in the years 1721 and 1723. He died in May 1729, when he had nearly completed his 79th year. He was a prelate of great learning, and steadily attached to the principles of the Revolution;

volution; zealous for the prosperity of the established church, to which he belonged; and of an unblemished and exemplary moral character. He was ambitious of the primacy of Ireland, which was refused him, under the pretence of his being too old to perform the duties of the office. This reason, it is said, was as little agreeable as the refusal itself; and when the new primate called upon him after his elevation, archbishop King received him in his own house, without rising from his chair, making this apology, in a sort of farcical manner, "My lord, I am certain your grace will forgive me, because you know I am too old to rise." After his death, the papers which he left were put into the hands of Mr. Law, afterwards bishop of Carlisle, who published a translation of his work "De Origine Mali," corrected and enlarged on the author's notes, to which were added two sermons on the Divine Preseience, and the Fall of Man, 2 vols. 8vo. Biog. Brit.

**KING**, or *Kin-yuen*, in *Geography*, a town of China, of the first class, in the province of Quang-li. N. lat. 24 21'. E. long. 108°.

**KING**, a town of Africa, in the kingdom of Cacongo; 40 miles S.E. of Essena.

**KING'S**, a maritime county of New York, in the United States, containing that part of the state that is bounded E. by Queen's county; N. by New York county; W. partly by Hudson river, and partly by the ocean; and S. by the Atlantic ocean, including Coney islands. This fertile tract of land, situated on the W. end of Long island, and separated from Staten island by the Narrows, serves very much to the supply of the New York market with butter, vegetables, fruit, &c. It is divided into six townships, and contains 5740 inhabitants, including 1479 slaves. Its chief towns are Brooklyn, and Flatbush.—Also, a county of Nova Scotia, comprehending the islands on the S.W. and S. sides of the basin of Minas. The rivers Habitant, Caniad, and Cornwallis, are navigable to some distance. The lands on these rivers afford arable and pasture soil; the rivers abound with fish; and in the basin of Minas are fine cod-fish, haddock, and different kinds of flat fish.

**KING'S**, or *Pearl Island*, a small island in the bay of Panama; belonging to Spain, and famous for its pearl-fishery. N. lat. 7 12'. W. long. 81° 36'.

**KING'S Bay**, a bay on the S.E. coast of Nova Scotia. N. lat. 44 32'. W. long. 59° 10'.

**KING'S Bridge**, a post-town of New-York, 15 miles N. of New York city. The bridge connects New York island with the main land.

**KING'S County**, a county of Ireland, part of the old district of Ophaley, which, having been confiscated in the reign of the first Mary, was called the King's county, and its chief town Philip's-town, in compliment to her husband, Philip II. of Spain. It has Weltmeath and Meath on the N.; Kildare and the Queen's county on the E.; Tipperary on the S. and S.W.; and part of Galway and Roscommon on the W. Its chief natural boundary is the Shannon, which separates it from Galway. The little Brosna and the Barrow serve, each of them, to mark its limits for a few miles. Its breadth, in the northern and broadest part, is 32 Irish miles (39 English), but it contracts very much as it stretches to the southward. In this part of the country it extends 34 Irish (43 English) miles from N. to S. It contains 282,200 acres, which make upwards of 440 square miles, equal to 453,370 acres, or 707 square miles English. There are 52 parishes and 25 churches, and, according to Dr. Beaufort, a population of about 74,500. The completion of the grand canal has, however, tended much to increase the population of this county. The only

mountains in it are the Sliebh-Dloom, in the S.E. which extend into the Queen's county. These run in a range of about 15 miles, having but one pass, called the gap of Glendine, which is very difficult of approach, steep and craggy, and not five feet wide. The soil in the northern part is mostly argillaceous, and requires a great deal of lime to make it arable. The rocks are red argillite and freestone, which intersect each other. In the centre there are various soils, light sandy loam, stiff yellow clay, gritty shallow gravel, and deep brown earth. In this part of the range the land is often fertile in pasture, and grazed throughout the year with numerous flocks of sheep and young cattle: limestone is thickly interperfed, and the bottom is a stiff clay, where abundant crops of corn are yielded. In another part we find a cold, spongy clay, and at the foot, where the declivity vanishes, a deep ir-reclaimable bog, which can be approached only in very dry seasons. The mineral productions of this mountainous district have not been yet ascertained. In the arable parts of the county, we are informed that the soil is not naturally fertile, and is only rendered so by manures, and proper attention to a rotation of crops. The quality of the soil is either a deep moor, or a shallow gravelly loam; the moist season being most favourable to the produce yielded by the latter, and the moors very productive in dry summers. There is every where abundance of lime-stone and lime-stone gravel, which is found the best manure. The pastures, though not luxuriant, are kind and fattening, and well adapted for sheep-walks, where numerous flocks are supported, the wool of which is abundant, and of a very fine quality. The coarsest pasture, which is the unreclaimed moor, is highly nutritious to young cattle. The surface is rather an uninterrupted flat, unfavourable to dairy husbandry, and the corn crops are principally oats and barley. In some parts, however, improvements in husbandry are attended to, in the raising of green crops, introducing artificial grasses, and drilling potatoes. Considerably more than a third part of the whole county is occupied by bog and mountain. The bogs, however, supply an abundance of most excellent fuel, which not only serves the inhabitants, but is sent by the canal to Dublin. They also yield, when calcined, an excellent and lasting manure, both for their own improvement and that of the high grounds. As there is a natural fall in many places, these bogs are very capable of being drained and reclaimed by lime-stone. Such land is fit for all the purposes of husbandry, and will be found more productive, either in pasture or tillage, than the general run of the best lands in the county. This reclaiming of bog is now pursued with much spirit in many parts; and nothing surely can be more gratifying than to behold rich carpets of white clover and trefoil in spots which had been dark and barren moor. These bogs have been lately furveyed by the direction of the commissioners for the investigation of bogs, and it is to be hoped that some extensive plan of drainage will be carried into effect. The mineral productions of the county are inconsiderable. Sir C. Coote, author of the Statistical Survey, mentions only manganese, iron ores in small quantity, ochre, marble, lime-stone, freestone, and potter's clay. There is a great scarcity of timber, except ornamental plantations, though the bogs afford abundant proof of its having once been an almost uninterrupted forest. The alder appears to have been a native of this county, and a few of them still rear their venerable tops in a park at Droughtville. This county is well watered. Besides the Shannon and the little Brosna, before mentioned, the greater Brosna, after winding through a great part of it, between pleasant banks, loses itself in the Shan-

non. There are also several small rivers, and some lakes, of which Lough Pallis and Lough Annagh are the largest; and the Grand Canal crosses the northern part of the county. Of the towns, Birr is the most considerable; but Philipstown is the county town. Tullamore is a pretty and thriving place. The county is represented in parliament by the two knights of the shire only; the boroughs of Philipstown and Banagher having been disfranchised by the Union. Coote's Statistichal Survey. Beaufort's Memoir.

**KING'S COURT**, a post-town of the county of Cavan, Ireland; 39 miles N.W. from Dublin.

**KING'S CREEK**, a river of Virginia, which runs into the Chesapeake. N. lat. 37° 20'. W. long. 76° 2'.—Also, a river of North Carolina, which runs into the Cangaree, N. lat. 35° 8'. W. long. 81° 40'.

**KING'S ISLAND**, an island in the East Indian sea, near the W. coast of Siam, about 51 miles in circumference. N. lat. 12° 18'. E. long. 98.—Also, a small island in Beering's straits. N. lat. 65° 2'. W. long. 168'.—Also, an island near the W. coast of North America, separated by Fisher's canal from the southernmost of Princess Royal's islands, and by Burk's canal from New Hanover; so called by captain Vancouver, after captain James King, of the British navy. It is about 33 miles in length, and rather more than six in breadth. Point Edward is the farthest point to the N. and point Waller to the S. N. lat. 51° 56' to 52° 26'. E. long. 232° 9' to 232° 43'.

**KING'S KEYS**, islets and rocks in the Spanish main, near the Mosquito shore. N. lat. 12° 42'. W. long. 82° 35'.

**KING'S POINT**, the N.W. extremity of the island of Sumatra; 15 miles W. of Acheen. N. lat. 5° 30'.

**KING AND QUEEN**, a county of Virginia, on Mattapony river, which separates it from king William's county. It is about 25 miles long and 20 broad, and contains 4499 free inhabitants, and 5380 slaves. At King and Queen, in this county, is a post-office.

**KING GEORGE**, a county of Virginia, between the Patowmac and Rappahannock rivers. It is 22 miles long and 14 broad, and contains 2762 free inhabitants, and 3957 slaves. In the court house is a post-office.

**KING GEORGE'S ISLANDS**, two islands in the South Pacific ocean, discovered by commodore Byron in 1765, and visited by captain Cook in 1773. The commodore's landing was opposed by the natives, when, a shot or two being fired, one man was killed, and the rest fled. The canoes were curiously wrought with planks, ornamented with carving, and the seams filled up by strips of tortoise-shell. They were about 32 feet long, very narrow, with bottoms as sharp as a wedge. Two of them were joined together laterally by strong spars, so that between them there was an interval of about six or eight feet; each had a mast, and the sail was neatly made of matting. The houses were low mean hovels, thatched with branches of cocoonut tree; but they were delightfully situated in a grove of stately trees. The cocoonut tree seemed to afford them almost all the necessaries of life; particularly food, sails, cordage, timber, and vessels for holding water. The shores appeared to be covered with coral, and the shells of large pearl oysters. The island was covered with scurvy-grass. The flesh water is good, but scarce, being furnished by very small wells, which are soon emptied, and as soon filled again. In one of the islands was a lake or lagoon, in which were observed two or three vessels, one of which had two masts, and some cordage aloft to support them. S. lat. 14° 35'. W. long. 149° 2'.

**KING GEORGE THE THIRD'S ARCHIPELAGO**, a group of islands in the North Pacific ocean, extending from N. to S. about

150 miles in length; about 15 miles broad towards the N. and diminishing to little more than a mile at the southern extremity. N. lat. 56° 10' to 58° 18'. E. long. 223° 45' to 225° 40'.

**KING GEORGE THE THIRD'S ISLAND**. See OTAFUTE.

**KING GEORGE THE THIRD'S SOUND**, a harbour on the S.W. coast of New Holland, discovered by captain Vancouver in 1791. In approaching it from the westward, it is the first opening that appears like a harbour eastward of Cape Chatam. The Eclipse islands are an excellent guide to the Sound, having between them and Bald-head some rocks on which the sea breaks with great violence. The port is safe, and easy of access any where between its outer points of entrance: Bald-head and Mount Gardner lying N. 62° E. and S. 62° W., 11 miles distant from each other. S. lat. 35° 5'. E. long. 118° 17'.

**KING GEORGE'S SOUND**, a name given by Captain Cook to Nootka found. See NOOTKA.

**KING WILLIAM'S ISLAND**, a small island in the East Indian sea, near the N. coast of the island of Poggy. S. lat. 2° 33'. E. long. 99° 43'.—Also, a small island in Dampier's strait, near the S. coast of the island of Waigoo. S. lat. 0° 32'. E. long. 130° 51'.—Also, a cape on the eastern extremity of New Guinea. S. lat. 6° 45'. E. long. 148° 5'.

**KINGDOM**, the dominion of a king. See KING and MONARCHY.

**KINGDOM**, among *Chemists*, is a term which they apply to each of the three orders or classes of natural bodies; *animal, vegetable, and mineral*.

**KINGDOM OF GOD**, or of Heaven, in the Gospel History, is a phrase, which, according to Dr. Campbell, has a manifest allusion to the predictions in which this economy was revealed by the prophets in the Old Testament, particularly by Daniel, ch. ii. 44, vii. 13, 14; by Micah, ch. iv. 6, 7; and by other prophets. To these predictions there is a manifest reference in the title ἡ βασιλεια τοῦ ΘΕΟΥ, or τῶν ΕΒΡΑΙΩΝ, or simply ἡ βασιλεια, given, in the New Testament, to the religious constitution which would obtain under the Messiah. In most cases βασιλεια answers to the Latin *regnum*. But this word is of more extensive meaning than the English, being equally adapted to express both our terms *reign* and *kingdom*. The first relates to the time or duration of the sovereignty; the second to the place or country over which it extends. Nevertheless, though it is manifest in the Gospels, that it is much oftener the time than the place that is alluded to; it is never, in the common version, translated *reign*, but always *kingdom*. Yet the expression, says Campbell, is often thereby rendered exceedingly awkward, not to say absurd. In order to prevent this misapplication of terms, βασιλεια ought sometimes to be rendered *reign*, and not *kingdom*. When it refers to the time, it ought to be rendered *reign*, and when to the place, *kingdom*. There are, however, a few passages in which neither of the English words can be considered as a translation of βασιλεια strictly proper. In some of the parables (Matt. xviii. 23.) it evidently means administration, or method of governing; and in one of them (Luke, xix. 12. 15.) the word denotes royalty, or royal authority, there being a manifest allusion to what had been done by Herod the Great, and his immediate successor, in recurring to the Roman senate in order to be invested with the title and dignity of king of Judea, then dependent upon Rome. Upon the whole, we may observe, that the phrases, *kingdom of God*, and *kingdom of heaven*, are synonymous; and that they sometimes denote the state of the blessed, and sometimes the gospel dispensation. Campbell's Prel. Diss. p. 136, &c.

**KINGHALE**, in *Geography*, a town of Africa, in Caecongo, situated on the Louisa. S. lat. 5° 20'. E. long. 12° 10'.

**KINGHORN**, a small sea-port town in the county of Fife, in Scotland, situated on the north bank of the frith of Forth, nearly opposite to the city of Edinburgh and port of Leith, from the latter of which it is about seven miles distant. Kinghorn is principally inhabited by fishermen and boatmen employed on the ferry, which is one of the chief routes of intercourse between the metropolis and the counties of Fife and Angus. The boats employed on the ferry are large, well built decked-boats; but-decked for carrying carriages, horses, and black cattle; and there are handsome small pinnaces for pleasure parties, and passengers who have no equipage or horses. The fares are regulated, and the conduct of the ferrymen superintended by the magistrates of Edinburgh, who punish offences and frauds upon passengers upon a summary complaint. In the middle of the frith is a small pleasant island, about a mile in circumference, called Inch-Keith, upon which is the ruins of an old castle, which was once a place of some strength. About the commencement of the present war some entrenchments were made, and guns mounted upon this island for the protection of the shipping in the Forth from any surprise, probably from the recollection of the daring but nugatory attempt of Paul Jones, during the American contest; but hitherto there has been no occasion to employ them. Inch-Keith, we believe, is the property of the city of Edinburgh.

**KINGIKSOK**, a town of West Greenland. N. lat. 61° 55'. E. long. 47° 40'.

**KING-KI-TAO**, a city and capital of Corea, situated in the province of King-ki, and the ordinary residence of the sovereign. N. lat. 47° 38'. E. long. 126° 41'.

**KI-NG-NAN**, a city of China, of the first class, in the province of Kiang-si, seated on the river Kan, which is difficult and hazardous of navigation, on account of its numerous rocks and currents, and which requires the assistance of persons provided in this city. The adjoining fields and valleys are agreeable and fertile; and the mountains are said to contain mines of gold and silver. N. lat. 27° 7'. E. long. 114° 32'.

**KINGROAD**, a part of the Severn below Bristol, from whence the outward-bound ships from that city take their departure.

**KINGS**, *Books of*, in *Scripture History*, two canonical books of the Old Testament, so called, because they contain the history of the reigns of Israel and Judah, from the beginning of the reign of Solomon, down to the Babylonish captivity. The first book of Kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of sixteen kings of Judah, and twelve of Israel, and the end of both kingdoms, by the carrying off the ten tribes captive into Assyria by Salmanassar, and the other two into Babylon by Nebuchadnezzar.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation. These are the only books which the Hebrews call "Malachim or Kings," though the two books of Samuel have been also mentioned

under this general title; and authors have enumerated four books of Kings, those of *Samuel* (which see) being the first and second. The four books contain the history of almost 600 years.

**KINGSBRIDGE**, in *Geography*, a small market town and parish in the hundred of Stanborough, and county of Devon, England, is situated on a branch of the Salcombe river, and, according to Rifdon, derives its name from the bridge, which connects it with Dodbrooke. The town is in general well built. A free-school was founded here by Mr. Crispin of Exeter, and has obtained some degree of reputation. The parish was returned, under the population act of 1800, as containing 155 houses, and 1117 inhabitants. Kingsbridge is distant from Dartmouth 10 miles, from Exeter 39, and from London 207. It has a weekly market on Saturdays, and three annual fairs. David Tolley or Tolbey, called by Leland Taveleus, an eminent Greek and Latin scholar in the time of Henry VIII., was a native of this town. Beauties of England and Wales. Polwhele's History of Devonshire, folio.

**KINGSBURY**, a township of America, in the county of Washington, and state of New York, situated on the bend of Hudson's river, on the N.E. side; containing 1659 inhabitants.

**KINGSCLERE**, a small market town and parish in the hundred of the same name, Hampshire, England, is situated on the edge of a chain of hills, 17 miles from Reading in Berkshire, and 55 from London. It is mentioned by Camden as being a considerable town, but is now of a mean appearance, and only remarkable for having been the residence of the West Saxon kings. The church is a small stuccoed building, with a low tower. This parish was returned in the year 1801 as containing 394 houses, and 1939 inhabitants, of whom 492 were employed in trade, principally in the malting line, which produces a considerable traffic with London. A weekly market is held on Tuesdays, and here are three annual fairs. It is probable that the palace of the Saxon sovereigns was connected with Freemantle Park, a short distance to the south, as that is known to have been a royal residence in the time of king John, and was in the possession of the crown so late as the reign of queen Elizabeth. The mansion has been lately pulled down, and the park ploughed up and converted into a farm. Beauties of England.

**KINGSEY**, a township of Lower Canada, N.W. of Slipton, adjoining on both sides of Nicolet river, having about 30 inhabitants.

**KINGSLAND CREEK**, a river of Virginia, which runs into James river. N. lat. 37° 24'. W. long. 77° 40'.

**KINGSTON**, or ESOPUS, a post-town of America, in New York, in Ulster county, on the west side of Hudson's river, six miles west of Rhinebeck, and on the east side of Esopus hill, or creek. In 1777, this town was burned by the British troops, under the order of general Vaughan. It has been since rebuilt on a regular plan, and contains about 150 houses, a court-house, gaol, a Dutch reformed church, and an academy. Its situation is pleasant, being surrounded by a spacious plain; 56 miles S. of Albany. N. lat. 41° 56'. W. long. 73° 56'. The township contains 4615 inhabitants.—Also, a township in Addison county, Vermont, containing 585 inhabitants.—Also, a post-town in Plymouth county, Massachusetts, on the western part of Plymouth bay, bounded northerly by Duxborough, and containing 1037 inhabitants. It was incorporated in 1707; 38 miles S.E. of Bolton.—Also, a post-town in Rockingham county, New Hampshire, on the road that leads from Exeter to Haverhill

Haverhill in Massachusetts; 6 miles from the former, and 12 from the latter. It was incorporated in 1694, and contains 785 inhabitants.—Also, a town, now “Conway-borough,” in Horry district, South Carolina, on the west side of Wakkamaw river, having an episcopal church, and about 36 houses; 41 miles N. by E. from George town.—Also, the chief town of Lenoir county, Newbern district, in North Carolina. It is a post town, situated on a beautiful plain on the north side of Neus river, and containing a court-house, gaol, and about 30 houses; 40 miles W. of Newbern.—Also, a township in Luzerne county, Pennsylvania, containing 752 inhabitants.—Also, a town of Upper Canada, at the head of the river St. Lawrence, on the north shore, opposite to Wolf island; occupying the site of old fort Frontinac, laid out in 1784, and now advanced to a considerable size. It has a barrack for troops, a house for the commanding officer, an hospital, several store-houses, and an episcopal church. About Kingston there are several valuable quarries of lime-stone, and the country in general is rather stony, though not detrimental to the crops. It is 200 miles S. of Montreal, and 150 N. of Niagara. Large vessels go no farther than this place; thence to Niagara, &c. stores and merchandise are conveyed in boats.—Also, a township of Upper Canada, being the fourteenth and uppermost in ascending the St. Lawrence. It is in the county of Frontinac, and lies partly open to lake Ontario.—Also, the capital of the island of St. Vincent’s, in the West Indies, and the seat of government. It lies at the head of a bay of the same name, on the south-west shore of the island, in St. George’s parish. N. lat. 13° 6′. W. long. 60.—Also, a town of Jamaica, in the county of Surrey, situated on the north side of a beautiful harbour, and founded in 1693, when repeated desolations by earthquake and fire had driven the inhabitants from Port Royal. It contains 1665 houses, besides negro-huts and warehouses. The number of white inhabitants, in the year 1788, was 6339; of free people of colour, 3280; of slaves, 16,659; total number of inhabitants, of all complexions and conditions, 26,478. It is a place of great trade and opulence. Many of the houses in the upper part of the town are extremely magnificent; and the markets for butchers’ meat, turtle, fish, poultry, fruits and vegetables, &c. are inferior to none. From comparative registers of mortality it appears, that since the furlounding country is cleared of wood, this town has been proved to be as healthful as any in Europe. Assize courts are held every three months in Kingston, for the county of Surrey. N. lat. 18°. W. long. 76° 33’.

·KINGSTON-UPON-HULL. See HULL.

KINGSTON-UPON-THAMES, a market town and parish in the hundred of Kingston, and county of Surrey, England, derives its name from having been a royal residence; and the adjunct is affixed to mark its situation, and distinguish it from other Kingstons. It is seated on the southern bank of the river Thames, at the distance of 11 miles from Westminster-bridge. In the fourth, fifth, and sixth years of king Edward II., this town sent members to parliament; and again in the forty-seventh of king Edward III. The corporation afterwards petitioned to be relieved from sending members, and the town then ceased to be a borough. Several valuable privileges and immunities were granted to Kingston by charters from kings John, Henry III., Edward III., and other subsequent monarchs. The corporation now consists of about sixty members. Here are one weekly market, and three annual fairs. In the year 1769, an act of parliament was obtained for separating the parish of Kingston and its dependant chapelrys of Richmond,

Moulsey, Thames-Ditton, Petersham, and Kew, into two vicarages and two perpetual curacies. In this town is Canterbury-house, a feat of the late Lord Dillon, near which is a very large barn, which has four entrances, four threshing floors, and is supported by twelve pillars: twelve waggons may be unloaded at once within its walls.

The historical annals of Kingston relate many interesting events, as having occurred here. In the year 838, a grand council was assembled at this place, and was attended by Egbert, first Saxon king of all England, his son Ethelwolf, and the principal nobles and bishops of the land; at the same, the archbishop of Canterbury presided. Other monarchs were crowned here, of which the following are specified by our ancient historians: Edward the Elder, crowned A.D. 900; his son Athelstan, in 925; Edmund, in 940; Eldred, or Eured, in 946; Edwy, or Edwin, in 955; Edward the Martyr, in 975; and Ethelred, in 978. Previous to the reign of Henry III. a castle was standing here, as that monarch, in the year 1264, marched out of London, and seized the castle of Kenington, or Kingston, which then belonged to Gilbert Clare, earl of Gloucester, and which is not mentioned in any subsequent period. In the civil wars of the seventeenth century, Kingston was again a place of public celebrity; for the first armed force is said to have been assembled here under the command of colonel Lusford, with a troop of 400 or 500 horse. The colonel was proclaimed a traitor, as having levied war against the parliament, and was apprehended. Respecting this event, and some other contemporaneous proceedings, the different party writers are very contradictory. In the month of October 1642, the earl of Essex was in this town with 3000 men under arms; and at several other times, during the parliamentary civil war, Kingston was possessed by both parties: but the townsmen were mostly in favour of the royalists. Leland states, that “many old monuments were founde yn the decayling doune from Come-Parke towards the galows;”—also, “fundation of waulles of houses, and diverse coynes of brasse, sylver, and gold, with Romayne inscriptions, and painted yerthen pottes; and yn one, yn cardinal Wolsey’s tyme, was founde much Romayne monecy of sylver, and plates of sylver to coyne, and masses to bete into plates to coyne, and chaynes of sylver.” The bishops of Winchester formerly had a hall here.

In the market-place is the town-hall, which was built in the time of queen Elizabeth. In this are held the Lent assizes for the county of Surrey; and in a room adjoining, the corporation hold their courts of assize.

Adjoining the town is an old mansion, called Ham-house, which was intended for Henry, prince of Wales, son of James I. It afterwards belonged to the duke of Lauderdale, who furnished it in a very expensive and gorgeous style. In the centre of the house is a large hall, surrounded with an open gallery. Some of the ceilings are painted by Verrio; and several rooms are ornamented with paintings by the old masters, among which are a few valuable portraits. In this house was born John, duke of Argyll, and his brother Archibald, who was also created duke, and made lord keeper of Scotland. The church of Kingston has some ancient parts. On its south side was the chapel of St. Mary, which fell down in the year 1730, and buried the sexton, his daughter, and another person, in the ruins. The daughter, however, was rescued alive, and succeeded her father. In the church are several monumental memorials, some of which are for persons of eminence. Near Kingston is a bridge across the Thames, said, by Mr. Lysons, “to be the most ancient on the river, except that of London. It is men-

tioned

tioned in a record of the eighth of Henry III." An act of parliament was obtained in the thirteenth year of George, for lighting and watching this town. In 1800, Kingston contained 682 houses, and 3793 inhabitants. Lyfons' Environs of London, vol. i. 4<sup>to</sup>. 1796.

**KINGSTOWN**, a town of Africa, in the kingdom of Kauror.

**KINGSTREE**, a post-town of America, in Williamsborough county, South Carolina; 180 miles from Washington.

**KING-TCHEOU**, a city of China, of the first class, in the province of Hou-quang, seated on the Yang-tse river. The district of this town has two cities of the second order, and eleven of the third class. It is surrounded with lakes, which contribute to render the land about it fruitful and pleasant. It is well-built and populous; and its trade is great. A wall divides it into two parts, one of which belongs to the Chinese, the other to the Tartars, of which the garrison consists. N. lat. 30° 28'. E. long. 111° 37'.

**KING-TE-CHING**, a village belonging to the district of Jao-tcheou in China, in which are collected the best workmen in porcelain, and as populous as the largest cities of China. It is reckoned to contain a million of inhabitants, who consume every day more than ten thousand loads of rice. It extends 1½ league along the banks of a beautiful river, with crowded buildings, and its streets are thronged with inhabitants; for a great number of whom it furnishes employment. The river in this place forms a kind of harbour, about a league in circumference, which accommodates a great number of barks. This village contains about 500 furnaces for making porcelain; and to those who approach it at night it appears like a large city on fire. Strangers are not permitted to sleep here, but they are required either to sleep in their barks, or with their friends. N. lat. 29° 25'. E. long. 116° 56'.

**KINGTON**, or **ΚΥΝΕΤΟΝ**, a small market town and parish in the hundred of Huntington, and county of Hereford, is situated on the Black Brook, under Bradnor mountain. A castle was constructed at this place, at a former period, for the defence of the marches; but the whole is now destroyed. The church is a very irregular structure, having a detached tower, with a spire of singular form. The town is in general well built, and has a free grammar school, erected and endowed by lady Watkins. The inhabitants of this parish, as ascertained by the act of 1801, amounted to 1424; the number of houses to 311. The principal manufacture is that of woollen cloth. Kington is distant from Hereford 20 miles, and from London 155. Here are four annual fairs, and a weekly market on Wednesdays. The markets immediately before Easter, Whitsuntide, and Christmas, are very considerable for corn, cattle, and cloth; and are equal to most fairs. On the summit of Bradnor mountain are the remains of a square entrenchment.

About two miles eastward of Kington are the ruins of Lyons-hall castle, a very ancient structure, of which scarcely any thing now remains but fragments of the outer walls; the castle having been demolished in the reign of Edward II. Beauties of England, vol. vi.

**KING-TONG**, a city of China, of the first class, in the province of Yun-nan, on the Pa-pien river. It is surrounded with very high mountains, in which, it is said, there are silver mines. The adjacent country abounds with rice, and the valleys are well watered. N. lat. 24° 30'. E. long. 100° 39'.

**KINGUA**, a town of East Greenland. N. lat. 62° 21'. E. long. 45° 26'.

**KING-WILLIAM**, a county of Virginia, between Mattapony and Pamunkey rivers. It is 47 miles long, and 15 broad, and contains 5744 free inhabitants, and 3311 slaves. At the court-house is a post-office.

**KINGWOOD**, a township in Huntingdon county, New Jersey, containing 2436 inhabitants, of whom 104 are slaves; 15 miles S.W. of Lebanon.—Also, the name of a small river of New Jersey.

**KING-YANG**, a city of China, of the first class, in the province of Chen-fi. N. lat. 36° 6'. E. long. 107° 20'.

**KING-YUEN**, or **KIN-YUEN**, a city of China, of the first class, in the province of Quang-fi. This city is built on the banks of a large river, and surrounded with lofty and craggy mountains. The valleys between these mountains are full of villages and forts, and in the rivers is found gold. Under its jurisdiction are two towns of the second order, and five of the third. N. lat. 24° 26'. E. long. 108°.

**KIN-HOA**, a city of the first class in China, in the province of Tehe-kiang, situated in the middle of the province, on the banks of a fine river; formerly distinguished both as to the extent and beauty of its buildings, but much injured by the attacks of the Tartars. It has eight towns of the third order in its district, situated partly in a level country, and partly among mountains. Rice grows plentifully, and the wine made of it is much esteemed. The inhabitants carry on a large trade in dried plums and hams, which are sent into all provinces of the empire. Near it are small shrubs, resembling jessamine, which produce tallow, that make very white candles. N. lat. 29° 16'. E. long. 119° 16'.

**KINIC ACID**, in *Chemiſtry*, is a peculiar substance, recently found in Peruvian bark, where it exists in combination with lime. We are indebted for the discovery to a Mr. Deschamps, apothecary at Lyons, who described the salt in the 48th volume of the *Annales de Chimie*. He obtained it by macerating the bark in cold water; afterwards evaporating the solution, and leaving it to crystallize. The crystals produced were equal to about 7 *per cent.* of the bark employed. He did not prosecute his inquiry further; and it was not until some experiments which were afterwards undertaken upon it by Vauquelin, that the salt in question was found to contain a new acid. The researches of this excellent chemist, however, appear fully to have established the fact; and he has denominated it the *kinic acid*, from the word *quinquina*, which is a name given by the French to the yellow kind of bark from which the salt described was extracted.

The kinat of lime, obtained by the foregoing process, is of a white colour, and crystallizes in plates. It is devoid of taste, dissolving in about five times its weight of water, at the temperature of 55°. Alcohol exerts no action upon it. By exposure to heat it is decomposed, and carbonat of lime and charcoal are the products. Its solutions are not altered by ammonia; but the fixed alkalis precipitate the lime. This also takes place with the oxalis and sulphuric acids. It appears to be composed of 90 acid, and 10 lime.

To procure the free acid, M. Vauquelin precipitated the lime by an oxalat, and afterwards concentrated the liquid by evaporation. It was of a syrupy consistence; and on being set aside to crystallize, was found, at the end of a week, to have undergone no change; but the moment he touched it with a glass rod, the whole mass assumed the form of divergent crystalline plates. The colour of the acid was of a slight brown; occasioned, probably, by the evaporation

poration having been carried too far. Its taste was extremely four; and there was also a bitterness in it, which might be owing to an imperfect separation of the other constituents of the bark. Exposure to the air effected no alteration upon it.

By heat, kinic acid is decomposed, and converted into charcoal. It combines with different bases; and with the earths and alkalis, produces soluble and crystallizable salts. On the nitrats of silver, mercury, and lead, no change is occasioned by it. *Annales de Chimie*, t. 59.

KINITS, in *Geography*, a town of Moravia, in the circle of Olmutz; 24 miles W. of Olmutz.

KINK-COUGH, in *Medicine*. See PERRUSSIS.

KINKS, in the *Sea Language*. When ropes are new, or too hard laid, they are apt in foldings to make turns, which are called kinks.

KIN-LI, in *Geography*, a town of Corea; 15 miles E.N.E. of Cou-fou.

KIN-MEN-LO, an island in the Chinese sea, near the coast of China, about 24 miles in circumference, of a triangular form. N. lat. 24° 30'. E. long. 118° 20'.

KINNAIRD'S HEAD, a promontory on the east coast of Scotland, forming the fourth boundary of the frith of Murray; supposed to be the "promontorium Taixalium" of Ptolemy. N. lat. 57° 58'. W. long. 1° 54'.

KINNARAS, or CINNARAS, in *Hindoo Mythology*, are male dancers in Swerga, or the heaven of Indra.

KINNBACK, in *Geography*, a small island on the west side of the gulf of Bothnia. N. lat. 65° 9'. E. long. 21° 30'.

KINNEGAD, a post-town of Ireland, in the county of Westmeath, province of Leinster. A kind of cheese, of a very inferior quality, made in this neighbourhood, is called Kinnegad cheese, from this town. It is 29½ miles W. by N. from Dublin.

KINNEL, in *Rural Economy*, a provincial term sometimes applied to a powdering tub or salting vessel.

KINNEYETO, in *Geography*, a considerable town of Africa, in the kingdom of Manding; about 24 miles N.E. of Kamalia. N. lat. 12° 55'. W. long. 5° 52'.

KINNOR, in the *Jewish Antiquities*. See CYNRA, and CHINNON.

KINO, in *Chemistry*, is an astringent substance, of a black colour, supposed to have been originally introduced into this country from Africa. It is commonly called a gum, but very improperly; for, as Vauquelin has remarked, it has neither the physical nor chemical properties characteristic of that class of vegetable products. According to Dr. Duncan, the kino now known in the shops is principally imported from Jamaica; and is an extract from the *coccoloba uvifera*, or *jujube grape*. It is nearly wholly soluble in hot water and hot alcohol, and chiefly consists of tannin in a particular state; which has the property of precipitating the salts of iron of a green colour, instead of black. With gelatine it forms a rose coloured coagulum. We are indebted to Dr. Duncan for the first description of its properties; and he has published the result of his observations in the *New Edinburgh Dispensatory*, p. 242. Vauquelin afterwards took up the subject; but the kino that his experiments were made upon, Dr. Duncan suspects to have been the product of some of the species of *eucalyptus*, particularly the *resinifera*; being the substance called *Botany Bay gum*, a quantity of which was some years ago imported into Europe. It differs from the kino of the *coccoloba* in being of a much finer quality. *Nicholson's Journal*, vol. vi. No. 24, p. 232—234.

KINO, in the *Materia Medica*, or "*Gummi rubrum astringens gambiense*," the gum resin of a non-descript

African tree. Although the tree, from which this resin is obtained, is not yet botanically ascertained, it is known to grow on the banks of the river Gambia in Africa. The first account of this drug is related by Moor in his "*Travels into the interior Parts of Africa*," ed. 2. p. 113, by which we learn, that in wounding the bark of this tree, the fluid kino immediately issues drop by drop, and by the heat of the sun is formed into a hard mass. This, which was for some time considered as a species of *Sanguis draconis*, was afterwards fully explained, and its medical character established, by Dr. John Fothergill. (*Med. Obs. and Enq. vol. i.*) Kino has a considerable resemblance to Catechu, but redder, and is more firm, resinous, and astringent. It is now in common use, and is the most efficacious vegetable astringent, or styptic, in the materia medica. The "tincture of kino" is prepared by macerating three ounces of kino powdered in two pints of proof spirit, for 14 days, and straining it. All the astringency of kino is included in this preparation. The dose is from one fluid-drachm and a half to two fluid-drachms. The "compound powder of kino" consists of 15 drachms of kino, half an ounce of cinnamon bark, and a drachm of hard opium, which are to be reduced separately into a very fine powder and then mixed. This astringent powder was first introduced into the London Pharmacopoeia in 1809; the proportion of opium contained in it being one in twenty. The dose is from five gr. to ʒj.

KINOGAM, in *Geography*, a river of Canada, which runs from lake Wiakwa to the river Saguenay. N. lat. 48° 34'. W. long. 71° 31'.

KINOLLI, a town of Asiatic Turkey, in Natolia, in the coast of the Black sea; 16 miles N.W. of Sinob.

KINOSA, Str., an island in the Grecian Archipelago. N. lat. 36° 53'. E. long. 25° 34'.

KINROSS, the chief town of a small county of the same name, bordering N.E., E., and S. upon Fife, and the other part on Perth, in Scotland. The number of inhabitants of this county in 1801 was 6725, of whom 888 were employed in trade and manufactures, and 667 in agriculture. Kinross is a small town of little consequence, excepting as a market for the neighbouring country. It is situated on the border of Lochleven, a fine fresh water lake, with two small islands in it, on one of which is a castle, which was one of the many places in which the unfortunate Mary Stewart, queen of Scots, was confined, and from which she effected her escape. The lands near Kinross, like those of the adjoining counties of Fife and Stirling, are fertile and well cultivated. The county returns a member to parliament alternately with the small island of Clackmannan. The town was formerly famous for its cutlery; but the chief manufacture now is Silesia linen. In 1801, the number of inhabitants was 2124, of whom 394 were employed in trade and manufactures; 18 miles N.N.W. of Edinburgh. N. lat. 56° 13'. W. long. 3° 25'.

KINROSS-SHIRE is a small inland county in the northern part of Scotland. The ancient shire of this name was divided, about the year 1426, into the two counties of Fife and Kinross; and at the revolution Kinross, being thought too small a county as it then stood, was enlarged by the addition of Orwell, Cleith, and Tillibole; which parishes, before that period, were part of the county of Fife. But though these are now two distinct counties, and are separately represented in parliament, they are both comprehended in the sheriffdom of Fife. Kinross-shire is bounded on the east and south by Fife-shire, and on the north and west by Perthshire. It extends, from east to west, from Foffaway church to Anchmore bridge, eleven miles; and from Kelly-bridge nearly due north to Damhead, about nine miles and a half.

a half. The general figure of the county is circular, though the line of its boundary is very irregular. That which limits with Perthshire measures twenty-one miles; but when taken in a right line is only about fourteen: the boundary with Fifeshire nearly twenty-eight miles, but in a straight line does not exceed nineteen. The county contains 78 square miles, or about 39,702 Scottish acres; comprehending one town, Kinross, with six other parishes; and was returned under the population act of 1801 as containing 1,409 houses, and 6725 inhabitants. The surface of the county is greatly varied. The middle portion occupies a situation comparatively low, and may be considered as a kind of plain slightly varied with gentle rising grounds. The boundaries, in every direction, are hilly, or formed of a higher land than the high or vale of Kinross, with a single exception, at the narrow passage at the eastern extremity of the county, where the river Leven issues from the celebrated loch of that name. The Ochil hills form the northern boundary of Kinross-shire; the Cleith hills, the southern; and Balnearthie hill, with West Lomond, or Bishop's hill, as it is called, bound it on the east and south-east quarters. The sides of these hills, which form the central part of the county, are for the most part excellent pastures, generally retaining beautiful verdure; patches of moorland occurring only near their summits. In the interior and higher part of the Ochils, however, heath becomes more abundant. The chief variety in the appearance of the low grounds is produced by the mixture of corn and grass-lands, and by a few thriving plantations interspersed with villages. Some intervening morasses, and extensive moors, likewise variegated the surface. Even the margin of Lochleven is ornamented in this way by a common moor of more than 300 acres, in the vicinity of the town of Kinross, in the very centre of the county. The aspect of the whole shire is open and exposed, there being but a small part inclosed, and many of the inclosures formed not of hedges but of stone walls.

Of the waters of this county, the most remarkable is the lake called Lochleven, on the western banks of which stands the town of Kinross. This lake, though inferior in magnitude and grandeur to Lochlomond, is a noble expanse of fresh water, about fifteen miles in circumference, including its angular juttings, and covering nearly 3300 acres. The surface of the water at its highest rise and lowest fall, varies about three feet. Lochleven is bounded on the east by the Lomond hills, on the south by that of Balnearthie, and on the west by the plain of Kinross. It is remarkable for producing trout of a large size with flesh of a reddish colour, nearly approaching to the taste and appearance of salmon. Some of them weigh from two to eight, and even ten pounds each. The high colour of these trout is ascribed to the great quantity of small red shell-fish which abounds at the bottom of the loch; the trouts have often their stomach full of them. Lochleven receives the waters of three small rivers; Gairny, the southernmost stream in the county, South Queech and North Queech, which both have their rise among the Ochil hills. Lochleven gives rise to the river Leven, which passes through a considerable part of Fifeshire into the sea, forming the largest water in that county. In September, the eels, which greatly abound in Lochleven, begin to emigrate in great numbers to the sea; but only attempt this passage during the night. The county contains several small lakes; of these four are in the parish of Cleith: the largest is about a mile and a half in circumference: the four cover about 250 acres. The climate in the higher grounds of this county is cold and wet; owing to the elevation of the land, and chiefly to the hills, which attract the clouds and vapours. Frost sets in earlier, and

continues longer, than in the adjacent districts towards the south. The county is well intersected with roads, which are, in general, kept in excellent repair by the stature labour. The carriages and the personal duty may be furnished in kind, or commuted, at the option of the persons chargeable. The principal turnpike roads are those from Perth to Queensferry, and from Stirling to Kinross: they are kept in the highest preservation.

Of the antiquities of Kinross-shire, those connected with Lochleven are the most remarkable. The castle of Lochleven, now in ruins, stands upon an island of about two acres in extent. The circuit of the outer rampart is 585 feet. This castle is said to have been built by Congal, son of Dongart, king of the Picts: but it has been rendered particularly conspicuous in Scottish history, by the confinement of the unfortunate queen Mary. In the largest island of the lake was formerly situated a priory dedicated to St. Serff, or Servanus; and said to have been founded by Brudo, the last but one of the Pictish sovereigns.

KINSALE, a sea-port and post-town of the county of Cork, Ireland. It is situated at the mouth of the river Bandon, which forms a fine harbour, and is navigable for large ships near 12 miles above the town, though a bar prevents large men of war from coming into the basin. In this port there was formerly a dock furnished with stores for the use of the navy, but this has lately been removed to the neighbouring harbour of Cork, where the accommodations are greater, and which is the chief naval station in Ireland. The entrance of Kinsale harbour is defended by a fort, which having been constructed in the reign of Charles II. is called Charlesfort, in which there is always a good garrison. Kinsale is the town which the Spaniards took possession of, and in which they were besieged and taken prisoners, at the latter end of queen Elizabeth's reign. The town, which contains at least 10,000 inhabitants, is built at the side of Compass hill; the streets are narrow and the houses indifferent, yet in the bathing season it is the resort of much fashionable company, and there are at all times many genteel residents, so as to afford good society. Kinsale is represented by one member in the imperial parliament, who is chosen under the influence of the lord de Clifford, chief proprietor of the town. It gives title of baron to the descendant of the famous John de Courcy, who procured for himself and posterity the privilege of being covered in the king's presence. Kinsale is 136 miles S.W. from Dublin, and about 12 miles S. from Cork. N. lat. 51° 42'. W. long. 8° 30'.

KINSALE, *Old Head of*, a cape of Ireland, projecting a considerable way into the sea, and forming a very noted land mark. N. lat. 51° 37'. W. long. 8° 30'.

KINSALE, a post-town of Virginia, 16 miles from Westmoreland court-house, and 12 from Northumberland court-house.

KINSOMBA, a town of Africa, 25 miles S.E. of New Benuea.

KINTAL, or QUINTAL, a weight of one hundred pounds, more or less, according to the different usage of divers nations.

The kintal of Smyrna is 123 pounds three ounces nine drachms, or 120 pounds seven ounces 12 drachms; but that of Aleppo is 165 pounds 11 ounces 15 drachms.

KIN-TAM, in *Geography*, an island in the Chinese sea, near the coast of China, about 24 miles in circumference. N. lat. 30° 8'. E. long. 121° 24'.

KINTARRA, a town of Hindoostan, in the circar of Cicaele; 10 miles N. of Cessimotta.

KIN-TCHENG, a town of Corea; 80 miles E. of King-ki-tao.

**KIN-TCHIN**, a city and capital of the isles of Lieou-keiou. This city is situated in the S.E. part of the large island called "Cheou-li," where the court resides. The king's palace, which is reckoned to be four leagues in circumference, is built on a neighbouring mountain. It has four gates, which correspond to the four cardinal points; and that which fronts the west, forms the grand entry. The view which this palace commands is most extensive and delightful; it reaches as far as the port of Napa-kiang, at the distance of 10 lys, 200 lys making 60 geographical miles), to the city of Kin-tching, and to a great number of other cities, towns, villages, palaces, temples, monasteries, gardens, and pleasure-houses. N. lat. 26° 2'. E. long. 146° 25'.

**KINTEN**, a town of Prussian Lithuania; 15 miles S. of Memel.

**KINTORE**, a small borough town and parish of Aberdeenshire, Scotland, in the district of Garriwick, is feued on the river Don, at the distance of 15 miles N.W. of the county town, and 137 N. of Edinburgh. It is said that this place obtained a charter at an early period, but the only authentic deed of this description was granted by James V.; its government is vested in a provost, two bailiffs, a dean of guild, a treasurer, and a council of eight other burghesses. The first of these offices has long been veiled in the ears of Kintore. In this place are a town-house and a prison; and in the year 1800 it contained 198 houses and 846 inhabitants. In conjunction with Bamff, Cullen, Elgin, and Inverury, it returns one member to the British parliament. The parish of Kintore is about six miles in length by eight in breadth, and rises gradually from the river Don to a range of hills. In it is Thailone, the seat of Forbes Mitchell, esq. and in one part of it are several cairns and tumuli, which are traditionally said to mark the scene of an action between Robert Bruce, and the army of Edward I. Sinclair's Statistical Account of Scotland.

**KINTYRE**, or **CANTYRE**, one of the three districts of Argyleshire, in Scotland. Of the three districts or divisions of the county of Argyle, viz. Lorn, Knappdale and Kintyre, the latter is the most level and best adapted to the purposes of agriculture. It forms a long narrow peninsula, bordered by Lochfinc and the Firth of Clyde on the east side, and by the western sea on the west. Of this peninsula, by much the greatest part belongs to the duke of Argyle, who has a chamberlain or factor resident at Campbeltown, for the superintendance of this part of his estate. There is also a custom house at Campbeltown, for the regulation of the collection and prevention of frauds on the revenue, and some of the cruisers are generally on this station, for the detection and capture of smugglers. The loch or harbour of Campbeltown is excellently adapted for this, as from it a vessel of force can with ease command the whole shipping of the Clyde in moderate weather, and may board, over-haul, and inspect almost every vessel in the least suspected. The termination of the peninsula is called the Mull or Moyle of Kintyre.

**KINVACA**, a town of Africa, in Fooladoo. N. lat. 13° 10'. W. long. 6° 2'.

**KINURE POINT**, a cape of Ireland; in the county of Cork, at the entrance of Oyster haven, and about three miles east from Kinfales harbour.

**KINWAT**, a town of Bengal; 17 miles S.E. of Curuckpou.

**KINYALOO**, a town of Africa, in the town of Manding. N. lat. 12° 5'. W. long. 6° 5'.

**KIN-YANG**, a city of China, of the first class, in the province of Chen-li; which, being regarded as a barrier

against the incursions of the Tartars, is strongly fortified in the Chinese manner: the adjacent country is very fruitful; and produces a kind of herb, called "Kinfee," i. e. golden silk, to which is ascribed some medicinal virtue, and also a kind of bean which is said to be an admirable specific against any sort of poison. This city has in its district one town of the second order and four towns of the third order. N. lat. 36° 6'. E. long. 107° 19'.

**KINYAKOORA**, a town of Africa, in the kingdom of Gadou; 36 miles S.W. of Kamalia.

**KIOANON POINT**, called in some maps *Kikelones*, is the extremity of a large peninsula which projects far into the S. side of Lake Superior.

**KIO-PEOU**, a celebrated city of China, in the province of Chang-tong, which was the birth-place of Confucius. Several monuments are still to be seen there, erected in honour of this eminent man.

**KIOGE**, a sea-port of Denmark, situated on the island of Zealand, in a bay at the mouth of a river, formerly a place of considerable trade, with manufactures of valuable tapestry. In 1659, it was fortified by Charles Gustavus, king of Sweden, with ditches and ramparts; 10 miles S.S.W. of Copenhagen. N. lat. 55° 28'. E. long. 12° 12'.

**KIOLEN**, a town of Sweden, in Warmeland; 40 miles N.W. of Carlstadt.

**KIONGONG**, a town of Bengal; 30 miles N.N.E. of Burdwan. N. lat. 23° 41'. E. long. 88° 10'.

**KIONTONA**, an Indian town on Conewango river, in Pennsylvania; 11 miles N. from its mouth in the river Alleghany.

**KIOPING**, a town of Sweden, in Westmanland, on a river of the same name, communicating with Malar lake. It is a place of good trade; 10 miles W. of Stroomsholm. N. lat. 59° 33'. E. long. 16° 42'.

**KIORAH**, a town of Hindoostan, in Daggileund; 27 miles N.N.E. of Rewah.

**KIOREHVESI**, a town of Sweden, in Tavastland; 58 miles N. of Tavasthus. N. lat. 61° 56'. E. long. 24° 33'.

**KIOV**. See **KREV**.

**KIOVA**, a town of Africa, in the kingdom of Congo, and province of Sogno.

**KIOUMZEIK**, a well built town of Ava, situated on the Irwaddy, and gradually improving. The manufacture of cotton cloth is the source of its prosperity. A town called "Hinzaelah" near it, is of much greater antiquity; 76 miles N.W. of Rangoon. N. lat. 17° 42'.

**KIOZDI**, a town of Walachia; 77 miles N. of Bucharest.

**KIPE**, a kind of ozier basket, wide in the middle, and narrow at both ends; used for taking fish.

**KIPE** is also a game, which consists in throwing something into a hole, called the kipe-hole.

**KIPHANTA**, in *Geography*, a town of European Turkey, in the Morea; 20 miles E. of Militra.

**KIPPER**. See *Salmon FISHERY*.

**KUPPER-TIME**, a space of time between the festival of the finding of the Holy Cross, May the 3d and 12th day; during which, salmon-fishing in the river Thames, from Gravesend to Henley, is forbidden by Rot. Parl. 50. Edw. III.

**KIPPIS, ANDREW**, in *Biography*, an eminent nonconformist minister of the last century, was born at Nottingham on the 28th day of March, in the year 1725. He was defended, both by the father's and mother's side, from ejected ministers of the names of King and Ryther, who are mentioned with respect in Dr. Calamy's Account of the Ministers

Ministers ejected and silenced by the Act of Uniformity. Upon the death of his father, when he was about five years of age, he was removed to his grandfather at Sleaford in Lincolnshire, where he received his grammatical education. His talents and application attracted the peculiar notice of Mr. Merrivale, who was pastor of a congregation of dissenters in that town; and by his advice and encouragement, his views were directed to the profession of a dissenting minister, and to those literary pursuits in which he afterwards so much excelled. At the age of sixteen, he was admitted to the academy at Northampton, under the care of Dr. Doddridge; and in that seminary he prosecuted his studies with such diligence and improvement, and conducted himself with such exemplary propriety, as to conciliate the affectionate esteem and partial attachment of his tutor. Having completed his course of five years at the academy, he undertook the charge of a dissenting congregation at Boston, in Lincolnshire, with which he settled in September 1746. From Boston he removed to Dorking in Surrey, in 1750; and in 1753, he succeeded Dr. Hughes as pastor to the society in Prince's street, Westminster. In the same year he married Miss Elizabeth Bott, the daughter of a respectable merchant at Boston, in whom he found a sensible, prudent, sprightly, and cheerful companion, and by whose attentions his mind was relieved from all family concerns; so that he was left at full leisure to prosecute the various duties which his numerous engagements devolved upon him. Whether we consider the literary talents, the ministerial abilities, or the external accomplishments of the subject of this article, no person could have been better qualified for the situation into which he was introduced than himself. His settlement with the society in Westminster laid the foundation of that celebrity which he afterwards acquired, and of that extensive usefulness which distinguished his future life. He was thus soon introduced into a connection with the Presbyterian fund, to the prosperity of which he was afterwards very ardently devoted. In June 1762, he became a member of Dr. Williams's trust; and this appointment afforded him an additional opportunity of being eminently and extensively useful in a variety of respects. His connection with the general body of Protestant dissenting ministers, belonging to the cities of London and Westminster, and with many charitable institutions, which the liberality of dissenters has established, gave him frequent occasion to exercise his talents for the honour and interest of the cause, to which, both by his sentiments and profession, he was zealously attached.

His literary abilities and attainments were acknowledged by all who knew him. It was, therefore, natural to imagine, that when a favourable opportunity offered, he would be employed in the department of public education. Accordingly, when the death of the reverend Dr. Jennings rendered it necessary to make a new arrangement of tutors in the academy, supported in London by the funds of William Coward, esq. the trustees directed their views to him; and in the year 1763, he was appointed classical and philological tutor to that institution.

In 1767 he received the degree of doctor in divinity from the university of Edinburgh; an honour, in the unsolicited grant of which the principal and professors very cordially concurred. No one can dispute his peculiar claim to such a token of respect.

In March 1778, he was elected a fellow of the Society of Antiquaries; and in June 1779, a fellow of the Royal Society. He was a member of the council of the former society from 1782 to 1784, and of that of the latter from

1786 to 1787. In both these societies he was a regular attendant, and a respectable and useful member.

Having, in the year 1784, quitted his connection with Mr. Coward's academy, which, upon the resignation of the two other tutors, was discontinued, he cordially concurred with a very respectable body of dissenters, in 1786, in establishing a new institution in the neighbourhood of London, with a view of educating ministers and other young gentlemen intended for civil life. Dr. Kippis was very assiduous and active in his endeavours to accomplish this laudable design; and though his other engagements rendered it very inconvenient for him to accept any official connection with it, he was urged to unite with other persons, for whom he entertained a peculiar respect; and he at length, though not without reluctance, acquiesced in the appointment to be one of the tutors of this new institution. The distance of his residence from Hackney, where the college was fixed, and some other circumstances which it is unnecessary to recite, induced him in a few years to withdraw from it, as a tutor; though he still continued to serve it by a liberal subscription, and by his interest with opulent friends.

Dr. Kippis continued to prosecute his other useful labours without intermission; and till within a fortnight of his death, his friends had no reason to imagine that they were so near their close. In the course of the summer, a few weeks before his death, he took a long journey on public business, and returned, as his fellow travellers apprehended, with recruited spirits and established health; and they were equally surpris'd and grieved when they heard that he was confined to his bed with a fever, which baffled the skill of the most eminent physicians, and which hastily advanced to the fatal crisis. His disorder was of such a nature, that he found himself both disinclined and unable to make any exertion, or to converse much even with his most constant attendants. There is reason, however, to believe, that in a very early stage of his disorder he was not without apprehensions of its terminating in his dissolution. The last public service he performed was on the 20th of September; and on Thursday evening, the 8th of October, he awoke after a tranquil sleep of some continuance, and in a little while expired: having served his generation according to the will of God, and attained the age of 70 years and 6 months.

It is not easy to do sufficient justice to the eminent talents, the extensive labours, and exemplary character of Dr. Kippis.

His mild and gentle temper, his polished manners, his easy and graceful address, and a variety of external accomplishments, prepossessed those who first saw him in his favour, and could not fail to conciliate esteem and attachment on a more intimate acquaintance. These qualities contributed very much to recommend him to persons in the higher ranks of life, to several of whom he had occasional access; and qualified him, in a very eminent degree, for the situation in which he exercised his ministerial office. But he was no less condescending, courteous, and affable to his inferiors, than to those who occupied superior stations. Dr. Kippis had nothing of that austerity and reserve, of that haughtiness and superciliousness, of that parade and self-importance, and ostentatious affectation of dignity, which forbid access, and which mar the freedom and the pleasure of all the social intercourses of life. And yet these disgusting and odious qualities sometimes accompany literary men, and especially those who have acquired any considerable degree of eminence and reputation.

The mental abilities of Dr. Kippis were of the superior kind. He possessed a comprehensive understanding, a sound

judgment, a retentive memory, a correct imagination, a refined taste, a quickness and a facility of exerting his faculties on any subject or occasion, however suddenly they might occur.

The natural powers of his mind were cultivated with an assiduity and perseverance of application, in which he had few superiors, and not many equals. They had been habituated through life to regular and constant exercise, and had acquired strength and vigour from use. He was never hurried and distracted by the variety of his literary pursuits; and though he had many engagements which required his attention, and which diverted his mind from the objects of study to which he was devoted, he never seemed to want time. Every kind of business was referred to its proper season. By a judicious arrangement of his studies, as well as of his other occupations, the number and variety of which he never ostentatiously displayed, and by the punctuality of his attention to every kind of business in which he was employed, he avoided confusion; he retained on all occasions the possession of himself; and he found leisure for reading and writing, and for all his literary avocations, without encroaching on that time which he appropriated to his professional duties and social connections.

Indeed, there have been few persons, says his biographer, who read so much, and with such advantage to themselves and others, as Dr. Kippis. Hence he acquired that extensive acquaintance with books, and with the literature of ancient and modern times, and particularly of the last century, which rendered him an instructive companion, and which directed him where to apply for necessary information on any subject that employed his own attention or that of others. But though he read much, he was not one of those who waste their time in desultory reading, and who make no addition to their stock of useful knowledge by the volumes which they turn over for mere present amusement. He read with attention and discrimination. He formed an accurate judgment of the intrinsic value of every publication, to which he had recourse: and there have been few works, in the department of literature with which he was conversant, that have issued from the press, for many years, of the specific objects and real merit of which he could not give a just and satisfactory account.

There is one circumstance, to which it was principally owing that Dr. Kippis seemed, in the midst of a great number of engagements, to have time at his own command, and which enabled him to dispatch much business without apparent hurry and confusion.

We mention it here, for the direction of young persons, and especially of young students, whose habits are not established. He had been accustomed from his youth to early rising; and he thus secured to himself a certain portion of time, during which he was not liable to be interrupted by any foreign avocations. This habit was no less conducive to his health, than to the discharge of his various literary and professional obligations. Providence had blessed him with an excellent constitution. He had preserved it unimpaired by a course of uniform regularity and temperance. He was little interrupted through life by any bodily disorder in any of the occupations to which he was devoted. If we except a fever, which laid him aside for some years before his death, and a constitutional cough which was rather beneficial than injurious, he enjoyed an unusual share of health and spirits.

Dr. Kippis possessed other qualities, besides his mental abilities, however excellent, however assiduously cultivated, and however usefully employed, which rendered his character

in a still higher degree estimable and praise-worthy. In private life, his disposition and deportment were amiable and exemplary. His piety originated in honourable sentiments of the perfections and providence of God; and its practical influence was uniform and permanent. He exhibited, in all his connections and concerns, a humble, meek, placable, forgiving, and benevolent temper. The gentleness, mildness, and philanthropy of his disposition formed very distinguishing traits of his character. With these virtues, so congenial to the spirit of the religion he professed, so conducive to the tranquillity of his own mind, and so powerful as incentives to activity and usefulness, he united an inflexible integrity, and an independence of spirit, which disdained every thing that was mean, selfish, and servile.

If we accompany Dr. Kippis from private and domestic life into the various stations of public usefulness, which Providence assigned him, we shall find him eminently qualified, and ardently disposed to serve his generation according to the will of God. His knowledge of the world, the rectitude of his judgment, and the mildness of his temper, gave him considerable influence in various connections to which he belonged. At the Presbyterian Board, in Dr. Williams's Trust, and in the general body of associated ministers, his opinion always claimed peculiar deference. As he was become the father of several societies of this kind to which he stood related, his age commanded respect; and his condescending, complying disposition rendered it easy and pleasant to act with him on every occasion. Notwithstanding the variety of his engagements, he was a constant attendant. He never pleaded them as an apology for absence. He never wished to decline any public service, whatever personal inconvenience or trouble might attend it. He preferred the concerns of others, who needed his assistance, to his own.

As a scholar, the literature of Dr. Kippis was various and comprehensive. But the studies to which he principally applied, and in which he most excelled, were those of the classics, the belles lettres, and history; besides those which were immediately connected with his profession. The history of his own country had been the subject of his long and laboured investigation; and the principles of the British constitution he had diligently studied. To these he was zealously attached; and he ably defended them, though he was not unapprized of the corruption which time had introduced, and of the necessity and wisdom of a speedy reformation. He was a steady, uniform, and ardent friend to the cause of civil and religious liberty; and in the course of his life he had various occasions of avouching himself the advocate of this cause. But whilst he detested tyranny and oppression, he dreaded anarchy and tumult. In the political contests, which have lately agitated this country, the moderation of his temper was eminently conspicuous. His disposition was gentle and conciliating. He was an enemy to every species of violence; and he thought that calmness, firmness, and perseverance in the pursuit of constitutional measures, were the most likely means of obtaining a reformation of acknowledged abuses, and a termination to public calamities and evils. Though he thought it most prudent to withdraw from some societies of a political nature, with which he had been long connected, he never abandoned the principles upon which his first connection with them was founded; nor did he ever disguise his sentiments either of men or of measures, whenever a proper occasion for declaring them occurred.

In many other societies of a different kind, that were established for literary improvement or friendly intercourse,

Dr. Kippis was a very valuable and useful member. Whilt his modestly prevented his obtruding his sentiments on others, or assuming the lead, and presuming to dictate amongst those who were in various respects inferior to himself, he was always communicative and entertaining. He never offended either by an ungracious reserve and affected silence, on the one hand, or by an intrusive and troublesome loquaciousness on the other. His literary character was universally acknowledged by persons of this description, with whom his acquaintance was intimate and extensive. The course of his studies furnished him with a variety of anecdotes, that rendered his conversation, on particular occasions, interesting and instructive. His knowledge of books, and his judgment of their respective merit, which was always formed with candour and pronounced with modesty, were very comprehensive and accurate; and he was often appealed to by those who wished to obtain information on subjects of this nature. In those friendly associations to which he belonged, he was always placid and cheerful; placid without dulness, and cheerful without an unbecoming levity. In him were invariably united, the knowledge of the scholar, and the judgment resulting from experience and an attentive observation of the course of the world, with the manners of the gentleman, and the decorum belonging to his public character as a Christian, and his profession as a minister.

Amidst a variety of other occupations, Dr. Kippis sustained the office of tutor, for more than 25 years, with singular reputation to himself, and with great benefit to the young persons who were under his care. His lectures and his general conduct conciliated the esteem, and promoted the improvement of his pupils. They all honoured and loved him; for he had a happy talent of attaching their affection and respect. They lamented his removal from this sphere of public service. To young men, and particularly to young ministers, Dr. Kippis was always attentive and friendly. He was ready, on all occasions, to assist them with his advice in the prosecution of their private studies and public labours; and to those who needed pecuniary aid, his hand was extended for the distribution of his own property, as well as that of others entrusted to his disposal.

As an author, Dr. Kippis commenced his career in early life, as many other young men have done, by contributing to the magazines of the time, particularly the Gentleman's Magazine. He afterwards became a more constant writer in the Monthly Review. His articles were chiefly historical and theological, with occasional strictures on works of general erudition. He also furnished a periodical publication, called the Library, with several valuable papers. He laid the foundation of the New Annual Register; and suggested the improved plan upon which that work is conducted. The History of Ancient Literature, and the Review of modern Books, were, at its first commencement, written by him, and continued to the year 1784, inclusive. He was also the author of the "Review of the Transactions of the present Reign," prefixed to the Register for 1780; and of the "History of Knowledge, Learning, and Taste, in Great Britain;" prefixed to the succeeding volumes, to the year 1794 inclusive.

During the application of the dissenting ministers to parliament, for the enlargement of the Act of Toleration in the year 1772, to which he devoted much of his time and attention, he published a valuable pamphlet, vindicating that measure as to the matter, manner, and time of it. It was intended as an answer to a publication ascribed to a writer who afterwards filled a very high station in the church, and was

entitled "A Vindication of the Protestant Dissenting Ministers, with regard to their late Application to Parliament," 8vo.

Soon after his admission into the Royal Society, he published a pamphlet, entitled "Observations on the late Contents in the Royal Society," 1784, 8vo.; with a view of allaying the animosities that subsisted in that body, which produced a good effect. His intimate connection with Sir John Pringle, bart. who was formerly a very respectable and useful president of the Royal Society, led Dr. Kippis, after his decease, to republish his Six Discourses, delivered at the assignment of Sir Godfrey Copley's medal, to which he has prefixed a valuable life of the author, 1783, 8vo. At the close of the American war he published a political pamphlet, formed from materials which were communicated to him by persons of eminence, and designed to justify the peace, which terminated that unhappy contest. This pamphlet was entitled "Considerations on the Provisional Treaty with America, and the Preliminary Articles of Peace with France and Spain." He also published several single discourses, which were delivered on particular occasions; some of which are reprinted in his volume of sermons, 1794. Nor should we omit to mention his account of the life and voyages of captain Cook, 1788, 4to.; his new edition of Dr. Doddridge's Lectures, with a great number of additional references; his life of this excellent person, prefixed to a new edition of his Exposition of the New Testament, 1792; his life of Dr. Lardner (to whose abilities, character, and writings he has paid the just tribute of respect) prefixed to the complete collection of his works; in 11 vols. 8vo. 1788: and "An Address delivered at the Interment of Richard Price, D.D. F.R.S., &c. 1791;" and an "Ordination Charge," 1788, 8vo. He also assisted in selecting and preparing "A Collection of Hymns and Psalms, for public and private Worship," 1795, 8vo. and 12mo. which is used in many places of worship among Protestant dissenters, and has passed through several editions. But the work, to which Dr. Kippis devoted his principal attention for many of the last years of his life, and by which he has acquired singular reputation, was the Biographia Britannica. His indefatigable industry in collecting materials for it, his access to the best sources of information, his knowledge of men and books, his judgment in selecting and marking every circumstance that could serve to distinguish talents and character, and the habit which he had acquired by long practice of appreciating the value of different works, qualified him, in a very high degree, for conducting this elaborate performance. It has been much regretted, that he did not live to carry on this edition of the "Biographia," farther than to about a third part of the sixth volume, which has not yet made its appearance.

Notwithstanding the time that must have been devoted to the several objects now recited, and to the correction and publication of the works of friends, who respected his judgment and wished to avail themselves of his assistance, which he could never refuse to those who requested it; Dr. Kippis never neglected the studies and duties more immediately pertaining to his character as a divine, and his profession as a minister. His acquaintance with the various branches of theology, and with subjects subservient to his critical study of the scriptures, was very extensive. He was in the daily habit of reading some portion of the New Testament in the original language. He was conversant with the best writers on Jewish and Christian antiquities; and in the course of his reading no work escaped him, that was designed to illustrate the evidence, to establish the truth and

divine original, and to investigate the genuine doctrines of the Christian Revelation.

He was a believer in Christianity upon the maturest examination and the fullest conviction. No person was better acquainted with the controversies which Revelation has produced. He had studied them in his earlier and riper years with great attention; and though he was ready to allow the force of every difficulty and objection, yet to the ample preponderance of evidence his deliberate and impartial judgment submitted. Authority, indeed, is not absolutely conclusive in questions of this nature. Yet whilst Christians can rank in the number of the advocates of their religion such men as Bacon and Boyle, Newton and Locke, Clarke and Hoadeley, Jortin and Lardner, and many other living writers of the first eminence with respect both to learning and character, who have professedly studied the evidence of Revelation; there is no real ground of alarm from the feeble efforts of avowed infidels, who have acquired popularity in another way, and to whom a partial attention may be directed, but who manifest great ignorance of its subject, and who are very reprehensible on account of their mode of attacking Christianity.

The principles which Dr. Kippis derived from Christianity were the directory of his conduct and the source of his consolation. By the amiable sensibility of his heart, as well as by the sober conviction of his judgment, he was led to value the discoveries and hopes of the gospel; to submit to the practical influence of its doctrines and precepts; and to cherish the pleasing and animating expectations which it afforded. He had imbibed in a very high degree the mild and placable and benevolent spirit of the religion which he professed, and he exemplified this spirit both in his preaching and in his practice.

Of his sentiments as a divine, and of his abilities as a preacher, it is hardly necessary for us to say any thing on this occasion. Towards the close of his life the inclination of his mind was to the distinguishing opinion of the modern Unitarians; though he was far from embracing all the tenets that have been adopted by some persons who are thus denominated. However, he disapproved their appropriating this appellation to themselves, which he considered as assuming and exclusive; and he lamented that excess of zeal, with which speculations, comparatively of small importance, are maintained and propagated. Those doctrines and duties which he thought of principal moment, he sedulously inculcated. Tenets of inferior importance, and that had no immediate influence on rectitude of temper and practice, he more generally avoided. Such, indeed, were the meekness and moderation of his temper, his solicitude to preserve peace and unity, and his governing desire to guard against the pernicious effects of a controversial and contentious spirit, that he beheld with concern the intemperate eagerness and ardour with which disputes of trivial moment have been sometimes conducted, and he deprecated the unhappy divisions which they are likely to occasion.

As a preacher, Dr. Kippis was rational and scriptural; judicious and instructive; practical and interesting, especially towards the close of his discourses; and he blended the argumentative and pathetic on particular occasions. His compositions were always well studied; his voice was clear and harmonious; his delivery was natural and unaffected, and on occasions that required it, animated and impressive; and though he sought not that popularity which depends more on sound and gesture and mechanical exertions, than on rational and fervent addresses to the judgment and affections, and which is generally of no long duration, he re-

tained the respect and esteem of the society in Westminster for more than 42 years.

Such are the general outlines of the character and labours of Dr. Kippis. "The portrait, I am sensible," says the writer from whose account of him this article is extracted, "is not sufficiently just to the original. In delineating a character, which exhibits so many excellencies and so few defects, none can suspect me of approaching to adulation. My respect for him was great. I honoured him as a father. I loved him as a brother. But my affection, I am confident, has not misled my judgment. By the favour of Providence, which marks the bounds of our habitation, I was led in early life into an intimate connection with him. Our acquaintance, as co-tutors and co-adjustors in public business, ripened into an established friendship; and our friendship continued, without so much as a momentary interruption, and with increasing attachment, for more than 32 years, to the day of his death. It must have been my own fault, if I have not derived advantage from his extensive literary knowledge, from the wisdom of his counsel, and from the exemplariness of his conduct. No apology, I trust, will be thought necessary for introducing myself on this occasion. As it was my ambition to cultivate the friendship I enjoyed, it is my pride to have it publicly known, that I valued that friendship, as one of the chief honours and pleasures of my life. The friend I have lost cannot be easily replaced." See Rees's Funeral Sermon, preached at the Meeting-house, in Prince's-street, Westminster, Oct. 18, 1795.

KIPPURE, in *Geography*, the name of the highest mountains in the chain extending into the counties of Wicklow and Dublin, about ten miles south of the city of Dublin.

KIRA, a small island in the gulf of Engia; nine miles W. of Engia.

KIRAHIANA, a town of Hungary; 15 miles E.S.E. of Munkacz.

KIRALI, a town of Asiatic Turkey, in Caramania; 35 miles W.S.W. of Cogni.

KIRANOOR, a town of Hindoostan, in the Carnatic; 22 miles N. of Nattam.

KIRANORE, a town of Hindoostan, in Marawar; 20 miles S. of Tripatore.

KIRBYE, GEORGE, in *Biography*, an excellent English madrigalist on the Italian model; but who was more remarkable for simplicity than taste and fancy. In 1597, he published his first set of madrigals to 3, 4, 5, and 6 voices; several of which were successfully revived at the concert of ancient music and the Catch-club, during the first years of those institutions. They are now suffered again to sleep in peace, with those of Walker, Wilbye, Eli, and Bennet, our principal madrigalists, perhaps never to be waked again.

KIRCAGATCH, in *Geography*, a town of Asiatic Turkey, about 40 miles N.E. of Magnisi or Magnesia, on the route to Prusa, which has risen to considerable population, from the cultivation of cotton.

KIRCAJAN, a town of Persia, in the province of Kerman; 117 miles E. of Sirgjan.

KIRCALDY, a small town of Fife, on the N. coast of the Frith of Forth, about three miles east of Kinghorn, from which also there is a ferry to Leith and Edinburgh. Besides the ferry and the fishing, Kircaldy used to employ a considerable number of ships, brigs, and other vessels, in the trade with the eastern countries of Europe and the Baltic, but these were more frequently chartered or freighted from other ports than their own. It has also been long a consider-

able place for the manufacture of coarse goods both of linen and cotton, and this trade is still prosecuted to a very considerable extent. The chief article of their manufacture consists in low-priced blue and white checked goods, used for seamen's shirts, and for clothing for the negroes in the West Indies. So great has been the demand for these articles at particular times, that shortly after the capture of Trinidad by the British, the writer of this article was requested by an eminent West India house in Liverpool, to endeavour to procure for them seven thousand pieces of these checks, or any quantity which could be supplied. Upon application, however, he found the demand from other quarters so great, that only a very small proportion of the supply could be procured. Coarse low-priced checked handkerchiefs are also manufactured to a very considerable extent.

Kircaldy was erected into a royal burgh in the fifteenth century, and its charter was ratified by Charles I. in 1644, and is governed by a provost, bailiff, and council, at which time it is said that 100 sail of ships belonged to the port: the chief article of export is coals; and the importation consists of corn, flax, flax-seed, linen-yarn, wood, iron, ashes, tallow, bark, hides, &c. Kircaldy is united with Dyfart, Kinghorn, and Bursafland, in electing a member to serve in parliament. In 1801, the number of inhabitants was 3248, of whom 700 were employed in trade and manufactures; 13 miles north of Edinburgh. N. lat. 56° 7'. W. long. 3° 9'.

KIRCH, GODFREY, in *Biography*, an able astronomer, was born at Guben, a town in Lower Lusatia, in the year 1640. He prosecuted his studies at Leipzig, where he acquired considerable reputation by the almanacs which he published. In 1692, he married Mary Margaret Winckelman, who rendered him much useful assistance by making astronomical observations for the construction of his Ephemerides. In 1701, on the establishment of the Academy of Sciences at Berlin, by Frederic I., king of Prussia, that prince invited M. Kirch to be a member of the society, and to take upon himself the office of astronomer in ordinary, with an honourable pension for his support. He died at Berlin in 1710, at the age of seventy-one years. He had been in the habit of corresponding with all the learned societies of Europe, and published a variety of astronomical treatises, which are in considerable estimation.

KIRCH, MARY-MARGARET, wife of the preceding, was daughter of a Lutheran clergyman at Panitzsch, a village near Leipzig, where she was born in the year 1670. Having lost her father when she was only twelve years of age, she was educated by his successor, and indulged the inclination which she discovered for the acquisition of knowledge, and particularly that of astronomy. This partiality for his favourite pursuit was a recommendation to M. Kirch, who obtained her hand in marriage, and found her a most valuable assistant in his scientific labours. She was not contented, however, with rendering her husband important services, but shewed herself capable of viewing the heavens with the eye of a discoverer, and in 1702, the first saw a comet, upon which M. Kirch published his observations. In 1707, she discovered a peculiar Aurora Borealis, of which mention is made in the Memoirs of the Academy of Sciences at Paris, for the year 1716. These exertions of her genius procured her the esteem of the learned at Berlin, notwithstanding which she was in very low circumstances when her husband died. She contrived to maintain herself and educate her children, by constructing almanacs, and, in 1711, she published a dissertation, intitled "Preparations for observing the grand Conjunctions of Saturn, Jupiter, &c."

Soon after this she found a patron in the baron de Throfsick, who furnished her with apartments in his own house, adapted to the carrying on her astronomical observations. Here she lived till the baron's death, which happened about two years afterwards. She now removed to Dantzic, when Peter the Great wished to engage her to settle in his empire. She preferred her native country, and, in 1716, accompanied her son to Berlin, where she was appointed astronomer to the Academy of Sciences in that city. She was now introduced to the notice of the royal family, and secured the patronage of some of the branches of it. She died in 1720, in her fifty-first year.

KIRCH, CHRISTIAN FREDERIC, son of the preceding, was born at Guben, in the year 1694, and discovered an early and very strong bias for scientific pursuits. He commenced his studies at Berlin, and afterwards continued them at Halle, whence he made excursions, for improvement, to Nuremberg, Leipzig, and Prussia. He was employed a considerable time in the observatory at Dantzic, and during his residence there the czar, Peter the Great, offered him an establishment at Moscow; but his attachment to his mother, who was averse from leaving Germany, led him to decline it. In 1717, he was made member of the Academy of Sciences at Berlin, and, in 1723, he was chosen a corresponding member of the Royal Academy of Sciences at Paris, and he shewed himself worthy of that distinction, by the frequent valuable contributions which he transmitted to them during the remainder of his life. He died in 1740, in the forty-sixth year of his age. He published several works connected with astronomy, which were in considerable reputation at the period in which he flourished. Moreri.

KIRCHBACH, in *Geography*, a town of the duchy of Stiria; 14 miles S.E. of Gratz.

KIRCHBERG, a town and castle of Bavaria; 12 miles N of Landthut.—Also, a town of Germany, in the principality of Hohenlohe, on the Jaxt; 28 miles W. of Anspach.—Also, a town of Saxony, in the circle of Erzgebirg; six miles S. of Zwickau.—Also, a town of the principality of Nassau-Dietz, capital of a bailiwick; five miles S.E. of Dietz.—Also, a town of Austria; 11 miles S. of St. Polten.—Also, a town of France, in the department of the Rhine and Moselle, and chief place of a canton, in the district of Simmern. The place contains 772, and the canton 6491 inhabitants, in 35 communes.

KIRCHEAN MUSEUM at Rome, was founded by father Kircher about the middle of the seventeenth century. This celebrated museum is full of ancient paintings, vases, gems, intaglios, cameos, and other antiquities, which are there in such abundance, that a spectator might fancy himself at Portici; but the curiosities which we were most eager to see and examine, were father Kircher's musical instruments and machines described in his *Musurgia*. They were almost all out of order in 1770, and in decay; and it is to be feared that time has not improved them. Their construction was not only curious, but manifested the ingenuity as well as zeal of the learned father, in his musical enquiries and experiments.

KIRCHEIM-BOILANDEX, in *Geography*, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the district of Mayence; 28 miles N.W. of Manheim. The place contains 1872, and the canton 9265 inhabitants, in 22 communes. N. lat. 49° 39'. E. long. 7° 50'.

KIRCHER, ATHANASUS, in *Biography*, a celebrated mathematician and philosopher, was born at Fulda in the year 1601, and when he was seventeen years of age he commenced his noviciate in the society of the Jesuits, among whom

whom he distinguished himself by his vast proficiency in literature and science. Having finished his studies, he was selected by his superiors to fill the chair of professor, and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Wirtzburg, in Franconia, with great success till the year 1631. During the war between the emperor Ferdinand II. and Gustavus, king of Sweden, he withdrew to France, and resided some time in the Jesuits' college at Avignon. After this he was called to Rome, where, for six years, he filled the post of mathematical professor in the Roman college, and then undertook the professorship of Hebrew. He died in the year 1680, in the eightieth year of his age. His works amount to twenty-two volumes folio, eleven in quarto, and three in octavo. Of these the following are mentioned as the principal, "Prælectiones magneticae;" "Primitivæ gnomonicae catoptricae;" "Ars magna lucis et umbræ;" "Mufurgia univerfalis;" "Obeliscus Pamphilus;" "Œdipus Ægyptiacus;" "Itinerarium extaticum;" "Obeliscus Ægyptianus;" "Mundus subterraneus;" "China illustrata." Kircher was a man of very extensive erudition, and of indefatigable industry, but the subjects of his studious labours were more frequently curious than useful, and a visionary fancy, rather than a cool judgment and accurate enquiry, too frequently guided his pen. Whatever wore the stamp of antiquity fascinated his attention, and he had a particular passion for decyphering hieroglyphical characters, of which, if he could not discover the true meaning, he was always ready to give what he conceived to be a plausible one. He had collected a rich cabinet of antiquities, curiosities, medals, mathematical instruments, rare animals, minerals, &c. for the museum of the Roman college, the arrangement of which was begun by himself, and finished by father Bonanni, who published a description of it at Rome in 1709, intitled "Musæum Kircherianum, &c." Moreri.

The chief work of Kircher, which we shall notice here, is his "Mufurgia Univerfalis," dedicated to Leopold, archduke of Austria, afterwards emperor of Germany, who was not only a patron of music, but an excellent performer on the harpsichord. The Mufurgia is written in Latin, in ten books, occupying two volumes in folio, of which the first contains seven books, and the second three.

The subjects which he treats are, chiefly, the following:—of the propagation of sound;—of the elements of practical music;—of harmonics, or the ratio of sounds;—geometric and algebraic division of the monochord;—new experiments on the construction of musical instruments;—of melody, comprehending new secrets for producing every species of cantilena;—a parallel between the ancient and modern music, pointing out the dignity of the ecclesiastical canto fermo, and the means of arriving at the pathetic style;—of composition, or the combination of sound, and application of melody to poetical numbers and rhythms in all languages;—musical wonders produced by latent means and new experiments of various kinds;—and lastly, of the various derivations of music and the physical and artificial purposes to which it is, or may be, applied.

This work, which undoubtedly contains many curious and amusing sections, is, however, disgraced by the author's credulity and ill-founded assertions.

Father Kircher has been very truly called "Vir immense quidem, sed indigestæ eruditionis," a man of immense, but indigested learning.

He was always careless of what he asserted, credulous, and inaccurate; collecting, without choice or discernment, whatever he found relative to the subject upon which he was

writing; and adopting whatever was offered to him, true or false, provided it contained any thing marvellous.

His Mufurgia, published at Rome in 1650, is a large book; but a much larger might be composed in pointing out its errors and absurdities. Yet with all its imperfections, it contains much curious and useful information, for such as know how to sift truth from falsehood, and usefulness from futility; for a considerable portion of which, however, he was obliged to Père Merienne, whose "Harmonie Universelle" appeared in 1536.

KIRCHER, CONRAD, a German Protestant divine, who was settled at Augsburg, and was author of a very learned and laborious work, of considerable use in illustrating the genuine sense of the holy scriptures. This work was intitled "Concordantia veteris Testamenti Græcæ, Ebræis vocibus respondentes πολυγλωσσοι. Simul enim et Lexicon Ebraicolum, &c." printed at Franckfort, 1607, in two volumes, quarto. This work, which is a Hebrew Dictionary and Concordance, is strongly recommended by father Simon when treating of the best methods to be adopted in undertaking any new translation of the scriptures. It contains all the Hebrew words in the Old Testament, introduced in an alphabetical order, and underneath is the Greek version of them from the Septuagint, followed by a collection of the passages of scripture in which those words are differently interpreted. Moreri.

KIRCHHAMM, in *Geography*, a town of Carinthia, on the borders of the Tyrol; 16 miles N.N.W. of Greiffenberg.

KIRCHHAYN, a town of Hesse Cassel, on the Wohra, containing more than 400 houses; 35 miles S.S.W. of Cassel.—Also, a town of Lusatia, on the Little Elster; 14 miles S. of Luckau. N. lat. 51° 36'. E. long. 13° 35'.

KIRCHHEIM, a town of Wurtemberg, on the Lauter; 24 miles N.W. of Ulm.—Also, a town of Germany, the capital of a lordship belonging to the family of Fugger; 25 miles E.S.E. of Ulm.

KIRCHLAUTERN, a town of the duchy of Wurzburg; 8 miles N.W. of Bamberg.

KIRCHPACH, a town of Austria; 10 miles W.N.W. of Horn.

KIRCHPERG, a town of Bavaria; 13 miles N.W. of Moßburg.—Also, a town of Austria; 8 miles S.W. of Sonneberg.

KIRCHSCHLAGEN, a town of Austria, with a medicinal bath; 10 miles S. of Zwettl.

KIRCHWALSEDE, a town of Germany, in the county of Verden; 11 miles N.E. of Verden.

KIRCKMAN, JACOB, in *Biography*, an excellent harpsichord-maker from Germany, who came to England about the year 1740, and worked with the celebrated Tabel, as his foreman and finisher, till the time of his death. Soon after which, by a curious kind of courtship, Kirckman married his master's widow, by which prudent measure he became possessed of all Tabel's seasoned wood, tools, and stock in trade. Kirckman himself used to relate the singular manner in which he gained the widow, which was not by a regular siege, but by storm. He told her one fine morning, at breakfast, that he was determined to be married that day before twelve o'clock. Mrs. Tabel, in great surprize, asked him to whom he was going to be married, and why so soon? The finisher told her, that he had not yet determined whom he should marry, and that, if she would have him, he would give her the preference. The lady wondered at his precipitancy, hesitated full half an hour; but he continuing to swear that the business must be done before twelve o'clock that day, at length she succumbed;

dered; and as this abridged courtship preceded the marriage act, and the nuptials could be performed at the Fleet or May Fair, "without loss of time, or hindrance of business," the canonical hour was saved, and two fond hearts were in one united, in the most summary way possible, just one month after the decease of Tabel.

Kirkman lived long enough to flock the whole kingdom with his instruments, and to amass great wealth. He had no children, but as many nephews hovering over him as a Roman pontiff.

Theodorus, the father of Ilocrates, was a flute-maker, who acquired wealth sufficient by his employment not only to educate his children in a liberal manner, but also to bear one of the heaviest public burthens to which an Athenian citizen was liable; that of furnishing a choir or chorus for his tribe, or ward, at festivals and religious ceremonies.

Each tribe furnished their distinct chorus; which consisted of a band of vocal and instrumental performers and dancers, who were to be hired, maintained, and dressed, during the whole time of the festival; an expence considerable in itself, but much increased by emulation among the richer citizens, and the disgrace consequent to an inferior exhibition. The fluctuations of trade and public favour have rendered the business of boring flutes far less profitable at present, than it was in the time of Theodorus. But our harpsichord maker, Kirkman, who was known to be worth 90,000*l.* twenty years before he died, doubled the profits of his instruments, by becoming a pawnbroker and a usurer; obliging young heirs with money as kindly, and with as much liberality, as a Hebrew.

At a time when ruin stared harpsichord-makers in the face, by the rage with which musical ladies were seized for the guair, in preference to all other instruments, Kirkman hit on an ingenious expedient which saved himself from bankruptcy, and restored the harpsichord to all its former favour. (See GUITAR.) He did not live to see his excellent double harpsichords of sixty or seventy guineas price, sold at auctions for twelve or fourteen pounds, and the original purchasers turn them out of their houses as useless lumber. But such are the vicissitudes of this world, that our descendants will, perhaps, know as little about the pianoforte, as we do now of the late or lyre. Kirkman is supposed to have died, in 1778, worth near 200,000*l.*

KIRCUBBIN, in *Geography*, a post-town of Ireland, in the county of Down and province of Ulster, situated in the peninsula of Ardes, and 97 miles N. by E. from Dublin.

KIRCUDBRIGHT. See KIRCUDBRIONT.

KIRDORF, a town of Upper Hesse; 34 miles W. of Cassel.

KIRENSK, a town of Russia, in the government of Irkutsk, on the Lena. N. lat. 57 40'. E. long 108 14'.

KIRENSKOL, a town of Russia, in the government of Irkutsk, on the borders, built in the year 1655, on a fertile soil, but now decaying; 112 miles W. of Doroninsk.

KIRGANELIA, in *Botany*, from *Kirgani*, a name in the Hortus Malabaricus for several species of *Phyllanthus*. Juss. 387. This genus is founded by Jusseu on a shrub called in the island of Mauritius *Bois de demoiselle*, and which Commerçon, in conformity perhaps to that appellation, destined to commemorate a botanical Neapolitan lady, Maria Angela Ardinghelli, who translated the works of Dr. Hales into Italian. Our specimen from Commerçon is marked *Ardinghella*, and we cannot account for Jusseu's passing this name over in silence. How far the genus is distinct from *Phyllanthus*, or from *Cicca*, with which latter its pulpy fruit nearly accords, we are not furnished with materials sufficient to decide.

KIRGHISES, KIRGEISES, or *Kirgises*, in *Geography*, a tribe of Tartars, who occupy about one-half of Independent Tartary, in the north. They are also called "Kaizaks," and are of undoubted Tartaric origin, so that they seem to live in perfect amity with their southern brethren, the Uzbeks. These Kirgises are divided from Siberia by the great Stepp, or desert of Ilim, which is interlined by a river of the same name. On the west of the Kirgises there still remain some tribes of Kalmuks, though the most of them migrated from the Volga in 1770, when they sought the protection of the Chinese. The Kirgises are supposed to derive their name from the founder of their horde; and from time immemorial have been classed under three divisions, of great, middle, and lesser, though quite unknown to Europe till the Russian conquest of Siberia, at which time they nominalized at the superior Yenissey about the Yufs, the Abakhan, &c.; and in the year 1606, some tribes of them became subject to the Russian empire, at the same time with the Barabines. From that period, by their puffedness, their faithlessness, their frequent rebellion, and the subjugation of correlative nations, they have had the character of an extremely turbulent people. The revolutions which have thus been produced in their political condition, induced them to remove from the Yenissey to the Oby, and gradually farther to the west and the south. They at present inhabit the prodigious desert between the Ural and the Irtysh, denominated by the Russians the Kirghisian Steppe, and bordering westward on the Caspian and the government of Caucasus, northwards upon the parts about the Ufa and the Tobol, and eastwards on the government of Kolhyvan. The great horde, defended by mountains on the south and east, asserted their independence in repeated contests with the Kalmuks of Soongaria. The middle and little hordes have acknowledged the Russian sovereignty ever since the year 1731; but having always been unfaithful allies, and a very piratical people, the Russians have been obliged to construct lines of small forts along the frontier rivers. Each of these two hordes is estimated at 30,000 kibitkies, or families, and supposing the great horde to contain 60,000, and each family to consist of six persons, the population of this wide region may amount to 720,000; but it probably does not exceed half a million. Their manners have been minutely described by Pallas. Their tents are constructed of a kind of felt; their drink is kumis, made of acidulated mare's milk. The great horde is considered as the source of the two others. Being settled near the mountains of Alak, called also Ala Tau, this horde has been denominated the Alatanian Kirgises. They lead a wandering life from the borders of the Upper Sirr, or Syrt, near Tashkunt, to the Steppe of Ilim. Each horde has its peculiar khan; but the middle horde, when Pallas approached this country, was contented with a prince, that acknowledged the khan of the lesser horde; and in 1777, this khan of the lesser horde, whose election had been confirmed by Russia, was called Nur Hali, a sensible and equitable prince. The features of the Kirgises are Tartaric, with the flat nose and small eyes; but not oblique like those of the Monguls and Chinese. They have horses, camels, cattle, sheep, and goats. Some individuals in the middle horde are said to have 10,000 horses, 300 camels, 3 or 4000 cattle, 20,000 sheep, and more than 2000 goats; while some in the lesser horde were proprietors of 3000 horses, and a proportionable number of the other animals. Their dromedaries furnished a considerable quantity of woolly hair, which was sold to the Russians and Bucharians, being annually clipped like that of sheep. Their chief food is mutton, of the large-tailed sort; and so exquisite is the

lamb, that it is sent from Orenburg to Petersburg for the tables of the palace. The lamb-skins are the most celebrated after those of Bucharia, being damasked as it were by clothing the little animal in coarse linen. But the wool of the sheep being coarse, is used only in domestic consumption for felts and thick cloths. The fleppes supply them with objects of the chace, wolves, foxes, badgers, antelopes, ermines, weazels, marmots, &c. In the southern and eastern mountains are found wild sheep, "ovis musimon," the ox of Tibet, "bos grunniens," which seems to delight in snowy alps; with chanoys, chacalls, tigers, and wild asses.

"As the Kirgufians regard one another as brethren, they are obliged to employ slaves, being captives whom they take in their incursions. Their dress is the common Tartaric, with large trowsers and pointed boots. A thin veil supplies the place of a shirt, and they commonly wear two short robes. The head is shaved, and covered with a conic bonnet. Their clothes are numerous and light, so that if they fall from horseback, they are seldom hurt; their saddle-horses are richly ornamented; but their riders are short in stature, and their trowsers ascend to the arm-pits, so that they resemble a pair of pantaloons on horseback. The ladies ornament their heads with the necks of herons, disposed like horns. They appear to be Mahometans, though rather of a relaxed creed.

"The Kirgufians carry on some trade with Russia. The chief traffic, which is wholly by exchange, is at Orenburg, but the middle horde proceed to Omik. Sheep, to the amount of 150,000, are annually brought to Orenburg; with horses, cattle, lambs, skins, camels'-wool, and camels; sometimes they offer slaves, Persians or Turcomans. In return they take manufactured articles, chiefly clothes and furniture. From Bucharia, Kliiva, and Tashkund, they receive arms and coats of mail, which Russia refuses, in return for camels and cattle. They are extremely fond of the Kalmuk women, who long retain their form and charms; and often marry them, if they will adopt the Mahometan religion. There is an annual festival in honour of the dead. About the beginning of the 17th century this people, who were formerly Shamanians, became children of circumcision, by the exertions of the priests of Turkistan; but Pallas, in 1769, found them addicted to forceries and other idle superstitions."

This barren country, now inhabited by the Kirgufes, has been the scene of considerable events; and it is not improbable, that its numerous deserts and plains have been formerly more fertile, at least in pasturage. However this be, these regions have been held by successive nations of high repute, from the Massagetae of early times to the Turks. Pallas, cited by Pinkerton in his Geog. vol. ii. Tooke's View of the Russian Empire, vol. i.

KIRIAN, a mountain of Tibet. N. lat. 33° 12'. E. long. 79° 44'.

KIRIANI, a town of European Turkey, in Livadia; 8 miles S.E. of Athens.

KIRILOV, a town of Russia, in the government of Nvorgorod; 52 miles N.W. of Vologda.

KIRIN, or KIREN-OLA, one of the three grand departments of the country of the Mantchew or Mandhur Tartars, or Eastern Chinese Tartary, bounded on the N. by the river Saghalien, on the E. by the sea, on the S. by Corea, and on the W. by the province of Leao-tong. This country, which is rendered extremely cold by the number of forests that cover it, is scarcely inhabited; it contains only two or three ill-built cities, surrounded by plain mud-walls. The valuable plant "ginseng" grows here; and the em-

peror sends hither those criminals, who are condemned to banishment by the laws. The capital is also called Kirin, or Kerin, and is situated on the river So-gari, called at this place Kirin, which falls into the Saghalien or Amur, and was the residence of the Mantchew or Mandhur general, who was invested with all the powers of a viceroy; inspecting the troops and having authority over all the Mandarins; 500 miles N.E. of Peking. N. lat. 43° 48'. E. long. 126° 24'.

KIRKBY-LONSDALE, a market town and parish in the valley of Lonsdale, whence its second, or distinctive name, on the bank of the river Lune, at the northern edge of the county. It is 12 miles south-east of Kendal, and 252 north of London. In the year 1800, the town contained 260 houses, and 1283 inhabitants. At this place Kirkby, bishop of Carlisle, repulsed the Scots. He was a native of this town. Over the Lune is a curious bridge of three arches, and in the market place is a cross of rather singular character. The church is a large building, 120 feet in length, by 102 in breadth. In the church library is the following inscription: "This library, pulpit, and new loft, together with the school-house, were founded by Mr. Henry Wilton, of Underly, who gave to the colleges 100*l.* besides 35*l.* yearly to seven poor scholars going to Queen's-college in Oxford; and to this church and school 240*l.*; to the poor of Kirkby-Lonsdale lordship 500*l.*; besides many other gifts to pious uses in other places: by all which, he, being dead, yet speaks." About two miles from the town, towards Lonsdale, is Borrow-hall, the seat of Thomas Fenwicke, esq. It is seated in a narrow dale, and nearly surrounded by mountains. At Kirkby a weekly market and three fairs, annually. Nicholson and Burn's History, &c. of Westmoreland, 2 vols. 4to. 1777.

KIRKBY-Moorfield, a market town and parish in that part of Yorkshire called the North-Riding, England, as its name implies, is seated among the moors, or mountains, which abound in that part of the island. This town is 28 miles N. of York, and 233 from London. In the year 1800, it contained 287 houses, and 1396 inhabitants. By the statement in Domesday-book the manor of this place, then called Chirchabi, was one of the heads of the ancient family of Stutevilles, one of whom founded an abbey at Keldholone, about one mile from this town. On the top of a hill, to the north-east of Kirkby, is the site of an ancient building, said to have been the seat of the abovenamed family, who continued to reside here till the reign of Henry III. The Nevilles, lords, Latimer, had also a manor-house here. George Villiers, the dissolute duke of Buckingham, part of whose estates lay here, and at Helmfle, where he had a seat, died in a miserable condition, in a mean house in this town. Pope, in his Moral Essays, has characterized the place, and severely reprobated the man in lines of peculiar force and severity.

"In the worst inn's worst room, with mat half-bung,  
The floors of plaster, and the walls of dung,  
On once a flock-bed, but repaired with straw,  
With tape-tied curtains, never meant to draw,  
The Gorge and garter dangling from that bed,  
Where tawdry yellow strove with dirty red,  
Great Villiers dies."

About one mile west of the town is Kirkdale church, an ancient edifice, seated in a most romantic situation, and noted for an inscription over the south door. An account of this was written by Mr. Brooke, for the Society of Antiquaries, who published the same with a print in vol. v. *Archæologia*.

**KIRKBY-Stephen**, a market town and parish in the county of Westmoreland, England, is seated on the western bank of the river Eden, in a mountainous part of the country. The town consists of one street, running north and south, at the extremities of which are prospects of the Helbec and Wildbore mountains. Formerly there was a spacious area for a market place, which has been nearly covered with buildings. A market is held here every Monday, and is chiefly occupied by the manufacturers and dealers in stockings. This town is four miles from Brough, and 266 north of London. The parish church is a large building, and contains some old monuments. Adjoining it is a handsome parsonage-house, built by the late Dr. Chaters, prebend of Durham, to whose family the living belongs. In the town is a free grammar-school, which has two exhibitions.

Near Kirkby are the ruins of Pendragon-castle, which was formerly the seat of the lords Clifford; and about one mile south of the town are Wharton-parks, the ancient seat of the Wharton family. This place is deserted, and the house fallen to decay. Nicholson and Burn's History, &c. of Westmoreland, 2 vols. 4to. 1777.

**KIRKCALDY.** See **KIRCALDY.**

**KIRK-CLISSA**, or **KIRKLEBAN**, a town of European Turkey, in the province of Romania; formerly called "Tessaraconta Ecclesie," or forty churches; at present it has neither walls nor churches, and but few Christian inhabitants. It is inhabited by many Jews, who are chiefly employed in making butter and cheese, for which they have a ready market among their friends at Constantinople; 30 miles E. of Adrianople.

**KIRKCUDBRIGHT**, the chief town of one of the stewartries into which the county or shire of Galloway in Scotland is divided. Kirkcudbright is situated on the Solway Frith, near the mouth of the river Dee, and, excepting as a market town for the adjacent district, is not eminent for any species of commerce, manufacture, or trade. The harbour is safe, with good anchorage, and sheltered from all winds; but being a tide-harbour is well fit for vessels that can take the ground. It was anciently a burgh of regality, and held of the Douglases, lords of Galloway, as superiors. On the forfeiture of the earl of Douglas, last lord of Galloway, in 1455, it was by James II. erected into a royal burgh, and is now governed by a provost, three bailiffs, and town-council. In the environs are many traces of ancient camps, British and Roman. Its castle, the mounds and dikes of which are still remaining, was evidently constructed to defend the entrance of the river Dee. In 1801, the number of inhabitants was 2380; 28 miles S.W. of Dumfries. N. lat. 54° 55'. W. long. 4° 5'.

**KIRKCUDBRIGHTSHIRE**, a division or county of Scotland, called the *Stewartry of Kirkcudbright*, forms the eastern, and by far the most extensive portion of Galloway. The latter name was anciently applied to an independent principality, which included the greater part of Ayrshire and Dumfriesshire, but is now limited to the two counties of Wigton and Kirkcudbright. The stewartry is situated between 54° 40' and 55° 20' of N. latitude, and contains 882,57 square miles, on 449,313 Scotch acres. It is bounded on the south by the Solway frith, which divides it from England; by Dumfriesshire and the estuary of the Nith on the east, by the same county and Ayrshire on the north, and by the latter, with the shire of Wigton and the bay of that name, on the west. Kirkcudbright has no subdivisions, except that four of the most northerly parishes, Cavefain, Dalry, Kells, and Balmaclellan, are commonly called the district of Glenkens. The aspect of the country,

Vol. XX.

however, affords a very natural division into two parts. If a line be drawn from the centre of Irongray parish to the Gatehouse of Fleet, all to the west and north, with little exception, is so mountainous, that it may be very properly termed a Highland district; while the south and east exhibit a fine champaign and cultivated country. The parishes are 28 in number, the whole population of which, according to the parliamentary returns of 1800, amounted to 29,211 persons. Kirkcudbright, Gatehouse of Fleet, Creetown, Castle Douglas, and New Galloway, are the principal towns. Besides these there are several considerable villages, which it will not be necessary to particularize in this place. Kirkcudbright is the county town, and a royal borough, as is also New Galloway. Creetown, which is situated at the upper part of Wigton bay, has lately been constituted a borough of barony: so likewise has Castle Douglas, a thriving village, not much above thirty years old, but which now contains nearly a thousand inhabitants. Some attempts have been made to introduce the cotton manufactures here; but the high price of coals opposes an almost unsurmountable impediment to ultimate success. The same circumstance operates, in no inconsiderable degree, against the establishment of manufactures, requiring large quantities of fuel, in every part of the stewartry. Those villages which are situated on the coast, however, being supplied with coal from England, have made more rapid progress, even in the manufacture of cotton, than could reasonably have been expected.

Though, as mentioned above, the greater part of this stewartry is hilly; yet, upon the whole, it contains few mountains remarkable for their size or height. The most lofty of those in the western division is that called Cairn-muir, within the parish of Minigaff, which rises 1737 feet above the level of the sea, and is surrounded by several others of equal altitude, though less striking to the eye, from the greater elevation of the circumjacent grounds. The hill called Cairnbarrow, in the parishes of Ayrworth and Kirkmabreck, is 1100 feet in height, very little encumbered with rocks, and commanding a very beautiful and extensive view, not only of the stewartry of Kirkcudbright and the shire of Wigton, but also of the Isle of Man, and the opposite coasts of England and Ireland. Crowfell, which terminates a lofty ridge of hills in the south-eastern part of the county, was formerly one of the alarm-posts for giving notice of the incursions of the English. The elevation of Douglas-Cairn, on the summit of this mountain, is said to be about 1903 feet, and Knockedoch, which surmounts the north wing, 1500 feet above the level of the sea. From this range of hills, the country descends towards the shore in the most regular and beautiful manner, exhibiting a delightful view of well-enclosed fields in a state of excellent cultivation. Immediately upon the sea, the scene is of a very different description: the coast here being remarkably bold and rocky, discloses from the sand, at low water, some grand and picturesque appearances; tremendous and rugged precipices; high and pointed spires, under the bases of which are passages resembling the form of rude arches; large and regular amphitheatres, leading into caverns, the extent of which no human being has yet ventured to explore.

At this point, and indeed on almost every part of the coast of this county, a great variety of marine plants are found. Among these the most remarkable are *samphire*, used for preserves or pickles; and the water *polyopus*, or *sea anemone*, which naturalists consider as the connecting link between the animal and vegetable kingdoms: for, though destitute of the faculty of locomotion, it possesses a degree

## KIRKCUDBRIGHTSHIRE.

of irritability and sensation much superior to any other known vegetable production. For a particular account of this very curious subject, see the article ANEMONE.

The stewardry of Kirkcudbright gives rise to several rivers, besides a number of smaller streams. The most remarkable of these are, the Orr or Urr, the Ken, the Dee, the Fleet, and the Cree. The Urr, which is also called the Uurr or Whurr, flows from a lake of the same name, in the parish of Balmacellan, situated in the district of Glenkens. Hence it runs almost directly south, and falls into the Solway frith near the village of Colvend. This river is navigable for vessels of 80 tons burden, to the distance of eight miles from its mouth. By means of it, therefore, coals, lime, and other articles, imported from England, are conveyed thus far up the county, and hence distributed to the more interior parts. The dangers and difficulties, however, attending this trade, owing to the numerous sand-banks in the channel of the Solway, which are every day becoming more extensive, oppose powerful obstacles to its increase, either here or at any other port on this coast. One advantage possessed by this river, is a large basin called Gibbs-hold, which it forms within land, about two miles from its confluence with the sea, where large vessels often secure a safe retreat during stormy weather. The Ken, the second river above mentioned, takes its rise also in the northern part of the stewardry, near the borders of Nithsdale. Flowing hence, at first in a south-westerly direction, it separates the parishes of Dalry and Cavephairn; then proceeding towards the south, with an inclination eastwards, it falls into Kenmuir-loch, and forms a junction with the Dee. This river begins its course among the hills in the north-western division of the county. After receiving the Ken, it flows towards the Solway frith, into which it discharges itself, after passing the town of Kirkcudbright. The Dee is remarkable both on account of its breadth and depth, particularly at the place called Kenmuir-loch. It is navigable to the village of Tongland, two miles above the town of Kirkcudbright; and, were it not for the number of rocks and shallows with which it abounds beyond this point, might be made the means of introducing an inland navigation to the very centre of the county. A survey was made some years ago, with a view to supply the defects of the river by a navigable canal, but the plan was not successful in meeting the approbation of parliament. A small canal, however, has been cut by the steward of the county between the Dee and a lake called Carlinwark-loch, which is situated above the shallows of Tongland, and furnishes marle in great abundance. The Fleet and the Cree are also navigable for several miles. The former rises out of a lake called Lochfleet, and pours its waters into the bay of Wigton, at a short distance from the village called Gatchoufe-of-Fleet. The Cree takes its rise among the mountains which separate the northern part of the county from Ayrshire, forming, for several miles of its course, the boundary of the stewardry. It serves as a continuation of the navigation of Wigton bay, and produces fish of various kinds, particularly salmon, in great plenty.

Few counties can boast of a greater number of lakes or lochs than Kirkcudbright. With the exception, however, of Lochken, or Kenmuir-loch, already mentioned as formed by the waters of the Ken and Dee, which is ten miles in length, they are, generally speaking, of small extent. The parish of New Abbey, in the eastern district of the stewardry, contains three lakes, Lochkendan, Lochend, and Craigend, the two last of which are nearly a mile long, and more than one half of a mile broad. Lochrutton, which gives name

to a parish, is of similar dimensions. In the centre of it is an artificial island, nearly of a circular form, and somewhat more than half a rood in circumference. It is composed, on the surface, of a vast collection of large stones. In Balmacellan parish there are five lakes. One of these, though very small, is famous for a particular species of trout, many of which weigh ten English pounds each. Carlingwark-loch, in the parish of Kelton, formerly covered 116 acres, but since the canal joined it to the Dee, it has been reduced to less than 80. This loch contains an inexhaustible fund of the very best shell marle. Before its extent was contracted, there were two isles in it, upon which the country people say two churches or chapels formerly stood. Indeed, the tradition in the neighbourhood is, that there had been a town in the loch, which was drowned or swallowed up. The discovery of an iron forge, on the south isle, some years ago, seems to give some probability to this idea. It was surrounded by the remains of a stone building or rampart, and communicated with the opposite side of the lake by a causeway or road of stones, secured by piles of oak wood, and having an opening in it, supposed to have been for a drawbridge. Several canoes, hollowed by fire, after the manner of the American savages, and a large iron mallet, have also been found in this loch. Besides those already noticed, there are a number of smaller lakes in different parts of the county. None of them, however, deserve to be particularized except Loch Kohn or Koan, which is situated in the parish of Crossmichael. It extends over 40 acres of ground, and is from 10 to 22 fathoms deep. No rivulets or streams flow into it, nor indeed has it any visible source of supply excepting the clouds. It never freezes but during the most intense froit.

This county contains a variety of minerals and mineral springs. The want of coals, however, and the difficulty of shipping them, in general prevents the former from being turned to advantage. A rich iron-mine, in the parish of Kerriek, was wrought for some time by an English company, but they were at last obliged to abandon it. A lead mine, however, has been opened, and is still successfully carried on in the western division of the stewardry. Both these metals are found in abundance in many other parts. Appearances of copper have also been observed; but it is not known that any trial of it has been made. There is also great plenty of limestone, though of an inferior quality, as yet untouched; and a vast fund of excellent shell-marle for manure, which is too much neglected by the farmers, and lime exported in its stead, at a very considerable expence.

The remains of antiquity in this county are still very numerous, and many of them in no small degree interesting. The abbey of Sweetheart, or New Abbey, in a parish of that name, is a beautiful lofty building in the light pointed style. It was founded in the 13th century by Devongilla, the mother of John Baliol, king of Scotland. This structure stands in a fine level field about 20 acres in extent, which is enclosed by a stone wall ten feet high, built of granite stones, some of which are of immense size.

Hil's castle situated near Lochrutton, and about three miles from Dumfriess, was one of the many fortified places which belonged to the Douglas family, as lords of Galloway. Edward the first lodged here, on his way to Kirkcudbright in the year 1300. A tower and a few small buildings, which surround a square court, are all that remain of this edifice. Buittle castle, the favourite residence of king John Baliol, is still to be seen in the parish whence it derives its name. The hand of time, however, has nearly levelled it with the ground. An old coin was discovered  
here

here some years ago, bearing the date 1220. This neighbourhood is remarkable for a number of wittified forts, the nature and formation of which antiquaries have found it difficult to determine; and respecting which various opinions are entertained.

One of these forts appears also on the top of a small hill in the parish of Anworth. The summit forms an area of thirty paces long and twenty broad, and is nearly surrounded by an irregular ridge of loose stones, intermixed with large portions of vitrified matter. These stones are of the common blue schist kind, and from the manner in which they lie scattered about, it would seem that the fort has either been deficient in regularity of structure originally, or been intentionally demolished. Some coins of Edward VI. and queen Elizabeth were lately found near this spot. Thrieff castle, which is situated in an island formed by the river Dee, is famous for having been the chief residence of the Douglasses. A great square tower is all that remains of the once proud and lofty mansion of these celebrated warriors.

Lincluden college was founded in the reign of Malcolm IV. It was originally a Benedictine nunnery, but afterwards converted into a monastery, in the chapel of which is an elegant monument, erected in honour of Margaret, daughter of Robert III. and wife to one of the earls of Douglas. The college is situated upon a small stream called Cluden, about two miles from its junction with the river Nith, and presents in its ruins many marks of its former magnificence and grandeur.

Dundrennan Abbey, which stands in the parish of Ker-rich, about a mile and a half from the Solway frith, is also a fine ruin. It was founded in the year 1142, and has acquired celebrity as the asylum of Mary queen of Scots after the battle of Langside. Besides these, the stewartry contains several other curious remains of antiquities. The most remarkable are the *rocking stone*, in the parish of Kells, which is so nicely balanced, that it can be moved by the slightest pressure; the monastery of Tongland, the Dun of Barendland, the moat of Urr, probably the largest work of the kind in Scotland, and the castle of Kennuir, situated near the lake of that name. To these may be added the tomb of king Galdus, called Cairnholly, said to have been erected to commemorate the fall of that prince in a battle between the Scots and Picts about the year 82, or, according to another tradition, in memory of bishop Whitehorn and other gentlemen, who were killed in an action with the English about the year 1150. Which of these accounts is the correct one it is perhaps impossible to determine. This, however, is certain, that this stewartry was the scene of many sanguinary contests, particularly during the invasions of the Romans, and during the contentions of Bruce and Baliol.

The principal country seats in the stewartry are those of the earl of Selkirk, Mr. Murray of Broughton, and a large house built by the late sir Samuel Hannay, the exterior of which is wholly formed of the most beautiful granite. The chief products of this district, besides those already noticed, are sheep and black cattle for the English market. It has given birth to few remarkable characters, except Thomas Gordon, famous for his writings in the Bangorian controversy, and Paul Jones the celebrated pirate, who spread so much terror over different parts of the coast during the American war.

A very interesting and well written account of this district, was published in 1810, entitled "General View of the Agriculture of Galloway; comprehending two counties, viz. the Stewartry of Kirkcubright, and Wigtonshire," by the Rev. Samuel Smith, minister of Borgue.

KIRKHAM, a small market town and parish in the hundred of Amounderness, Lancashire, England, is situated in a tract of country called the File-lands, between the Ribble and another small river. It is 22 miles distant from Lancaster, and 225 from London; and contained, according to the return under the population act of 1800, 363 houses, inhabited by 1561 persons. The chief trade is in coarse linen and sail cloth. Here are a well endowed free-school for the education of 100 boys, and a charity-school for 40 girls: two fairs are held annually, and a market weekly on Tuesdays. The Lancaster canal passes by this town, from Liverpool. One mile west of Kirkham is Ribby-hall, a large well built brick mansion, belonging to Joseph Hornby, esq. Beauties of England, vol. ix.

KIRKI, a town of Grand Bucharia; 100 miles S.E. of Bokhara.

KIRKIE, a town of Hindoostan, in the circar of Chandaree; 24 miles S.S.W. of Chatterpouur.

KIRKINTULLOCH, a small town of Dumbartonshire, situated about nine miles from Glasgow, and four from Kilsyth. The Forth and Clyde canal is carried over the small river Logie, about half a mile from this place, by an aqueduct of a single arch of great dimensions, which was considered at the time it was built as a very extraordinary specimen of masonic art. Kirkintulloch is not a place of any importance, but the country round it is populous and well cultivated, and many respectable land-holders of middling fortunes reside upon their estates, and contribute much to its improvement. It is a burgh of barony, governed by two bailiffs, annually chosen. In 1801, the number of inhabitants was 5210, of whom 1785 were employed in trade and manufacture. Its manufactures are linen and cotton.

KIRK-MOTE, a synod. See SYNOD.

Sometimes the word is also taken for a meeting in the church, or vestry. See MOTE.

KIRK-OSWALD, in *Geography*, a market town and parish in the ward of Leath and county of Cumberland, England, is seated in the pleasant vale of Eden, and is a place of some note in the early annals of the kingdom. The church dedicated to St. Oswald, the king and martyr of Northumberland, is a large irregular building, evidently erected at different periods; probably at the expense of the Dacre family, whose arms appear in various parts of the building. Here is an handsome monument raised to the memory of sir Timothy Featherstonehaugh, an active supporter of king Charles I. He was beheaded, and his two sons were slain in the battle of Worcester. A descendant of the same name resides near this town. At the west end of the church issues a copious spring of excellent water; which, in the reign of Monachism, was deemed to possess miraculous powers. The belfry tower stands on an eminence at some distance from the church. In the town is an endowed free school, and a meeting house for Dissenters. On an elevated spot, about a quarter of a mile from the town, are the ruins of a castle, which Sandford describes "as the fairest fabric that ever eye looked upon." At present only a small tower and some vaults are all that remain; but originally it was extensive, of a square form, and bounded on three sides by a foss, and on the fourth by a brook. Hugh de Morville procured a licence from king John to inclose his woods at Kirk-Oswald, to fortify his manor house, and to have there an annual fair and a weekly market. This Hugh was one of the murderers of archbishop Becket; and the weapon of assassination was kept for a long time in this fortress.

On a hill about three miles from Kirk-Oswald, near the vil-  
lage

lage of Little Salkeld, is a noted Druidical monument, called "Long Meg and her Daughters." It consists of a circular arrangement of unhewn stones; the circumference of the circle is about 350 yards. Some of the stones are 10 feet high, and from 12 to 15 feet in girth. The stone called Long Meg, about 17 feet out of the circle, is 18 feet in height, and nearly 14 feet in circumference. Pennant's Tour to Allon-Moor, 4to. Hutchinson's History, &c. of Cumberland, 2 vols. 4to. Beauties of England, vol. xi. 8vo. 1802.

**KIRK-SESSIONS**, the name of a petty ecclesiastical judicatory in Scotland. Each parish, according to its extent is divided into several particular districts, every one of which has its own elder and deacon to oversee it. A consistory of the ministers, elders, and deacons of a parish, form a kirk-sessions.

These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechising, visitations, &c. It judges in matters of less scandal; but greater, as adultery, are left to the presbytery; and in all cases an appeal lies from it to the presbytery.

**KIRKSTALL**, in *Geography*, a village in Yorkshire, was formerly a place of note, and adorned with a most splendid and richly endowed abbey, of which the ruins of the church present a grand and interesting mass of ancient ecclesiastical architecture. It was founded in the reign of king Stephen for Cistercian monks. Parts of the original building still remain: the columns of the nave are massive, and support heavy, pointed arches. The side aisles are nearly perfect, as are also the nave, transepts, and choir. At the west front is a fine door-way with a semicircular arch, and above it two handsome windows, curiously ornamented. On the fourth side are several ruinous apartments, among which the dormitory and some other rooms are still covered in. "Kirkstall will be found highly interesting to the picturesque traveller, as it affords a variety of subjects for the pencil, both architectural, and where the ruins will unite finely with the landscape." This place is three miles from Leeds, and 101 from London. Dayes' Excursions in Yorkshire, 8vo. 1805, in which work is a neatly engraved view of Kirkstall, and an interesting account of the picturesque features of the country around that grand pile of ruins.

**KIRKULETI**, a river of Asia, which rises in the mountains of Armenia, and traversing the principality of Gurjel, runs into the Black sea. N. lat. 41° 55'. E. long. 41° 25'.

**KIRKUR**, a town of Hindostan, in Rohilcund; 35 miles S. of Bareilly.

**KIRKWALL**, the chief or principal town of the Orkney islands, Scotland, is seated on the northern coast of the Main-land, in the latitude of 59° 9' N. and in the longitude of 2° 30' W. of Greenwich, towards the S.E. side of the bay of the same name; and is divided into the old town that bends along the bay, and the new, which stretches a considerable way to the south. Its original name appears, from ancient authorities, to have been Kirkiovoog, or the kirk on the bay. The town has only one street, nearly a mile long, with many excellent houses ranged on each side, which, for the style of their building, and the manner in which they are finished and furnished, may bear a comparison with those of any small town in the kingdom. Several gentlemen of property reside here, and also a considerable number of shopkeepers; but the bulk of the people is composed of tradesmen, boatmen, servants, and day-labourers: and when the population of the country parish, which makes a fourth of the whole, is considered, the united parishes of Kirkwall and

St. Ola, in which are two established clergymen, contain the former about two thousand, the latter five hundred inhabitants. The town was erected into a royal borough by charters from the Scottish sovereigns, confirming all its ancient privileges: and all its rights and advantages were at last solemnly ratified by act of parliament. The government is vested in a provost, four magistrates, a dean of guild, a treasurer, and fifteen other members, who together compose a council. In this town, the sheriff, the admiral, the commissary, and the justice of peace courts, are also occasionally convened for the administration of law; and for the cognizance and regulation of ecclesiastical matters: the three presbyteries, of which the provincial synod is composed, and sometimes the synod itself, meet at least once a year, or oftener, according to circumstances. Here are also a custom-house, a post-office, and a store-house, into which are collected the rents, that are mostly paid in kind, of both the bishopric and earldom, which are generally let on lease to merchants, who sometimes dispose of them here, and sometimes send them out of the country. Kirkwall, with the four northern burghs, Wick, Dornock, Tain, and Dingwall, choose a burghs to represent them in the British parliament. The principal modern building is a town-house, divided into apartments respectively appropriated to a prison, an assembly-hall, a court of justice, and a lodge of freemasons. At a small distance are school-houses for the several branches of education. These structures, however, are but trifling, compared with the relics of the bishop and earl's palaces, the castle, once a place of great strength, and the venerable cathedral of St. Magnus: but for nothing is the town more celebrated than for its excellent harbour, which is broad, safe, and capacious, with a bottom of clay so firm, and a depth of water so convenient, as to afford anchorage for ships of a large size, and in great numbers. Towards the south-east side, are still visible the vestiges of a rude temporary fort, thrown up on an emergency by Oliver Cromwell; and on the opposite side another of the same kind has been evidently marked out for co-operation in either annoying or protecting the harbour. Most of the lands in the parish of St. Ola, which surround Kirkwall, formerly made part of the temporality of the bishopric of Orkney, and were separated at the Reformation, or on the prospect of the abolition of episcopacy. Some additional particulars relating to this town, and to places in its vicinity, will be given in a subsequent article, under the word **ORKNEYS**. In the interim, the reader is referred to an interesting volume published in 1808, entitled "History of the Orkney Islands," &c. by the Rev. Dr. Barry: second edition, with corrections and additions, by the Rev. James Healdrick.

**KIRLAK**, an island of a triangular form in the Frenzen sea, about 240 miles in circumference. N. lat. 71° 30' to 72° 15'. E. long. 221° to 126°.

**KIRMANSHA**, or **KIRMONCHA**, a town of Persia, in the province of Irak; 145 miles N.E. of Bagdad. N. lat. 34° 35'. E. long. 46° 30'.

**KIRN**, a town of France, in the department of the Rhine and Moselle, and chief place of a canton, in the district of Simmern; 17 miles W. of Creutznach. The place contains 1240, and the canton 4084 inhabitants, in 18 communes. N. lat. 49° 47'. E. long. 7° 26'.

**KIRNBERGER**, **JOHN PHILIP**, in *Biography*, a German musician, much respected as a learned contrapuntist, was born in 1721, at Saalfeld, in Thuringia, a province of Saxony; at the age of eighteen he went to Leipzig, where he studied under Sebastian Bach till 1741, when he went into Poland, where he was admitted into the service of several Polish princes; and afterwards appointed director

rector of the music at a convent. In 1751, he went to Dresden, where he studied the violin under Fickler, and some time after entered into the service of the king of Prussia, as a performer on that instrument. About the year 1756, he was appointed court musician to her royal highness princess Amelia of Prussia. The harpsichord, which was his first, was likewise his best instrument, and his compositions for that and the organ were very numerous, as well as his polemical and theoretical writings. Besides these publications, he was editor of four collections of harpsichord pieces, which included several of his own; and of all these he marked the fingering according to the rules of Emanuel Bach.

During the last years of his life, his knowledge in the laws of harmony made him regarded as the *Pepusch* of Berlin; but being gifted with less temper than the venerable organist of the Charter-house, his critical quarrels kept his mind in perpetual perturbation. Naturally grave and austere, he was said to be rendered more so by opposition and disappointment.

His fugues and church music are models of correct counterpoint, but too elaborate and dry for the public. He never seems to have aspired at, or thought of, facility, grace, and elegance. His ambition seems to have been to shew what could be done by labour and study, which had never been attempted before, and which, when achieved, amused the eye much more than the ear. He seems to have created giants which none could vanquish but himself. His musical institutes manifest great meditation and science; but will be intelligible to none but those who have already advanced far into the mysteries of counterpoint.

This profound musician, whose knowledge in all the laws and subtleties of canon, fugue, and modulation, were indispensible, but who, in his latter days, appeared to be more ambitious of the character of an algebraist than a musician of genius, now and then suffered fine passages, and even whole movements, to escape him; which proves that, like his great master Sebastian Bach, if he had condescended to be less artificial, he was possessed of the means of exciting, by his abilities, delight as well as wonder. See his *Institutes*, pp. 242 and 243, where the composition is admirable, clear, neat, and pleasing. This able professor died at Berlin, in 1773, at the age of sixty-two years.

KIRNEE, in *Geography*, a town of Hindoostan, in Bahar; 48 miles S.W. of Arrah.

KIROLL, a town of Hindoostan, in Doob; 28 miles N. of Etaya.

KIROO, a town of Bengal; 24 miles N. of Tomar.

KIRRIEMUIR, commonly pronounced Killamoor, a town and parish of Angus-shire, Scotland, is built on the S.W. side of a hill near a romantic glen, through which flows the small river Gairie. This town is 16 miles from Dundee, 20 from Arbroath, six from Forfar, and 75 from Edinburgh. Here is a large weekly market; and the town contains some considerable manufactories for Osnaburghs and coarse liens. In the year 1792, the value of these goods, manufactured here, and in the immediate neighbourhood, was about 30,000*l.* sterling. The town is a burgh of barony, but the date of its charter is unknown. In the population report of 1800, this town was returned as containing 949 houses, and 4421 inhabitants; but it is presumed this total must include the whole parish, as in a previous census for 1793, the town is said to have comprised only 1584 inhabitants. The parish consists of an area measuring about eight miles in length by six in breadth, and is beautifully diversified by hills, dales, woods, and plains.

At Kinnordy, Mr. Lyall has a handsome seat, with fine plantations; and at Clova, the seat of Mr. Ogilvie, the woods are abundant, and serve to beautify the aspect of the country. At Invercarty is a large castle formerly belonging to the Ogilvies. Sinclair's Statistical Account of Scotland.

KIRSANAFF, a town of Russia, in the government of Tambov, seated on the Vorona, which falls into the Khoper; 56 miles S.E. of Tambov.

KIRSHEHR, a town of Asiatic Turkey, in Natolia, and capital of a district; formerly a considerable city, and called "Diocæsaria." In the vicinity salt is manufactured; 84 miles N. E. of Cogni. N. lat. 39° 12'. E. long. 34 13'.

KIRSHEHCH, a town and district of the government of Volodimir, in Russia, seated on a rivulet that falls into the Khasma.

KIRSOVA, a town of European Turkey, in Bulgaria, on the Danube; 30 miles S. of Galatz. N. lat. 44° 50'. E. long. 27° 30'.

KIRSTENIUS, PETER, in *Biography*, a learned physician, was born at Breslau, in Silesia, on the 25th of December, 1577, where his father was a merchant. He lost his parents when he was very young, but his guardians took good care of his education, intending him for his father's profession. He early evinced, however, a passion for letters, which they did not think proper to control, and left him to indulge it to the utmost. He learned the Greek and Latin languages, and paid considerable attention also to the Hebrew and Syriac; at the same time, as he now began to look to medicine as his object, he cultivated natural philosophy, anatomy, and botany, with the greatest assiduity. He afterwards studied at the universities of Leipzig, Wittenberg, and Jena, where he was much distinguished among his fellow-students, and determined upon farther improving himself by traveling. He had been told, that no person could obtain a high rank in the practice of physic, unless he understood Avicenna; and knowing the translation of that physician's work to be bad, he had a strong inclination to learn Arabic. To this he was urged by Joseph Scalger and Isaac Casaubon, who judged that he was capable of rendering great service to the republic of letters in that way; and he resolved to read not only Avicenna, but also Mesue, Rhafes, Avenzoar, Albukasis, and Averroës. This passion, however, did not prevent him from gratifying the inclination which he had to travel, and he accordingly spent seven years from home. He first went through the Low Countries into France, and thence to Switzerland, where he received the degree of M. D. from the university of Basle, at the age of twenty-four. He then continued his travels, visiting Italy, England, and Spain, and reaching even Greece and Asia.

Soon after his return to Silesia, he was appointed by the magistrates of Breslau to be director of the college and schools of that city. But he afterwards resigned that difficult employment, and applied himself entirely to the practice of physic and to the study of Arabic, with which he became so enamoured, that he resolved to promote the knowledge of it by establishing an Arabic press, and employed all the money he could spare in accomplishing that object; refusing, at the same time, the most honourable offers from courts and universities, which would have interfered with his project. He afterwards retired into Prussia, still with the intention of fulfilling his designs, and pursuing his favourite studies; but obtaining the friendship of chancellor Oxenstiern, he was induced to accompany him in a journey to Germany. While at Erfurth, Kirstenius received the offer

of a professorship, which he accepted. But his patron induced him, nevertheless, to quit this university, and to accompany him to Sweden, where he was appointed professor of medicine, in 1636, and soon afterwards physician to the queen. His constitution, however, was considerably impaired, and he did not enjoy these advantages above four years; for he died on the eighth of April, 1640, in the sixty-third year of his age. The epitaph, inscribed by Schröer to his memory, eulogizes his extraordinary knowledge of languages, of which, it is there said, he was acquainted with twenty-six.

He published several works, for which divines are as much indebted to him as those of his faculty. These are, 1. "Grammatica Arabica."—2. "Triâ Specimina Characterum Arabicorum."—3. "Decas sacra Canticorum et Carminum Arabicorum ex aliquot MSS. cum Latina ad verbum interpretatione."—4. "Vitæ quatuor Evangelistarum ex Antiquissimo Codice MS. Arabico erute."—5. "Liber secundus Canonis Avicennæ, typis Arabicis ex MSS. editus, et ad verbum in Latinum translatus, &c."—6. "Liber de vero Ufu et Abusu Medicinæ."—7. "Hypotyposis, five, Informatio Medicæ Artis studiose perutilis, aliquandiu in Pharmacopolio versaturo."—8. "Nota in Evangelium S. Matthæi ex collatione Textuum Arabicorum, Syriacorum, Ægyptiacorum, Græcorum, et Latinorum."—9. "Epistola S. Judæ ex MSS. Heidebergensi Arabico ad verbum translata, &c." Hutchinison Biog. Med. Eloy. Dict. Hist.

KIRSTENIUS, GEORGE, also a physician, was born at Stettin, in January, 1613. He pursued his studies, during several years, at Jena and Strasburg, and afterwards travelled through Germany and the Low Countries. He was invited to professional chairs in the universities of Gripswald and Derp; but the political troubles of the times prevented him from accepting them: he determined at length to settle at his native place, and contented himself with a professorship in the Royal College of Stettin. He died on the 4th of March, 1660. The greater part of his life was passed in useful research, and he obtained a high reputation in his profession. He left several learned essays, in Latin, on the secretion of milk, on wounds of the head, on the sight, smell, taste, &c. which were esteemed in their day; and he published also the following works: "Oratio de Medicinæ dignitate et præstantia," 1647.—"Adversaria et Animadversiones in Joannis Agricolæ Commentarium in Poppium et Chirurgiam parvam," 1648.—"Disquisitiones Phytologicæ," 1651. Eloy. Dict. Hist.

KIRTI, in *Hindoo Mythology*, a name of Parvati, the consort of Siva.

KIRTLE, a term used for a short jacket; also for a quantity of flax, about a hundred weight.

KIRTON, or KIRKTOWN, in *Geography*, a large village and parish in the division of Holland, and county of Lincoln, England, has been a place of considerable size and importance, but from having lost its weekly market, and being out of a public road, and divested of manufactures, is now reduced to the rank of a village. In the year 1800, it contained 269 houses, and 1238 inhabitants. Kirton has long been famed for its large and elegant church, which was formerly collegiate, and, according to some writers, was built by Alexander, bishop of Lincoln, in the time of king Henry I. This statement is, however, evidently erroneous, for the style of architecture marks it to be as late as the early part of the 15th century. Being much injured by neglect, and larger than necessary for the population of the parish, the chancel, tower, and transepts were taken down in the year 1806. A new tower was, however, erected at the west end

of the church with the original materials. At the western end of the nave is a semicircular arch, probably of the age of the bishop above named. In the church is a handsome octangular font, on the pedestal of which is an inscription, stating, that it was made for Alauin Burton, in the year 1405. Beauties of England, vol. ix. 1807.

KIRTON *Lindsey*, a market town and parish in the wapentake of Corringham, in Lindsey division of the county of Lincoln, England, is situated 20 miles from Lincoln, and 147 from London. The inhabitants were returned under the population act as 1092, the houses as 243. Dr. Stukely states, that John of Gaunt had a palace here. At this place Mr. Pegge places the Sidnaceiter of the Romans. See Gough's edition of Camden's Britannia, vol. ii. p. 266. ed. 1789.

KIRWANI, a town of Africa, in the country of Dentela, in which Mr. Park saw some iron smelting-furnaces; 20 miles W. of Baniferile. N. lat. 12° 30'. W. long. 11°.

KIRWEILER, a town of France, in the department of the Lower Rhine; 15 miles N. of Strasburg.—Also, a town of France, in the department of Mont Tonnerre; 18 miles S. of Lauterburg.

KIRZAK, a town of Russia, in the government of Vladimir; 48 miles W. S. W. of Vladimir.

KIS, in *Natural History*, a name given by some people to the common pyrites; and by others to a peculiar kind of it, containing copper, and a small quantity of silver.

KISAK, in *Geography*, an island near the S. W. coast of East Greenland. N. lat. 59° 51'. W. long. 45°.

KISERYA, a town of Hindoostan, in Bahar; 32 miles S. S. E. of Bettiah. N. lat. 26° 20'. E. long. 85° 6'.

KISH, or KESH, a post-town of Ireland, in the county of Fermanagh; 93 miles N. W. by N. from Dublin.

KISI, a land-bank in the Irish sea, about six miles long, and hardly one wide; 7 miles from the coast of the county of Dublin. N. lat. 53° 15'. W. long. 5° 54'.

KISHCORRAN MOUNTAINS, a long ridge of mountains in the southern part of the county of Sligo, Connaught, Ireland, on the summits of most of which are very large cairns. Beaufort.

KISHENAGUR, a circar of Bengal, lying on the E. side of the Hoogly, about 110 miles long, and from 7 to 30 broad.—Also, the capital of this circar; 45 miles N. of Calcutta. N. lat. 23° 23'. E. long. 88° 38'.—Also, a town of Hindoostan; 15 miles S. of Aumimere.

KISHMA, KISHMISH, *Kijmich*, or *Djijme*, the largest island in the Persian gulf, 30 miles long and from six to eight broad. A narrow channel separates it from the continent of Persia, navigable, but dangerous, on account of pirates. This island contains three or four towns or villages, one of which, on the N. coast, is called by the same name. N. lat. 26° 54'. E. long. 56° 50'.

KISHNUKOOD, a town of Persia, in the province of Segestan; 36 miles W. of Candahar.

KISHTAC, an island in the N. Pacific ocean, E. of Foggy Cape, opposite to the mouth of Cook's river; about 100 miles long, and from 30 to 50 broad. N. lat. 57° to 58° 40'. W. long. 152° 30' to 154° 50'.

KISHTEWAR, a country of Asia, lying S. E. of Cashmere, near the banks of the river Chunaat. Its capital, called Muddul, or Mundul-Muder, is situated about three coffes E. of this river.

KISI-HISAR, a town of European Turkey, in Bulgaria; 36 miles N. E. of Sofia.

KISLE-DARIA. See KIESL.

KISKEMANITAS, a river of America, which is a branch

branch of the Alleghany, into which it discharges itself. N. lat.  $40^{\circ} 40'$ . W. long.  $79^{\circ} 42'$ , in Westmorland county, Pennsylvania. Its headwaters are, Little Cone-maugh and Stone creek, which after their junction assume the name of Cone-maugh river. After receiving other waters it takes the name of Kilkemanitas. It is navigable for bateaux 40 or 50 miles, and good portages are found between it and Juniatta and Potowmac rivers. Coal and salt are discovered in the vicinity of these rivers.

KISKIN-OSTROG, a town of Russia, in the peninsula of Kamtschatka; 52 miles W. of Verchnei-Kamtschat-fkoi.

KISKO, a town of Sweden, in the province of Nyland; 12 miles N. of Eknas.

KISLAK, a town of Poland, in the palatinate of Braclaw; 20 miles E.S.E. of Braclaw.

KISLAR. See KIZLAR.

KISMA, a town of Persia, in the province of Ghilan; 21 miles W.N.W. of Rehd.

KISMALO, a town of Hungary; 12 miles N.N.E. of Gran.

KISSABATTY, a town of Bengal; 22 miles S.E. of Burdwan. N. lat.  $23^{\circ} 2'$ . E. long.  $88^{\circ} 18'$ .

KISSAMOS, a small town, formerly the harbour of "Aptera," which gives name to a district or province in the north-western part of the island of Crete. This town would be of some importance, if the pachas had not prohibited the exportation of the commodities of the island, except from the chief place of their government. This province is one of the best cultivated and most productive of the island; it furnishes a tolerably large quantity of oil and wine; it produces honey, wax, and silk; but little barley and wheat. Its mountains are for the most part wooded; and among the trees are scattered many common and horn oaks, the acorns of which allow the Greeks to breed a large number of hogs. Here are also many carob-trees, whose fruits are carried to Canea. In this province the vine deserves attention, which produces grapes with one hoeing and without any manure. The wine of Kissamos is a claret, spirituous, and of a tolerably good quality. As it is not an article of commerce, the Greeks convert a part of it into brandy for their winter stock. On the gulf of Kissamos is a quarry of beautiful gypsum. The fort of "Grabufas," situated on a steep islet, at the most western and northern part of Crete, is comprised in the district of Kissamos. The junction of these small islands and an advanced cape form a natural harbour, in which the largest ships anchor in safety. The population of the Turks of Kissamos is estimated at upwards of a third of the inhabitants. See CANDIA.

KISSEE, or KISSEY, a town of Africa, in the country of Sierra Leona, at the head of a river of the same name, eight journeys from Teembo. According to Dr. Azelius the town of Kissley may be, in direct distance, about 56 geographical miles to the N.E. by E. of Sierra Leona.

KISSEL, JOHN VAN, in *Biography*, a painter of portraits and still life. He was born at Antwerp in 1626. Nature was his guide in the practice of the art he professed, and it was his constant custom to make sketches of all his various productions at the different seasons of the year; merely sketching some, and colouring and even modelling others; by these means he possessed a large stock of things ready to his hand for composition, and he executed them with great taste and delicacy.

He demanded so high a price for his productions, that few could purchase them. Among those who did was the king of Spain, who, after having obtained many of his

works, at last gained possession of the painter also. He was appointed painter to the queen of Spain, and was retained in her service as long as he lived.

His portraits are very highly esteemed, being executed with a light free touch, and a tone of colour that very much resembles Vandyke's. He died in 1708, at the age of 82.

KISSELPUR, in *Geography*, a town of Bengal; 35 miles S.S.W. of Doofa. N. lat.  $22^{\circ} 32'$ . E. long.  $84^{\circ} 41'$ .

KISSER, a town of Africa, in Tunis; 18 miles S.E. of Sbeah.

KISSI, Sr., a small island in the Grecian Archipelago. N. lat.  $38^{\circ} 43'$ . E. long.  $24^{\circ} 10'$ .

KISSIMA, a town of Japan; 45 miles N. of Nan-gasaki.

KISSINGEN, a town of the duchy of Wurzburg, on the Saal, in the environs of which are some medicinal- and salt springs; 24 miles N. of Wurzburg. N. lat.  $50^{\circ} 14'$ . E. long.  $10^{\circ} 17'$ .

KISSOREGUNGE, a town of Hindoostan, in Bundelcund; 18 miles S.E. of Chatterpouur.

KISSUNPOUR, a town of Hindoostan, in Bahar; 11 miles N. W. of Bahar.

KIST, a word used by Paracelsus as the name of a weight, equal to 14 grains.

KISTNA, in *Geography*, a town of Hindoostan, in the Carnatic.

KISTNABARAM, a town of Hindoostan, in Myfore; 13 miles S. of Tadameri.

KISTNAGHERI, a town and fortrefs of Hindoostan, in the Myfore country; 90 miles E. of Seringapatam. N. lat.  $12^{\circ} 30'$ . E. long.  $78^{\circ} 22'$ .

KISTNAGUR, a town of Bengal; 24 miles N. of Goragot.—Also, a town of Bengal; 16 miles S. of Nagore. N. lat.  $22^{\circ} 52'$ . E. long.  $87^{\circ} 21'$ .

KISTNAH, a river of Hindoostan, which rises in the mountains of Vissapour, about 20 miles from Sattarah, and after obliquely traversing almost the whole extent of Hindoostan, from W. to E., discharges itself, by several mouths, into the gulf of Bengal, between Masulipatam and Nizapatam, in the circar of Guntoor. The Godavery and Kistnah, approaching one another in their descent towards the sea, inclose a tract of country, for an account of which, (see DELTA.) The islands, formed by the mouths of the Kistnah, are very fertile, and produce grain, excellent timber, and some of the best tobacco in India; and besides, the low grounds, which at spring tides are overflowed, produce a shrub of great use in dyeing chintzes and callicoes.

KISTNAPORAM, a town of Hindoostan, in the Carnatic; 25 miles W.N.W. of Tritchinopoly.

KISTNAPORUM, a town of Hindoostan, in Golconda; 48 miles S. of Hydrabad.

KISTNAVERAM, a town of Hindoostan, at the mouth of a river, which runs into the bay of Bengal; 15 miles S.E. of Nellore. N. lat.  $14^{\circ} 16'$ . E. long.  $80^{\circ} 11'$ .

KISTVAEN, or CIST-VAEN, in *British Antiquities*, a stone chest, coffin, or cavity for the interment of the human body, after its decease. Many antiquarians have confounded this subject with the Cromlech, and have thus confused their readers, and indeed have bewildered themselves. Some even call the perpendicular, or standing stones of the Cromlech, by the appellation of Kistvaen, and the horizontal, or covering-stone, the Cromlech. This is multiplying terms without meaning or utility. Kistvaen is a compound word from the British language, and literally signifies a chest of stone; *i. e.* Cijl, a chest or coffer, and

*Vaen*, from *Maen*, a stone: the *m* in British being commonly changed to *v* in composition. The Kiltvaen decidedly differs from the Cromlech, the first being always immersed, or covered over with many stones, when the whole is called *cairn*, or by a heap or mound of earth, which is called barrow. Mr. Owen describes the Ciltvaen "as a kind of cell formed by placing four flat stones together in a square, with another laid on the top for a cover." In some instances, however, the cist is formed by five, six, or seven stones, raised on their edges, and covered by two or three flat stones. In Berkshire, near the track of the ancient Ridge-way, on the downs, in the vicinity of the White-horse Hill, are some remains of a monument of this class. The upper part of a barrow being removed, several large stones were discovered, some of which were set up edge-ways, and others placed flat, or horizontally. Three of large dimensions formed the sides and end of a cell, which was nine feet from east to west, by about six feet from north to south. At the mouth, or entrance towards the west, were two upright stones, forming jambs, between which was a passage to the cist. Several other stones were placed near the entrance, and the barrow appeared to have been surrounded with a circle of stones. (See Beauties of England, vol. i.) "In the various practice of the Britons, the Ciltvaen sometimes contained the urn which preserved the precious ashes of the deceased; but it often contained the ashes and bones without any urn." (Caledonia, by Chalmers, vol. i. p. 84.) Toland thinks that Kiltvaens were altars for sacrifice: and some writers have conjectured that they were intended for cells, or dungeons to confine prisoners. "In Cornwall, and elsewhere, we find Kiltvaens (of an area equal to the size of the human body) consisting of side stones pitched on end, without any covering stone: these certainly once inclosed bones of the dead, though now generally dug up to search for money." Borlase's "Antiquities of Cornwall," p. 228: see also p. 225. Gough, in his "Sepulchral Monuments of Great Britain," vol. i. p. 16, &c. has given accounts of the contents of several Kiltvaens. See also Stukeley's "Abury" and "Stonehenge." King's "Monimenta Antiqua," vol. i. pp. 232, 253, 267. Rowland's "Mona Antiqua." Davies' "Mythology and Rites of the Druids," p. 394. "Archæologia," vol. ii. pp. 256, 362.—iii. 116.—iv. 114.—xii. 328.—xiv. 227. Jamieson's Etymological Dictionary. Douglass's "Nenia Britannica," folio.

**KISWARDA**, in *Geography*, a town of Hungary; 17 miles E. of Tokay.

**KISZENAU**, or **KITZNU**, a town of European Turkey, in Moldavia; 72 miles E. of Jassi. N. lat. 47° 13'. E. long. 29° 30'.

**KIT**, in *Music*, the name of a small violin of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, measuring from the extremities, is about sixteen inches, and that of the bow about seventeen. Small as this instrument is, its powers are co-extensive with those of the violin.

**KIT**, in *Laboratory Works*, a composition made of resin glib., pitch glib., bees-wax glib., and tallow lb., used for the last covering of carcases. This is used, when previously pounded and rendered completely liquid.

**KIT** is likewise used, among dragoons, to denote their lot of necessaries, collected and packed up in a small compass. The term is also applied, among the infantry, to the contents of a soldier's knapsack.

**KIT**, in *Rural Economy*, in some places, a name given to a milking-pail or vessel in the form of a churn, with two ears and a cover, used to convey milk in by horses or other means, in country situations.

**KITAIJELIA**, in *Botany*, so named, by Willdenow, in honour of Dr. Kitaib, one of the authors of the splendid work, entitled *Plante Rariores Hungariae*, which was published in imitation of Jacquin's *Flora Austriaca*. and intended as a continuation or sequel of that book. Willd. Nov. Act. Soc. Nat. Scrut. Berol. v. 2. 107.—Curt. Mag. t. 821. Clafs and order, *Monadelphica Polyandria*. Nat. Ord. *Cuniliferæ*, Linn. *Malvaceæ*, Juff.

Eff. Ch. Calyx double; the outer one seven, or nine-cleft. Capules single-seeded, forming a roundish, five-lobed head.

*K. vitifolia*. Willd. Sp. Pl. v. 3. 800. Waldst. et Kitaib. Pl. Rar. Hung. v. 1. 29. t. 31.—A native of Sclavonia. This plant, when wild, rises to the height of seven or eight feet, and is entirely covered with small viscid glanduliferous hairs. *Stem* round, even, not striated. *Leaves* alternate, on footstalks, five-lobed, unequally toothed; the intermediate lobe longer than the rest, pointed. *Footstalks* round, the lower ones as long as the leaves, the upper shorter. *Stipules* ovate, rather heart-shaped, bifid. *Flowers* axillary, generally about three, pedunculated. *Inner calyx* villose, smaller than the outer one. *Petals* white, wedge-shaped, truncate, a little smaller than the segments of the outer calyx.

**KITANESJO**, in *Geography*, a town of Japan, on the N.W. coast of the island of Niphon. N. lat. 36° 40'. E. long. 137° 30'.

**KI-TCHANG**, a town of Corea; 65 miles S.S.E. of Kang-tcheou.

**KITCHEN**, a room appropriated to the dressing of meat, and furnished with suitable accommodations and utensils for that purpose. See **BUILDING**.

The kitchen in the king's household is under the direction and management of a clerk-controller, who has a salary of 500*l.* a-year, subordinate clerk at 250*l.* a-year, first clerk at 150*l.* a-year, junior clerks, two master-cooks, the salary of the first being 237*l.* 10*s.* a-year, and of the second 217*l.* 10*s.* a-year, yeomen, grooms, &c.

**KITCHEN-GARDEN**, that sort of garden which is principally destined to the growth of different sorts of culinary vegetables and roots.

The land designed for this sort of garden should be sufficiently spacious, of a good depth and quality of mould, dry, and at the same time well situated for warmth, and the influence of the sun.

The soils and situations which are the most adapted for this purpose, as well as the forms and modes of laying them out, have been already fully explained in speaking of gardens in general. The great expense of cultivating kitchen gardens by means of hand-labour, however, renders it essentially necessary that they should be so contrived, as to have the principal part of the work executed in other ways, as by the use of small teams. In this way much money may in numerous instances be saved, and at the same time the labour be equally well performed. Mules and large asses have been found extremely beneficial in this intention, in a great number of situations. See **GARDEN**.

**KITCHEN-GARDEN PLANTS**, the common name of all such plants as are cultivated for the purpose of food, in gardens of this kind.

*Names and Sorts of Plants, with Modes of Culture respectively.*

*Agaricus campestris*, the field agaric or mushroom. Cultivated by the spawn of the root, or invisible seed, running in lumps of earth or dung, in the autumn season.

*Allium*, garlic, onion, leek, &c., of the first kind, large white

white garlic and red garlic—By the cloves of the root when separated.

In the second, or rocambolè fort—By the root and bulbs from the stalk.

In the third, or onion kind, as the common oval Strasbourg onion, great oval Portugal onion, flat white Spanish onion, flattened Spanish onion, silver-skinned onion, bulbless rooted Welch onion—By seed annually, which should be sown at different times in the early spring months.

In the fourth fort, as chives or cives—By dividing the roots, and planting them out in the spring.

In the fifth kind, the escalot or shallot—By offsets of the root planted out in spring.

In the sixth fort, or Canada tree-onion—By offset bulbs of the root, and the bulbs at the top of the stalk, planted out in spring.

In the seventh, or the leek kind, as the broad-leaved London leek, narrow-leaved leek—By seed annually, which should be sown in the early spring.

*Anethum, dill*, &c.; common dill—By seed annually, sown in the spring.

Fennel, light-green leaved, dark-green fennel, sweet-seeded fennel—By seed sown in spring; also by slipping the old roots, and planting them out in the autumnal season.

Italian fennel—By seed annually, sown in the spring. *Angelica javita*, common angelica—By seed annually, sown in spring.

*Apium*, parsley, celery, &c.; parsley, common plane-leaved parsley, curled leaved common parsley, broad-leaved, or large rooted parsley—By seed sown in spring.

Celery, common upright celery, upright celery with solid stalks, turnip-rooted spreading celery—By seed sown in the spring, for transplanting in summer and autumn.

*Asparagus officinalis*, common asparagus—By seed sown in the autumn, and when once raised, the roots abide for some years.

*Atriplex hortensis*, garden orach, white-leaved garden orach, green orach, purple orach—By seed annually sown in the spring season.

*Beta vulgaris*, beet, common culinary beet, green-leaved culinary beet, white beet, chard, or great white Swiss beet, mangel wurzel beet—By seed annually sown in the spring months.

Red beet, large long red-rooted beet, turnip-rooted red beet, red-rooted beet with green leaves, pale-red beet—By seed annually sown in the early spring.

*Barago*, borage—By seed annually sown in autumn or spring.

*Braffica*, the cabbage, cauliflower, broccoli, turnip, &c. The cabbage fort, small early summer cabbage, dwarf early sugar-loaf-shaped cabbage, large hollow sugar-loaf-cabbage, early Ruffia cabbage, common round white cabbage, long-sided hollow cabbage, oval hollow cabbage, flat-topped cabbage, musk-scented cabbage, giant cabbage, red cabbage—By seed annually sown at different times, in spring and autumn, for use all the year, by having the plants set out at various times.

Savoy cabbage, common green curled savoy, large green Dutch savoy, yellow savoy—By seed annually sown in spring, for autumn and winter use.

Laciniated, and other open-leaved coles, green curled borecole, red curled borecole, thick-leaved curled borecole, finely fringed borecole, broad erect curled-leaved Siberian borecole, or Scotch cole or kale, red and green common

plane-leaved green colewort—By seed annually sown in spring and summer, for plants for autumn and winter use.

Turnip cabbage, turnip cabbage with the turnip above ground, with the turnip under ground—By seed sown annually in spring and summer.

The cauliflower forts, early cauliflower, late cauliflower—By seed sown annually in spring and autumn, for plants for summer and autumn use.

Italian *brassica*, or broccoli, early purple broccoli, late large purple broccoli, comprehending varieties, with blue, brown, green, and yellow heads, dwarf purple broccoli, white or cauliflower broccoli, black broccoli—By seed sown in spring and beginning of summer, for plants for autumn, winter, and spring use.

The turnip, early Dutch turnip, white round turnip, green-topped turnip, red-topped turnip, yellow turnip, oblong white turnip, long white-rooted French turnip, round purple French turnip—By seed sown in spring and summer, for plants for use most part of the year.

*Calendula officinalis*, common marigold—By seed sown annually in spring, summer, or autumn.

*Cichorium endivia*, endive, green curled endive, white curled endive, broad-leaved Batavian endive—By seed sown annually, in summer, from May till July, for plants for autumn and winter use.

*Cochlearia armoracia*, horse radish—By pieces of the roots planted out in spring, for use for most part of the year.

*Crambe*, sea-cabbage or colewort, the different varieties—By seed sown in spring; but when once raised, the roots remain for years, sending up shoots for use in spring and summer.

*Cucumis*, cucumber and melon, the cucumber, early short prickly cucumber, early cluster cucumber, long green prickly cucumber, long white prickly cucumber, long smooth green Turkey cucumber, large smooth white cucumber, large smooth green Roman cucumber—By seed sown annually, at different times on hot-beds, in the early spring and summer.

The melon, Romana melon, Cantsleupe melon; varieties of each, and several other sorts—By seed sown annually at different times, on hot-beds, in the spring months.

*Cucurbita*, the gourd and water melon—By seed sown annually in the spring season.

*Cynara*, artichoke and cardoon, the common artichoke, globular-headed red Dutch artichoke, oval-headed green French artichoke—By suckers from the sides of the old plants, in spring, of many years duration.

The common cardoon—By seeds sown annually in the early spring.

*Daucus carota*, the carrot, orange-coloured carrot, red carrot, yellow carrot, white carrot—By seed sown annually in spring, summer, and autumn, for use most part of the year.

*Helianthus tuberosus*, tuberous sun-flower, or Jerusalem artichoke—By pieces of the root planted annually in the spring season.

*Hypopis officinalis*, common hyssop, the several different varieties—By seed sown in spring, and by planting slips and cuttings of its branches.

*Lactuca*, lettuce, early green cabbage-lettuce, white cabbage-lettuce, brown Dutch cabbage-lettuce, great admirable cabbage-lettuce, green and white ball cabbage-lettuce, green cos-lettuce, white cos-lettuce, black cos-lettuce, spotted Aleppo cos-lettuce, brown Cilicia lettuce, Imperial lettuce, red Capuchin lettuce, green Capuchin lettuce, curled-

lettuce—By seed sown annually, at different times, in spring, summer and autumn, for plants for setting out for use most part of the year.

*Lavandula*, lavender, spike-flowered common lavender, common narrow-leaved, broad-leaved, blue-flowered, white-flowered, and dwarf lavender—By slips planted out in spring, which are of many years continuance.

*Stechas*, or French lavender—By planting slips or cuttings, and by seed, which are of many years duration.

*Lepidium sativum*, garden-cress, common small-leaved, broad-leaved, curled-leaved—By sowing seed at different times of the year, according as the plants are wanted.

*Melissa officinalis*, balm, common balm—By dividing and planting the roots in spring or autumn, which are of many years duration.

*Mentha*, mint, penny-royal, &c., green common spearmint, curled-leaved spearmint, variegated spearmint—By dividing the roots, by young plants, and by cuttings of the stalks, planted out in spring, and which continue many years.

Peppermint—By roots and plants, &c. like the former.

Penny-royal—By dividing and slipping the plants, as for the mint, and planting them out.

*Ocimum basilicum*, basil, common sweet basil, several varieties—By seed sown in spring on a hot-bed, the plants being afterwards planted out.

*Origanum marjoram*, common, wild, perennial pot marjoram, winter perennial sweet marjoram, marjorana, or annual sweet marjoram—By sowing seeds in spring, and the two former also, by slipping the roots, and planting them.

*Pastinaca sativa*, parsnip, common garden parsnip—By seed sown annually for winter use.

*Phacelia vulgaris*, common kidney-bean, dwarfs and runners, dwarf kinds, early white, early yellow, liver-coloured speckled dwarf, Canterbury white dwarf, Battersea white dwarf, large white dwarf, cream-coloured dwarf, black dwarf, sparrow-egg dwarf, amber-speckled dwarf—By seed sown annually, at different times, from April till July, or the following month.

Running kinds, scarlet runner, white variety, large Dutch runner, Battersea white runner, negro runner, variable runner—By sowing the seed like the former, but principally in the summer months.

*Pisum*, the pea, Charlton pea, golden Charlton, earliest golden Charlton, long Reading hotspur, Maister's hotspur, Spanish morotot, green noupareil, early dwarf marrowfat, large marrowfat, green rouncival or union, white rouncival, Ledman's dwarf pea, small fugar pea, large fugar pea, cluster pea, crown pea, egg-pea, sickle pea, &c.—By seed sown annually, at different times, from October till June, but principally in the early spring months.

*Portulaca oleracea*, purslane, green purslane, golden purslane—By seed sown different times in April and May.

*Potterium sanguisorba*, burnet, common garden burnet—By seed sown in autumn or spring, and parting the roots.

*Raphanus sativus*, the radish, short-topped early radish, long-topped radish, deep-red radish, pale-red, transparent, mild radish, salmon-coloured radish, small white turnip-rooted radish, small red turnip radish, large white turnip-rooted Spanish radish, large black turnip-rooted Spanish radish—By seed sown at different times, from Christmas till June or August; but the latter sorts sown principally in June and July, for autumn and winter use.

*Rofmarinus*, rosemary, some varieties—By planting layers, slips, and cuttings in spring.

*Rumex acetosa*, sorrel, common long-leaved sorrel, round-leaved French sorrel, barren sorrel—By parting the roots and the first root also plentifully by feed.

*Ruta graveolens*, rue; several varieties—By planting slips and cuttings; also by feed.

*Salsvia*, sage, clary, &c. The sorts are; common sage, red sage, broad-leaved green sage, narrow-leaved green sage, broad-leaved hoary sage, sage of virtue, worm-wood sage, &c.—By planting slips in April, May, and June; also by sowing the seed in the spring season.

Clary—By seed sown annually in the spring.

*Satureja*, savory, winter perennial savory, summer annual savory—Both by seed sown in the spring season, and the former also by planting slips.

*Scandix cerefolium*, chervil, annual garden chervil—By feed annually, in August, for winter and spring use, or sown also in spring and summer, for succession crops.

*Scorzonera*, scorzonera, Spanish scorzonera—An eatable root, raised from seed sown in spring.

*Sinapis*, mustard, white mustard, black mustard, field or wild mustard; the former to use young in salad, and the two last for their seeds, to make the table sauce called mustard—By feed in spring; or, if for fallads, at any time of the year.

*Sium sibiricum*, siliarium or skirret—An eatable root raised by planting offsets commonly of the root; also by feeds.

*Smyrniolum olusatrum*, Alianders, or common Alexanders—By seed annually in spring.

*Solanum*, nightshade, furnishing the potatoe and tomatoe, tuberous-rooted solanum or potatoe, the common found red potatoe, early round red, oblong red, deep red, pale red, rough red, white kidney-shaped, large red-ended kidney, white round, white cluster, prolific American—By planting pieces of the roots or the roots whole in spring; also by sowing seed occasionally to obtain new varieties.

Tomatoe or love-apple; varieties—By sowing the seed annually, on a hot-bed, in the spring.

*Spinacia*, spinach, round thick-leaved or smooth-seeded, triangular leaved or prickly seeded; the former for spring and summer crops, the latter to stand the winter—By sowing annually in spring, summer, and autumn, for use most part of the year.

*Tanaacetum vulgare*, common tansey—By parting the roots, and planting in spring or autumn.

*Thymus vulgaris*, common thyme, the varieties with broad leaves, with narrow leaves, with striped leaves—By sowing seeds in March and April; also by planting slips of the roots and branches, and by cuttings; but seed is the only way to raise a quantity of the common sort; and the other methods to continue the varieties, or for a general supply.

*Tragopogon porrifolium*, fallafy—An eulent root, by feeds annually in spring.

*Tropaeolum*, Indian cress, or nasturtium, nasturtium minus, nasturtium majus; their flowers for garnish and fallads, and their seeds to pickle—Raised annually from seeds sown at different times in spring.

*Valeriana locusta*, corn fallad or lamb's lettuce—By seed sown in spring and autumn.

*Vicia faba*, the bean, early Mazagan, early Lisbon, long-pod, Turkey long-pod, toker bean, Sandwich bean, Windsor-bean, white blossomed, red-blossomed, Spanish bean, noupareil bean, dwarf fan bean, very low—By seed sown annually

nually, at different times from October until June, but principally in the early spring months.

More full explanations of the nature of the culture, application, and use of each, will be given under the different heads to which they particularly belong.

KI-TCHENG, in *Geography*, a town of Corea; 65 miles E. N. E. of Kiang-ki-tao.

KITCHIK-JOURLOU, a town of Natolia; 16 miles N. of Ibsarbeh.

KITCHWARA, a circar of Hindooftan, in Malva, bounded on the N. by the circar of Cotta, on the E. by Chandace, on the S. by Malva, and on the W. by Oudipour and Banfwaleh.

KITE, in *Ornithology*. See *FALCO Milvus*. Its motion in the air distinguishes it from all other birds; being so smooth and even as to be scarcely perceptible: sometimes it will remain quite motionless for a long while: at other times, glide through the sky, without the least apparent action of its wings, from whence it derived the old name *glad*, of the Saxon *glida*. Lord Bacon observes, that when kites fly high it portends fair and dry weather. Pliny thinks that the invention of the rudder arose from the observation made of the various motions of the tail, when the kite was steering through the air. Lib. x. c. 10.

The kite is a destructive bird to farmers, &c. on which account it is necessary to guard against its depredations as much as possible. This last purpose may sometimes be effected by laying such animal substances as have been infused in some sort of liquid with *nux vomica*, in the places where they come in order to feed.

KITE, in *Electricity*. See *CONDUCTOR*.

KITLOLL, in *Geography*, a town of Bengal; 15 miles S. S. W. of Goragot.

KITNAISE, a town of Egypt, on the left branch of the Nile; 20 miles S. of Faouf.

KIPOISKA, a town of Russia, in the government of Irkutsk, situated on the Kitoi, which runs into the Angara: 68 miles N. N. W. of Irkutsk.

KITORAH, a town of Hindooftan, in Boggilcund; 25 miles N. N. E. of Rewah.

KITRIANI, a town on the S. coast of the island of Siphanto. N. lat.  $36^{\circ} 55'$ . E. long.  $24^{\circ} 49'$ .

KITTATINNY MOUNTAINS, a ridge of the Alleghany mountains, which runs through the northern parts of New Jersey and Pennsylvania.

KITTEN ISLAND, a small island in the Mergui Archipelago, near the S. E. coast of Cat island.

KITTER, a town of Hindooftan, in Bahar; 37 miles N. of Hajypour.

KITTERY, a township of York county, in the state of Maine, incorporated in 1653, and consisting of three parishes, which contain 3114 inhabitants. It is situated between Piscataqua and York rivers, 67 miles N. of Boston.

KITTILA, a town of Swedish Lapland; 103 miles N. of Kemi.

KITTIWAKE, in *Ornithology*, a species of the gull kind, being the *larus risfa* of Linnæus: the head, neck, belly, and tail are of a snowy whiteness; behind each ear is sometimes a dusky spot; the back and wings are grey; the bill is yellow, tinged with green; the legs are dusky, and have a small knob instead of the back toe. This bird inhabits the romantic cliffs of Flamborough-head, the Bass Isle, the rocks near the castle of Slains, in the county of Aberdeen, and Priestholm-Isle. The young of these birds are a favourite dish before dinner, for whetting the appetite, in North Britain, but they have a rank taste and smell. Pennant. See *LARUS*.

KITT'S, ST., in *Geography*. See *St. CHRISTOPHER'S*.

KITWADA, a town of Japan, in the island of Niphon; 45 miles N. W. of Meaco.

KITZBUHL, a town of the county of Tyrol, on the Acha; 36 miles E. of Inspruck. N. lat.  $47^{\circ} 25'$ . E. long.  $12^{\circ} 27'$ .

KITZINGEN, a town of the duchy of Wurzburg, on the Maine; it is a large, handsome town, owing its rise to a convent of Benedictines, founded in 745 by duke Pepin. Most of the inhabitants are Lutherans; 10 miles E. S. E. of Wurzburg. N. lat.  $49^{\circ} 42'$ . E. long.  $10^{\circ} 12'$ .

KIU, a city of China, of the first class, in the province of Tche-kiang; pleasantly situated near a fine river, and between two others that run into it. It borders on Kiang-fi and Fo-kien; but to the last province the passage is difficult on account of the intervening mountains. N. lat.  $29^{\circ} 2'$ . E. long.  $118^{\circ} 39'$ .

KIVA, See *KHIEVA*.

KIVAK, a town of Persia, in the province of Khorasan; 300 miles N. of Herat.

KIVALORE, a town of Hindooftan, in the Carnatic; 8 miles W. of Negapatam.

KIVJARVI, a town of Sweden, in the government of Wafa; 70 miles S. E. of Jacobstätt.

KIUKA, a town of Sweden, in the government of Abo; 30 miles S. S. E. of Biorneborg.

KIULO, a town of Sweden, in the government of Abo; 30 miles S. S. E. of Biorneborg.

KIUN-TCHEOU, a city of China, of the first class, and capital of the island of Hainan, which see. It stands on a promontory, and ships often anchor at the bottom of its walls. Two different kinds of Mandarins command here, as in all the other provinces of China; the first are called Iterati; the second, mandarins of arms, or military officers. Its jurisdiction extends over three cities of the second class, and ten of the third. N. lat.  $20^{\circ}$ . E. long.  $109^{\circ} 38'$ .

KIURAWASI, town of Sweden, in the government of Kuopio; 15 miles N. N. W. of Kuopio.

KIUSIU, an island of Japan, also termed Saikokf, or the western country, situated on the S. W. The length of Kiufiu from N. to S. is about two degrees, or 140 British miles, and the greatest breadth about 90. See *XIMO*.

KIUTAJA, or CUTAJA, a town of Asiatic Turkey, capital of a fangiakate, and residence of the beylerbeg of Natolia, situated at the foot of a mountain, near the river Purfak, which runs into the Sakaria: It contains several mosques, and three Armenian churches. The soil is fertile, and the air healthy. Near it are some warm baths, in high estimation for several disorders; 136 miles E. of Constantinople. N. lat.  $39^{\circ} 14'$ . E. long.  $30^{\circ} 30'$ .

KIWACZE, a town of Poland, in the palatinate of Brzelsk; 20 miles E. of Brzelsk.

KIZ, a town of Kharafin; 290 miles N. W. of Samar-cand.

KIZELGICK, a town of Natolia, on or near the seite of the ancient Euronius; 9 miles N. N. W. of Melafio.

KIZIDANY, a town of Samogitia; 20 miles E. S. E. of Rosienne.

KIZILBASCH, or KEZELBASCH, a Turkish term signifying *red-head*: applied by way of obloquy to the Persians, ever since Ishmael Sophi, founder of the family last reigning in Persia, who ordered his soldiers to wear a red cap, round which is a scarf or turban with a dozen plaits in it, in memory of twelve imams, successors of Ali, from whom he pretended to descend.

Vignere writes the word *kezilbasch*, and adds, that according

to the vulgar interpretation among the Persians, the twelve plaits signify the twelve sacraments of their law. But not contented with this, he looks out for another original, and tells us there is a mystery in it, derived from the ancient paganism, when the Persians adored fire, whose heat is denoted by the red colour, which in some measure symbolizes with the sun, held by them in the highest veneration. He adds, that the twelve plaits shew the twelve months of the year, and twelve signs in which that luminary performs his course.

**KIZILERMAK**, or **KIZIL-IRMAK**, the celebrated *Haly's* of antiquity, in *Geography*, a river of Asiatic Turkey, which rises in mount Taurus, a few miles S. of Kaisarië, in Carmania, and runs into the Black sea, N. lat.  $41^{\circ} 40'$ . E. long.  $36^{\circ}$ , on the coast of the gulf of Sanfoun.

**KIZIL-KHAN**, a town of Asiatic Turkey, in Diarbekir; 12 miles W. of Merdin.

**KIZILAGADJE**, a town of Persia, in the province of Ghilan; 25 miles N. of Aftara.

**KIZILHIZAR**, a town of Syria; 8 miles E. of Antab.

**KIZIL-OZAN**, or **SEFID BUD**, called by Hanway *Sefitrood*, a river of Persia, which M. D'Anville derives from the mountain of Elwend, not far N of Hamadan; so that, by a very winding course to the Caspian sea, its length doubles what is assigned in more recent maps. This river is the Mardus of antiquity, and the Swidura of Gmelin, rising on the confines of Turkey, and falling into the sea below Langorod. It supplies numerous pike, carp, and other kinds of fish, esteemed by the Persians. Gmelin says that it abounds in sturgeon.

**KIZILRABAT**, a town of the Arabian Irak; 10 miles N.N.E. of Shehrban.

**KIZIL-FASHI**, or **TAMAN**, an island at the mouth of the river Kizil, between the Persian coast and the sea of Azoph; inhabited by Cossack Tartars. N. lat.  $45^{\circ}$ . E. long.  $37^{\circ}$ .

**KIZIZANAN**, a town of Moravia, in the circle of Brunn; 15 miles S.E. of Brunn. N. lat.  $49^{\circ} 8'$ . E. long.  $16^{\circ} 52'$ .

**KIZLIAR**, or **KISLAR**, a Russian town, fortrefs, and port, in the government of Caucasus, established in the year 1735, near the eastern coast of the Caspian, and covering the frontiers towards the limits of Persia. Vessels formerly entered the southern branch of the Terek; but as the mouths of that river are now choaked up, the merchandize is landed in a small bay, at the distance of 34 miles. Kislar draws from Altrachian the European commodities necessary for the Persian traffic, together with corn and provision for the Russian colonies on the Terek, and for the neighbouring district of mount Caucasus. Besides the goods which are disposed of at Kislar, and sent to the Persian ports, the inhabitants carry on a contraband trade to Shamakee, Derbent, and even Teflis, in Georgia, which is exceedingly precarious from the numerous banditti who pillage the caravans. The environs of Kislar are very fertile in corn and fruit, with plenty of game; 160 miles S.S.W. of Altrachian. N. lat.  $44^{\circ} 50'$ . E. long.  $46^{\circ} 44'$ .

**KIZLUK**, a town of Russia, lately in the palatinate of Braclaw; 16 miles E. of Braclaw.

**KLACKS**, a small island on the W. side of the gulf of Bothnia. N. lat.  $61^{\circ} 21'$ . E. long.  $17^{\circ} 4'$ .

**KLADNO**, a town of Bohemia, in the circle of Schlan; 10 miles N.W. of Prague.

**KLAN**, a town of Istria; 13 miles N.E. of Pedara.

**KLAN**, or *Clano*, a town of the duchy of Carniola; 28 miles E. of Treleve.

**KLANG POINT**, a cape on the S. coast of the island of Java. S. lat.  $7^{\circ} 40'$ . E. long.  $109^{\circ} 32'$ .

**KLATTAU**, a town of Bohemia, in the circle of Pilsen, built in 775, and surrounded with walls in 1000; having some silver mines in its vicinity; 21 miles S. of Pilsen. N. lat.  $49^{\circ} 24'$ . E. long.  $13^{\circ} 15'$ .

**KLEBANI**, a town of Poland, in the palatinate of Braclaw; 10 miles S. of Braclaw.

**KLEBANON**, a town of Poland, in Podolia; 60 miles N. of Kamianec.

**KLEBER**, J. B. in *Biography*, a French general, was born at Straburgh in 1759, and was bred an architect. Accident led him to enter himself into the Austrian service, in which he continued eight years, and then returning to his native country, became inspector of the public buildings in Upper Alsace. The revolution of France rekindled his military ardour, and he obtained a commission in the service. He displayed great bravery and judgment at the siege of Mayence, after which he was employed in La Vendée; but the sanguinary scenes there so disgusted him, that he obtained his recall, and was afterwards engaged in the north, where he defeated the Austrians, took Mons, and drove the enemy from Louvain. He captured Maeltricht, and contributed to the taking of several other strong places. Discontented with the Directory, he left the army and returned to Paris, where he led a private life, writing his military memoirs, till Bonaparte, being appointed general of the army of Egypt, chose Kleber as his companion. At the siege of Alexandria he was wounded on the head as he was climbing the ramparts, but he did not retire till he received a second wound. He defeated the Turks in several actions; and Bonaparte, on quitting Egypt, left Kleber in the chief command. In a short time he signed the treaty of El-Arisch with sir Sidney Smith, by which the French agreed to leave Egypt; but it was annulled by the British government, and hostilities were renewed. Kleber, though reduced, did not bend under his misfortunes, but defeated the Turks at the obelisk of Heliopolis. He next took Cairo by storm, and formed an alliance with Murat Bey; but he was assassinated by a Turk, named Solyman, who gave him four stabs with a dagger, in the year 1800.

**KLECK**, in *Geography*, a town of Lithuania, in the palatinate of Novogrodek, 24 miles W.N.W. of Sluck.

**KLEIN**, a town of the duchy of Stiria; 12 miles E.S.E. of Landferg.

**KLEINENBERG**, a town of Westphalia, in the bishopric of Paderborn; 8 miles N.W. of Warburg.

**KLEINHOVIA**, in *Botany*, was so designated by Linnaeus, in honour of Mr. Kleinhoff, a sedulous and ingenious cultivator of the botanic garden established in the island of Java. Linn. Gen. 468. Schreb. 324. Willd. Sp. Pl. v. 2. 871. Cavan. Diss. v. 2. 288. Mart. Mill. Dict. v. 3. Julii. 278. Lamarck. Dict. v. 3. 367. Gærtn. t. 137. Clafs and order, *Dodecandria Monogynia*. Nat. Ord. *Collumiferae*. Linn. *Malvaceae*, Juss.

Gen. Ch. *Cal.* Perianth deciduous, of five, oblong, nearly equal leaves; the lower one rather shorter than the rest. *Cor.* Petals five, lanceolate, sessile, a little longer than the calyx; the upper one shorter, broader, curved and truncated; nectary central, supported by a column the length of the calyx, surrounded with glandules at the base, ascending at the top, bell-shaped, very small, divided half way down into five recurved segments. *Stam.* Filaments 15, very small, three placed on each segment of the nectary; two of them are terminal, the other rather lower; anthers of two lobes. *Pist.* Germen superior, ovate, five-sided, placed in the hollow of the nectary; style simple; stigma slightly

slightly notched. *Peric.* Capsule five-lobed, five-sided, inflated. *Seeds* solitary, roundish, somewhat mucicated.

Obf. This genus is, according to LINNÆUS, who places it in *Cynandria*, allied to *Ayenia*, but perfectly distinct from it.

Eff. Ch. Calyx of five leaves. Petals five. Nectary bell-shaped, five lobed, bearing the stamens, and affixed to the column of the germen. Capsule five-sided, inflated, consisting of five single-seeded cells.

1. *K. Hesperia*. Linn. Sp. Pl. 1365. Cavan. Diff. v. 2. t. 146.—(Catti-marus; Rumph. Amboin. v. 3. 177. t. 113.) A native of Java, Amboina, and the Philippine islands, flowering throughout the year, and bearing fruit in October.—*Stem* like that of a common apple-tree, thick, incurved, and knotty. *Branches* smooth. *Leaves* alternately scattered, somewhat heart-shaped, broad, ovate, acute, seven-ribbed, with arched veins. *Stipulas* lanceolate. *Flowers* bright purple. *Fruit* at first greenish purple, afterwards reddish. Rumphius has remarked, that the younger leaves, when bruised, emit an odour like violets, on which account the natives of Amboina wash their heads with an infusion of them. This handsome tree is universally admired among the Malays for the beauty of its foliage as well as for the firmness and excellence of its wood, of which their quivers are generally formed.

KLEINIA, named in honour of the celebrated German zoologist, James Theodore Klein, F. R. S. well known for his critical opposition to Linnaeus in that department of natural history. His claim to botanical distinction is founded chiefly on a treatise concerning the plant now called *Cacalia Kleinia*; nor would this perhaps have excited much attention, but for the absurdity of the phrase by which it distinguishes it, *Nec Cacalia, nec Cacaliastrum, an Tithymaloideis*. This is cited in the *Critica Botanica* of Linnaeus, as an instance of the confusion that must ensue from botanists not bestowing new names upon new plants.—Klein flourished in the first half of the eighteenth century, having been born in 1685, and living till 1759.—Schreb. 545. Willd. Sp. Pl. v. 3. 1738. Jacq. Amer. 215.—Class and order, *Syngenesia Polygamia Æqualis*. Nat. Ord. *Compositæ Discoidææ*, Linn. *Corymbiferae*, Juss.

Obf. For an account of the separation of this genus from *Cacalia*, see that article.

Gen. Ch. *Common Calyx* perfectly simple, oblong, cylindrical, composed of five, linear, lanceolate, pointed, equal leaves. *Cor.* compound, uniform, tubular. Florets all fertile, numerous, equal, a little longer than the calyx, funnel-shaped; tube slender, very long; limb somewhat bell-shaped, five-cleft. *Stam.* Filaments five, capillary, very short; anthers cylindrical, tubular. *Pist.* Germen superior, linear, half as long as the calyx; style thread-shaped, the length of the stamens; stigma bifid, revolute. *Peric.* none. The whole calyx is bent backwards when in fruit. *Seeds* solitary, linear; seed-down capillary. *Recept.* naked, flatfish.

Eff. Ch. Receptacle naked. Down simple. Calyx simple, equal, of five leaves.

1. *K. ruderalis*. Willd. n. 1. Jacq. Amer. t. 127. (*Cacalia ruderalis*; Swartz. Prod. 110.)—Leaves oblong-lanceolate, acute at each end, nearly entire.—Found in gravelly waste ground and on walls, in Jamaica, St. Domingo, and Martiuico.—*Root* annual. *Stem* erect, about three feet high, very smooth. *Leaves* mostly alternate, sometimes undivided, sometimes waved or cut, of a glaucous green. *Flowers* greenish-yellow, inodorous.

2. *K. Porophyllum*. Willd. n. 2. (*Cacalia Porophyllum*; Linn. Sp. Pl. 1169. Cavan. Ic. v. 3. 11. t. 222.)—Leaves elliptical, obtuse, besprinkled with transparent dots.—A

native of Peru. It flowered in the royal garden of the Escorial during the month of November.—*Stem* straight, simple, smooth, slightly striated, about a foot and half high. *Leaves* numerous, scattered, on footstalks, oval or elliptical, crenate, and dotted with small diaphanous spots. *Flowers* terminal, cylindrical.

3. *K. angulata*. Willd. n. 3. (*Cacalia angulata*; Vahl. Symb. v. 3. 92. *C. fenchifolia*; Forst. *Agypto-Arab.* n. 485.)—"Lower leaves on footstalks, oblong, toothed, angulated; upper ones lanceolate, entire."—A native of Arabia Felix.—*Stem* herbaceous, divided at the upper part, striated. The flowering *branches* elongated and naked upwards. *Leaves* very smooth, about an inch and half long. *Flowers* corymbosæ.

4. *K. suffruticosa*. Willd. n. 4. (*Cacalia suffruticosa*; Linn. Mant. 109. *C. Linaria*; Cavan. Ic. v. 3. 29. t. 257.)—"Leaves linear, entire, with pellucid dots. Stem rather shrubby."—A native of New Spain, and sent by Arduino to Linnæus from Brasil.—*Stems* about six inches high, thread-shaped. *Leaves* scattered, entire, small, fleshy. *Flower-stalks* terminal, single-flowered, erect. *Flowers* numerous, of a purple-colour, and very similar to those of *K. Porophyllum*, but the herbage is totally unlike that species.

KLEIST, CHRISTIAN EWALD VON, in *Biography*, was born at Zoeblin, in Pomerania, in 1715. His parents, who were of the order of nobility, sent him to the Jesuits' college in Upper Poland, whence he was sent to the academy of Dantzic, and afterwards to the university of Konigsberg. At the age of twenty-one he entered the Danish military service, but having an attachment to literature he did not forget the Muses amidst his other avocations. Once he was so intent on reading Milton, that he forgot to relieve guard. He did not remain long in the Danish service, but entered into that of Prussia. Frederic the Great gave him a commission in the regiment of prince Henry, and in this situation he formed an intimacy with all the great characters at Potsdam. He was particularly noticed by the king, and advanced in the army. He requested and obtained leave to take an active part in the campaign of the year 1759, but this instance of military ardour proved fatal to him, and deprived Germany of one of its best poets. He was present at the battle of Kunnerdorff, and after the most heroic displays of valour in the successive attacks of four batteries, he fell covered with wounds, of which, after much suffering, he died in the forty-fourth year of his age. His principal work, as a poet, was entitled "Spring," which was first published in 1749. On account of this poem he was called the imitator of Thomson; he is reckoned to excel in painting the sweet and beautiful scenes of nature, in a style singularly elegant and harmonious. The Spring was translated into several languages. He wrote Idyllis in the manner of Gesner, which possess great simplicity and neatness. He was author, likewise, of some moral treatises, and "Reflections on the Art of War." He published an edition of his works in 1756, with additions, among which is a description of an inundation, a piece of the terrific kind. Gen. Biog.

KLEMPENOW, or CLEMPENOW, in *Geography*, a town of Anterior Pomerania; eight miles N. of Treptow.

KLEMS, a town of Moravia, in the circle of Olmutz; eight miles S.E. of Olmutz.

KLEPOT, a town of Transylvania; 14 miles S. of Hunyad.

KLEPS, a town of Norway; 11 miles S. of Stavanger.

KLESÄKU, a town of Walachia; 21 miles W.S.W. of Bucharest.

KLETTGAU,

KLETTGAU, a landgrate of Germany, called also "The county of Sulz," situated near the Rhine as it leaves the lake of Constance.

KLEWAH, a town of Russian Poland, in Volhynia; 24 miles E.N.E. of Lucko.

KLIMATOVSKOI, a town of Russia, in the government of Novgorod; 44 miles W.N.W. of Novgorod.

KLIMATZSKOI, an island of Russia, in the lake of Onetzkoi; 48 miles N.N.E. of Petrovskifk.

KLIMIA, or CLIMIA, in the *Materia Medica*, the name given by the Arabian writers to the lapis calamarinis. Avicenna and Serapion never call it by any other name. Some pronounce the word *climia*. Hence the modern Greeks have formed their *climic*, which is the name of the same substance; and our calamarinis is evidently deduced from the same original.

KLIMOVA, in *Geography*, a town of Russia, in the government of Tobolsk, on the Tunguska; 200 miles E. of Eniseisk.—Also, a town of Russia, in the government of Tobolsk, on the Mura; 232 miles E.S.E. of Eniseisk.

KLIMOVIGI, or KLIMOVITICH, a town of Russia, and district of the government of Mogilev, or Mohilef, on the river Oteq, which falls into the Soff; 80 miles E. of Mogilev.

KLIN, a town of Russia, and district of the government of Moscow, on the river Seltra, falling into the Dubnia, which joins the Volga; 36 miles N.N.W. of Moscow.—Also, a small island in the N. Pacific ocean, near the E. coast of Kamtschatka.

KLINGENFEL, a town of the duchy of Carniola; nine miles S.W. of Landitrafs.

KLINGENTHAL, a town of Saxony, in the Vogtland, inhabited chiefly by miners and woodmen, driven out of Bohemia an account of their religion; 12 miles E. of Oelmitz.

KLINGERSKOI, a town of Russia, in the government of Irkutsk; 76 miles S.S.E. of Nerchinsk.

KLINGAN, a town of Switzerland, in the county of Baden; nine miles N. of Baden.

KLINGSTEIN, in *Mineralogy*, *Pierre Sonante*, Broch. Its colour is dark greenish-grey, passing into yellowish and ash-grey, a light olive-green or liver-brown. It occurs in mass. The cross fracture is almost dull, the longitudinal fracture is glistening. The former is splintery, passing into conchoidal, the latter is more or less flaty. It branches into indeterminate sharp-edged, sometimes tabular fragments. Usually translucent on the edges, considerably hard, and not easily frangible. When struck with a hammer, it gives a ringing metallic found, whence its name. Sp. gr. 2.57. It melts easily before the blow-pipe, and yields a clear, almost colourless glass. According to Klaproth's analysis, it consists of

Silex	57.25
Alumine	23.5
Lime	2.75
Oxyd of Iron	3.25
———— Manganese	0.25
———— Soda	8.1
———— Water	3.0
	98.1

Werner refers it to the floetz-trap formation, resting upon basalt, into which it frequently passes. It often contains crystals of feldspar, and then forms slate porphyry. Reufs reckons it to belong to the primitive rocks. It occurs in the middle mountains of Bohemia, particularly the Don-

nerberge, near Milbtschau, a conical mountain above 2500 feet high, which consists entirely of this mineral. It has also been observed by Jamieson in the island of-Landaf, in the Frith of Clyde. Very beautiful varieties of it also occur in rock masses between Llanberis and Caernarvon in North Wales. Aikin's Dict. of Chem. and Miner.

KLINKETS, in *Fortification*, a fort of small gates made through palisades, for sallies.

KLINKOSEE, in *Geography*, a town of Poland, in Podolia; 52 miles N.N.E. of Kamince.—Also, a river of Poland, which runs into the Dniester; eight miles S. of Kamince.

KLIP FISH, in *Icthyology*, a name by some authors supposed to mean the *lupus piscis*, or wolf-fish; and by others, the common cod-fish.

Of the former opinion is Fabricius, who supposes the *lupus* so called, because it is able to climb up rocks, or generally lies hid among rocks: the word *klip*, in the German, signifying a rock. Of the other is Schonefeldt, who supposes the cod has its name of klip-fish, or rock-fish, from its being usually dried upon the rocks.

KLIP-FISH is also a name by which the Dutch in the East Indies call a flat fish, caught frequently on those shores, and sometimes called also *soldaten visch*, or the soldier's fish. It somewhat resembles the bream in shape. Its general size is about six or seven inches in length, and it is of a very white and silvery hue. It differs very greatly, however, from the bream in many particulars. The nerves of its back fin are prickly, as in the perch; its tail is pointed, not forked; and the irises of its eyes are yellow. It is one of the finest fish of the East Indies. Its flesh is very firm, and falls into large pieces, when dressed, like that of the cod, and is very well tasted. See *CHAETODON teira*, *cornutus*, and *striatus*.

KLIPPE, in *Geography*, a small island in the Atlantic, near the coast of Africa. S. lat. 32° 10'.

KLOBUK, a town of Moravia, in the circle of Hradisch; 20 miles E. of Hradisch.

KLODAWA, a town of the duchy of Warsaw; 12 miles N.W. of Lencicz.

KLOETZEN, a town of Westphalia, in the principality of Lüneburg-Zelle; 45 miles E. of Zelle. N. lat. 52° 41'. E. long. 11° 8'.

KLOKLSBERG, a town of Bohemia, in the circle of Bechin; 12 miles S.E. of Rosenber.

KLOKOTZ, a town of Croatia; 24 miles S. of Carlstadt.

KLOPSTOCK, FREDERIC THEOPHILUS, in *Biography*, a German poet, was born at Quedlinburg in 1724. He was the eldest of eleven children, and distinguished himself in his youth among his companions in bodily and mental exercises. At the age of sixteen he went to college, and being placed under an able tutor, he made himself familiar with the languages, and acquired a taste for the beauties of the best classical authors. He made attempts in composition both in prose and verse. In the latter he wrote some pastorals, but not contented with these humbler efforts, he formed the resolution of composing an epic poem, and fixed upon the "Messiah" as his subject. In 1745, he went to the university of Jena, where he commenced the study of theology, but in the midst of his academical pursuits he was planning his projected work, and sketched out his three first cantos.

In 1746, he removed from Jena to Leipzig, and became a member of a society of young men who had formed themselves into a literary club for mutual improvement. About this time he exercised his genius in lyric compositions. Several of his odes, together with the three first cantos of his Messiah,

Messiah, appeared in a periodical paper, entitled "Bremen Contributions." The publication of ten books of his Messiah made his name known throughout Germany, and raised his reputation very high. This work was extremely popular among those who had hearts to feel the beauties of poetry and the warmth of devotion. The Messiah was quoted again and again from the pulpit by the younger divines, while those more advanced censured the fictions in which the poet had indulged himself on sacred topics, and rigid grammarians made severe strictures on the style and verification. He travelled into Switzerland in 1750, to pay a visit to Bodmer of Zurich, in consequence of an invitation, where he was received with every token of respect. The sublime scenery of that country, the simplicity of the inhabitants, and the freedom they enjoyed, were much suited to the taste of Klopstock. Here he intended to have spent the remainder of his life, but baron Bernstorff caused an invitation to be sent to him to reside at Copenhagen, with assurances of such a pension as would make him independent. Klopstock acceded to the proposal, and set out in 1751, by the way of Brunsviek and Hamburg, at which latter place he became acquainted with Miss Muller, a lady perfectly adapted to his own mind, whom he soon after married. They seemed by Providence destined to be one of the happiest couples upon earth, but he was soon deprived of her, for she died in childhood; her memory, however, was sacred to Klopstock to the last moment of his existence. He lived chiefly at Copenhagen, till the year 1771, after which he resided at Hamburg as Danish legate, and counsellor of the margrave of Baden, who gave him a pension. The latter part of his life was little varied by incidents, and after he had brought the Messiah to a conclusion, he continued to employ himself in composition, and in the correction and revision of his works. He died at Hamburg, in March 1803, being 79 years of age. By those who were intimate with him, he is represented as a truly amiable man, happy in a small circle of private friends, and particularly fond of the society of young persons. The character of Klopstock, as a poet, is that of exuberance of imagination and sentiment. His sublimity is almost unparalleled, he is apt to lose himself in mystical abstraction, and his excess of feeling sometimes betrays him into rant and extravagance. An able critic claims for the author of the Messiah a rank among the first poets. His odes and lyric poems have likewise been much admired by his countrymen, and his dramas display great force and dignity, but they are better adapted to the closet than the stage. To his talents as a prose writer, his "Grammatical Dialogues" will bear witness: they abound with judicious remarks, and the object of them is worthy of a true patriot, viz. an attempt to prove that the German tongue is capable of all the strength and nobleness of a classical language.

- KLOTEN, in *Geography*, a town of Switzerland, in the canton of Zurich; 5 miles N. of Zurich.

KLOTZ, CHRISTIAN ADOLPHUS, in *Biography*, an eminent German critic, was born in the year 1738 at Bifchofswerden, near Dresden, where his father was settled as a clergyman. He displayed, at an early period, such an attachment to letters, that his parents spared no expence to gratify his taste, and to enable him to cultivate his talents to the best advantage. He employed those leisure hours, which other lads devote to amusement, in composing and reciting German verses. At Gerlitz, he studied under Baumgarten the Greek and Roman classics, and gave a specimen of his powers in verification, by a poem composed on the "Destruction of Zittau," which was laid waste in the year 1757. In 1758, he proceeded to Leipzig to study

jurisprudence, and while here, he published several papers in the "Acta Eruditorum," and some separate pieces. In 1761, he published his "Opuscula Poetica," containing twenty-three odes, three satires, and as many elegies. From Leipzig he repaired to Jena, where he opened a school, which was well attended. Having accepted of an invitation to a professorship at the university of Gottingen in 1762, he set off for that place, and almost immediately after his arrival he was attacked by a severe illness, from which, however, he recovered, and immediately published a treatise, "De Verecundia Virgilii," to which were added three dissertations relative to the eclogues of the poet. He also published "Miscellanea Critica," and applied himself to the study of ancient gens and paintings, with which he became well acquainted. His celebrity had now increased so much, that he received two offers in the same day, one from the prince of Hesse Darmstadt, to be professor of the Oriental languages at Giessen, and the other from his Prussian majesty, to be professor of eloquence at Halle. While he was deliberating respecting the choice he should make, he was nominated by his Britanic majesty to be professor of philosophy at Gottingen, with an increased salary, which induced him to remain in that city, till some attempts were made to ruin his reputation. He then quitted Gottingen, and accepted an offer made him by his Prussian majesty, of being professor of philosophy and eloquence at Halle, with the rank and title of aulic counsellor. While preparing for his departure, he published "Historia Nummorum Contumeliosorum et Satyricorum," containing a history of these coins; and on his removal to Halle he gave the public another work of the same kind, and at the same time he effected, what had been often attempted before without success, the institution of a new society, called the "Literary Society of Halle," which afforded great satisfaction to the liberal-minded part of the learned in Germany. In 1766, he was invited by his Polish majesty to Warsaw to superintend the education of the children of the Polish nobility, which he would gladly have accepted, as it afforded him an opportunity of visiting new countries, but the king ordered him to remain at Halle, conferred upon him the rank of privy-counsellor, and accompanied this mark of honour with a considerable addition to his salary. He died in 1771, leaving behind him many other works besides those to which we have referred. Before his death, he revised every thing which he had written on coins, and published "Opuscula, nummaria quibus Juris Antiqui Historizque nonnulla Capita explicantur." Gen. Biog.

KLUMP-FISH, in *Ichthyology*. See TETRODON *Mola*.

KLYDAU, LILL, in *Geography*, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 37'. E. long. 20° 54'.

KLYDAU, *Stor*, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 39'. E. long. 20° 48'.

KLYSSA, a town of Prussia, in Pomerelia; 33 miles S.S.W. of Dantzic.

KMIDOMOUKA, a town of Poland, in the palatinate of Kiev; 32 miles S.E.E. of Bialacerkiev.

KNAG, a term used by country people for a knot in wood; also for the branches which grow out in the hart's horn, near the forehead.

KNAP'S BAY, in *Geography*, a bay in Hudson's bay. N. lat. 61° 15'. W. long. 94° 54'.

KNAPPIA, in *Botany*, so named by the writer of the present article, in honour of John Leonard Knapp, esq. F. L. S. and A. S. author of "Gramina Britannica, or Representations of the British Grasses, with Remarks and occasional Descriptions," an elaborate work in quarto, with

119 coloured plates, drawn by the author, published in 1804.—Sm. Fl. Brit. 1387. Engl. Bot. v. 16. 1127. (Chamaeropsis; Schrad. Germ. v. 1. 158.)—Clafs and order, *Triandra Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Glume of two erect, equal, oblong, abrupt, keeled valves, without awns, containing a fingle floret. *Cor.* the length of the calyx, ovate, obtufe, clofed, confifting of innumerable, fimple or branched, parallel fibres, denfely matted together, united at their bafe, without awns. *Stam.* Filaments three, capillary, twice as long as the corolla; anthers of two elliptical pointed lobes, feparate at the bafe and fummit. *Pyl.* Germen fuperior, ovate, fmooth; ftyles two, very fhort; ftigmas very long, capillary, acute, downy. *Peric.* none, except the permanent corolla and calyx. *Seed* one, elliptical, unconnected with the glumes, but enveloped in them.

Efl. Ch. Calyx of two abrupt awnlefs valves, fingle-flowered. Corolla compofed of denfely-compacted fibres, clofed, permanent. Seed unconnected.

1. *K. agrostoides*. Engl. Bot. t. 1127. Knapp Gram. t. 110. Hull. ed. 2. 23. (Chamaeropsis minima; Schrad. Germ. 158. Agrostis minima; Linn. Sp. Pl. 93. Willd. Sp. Pl. v. 1. 372. Sm. Fl. Brit. 82. Hudf. 32. With. 134. Gramen minimum, paniculis elegantiffimis; Bauh. Theatr. 26. G. minimum, Anglo-Britannicum; Rai Syn. Indic. Pl. Dub. G. fpartuum, capillaceo folio minimum; Dill. Giff. 172. t. 16. excellent.)—A native of fandy paftures, efppecially near the fea, in various parts of Europe; as Germany, the fouth of France, and the fouth-weft coaft of Anglefea, at which laft place it has been obferved in plenty by the Rev. H. Davies. It is a fmall, delicate, annual grafs, flowering in the early fpring, after which it foon withers and difappears. The root confifts of a few long fimple fibres. *Stems* from one to three inches high, fimple, fender, ftraight, fmooth, naked, except at the bottom. *Leaves* almoft entirely radical, fhort, linear, channelled, blunt, with very broad fheathing membranous bafes. *Spike* fimple, terminal, hady an inch long, of eight or ten little purpifh or green flowers, placed alternately, each on a fhort ftalk, on a fender, zig-zag, common ftalk, to which, when in feed, they become clofely preffed.

The name of *Knappia* cannot be fuperfeded by *Chamaeropsis*, the latter being untenable, as compofed of another eftablifhed generic name *Agrostis*, and contrary to the rule of Linnæus, Phil. Bot. feft. 225, “a generic name, with one or two fyllables prefixed, fo as to make it apply to a totally different genus from what it originally designated, is to be rejected.” We cannot but wonder, therefore, that the excellent Schradler fhould have been led, by any of his lefs learned countrymen, to adopt fuch a name, when another was already before him, liable to no objection. S.

**KNAPSACK**, in *Military Language*, is a rough leather or canvas bag, which a foldier carries on his back, containing all his neceffaries. Square knapfacks are moft convenient, and fhould be made with a divifion to hold the fhoes, black-balls, and brushes, feparate from the linen. White goat-fkins are fometimes ufed. Soldiers are put under ftoppages for the payment of their knapfacks, which, after fix years, become their property.

**KNAPWEED**, in *Botany*. See *JACEA*.

**KNAPWEED**, a common name given to a kind of weed, which is fometimes called blue-bottle. It infests arable land greatly in many cafes.

**KNARED**, in *Geography*, a town of Sweden, in the province of Halland; 14 miles E.S.E. of Halmilad.

**KNARESBOROUGH**, a borough, market-town, and parifh in the wapentake of Claro, Weft-Riding of Yorkfhire,

England, is fituated on a rocky mountain, at the foot of which runs the river Nid. It is one of the ancient burghs that were part of the demefnes of the crown, found under the title of Terra Regia, in Domefday Book, and other records. The fite of Knarefborough correponds with the difcription given of the towns of the Britons; being placed on the bank of a river for the fupply of water, and on the firt of a foreft, for convenience of hunting and palture. The remains of a ditch and rampart, which may yet be traced, include an area of 900 feet in length, and 600 in breadth. Soon after the Norman conqueit, a ftrong caftle was built here by Serlo de Burgh, who accompanied the conqueror to England, and received this manor, with feveral others, as a reward for his fervices. The caftle, having fallen to the crown, was granted by Henry III. to his brother Richard, earl of Cornwall, in the year 1257. In 1327, it was taken by John de Lilburn, an officer belonging to the earl of Lancafter; but, being befieged by the king's order, and Lilburn finding no profpect of relief, he furrendered, having firft destroyed all the records, and every memorial of the liberties and privileges of the burgh. In 1371, the caftle and manor were granted by Edward III. to his fon, John of Gaunt, duke of Lancafter: from whofe time it has been an appendage to the duchy of Lancafter. The town and caftle had a confiderable fhare in the civil war of the 17th century: after a brave refiftance, the caftle furrendered to lord Fairfax; and was ordered by the houfe of commons to be rendered untenable. The walls and towers have ever fince been mouldering away. This caftle contained nearly two acres and a half within its walls, which were flanked with eleven towers: thefe, with feveral other buildings in the different wards, afforded accommodation for a numerous garrifon. Part of the principal tower is ftill remaining, and appears to have been built about the time of Edward III. It confifts of three ftories above the keep or dungeon. The firft room on the ground-floor has been, from time immemorial, the repository of the ancient records. On the fecond ftory is a ftate-room, called the king's-chamber, in which Richard II. was imprifoned after his depofition. Beneath this tower is the dungeon, to which there is a defcent by twelve fteps: the roof is arched with ftone, and fupported by one round pillar, nine feet in circumference. In a part of the ruins are the remains of a fecret cell, or hiding-place, conftructed in the middle of the wall: this receptacle is three feet four inches high, two feet eight inches wide, and more than twenty feet in length. In the caftle-yard is the entrance to an arched fubterraneous paffage leading to the moat. Leland, fpeaking of this caftle, fays, “It ftandeth magnificently and ftroglly on a rock, having a deep ditch hewn out of the rock, where it was not defended by the river Nid.”

The church of Knarefborough, dedicated to St. John the Baptift, was a grant from the crown at the beginning of the 12th century. On the north fide of the choir is a chapel belonging to the Slingby family: on an altar-tomb are whole length figures of fir Francis Slingby and his lady; the knight in complete armour; the lady in a long robe, with folding plaits down to the feet: here are alfo figures of fir William Slingby and Henry Slingby, efq. and various other monuments and infcriptions. On the fourth fide of the choir is a chapel belonging to the Plumpton of Plumpton, though no traces now remain of that ancient family, except their arms ftained on glafs in the window. The feat on either fide of the choir, and a pulpit facing the eaft window, appear to be ancient.

Knarefborough was fummoned to fend members to parliament in the firft year of queen Mary; from which

time it has returned two representatives: the right of election is vested in the holders of burgage tenures, 84 in number. In the diary of sir Henry Slingby, who was elected in 1640, is the following note:—"There is an evil custom at such elections, to bestow wine on all the town, which cost me sixteen pounds at least." The practice of purchasing the burgage-houses began about the year 1714; since which a majority of the votes have been in the possession of the dukes of Devonshire, who have nominated the two members. The town, though a borough, is not incorporated; but is governed only by a bailiff and constable. Here are a spacious market-place, and a neat market-cross, which was erected in the year 1710. Over the river is a good stone bridge. On the east side of the church is a free-school, endowed, in 1616, by the Rev. Robert Challoner, a native of Goldborough, and rector of Amerham, in Buckinghamshire. The present building was erected by subscription in 1741. In Windfor-lane is a Dissenters' chapel, founded by lady Hewley, of Bell-hall, near York; the present edifice was built, on the ancient site, in 1778. In Gracious-street is a Quaker's meeting-house, erected in 1701. A considerable manufacture of linen has been carried on here for many ages, and is still in a flourishing condition; upwards of 1000 pieces, each 20 yards in length, being often woven in a week. In the year 1764, an act of parliament was obtained for the better supply of river water, of which the conveyance before was, from the elevated situation of the town, rendered difficult and expensive. In the Long walk, close by the river Nid, is the *Dropping well*, or Petrifying spring, which issues from a lime-stone rock, about 40 yards from the bank of the river; and, after running about 20 yards, divides, and spreads itself over the top of a ledge of rock, whence it trickles or drops down from 30 or 40 places, into a channel hollowed for the purpose. The spring is supposed to send forth 20 gallons in a minute. This rock, which is about 10 yards high, 16 long, and from 10 to 16 broad, about the year 1704, started from the common bank, and left a chafin between them. Tradition states, that near this rock the famous Yorkshire fybil, Mother Shipton, was born, about the year 1488. From the Dropping well, the walk extends along the river side to the High-bridge; producing, as the river meanders very much, every 10 or 20 yards, a new point of view, which, though composed of the same objects, is surprisngly variegated. From some parts of this walk are seen the venerable ruins of the castle, the hermitage, &c. with an intermixture of rocks and trees, over which part of the tower of Knareborough church makes its appearance. On the other side of the river, at the foot of a perpendicular rock, is St. Robert's chapel, supposed to have been made, in the reign of king John, by a learned and pious hermit of that name. This chapel is hollowed out of the solid rock; its roof and altar are beautifully ornamented; at the entrance is the figure of a knight templar in the act of drawing his sword. Near Grimbald-bridge is a hermitage called St. Robert's cave, supposed to have been the dwelling of the hermit above-mentioned. This cave has been rendered remarkable by a circumstance, which, in the year 1758, led to the discovery of the murder of Daniel Clarke, committed 14 years before, by Eugene Aram, a school-master of this town, a man of extraordinary learning, who pleaded his own cause in the most able manner. He was, however, convicted and executed. About half a mile from St. Robert's chapel, stood the priory, founded by the great earl of Cornwall, about the year 1257, for a society of friars of the order of the Holy Trinity. The site, at the dissolution, was granted to the earl of

Shrewsbury. It soon after became the property of the Slingbys, in which family it has ever since remained. The chapel, priory, and other buildings, are now entirely demolished; the ruins lying scattered in "many a mouldering heap." The remains of the fish-ponds shew them to be of a singular construction, so that the water might be drawn off at pleasure. On the opposite bank of the river stands a high rock, called Grimbald-crag; from the top of which is a fine prospect of the subjacent vale, the river, Birkham-wood, and the lofty summit of Almas-cliff. On the side of the rock is a cavern, which, by its rude remains, appears to have been the residence of a hermit, of the name of Grimbald.

Knareborough is 17 miles distant from York, and 202 north of London. The population, as returned to parliament in the year 1800, was 3388, inhabiting 766 houses. A market is held on Wednesday, which is plentifully supplied with all kinds of provisions: the quantity of corn sold here weekly, is supposed to exceed that of any other market in the county. In the year 1708, queen Anne granted to the burgesse five annual fairs, with a court of Pie-poudre; a court held in fairs to redress disorders committed in them.

On the east side of the town is Hay-park, containing about 1200 acres, granted by the crown to an ancestor of the late lord Bingley; and afterwards in the possession of sir John Hewley, whose widow appropriated the rents to charitable uses.

Knareborough forest extends from east to west upwards of twenty miles, and in some places eight miles in breadth. By the Domesday survey, there were then only four townships in this forest; Birtwith, Fultou, Beckwith, Rollett. But in the year 1368, there appear to have been three principal towns and sixteen hamlets.

At a short distance from Knareborough is Bilton park, formerly in the possession of the Slingby family, afterwards in that of Stockdale for above an hundred years, from whom it passed by sale to the Watsons; John Farside Watson, esq. is the present possessor.

On a small elevation above the river Nid, stands Conyng-ham house, formerly called Coghill hall: which for several centuries belonged to the Coghill family; but was purchased of sir Thomas Coghill, bart. with 51 acres of land, by the counts of Conyng-ham in the year 1706. Hargrove's History of the Castle, Town, and Forest of Knareborough, 1798, 12mo.

KNAVE, an old appellation for a man servant, and so used in 14 Edw. III. stat. 1. cap. 3.

The word is formed from the Saxon *cnapa*, or Flemish *knape*, which signify the same.

KNAVE also signifies a male-child, or boy, in which sense *knave-child* has been frequently used in contradiction to a girl; and in this sense Wickliffe uses the word in his translation of Exod. i. 16. and other places of the Bible. In the old Saxon translation of Mat. viii. 6. "Puer meus jacet in domo paralyticus," was termed *Myn knapa*.

KNAVE has sometimes also been used as an addition; as Willielmus Cowper de Denbigh, knave, &c.

It is a common opinion, that Rom. i. 1. was translated, *Paul, a knave of Jesus Christ*. This mistake was occasioned by a Bible in the duke of Lauderdale's library, where the word *knave*'s is inserted in lauders characters than the others, and a rasure might easily be discerned.

KNAVE-Line, in a Ship, a rope fastened to the cross-trees, under the main or fore-top, whence it comes down by the ties to the ram-head, and there it is reeved through a piece of wood of about two feet long, and so is brought to the ship's side, and there hauled up taugt to the rails.

**KNAUTIA**, in *Botany*, received its appellation in honour of two botanists, Christopher Knaut, the father, and Christian Knaut, the son, who lived at Halle, in Saxony, about the end of the 17th, and beginning of the 18th centuries, and who distinguished themselves by some paradoxical opinions respecting the methodical arrangement of plants. The method of the former is an alteration of that of Ray, without any improvement.—The latter was absurd enough to suppose that the essence of a flower consisted in its corolla.—Linn. Gen. 49. Schreb. 65. Willd. Sp. Pl. v. 1. 561. Mart. Mill. Dict. v. 3. Sm. Prod. Fl. Græc. p. 1. 85. Ait. Hort. Kew. ed. 2. v. 1. 231. Juss. 195. Lamarck Dict. v. 3. 367. Illustr. t. 58. Gartn. t. 86.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Aggregate*, Linn. *Dipsacæ*, Juss.

Gen. Ch. *Cal.* Common perianth, containing the florets disposed in a simple orb, cylindrical, oblong, erect, divided into as many segments as there are florets; proper perianth very small, crowning the germen. *Cor.* universal, equal; proper of one petal, unequal; tube the length of the calyx; limb unequal, in four segments, of which the outer one is larger and ovate. *Stam.* Filaments four, longer than the tube of the corolla, inserted into the receptacle; anthers oblong, incumbent. *Pist.* Germen inferior; style thread-shaped, as long as the stamens; stigma thickish, bifid. *Peric.* none. *Seds.* solitary, square with a woolly tip. *Recept.* common, very small, flat, naked.

Obf. This genus is distinguished from *Scabiosa* in having a tubulated calyx, and the florets arranged in a simple orb.

Elf. Ch. Common calyx oblong, simple, containing about five flowers; proper calyx simple, superior. Florets irregular. Receptacle naked.

1. *K. orientalis*. Linn. Sp. Pl. 146. Till. Pis. t. 48.—“Leaves cut. Florets five, longer than the calyx.”—A native of the Levant, flowering from June to September, and frequently to be seen in our gardens. *Root* annual. *Stem* branched, about four feet high. *Branches* terminated by single peduncles, each supporting a flower. *Florets* of a bright-red colour. *Leaves* on the middle of the stem pinnated; the rest are serrated. *Seds.* compressed, hairy, many-toothed at top. *Down* a concave crown, with many bristle-shaped, unequal teeth.

2. *K. propretica*. Linn. Sp. Pl. 1666. Willd. n. 2. (*Scabiosa orientalis villosa*, flore flavescentibus; fructu pulchro oblongo; Tourn. Cor. 35.)—“Upper leaves lanceolate, entire. Florets ten, equal with the calyx.”—A native of the East, from whence Forskall sent seeds of it to Linnaeus, who raised plants from them in his garden, from one of which he made the following description.—“*Stem* biennial, the thickness of a finger, two feet in height, villous, resembling *Chirantus incanus*. *Leaves* roughish, serrated; the upper ones a span long. *Calyx* oblong, cylindrical, composed of eight or ten leaves, awl-shaped at the point. *Corolla* four-cleft, purplish; anthers of the same colour; filaments and pistils white. It differs from the last species in having the upper leaves undivided; florets about ten, instead of five, whilst the seed-crown is fifteen-toothed and fringed.”—It appears to us, nevertheless, to be a mere variety.

*K. palestina* and *plumosa* of Linnaeus are referred by Dr. Smith, in his *Prodromus Floræ Græcæ*, to the genus *Scabiosa*, to which they most indubitably belong.

**KNAUTIA**, in *Gardening*, contains plants of the herbaceous, annual, and biennial kinds; of which the species cultivated are, the oriental knautia (*K. orientalis*); and the Levant knautia (*K. propretica*).

*Method of Culture.*—Plants of this kind may be easily increased by seeds, which, when permitted to scatter in the

autumnal season, produce good plants. After they this may be taken up, and planted out in the clumps and borders of pleasure-grounds, among other low shrubs near the walks. In this way the plants live through the winter, and flower in June. There is no particular sort of culture requisite afterwards, but to keep the plants perfectly clean from weeds. The seeds fall to the ground as soon as they become fully ripe.

These plants are capable of affording variety among other hardy flowering plants which are of similar growths.

**KNAWEL**, in *Botany*, said to be a word of German origin, but of its signification Dillenius confesses himself, “though a German,” to be ignorant. He adopts it, in his *Novæ Plantarum Genera*, 94. t. 3, for what Linnaeus more happily called *Sceleranthus*, of which we shall treat in its place.

**KNECK**, in the *Sea Language*, the twisting of a rope or cable, as it is veering out.

**KNEE**, GENU, in *Anatomy*. See EXTREMITIES.

**KNEE**, *Preternatural Cartilaginous Substances in, in Surgery*. See JOINTS, *Diseases of*.

**KNEE**, *Dropsy of*. See JOINTS, *Diseases of*.

**KNEE**, *White Swelling of*. See WHITE SWELLING.

**KNEE**, *Dislocation of*. See LUXATION.

**KNEE-CAP**, a sort of bandage employed for keeping up a steady, equal, and effectual pressure on the knee, when the nature of the case requires such treatment, as for instance, when there are preternatural cartilaginous substances in the joint, and it is not judged proper to submit to the operation of excision. See JOINTS, *Diseases of*.

**KNEE-PAN**, in *Anatomy*. See EXTREMITIES.

**KNEE-PAN**, *Dislocations of, in Surgery*. See LUXATION.

**KNEE-PAN**, *Fractures of*. See FRACTURE.

**KNEE**, in the *Manège*, is the joint of the fore-quarters, that joins the fore-thigh to the flank.

**KNEES**, in a *Ship*, are the crooked parts of oak timber which secure the beams to the sides of the ship, and are distinguished by the terms hanging-knees and lodging-knees; the former are those whose arms lay to the side in a perpendicular direction, whereas the latter lay next the timber upon the clamps in the direction of the hang of the deck. The scarcity of those articles has compelled the ship-builder to introduce knees of iron; but being inferior in point of contact with the ship's sides, and as the bolts cannot be drove tight in the iron-knees if the ship strains, they consequently mult work loose, these, therefore, should only be reckoned as an inferior substitute.

**KNEE of the Head**, by sailors called the *cawwater*, an assemblage of pieces of oak timber, tabled or coaked together edgeways, upon account of its great breadth: it extends from the fore-part of the stern to the figure-head, which it supports, as likewise the rails and all other compartments of the head, and is secured to the bows by large knees, called cheeks of the head, and through the stern, &c. by bolting.

**KNEE Holm**, or **KNEE Holly**, in *Botany*. See *Ruscus aculeatus*.

**KNEE Lake**, in *Geography*, a lake of North America. N. lat. 55. W. long. 95.

**KNEELING**. See GENUFLEXION.

**KNEEP HEAD**, in *Geography*, a cape on the E. coast of the island of Lewis. N. lat. 58° 10'. W. long. 6° 9'.

**KNEKINIC**, a town of Aultrian Poland, in Galicia; 28 miles S.E. of Lemberg.

**KNELLER**, Sir GODFREY, *Baronet*, in *Biography*, a portrait painter, more liberally encouraged, more praised and paid than any other man who ever trod the same path

with the same portion of real power in the art of painting. A rapid pencil and a ready talent of taking likenesses were the foundation of his reputation; and a most fortunate ignorance of the art among the best informed even of the public, by whom he was employed, aided his progress. Not but that he was equal to the production of good works if he had been more carefully trained, and had lived amongst those who knew how to value works of art upon just principles; but he was amongst the most vain of mankind, and had no regard whatsoever for that posthumous fame which leads men to sacrifice present enjoyments to future glory. His motto was, "to live whilst he lived," and, consequently, to make money was a matter of greater moment with him than to make good pictures; and he succeeded fully; for although he lost 20,000*l.* by the South-sea speculation, he left, at his death, an estate of 2000*l.* a-year. His prices, whilst he painted here, were 15 guineas for a head; 20 if with one hand; 30 for a half, and 60 for a whole length.

He was born at Lubec about the year 1648. His father was surveyor-general of the mines, and inspector of count Mansfeld's revenues. At first Godfrey was destined for a military life, but painting was his passion. His father acquiesced in his wishes, and placed him under Bol, at Amsterdam. He had even some instructions from Rembrandt. He visited Italy in 1672, and remained some time at Venice, where he painted some of the first families, and amongst them the cardinal Bassadonna. It is probable that he here learnt that free, loose style of execution in which he delighted, but by no means excelled; with him it fell to negligence and clumsiness, particularly in his draperies, which sometimes his heads exhibit a perfect master of the pencil.

Kneller did not stay long in Italy, as in 1674, he came to England with his brother, John Zachary, who assisted him in painting, without intending to reside here; but being recommended to Mr. Banks, a Hamburg merchant, he painted him and his family. Mr. Vernon, secretary to the duke of Monmouth, saw them, and sat to Kneller; and persuaded the duke also to sit. His grace was delighted, and engaged the king his father to have his picture by the new artist, at a time when the duke of York had been promised the king's picture by Lely. Charles, unwilling to have double trouble, proposed that both artists should paint him at the same time. Lely, as the established artist, chose his light and station: Kneller took the next best he could, and performed his task with so much expedition and skill, that he had nearly finished his piece when Lely's was only dead-coloured. The circumstance gained Kneller great credit; and Lely obtained no less honour, for he had the candour to acknowledge and admire the abilities of his rival. This success fixed Kneller here, and the immense number of portraits he executed, prove the continuance of his reputation.

He was equally encouraged by Charles, James, and William; and had the honour of painting the portraits of ten sovereigns (*viz.* Charles II. James II. and his queen, William and Mary, Anne, George I. Louis XIV. the czar Peter the Great, and the emperor Charles VI.), which is more than can be said of any other painter. His best friend was William, for whom he painted the beauties of Hampton Court; and by whom he was knighted in 1692, and presented with a gold medal and chain worth 300*l.* In his reign, he also painted several of the admirals for Hampton Court, and the Kit-Cat club. He lived to paint George I. and was made a baronet by him. In 1722, sir Godfrey was seized with a violent fever, from the immediate danger of which he was rescued by Dr. Meade. He languished,

however, some time, and died in October 1723. His body lay in state, and was buried at his country-seat called Wilton; but a monument was erected to him in Westminster Abbey, for which he left 300*l.* and gave particular instructions for the execution of it to Rybrach.

During the latter part of his time, that is, after the death of Lely, in 1680, Kneller stood at the head of the professors of his art in this country, and that most conspicuously. It is not therefore surprising that he experienced the encouragement he did. He has left some few good pictures behind him as proofs of the natural powers he possessed; but his most sincere admirers, who are judges, must acknowledge that the far greater portion of those he allowed to pass into the world under his name, are a disgrace to him and his patrons. His picture of the converted Chinese at Windsor, he is said to be most proud of, as justly he might be. This, however, shews his profligacy in principle, as it exhibits that he really knew what was good, and could produce it if he chose. According to his own doctrine, he did as much and no more than was necessary to pass current among his employers. "History painters," he said, "make the dead live, and don't begin to live till they are dead. I paint the living, and they make me live."

There is a singular paucity of imagination in Kneller's pictures. He did indeed (and Walpole justly commends him for it) indulge in an ideal drapery for women, instead of the monstrous dresses they wore at the time; but his ingenuity does not appear equal to assist them so much; so that there is a ridiculous mixture of positive formality in the stiff neckcloths and wired skirts of coats of the one, and of an affected flow and grace in the loose robes of the other, which consist of nothing more than a chemise thrown open, and discovering the bosom, and a robe-de-chambre loosely drawn over it.

All that Kneller can be justly praised, or deservedly esteemed for, generally speaking, is, that his heads, or rather his faces, have a good deal of liveliness and gentility. It seldom amounts to character in the general run of his portraits. Now and then the master-hand appears, when the subject or the moment were favourable. There is, at Petworth, a head of sir Isaac Newton that would be an honour to any man to have produced; and portraits of branches of the Seymour family, which are a disgrace to the name they bear.

The artists who succeeded him, dazzled by his success, and allured by the professed admiration of his taste, most unaccountably lost sight of the infinitely greater beauties of Vandyke's manner, and followed his alone. In consequence, the art sunk to the lowest ebb, till it was somewhat redeemed by Richardson's writings, and Hudson's and Ramsay's talents in painting. But true taste was not restored till Reynolds took up the pencil; and now, happily, the weakness as well as the merits of Kneller are duly appreciated, and hundreds of his works consigned to the oblivion he probably wished they might experience. When the mass may be thus disposed of, and the select only remain, then he will obtain, unalloyed, the praise his talents, when carefully exerted, fully deserved.

**KNEMA**, in *Botany*, a genus named by Loureiro, is derived from *xman*, the *spoke of a wheel*, on account of the authors being disposed into a star-like, or wheel-shaped form.—Loureir. Cochinch. 604.—Clais and order, *Diacrya Monadelphica*. Nat. Ord. . . .

Gen. Ch. Male, *Cal.* none. *Cor.* of one petal, fleshy; tube thick, short; limb in three, acute, segments, woolly on the outside. *Stam.* a single filament, short, turbinate,

anthers to nr 12, ovate, two-celled, expanded horizontally about the top of the filament. Female, (flowers on a distinct plant.) *Cal.* Perianth inferior, very short, somewhat truncated, permanent. *Cor.* as in the male. *Pist.* Germen superior, roundish, hairy; style none; style lacinated, erect. *Peric.* Berry ovate, succulent. *Seed* solitary, ovate, tunicated.

*Eff. Ch.* Male, Calyx none. Corolla three cleft. Anthers formed into a star, about the filament. Female; Calyx rather truncated. Corolla three-cleft. Stigma one. Berry superior, single-seeded.

1. *K. corticofti.* Loureir.—A native of the woods of Cochinchina.—This is a large tree, with a thick brown, or reddish bark. Branches ascending. Leaves lanceolate, entire, smooth, alternate, on foot-stalks. Both male and female flowers nearly terminal, on many-flowered stalks. Corolla brown on the outside, yellowish red within. Berry small, pulpy, red.

It seems to us that Loureiro refers this genus to the order *Menandria* rather inadvertently, because he describes 10 or 12 anthers as pertaining to the generic character.

KNEVELS, in a *Ship.* See KEVELS.

KNIAGININ, in *Geography*, a town of Russia, in the government of Nizagorod, on a rivulet that falls into the Volga; 40 miles E.N.E. of Niznei Novgorod.

KNIASE, a town of Poland, in Volhynia; 50 miles S.W. of Lucko.

KNIFA, in *Botany*, one of Adanson's whimsical names, of whose origin or meaning no account is given. He uses it to designate a genus of his own, composed of the Linnean *Hypericum mutilum* and *setifolium*, whose flowers have but two styles, and their capsules two cells.

KNIFE is a well known instrument made for cutting, and adapted in form to the uses for which it is designed.

Knives are said to have been first made in England in 1563, by one Matthews, on Fleet-bridge, London. *Anderf. Hist. Com.* vol. i. p. 402.

Surgeons have various sorts of knives. See BISTOURY, &c.

KNIFVEN, in *Geography*, a small island on the W. side of the gulf of Bothnia. N. lat. 60° 38'. E. long. 17° 30'.

KNIGHT, EQUES, among the *Romans*, was the second degree of nobility; following immediately that of the senators.

At the time of building the city of Rome, the whole army of Romulus consisted of 3000 foot and 300 horse, which 300 horse were the original of the Roman equites or knights. These made the second order that had places in the senate.

Manutius and Sigonius are of opinion, that beside the equestrian order, and those knights immediately below the senators, Romulus instituted a military order, whereof the Roman cavalry was composed. But no ancient author takes notice of any order of knighthood instituted on purpose for the war, nor any other knights but those 300, which, as we have observed, were the first foundation of the equestrian order.

The knights had horses kept for them at the public charge; but when they were admitted among the senators, they resigned that privilege. To be a knight, it was necessary they should have a certain revenue, that their poverty might not disgrace the order; and when they failed of the prescribed revenue, they were expunged out of the lists of knights, and thrust down among the plebeians. Ten thousand crowns are computed to have been the revenue required.

The knights grew so very powerful, that they became a

balance between the power of the senate and the people. They neglected the exercises of war, and betook themselves principally to civil employments in Rome; inasmuch that Pliny observes, in his time, they had no longer a horse kept at the public expence.

Some say that the order of knights, as distinct from the people, did not begin before the time of the Gracchi; others say, the privilege was then first granted them, that no judge should be chosen, but out of their order; some time after which they admitted them into the senate. This, however, is certain, it was only from that time that a certain revenue was necessary, and that this entitled them to the knighthood, without being descended from ancient knights.

KNIGHT, in a more modern sense, properly signifies a person, who, for his virtue and martial prowess, is, by the king, raised above the rank of gentlemen, into a higher class of dignity and honour.

The word knight, in its original German, *knecht*, signifies a *servant*; and has since been used for a soldier or man of war. We have but one instance among us where knight is used in the first sense, and that is in *knight of the shire*, who properly serves in parliament for such a county. In the Latin, French, Spanish, Italian, and Dutch languages, knight is expressed by a word (*equites*) which properly signifies a *horseman*, as being usually employed on horseback. Indeed our common law calls them *milités*, *soldiers*, because they formed a part of the royal army, in virtue of their feudal tenures: one condition of which was, that every one who held a "knight's fee" immediately under the crown was obliged to be knighted; to serve the king as soldiers in his wars, in which sense the word *miles* was used *pro vassallo*; or fine for non-compliance.

The exertion of this prerogative, as an expedient to raise money, in the reign of Charles I., gave great offence, though warranted by law, and the recent example of queen Elizabeth; but it was by the statute 16 Car. I. c. 16. abolished: and this kind of knighthood has, since that time, fallen into great disregard.

Knighthood was the first degree of honour in the ancient armies, and was usually conferred with a great deal of ceremony on those who had distinguished themselves by some notable exploit in arms. They were originally said to be adopted, *adoptabantur in militum*, which we now call *dubbed*; as being supposed, in some measure, the sons of him who knighted them.

The custom of the ancient Germans was to give their young men a shield and a lance in the great council: this was equivalent to the "toga virilis" of the Romans. Before this, they were not permitted to bear arms, but were accounted as a part of the father's household; after it, as part of the community. (*Tacit. de Mor. Germ.* § 13.) Hence some derive the usage of knighting, which has prevailed all over the western world, since its reduction by colonies from those northern heroes. See KNIGHTHOOD, *Military, infra.*

The ceremonies at the creation of a knight have been various. The principal were a box on the ear, and a stroke with a sword on the shoulder. Then they put on him a shoulder-belt, gilt sword, spurs, and the other military accoutrements; after which, being armed as a knight, he was led in great pomp to the church.

The manner of making a knight with us, is described by Camden in a few words: "Qui equestrem dignitatem suscipit, flexis genibus leviter in humero percussitur: princeps his verbis Gallice affatur: *fus vel fois chevalier au nom de Dieu, surge vel sis eques in nomine Dei.*" This is meant

of knights-bachelors, which are the lowest, though the most ancient order of knighthood among us; for we have an instance of king Alfred's conferring this order on his son Athelstan. Will Malmb. lib. ii.

Knights grew so very numerous, that the dignity became of much less repute. Charles V. is said to have made five hundred in a single day: on which account, therefore, new orders of knighthood were instituted, in order to distinguish the more deserving from the crowd. For the several kinds of knights among us, see BACHELOR, BANNERET, BARONET, BATH, GARTER, &c.

KNIGHT is also understood of a person admitted into any order either purely military, or military and religious, instituted by some king or prince, with certain marks and tokens of honour and distinction.

Such are the *knights of the Garter, of the Elephant, of the Holy Gbosh, of Malta, &c.* All which see under GARTER, ELEPHANT, &c.

KNIGHT *Marshall.* See MARSHALL.

KNIGHTS of *St. Ampulla.* See AMPULLA.

KNIGHTS of *Annunciata.* See ANNUNCIATA.

KNIGHTS of *St. Anthony.* See ANTHONY.

KNIGHTS of *St. Bridget.* See BRICIANI.

KNIGHTS of *St. Calbarine of Mount Sinai.* See CATHARINE.

KNIGHTS of *the Chapel.* See CHAPEL.

KNIGHTS of *Christ.* See CHRIST.

KNIGHTS of *the Collar.* See COLLAR.

KNIGHTS of *the Dragon.* See DRAGON.

KNIGHTS of *the Elephant.* See ELEPHANT.

KNIGHTS of *the Ermin.* See ERMIN.

KNIGHTS-ERRANT, a pretended order of chivalry, whereof ample mention is made in the old romances.

They were a kind of heroes, who travelled the world in search of adventures, redressing wrongs, rescuing damsels, and taking all occasions of signaling their prowess. This romantic bravery of the old knights was heretofore the chimerica of the Spaniards; amongst whom there was no cavalier but had his mistress, whose esteem he was to gain by some heroic action. The duke of Alva, notwithstanding his age and gravity, is said to have vowed the conquest of Portugal to a young lady.

KNIGHTS of *St. George.* See GEORGE.

KNIGHTS of *Hospitallers.* See HOSPITALERS and MALTA.

KNIGHTS of *St. Louis.* See LOUIS.

KNIGHTS of *Malta.* See MALTA.

KNIGHTS, *Rad.* See RAD.

KNIGHTS of *the Round Table.* See TABLE.

KNIGHTS of *the Temple.* See TEMPLARS.

KNIGHTS *Teutonic.* See TEUTONIC.

KNIGHTS of *the Thistle.* See THISTLE.

KNIGHTS of *the Shire, or KNIGHTS of Parliament,* are two gentlemen of worth, chosen on the king's writ in pleno comitatu, by such of the freeholders of every county as have the value of 40s. *per ann.* within the county, clear of all taxes and deductions except parliamentary and parochial taxes, to represent such county in parliament.

This qualification of electors for knights of the shire or county members, is settled by stat. 8 Hen. VI. c. 7. and 10 Hen. VI. c. 2. amended by 14 Geo. III. c. 58. According to the estimate of bishop Fleetwood in his "Chronicon Preciosum," 40s. in the reign of Henry VI. was equal to 32*l.* *per annum* in the reign of queen Anne; and as the value

of money has been lowered since, judge Blackstone concludes that 1*l.* in the bishop's days must have been equivalent to 20*l.* in his own time; and the depreciation of money in later times must have made the difference much greater. (See DE-EX-PENSIS.) The other qualifications of the electors for counties in England and Wales, collected from statutes are; that no person under twenty-one years of age shall be capable of voting; nor any person convicted of perjury or subornation of perjury; that no person shall vote in right of any freehold granted to him fraudulently to qualify him to vote: that every voter shall have been in the actual possession or receipt of the profits of his freehold to his own use for twelve calendar months before, except it came to him by descent, marriage, marriage settlement, will, or promotion to a benefice or office: that no person shall vote in respect of an annuity or rent-charge, unless registered with the clerk of the peace twelve calendar months before: that in mortgaged or trust estates, the person in possession shall have the vote: that only one person shall be admitted to vote for any one house or tenement, to prevent the splitting of freeholds: that no estate shall qualify a voter, unless the estate has been assessed to some land-tax aid, at least twelve months before the election: and that no tenant by copy of court-roll shall be permitted to vote as a freeholder. (7 and 8 W. III. c. 25. 10 Ann. c. 23. 2 G. II. c. 21. 10 G. II. c. 18. 31 G. II. c. 14. 3 G. III. c. 24.) By statute 22 G. III. c. 41. no commissioner, or officer, employed in managing the duties of excise, customs, stamps, salt, windows or houses, or revenue of the post-office, shall be capable of voting in the election of a member of parliament.

These knights, when every man who had a knight's-fee was customarily constrained to be a knight, were of necessity to be *militēs gladio cincti*, for so the writ runs to this day; but now custom admits esquires to be chosen to this office.

It is required by 23 Hen. VI. c. 15. that all knights of the shire shall be actual knights, or such notable esquires and gentlemen as have estates sufficient to be knights; and by no means of the degree of women; and more precisely by 9 Ann. c. 5. that every knight of the shire shall have a clear estate of freehold or copyhold to the value of 600*l.* *per annum*, except the eldest sons of peers and of persons qualified to be knights of shires. For other qualifications, see PARLIAMENT.

The expences of knights of the shire, are to be defrayed by the county, during their sitting in parliament, at the rate of four shillings a day. This rate of wages was established in the reign of Edw. III. (See also 35 Hen. VIII. c. 11.) It is hardly necessary to add, that these are never now required.

KNIGHT'S *Cross, in Botany.* See CAMPION.

KNIGHT-HEADS, or *Bollard Timbers,* are oak timbers with large upper parts or heads, which are fayed and bolted together, one on each side the stern, or with a filling between, as they must open at the heads sufficient to admit the bowsprit between them, and running high enough to support the same above the stern.

KNIGHTS *Fee,* an ancient *law-term*, signifying so much land of inheritance as was esteemed sufficient to maintain a knight with suitable retinue; which, in the days of H. III., was reckoned at 15*l.* *per ann.* And by stat. 1 Edw. II. such as had 20*l.* *per ann.* in fee, or for life, might be compelled to be knights. But this statute is repealed by 16 Car. I. Sir T. Smith rates a knight's fee at 40*l.* yearly. According to Coke, a knight's fee contained twelve carucates, or plough-lands. Stow says, that there were found in England, at the time of the Conqueror, 60,211 knight's fees; according

ording to others there were 60,215; where of the religious houses, before their suppression, were possessed of 28,015. See FEE.

In consequence of the introduction of the feudal system upon the Norman conquest, all the lands in the kingdom were divided into knight's fees, in number, as Stow says, above 60,000; and for every knight's fee, a knight or soldier, *miles*, was bound to attend the king in his wars, for 40 days in a year; in which space of time, before war was reduced to a truce, the campaign was generally finished, and a kingdom either conquered or victorious. By this means, the king had, without any expence, an army of 60,000 men always ready at his command. Accordingly we find among the laws of William the Conqueror, one, (c. 58.) which in the king's name commands, and firmly enjoins, the personal attendance of all knights and others; "quod habeant et teneant se semper in armis et equis, ut decet et oportet: et quod semper sint prompti et parati ad servitium suum integrum nobis exultandum et peragendum, cum opus adfuerit secundum quod debent de feodis et tenementis suis de jure nobis facere." This personal service in time degenerated into pecuniary commutations or aids, and at last the military part of the feudal system was abolished at the restoration, by stat. 12 Car. II. c. 24.

**KNIGHTS SERVICE, *servitium militare***, a tenure whereby several lands in this nation were anciently held of the king. This was the first, most universal, and esteemed the most honourable species of tenure, called in Latin "*servitium militare*," and in law-French "*chivalry*" or "*service de chevalier*," answering to the "*sief d'haubert*" of the Normans; a name that frequently occurs in the Mirror. It differed in few respects from a pure and proper feud, being entirely military, and the genuine effect of the feudal establishment in England. In order to make this tenure, a quantity of land, called a knight's fee "*feudum militare*," was necessary; and he who held this proportion of land (or a whole fee) by knight-service, was bound to attend his lord to the wars for 40 days in every year, if called for; and this attendance was his "*reditus*" or return, his rent or service for the land he claimed to hold. If he held only half a knight's fee, he was only bound to attend 20 days, and so in proportion. This tenure had all the marks of a strict and regular feud; it was granted by words of pure donation, *dedi et concessi* (Co. Litt. 9.); was transferred by investiture or delivering corporal possession of the land, usually called livery of seisin; and was perfected by homage and fealty. It also drew after it these seven fruits and consequences, as inseparably incident to the tenure in chivalry; *viz.* aids, relief, primer seisin, wardship, marriage, fines for alienation, and escheat; which see respectively. It was by this tenure of knight-service that the greatest part of the lands in this kingdom was holden, and that principally of the king *in capite*, till the middle of the 17th century; and which was created, as Sir Edward Coke expressly testifies (4 Inst. 192.), for a military purpose; *viz.* for defence of the realm by the king's own principal subjects, which was judged to be much better than to hirelings or foreigners. The description above given relates to knight-service proper; which was to attend the king in his wars. There were also some other species of knight-service; so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering it, as that of knight service proper, and because they were attended with similar points and consequences. Such was the tenure by *grand serjeanty*, which see; and of this tenure that by *avowage* (which fee) was a species.

**KNIGHT'S Canal**, in *Geography*, an inlet of the Paci-

fic ocean, on the W. coast of North America, extending in an E. and N.E. direction about 50 miles. Its entrance from an arm of the sea lies in N. lat. 50° 45'. E. long. 233° 16'.

**KNIGHT'S Island**, a small island in Beering's bay, N.W. of Eleanor's sound, separated from the American continent by a narrow channel, which is navigable. N. lat. 59° 45'. E. long. 220° 47'.—Also, an island in Prince William's sound, about 30 miles in length from N. to S., and from two to five broad. N. lat. 60° 24'. E. long. 212° 52'.—Also, a small island in Hudson's bay. N. lat. 61° 50'. W. long. 93° 30'.—Also, an island in the Pacific ocean, and the largest of those called by Capt. Vancouver the "Snares;" discovered by Broughton, commander of the Chatham under Vancouver, in November 1791. Some parts of the island presented a very barren appearance, not unlike the W. side of Portland, composed of whitish rocky cliffs. The rocky islets are five in number, some of which are of a pyramidal form. It did not appear to be inhabited. The fourth point is situated in S. lat. 48° 15'. E. long. 166° 44'.

**KNIGHTS, *Poor***, a group of small islands, so called by Lieutenant Cook, who discovered them in November 1770, on the coast of New Zealand, when he was in S. lat. 36° 36'; at the distance of three leagues N.E. by N.

**KNIGHTEN-GILD**, in our *Old Writers*, a gold or company in London, consisting of nineteen knights, which King Edgar founded, giving them a portion of void ground lying within the walls of the city, now called Portokenward.

**KNIGHTHOOD**, a military order, or honour; or a mark or degree of ancient nobility, or reward of personal virtue and merit.

There are four kinds of knighthood; *military, regular, honorary, and social*.

**KNIGHTHOOD, *Military***, is that of the ancient knights, who acquired it by high feats of arms.

These are called *knights*, in ancient charters and titles, by which they were distinguished from mere *bachelors*, &c. These knights were girt with a sword, and a pair of gilt spurs; whence they were called *equites aurati*.

Knighthood is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The sons of kings, and kings themselves, with all other sovereigns, heretofore had knighthood conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

Between the age of Charlemagne and that of the Crusades, the service of the infantry was degraded to the Plebeians; the cavalry formed the strength of the armies, and the honourable name of *miles*, or soldier, was confined to the gentlemen who served on horseback, and were invested with the character of knighthood. The dukes and counts, who had usurped the rights of sovereignty, divided the provinces among their faithful barons; the barons distributed among their vassals the fiefs or benefices of their jurisdiction; and these military tenants, the peers of each order, and of their lord, composed the noble or equestrian order, which disdain to conceive the peasant or burgher as of the same species with themselves. The dignity of their birth was preferred by pure and equal alliances; their sons alone, who could produce four quarters or lines of ancestry, without spot or reproach, might legally pretend to the honour of knighthood; but a valiant plebeian was sometimes enriched and enroled by the sword, and became the father of a new race. A simple knight could impart, according to his judgment, the character which he received; and the warlike sovereigns of Europe

rope derived more glory from this personal distinction than from the lustre of their diadem. This ceremony, of which some traces may be found in Tacitus and the woods of Germany, was, in its origin, simple and profane: the candidate, after some previous trial, was invested with the sword and spurs; and his cheek or shoulder was touched with a slight blow, as an emblem of the last affront, which it was lawful for him to endure. But superstition mingled in every public and private action of life; in the holy wars, it sanctified the profession of arms; and the order of chivalry was assimilated in its rights and privileges to the sacred orders of priesthood. The bath and white garment of the novice were an indecent copy of the regeneration of baptism; his sword, which he offered on the altar, was blessed by the ministers of religion; his solemn reception was preceded by fasts and vigils; and he was created a knight in the name of God, of St. George, and of St. Michael the archangel. He swore to accomplish the duties of his profession; and education, example, and the public opinion, were the inviolable guardians of his oath. As the champion of God and the ladies ("I blush," says Gibbon, "to unite such discordant names"), he devoted himself to speak the truth; to maintain the right; to protect the distressed; to practise *courtesy*, a virtue less familiar to the ancients; to pursue the infidels; to despise the allurements of ease and safety; and to vindicate in every perilous adventure the honour of his character. The abuse of the same spirit provoked the illiterate knight to disdain the acts of industry and peace; to esteem himself the sole judge and avenger of his own injuries; and proudly to neglect the laws of civil society and military discipline. Yet the benefits of this institution, to refine the temper of barbarians, and to infuse some principles of faith, justice, and humanity, were strongly felt, and have been often observed. The asperity of national prejudice was softened; and the community of religion and arms spread a similar colour and generous emulation over the face of Christendom. Abroad, in enterprise and pilgrimage, at home in martial exercise, the barriers of every country were perpetually associated; and impartial taste must prefer a Gothic tournament to the Olympic games of classic antiquity.

The lance was the proper and peculiar weapon of the knight; his horse was of a large and heavy breed; but this charger, till he was roused by the approaching danger, was usually led by an attendant, and he quietly rode a pad or palfrey of a more easy pace. His helmet and sword, his greaves and buckler, is needless to describe in this place; but at the period of the crusades the armour was less ponderous than in later times; and instead of a massy cuirass, his breast was defended by an hauberk or coat of mail. Each knight was attended to the field by his faithful squire, a youth of equal birth and similar hopes; he was followed by his archers and men at arms, and four, or five, or six soldiers, were computed as the furniture of a complete "lance." In the expeditions to the neighbouring kingdoms or the Holy Land, the duties of the feudal tenure no longer subsisted; the voluntary service of the knights and their followers was prompted by zeal or attachment, or purchased with rewards and promises; and the number of each squadron were measured by the power, the wealth, and the fame of each independent chieftain. They were distinguished by his banner, his armorial coat, and his cry of war; and the most ancient families of Europe must seek in these achievements the origin and proof of their nobility. Gibbon's Decl. and Fall of the Rom. Emp. vol. xi. For a further account of the character of the ancient knights and the beneficial effects of chivalry and the crusades: see the articles CHIVALRY and CROSSADES.

These services, both of chivalry and of grand-serjeanty, were all personal, and as to their quantity or duration uncertain. But personal attendance in knight-service being found inconvenient and troublesome, the tenants found means of compensating for it; first, by finding others to serve in their stead, and in process of time by making a pecuniary satisfaction to the lords in lieu of it. (See ESCUAGE.) When knight-service, or personal military duty degenerated into escuage, or pecuniary assignments, all the advantages (promised or real) of the foedal constitution were destroyed, and nothing but the hardships remained. These hardships, which were numerous and grievous, were from time to time palliated by successive acts of parliament, till at length the humanity of king James I. consented, (4 Inst. 202), in consideration of a proper equivalent, to abolish them all, upon a plan similar to that, which he had formed and began to put in execution, for removing the feodal grievance of heritable jurisdiction, in Scotland, which has since been pursued and effected by the statute 20 Geo. II. c. 43. By another statute of the same year (20 Geo. II. c. 50.) the tenure of "ward-holding" (equivalent to the knight-service of England) is for ever abolished in Scotland. At length the military tenures, with all their heavy appendages, (having during the usurpation been discontinued) were totally destroyed by the statute 12 Car. II. c. 24. Blackst. Com. b. ii. See TENURE.

KNIGHTHOOD, *Regular*, is applied to all military orders, which profess to wear some particular habit, to bear arms against the infidels, to succour and assist pilgrims in their passage to the Holy Land, and to serve in hospitals where they should be received; such were the knights Templars, and such still are the knights of Malta, &c.

KNIGHTHOOD, *Honorary*, is that which princes confer on other princes, and even on their own great ministers and favourites; such are the knights of the Garter, St. Michael, &c.

KNIGHTHOOD, *Social*, is that which is not fixed, nor confirmed by any formal institution, nor regulated by any lasting statutes; of which kind there have many orders been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

The abbot Bernardo Justiniiani, at the beginning of his history of knighthood, gives us a complete catalogue of the several orders: according to this computation, they are in number ninety-two. Favin has given us two volumes of them under the title of Theatre d'Honneur & de Chevalerie. Menenius has published *Deliciae Equestrum Ordinum*, and Andr. Mendo has written *De Ordinibus Militaribus*. Beloi has traced the original, and Geliot, in his *Armorial Index*, has given us their institutions.

To these may be added, Father Menestrier de la Chevalerie Ancienne & Moderne, Micheli's *Trefor Militaire*, Caramuel's *Theologia Regolare*, Miræus's *Origines Equestrum sive Militarum Ordinum*: but above all, Justiniiani's *Historie Chronologiche del' Origine de gl' Ordine Militari*, e di tutte le Religione Cavaleresche: the edition which is fullest, is that of Venice in 1692, in two vols. fol.

KNIGHTON, HENRY, in *Biography*, who flourished at the close of the 14th century under Richard II. is celebrated as an ancient chronicler. He was a canon-regular of Leicester abbey, and wrote a history of English affairs in five books, from the conquest to the year 1395. He wrote likewise an account of the deposition of Richard II. His works are printed with the ten English historians published by

by the learned Selden. He is reckoned an exact and faithful narrator of events within his own times.

**KNIGHTON**, or *Tref-y-clawdd*, in *Geography*, a market-town and parish in the hundred of Knighton, and county of Radnor, South Wales; is seated in a valley, through which the river Teme meanders at the distance of 17 miles W. of Ludlow, and 33 S. of Shrewsbury. The valley of Teme, in the vicinity of this town, is skirted by lofty hills, the sides of which are well clothed with wood and verdure. The town contains some good houses, ranged on the sides of streets, which in parts are steep. Here is a free grammar school. The church has rather a singular appearance, from its irregular form, detached tower, with strange spire. Knighton has a weekly market, and an annual fair; and contained, in the year 1800, 221 houses and 785 inhabitants.

On the western side of the town, is part of the noted boundary embankment called Offa's Dyke, which was formed in the year 760, and intended to be the line of demarcation between England and Wales. Harold made a law, that if any Welshman was found on the eastern side of this dyke, he should lose his right hand. See **PRESTEIGN**.

**KNIN**, a town of Bohemia, in the circle of Beraun, near which is a gold mine, 12 miles S. E. of Beraun. N. lat. 49° 49'. E. long. 14° 18'.—Also, a fortified town of Dalmatia, strengthened by a deep ditch, and situated on a narrow neck where the river Kerka is joined by another stream, called Butim-ſchiza. This is supposed to be the ancient castle called "Arduha," taken by Germanicus, 40 miles E. of Zara. N. lat. 43° 55'. E. long. 16° 55'.

**KNIP BAY**, a bay on the W. coast of the island of Curaçoa.

**KNIPHAUSEN**, a sea-port town of Germany, in the lordship of Jever, taking its name from an ancient castle, where the tribunal of justice is held; 5 miles E. S. E. of Jever. N. lat. 53° 20'. E. long. 8°.

**KNISFENEAX**, otherwise called *Killſſinons* or *Kiſſinons*, the name of a people, who are spread over a considerable extent in the centre of the northern part of America. We are indebted to Mr. Mackenzie (see Voyage from Montreal, &c. Introd. p. 91, &c.) for a particular account of these people. Their language is the same as that of the people who inhabit the coast of British America on the Atlantic, the Esquimaux excepted, and continues along the coast of Labrador, and the gulf and banks of St. Lawrence to Montreal. The line then follows the Utawas river to its source, and continues from thence nearly W. along the highlands, which divide the waters that fall into Lake Superior and Hudson's Bay. It then proceeds till it strikes the middle part of the river Winnipeg, following that water through the lake Winnipeg, to the discharge of the Saskatchewan into it; from thence it accompanies the latter to Fort George, when the line, striking by the head of the Beaver river to the Elk river, runs along its banks to its discharge in the lake of the Hills, from which it may be carried back E. to the isle à la Croix, and so on to Churchill, by the Mississippi. The whole of the tract between this line and Hudson's bay and straits, that of the Esquimaux in the latter excepted, may be said to be exclusively the country of the Knisfeneaux. Some of them, indeed, have penetrated farther W. and S. to the Red river, to the S. of lak. Winnipeg, and the S. branch of the Saskatchewan.

These people are of a moderate stature, well proportioned, with few examples of deformity, and very active. Their complexion is copper-coloured, and their hair black, in which they resemble all the natives of North America. It is cut in various forms, according to the fancy of the several

tribes, and by some it is left in the long, lank flow of nature. They very generally extract their beards, and both sexes manifest a disposition to pluck the hair from every part of the body and limbs. Their eyes are black, keen, and penetrating; their countenance is open and agreeable, and they are fond of decorating their persons. In the use of vermilion, to which they are much accustomed, they contrast it with their native blue, white, and brown earths, to which they frequently add charcoal. Their dresses is simple and commodious. It consists of tight leggins, reaching near the hip; a strip of cloth, or leather, called *Aſſian*, about a foot wide, and five feet long, whose ends are drawn inwards and hang behind and before, covering a belt tied round the waist for that purpose; a close vest or shirt reaching down to the former garment, and cinctured with a broad strip of parchment fastened with thongs behind; and a cap for the head, consisting of a piece of fur, or small skin, with the brist of the animal as a suspended ornament; a kind of robe is thrown occasionally over the whole of the dress, and serves both night and day. These articles, with the addition of shoes and mittens, constitute the variety of their apparel. The materials vary according to the season, and consist of dressed moose-skin, beaver prepared with the fur, or European woollens. The leather is neatly painted, and fancifully wrought in some parts with porcupine quills, and moose-deer hair; the shirts and leggins are also adorned with fringe and tassels; nor are the shoes and mittens without somewhat of appropriate decoration, and worked with a considerable degree of skill and taste. Their head-dresses are composed of the feathers of the swan, the eagle, and other birds. The teeth, horns, and claws of different animals are also the occasional ornaments of the head and neck. Their hair is always besmeared with grease. The making of every article of dress is a female occupation; and they pay particular attention to the appearance of the men, whilst they neglect no decoration of their own persons; and their faces are painted with more care than those of the women.

The female dress is formed of the same materials with those of the men, but they are differently made and arranged. Their shoes are commonly plain, and their leggins gathered below the knee. The coat, or body-covering, falls down to the middle of the leg, and is fastened over the shoulders with cords, a flap or cape turning down about eight inches, both before and behind, and agreeably ornamented with quill-work and fringe; the bottom is also fringed, and fancifully painted as high as the knee. Being loose, it is inclosed round the waist with a stiff belt, decorated with tassels, and fastened behind. The arms are covered to the wrist, with detached sleeves, sewed as far as the bend of the arm, from thence they are drawn up to the neck, and the corners of them fall down behind, as low as the waist. The cap, when a cap is used, consists of a quantity of leather or cloth, sewed at one end, by which means it is kept on the head, and, hanging down the back, is fastened to the belt as well as under the chin. The upper garment is a robe like that of the men. Their hair is divided on the crown, and tied behind, or sometimes fastened in large knots over the ears. They prefer European articles to their own commodities. Their ornaments, like those of savages in general, consist of bracelets, rings, and similar baubles. Some of the women tattoo three perpendicular lines, which are sometimes double: one from the centre of the chin to that of the under lip, and one parallel on either side to the corner of the mouth.

The Knisfeneaux women are the most comely of any seen by Mr. Mackenzie on the American continent: they are well proportioned, and the regularity of their features would

would be acknowledged by the more civilized people of Europe; and their complexion is less darkly tinged than that of those savages who have less cleanly habits. These people are in general subject to few disorders. The lues venerea, however, is common, and is cured by the use of simples, with the virtue of which they are well acquainted. They are also subject to fluxes, and pains in the breast. They are naturally mild and affable, as well as just in their dealings; they are generous and hospitable, and extremely good natured, when not inflamed by spirituous liquors; indulgent to their children to excess; the father takes pains in qualifying them for the operations of war and hunting, and the mother is equally attentive to the instruction of the daughters. Illegitimacy is only attached to those children who are born before their mothers have cohabited with any man by the title of husband. Chastity does not seem to be a virtue among them, nor is fidelity thought to be essential to the happiness of a wedded life. Sometimes, however, the infidelity of a wife is punished with the loss of her hair, nose, and perhaps life. A temporary interchange of wives is not uncommon; and the offer of their persons is considered as a necessary part of the hospitality due to strangers. When a man loses his wife, it is considered as a duty to marry her sister, if he has one; or he may have both, if he pleases, at the same time. Notwithstanding the amiable traits of their character, they are not free from vices, even of the most atrocious kind. They are addicted to incest and bestiality. When a young man marries, he lives with the father and mother of his wife, and is considered as a stranger, till after the birth of his first child; he then attaches himself more to them than to his own parents; and his wife gives him no other denomination than that of the father of her child.

The profession of the men is war and hunting: they also spear fish, but the management of the nets is committed to the women. The females are subordinate, like those of savages in other tribes; but their labour is alleviated by the contiguity of lakes and rivers, where they employ canoes. In winter, when the waters are frozen, they travel with sledges drawn by dogs. They are subject, however, to every kind of domestic drudgery: they dress the leather, make the clothes and shoes, weave the nets, collect wood, erect the huts, fetch water, and perform every culinary service; so that their life is an uninterrupted succession of toil and pain. Under the impulse of this feeling, they sometimes destroy their female children. By the use of simples they also procure abortion; and this they do without any material injury to their own health.

Their funeral rites commence with smoking, and terminate with a feast: the body is dressed in the best habiliments possessed by the deceased, or his relations, and is then deposited in a grave, lined with branches: some domestic utensils are placed in it, and a canopy erected over it. During the ceremony, they make great lamentations; and when the deceased person is very much regretted, the near relations cut off their hair, pierce the fleshy part of their arms and thighs with arrows, knives, &c. and blacken their faces with charcoal. If they have distinguished themselves in war, they are sometimes laid on a kind of scaffolding; and it is said, that women, as in the East, have sacrificed themselves to the manes of their husbands. The whole property of the deceased person is destroyed, and the relations take in exchange for the wearing apparel any rags that will cover their nakedness. The feast which is given on this occasion, and which in some cases is repeated annually, is accompanied with eulogiums on the deceased; and on the tomb are carved or painted the symbols of his tribe, which are taken from the different animals of the country.

These people have frequent feasts; and at stated periods, as in spring and autumn, they practise long and solemn ceremonies. Dogs, and particularly those that are fat and milk-white, are offered as sacrifices. They also make large offerings of their property, of whatever kind it be. These ceremonies are performed on the bank of a river or lake; and if any stranger, who is in want of any thing that is displayed as an offering, chance to pass by, he has a right to take it, upon replacing something of inferior value; but to take or touch any thing wantonly is considered as a sacrilegious act, and highly insulting to the great Master of life, to adopt their expression, who is the sacred object of their devotion. The scene of private sacrifice is the lodge of the person who prepares it, and it is conducted with a variety of ceremonies. He begins by spreading the contents of his medicine-bag, containing various articles, on a piece of new cloth or well-dressed moose-skin neatly painted. The principal of these articles is a kind of house-hold-god, which is a small carved image about eight inches long, and is an object of the most pious regard. The next article is his war-cap, decorated with the feathers and plumes of rare birds, beavers, eagle's claws, &c. From this is suspended a quill or feather for every enemy whom the owner of it has slain in battle. The remaining contents of the bag are a piece of Brazil tobacco, several roots and simples in repute for their medicinal qualities, and a pipe. After certain previous ceremonies, an assistant lights the pipe, and presents it to the officiating person, who, turning to the east, draws a few whiffs, which he blows to that point. He practises the same ceremony towards the other three quarters, with his eyes constantly directed upwards. After some other ceremonies performed with this pipe, he makes a speech, explaining the design of the attendants being called together, and concludes with an acknowledgment of past mercies, and a prayer for the continuance of them, from the Master of life. He then sits down, and the whole company declare their approbation and thanks by uttering the word *ho!* with an emphatic prolongation of the last letter. The Assistant or Michiniwais again takes up the pipe, and holds it to the mouth of the officiating person, who, after smoking three whiffs out of it, utters a short prayer, and then goes round with it in a course from east to west, to every person present; and thus the pipe is smoked out: when, after turning it three or four times round his head, he drops it downwards, and replaces it in its original situation. He then returns the company thanks for their attendance, and wishes them, as well as the whole tribe, health and long life. These smoking rites precede every matter of great importance, with more or less ceremony, but always with equal solemnity. The public feasts are conducted in a similar manner, but with some additional ceremony. At these several chiefs officiate, and the guests discourse upon public topics, repeat the heroic deeds of their forefathers, and excite the rising generation to follow their example. From these feasts the women and children are excluded; but the women, who are forbidden to enter the places sacred to these festivals, dance and sing around them, and sometimes beat time to the music within them; thus forming an agreeable contrast.

As to their divisions of time, the Knisteneaux compute the length of their journeys by the number of nights passed in performing them; and they divide the year by the succession of moons, the names of which are descriptive of the several seasons. These people are acquainted with the medicinal virtues of many herbs and simples, and apply the roots of plants and the bark of trees with success. But the conjurers, who monopolize the medical science, blend mystery with their art, and conceal their knowledge. Their materia

medica they administer in the form of purges and clysters; but the remedies and surgical operations are supposed to derive much of their effect from magic and incantation. A sharp flint serves them as a lancet for letting blood, as well as for scarification in bruises and swellings.

Among their various superstitions, they believe that the vapour which is seen to hover over moist and swampy places is the spirit of some person lately dead. They also fancy another spirit which appears in the shape of a man, upon the trees near the lodge of a person deceased, whose property has not been interred with him. He is represented as bearing a gun in his hand; and it is believed that he does not return to his rest, till the property that has been withheld from the grave has been sacrificed to it. Mr. Mackenzie has given examples (*ubi supra*) of the Kniteneaux and Algonquin languages, between which there is a considerable resemblance. See ALCONQUINS.

KNITTERFELDT, a town of the duchy of Stiria, on the river Muehr; 20 miles S.W. of Pruck. N. lat. 47° 14'. E. long. 14° 36'.

KNITTLE, in *Sea Language*, a small line, which is either plaited or twisted, and used for various purposes at sea; as to fasten the service in the cable, to reef the sails by the bottom, and to hang the hammocks between decks, &c.

KNITTLINGEN, in *Geography*, a town of Wurtemberg, the birth-place of Faust, one of the first printers; 22 miles S. of Heidelberg.

KNOCK-HEAD, a cape of Scotland, on the north coast of Banffshire; 3 miles W.N.W. of Banff.

KNOCKING MILL. See STAMPING.

KNOCKLADY, in *Geography*, a mountain in the northern part of the county of Antrim, Ireland; about two miles S. of Ballycastle.

KNOCKMELEDDOWN, a chain of mountains in Ireland, between the counties of Waterford and Tipperary, and extending into both. These are rated by Smith amongst the highest mountains in Ireland. On the summit of one of them, major Eccles, the electrician, was buried by his own desire.

KNOCKNAREA, a cape of Ireland, in Sligo bay; 6 miles W. from Sligo.

KNOCKTOPHER, a post-town of the county of Kilkenny, Ireland; 63 miles S.W. from Dublin.

KNOLL, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself.

KNOLLES, RICHARD, in *Biography*, an English historian, a native of Northamptonshire, was entered at the university of Oxford about the year 1560. He was afterwards chosen master of the free-school at Sandwich, and proved his fitness for this post by publishing a compendium of Latin, Greek, and Hebrew grammar. In 1610 he published, in folio, "A History of the Turks," which had been the labour of twelve years, and was executed in a manner highly creditable to his reputation. It has passed through many editions; and continuations have been made to it, of which the best is that of Paul Rycart, consul at Smyrna. Mr. Knolles likewise wrote "A brief Discourse of the Greatness of the Turkish Empire." He died at Sandwich, in 1610.

KNOLLIS, FRANCIS, an English statesman, was born at Grays, in Oxfordshire; and after receiving an university education, he went to court, and became a zealous friend to the reformation, in the reign of Edward VI., at whose death he went abroad. On the accession of queen Elizabeth he returned, and was made privy counsellor, and vice chamberlain of the household. He was employed in several

important matters of state; was one of the commissioners who sat in judgment on Mary queen of Scots; was appointed treasurer of the royal household, and knight of the Garter. He died in 1596. Sir Francis wrote a treatise against the usurpations of papal bishops, printed after his death in 1608; and a general survey of the Isle of Wight, which has not been printed.

KNOLLS, in *Agriculture*, a provincial term used in some counties to signify turnips.

KNONAU, in *Geography*, a bailiwick of Switzerland, in the canton of Zurich.

KNOPPERS, a superior kind of *Gall-nuts*; which see.

KNORR à RUSSENROTH, CHRISTIAN, in *Biography*, a learned German orientalist, was born in the year 1636. He pursued his studies at various colleges, and then travelled for improvement into France, England, and Holland. The subjects which had engaged his attention were chemistry and the cabalistic art, of which he had been from his youth a great admirer. At Amsterdum he was introduced to the knowledge of the Oriental tongues, and Hebrew; and made such progress in his favourite studies, as to obtain the esteem and friendship of Lightfoot, More, and Van Helmont. By the latter of these learned men he was introduced to the count palatine of Sulzbach, who, in 1688, nominated him one of his privy council, and afterwards gave him the appointment of his chancellor. The duties of these offices did not divert him from his literary, chemical, and mystical pursuits. He translated, into the German language, sir Thomas Brown's "Inquiry into vulgar Errors," and various other pieces; but his reputation is chiefly founded on a work, entitled "Kabbala Denudata, seu Doctrina Hebræorum transcendentalis, et metaphysica, atque theologica, &c." in 3 vols. 4to. This work abounds in wild reveries, fanciful chimeras, and mystical absurdities; but it contains, at the same time, very learned and valuable researches relative to the philosophy of the Hebrews.

KNOTS, in *Gardening*, a term used to express the rudiments of the first branches of plants, as they grow up from the seed. Thus, in the melon, the two first leaves or seed-leaves are called the ears, and the branches that grow from them are called, according to the order of their growth, the first, second, and third knots. Mr. Quintiny's famous method of raising the best melons, depended principally on the cutting off every third knot of the plant as they grew up. Philof. Trans. N° 45.

In trees, the knot denotes that part from whence it shoots out branches, roots, or even fruit.

The wood is harder and closer in the knots than in any other part, but it is also more subject to split there.

The use of the knots of plants is to strengthen the stem: they serve also as sieves to filtrate, purify, and refine, the juice raised up for the nourishment of the plant.

KNOT, in *Military Language*, the wing or epaulette, commonly made of worsted, of a non-commissioned officer or corporal. When sergeants and corporals are sentenced to be reduced to the ranks, the knot is generally cut off by the drum-major, in the presence of the battalion, as a mark of infamy.

KNOT on board a Ship, is a large knob formed on the extremity of a rope, by untwisting the ends thereof, and interweaving them regularly amongst each other. Of this there are several sorts: the chief of which are the *wale knot*, which is so made with the lays of a rope, that it cannot slip, and serves for sheats, tacks, and stoppers; the *bow-line knot* is so firmly made, and fastened to the crenelles of the sails, that they must break, or the sails split, before it will slip; the *sheep-shank knot*, which serves to shorten a rope without cutting it, which may be presently loosened; the *diamond knot*,

knot, the *rose knot*, &c. The knots are generally used to fasten one rope to another, by means of a small cord attached to the neck of the knot, called the *laniard*, which is firmly tied about both ropes. They are also designed to prevent the end of a rope from sliding through an eye, which the knot is intended to confine in a particular situation.

**KNOT-BERRIES.** See **RASPBERRIES.**

**KNOT-GRASS**, in *Botany*. See **POLYGONUM.**

**KNOT-GRASS**, in *Rural Economy*, a common name often given to couch-grass. See **COUCH-GRASS.**

**KNOT-GRASS**, *Mountain*. See **WHYLOW-GRASS.**

**KNOTS of the Log-Line**, at sea, are the divisions of it. See **LOG.**

**KNOT** is also used for the intrigue of a romance, or dramatic piece; being that part where the persons are the most embarrassed, by a conjuncture of affairs, whose end it is not easy to foresee.

Aristotle, under this term, includes all the incidents of a tragedy, from its beginning to the place where it begins to unravel. The knot holds as long as the mind is kept suspended about the event. The knot ought always to last to the middle of the fifth act, otherwise the rest of the piece languishes.

**KNOT**, *Order of the*, was the name of a military order in the kingdom of Naples, instituted in 1352, by queen Jane I. on occasion of the peace established between her and the king of Hungary, by means of her marriage with Louis prince of Tarantum. It was so called because the knights wore for their badge a knot, like a true-lover's knot, embroidered on the breast of their coat in purple silk, intermixed with gold.

The order consisted of sixty knights. Clement VI. approved of this order, and gave it the rule of St. Basil: it chose St. Nicolas for its protector; but it dwindled away after the death of its foundress.

**KNOT**, in *Ornithology*, the name of an English bird of the snipe kind, not known among authors by any particular Latin name, unless it be the *calidrys nigra*, or black calidrys of Bellonius, which is doubtful from his description; and said to have obtained its English name from Canute, one of the Danish kings of this island, who was particularly fond of it: it is the *tringa Canutus* of Linnæus, which see.

**KNOT**, or *Boss*, in *Pointed Architecture*, the key stone of the groin, where all its springs or ribs meet together.

**KNOULTON LAKE**, in *Geography*, a lake of America, in the state of Vermont. N. lat. 44° 48'. W. long. 71° 50'.

**KNOUT**, or **KNOOT**, is the name of a punishment inflicted in Russia, with a kind of whip called *knout*, and made of a long strap of leather prepared for this purpose. This instrument is a hard thong, about the thickness of a crown piece, and  $\frac{3}{4}$  of an inch broad, and tied to a thick plaited whip, which is connected, by means of an iron ring, with a small piece of leather fastened to a short wooden handle. With this whip the executioners dextrously carry off a slip of skin from the neck to the bottom of the back laid bare to the waist, and repeating their blows, in a little while rend away all the skin off the back in parallel strips. In the common knout, the criminal receives the lashes suspended on the back of one of the executioners: but in the great knout, which is generally used on the same occasions as racking on the wheel in France, the criminal is raised into the air by means of a pulley fixed to the gallows, and a cord fastened to the two wrists tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breast. Sometimes his hands are tied behind over his back, and when he is pulled up in this

position, his shoulders are dislocated. The executioners can make this punishment more or less cruel: and, it is said, are so dextrous, that when a criminal is condemned to die, they can make him expire at pleasure, either by one or several lashes.

**KNOWING**, *Principles and Rules of*. See **PRINCIPLE**, and **RULE.**

**KNOWLEDGE** may be considered either as an operation of the mind, or as the result of that operation. In the former sense, it denotes the clear perception of truth; and in the latter, it signifies the treasure of associated ideas, that are laid up in the mind, in consequence of clear perceptions; thus, mathematics, astronomy, ethics, history, &c. are branches of knowledge.

**KNOWLEDGE**, according to Mr. Locke, consists in the perception of the connection and agreement, or disagreement and repugnancy, of our ideas. See **IDEA.**

In this sense, knowledge stands opposed to ignorance.

To *know* that *white is not black*, is only to perceive that these two ideas do not agree. So, in knowing that the three angles of a triangle are equal to two right ones; what do we more than perceive, that equality to two right ones necessarily agrees to, and is inseparable from, the three angles of a triangle?

**KNOWLEDGE**, *Kinds of*. As to what relates to the agreement or disagreement of ideas, we may reduce the whole doctrine, and consequently the whole stock of our knowledge, to four heads. *viz.* *identity or diversity, relation, co-existence, and real existence.*

With respect to the *identity or diversity* of our ideas, we may observe, that it is the first act of the mind to perceive its own ideas; and, so far as it perceives them, to know what each is, and thereby to perceive their difference; that is, the one not to be the other: by this the mind clearly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree. This it does without any pains, or deduction, by its natural power of perception and distinction; and, for doing this, men of art have established certain general rules or principles; as that, *what is, is*; and that it is impossible for the same thing to be, and not to be. But no maxim can make a man know clearer, that round is not square, than the bare perception of the two ideas, which the mind, at first sight, perceives to disagree.

The next kind of agreement, or disagreement, the mind perceives, in any of its ideas, may be called *relative*, and is nothing but the perception of the relation between any two ideas, of what kind soever; that is, their agreement or disagreement, one with another, in the several ways, or respects, the mind takes of comparing them.

The third sort of agreement, or disagreement, to be found in our ideas, is *co-existence*, or *non-co-existence*, in the same subject; and this belongs particularly to substances. Thus when we pronounce concerning gold, that it is fixed, it amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea which always accompanies that particular sort of yellowness, weight, fusibility, &c. which make our complex idea signified by the word *gold*.

The fourth sort is that of *actual and real existence*, agreeing to any idea.

Within these four sorts of agreement, or disagreement, seems contained all the knowledge we have, indeed all we are capable of; for all that we know, or can affirm, concerning any idea, is, that it is, or is not, the same with some other; as, that blue is not yellow: that it does, or does not, co-exist with another in the same subject; as, that iron is susceptible of magnetical impressions: that it hath that or

this relation to some other ideas; as, that two triangles upon equal bases, between the same parallels, are equal; or, that it has a real existence without the mind; as, that God is.

The mind becomes possessed of truth in several manners, which constitute so many different species of knowledge. Thus, when the mind has a present view of the agreement or disagreement of any of its ideas, or of the relation they have one with another, it is called *actual* knowledge.

Secondly, a man is said to know any proposition, when, having once evidently perceived the agreement or disagreement of the ideas whereof it consists, and so lodged it in his memory, that whenever it comes to be reflected on again, the mind assents to it without doubt or hesitation, and is certain of the truth of it: this may be called *habitual* knowledge. And thus a man may be said to know all those truths which are lodged in his memory, by a foregoing, clear, and full perception.

Of *habitual* knowledge, there are two sorts: the one consists of such truths, laid up in the memory, as, whenever they occur to the mind, it actually perceives the relation that is between their ideas; and this is in all those truths where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another. The other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, knows it to be true, when that demonstration is gone out of his mind, and cannot possibly be recollected; but he knows it in a different way from what he did before: namely, not by the intervention of those intermediate ideas; whereby the agreement, or disagreement, of those in the proposition was at first perceived; but by remembering, that is, knowing, that he was once certain of the truth of this proposition, that the three angles of a triangle are equal to two right ones,—the immutability of the same relation between the same immutable things, is now the idea that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be so. And hence he comes to be certain, that what was once true, is always true; what ideas once agreed, will always agree; and consequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

KNOWLEDGE also may be usefully distinguished into three kinds; *historical*, *philosophical*, and *mathematical*.

KNOWLEDGE, *Historical*, is merely the knowledge of facts, or of what is or happens in the material world, or within our own minds. Thus, that the sun rises and sets, that trees bud in the spring, that we remember, will, &c. are instances of historical knowledge.

KNOWLEDGE, *Philosophical*, is the knowledge of the reasons of things, or of what is or happens. Thus he has a philosophical knowledge of the motion of rivers, who can explain how it arises from the declivity of the bottom, and from the pressure which the lower part of the water sustains from the upper. So likewise the shewing how, and by what reason, desire or appetite arises from the perception or imagination of its object, would be philosophical knowledge.

KNOWLEDGE, *Mathematical*, is the knowledge of the quantity of things, that is, of their proportions or ratios to some given measure. Thus he who knows the proportion of the meridian heat of the sun at the summer solstice to its meridian heat at the winter solstice, might so far be said to have a mathematical knowledge of the sun's heat. So likewise he has a mathematical knowledge of the motion of a planet in its orbit, who can distinctly shew how, from the

quantity of the impressed and centripetal force, the velocity of the planet is produced; and how, from the action of the double force, the elliptical figure of the orbit arises.

These three kinds of knowledge differ evidently, it being one thing to know that a thing is; another, the reason why it is; and a third, to know its quantity or measure.

It is also evident, that *historical* knowledge, though extensively useful, and the foundation of the rest, is the lowest degree of human knowledge. Those who aim at the greatest certainty ought to join mathematical with philosophical knowledge. Nothing can more evidently shew that an effect arises from a certain cause, than the knowledge that the quantity of the effect is proportional to the force of the cause. Besides, there are many things in nature, the reasons of which depending on certain figures or quantities, are not assignable but from mathematical principles.

KNOWLEDGE, *Degrees of*. As to the different degrees, or clearness of our knowledge, it seems to lie in the different way which the mind has of perceiving the agreement or disagreement of any of its ideas. When the mind perceives this agreement or disagreement of two ideas immediately by themselves, without the intervention of any other, we may call it *intuitive* knowledge; in which case the mind perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that white is not black; that three are more than two, and equal to one and two. This part of knowledge is irresistible; and, like the bright sunshine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends, which certainly every one finds to be so great, that he cannot imagine, and therefore cannot require a greater. The next degree of knowledge is, where the mind perceives not this agreement, or disagreement, immediately, or by the juxtaposition, as it were, of the ideas; because those ideas, concerning whose agreement, or disagreement, the inquiry is made, cannot, by the mind, be so put together as to shew it. In this case, the mind is obliged to discover the agreement, or disagreement, which it searches for, by the intervention of other ideas: and this is that which we call *reasoning*.

Thus, if we would know the agreement, or disagreement, in bigness, between the three angles of a triangle and two right angles, we cannot do it by an immediate view and comparison of them, because the three angles of a triangle cannot be brought together at once, and compared with any other one or two angles; and so of this the mind has no immediate or intuitive knowledge. But we must find out some other angles, to which the three angles of a triangle have equality; and, finding those equal to two right ones, we come to know the equality of these three angles to two right ones.

Those intervening ideas, which serve to shew the agreement of any two others, are called *proofs*; and where the agreement, or disagreement, is by this means plainly and clearly perceived, it is called *demonstration*; and a quickness in the mind to find those proofs, and to apply them right, is that which is called *agacuity*.

This knowledge, though it be certain, is not so clear and evident as intuitive knowledge; it requires pains and attention, and steady application of mind, to discover the agreement, or disagreement, of the ideas it considers; and there must be a progression by steps and degrees, before the mind can, in this way, arrive at any certainty. Before demonstration, there was a doubt, which, in intuitive knowledge, cannot happen to the mind, that has its faculty of perception

ception left in a degree capable of distinct ideas, no more than it can be a doubt to the eye (that can distinctly see white and black), whether this ink and paper be all of a colour. Now, in every step that reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement, or disagreement, it seeks, with the next intermediate idea, which it uses as a proof; for, if it were not so, that yet would need a proof, since, without the perception of such agreement, or disagreement, there is no knowledge produced.

By which it is evident, that every step in reasoning, that produces knowledge, has intuitive certainty; which when the mind perceives, there is no more required, but to remember it, to make the agreement, or disagreement, of the ideas, concerning which we inquire, visible and certain. This intuitive perception of the agreement, or disagreement, of the intermediate ideas in each step and progression of the demonstration, must also be exactly carried in the mind; and a man must be sure, that no part is left out, which, in long deductions, the memory cannot easily retain, and therefore this knowledge becomes more imperfect than intuitive, and men often embrace falsehoods for demonstrations.

It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty: but to have such an agreement, or disagreement, as may be intuitively perceived, being, as we imagine, not the privilege of the ideas of number, extension, and figure alone, it may possibly be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge. For, in whatever ideas the mind can perceive the agreement, or disagreement, immediately, there it is capable of intuitive knowledge, and, where it can perceive the agreement, or disagreement, of any two ideas, by the intuitive perception of the agreement, or disagreement, they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to the ideas of figure, number, extension, or their modes.

The reason why it has been generally supposed to belong to these only, is, because, in comparing their equality or excess, the modes of numbers have every the least difference very clear and perceivable; and, in extension, though every the least excess is not so perceptible, yet the mind has found out ways to discover the just equality of two angles, extensions, or figures; and both numbers and figures can be set down by visible and lasting marks. But, in other simple ideas, whose modes and differences are made and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences, as to perceive or find ways to measure their just equality, or the least differences. For those other simple ideas being appearances, or sensations produced in us, by the size, figure, motion, &c. of minute corpuscles, singly insensible, their different degrees also depend on the variation of some or all of those causes; which, since it cannot be observed by us in particles of matter, whereof each is too subtle to be perceived, it is impossible for us to have any exact measures of the different degrees of these simple ideas.

Thus, not knowing what number of particles, nor what motion of them, is fit to produce any precise degree of whiteness, because we have no certain standard to measure them by, nor means to distinguish every the least difference; the only help we have is from our senses, which in this point fail us. But where the difference is so great as to produce

in the mind ideas clearly distinct, these ideas, as we see in colours of different kinds, blue and red for instance, are as capable of demonstration as ideas of number and extension; and what is here said of colours, holds true in all secondary qualities.

These two then, *intuition* and *demonstration*, are the degrees of our knowledge; and whatever comes short of one of these, is only *faith*, or *opinion*, not *knowledge*, at least in all general truths.

There is, indeed, another perception of the mind, employed about the particular existence of finite beings without us, which going beyond probability, but not reaching to either of the foregoing degrees of certainty, passes under the name of knowledge.

Nothing can be more certain, than that the idea we receive from an external object is in our minds: this is intuitive knowledge; but whether we can thence certainly infer the existence of any thing without us, corresponding to that idea, is that whereof some men think there may be a question made; because men may have such an idea in their minds, when no such thing exists, nor any such object affects their senses.

But it is evident, that we are invincibly conscious to ourselves of a different perception, when we look on the sun in the day, and when we think on it by night; when we actually taste wormwood, or smell a rose, or only think on that favour or odour; so that we may add, to the two former sorts of knowledge, this also of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them; and allow these three degrees of knowledge, *viz. intuitive, demonstrative, and sensitive*.

But, since our knowledge is founded on, and employed about, our ideas only, will it follow thence, that it must be conformable to our ideas, and that where our ideas are clear and distinct, obscure and confused, there our knowledge will be so too? We answer, No; for our knowledge consisting in the perception of the agreement, or disagreement, of any two ideas; its clearness or obscurity consists in the clearness or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves. A man (for instance), who has a clear idea of the angles of a triangle, and of equality to two right ones, may yet have but an obscure perception of their agreement, and so have but a very obscure knowledge of it: but obscure and confused ideas can never produce any clear or distinct knowledge; because, as far as any ideas are obscure or confused, so far the mind can never perceive clearly, whether they agree or disagree; or, to express the same thing in other words, he that has not determined ideas to the words he uses, cannot make propositions of them, of whose truth he can be certain.

From all this it follows; 1. That we can have no knowledge farther than we have ideas.

2. That we have no knowledge farther than we can have perception of the agreement, or disagreement, of our ideas, either by intuition, demonstration, or sensation.

3. We cannot have an intuitive knowledge, that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another by juxtaposition, or in immediate comparison one with another. Thus, we cannot intuitively perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

4. Our rational knowledge cannot reach to the whole extent of our ideas; because, between two different ideas which

we would examine, we cannot always find such proofs, whereby we can connect one to another with an intuitive knowledge in all the parts of the deduction.

5. Sensitive knowledge, reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

6. From all which it is evident, that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. We have the ideas of a square, a circle, and equality; and yet, perhaps, shall never be able to find a circle equal to a square. See CIRCLE.

KNOWLEDGE, *Extent and Limits of.* The affirmations or negations we make concerning the ideas we have, being reduced to the four sorts above-mentioned, *viz.* identity, co-existence, relation, and real existence, let us inquire how far our knowledge extends in each of these.

1. As to identity and diversity, our intuitive knowledge is as far extended as our ideas themselves; and there can be no idea in the mind, which it does not presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

2. As to the agreement or disagreement of our ideas of co-existence, our knowledge herein is very defective, though it is in this that the greatest and most material part of our knowledge, concerning substances, consists: for our ideas of substances being nothing but certain collections of simple ideas co-existing in one subject (our idea of flame, for instance, is a body, hot, luminous, and moving upwards); when we would know any thing farther concerning this; or any other sort of substance, what do we but enquire what other qualities, or powers, these substances have, or have not? which is nothing else but to know what other simple ideas do, or do not exist with those which make up such complex ideas. The reason of this is, that the simple ideas, which make up our complex ideas of substances, have no visible necessary connection, or inconsistency, with other simple ideas, whose co-existence with them we would inform ourselves about. These ideas being likewise, for the most part, secondary qualities, which depend upon the primary qualities of their minute or insensible parts, or on something yet more remote than these from our comprehension, it is impossible we should know which have a necessary union, or inconsistency, one with another; since we know not the root from whence they spring, or the size, figure, and texture of parts on which they depend, and from which they result. Besides this, there is no discoverable connection between any secondary quality, and those primary qualities that it depends on. We are so far from knowing what figure, size, or motion, produces (for instance) a yellow colour, or sweet taste, or sharp sound, that we can by no means conceive how any size, figure, or motion, can possibly produce in us the idea of any colour, taste, or sound, whatsoever; there being no conceivable connection between the one and the other.

Our knowledge, therefore, of co-existence reaches little farther than experience. Some few, indeed, of the primary qualities have a necessary dependence, and visible connection, one with another: as figure necessarily supposes extension; receiving or communicating motion by impulse supposes solidity: but qualities co-existent in any subject, without this dependence and connection, cannot certainly be known to co-exist, any farther than experience, by our senses, informs us. Thus, though, upon trial, we find gold yellow, weighty, malleable, fusible, and fixed; yet, because none of these have any evident dependence, or necessary connection, with the other, we cannot certainly know, that,

where any four of these are, the fifth will be there also, how highly probable soever it may be. But the highest degree of probability amounts not to certainty, without which there can be no true knowledge; for this co-existence can be no true knowledge; for this co-existence can be no farther known than it is perceived; and it cannot be perceived, but either, in particular subjects, by the observation of our senses, or, in general, by the necessary connection of the ideas themselves.

As to incompatibility, or repugnancy to co-existence, we know, that no subject can have of each sort of primary qualities more than one particular at once, as one extension, or one figure; and so of sensible ideas peculiar to each sense: for whatever, of each kind, is present in any subject, excludes all other of that sort; for instance, one subject cannot have two smells, or two colours, at the same time.

As to powers of substances, which make a great part of our enquiries about them, our knowledge reaches little farther than experience; because they consist in a texture and motion of parts, which we cannot by any means come to discover; and I doubt, whether, with those faculties we have, we shall ever be able to carry our general knowledge much farther in this part. Experience is that, which, in this part, we must depend on: and it were to be wished, that it were more improved. We find the advantages some men's generous pains have in this way brought to the stock of natural knowledge; and if others, especially the philosophers by fire, had been so wary in their observations, and sincere in their reports, as those who call themselves *philosophers* ought to have been, our acquaintance with the bodies here about us, and our insight into their powers and operations, might have been yet much greater.

As to the third sort, the agreement, or disagreement, of our ideas in any other relation; this is the largest field of knowledge, and it is hard to determine how far it may extend: this part depending on our sagacity in finding intermediate ideas, that may shew the habitudes and relations of ideas, it is a hard matter to tell when we are at an end of such discoveries. They who are ignorant of algebra, cannot imagine the wonders of this kind that are to be done by it: and what farther improvements aid helps, advantageous to other parts of knowledge, the sagacious mind of man may yet find out, it is not easy to determine.

This, at least, we may believe, that the ideas of quantity are not the only ones capable of demonstration and knowledge; and that other, and, perhaps, more useful parts of contemplation, would afford us certainty, if vices, passions, and domineering interest, did not oppose or menace endeavours of this kind.

As to the fourth sort of knowledge, *viz.* of the *real, actual existence of things*, we have an intuitive knowledge of our own existence, a demonstrative knowledge of the existence of God, and a sensitive knowledge of the objects that present themselves to our senses.

Hitherto we have examined the extent of our knowledge, in respect of the several sorts of beings that are: there is another extent of it, in respect of universality, which will also deserve to be considered; and this, in regard to our knowledge, follows the nature of our ideas. If the ideas, whose agreement, or disagreement, we perceive are abstract, our knowledge is universal; for what is known of such general ideas, will be true of every particular thing, in which that essence, that is, that abstract idea, is found: and what is once known of such ideas, will be perpetually and for ever true; so that, as to all general knowledge, we must search and find it only in our own

minds; and it is only the examining our own ideas that furnishes us with it. Truth belonging to essences of things (that is, to abstract ideas) are eternal, and are to be found out by the contemplation only of those essences; as the existence of things is to be known only from experience.

KNOWLEDGE, *Reality of.* It is evident, that the mind knows not things immediately, but by the intervention of the ideas it has of them. Our knowledge, therefore, is real, only so far as there is a conformity between our ideas, and the reality of things. But how shall we know when our ideas agree with things themselves? It is answered, There are two sorts of ideas, that we may be assured agree with things: these are,

1. *Simple ideas*, which, since the mind can by no means make to itself, must be the effect of things operating upon the mind in a natural way, and producing therein those perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that simple ideas are not fictions of our fancies, but the natural and regular production of things without us, really operating upon us, which carry with them all the conformity our state requires, which is to represent things under those appearances they are fitted to produce in us. Thus the idea of whiteness, as it is in the mind, exactly answers that power which is in any body to produce it there; and this conformity between our simple ideas, and the existence of things, is sufficient for real knowledge.

2. All our *complex ideas*, except only those of substances, being archetypes of the mind's own making, and not referred to the existence of things, as to their originals, cannot want any conformity necessary to real knowledge; for that which is not designed to represent any thing but itself, can never be capable of a wrong representation. Here the ideas themselves are considered as archetypes, and things are no otherwise regarded than as conformable to them. Thus, the mathematician considers the truth and properties belonging to a rectangle, or circle, only as they are ideas in his own mind, which possibly he never found existing mathematically, that is, precisely true; yet his knowledge is not only certain, but real, because real things are no farther concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in the mind.

3. But the *complex ideas*, which we refer to archetypes without us, may differ from them; and so our knowledge about them may come short of being real: and such are our ideas of substances. These must be taken from something that does, or has existed, and not be made up of ideas arbitrarily put together, without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only as are made up of such simple ones as have been discovered to co-exist in nature: and our ideas, being thus true, though not, perhaps, very exact copies, are the subject of real knowledge of them. Whatever ideas we have, the agreement we find they have with others will be knowledge. If those ideas be abstract, it will be general knowledge; but to make it real concerning substances, the ideas must be taken from the real existence of things. Wherever, therefore, we perceive the agreement, or disagreement, of our ideas, there is certain knowledge; and wherever we are sure those ideas agree with the reality of things, there is certain, real knowledge.

KNOWLEDGE, *method of improving or enlarging.* It being the received opinion amongst men of letters, that maxims are the foundation of all knowledge, and that sciences are each of them built upon certain præcognita, from whence

the understanding is to take its rise, and by which it is to conduct itself in its enquiries in the matters belonging to that science: the beaten road of the school has been to lay down, in the beginning, one or more general propositions, called *principles*, as foundations whereon to build the knowledge that was to be had of that subject.

That which gave occasion to this way of proceeding was, the good success it seemed to have in mathematics, which of all the sciences have the greatest certainty, clearness, and evidence in them. But, if we consider it, we shall find, that the great advancement and certainty of real knowledge men arrive to in these sciences, was not owing to the influence of those principles, but to the clear, distinct, and complete ideas their thoughts were employed about, and to the relation of equality and excess, so clear between some of them, that they had an intuitive knowledge, and by that a way to discover it in others, and this is without the help of those maxims. For is it not possible for a lad to know, that his whole body is bigger than his little finger, but by virtue of this axiom, the whole is bigger than a part; nor be assured of it till he has learned that maxim? Let any one consider which is known first and clearest by most people, the particular instance, or the general rule; and which it is that gives life and birth to the other: these general rules are but the comparing our more general and abstract ideas, which ideas are made by the mind, and have names given them, for the easier dispatch in its reasonings: but knowledge began in the mind, and was founded on particulars, though afterwards, perhaps, no notice be taken thereof, it being natural for the mind to lay up those general notions, and make the proper use of them, which is to disburden the memory of the cumbersome load of particulars. The way to improve in knowledge is, not to swallow principles with an implicit faith, and without examination, which would be apt to mislead men, instead of guiding them into truth; but to get and fix in our minds clear and complete ideas, as far as they are to be had, and to annex to them proper and constant names; and thus, barely by considering our ideas, and comparing them together, observing their agreement or disagreement, their habitudes and relations, we shall get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting our minds into the disposal of others.

We must, therefore, if we would proceed as reason advises us, adapt our methods of enquiry to the nature of the ideas we examine, and the truth we search after. General and certain truths are only founded on the habitudes and relations of abstract ideas; therefore, a sagacious, methodical application of our thoughts for the finding out these relations, is the only way to discover all, that can with truth and certainty be put into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths, that, at first sight, appeared beyond human capacity. This may reasonably be said, that, if other ideas that are real, as well as nominal essences of their species, were pursued in a way similar to that of mathematicians, they would carry our thoughts farther, and with greater evidence and clearness, than possibly we are apt to imagine. This is reason sufficient to advance that conjecture above mentioned; viz. "That morality is capable of demonstration, as well as mathematics;" for moral ideas being real essences, which have a discoverable connection and agreement one with another, so far as we can find their habitudes and relations, so far we shall be possessed of real and general truths.

In our knowledge of substances, we are to proceed after a quite different method; the bare contemplation of their abstract ideas (which are but nominal essences) will carry us but a very little way in the search of truth and certainty. Here experience must teach us what reason cannot; and it is by trying alone, that we can certainly know what qualities co-exist, with those of our complex idea; for instance, whether that yellow, heavy, fusible body, we call *gold*, be malleable, or not; which experience (however it prove in that particular body we examine) makes us not certain that it is so in all, nor any other yellow, heavy, fusible bodies, but that which we have tried; because it is no consequence, one way or other, from our complex idea. The necessity or inconstancy of malleability has no visible connection with the combination of that colour, weight, and fusibility, in any body. What is here said of the nominal essence of gold, supposed to consist of a body of such a determinate colour, weight, and fusibility, will hold true if other qualities be added to it. Our reasonings from those ideas will carry us but a little way in the certain discovery of the other properties in those masses of matter wherein all those are to be found. As far as our experience reaches, we may have certain knowledge, and no farther. It is not denied, but that a man, accustomed to rational and regular experiments, shall be able to see farther into the nature of bodies, and their unknown properties, than one that is a stranger to them; but this is but judgment and opinion, not knowledge and certainty.

This would make it suspected, that natural philosophy is not capable of being made a science. From experiments, and historical observations, we may draw advantages of ease and health, and thereby increase our stock of conveniences for this life; but beyond this, it is to be feared our talents reach not, nor are our faculties able to advance farther. See *PHYSICS*.

The ways to enlarge our knowledge, as far as we are capable, seem to be these two: the first is, to get and settle in our minds, as far as we can, clear, distinct, and constant ideas of those things we would consider and know; for it being evident that our knowledge cannot exceed our ideas, where they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge. The other art is, of finding out the intermediate ideas, which may shew us the agreement or repugnancy of other ideas, which cannot be immediately compared.

That these two (and not relying on maxims, and drawing consequences from some general propositions) are the right method of improving our knowledge in the ideas of other modes, besides those of quantity, the consideration of mathematical knowledge will easily inform us; where, first, we shall find, that he, who has not clear and perfect ideas of those angles or figures, of which he desires to know any thing, is utterly thereby incapable of any knowledge about them. Suppose a man not to have an exact idea of a right angle, scalenum, or trapezium, and it is clear, that he will in vain seek any demonstration about them.

And farther, it is evident, that it was not the influence of maxims or principles that led the masters of this science into those wonderful discoveries they have made: let a man of good parts know all the maxims of mathematics ever so well, and contemplate their extent and consequences as much as he pleases, he will, by their assistance, scarce ever come to know, that the square of the hypothenuse in a right-angled triangle, is equal to the squares of the two other sides. This, and other mathematical truths, have been discovered by the thoughts otherwise applied. The mind had other objects, other views before it, far different from those

maxims, which men, well enough acquainted with those received axioms, but ignorant of their method who first made those demonstrations, can never sufficiently admire.

Our knowledge, as in other things, so in this also, has so great a conformity with our sight, that it is neither wholly necessary, nor wholly voluntary. Men, who have senses, cannot choose but receive some ideas by them; and, if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot but perceive the agreement, or disagreement, of some of them one with another. As he that has eyes, if he will open them by day, cannot but see some objects, and perceive a difference in them; yet he may choose whether he will turn his eyes towards an object, curiously survey it, and observe accurately all that is visible in it. But what he doth see he cannot see otherwise than he doth; it depends not on his will to see that black which appears yellow. Just thus it is with our understanding: all that is voluntary in our knowledge, is the employing or withholding any of our faculties from this or that sort of objects, and a more or less accurate survey of them; but, they being employed, our will hath no power to determine the knowledge of the mind one way or another; that is done only by the objects themselves, as far as they are clearly discovered. Thus, he that has got the ideas of numbers, and has taken the pains to compare one, two, or three, to six, cannot choose but know they are equal. He also, that hath the idea of an intelligent, but weak and frail being, made by, and depending on, another, who is eternal, omnipotent, and perfectly wise and good, will as certainly know, that man is to honour, fear, and obey God, as that the sun shines when he sees it. But yet, be these truths ever so certain, ever so clear, he may be ignorant of either or both of them, who will not take the pains to employ his faculties, as he should, to inform himself about them.

**KNOWLTON**, in *Geography*, a township of America, in Sussex county, New Jersey, containing 1937 inhabitants.

**KNOWLTONIA**, in *Botany*, so named by Mr. Salisbury in memory of Mr. Thomas Knowlton, who is said to have been Sherard's gardener at Eltham. *Salif. Prodr.* 372. Sims in *Curt. Mag.* v. 22. 775. (Ananmia; Venten. Malmaif. 22.)—Class and order, *Polyandria Polygynia*. Nat. Ord. *Muliflorique*, Linn. *Ranunculaceae*, Juss.

Gen. Ch. *Cal.* none. *Cor.* Petals numerous, from ten to twenty, oblong, without any nectary, deciduous, the innermost longest and nearly linear; outermost somewhat ovate, externally hairy. *Stam.* Filaments numerous, thread-shaped, much shorter than the petals; anthers vertical, two-lobed, roundish, thick-edged, bursting at the edges. *Pist.* Germens superior, numerous, ovate, collected into a round head; styles lateral, awl-shaped; stigmas simple, slightly recurved. *Peric.* Berries numerous, distinct, elliptical, pointed, of one cell. *Seed* solitary, large, smooth, of the shape of the pericarp, and attached to its base. *Receptacle* globose.

Eff. Ch. Calyx none. Petals numerous, oblong, destitute of a nectary. Receptacle of the fruit globose. Berries numerous, of one cell. Seeds solitary.

Obs. Mr. Salisbury separated this very distinct genus from the Linnæan *Adonis*, and published it in 1796, by the above unexceptionable name, which therefore takes place of Ventenat's *Ananmia*, published several years after; the latter being moreover liable to objection, from strict Linnæan scholars, as being formed of an Arabic word.

1. *K. capensis*. Hairy Knowltonia. (*K. vesicatoria*; Sims in *Curt. Mag.* t. 775. *Adonis capensis*; Linn. Sp. Pl. 772. Suppl.

Suppl. 272. *Anamenia hirsuta*; Venten. Malmalf. 22. n. 4. *Chirilophoriana trifoliata, foliis feabris, flore sulphureo-rariore*; Burn. Afr. 145. t. 51.—Hairy. Leaves twice ternate; leaflets elliptic-ovate. Petals linear.—Native of the Cape of Good Hope. With us it is a hardy green-house plant, flowering in the spring. *Root* perennial, and, as appears from Dr. Sims's description, of long duration, the plant from which his figure was taken, in 1804, having come out of Dr. Fothergill's collection near 25 years before. *Leaves* several, radical, on long hairy stalks, twice ternate; their leaflets elliptical, or somewhat ovate, ferrated, more or less hairy, the terminal ones usually largest. *Stems* taller than the leaves, branched nearly from their very bottom, hairy, almost leafless; their branches elongated, subdivided, somewhat corymbose; ultimate ones umbellate, single-flowered, very hairy. *Bractæas* leafy; the upper ones narrowest, lanceolate and entire. *Flowers* an inch broad, spreading, of a light yellow with green.

2. *K. vesicatoria*. Blistering Knowltonia. (*Adonis vesicatoria*; Linn. Suppl. 272 Willd. Sp. Pl. v. 2. 1307. *Anamenia coriacea*; Venten. Malmalf. 22. n. 1. t. 22. *A. lasperitifolia*; *ibid.* n. 2. *Ranunculus æthiopicus, foliis rigidis, floribus ex luteo viridicentibus*; Comm. Hort. v. 1. t. 1. *Imperatoria ranunculoides africana cneaphylos, lasperitifolia foliis rigidis, margine spinosis*; Pluk. Phyt. t. 95. f. 2.)—Smooth, leaves twice ternate; leaflets nearly heart-shaped, coriaceous; the lateral ones unequal at their base. Petals elliptic-oblong. Umbels compound, many-flowered.—Native of the Cape of Good Hope, and occasionally kept in green-houses, like the preceding, from which we cannot but think it specifically different. The *leaves* are much larger, smooth, very thick and rigid, with strong, almost pungent, ferratures or teeth; sometimes they are thrice compounded. *Stems* more umbellate in all their subdivisions, the ultimate umbels consisting of very numerous stalks, which are but slightly hairy. *Bractæas* rather elliptical. *Petals* elliptic-oblong rather than linear. *Berries* purplish black. Thunberg says that the leaves are used at the Cape to raise blisters, they having that property in common with some species of *Ranunculus* and *Clematis*, their near allies.

3. *K. gracilis*. Slender Knowltonia. (*Anamenia gracilis*; Venten. Malmalf. 22. n. 3. *Adonis æthiopica*; Thunb. Prodr. 94?)—Leaflets ovate, deeply ferrated, rigid, hairy. *Stems* branched at the top; branches erect, with few flowers." *Vent.*—We know nothing of this but from the definition of Ventenat, who saw it in Justici's herbarium. Thunberg, whom he quotes with doubt, defines his plant thus. "Leaves more than twice compound; leaflets deeply toothed, divaricated. Stem villous."—With this we have no further acquaintance, unless, as we strongly suspect, it is the same as the following; but if so, it by no means answers to the character given in Ventenat's work.

4. *K. filia*. Fine-leaved Knowltonia. (*Adonis filia*; Linn. Suppl. 271. A. *æthiopica*; Thunb. Prodr. 94? *A. daucifolia*; Lamarek. Dict. v. 1. 46. *Anamenia daucifolia*; Venten. Malmalf. 22. n. 5.)—Leaves twice ternate; leaflets pinnatifid, deeply cut, smooth, their segments decurrent. Flower-stalks hairy.—The only specimen we have seen was given to Linnæus, by Thunberg, who gathered it at the Cape. We presume, therefore, it must be his *Adonis æthiopica*, with the character of which, cited under our last species, it sufficiently tallies. The *leaves* are finely divided, but not sufficiently like a *Daucus* to warrant Lamarek's change of the original name, however unmeaning that may be. The *stem* is tall and slender, bearing two hairy-stalked umbels. Lower *bractæas* compound. *Petals* nearly linear. La-

marek's account seems entirely taken from the *Supplementum* of Linnæus. S.

KNOX, JOHN, in *Biography*, the intrepid and successful promoter of the Reformation in Scotland, was descended from an ancient family, and born near Haddington, in East Lothian, in the year 1505. Having received the elementary parts of a good education, he was, at a proper time, sent to the university of St. Andrews, where he applied himself with uncommon diligence in the studies of the place, made a very rapid proficiency, and was admitted to the degree of M.A. at an early age. Having determined to embrace the ecclesiastical profession, he was admitted to priest's orders before the period usually allowed by the canons. He now commenced teacher, and acquired great applause in that capacity. But by instructing others, he discovered the errors of the common system in which he had been educated, and which he had endeavoured to establish in the minds of the people. Feeling dissatisfied with what he was engaged in, he chose rather to be a hearer than a preacher, and frequented the discourses of Thomas Williams, a black-friar, who publicly preached against the pope's authority, and who was the first from whom Mr. Knox received any taste for the truth. About the same time, Mr. George Wishart, another celebrated reformer, coming from England, with the commissioners sent by king Henry VIII. Knox learned from him the principles of the reformed religion, and with these he was so well pleased, that from this moment he renounced Popery and became a zealous Protestant. Mr. Knox had quitted St. Andrews a little before this entire change of his opinions, having been appointed tutor to the sons of the lairds of Ormilton and Langnirny, who were both favourers of the Reformation. Knox intruded into the minds of his pupils the principles of piety and the Protestant religion, notice of which being given to David Beaton, cardinal and archbishop of St. Andrews, that prelate persecuted him with such severity that he was obliged to abscond, and frequently to change the place of his concealment. He thought of retiring into Germany, but was dissuaded from it by the fathers of his pupils, and he took shelter with them in St. Andrews castle, which was then in possession of the Leslies, the determined friends of the Reformation. In this asylum he continued to instruct his pupils, and he gave them public lectures in theology, which he delivered at a stated hour in the chapel, within the walls of the castle. These were frequented by several persons of note in the city, who entreated Mr. Knox to take upon himself the office of preacher, to which, though with great reluctance, he agreed to comply. He began his public ministry at St. Andrews, in the year 1547, with that success which always accompanies a bold and popular eloquence. He without hesitation struck at the root of Popery, and attacked both the doctrine and discipline of the established church with a vehemence peculiar to himself, but well adapted to the temper and wishes of the age. In his first sermon he proved, to the satisfaction of his hearers, that the pope was antichrist, and that the doctrine of the Roman church was contrary to the doctrine of Christ and his apostles. He shortly made converts of all the people in the castle, and of great numbers in the city, who even joined him in partaking of the Lord's supper. In the month of July 1547, an interruption took place in the exercise of Mr. Knox's ministry, in consequence of the surrender of the castle to the French, when he was carried prisoner with the garrison to France. He remained in confinement in the galleys till the latter end of the year 1549, when, being set at liberty, he passed over to England, and arriving at London, was licensed either by Cranmer, or Somerset,

the protector, and appointed preacher, first at Berwick, and afterwards at Newcastle. In 1552, he was appointed one of six chaplains, whom the council thought proper to retain in the service of king Edward VI., not only to attend the court, but to be itinerary preachers of the Protestant religion throughout the kingdom; he had also the grant of forty pounds a year till some benefit should be procured for him. Shortly after he was offered the living of All-hallows, which he refused, not choosing to conform to the liturgy. Soon after the accession of queen Mary, he thought it right to retire from the impending storm; he accordingly went to Geneva, where he had not resided long before he was invited by the English refugees at Frankfort to become their minister: this invitation he accepted, though against his will, through the interference of John Calvin, and he continued his services among them till some internal disputes about ceremonies broke up their society. Some of the English, particularly Dr. Cox, afterwards bishop of Ely, wished for a liturgy according to king Edward's form, but Knox and others preferred the Geneva service; at length the party of Cox, to get rid of the Scotch reformer, taking advantage of certain unguarded expressions in one of his former publications, threatened to accuse him of treason unless he quitted the place, which he did, and went again to Geneva. In 1555, he went to Scotland; upon his arrival, finding the professors of the Protestant religion greatly increased in number, he formed them into a society, associated with them, and commenced his preaching with the usual vehemence. He had an opportunity, in the course of a few months, to preach in various parts of Scotland, and in all the places the people flocked in great crowds to hear him. The Popish clergy began to be alarmed at the consequences of his discourses, which were daily making converts, and summoned him to appear before them in the church of Black-friars in Edinburgh: he, having received assurances of support from various persons of rank and estimation, determined to obey the summons, but before the day arrived, his enemies thought fit to abandon the prosecution. Knox, however, went to Edinburgh, and as he was not allowed to vindicate his cause in the presence of his opponents, he preached twice every day for ten days to the people, and had on these occasions more numerous audiences than he had before witnessed. Emboldened by success, he wrote a letter to the queen regent, urging her to hear the Protestant doctrine, which she declined, and Mr. Knox afterwards published his letter with some additions. In the summer of 1556, Mr. Knox set out for Geneva, at the earnest entreaty of the English congregation, and almost the moment in which he embarked, the bishops summoned him to appear before them, and upon his non-appearance, they passed sentence of death upon him as a heretic, and burnt him in effigy at Edinburgh. Against this wicked sentence he appealed, in a work which he printed at Geneva, and which contains a masterly defence of religious independency, and is distinguished for purity of style. In 1557, he was invited back to Scotland, and having consulted Calvin and other persons as to the prudence and necessity of the step, he set out, and had proceeded as far as Dieppe, when he was advised that some of his best friends seemed, through timidity, to be abandoning their principles, and that therefore it would not be safe for him to proceed. He immediately wrote letters to those who had invited him, complaining of their irresolution, and even denouncing the severe judgments of God on all those who should betray the cause of truth and of their country, by weakness or apathy. These letters made such an impression on those to whom they were immediately addressed,

that they all came to a written resolution, "that they would follow forth their purpose, and commit themselves, and whatever God had given them, into his hands, rather than suffer idolatry to reign, and the subjects to be defrauded of the only food of their souls." To secure each other's fidelity to the Protestant cause, a common bond, or covenant, was entered into by them, dated at Edinburgh, December 3, 1557, and from this period they were distinguished by the name of "The Congregation." In the mean time Mr. Knox returned to Geneva, where, in 1558, he published his treatise, entitled "The first Blast of the Trumpet against the monstrous Regiment of Women;" which was written in detestation of the cruel and infamous government of queen Mary, and of the endeavours of the queen-regent of Scotland to establish arbitrary government in that kingdom. He intended to have followed this with "The second Blast," but the death of Mary prevented him going any farther. He expected much from the government of Elizabeth. She had, however, been so disgusted by what he had written against the government of women, that she embraced an early opportunity of displaying her resentment against him. She refused his request of preaching to his friends in England, in his way from the continent, and rendered his abode there so uncomfortable, that he was glad to make the best of his road to Scotland, where he arrived in the month of May 1559. At this time a public prosecution was carried on against the Protestants, and their trial was just ready to commence at Stirling; Knox instantly hurried to share with his brethren in the threatened danger, or to assist them in their common cause. Dr. Robertson, in describing this business, says, "While their minds were in that ferment which the queen's perfidiousness and their own danger occasioned, Knox mounted the pulpit, and, by a vehement harangue against idolatry, inflamed the multitude with the utmost rage. The indifferency of a priest, who, immediately after Knox's discourse, was seen preparing to celebrate mass, and began to decorate the altar for that purpose, precipitated them into immediate action. With tumultuous, but irresistible violence, they fell upon the churches in that city, overturned the altars, defaced the pictures, broke in pieces the images, and proceeding next to the monasteries, laid those sumptuous fabrics almost level with the ground. This riotous insurrection was not the effect of any concert, or previous deliberation. Censured by the reformed preachers, and publicly condemned by the persons of most power and credit with the party, it must be regarded merely as an accidental eruption of popular rage." From this time Mr. Knox continued to promote the reformation by every means in his power, sparing no pains, nor fearing any danger. Mr. Knox, by his correspondence with secretary Cecil, was chiefly instrumental in establishing those negotiations between "The Congregation" and the English, which terminated in the march of an English army into Scotland to assist the Protestants, and to protect them against the persecutions of the queen-regent. This army, being joined by almost all the great men of Scotland, proceeded with such vigour and success, that they obliged the French forces, who had been the principal supports of the tyranny of the regent, to quit the kingdom, and restored the parliament to its former independency. Of that body, a great majority had embraced the Protestant opinions, and encouraged by the zeal and number of their friends, they improved every opportunity in overthrowing the whole fabric of Popery. They sanctioned the confession of faith presented to them by Knox, and the other reformed teachers: they abolished the jurisdiction of the ecclesiastical courts, and transferred

the causes to the cognizance of the civil courts; and they prohibited the exercise of religious worship, according to the rites of the Romish church. In the year 1561, Mary queen of Scots, the widow of Francis II. king of France, arrived in her native country, from which she had been absent more than twelve years, though she was then scarcely nineteen. On the Sunday after her arrival the commanded mas was celebrated in the chapel of her palace: the Protestants, from low murmurs, began to exclaim loudly against the practice, and Knox, with his usual vehemence, declared from the pulpit, "that one mas was more frightful to him than ten thousand armed enemies landed in any part of the realm." Knox himself frequently insulted her from the pulpit, and when admitted into her presence, regardless of her sex, her beauty, and her rank, behaved to her with very unjustifiable freedom. He avowed himself the author of "The Blast," and contended for the right of teaching and propagating doctrines contrary to the common opinion, and concluded a long conference by saying, "If the realm finds no inconvenience in the regiment [government] of a woman, I shall be well content to live under your Grace, as Paul was under Nero. And my hope is that so long as ye defile not your hands with the blood of the saints of God, neither I nor the book shall either hurt you or your authority; for in very deed, madam, that book was written most especially against the wicked Jezebel of England." In 1562, Mr. Knox was employed in bringing about a reconciliation between the earls of Bothwell and Arran, which shews in what estimation he was held by persons of the highest rank in the state. In the same year he was appointed, by the general assembly, commissioner to the counties of Kyle and Galloway, and by his influence several gentlemen entered into a bond or covenant at Ayr, similar to that entered into at Edinburgh in 1557. About the same time he accepted a challenge, made by the prior of Whithorn, to a public disputation upon the mas, which continued for the space of three days, and the substance of which was afterwards published. In 1563, during the queen's absence on a progress to the west of Scotland, the Protestants at Edinburgh excited a riot in the chapel royal while mas was celebrating: of these some of the most active were seized in order to be brought to trial. Knox, determined to assist and succour them, and being authorized by the last general assembly to give information to the whole body of Protestants in Scotland, should any circumstance arise that might threaten danger to the reformation; issued circular letters, requiring all who professed the true religion, or were concerned in its preservation, to assemble at Edinburgh on the day of trial, that they might comfort and assist their distressed brethren. One of these letters fell into the hands of the queen, and it was immediately construed into an act of treason, for which he was indicted, brought to trial, and acquitted. His conduct was also approved by the general assembly of the church, which met soon afterwards. In 1565, lord Darnley, who had lately married the queen, contented, at the desire of his friends, to hear Mr. Knox preach, in hopes thereby of conciliating him, instead of which he took occasion to declaim against the government of wicked princes, who, for the sins of the people, are sent as tyrants and scourges to torment them. Darnley complained of the insult, and the council silenced the preacher for several days. In the same year he was appointed by the assembly to visit and establish the churches in the south; and he was the bearer of a letter from the assembly to the bishops of England, drawn up by himself; the purport of which was to complain of the severe treatment of the English Puritans, and to solicit indulgence for them. In 1571,

he found it expedient to consult his own safety by withdrawing from Edinburgh, and in the following year, as he knew his enemies were plotting his destruction, he went first to Abbot's-hall, in Fife, and from thence to St. Andrews, where he remained till August 1572. When the troubles of the country were in some measure abated, the people of Edinburgh, who had been obliged to leave it, returned, and sent a deputation to St. Andrews, to invite Mr. Knox to resume his ministry among them. He accepted the invitation, on condition that they would allow him to speak to them according to the dictates of his conscience, as in former times, and on the last day of August he preached to them in the great kirk. His voice was, however, very weak, and his health was evidently declining. The news of the accursed massacre of Protestants at Paris gave the finishing blow to his already shattered constitution: he, nevertheless, mustered sufficient strength to preach against the bloody deed, and with much energy denounced God's vengeance on the wicked actors in it, of which he desired the French ambassador might be informed. From the moment that he had finished his discourse, his approaching dissolution was observed with the utmost concern by his friends. During a long illness he discovered the utmost fortitude, and met the approaches of death with a magnanimity worthy of his high character. He anticipated with joy the prospects of immortality, and exulted in the expectation of being released from the infirmities of the body. He died November 24th, 1572, in the sixty-seventh year of his age; his corpse was attended to the grave by several of the nobility then in Edinburgh, particularly by earl Morton, who was regent at the time, and who exclaimed, when he saw the body deposited in the ground, "there lies he, who never feared the face of man; who hath often been threatened with the dagger, but hath yet ended his days in peace and honour: for he had God's providence watching over him in an especial manner, when his very life was sought." The private life of this eminent reformer was irreproachable and exemplary, and the world is not a little indebted to him for that degree of light and religious liberty which it enjoys: "He was," says Dr. Robertson, "the prime instrument of spreading and establishing the reformed religion in Scotland. Zeal, integrity, disinterestedness, were virtues which he possessed in an eminent degree. He was acquainted, too, with the learning cultivated among divines in that age, and excelled in that species of eloquence, which is calculated to rouse and inflame. His maxims, however, were often too severe, and the impetuosity of his temper excessive. Rigid and uncompromising himself, he shewed no indulgence to the infirmities of others. Regardless of the distinctions of rank and character, he uttered his admonitions with acrimony and vehemence, more apt to irritate than to reclaim. This often betrayed him into indecent and undutiful expressions with respect to the queen's person and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to surmount opposition, from which a person of a more gentle spirit would have been apt to shrink back." After the death of this great man, his "History of the Reformation of Religion in the Realm of Scotland, &c." was published in a folio volume. To the fourth edition of which, printed in 1732, several of his other pieces were added. There are, among the Harleian MSS. in the British Museum, two pieces attributed to Mr. Knox, one is a letter to his wife, and the other a treatise addressed to the faithful in London, Newcastle, and Berwick. Biog. Brit. Robertson's Hist. of Scotland.

**KNOX**, in *Geography*, a county of Kentucky, containing 1119 inhabitants.—Also, a county of Tennessee, in Hamilton district, bounded on the S. by Blount county and W. by the Indiana territory, and watered by the rivers Holston and Clinch. It contains 11,681 inhabitants, of whom 1122 are slaves.—Also, a county in the Indiana territory, erected in June, 1790, and containing 2517 inhabitants, of whom 28 are slaves. Fort Knox is in the same territory.—Also, one of the two islands discovered by captain Ingraham; the other being Hancock, called by captain Roberts, who soon after discovered them, Freeman and Langdon. These islands had every appearance of fertility. Their latitude is from 83° to 85° S., and their longitude very nearly 141° W. from Greenwich.

**KNOXIA**, in *Botany*, a genus named by Linnaeus, in honour of Robert Knox, an Englishman, who spent many years in examining the natural productions of Ceylon, and who published at London, in folio, an "Historical relation" of that island in the year 1681. In this work, "the botanical descriptions," says Haller, "shew him to have been well skilled in the knowledge of plants." It was translated into German, and published in quarto at Leipzig in 1689. A French edition of it appeared, in two volumes octavo, at Amsterdam, in 1693.—Linn. Gen. 51. Schreb. 68. Willd. Sp. Pl. v. 1. 582. Mart. Mill. Dict. v. 3. Juss. 197. Lamarck. Dict. v. 3. 369. Illustr. t. 59. Gært. t. 25.—Clas and order, *Telandria Monogynia*. Nat. Ord. *Stellatae*, Linn. *Rubiaceae*, Juss.

Gen. Ch. *Cal.* Perianth superior, small, deciduous, of four acuminate leaves; one lanceolate, triple the size of the rest. *Cor.* of one petal, funnel-shaped; tube thread-shaped, long; limb deeply divided into four, equal, rather oblong, rounded segments. *Stam.* Filaments four, capillary, situated within the throat of the corolla; anthers oblong, equal. *Pist.* Germen roundish, inferior; style thread-shaped, as long as the stamens; stigma two, capitate. *Peric.* Fruit naked, somewhat globular, pointed, furrowed. *Seeds* two, roundish, pointed, outwardly convex, marked with three streaks; flat within, and affixed at the upper part to a thread-like receptacle.

*Effl.* Ch. Corolla of one petal, funnel-shaped. Seeds two, furrowed. One leaf of the calyx larger than the rest.

1. *K. zeylanica*. Linn. Sp. Pl. 151. Fl. Zeylan. 189; Burm. Ind. 34. t. 13. f. 2. (*Veronica* affinis; Pluk. Phyt. t. 114. f. 2.)—"Flowers in spikes. Leaves smooth."—Found in Ceylon, upon the trunks of rotten trees.—This plant in appearance is like a *Plumbago* or *Lychnis*. *Stem* erect, a foot high, smooth, jointed. *Leaves* opposite, lanceolate, nearly sessile. *Spikes* long, narrow, with scattered, sessile flowers.

2. *K. corymbosa*. Pootumby of the Malabars. Willd. n. 2. (*Planta Maderaspatana*; Pluk. Amalt. 172. t. 454. f. 2. *K. stricta*; Gært. v. 1. 122. t. 25. f. 83.)—"Flowers corymbosae. Leaves downy beneath."—A native of the East Indies and found near Velore.—*Stem* pubescent. *Leaves* two together, pointed, on footstalks, lanceolate, smooth above, covered on the under side with short thick hairs. *The inflorescence* in size and habit is like that of *Valeriana dioica*. *Flowers* on footstalks. *Seeds* small, striated, disposed in an umbel at the summit of the stem. We have little doubt but that Willdenow is perfectly correct in presuming this to be the *K. stricta* of Gærtner.

**KNOXVILLE**, in *Geography*, a post-town of America, the metropolis of the state of Tennessee, situated in Knox county, on the N. side of Holston river, where it is 300 yards wide, on a beautiful spot of ground, 22 miles above

the junction of the Holston with the Tennessee, and four below the mouth of French Broad river. This town is flourishing, and communicates by post with every part of the United States. It is regularly laid out, and contains 518 inhabitants, a court-house, gaol, and barracks large enough to contain 700 men. The supreme courts of law and equity for the district of Hamilton are held here every half year, and the courts of pleas and quarter-sessions for Knox county are also held here. A college has been established in this town by government, called "Blount college." N. lat. 35° 48'. W. long. 83° 44'.

**KNUCKLE POINT**, a cape on the N.E. coast of New Zealand. S. lat. 34° 51'. W. long. 186° 21'.

**KNUCKLE-TIMBERS**, in a *Ship*, are the upper or top timbers next the beak-head, whose heads standing perpendicular, and the heels or lower part partaking of the hollow of the top side, form an angle or knuckle near the plank-sheer.

**KNUD'S HOVED**, in *Geography*, a cape of Denmark, on the E. coast of Sleswick, eight miles N.E. of Haderleben. N. lat. 55° 20'. E. long. 9° 40'.—Also, a cape of Denmark, on the E. coast of the island of Fyen, projecting into the Great Belt, and forming a bay on the S. of the town of Nyeborg. N. lat. 55° 17'. E. long. 10° 52'.—Also, a cape of Denmark, on the S.W. coast of the island of Zealand. N. lat. 55° 5'. E. long. 11° 37'.

**KNUTSFORD**, a considerable market town in the hundred of Bucklow, and county of Chester, England, is seated on the great road from London to Liverpool, being 173 miles from the former, 30 from the latter, 24 from Chester, and 15 from Manchester. It was formerly a chapelry within the parish of Rothesme, but was made a distinct parish, by act of parliament, in the year 1741, and comprizes the townships of Over-Knutsford, Nether-Knutsford, Bexton, Ollerton, and Toft.

William de Tabley, who was lord of both the Knutsfords, about the year 1292, granted a charter of privileges to his burgesses of Knutsford, which is printed in Sir Peter Leicesters History of Bucklow hundred; this William, about the same time, procured a charter for a market on Saturday, which still continues, and a fair for three days, at the festival of St. Peter and St. Paul; the charter was confirmed to William Tabley the younger, 1332; this fair also is still continued; there is another on the 8th of Nov. and a third has been established within these few years on the 23d of April; none of them are noted as great marts for the sale of any particular commodities. A charter for a Wednesday's market at Over-Knutsford, on Knutsford-Booth, was granted in 1335, to Ellen Legh, with a fair on Tuesday and Wednesday in Whitfun-week; this market has been long discontinued, but the fair is still held.

Knutsford is not a corporate town, but it appears that its chief officer was called a mayor in the reign of King Edward I; it has now no peculiar government. The quarter-sessions for the county are held in this town at Midsummer and Michaelmas. In the year 1777, an account having been taken of the population of Knutsford, it was found that there were 375 families, and 1674 inhabitants; annual average of deaths for the ten years then preceding had been only one in forty, being about the same proportion as in the city of Chester, and very much below the usual average of towns. According to the returns made to parliament, under the population act in 1801, there were then 543 families in Over and Nether-Knutsford, and 2372 inhabitants, of whom 782 were employed in trade, manufactures, or handicraft. A manufacture of thread has been long established in this town. There is no cotton factory,

but a great deal of cotton spinning and weaving is done in private houses.

Under an act of parliament passed in the year 1741, Knutsford was made a distinct parish and vicarage, and the ancient chapel in Nether-Knutsford taken down; the new parish church, then built in the Tentry-croft, was consecrated in the year 1744, and dedicated to St. John the Baptist; the patronage is vested, by the act, in the lords of Over-Knutsford, Nether-Knutsford and Ollerton, Toft, and Bexton, who present in rotation. Knutsford is divided into two parts by a small rivulet, and from the relative situation, these divisions are called Upper and Lower. Annual races are held in the vicinity of this town. Immediately in the neighbourhood are some feats distinguished for their antiquity and picturesque features. To the north is Tatton-hall, the seat of Wilbraham Egerton, esq. a large stone mansion, recently erected from the designs of Samuel Wyatt, esq. The adjoining park comprizes about 2000 acres of land, some of which is annually in tillage. West of the town is Tabley-house, the seat of sir John F. Leicester, bart., a large brick mansion, in a spacious park, which is ornamented with a large lake and fine forest trees. The house is particularly noted for its noble gallery of pictures, all executed by English artists. Lysons's *Magna Britannia*, vol. ii. qto. 1810.

KNUTWEIL, a bailiwick of Switzerland, in the canton of Lucerne.

KNUTZEN, MATTHIAS, in *Biography*, a native of Oldenburgh, in the duchy of Slefwick, was educated at Konigsberg, in Prussia. He is the only person on record who openly professed and taught the principles of Atheism. It has been asserted that he had, at one time, 1000 disciples in the different parts of Germany. They assumed the title of "Conscientians;" because they maintained that people were bound to lay aside all consideration of God and religion, and to follow the dictates of reason and conscience alone. Reason, said Knutzen, teaches every man the three fundamental principles of the law of nature: "to hurt nobody"—"to live honestly"—and "to give to every man his due." In the year 1674, he dispersed a Latin letter, and two dialogues in German, explanatory of his doctrines, which assumed that there was neither God nor devil: that neither magistrates nor priests were to be regarded, and that there is no life but the present. Museums published an answer to his Letter and Dialogues, as well to refute the absurdity and wickedness of his system, as to contradict the fact respecting the number of the disciples. He probably died in contempt, as no notice is taken of the latter part of his life by historians. Moreri, Bayle.

KNUTZEN, MARTIN, a professor of philosophy in Prussia, was born at Konigsberg in the year 1713. He filled, for some years, the philosophical chair in the university of his native place, and occupied the post of librarian. He died in 1751, when he was only about thirty-eight years of age. He was author of several learned works, of which the principal are, "Systema Causarum Efficientium;" "Elementa Philosophicæ Rationalis, Methodo Mathematico demonstrata;" "Theoremata de Parabolis infinitis;" and "A Defence of the Christian Religion." This last is said to be a very excellent piece, and one that is honourable to his virtues and talents.

KNYSNA, in *Geography*, an arm of the sea on the coast of Africa, in the colony of the Cape of Good Hope, at the distance of about 13 miles to the westward of Plettenberg's bay, which, in the opinion of Mr. Barrow, may one day become an important situation. He has given a plan of it in the second volume of his "Travels in Southern Africa."

The tide sets into it through a narrow passage, or portal, as into a dock. The depth of water, and great extent of it, running into the centre of very fine forests, render it a most eligible place for building and repairing ships. Vessels of 500 tons and upwards, deeply laden, may pass the portal, and those that are much larger might be built in it and sent out light, to be completed in Plettenberg's bay. The forests contain several different kinds of durable and well-grown timber fit for that valuable purpose, as well as abundance of masts and yards.

KNYSZYN, a town of the duchy of Warfaw; 36 miles N. of Biellie.

KOADGWAH, a town of Hindoostan, in the circuit of Jenhat; 20 miles W.N.W. of Gujrat.

KOALA, in *Zoology*, a species of the *Wombat*, the peculiarities of which have been described by Mr. E. Home in the Phil. Transf. for 1803, part. ii. The koala inhabits the forests of New Holland, about 50 or 60 miles to the S.W. of Port Jackson, and was first brought to that place in August, 1803. It is commonly about two feet long and one high, in the girth about one and a half foot: it is covered with fine soft fur; lead-coloured on the back, and white on the belly; the ears are short, erect, and pointed; the eyes generally ruminating, sometimes fiery and menacing; resembling the bear in the fore part of its body; it has no tail; and its posture is commonly sitting. The New Hollanders eat the flesh of this animal, and are therefore diligent and active in the pursuit of it; ascending the loftiest gum trees, and following the animal from bough to bough, till at length they are able either to kill it with the tomahawk, or to take it alive. In the day time the koala feeds upon the tender shoots of the blue gum tree, and in the night it descends, and prowling about, scratches the ground in search of some particular roots. It seems to creep rather than walk; when incensed or hungry, it utters a long shrill yell, and assumes a fierce and menacing look. These animals are found in pairs, and the mother carries the young on its shoulders. The koala appears soon to form an attachment to the person who feeds it. These animals seem to form the intermediate link between the opossum and kangaroo. See WOMBAT.

KOAMAROO, CAPE, in *Geography*, the S.E. projection of land at the entrance of Queen Charlotte's Sound, on the island of Tavai-Poennamoo, one of the New Zealand islands. S. lat. 41° 34'. E. long. 176° 30'.

KOANG-TCHEOU, a town of Corea; 150 miles S. of King-ki-tao. N. lat. 35° 6'. E. long. 125° 41'.

KOB, in *Zoology*. See ANTELOPE *Lusiva*.

KOBA, in *Geography*, a town of Africa, in Kullo. N. lat. 12° 20'. W. long. 9°.—Also, a town of Arabia, in the province of Hedsjas; three miles N.W. of Medina.—Also, a town of Turkestan; 70 miles E. of Toucat.

KOBA of Buffon, in *Zoology*, *Antelope Koba*, is referred by Gmelin, with some hesitation, to ANTELOPE *Pygarga*, (which see); but Pennant refers the koba to the species we are now to describe; *i. e.* his Senegal antelope, the *Cervus temanaqama* of Seba, the antelope Bubalis of Pallas, la grande vache brune of Adanson. The horns are thick and annulated, very close at the roots, much bent in the middle, then approaching and receding at the ends, which are smooth, sharp, and bent backwards. This animal inhabits Senegal; it is a large species, seven feet long; the head is large and clumsy, with large ears, seven inches long; the horns are seventeen inches long, and are surrounded with fifteen prominent rings; the head and body are of a light reddish-brown colour, with a narrow black list down the hind part of the neck; the rump is dirty white; there is a dusky mark on each knee, and above each fetlock joint

the tail is about a foot long, and is covered with longish black hairs.

KOBACK, in *Geography*, a town of Slavonia, on the Save; 20 miles E.S.E. of Belgrade.—Also, a town of Africa, in the kingdom of Yani.

KOBAD, a district of Persia, in the N.W. part of Farsistan.

KOBAK, a town of Sweden, in West Bothnia; seven miles N.W. of Umea.

KOBAN KUPRI, a town of Turkish Armenia; 27 miles E. of Erzerum.

KOBELNIKA, a town of Austrian Poland, in Galicia; 34 miles W. of Lemberg.

KOBELWIES, a town in the canton of St. Gallen, in Switzerland, at the foot of the Kamor. About two miles above Kobelwies are the caves known by the name of the *Crystal Caves*. These are difficult of access, the only possible mode of entering them being in a creeping posture. From the first of these caves you descend into the second, and ascend again in order to arrive at the third, out of which issues a brook, which supplies forty baths at Kobelwies. The interior of the caves is fudded all over, not with rock crystals, but with calcareous spar, which is partly coated with a yellow kind of clay; it is found white and of an ashy-grey colour, separates into brilliant large grains with a smooth surface, and when burnt yields the finest and whitest sort of lime which is applied for the purposes of art. The water issuing out of the caves is very clear; it is impregnated with lime and sulphuric acid, and the baths it supplies (especially when taken warm) are very efficacious in the cure of the ague prevailing in the marshy parts of the country bordering on the Rhine.

KOBEN, a town of Silesia, in the principality of Glogau, on the Oder. N. lat. 51° 31'. E. long. 16° 26'.

KOBI, a town of Russia, in the government of Caucasus; 60 miles S.E. of Ekaterinograd.

KOBIELE, a town of Lithuania, in the palatinate of Troki; 20 miles N.N.E. of Grodno.

KOBIELEN, a town of the duchy of Warsaw; 28 miles W. of Kalish.

KOBIL, a town of Russia, in the government of Peterburg, on the E. coast of the Tschudzhoi lake; 24 miles N. of Pskov.

KOBILINKAIA, a town of Russia, in the country of the Cossacks; 156 miles E.N.E. of Azoph.

KOBIN, a town of Persia, in the province of Segellan; 30 miles S. of Zareg.

KOBINIKI, a town of Lithuania, in the palatinate of Wilna; 52 miles E.N.E. of Wilna.

KOBRESIA, in *Botany*, so called by professor Willdenow, in honour of a nobleman at Vienna, named de Kobres, whom he celebrates as an eminent promoter of natural history.—Willd. Sp. Pl. v. 4. 205.—Class and order, *Monocotyledon Triandria*. Nat. Ord. *Calamariæ*, Linn. *Cyperoideæ*, Juss.

Gen. Ch. Male, *Cal.* the inner scales of a catkin, each oblong, slightly concave, single-flowered, permanent, sometimes wanting. *Cor.* none. *Stam.* Filaments three, capillary, erect, longer than the calyx; anthers vertical, linear, erect.

Female, *Cal.* the outer scales of the same catkin, rather larger, sheathing, elliptic-oblong, single-flowered, permanent. *Cor.* none. *Pist.* Germen superior, triangular; style cylindrical, short; stigmas three, bristle-shaped; downy. *Peric.* none, except the permanent scales. *Seed* one, triangular, pointed, hard, naked.

Ess. Ch. Male, Calyx the inner scales of an imbricated catkin, solitary. Corolla none.

Female, Calyx the outer scales of the same catkin, sheathing, permanent. Corolla none. Stigmas three. Seed triangular, naked.

Obs. This genus differs from *Carex* in the want of a tunic to the seed, which is so remarkable in that, and has been called sometimes a corolla or nectary; as well as in the disposition of the flowers. These in *Kobresia* stand in pairs, the males being intersal, and smaller. In one known instance only they want their scale or calyx, so that there is no separation between the stamens and pistil, and the flowers become apparently united, or hermaphrodite. Three species only are known.

1. *K. stirpina*. Willd. n. 1. (*Carex* Bellardi; Allion. Pedem. v. 2. 264. t. 92. f. 2. Schkuhr. Car. 12. t. D. f. 16. C. myosuroides; Villars. Dauph. v. 2. 194. t. 6. See CAREX, n. 15.)—Spike solitary, simple, cylindrical.—Native of dry elevated spots on the mountains of Savoy, Dauphiny, Italy, Carinthia, Styria, and the Tyrol, flowering in July and August. We have gathered it high on Mount Cenis, in company with the able botanist whose name it bears. Linnæus had specimens from Italy, which he never described. Mr. Daval found this plant on the mountain of Valforey, though Haller has it not. The root is perennial, tufted, consisting of numerous blackish, zig-zag fibres, running deep into crevices of rocks. Stems numerous, a span high, or less, simple, naked, round, striated, smooth, erect or slightly curved, composing dense tufts, with numerous, sheathing, brown, polished radical scales, Leaves radical, erect, shorter than the stems, narrow, acute, involute, rough-edged. Spike terminal, solitary, erect, about an inch long, obtuse, slender, of from ten to twenty pair of flowers, most lax in its lower part. Glumes brown, shining, with membranous edges, awnless. Schkuhr figures but two stigmas; we find three, as all other writers describe them. The permanent glumes, investing the seed, look like the torn tunic of a *Carex*, as Villars represents them. That of the male flower is much the smallest and most membranous.

2. *K. caricina*. Willd. n. 2. (*Carex* hybrida; Schkuhr. Car. t. Rrr. f. 161. Willd. Schoenus monoicus; Sm. Eng. Bot. v. 20. t. 1410.)—Spike compound, dense, somewhat ovate; spikelets alternate, imbricated.—Native of Mount Cenis, in rather moist muddy spots, flowering in August; gathered by the writer of the present article in 1787. Mr. Dickson observed it in the county of Durlan in 1799. The Rev. Mr. Harriman mentions the mountain of Cronkley, and the neighbourhood of Widdy bank, in Teesdale forest, as its particular stations. At the suggestion of the late Mr. W. Brunton, it was referred in *Eng. Bot.* to *Schoenus*, proving, on examination, no *Carex*. Its habit and size are much like the preceding, except that the stems grow less crowded or tufted, and are stouter, and the leaves shorter, somewhat broader, as well as more spreading. The spike is essentially different, being composed of four or five alternate, short, elliptical spikelets, making all together an ovate figure. Glumes rather more pointed, keeled, and less membranous, than in the foregoing species. Stigmas three. Seed elliptic-oblong, triangular, pointed, horny.

3. *K. cyperina*. Willd. n. 3. (*Carex* hermaphrodita; Jacq. Coll. v. 4. 174. Ic. Rar. t. 615.)—Umbel twice compound, leafy; spikes cylindrical; spikelets spreading. Male flowers without their proper calyx.—Jacquin received this from the Caracæes, where it grows in wet situations, and it flowered with him in the stove at Vienna, from May to August. The habit is that of a *Cyperus*, or a *Kyllingia*. Root perennial. Stems annual, triangular, smooth, about two feet high, with several long, sheathing, linear, roughish leaves, half an inch broad at their base, and many smaller ones

ones at the *umbel*, which consists of numerous, simple, or compound stalks, bearing various thick but lax *spikes*. These are composed of numerous spikelets, spreading horizontally, each linear lanceolate, slender, a quarter of an inch long, and consisting of four or five, apparently hermaphrodite, imbricated *flowers*. It seems to us, however, that they are really *pairs of flowers*, of which the male wants the glume or calyx, which supposition is justified by the analogy of the other species. The colour of the whole plant is represented by Jacquin, as a nearly uniform pale green.—*Stigma* three. *Seed* oblong, triangular, pointed, brown. S.

KOBRYN, in *Geography*, a town of Lithuania, in the palatinate of Brzecz; 28 miles E. of Brzecz.

KOBYN, a town of Lithuania, in the palatinate of Brzecz; 34 miles E.S.E. of Brzecz.

KOCHEISKAYA, a town of Russia, in the government of Irkutsk, on the Ilga; 28 miles N.W. of Vercholenik.

KOCHIA, in *Botany*, so named by Dr. Roth, and adopted by Mr. R. Brown, in honour, as we presume, of a German botanist, John Frederick William Koch, author of a periodical work on economical plants, printed at Magdeburgh in 1797 and 1798, in octavo. It may also commemorate Joseph Matthias Koch, who published on agriculture at Vienna in 1767, recommending salt for manure; an opinion perhaps to be adopted "*cum grano salis*;" but as this plant belongs to a *saline* tribe, he may, under such limitation at least, be said to have merited the distinction as well as some professed botanists.—Brown Prodr. Nov. Holl. v. 1. 400.—Class and order, *Pentandria Dignia*. Nat. Ord. *Holeraceæ*, Linn. *Atriplices*, Juss. *Chenopodeæ*, Decandolle and Brown.

Eff. Ch. Calyx inferior, of one leaf, in five segments, having appendages at their backs when in fruit. Corolla none. Seed one, depressed, enclosed in the winged calyx.

Two species only are mentioned by Mr. Brown as natives of the south coast of New Holland.

1. *K. brevifolia*. Leaves cylindrical, sessile, smooth. Stem shrubby, much branched, erect and woolly. Appendages of the calyx dilated and membranous.

2. *K. aphylla*. Shrubby and leafless. Branches divaricate and bent downwards; the young ones spinous. Spikes lateral. Calyx woolly; its appendages when in fruit membranous.

There seem to be many more species in other parts of the world, as Mr. Brown advises a division of the genus into *Kochia*, properly so called, the species of which have the appendages of their calyx awl-shaped and spinous, their seeds destitute of albumen, and their embryo cloven at the base; and *Willemetia*, whose appendages are membranous and dilated, their seeds furnished sparingly with albumen. This difference however, respecting the albumen, in plants so nearly akin, shews how little any character is to be trusted absolutely. The absence or presence of albumen forms one of the most essential marks of distinction with writers on natural orders, and, on account of the difficulty of its detection, might seem more imposing and authoritative to the unlearned than it really is.

KOCNI, in *Geography*, a town of Walachia, on the Arégis; 15 miles N. of Bucharest.

KOCYCK, a town of Poland, in the palatinate of Lublin; 24 miles N. of Lublin.

KOCZARAWAC, a town of Poland, in the palatinate of Braclaw; 48 miles S.S.W. of Braclaw.

KOCZMYN, a town of Lithuania, in the palatinate of Novogrodek; 28 miles N. of Sluck.

KOCZOWA, a town of Poland, in the palatinate of Kiev; 22 miles S.S.E. of Bialacerkiev.

KODAJA, a town of Arabia, in the province of Nedsjed; 50 miles W. of Janama.

KODALLY, a town of Hindoostan, in Myfore; 27 miles E. of Chinna Balabaram.

KODDA-PAIL, in *Botany*, the Indian name of the Linnean *Pistia Stratiotes*. See Rheede Hort. Mal. v. xi. 63. t. 32, and Plum. Nov. Gen. 30. t. 39.

KODDE, VANDER, in *Biography*. There were three brothers of that name, *viz.* John, Adrian, and Gilbert, inhabitants of Warmond, near Leyden, who are entitled to notice from their having been founders of a religious community known by the name of COLLEGIANTS, which fees. The founders passed their days in the obscurity of a rural life, but were said to be men of eminent piety, well acquainted with sacred literature, and enemies to religious controversy. Gilbert was an elder of the Remonstrant church at Warmond, and possessed a fluent elocution. In the year 1619, when the persecution of the Calvinists had driven the Remonstrants from their churches, the three brothers proposed that meetings should be held of members of the church at Warmond, at which one or more of their number should read a chapter or two out of the Bible and pray; and if any person had any thing to offer by way of exhortation, instruction, or the edification of others, he should be at liberty so to do. Hence they soon inferred the utility of the ministerial profession, as the people were sufficiently qualified to teach and instruct one another. From this origin sprung a sect, or community, already referred to, consisting of persons of all sects which spread very widely over the Dutch provinces. Mosheim's Eccles. Hist.

KODEN, in *Geography*, a town of Lithuania, in the palatinate of Brzecz; 12 miles S. of Brzecz.

KODGIA-HISAR, a town of Asiatic Turkey, in the province of Diarbekir; 10 miles S. of Merdin.

KODGIA-SHEHR, a town of Natolia; 12 miles N. of Koutaja.

KODJAK, a range of islands, consisting of one large, bearing this name, and several smaller, in the North Pacific ocean, extending about 120 miles in length from S.W. to N.E., and about 40 miles in breadth; above 20 miles from the W. coast of America, and 30 S. from the entrance into Cooke's inlet. N. lat. 56 45' to 58 28'. E. long. 206° 12' to 208 45'.

KODJA. See the next article.

KODJAKANS, or KODJAS, a numerous class of persons in the Ottoman empire, particularly in the capital, which holds the middle rank between the military men and the lawyers, and which is become sufficiently powerful, since the influence of the Ulemas has declined, as the divan is composed of them, and as some of them obtain fees, military rank, and governments. Almost all the ministers, all the agents in the different administrations of the capital, the customs, and the mosques; all the principals of offices, all the secretaries, all the clerks, all the school-masters; in a word, all the writers from the simple "*kiatib*," who copies books, petitions, or memorials, and him who applies himself to writing purely and correctly the language, to the "*reis-effendi*," who is at the head of them, are all distinguished by the name of Kodja, and make part of that sort of corporation. The art of transcribing the national books, and especially the koran, is a kind of nursery for this class of persons. The Mussulmen are indebted to the Kodjas for a great number of works, which they hold in high estimation, relative to the Arabic and Persian languages, philosophy, morality, Mahometan history, and the geography of their provinces; and among them are generally found the most intelligent

statesmen, or those who are most capable of serving as ministers.

KODI-HISSAR, a town of Anatolia; 13 miles N of Kiugari.—Also, a town of Asiatic Turkey, in Aladulia, 18 miles N.E. of Sivas.

KODINSKA, a town of Russia, in the government of Tobolsk; 224 miles E. of Eniseik. N. lat. 58° 30'. E. long. 99° 14'.

KODMA, a town of Persia, in the province of Kerman; 40 miles N. of Kermandhir.

KODMANA, a town of Walachia; 10 miles S. of Kordecarda.

KODNIA, a town of Russian Poland, in Vollynia; 10 miles S. of Zytomiers.

KOEG. See DAGZUELLER.

KOEL, or KOEI-YANG, a city of China, of the first class, and capital of the province of Koei-tcheou. It is a small city, being only about three miles in circuit; its houses are partly of earth, and partly of brick, and as the river that approaches it is not navigable, it is a place of no trade. It was once the residence of the ancient kings; the remains of temples and palaces announce its former magnificence; but these monuments of grandeur are mouldering into ruins. Within its jurisdiction there are three towns of the second order, and four of the third; about it are many forts. N. lat. 26° 30'. E. long. 106° 19'.

KOEL-TCHEOU, the smallest province of China, bounded on the N. by Se-tchuen, on the E. by Hou-quang, on the S. by Quang-si, and on the W. by Yun-nan. The whole country is almost a desert, and covered with inaccessible mountains; so that it may be regarded as the Siberia of China. The inhabitants are independent and ferocious. The Mandarins and governors, who are sent into this province, are sometimes disgraced noblemen, for whom the emperor wishes to provide; the garrisons are entrusted to their charge, in order to overawe the country; but no troops of the empire are found sufficient to subdue the intractable mountaineers of this province. Many efforts have been made for this purpose, forts have been erected, and troops sent to conquer them; but they retire within the fastnesses of their mountains, and seldom issue forth, but to destroy the Chinese works, or ravage their lands. Neither silk stuffs, nor cotton cloths, are manufactured within this province; but it produces a plant, resembling our hemp, of which they make cloth for their summer dresses. It has mines of gold, silver, quicksilver, and copper; and of the last metal, they make those small pieces of coin, which are in circulation throughout the empire. This province contains 10 cities of the first class, Koei-yang being the capital, and 38 of the second and third. Some of these cities, which are constructed of earth and brick, and which may be said to resemble heaps of cottages, are situated on the banks of agreeable rivers and in fertile valleys; and though a quantity of land might be found in this province, which by proper cultivation would yield a considerable produce, the Chinese are so awed by the mountaineers, that they dare not leave the neighbourhood of their fortresses.

Koei-tcheou furnishes the best horses in China; an immense number of cows and hogs are raised here, and wild poultry, of a most exquisite taste, are every where to be found. Sir George Staunton estimates the population of this province at 9,000,000.

KOEL-TCHEOU, a city of China, of the first class, in the province of Se-tchuen; situated on the banks of the great river Kincha, or Yang-tse-kiang, and forming the key to the province with a custom house for receiving the duties of the merchandize which is brought thither. Its trade is great,

and of course it is opulent. Its jurisdiction comprehends one city of the second class, and nine of the third. The adjacent country is mountainous, but is rendered fruitful by the industry of its occupiers, who are unpolished husbandmen. The neighbourhood affords great quantities of musk, and several springs from which salt is procured. Orange and lemon trees are very common. N. lat. 31° 10'. E. long. 119° 14'.

KOELCOTTY, a town of Thibet, on the Ganges; 30 miles S. of Gangotri.

KOELF, a ridge of mountains between Sweden and Norway.

KOEL-PINIA, in *Botany*, so named by professor Pallas, in the third volume of his Russian Travels, p. 755. t. L. l. fig. 2, in memory of his "highly meritorious friend," Alexander Bernard Koelpin, Professor of Physic at Stetin, in Pomerania, author of several botanical tracts. Pallas submits this genus to the decision of those who, as he modestly says, take the lead in botany. Few are more worthy to do so than himself, and his *Koelpinia* is established as a genus by Schreber and Willdenow, though they found themselves obliged to adopt a different name, this identical genus being the *Rhagadiolus* of Cæsalpinus, Tournefort, Vaillant, Justieu, and Gartner, confounded by Linnæus under *Lapsana*. The name they have retained seems to us expressive and unexceptionable, though Ambrosini surely gives a wrong explanation of its meaning. See RHAGADIOLUS.

KOELREUTERIA, a genus named by Laxman, in the Memoirs of the Peterburg Academy, in honour of John Theophilus Kœreuter, M.D. professor of Natural History at Carlshue, born in the year 1733, author of some dissertations relative to the plants about Tubingen, and of several experiments relative to vegetable fecundation.—Laxman, in Nov. Comm. Petrop. v. 16. 561. t. 18. Schreb. 731. Willd. Sp. Pl. v. 2. 330. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 351. L'Herit. Sert. Angl. 18. Juss. 451. Lamarck. Illustr. t. 308.—Clafs and order, *Ocandria Monogynia*. Nat. Ord. *Tribilata*, Linn. *Sapindi*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of five, ovate, obtuse, concave, membranaceous, unequal leaves, ascending towards the upper side, gaping below. *Cor.* Petals four, equal, ascending towards the upper side; the two lower ones opposite; claws cylindrical, straight, the length of the calyx; borders lanceolate, recurved at the top, spreading. Nectary composed of four erect, deeply cloven scales, affixed to the claws of the petals, forming a crown to the orifice; with three glands between the filaments and pistil. *Stam.* Filaments eight, awl-shaped, erect, affixed to the columnar receptacle; anthers oblong, obtuse. *Pist.* Germen superior, oblong, triangular, standing upon the columnar receptacle; style simple, three-sided, ascending, as long as the petals; stigma trifid, spreading, small. *Peric.* Capsule oblong, of three cells, and three valves, the partitions from their centre. *Seeds* in pairs, attached to the partition, one of them generally abortive.

Ess. Ch. Calyx of five leaves. Corolla of four petals, irregular. Nectary of four cloven scales, and three glands. Capsule of three cells, with two seeds in each.

1. *K. paniculata*. Willd. n. 1. L'Herit. Sert. Angl. t. 19. (*Sapindus chinensis*; Linn. Suppl. 228.)—A native of China, hardy with us, flowering in July and August. —*Stem* arboreous, upright, round, smooth, branched, six or seven feet high. *Branches* scattered, twined; the younger ones glandulous and dotted. *Buds* conical, imbricated. *Leaves* on long, club-shaped, channelled foot-stalks, unequally pinnate, with about six pair of ovate, lacinated, serrated,

rated, acute, flat leaflets. *Panicles* terminal, more than twice compound, loose and spreading. *Flowers* three or more on each partial stalk, greenish and in themselves not very conspicuous. Some male flowers being intermixed among the rest, have induced Schreber to refer the genus to *Polygonia*.

**KOEMPERIA.** See **KEMIFERIA.**

**KOENIG, SAMUEL,** in *Biography*, a learned philosopher, distinguished by his mathematical abilities, was a Swiss by birth. He filled the chair of philosophy and natural law in the university of Franeker, whence he removed to the Hague, where he had the appointment of librarian to the stadtholder, and to the prince of Orange. He was elected a member of the Academy of Sciences at Berlin, but was afterwards expelled from that body, on account of an attack upon Maupeituis the president, charging him with plagiarism. The learned in every part of Europe felt interested in the dispute. Koenig published an "Appeal" written with much animation, which procured him many supporters. He died in 1757, leaving behind him the character of being one of the best mathematicians of the age. He was author of several other pieces. According to Voltaire "he was a great metaphysician, a good geometriician, and, what is of still greater moment, a very good man."

**KOENIGIA,** in *Botany*, so called by Linnæus in honour of his disciple Dr. John Gerard Koenig, a native of Courland, born in 1728, who in 1765 discovered this plant in Iceland, and after having investigated the vegetable productions of that dreary country, and of its circumjacent seas, visited the richer climes of India, where he died at Jagrenatpou, in Bengal, in 1785. His communications have greatly enriched the collections of Europe, especially those of Linnæus, Retzius, and Sir Joseph Banks. The fine Banksian library contains his botanical manuscripts. His letters to Linnæus are very numerous and instructive.—*Linn. Mant.* 3. Schreb. 57. Willd. Sp. Pl. v. 1. 490. Mart. Mill. Dict. v. 3. Art. Hort. Kew. ed. 2. v. 1. 183. Juss. 83. Lamarck. Illust. t. 51. Gært. t. 128.—Class and order, *Triandria Trigynia.* Nat. Ord. *Holeraceæ*, Linn. *Polygonææ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in three deep, ovate, concave, permanent segments. *Cor.* none. *Stam.* Filaments three, capillary, shorter than the calyx; anthers roundish. *Pist.* Germen superior, ovate; styles none; stigmas three (often but two), close together, downy, coloured. *Peric.* none. *Seed* solitary, ovate, as long as the calyx.

Eff. Ch. Calyx in three deep segments. Corolla none. Seed solitary, ovate, naked.

1. *K. Islandica.* Linn. Mant. 35. Fl. Dan. t. 418.—Native of Iceland, from whence Sir Joseph Banks brought seeds to Kew garden in 1773, and where Mr. William Jackson Hooker observed it on his late eventful visit to the same country, of which he has favoured the public with so pleasing and unaffected a narrative. This humble plant is chiefly calculated to attract the scientific botanist, being an annual, scarcely two inches high, with a few alternate, obovate, or spatulate, entire leaves, and small, green, fasciculate, terminal flowers. The whole herb is smooth, a little succulent, turning red in decay, or from exposure to much light, like its allies the tribe of Docks and Sorrels.

**KOERTEN, JOANNA,** in *Biography*, was born at Amsterdam in 1650. She had a fine taste for drawing in water colours and for embroidery. She also modelled in wax, and made artificial ornaments and flowers; but her chief excellence consisted in cutting out figures in paper with scissors only, and her portraits and landscapes in this way were so much

talked of that foreigners from all countries visited Amsterdam to see them, among whom was Peter the Great of Russia. She made a magnificent display of her art for the comfort of the emperor Leopold, consisting of trees, arms, eagles, &c. for which she was very handsomely paid. She died in 1715.

**KOETEKOIE,** in *Geography*, a small island in the East Indian sea. S. lat. 4° 38'. E. long. 132° 8'.

**KOEWAK,** a town on the S. coast of the island of Ceyram. S. lat. 3° 14'. E. long. 129° 18'.

**KOF,** a town of Japan, in the island of Niphon; 27 miles S.E. of Nigata.

**KOFEL,** a town of the county of Tyrol, on the borders of the Vicentin; near which is a celebrated pass, with a fort erected on a high and steep rock, in which is a spring of water for the supply of a small garrison, which can only enter by means of pulleys. The road below is scarcely wide enough for two carriages. On the side opposite to the fort is the precipitous bank of the Brenta; 21 miles E. of Trent.

**KOFEZ,** mountains of Persia, between Mecran and Kerman.

**KOGETIN,** a town of Moravia, in the circle of Olmutz; 14 miles S. of Olmutz. N. lat. 49° 20'. E. long. 17° 15'.

**KOGL,** a town of the duchy of Stiria; 17 miles N.N.W. of Rakepsurg.

**KOGONG,** a town of Africa, in the country of Sierra Leone. N. lat. 10° 45'. E. long. 12° 12'.

**KOHAUT,** a town of Candahar; 130 miles S.E. of Cabul. N. lat. 33° 5'. E. long. 70° 20'.

**KOHHEL,** a town of Arabia, in the province of Yemen; 10 miles N. of Dcbin.

**KOHLBERG,** a town of Bavaria, in the principality of Sulzbach; 11 miles N.E. of Sulzbach.

**KOHLMEISE,** in *Ornithology*, the *Colemouse* of Pennant, &c. See **PARUS ater.**

**KOHLMULEN,** in *Ichthyography*, a name given by some to the *asellus flavescens*, or yellow cod, called by others *blank* and *gelbe*. See **GADUS Pollachius.**

**KOHLRABI,** in *Agriculture*, the name of a sort of turnip cabbage, which is probably capable of being cultivated to advantage as an article of cattle food, though it is not yet much known to the farmers of this kingdom. It has the eatable part, or bulb, above the ground upon the stem, and there are two varieties, the green and the blue, which are both equally good and hardy in their nature.

In the raising of plants of this kind, the seed should be sown at the same period as for the common cabbage, and the plants, when of proper growth, be transplanted out in the same manner about the beginning of June, allowing good distances both between the plants and rows. In performing this work, it is advised to cut off about one-third of the roots of the plants, care being taken to plant them sufficiently deep in the ground, as by this means the bulb grows to a much larger size without becoming tough.

Plants of this sort succeed best on such soils as are not too much disposed to moisture. This plant is found to withstand the severity of frosts much better than the *Ruta baga*, or Swedish turnip. And it is further observed, that in the botanical garden at Brompton, some of the plants weighed seven or eight pounds; and that though many of them were notched and hacked on purpose for the experiment, the turnip remained perfectly sound and uninjured, while a bed of Swedish turnips near them was quite rotten. The faccharine quality of it is equally remarkable, and both its leaves and bulb are very useful as kitchen vegetables.

In our own trials, we found it to stand the severity of the winter without the least injury, and to be perfectly well tailed, though the bulbs did not increase to a large size. It has every appearance of being a variety of the turnip cabbage. But few experiments have, however, yet been made upon it, either in regard to its culture or application as a green cattle fodder.

KOHMU, in *Geography*, a town of Bengal; nine miles N. of Poree.

KOHOME, a town of Africa, in the kingdom of Burfali.

KOHTAUM, a town of Bengal; 18 miles W. of Doefa.

KOH-ZERDEH, mountains of Persia, in the province of Chufistan, bordering on the Irak. See HETZARDARA.

KOJA-KIZ, a town of Kharasim, near lake Aral; 18 miles N.E. of Urkonje.

KOIDANOW, a town of Russian Lithuania; 15 miles S.W. of Minfk.

KOJEND, or KOGEND, a town of Greater Bucharia, on the left bank of the Scir, on the borders of Turkellan. In 1220, it was taken and plundered by Jenghiz Khan, after a brave defence; 120 miles N.E. of Samarcand.

KOIRVIRAH, a town of Persian Armenia; 18 miles S. of Erivan.

KOISJU, a town of Japan, in the island of Ximo; 26 miles W. of Naka.

KOIVISTA, a town of Russia, in the government of Viborg; 20 miles S. of Viborg.

KOKANO, a town of Poland, in the palatinate of Bracław; 28 miles N. of Braclaw.

KOKAR, a small island of Sweden, in the Baltic, about 40 miles S.E. from the island of Aland. N. lat. 59° 58'. E. long. 20° 46'.

KOKERWARA, a town of Hindoostan, in Guzerat; 15 miles N.W. of Amedabad.

KOKETARRA, a town of Hindoostan, in the circar of Gangpou; 16 miles N.E. of Pada.

KOKLOT, a small island on the E. side of the gulf of Bothnia. N. lat. 62° 17'. E. long. 21° 25'.

KOKOB, in *Zoology*, the name of a species of serpent found in the West Indies, and very fatal by its bite. It is smaller than our viper, and of a brown colour, variegated with green and red spots.

KOKONOR, TARTARS OP, in *Geography*, a tribe of Tartars, who are, by nation, Eleuthes or Kalmucks, and subjects of the emperor of China, and who occupy an extensive country to the W. of China, and the province of Chen-si, from which they are separated by lofty mountains. See KALMUCKS.

KOKONOR, or *Kokonol Lake*, is the largest in Tartary; it is about 20 leagues in length, and 10 in breadth, and is situated between 36° 40' and 37° 10' N. lat. and 100° and 101° E. long.

KOKORE, a town of Hindoostan, in the circar of Kitchhara; 45 miles E.N.E. of Shajehanpou.

KOKORO, the eastern branch of the Senegal river, which rises about N. lat. 11° 50'. W. long. 6° 46', and joins the westerly branch about N. lat. 14°.

KOKORY, a town of Moravia, in the circle of Prerau; six miles N.W. of Prerau.

KOKRA, a town of Hindoostan, in the circar of Ruttunpou; 20 miles S. of Ruttunpou.

KOKURA, a sea-port town of Japan, on the N. coast of the island of Ximo; surrounded with walls, and having a citadel, it is a place of extensive trade, but the harbour is nearly choked with sand. N. lat. 33° 50'. E. long. 130° 20'.

KOLA, a sea-port town of Russia, in the government of Archangel, situated near the North sea, on the river Kola, forming a bay at its mouth, in which is a considerable fishery for whales, sea-dogs, and other fish, which the inhabitants cure for sale. N. lat. 68° 52'. E. long. 32° 26'. According to Mayer, it is 420 feet above the level of the sea. The thermometer was once, in May 1769, at 73°. —Also, a town of European Turkey, in Servia; five miles S. of Semenaria.—Also, a town of Turkish Armenia; 40 miles N.E. of Kars.

KALABOORA, a town of Hindoostan, in Orissa; 20 miles N.E. of Sumbulpour.

KOLAH, a town of Natolia; 36 miles N.E. of Alah-Sehr.

KOLAR, a town of Africa, in the kingdom of Burfali, near the coast of the Atlantic. N. lat. 13° 50'. W. long. 15° 55'.

KOLASSIN, a town of Dalmatia; 24 miles S.E. of Mostar.

KOLAY, a river of Cochinchina, which runs into the Chinese sea, N. lat. 13° 51'. E. long. 108° 54'.

KOLBE, or KOLBEN, PETER, in *Biography*, was born at Doufas, a village in the principality of Bairouth, of which place his father was a judge, and afterwards a receiver of taxes. When he had attained the first principles of knowledge, he was sent to Nuremberg to pursue his maturer studies. Here he lived some time in great poverty, being unknown, and having brought with him a single dollar only. In 1696, he was received into the house of Eimart, a great astronomer, under whose directions, and by whose aid, he made considerable progress in the sciences. He entered himself at the university of Halle in the year 1700, and in the following year he disputed "De Natura Cometarum," after which he gave a course of lectures in mathematics and philosophy. He was introduced to baron von Krosie, privy counsellor to his Prussian majesty, to whom he became secretary, and whom he accompanied in his travels. It being known that he had a great desire to visit foreign countries, a proposal was made to him to go to the Cape of Good Hope, which he gladly embraced. Here he remained ten years, making observations on the country and the people, till he was afflicted with the misfortune of blindness, which came on without any external injury. He now returned to Europe, and by means of medical assistance he so far recovered his sight as to be able to read with the assistance of glasses. In 1716, he inserted in the *Acta Eruditorum* a treatise "De aquis Capitis Bonæ Spei." This work introduced him into farther notice, and he was invited to travel with two Austrian counts, but his passion for foreign countries had subsided, and he preferred remaining at home, and taking upon himself the office of rector of the school of Neuladt. He discharged the duties of his situation with much diligence till the year 1726, when he died, in the fifty-second year of his age. His business, as an instructor, had not prevented him from publishing his great work, entitled "A Description of the Cape of Good Hope," in folio, with twenty-four plates. This work was translated into the Dutch language in 1727; and at London, into the English, in 1731. It was afterwards abridged, and published in French in three vols. 12mo. Kolbe has been charged with receiving information without much examination, and with having published, as true, many false and incredible stories; but when the proper deductions are made that severe criticism has suggested, there still remains much important information with regard to a country, which, at that time, was scarcely known. Gen. Biog.

**KOLBENDORF**, in *Geography*, a town of Bohemia, in the circle of Koniggratz; nine miles N.N.W. of Trauttau.

**KOLCHY**, a town of Poland, in the palatinate of Volhynia; 52 miles N. of Zytomyr.

**KOLEI-HISAR**, a town of Asiatic Turkey, in the government of Sivas; 45 miles N.E. of Sivas.

**KOLÉN**, a chain of mountains, extending between Norway and Swedish Lapland, and afterwards bending, in the form of a horse-shoe, on the S. of Finmark.

**KOLGAPARI**, a town of Russia, in the government of Olonetz; 80 miles N.N.W. of Olonetz.

**KOLIAKOV**, a town of Russia, in the government of Simbirsk, on the Sura; 80 miles W.S.W. of Simbirsk.

**KOLIAZIN**, a town of Russia, in the government of Tver, on the Volga; 68 miles E.N.E. of Tver.

**KOLIKUNDA**, a town of Africa, in the kingdom of Jenaraw.

**KOLIMA**, **KOLYMA**, or *Kovyma*, a river of Russia, which rises in the Stanovoi-Krchet, almost over-against Ochotk, and after receiving several other rivers, particularly the Omolon, forms a multitude of islands, and, by means of four broad arms, flows into the Frozen ocean, N. lat.  $71^{\circ} 25'$ . E. long.  $152^{\circ} 24'$ .

**KOLIN**, a town of Bohemia, in the circle of Kaurzim, on the Elbe; 30 miles E.S.E. of Prague. N. lat.  $49^{\circ} 58'$ . E. long.  $15^{\circ} 15'$ .

**KOLIVAN**, **KOLYVAN**, or *Kolyvan*, a city of Russia, and capital of the government of the same name, situated on the Oby, near the mouth of the Berda; known before the institution of this government under the name of "Berdskoi otdrog." Kolyvan is famous for the silver mines discovered in its vicinity. They lie between the rivers Oby and Irtysh, near the mountains which separate Siberia from the Chinese empire, or rather from the territory of Kalmucks dependent on the Chinese. They were discovered in the year 1725 or 1728, and appropriated to the crown by the empress Elizabeth in 1744. They produced annually, between 1749 and 1762, from 8000 to 16,000 pounds of silver; between 1763 and 1769, from 20,000 to 32,000; and since that period to 1778, from 40,000 to 48,000. The silver contains upwards of three *per cent.* of gold; the separation of which is made in the imperial laboratory at Petersburg. Upon the whole, it appears from the accounts of the board of mines, that they have produced, from their discovery to the year 1786, about 3,520,000 pounds of silver, and 48,000 pounds of gold, which yield, at an average, a produce of 50,000 pounds of silver, and 1600 pounds of gold *per annum*. The mines and foundries of Kolyvan employ nearly 40,000 colonists, besides the peasants in the districts of Tomsk and Kuznetz, who, in lieu of paying the poll-tax in money, cut wood, make charcoal, and transport the ores to the foundries. In the year 1765, a mint was established at the foundry of Sufunsk, for the coinage of the copper supplied from these mines, the greater part of which had been, till that period, of no use. Pieces of one, two, five, and ten copecks (the copeck being nearly equal to a halfpenny) are struck and dispersed over Siberia. Of this currency, the amount of 500,000 roubles is annually coined, which is sufficient for reimbursing the poll-tax, paying the miners, transporting the ore, purchasing the lead, which must be brought from Nerzhinsk, and defraying the expence of sending the gold and silver as far as Tobolsk. The silver melted in the foundries is conveyed on large sledges twice a year; the first convoy sets off in the beginning of winter, and reaches Petersburg a little after

Christmas; the second in the middle of winter, and arrives there towards spring. Kolyvan is distant 480 miles S.S.E. of Tobolsk. N. lat.  $54^{\circ} 20'$ . E. long.  $81^{\circ} 20'$ . Coxe's Travels in Russia, vol. iii.

**KOLIVAN**, *Kolyvan*, or *Kolyvan*, is also a government of Russia, bounded on the N. by the government of Tobolsk, on the E. by that of Irkutsk, on the S. by China, and on the W. by Tartary; about 720 miles in length, and from 240 to 360 in breadth. This government was formerly included in that of Tobolsk; it contains five districts, viz. Kolyvan, Semipalat, Birk, Kufnez, and Krasnoiarik.

**KOLIVAN**, or *Kolyvan*, is also the name of a range of mountains, constituting the principal part of the Altay mountains, or the proper ore-mountains of Altay. (See **ALTAY**.) The Kolyvan-vos-krefenskoï mountains derive their appellation from the adjacent lake Kolyvan, which has given its name to the whole chain between the Irtysh and Oby, as well as to the government, and from the first copper-mine, called Volkrefenskoï. These mountains are bounded on the S. by the granitic ridge, which parts them from the **KORBO-lilinkoi**, which see. They are confined to the E. by the deep valley in which the line of the present fire-poets is drawn, and by the lofty Tigaretzkoi snow-mountains; and bounded on the N. by the river Tiharysh, whose course is accompanied by considerable high schist and chalk mountains; towards the W. they lose themselves in the north-western Steppe. The greatest elevation of these mountains is the Simaia-fopka, or Blue-mountain, which is computed to ascend 2814 Parisian feet above the level of the sea. At the middle and greatest height, this range consists of a molty coarse granite, composed of Spatum compacte, quartz, and blackish mica. In the angle formed by the little Biela with the great Biela, at the foot of the Blue mountain, are found schistus and chalk-stone, in which latter are some little cavities, containing lapis calcareus stalaçites. From the little Biela the mountains rise again toward the south, elevating themselves to the Revennaia-fopka, or Rhapsodii fummut, which is surrounded by the ore-mountains, and consisting of schistus corneus, mixed sparingly with mica sphatola and crumbs of mica campestris, in which latter are a few small hollows, in which are found stalaçites. Towards the west, from the Blue mountain, runs the granite-mountain range, in bulk from 15 to 30 versts, interrupted by a multitude of valleys, proceeding 100 versts to the Alay, and there uniting with the Alaikoi granite-hills. The northern foot of this granite-ridge runs under powerful schistus and chalk mountains, in and between which the two first Kolyvan mines were dug. Another mighty ridge of granite runs from the Blue mountain northwards to the river Tiharysh, under-run on the western side by schistus and chalk. The component parts of these granite ridges are various. In some parts the feldspar, in others the quartz, has the ascendancy. In one place the component parts are coarse, and then so delicate and so poor in mica, that one might be induced to take the granite proceeding from them for sand-stone. This tract of mountains is uncommonly rich in silver, copper, and zinc ores. Tooke's Russia, vol. i.

**KOLKI**, a town of Poland, in the palatinate of Volhynia; 22 miles N.N.E. of Lucko.

**KOLKOTOVATOL**, an island in the Caspian sea, near the W. coast. N. lat.  $44^{\circ} 45'$ .

**KOLLAT**, a town of European Turkey, in Bulgaria; 72 miles E.S.E. of Driltra.

**KOLLOW**. See **KILLOW**.

KOLLUVI, a country of Africa, between Aſben and Cathna, inhabited by the Tuarick.

KOLLYRITE. Under this name an argillaceous foſſil is mentioned in Karſten's Mineralogical Tables, which is found at Strehani-Schlacht, near Schemnitz. Dr. Townſon, we ſuppoſe, is one of the firſt naturaliſts who obſerved it there. This mineral ſubſtance, which was firſt conſidered as pure alumine, is light, very friable, and ſnow-white; it ſoils the fingers, and adheres ſtrongly to the tongue, which laſt property has procured it the name of *kollyrite* (from *kol'yris* of Dioſcorides and Pliny.) According to Klaproth's analysis of the Hungarian kollyrite, it conſiſts of

Alumine	45
Silica	14
Water	41

---

100

---

This ſubſtance, which may be conſidered as a purer variety of clay, has alſo been found, by Frieſleben, at Weiſſenfels, in Thuringia, in a ſtratum of ſand-ftone.

According to Brongniart, it has a tolerable degree of tenacity, and the water it abſorbed is ſeen to ooze out on the application of preſſure, but it retains the liquid with ſuch force, that more than a month is required to dry even a ſmall quantity of it. By defecation, it ſeparates into baſaltic priſms, like ſtarch, loſes half of its weight, and becomes very light.

KOLMOGOR, in *Geography*, a diſtrict of the government of Archangel, ſituated on the Dwina.

KOLNO, a town of the duchy of Warſaw; 80 miles N.E. of Warſaw.—Alſo, a town of Lithuania, in the palatinate of Brzeſc; 88 miles E. of Pinfk.

KOLO, a lake of Ruſſia, in the government of Archangel; 28 miles S. of Archangel.—Alſo, a town of the duchy of Warſaw; 24 miles N.E. of Kalifch.

KOLOCKEN, a town of the duchy of Courland; 32 miles N.E. of Pilten.

KOLOGRIN, a town of Ruſſia, in the government of Koſtroma, on the river Unza; 116 miles N.E. of Koſtroma. N. lat. 58° 55'. E. long. 44° 14'.

KOLOMNA MOSEVA, a town of Ruſſia, and diſtrict of the government of Moſcow, about five verſts from its junction with the Occa; the ſee of a biſhop; 48 miles S.E. of Moſcow. This town is reckoned to contain about 60,000 inhabitants.

KOLONEI, a town of Auſtrian Poland, in Galicia, on the Pruth; 86 miles S.S.E. of Lemberg.

KOLOR, a town of Africa, in the kingdom of Woollis; 20 miles E.N.E. of Medina.

KOLOSVAR. See COLOSVAR.

KOLOZ, a town of Tranſylvania; 14 miles S.S.E. of Hunyad.

KOLPAK, a town of European Turkey, in Beſſarabia; 40 miles W. of Akerman.

KOLSKOI, a town of Ruſſia, in the government of Archangel, on the E. ſide of the Dwina; 96 miles S.S.E. of Archangel.

KOLTER, one of the Faroer iſlands.

KOLTYNIANY, a town of Lithuania, in the palatinate of Wilna; 32 miles E. of Wilkomierz.—Alſo, a town of Samogitia; 28 miles N.W. of Roſienne.

KOLVEREID, a town of Norway; 95 miles N.N.E. of Drontheim.

KOLUMBATZ, a town of European Turkey, in Macedonia; 68 miles N. of Akrida.

KOLZUM, or COLSUM, anciently *Olyſma*, (which ſee,) a town of Egypt, which formerly exiſted near the E. coaſt of the Red ſea, but the ſea has long ſince left the coaſt; and the town has been deſtroyed. From Volney we learn, that the name is ſtill attached to a hillock of ſand, bricks, and ſtones, on the coaſt of the Red ſea, about 300 paces to the N. of Suez: whereas D'Anville places it 16 miles S. of Suez.

KOM, or KHUM, a large and populous city of Perſia, in the province of Irak, at the foot of high mountains, and near a conſiderable river, which is loſt in the great ſalt deſert. When Chardin viſited it, the houſes were computed at 15,000; and the chief manufactures were white earthen ware, ſoap, and ſword-blades, ſabres, and poniards. The walls are lofty, and the town has ſeven gates. The public ſquares are ſmall; the grand bazar croſſes the town from one gate to the other; and there are others, which are furniſhed with coffee-houſes, and ſhops of various kinds. Here are a celebrated moſque, and an aſylum for debtors, who are protected and ſupported. One of the moſques is highly eſteemed by the Perſians, on account of the ſepulchres of ſhah Seſi I. and ſhah Abbas II., and alſo that of Sidy Fatima, grand-daughter of Mahomet. Theſe tombs are frequented by pilgrims from all parts of Perſia, who reſort hither once a year to pay their devotions, and are ſupported by a fund assigned to this purpoſe. The city is governed by a viſier, and is the reſidence of a khan. The adjacent country is fertile in rice and fruit; 150 miles N. of Iſpahan. N. lat. 34° 20'. E. long. 51° 14'.

KOMA, a town of Lithuania, in the palatinate of Wilna; 42 miles S. of Braſlaw.—Alſo, a town of Perſia, in the province of Khorafan; 227 miles N.N.E. of Herat.

KOMANA, in *Botany*, an arbitrary name given by Adanſon to *Hypericum monogynum* of other authors, which he eſtabliſhes as a genus, on account of its ſolitary ſtyle. Juſſieu, however, asserts that this ſuppoſed ſimple ſtyle is compoſed of five, cloſely united. The capsule is deſcribed as of one cell, but we have never ſeen it at all advancing towards maturity, ſo as to form an opinion on the ſubject. See HYPERICUM and KNIFA.

KOMANA, in *Geography*, a town and abbey of Walachia; 18 miles S. of Buchareit.—Alſo, a diſtrict of Africa, on the Slave coaſt.

KOMANGO, or AMANGO, one of the Friendly iſles; 5 miles E. of Annamooka.

KOMARA, a town of Hindooſtan, in Myfore; 65 miles E.N.E. of Harponelly.

KOMARNA, a town of Auſtrian Poland, in Galicia; 24 miles S.S.W. of Lemberg.

KOMBAH, a town of Africa, in the country of Gago; 170 miles E. of Kaffaba. N. lat. 11° 25'. E. long. 2° 30'.

KOMBO, a kingdom of Africa, near the Atlantic, S. of the Gambia.

KOMBREGUDU, or COMBREGO-ADOU, a kingdom of Africa, ſituated on the banks of the river Falemi, about N. lat. 13° 10'. W. long. 10°.

KOMCHA, or KOMSILA, a decayed town of Perſia, in the province of Irak, celebrated for its gardens and dove-houſes, and degraded by the bad character of its inhabitants; 39 miles S. of Iſpahan.

KOMENTING, the name of two towns in the iſland of Borneo; one 45 miles N. and the other 15 miles S.S.W. of Negara.

KOMMANICK, in *Ornithology*, the German name for the large-crested lark, common in many parts of Germany, but not known in England. See ALAUDA *criſtata*.

KOMOL,

KOMOL, or COMOL, in *Geography*, a sea-port town of Nubia, with a small but safe harbour in the Red sea. N. lat.  $22^{\circ} 45'$ . E. long.  $35^{\circ} 15'$ .

KOMRI, A. L., a mountainous ridge in the interior part of Africa, called also the "Mountains of the Moon," terminating the country of Donga. N. lat. 7.

KONAPOUR, a town of Hindoostan, in the country of Sajoire; 50 miles E.N.E. of Goa. N. lat.  $15^{\circ} 45'$ . E. long.  $74^{\circ} 32'$ .

KONDOZ, a town of the Greater Bucharja; 60 miles N.W. of Anderab. N. lat.  $36^{\circ} 50'$ . E. long.  $67^{\circ} 22'$ .

KONDRA, a town of Bengal; 36 miles S.W. of Docha.

KONDUR, a town of Hindoostan, in Dowlatabad; 100 miles S.E. of Aurungabad. N. lat.  $18^{\circ} 54'$ . E. long.  $77^{\circ} 30'$ .

KONEVETZ, a small island of Russia, in lake Ladoga; 60 miles N.N.E. of Petersburg.

KONEZKOI, a town of Russia, in the government of Vologda, on the Vm; 56 miles N.E. of Yarenk.

KONG. See G. N. JAH.

KONGA, a town of Africa, in the kingdom of Loango.

KONG-FORS, a town of Sweden, in Welt Bothnia; 16 miles N.W. of Umea.

KONGHELL, KONGSHELE, or *Kong-elf*, a town of Sweden, in the province of Welt Gothland, on an island in the Gotha; formerly the capital of Norway, and residence of kings, but now decayed; 10 miles N. of Gotheburg.

KONGBACKA, a sea-port town of Sweden, in Halland; 13 miles S. of Gotheburg. N. lat.  $57^{\circ} 30'$ . E. long.  $12^{\circ} 56'$ .

KONGBERG, or CONISBERG, a town of Norway, celebrated for its silver mines. It stretches on both sides the river Lowe, which, in its course through the town, falls in a series of small but picturesque cataracts over the bare rocks. The crags which border the town are in some parts naked, in others clothed with wood, and intermixed occasionally with slips of corn and pasture; nevertheless, the prominent features of the circumjacent scenery are ruggedness and horror. Kongberg contains about 1000 houses, including those of the miners, and 6000 inhabitants. The mines are distant from the town two miles. They were discovered and opened during the reign of Christian IV. Thirty-six mines, says Coxo, are now working; the deepest is 652 feet perpendicular. The matrix of the ore is the *Jaxum* of Linnæus; the silver is extracted according to the usual process, either by smelting the ore with lead, or by pounding. Pure silver is occasionally found in small grains, and in small pieces of different sizes, seldom weighing more than four or five pounds. One mass has been found which weighed 429 marks, and was worth 3000 rix-dollars (600*l.*); this piece is preserved in the cabinet of curiosities at Copenhagen. Formerly these mines produced annually 70,000*l.*; in 1769, 79,000*l.*; at present, (says Mr. Coxo) they yield only from 50,000*l.* to 54,000*l.* The expences, it is said, generally equal, and sometimes exceed the profits. The largest piece of money struck at Kongberg is only eight skillings, or four-pence.

KONGSWINGER, a town of Norway, in the province of Christiania; 42 miles N.E. of Christiania. N. lat.  $60^{\circ} 12'$ . E. long.  $12^{\circ} 8'$ .

KONG-TCHANG, a city of China, of the first class, in the province of Chen-si, seated on the banks of the river Hooi, and surrounded by very high mountains. This city is very populous, and has great trade. A tomb is shown here, which the Chinese pretend to be that of Fo-hi. The jurisdiction of this city extends over three others of the se-

cond class and seven of the third. N. lat.  $34^{\circ} 56'$ . E. long.  $104^{\circ} 19'$ .

KONI, a town of Imiretta; 30 miles S.W. of Co-tatis.

KONJADA, *Gros*, and *Klein*, two towns of Prussia, in the palatinate of Culm; the former 12 miles N.N.W. of Straßburg; and the latter 14 miles.

KONIAWA, a town of Lithuania, in the palatinate of Troki; 36 miles N.E. of Grodno.

KONIECPOLE, a town of Poland, in the palatinate of Bracław; 60 miles S.E. of Bracław.

KONIGINGRATZ, or KRALOWE HRADECZ, a city of Bohemia, and capital of a circle of the same name, seated on the Elbe, built in the year 782, and the see of a bishop, under the archbishop of Prague; 58 miles E. of Prague. N. lat.  $50^{\circ} 10'$ . E. long.  $15^{\circ} 39'$ .

KONIGSBERG, a large and beautiful city and sea-port of Prussia, situated on the river Pregal, which has seven bridges; founded in 1255, rebuilt in another situation in 1264, and well fortified in 1526, by a rampart about seven English miles in circumference. The rampart incloses the gardens, the large cattle moat, with some meadows and fields. The number of houses is about 3800, and of inhabitants about 60,000. This city properly consists of three towns that are joined together; *viz.* Altstadt, Lobenicht, and Kneiphof, and of several suburbs. Altstadt, or the old town, contains 16 streets, and 550 houses, of which more than 100 are malt-houses and brew-houses. It is embellished with six gates, two strong-built towers, and four bridges. Lobenicht, built about the year 1300, was formerly called Neustadt, or the new town. Kneiphof is the most modern, as it was founded in 1324. This stands on an island formed by the river Pregal, the buildings of which are erected on piles of alder-trees, which by length of time are become as hard as iron. It has five large gates, and 13 streets. The cathedral of this town has a famous organ, which consists of 5000 pipes, and was finished in 1721. The university was founded, in 1544, by the margrave Albert, and has 38 professors, exclusive of the tutors. The number of students in 1802 was 300. The town-house is a fine building, where the magistrates of the three towns, which were incorporated in 1724, meet every day. The strong citadel, called "Fredericksbürg," was built in 1657, and directly faces Kneiphof, at the conflux of the two branches of the Pregal. This fort is a regular square, surrounded with broad ditches and the river Pregal, which is here increased by the canal or dyke, called "Kupferteeich." In the citadel are a church and an arsenal. Kongberg has always ranked high in commerce and shipping, and was formerly one of the Hans towns. Its trade is still flourishing, by means of the river Pregal, which is here navigable, and from 120 to 240 feet in breadth. In 1752, 493 large ships, and 373 floats of timber, arrived in this port, besides smaller vessels. A colony of French Calvinists excepted, the inhabitants of Kongberg are chiefly Germans of the Lutheran persuasion. In 1758, this city was taken by the Russians, and in 1807 by the French. N. lat.  $54^{\circ} 43'$ . E. long.  $20^{\circ} 38'$ .

KONIGSBERG, or *Klinkowice*, a town of Silesia, in the principality of Troppau; 13 miles S.E. of Troppau. N. lat.  $49^{\circ} 40'$ . E. long.  $18^{\circ} 10'$ .

KONIGSBERG, a town of Brandenburg, in the New Mark; 24 miles N.N.W. of Culstrim. N. lat.  $53^{\circ} 2'$ . E. long.  $14^{\circ} 33'$ .—Allo, a town of Germany, in the principality of Coburg, situated on the side of a mountain, on which is an ancient castle; 20 miles S.S.W. of Coburg. N. lat.  $50^{\circ} 4'$ . E. long.  $10^{\circ} 45'$ .

**KONIGSBRONN**, a town and convent of Wurtemberg; 20 miles N.N.E. of Ulm.

**KONIGSEGG**, a principality of Germany, comprehending Konigsegg-Rothenfels, and Konigsegg-Aulendorf. The former possesses the county of Rothenfels and lordship of Stauffers; and the latter the county of Konigsegg, and lordship of Aulendorf. The lordship of Konigsegg confists only of an ancient castle, 8 miles N.W. of Ravensburg, and a few hamlets.

**KONIGSEK**, a town of Bohemia, in the circle of Böhlin; 10 miles E.S.E. of Neuhaus.

**KONIGSFELD**, a town and citadel of the duchy of Berg; 26 miles S.S.E. of Cologne.—Also, a town of Bavaria, in the bishopric of Bamberg, on the Auffses; 10 miles N.E. of Bamberg.

**KONIGSFELDEN**, a bailiwick of Switzerland, in the canton of Berne, situated between the town of Bruck and the river Reufs. The monastery of this place, belonging to the monks of St. Francis and the nuns of St. Claire, founded in commemoration of the death of the emperor Albert, who was assassinated in 1308 by his nephew John, duke of Swabia, became very rich by grants from the house of Austria, and other nobility.

**KONIGSHEIM**, a town of Germany, in the county of Wertheim; 14 miles S. of Wertheim.

**KONIGSHOF**, a town of Bohemia, in the circle of Königgratz; 14 miles N. of Königgratz.

**KONIGSHOFEN**, a town of the duchy of Wurzburg, on the Tauber; 20 miles S.S.W. of Wurzburg.—Also, a town of the duchy of Wurzburg, on the Saal; 38 miles N.E. of Wurzburg. N. lat. 50° 12'. E. long. 10° 27'.

**KONIGSLUTTER**, a town of Westphalia, in the principality of Wolfenbuttel, situated on a stream, called the "Lutter;" 12 miles N.E. of Wolfenbuttel. N. lat. 52° 17'. E. long. 10° 56'.

**KONIGSTEIN**, a town of Germany, and capital of a county of the same name, with a castle built on a rock; 11 miles N.W. of Francfort on the Maine.—Also, a town of Bavaria, in the principality of Sulzbach, near Sulzbach.—Also, a fortress of Norway, in the diocese of Christiania, built for the defence of Frederickstad.—Also, a town of Saxony, in the margraviate of Meissen, situated on the left side of the Elbe, with manufactures of linen and woollen. It is situated on a mountain, and rendered, as it was supposed, impregnable. It is accessible only in one place, and supplied with water from a very deep spring in the mountain; 16 miles S.E. of Dresden.

**KONIGSTUHL**, *i. e.* King's Chair, a head-land on the N.E. coast of the island of Usedom, in the Baltic. N. lat. 54° 37'. E. long. 13° 58'.

**KONIGSWALD**, a town of Bohemia, in the circle of Leitmeritz; 13 miles N.N.W. of Leitmeritz.

**KONIGSWALDE**, a town of Brandenburg, in the New Mark; 22 miles E. of Cultrin. N. lat. 52° 25'. E. long. 15° 26'.

**KONIGSWERT**, a town of Bohemia, in the circle of Pilsen; 12 miles W.N.W. of Topel.

**KONIN**, a town of the duchy of Warfaw; 20 miles N. of Kalisch. N. lat. 52° 6'. E. long. 18° 15'.

**KONINCK**, or **KONING**, **DAVID DE**, in *Biography*, a painter of birds, animals, and still life. He acquired the principles and executive powers of the art under the tuition of John Fytt; whose jealousy is said to have been excited by the praises bestowed upon his disciple.

On this account De Koninck left him, and travelled to

Italy, from Antwerp, where he was born. He arrived in Rome in 1668, having refused engagements to paint upon his journey, offered him by the dukes of Bavaria and the court of Vienna. In Rome he was highly honoured. Balduino, who lived at the time, speaks of him as employed by the greatest among the nobles there; and receiving commissions from foreign kings and sovereign princes.

His works and manner resemble those of Fytt, with whom, on his return to Antwerp, he was a constant competitor. But he is not so perfect, his effects are not so brilliant, nor is his touch so free. He died in 1687: his age is not known.

**KONINCK**, or **KONING**, **PHILIP DE**, a portrait painter, who, having studied in the school of Rembrandt, proceeded in his course with great success, obtaining in early life a good reputation, and maintaining it in the great number of pictures which he produced. His style is, necessarily, almost an imitation of that of his master. It is too fascinating for a man that had once obtained possession of the court to quit it easily. His likenesses were esteemed, and he had great choice and variety of attitude. He is among the number of those whose portraits are honoured with a place in the gallery at Florence. He died in 1689, at the advanced age of 70.

**KONINGH**, **SOLOMON**, a portrait and historic painter of the Flemish school. He was the disciple of Vernando and Moojart, and rose to a certain degree of eminence, but not among the first class.

**KONIT**, or **CONIT**. Professors Retzius and Schumacher describe under this name a calcareo-siliceous rock of a whitish-grey, or white colour, found in Norway, Iceland, &c. It has only been seen in detached pieces, most of which bear the marks of being rolled. It is faintly glimmering; in some pieces its lustre approaches to the vitreous, and even the unctuous lustre. Its fracture is uneven, flat conchoidal, sometimes obsoletely foliated, sometimes even and splintery, not unlike that of some varieties of horn-stone. The fragments are indeterminately angular. The varieties having an unctuous lustre, and obsoletely foliated fracture, are translucent at the edges. Its hardness is far superior to that of common compact limestone, and it even strikes fire with the steel. It is not easily frangible. Specific gravity 2.8. When reduced to powder, and thrown on burning charcoal, it emits a greenish light, but it is not phosphorescent from friction. It effervesces with diluted nitric acid, and is partly dissolved in it: the remainder is siliceous earth.

The proportion of the calcareous and siliceous earth, of which the konit consists, is not yet ascertained.

Upon the whole, we know too little of this mineral substance to assign it its proper place in the system. Häuy refers it, with a query, to his quartz-agathe calcifere, which is the silicealce of Saussure. See Häuy and Brongn. vol. i. p. 325.

The specimens of conite described by Schumacher were from Iceland; the one which we had an opportunity of examining came from Kenrudvern, near Dramen, in Norway.

Among the many new names which a modern writer on rocks is desirous of palming upon the world, we have also that of *konite*, which, without mentioning that it has been previously given to a different rock, he applies to the variety of compact lime-stone, called *freestone*.

**KONITZ**, in *Geography*, a town of Germany, in the county of Schwartzburg-Rudolstadt; where are mines of silver and copper; 6 miles E.S.E. of Rudolstadt.—Also, a baili.

a bailiwick of Switzerland, in the canton of Berne.—Also, a town of Moravia, in the circle of Olmutz; 15 miles W. of Olmutz.—Also, a town of Prussia, in Pomerelia; 8 miles E. of Schlockaw.

KONKODOO, a country of Africa, bounded on the N. by Bambouk, on the E. by Gadou, on the S. by Worada and Jallonkadoo, and on the W. by Satadoo; about 60 miles from N. to S., and 40 from E. to W. N. lat. 12° 10' to 13° 10'. W. long. 9 to 10°.

KONN, a town on the N. coast of the ifle of Timor. S. lat. 8 18'. E. long. 126° 16'.

KONNARUS, a name given by Agathocles in Athens to a plant of Arabia, which the description fhews to be the fame with the *faduc* of the later Arabians, the fruit of which is called *nabac* or *nabech*. See CONNARUS.

This tree is the lotus of Dioscorides, and the acanthus of Virgil, whose berries he mentions. The fruit of this tree is like a cherry, but smaller, and is ground to powder by the Africans when dried. It is very well known to all who are acquainted with the writings of the old physicians, that the berries of the lotus or nabac were ground down, by the Egyptians and other nations where they grew, to a fine powder for medicinal uses. They were astringents, and used both externally in poultices and fomentations, and internally in decoctions and other forms where astringents were required.

KONNO, in *Geography*, a town of Japan, in the island of Niphon; 70 miles N.W. of Meaco.

KONOE, one of the Faroer islands; 2 miles N. of Bardoe.

KONOS, a town of Asiatic Turkey, in Natolia; 20 miles N.E. of Degenizlu.

KONOTOP, a town of Russia, and district of the government of Novogorod Sieverskoi, seated on a rivulet falling into the Seim. N. lat. 51° 5'. E. long. 33° 34'.

KONSAN, a town of Africa, in the country of Sierra Leone. N. lat. 10° 44'. W. long. 12° 15'.

KONSBERG. See KONGSBERG.

KONSTANTINGRAD, a town of Russia, in the government of Ekaterinoflav, on the borders of Turkey. N. lat. 49° 15'. E. long. 34° 52'.

KONTOP, a town of Silesia, in the principality of Glogau; 15 miles E. of Grunzberg.

KOOCH, a town of Hindoostan, in the country of Agra; 60 miles E. of Gwalior. N. lat. 26°. E. long. 79 35'.

KOOHANGAN, a small island in the Sooloo Archipelago. N. lat. 6 3'. E. long. 121° 18'.

KOOJAR, a town of Africa, in the country of Woulli; 54 miles E. of Medina.

KOOLASSIAH, a small island in the Sooloo Archipelago. N. lat. 6 22'. E. long. 120° 38'.

KOOLBARY, a town of Hindoostan, in Golconda; 35 miles S. of Combarot.

KOOLIKORRO, a town of Africa, in the kingdom of Bambarra, on the Niger; which is a great salt-market; 130 miles S.W. of Sego.

KOOLUCONDA, a town of Hindoostan, in Myfore; 13 miles N.E. of Nagamungalum.

KOOMAR, a town of Hindoostan, in Bahar; 13 miles E.N.E. of Bahar.

KOOMBOO, a town of Africa, in the kingdom of Tenda. N. lat. 12° 42'. W. long. 12°.

KOOND, a town of Hindoostan, in Bahar; 17 miles N. of Saferam.

KOONDA, a circar of Bengal, bounded on the N.E. by Bahar, on the E. by Rangur, on the S. by Toree, and on

the W. by Palamow; about 25 miles long, and 16 broad; the capital is Koonda; 92 miles S. of Patna. N. lat. 24° 11'. E. long. 84° 48'.

KOONI, a town of Japan, in the island of Niphon; 30 miles N. of Tomu.

KOONIAKARY, a town of Africa, in the country of Woulli; 48 miles E.N.E. of Medina.—Also, a town of Africa, in Kaffon. N. lat. 14° 36'. W. long. 8° 58'.

KOONJOOR, a circar of Hindoostan, in Orissa, between Gangpur and Mohurunge, the capital of which, of the same name, is 86 miles N.N.W. of Cattaek.

KOONKA, a town of Bengal; 25 miles W.S.W. of Rangur.

KOONTI, in *Hindoo Mythological History*, is the mother of three of the five Pandus, whose wars are related in the *Mababarats*; which see. See also PANDU.

KOORBAH, in *Geography*, a town of Hindoostan, in the circar of Ruttunpur; 20 miles E. of Ruttunpur.

KOORGUNGE, a town of Bengal; 22 miles E. of Boghrpur.

KOORKARANY, a town of Africa, in Bondou; 50 miles W. of Fatteconda.

KOORNHERT, THIEDORF, in *Biography*, descended from a respectable family at Amsterdani, was born in the year 1522. He was brought up to the profession of an engraver, which he soon abandoned, to travel into Spain and Portugal, but on his return home, an imprudent marriage forced him to take up the graver at Harlem, to support himself and wife. His leisure hours he employed in reading and improving his mind in various ways, in the hope that knowledge might fit him for a better employment than that in which he was labouring. We accordingly find him admitted a notary in 1561, and in the following year he was appointed secretary to the city of Harlem, and in 1564 he was made secretary to the burgo-masters of that city. In this character he was frequently sent to the prince of Orange, governor of Holland, with whom, and with other persons of consequence, he consulted respecting the means of maintaining the liberty of his country. Through him, the famous petition of the Confederates was presented to the dukes of Parma in 1566. He was also the author of the first manifesto which the prince of Orange published in his camp, intitled "An Advertisement to the Inhabitants of the Low Countries for the Law, the King, and for the Flock." The part which he took in politics excited against him the resentment of the government of Brussels, by whose directions he was sent to the Hague, where he suffered a long and cruel imprisonment. He at length obtained a hearing, and, successfully vindicating himself, he was set at liberty; but he found it necessary to withdraw from the power of his enemies, and went to the county of Cleves, where he again maintained himself by his profession as an engraver. When, in the year 1572, the States of Holland had taken the resolution to assert their liberty against the tyranny of the Spaniards, Koornhert returned to his own country, and was appointed secretary to the states of the province; finding, however, the people prejudiced against him, for avowedly vindicating the principles of toleration in respect to the Roman Catholics, he resigned his post, and withdrew to Embden. It does not appear that he was a Catholic himself, but he formed the project of uniting all persons of all sects, by way of *interim*, till God should be pleased to raise reformers, in all respects like the apostles. His plan being, that only the text of God's words should be read to the people without comment or explication, and without prescribing any commandment, or prohibition, but at most by way of advice. In 1578, he returned to Holland, where

was engaged in a controversy with two ministers of Delft at Leyden, concerning the characteristics of the true church. He soon proved too powerful for his antagonists, who charged him with the design of making a schism among the people, and who obtained an order that he should not be permitted to publish any thing in print concerning the dispute. He was also forbidden to trouble the ministers of Delft with letters, or otherwise, upon pain of the utmost severity. Being thus effectually silenced, the ministers in different towns of Holland directed their attacks against him from the pulpit, representing him, by name, as a heretic, an impious fellow, and a free-thinker. He petitioned to be heard in his own defence, but was refused, and ordered to comport himself peaceably and dutifully, in which case he should be secure from danger. This he regarded as the introduction of a new inquisition, or force upon consciences in Holland. Koonhert was ever, and at all times, the consistent friend to liberty of conscience, and the firm opponent to whatever could abridge the right of free discussion; for his zeal and intrepidity in this cause, he was continually harassed by bigots and the government of the country: he had, however, a mind that could not be subdued, and he made use of his pen, in various tracts, to vindicate the principles which he espoused. Among his other literary antagonists was the celebrated Lipsius, who, in a treatise on civil government, maintained that only one kind of religion should be tolerated in one state, and that persons who held different opinions, and who endeavoured to bring others over to their party, ought to be punished. "Mercy," says the professor, "has no place here, caustics and amputations must be made use of, it being better that one limb should perish than the whole body." In answer to these persecuting tenets, Koonhert published his treatise, intitled "The Process, or Trial of Heretic-killing, and Force upon Conscience," which he dedicated to the magistratés of Leyden. These, however, to gratify Lipsius, gave notice officially, that they did not accept the dedication, and that the author had, by it, done them neither service nor honour. Koonhert died at Gouda in 1590, in the 68th year of his age. Grotius expressed a high esteem for his character, and an ardent hope that his judicious labours would be useful to his country and the world. He is classed by Pontanus among the learned men of the city of Amsterdam, and as one warmly attached to the interests of piety and truth. Hadrian Janinius, in his description of Holland, calls him a man of divine understanding: he adds, that Fortune was his enemy, and he thinks that he suffered himself to be made use of by God "as a voluntary demolisher of the murdering prison of consciences." An edition of all his works was published in 1630, in three volumes folio. Bayle. Gen. Biog.

**KOOROO**, in *Geography*, a town of Africa, in the country of Fouta. N. lat. 10° S. W. long. 10° 20'.

**KOORTA**, a town of Bengal; 35 miles W. of Nagore.

**KOORUMBAH**, a town of Hindoostan, in Dowlatabad; 40 miles E. of Poorunder.

**KOORWEY**, a town of Hindoostan, in the route from Agra to Oojein, connected with another town called "Baraf," on the banks of the Betwa. These towns are of considerable size, and at the former is a large stone-fort. They are inhabited by Patans, who settled here about 100 years ago, in the time of Aurungzebe. The revenue of the present Nawab is said to be between one and two lacs of rupees, which is sequestered for the payment of a debt to the Mahrattas.

**KOOS**, a town of Japan, in the island of Niphon; 45 miles S. E. of Jessen.—Also, a town in the island of Ximo; 36 miles E. S. E. of Udo.

**KOOSAMBO**, a town on the N. coast of the island of Bali. S. lat. 8° 24'. E. long. 114° 46'.

**KOOSHAUB**, a town of Hindoostan, in the subah of Lahore, on the Behut; 95 miles W. of Lahore. N. lat. 31° 45'. E. long. 71° 5'.

**KOOSHINJEE**, or **PUSHING**, a town of Candahar; 80 miles S. E. of Candahar. N. lat. 32° 14'. E. long. 66° 58'.

**KOOTACONDA**, a town of Africa, in Woolli; 16 miles W. S. W. of Medina.

**KOOTAKOO**, a town of Africa, in Fooladoo. N. lat. 13° 30'. W. long. 7° 40'.

**KOOTY**, a town of Hindoostan, in Bahar; 84 miles S. S. W. of Patna. N. lat. 24° 23'. E. long. 84° 43'.

**KOPACZOW**, a town of Poland, in the palatinate of Braclaw; 72 miles N. W. of Braclaw.

**KOPAN**, a town of Hungary; 18 miles W. S. W. of Symontornya.

**KOPANITZ**, a town of Selavonia; 21 miles S. S. W. of Eszek.

**KOPASH**, a town of Dagestan; 45 miles N. W. of Derbend.

**KOPIGOWKA**, a town of Poland, in the palatinate of Braclaw, on the Bog; 16 miles S. W. of Braclaw.

**KOPIL**, a town of Lithuania, in the palatinate of Novogrodek; 45 miles S. E. of Novogrodek.

**KOPIN**, a town of Poland, in Podolia; 28 miles N. of Kaminiac.

**KOPOLET**, a sea-port of the principality of Gurick, on the Black sea. N. lat. 41° 35'. E. long. 41° 22'.

**KOPORE**, a town of Russia, in the gulf of Finland; 32 miles W. of Petersburg.

**KOPYL**, a town of Lithuania, in Novogrodek; 16 miles N. W. of Sluck.

**KOPYSS**, a town of Russia, and district of the government of Mohilef, situated on the Dnieper.

**KORA**, a town of Russia, in the government of Irkutsk, on the Ilga; 36 miles N. W. of Vercholenk.—Also, a town of Africa, in the kingdom of Jemarror.

**KORACHORYNCHUS INDICUS**, in *Ichthyology*, the name of a sea-fish of the East Indies, called by the Dutch the *raevenbeck*. It has its name from its nose resembling the beak of a raven or crow, and is about seven inches long; its back and tail are red, and its belly yellow; it has also, on each side, two pale yellow longitudinal lines, running from the gills to the tail. It is a wholesome and well-tasted fish. Ray.

**KORALLEN-ERTZ**, *i. e.* *Coral-Ore*, a name given by the miners of Idria, in Friaul, to a variety of bituminous shale, with tuberculated shining surface, and containing much hepatic and some other mercurial ores. See *MERCURY*.

**KORAMO**, or **CURAMO**, in *Geography*, a town of Africa, in the kingdom of Benin.

**KORAN**. See *ALCORAN*.

**KORASAN**, or **CHORASAN**, a province of Persia, terminating it in the N. E. is bounded on the N. by Charafin and the country of the Usbeck Tartars, on the N. E. by the Gihon or Oxus, on the E. by Bucharia and Candahar, on the S. by Segestan and the lake of Zeré, or Zurra, the Aria palus of antiquity, and on the W. by the province of Mazanderan and the Caspian sea; about 450 miles in length and 420 in breadth. This country formerly comprehended Margiana in the north and Ariana in the south. It was conquered by Timur Bec in the year 1396, and granted by him to his son Mirza Charoe, together with Mazanderan and Segestan. The principal towns are Herat, Kenef, Talekan, Merwah, Zaweh, &c.

**KORBETH**,

**KORBETH**, a town of Persia, in Irak; 126 miles S. of Hamadan.

**KORBI-LA-HOU**, a town of Africa, on the Ivory Coast.

**KORBOLE**, a town of Sweden, in Hellingland; 53 miles W.N.W. of Hudwiskfall.

**KORBOLIKINSKOI MOUNTAIN**, a mountain of Russia, part of the range of *Kolván* (which see), which has its name from the brook Korholikha, which runs through it. It is enclosed from the S., E., and W., by granite mountains; but on the N.E. is bounded by the great Biela, together with schist and chalk mountains. It consists, except in some few points, which are covered with sea-bottom materials, for the most part of clay, schist, marl-wacke, lapis corneus, and quartz, here and there underlain by granite and porphyry. Although the height of these mountains, between the origin of the Korholikha and the little Biela, is considerable, yet the mountain on the great Biela, such as the Revennaia Sopka, and the Karaulnaia-Sopka, remarkably distinguish themselves on account of their single summits. The mineral of this mountain consists of a schistose marl-wacke and horn-schist, in which here and there hornblende and crumbs of feldspar are to be met with. The chain of mountains, in conjunction with the north-western and south-eastern rivers of the Revennaia-Sopka, the Blue mountain, and the Kolhyvan granite mountain, and in the south-east, after they have encompassed the *klitsheski* majak, terminate at the foot of high granitic snow mountains. The Revennaia-Sopka is the highest point of these mountains, being estimated at 2213 Parisian feet higher than the Slangenberg; it is said not to consist of granite, but of firm horn-schistous. In this Korholikinkoi tract of mountains, the richest of all the Altay mine-works are carried on. See **KOLIVAN** and **ALTAI**.

**KORCHELLEN**, a town of the duchy of Warfaw; 52 miles N. of Warfaw.

**KORCHINO**, a town of Russia, in the government of Nizgorod; 80 miles S.S.W. of Niznei Novgorod.

**KORCK**, a town of Norway, in the diocese of Drontheim; nine miles S.W. of Romidal.

**KORCZANY**, a town of Samogitia; 24 miles W.N.W. of Miedniki.

**KORCZICK**, a town of Poland, in Volhynia; 15 miles N.E. of Ostrog.

**KORDEDEARDA**, a town of European Turkey, in Walachia; 80 miles N.W. of Bucharest. N. lat. 45° 15'. E. long. 24 24'.

**KORDOFAN**, a country of Africa, between Dar-Für and Sennaar, subject to the sultan of Dar-Für, by whom it was conquered in 1795. Mr. Brown informs us in his "Travels in Africa, Egypt, and Syria," that an inveterate animosity subsists between the natives of Dar-Für and those of Kordofan; inasmuch that wars have been almost continual between the two countries, as far as the memories of individuals extend. One of the causes of this hostility appears to be their relative position; the latter lying in the road between Dar-Für and Sennaar, which is considered as the most practicable, though not the direct communication between the former and Mecca. Nor can caravans pass from Suakem to Für, unless by the permission of the governors of Kordofan. The jealousy of trade is, therefore, in part the origin of their unvaried and implacable animosity. A king, of the name of "Abli-Calik," is the idol of the people of Kordofan, where he reigned some years ago, and was renowned for probity and justice. The kings of Kordofan had been deputed by the meque of Sennaar, till after the death of the son of Abli-Calik, when it was usurped by

Für, in consequence of the weakness and dissensions of the government at Sennaar. The people of Kordofan are reported to be not only indifferent to the amours of their daughters and sisters, but even attached to their seducers. The father or brother will even draw the sword against him who offends the "Refik," or companion of his daughter or sister. Kordofan extends from N. lat. 12° to 14° 40', and from E. long. 20° 25' to 32° 30'.

**KORDYN**, a town of Poland, in the palatinate of Kiev; 44 miles W.S.W. of Kiev.

**KOREPSKOI**, a cape on the N. coast of Russia, in the North Sea; 124 miles N.W. of Archangel.

**KORIAKI**, an oligo of Kamtschatka, on the Awatka; 27 miles W. of Awatika.

**KORIAKS**, the denomination of a people who inhabit the northern parts of the Penhsinkoi gulf, and of the peninsula of Kamtschatka, near and among the Kamtschadales, Tunguses, Lamutes, and Tschukthes. They are supposed to derive their name from the word *Kora*, which in their language signifies a rein-deer. The great likeness they bear to many islands of the Eastern ocean, and to the nearest Americans beyond the Strait, afford reason for supposing that they, and also the Tschukthes, are the primitive possessors of these coasts; who either came over from the continent of America, or were separated from it by the probable infractions of the sea, and the consequent division of the two quarters of the world. With respect to number they are about equal to the Kamtschadales, who, according to the enumeration of 1760, amounted to about 3000 males, though it is not unreasonable to conclude, that their number is in reality three or four times larger. According to Lesslepe the Koriaks are supposed not to exceed 2000 families. These people are divided into two classes, *viz.* the wandering and the fixed Koriaks. The latter inhabit the northern part of the isthmus of Kamtschatka, and the whole coast of the eastern ocean, from thence to the Anadyr. The country of the former stretches along the N.E. of the sea of Ochotik, to the river Penskina, and westward towards the river Koyoma. The fixed Koriaks have a strong resemblance to the Kamtschadales; and, like them, depend altogether on fishing for subsistence. Their dress and habitations are of the same kind. They are tributary to the Russians, and under the district of the Ingiga. The wandering Koriaks occupy themselves entirely in breeding and pasturing deer, of which they are said to possess immense numbers; so that it is not unusual for a single chief to have a herd of 4 or 5000. They despise fish, and live altogether on deer. They have no balagans, and their only habitations are like the Kamtschadale jouts, with this difference, that they are covered with raw deer-skins in winter, and tanned ones in summer. Their sledges are drawn by deer, and never by dogs; which, like the latter, are always spayed, in order to be trained to this business. The draft deer pasture in common with the others; and when they are wanted, the herdsman makes use of a certain cry, which they instantly obey, by coming out of the herd. Captain King was informed by the priest of Paratouca, that the two nations of the Koriaks and the Tschutiki speak different dialects of the same language; and that it does not bear the least resemblance to the Kamtschadale. According to the account of Lesslepe, the manners of the fixed Koriaks are a composition of duplicity, mistrust, and avarice; and they are said to have all the vices of the northern nations of Asia, without the virtues. Robbers by nature, they are suspicious, cruel, and incapable either of pity or benevolence. Perfidious and savage in their disposition, they are in a state of

perpetual hostility with their neighbours; and hence every individual is led to cherish a ferocious spirit. Hence also they acquire an inflexible courage, and glory in a contempt of life. Superstition also imposes upon them a law which obliges them to conquer or to die. The vicinity of the Russian settlements has hitherto produced no change in the mode of life of the resident Koriaks. Their commercial intercourse with the Russians merely seem to render them more avaricious and more addicted to plunder; and they resist every attempt of civilization. The wandering Koriaks were for a long time more intractable. Their regular occupation is hunting and fishing, and when the season does not allow of their pursuing it, they sleep and smoke, and indulge themselves in drunkenness. Their passion for strong liquors has led them to invent a drink, equally powerful with brandy, which is scarce and dear, and which they extract from a red mushroom, known in Russia as a strong poison, under the name of "moukhamorr." With a preparation of this they entertain their guests for one, two, or three days, till their stock is exhausted. The features of a majority of the Koriaks are not Asiatic; but they might be considered as Europeans, if it were not for their low stature, ill shape, and the colour of their skin. Others of them have the same characteristic outlines with those of the Kamtschadades. Among the women particularly, there are very few who have not sunk eyes, flat noses, and prominent cheeks: the men are almost wholly destitute of beards, and have short hair. The women carry their children in a sort of arched basket, in which the infant is placed in a sitting posture, and sheltered from the weather. When a Koriak dies, his relations assemble, erect a funeral pile, and place a portion of the wealth of the deceased, and a stock of provisions, consisting of rein-deer, fish, brandy, and whatever else they conceive will be wanted by him for his journey, and prevent his starving in the other world. The body is exhibited in his best attire, and lying in a kind of coffin; and after receiving the adieu of his attendants, who have torches in their hands, they hasten to reduce it to ashes. They wear no mourning, as they feel only the regret of a temporary absence, and not of an eternal separation; and the funeral pomp generally terminates in the intemperate use of liquor and tobacco. Death is regarded by them as a passage to another life, in which other joys are reserved for them. They acknowledge a supreme being, the creator of all things, whose residence is the sun; but they neither fear nor worship him. Goodness, they say, is his essence; and it is impossible, as all good proceeds from him, that he should do any injury. The principle of evil they consider as a malignant spirit, who divides with the sovereign good being the empire of nature. To this evil spirit they pay respect, and perform their devotion, in order to pacify his wrath, and to avert the calamities which he inflicts. Accordingly they offer him, as expiatory sacrifices, various animals that have begun to exist: rein deer, dogs, the first fruits of their hunting and fishing, and the most valuable of their possessions. Supplications and thanksgiving constitute their devotional exercises. His votaries have no temple nor sanctuary. This imaginary god is worshipped in all places; and they conceive that he hears their prayers in the solitude of the desert, as well as in society; and that he is rendered propitious by their indulging to drunkenness in their jouts: for, strange as it may seem, drunkenness is among these people a religious practice, and the basis of all their solemnities. See KAMTSCHATKA and TSCHEUTSKI.

**KORKAN**, or **JORJAN**, a flat district on the east side of the Caspian sea, subject to great heat, frequent inundations, and an unwholesome air; but the soil is fertile, and produces dates, wine, cotton, silk, and corn.

**KORKINA**, a town of Russia, in the government of Tobolsk; 20 miles S.W. of Iselim.

**KORKUB**, a town of Persia, in Chufitan; 30 miles W.S.W. of Jondifabur.

**KORMAND**, a town of Hungary, on the Raab; 52 miles S. of Vienna.

**KORMESHTY**, mountains of Ireland, in the county of Mayo; 17 miles N.W. of Castlebar.

**KORMUDSEH**, a town of Persia, in the Farfistan; 100 miles S.W. of Schiras. N. lat. 28 37'.

**KORNBURG**, a town of Sturia, on the Raab; 24 miles S.E. of Graz.

**KORN DYCKT**, a small island of Holland, in the Meuse, with a town of the same name; about 7 miles W.N.W. of Willemstadt.

**KORN-NEUBURG**, a town of Austria, on the north side of the Danube, opposite to Closter-Neuburg; 8 miles N. of Vienna. N. lat. 48° 19'. E. long. 16 40'.

**KORNOCK**, an island near the west coast of West Greenland. N. lat. 61° 38'. W. long. 47° 40'.

**KOROL**, a town of Hindoostan, in Guzerat; 20 miles E. of Baroch.

**KOROLOVETZ**, one of the eleven districts of the government of Novogorod Severkoi in Russia, situated on a rivulet falling into the Defna; 40 miles S.E. of Novogorod Severkoi.

**KOROMANTEES**, a general appellation given in the British West Indies to most of the negroes purchased on the Gold Coast, from *Koromantyn*, one of the earliest of our factories on this part of the African coast; which is now become an insignificant village, or factory, in possession of the Dutch. It is situated in the kingdom of Fantyn, two miles from the fort of Anamaboe. The Koromantyn or Gold Coast negroes are distinguished from all others by firmness both of body and mind, a ferociousness of disposition, and, at the same time, activity, courage, and a kind of stubbornness, which prompts them to enterprises of difficulty and danger, and enables them to meet death, in its most dreadful forms, with fortitude or indifference. Many of them had been slaves in Africa, and others had been engaged in perpetual hostility with one another; and they were, therefore, prepared for endeavouring, even by means the most desperate, to regain the freedom of which they had been deprived. Accordingly they have been disposed to excite or to encourage rebellion. This was the case in Jamaica in the year 1760. The firmness, and intrepidity, and contempt of death, which are distinguishable in adults, brought from the Gold Coast, are visible even in boys at the age of ten years. Edw. W. Indies, vol. ii.

**KOROP**, a town of Russia, and district of the government of Novogorod Severkoi, seated on the left shore of the Defna.

**KOROROFAH**, a country of Africa, situated east of Wangara.

**KOROTCHA**, a town of Russia, and district of the government of Kurik, seated on a rivulet of the same name, that falls into the Donetz; 44 miles E.S.E. of Kurik.

**KOROTOIAN**, a town of Russia, and district of the government of Voronez, situated on the Don; 20 miles S. of Voronez.

**KOROVA**, a small island in the sea of Ochotik; 240 miles E. of Ochotik. N. lat. 59° 20'. E. long. 150° 40'.

**KORPIKYLÄ**, a town of Sweden, in West Bothnia; 14 miles N.N.W. of Tornea.

**KORPLAX**, a town of Sweden, in Tavastland; 68 miles N.N.E. of Tavasthus.

**KORPO**, an island of Sweden, in the Baltic, near the

fourth-west coast of Finland, of an oval form, about 20 miles in circuit; having on the north-west coast a town of the same name, and several villages. N. lat. 60° 9'. E. long. 21° 25'.

KORPONA, a town of Hungary; 28 miles N.N.E. of Grau.

KORS, a town of Persia, in the province of Adirbeizan; 80 miles S.S.E. of Erivan.

KORSA, a town of Hindoostan, in the subah of Delhi; 26 miles W. of Delli.

KORSAKI, or CORSAC, in *Zoology*. See Fox.

KORSEK, in *Geography*, a town of Poland, in Volhynia; 32 miles E. of Lucko.

KORSENIÉC, a town of Lithuania; 60 miles E. of Wilna.

KORSEWALAN, a small island in the East Indian sea. S. lat. 7° 39'. E. long. 128° 40'.

KORSNÄS, a town of Sweden, in East Bothnia; 25 miles S.S.E. of Wafa.

KORSÖER, a fortified town of Denmark, lying at the mouth of a small bay, forming a well-protected harbour, on the Great Belt. It has a few good houses, which belong to merchants, &c. Some trade is carried on from hence up the Baltic, and in the vicinity. The fortifications are in ruins, and the town is chiefly inhabited by fishermen and seafaring people. The breadth of the Great Belt between Korsöer and Nyeborg is about 22 miles.

KORSUN, a town of Poland, in the palatinate of Kiev; 44 miles S.S.E. of Biala-cerkiev.

KORSZANY, a town of Samogitia; 25 miles N.W. of Midiki.

KORTCHERA, or KORTCHEF, a town of Russia, and district of the government of Tver, on the Volga.

KORTHOLT, CHRISTIAN, in *Biography*, a native of Holstein, was born at Burg, in the isle of Femen, in the year 1633. Having acquired the rudiments of learning, he was, at the age of sixteen, sent to Sleswick, where he pursued his studies two years; and from this place he went to the college of Steutin, made great proficiency in learning, and obtained high applause by the able manner in which he maintained two theses. He continued his literary studies at Rostock, to which place he removed in 1652; and afterwards he delivered lectures, in his own apartments, on logic, metaphysics, and Hebrew. In 1656 he took his degree of doctor in philosophy, after which he went to study at the university of Jena, where he distinguished himself by his academical acts, and by his private lectures on philosophy, the oriental languages, and divinity. In 1661 he went to the court of Schwerin, at the invitation of the duke of Mecklenburg, in whose presence, as well as in the presence of a great number of the nobility, he disputed two days on theological topics with two learned Roman Catholics, one an Austrian, and the other a Pole; and on a similar invitation he disputed, in the following year, with a Roman Catholic of Paris. On these occasions he acquired universal applause from the auditors. In 1662 he was nominated to the chair of the Greek professor at Rostock, and took his degree of doctor of divinity. From thence he removed to Kiel, became second professor of divinity, and afterwards vice-chancellor and first divinity professor. In 1680 the duke of Holstein bestowed upon him the professorship of ecclesiastical antiquities, and, in 1689, declared him vice-chancellor for life. Five times he had the honour of being nominated vice-rector at Kiel; and it is universally allowed that he performed the duties of his various posts with great ability and perseverance. He died in the year 1694, at the age of sixty-one, much respected and honoured by his friends

and the university of Kiel. To the republic of letters he had been an ornament by a number of curious, learned, and useful works; the titles of which are given in Moreri, and also in Bayle, to which the reader is referred for further information.

KORTISJARVE, in *Geography*, a town of Sweden, in the province of Wafa; 43 miles E.N.E. of Wafa.

KORTRICHT, a post-town of America, in Delaware county, New York, in which are 1513 inhabitants.

KORTSCHIN, a town of Poland, in the palatinate of Sandmirz; 40 miles S.W. of Sandmirz.

KORTY, a town of Africa, in Sennaar, on the borders of the Nile, where the caravans quit the river, and turn to the Desert, in order to avoid the pirates of the Nile; 60 miles E. of Dongolu.

KORYSOWA, a town of Poland, in the palatinate of the Kiev; 32 miles S.W. of Kiev.

KORZÉCZOW, a town of Poland, in the palatinate of Sandmirz; 24 miles S. of Sandmirz.

KORZELLAN, a town of the duchy of Warlaw; 70 miles N.W. of Warlaw.

KORZYMECK, a town of Poland, in the palatinate of Lublin; 38 miles N.N.E. of Lublin.

KOS, in the *Jewish Antiquities*, a measure which held the quantity of four cubic inches, and something over. This was the cup of blessing, out of which they drank when they gave thanks after solemn meals, as on the day of the passover.

KOSA, in *Geography*, a town of Russia, in the government of Perm; 48 miles W. of Solikamsk.

KOSARIA, in *Botany*, Forsk. *Egyptiaco-Arab.* 164. Ic. t. 20. A latecent fetid very singular plant, found by Forskall in the coffee plantations at Hadie. Jussieu, on the authority of Niebuhr, refers it to *Dorstenia*, and it is *D. radiata* of Willdenow, Sp. Pl. v. i. 683. *Kosar* is its Arabic name. The stem is thick and fleshy, like that of some African *Euphorbia*, bearing on the upper part several oblong, jagged, stalked leaves. The flowers have a radiated common receptacle, and grow on stalks, from tubercles at the sides of the stem. The plant bruised is applied as a cure for eruptive disorders.

KOSCEA, in *Geography*, a town of Walachia; 16 miles N. of Kimmik.

KOSCIABAD, a town of Persia, in the province of Kerman; 60 miles S.W. of Sirjian.

KOSCLOW, a town of Austrian Poland, in Galicia; 60 miles E. of Lemberg.

KOSEL, a town of the county of Tyrol, on the Brenta; 21 miles E. of Trent.

KOSHA, in *Zoology*. See *Siberian Dog*.

KOSHAB, in *Geography*, a town of Curdistan; 20 miles S. of Van.

KOSHANIA, a town of Great Bucharia; 30 miles W. of Samarand.

KOSHANIKUT, a town of Persia, in the province of Segeftan; 110 miles N.E. of Bost.

KOSKANUADEGO, a river of Pennsylvania, which runs into the Alleghany, N. lat. 41° 52'. W. long. 79° 20'.

KOSKIN, a town of Norwegian Lapland; 108 miles S.W. of Pofanger.

KOSKIS, a town of Sweden, in Tavastland; 22 miles E. of Tavasthus.—Also, a town of Sweden, in the government of Abo; 20 miles E.N.E. of Abo.

KOSL, a town of Arabia, in the province of Yemen; 18 miles W.N.W. of Chamir.

KOSLOF, a town of Russia, and district of the government

ment of Tanbof, on the rivulet Ufnoi Voronetz; 48 miles N.W. of Tanbof.

KOSOLULI, a town of European Turkey, in Bessarabia; 28 miles N.N.W. of Bender.

KOSREUKEN, a town of Natolia; 16 miles N.W. of Kiutaja.

KOSSAR, a town of Poland, in Volhynia; 28 miles W.N.W. of Lucko.

KOSSATZ, a town of Bohemia, in the circle of Koniggratz; 12 miles W. of Koniggratz.

KOSSOW, a town of Lithuania, in the palatinate of Novogrodek; 56 miles S.S.W. of Novogrodek.

KOST, a town of Great Bucharia; 70 miles S.S.E. of Balk.

KOSTEL, a town of Moravia, in the circle of Brunn, anciently the see of a bishop; 25 miles S. of Brunn. N. lat. 48° 50'. E. long. 16° 47'.

KOSTELOTZ, a town of Bohemia, in the circle of Koniggratz; 16 miles S.E. of Koniggratz.—Also, a town of Bohemia, in the circle of Kaurzim, on the Elbe; 12 miles N.N.E. of Prague. N. lat. 50° 12'. E. long. 14° 45'.—Also, a town of Moravia, in the circle of Olmutz; 7 miles S.W. of Olmutz.

KOSTENBLUT, a town of Silesia, in the principality of Breslau; 18 miles W.S.W. of Breslau. N. lat. 50° 59'. E. long. 16° 40'.

KOSTESH, a town of European Turkey, in Moldavia; 16 miles N. of Birlat.

KOSTIAN, or KOSTAN, a town of the duchy of Warfaw; 20 miles S.E. of Pofen.

KOSTOLETZ, a town of European Turkey, in Servia; 18 miles E. of Semendria.

KOSTOLNA, a town and castle of Hungary; 24 miles N.W. of Topolztan.

KOSTROMA, a government, town, and river of Russia; the government, formerly included in that of Moscow, is about 210 miles from E. to W., and 150 from N. to S. The capital, Kostroma, with its district, is situated near the Volga, and furrounded by a rampart. N. lat. 57° 30'. E. long. 41° 14'. The river runs into the Volga at the capital.

KOSUMA, a town of Japan, in the island of Nippon; 60 miles W.S.W. of Meaco.

KOSZARA, a town of Bosnia; 12 miles N. of Banjaluka.

KOSZO, a town of Lithuania, in the palatinate of Novogrodek; 60 miles S.S.W. of Novogrodek.

KOSZULA, a town of European Turkey, in Moldavia; 36 miles N.W. of Jaffy.

KOTAH. See KOTTA.

KOFAIGROD, a town of Poland, in Podolia; 12 miles S.E. of Kaminiac.

KOTAN. See HOTOH.

KOTANA, a town of Hindoostan, in the circar of Sirhind; 40 miles E.N.E. of Sirhind.

KOTANKODERIPO, a town on the E. coast of Ceylon; 10 miles S.E. of Batacala.

KOTAR, a province of Dalmatia, about 30 miles long, and 20 broad; called also the county of Zara, from its capital Zara.

KOTCHA, a town of Russia, in the government of Perm; 60 miles W. of Solihanfk.

KOTCHEEL, a town of Hindoostan; 10 miles S. of Agimere.

KOTCHELOVSKAIA, a town of Russia, in the country of the Cossacks, at the conflux of the Donetz and the Don; 52 miles E. of Azoph.

KOTCHENGSKA, a town of Russia, in the government of Irkutsk, on the Ilm; 60 miles W.S.W. of Orlena.

KOTCHUG, a town of Russia, in the government of Irkutsk, on the Lena; 16 miles E. of Vercholenk.

KOTELNA, a town of Poland, in the palatinate of Kiev; 60 miles W.S.W. of Kiev.

KOTELNITCH, a town of Russia, and district of the government of Viatka, on the Viatka; 36 miles S.W. of Viatka.

KOTIAKOF, a town of Russia, and district of the government of Simbirsk, on the right side of the river Sura.

KOTIGNOW, a town of Poland, in Podolia; 34 miles N. of Kaminiac.

KOTINGHY, a town of Hindoostan, in the circar of Ruttunpour; 36 miles N.E. of Raypour.

KOTLAN, a town and capital of a district of the same name, in Great Bucharia; 200 miles S.E. of Samarand. N. lat. 38° 10'. E. long. 68° 36'.

KOTMANA, a town of Valachia, near the source of a river of the same name, which runs into the Danube; 45 miles N.W. of Buchareit.

KOTNA, a town of Great Bucharia, on the Gihon; 40 miles S. of Bokhara.

KOTNAR, a town of Moldavia; 24 miles W.S.W. of Jaffy.

KOTO, or LAMPI, a small and barren district of Africa, on the Slave Coast, in the Whidah country, extending about 18 miles along the Atlantic; the land is flat and the soil sandy. Slaves have been the chief article of trade with the Europeans. The chief town is called Koto, or Verku.

KOTONA, a town of Hindoostan, in Mewat; 25 miles N.N.W. of Cotputly.

KOTOO, one of the small Friendly islands, furrounded by coral reefs, and scarcely accessible by boats; not more than 1½ mile, or two miles long, but not so broad. The N.W. end of it is low, like the islands of Hapae; but it rises suddenly in the middle, and terminates in reddish clayey cliffs at the S.E. end, about 30 feet high. In that quarter the soil is of the same sort as in the cliffs; but in the other parts, it is a loose black mould. It produces the same fruits and roots which are found in the other islands; it is tolerably cultivated, but thinly inhabited. The water is dirty and brackish. The burying places are neater than those of Hapae; 16 miles N. of Anamooka. S. lat. 19° 58'. E. long. 185° 11'.

KOTRA, a town of Lithuania, in the palatinate of Troki; 15 miles E.S.E. of Grodno.

KOTROU, a town of Africa, on the Ivory Coast.

KOTSKA, a town of Russia, in the government of Irkutsk, on the Tunguska; 140 miles N.N.W. of Ilimfk.

KOTLA, or KOTAH, a circar of Hindoostan, in Malwa; bounded on the N. by Rantampour, on the E. by Yohud and Chandaree, on the S. by Kitchwara, and on the W. by Meywas, or Oudipour. It is crossed in the centre by the river Jeshul.—Also, a town, which is the capital of the circar, seated on the Jeshul. This town is of considerable extent, of an irregular oblong form, inclosed with a stone wall and round bastions. It contains many good stone houses, and several handsome public edifices. The palace of the rajah is an elegant structure. The streets are paved with stone. It has, on the W., the river Chumbul, and on the N.E. a lake, smooth and clear as crystal, which, on two sides, is banked with stone, and has, in the middle, a building called "Jug-mundul," which is consecrated to religious purposes. Near the N.E. angle of the town, and

only separated from the lake by the road, is the "Chetrea," or manoleum of one of the knights. In front of this handsome building are placed several statues of horses and elephants, hewn out of stone. To the fourth of the city, about three furlongs beyond the wall, is a place consecrated to the celebration of Rum's victory at Lanka. Behind this, in a recumbent posture, is an enormous statue of earth, which represents the demon "Rawoon." On the day of celebration the principal people assemble; and the fire of the guns is directed against the earthen wall, which make a breach in it, and deface or demolish the image of Rawoon. The revenue of Kotah is 30 lacks of rupees; out of which is paid, though not regularly, a tribute of two lacks yearly to Sindiah, and as much to Holcar. N. lat. 25° 15'. E. long. 76° 20'. *Asiat. Ref.* vol. vi.

KOTTIMBEL, a small island in the Red sea. N. lat. 17° 57'. E. long. 41° 25'.

KOTFIS, a town of Austria; 10 miles S.E. of Zwettl.

KOTTCOMB, a town of Africa, in Bornou; 75 miles S. of Bornou.

KOTTOKOLEE, a town of Africa, and capital of a country of the same name, in Negroland. N. lat. 13°. E. long. 5° 40'.

KOPUL, a town of Hindoostan, in Bundelcund; 20 miles S. of Pannah.

KOTY, a town of Bundelcund; 18 miles S. of Callinger.

KOTZENAU, a town of Silesia, in the principality of Lignitz; 16 miles N.W. of Lignitz.

KOU, a town of Turkish Armenia; 30 miles S.E. of Akalkiké.

KOUAKAND, a town of Turkestan, on the Sirt; 60 miles S. of Tashkund.

KOUANG-SI, or QUANG-SI, a city of China, of the first class, in the province of Yun-nan. N. lat. 24° 40'. E. long. 103° 28'.

KOUANG SIN, or KOANG-SIN, a city of China, of the first class, in the province of Kiang-si. This city is surrounded by mountains, many of which are lofty, and about some of them with forests, and others with fine crystal; the country, however, is fertile and well inhabited; many of the mountains are cultivated, and are no less productive than the most fertile plains. They make a very good paper in this city, and the best candles in the empire. N. lat. 28° 27'. E. long. 117° 44'.

KOUANIN, in the *Chinese Language*, the name of a tutelary deity of women. The Chinese make great numbers of the figures of this deity in white porcelain, and send them to all parts of the world, as well as keep them in their own houses. The figure represents a woman with a child in her arms. The women, who have no children, pay a sort of adoration to these images, and suppose the deity they represent to be of power to make them fruitful. It has been supposed, by many Europeans, that these images were meant to represent the Virgin Mary, with our Saviour in her arms; but this is an idle opinion; the Chinese having been fond of this figure in all times that we have an account of. The statue always represents a handsome woman, very modestly attired.

KOVAR, in *Geography*, a town of Hungary; 16 miles N.W. of Bilritz.

KOVARABAD, a town of Great Bucharia, in the kingdom of Balk; 90 miles W. of Balk.

KOUCO, a town of Africa, in Upper Guinea, on the river Scherbro; 36 miles from the sea.

KOUDJEH, a town of Asiatic Turkey, in Natolia; 48 miles W. of Kiutaja.

KOUDRA, a town of Hindoostan, in Bahar; 27 miles S. of Burwah.

KOUDUR, a town of Hindoostan, in Dowlatabad; 7 miles N.N.W. of Beder.

KOUE-HOA, a city of China, of the first class, in the province of Yun-nan. N. lat. 23° 26'. E. long. 103° 56'.

KOUEIT, 柯雷, *Cathem*, or *Kadhma*, a sea-port town of Arabia, in the province of Lachia, situated in a bay of the Persian gulf, and governed by a feichei, who is vassal to the feichei of Lachia, but occasionally aspires to independence. Whenever the feichei of Lachia advances with his army, the citizens of Koueit retreat with their effects into the little island of Feludsje. The inhabitants are chiefly occupied in fishing, and particularly for pearls; in which business they are said to employ more than 800 boats. N. lat. 27° 40'. E. long. 48° 10'.

KOUEI-TE, a city of China, of the first class, in the province of Ho-nan, situated in an extensive and fertile plain, between two large rivers; but in order to render it opulent, it wants an increase of inhabitants and trade. The air is pure, and the fruits, especially oranges and pomegranates, are excellent. The inhabitants are distinguished by their mildness and hospitality. The jurisdiction of this city comprises seven towns. N. lat. 34° 30'. E. long. 115° 29'.

KOU-HISAR, a town of Asiatic Turkey, in Caramania; 12 miles N.W. of Akferai.

KOVINSKOL, *Nivnei*, *Sred*, and *Yerebnei*, towns of Russia; the first, on an island in the river Kolima, N. lat. 69° 40'. E. long. 156° 24'.—the second, in the government of Irkutsk, on the Kolima, N. lat. 65° 5'. E. long. 158° 14'.—the last, in the same government, on the same river, N. lat. 66° 15'. E. long. 149° 14'.

KOUKOU, or KOUGOU, a town of Asia, in the kingdom of Gaaga; the residence of a powerful king in the twelfth century.

KOULIK, in *Ornithology*. See *RAMPHASTOS Pipivivorus*.

KOULI-KHAN, THAMAS, or NADIR SHAH, in *Biography*, was born in the province of Khorasan; his father was chief of a branch of the Afghans, which rank descended to Nadir when he was a minor, but his uncle usurped the government. On this he entered into the service of the Beglerbeg, governor of Muscada, in Khorasan, who gave him the command of an army sent against the Tartars. Nadir, on this occasion, gave signal proofs of his prowess and military skill; he gained a complete victory with an inferior force, and took the Tartar general prisoner. For this able conduct, the Beglerbeg appeared extremely grateful, and, at first, treated Nadir with great distinction, but at length he became jealous of his aspiring spirit, and refused to promote him in the army as he had promised, and when Nadir complained of his breach of faith, he caused him to be banished. Driven to desperation, he joined a banditti of robbers, and committed great ravages. The Afghans having made themselves masters of Ipahan, and the Turks and Muscovites ravaging other parts of Persia, Schah Thamas applied to Nadir for assistance. He, without hesitation, entered into the service of the schah; but one of his first actions was to murder his uncle who had usurped his title. For his great services against the Turks, he was ennobled with the title of khan, and honoured with other distinctions; nevertheless, he deposed Thamas, and placed a son of that prince on the throne by the name of Abbas III. to whom he became regent. Under a prince, six months old only, Kouli-khan meditated to be the real sovereign of Persia. He disposed of every thing according to his own pleasure: he defeated the Turks, and obliged them to sue for peace. Within a few months the prince died,

died, and Kouli-khan was elected to the vacant throne, and on his accession assumed the name of Nadir Shah. His reign was marked with a high degree of glory, but his government was to the last degree despotic. In the year 1739, he conquered the Mogul empire, making himself master of Delhi, where he acquired immense riches. He there assumed the title of emperor of the Indies, but disgraced himself by ordering a massacre of the inhabitants of Delhi, in revenge for an insult offered to some of the troops. The project was discovered, and the profcribed party assembled with a view of taking revenge. They were surrounded by a powerful army, which was devoted to the schah. It was necessary to force a confidential guard, and they were neither acquainted with the situation of the emperor's tent, nor knew how to distinguish it from the rest. Despair, however, enabled them to surmount every obstacle. Five of them rushed into the pavilion, and the emperor was instantly known by the glitter of the ornaments with which he was covered. In defending himself he slew two of the conspirators, when a third gave him a mortal wound. He exclaimed "spare me, and I will pardon all." "No," replied the fourth, "thou hast never shewn mercy to any, and we will shew none to thee." They then dispatched him, and severed his head from his body. This event took place in 1747. Univer. Hist.

KOUM, in *Geography*, a town of Thibet; 15 miles N. of Darmadjira.

KOUNDGL-AGHIZ, a town of Asiatic Turkey, in the government of Sivas, on the coast of the Black sea; 15 miles N.W. of Samfoun.

KOUNMEON, a town of Birmah; 48 miles N. of Ava. N. lat. 22 35'. E. long. 97° 56'.

KOUPHOLITE, in *Mineralogy*. See PRENNITE.

KOURAH, in *Geography*, a town of Natolia; 44 miles W. of Kutaja.

KOURATTY, a town of Hindoostan, in Dowlatabad; 15 miles W. of Carmulla.

KOURESTAN, a town of Persia, in Laristan; 36 miles S. of Tarcam.

KOURMA, or KURMA, a small town of Dar-Für, W. by S. of Cobbé, at the distance of 12 or 13 miles.

KOVROF, a town of Russia, and district of the government of Volodimir, on the river Kliasma; 24 miles E. of Volodimir.

KOUROU, a river of Guiana, which runs into the Atlantic, N. lat. 5 5'. W. long. 53 36'.

KOUS. See COUS and APOLLINIS *Urbs*.

KOUSSIE, a river of Africa, which runs into the Atlantic, S. lat. 30° 12'. E. long. 17 50'. This river is the northern boundary of the colony of the Cape of Good Hope.

KOUSSIS. See KAFFERS.

KOUTA, a town of Hindoostan, in Vissipour; 10 miles N. of Merritch.

KOUXEURY, in *Ichthyology*, a fish found in the lakes of South America, whose palate is employed by the Indians for polishing their carvings in wood. It is unknown to which genus this fish belongs.

KOWAL, in *Geography*, a town of Asia, in the province of Adirbeitzan; 120 miles W. of Tauris.

KOWAL, or COWAL, a town of Poland, in the palatinate of Brzesc; 16 miles E. of Brzesc.

KOWAR, a town of Africa, in the kingdom of Burfalli, on the river Gambia, which formerly had a large traffic in slaves.

KOWARSKO, a town of Lithuania, in the palatinate of Wilna; 10 miles N. of Wilkomierz.

KOWEL, a town of Poland, in Volhynia; 28 miles N.W. of Lucko.

KOWERO, a town of Sweden, in the government of Kuopio; 80 miles E.S.E. of Kuopio.

KOWNO, or KOWIA, a town of Lithuania, in the palatinate of Troki, at the conflux of the rivers Wilna and Niemen, containing eleven churches, one of which is Lutheran; 40 miles N.W. of Troki. N. lat. 54° 54'. E. long. 23° 45'.

KOWRA, a town of Birmah; eight miles N. of Raynangong.

KOWRAH, a town of Hindoostan, in Guzerat; 10 miles S. of Gogo.

KOWROWA, a village in Karakakooa bay, rendered infamous by the murder of captain Cook. See COOK, and KARAKAKOOA.

KOYAHT, a small American isle, at the S. end of Washington's isle, at the entrance of a strait separating a small isle from the largest.

KOYDANOW, a town of Lithuania, in the palatinate of Minsk; 16 miles S.W. of Minsk.

KOZAK, JOHN SOPHONIOUS, in *Biography*, a physician of some celebrity, was a native of Bohemia, and practised his profession at Bremen during a series of forty-five years, and died there on the 30th of January 1685, at the age of 82. He was an admirer of Robert Fludd, the rosyercrucian, and adopted many of his fanciful notions in his writings. He left the following works: "Discurfus Physic quatuor, de rerum naturalium principijs, de generationum et transmutationum modis, morborum causis et speciebus, methodo curationum," Bremen, 1631.—"Anatomia vitalis Microcosmi," ibid. 1636.—"Tractatus spagyrici de Phlebotomis et de Fontanellis," ibid. 1655.—"Tractatus Medicus de Sale, ejusdemque in corpore humano resolutionibus salutaribus et noxis," Francfort, 1663.—"Tractatus de Hæmorrhagiâ," Ulm, 1666. Eloy, Dict. Hist.

KOZANGRODEK, in *Geography*, a town of Lithuania, in the palatinate of Brzesc; 42 miles E. of Pinski.

KOZAR, a town of Persia, in the province of Adirbeitzan; 75 miles W. of Tabris.

KOZDAR, a town of Asia, in the kingdom of Candahar, on the borders of Persia; 180 miles S.S.E. of Candahar. N. lat. 30° 30'. E. long. 67° 15'.

KOZELSK, a town of Russia, and district of the government of Kaluga, seated on the left side of the small river Shifra, which falls into the Oeca; 36 miles S.S.W. of Kaluga.

KOZELUCH, JOHN ANTHONY, in *Biography*, music director in the Metropolitan church at Prague, was born at Wellwar, in Bohemia, 1738. He studied and lived privately many years at Prague, long before he obtained any professional honours or preferment. His first advancement was to the place of chapel-master of Chril-church, and the next, in 1784, was that of organist of the dan kirk or cathedral. He afterwards distinguished himself as a composer both for the church and theatre. Among his productions for the latter are his Italian operas of Demofonte, and Alessandronell' Indie, by which he very much increased his reputation. It is a pity, says Gerber (*Musical Lexicon*) that more of his works have not been published!

KOZELUCH, LEOPOLD, a celebrated harpsichord-master and composer for that instrument at Vienna, was born at Wellwar in 1753. He had learned the principles of music regularly at 18 years old, and the art of singing. At 19, he was brought to Prague, where he studied at the same time composition and the harpsichord. But before he was 18, he produced specimens of his genius and talents. In

1771, he published his first essay at composition, in a ballet for the Prague playhouse. This was followed by 24 others and two pantomimes. After this he was invited to Vienna, where he established himself, and whence his fame and works were circulated all over Europe, with those of Vanhal, Hady, and Mozart. His style is more easy than that of Emanuel Bach, Haydn, or Mozart; it is natural, graceful, and flowing, without imitating any great model, as almost all his contemporaries have done. His modulation is natural and pleasing, and what critics of the old school would allow to be warrantable. His rhythm is well phrased, his accents well placed, and harmony pure. He published 20 or 30 different sets of harpichord and piano-forte sonatas, some with and some without accompaniments, which were not only in high favour with the ladies of Vienna, but with female dilettanti all over Europe. The adagios and violin accompaniments to all his pieces have been universally admired. If any one set of his sonatas was more in favour at Vienna than another, it was his 12th set. He was the first in Vienna who published duets for two performers on one-keyed instruments, and several of them are excellent. He published likewise a duet for two harpichords, or pianofortes, with many concertos for the harpichord à grand orchestre.

Nor has he confined himself to instrumental music; he has set a French comic opera, *Le Muret*; *Didone abbandonata*, a serious opera in Italian; *Moses in Egypt*, a grand oratorio, in Italian, 1787, the best for the widows and children of decayed musicians, that had been composed for that society. The same year he was engaged, by a society of 150 subscribers, to compose for the Italian opera: and for the national theatre, or German playhouse, he composed airs, cantatas, and ballets without end. In 1781, on the death of the empress queen, he composed the music to a very pathetic dirge. Joseph and his Brethren, a cantata, with a harpichord accompaniment only. Pfeifel's cantata for Mad. Paradis, his scholar in 1784, with innumerable lessons and concertos expressly for that blind but admirable performer; 15 songs to German words, and cantatas in Italian, with accompaniments for two French horns, two violins, hautbois, tenor, and base; three symphonies, various sets of trios, and quartets; two concertos for clarinets, and two for the violoncello.

**KOZIN**, in *Geography*, a town of Poland, in Volhynia; 24 miles S. of Lucko.

**KOZLAN**, a town of Bohemia, in the circle of Rakonitz; 12 miles S.W. of Rakonitz.

**KOZLOV**. See **KOSLOP**.

**KOZMODEMIANSK**, or **KUSMODEMIANSK**, a town of Russia, and district of the government of Kazan or Casan, on the Volga; 100 miles N.W. of Kazan.

**KOZU**, a town of Poland, in the palatinate of Volhynia; 56 miles E. of Lucko.

**KRABBen**, a small island in the Atlantic, near the coast of Guiana. N. lat. 0° 10'. W. long. 57° 50'.

**KRAFT**, **GEORGE WOLFGANG**, in *Biography*, a celebrated mathematician, was born at Durlingen, where his father was pastor. He received a good education, but applied himself chiefly to geometry and natural philosophy, in which he made great progress under the celebrated Bulingger, whose friendship and patronage he enjoyed. In 1728, he took his degree of master of arts, and almost immediately set out for Peterburgh, and was appointed teacher, in that city, of mathematics in the New college, founded by the Imperial Academy of Sciences. At the end of five years, he was appointed a professor of natural philosophy. He was, in consequence of his great reputation, recalled to his

native country, which obliged him to solicit permission to resign his professorship. This was accompanied with the most distinguished testimonies of high esteem; the academy elected him an honorary member, and settled upon him a handsome pension. He quitted Peterburgh in 1744, and arrived at Tubingen, where he entered on his office as professor of mathematics and natural philosophy, which he retained till his death in 1754. He was author of many very valuable works, among which are "Institutiones Geometriæ sublimioris;" "Prælectiones Academicæ publicæ in Physicam Theoreticam;" "De vera experimentorum Physicorum constitutione;" "De Hydrostaticis Principiis generalibus."

**KRAGG STONE**, a rock found near Belfast, belonging to the stetztrapp formation, but which, together with those rocks called wacke and mullen, is kept distinct from basalt by Mr. Kirwan, who gives the following description of the kragg stone. Colour greyish-red or reddish-grey, exceeding porous: the pores often filled with various crystallizations. Lustre and transparency none. Fracture uneven and earthy; fragments 2; hardness from 5 to 7. Spec. grav. 2.314. Feels rough and harsh; gives a yellowish-grey streak. At 138 it melted into a reddish-brown porcelain mass. It is often mixed with globules of magnetic iron-stone, which adds considerably to its specific weight.

Wacke, mullen, and kragg (Mr. Kirwan adds) have been by most writers confounded with what he considers as trap; but their colour, specific gravity, and fusibility, shew that they must be distinguished.

**KRAGLIKIU**, in *Geography*, a town of Moldavia; 95 miles N.N.W. of Jassy.

**KRAGOJEVA**, a town of Servia; 45 miles N.E. of Novibazar.

**KRAGOWATZ**, a town of Servia; 30 miles N.N.W. of Belgrade.

**KRAKA**, a town of Walachia, on a considerable lake, that communicates with the Danube; 30 miles S.S.E. of Bucharest. N. lat. 44° 5'. E. long. 26'.

**KRAKAN**, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 30'. E. long. 19° 33'.

**KRAKATOA**, a small island in the straits of Sunda. S. lat. 6° 6'. E. long. 105° 21'.

**KRAKAW**, or **KRAKO**, a town of the duchy of Mecklenburg, on a lake; 10 miles N. of Guldrow.

**KRAKEN**, in *Zoology*, a marine animal of most stupendous magnitude, said to have been seen in the northern seas, and particularly near the coasts of Norway and Sweden. The existence of such an enormous creature is attested by bishop Pontoppidan, who, in his "Natural History of Norway," affords an entertaining, if not a very satisfactory and accurate, account of this surprising creature. From his details we learn the kraken lies in the deeper parts of the sea, in eighty or one hundred fathoms water, and at some leagues from land. This mighty, and as it seems unwieldy mass of animated substance, very rarely rises near the surface; when it does, the calmest sea becomes troubled to a vast distance around it, the heaving billows point out the more immediate space in which it will emerge, and when it has risen, those parts visible above the surface of the water assume the aspect of so many islands, variable in dimensions as well as shape, at every motion of the kraken. The form of this enormous being is compared to that of a crab; the back or upper part, (so far as can be probably estimated,) is said to be a mile and a half in circumference, (or, as some affirm, even more.) Its limbs, and of these it is furnished with several, are truly gigantic, appearing, when elevated above the water, as thick and long as the masts of vessels of a moderate size, and are besides endowed with so much strength, that

that with one of these it can seize on boats and the smaller kinds of vessels, and draw them under water. The descent of this monster from the surface of the sea to the bottom, is said also to be not less terrible than its rising, since it occasions a swell and whirlpool so violent and irresistible, that ships of the largest burthen, drawn within its vortex, inevitably sink into the abyss of the waters, and sink to rise no more.

These, and various other circumstances equally calculated to excite astonishment, are related of the kraken by the learned prelate before mentioned, the particulars of which have been differently received, many having placed an implicit confidence in his relations, and others as strenuously determining to reject them as tales unworthy of belief. In justice to Pontoppidan, we should observe, however, that though we are principally indebted for our knowledge of the kraken to this writer, it must be understood that the existence of such an animal as the kraken is not testified on his authority alone; nor is it in his volumes only that details so marvellous have appeared; his accounts in general are in a greater or less degree corroborated by several northern writers, and with such internal evidence of truth, that we cannot reject their reports as wholly fabulous, or conceive the kraken to be the mere creature of fiction. Still we must receive their observations deliberately; we may, and certainly do, on their veracity, admit the probable existence of a marine animal, such as the kraken is described, of a size very far surpassing that of the whale, and consequently, of any animal at present known, but here we pause; we have yet to be informed how far the truth has really been exaggerated as to the actual magnitude, and powers of this tremendous creature. As to the nature of this being, that particular appears to be pretty clearly defined; we have little doubt, if any confidence can be placed in the confessedly imperfect descriptions left us by different authors, that it is a creature by no means analogous either to the whale tribe, or any kinds of fishes; it is assuredly, on the contrary, one of the mollusca order or family of worms peculiar to the sea. Denys Montfort, a writer who seems to have considered its nature with attention, believes it to be a sort of sepia, an idea not improbable, or perhaps rather, should fortune ever favour the naturalist so far as to decide the point in question, it may prove to be one of the meduse tribe; this we suggest, though we should still rather be inclined to imagine it an animal of a distinct genus not at present ascertained, as being most likely partaking in some degree of the characters both of the genera *SEPIA*, and *MEDUSA*, and yet not strictly pertaining to either. See *SEPIA* and *MEDUSA*.

**KRAKO**, in *Geography*, a town of Sweden, in the province of Upland; 17 miles N. of Upfal.

**KRAKON**, a small island on the W. side of the gulf of Bothnia. N. lat. 61 33'. E. long. 17 9'.

**KRALAM**, a town of Bosnia, near the river Misaa; 34 miles S. of Serajo.

**KRALITZ**, a town of Moravia, in the circle of Olmutz; 8 miles S. of Olmutz.

**KRALOVAVELKA**, a town of Slavonia; 30 miles W. N. W. of Pofzega.

**KRALOWIDWUR**, or **KONIGINGHOF**, a town of Bohemia, in the circle of Koniggratz, on the Elbe; 13 miles N. of Koniggratz.

**KRALOWITZ**, a town of Bohemia, in the circle of Rakonitz; 13 miles S. W. of Rakonitz.—Also, a town of Bohemia, in the circle of Czassau; 16 miles S. W. of Czassau.

**KRAMER**, in *Biography*. See the next article.

**KRAMERIA**, in *Botany*, received its name from Lin-

næus, in commemoration of two German botanists, John George Henry Kramer, the father, and William Henry, the son, both of whom flourished towards the middle of the last century. The former, a physician to the army, published at Dresden, in 1728, an anomalous arrangement of plants, partly by the system of Rivinus, and partly by that of Tournefort, dividing them according to the months in which they flower. This same book, amended and enlarged, was reprinted at Vienna in 1744, interspersed with various remarks upon the technical terms of botany, anecdotes of what happened to the author in various journeys, and, according to Haller, many fabulous absurdities. He was also author of other botanical tracts.—The latter (William Henry) published at Vienna, in 1756, a catalogue of the animals and plants of Austria.—Linn. in *Loeffl. It.* 195. *Gen.* 63. *Schreb.* 86. *Willd. Sp. Pl.* v. 1. 693. *Mart. Mill. Dict.* v. 3. *Juss.* 425. (*Ixine*; *Loeffl. MSS.*)—Clas and former, *Tetrandria Monogynia*. *Nat. Ord.* uncertain, possibly *Lomentacea*, Linn. *Leguminosa*, *Inf.*

*Gen. Ch.* reformed. *Cal.* Perianth inferior, of four or five oblong, acute, unequal, spreading leaves, internally coloured, deciduous. *Cor.* Irregular, much shorter than the calyx, of five petals; the three uppermost with long claws, reflexed, and a small ovate limb, which is sometimes wanting in the middle one; two lowermost ovate, concave, sessile, at each side of the germen, scarcely spreading, much shorter than the others. *Stam.* Filaments four, at the upper side of the germen, awl-shaped, parallel, ascending, two of them rather shorter than the rest; anthers terminal, small, ovate, erect, opening by two terminal pores. *Pist.* Germen superior, sessile, ovate; style awl-shaped, ascending, nearly equal to the stamens; stigma simple, acute. *Peric.* Legume? globose, of one cell, not burbling, armed on all sides with barbed projecting bristles. *Seed* solitary, ovate, hard, smooth.

*Eff. Ch.* Calyx of four or five leaves. Petals five; the three uppermost with long claws; two lowermost sessile, ovate. Fruit globose, prickly, of one cell. Seed solitary.

*Obs.* It does not appear that Linnæus ever saw this genus; all that he says of it being taken, not very exactly, from Loefling; nor is there a specimen in his herbarium. Neither does Mutis seem to have known any thing of it, when he sent Linnæus a description of the *Acaena*, *Mant.* 2. 145, under the denomination of "*Krameria affinis*;" for these two genera have nothing in common, except a slight coincidence in their artificial characters, not founded in nature. This *Acaena* indeed was never seen by Linnæus, being adopted entirely from his friend's account. It is, with great judgment, referred by Jusseu to his own natural order of *Rosaceæ*, after *Ancistrum*, with which *Krameria* has no resemblance whatever.—The description and figure of a second species of *Krameria*, in Cavanilles, have enabled us to form some idea of its natural affinities, hitherto left in the dark, as well as to venture on a reformation of its generic characters; though all this is done from the above authorities alone, without inspection of any specimens. The genus in question will not conveniently go into any of Jusseu's present sections of the *Leguminosæ*, but a comparison of its anthers with those of *Callia*, its hard ovate seed, and its anomalous corolla, will, we presume, confirm those more obvious indications which have led us to the above conclusion, notwithstanding the strange and peculiar seed-vessel.

Only two species have hitherto been described by authors, both natives of South America.

1. *K. Ixina*. Linn. *Sp. Pl.* 177.—Leaves all simple. Calyx four-cleft.—Gathered by Loefling near the town of Comana, on the coast of the Caracacas, latitude about 10° S. The inhabitants

inhabitants call it *Cardillo Brevis*, or rather, as we presume, *Cardillo Brevis*, Teasel Fig, from the shape of the fruit and its barbed bristles. Whether there be any thing viscid in its habit, which might induce its discoverer to adopt the Greek name *Levis*, does not appear from his description here subjoined. "Roots fibrous. Stems shrubby, procumbent in their lower part, and spreading every way, but soon ascending and wand-like: their branches feathered and erect. Leaves alternate, lanceolate; the upper ones linear, acute, nearly sessile. Flowers alternate, in a terminal (leafy) cluster, their stalks axillary, furnished about the middle with two small acute linear bractæes. Calyx of a rosy purple. Upper petals pale at the tips, lower ones rugose, dark purple. The plant itself is of a brownish hoary hue."

2. *K. cythoides*. Cavan. Ic. v. 4. 61. t. 305.—Leaves ternate; the floral ones simple. Calyx five-cleft.—Found by Lewis Née, near the town of Cimapan in New Spain, especially on the hill commonly called *del carpintero*, bearing flowers and fruit in September.—The stem is shrubby, three feet high, with a grey bark; its branches numerous, alternate, downy when young. Leaves alternate, on longish, downy, compressed foot-blanks, ternate; leaflets elliptical, sessile, entire, downy. Flowers forming a simple cluster at the end of each branch, with a simple elliptic-lanceolate leaf at the base of each of their stalks, and a pair of smaller ones above the middle, the stalks all single-flowered, rather longer than the leaves, and downy. Calyx externally downy, internally of a violet red. Stamens equal, red, inserted into the receptacle, all at the upper side of the germen, and within the upper petals, which latter therefore cannot, as Cavanilles suggests, be abortive filaments. The lower petals are dark violet; the central one of the three upper is elongated, taper-pointed, and recurved, not dilated at the summit like the others. Germen hairy. Fruit globular, the size of a currant, downy, mucicated on all sides with longish projecting bristles, barbed at their points only with three or four sharp reflexed teeth. S.

KRAMERSKY, in *Geography*, a town of Prussia, in the province of Ermeland; 15 miles S. of Heilsberg.

KRANICHELD, a town of Saxony, in the principality of Altenburg; 12 miles S.E. of Erfurt. N. lat. 50° 43'. E. long. 11° 4'.

KRANOWITZ, a town of Silesia, in the principality of Troppau; 11 miles N.E. of Troppau. N. lat. 49° 55'. E. long. 18°.

KRANTZ, ALBERT, in *Biography*, a native of Hamburg, of whose early life we have no information, became professor of canon law and theology in the university of Rostock, and afterwards rector of it about the year 1482. He took his degree of doctor of divinity in 1490, and then removing to Hamburg was elected dean of the cathedral there. He obtained great reputation for his abilities and prudence, and was consulted on various occasions. Of such consequence was his opinion reckoned, that in the year 1500, the king of Denmark and the duke of Holstein made him their umpire in a dispute with the people of Dithmarsh. He died in 1517, leaving behind him a character for integrity and industry in his researches. His works are, "Chronica Regnorum Aquiloniorum Danicæ, Suevicæ, Norvegicæ;" "Vandalia, sive Historia de Vandalorum origine;" "Metropolis, sive Historia Ecclesiasticæ de Saxonia." Moreri.

KRAPERNA, in *Geography*, a town of Russia, and district of the government of Tula.

KRAPINA, a town of Croatia; 8 miles W. of Agram.

KRAPITZ, or KRZAPKOWITZ, a town of Silesia, in the principality of Oppeln, near the Ober; 12 miles S. of Oppeln. N. lat. 50° 25'. E. long. 17° 52'.

KRAS, a town of Poland, in the palatinate of Lublin; 26 miles S. of Lublin.

KRASILOW, a town of Poland, in Volhynia; 18 miles W. of Constantinow.

KRASCHENNIKOVIA, in *Botany*, a genus formed by Gleditsch, Nov. Comm. Petrop. v. 16. 551, of the *Azyris Cervatoides* of Linnæus, and which is retained in Schreber's Genera 633 under the name of *Distis*. Of the propriety of its establishment we have some doubts, having never examined the living plant, nor traced the progress from the flower to the fruit. It possibly, however, bears the same analogy to *Azyris* that *Atriplex* does to *Che-nopodium*.

KRASNE, in *Geography*, a town of Poland, in the palatinate of Braclaw; 24 miles N.W. of Braclaw.

KRASNEPOL, a town of Poland, in Podolia; 32 miles N.E. of Kamincez.

KRASNOBORSK, a town of Russia, and district of the government of Volgoda, in the province of Ve'iki-Uf-fing, on the left side of the Dwina; 60 miles N.N.W. of Uiling.

KRASNOBROD, a town of Poland, in the palatinate of Belcz; 28 miles W. of Belcz.

KRASNOI, a town of Russia, and district of the government of Smolensko, on a rivulet which falls into the Dnieper; 28 miles S.W. of Smolensko.

KRASNOIAR, a town of Russia, in the government of Upha; 16 miles N.N.W. of Upha.

KRASNOIARK, a town of Russia, and district of the government of Kolyvan, on the Yenisei, where it receives the Katcha: it was built in 1618, surrounded with palisades, small towers, and some batteries. The inhabitants, who occupy about 350 houses, principally trade in cattle, horses, and furs; 100 miles S. of Eniseisk. N. lat. 56°. E. long. 96 1/4°.

KRASNOIARSKAIA, a town of Russia, in the government of Irkutsk, near the conflux of the Oka and Angara; 64 miles W.S.W. of Ilimik.

KRASNOI-KHOLM, a town of Russia, and district of the government of Tver, on the river Schoea, which falls into the Mologa; 60 miles N. of Tver.

KRASNOKUTSK, a town of Russia, and district of the government of Kharkov, or Charcov, on the Merlo; 40 miles W.S.W. of Kharkov; which see.

KRASNOSLAW, a town of Poland, in the palatinate of Chem; 26 miles S.S.W. of Chem.

KRASNOSLOBODSK, a town of Russia, and district of the government of Penza, on the Mokvka, or Moskva; 84 miles N.W. of Penza.

KRASNOUFIMSK, a town of Russia, and district of the government of Perm, on the Upha; 96 miles S.E. of Perm.

KRASOIAR, a town of Russia, in the government of Caucasus, at the mouth of the Volga; 16 miles N. of Astrachan.

KRASUKKA, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 22'. E. long. 24° 46'.

KRASUPOL, a town of Poland, in Braclaw; six mile E. of Braclaw.

KRASZNA, a town of Hungary, on a river of the same name, which runs into the Samos; 16 miles S. of Zatmar.

KRAUPEN, or KRUPKA, a town of Bohemia, in the circle of Leitmeritz; 14 miles W.N.W. of Leitmeritz. N. lat. 50° 41'. E. long. 13° 54'.

KRAUS, MARTIN, in *Biography*, an eminent scholar in polite literature, the son of a Lutheran clergyman, was born

in 1526, at Grebern, in the bishopric of Bamberg. He received his classical education at Ulm, where he acquitted himself with so much credit, that the magistratus of the city allowed him a pension to assist him in his future studies. He went to Strasburg, and added to his former acquisitions theology and the Hebrew language. He afterwards undertook the direction of the public school at Memmingen, which he rendered celebrated by adopting the methods pursued at Strasburg. In 1559, he was appointed professor of moral philosophy and the Greek language at the university of Tubingen, where he resided till the time of his death, which happened in 1607. He published a great number of works, grammatical and critical, with orations, Greek and Latin, but his most valuable publication is entitled "Turco-Greciae libri octo," containing an excellent collection of pieces relative to modern Greece, with the language and literature of which he was well acquainted. He was author likewise of *Annales Suevici, ab initio rerum ad annum, 1594.* A very short time before his decease, and foreseeing that the time of his departure was at hand, he gave an entertainment to the academical body, and presented to them, as a memorial of his esteem, a valuable gold goblet. Moreri.

**KRAUTHEIM**, in *Geography*, a town of Germany, on the Jaxt; 34 miles N. of Heilbronn.

**KRAW**, *Isthmus* of, the narrow part of Lower Siam, between the Indian sea and the gulf of Siam, about 70 miles wide. N. lat.  $9^{\circ}$  to  $12^{\circ}$ . E. long.  $98^{\circ} 20'$  to  $99^{\circ} 30'$ .

**KRAYSK**, a town of Lithuania, in the palatinate of Wilna; 84 miles E. of Wilna.

**KREESÉ**. See *CRISSE*.

**KREIDITSCH**, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; 24 miles N.N.E. of Leitmeritz.

**KREMENTCHUK**, a town of Russia, and district of the government of Catharinenflaf or Ekaterinoflav, on the Dnieper; 38 miles W.N.W. of Ekaterinoflav. N. lat.  $49^{\circ}$ . E. long.  $33^{\circ} 10'$ .

**KREMINIEK**, a town of Poland, in Volhynia; 36 miles S. of Lucko.

**KREMPE**, a small town of Holstein, formerly situated on the banks of the Elbe and strongly fortified, but now only remarkable for the height of its steeples, which serves as a mark for seamen, situated between Itzehoe and Gluckstadt; 3 miles N. of the latter.

**KREMSIER** or **KROMERZZ**, a town of Moravia, in the circle of Prerau, on the Morawa, belonging to the bishop of Olmutz; 17 miles S. of Olmutz. N. lat.  $49^{\circ} 17'$ . E. long.  $17^{\circ} 20'$ .

**KREMSMINSTER**, a town of Austria; 12 miles W. of Steyr.

**KRENENSKAIA**, a town of Russia, in the country of the Cossacks, near the Don; 216 miles N.E. of Azoph.

**KRESABAD**, a town of Hindoostan, in Bundelcund; 28 miles S.S.W. of Pannah.

**KRESTA**, a small island near the S. coast of Nova Zembla, in the Straits of Waigats. N. lat.  $70^{\circ} 32'$ . E. long.  $59^{\circ} 20'$ .

**KRESTA, St.**, a gulf or bay of Russia, in the north part of the Anadirikaia gulf. N. lat.  $65^{\circ} 20'$  to  $65^{\circ} 40'$ . E. long.  $180^{\circ} 34'$  to  $181^{\circ} 24'$ .

**KRESTIAK**, an island in the Frozen sea, at the mouth of the Lena, of a triangular form, having its mean diameter about 12 miles. N. lat.  $77^{\circ} 42'$ . E. long.  $16^{\circ} 14'$ .

**KREUPEL**, a small island near the W. coast of Borneo. N. lat.  $3^{\circ} 47'$ . E. long.  $112^{\circ} 25'$ .

**KREUSBACH**, a town of Austria; 9 miles S.S.E. of St. Polten.

**KREUTZBURG**, a town of Russia, in the government of Polorsk, on the Dura; 60 miles E.S.E. of Riga.

**KREWITZ**, a town of the duchy of Mecklenburg; 10 miles E. of Schwerin. N. lat.  $53^{\circ} 40'$ . E. long.  $11^{\circ} 45'$ .

**KREWO**, a town of Lithuania, in the palatinate of Wilna; 42 miles S.E. of Wilna.

**KRICHEVSKAIA**, a town of Russia, in the government of Archangel, on the Dwina; 16 miles S. of Kolmogori.

**KRIEBEL KRANKHEIT**, the German appellation of the disease said to arise from eating the seeds of the *raphanus*, and thence called *Raphania* by Linnæus and others. See that article: also *ENGOR* and *IGNIS SACER*.

**KRIEGSTETTEN**, in *Geography*, a bailiwick of Switzerland, in the canton of Berne.

**KRIENS** and **HORB**, a bailiwick of Switzerland, in the canton of Lucerne.

**KRIGIA**, in *Botany*, named by Schreber, apparently in honour of Dr. David Krieg, a German physician, mentioned in the preface to the third volume of Ray's *Historia Plantarum*, who is there said to have accompanied Mr. William Vernon, fellow of St. Peter's college, Cambridge, in a botanical excursion through the province of Maryland. In this journey they discovered and collected some hundreds of new and rare plants, many of which are described in the work of Ray, above cited. Schreb. 532. Willd. Sp. Pl. v. 3. 1618 — Class and order, *Syngenesia Polygamia Æqualis*. Nat. Ord. *Compositæ Semisfoculosæ*, Linn. *Ciboraceæ*, Juss.

Gen. Ch. *Common calyx* simple, cylindrical, of about ten, lanceolate, erect, acute, equal leaves, shorter than the corolla. *Cor.* compound, somewhat imbricated, uniform, each flower hermaphrodite; proper, of one petal, tongue-shaped, linear, truncated, five-toothed. *Stam.* Filaments five, capillary, very short; anthers cylindrical, tubular. *Pistl.* Germen nearly ovate; style thread-shaped, the length of the filaments; stigmas two, reflexed. *Peric.* none; common permanent calyx ovate, at length reflexed. *Seeds* solitary, five-sided, striated, with a membranaceous crown of five, roundish, erect leaves; down capillary, consisting of five long rough bristles, alternating with the crown. *Recept.* naked.

Eff. Ch. *Receptacle* naked. *Calyx* simple, of many leaves. *Seed-down* of five membranaceous leaves, with five alternate bristles.

1. *K. virginica*. Willd. (*Hyoseris virginica*; Linn. Sp. pl. 1138. Michaux Boreal-Amer. v. 2. 88. Lamarck in Journ. d'Hist. Nat. v. 1. 222. t. 12.)—A native of Virginia and Pennsylvania, found even from Canada to Florida.—The habit of this plant is very similar to that of a starved Dandelion. *Radical leaves* at first ovate, then lanceolate, and at length lyrate, acute, smooth. *Stalks* naked, single-flowered, thrice as long as the leaves. *Calyx* perfectly simple, not imbricated, of ten lanceolate leaves. *Flowers* deep yellow. *Seeds* square, crowned with five long, rounded, membranaceous scales, and as many alternate, long, rough, straight bristles.

**KRIJNAGUR**, in *Geography*, a town of Hindoostan, in Mewat; 18 miles N.N.E. of Alwar.—Also, a town in Agimere; 15 miles E.N.E. of Roopnagar.

**KRIKA**, a district of Africa, in the kingdom of Calbari.

**KRIM**. See *CRIM*, *CRIMEA*, and *TAURIDA*.

**KRINK**, a town of Iltria; 12 miles S.S.E. of Capod'Istria.

**KRIS**,

KRIS, the denomination of Indians that inhabit the banks of lake Chirillineux, who can raise 1000 warriors.

KRISHNA, in *Hindoo Mythology*, one of the avatars, or incarnations of the god Vishnu, in which he is said by the sectaries, who exclusively worship him under this name, to have magnified himself in a degree of power and glory far exceeding any other of his forms. They maintain, indeed, that under the other avatars, he assumed only an *ansa*, or portion of his divinity, while Krishna was Vishnu himself in mortal mould. A numerous fable, called Gokalasta, from Gokala, one of Krishna's names, worship him exclusively, or conjointly with his consort Radha: this sect are immeasurably lavish in their praises, and vehement in their adoration of this deity, while other sects of Hindoos call Krishna an impious wretch, a merciless tyrant, an incarnate demon, now expiating his crimes in hell. As information is received from these different descriptions of zealots, so consequently will it differ in the account of the character and actions of this motley personage, of whom as much is recorded as of any of the Hindoo deities. His life and actions have occupied the attention of many voluminous writers; and if taken literally he led a life of excessive libertinism, but his followers maintain such appearances to have been the result of *maya*, or delusion, for that in reality his life was chaste and holy. The Gita Govinda, a beautiful poem by Jayadeva, is a series of mythical rhapsody in praise of Krishna, and a relation of his loves with his consort Radha, and although warm, and indeed loose, in a degree not admitting of literal translation into our language, is said to be purely mythical, and to mean the "reciprocal attraction between the divine goodness, and the human soul." This poem has been finely translated by Sir W. Jones, and appears in his works, and in the third volume of the Asiatic Researches. The same subject is mystically handled in the tenth book of the Sri Bhagavata, a life of Krishna, not hitherto translated, so much venerated among certain sects, as to be esteemed as the eighteenth Purana. (See JAYADEVA, MYSTICAL POETRY, SRI-BHAGAVATA, and PURANA.) Most of the extravagant tales related of Krishna, may be resolved into a continued solar allegory, for he is a personification of the sun, and corresponds with the Apollo of the Greeks. (See KALIYA.) His mortal parents were Vasu-deva and Devaki. He was fostered by an honest herdman named Ananda, or the happy, and his amiable wife Yasuda; and passed his youth in dancing, sporting, and piping among a multitude of young Gopas, or cow-herds, and Gopias, or milk-maids, from whom he selected nine as favourites. As a specimen of the tales of the Bhagavata, it may suffice to relate, that on one occasion the Gopias, his playfellows, (that is, the Muses) complained to Yasuda, that he had pilfered and ate their curds; and being reproved by his foster mother, he desired her to examine his mouth, in which, to her just amazement, she beheld the whole universe in all its plenitude of magnificence. Another of his miracles is given under *Kafsa*, which see.

Innumerable are the extravaganzas related of Krishna, whom some French writers have impiously compared with Jesus Christ. On this subject the following passage occurs, in Moor's Hindoo Pantheon, whence chiefly this article is taken. Describing a plate of Krishna destroying Kaliya, "It has," he says, "been surmised by respectable writers, that the subject here represented has reference to an awful event figuratively related in our scriptures, and Krishna is not only painted, as seen in the plates, bruising the head of the serpent, but the latter is made to retort by biting his heel. Among my images and pictures of this deity (and they are very numerous, for he is enthusiastically and

extensively adored, and his history affords great scope for the imagination) I have not one original, nor did I ever see one, in which the snake is biting Krishna's foot; and I have been hence led to suspect, that the plates engraved in Europe of that action are not solely of Hindoo invention or origin. I may easily err in this instance; but I am farther strengthened in the suspicion, from never having heard the fact alluded to, in the many conversations that I have held with Brahmans and others on the history of this avatara.

"Somner was, I believe, the first who exhibited Krishna crushing a snake: how, otherwise would he or any one kill it so easily and obviously, as by stamping on its head? Nor can the reptile in any mode retort but by biting the foot of its assailant. Zeal sometimes may have in its results the same effects as indelicacy; and one cannot help lamenting that a superstructure requiring so little support, should be encumbered by awkward buttresses, so ill applied, that they would, if it were possible, diminish the stability of the building that they were intended to uphold. Of this description were the zealous researches of some missionaries, who in Brahma and Saravati easily found Abraham and Sarah; and the Christian Trinity as readily discovered in the monstrous Trimurti of the Hindoos." (See SARASWATI and TRIMURTI.) Of this description also, I am disposed to think, are the attempts at bending to many of the events of Krishna's life to tally with those real or typical of Jesus Christ's. That Krishna, according to his historians, passed a life of a most extraordinary and incomprehensible nature, may be admitted; and that his name, and the general outline of his story, existed long anterior to the birth of our Saviour, is very certain, and probably to the time of Homer. His miracles are amazing, but ridiculous; a term that may, perhaps, be applied to a majority of the legends detailed with such prolixity in the modern poem, the Sri Bhagavata. He is represented as the meekest, tenderest, and most benevolent of beings; still, however, he fomented the terrible war described in the Mahabarat: he washed the feet of the Brahmans: he exhibited an appearance of excessive libertinism; but it was, they say, all *maya*, or *delusion*, for he was pure and chaste in reality; he uplifted mountains, raised the dead, (see KASYA,) descended into hell, and performed such motley exploits, as induced Sir William Jones (As. Res. i. 274.) to think that "the spurious gospels, which abounded in the first ages of Christianity, were carried to India, and the wildest parts of them repeated to the Hindoos, who engrained on them the old fable of Kefava, the Apollo of Greece."

Krishna has eight regular wives assigned him, whose names are 1. Rukmeni or Radha, an incarnation of Lakshmi; 2. Yamuminti; 3. Kalenderi, a water nymph, daughter of Surya, or the Sun; 4. Satyawama; 5. Lakhmeni; 6. Mitravinda; 7. Satya; 8. Vrundi. Of these something is said under their names respectively. He besides attached to him 16,000 women that he found virgins in the ample seraglio of a five-headed tyrant, who, for his manifold crimes, Krishna slew. The legendary tales descriptive of these events are of great length and variety. Each of these 16,000 women bore him ten sons, and each supposed herself the exclusive favourite of her lord. Kama, the god of love, is said to have been the offspring of his first wife Rukmeni; and in this birth he was named Pradyanna. (See KAMA.) On the death of Krishna, Rukmeni became a sati (see SATI), and, with several other of his wives, burned herself, with a view to an immediate reunion with her lord in Vaikontha. See VAIKONTHA.

Krishna's names, like other deified personages, are numerous. He being Vishnu, they enjoy several in com-

mon, Murari, Heri, Madhava, and Baghavan, among them; Govinda, Gopala, Gokala, are derived from his occupation of herdsman; Gopinatha, or the Gopai's god; Muridur, the tuncful; Keshu, Kefava, or Kefavi, are said to refer to the tuncfulness of his hair; Vaminali to his pendant garland; Yadava, Vaishtceya, and Vasudeva, to his tribe and family.

He is usually painted of a dark blue colour; his name Krishna denotes this; and with four arms; elegantly dressed with a profusion of jewels, and often playing on a pipe. Many plates of him are given in the Hindoo Pantheon, from original images and pictures, and many legends are there related, connected with their subjects. In the Gita Govinda he is thus described. "His azure breast glittered with pearls of unadmitted lustre, like the full bed of the cerulean Yamuna, interpersed with curls of white foam. From his graceful waist flowed a pale yellow robe, which resembled the golden dust of the water lily scattered over its blue petals. His passion was inflamed by the glances of Radha's eyes, which played like a pair of water birds with azure plumage, that sport near a full blown lotus, on a pool in the season of dew. Bright ear-rings, like two suns, displayed, in full expansion, the flowers of his cheeks and lips, which glistened with the liquid radiance of smiles. His locks, interwoven with blossoms, were like a cloud variegated with moon-beams; and on his forehead shone a circle of odorous oils, extracted from the sandal of Malaya, like the moon just appearing on the dusky horizon; while his whole body seemed in a flame, from the blaze of unnumbered gems."

In that very curious work translated by Mr. Wilkins, entitled Bhagavat-Gita, Arjun, the son of Pandu, addresses Krishna as "the supreme Brahm; the most holy; the most high god; the divine being before all other gods; without birth; the mighty lord; god of gods; the universal lord." In different parts of the Gita he says of himself, "I am, of things transient, the beginning, the middle, and the end: the whole world was spread abroad by me in my invisible form. At the end of the period kalpa (see KALPA) all things return into my primordial source; and, at the beginning of another kalpa, I create them all again. I am the creator of all mankind, uncreated, and without decay. There is not any thing greater than I, and all things hang on me, as precious gems on a string. I am the understanding of the wise, the glory of the proud, the strength of the strong. I am the eternal seed of all nature; I am the father and mother of this world, the grandfere and the preserver; I am death and immortality; I am entity and nonentity; I am never failing time; I am all-grasping death, and I am the resurrection."—"I am the emblem of the immortal, and of the incorruptible; of the eternal, of justice, and of endless bliss."—"Neither the sun nor the moon, nor the fire, enlighteneth that place, whence there is no return, and which is the supreme mansion of my abode."

Sanjay, one of the interlocutors of the Gita, describes Krishna, as he revealed his "million forms divine," to Arjun, "covered with every marvellous thing—the eternal god, whose countenance is turned on every side. The glory and amazing splendour of this mighty being may be likened to the sun, rising at once into the heavens with a thousand times more than usual brightness. The son of Pandu then beheld within the body of the god of gods, standing together, the whole universe divided forth into its vast variety." Arjun, terrified at this wondrous exhibition, exclaims—"Thou art the supreme being! I see thee without beginning, without middle, and without end; of valour infinite, of arms innumerable; the sun and moon thy eyes; thy mouth a flaming fire; and the whole world shining with thy reflected glory.

Having beheld thy dreadful teeth, and gazed on thy countenance, emblem of time's last fire, I know not which way to turn; I find no peace. Have mercy then, O god of gods! thou mansion of the universe! and show me thy celestial form, with the diadem on thy head, and thy hands armed with the club and *chakra*. Assume then, O god of a thousand arms! image of the universe! thy four-armed form."—Krishna is here, as usual by his sectaries, identified with Vishnu, and as "an emblem of time's last fire," and other passages of the above extracts, is apparently alluded to in the character noticed under KALPA, as the ruling Kalfva-rupi, or Chronus.

It is believed by some of the most respectable researchers into Hindoo theology, that the worship of Krishna, Rama, and other deified personages, is modern compared with the institutions of the vedas (see VEDA), in which no mention is made of such deities. As noticed under the article JAGANNATHA, one of the names of Krishna, he is principally worshipped at that extensively revered temple. Under JAMBAVANTI is related a legend of this frolicsome deity, who espoused a bear of that name. (See also KANSA.) Many plates, and legendary particulars and speculations, are given of Krishna and his extravagant history, in the work whence this article is taken, to which we refer the reader desirous of farther information thereon.

The name of Krishna is variously written in European languages: Crishta, Crishta, Kruitna, Kishna, Kishna, Quixena, Kishen, &c. and is differently pronounced in different provinces of India.

KRISS. See CREESE.

KRITANTA, a name of Yama, the Hindoo Pluto. KRITAMA is the name of a river connected with the history of this personage under some of his forms, and may have a common origin. See YAMA.

KRITIKA, in *Astronomy*, the Hindoo name of the Pleiades, respecting which their poetical mythologists have related many pleasing tales, every thing connected with Hindoo science being veiled in allegories. This constellation personified is, as one of the mansions of the moon, or Soma (see SOMA), fabled to be a beautiful nymph receiving the incessant deity in his nocturnal wanderings. (See NAKSHATRA.) The six Kritikas are feigned also to have been the wet-nurses of *Kurukya*, as mentioned under that article. Other legends make them the wives of the Rishis, who, among other characters, are made to shine the seven bright stars in Ursa major; but being unequal in number, further fables became necessary to reconcile the difference, and an astronomical legend is related in the Hindoo Pantheon, affording a specimen of the manner in which the Brahmans have buried, in mythological fictions, historical or scientific facts, and of the coincidence of these fictions with the tales of western fabulists. "It is related that Agni, or Pavaka, the ardent deity of fire (see PAVAKA), was charitably and gallantly disposed to communicate a portion of his warmth to these ladies, wives of the frozen Rishis; and situated as they were in the arctic circle, their complacency to such a comfortable suitor is not surprising. But it is said that he had not, in fact, complete success, for that his wife (see SWATA), dreading the resentment of the holy Rishis, assumed successively the shape and countenance of each of their desirable wives, and thus personifying them, satisfied her husband's ardour. Arundhati, however, the wife of Vashista (see VASISTHA) having always been exemplary, as to holiness and sanctity, was not suspected on this unlucky occasion; but the other six Rishis, in consequence of scandalous reports, not only dismissed their sparkling spouses, but, like great bears, drove them out of the arctic circle, and they now shine the Pleiades.

It would appear that they had qualified themselves for wet-nurses, and accordingly nursed young *Kartikya*, as noticed under that article, or were entrusted with his education, and were placed by him in the zodiac." In this wild tale we see an allusion to the disappearance of the seventh star of the Pleiades. Arundhati, the wife of Vasistha, is retained by him. The star called by his name is in lat. 61° N. and she is the smaller star near him. They are proverbial for constancy; and astrologers carefully watch their motion, as their influences are variously modified: whatever newly married couple see them in an auspicious conjunction or position, are surely to live happily together for a hundred years. Peurile as these stories appear, they are matched by others that we have been taught to listen to with more attention perhaps than they deserve. "The Pleiades, according to mythology, in the west, were entrusted likewise with the education of Bacchus (who, according to Macrobius, was the same with Mars, or Kartikya), and on that account he translated them into heaven. According to those writers they suffered a real bodily pollution; and the seventh, says Hyginus (Poet. Astro. p. 471.) left her sisters and fled to the regions of the heavens: and this is the Arundhati of the Hindoos. Hin. Pan. p. 88.

KRIVENA, in *Geography*, a town of European Turkey, in Bulgaria, on the Danube; 33 miles E. of Nicopolis.

KROBE, or SULCAVA, a town of the duchy of Warsaw; 32 miles S. of Posen.

KROEPELEIN, a town of the duchy of Mecklenburg; 12 miles W. of Roltok.

KROKEK, a town of Sweden, in East Gothland; 11 miles N.E. of Nordkiöping.

KROKINOW, a town of Samogitia; 22 miles E. of Rofienne.

KROKY, a town of Samogitia; 18 miles S.E. of Rofienne.

KROLENDORF, a town of Austria; 16 miles E. of Steyr.

KROMAYER, JOHN, in *Biography*, a learned German divine, who acquired a very high reputation as a preacher, and was appointed chaplain to the court of the duchess dowager of Saxony. The duke Weimar afterwards nominated him superintendent-general of the churches in that district, and the senate of that city chose him as pastor of their church. He died at the age of sixty-seven. He was author of "Harmonia Evangelitarum;" "Historiæ Ecclesiasticæ Compendium;" "Specimen Fontium, Scripturæ sacræ apertorium;" "A Paraphrase on the Prophecy and Lamentations of Jeremiah," &c. &c.

KROMAYER, JEROME, nephew of the preceding, was brought up chiefly at Leipzig, where he took his degree of M.A. in 1632. From that time he became lecturer on logic, rhetoric, natural philosophy, and astronomy. In 1643, he was appointed professor of history and oratory in the lesser college of princes, at Misnia. Four times he was called to the office of dean of the university; twice he presided as pro-chancellor, at the creation of masters, once he was chosen rector; and in the lesser college he was honoured three times with the post of provost. He filled several other high posts in the university with great advantage to the place, and died at the age of fifty, in the year 1670. He was author of "Commentaries on divers Parts of the Holy Scriptures;" of an "Ecclesiastical History," and other works.

KROMI, in *Geography*, a town of Russia, in the government of Orel; 16 miles S. of Orel.

KROMME, a river of Africa, forming a bay at its mouth in the Indian sea, S. lat. 34° 6'.

KRONENBURG. See CROKENBURG.

KRONHAMN, a small island on the W. side of the gulf of Bothnia. N. lat. 62° 25'. E. long. 17° 26'.

KRONOBY, a town of Sweden, in the government of Ulea; seven miles S. of Gamla Karleby.

KRONORN, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 27'. E. long. 19° 8'.

KRONOTSKOI NOSS, a cape in the northern part of Kamtschatka, about which the land is very high. N. lat. 54° 42'. E. long. 162° 17'.

KROPPA, a town of Sweden, in the province of Warmeland; 30 miles N.E. of Carlstadt.

KROPPENSTADT, a town of Westphalia, in the principality of Halberstadt; nine miles E.N.E. of Halberstadt.

KROPSUNKARI, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 10'. E. long. 25° 6'.

KROREN, a lake of Norway; 33 miles N.W. of Christiania.

KROSKA, a town of Servia, on the right bank of the Danube; 10 miles S.S.E. of Belgrade.

KROSNO, a town of Austrian Poland, in Galicia; 25 miles N.W. of Sanock.

KROTtau, a town of Bohemia, in the circle of Bolef-lau; 46 miles E. of Dresden.

KROUNA, a town of Bohemia, in the circle of Chrudim; 12 miles S.S.E. of Chrudim.

KROUSTA, in the *Ancient Music*, is a term purely Greek, implying the third species of musical instruments, which the Latins term *pulsatilia*, and the English, *instruments of percussion*; their tones being produced by beating with the hand, as drums, tabours, timbrels, &c. or with small sticks or iron rods, as the psaltry, cymbal, and dulcimer, or by being struck with hammers, as bells, gongs, pianofortes, &c.

Representations and descriptions of all these instruments may be seen in Lucicinus, Merfennus, Kircher, Bonanni, Laborde, and in almost all histories of music.

KROZE, in *Geography*, a town of Samogitia; 20 miles N.W. of Rofienne.

KRUCKEN, a town of Prussia, in Natangen; 15 miles S.E. of Brandenburg.

KRUDOSEL, a town of Persia, in the province of Ghilan; 12 miles S.E. of Reshd.

KRUDZEWO, a town of Lithuania, in the palatinate of Wilna; 16 miles S.E. of Wilna.

KRUG, LOUIS, in *Biography*. See GERMAN *School of Engraving*.

KRUGLIKIN, in *Geography*, a town of European Turkey, in Moldavia; 12 miles S. of Choczim.

KRUMPACH, a town of Austria; 20 miles S. of Ebenfurth.

KRUPA, a town of Poland, in Volhynia; 60 miles E. of Lucko.

KRUPKA, a town of Lithuania, in the palatinate of Minsk; 60 miles N.E. of Minsk.

KRUPULIK, a town of European Turkey, in Macedonia; 84 miles N.N.W. of Saloniki.

KRUSCHIN, a town of Prussia, in the palatinate of Culm; 24 miles E. of Culm.

KRUSZWICA, or KRUTSWICZA, a town of Poland, in the palatinate of Brzesc; 28 miles W. of Brzesc. This place deserves to be recorded, as it was the birth-place of Piast,

Piast, who, occupying the flation of a private citizen, was elected king of Poland in 842.

KRUTALA, a town of Russia, in the government of Tobolsk, on the Irtysh; 36 miles N. of Omsk.

KRUTEN, a town of Courland; 32 miles S.S.W. of Goldingen.

KRÜTOGORSKOI, an ostrog of Russia, in Kamtschatka. N. lat. 54° 50'. E. long. 155° 54'.

KRUWOTOW, a town of Austrian Poland, in Galicia; 22 miles S.E. of Halicz.

KRYLOW, a town of Galicia; 10 miles N. of Belz.

KRYOLITE, or CRYOLITE; *Alumine fluatée alcaline*, Haiiy. The colour of this mineral is snow-white, sometimes brownish-yellow, by the admixture of a small portion of iron ochre.

It occurs massive, generally in angular fragments with faint striæ, indicating a rhomboidal nearly cubical nucleus; secondary forms have not yet been observed.

Its luitre is vitreous, often inclining to pearly.

Fracture imperfectly foliated, smooth in one direction, and uneven in another.

It is translucent even in fragments of considerable size; small pieces approach to transparent, and when immersed in water for some time become completely fro.

It is soft, fo as to be scratched by fluor, particularly in the principal direction of the laminae.

It is easily frangible.

The specific gravity of kryolite is 2.928; that of a small fragment immersed in water for twelve hours was 2.941, Schumach. Haiiy flates it to be 2.949; Karlen 2.957; and Andrada 2.969.

Before the blow-pipe it soon melts, (though certainly not with sufficient ease or rapidly to warrant the incorrect appellation of kryolite, supposed to be derived from that circumstance;) and is afterwards converted into a white opaque pearly slag, of a slightly alkaline taste. With borax an opaque pearl is formed, which, some time after cooling, shews a degree of deliquescence. It is not operated on by the muriatic and nitric acids, but is dissolved by concentrated sulphuric acid under development of greyish-white vapours that corrode glass.

Professor Abildgaard, who was the first who analyzed this mineral, which had before been mistaken for a substance related to barytes, found it to be composed of alumine and fluoric acid. Vauquelin, who examined it after him, obtained the same results, and both chemists accounted for the small proportion of alumine which they found, by the possibility that part of the earth might have been carried off by the sulphuric acid. Klaproth was enabled to assign the true cause of the apparent disproportion by the discovery of a considerable proportion of soda, till then but little known as an ingredient of stony substances. His analysis, and the subsequent one by Vauquelin, have given the following results.

	Klapr. Beitr.	Vauquelin A. de Ch.
Alumine	24	21
Soda	36	32
Fluoric acid and water	40	47
	100	100

The only place where kryolite has been hitherto found is Greenland; but nothing is known respecting its geognostic situation. Werner, we are told, has adopted this mineral as a species of a genus of his, called the *Halite* genus, which is

to comprehend such substances as bear great resemblance to fossil salts, without possessing all the requisite characters to entitle them to be enumerated as such.

KRZEMIEN, in *Geography*, a town of the duchy of Warsaw; 34 miles S.W. of Bielsk.

KRZEMINIEC, a town of Poland, in Volhynia; 40 miles S.S.E. of Lucko.

KRZEPIEC, a town of Poland, in the palatinate of Cracow; 52 miles N.W. of Cracow.

KTEIPHE, a town of Syria, anciently called *Adariff*; the last town in the pachalic of Damafcus, encompassed with walls, as a defence against the Arabs; 22 miles N.E. of Damafcus.

KUAN, a town of Persia, in Farfistan; 16 miles S.S.W. of Schiras.

KUAR. See KAWAN.

KUASHKIR, a town of Imiretta; 21 miles S.S.W. of Cotatis.

KUAVAR, a town of Persia, in Ghilan; 90 miles N.W. of Reshd.

KUBA, a town of Persia, in Schirvan; 30 miles S. of Derbend.

KUBAN. See CUBAN.

KUBBET-CHIAR, a town of Arabia, in Yemen; 44 miles N. of Chamir.

KUBBOOLEAH, a town of Hindooistan, in the subah of Moultan; 45 miles E. of Moultan.

KUBENSKOI, a town of Russia, in the government of Vologda, on a lake of the same name, about 40 miles long and eight broad; 16 miles N.W. of Vologda.

KUBLICZ, a town of Lithuania; 15 miles S.E. of Braclaw.

KUBUCHANSKOI, a town of Russia, in the government of Irkutsk, on the Amul; 86 miles S.E. of Doroninsk.

KUCHAVIE, a town of Poland, in the palatinate of Kiev; 60 miles N.N.W. of Kiev.

KUCHTA, a town of Prussia, in the province of Olonetz; 52 miles N. of Pownetz.

KUCKENDORF, a town of Prussia, in Ermeland; 24 miles S.W. of Heilsberg.

KUDA, a town of Mingrelia, on the coast of the Black sea; 10 miles S.S.E. of Ilori.

KUDACOIL, a town of Bengal; 26 miles S.E. of Doefa.

KUDAMIA, a town of Egypt, on the E. branch of the Nile; 20 miles N. of Cairo.

KUDASELSKO, a town of Russia, in the government of Tobolsk. N. lat. 65° 15'. E. long. 81° 14'.

KUDDA, a town of Hindooistan, in Visiapour; 20 miles N. of Poonah.

KUDDANO, a town of Africa, in Bergoo; 65 miles N.W. of Wara.

KUDEEL, a town of Hindooistan, in Bahar; 20 miles W. of Ramgur.

KUDEZEVA, a town of Russia, in the government of Kolyvan; 28 miles S.E. of Kuznetk.

KUDINSKA, a town of Russia, in the government of Irkutsk; 32 miles N. of Irkutsk.

KVETLI, a town of Turkish Armenia; 27 miles W.S.W. of Akalziziké.

KUFFSTEIN, or KOPSTEIN, a town of the county of Tyrol, near the borders of Bavaria, on the Inn; built at the foot of a stupendous rock, on which is a castle, that serves for a fortress; 32 miles E.N.E. of Inspruck. N. lat. 47° 32'. E. long. 12° 14'.

KUGNA,

**KUGNA**, a river of Bessarabia, the waters of which begin to expand into a lake at Tobak, 30 miles from its union with the Danube.

**KUHDEAL**, a town of Bengal; 34 miles W. of Ramgur.

**KUHESTEK**, a sea-port of Persia, at the entrance of the Persian gulf; 36 miles W. of Ormus.

**KUHISAR**, a town of Caramania; 15 miles N.W. of Akferai.

**KUHMOIS**, a town of Sweden, in the province of Tavastland; 39 miles N.N.E. of Tavasthus.

**KUHMONIEMI**, a town of Sweden, in the government of Ulea; 50 miles E.S.E. of Cajana.

**KUHN**, JOACHIM, in *Biography*, a learned critic, son of a rich merchant at Gripfwalde, in Pomerania, was born in 1647. He studied at the university of Jena, and after visiting several parts of Germany, was appointed, in 1669, principal of the college at Oetingen in Suabia. In 1676, he was chosen professor of Greek and Hebrew at Strasburg. He died in 1697, and after his death appeared his "Quæstiones Philosophicæ ex facris Veteris et Nov. Test. aliisque scriptoribus." He is well known in the learned world by his editions of Ælian, Pausanias, and Diogenes Laertius.

**KUHNAU**, JOHANN, the son of a fisherman of Gryngingen, a town near Altenberg, on the borders of Bohemia, four miles distant from Dresden, was a learned and skilful musician of the higher class, among those who have formed and established the German school of music, particularly in the ecclesiastical style, and in organ playing.

In the year 1684, he was organist of the church of St. Thomas at Leipzig; and while in that station, he wrote a dissertation "De juribus circa musicos ecclesiasticos," and afterwards defended it against the censures of his adversaries.

In 1689, he published lessons for the harpsichord in two volumes, and in 1696 seven sonatas, entitled Clavier frucht, fruits of the keys or of keyed instruments; and in 1700, six sonatas, entitled Wiltliche Wiltosi, a bible narrative. Here Lustig of Groningen, in a Dutch treatise entitled "Inleiding tot de Musikkunde," takes notice of this work, and says that it is a lively representation, in musical notes, of David manfully combating Goliath. In the same year (1700) Kuhnau, to silence the clamours of some ignorant men of his profession, who, envying his merit and reputation, had libelled him, he wrote a small tract, which he entitled "The Musical Quack, or Mountebank." In the same year (1700) Kuhnau was appointed *director musicæ* of the university of Leipzig, in which station he died in 1722, in the 63d year of his age; and was succeeded in that honourable post by John Sebastian Bach. Kuhnau was celebrated immediately after his death in a Latin discourse by a count palatine and magistrate of Merseberg for his skill, not only in music, but theology, law, eloquence, poetry, foreign languages, algebra, and mathematics.

Mattheson, in his life of Handel, as the highest praise he could bestow on his performance, says, that he was even more powerful on the organ than the famous Kuhnau of Leipzig, who was then (in Handel's younger days) regarded as a prodigy.

**KUHNEELD**, in *Geography*, a town of Bavaria; 17 miles S.S.W. of Bamberg.

**KUHNTIA**, in *Botany*, so named by Linnæus, after his pupil Adam Kühn, a native of Pennsylvania, who travelled to Upsal for the sole purpose of improving himself in natural history, and brought this plant with him for the examination of Linnæus; in whom it excited considerable attention, as having distinct anthers, though in every other respect ap-

pearing to belong to the class *Syngenesia*. Arduino, who had obtained the same from Siberia, had referred it to *Eupatorium*, noting the peculiar structure of its anthers, which he describes as "divided into two or three bodies," or fets. He further adverts to the feathery feed-down, as differing from *Eupatorium*; and Linnæus remarks that the leaves, being alternate, afford another distinction, as to habit. On these grounds *Kubnia* was established as a genus in *Pentandria Monogynia*. So it remained till Gærtner, in his 2d vol. p. 411, having acquired another species, which he mistook for the original, and finding its anthers firmly united into a tube, took upon him to say that the Linnæan character of *Kubnia* was "altogether fictitious," and that the genus, differing from *Eupatorium* in having an evidently feathery feed-down, should be referred to the *Critonia* of Browne; see Browne's Jamaica, 490 and 314. Now this *Critonia* is *Eupatorium Dalea* of Linnæus, a true *Eupatorium*, with opposite leaves and a bristly feed-down, rough indeed, but by no means feathery, as is abundantly evident in Browne's own specimen now before our eyes. But the author last mentioned describes it "*pappo ramofo*," which it seems Gærtner adopted upon trust. We are well aware that the distinction between feathery and rough feed-down, is only a difference in degree; but by this many good genera are discriminated, and upon it, as a technical character, *Kubnia* must chiefly depend; for more recent examinations have found other examples of distinct anthers in compound flowers, witness several species of *Tussilago*, and one of *Siegesbeckia*; and as the genus in question has, according to the above authors, one species with united, and another with more or less distinct anthers, it is best placed with its natural allies in the *Syngenesia*, to which class we shall follow Willdenow in removing it.—Linn. Gen. 95. Schreb. 129. Willd. Sp. Pl. v. 3. 1772. Mart. Mill. Dict. v. 3. Juss. 177. Lamarck. Dict. v. 3. 370. Illust. t. 126. (Critonia; Gærtner. t. 174; and not Browne Jam. 490.)—Class and order, *Syngenesia Polygamia æqualis*. Nat. Ord. *Compositæ discoides*, Linn. *Corymbifera*, Juss.

Gen. Ch. *Common Calyx* oblong, imbricated; scales linear-oblong, erect, unarmed, unequal; the outermost sharpest and somewhat ovate; innermost bluntish, slightly membranous at the end. *Cor.* compound, uniform, discoid; florets from 10 to 15, all equal, perfect, fertile, of one petal, funnel-shaped, with a regular, five-cleft, erect border. *Stam.* Filaments five, capillary, very short; anthers oblong, either all united into one tube, or into two or three fets, or entirely distinct, each opening at the top, with a projecting lip. *Pist.* Germen oblong, furrowed; style thread-shaped, longer than the corolla, cloven down to the top of the anthers; stigmas two, slightly club-shaped, bluntish, spreading. *Peric.* none, except the permanent calyx. *Seeds* solitary, oblong, angular, rough; down sessile, long, feathery. *Recept.* naked.

Eff. Ch. *Receptacle* naked. Down feathery, sessile. Calyx imbricated, oblong. Style prominent, cloven half down, divaricated.

Obs. If the above characters be finally judged sufficient to establish *Kubnia*, the word *feathery* must be struck out of the character of the feed-down in *Eupatorium*; see that article.

1. *K. eupatorioides*. Linn. Sp. Pl. 1662. Linn. fil. Dec. 21. t. 11. (*Eupatorium alternifolium*; Ard. Spec. Alt. 40. t. 20.)—Leaves lanceolate, toothed, stalked. Anthers separate.—Native of Pennsylvania, from whence seeds were brought to the Upsal garden in 1762, and the plants they produced, kept in the green-houses, flowered the same year in November. *Root* fibrous, perennial. *Stems* several, herbaceous, a foot and half high, erect, round, leafy, mi-

ately downy, bearing a few short axillary branches. *Leaves* alternate, on short channelled bordered footstalks, lanceolate inclining to ovate, near two inches long, pointed, strongly and variously toothed, decurrent at the base, somewhat triply nerved, green, roughish, or minutely downy, on both sides, with pale ribs and veins. *Flowers* corymbose, terminating the stem and branches, white, with a striated roughish calyx.—We find no reason to doubt Ardeino's Siberian plant, in the Linnean herbarium, being the same species with that from the Ural garden.

2. *K. Critonia*. Willd. n. 2. (*Critonia* Kuhnia; Gært. v. 2. 411. t. 174; the synonyms wrong).—*Leaves* linear, nearly entire, sessile. *Anthers* united.—Native of Pennsylvania and Virginia, according to Willdenow, who had it alive. *Root* perennial. *Stem* round, smooth. *Leaves* an inch and half long, attenuated at each end, sessile, alternate, almost perfectly entire, smooth. *Corymbs* of few flowers, divaricated, at the top of the stem and branches. *Willd.*

Neither of these plants is known in the gardens of England. S.

KUHU, in *Mythology*, is the Indian goddess of the day. It is most likely one of the many names of Parvati; but respecting her very little has yet been made known.

KUIA, in *Geography*, a town of Russia, on the coast of the White sea, in the government of Archangel; 20 miles N. of Archangel.

KUIATZKAIA, a town of Russia, in the government of Irkutsk, on the Dzoornure, built in 1728 for carrying on commerce between the Russians and Chinese; it consists of two parts, one inhabited by the people of each country; 44 miles N. of Irkutsk. N. lat. 52° 50'. E. long. 105° 14'.

KUINUC, a town of Natolia; 20 miles N. of Elki-shehr.

KUIVAINEMI, a town of Sweden, in the government of Ulea; 20 miles E. S. E. of Tornea.

KUIVAMAKI, a town of Sweden, in the government of Wafa; 106 miles S. E. of Wafa.

KUKA, a town of Sweden, in the government of Abo; 32 miles S. E. of Biorneborg.

KUKALAR, a town of Sweden, in the government of Abo; 38 miles E. of Abo.

KUKERPEH, a town of Natolia; 32 miles W. of Boli.

KUKI, a town of Japan, in the island of Nippon; 70 miles N. of Meaco.

KUKKAISTENMAA, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 53'. E. long. 21° 1'.

KUKU, an extensive country of Africa, bordering on the desert of Libya, and partaking of its nature. It lies to the N. E. of Tagua and Bornou, and on the N. E. joins to Al Wahat. Its capital of the same name is situated at 20 journees to the N. of Kauga, and about 250 miles N. E. of Bornou. N. lat. 21° 45'. E. long. 24° 45'. A river runs from N. to S. by Kuku, and is received into a lake at a great distance from it; perhaps the lake of Kauga; and the river itself may form a part of that, which is said to run near Angini, a city eight days' journey from Matthan, and six from Tagua, and towards Nubia and the Niger; consequently to the S. E. of Matthan, and apparently not far from the northward of Kauga.

KUKUS, a town of Bohemia, in the circle of Koninggratz, famous for its baths; 11 miles N. of Koninggratz.

KUL, or KOOL, a Turkish term, probably signifying a slave or servant.

Meminly tells us, the name is given to all the soldiers in the Ottoman empire, particularly to those of the grand

seignior's guard, and the infantry. The captains of the infantry, and those who command the guards, are called *kül zabıtları*, and the soldiers of the guard *kapu kulleri*, i. e. *slaves of the court*. Others inform us, that all who hold any places depending on the crown, or receive wages from it, in a word, all who are, in any measure, the grand seignior's servants, take the title of *kül*, or *cool*, i. e. *slave*, as more creditable than that of subject; even the grand vizir and the bashaws value themselves upon it. A *kül*, or slave, of the grand seignior, has authority to abuse any who are only his servants; but a subject, who should affront a *kül*, or slave, would be severely punished. The *küls* are entirely devoted to the will of the grand seignior, and look on it as a kind of martyrdom, that merits heaven, when they die either by his order, or in the execution of his commands.

KULALI, in *Geography*, an island of Russia, in the Caspian sea. N. lat. 45°.

KULB, a town of Austria; 10 miles S. S. W. of St. Polten.

KULBAEVA, a town of Russia, in the government of Upla; 48 miles E. of Menzclink.

KULDATZKOI, a town of Russia, in the government of Irkutsk, on the borders of China; 80 miles S. W. of Seleginsk.

KULEBAKINA, a town of Russia, in the government of Irkutsk, on the Lena; 20 miles S. of Kirensk.

KULEBRUN, a town of Prussia, in the province of Oberland; 12 miles S. of Elbing.

KULEBUGAGE, a town of Asiatic Turkey, in Carmania; 40 miles N. of Tarfus.

KULICHOW, a town of Austrian Poland, in Galicia; 10 miles N. N. E. of Lemberg.

KULING, a town of Grand Bucharia, in the kingdom of Balk; 30 miles N. E. of Balk.

KULLA, DAR, a small country of Africa, situated to the S. W. of Dar-Für. The natives of Kulla are partly negroes, and partly of a red or copper colour. Their language is nasal, but very simple and easy. It is said they worship idols. They are very cleanly, to which the abundance of water in their country contributes, and they are remarkable for honesty and even punctilious in their transactions with the Jelabs. They have ferry boats on the river, which are impelled partly by poles, partly by a double oar, like our canoes. Slaves are obtained in Dar-Kulla, either by violence, or by the following method. The smallest trespass on the property of another is punished, in this country, by enslaving the children or young relations of the trespasser. The least offence in this way is followed, after previous proof, by the forfeiture of a son, daughter, nephew, or niece of the offender to the person aggrieved. Accidents of this kind are continually happening, and produce a great number of slaves. A commission to purchase any thing in a distant market, not exactly fulfilled, is attended with a like forfeiture. But above all, if a person of note die, the family have no idea of death as a necessary event, but say that it is effected by witchcraft. To discover the perpetrator, the poorer natives, far and near, are obliged to undergo expurgation by drinking a liquor, which is called in Dar-Für "kilingi," or something that resembles it; and the person on whom the supposed signs of guilt appear, may either be put to death, or sold as a slave. The people of Kulla are strangers to venereal complaints, but are subject to the small-pox. In that part of the country that is visited by the Jelabs, there is a king; the rest is occupied by small tribes, each of which is ruled by the chief who happens to have most influence at the time. The "Kumba," or pimento tree, is found there in great plenty.

plenty, that a rotal or pound of falt will purchase four or five mid, each mid about a peck. The trees are so large, from the quantity of water and deep clay, that canoes are hollowed out of them of sufficient capacity to contain 10 persons. The Jelabs of Bergoo and Für sometimes journey to this country in order to procure slaves. The chief article they carry hither is salt, 12 pounds of which are estimated as the price of a male slave, about 12 or 14 years of age. A female brings three pounds more, whimsically computed by the natives, as a pound for the girl's eyes, another for her nose, and a third for her ears. If copper be the medium, two rotals are esteemed equal to four of salt. "Hoddür," a large fort of Venetian glass beads, and tin, are in great estimation. Of the latter they make rings, and other ornaments. Brown's Travels in Africa, p. 30, 8vo.

KULLA, a town of Sweden, in the province of Upland; 17 miles N. E. of Stockholm.—Also, a town of Sweden, in Abo; 10 miles E.S.E. of Björneborg.—Also, a town of Hindoostan, in Guzerat; 60 miles S.W. of Gogo.

KULLAPOLLAM, a town of Hindoostan, in the circuit of Guntoor; 32 miles N.E. of Mootapilly.

KULLAUT, a town of the kingdom of Candahar; 55 miles E. of Candahar.

KULLEN, a town of Sweden, in the province of Skone; 15 miles N. of Helsingborg.

KULLERWAH, a town of Hindoostan, in Gurry Mundella; 35 miles E. of Mundella.

KULLO, a country of Africa, E. of Konkodoo.

KULLOWGUY, a town of Africa, in the country of Kulo. N. lat. 12° 24'. W. long. 8 28'.

KULM. See CULM.

KULM, a town of Grand Bucharia, in the country of Balk; 30 miles N.E. of Balk.—Also, a town of Bohemia, in the circle of Leitmeritz; 9 miles S.W. of Kamnitz.—Also, a mountain of Dalmatia; 15 miles N. of Ragusa.

KULMALAX, a town of Sweden, in Tavastland; 31 miles N. of Tavasthus.

KULMEETA, a town of Algiers, on the left side of the Shellif, near its mouth; 6 miles N. of Mutlygannim.

KULSAGE, or SUGAR-*Teoua*, a little Cherokee town in the vale of Keowe.

KULSI, a river of Russia, which takes its rise in the government of Archangel, and falls into the White sea, in the district of the town of Mefensk.

KU-LONG-TCHAT, a town of the north coast of the island of Formosa. N. lat. 25° 16'. E. long. 121° 34'.

KULSUTANSKOI, a town of Russia, in the government of Irkutsk; 100 miles S.W. of Nertchinsk.

KUMADER, a town of Japan, in the island of Nippon; 10 miles N.E. of Moria.

KUMALA, a town of Sweden, in the province of Tavastland; 65 miles N.N.E. of Jamio.

KUMANO, a town of Japan, in the island of Nippon; 6 miles N.E. of Ixo.

KUMANT, a town of Japan, in the island of Nippon; 70 miles N.N.W. of Meaco.

KUMBO, a kingdom of Africa, near the mouth of the Gambia.

KUME JACUB, a town of Egypt; 16 miles S. of Girgê.

KUMEGAN, a town of Prussia, in the province of Samland; 16 miles N.W. of Konigberg.

KUMARA, in *Hindoo Mythology*, a name of KARTIKYA, which see.

KUMBA, and NIKUMBA, names of fiends, in Hindoo mythological legends, said by some accounts to have been destroyed by Krishna; according to others, by Kama,

KUMI, in *Geography*, an island in the East Indian sea, the most westerly in a cluster of six or seven others, from which it is separated by channels from eight to ten leagues wide, between Formosa and Japan, seen by M. la Perouse, who did not land upon it. These islanders are neither Japanese nor Chinese, but seem to be a mixture of both people. They were covered with a flurt and a pair of cotton drawers. Their hair, tucked up on the crown of the head, was rolled round a bodkin, which appeared to the voyagers to be gold. Each of them had a dagger, the handle of which was also gold. Their canoes were made of hollowed trees, and they were awkward in the management of them. Vessels that had been long at sea might procure wood, water, and provisions in this island, and also trade here in a small degree. But as it is scarcely three or four leagues in circumference, its population does not probably exceed four or five hundred. N. lat. 24° 33'. E. long. 123° 16'. Perouse's Voyage, vol. ii.

KUMINGE, a town of Sweden, in the government of Ulea; 11 miles N.E. of Ulea.

KUMISS, or KOUMISS, a kind of liquor made in Tartary, used by the natives as their common beverage, and often serving them instead of all other food. It is said to be so salutary and nourishing, that the Bashkirs, though emaciated in winter, return to the use of it in summer, and become strong and fat. The Russians have borrowed it from the Tartars, and use it medicinally. It is made with fermented mare's milk, according to the following receipt, communicated by Dr. Grieve in the Edinburgh Philosophical Transactions, vol. i. p. 181. as he obtained it from a Russian nobleman, who visited that part of Tartary where it is made, for the sake of the medical use of it:—"Take of fresh mare's milk, of one day, any quantity; add to it a sixth part of water, and pour the mixture into a wooden vessel; use then, as a ferment, an eighth part of the fourfold cow's milk that can be got: but at any future preparation, a small portion of old koumiss will better answer the purpose of souring; cover the vessel with a thick cloth, and set it in a place of moderate warmth; leave it at rest twenty-four hours, at the end of which time the milk will have become sour, and a thick substance will be gathered on the top: then with a stick, made at the lower end in the manner of a churn-staff, beat it till the thick substance above-mentioned be blended intimately with the subjacent fluid. In this situation, leave it again at rest for twenty-four hours more; after which pour it into a higher and narrower vessel, resembling a churn, where the agitation must be repeated as before, till the liquor appear to be perfectly homogeneous; and in this state it is called koumiss, of which the taste ought to be a pleasant mixture of sweet and sour. Agitation must be employed every time before it be used."—To this detail of the process the nobleman subjoined, that, in order to obtain milk in sufficient quantity, the Tartars have a custom of separating the foal from the mare during the day, and allowing it to suck during the night: and when the milk is to be taken from the mare, which is generally about five times a-day, they always produce the foal, on the supposition that she yields her milk more copiously when it is present.

To the above method of making koumiss, our author has added some particulars taken from other communications with which he was favoured by Tartars themselves. According to the account of a Tartar who lived to the fourth east of Orenbourg, the proportion of milk and souring ought to be the same as above; only, to prevent changing the vessel, the milk may be put at once into a pretty high and narrow vessel; and in order to accelerate the fermentation,

tion, some warm milk may be added to it, and, if necessary, more fousing.—From a Tartar whom the doctor met with at the fair of Macarieff upon the Volga, and from whom he purchased one of the leathern bags which are used by the Kalmucks for the preparation and carriage of their koumiss, he learned that the process may be much shortened by heating the milk before the fousing be added to it, and as soon as the parts begin to separate, and a thick substance to rise to the top, by agitating it every hour or oftener. In this way he made some in the doctor's presence, in the space of twelve hours. Our author learned also, that it was common among some Tartars to prepare it in one day during summer, and that with only two or three agitations; but that in winter, when, from a deficiency of mares' milk, they are obliged to add a great proportion of that of cows, more agitation and more time are necessary. And though it is commonly used within a few days after the preparation, yet when well secured in close vessels, and kept in a cold place, that it may be preserved for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by four milk as above, by a four parts of rye flour, by the rennet of a lamb's stomach, or, what is more common, by a portion of old koumiss; and that in some places they saved much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very soon undergoes the vinous change.

It was according to the process first mentioned, however, that all the koumiss which the doctor employed in medicine was prepared. It has been found serviceable in hectic and in nervous complaints; and our author relates some very striking cases which the use of it had completely cured. All those who drank it, our author informs us, agreed in saying, that, during its use, they had little appetite for food; that they drank it in very large quantities, not only without disgust, but with pleasure; that it rendered their veins turgid, without producing languor; that, on the contrary, they soon acquired from it an uncommon degree of sprightliness and vivacity; that even in cases of some excess, it was not followed by indigestion, headach, or any of the symptoms which usually attend the abuse of other fermented liquors.

The utility, however, of this preparation as a medicine, supposing it completely ascertained, would among us, as our author observes, be greatly circumscribed by the scarcity of mares' milk in this country. "Hence," says he, inquiries will naturally be made, whether other species of milk admit of a similar vinous fermentation, and what proportion of spirit they contain. As these have never been the object, however, of my attention, I will here give the substance of what I have been able to learn from others respecting that which is the most common, the milk of cows.

"Dr. Pallas says, that cow's milk is also susceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mares' milk fails them; that the wine prepared from cow's milk they call *aireu*; but that they always prefer koumiss when it can be got, as it is more agreeable, and contains a greater quantity of spirit; that koumiss, on distillation, yields of a weak spirit one third; but that *aireu* yields only two ninth parts of its whole quantity, which spirit they call *arika*.

"This account is confirmed by Oseretkowsky, a Russian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary. He published lately a dissertation on the ardent spirit to be obtained from cow's milk.

"From his experiments it appears, that cow's milk may be fermented with, or even without, fousing, provided sufficient time and agitation be employed; that no spirit could be produced from any one of its constituent parts taken separately, nor from any two of them, unless inasmuch as they are mixed with some part of the third; that the milk with all its parts in their natural proportion was the most productive of it; that the clofer it was kept, or, which is the same thing, the more difficultly the fixed air is allowed to escape during the fermentation, (care being taken, however, that we do not endanger the bursting of the vessel,) the more spirit is obtained. He also informs us, that it had a fouler smell before than after agitation; that the quantity of spirit was increased, by allowing the fermented liquor to repose for some time before distillation; that from six pints of milk, fermented in a close vessel, and thus set to repose, he obtained three ounces of ardent spirit, of which one was consumed in burning; but that from the same quantity of the same milk fermented in an open vessel, he could scarcely obtain an ounce."

KUMLA, in *Geography*, a town of Sweden, in the province of Nericia; 7 miles S. of Orebro.—Also, a town of Sweden, in East Gothland; 10 miles S.S.W. of Nordkiöping.—Also, a town of Sweden, in Sudermanland; 25 miles W. of Stockholm.

KUMLINE, a small island in the Baltic, between the continent of Finland and the island of Aland, with a town upon it. N. lat. 60° 17'. E. long. 20° 37'.

KUMO, a town of Sweden, in the government of Abo, on a river of the same name; 23 miles S.E. of Björneborg.

KUMRI, a chain of lofty mountains in Africa, in which are the sources of the Nile and Bahr Kulla, lying, according to Browne, in N. lat. 7; and probably running across the continent.

KUMUK, a province bordering on the Caspian sea, part of the territory included between the rivers Terek and Kur, and lying between the Terek and Koifu, comprehends a fertile plain watered by these rivers, as well as the Akkai and Kafma, and the next adjoining mountains to the west. It is under the government of several Kumuk Begs, of whom the two most powerful reside in the cities Akkai and Endors, (called by the Russians Andrewka,) at the foot of the mountains; and is inhabited by the Kumuk and Nogai Tartars, and by Armenian and Georgian merchants, who dwell in the cities. In winter the Lefgians descend likewise with their herds from the mountains into the plain; for the liberty of doing which they pay a tribute. The Nogai Tartars keep numerous herds, and dwell in moveable felt-huts, near the walls and banks of the rivers and canals. The length of this province is about 11, and the breadth 8, German miles. The Kumuks are vassals to Russia.

KUNA, a town of Lithuania; 15 miles S.E. of Bracław.

KUNASSYR, one of the Kurile islands, 150 versts long, and 50 broad, and entirely surrounded by mountains with lofty summits; but in the middle of the island are low plains. Firs, larches, birch, &c. grow here. At the southern extremity, a flat sandy beach extends from the lofty mountains, where the sea brings up a species of pearl-bearing mussel in vast abundance; some of the size of a desert-plate. The island has lakes and broad streams that abound with fish. It is inhabited by Kurils, who are rated at 41 persons.

KUNCKEL, JOHN, in *Biography*, a celebrated chemist, was born at Hufum, in the duchy of Sleswick, in the year 1630. He was originally intended for the practice of pharmacy;

macy; but having applied himself with equal diligence to the study of chemistry and metallurgy, he obtained great reputation for his skill in these departments, and was appointed chemist to the elector of Saxony. He afterwards went to the court of Frederic William, elector of Brandenburg, with a similar appointment; and subsequently to that of Charles XI. king of Sweden, who gave him the title of confeller metallique; and, in 1693, granted him letters of nobility, under the name of Kunckel de Loewenstern. He was elected a member of the imperial Academia Naturæ Curiosorum, under the name of Hermes III. He died in Sweden, in March 1703.

Kunckel laboured in the practical pursuit of chemical knowledge for upwards of fifty years, and obtained an extraordinary skill in the art. His patrons defrayed the expence of all the operations which he chose to undertake; and, as director of the glass-works, he had many opportunities of exercising his talent of acute observation. His theoretical knowledge, however, was very imperfect: for it is allowed that he was altogether destitute of the least tincture of philosophy, and was even fabled to have been one of the searchers for the philosopher's stone. He is now principally known as the discoverer of *phosphorus*, which he prepared from urine, and which bears his name in the shops. He was the author of several works, written in German, in a very bad style, and with as little method as the rest of the alchemists. His treatise "On Phosphorus" was printed at Leipzig in 1678, and his "Art of Glass-making" in 1689. Two or three of his essays have been translated into Latin. Eloy. Dict. Hist.

KUNDAL, in *Geography*, a town of Bengal; 20 miles S.E. of Comillah.

KUNDALIAH, a town of Hindoostan, in Dowlatabad; 10 miles E.S.E. of Toolipour.

KUNDAWILSA, a town of Hindoostan, in Cicacole; 20 miles S.W. of Cicacole.

KUNDERA, a town of Hindoostan; 35 miles W. of Poonah.

KUNDJEH, a town of Turkish-Armenia, on the Euphrates; 65 miles S. of Erzerum.

KUNDOZERSKAIA, a town of Russia, in the government of Archangel; 128 miles S. of Kola.

KUNDRUTCHIA, a town of Russia, in the country of the Cossacks, on the Donetz; 68 miles N.E. of Azoph.

KUNGIPARA, a town of Hindoostan, in the subah of Delhi; 10 miles S.E. of Tannafar.

KUNGUR, a town of Russia, and district of the government of Perm, on the river Sylva; 40 miles S. of Perm.

KUNK, Congo, or CUNG, a sea-port town of Persia, in the province of Larilan, on the coast of the Persian gulf, opposite the island of Kishme; 60 miles S.E. of Lar. N. lat. 26° 44'. E. long. 54° 50'.

KUNNERSDORF, a town in the Middle Mark of Brandenburg, remarkable for a battle fought between the Prussians and the united forces of the Austrians and Russians, August the 12th, 1759; 3 miles E.N.E. of Francfort on the Oder.

KUNNIPOUR, a town of Hindoostan, in Benares; 15 miles E. of Merzapour.

KUNOE, one of the Faroer islands.

KUNOSY, a town of Lithuania, in the palatinate of Novogrodek; 34 miles E.S.E. of Novogrodek.

KUNOVATSKOI, a town of Russia, in the government of Tobolsk, on the Ob; 80 miles S. of Obdorskoi.

KUNOW, a town of Poland, in the palatinate of Sandomirz; 16 miles S.S.E. of Radom.

KUNTE, a town of Japan, in the island of Xicoco; 18 miles S. of Ijo.

KUNTZEN, a town of Prussia, in the province of Sannland, on the Curisch Neuring; 28 miles N. of Konigsberg.

KUNZEN, ADOLPH. CART., in *Biography*, born at Wittenburg in 1720, was an excellent performer on the harpsichord and organ, who in early youth, about the middle of the last century, came to England, where his masterly and powerful manner of treating these instruments, both as a performer and composer, may be still remembered with pleasure by those who heard him. On his return to Germany, he was appointed organist of Lubce, where he died in 1771.

KUOPIO, in *Geography*, a town of Sweden, and capital of Savolia, and that part of Carelia reserved to Sweden, formed into one province under the appellation of Hoedingedorne of Kuopio. The town stands on the west side of an extensive lake; 150 miles S.S.E. of Ulea. N. lat. 62° 54'. E. long. 27° 28'.

KUORTANE, a town of Sweden, in the government of Wafa; 52 miles E.S.E. of Wafa.

KUPENKA, a town of Russia, in the government of Voronetz; 128 miles S.S.W. of Voronetz.

KUPERPEH, a town of Natolia; 35 miles W.N.W. of Boli.

KUPFENBERG, a town of Bavaria, in the bishopric of Bamberg; 32 miles N.E. of Bamberg.—Also, a town of Bavaria, in the bishopric of Aichlstadt; 10 miles E.N.E. of Aichlstadt.

KUPFER NICKEL. See NICKEL.

KUPFERBERG, in *Geography*, a town of Silesia, in the principality of Jauer; 15 miles S.S.W. of Jauer. N. lat. 50° 40'. E. long. 15° 55'.—Also, a town of Bohemia, in the circle of Saatz; 22 miles W.S.W. of Saatz. N. lat. 50° 23'. E. long. 13° 5'.

KUPH, a decayed town of Syria, bearing amongst its ruins marks of ancient splendour. Its houses are constructed of yellow hewn stone; the walls are about eighteen inches thick, and are neither fastened with iron, nor laid in mortar. The houses are built round courts, and appear like palaces. Crosses over the doors indicate that they were erected by Christians; and from the style of architecture, Dr. Pococke supposes that it was about the fourth or fifth century; 35 miles S.S.W. of Aleppo.

KUPHE, a name given by Guettard to a petrification, the body of which is conical, the anterior part blunt, and the posterior part forked, while the interior is divided into two hollows or tubes.

KUPINATZ, in *Geography*, a town of Croatia; 14 miles E. of Carlsbad.

KUPISZKI, a town of Lithuania, in the palatinate of Troki; 30 miles S.S.E. of Birza.

KUPLIAGHISI, a town of Natolia; 16 miles S. of Sinob.

KUPPENHEIM, a town of Baden; 3 miles S.S.E. of Ralsbad.

KUPPOREAH, a town of Hindoostan, in the circar of Sirhind; 50 miles S.W. of Sirhind.

KUPRI, a river of Natolia, which runs into the gulf of Satalia. N. lat. 36° 59'. E. long. 37°.

KUPRIBAZARI, a town of Asiatic Turkey, in Caramania; 6 miles W. of Satalia.

KUPSINGA, a town of Hindoostan, in the circar of Gangpou; 10 miles S.S.W. of Gangpou.

**KUR**, a river of Asia, the ancient *Cyrus* (which see), rises in the Caucasian mountains, and pursuing a rapid course through Georgia, Schirwan, &c. falls into the Caspian sea, 70 miles S.S.W. of Baku. In the vicinity of this river the land is subject to inundations, and overgrown with high rich grass; towards the sea it is brackish and barren, but fertile towards the mountains. About 14 miles upwards from its mouth, the Kur receives from the right the Aras, or ancient Araxes; and there on the left bank is situated a large village, named Dschawat. After its junction with the Aras, the Kur is about 70 fathoms broad, and only so far navigable; the rocks in the bed of the river hindering the navigation higher up. At about four German miles from the sea, it branches out into a number of arms, the northernmost and southernmost of which are the most considerable. The islands thus formed belong to Schirwan. On the northern main arm lies the town of Sallian, which properly consists of a number of villages extending along the river, and owes its prosperity to the uncommonly productive fishery of the Kur; for this river abounds with sturgeon and other fish. Between the Kur and the Terek lies a tract of land, along the Caspian sea, extending in length from the 30th to the 44th degree of N. latitude, and of various breadth, though for the most part inconsiderable in proportion to its length. This tract contains somewhat more than 2500 French square miles, and is divided into three provinces, *viz.* *Kumak*, *Daghestan*, and *Schirwan*, of which the first is now dependent on Russia, and the two latter on Persia. See each respectively.

**KURA**, a small island in the Caspian sea, with steep shores round it. N. lat. 39°.

**KURABAD**, a town of Candahar; 8 miles W. of Attock.

**KURAGGI**, a town of Japan, in the island of Niphon; 45 miles N.N.E. of Jedo.

**KURCH**, a town of Natolia; 34 miles W. of Sinob.

**KURDIUM**, a town of Russia, in the government of Saratof, on the Volga; 16 miles N.N.E. of Saratof.

**KURGAN**, a town of Russia, and district of the government of Tobolsk, on the river Kurgan; 68 miles S.W. of Yalutorovsk.—Also, a river of Asia, which rises in Khorasan, and runs into the Caspian sea, W. of Altarabat.

**KURIAT**, a town of Arabia, in the country of Oman, at the mouth of a river of the same name, which runs into the Arabian sea, S. of cape Kuriah; 20 miles S.E. of Mascat.

**KURIAI**, *Capes*, or *Ros Kuriat*, a cape on the coast of Arabia. N. lat. 23° 27'. E. lon. 57° 50'.

**KURJAUN**, a town of Hindoostan, in the circar of Gohud; 25 miles S.W. of Gwalior.

**KURIKKA**, a town of Sweden, in the government of Wafsa; 36 miles N.E. of Christinelstadt.

**KURLA**, a town of Sweden, in East Bothnia; 20 miles S.W. of Brahetlad.

**KURLAUT**, a town of Kharafin; 60 miles S.S.E. of Urkonje.

**KURILE**, or **KURILSKOI**, *Islands*, a chain of islands, running in a S.W. direction from the southern promontory of the peninsula of Kamtschatka, or the Kurilloy Lopatka, to Japan, extending from N. lat. 51° to 45°. They obtained this name from the inhabitants of the neighbourhood of Lopatka, who being themselves called Kuriles, gave their own name to these islands, on first being called acquainted with them. Some of them are inhabited and wooded, others quite bare and rocky, and a few that are volcanic. According to Spanberg, they are 22 in number, without reckoning the small ones. Of the two Kurile islands that lie nearest to Lopatka, the first accounts were brought to

Russia in the year 1713. The others have been successively known from that period to 1779, by means of Russian mariners, who, at the time, put them under contribution to the crown. The 22 islands are Shoornthu or Shoornka, Poromufhir, or Paramoufir, Sherinki, Mikan-Kur-Afsey, Anakutan, Ar-Amakutan, Syakutan, Ikarma, Tshirinkutan, Mussfy, Rach-koke, Mutova, Rafagu, Uffalfy, Ketoi, Semuffyr, Tshirpa-Oi, Urup, or Ooroop, Etorpu, Kunaffyr, Tshikota, and Matmai. Anakutan is distant from the fourth island (in the order of enumeration) 35 versts; it is about 100 versts long and 15 broad; has three elevated summits of mountains, of which two have exhausted craters; the wood is scrubbed and scanty; red foxes are pretty numerous, but on the coast are few sea-beavers, &c. Several streams of hard water flow from it into the sea. From this Ar-Amakutan is distant six versts; its length is twenty versts and breadth ten; in the centre of the island is a rocky mountain, which was formerly a volcano, and towards the strait between it and the fifth island, on the eastern shore, stands another, which is reported to have been a burning mountain. This island is uninhabited, and is only visited by the Kurils, on account of the chace, as it abounds with foxes; and on the shores are sea-lions and sea-otters. Ikarma is about 12 versts from the seventh island, and is eight versts long. Upon it is a volcano, which occasionally emits flames; the shore is stony, presenting here and there a sulphureous spring. It has neither lakes nor streams; and with respect to wood and animals, it is in the same state with Syakutan. For an account of the other islands, see the respective articles. Of these 22 Kurile islands, the first 21 are subject to Russia; and all of these do not pay tribute. The islands are reported by their missionary, the pastor of Paratounca, who visits them once in three years, to be a friendly, hospitable, generous, humane race of people, and excelling their Kamtschadale neighbours, not less in the formation of their bodies than in docility and quickness of understanding. Of these islands it is said, that four only are inhabited, and their population is estimated at 1400 persons. The inhabitants are generally hairy, wear long beards, and live entirely upon seals, fish, and the produce of the chace. The more southerly and independent islanders sometimes pass in canoes the channel that separates them from the Russian Kuriles, in order to give some of the commodities of Japan, such as silk, cotton, iron, &c. in exchange for furs, dried fish, and oil. The inhabitants of as many of the islands as are brought under the Russian dominions are, at present, converted to Christianity; and probably the time is not very distant, when a friendly and profitable intercourse will be brought about between Kamtschatka and the whole of this chain of islands; which will be followed by a communication with Japan itself. These islands extend from N. lat. 42° to 51°. *Tocke's Russ. Emp. vol. i. Cook's Third Voyage, vol. iii.*

**KURISONDA**, a town of Asiatic Turkey, in Carmania; 60 miles N.N.E. of Tocat.

**KURISSIMA**, a town of Japan, in the island of Xicoco; 16 miles W. of Ijo.

**KURK**, a town of Candahar; 25 miles E. of Cabul.

**KURKIN**, a town of Bengal; 11 miles N.E. of Rangpur.

**KURKUMBA**, town of Hindoostan, in the circar of Ruttunpour; 32 miles E. of Ruttunpour.

**KURKUNA**, a town of Hindoostan, in the circar of Surgooja; 25 miles N.E. of Surgooja.

**KURKSTAT**, a town of Sweden, in the province of Nyland; 18 miles W. of Helsingfors.

**KURMA**. See **KORMA**.

**KURMAVATARA**, in *Mythology*, the second of the ten incarnations of the Hindoo god Vishnu, of which the following account is given in the Hindoo Pantheon. "The second grand avatara of Vishnu, in the form of a tortoise, evidently refers all to the deluge. In that of Matya, or the fish, (see **MATSYAVATARA**.) we find the necessity of a deluge to cleanse the world from his sinful taints. By the demon Hyagria having stolen the Vedas while Brahma was dozing, we must understand the dereliction of mankind from the doctrines and conduct prescribed in the scriptures, and the criminal indifference of their pastors. The preserving attribute of the deity interposed, saved a remnant of creatures from destruction, and by recovering the scriptures, reclaimed mankind to purity of faith and conduct. For the purpose of restoring to man some of the comforts and conveniences that were lost in the flood, Vishnu is fabled to have become incarnate again in the form of a tortoise; in which shape he sustained the mountain Mandara placed on his back to serve as an axis, whereon the gods and demons, the vast serpent Vafoky serving as a rope, churned the ocean for the recovery of the *amrita*, or beverage of immortality." (See **KETU**.) Plate 49, of the Hindoo Pantheon exhibits this process, where Vishnu is seen in his place with the two other great powers opposed to the Asuras, or demons; and appears again on the summit of the mountain, and again beneath it in the form of the tortoise. The history of this avatara forms an episode in the Mahabarat, and Mr. Wilkins has introduced a fine translation of it in his elegant version of the Gita, where, however, the metamorphosis of Vishnu into the tortoise is not directly mentioned. But such is the usual mode of telling and receiving the story, which is one of the most popular, both in recitation and painting, among the monstrous mass of subjects derived from the copious Pantheon of the Hindoos.

Kurma, or Koorma, is the Sanscrit appellation of the avatara. Among the Maharratas, and others in the western parts of India, it is more commonly called Katch, that word, or Katchiva, meaning, like Kurma, a tortoise or turtle. The result of the operation, in view to which the incarnation appears to have occurred, was obtaining from the churned ocean fourteen articles, usually called fourteen gems, or chaterdefa-ratana; in common language chawda-ratny; usually thus enumerated: 1. the Moon, Chandra or Soma; 2. Sri or Lakshmi, the goddess of fortune and beauty; 3. Sura, wine, or Suradevi, the goddess of wine; 4. Oochirava, an eight-headed horse; 5. Kustubha, a jewel of inestimable value; 6. Paryata or Pariyata, a tree that spontaneously yielded every thing desired; 7. Surabhi, a cow similarly beautiful; 8. Dhanvantara, a physician, or the god of physic; 9. Iravat, the elephant of Indra with three proboscis; 10. Shank, a shell conferring victory on any one who should sound it; 11. Danusha, an unerring bow; 12. Bikh, poison, or drugs; 13. Rheмба, a beautiful woman, corresponding in many points with our popular Venus; 14. The Amrita, or beverage of immortality, which appears, though last obtained, to have been the primary object of this churning process; the other gems appear to have been obtained incidentally.

Under most of the articles whose foreign names occur in this, some notice is taken of them, and we refer thither respectively and generally for farther information thereon.

**KURMDYA**, in *Geography*, a town of Bengal; 55 miles S.S.W. of Doofa.

**KURMUKI**, a town of the principality of Georgia; 105 miles S.E. of Teflis.

**KURMYK**, a town of Russia, and district of the go-

vernment of Simbirsk, on the Sura; 104 miles N.W. of Simbirsk.

**KUROPATNIKI**, a town of Austrian Poland, in Galicia; 45 miles E.S.E. of Lemberg.

**KUROSACKI**, a town of Japan, in the island of Ximo; 27 miles N. of Taifeiro.

**KUROW**, a town of the duchy of Holstein; 9 miles N.W. of Lubeck.

**KURRA**, a river of Hindoostan, which runs into the Beema; 32 miles N. of Vishapur.

**KURRABAGH**, a town of Candahar, in the province of Ghizni; 20 miles W.S.W. of Ghizni. N. lat. 33° 30'. E. long. 67° 50'.

**KURRERA**, a town of Hindoostan, in the circar of Gohud; 12 miles S.S.E. of Narwa.

**KURRIGOORA**, a town of Bengal; 45 miles S.S.W. of Doofa.

**KURRYA**, a town of Bengal; 30 miles S.E. of Palamou.

**KURSK**, a government of Russia, which was formerly part of that of Bielgorod; comprehending 16 districts: it is bounded on the N. by the government of Orel, on the E. by that of Voronetz, on the S. by Voronetz and Khar-kof, and on the W. by Tchernigof; about 112 miles from N. to S., and generally 100 from E. to W., extending, however, by a narrow part, about 12 miles wide, 40 miles further west.—Also, the capital of the above-mentioned government, on the river Tugar, which falls into the Sem or Sem. N. lat. 53° 40'. E. long. 36° 24'.

**KURSY**, a town of Hindoostan, in Candesh; 45 miles S.W. of Burhanpou.

**KURTACULAC**, a town of Afatic Turkey, in Aladulia; 25 miles S.E. of Adana.

**KURTAPOUR**, a town of Hindoostan, in Lahore; 10 miles S. of Jallindar.

**KURTCHI**, a order of soldiery among the Persians.

The word, in its original, signifies *army*, and is applied to a body of cavalry, consisting of the nobility of the kingdom of Persia, and the posterity of those conquerors, who placed Ismael Sophi on the throne. They are in number about eighteen thousand men.

Their commander is called *kut-bi baschi*, which was formerly the first post in the kingdom; equivalent to a constable in France.

**KURTUS**, in *Ichthyology*, a genus of the jugulares, consisting only of a single species, called *Indicus* from its being an inhabitant of the Indian seas. The body in this genus is carinated each side, the back elevated, and the gill-membrane furnished with two rays. The species known subsists on crabs and shells, or testaceous animals: the body is short, slender, golden, and appearing as if covered with silvery plates: the head is large, compressed, and obtuse; eyes very large, with black pupil, and iris above blue, beneath white; mouth large; jaws with numerous teeth; tongue short and cartilaginous; lateral line straight, and commencing above the pectoral fin; first ray of the dorsal and ventral fins hard, and two firm of the anal spinous.

**KURU**, in *Geography*, a town of Sweden, in the government of Abo; 63 miles E.N.E. of Biorneborg.

**KURU**, in *Hindoo Mythological Legends*, was the brother of Pandu, who was the father of the five heroes of the Mahabarat. Kuru had a hundred sons, whose contests with the Pandus are the subject of that poem, which is a continued allegory of the struggles between man's virtues and vices, personified in the offspring of the brothers. See **MAHABARAT**, and **PANDU**.

**KURUMA**, in *Geography*, a town of Japan, in the island of Ximo; 16 miles E.N.E. of Ikuu.

**KURYMA**, a town of Hungary; 12 miles N.E. of Szeben.

**KUSA**, in *Botany*, the species of *grafs poa cynosuroides*, esteemed by the Hindoos very sacred and mythical, and used by the Brahmins in many of their sacred or superstitious ceremonies. Among this race of fabulists some poetical legend exists, accounting, in their way, for every subject and allusion in their complex mythology and theogony. Of the kusa grafs this is related in the Hindoo Pantheon. "Some legends make Garuda the offspring of Kasyapa and Diti. (See KASYAPA.) This all-prolific dame laid an egg, which, it was predicted, would produce her deliverer from some great affliction: after a lapse of five hundred years, Garuda or Superna (see SUPERNA) sprang from the egg, flew to the abode of Indra, extinguished the fire that surrounded, conquered its guards, and bore off the amrita, (see KURMAVATARA,) which enabled him to liberate his mother, at that time afflicted in captivity. A few drops of this immortal beverage falling on the kusa, it became a grafs eternally consecrated; and some snakes, greedily licking up the ambrosia, so lacerated their tongues with the sharp blades of the grafs, that they have ever since remained forked; but the boon of eternity was insured to them also by their thus partaking of the immortality-conferring fluid. (See KETU.) This cause of snakes having forked tongues is still popularly, in the tales of India, attributed to the above greediness." P. 341.

**KUSAMO**, in *Geography*, a town of Sweden, in the government of Ulea; 85 miles E. of Tornea.

**KUSBAH**, a town of Hindoostan, in Benares; 22 miles W.N.W. of Benares.

**KUSCAN**, a town of Persia, in the province of Segeestan; 21 miles N.E. of Kin.

**KUSCARI**, a town of Mingrelia; 30 miles N.N.E. of Anarghia.

**KUSCHAIL**, a town of Russia, in the government of Tobolsk; 28 miles S. of Tomsk.

**KUSHA**, a town of Poland, in Podolia; 32 miles E. of Kamieniec.

**KUSHAL**, **KUSIEL**, or *Kubal*, a fortress of Asia, in Kuttore. N. lat. 35 17'. E. long. 70 39'.

**KUSHKAT**, a town of Great Bucharia; 72 miles W. of Kojend.

**KUSKO**, a town of the duchy of Warsaw; 18 miles W.S.W. of Kalitch.

**KUS-KHUSER**, a town of Persia, in Farfistan; 31 miles N. of Schiras.

**KUSMA**, a small town of Arabia, standing upon a high hill, in the province of Yemen, inhabited by free Arabs; 50 miles E. of Hodeida. The mountains, which extend far into the country, produce coffee.

**KUSSI**, a town of Japan, in the island of Nippon; 65 miles N.E. of Jedo.

**KUSSNACHT**, a bailiwick of Switzerland, in the canton of Zurich.—Also, a town of Switzerland, in the canton of Schweitz, near which is a chapel, erected on the spot where William Tell slew the Austrian governor; 10 miles W. of Schweitz.

**KUSSOOR**, a town of Hindoostan, in Lahore; 26 miles W.N.W. of Firozpour.

**KUSTANGI**, or **CHUSTENGI**, a town of European Turkey, in Bulgaria, on the Black sea, formerly called *Constantia*. N. lat. 44 30'. E. long. 28 37'.

**KUSTER**, **LUDOLPH**, in *Biography*, was born in 1670,

at Blomberg, in Westphalia, of which town his father was a magistrate. He studied under his elder brother at the Joachim college of Berlin, and was afterwards appointed tutor to the two sons of the count Schwering. On quitting that station, with a pension, he went to Frankfort on the Oder, and there published, in 1696, his "*Historia Critica Pomeri*." He was promised a professorship in the university of Joachim, and till that should be vacant he resolved to travel, and visited Leyden and Utrecht; at the latter place he delivered a course of lectures on the law of nations, and published his "*Bibliotheca Librorum*." He then went to England, and thence to France, for the purpose of collating MSS. for a new edition of Suidas. Having furnished himself with many very valuable materials and fragments for his work, from the king's library, he returned to England. Here he lived in great familiarity with Bentley and other learned men, and upon the publication of his work, which was printed partly at the expence of the university of Cambridge, he was honoured with the degree of doctor of laws. Several advantageous offers were made him if he would remain in England, but he was called back to Berlin, and installed in the professorship promised to him. The situation did not answer his expectations, he was rendered uncomfortable by disputes respecting his salary, and by having incurred the suspicion of being addicted to the principles of Ariamism, so that in a short time he found it expedient to retire to Amsterdam. Here he was reduced to absolute poverty by the failure of his banker. He afterwards went to Antwerp, embraced the Catholic religion, and was rewarded by a pension from the king, and with an admission into the Academy of Inscriptions. He died at the age of forty-six. He was a great master of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. Besides the works already referred to, he published "*Jamblicus Porphyrius*, et Anonymus apud Photium de Vita Pythagoræ." A new edition of Dr. Mill's Greek Testament. "*Aristophanes Gr. et Lat.*" "*De vero usu verborum medicorum*," which has been much esteemed as a grammatical treatise.

**KUSTUBHA**, in *Hindoo Legends*, is an inestimable gem, of which many wonderful tales are related. It is one of the fourteen precious things recovered from the ocean when churned for the amrita, by gods and demons, in the *Kurma-vatara*; which see.

**KUTALI**, in *Geography*, a small island, in the sea of Marmora. N. lat. 40° 30'. E. long. 27° 22'.

**KUTAN**, a town of Hindoostan, in Oude; 30 miles E. of Kairabad.

**KUTATS**, a town of Japan, in the island of Nippon; 25 miles E. of Meaco.

**KUTINA**, a town of Sclavonia; 33 miles W.N.W. of Pofzega.

**KUTSCHINA**, a town of Servia; 16 miles S.S.W. of Orfova.

**KU-TSING**, a city of China, of the first rank, in the province of Yun-nan; surrounded with mountains, about which the soil is fruitful. Its jurisdiction comprehends five towns of the second class, and two of the third. The inhabitants are industrious in cultivating the ground. N. lat. 25 34'. E. long. 103 27'.

**KUTSKOI**, a town of Russia, in the government of Irkutsk, on the Kuta, where it joins the Lena; 60 miles E. of Ilmsk. N. lat. 56 40'. E. long. 123 20'.

**KUTTENBERG**, or **KUTNA-HORA**, a town of Bohemia, in the circle of Czaflau, famous for its silver mines, formerly

formerly abundant, discovered by a monk in 1237; 4 miles N.W. of Czasslau. N. lat.  $49^{\circ} 52'$ . E. long.  $15^{\circ} 16'$ .

**KUTTPORE**, a tract of country between the N.E. part of Cabul, and the N.W. of Cachemire, now subject to Candahar. This tract borders on the N. of Sewad, Bijore, Puckholi, &c. It has obtained from the Mahometans the name of *Cafcrijan*, or land of infidels, and is classed by the people of Hindoostan as a dependency of Cashgar. It occupies nearly the place of Ptolemy's *Comedi*, and answers to it in description, being entirely mountainous. An author, cited by Rennell, states that Kuttore contains a great number of towns and villages, and is exceedingly populous. Its principal towns are Towkul, called also Showkul, and Jour-kul; these being the residences of its rulers. It abounds in fruits, such as grapes, plumbs, &c. It likewise yields rice, wheat, and other sorts of grain. The natives are exceedingly fond of wine and hog's flesh; although their country is well-stocked with cows and goats. They have a distinct language not at all resembling that of any other people; and their arms consist of the bow and arrow, the sabre and the sling. Another author says, that they are, for the most part, idolaters; that they are of a robbul make, and that their complexion is a mixture of red and white.

**KUTTPORE** is also a town and fortrefs in the above described country; 100 miles N.E. of Cabul. N. lat.  $35^{\circ} 27'$ . E. long.  $70^{\circ} 17'$ .

**KUTTRY**. See RAJPOOTS.

**KUTTUHDUA**, a small island in the bay of Bengal, near the coast of Aracan, inhabited chiefly by fishermen. It is well wooded. N. lat.  $21^{\circ} 52'$ . E. long.  $91^{\circ} 45'$ .

**KUTUM**, a town of Hindoostan, in Benares; 10 miles N.E. of Bidrigur.

**KUTZABAR**, a town of Persia, in Mazanderan; 40 miles S.W. of Fehrabad.

**KUVA**, a small town of Persia, S. of Derbent; the residence of a khan.

**KUVERA**, in *Hindo Mythology*, is the regent of wealth, corresponding with the Plutus of the western Pantheon. He is described, in respect of externals, as a mere man, gloomy, selfish, and deformed; but as a magnificent deity, residing in the splendid city Alaka, and borne through the sky in a gorgeous car, called *pushpaka*, or flowery. He is also called Viteffa, Paulastya, and Dhanada; and as the son of a sage named Vifrava, he is called Vifravana, a name likewise of Ravena, half brother, by the same father, of Kuvera. (See RAVENA.) His servants and companions are the Yakhas and Guhyakas, into whose filthy forms transmigrate the souls of those men who in this life are addicted to fordid and base passions, or absorbed in worldly prosperity. The term Guhyaka is derived from *guh* (ordure) a word retained in several dialects. He has a consort named *Kauseri*, which see; but neither would be invoked by a Hindoo, for the boon of riches, but *Lakshmi*, which see.

The Hindoos have assigned regents to each cardinal and intermediate point of the compass. (See MARUT.) Kuvera rules the north.

**KUWANA**, or **QUANO**, a sea-port of Japan, in the province of Owari.

**KUYALI**, a town of European Turkey, in Romania; 27 miles E.S.E. of Philippopol.

**KUYNDER**, a sea-port town of Holland, in Friesland, on the W. side of the river of the same name, at its entrance into the Zuyder see; 23 miles S. of Lewardan. N. lat.  $52^{\circ} 43'$ . E. long.  $5^{\circ} 46'$ .

**KUYP**, or **CUYP**, **ALBERT**, in *Biography*, a painter who ranks among the best and most original artists. He was born at Dort in 1606, and was the son of Jacob Gerritz

Kuyp, a landscape painter of much merit. From his father he first learnt the rudiments of the art; but surpassed him infinitely in his progress. He was one of the most agreeable painters that ever lived; imitating with the greatest perfection the purity and brilliancy of light. No artist ever represented the atmosphere which surrounds all objects more completely than Cuyp; not even Claude: and in the effect of sun-shine, none ever approached him. The simplest scenes and combinations of objects were sufficient for him to exert his talents upon; and he never failed to give an interest to them by the sweetness of his colour, and the beauty of his light and shade.

Little or nothing is known of his life. His works are numerous, and therefore he must have lived long; for they are of so highly finished a quality that he must have given much time to them.

In the various collections among the nobility in England, works of his shine with almost unrivalled lustre; and are not very uncommon. At the marquis of Stafford's is a very fine one of the landing of prince Maurice at Dort. There are also several others of great merit.

**KUZNETCHICA**, in *Geography*, a town of Russia, in the government of Simbirsk, on the Volga; 16 miles N.E. of Simbirsk.

**KUZNETZK**, a town of Russia, and district of the government of Saratof, seated on a rivulet, falling into the Sura; 96 miles N.N.E. of Saratof.

**KUZNETZK**, a town of Russia, and district of the government of Kolyvan, situated on the river Tom, opposite to the mouth of the Kondama; built in 1618, on a place whither the Tartars generally retired, and colonized from Tomsk, and some other towns. It contains about 300 houses, and the inhabitants are chiefly employed in the manufacture of iron; 188 miles E.S.E. of Kolyvan. N. lat.  $53^{\circ} 40'$ . E. long.  $86^{\circ} 49'$ .

**KUZNETSKOI MOUNTAINS**, a range of mountains, forming one of the sub-divisions of the Russian share of the Altaian mountains, the other being the Oby and the Yenisey. See ALTAI.

**KUZNIK**, a town of Russia, in the government of Viatka; 48 miles S.S.W. of Glazov.

**KUZOMEN**, a town of Russia, in the government of Archangel, on the coast of the White sea; 124 miles N.W. of Archangel.

**KUZREKA**, a town of Russia, in the government of Archangel, on the N. coast of the White sea; 140 miles S.S.E. of Kola.

**KWASSITZ**, a town of Moravia, in the circle of Hradisch; 14 miles N. of Hradich.

**KWASSOWA**, a town of Poland, in Volhynia; 28 miles N. of Zytomiers.

**KYANITE**, or **CYANITE**, Wern.; *Dijshene*, Haüy; *Sappare*, Sauffure. Other names derived from fancied resemblances, are blue-floril, blue talc, blue mica, foliated beryl, sapphir spar, blue feldspar, &c. Haüy's name implies the power this substance possesses of acquiring both vitreous and resinous electricity; all the other denominations are expressive of its characteristic.

Colour, which is generally azure-blue, light Prussian blue, or smalt-blue; but it is also seen blueish-grey, milky, greyish and greenish-white, and more seldom scaldon, and other shades of blueish-green. These colours are either uniform or mixed: the blueish-grey, striped or flamed with various shades of Prussian blue, is the most common mixture.

It occurs massive, disseminated in blunt-edged pieces, and crystallized. The following are the modifications we are acquainted with: 1. The oblique quadrangular prism, (which

(which appears also to be the primitive form of this substance,) with two opposite sides very narrow, which give the crystal a contracted tabular form. 2 The lateral edges formed by the acute angles of the preceding crystals, intercepted each by a plane, or truncated: this plane is generally very narrow. 3. The lateral edges formed by the obtuse angles of N 1, intercepted each by a plane, or truncated. This modification appears to be very scarce. 4. Four of the terminal edges of N<sup>2</sup>, intercepted each by a plane, which, if they met in a point, would form a four-sided pyramid. This we have observed in a small crystal included in rock-crystal.

These crystals, especially those from Mount St. Gothard, are not infrequently seen as twin-crystals, or macles.

They are mostly middle-sized, but also small, and very small; and occur imbedded, either singly, or in groups, intersecting each other. They are not infrequently seen curved and twisted, as if they had sustained pressure, when not yet hardened.

The internal, and generally also the external lustre of the cyanite is shining and splendid; it is a perfectly pearly lustre.

The longitudinal fracture of the crystals is foliated, with two-fold cleavage, one of which is much more distinct than the other. In the uncrystallized varieties the fracture is broad, straight, or curved-radiated, sometimes passing into foliated. The fragments are splintery, wedge-shaped, or even approaching the rhomboidal figure. The wedge-shaped distinct concretions, in which it occurs, are often grown together in all directions.

The massive cyanite is faintly translucent; but the crystals are often perfectly transparent: refraction simple.

It is semi-hard, nearly soft; a steel needle easily scratches the broad planes of the crystals, but not the narrow and truncating planes.

It is slightly flexible, but not elastic: and easily frangible.

Its specific gravity is stated to be 3.517 by Saussure, 3.622 (the Siberian) by Herrmann, and 3.092 (the bluish-grey var. from Tyrol) by Kirwan.

The following are the results of the analyses made of this substance.

	Saussure, fen.	Saussure, jun.
Silica	12.81	29.2
Alumine	66.92	55.0
Lime	1.71	2.25
Magnesia	13.25	2.0
Oxyd of iron	5.48	6.65
Loss and water	0.0	5.0
	100.17	100.

	Struve.	Herrmann.
Silica	51.5	23
Alumine	5.5	30
Lime	4.0	3
Magnesia	30.5	39
Oxyd of iron	5.0	2
Loss and water	4.5	3
	100.	100

The two following analyses differ from the preceding, particularly in the absence of magnesia and lime:

	Laugier.	Klaproth.
Silica	38.5	43.
Alumine	55.5	55.50
Lime	0.5	0.0
Oxyd of iron	2.75	0.50
Loss and water	2.75	Soda a trace

Cyanite is infusible before the blow-pipe, a property which, according to Saussure, renders it a convenient support for fubstances to be tried by that instrument.

This substance is found only in primitive mountains, imbedded in mica slate and talc slate, accompanied by granitic or fluoritic and garnets, with new and then iron ochre, iron pyrites, calcareous spar, &c. In Moravia and Saxony it occurs in small groups imbedded in a variety of a primitive rock called weils-lein, or white-stone.

Its principal localities are Switzerland (especially at Airolo, on the fourth side of Mount St. Gothard); Salzburg and Tyrol (in the Zillertal); Carinthia (on the Sau-Alpe); Scotland (Aberdeenshire, near Banclachy, and in the Mainland, one of the Shetland islands); France (in the neighbourhood of Lyons); it has also been found in Norway, in Siberia, in Brazil, &c.

When cut and polished it resembles in colour some varieties of sapphir, and specimens of it are sometimes exhibited under this name; but, not to mention the striae always observable in the interior of cyanite stones, their inferior lustre, and comparative softness, will soon clear up all doubts respecting their nature.

Saussure has endeavoured to introduce the name *Sappare* for this mineral, and he tells us, that in Scotland it is known by that appellation. Some authors have lately criticized this name as being derived from the bad pronunciation of the word *Sapphir*, with which the cyanite is said to have been confounded by the person who pointed it out to Saussure: but this is a mistaken notion, the name *sappare* being known to occur in several old works on mining; and as it appears to have been a very vague sort of name, it is not improbable that it may also have included the subject of this article.

KYBAR, in *Geography*, a town of Norway; 6 miles S.W. of Wardhus

KYBURG, a bailiwick of Switzerland, in the canton of Zurich.

KYDREBAD, a town of Hindooistan, in Oode; 8 miles N.E. of Fyzabad.

KYHOLM, a small island of Denmark, near the island of Samsoe.

KYL, a town of Sweden, in the province of Warmeland; 25 miles S.E. of Carlstadt.—Allo, a town of Sweden, in the province of Nericia; 8 miles N.W. of Orebro.

KYLA, a town of Sweden, in Warmeland; 23 miles S.W. of Carlstadt.

KYLE of *Durness*, a bay on the N. coast of Scotland, at the mouth of the river Durness: the entrance, W. of Farout head, is in N. lat. 58° 40'. W. long. 4° 42'.

KYLE of *Rhea*, a narrow strait between the island of Sky, and the main land of the county of Inverness. N. lat. 57° 15'. W. long. 5° 40'.

KYLE *Scotic*, a bay on the W. coast of Scotland, and county of Sutherland. N. lat. 58° 16'. W. long. 5° 5'.

KYLE of *Tongue*, a bay on the N. of Scotland, and county of Sutherland; 13 miles W.S.W. of Strathly-head. N. lat. 58° 35'. W. long. 4° 13'.

KYLLINGIA, in *Botany*, so called by Rottböll, in memory of his countryman, Peter Kylling, a Dane, who, in 1688, published at Copenhagen, the *Friidarium Danicum*, which is a catalogue in Latin, Danish, and German, of the native

native plants of Denmark, making 174 quarto pages.—Rottb. Gram. 12. Linn. Fil. Nov. Gram. Gen. 24. t. 1. Am. Acad. v. 10. 2. 24. t. 1. Suppl. 11. Schreb. 40. Willd. Sp. Pl. v. 1. 256. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 125. Brown. Prodr. Nov. Holl. v. 1. 218. Juff 27 Lamarck Illustr. t. 38. — Clafs and order, *Triandria Monogynia*. Nat. Ord. *Calamaria*, Linn. *Cyperoides*, Juff.

Gen. Ch. *Flowers* aggregate, in an oblong fealy head. *Cal.* Glume of two unequal valves, compressed, nearly single-flowered, single-seeded; valves lanceolate, channelled, acute, much shorter than the corolla. *Cor.* Glume of two unequal valves, compressed, larger than the calyx, keeled, spreading; the larger lanceolate, folded, very acute, embracing the smaller. *Stam.* Filaments three, awl-shaped, flat; anthers terminal, linear, erect. *Pist.* Germen superior, obovate, compressed, gibbous at one of its edges, without any bristles at the base; style thread-shaped; stigmas two or three, capillary. *Peric.* none, except the permanent corolla. *Seed* oblong, triangular, beardless.—The same calyx sometimes contains also either a male or a neutral flower.

Eff. Ch. *Flowers* aggregate, in an oblong, imbricated, head. Calyx of two valves. Corolla of two valves. Seed without bristles at the base.

This genus, adopted from Rottböll by the younger Linæus, had by his father been confounded with *Schoenus*, which its flowers in some measure resemble; but the habit, especially the aggregate, long, floral leaves, are akin to *Cyperus*. In the *Supplementum* four species are defined; Willdenow has eight; and a new one, *K. intermedia*, is described by Mr. Brown in his *Prodromus*, as found at Port Jackson, New South Wales.—They are all natives of warm countries, chiefly in the East or West Indies, and moist situations. Their roots seem to be perennial. Their herbage is slender. Stem simple, triangular, striated, and roughish. Leaves narrow, rough-edged. Heads pale or whitish, terminal, usually sessile, among the floral leaves, either solitary or several together, roundish or oblong, consisting of numerous, small, densely crowded flowers, whose glumes are more or less ribbed or striated, destitute of awns.

Examples of this genus are,

*K. monocephala*. Rottb. Gram. 13. t. 4. f. 4. (*Schoenus coloratus*; Linn. Sp. Pl. 64.)—Stem slender, triangular. Head globose, sessile, solitary. Floral leaves three, very long.—Native of both Indies. *Root* creeping. *Stems* solitary, a span high, bearing two or three leaves at the base, and three as long at the top, accompanied sometimes by a smaller one. The head of *flowers* is scarcely bigger than a large pea, whitish, very dense.—*Thryocophalon nenorale* of Forster, from Otaheite, appears to be precisely this plant.

*K. triceps*. Rottb. Gram. 14. t. 4. f. 6. (*Scirpus glomeratus*; Linn. Sp. Pl. ed. 1. 52. *Schenus niveus*; Syst. Veg. ed. 13. 81.)—Heads of both three together, clustered, sessile, somewhat ovate.—Native of both Indies. Rather larger than the last, of which, in the 2d edition of *Species Plantarum*, it is made a variety, but it is a smoother plant, and the clustered rather less globular heads distinguish the present species.

*K. incompleta*. Jacq. Coll. v. 4 101. Ic. Rar. t. 300.—Umbel compound. Spikes numerous, cylindrical. Calyx of one valve.—Native of the Caraccas. This is a very large species, with a sharply triangular stem three or four feet high, very long floral leaves under the general umbel, and many small leaves under the partial ones. The numerous clustered heads, or rather spikes, are oblong, various in

size, greenish, of numerous spreading flowers, whose calyx, according to Jacquin, has but one valve.

*K. monocephala*, *triceps*, and *umbellata*, are cultivated in the flowers at Kew, where they flower in summer or autumn, but probably excite little attention, except among curious botanists.

KYLY, or KYELA, in *Geography*, a sea-port on the W. coast of the island of Celebes, with a spacious harbour. S. lat. 1 15.

KYMITS, an island in the Baltic, near the coast of Finland; 20 miles long, and from one to two broad. N. lat. 60 16.

KYMMEN, a river of Finland, which flows from the lake of Pejend, or Pejma, into the centre of the gulf of Finland.

KYNE, a town of Sweden, in East Bothnia; 18 miles N.E. of Wafa.

KYNETON. See KINETON.

KYNOFO, a lake of Russia, in the government of Olo-netz, about 48 miles long, and from 12 to 16 broad. N. lat. 65 40. E long. 28 40.

KYPER, ALBERT, in *Biography*, a physician, was born at Konigsberg, in Prussia, and probably took the degree of M. D. at Leyden, where he was studying in the year 1642. He was afterwards chosen first professor of physic, in the new medical school established at Breda in 1646: but he quitted this station two years afterwards, in order to take possession of a medical chair, to which he was elected, at Leyden; an appointment which he held till his death, which occurred in September, 1655, at the time when he was rector of that university. He published several works. "Methodus Medicinæ ritè discendi et exercendi," Leyden, 1642. "Institutiones Physicæ," *ibid.* 1647. "Anthropologia, corporis humani contentorum, et animæ naturam et virtutes, secundum circulearem sanguinis motum, explicans," *ibid.* 1647, &c. "Institutiones Medicæ ad hypothesein de circulari sanguinis motu compoſitæ;" Amſterdam, 1654. "Collegium Medicum, xxvi. Disputationibus breviter complectens quæ ad Institutiones pertinent," Leyden, 1655. This volume contained also some miscellaneous and political tracts. Eloy. Dict. Hist. de Med.

KYPHONISM, KYPHONISMUS, or *Cyphonismus*, an ancient punishment, which was frequently undergone by the martyrs in the primitive times; wherein the body of the person to suffer was anointed with honey, and so exposed to the sun, that the flies and wasps might be tempted to torment him. This was performed in three manners; sometimes they only tied the patient to a stake; sometimes they hoisted him into the air, and suspended him in a basket; and sometimes they stretched him out on the ground, with his hands tied behind him. The word is originally Greek, and comes from *κῦρῶς*, which signifies either the *stake* to which the patient was tied, the *collar* fitted to the neck, or an *instrument* wherewith they tormented him; the scholiast on Aristophanes says, it was a wooden lock, or cage; and that it was called so from *κῦρῶς*, to *crook* or *bend*, because it kept the tortured in a crooked bowing posture; others take the *κῦρῶς* for a log of wood laid over the criminal's head to prevent his standing upright; Hefychius describes the *κῦρῶς* as a piece of wood, whereon criminals were stretched and tormented. In effect, it is probable the word might signify all these several things. It was a general name, whereof these were the species.

Suidas gives us the fragment of an old law, which punished those who treated the laws, with contempt, with *kyphonism* for the space of twenty days; after which they were to be precipitated from a rock, dressed in women's habit.

KYRA, in *Geography*, a town of Hindoostan, in Rohilcund; 20 miles S. of Budavoon.

KYRADAW, a town of Hindoostan, in Malwa; 7 miles S.W. of Kimlaffa.

KYRADEE, a town of Bengal; 14 miles W.S.W. of Curruckdeagh.

KYRALFALVA, a town and castle of Hungary; 12 miles S.W. of Sivat.

KYRANTY, a town of Bootan; 60 miles S. of Taffadon.

KYREZYCE, a town of Poland, in the palatinate of Volhynia; 56 miles N.W. of Zytoniers.

KYRIE, in *Ecclesiastical Music*, the first word of every mass in music. It furnishes, with *elision*, the only articulations of the first movement of all masses ancient and modern. *Kyrie*, the vocative case, implies O Lord, and joined with *elision*, is equal to "Lord have mercy on us." *Kyrie*, in speaking of a mass in music, is often used substantively, as "there is a well written *kyrie* in that mass or service."

KYRILA, in *Geography*, a town of Sweden, in East Bothnia; 36 miles E.N.E. of Christianstadt.

KYRITZ, a town of Brandenburg, in the Mark of Pregelitz; 40 miles N.W. of Berlin. N. lat. 52° 26'. E. long. 12° 26'.

KYRKAS, a town of Sweden, in the province of Jamtland; 7 miles N.E. of Otterfund.

KYRKSTATT, a town of Sweden, in the province of Nyland; 16 miles W. of Helsing.

KYRO, a town of Sweden, in North Finland, on a lake of the same name; 42 miles E. of Biorneborg.

KYRO, *Lille*, a town of Sweden, in East Bothnia; 12 miles E.S.E. of Wafa.

KYRO, *Stor*, a town of Sweden, in East Bothnia; 20 miles S.E. of Wafa.

KYSCHAW, a town of Prussia, in Pomerelia; 32 miles S.E. of Dantzic.

KYSTIS, *Kyris*, in *Anatomy*. See *CYSTIS*.

KYTEE, in *Geography*, a town of Bengal; 12 miles S. of Burdwan. N. lat. 23° 3'. E. long. 88°.—Also, a town of Hindoostan, in Bahar; 28 miles S.S.W. of Arrah.

KYTEKIEHL, or KYTZBUNL, a town of the county of Tyrol; 45 miles N.E. of Inspruck.

KYUQUOT, a large sound or bay on the N.W. coast of N. America, having on one side of it Robert's island. N. lat. 50°. W. long. 127° 20'.

KZILKAN, a town of Asiatic Turkey, on the Tigris; 21 miles N. of Teerit.

KZIKEN, a town of Asiatic Turkey; 15 miles W. of Merdin.

## L.

**L**, EL, a semi-vowel, or liquid consonant, making the eleventh letter of the English alphabet, and always preserving the same sound.

The *l* is pronounced by applying the tongue to the palate.

Pafferat observes, that *l* was frequently used among the ancients for *b*, as in *cillibe* for *cibillz*; for *d*, as *alipe* for *alipse*; for *c*, as *mutila* for *mutica*; for *n*, as *arvilla* for *arvina*, *belle* for *bene*, *colligo* for *colligo*; for *r*, as *fratellus* for *frater*, *balatrones* for *baratones*; for *s*, as *ancille* for *an* and *cesum*, *equitio* for *equiso*; for *t*, as *equifelis*, for *equifetis*, *Thelis* for *Thetis*. See *B*, *T*, &c.

The *ll* is a modern contrivance, and was never used among ancient Roman authors: they wrote *allium*, not *allium*; *macellum*, not *macellum*; *polucere*, not *pollucere*.

The *ll* of the Greeks was sometimes changed by the Romans into *ll*, as in *αλλουσι*, *salio*; *αλλος*, *alios*; *φωλλος*, *folium*; *r* has also been turned into *ll*; as *bira*, *illa*; *farare*, *fatullare*; &c. and *l* into *x*, or *xill*; as *ala*, *axilla*; *mala*, *maxilla*; *velum*, *vesillum*; *d* was also used for *ll*, *n* for *ll*, and *r* for *l*. See *R*, &c.

*l* is also frequently used instead of *d*, as in *Ulyffis*, from the Greek *Ὀδυσσεύς*, in that Æolic dialect *Ἰδυσσεύς*. Thus

also for *dautia*, we say *lautia*; for *dacrumis*, *lacryme*, &c. See *D*.

There are several people, for instance, the Chinese in Asia, the Illinois in America, &c. who cannot pronounce the *r*, but always change it into *l*. Thus, when any of them have been baptized by the name of *Petrus*, *Franciscus*, &c. they always pronounce it *Pellus*, *Flanciscus*, &c. See *R*.

Among the Saxons the *l* was aspirated, and the Spaniards and Welsh usually double it at the beginning of a word, which sounds nearly the same with our *hl* or *fl*. At the end of a monosyllable it is always doubled, except after a diphthong. The monosyllables in which it is doubled, as *kill*, *vill*, *full*, were originally written *kille*, *ville*, *fulle*, and when the *e* first became silent, and was afterwards omitted, the *ll* was retained, to give force, according to the analogy of our language, to the foregoing vowel. In a word of more syllables it is written single. It is sometimes inserted before *e*, and sounded feebly after it, so as to be almost mute; as *table*, *fluttle*.

The figure of our *L* borrowed from the Latins, they from the Greeks, and they again from the Hebrews, whose

lamed is much like our L, excepting that the angle is somewhat more acute.

L was also a numeral letter among the ancients, and is still so in the Roman cyphering, signifying *fifty*; according to the verse,

“Quinquies L denos numero designat habendos.”

When a dash was added at the top, thus,  $\bar{L}$ , it stood for *fifty thousand*.

L was used for fifty, being half a C, which signified a hundred, and was formerly written thus L, which, according to Pasquiere, makes two LL, the one upright, the other inverted.

The French Louis-d'ors have a cross on them, consisting of eight L's interwoven, and disposed in form of a cross. The letter L is marked on the money coined at Bayonne. The epochs on Greek medals are usually written with the ancient *lambda*, L; which, according to the tradition of the antiquaries, stands for *Λυσις*, a poetical word, unknown in common speech, signifying *anno*, and which it is probable was more used in Egypt than Greece.

L as an abbreviation stands for Lucius; and LLS. for a *sterlinge*. In English, it denotes a pound sterling.

LA, in *Music*, is the sixth found of the Guido scale. See GAMMUT, and SOLMISATION.

LAAB, or LAVA, in *Geography*, a town of Austria, on the river Taya; 26 miles N. of Vienna. N. lat. 48° 39'. E. long. 16° 16'.

LAADSTEE, a town of Norway; 112 miles N. of Bergen.

LAAGE, a town of Mecklenburg; 14 miles S.E. of Rostock. N. lat. 55° 58'. E. long. 12° 30'.

LAALAND, or LALAND, an island of Denmark, situated at the entrance into the Baltic, from the Great Belt; about 50 miles long, and 20 in its medial breadth, and reckoned the most fertile spot in the Danish dominions. It produces variety of grain, particularly wheat, and also pease; and is chiefly appropriated to the cultivation of corn. Its woods, in which it is not deficient, are more frequent in the east, than on the west side of the island. As its situation is low, the air is damp and the climate is insalubrious. Of all the inhabitants, the clergy are most liberally provided for, according to their rank. The nobility are numerous, and possess large estates with fine houses. This island, like Tealier, has a peculiar governor; but both are under the spiritual jurisdiction of the bishop of Funen. The capital is Naskow. N. lat. 54° 40' to 55°. E. long. 10° 59' to 11° 52'.

LAALGUNGE, a town of Hindoostan, in Oude; 25 miles E. of Manichpour.

LAARET, an island in the East Indian sea, about 50 miles in circuit. S. lat. 6° 48'. E. long. 132° 36'.

LAAS, or LOSCH, a town of Carniola, with a citadel; 23 miles E. N. E. of Trieste. N. lat. 45° 58'. E. long. 14° 25'.

LAASPHA, or LASPA, a town of Germany, in the county of Witgenstein; 64 miles E. of Cologne. N. lat. 50° 53'. E. long. 8° 30'.

LAB, a town of Germany, in the bishopric of Wurzburg; 6 miles E.S.E. of Volkach.

LABAAR, a town of Hindoostan, in the subah of Agra; 75 miles S.S.E. of Agra.

LABACCAN, a northern province of Celebes, which, together with Bougero and Sageree, are the plains lying between Tello and Tanete, the proper granaries of Celebes.

Labaccan has one native regent, who has the appellation of “Crain.”

LABADDA, a town and district of Africa, on the Gold Coast.

LABADIE, JOHN, in *Biography*, a celebrated enthusiast, was born at Bourg, in Guenac, in the year 1610; when he was six years old he was sent to Bourdeaux to be instructed in the Jesuits' school, and was at an early age admitted into the order, of which he continued a member fifteen years: He was so highly esteemed for piety and learning, that it was with the utmost difficulty he obtained his dismissal when he asked for it. At length he quitted the society and became an itinerant preacher. The austerity of his manners, his great zeal, and affected piety, procured him many admirers wherever he went. At Amiens he obtained a canonry, but being detected in some criminal intrigues, the bishop ordered him to be arrested; he, however, escaped, and concealed himself at Paris. On this and some other parts of Labadie's conduct, Bayle makes the following remarks, which, in some degree, are probably applicable to religious enthusiasts of other countries besides France: “I do not,” says the biographer, “warrant the certainty of all these facts, but I affirm that it is very probable, that some of those spiritual devotees, who make people believe that a strong meditation will ravish the soul, and hinder it from perceiving the actions of the body, have a mind to toy with their devout sisters with impunity, and to do still worse. In general, there is nothing more dangerous to the mind than too mystical and too abstracted devotions; and, doubtless, the body in that case runs some hazard, and many are glad to be deceived.” Labadie became a director of a convent of nuns, among whom he introduced a new rule, and the notions of the Quietists, with additions of his own, *viz.* that the scriptures were not necessary to salvation; that outward worship is of no avail: that all prayer ought to be mental; and that there are two churches, that of Christians in degeneracy, and the other regenerate. About the year 1650, Labadie renounced the Romish religion at Montauban, at the same time declaring he had contemplated this measure more than fifteen years. His conversion excited much conversation and many discussions among the Catholics; several attempts were made to engage him to return to the bosom of the true church, but without producing any effect on his mind. His licentious practices were now exposed, and probably very much exaggerated: the Protestants, proud of so important a convert to their cause, would listen to none of the accusations, and he was chosen pastor of the reformed church at Montauban in the year 1651. Here he exercised the duties of the ministerial office for eight years, and then, on account of some disputes on subjects which he was unable to justify, he went to Geneva. Here his devout manners and popular preaching gained him a vast multitude of adherents, but by others every means was taken to drive him from the town, and in 1666, these people accomplished their purpose, by procuring an invitation to be sent to him from the Walloon church at Middleburgh, the capital of Zealand, which he readily accepted. He made many converts in this place, among whom was the celebrated Anna Maria Schurman, of Utrecht, whose great learning rendered her so famous in the republic of letters during the seventeenth century. Labadie sent disciples to propagate his doctrines, and to gather contributions in different parts of Holland, on which account he was obliged to withdraw to Erfurt, the capital of Thuringia, and from thence to Altona, where he died at the age of sixty-four, in the year 1674. After his death, the community settled at Wiewert, in North Holland, where it

found a peaceful retreat, and soon fell into oblivion. Labadie was author of many works which are full of mysticism; but they carry evident marks of a lively and glowing imagination. Bayle. Meisern.

**LABADISTS, or LABBADISTS, in Ecclesiastical History,** a sect of religionists, followers of the opinion of Jean de Labadie, who lived in the 17th century, and was contemporary with Mademoiselle Bourignon.

Some of his tenets were, that, 1. God could and did deceive men. 2. That in reading the scriptures, greater attention should be given to the internal inspiration of the Holy Spirit, than to the words of the text; that the scripture was not sufficient to lead men to salvation, without certain illuminations and revelations from the Holy Ghost; and that the efficacy of the word depended upon him that preached it. 3. That baptism ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, providing they descended from Abraham, but that the new admitted only spiritual men. 5. That the observance of Sunday was a matter of indifference. 6. That Christ would come and reign a thousand years on earth. 7. That the eucharist was only a commemoration of the death of Christ; and that though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the summit of perfection, &c. 9. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and sees all things in him. 10. That this estate was to be come at by an entire self-abnegation, by the mortification of the senses and their objects, and by the exercise of mental prayer. He also maintained, that the faithful ought to have all things in common, and that there is no subordination or distinction of rank in the church of Christ. It is said that the Brownists, and afterwards the Quakers, offered to connect themselves with this sectary, but were rejected. See Journ. des Scavans for October, 1727, where we have some account of Labadie and his followers, which were mostly women; and with some of whom, it has been said, he took criminal liberties.

**LABAREES, in Geography,** a town of Spain, in the province of Asturia; 12 miles W. of Santillana.

**LABARIFERI, among the Romans,** standard bearers, who carried the labarum.

**LABARIUM, a looseness of the teeth.**

**LABARUM, in Antiquity,** the banner or standard borne before the Roman emperors in the wars.

The labarum consisted of a long lance, or pike, with a staff at the top, crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones, and curiously inwrought with the images of the reigning monarch and his children.

Till the time of Constantine, this standard had an eagle painted upon it; but that emperor introduced in lieu of it a cross. Accordingly, the summit of the pike supported a crown of gold, which inclosed the mysterious monogram, at once expressive of the figure of the cross, and the initial letters of the name of Christ, as represented under the article Cross. The safety of the labarum was entrusted to 50 guards, of approved valour and fidelity; their station was marked by honours and emoluments; and some fortunate accidents soon introduced an opinion, that as long as the guards of the labarum were engaged in the execution of their office, they were secure and invulnerable, amidst the darts of the enemy. This standard the Romans took from

the Germans, Dacæ, Sarmatæ, Pannonians, &c. whom they had overcome.

The name labarum was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors.

In the second civil war Licinius felt and dreaded the power of this consecrated banner, the sight of which, in the distress of battle, animated the soldiers of Constantine with an invincible enthusiasm, and scattered terror and dismay through the ranks of the adverse legions. Eusebius (in Vit. Constantin. l. ii. c. 7, 8, 9.) introduces the labarum before the Helvic expedition; but his narrative seems to indicate that it was never shewn at the head of an army, till Constantine, above 10 years afterwards, declared himself the enemy of Licinius, and the deliverer of the church. The Christian emperors, who respected the example of Constantine, displayed in all their military expeditions the standard of the cross; but when the degenerate successors of Theodosius had ceased to appear in person at the head of the armies, the labarum was deposited as a venerable, but useless, relic in the palace of Constantinople. Its honours are still preserved on the medals of the Flavian family. Their grateful devotion has placed the monogram of Christ in the midst of the ensigns of Rome. The solemn epithets of, safety of the republic, glory of the army, restoration of public happiness, are equally applied to the religious and military trophies; and there is still extant a medal of the emperor Constantine, where the standard of the labarum is accompanied with these memorable words, "BY THIS SIGN THOU SHALT CONQUER."

The derivation and meaning of the word *labarum*, or *labarum*, which is employed by Gregory Nazianzen, Ambrose, Prudentius, &c. still remain totally unknown; in spite of the efforts of the critics, who have ineffectually tortured the Latin, Greek, Spanish, Celtic, Teutonic, Illyric, Armenia, &c. in search of an etymology.

Some derive the word from *labor*, as if this finished their labours; some from *λαβειν*, reverence, piety; others from *λαβειναι*, to take; and others from *λαβειναι*, spoils. The labarum has afforded very ample matter for criticism, and has been discoursed of by Fuller, Alcinius, Cujas, Gyraldus, Lipsius, Meursius, Vossius, Hoffman, Valois, Du-Cange, &c.

**LABAT, JOHN BAPTIST, in Biography,** was born at Paris in 1663; at the age of twenty he entered into the Dominican order, and made his profession in 1685. Having completed his studies he became professor of philosophy at Nantz, after which he was, in 1693, sent by his superiors to America as a missionary. He returned to Europe in 1705, and being landed at Cadix, he travelled through Spain and Italy, where he resided some years. During this period he employed himself in drawing up a narrative of his observations, which he published at Paris, in 1722, with the title "Nouveau Voyage aux Isles de l'Amérique, &c." in six volumes. A second edition was given to the world in eight volumes, in the year 1741. He was author likewise of "Travels in Spain and Italy;" in eight volumes; and he edited the following, viz. "New Relation of Western Africa," 5 vols.: "Voyages of the Chevalier Merchaux to Guinea;" "Historical Relation of Western Ethiopia;" and "Memoirs of Chevalier d'Arvieux," in 6 vols. Labat died at Paris in 1738. Moreri.

**LABATA, in Geography,** a town of Spain, in Aragon; 10 miles E. of Huelca.

**LABATIA, in Botany,** named by professor Swartz, in memory of John Baptist Labat, a Dominican monk, who, between

between the years 1700 and 1713, investigated the plants of Africa and the West Indies, of which he drew up numerous descriptions, collecting every thing memorable respecting their economical uses, and their modes of cultivation and preparation. Haller speaks of him as a shrewd man of business, rather than an able naturalist.—Swartz. Prodr. 32. Fl. Ind. Occ. v. 1. 263. Schreb. 790. Willd. Sp. Pl. v. 1. 623. (*Chaetocarpus*; Schreb. 75. *Pouteria*: Aubl. Guian. v. 1. 85. Juss. 176. Lamarck (Illustr. 1. 72).—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Bicornis*, Linn. *Guianacae*, Juss.

Gen. Ch. Calyx inferior, permanent, of four leaves; the two opposite ones erect; two smaller ovate, obtuse, concave, internal. Cor. of one petal; tube somewhat bell-shaped, shorter than the calyx; limb in four minute, erect, bluntish, equal segments, with two opposite, smaller, intermediate, lanceolate ones. Stam. Filaments four, the length of the corolla, erect, awl-shaped, close to the pistil; anthers erect, pointed. Pist. Germen superior, roundish, minute; style awl-shaped, equal to the stamens; stigma simple, obtuse. Peric. Capsule large, roundish, rough, of four cells and four valves. Seeds solitary, oblong, compressed.

Eff. Ch. Calyx inferior, of four leaves. Corolla somewhat bell-shaped, four-cleft, with two smaller intermediate segments. Capsule of four cells. Seeds solitary.

1. *L. sessiliflora*. Sw. Fl. Ind. Occ. t. 6.—Flowers sessile. Leaves silky.—Found by Swartz in bushy parts of the mountains of Hispaniola. The stem is shrubby, six feet or more in height, erect, smooth, with a greyish rusty bark; the branches alternate, straight, bearing upright, round, rusty smaller branches. Leaves alternate, stalked, oblong-lanceolate, pointed, entire, wavy, rigid, two or three inches long, elegantly ribbed and veined beneath; the young ones shining and silky, with a golden rusty hue; the older more silvery. Footstalks short, round, rusty. Flowers axillary, sessile, mostly solitary, whitish, very small. Fruit the size of a nutmeg, roundish, rough and rusty, the internal partitions yellow. Sometimes there are but two cells and as many seeds, the fruits of this natural order being liable to vary greatly in the number of their divisions. The flowers appear in May and June; the fruit ripens in December and January.

2. *L. pedunculata*. With. n. 2. (*Pouteria guianensis*; Aubl. Guian. t. 33.)—Flowers stalked. Leaves smooth.—Native of woods in Guiana, where it is called by the Indians *Pourouma-Pouteri*. Aublet found it bearing both flowers and fruit in November. The trunk, according to this writer, is 40 feet high, and a yard in diameter, with a rough reddish bark, and hard, close-grained, white wood; the branches long and subdivided, leafy at their extremities. Leaves obovate, pointed, entire, smooth, three or four inches long, on foot-stalks nearly half that length. Flowers small, greenish, on short simple axillary stalks, two or three together. Fruit oval, hard, rough with rigid short hairs, red internally, as is likewise the skin of the seeds.

LA BATIE NEUVE, in *Geography*, a town of France, in the department of the Higher Alps, and chief place of a canton, in the district of Gap. The town contains 200, and the canton 3130 inhabitants, on a territory of 125 kilometres, in eight communes.

LABE, PULLIS, in *Biography*, was born at Bourges in the year 1607, and at the age of sixteen he entered the society of the Jesuits, and became distinguished as a teacher of the languages, of rhetoric, and philosophy, in the college of his native place. He was afterwards professor of moral theology at Paris, where he resided till his death, which

happened in 1667. He was reckoned a man of profound learning, and indefatigable industry. He was author of many works, of which several relate to the history of his own order; the most important is "A General Collection of Councils," with notes, in seventeen vols. fol. His grammatical work for the use of students in the languages, entitled "Erudite Pronuntiatiois Catholici Indices," has been frequently reprinted in this country. The edition by Edward Leedes is well known in our schools. Its object is to point out the quantity of Latin proper names of persons, places, &c. Moren.

LABBE, in *Ornithology*. See *LARUS parasiticus*.

LABBOCK BAY, in *Geography*, a bay on the N.E. coast of the island of Borneo. N. lat. 6 2'. E. long. 117° 55'.

LABDACISM, *Λαδδακισμος*, in *Rhetoric*, the too frequent repetition of the letter L, as *sol et luna luce luculant*, and *alra levi lactea*.

LABDANUM, in the *Materia Medica*. See *LABANUM*.

LABDARA, in *Geography*, a small island in the gulf of Venice. N. lat. 44° 14'. E. long. 15 19'.

LABEL, a long thin brass ruler, with a small sight at one end, and a centre-hole at the other; commonly used with a tangent line on the edge of a circumferentor, to take altitudes, &c.

LABEL, in *Law*, is a narrow slip of paper, or parchment, affixed to a deed or writing, in order to hold the appending seal. Any paper annexed by way of addition, or explanation, to any will or testament, is also called a label, or codicil.

Among apothecaries likewise, the slip of paper round their phials, containing directions how to use the medicine, is called a label.

LABEL, in *Heraldry*, a kind of addition to the arms of the heir or first son, to distinguish him from the others. See *FILE*.

Although the file or label be used as a distinction of houses, it is nevertheless properly placed by Holme, as an ordinary, because it is variously borne and charged.

The label is esteemed the most honourable of all differences; and is formed by a fillet usually placed in the middle, and along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief.

It is adorned with pendants somewhat like the drops under the triglyphs in the Doric frieze. When there are above three pendants, the number must be specified in blazoning. There are sometimes six.

The label, variously charged, is the difference generally affixed on the coats of arms belonging to any of the royal family; when his majesty shall think fit so command that arms be granted them.

LABELLA LEPORINA, in *Surgery*. See *HARE-LIP*.

LABELLED LINE, in *Heraldry*, a term used by some to express the line in certain old arms, called more usually *urdee* or *champagne*. Others apply the same word to express the patee or dove-tail line, called also the *inclave line* by Morgan. It somewhat resembles the joint called a *dovetail* by our joiners, and its points, as they proceed from the ordinary, whether chief or fess, resemble the ends of labels. See *URDÉE* and *PATEE*.

LABEO, C. ANTISTIUS, in *Biography*, an eminent Roman lawyer, the son of one of the persons who conspired against the life of Julius Cæsar, was a disciple of Trebatius, and lived under Augustus. He became a very learned man, preserved a free and independent spirit under the rule of a despot, and shewed on various occasions that he had not for-

gotten,

gotten, nor was careless of the liberties of his country. His great rival in jurisprudence was Ateius Capito, and Tacitus, speaking of these two rivals, calls them "the two ornaments of peace in their age;" he however celebrates the incorrupt freedom of the latter, which was the cause of his rising no higher than the prætorship; while the obsequiousness of the former was rewarded with a consulate. Labeo divided his time between business and study, spending six months at Rome, in giving advice and attending to public duties, and living the other six in a country retreat. He wrote a number of books chiefly relating to jurisprudence. Aulus Gellius refers frequently to the commentaries of Labeo, on the twelve tables. Suetonius, Lempriere.

LABEO, in *Ichthyology*, a name given by the old Latin writers to the fish usually called *cheilon* and *cheilon*. See *CYPRINUS Labeo*.

LABER, in *Geography*, a town of Bavaria, in the principality of Newburg; nine miles W.N.W. of Ratibon.

LABERIUS, DECIMUS, in *Biography*, a writer of dramatic pieces, similar in some respects to our pantomimes, was a knight by birth. He was sixty years of age when Julius Cæsar, in the plenitude of his power, urged him, by the promise of a liberal reward, to appear on the stage, in one of his own pieces. The poet consented with great reluctance, and shewed his resentment during the acting of the piece, by throwing severe aspersions upon Julius Cæsar, and by broadly hinting at the tyranny and despotism of which he was guilty. In pronouncing the following line, he fixed the eyes of the whole assembly upon the usurper:

"Necesse est multos timeat quem multi timent."

"Many he dreads in turn, whom many dread."

Cæsar restored him to the rank of knight, which he had lost by appearing on the stage, but he could not so easily restore him to the good opinion of his friends. When he went to take his seat among the knights, no one offered to make him room, even his friend Cicero sarcastically said "Recipissem te nisi angustè fedem;" *I would make you room if I were not so much crowded:* to which Laberius replied, "Mirum si angustè fedes, qui soles duabus sellis federe;" *I wonder you should be crowded, who usually sit upon two seats at once;* alluding to the orator's meanness and duplicity, during the civil wars between Cæsar and Pompey. Laberius died in the year 44, B.C. Some fragments of his poetry remain, and are given in Mattaire's *Corpus Poetarum*: the titles of his several pieces are preserved in Aulus Gellius. Horace alludes, but without any respect to the names of Laberius, this was, probably, rather in contempt of the species poetry, than the author.

LABES, in *Geography*, a town of Hinder Pomerania; 30 miles S. of Colberg. N. lat. 53° 39'. E. long. 15° 39'.

LABEZ, a province, sometimes called a kingdom, of Algiers, S. of Boujeh.

LABIA, or LIPS, in *Anatomy*. See *DEGLUTITION*.

LABIAL, a term in the French law, used in the same sense with oral.

LABIAL Letters, among *Grammarians*, are those whose pronunciation is chiefly effected by the motion of the lips. By which they stand contradistinguished from palatal, dental, guttural, &c. letters.

LABIAL Offers are such as are only made by word of mouth, or even by writing, where there is no valuable consideration. In courts of equity these are not regarded.

LABIALIS, in *Anatomy*, an epithet given to certain parts belonging to the lips, as the arteries, veins, glands, &c.

LABIATÆ, in *Botany*, a natural order of plants, fo-

called, after Tournefort, from *labium*, a lip, in allusion to the shape of the corolla, which resembles the mouth and lips of an animal. This order, the 39th of Jusseu's system, and the sixth of his eighth class, is equivalent to Linnæus's 42d natural order, *Vericillatæ*; or to the *Didynamia Gymnospermia* of his artificial system; except that the latter necessarily excludes such genera of *labiate* as have but two stamens, and which are therefore referred to his second class, *Diandria*.

The characters of Jusseu's eighth class are—"Cotyledons two. Corolla of one petal, inferior." (See *GENTIANÆ*.) He defines the order in question thus.

*Calyx* tubular, either equally five-cleft, or two-lipped. *Corolla* tubular, irregular, generally two-lipped. *Stamens* four, two longer and two shorter, situated under the upper lip of the corolla; in some cases only two, the others being abortive. *Germen* four-lobed; style solitary, springing out of the receptacle, between the lobes of the germen; stigma cloven. *Seeds* four, naked, erect, affixed to the receptacle by their base, and concealed in the permanent calyx. *Embryo* destitute of albumen. *Stem* quadrangular, oppositely branched, for the most part herbaceous, but sometimes shrubby. *Leaves* opposite. *Flowers* opposite, often bracteated, or attended by bristles, solitary or whorled, corymbose or spiked, terminal or axillary.

The sections are four.

1. Stamens two fertile, two abortive. This contains *Lycopus*, *Anethus*, *Cunila*, *Ziziphora*, *Monarda*, *Rosmarinus*, *Salvia* and *Collinsonia*, to which are added by Mr. Brown (Prodr. v. t. 501.) *Wstringia*, Smith's Tracts, 277. t. 3, *Microcoris*, *Hemigenia* and *Hemiandra* of Brown; see the two latter articles in their places.

2. Stamens four, all fertile. Upper lip of the corolla wanting, or nearly so.—*Argemone* of Linnæus, (which Jusseu chooses to call *Bugula* after Tournefort), and *Teucrium*, with *Anisomelis* a new genus of Mr. Brown's.

3. Stamens four, all fertile. Corolla with two lips. Calyx five-cleft.—*Satureia*, *Thysanopus*, *Nepeta*, *Perilla*, *Hyssopus*, *Lavandula*, *Sideritis*, *Mentha*, *Glechoma*, *Lamium*, *Galopissis*, *Betonica*, *Stachys*, *Ballota*, *Marrubium*, *Leonurus*, *Plonius* and *Moluccella*, to which are to be added *Elytholzia* (see that article), and *Leucas* of Burmann and Brown.

4. Stamens four, all fertile. Corolla with two lips. Calyx two-lipped.—*Clinopodium*, *Origanum*, *Thymus*, *Thymbra*, *Melissa*, *Dracocephalum*, *Horminum* (now reduced to *Melissa*), *Melilotus*, *Plectranthus* (which is *Germana* of Lamarck and Jusseu), *Ocymum*, *Trichostema*, *Prunella*, *Scutellaria*, *Prasium* and *Phryma*, with *Cibolida* and *Cryphia* of Brown, and *Prasanthera* of La Billardiere.

The plants of this natural order are, for the most part, agreeably aromatic, or bitter, none of them poisonous. The root is generally perennial. Flowers of various colours, seldom fragrant in themselves, except as they partake of the aromatic quality of the herbage. The stamens and stigma are, as Linnæus observes, so well sheltered, in most instances, from the rain, while the air has free access at the sides, that impregnation rarely fails. *Mentha*, however, forms an exception, the stamens being prominent, and the corolla open; and as its seeds are scarcely ever prolific, no plant has a more ample increase by the roots.

LABIAU, in *Geography*, a town of Prussia, in the province of Samland, with an ancient castle, on the Deim; 20 miles E.N.E. of Königsberg. N. lat. 54° 10'. E. long. 21° 15'.

LABIEZ, a town of the duchy of Warsaw; 32 miles N. of Gnesna.

LABINÆ, in *Natural History*, a term used by the authors who have written of Switzerland, and other mountainous

tainous countries, to express those vast masses of snow, which sometimes fall from the hills and bury houses, or even whole towns; and when hardened by the frosts, as is often the case, into solid substances, they overthrow woods, villages, and whatever stands in the way of their course, as they roll down the steep sides of the precipices in their way. Some authors have also extended the word to a larger sense, and made it express the falling of vall rocks, or parts of mountains, and their rolling down in the same manner into the flat country: this is a mischief very frequent in the same places, after frosts, and often very fatal. See GLACIERS.

**LABIUM**, in *Anatomy*, a term given to various parts in the body, which, from their prominent figure, admit of being compared to the lips. Thus the labia pudendi are the two folds of skin which bound the external female organs of generation laterally. (See GENERATION.) The edges of the crilla of the os innominatum are called its labia.

**LABIUM Leporinum**, in *Surgery*. See HARE-LIP.

**LABON**, in *Geography*, a town on the W. coast of the island of Sumatra, which chiefly trades in pepper. N. lat.  $3^{\circ} 20'$ .

**LABOMAS**, a town of the island of Cuba; seven miles S. E. of Spiritu Santo.

**LABON**, a town on the W. coast of Sumatra, celebrated for gold dust and camphire; but the inhabitants are referred in their traffic with strangers: 150 miles S. E. of Acheen. N. lat.  $3^{\circ} 10'$ . E. long.  $96^{\circ} 40'$ .

**LABOON**, a district of Sumatra, on the banks of the river CATTOW, bounding the country of the Rejangs on the N. or inland side.—Also, a town on the E. coast of the island of Borneo, seated on a peninsula that projects into the sea. N. lat.  $5^{\circ} 9'$ . E. long.  $119^{\circ} 5'$ .

**LABOR**, a town of New Navarre; 280 miles S. E. of Casa Grande.

**LABORATORY** is a place furnished with chemical apparatus, and entirely devoted to the different operations of chemistry, whether on the scale of chemical manufacture, or for the purpose of experimental research. In the present article, however, we shall confine ourselves to the latter, since it is more proper to describe the apparatus used in the large way under the manufacture of the respective articles. Although many of the most distinguished labourers in chemical science have been content with such apparatus as they have made themselves, or converted from the common domestic utensils; it must, nevertheless, be obvious, that they would have succeeded better with well contrived and appropriate apparatus, and their researches would, in all probability, have been much more extended.

Every chemical experimenter will find a considerable advantage in so much mechanical talent, as will enable him to make, or repair at least, the most common of his apparatus. For this purpose he should possess a set of mechanical tools, such as a lathe and vice, with files and rasps for metal and wood. The tools for making ferrets, as well in the lathe as by the *ferret-plate* and *taps*, will also be necessary. To these should be added a small forge, anvil, and hammer, for the purpose of forging small articles. A set of brazier's and tinman's tools will be found very useful, and a little experience will enable the operator to make any article of tin or copper, which is not very complicated. In addition to the above, the glass-blower's lamp and bellows will be of essential service for sealing and bending glass tubes, and other purposes.

Some of these may appear unnecessary, especially in large towns, where the different artists may be found, but it will be strongly in the recollection of all who have had occasion to get apparatus made, that they can seldom get them constructed to

their wish, although they stand by the art. The want of proper tools, and a little mechanical dexterity, have frequently prevented or put an end to experimental investigations of considerable importance. Independent of the apartment containing the mechanical apparatus, the chemist will require at least one distinct room for a laboratory. Two rooms, however, should be employed when it is convenient. The principal room of the laboratory should be on a ground floor, for several reasons. A furnace for great heat should be in a low room, in order to have the greatest length of chimney. The ash-pit of this furnace should terminate in a cellar under the laboratory, in order that the air may enter perpendicularly, and of the lowest possible temperature. See FURNACE.

That side of the laboratory allotted for furnaces should have an arch projecting into the room about three or four feet, and of such height that a person may freely walk under it. In the highest part of this arched portion must be an opening into a chimney distinct from the rest, and built up in the same stack.

It will be found more convenient to use portable furnaces for most purposes, having none fixed but for producing very great heats, upon a larger scale, and what are generally denominated melting furnaces.

The iron chimney of the portable air-furnace may be carried to any height, and placed under or within the chimney, used for the escape of smoke and vapours.

A chimney with a funnel may, in the same way, be placed over the mouth of the portable blast furnace, invented by Mr. Aikin. This furnace may be so contrived that when the body of it is removed, the bafe may form a forge hearth, which will be found very useful. For the varieties of furnaces used in the laboratory, see FURNACE.

On another side of the laboratory must be placed a stone trough or sink, joined to a tub or cistern of water, which can be filled and emptied at pleasure, by means of a stop-cock over it, and a plug in the bottom. Over the sink-stone should be suspended a rack for holding bottles and glasses to drain after washing. On the same side may be placed a large block of wood or stone, for the purpose of holding a mortar or anvil occasionally.

A third side of this room must be occupied by cupboards and shelves, for holding the different apparatus of glass and earthen ware, and for the different substances hereafter to be mentioned.

The fourth side, which should be the lightest, must be provided with a table the whole length of this side, in the front of which, down to the floor, should be a number of drawers for holding all the dry substances. This table is for making the experiments upon, and for holding the apparatus in use at any time.

If possible, every laboratory should be joined to a second room, however small it may be, in which to perform the very nice and delicate experiments, and for keeping a few books, and choice instruments of metal, such as balances, &c.. This room should be kept very clean and dry, and as free as possible from steam and the fumes of acids.

If any part of the furniture require to be painted, the paint should be made with sulphat of lead, since it is not acted upon by acids. This substance has been used by Dr. Henry not only for this purpose but for repairing broken glass and labelling bottles. The following are the most particular apparatus with which a laboratory should be furnished.

*Mortars*.—These are of various kinds, cast-iron, bronze, steel, and Wedgwood ware. The cast-iron mortar is generally used for vegetable substances, and such as are not liable to grind off the iron. The hardness of this instrument is

much increased by casting the interior surface upon a metal mould, of the greater weight the better.

The hardness of the bronze mortar, which is generally used for the same purposes, may be increased by the same means.

The steel mortar is used for reducing very hard minerals into small bits, fitted for grinding in the mortar of agate. It consists of a cylinder of hardened steel, with a flat bottom, and a pestle of the same made to fit the mortar, accurately, from top to bottom. It is used by putting the pieces of the mineral into it, and striking the pestle with a hammer. By this means it can be reduced into tolerably small particles, without grinding off any portion of the mortar.

Hardened steel mortars of the common shape would be of great use, but it would be difficult to harden so large a mass without cracking. It might perhaps be made by welding a plate of cast steel upon a thick piece of iron, and afterwards working it into the required shape, and polishing it in the inside. If the substance is not very particular, it may be ground in a mortar of Wedgwood ware. If, on the contrary, it be very hard, the matter from the mortar will be liable to be mixed with the powder. In this case the agate mortar is much to be preferred; some stones are, however, so hard as to act upon the agate. In this instance, the matter to be ground should be weighed before and after grinding, and the increase of weight may be safely deemed loss, and allowed for in the analysis accordingly.

**Balance.**—This instrument is of great importance to the analytical chemist, and ought to weigh 100 grains to the  $\frac{1}{4}$  th of a grain. A very masterly account of the principles and construction of the balance will be found under the article BALANCE.

It will be almost unnecessary to observe, that so delicate an instrument should be kept in a separate apartment from the laboratory where fumes of acids do not prevail. It should be closely shut up in a glass case having a sliding door in the front. The strings to which the scales are suspended, should be of fine gold or silver cord, and the scales of silver or platina, and very thin. One of the scales should be provided with a loose pan of very thin platina, and balanced with the other, for the purpose of holding the substance to be weighed. The weights for chemical substances should be reckoned in, and marked with grains and decimals of grains.

**Lamp.**—This valuable instrument is a very great improvement upon the sand-bath. Its heat is regular, and may, by means of the concentric wick, be made of sufficient intensity for most purposes. Its greatest advantage, however, consists in the facility with which it can be applied or withdrawn without loss of time. See LAMP.

For nice and delicate purposes, where the heat of the lamp is required, alcohol, instead of oil, gives an intense and steady heat, and is not very expensive when a proper vessel is used for burning it. The latter kind of lamp is particularly adapted for a public lecture.

**Fig. 1. Plate XVI. *Chemistry*,** is a stand supporting the lamp, and at the same time the substance to be heated, and the connecting apparatus A B is a frame of wood. F a pillar of wood or iron, smooth and cylindrical throughout, so as to admit of the sliding rings, such as *g*, to move freely without shaking. C is the Argand lamp, having a chimney at *o* of iron. This chimney consists of two concentric tubes, connected together by small wedges of baked clay, or some other incombustible substance which is a bad conductor of heat. This contrivance not only economizes the heat, but keeps the outer tube so cool, that it may be taken hold of with the fingers. In this lamp the wick is raised by the screw,

instead of the rack, which is performed by turning the chimney round.

The funnel-shaped ring D is an improvement upon the common ring used for supporting the retort. It consists of a number of conical hoops, one fitting upon the other, so as to hold different sized retorts. The smallest hoop is about two inches in diameter, and the largest, which is attached to the sliding part, about five inches. The conical surface directs the heat to the retort, which on the common plan only serves to annoy the fingers and face of the operator, and at the same time heats the neck of the retort, where the condensation of the vapour should take place: *f* is a retort supported by the ring; *g* is a slider, having two prongs at *p* to keep the retort from falling sideways: E is a receiver to receive the contents of the retort, which may be either used alone, or with Woulfe's bottles *a, b, c*, hereafter to be described. G is a stand, with three inclined prongs of wood to support receivers of different sizes, and which may be placed at different elevations by means of the screw *n*.

**Retort.**—**Fig. 2.** This is a chemical utensil of very ancient origin, and is the most simple apparatus for distillation. Retorts are of glass, earthen-ware, and metal. Those of glass are sometimes of green glass, particularly when such heat is employed in the naked fire, as might soften the more fusible white glass. Those of flint-glass should be as thin as possible, in order to avoid breaking by an unequal expansion. When the retort is provided with a glass stopper, as at *a*, it is said to be tubulated.

This appendage is necessary only, when some fluid, such as an acid, has frequently to be added, or when it would be difficult to get the materials into the mouth of the retort. In order to add any fluid from time to time while the process is going on, the vessel (*fig. 3*) called an *acid holder* is made to fit in the place of the stopper of the retort, the part *d* being ground to fit the same. The acid is put into this vessel, and let into the retort, by a little at once, through the glass stop-cock *c*.

When the retort is used for purposes of distillation, the neck is fitted or luted into the neck of the receiver (*fig. 4*) This receiver is used for the distillation of liquids, the vapours of which are easily condensable, such as water or alcohol. When the vapours, coming over, are accompanied with elastic fluids, which are incondensable, the receiver (*fig. 5*) is better adapted. If the elastic fluid be of no importance, and inoffensive, it may escape at the conical stopper of the latter vessel every time the pressure is sufficient to raise it. It is, however, sometimes necessary to collect the gaseous fluid. In this case the bended tube (*fig. 6*) is put into the place of the stopper (*fig. 5*), the other end terminating in a pneumatic apparatus where the gas is collected. In the distillation of very volatile liquids, such as ether, it is sometimes necessary to remove the receiver to a distance from the retort, by placing between them an intermediate vessel, (*fig. 7*) called an *adopter*. The receiver (*fig. 8*) is employed for collecting the product of different degrees of strength by the application of the bottle *b*.

In the distillation of substances, which require a greater heat than glass will bear, earthen retorts are employed. They are of the same shape with those already described, and should be made of the materials with which crucibles are made. This sort of retort is generally used for the distillation of phosphorus. If its texture be not close, the phosphorus will escape in vapours through the pores. This, however, may be prevented by covering the surface with some glazing material. Iron retorts, from their great firmness, are well adapted for distilling such substances as will have no

chemical action upon them. Hence they are unfit for distilling sulphur, phosphorus, and acids, but are extremely proper for ammonia, mercury, and pitcoal. A retort of lead is used for the distillation of fluoric acid, owing to that acid combining with the flux of glass.

*Woulfe's Apparatus.*—In the distillation of substances which are merely to be raised into vapour by heat and condensed by cold, the retort, or still, with the receiver and the proper means of producing cold, are the only apparatus necessary. There is another distinct branch of distillation, in which the product is a gas, which is incondensable at the common temperature, and requires to be absorbed by water, or by some other substance dissolved in that liquid. In these processes, therefore, the temperature and size of the receiving vessels are not of so much importance as the exposure of the gaseous product to the greatest possible quantity of the absorbing liquid. Before the discovery of this most useful apparatus by Mr. Woulfe, from whom it takes its name, the common retort and receiver were used for all purposes. The elastic fluids were in consequence either compressed, and the operator was constantly in danger of being injured by the bursting of vessels, or, to remedy that evil, they were suffered to escape, and he was perpetually annoyed by the suffocating fumes which were set at liberty.

In *fig. 1.* the retort contains the materials for furnishing the elastic fluid to be absorbed by some liquid contained in the receiver E, and the succeeding bottles *a*, *b*, *c*, with their connecting tubes *r*, *h*, *t*: *v* constitutes the *Woulfe's apparatus*. A certain portion of the gas is taken up by the liquid in the receiver E. The excess passes through the tube *r* to the bottom of the liquid into the second receiver, by which another portion of the gas is absorbed. The residual gas passes along the tube *h* to the third receiver, which gives the gas a third chance of absorption. In this way it may be made to pass through any number of bottles, according to the greater or lesser facility with which the gas is absorbed. The last tube *v*, which is provided with a column of mercury, conveys the remaining gas, which is presumed to be unabsorbable, into the atmosphere, or it may be collected by a jar in the pneumatic apparatus. When the gas ceases to be furnished from the retort, in a quantity equal to the absorption in the receiving vessels, a retrograde motion will begin to take place. Atmospheric air will enter at the tube *v*. The liquid in the last receiver will be forced by its pressure into the preceding one, and if the absorption were to become complete, the whole of the liquid would be carried into the first receiver, and from thence to the retort. This evil has been very completely removed by what is called a tube of safety *f*, *l*, *x*.

*Fig. 1.*—The bulb *l* contains as much mercury as will be contained from *q* to *x*, so that when the gas, from defective absorption, accumulates in E, till its force is equal to the pressure of such a column, the excess of gas will bubble through the mercury into the atmosphere. On the contrary, when the absorption of the gas exceeds its evolution, the pressure of the atmosphere, to restore the equilibrium, will cause the mercury to occupy the ball *l*, and common air will bubble through it into the vessel E. Although this ingenious contrivance completely prevents any evil arising from the inequality of internal pressure, it is very objectionable, owing to its delicate structure, on which account it is constantly liable to be broken.

We are indebted to Mr. Knight for a great improvement on the tube of safety. This consists in having a valve of glass, similar to that of the *Nooth's apparatus* (described below), placed between the first and second vessel, so that the liquid in the succeeding bottle can never have a retrograde motion. To this valve there is no other objection than the

difficulty of getting it made in places distant from the metropolis, and its liability to be split, especially in making crystalline salts, such as the oxymuriat or carbonat of potash.

The same objection which we have made to the tube of safety, we are sorry to say applies to the whole of the *Woulfe's apparatus*. The connecting tubes are with very great difficulty ground into bottles, which makes the apparatus very expensive, and then are so liable to be broken, as to render it frequently useless.

We have before hinted, that the essential part of such an apparatus, is to expose the greatest possible quantity of the gas and the liquid to each other in a given time. In the *Woulfe's bottles*, this advantage does not obtain in so great a degree as might be effected in a simpler apparatus. We shall here subjoin a description of an apparatus of this kind, answering all the purposes to which the *Nooth's* and *Woulfe's* apparatus are separately applied. Although it has not been before made known, it has been used with great success by the writer of this article, and will no doubt be found an acquisition to the experimental as well as the manufacturing chemist.

*Fig. 9. Plate XVII. Chemistry,* is a representation of the apparatus for the absorption of gases. A is a retort from whence the gas is furnished, connected with the first bottle B, which contains the liquid to be impregnated, and into which the tube *a* is ground, reaching near to the bottom, so that when the gas enters this vessel, the liquid will be raised into the bottle C; at the same time the tube will be constantly filled, with the exception of the space occupied by bubbles of gas passing through it. If the gas is not all absorbed during its passage through this tube, the excess will pass down the tube *b* into the bottle D, which also contains the absorbent liquid. The same takes place in this bottle which is observed in that of B. The liquid ascends into the bottle E, the gas following it as before. The residual gas, should there be any, may either be conveyed into another bottle fitted like D, or may be collected in a pneumatic trough, or escape through the tube of safety *c*.

This apparatus was invented for the purpose of making the oxymuriats of the earths, for which it is admirably adapted. The earths which are mixed with the water being constantly at the bottom, if not kept in agitation, the absorption is very slow and imperfect. In this apparatus no agitation is necessary. The earth, which is at the bottom of the vessels B and D, is first raised into the tubes *a* and *c*, and becomes as much exposed to the gas as any part of the liquid medium. The tubes *a* and *c* are each about two feet long, but they do not require to be so long for most experiments of this kind. Their diameter is about  $\frac{1}{2}$  inch, so that in the course of about one minute, no less than about nine ounces are brought in contact with the gas, independent of the circular surfaces in the bottles.

In the common sized *Woulfe's bottles*, the tubes through which the gas enters seldom dip more than three inches into the fluid, so that we may safely rate the apparatus proposed as equal to at least eight of *Woulfe's bottles*. These bottles are the same with those of *Woulfe's*; the tubes are much simpler, and being stronger are less liable to break. Another great advantage is that of its not requiring a tube of safety. The great facility with which it can be applied to all the purposes of the *Nooth's apparatus*, as well as the *Woulfe's*, and with much more effect, will be soon appreciated. Under the article *Woulfe* will be found the description of a differently constructed apparatus. See *Plate V. Chemistry*.

*Nooth's Apparatus.*—This is represented in *fig. 10. Plate XVI.* It consists of three vessels fitted together by ground

ground joinings. It differs in its use from the Woulfe's, in being fully adapted for impregnating water and other bodies, with such gases as are disengaged from their combinations without heat, such as the carbonic acid, and sulphuretted hydrogen. The lower vessel A contains the substance from which the gas is obtained, such as carbonate of lime; the sulphuric acid being introduced occasionally at *d*; the gas enters the vessel B through the glass valve *b*. This is magnified in *fig. 12*. The tubes *b* and *d* are at first in one piece and ground into the part *a e*; the portion *e* is then cut away, to make room for the hemispherical valve, the under side of which is ground flat, to fit the end of the tube *b*. The valve, on being raised by the gas, instantly falls and prevents the water from descending into the lower vessel. The air then enters the liquid in B, *fig. 10*, through small holes to disperse it as much as possible. When the gas accumulates in B, a portion of the liquid is driven up into the vessel C, the bubbles of air following it tending still more to promote the absorption. The air in C, if not absorbed, will at certain intervals raise the conical stopper *e*. This stopper should be so heavy as just to rise before the vessels would burst, and should be so conical as not to stick in the least degree. After the liquid is impregnated it is drawn off at the cock D.

*Fig. 11*, is a simpler and better apparatus for this purpose, invented by Dr. Hamilton. It is simpler, because the vessels are fewer, and the valve, which is complicated and liable to be fast, is dispensed with; and it is better because the gas comes in contact with more of the liquid in a given time, and consequently the absorption is effected sooner. The gas is furnished by the retort B, ground into the vessel A. From the latter the absorbing liquid is raised into the vessel C, till the air bubbles go through it, and if not absorbed passes out at *d*. This apparatus wants nothing more than a tube of greater length, for the gas to pass through, to make it complete.

In comparing the two last with that of *fig. 9*, the latter will be found much superior even to that of *fig. 11*.

*Gasometer and Gas Holder.*—The difference between these two vessels, consists merely in one having the means of measuring the quantity of gas which it contains at any time, and the other not, while both are employed as gas holders.

The gasometer was made a very expensive and magnificent apparatus by the celebrated Lavoisier, at the time he prosecuted his experiments upon elastic fluids. This instrument, much simplified, we shall describe in *fig. 13, Plate XVII*. A is a vessel containing water or some other liquid, which will not be acted upon by the gas to be held in it. B is a vessel inverted in the vessel A, and capable of moving up and down in it. E and F are cords by which the vessel B is suspended, the weights and pulleys being concealed in the tube C D.

*Fig. 14* is a section to shew the interior parts of this apparatus. K L is an interior vessel of the same shape, with the vessel B soldered to the bottom of the vessel A, so that no water or other liquid in A can communicate with the inside of it. This is done for the sake of using less of the liquid employed, which in the mercurial gasometer is very desirable, as well for the sake of economy, as making the apparatus more portable; *a* is a pipe passing through the middle of the vessel K L, and communicates with the tubes *o* and *d*. The air is introduced at the stop-cock *e*, and passing along the pipes *o* and *a*, raises the vessel B, which is counterpoised by the weights *r* and *q*. These weights are conducted down the middle of the tube C D, by the small pulleys *x x* and *y y*. The tube *d*, which, with that of *o*, is common to the tube *a*, is to let the air out of the gasometer at the stop-cock *f*, so that the air passes through *a*, both in its entry and its exit: *g, fig. 13*, is a flexible tube, serving to con-

duct the air to a pneumatic trough for examination, or for using the blowpipe when the vessel contains oxygen. This apparatus is provided with a graduated scale G, which tells the number of cubic inches contained in it. It is this scale which constitutes it a gasometer, without which it would be simply a gas-holder.

The mercurial gasometer is on the same plan with the above, but the materials must be unobfusible of the action of the mercury. The vessels are generally made of cast-iron. The outer and the fixed inner vessels may be cast in one piece. The moveable vessel may be of the same metal, or of glass. The pipes must be of wrought iron, and accurately ground into the cast iron. Two gasometers with water, and one with mercury, will be indispensable in experiments in gaseous chemistry.

A very ingenious apparatus, answering the common purposes of gas-holder and gasometer, and in many instances the pneumatic trough, has been invented by Mr. Pepys. It consists of a tin vessel A, *fig. 15*, and a pan or tray B connected with it by pillars. The pipe *a* opens into the middle of the tray, and proceeds in a contrary direction near to the bottom of the vessel A: *v* is another pipe which also communicates with the tray, and just enters the vessel A: *r r* is a glass tube cemented firmly into two brass sockets, which communicate with the top and bottom of the vessel A. This tube is graduated, and shews how high the water stands in the vessel, and consequently tells the quantity of air contained in it. The vessel A is first filled with water by opening the cocks *a* and *v*, and shutting that of *n*, C being closed at the same time. The tray is now filled with water, which descends through the tube *a* into A, while the air in the same escapes at the opening into the tray, from *v*. When the vessel A is full of water, the cocks *a* and *v* must be closed, and the plug may be taken out of C. If the vessel and pipes be air-tight above, no water will be discharged at C, hence this pipe is inserted at such an angle into A, that the lowest part of the outer end is higher than the highest part of the inner end. The next thing is to fill the vessel with gas, and for this purpose the neck of a retort, or other tube from which the gas is to proceed, should be introduced at *c* till it passes the inner end of the same. The gas will rise in bubbles into the upper part of the vessel, while the same quantity of water will run out at the pipe C into an open vessel placed under it. When the water ceases to run out, and air-bubbles escape at C, the tube from whence the gas was furnished may be withdrawn, and the screw-plug put in its place.

In order to transfer the gas from this vessel into a jar, the tray must be filled with water, and also the jar, which must then be placed over the aperture from *v*. On opening the stop-cock *v*, that of *a* being previously opened, the air will ascend into the jar, while the same quantity of water will descend into the vessel A, to supply its place.

This apparatus may be used for several other purposes. A bladder may be tied to the stop-cock *n*, which being opened at the same time *a* is opened, the bladder will be filled with the gas. A flexible tube may be fixed on the same stop-cock for making experiments with the blow-pipe. The gasometer, *fig. 13*, will be found better for the blow-pipe, on account of the equal pressure in the apparatus last described.

*Pneumatic Trough*—This is a simple trough or cistern made of tin or copper japanned, and is used for collecting different gases. The size is generally about 18 inches long, 12 wide, and 12 deep. *Fig. 16, Plate XVI*, represents this trough. A is a sliding shield which can be taken out. It is formed of two plates laid together; the under plate is made so concave, that when the convex side touches the upper plate in the middle, they are distant at the edges about one inch.

A rim being foldered round the two gives the shelf the appearance of a solid, concave on the under side and flat on the upper side.

Any gas coming from the retort B, passing under the shelf in any situation, must be determined to the round hole in the middle, which is about half an inch wide. The trough, when used, is filled with water about an inch above the shelf, the jar C being filled with the same, and placed over the aperture through which the bubbles ascend. The stand D, having a foot of lead or iron, will be found very useful for supporting a retort or other vessel in these experiments. When a number of vessels are occupying the shelf, and frequently some are very tall, and of small diameter, it will be found necessary to support them to prevent their being thrown over. This may be effected by having a number of supporters of different sizes, such as A. This is better represented in *fig. 17*. At *d* is a socket to fit the pins which surround the shelf; *n, c*, are springing claws to embrace the glass.

In making experiments upon gases, a number of vessels, such as *fig. 18*, will be necessary. These are generally called eudiometer tubes, some of them are graduated into cubic inches, for the purpose of measuring the volume of gas used, or resulting from any experiment. See EUDIOMETRY.

Besides the trough already described, which is used with water, it is necessary to be provided with one for mercury. Indeed the latter is absolutely indispensable when the gases, which are the subject of experiment, are absorbable by water: such as the muriatic acid gas, and ammoniacal gas.

*Fig. 19*, is a view of the mercurial trough; it is generally made of a solid block of some hard wood, or of marble; or it may be made much neater, and with less labour, of pieces of wood joined together, closely and firmly by iron screws. The first cavity, *a, e, b*, may be about eight inches long, four inches broad, and one inch in depth: the second or lower cavity, *d*, should be about  $6\frac{1}{2}$  inches long,  $1\frac{3}{4}$  wide, and the same depth: *c* is a smaller cavity, about  $\frac{3}{4}$  of an inch wide,  $1\frac{1}{2}$  long, and one inch deep. The cavity *d* is intended to receive the glass jar, *fig. 20*, for the purpose of filling it with mercury: *a, b*, are small cavities in which to introduce the fingers for the purpose of raising the jar when full of mercury. The cavity at *e* is to place the inverted jar over, for the purpose of introducing any gas into it. The side *a, c* answers as a shelf to rest the inverted jars upon: *fig. 21*, is a ring of iron, with a leg to slip into holes on the side of the trough, for the purpose of supporting the jars, which would otherwise be liable to fall on account of their small base.

*Eudiometer*.—Formerly the use of this instrument was confined to the analysis of the atmosphere. It has now, however, become of great importance in gaseous chemistry, and has been considerably improved within these few years.

In order to ascertain the nature of, and to distinguish the different gases, chemists have generally recourse to some substance capable of absorbing the gas under examination. The eudiometer is the vessel which contains, or communicates with the substance which is to absorb the gas, and the tube being graduated marks out the quantity absorbed, and shews how much of that particular gas was present.

The first instrument of this kind, adapted to general purposes, was invented by Dr. Hope, of which a description will be found under EUDIOMETRY. Under the same article will be found Mr. Davy's eudiometer for the analysis of the atmosphere.

Mr. Pepys has lately invented a very good eudiometer: it differs from Dr. Hope's in the bulb, which holds the absorbing liquid, being an elastic gum bottle instead of glass.

A glass neck is tied into the neck of the bottle, into which the graduated tube is ground. When this eudiometer is used, the elastic bottle is filled with the absorbing liquid (lime water, for instance), and the tube filled with the gas under examination (supposed to be carbonic acid), introduced into the neck.

On agitating the liquid to mix it with the gas, as the absorption goes on, the elastic bottle collapses, by the atmospheric pressure, and the liquid occupies the place of the absorbed gas in the tube.

The only objection to this eudiometer is its want of flexibility, and this varying under different circumstances, so that the density of the contained air can never be accurately known. The writer of this article has done away the above objection, by using a bag of oiled silk instead of this elastic gum bottle. The silk must be very well coated, and the coating completely dry.

The eudiometer of Volta, which is found very useful in the presence of the electric machine, is also called the *determining jar*. It is used with oxygen to detect the presence of hydrogen, and *vice versa*. This instrument, *fig. 22*, consists of a very thick glass tube A B, having two bits of metal *a, b*, passing into the tube opposite to each other, the inner ends being separated from each other a small distance, so that an electric spark passing between them, may be capable of inflaming hydrogen with oxygen.

The gas to be examined is introduced into this jar, and the electric spark passed through it. If hydrogen and oxygen be present, in sufficient quantity, they will explode, forming water, and producing a diminution of volume equal to the original bulk of gases which have entered into combination. In the explosion of these gases the water or mercury is apt to be thrown in various directions by the concussion. We are indebted to Mr. Pepys for an ingenious method of preventing this evil. The tube A B is secured to the iron stand D E by means of a socket C. D is an iron tube containing a spiral spring, similar to that of the spring *steel-yard*. The rod *d*, which acts upon the spring, is fastened to the foot E, which is so heavy as not to be raised by the force exerted upon the spring. When the detonation of the gases takes place, the force is exerted equally upon the instrument and the liquid, in which it is immersed, when they are both at liberty. Instead of being all exerted upon the latter, it causes the tube to rise, the spring in the socket D giving way; and thus prevents the liquid from being dispersed. All the gaseous bodies containing hydrogen can now be analysed by this instrument. Dr. Henry has discovered that ammonia, which does not appear combustible, can be exploded with oxygen: its hydrogen forming water with that substance. See EUDIOMETRY.

*Evaporating Vessels*.—These are of metal, earthen-ware, and glass. They are generally made broad and shallow, as seen in *fig. 23*, in order to expose a greater evaporable surface. During the evaporation of any liquid, a current of air should constantly be passing over its surface. This object can be easily attained by placing the vessel under the mouth of a chimney into which there is a considerable draught. By this means also the vapour is prevented from coming into the room.

These vessels are of silver for expelling the water from alkalis, and of glass, or Wedgwood ware, for acids and some solutions of salts.

*Sand and Water Baths*.—The sand bath, although superseded by the Argand lamp, for distillations in the small way, is, nevertheless, very useful for digesting substances subjected to solution, and for evaporation. Its heat is much more regular than the naked fire, but it may sometimes be too

hot for substances which are liable to be decomposed, such as infusions of vegetable or animal matters. The most useful sand bath is made of a plate of cast iron, under which the flame of a fire plays, and a rim of cast or wrought iron laid upon it and filled with fine Calais sand.

A sand-bath frequently consists of an iron dish or pan made to fit the mouth of a furnace. See FURNACE.

When an uniform heat, not higher than 212° of Fahrenheit, is required, or when it will be sufficient, the water bath is found highly useful. Instead, however, of placing the substance to be heated in a vessel of boiling water, which was formerly the case, the bath may be heated with steam at any distance from the boiler. This bath may be a vessel of any shape, having a cavity for steam on the outside, thickly covered with flannel, or any bad conductor of heat, and the inside filled with sand. This bath is admirably fitted for the evaporation of solutions of animal and vegetable substances, and for drying precipitates and other substances liable to be decomposed or changed by great heat.

*Matras.*—This is a vessel used for making solutions of substances. It is generally of a spherical form, flattened at the bottom, as seen in *fig. 24*, having a long neck to allow the fluid to condense and return into the vessel. This useful apparatus is made of glass, and thin at the bottom, in order to prevent its breaking. The common Florence flask is a good substitute for the matras. A smaller vessel of this kind is used for boiling a less quantity of any liquid; these are called *proof glasses*. See *fig. 25*.

*Precipitating Glasses.*—See *fig. 26*.—These are tall cylindrical vessels, in which precipitations are performed, in order to collect the separated matter into less room. In washing precipitates it is found, that when hot water is poured into the glass, if the bottom be thick it is liable to break. This evil has existed more or less in all the precipitating glasses in general use. In making this vessel at the glass-house, the part to form the bottom should be blown out thin, like the matras, and then pushed inwards to make it stand firmly. Very small vessels in this shape are used for small quantities of any substance. These are called *test glasses*.

*Gas bottles*, such as *fig. 27*, are vessels for obtaining hydrogen, carbonic acid, and other gases. The materials, such as water and zinc filings, are introduced into the bottle A. The sulphuric acid being put into the bottle B, the plug *b*, which is ground into the neck *d*, can be raised to let in the acid as it may be wanted. The gas escapes through the crooked tube C, which may be put under the shelf of the pneumatic trough.

Funnels are used generally for filtration; they are commonly, and always ought to be ribbed for this purpose, in order to form channels between the paper and the glass, which greatly facilitates the process. In lieu of a ribbed filter, it is common to place a number of straws, or pieces of glass, between the paper and the vessel, which answers very well.

The separatory funnel, *fig. 34*, is used for separating fluids, such as water and oil, which do not mix from the difference in specific gravity.

The following articles are also essential to the laboratory, which it will be unnecessary to describe.

Thermometers and a barometer. Bottle for ascertaining the specific gravity of liquids.

A common still to furnish distilled water.

A small one of silver for nice purposes.

The different blow-pipe apparatus, with platina, spoon, and leaf platina.

A silver crucible, and one of platina.

Crucibles and crucible stands of earthen ware. See *figs. 29, 30*, and *32*.

Muffles and cupels. See *figs. 28* and *33*.

Iron retort and jointed tube for procuring oxygen gas. *Fig. 35*.

Glass jars of different sizes for collecting gases.

Filtering paper, and papers coloured with litmus, turmeric, and red-cabbage.

A general assortment of glasses, to filter liquids into, &c.

An assortment of earthen vessels for common purposes. Those made of the same materials as the soda water bottles are to be preferred.

Capsules of glass, and watch-glasses. The former may be cut out of broken retorts and receivers with a small hot iron.

Glass tubes of different sizes, and a spirit lamp for bending them.

Glass and porcelain rods and spoons for stirring acids, &c.

Jars of glass and earthen ware, with grooves round the top, for luting them closely from the air. These should be used for containing salts in crystals.

Ruled paper for labels; copal varnish to cover the same, to keep off the dampness and fumes of acids.

Sheets and wires of different metals.

Silk and thread of different strength.

Stands made of wood or rushes, for supporting vessels with round bottoms.

Iron ladles of different sizes.

Hammers, shears, and plyers.

Corks, bladders, and sponge.

Tongs of various forms.

Files, diamond, and magnet.

Lutes, linen, cloth, and tow. See LUTE.

The following philosophical apparatus;

Air-pump for condensing and exhauing.

Syringes, microscope, and burning lens.

Electric machine and Galvanic apparatus.

Zinc plates and wire, for minor experiments.

Hydrostatic balance and hydrometer.

We shall conclude this article with a list of the chemical substances necessary to be kept in a chemical laboratory. These are divided into wet and dry substances. The first of these must, of necessity, be kept in well-stopped bottles. The latter should also be kept in bottles, the necks of which should be wider than those for liquids.

Substances in common use should be kept in larger quantity than those which are kept as mere specimens, or only used occasionally and in small quantity.

*Liquids in common Use.*

Sulphuric acid, pure.

----- common.

Nitric acid, pure.

-----, common.

Muriatic acid, pure.

-----, common.

Acetic acid.

Water saturated with ammonia.

Solution of potash.

----- carbonat of potash.

----- potash.

----- super-carbonat of potash.

----- soda, and carbonat of soda.

----- carbonat of ammonia.

Lime water.

Distilled water.

Alcohol,

Alcohol, pure.  
 ———, common.

The bottles in which the above are kept should hold from a pint to a quart each.

After a change of temperature in the air from cold to hot, we find at the tops of bottles, about the stopper, a quantity of the liquid which has distilled up to the stopper, and been forced out by the expansion of the air in the bottle. This is very troublesome, especially with acids, and may be remedied by giving to the mouth of the bottle a slight funnel shape, which forms a recess for the liquid.

The following are the dry substances in common use.

- Oxyd of manganese, and common salt.
- Filings and rods of iron, tin, zinc, copper, and lead.
- Chalk and powdered marble.
- Quick lime, pipe clay, and sand.
- Magnesia, common and calcined.
- Sulphurets of potash, iron, and lime.
- Isinglass and nutgalls.
- Brazil wood and turmeric.
- Calcined plaster of Paris, and bone ashes.
- Black flux and white flux, See FLUX.
- Charcoal powder and saw-dust.
- Sulphat of lead, as a body for lutes.
- Nitre in crystals.
- Borax and alum.

The following are bodies in solution, used as tests and kept in small quantities, in bottles from one to two ounces in size. The bottles should be shaped at the mouth as above recommended, and the diameter should be half the height in the cylindrical part.

- |                      |                               |
|----------------------|-------------------------------|
| Sulphat of potash.   | Oxymuriat of mercury.         |
| — foda.              | Phosphat of foda.             |
| — alumine.           | — ammonia.                    |
| — ammonia.           | Fluat of potash.              |
| — magnesia.          | — ammonia.                    |
| — zinc.              | Borat of foda.                |
| — silver.            | Carbonat of potash.           |
| Oxy-sulphat of iron. | — foda.                       |
| Nitrat of potash.    | — ammonia.                    |
| — foda.              | Acetat of potash.             |
| — barytes.           | — barytes.                    |
| — strontian.         | — strontian.                  |
| — lime.              | — alumine.                    |
| — silver.            | — silver.                     |
| — copper.            | — copper.                     |
| — lead.              | — lead.                       |
| — bismuth.           | Oxyacetat of iron.            |
| Muriat of potash.    | Oxalat of foda and ammonia.   |
| — foda.              | Succinat of ammonia.          |
| — barytes.           | Tratrat of ammonia.           |
| — strontian.         | Prussiat of potash and iron.  |
| — lime.              | — lime and iron.              |
| — ammonia.           | Pure gallic acid in alcohol.  |
| — gold.              | Infusion of galls in alcohol. |
| — platina.           | — of litmus.                  |
| — tin.               | Acetic acid, pure.            |
| — cobalt.            | Hydrosulphuret of potash.     |

The following substances should be kept in the solid state, and free from the contact of air and moisture:

- Sulphat of iron kept in alcohol.
- Muriat of lime.
- Oxymuriat of potash.
- Barytic earth.
- Strontian earth, and all pure earths.
- Pure potash.
- foda.

Potassium and sodium, kept in naphtha. See POTASSIUM and SODIUM.

Sulphurets of potash, iron, and lime.

Phosphuret of lime.

Phosphorus.

Pyrophorus.

It is also proper that the chemist should possess as great a variety of all the known chemical bodies as possible, both simple and compound. They are worth possessing even as a matter of curiosity. But they will be highly valuable in giving a familiar knowledge of the different substances which the experimentalist may expect to meet with, and enable him to distinguish them from what may be new.

LABORATORY of an Hospital, is a place where the chemical, &c. remedies are made up.

LABORATORY, in a Camp, is a tent where the fire-workers and bombardiers prepare their works, drive their fuses, fix their shells and carcasses, make quick-match, &c.

LABORDE, M. DE, in *Biography*, author of an ample and comprehensive work, entitled "Essai sur la Musique, ancienne et moderne," published at Paris 1780, in four vols. 4to. The accumulation of curious materials for this publication is such, as nothing but a long and unwearied diligence could amass. It has, however, frequently given us much concern, in consulting this work, to see the spirit of system operate so strongly on the author, as to affect both his candour and conscience. The critique upon musical writers in the third volume, seems only a vehicle for general censure of all that have not subscribed to the fundamental base of Rameau, the triple progression of the Abbé Rouffier, and praise of all that have. There is no middle state, no music or musical merit of any kind, theoretical or practical, unanctioned by these dogmas. But will M. de Laborde venture to assert, or can he even believe, that till the publication of Rameau's "Système de la Basse fondamentale," and the Abbé Rouffier's "Mémoire sur la Musique des Anciens," there was no good music in the world, or that all which has been produced since, by innumerable great masters in several parts of Europe, who never studied or heard of either, is execrable? That there are great method and merit in the systems of both these theorists, no candid judges of the subject will deny; and perhaps there are few who will not grant that the principles of harmony have not been formed into a code, equally luminous and useful to students, by any other writers, and yet will not shut their ears to all music not built upon their principles. The inconsistency of *individually* praising Italian composers in such glowing terms, and yet seizing every opportunity to censure and sneer at Italians and foreigners in *general*, prove the work to have been compiled by persons of different principles. What a coil is made (v.iii. p. 690.) about a sharp fifth used merely as an appoggiatura, or note of taste, with which the base or harmony has nothing to do, and which, therefore, has no effect on the modulation! And yet M. de Laborde can bear the *quinte superflue*, and have patience to give a rule for its use in composition! Can any one sincerely praise the compositions of Piccini, Sacchini, and Pachello, who is disgusted by those happy licences, in which the very soul of Italian music consists?

M. de Laborde gives us his musical creed in pretty plain terms, (v.iii. p. 639.) in answer to a remark of Mr. Jarnard, who expresses his surprize, that "the Italians, without any formal system, compose better music than the French, who are in possession of the true principles of harmony." This M. de Laborde is so far from granting, that, on the contrary, he is certain the French music, with respect to counterpoint, is infinitely superior to the Italian; and that the Italians sur-

pafs the French in nothing but dramatic music, which is not like other music, fubfervient to the laws of counterpoint!—"We will allow," continues he, "that the Italians are fuperior to us in *melody*; but they in return muft grant, that with refpect to *harmony* we write in a manner fuperior to them in correctness, purity, and elegance." What! fuperior to Leo, Féo, Durante, Ahoſ, Jomelli, Caſtaro, and Manna? But neither melody nor harmony, alone, can conſtitute good muſic, which conſiſts in the union of both; and melody without harmony, or harmony without melody, is as imperfect as a man with one arm, or one leg, to whom nature has originally given two.

With refpect to all the feuds and contentions lately occaſioned by muſic in France, they ſeem to have annihilated the former diſpoſition of the inhabitants to receive delight from ſuch muſic as their country afforded. There are, at preſent, certainly, too many critics, and too few hearers with a diſpoſition to be pleaſed in France, as well as elſewhere. We have ſeen French and German *ſoi-diſant* connoiſſeurs liſten to the moſt exquisite muſical performance, with the ſame *ſang-froid* as an anatomit attends a diſſection. It is all analyſis, calculation, and parallel; they are to be wiſe, not pleaſed. Happy the people, however imperfect their muſic, if it gives them pleaſure! But when it is an eternal object of diſpute; when each man, like Nebuchadnezzar, ſets up his own peculiar idol, which every individual is to fall down and worſhip, or be thrown into the fiery furnace of his hatred and contempt, the bleſſing is converted into a curſe.

LABOUR, in *Agriculture*, the work which is neceſſary to be performed upon a farm, in order to render it fruitful and productive. It is of various kinds, and for the moſt part either performed by hired ſervants or day labourers. Where proper attention is paid by the farmer, to ſee that the labourer underſtands his buſineſs, &c. agricultural labour is probably, in general, beſt done by the piece, or what in ſome places is termed talk-work. The expence or price of labour varies conſiderably in different diſtricts, from particular circumſtances; ſuch as the ſituation, the ſtate of manufactures, the condition of agriculture, the facility of getting employment, and the manner of living. See LABOURER.

In the Survey of the County of Middleſex, it is ſtated, that agriculture may very properly be conſidered as the art of manufacturing the ſoil, and unqueſtionably ranks the higheſt in the claſs of manufactures; ſince it not only makes a greater return for the labour beſtowed, than all the reſt put together, but it is alſo of the firſt neceſſity, the demands for its products being urgent and irrefiſtible. Any other manufactory, Mr. Diron remarks, may be laid down at pleaſure, but agriculture muſt be ſupported, as it is the hinge upon which both our lives and actions turn; and the ultimate and only certain reſource of the ſtate, both for men and money.

In the above point of view the feed-grain, amounting to about 15s. an acre, may be ſaid to conſtitute, according to the writer of the Survey of the County of Middleſex, the raw material. When the corn and ſtraw, produced from this feed, are dreſſed and ſent to market, the greater part of it is then fit for conſumption, and may be called a finiſhed manufacture. The additional value above 15s. is entirely the produce of labour, at leaſt, in a conjunction with the aſſiſtance of nature; but as not one ſhilling could be procured for the natural products of the world, without the application of labour, the whole may therefore be ſaid to be derived from labour; and amounts to about 3l. 5s. an acre, or 1233l. per cent. on the coſt of the raw material. Wheat is ſtill farther manufactured into bread; but, excluſive of

the operations of the miller and the baker, this is certainly not above the average for the produce of the arable land of this county; and ſome parts of Surrey, Kez, and Eſſex, yield in the ſame proportion. The raw material, on an average of the arable of the whole of South Britain, amounts to about 16s. per acre, which is increaſed in value by labour to 5l. or 525l. per cent. Hence the labour beſtowed on fifteen millions three hundred thouſand acres, produce a return of 64,260,000l. ſterling.

And the cattle and implements may, it is ſuppoſed in a manufacturing point of view, be deemed the ſtock; the amount of which, on the meadow-land in this county, is about 4l. an acre, and the produce 10l. The labour and profits of ſtocks, therefore, are 150l. per cent. On a farm purely arable in this county the ſtock would be 5l. and the produce 10l. or 100l. per cent. There are not any grazing-farms in the county; if there were, their ſtock would be greater, and they would not yield fo large an increaſe. The farming capital of South Britain is 5l. an acre, or 200 millions; and its annual produce is about 130, that is, 65 per cent.

He particularizes the annual produce of the ſoil in this way:

The arable lands, as before ſtated,	-	£64,260,000
The hop-gardens make returns to the amount of 30l. an acre, for the produce of labour, or about	-	1,000,000
Nurſery grounds produce upwards of 65l. per acre. Deduct the raw material, and the produce of labour will not be leſs than 60l. on 10,000 acres, is	-	600,000
The fruit and kitchen-gardens are the moſt valuable reſources for labour, and make the greateſt return, probably to upwards of 100l. per acre, on an average of Great Britain; but he only eſtimates them at that ſum on 50,000 acres, is	-	5,000,000
The graſs land and cider counties, cultivated in South Britain, make returns to the amount of 3l. on twenty millions of acres, is	-	60,000,000
The commons, eight millions, at 1s. 3d. an acre	-	500,000
<b>Total</b>	-	<b>£131,360,000</b>

It is not preſumed to offer the foregoing ſtatement, as one that either is, or can be made out with accuracy and precision. But, under all the circumſtances of the caſe, it may, it is believed, be fairly ſtated, that the annual agricultural produce of South Britain is not leſs than one hundred and thirty millions; which muſt be allowed to ſurpaſs all other manufactures that can be brought into competition with it, not only as to the groſs amount, but alſo as to its ſuperior uſefulneſs.

And if it be further ſuppoſed, that there are two millions and a half of perſons employed in agriculture, their average earnings will be, for men, women, and children of all ages, 52l. which is a ſum ſo much exceeding their expences, that it is evident this employment muſt enrich ſociety; and it is equally clear, that it contributes at once its ſurplus, wealth, and population, to make up the deficiencies of the other departments both in men and money. This ſurely places the importance of rural labour in ſuch a point of view, as ſhould urge the cultivation of as much land of the kingdom as poſſible.

LABOUR, in a general sense, imports the exertion of human strength in the performance of any kind of work.

The annual labour of every nation, says Dr. Smith in his "Inquiry into the Nature and Causes of the Wealth of Nations," (vol. 1.), is the fund, which originally supplies it with all the necessaries and conveniences of life, which it annually consumes, and which consist always, either in the immediate produce of that labour, or in what is purchased with that produce from other nations. As this produce, or its value in purchase, bears a greater or a smaller proportion to the number of those who are to consume it, the nation will be better or worse supplied with all the necessaries and conveniences for which it has occasion. This proportion, in every nation, is regulated by two circumstances, *viz.* the skill, dexterity, and judgment with which its labour is generally applied, and the proportion which the number of those who are employed in useful labour, bears to that of those who are not so employed. Whatever be the soil, climate, or extent of territory of any particular nation, the abundance or scantiness of its annual supply must, in that particular situation, depend upon these two circumstances; and chiefly upon the former of them, which has served to improve the productive powers of labour. This improvement has very materially depended on the division of labour, as we may illustrate and evince by a single example taken from a manufacture, that is, on the first view of it, very trifling; *viz.* that of pin-making. A workman, not educated to this business, (which the division of labour has rendered a distinct trade), nor acquainted with the use of the machinery employed in it, (to the invention of which the same division of labour has probably given occasion), could scarcely, with his utmost industry, make one pin in a day, and certainly could not make twenty. But as the business is now conducted, not only the whole work is a peculiar trade, but it is divided into a number of branches, consisting, for the most part, of peculiar trades. One man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; and the making of the head requires two or three distinct operations; the putting of it on is a peculiar business, and the whitening of the pins is another; the putting of them into the paper is a trade by itself. Thus the important business of making a pin is divided into about 18 distinct operations, which, in some manufactories, are all performed by distinct hands, though in others, the same man will sometimes perform two or three of them. Dr. Smith mentions a small manufactory of this kind, where 10 men only were employed, and where some of them consequently performed two or three distinct operations. But though they were poor, and their machinery indifferent, they could, with exertion, make among them 12 pounds of pins in a day; each pound consisting of upwards of 4000 pins of a middling size; these 10 persons could therefore, among them, make upwards of 48,000 pins in a day; so that each person might be considered as making 4800 pins in a day. But if they had all wrought separately and independently, and without having been previously educated to this peculiar business, they certainly could not each of them have made 20, perhaps not one pin a day; that is, certainly, not the two hundred and fortieth, perhaps not the four thousand eight hundredth part of what they are at present capable of performing, in consequence of a proper division and combination of their different operations. This exemplification is applicable, in a certain degree, and with some modifications, to other arts and manufactories; and it shews that the division of labour, as far as it can be introduced, occasions, in every art, a proportionable increase of the productive powers of labour. The separation of dif-

ferent trades and employments from one another, seems to have taken place in consequence of this advantage. The great increase in the quantity of work, which, in consequence of the division of labour, the same number of people are capable of performing, is owing to three different circumstances; *first*, to the increase of dexterity in every particular workman; *secondly*, to the saving of the time which is commonly lost in passing from one species of work to another; and *lastly*, to the invention of a great number of machines which facilitate and abridge labour, and enable one man to do the work of many. This invention and introduction of machinery seem to have been originally owing to the division of labour. Of machines constructed for abridging and expediting labour, many have been devised by common workmen, who have been employed in some very simple operation, and whose attention has been wholly directed to an easy and ready method of performing it. Many improvements have also been made by the ingenuity of the makers of the machines, when the construction of them became the business of a particular trade; and some by that of those who are called philosophers and men of speculation, whose observation has enabled them to combine together the powers of the most distant and dissimilar objects. A sub-division of employment in philosophy, as well as in every other business, has taken place among persons of this description; in consequence of which dexterity is improved, and time is saved. Each individual, appropriating to himself a particular branch, performs more work upon the whole, and contributes in a considerable degree to augment the quantity of science. It is the great multiplication of the productions of all the different arts, in consequence of the division of labour, which occasions, in a well-governed society, that universal opulence which extends itself to the lowest ranks of the people. Every workman has a great quantity of his own work to dispose of beyond what he himself has occasion for; and every other workman being exactly in the same situation, he is enabled to exchange a great quantity of his own goods for a great quantity, or, which comes to the same thing, for the price of a great quantity of theirs. He supplies them abundantly with what they have occasion for, and they accommodate him amply with what he has occasion for; and a general plenty diffuses itself through all the different ranks of the society.

The division of labour, from which so many advantages are derived, is not originally the effect of human wisdom, which foresees and intends that general opulence to which it gives occasion. It is the necessary, though very slow and gradual, consequence of a certain propensity in human nature which has in view no such extensive utility; the propensity to truck, barter, and exchange one thing for another. As it is the power of exchanging that gives occasion to the division of labour, so the extent of this division must always be limited by the extent of that power, or, in other words, by the extent of the market. When the market is very small, no person can have any encouragement to dedicate himself entirely to one employment, for want of the power to exchange all that surplus part of the produce of his labour, which is over and above his own consumption, for such parts of the produce of other men's labour as he has occasion for. This leads us to observe, that by means of water-carriage a more extensive market is opened to every sort of industry, than what land-carriage alone can afford it; so it is upon the sea-coast, and along the banks of navigable rivers, that industry of every kind naturally begins to subdivide and improve itself; and it is frequently not till a long time after that these improvements extend themselves to the inland parts of the country. If we

advert to fact, we shall find, that the nations which appear to have been first cultivated, were those that occupied the countries around the coast of the Mediterranean sea. And of all these countries, Egypt seems to have been the first, in which either agriculture or manufactures were cultivated and improved to any considerable degree. Upper Egypt extends itself no where above a few miles from the Nile, and in Lower Egypt this great river breaks itself into many different canals, which, with the assistance of a little art, seem to have afforded a communication by water-carriage, not only between all the great towns, but between all the considerable villages, and even to many farm-houses in the country; much in the same manner as the Rhine and the Maese do in Holland at present. The extent and facility of this inland navigation, was probably one of the principal causes of the early improvement of Egypt. The same observation is verified by extending our views to the provinces of Bengal in the East Indies, and to some of the eastern provinces of China, where the Ganges and other great rivers, with a multitude of canals, formed an inland navigation favourable to internal commerce, long before foreign commerce was much, if at all, regarded; the case is very different with respect to the inland parts of Africa, and all that part of Asia, which lies at a considerable distance N. of the Euxine and Caspian seas, the ancient Scythia, the modern Tartary and Siberia, which in all ages of the world seem to have been in the same barbarous and uncivilized state in which we find them at present. See CANAL, COMMERCE, and NAVIGATION.

When the division of labour first began to take place, the power of exchanging, upon which it chiefly depended, must frequently have been very much clogged and embarrassed in its operations. In order to avoid part, at least, of the inconvenience resulting from this state of society, every prudent man, in every period of society, after the first division of labour, must naturally have endeavoured to manage his affairs in such a manner, as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as he imagined few people would be likely to refuse in exchange for the produce of their industry. Many different commodities, it is probable, were successively both thought of and employed for this purpose. In the rude ages of society, cattle are said to have been the common instrument of commerce. Thus we find, according to Homer, that the armour of Diomedes cost only nine oxen; but that of Glaucus cost 100 oxen. Salt is said to be the common medium of commerce and exchanges in Abyssinia; a species of shells in some parts of the coast of India; dried cod at Newfoundland; tobacco in Virginia; sugar in some of our West India colonies; hides or dressed leather in some other countries; and Dr. Smith mentions a village in Scotland in which it was not uncommon for a workman to carry nails instead of money to the baker's shop or the alehouse. Metals, however, have been preferred for this purpose to every other commodity; and different metals have been appropriated by different nations to this use. See COIN and MONEY.

After the division of labour has been once thoroughly established, it is but a very small part of the necessaries and conveniences of life with which a man's own labour can supply him. The far greater part of these he must derive from the labour of other people; and he must be rich or poor according to the quantity of that labour which he can command, or which he can afford to purchase. The value of any commodity, therefore, to the person who possesses it, and who means not to use or consume it himself, but to exchange it for other commodities, is equal to the quantity of

labour which it enables him to purchase or command. Labour, therefore, is the real measure of the exchangeable value of all commodities. This, however, is not the measure by which their value is commonly estimated. It is often difficult to ascertain the proportion between two different quantities of labour. The time spent in two different sorts of work will not always alone determine this proportion. The different degrees of hardship endured, and of ingenuity exercised, must likewise be taken into account. But it is not easy to find any accurate measure either of hardship or ingenuity. Hence it happens, that every commodity is more frequently exchanged for, and thereby compared with, other commodities than with labour. When barter ceases, and money has become the common instrument of commerce, every particular commodity is more frequently exchanged for money than for any other commodity. Nevertheless, labour alone, never varying in its own value, is the ultimate real standard by which the value of all commodities can at all times and places be estimated and compared. It is their real price; money is their nominal price only. But though equal quantities of labour are always of equal value to the labourer, yet to the person who employs them, they appear sometimes to be of greater and sometimes of smaller value. He purchases them sometimes with a greater and sometimes with a smaller quantity of goods, and to him the price of labour seems to vary like that of all other things. It appears to him dear in the one case, and cheap in the other. In reality, however, it is the goods which are cheap in the one case, and dear in the other. In this popular sense, therefore, labour, like commodities, may be said to have a real and a nominal price. Its real price may be said to consist in the quantity of the necessaries and conveniences of life which are given for it; its nominal price, in the quantity of money. The labourer is rich or poor, is well or ill rewarded, in proportion to the real, not to the nominal price of his labour.

The real value of all the different component parts of price, says Dr. Smith, is measured by the quantity of labour, which they can, each of them, purchase or command. Labour measures the value, not only of that part of price, which resolves itself into labour, but of that which resolves itself into rent (of land), and of that which resolves itself into profit. In every society the price of every commodity resolves itself into some one or other, or all, of these three parts; and in every improved society, all the three enter, more or less, into the price of the far greater part of commodities. In the most improved societies, however, there are always a few commodities of which the price resolves itself into two parts only, the wages of labour and the profits of stock; and a still smaller number, in which it consists altogether in the wages of labour.

The produce of labour constitutes the natural recompence or wages of labour. In that original state of things, which precedes both the appropriation of land and the accumulation of stock, the whole produce of labour belongs to the labourer; as he has no landlord or master to share with him. If this state had continued, the wages of labour would have augmented with all the improvements in its productive powers, to which the division of labour gives occasion. All things would gradually have become cheaper. They would have been produced by a smaller quantity of labour; and as the commodities produced by equal quantities of labour would naturally in this state of things be exchanged for one another, they would have been purchased likewise with the produce of a smaller quantity. But this original state of things, in which the labourer enjoyed the whole produce of his own labour, could not last beyond the first introduction of the appropriation of land and the accumulation of stock.

As soon as land becomes private property, the landlord demands a share of almost all the produce which the labourer can either raise, or collect from it. His rent makes the first deduction from the produce of the labour which is employed upon land. A second deduction is made by the profit accruing from the produce of the labour that has been so employed. The produce of almost all other labour, in all arts and manufactures, is liable to the like deduction of profit. What are the common wages of labour, depends every where upon the contract usually made between the two parties, to whom belong the profits of stock, and the wages of labour; and the interests of these parties are by no means the same. The workmen desire to get as much, the masters to give as little, as possible. The former are disposed to combine in order to raise, the latter in order to lower, the wages of labour. The masters commonly succeed; for being fewer in number, they can more easily combine; and besides, the law authorizes, or at least does not prohibit, their combinations, while it prohibits those of the workmen. But though in disputes between masters and workmen, the former must generally have the advantage, there is, however, a certain rate, below which it seems impossible to reduce, for any considerable time, the ordinary wages even of the lowest species of labour. The wages of a labourer must at least be sufficient to maintain him; and indeed, on most occasions, they ought to be somewhat more; otherwise it would be impossible for him to bring up a family, and the race of such workmen could not last beyond the first generation. There are certain circumstances, which sometimes give the labourers an advantage, and enable them to raise their wages considerably above the rate already specified; which is evidently the lowest that is consistent with common humanity. When in every country the demand for those who live by wages, labourers, journeymen, servants of every kind, is continually increasing; when every year furnishes employment for a greater number than had been employed the year before, the workmen have no occasion to combine in order to raise the wages. The scarcity of workmen occasions a competition among masters, who bid against one another, in order to get workmen, and thus voluntarily break through the natural combination of masters not to raise wages. This demand for those who live by wages, it is evident, cannot increase but in proportion to the increase of the funds, which are destined for the payment of wages: these funds are of two kinds: first, the revenue which is over and above what is necessary for the maintenance; and secondly, the stock which is over and above what is necessary for the employment of their masters. The demand for those who live by wages, therefore, necessarily increases with the increase of the revenue and stock of every country, and cannot possibly increase without it. The increase of revenue and stock is the increase of national wealth. It is this continual increase, and not the whole amount, of national wealth, which occasions a rise in the wages of labour. Accordingly, it is not in the richest countries, but in the most thriving, or in those which are growing rich the fastest, that the wages of labour are the highest. England is, without doubt, a much richer country than any part of North America; yet the wages of labour are much higher in North America than in any part of England. Although North America is not yet so rich as England, it is more thriving, and advancing with greater rapidity to the further acquisition of riches. The most decisive mark of the prosperity of any country is the increase of the number of its inhabitants. In Great Britain, and in most other European countries, they are not supposed to double in less than 500 years. In North America, it has been found, that they double in 20 or 25 years. Labour is

there so well rewarded, that a numerous family of children, instead of being a burthen, is a source of opulence and prosperity to the parents. The labour of each child, before it can leave their house, is computed to be worth 100*l.* clear gain to them. The value of children is evidently the greatest of all encouragements to marriage. In North America the people generally marry very young; and notwithstanding the great increase occasioned by such early marriages, there is a continual complaint in that country of the scarcity of hands. The demand for labourers, the funds destined for maintaining them, increase, it seems, still faster than they can find labourers to employ. Another circumstance deserves to be mentioned, *viz.* that the price of provisions is every where in North America much lower than in England, so that a family can be maintained at a much cheaper rate. Upon the whole, if the money price of labour be higher there than it is here, its real price, the real command of the necessaries and conveniences of life which it conveys to the labourer, must be higher in a still greater proportion. The liberal reward of labour, as it is the necessary effect, so it is the natural symptom of increasing wealth. The scanty maintenance of the labouring poor, on the other hand, is the natural symptom, that things are at a stand, and their starving condition that they are going fast backwards. The liberal reward of labour, as it is the effect of increasing wealth, is also the cause of increasing population.

It deserves to be remarked, that it is in the progressive state, while the society is advancing to the further acquisition rather than when it has acquired its full complement of riches, that the condition of the labouring poor, of the great body of the people, seems to be the happiest and the most comfortable. It is hard in the stationary, and miserable in the declining state. The progressive state is in reality the cheerful and the hearty state, to all the different orders of the society. The stationary is dull, the declining melancholy. The liberal reward of labour not only encourages the propagation, but it increases the industry of the common people. Where wages are high, we shall always find the workmen more diligent, active, and expeditious, than where they are low: in England, for example, than in Scotland; in the neighbourhood of great towns than in remote country places. Some workmen, however, when they can earn in four days what will maintain them through the week, will be idle the other three. But this is by no means the case with the greater part. Workmen, on the contrary, when they are liberally paid by the piece, are very apt to overwork themselves, and to ruin their health and constitution in a few years. Dr. Smith observes, that if masters would always listen to the dictates of reason and humanity, they have frequently occasion rather to moderate than to animate the application of many of their workmen: and it will be found, he says, in every sort of trade, that the man who works so moderately, as to be able to work constantly, not only preserves his health the longest, but, in the course of the year, executes the greatest quantity of work.

Although the variations in the price of labour not only do not always correspond with those in the price of provisions, but are frequently opposite, we must not, upon this account, imagine that the price of provisions has no influence upon that of labour. The money price of labour is necessarily regulated by two circumstances; the demand for labour, and the price of the necessaries and conveniences of life. The former determines the quantity of the latter which must be given to the labourer; and the money price of labour is determined by what is requisite for purchasing this quantity. Though the money price of labour, therefore, is sometimes high, where the price of provisions is low, it would be still

higher, the demand continuing the same, if the price of provisions were high. It is because the demand for labour increases in years of sudden and extraordinary plenty, and diminishes in those of sudden and extraordinary scarcity, that the money price of labour sometimes rises in the one and sinks in the other. The increase in the wages of labour necessarily increases the price of many commodities, by increasing that part of it which resolves itself into wages, and so far tends to diminish their consumption both at home and abroad. The same cause, however, which raises the wages of labour, the increase of stock, tends to increase its productive powers, and to make a smaller quantity of labour produce a greater quantity of work. The owner of the stock, which employs a great number of labourers, necessarily endeavours, for his own advantage, to make such a proper division and distribution of employment, that they may be enabled to produce the greatest quantity of work possible. For the same reason, he endeavours to supply them with the best machinery which he or they can think of. There are many commodities, which, in consequence of these improvements, are produced by so much less labour than before, that the increase of its price is more than compensated by the diminution of its quantity.

Labour is distinguished by Dr. Smith into productive and unproductive: the former is that which adds to the value of the subject upon which it is bestowed; the latter is that which has no such effect. Thus, the labour of a manufacturer adds, generally, to the value of the materials upon which he works, that of his own maintenance, and of his master's profit. The labour of a menial servant, on the contrary, adds to the value of nothing. Though the manufacturer has his wages advanced to him by his master, he, in reality, costs him no expence, the value of these wages being generally restored, together with a profit, in the improved value of the subject upon which his labour is bestowed. But the maintenance of a menial servant never is restored. A man grows rich by employing a multitude of manufacturers; he grows poor by maintaining a multitude of menial servants. The labour of some of the most respectable orders in the society, is, like that of menial servants, unproductive of any value, and does not fix or realize itself in any permanent subject, or vendible commodity, which endures after the labour is past, and for which an equal quantity of labour could afterwards be procured. The sovereign, for example, with all the officers, both of justice and war, who serve under him, the whole army and navy, are unproductive labourers. They are the servants of the public, and are maintained by a part of the annual produce of the industry of other people. Their service, how honourable, how useful, how necessary soever, produces nothing for which an equal quantity of service can afterwards be procured. The protection, security, and defence of the commonwealth, the effect of their labour this year, will not purchase its protection, security, and defence for the year to come. In the same class must be ranked some both of the gravest and most important, and some of the most frivolous professions: churchmen, lawyers, physicians, men of letters of all kinds, players, buffoons, musicians, opera-singers, opera-dancers, &c. like the declamation of the actor, the harangues of the orator, or the tune of the musician, the work of all of them perishes in the very instant of its production. Both productive and unproductive labourers, and those who do not labour at all, are all equally maintained by the annual produce of the land and labour of the country. This produce has certain limits; and according as a smaller or greater proportion of it is in any one year employed in maintaining unproductive hands, the more in the one case and the less in the other will remain for

the productive, and the next year's produce will be greater or smaller accordingly; the whole annual produce, if we except the spontaneous productions of the earth, being the effect of productive labour. This produce naturally divides itself into two parts: one of these parts, and frequently the largest, is destined for replacing a capital, or for renewing the provisions, materials, and finished work, which had been withdrawn from a capital; the other for constituting a revenue either to the owner of this capital, as the profit of his stock, or to some other person, as the rent of his land. This is the case with respect both to the produce of land and of a great manufactory. The part of the annual produce of the land and labour of any country, which replaces a capital, never is immediately employed to maintain any but productive hands; it pays the wages of productive labourers only. That which is immediately destined for constituting a revenue either as profit or as rent, may maintain indifferently either productive or unproductive hands. The rent of land and the profits of stock are every where the principal sources from which unproductive hands derive their subsistence. And, therefore, the proportion between the productive and unproductive hands depends very much upon the proportion between that part of the annual produce, which, as soon as it comes from the ground or from the hands of the productive labourer, is destined for replacing a capital, and that which is destined for constituting a revenue, either as rent or as profit. The latter part is not only much greater in rich than in poor countries, but bears a much greater proportion to that which is immediately destined for constituting a revenue, either as rent or as profit. The funds destined for the maintenance of productive labour are not only much greater in the former than in the latter, but bear a much greater proportion to those which, though they may be employed to maintain either productive or unproductive hands, have generally a predilection for the latter. The proportion between these different funds necessarily determines in every country the general character of the inhabitants as to industry or idleness. The proportion between capital and revenue seems every where to regulate the proportion between industry and idleness. Wherever capital predominates, industry prevails; wherever revenue, idleness. Every increase or diminution of capital, therefore, naturally tends to increase or diminish the real quantity of industry, the number of productive hands, and consequently the exchangeable value of the annual produce of the land and labour of the country, the real wealth and revenue of all its inhabitants. See on this subject Smith's Causes of the Wealth of Nations, passim.

LABOUR, in *Midwifery*. By the term labour is meant the act of detaching a fœtus or child from the uterus; and during the time this process is going on, the woman is said to be in labour. The exertion or efforts used by the woman, or any other animal, in effecting the expulsion of the fœtus, are called labour pains, or *throes*, a Saxon word, meaning suffering or enduring.

Labour pains return at intervals of longer or shorter duration. In the commencement of labour, the pains only recur once in an hour or two; but as the labour advances, the return of the pains becomes more frequent; and at length they are almost continual, one pain being scarcely finished when another begins: but in this there is a great variety, not only in different women, but in the same woman in subsequent labours.

The immediate or exciting cause of labour is the existence of a fœtus, with its placenta and membranes, in the uterus, now ripe, and fit for exclusion.

Physiologists have in vain attempted to explain why the  
uterus

uterus should bear the burthen of the ovum until the contained fœtus has arrived at its maturity, and should then attempt its expulsion. The most general and prevailing opinion has been, that the fœtus having acquired sufficient size and strength, and finding itself pressed upon, and frightened, it labours to free itself from its confinement, and that the pains are occasioned by its kicking against the sides and fundus of the uterus. But as pains equally strong are excited to expel a dead as a living fœtus, or to force away the placenta after the birth of the child, and as the eggs of oviparous animals are excluded by similar efforts, it is plain the fœtus is passive in the business.

If the bulk of the fœtus was in any way instrumental in occasioning labour, then the period of gestation would vary according as the fœtus happened to be larger or smaller, which, we know, is not the case; except when it is disturbed by accidental circumstances, as by falls, hurts, fever, or other diseases. To every animal there is an allotted time for utero-gestation. This law in the economy of nature is so uniformly attended to, that even when the fœtus is contained in one of the Fallopian tubes; or in a sac, in the cavity of the abdomen, at the end of nine calendar months, the time appointed for women to carry their young, exertions for its exclusion are excited, in the same manner as they would have been if it had been contained in the uterus.

When the fruit is ripe, its connection with the parent tree is gradually loosened, and at length it falls to the ground. When the fœtus has acquired that degree of maturity it is intended to attain to in the uterus, the fibres or vessels that connect the ovum, or bag in which the fœtus is contained, become loosened, and are gradually dissolved or broken; and the ovum, now an extraneous body, would, like the fruit, fall or slide through the vagina, if it were not prevented by the straightness of the passage through which it is to pass. It is for the same reason, viz. that they are become extraneous bodies, that abortions of two, three, four, or more months, are excluded soon after they cease to live.

Labours are divided or distinguished by the terms *natural*, *preternatural*, or *laborious*.

Labours are called *natural*, when the vertex of the head of the child presents to the uterine orifice, the face inclining towards the sacrum, the hind-head towards the pubes of the mother; the size of the head of the child being also so adapted to the pelvis of the mother, that the expulsion of it may be effected solely by the powers of nature, or by the pains, and within the space of a few hours.

Labours are called *preternatural*, when any other part of the child than the head presents to the uterine orifice, as the feet, the breech, a shoulder, or an arm. In all these cases, more or less of manual assistance will be required to complete the birth.

Labours are called *laborious* or *difficult*, in which the head of the child presents, but either in consequence of its offering in a wrong position, or with an ear, or the face to the uterine orifice, or on account of its disproportionate size, or from some disease in the os uteri or vagina, or distortion of the pelvis of the mother, it cannot be brought safely into the world, without great difficulty, or without the assistance of instruments.

*Progress and Management of a natural Labour.*—Two or three weeks before the completion of the term of gestation, the abdomen of the pregnant woman is observed to subside, and become less prominent; there is a secretion of mucus from the glands of the vagina, and perhaps from the cervix uteri. This serves to soften and relax the passage, and to render it more easily dilatate. The uterus sinks gradually lower into the pelvis, and the os externum is fre-

quently, from this cause, in a small degree thrust outward. In some women, slight pains, recurring every three or four hours, are excited in the course of this process; and milk flows from the breasts. These preliminary symptoms occur, but perhaps in a less degree, in preternatural and laborious, as well as in natural labours.

The term of gestation being completed, the fundus uteri begins to contract, and to propel the fœtus downwards, by which the labia of the os internum, called also os tinæ, are stretched, made thin, and at length forced open, at first to the size only of a sixpence, or so as scarcely to admit the end of the fore-finger of the assistant, if he should happen to examine the woman at this time. This advance in the labour is usually announced by the discharge of a thicker mucus than what had been discharged before, and often tinged with blood, effused probably by the small vessels which had contributed to connect the membranes to the cervix uteri. This discharge of mucus tinged with blood is by the women called a *show*.

Though it may be proper, and is usually expected, that the accoucheur or midwife should examine into the state of the uterus, early in labour, by passing the fore-finger of his right hand, anointed with lard, into the vagina, in order to discover what part of the child presents to the os uteri, and to repeat the examination every hour or two, to ascertain the progress of the labour; yet having found it is the head of the child that presents, and that there is no unnatural obstacle to the birth, he must be careful to do this in so gentle a manner as to give no pain to the woman; and he is on no account to attempt to hasten the dilatation of the os internum, or any part of the passage, that being only safely to be done by the natural pains.

By the continuance of the uterine contractions, aided by that of the diaphragm and muscles of the abdomen, the orifice at the womb becomes more and more thin and dilated, until it is sufficiently open to admit, during the pains, a portion of the membranes, filled with the liquor amnii, or fluid in which the fœtus is suspended. This bag, which is gradually enlarged, contributes materially in opening the uterine orifice, until it becomes sufficiently extended to admit the vertex of the head of the child, when it usually bursts, and the contained fluid rushes forth generally with violence. The women call this the *breaking of the waters*, and they expect the birth of the child will soon follow; and if the business has been entirely left to the agency of the pains, this usually happens in the space of one or two hours.

After the bursting of the membranes, there is usually a suspension of the pains for the space of ten or fifteen minutes, when they are again renewed, and the head of the child is forced down, until it presses against the perineum and the os externum, or outward orifice. In descending to this position, the head of the child makes a half turn, to bring the forehead to the sacrum, the hind-head to the pubes of the mother. The perineum of the woman becomes now so much distended, that the distance from the edge or frænum of the os externum to the anus amounts to three inches, or more. The pains now become more strong and frequent, distending and enlarging the os externum, until it is sufficiently opened to allow a passage for the head of the child, which is at length forced into the world, when it is usual to say the head of the child is born. The pains are now again suspended for the space of ten or fifteen minutes, during which time the fundus uteri gradually contracts, until it comes again into contact with the breech of the fœtus. Two, three, or more pains are required to expel the shoulders; and as many more to bring the re-

mainder of the body of the child into the world. The child being born, the woman now enjoys a degree of happiness, of which, if it be her first child, she had never been conscious before. But her trouble is not completely over; for at the end of fifteen, twenty, or a few more minutes, fresh pains arise, but not so violent as those she had before experienced. By these the placenta is gradually loosened from the uterus, and thrust down into the vagina, and at length expelled from the body.

After the birth of the child, but particularly after that of the placenta, there is a considerable discharge of blood, particularly from the placenta, but, principally, from the uterus. This is called the lochia, and it continues flowing, in greater or less plenty, for five, six, or more days; diminishing every day in quantity, and becoming thinner and paler, and is at length colourless. This is occasioned by the gradual contraction of the vessels of the uterus, which continues until that viscus is reduced to nearly the size it was before the woman conceived.

With first children, and, in a few instances, with subsequent births, this contraction of the uterus goes on almost imperceptibly to the woman, more ordinary pains are excited, similar to labour pains, and are called *after-pains*. As they are not attended with danger, and generally subside, and entirely cease by the end of three or four days, it is not often found necessary to attempt appeasing them by medicines; but when they are unusually frequent and violent, preventing sleep, they may be quieted by opening the bowels with some purging medicine, as castor oil, an infusion of fenna, with some of the neutral salts, or by an emollient and opening clyster, and at night giving a draught with ten, fifteen, or twenty drops of the tincture of opium.

The above is the usual progress of a natural labour, but there is a great variety in the number, strength, and frequency of the pains required for the expulsion of the child in different women, as well as in the time taken in completing the labour, which in some women is effected in a few minutes, and with very little pain; more ordinarily, it takes from two to six, eight, or ten hours. In some cases, when the pains are tardy, the term may be extended to twenty-four hours. If delayed beyond that time, the labour will be denominated laborious or difficult, as some assistance will be required to hasten the birth, lest the soft parts of the mother should be hurt, or the strength of the child exhausted, by its too long continuance in a straitened situation.

During the progress of the labour, the woman is to be allowed to be sitting, walking, or lying down, as she feels herself most disposed. The friends about her, and perhaps the nurse, generally advise her to hold in her breath, and to press down as strongly as she can with every pain, and to enable her to do this, they are incessant in offering her caudle, or other heating drinks. But these things are not only unnecessary, but likely to do mischief. The accoucheur or midwife will therefore interpose his advice. They must take care to keep the room cool, and not permit more than one or two of the friends of the woman to be in the room together. They may assure the parturient woman, that the pains are of themselves sufficient for the expulsion of the child, and that by endeavouring to increase their force, she will only unnecessarily fatigue herself; and that by taking warm spiced drinks, she will become hot and feverish, the parts will become more irritable and tender to the touch, whence she will indeed suffer more pain, but the birth of the child, instead of being accelerated, will be retarded, and rendered more difficult.

To assuage her thirst, if that should be troublesome, toast

and water, baum-tea, or any similar beverage, will be much more useful than wine or other heating drinks.

If she is costive, and feels uneasy from that cause, an emollient and gently opening clyster may be advantageously administered. When the pains become more strong and frequent, and from the complaints of the woman it is apparent that the head of the child is fast descending, it will then be proper that the woman be laid on the bed, either on one side or at the foot of it, according as the nurse has arranged it. The usual and most convenient posture for the woman is, that of lying on her left side, her head and shoulders raised, her knees drawn up to her belly, and with her feet supported on the knees of an assistant, or pressing against the bed-post. She is now to be covered with such a portion of the bed-clothes, as the season of the year, or the temperature of the air, may seem to render necessary. The accoucheur will sit down behind her, and taking advantage of a pain, he will introduce his fore-finger into the os externum, which, if the labour is as far advanced as has been supposed, he will find on the full stretch, and the perineum much distended. This is the only part in which the assistant need or ought to give any manual assistance in a natural labour. It will now be his duty to endeavour, with the greatest care and diligence, to prevent a rupture of the frænum, and of the perineum, which may happen if the head of the child should be allowed to pass into the world with too much rapidity. This distressing accident, which, when the rupture is considerable, extending to the anus, is hardly remediable by any art, rarely happens but with a first child, nor often perhaps with first children, but when means have been used, early in labour, to accelerate the birth. With the view of preventing it, if, on examination, the os externum and the perineum shall be found to be strongly pressed upon, and distended during the pains, and yielding with difficulty, the accoucheur must seriously admonish the woman to moderate her exertions, assuring her, at the same time, that the child will speedily be born. During the pains he must surround the part of the head of the child which protrudes, or is in the world, with the fingers and thumb of his right hand, the points of them resting on the edge of the os externum. In this position, the end of his thumb will touch the frænum, the part likely to give way first. If he finds that part too much distended as to be in danger of bursting, he will resist the further descent of the head during the pain. This operation will be assisted, by keeping his left hand, covered with a cloth, firmly pressed upon the distended perineum. When one-half of the head of the child has, by this cautious procedure, been conducted into the world, the accoucheur will find the occiput of the child rising upwards, turning on the pubes of the woman, and drawing the forehead and face from under the perineum. The head of the child being born, it is usual with midwives to draw the shoulders and the rest of the body soon after. But experience has shewn, that it is safer and better to wait for the return of the pains, as during the suspension of them, which lasts, as has been before mentioned, fifteen or twenty minutes, the fundus of the uterus contracts and descends until it comes again in contact with the breech of the child. By this means the sinuses and vessels of the uterus are gradually emptied, and diminished in size, whence one of the causes of inordinate hæmorrhage is removed, at the same time the placenta is loosened and prepared for its exit. The first two or three pains occurring after the birth of the head of the child, are usually expended in giving a favourable turn to the shoulders, *viz.* in bringing one of them to the pubes, and one to the sacrum of the mother; they are then gradually forced into the world, and soon after the rest of the body

the accoucheur using the same precautions in supporting the perineum, as has been recommended during the passage of the head.

The child usually announces its birth, by crying more or less violently according to its strength. This serves to open the vessels, and to facilitate the circulation of the blood through the lungs. The child may be allowed to lie some minutes under the clothes, before separating it from the placenta, taking care that none of the clothes lie upon its face, which might impede its respiration. In that interval the assistant will lay his hand upon the abdomen of the mother, which, if there should be another child, he will find nearly as much distended as it was in the commencement of the labour. In that case, it will be necessary, having previously disposed of the first child, that he make a ligature on the end of the funis, which hangs out of the vagina of the woman, but he is on no account to make any effort to bring away the placenta or membranes, which are usually found to be adherent to those containing the twin. As soon as the pains re-commence, which they usually do at the end of three or four hours, (though sometimes they do not return until six, eight, ten, or more hours,) the accoucheur will pass the fore-finger of the right hand into the os uteri, to discover the position of the fœtus. If the head presents, he will conduct the labour in the manner above described, but as the parts have been previously completely opened, there will be less difficulty to the woman, and less danger of any accident happening to the perineum. If the face, or any other part than the head of the child should present, it will be necessary that he immediately proceed to turn the child, and deliver it by the feet, in the manner to be described under the article *LABOUR, Præternatural*. If there should not be a second child, the abdomen, particularly the upper part of it, will be found loose and flaccid, and the accoucheur will perceive the fundus uteri contracted to the size of the head of a child.

The more the uterus is contracted, and the lower it is sunk down in the abdomen, with so much the greater ease and safety the placenta will be expelled. The assistant will now make a ligature upon the funis umbilicalis, or navel-string, about five inches from its insertion into the navel of the child, and having done this he will, with a sharp pair of scissors, divide the navel-string, about an inch beyond the ligature, leaving the other end of the funis hanging out of the vagina. Having then examined the child to see that it is perfect, and that no blood escapes through the ligature or the funis, he will place it in a proper receiver (a flannel cap being first put upon its head) and deliver it to the nurse. By this time, or soon after, the woman will have a bearing pain, pressing down the placenta, or perhaps, at first, only forcing away a clot of blood. During this and subsequent pains, the assistant will aid their effect, by drawing down the funis. If, after waiting twenty or thirty minutes, the placenta should not come away, he will pass his fingers, or, if necessary, his hand, into the vagina, until he gets hold of the placenta, and by this means he will usually easily extract it. It sometimes happens, though rarely, if the labour has been properly conducted, that the cervix of the uterus contracts, and prevents the descent of the placenta, and sometimes the placenta continues adherent to one side, or to the fundus of the uterus, long after the birth of the child. In either case, the accoucheur must pass one of his hands, gradually and slowly up into the uterus, until it reaches the placenta, when the fingers, and by degrees the whole hand, must be insinuated between the placenta and the uterus, until it be completely separated; it must then be brought down to the vagina, whence it will be easily extracted by the funis.

In this case the discharge of blood will be sometimes so great, as to endanger the life of the woman. This accident rarely happens but when the birth has been improperly and preposterously accelerated, by giving assistance, as it is called, in the early part of the labour; that is, by dilating the os internum and vagina during the pains, to make room for the head of the child to come down; by giving the woman hot and stimulating drinks to increase the pains, and by advising her to bear down strongly during the pains. As the uterus may from exhaustion have become torpid, and not disposed to contract, so as to lessen the capacity or size of the blood-vessels, large flannels wrung out of cold water, to which about a fourth part of vinegar has been added, should be laid over the abdomen, and over the os externum of the woman. These applications must be renewed every five or six minutes, or as often as they become warm, and they will usually have the effect of exciting the action of the fibres of the uterus, on which the cure entirely depends. In the mean while the woman is to be kept, if practicable, in a quiet and easy posture, her head only moderately raised, and covered with a single blanket, the door, or one of the windows of the room being opened, and every five or six minutes she should take a spoonful or two of a mixture, consisting of six ounces of distilled water, half an ounce of spirit of nutmegs, as much syrup of red poppies, fifteen drops of the tincture of opium, and as much of the vitriolic acid as will make it grateful to the palate. By these means the heat of the body will be diminished, and the rapidity of the circulation checked. When the pulse, which was scarcely to be perceived while the discharge was violent, begins to acquire strength, and on examination it appears that little or no blood now flows from the vagina, the cold and wet cloths may be removed, the proper clothes may be put upon the woman, and she may then be placed in the bed in such a position as may be most agreeable to herself.

The process by which a child is produced, or brought into the world, is with great propriety called *labour*, as it is rarely effected without considerable exertion, which has the usual effect, that of exhausting the strength and spirits of the woman. These are to be recruited in the same manner as if the waste had been occasioned by any other kind of exercise; *viz.* by rest, and by taking a moderate portion of plain and simple food at small intervals. In the choice of their food, the women may generally be allowed to consult their own tastes, which will rarely, at such times, incline them to spiced meats, or to drinks that are heating. It will be proper that they be kept in a recumbent posture for the first four or five days, only leaving their beds so long as may be sufficient to open and refresh them. By that time the vessels of the uterus will be so much contracted, as to remove all danger of hæmorrhage, or of an inconvenient descent of that viscus, which is sometimes the consequence of leaving the bed too early. It is proper also, on the second, or at the latest, on the third day after being delivered, to procure stools, either by such purging medicines as have been before described, or by giving a clyster. By this means the fever which is usually excited by the secretion of the milk will be moderated. This, which is called the *milk-fever*, is of short duration, lasting only three or four days, and is not attended with danger. In the cure nothing is required but to keep the body open, and to supply the patient with diluting drinks, taken warm, with the view of inducing a gentle perspiration. The child should be put to the breasts a few hours after the completion of the labour, that it may get some mouthfuls of the thin whey-like fluid which is at first secreted. This will stimulate its bowels, and enable them to discharge the meconium, or black  
viscid.

viscid excrements with which they are always filled. It will also keep the breasts of the mother from being too much distended, the pain occasioned by which, if it is not the cause, yet it certainly tends to increase the milk-fever.

But there is another fever to which women are at this time subjected, which is attended with considerable danger, and which not infrequently proves fatal. It is called, from an opinion that it is peculiar to this state, the *puerperal-fever*. Its commencement is almost always marked by a strong shivering fit, which is followed by a quick pulse, head-ache, lassitude, and dejection of the spirits. It sometimes makes its attack during the labour, more frequently on the next or subsequent day. It is sometimes mistaken for the milk-fever, but besides that its attack is earlier than that of the milk-fever, which never comes on until the third day after delivery, the secretion of the milk is in this fever interrupted, and the breasts, instead of being full and turgid, remain flaccid. From after pains, with which it is sometimes confounded, it is to be distinguished by the quickness of the pulse, arising very soon to 120 strokes in a minute, by the head-ache, nausea, and other concomitants of fever. Tenderness of the abdomen, increasing to extreme soreness and pain, soon come on, which are increased by drawing in the breath, and are rendered almost intolerable by coughing. As there is always a high degree of inflammation of the peritoneum present in this fever, and perhaps of some of the contained viscera, we cannot be too early in taking away eight, ten, or twelve ounces of blood from the arm, according to the strength of the patient. If the abdomen appears distended, attended with soreness and pain, six or eight leeches may be advantageously applied to that part, which may be afterwards fomented with flannels wrung out of a decoction of camomile and marsh-mallows moderately heated, and then covered with a poultice made with linseed-meal. A draught with infusion of fenna and some neutral salt may be given to procure two or three stools. The bowels may afterwards be kept open, and the pain relieved by giving a drachm of purgmg salt with two or three drops of the tincture of opium, in a sufficiency of water to dissolve the salt, every two or three hours. There are few cases that will require or bear a repetition of the bleeding. If, however, the pulse should appear to be strong, and the pain, with the difficulty in breathing, require it, that may be done on the second or third day, and a blister may be applied over the part of the abdomen which is most distended. A blister applied to the nape of the neck, succeeds remarkably in relieving the pain of the head. There is rarely delirium, at the least not to any considerable degree, attending this fever. The patient should be nourished with light broths, panada, and such like mild food, and drink barley-water, gruel, baum-tea, toast and water, or, where preferred, table-beer. By persisting in the use of these remedies, the fever is frequently subdued by the end of four, five, or six days, when recourse may be had to a light decoction or infusion of Peruvian bark, Colombo, or some other tonic taken twice in the day to recruit the strength. Too often, however, these and all other means that have been devised prove insufficient, and the patient dies, sometimes as early as the third or fourth day; at others, not until the sixth, eighth, tenth, or twelfth day. Puerperal fever is by no means to be considered as solely the consequence of tedious and difficult parturition; it full as often makes its attack after natural, easy, and expeditious labours, on which account it was thought proper to delineate the history and treatment of it here, rather than at the end of this dissertation.

Puerperal fever occurring in lying-in-hospitals, or where a

great number of sick or wounded persons are confined, at some times, that is, under certain dispositions and temperatures of the atmosphere, becomes infectious, almost every person delivered in the ward where the fever rages partaking of it in a greater or less degree. At such times, a larger proportion than usual of those who are delivered in their own houses are subjected to it. When it has made its way into a lying-in ward, the women should be removed, and separated, where it can be safely done, and no more persons admitted until the ward has been well ventilated and purified. It is recommended, that the floors be scoured, the walls and ceilings scraped and lime-washed; that the beds be taken down, and the bed-clothes, and the whole room be exposed to the vapour of burning sulphur, or fumigated with the vapour of the marine or nitric acid. All this may with safety and propriety be done, but experience does not warrant us in saying that they have any effect in extinguishing the fever, which, like the yellow fever, or the plague, does not, it is probable, quit the places where it has made its appearance, until the temperature, or other quality of the atmosphere, to which, perhaps, it owed its origin, is changed.

It sometimes happens that women are troubled with hæmorrhage, or discharges of blood from the uterus, during pregnancy, recurring at intervals of two, three, four, or more weeks. Such discharges happening early, that is, within the first, second, or third month of gestation, usually terminate in *abortion*, which see. When the hæmorrhage makes its first appearance in the fifth or sixth month, or later, if it is not very violent or frequent, the woman may go on to the end of her term. The immediate cause of the discharge is a partial separation of the placenta from the uterus; and it may be occasioned by taking too much exercise, by reaching down any article placed at an inconvenient height, by frequenting assemblies or crowded rooms, by dancing, also by any sudden fright or alarm, or by falls, blows, or other accidents. To whatever cause hæmorrhage may owe its origin, it is only to be restrained, and the ill effects of it to be prevented, by rest and retirement, and by avoiding all occasions of exertion; by keeping the air of the room of a moderate temperature, and using a diet that is plain, simple, and easy of digestion. If colicve, the body should be kept open by the use of mild cathartics, or glysters. When a contrary habit of body prevails, and the patient is disturbed with purging and griping pains in the bowels, a dram of any purging salt dissolved in two or three spoonfuls of water, with three or four drops of the tincture of opium, given every two or three hours, rarely fails of appeasing the tumult, and of restraining the hæmorrhage. But though the discharge may by these means be checked, it will return on the commencement of labour; on which it will have so much influence, that even when the presentation of the child should be such as to bring it under the class of natural labour, yet it will be necessary, in conducting it to its termination, to deviate considerably from the rules that have in those cases been recommended.

On examining, it will be found that the os uteri, in the earliest stage of the labour, is more open, soft, and yielding, than in ordinary cases; the pains are also generally less bearing and efficient. It will therefore be proper to assist in dilating the opening, by gently moving the end of the fore-finger round its edge. If it is the head of the child that is coming down, which will be easily perceived through the membranes, and the discharge of blood is not constant, or very considerable, it will be best to let it come in that posture; continuing, at intervals, to assist in dilating the os uteri. When that orifice is completely dilated, so as to ad-

mit the head of the child, the membranes may be opened, by scratching them with the nail of the fore-finger, that the waters may be discharged. This will enable the uterus to contract, and press the placenta against the head or body of the child, and so stop the further effusion of blood. The completion of the labour may now be effected by the pains, as in common cases. The placenta being in part detached, usually comes down soon after the birth of the child. If, however, it should be delayed, and the discharge of blood continue, it may be brought away in the manner before described. But when the discharge of blood is so considerable as to endanger the life of the woman, (and this will be the case when the placenta is placed near to, or, as it sometimes happens, part of it lies over the os uteri,) then it will be necessary, even although the child is coming down in a natural posture, as soon as the os uteri is sufficiently dilated, to break the membranes, or to pierce through the placenta, and gradually and slowly to pass first the fingers, and then the whole of the hand through the rupture into the bag, and to take hold of the feet of the child, and bring them down into the vagina. Time must then be given that the uterus may contract, so as to press upon the head and shoulders of the child, when the labour must be completed in the manner described under the next article.

It sometimes happens that, on the bursting of the membranes, the funis umbilicalis or navel-string falls down into the vagina, before the head or other part of the child that presents. In this case, it has been usual to recommend that the prolapsed funis be folded in a piece of soft linen, and returned into the uterus: but experience has shewn, that however carefully this be done, it constantly returns in a few minutes. If the accoucheur should be present at the time of the rupture of the membranes, or soon after, and find a pulsation in the navel-string,—a sure sign that the child is living, he will then, in whatever posture the child may happen to present, treat it as a preternatural labour; that is, he will pass his hand into the uterus, and turn the child, and bring it by its feet: for if the business be left to nature, the pressure on the funis will put a stop to the circulation of the blood, and the child will die long before it would be expelled by the pains.

In some irritable constitutions, the women become convulsed in the course of the labour. This accident more frequently occurs with first than with subsequent children. At whatever time convulsions make their attack, they never completely leave the woman until the labour is over, and sometimes not until the next or subsequent day. In very mild cases, the brain seems but little affected by the convulsions, which partake of the nature of hysterical complaints. These cases are easily curable, or give way spontaneously when the labour is completed. More commonly the convulsions are attended with coma, and other affections, indicating oppression on the brain. These are of more difficult management, and often prove fatal even under the most cautious and judicious treatment. Of whatever nature, or from whatever causes puerperal convulsions may proceed, they assist very much in forcing down the child.

At whatever period or state of the labour the accoucheur may be called in, he will generally find it expedient to take away six, eight, ten, or twelve ounces of blood from the arm; and in the space of two hours after, (unless the child is coming into the world,) this should be followed by a Clyster to empty the bowels. After the operation of the Clyster, from twenty to thirty drops of the tincture of opium may be advantageously given, which will generally succeed in making the fits less frequent and violent. The labour must now be conducted in the same manner it would have

been, if it had not been interrupted by the convulsions. If the child presents in a natural posture, and the pelvis of the woman is of the natural form and dimensions, it will be found that the convulsions have assisted much in dilating the os internum, and in accelerating the completion of the labour. If any other part than the head of the child presents, as soon as the internal orifice is sufficiently dilated, the accoucheur will pass his hand into the uterus, and turn the child, and bring it by its feet. If, on the other hand, the birth of the child should be retarded, rendered difficult, or impossible, without the aid of instruments, from distention of the bones of the pelvis, the accoucheur will use the lever, forceps, or crotchet, whichever shall be required, in the manner directed under the article *LABOUR, difficult*.

*LABOUR, Preternatural.* In all preternatural labours, the descent of the uterus and the dilatation of its orifice proceed more slowly than in natural labours: hence it often happens that the part of the child presenting cannot be distinctly perceived, even though the woman has been several hours in pain. If, therefore, on examining a woman in labour, during a pain, whose pelvis is of a proper form and dimension, no part of the child can be perceived, the accoucheur may be assured that it is some other part than the head that is coming down. Nothing, however, will be necessary to be done in this case, until the child is so far thrust down by the pains, and the os uteri is so much dilated, as to enable him to perceive the presenting part through the membranes, or until, by the bursting of the membranes, and the discharge of a part of the liquor amnii or waters, a part of the child is forced into the pelvis. If the breech, or one or both of the lower extremities are coming down, the operator will leave the expulsion of the child principally to the effects of the pains, only giving the assistance directed under the articles *BREECH* and *FEET Presentations*. But if the shoulder, arm, breast, or any portion of the upper part of the trunk of the child shall be found to have entered the os uteri, by the general consent of practitioners, the child must be turned, and extracted by the feet. To effect this, the accoucheur will immediately, and before the whole of the waters are drained away, pass his hand slowly and gradually into the uterus, until he comes to the feet of the child, which will often be found at or near the fundus, and grasping them in his hand, bring them down into the vagina; then pausing a little while, still holding the feet in his hand, he will, by another effort, bring them through the os externum, or into the world.

\* This operation, if undertaken soon after the bursting of the membranes, will generally be performed with great ease and safety, and with little pain to the woman: but if it be not begun until the waters are entirely evacuated, and the uterus is contracted, and come into close contact with the body of the child, it will require a much greater degree of force to introduce a hand so far into the uterus, as to be enabled to take hold of the feet of the child; and the whole of the delivery will be attended with much more pain, difficulty, and hazard.

From a due consideration of these circumstances, the following practical inference may be drawn, *viz* that whenever, on examining a woman in the commencement of labour, no part of the child can be felt, or, if felt, not so distinctly as to enable the accoucheur to decide whether it is the head that is presenting, he should by no means leave the woman, or be far absent from her, that he may be at hand to turn the child, if necessary, soon after the bursting of the membranes. But supposing this opportunity to have been neglected, or the accoucheur not to be sent for, until nearly the whole of the liquor amnii or waters are drained off, and

the uterus has contracted so as to come into contact with, and strictly to embrace the body of the child, yet, even in these cases, if the pelvis of the woman is of the proper form and dimensions, and the child is not disproportionately large, by proceeding slowly and cautiously in the manner about to be described, the resistance of the uterus may be overcome, and the delivery effected with perfect safety to the mother and child.

*Method of turning a Child in the Uterus, in preternatural Labours, and bringing it by the Feet.*—The woman being laid across the bed, on her left side, with her knees drawn up to her belly, a woman sitting on the side of the bed, to hold her feet, and keep her steady, the accoucheur must introduce, first one, then a second, third, and fourth finger of either of his hands, anointed with hog's lard, into the vagina, which he will gradually dilate, so as to make room for his whole hand, with which he will still further dilate the passage. Then, pausing a little while, until the straining, on the part of the woman, which the introduction of his hand will have occasioned, shall have subsided, he must again push his hand gently upwards, until it has passed the brim of the pelvis and entered the uterus; then, again pausing until the woman ceases to strain down, he must again push his hand upwards in the intervals between the pains or strainings of the woman, until he reaches one or both of the feet of the child, at which time the whole of his arm nearly, to the elbow, will be in the passage.

When the resistance of the uterus has been very great, it sometimes happens that the hand of the operator is so cramped and benumbed, that he has no power to grasp and bring down the feet of the child. In that case, he must slowly and gradually withdraw his hand, and wait some minutes until he has recruited his strength, and the woman is a little refreshed, and then re-introduce the same, or his other hand, with whichever he thinks (from the knowledge he has now acquired of the position of the child in the uterus) he shall be best able to complete the delivery. This re-introduction of his hand he will be able to effect much more easily than before, the uterus being somewhat stretched and loosened by his former effort. He will now sedulously endeavour to get hold of, and bring down, both the feet of the child; but if that is absolutely impracticable, he must be contented with one of them, which he will bring down slowly, and by intervals, as he had introduced his hand. It will sometimes happen that the operator will not be able in this way to bring the foot into the world, the contraction of the uterus around the body of the child being so considerable, as to prevent its turning by any effort he can make in this way. He must then withdraw his hand, and, after recruiting his strength, return it again into the vagina, with a noose or fillet over it, until he has got hold of the foot of the child, and then, with the fingers of his other hand, push up the noose until it passes the ankle of the child, by which means he will have a double purchase; then drawing down with the end of the fillet that hangs out of the vagina with one hand, and with the other grasping and pulling down the foot, he will usually, in a few minutes, succeed in bringing the leg of the child through the external orifice.

The operator may now again pass his hand up into the uterus to search for the other foot of the child, and bring it also down; or, not succeeding in this attempt, he will wrap the leg that is in the world in a soft cloth, and draw it downward steadily with both his hands, and with sufficient force to bring the breech of the child into the vagina. He will now pause a few minutes, both to allow the woman to recover her strength and spirits, and to give time for the uterus to contract, and come again in contact with the head and

trunk of the child; then, renewing his efforts, he will continue drawing down the thigh, until the breech has freed the external orifice. He must now examine the posture of the child, and if the fore-part of the child lays to the pubes of the mother, he will turn it round to the sacrum; then taking hold of the breech with both his hands, he will continue drawing downward steadily, at the same time moving it from side to side, until the whole of the body is born; he will then pass a finger first along one, and then the other arm of the child, to the joints of the elbows, and draw them down, and if the child be now living, which may be known by a pulsation being felt in the navel-string, he will hasten the birth, drawing down steadily and strongly by the shoulders. If he finds much resistance, with a view of accelerating the birth of the head, he must pass the fore-finger of his left hand along the back part of the vagina to the mouth of the child, and draw down the under-jaw, at the same time that he extracts by the shoulders with his right hand. The child being born, he will complete the delivery, in the manner directed under the article *LABOUR, Natural*.

Some writers and teachers of midwifery are very particular in prescribing the posture in which the woman should be placed as most convenient for the operator in turning a child, which they think should vary according to the position of the child in the uterus, as whether the face or fore-parts of the child be turned to the back, belly, or one of the sides of the mother; they also, from the same circumstances, determine which hand will be most proper for the accoucheur to use in performing the operation. But as the exact position of the child can rarely or never be known until the operator has actually introduced his hand into the uterus, there seems no necessity for embarrassing him with regulations of this kind. The most convenient posture will generally be found to be that in which women are usually placed in a natural labour, and, as has been now described, *viz.* lying on her left side, with her knees drawn up towards her belly, her feet in the lap of an assistant. In respect to which hand the operator should use, he will be guided by circumstances, or by his habit or custom: most persons using one of their hands more dextrously than the other. The most important rule is, that the whole operation be performed slowly and gradually. Other writers have advised that we by no means attempt to turn a child in the uterus, so long as the woman continues to have pains, lest the uterus should be ruptured. But as, at every pain, the uterus contracts, becomes thicker, embraces the body of the child closer, as well as thrusts the presenting part lower into the pelvis, it is evident that by waiting the difficulty of performing the operation will be increased. It will be sufficient, in addition to what has been said of the necessity of proceeding slowly and leisurely, to warn the operator only to push his hand on in the intervals of the pains.

It was supposed, by the early practitioners of midwifery, that when an arm of the child presented, and became considerably swelled, which it always is, when it has continued long in the vagina, that it so filled up the passage, as to add very much to the difficulty of passing a hand into the uterus, and sometimes even rendered it impossible to be done, until the arm was removed; and, accordingly, it was pretty much the practice in the beginning of the last century, first to attempt returning the arm into the uterus, but as that was rarely or never practicable, it was usual in these cases to make an incision through the integuments, under the arm-pits of the child, with a pair of scissors, or a scalpel, and then twist off the limb; and in this mutilated state the children were sometimes born alive. This practice has long since been abolished; experience having shewn, that the obstacle

obstacle opposed by the tumid arm is very inconsiderable, only affecting the first part of the operation, and by perseverance is easily overcome.

We have been lately told, by a practitioner of eminence, that when an arm or shoulder presents, and, by the continuance of the pains, has been thrust so low into the pelvis, that it is absolutely impracticable to turn the child (where the pelvis of the mother is too narrow to admit the hand of the operator, we presume the writer means), that by passing a blunt hook over the neck of the child, and drawing down strongly to separate the vertebræ of the neck, and then twisting the hook round, the integuments of the neck will break, and the head be dissevered from the body, which may afterwards be drawn away with the crotchet. From the facility with which this operation is said to be performed, it is to be feared, that persons of less skill and sagacity than the writer here alluded to, may be tempted to try the experiment on children supposed to be dead, but which are not so, or when there is sufficient room in the pelvis to bring away the child without mutilating it, and thus some lives be lost that might otherwise be preserved. This operation, therefore, should never be performed but in consultation.

It has in a few cases happened, when an arm or shoulder presents and enters first into the pelvis, and the woman has been neglected, or the assistant, not being called in time, was not able to turn the child, that by the continuance of the uterine contractions, or pains, the breech has been gradually forced down, the head and shoulders receding and mounting upwards, and in this posture, *viz.* breech foremost, the child has been expelled. This turning of the child in the uterus, by the sole agency of the pains, has been called by Dr. Denman the spontaneous evolution of the fœtus, and it has sometimes happened, we are told, that the child has, in this way, come into the world alive. It is well, as Dr. Denman justly observes, to know these facts, as in some extreme cases it may afford consolation both to the patient and the attendant; but the excitement of the uterus must be very great indeed to induce a practitioner, who regards either his fame or his feelings, to trull to such an event, as in a great majority of cases the child would be lost, and not uncommonly the woman would lose her life also.

It sometimes also happens, in cases where the arm, shoulder, or breast of the child presents, and the expulsion of it has been left entirely to the pains, that at the end of many hours, or of two or three days continued labour, the child becomes soft and putrid, and instead of making the evolution described, is thrust down through the pelvis, and into the world doubled, the head lying on the breast or back, and yet the woman has survived.

This, however, is rather to be expected in premature births, that is, when the woman is only advanced five, six, or seven months in pregnancy. At these periods, particularly at the two first, it will generally be right to let the fœtus come into the world in whatever posture it may present; as both the limbs of the fœtus are then too tender to bear any considerable degree of force or extension, and the capacity of the uterus is too straight to admit the introduction of the hand of the operator to turn the fœtus, and deliver it by the feet.

Labours of the third and last class are those which are called *difficult* or *laborious*. These vary much in degree, according as the causes vary. When the difficulty is solely occasioned by a mal-presentation of the head of the child, as when it offers by its face, or by one ear, the head will be frequently forced down in that posture by the pains, and very little more assistance will be necessary than what is given

in natural labours, from which it will only differ by its requiring a greater number of pains, and taking up a longer space of time for its completion. The same will happen when the birth is retarded by a disproportion between the head of the child and the pelvis through which it is to pass; that is, when a woman whose pelvis is small, but perfect in its form, produces a large child, or when the head of the child is more than usually ossified. By the continued force of the pains, the bones of the heads of the generality of children, which do not ordinarily meet, or come in contact with each other, will be pressed together until they ride, or lap one over the other, and sometimes until the head assumes a conical form, the vertex being the apex or point of the cone, and in this state it will come into the world. The midwives are accustomed to call the heads of children that have been so pressed, and altered in their shape, mould-flot heads, or horse-shoe moulds, and are busy, when dressing the children, in forcing the bones back into their places. But this is not necessary, the heads never failing, in time, to assume their proper figure. Children who have been subjected to such a degree of pressure as to occasion an alteration in the shape of the skull, should they be born alive, will generally be found to be so much weakened by the injury they have suffered, as not to be preserved without great care and difficulty.

It has here been supposed, that the expulsion of the head of the child has been left, as in natural labours, to the power of the pains, which will generally be sufficient for the purpose; but this will not happen, in some cases, until, by the long detention of the head of the child in the passage, the soft parts of the woman shall be so bruised and injured, by the pressure they have suffered, that suppuration or mortification of the vagina shall ensue, penetrating into the bladder, or rectum, and sometimes into both, making the vagina the common channel for the urine and the stools. To avoid these distressing accidents, which, when they occur, admit no remedy, or are only in a small degree alleviated by time, various contrivances have been invented to bring away the head of the child, when it is enclavé, or fixed in the pelvis, earlier than it would be forced away by the pains. Those which have been preferred, and which are now almost universally used, are the forceps, the invention of Dr. Hugh Chamberlen, and the lever of Roonhuyzen, (see the articles *FORCEPS* and *LEVER*), the time and manner of using which will now be described.

In all cases requiring the assistance of instruments to complete the delivery, the progress of the labour will be found, from its commencement, to be slower than in those labours which are denominated natural. The observation of this circumstance will induce the practitioner to be careful that the woman be kept cool, and that no efforts be used to accelerate or strengthen the pains; that she be encouraged from time to time to void her urine; that her bowels be kept open by clysters, or by giving her a gently purging medicine, and that ten or twelve drops of the tincture of opium be given at night to procure sleep. By these means, (which must be pursued the second day also if necessary,) her strength will be preserved, and she will be enabled to meet the difficulties she will have to encounter. Before the end of the second day it will generally be found that the os uteri is completely dilated, that the basis, or largest part of the head of the child, has been forced into the brim of the pelvis, that the membranes have burst, and that the greater part of the waters has been discharged. At this period, as if nature was tired with the conflict, the pains usually remit, both in frequency and strength; it now, therefore, becomes necessary to watch over the safety of the woman, and if, at the end of two or

three hours, the head continues still unmoved, to proceed, (having previously informed the woman and her friends of your intention,) to the use of the proper means for expediting the delivery.

*Manner of using the Forceps.*—Having laid the woman on the bed, in the usual position, the accoucheur will sit down behind her, and will introduce two or three fingers of his right hand into the vagina, and continue pushing them gently upwards, until he feels an ear of the child, which will generally be found under, or near, the os pubis; he will then take a blade of the forceps, previously anointed with lard, and introduce it between his fingers, and the head of the child, continuing to push it upwards until it pass over the ear, and so on until the whole of the blade is in the vagina; he will then withdraw his fingers, and raise the handle of the forceps towards the pubes of the woman, while he introduces the second blade in the same cautious manner, directly opposite to the first. He will then bring the handles together, and lock them, and that they may not slip, he will confine the handles together with a handkerchief, or any appropriate ligature. It generally happens, that the force used in applying the forceps gives fresh strength to the pains. During each pain the accoucheur will slowly, and gradually, draw the handles of the forceps downwards, with his right hand, moving them, at the same time, from side to side, keeping his left hand against the perineum of the woman, which he will, through the whole process, carefully guard, to prevent, if possible, its being ruptured, an accident more likely to occur in first, than in subsequent labours. Having in this cautious manner extracted the head of the child, the remainder of the delivery will be conducted as directed under the article LABOUR, *Natural*.

Many practitioners in these cases prefer the use of the lever, which may be considered as a blade of the forceps, and is to be introduced into the vagina between the fingers of the accoucheur and the head of the child, as before directed, and pushed on until it passes over the ear of the child, that lies under or near the pubes of the mother. The accoucheur will then withdraw his fingers from the vagina, and grasping the handle of the lever with his right hand, he will, during every pain, raise it over the pubes, guarding the perineum with his left hand, and continue this movement from time to time, until the head of the child is brought into the world. The plain and simple form of this instrument, and the greater facility with which it is used, have given it a deserved preference over the forceps. For a fuller account of the manner of using the forceps and lever, and for an account of their comparative merit, the reader is referred to Dr. Denman's valuable Introduction to the Practice of Midwifery, and for the history of the invention of the instruments, to Dr. Bland's Account of the Invention and Use of the Lever of Roonhuysen, published in the second volume of Medical Communications, in the year 1790. It is proper to observe, that in all cases in which it becomes necessary to have recourse to the use of instruments to finish the delivery of the child, and, in fact, in all lingering labours, the operator should pay particular attention to the state of the urinary bladder, and if the urine has been suppressed, he must draw it off with a catheter, before he begins to operate.

In the cases that have been described, where the labour has been retarded, and rendered difficult by the causes above enumerated, the methods recommended will generally be found to be competent to bringing it to a conclusion, without occasioning much injury to the mother or to the child. But when the obstacle arises from distortion of the bones of the pelvis of the mother, altering the shape of the pelvis,

and diminishing its capacity, means must then be used to lessen the volume or bulk of the head of the child, otherwise both the mother and child must inevitably perish. The persons in whom this defect in the pelvis is found, are usually short and delicate women, whose growth had been checked in infancy by the rickets, or who had been confined, too rigidly in their youth, to a sedentary posture, in order to acquire a proficiency in music, drawing, or some other accomplishment, and had therefore been prevented taking that portion of exercise in the open air, which is necessary for the growth and strength, as well as for the health of the body.

When called upon to attend a person labouring under this infirmity, the accoucheur will find, on examining, the lower vertebra of the loins, and the upper portion of the sacrum, projecting forward, so as to prevent the head of the child from entering the brim of the pelvis, and the ossa ilia, which form the sides of that cavity, approaching too near to each other, thus frightening the capacity of the pelvis, and changing its form from an oval to a triangular figure. On his discovering this derangement, it will be his duty to inform the friend to the woman of the manner in which he proposes to conduct the labour, and of the necessity he believes there will be of opening the head of the child, in order to preserve the life of the mother. To the perturbed woman he will only say, that the labour will be slow and tedious, that it will be necessary that she avoid all heating drinks, and that she manage her strength and her spirits in the best manner she is able. The bowels must be kept supple and open by clysters, the urine must be drawn off, if suppressed, with the catheter, and an opiate given at night, as in ordinary cases of difficult labour. At the end of the second or third day, according as the pains have been more or less severe, and frequent, the water being nearly all it drained off, and the uterus contracted so as to be in contact with the body of the child, a small portion of the vertex, or presenting part of the head, or perhaps only of the tumid scalp, will be found to be thrust through the brim of the pelvis. As no farther assistance can be expected from the pains, which now would only tend to exhaust the strength of the woman, and to excite such a degree of heat and fever, as might not afterwards be extinguished, it will be necessary to proceed to opening the head of the child, and in that manner complete the delivery. The woman being laid on the bed in the manner before described, and the accoucheur placed behind her, he will introduce two or three fingers of his left hand into the vagina, and pass them upwards until they touch the protruded part of the head of the child, and endeavour to find the fontanelle, or the part where the parietal bones meet; he will then, with his right hand, slide the perforator up into the vagina, which will be guided by his fingers to the place, which it will readily enter, and having, by opening them in various directions, made an aperture into the skull sufficiently large, he will withdraw the perforator, and also the fingers of his left hand, both to give a respite to the woman, and to allow the pains to force a larger portion of the skull, now yielding more easily to the pressure, through the brim of the pelvis. At the end of two or three hours he will re-commence the operation, and will pass his left hand, or as much of it as he can, into the vagina, and introduce one or two of his fingers into the aperture of the skull of the child; this will serve as a guide to the crotchet, which he will now use. Having further broken the texture of the brain with the crotchet, he will move it about within the cranium, until he finds it firmly fixed, when he will begin to draw downwards, and continue this action at intervals, until he finds he has brought the whole of the head of the child into the vagina. It is useful

to keep the left hand, or two or three fingers of it, in the passage, that if the crotchet should slip, they may prevent any injury being done to the vagina. Having paused again, for the space of an hour, to give the uterus opportunity of contracting, he will easily bring the head of the child, now emptied of its contents, into the world, and the remainder of the labour will be conducted as in ordinary cases.

In labours of this class, that is, in difficult labours, as the progress of them is always slow, giving opportunity to the uterus to contract, the expulsion of the placenta is usually performed sooner, and more easily, than in natural labours.

**LABOURED ACCOMPANIMENT.** See ACCOMPANIMENT.

**LABOURER,** in *Agriculture*, a person who performs the manual or most laborious part of the business of a farm. Labourers are mostly such persons as live in cottages, or small houses in the vicinity of the farms, or in the houses of the farmers themselves.

The author of *Modern Agriculture*, after premising that in all civilized states, the great body of the people live by labour; and that, of whatever nature it may be, the wages received must be more than sufficient to maintain the labourer, as, were it otherwise, he could not bring up his family, and consequently this class of men would soon become extinct; observes, that in every county or district, where the useful arts are in a flourishing state, and where those employed in carrying them on are most successful in accumulating riches, the rate of wages, or price of labour, is highest. Luxury is a never-failing attendant on riches, and the number of servants always increases with the means of maintaining them. Therefore an increasing demand for servants or labourers, whether for carrying on agriculture, the purposes of trade, or for administering to the artificial wants created by luxury, naturally tends to advance the price of labour. The very great recent advance in the rate of wages in some counties in Scotland, as Lanark, Renfrew, Perth, Angus, Fife, &c. amounts, it is supposed, to the most positive evidence, that commerce, manufactures, and improvements in agriculture have rapidly increased. The still low price of labour in the counties of Caermarthen, Pembroke, Cardigan, &c. in Wales; and Nairn, Inverness, and the other northern counties of Scotland, notwithstanding the great emigrations of labourers to those parts of the island, where they are more certain of finding employment, is a sure sign that in these remote districts the arts have scarcely ever been introduced. It shews also, that little attention is bestowed by the proprietors to improve the situation of the peasantry, either by inuring them to habits of industry, or instructing them in the advantages to be derived from a proper division of labour. In those counties where the arts have been introduced, and where the rate of labour has continued for a number of years nearly the same, it will be found that agriculture, commerce, and manufactures, although perhaps formerly in a prosperous state, are at present stationary, and that a national exertion is necessary, in order to set them again in motion.

And further, that the wages of farm-servants, and of labourers, who are occasionally engaged in the operations of husbandry, vary nearly as much in the different districts of Great Britain, as they do in the several kingdoms of Europe. In the counties in England, where commerce and manufactures are carried on to the greatest extent, as Middlesex, Surrey, Kent, Lancaster, Cheshire, the well-riding of Yorkshire, &c. the wages of farm-servants and day labourers may, it is conceived, be stated as follows:

	Average.
	<i>£. s. d.</i>
A ploughman by the year, from 9 <i>l.</i> to 15 <i>l.</i> -	12 0 0
A female servant, do. from 4 <i>l.</i> to 6 <i>l.</i> -	5 0 0
A labourer in the summer, from 1 <i>s.</i> 6 <i>d.</i> to 2 <i>s.</i> -	0 1 9
A labourer in winter, without board, from 1 <i>s.</i> to 1 <i>s.</i> 2 <i>d.</i> -	0 1 1
A mason ditto, from 1 <i>s.</i> 10 <i>d.</i> to 2 <i>s.</i> 2 <i>d.</i> -	0 2 0
A carpenter ditto, from 1 <i>s.</i> 8 <i>d.</i> to 2 <i>s.</i> 4 <i>d.</i> -	0 2 0

Where agriculture is the chief employment of the people, as in Hertford, Buckingham, Rutland, Northampton, Worcester, Northumberland, &c.

	Average.
	<i>£. s. d.</i>
A ploughman's wages may be stated from 7 <i>l.</i> to 12 <i>l.</i> -	9 0 0
A female servant, from 3 <i>l.</i> 10 <i>s.</i> to 5 <i>l.</i> -	4 5 0
A labourer in summer, without board, from 1 <i>s.</i> 4 <i>d.</i> to 1 <i>s.</i> 8 <i>d.</i> -	0 1 6
Ditto in winter, ditto, from 1 <i>s.</i> to 1 <i>s.</i> 2 <i>d.</i> -	0 1 1
A mason, ditto, from 1 <i>s.</i> 10 <i>d.</i> to 2 <i>s.</i> 2 <i>d.</i> -	0 2 0
A carpenter, ditto, from 1 <i>s.</i> 8 <i>d.</i> to 2 <i>s.</i> 4 <i>d.</i> -	0 2 0

In those counties in Wales, where improved modes of husbandry are little practised, and where there are scarcely any commerce or manufactures,

	Average.
	<i>£. s. d.</i>
A ploughman's wages are from 4 <i>l.</i> 10 <i>s.</i> to 7 <i>l.</i> -	5 15 0
A female servant, from 2 <i>l.</i> 10 <i>s.</i> to 4 <i>l.</i> 4 <i>s.</i> -	3 7 0
A day-labourer in summer, without board, from 8 <i>d.</i> to 1 <i>s.</i> -	0 0 10
Ditto, in winter ditto, from 6 <i>d.</i> to 8 <i>d.</i> -	0 0 7
A mason, ditto, from 1 <i>s.</i> 6 <i>d.</i> to 2 <i>s.</i> -	0 1 9
A carpenter, ditto, from 1 <i>s.</i> 4 <i>d.</i> to 1 <i>s.</i> 8 <i>d.</i> -	0 1 6

It has been observed, that the rate of wages has advanced very rapidly of late years, in many counties in Scotland. In that part of the kingdom south of the Grampian mountains, the rise in the price of labour has, he says, been general, and is now nearly double what it was twenty years ago.

	Average.
	<i>£. s. d.</i>
A ploughman's wages is from 7 <i>l.</i> to 12 <i>l.</i> -	9 10 0
A female servant, from 3 <i>l.</i> to 4 <i>l.</i> 10 <i>s.</i> -	3 15 0
A day labourer, in summer, without board, from 1 <i>s.</i> 2 <i>d.</i> to 1 <i>s.</i> 6 <i>d.</i> -	0 1 4
Ditto in winter, ditto, from 10 <i>d.</i> to 1 <i>s.</i> 2 <i>d.</i> -	0 1 0
A mason, ditto, from 1 <i>s.</i> 6 <i>d.</i> to 2 <i>s.</i> 4 <i>d.</i> -	0 1 11
A carpenter, ditto, from 1 <i>s.</i> 4 <i>d.</i> to 2 <i>s.</i> -	0 1 8

In the northern divisions of the kingdom, where there is little commerce or manufactures, and where improvements in agriculture are only partially introduced,

	Average.
	<i>£. s. d.</i>
A ploughman receives from 3 <i>l.</i> to 6 <i>l.</i> -	4 10 0
A female servant, from 2 <i>l.</i> 2 <i>s.</i> to 3 <i>l.</i> 14 <i>s.</i> -	2 18 0
A day labourer, in summer, without board, from 8 <i>d.</i> to 1 <i>s.</i> -	0 0 10
Ditto, in winter, ditto, from 6 <i>d.</i> to 8 <i>d.</i> -	0 0 7
A mason, ditto, from 1 <i>s.</i> to 1 <i>s.</i> 6 <i>d.</i> -	0 1 3
A carpenter, ditto, from 1 <i>s.</i> to 1 <i>s.</i> 4 <i>d.</i> -	0 1 2

From the above averages, the following table, which may be considered as containing pretty nearly, he says, the medium rate of agricultural labour in these kingdoms, at the present period, is formed:

# LABOURER.

General Average.

	£.	s.	d.
A ploughman - - - -	7	3	6
A female servant - - -	3	7	0
A day labourer, in summer, without board	0	1	3
Ditto, in winter, ditto - - - -	0	0	11
A mason, ditto - - - -	0	1	10
A carpenter, ditto - - - -	0	1	8

In the above statements, the difference in the rate of wages does not, it is supposed, appear so considerable (except in Wales, and the north of Scotland, compared with the better cultivated parts of Great Britain), as, had it been possible to ascertain the price of labour in each particular county, would have been evident; local circumstances frequently operating to augment or depress the rate of wages in particular districts, which is not discernible when numbers are classed together.

But the rates of wages, or prices of labour, have increased in the proportion of, from a quarter to a half, since the period in which the above was written, which is only a very few years. These are, he conceives, affected by some or all of the following causes, *viz.* 1<sup>st</sup>. The increase of commerce and manufactures: 2<sup>dy</sup>. The depreciation in the value of money, and its present nominal value, compared with the price of the ordinary articles of provisions: 3<sup>dy</sup>. The general introduction of improvements, and of new modes of cultivation; whereby, although fewer hands are necessary, those possessing superior skill become more in request: 4<sup>thly</sup>. The ease or difficulty of finding constant or regular employment: and, 5<sup>thly</sup>. The mode in which a farm-servant, or labourer, maintains his family.

With respect to the first, it is supposed, that the increase of commerce and manufactures of the towns has contributed to the improvement of the country, as well by affording a ready market for the produce of the soil, as by various other means, will not be denied; but that the rapid increase of them within these few years has had a great effect in raising the price of labour is equally evident. The great numbers of people crowded together in large cities and manufacturing towns, are not only against the increase of population, but also against longevity. There are besides several sorts of manufactures, which are well known to be destructive of the human constitution; not to mention the many accidents to which those employed in the various branches of commerce and manufactures are exposed, tending to shorten life, and from which those engaged in the operations of husbandry are exempted. For these reasons, there is a constant demand for people from the country, in order to keep up the population, and to carry on the commerce and manufactures of the towns. The great additional price commonly paid for commercial and manufacturing, beyond that for agricultural labour (except where the influence of the former affects the latter), and the habits of luxury, in which the labouring part of the community live in towns, compared with the generality of their neighbours of the same class in the country (particularly in Scotland), are strong inducements, it is contended, with many of the peasantry, either to remove to the towns, or send their children thither: while others, in consequence of the too general practice of adding farm to farm, and demolishing cottages, are forced to seek that asylum in towns which is refused them in the country. The demand for labourers from the towns being complied with, the country is thereby drained of useful hands, and the price of agricultural labour advanced. This must necessarily happen, it is thought, in every kingdom during the period that its commerce and

manufactures are on the increase; and more especially in those nations where the legislature turns its attention to support commerce and manufactures at the expence of agriculture.

The second, the depreciation in the value of money, is also another and substantial reason for the apparent rise in the price of labour. The increase of commerce and manufactures, which has been gradually taking place in this island ever since the beginning of the reign of queen Elizabeth, and the immense additions which have been made almost every year to the national debt within the present century, seem to have rendered it necessary to increase, nominally, by means of bank-notes, promissory-notes, bills, &c. the quantity of money in circulation. That these substitutes for specie have had the effect to reduce the value of money is an obvious fact. If, therefore, the value of money has fallen, the labourer of the present day requires of course a greater quantity to carry to market than his predecessors, to purchase even such articles as are consumed in the particular district where he resides (whether right or wrong), as indispensably necessary for the maintenance of a peasant's family. Whether the Middlesex labourer goes to market to purchase beef or mutton, or the Aberdeenshire cottager oatmeal, it will, it is conceived, be found that nearly double the sum is required to purchase the same quantity now that it did thirty years ago.

After this, some facts are stated in order to shew that, however much the nominal price of labour has increased, its real price, compared with that quantity of provisions it will purchase, remains all over the island nearly the same, except only where a variety of circumstances combine; such as contiguity to large towns, or extensive manufactories and public works; and the want of due attention to the providing of work, from improved modes of husbandry, not being introduced to raise or depress it beyond its ordinary level.

In regard to the third, it is observed, that besides forming canals and turnpike-roads, which may be considered equally beneficial to the interests of commerce and manufactures as to those of agriculture, there have been many improvements introduced in husbandry, which, while they have contributed to advance alike the prosperity of the nation, the proprietors and farmers have also been the means of bringing about a considerable alteration in the situation of the inhabitants at large, as well as in the price of labour. The immense number of people necessary for carrying on the various operations of inclosing, draining, planting, erecting farm-buildings, digging marle, quarrying and burning lime-stone, hoeing potatoes, turnips, and other green crops, must first have had the effect of giving full employment to the people in those districts where such improvements were introduced, and gradually to advance the rate of wages, in consequence of the increased demand for labourers. The general introduction of new modes of cultivation, whereby, although fewer people are necessary, those possessing superior skill become more in request, is another reason of the advance in the wages of the farm-servants. This observation will be considered as well founded by all those who recollect the period, when ploughing with a man and two horses, without a driver, became common in Scotland. The number of horses or oxen formerly worked in the plough varied in some cases, according to the nature of the soil; but was more frequently regulated either by the custom of the district, or the fancy of the farmer. When, in consequence of the spirited exertions of some individuals in several counties, the practice of ploughing with two horses was pretty generally introduced, the farmers found themselves thereby

relieved of a very great share of the annual expence of cultivation; but as it was then considered a very arduous undertaking to manage a two-horse plough, every farmer selected the best ploughman he could find; and these becoming thereby in request, it was no difficult matter for them to bargain for an augmentation of wages, which the farmers of that period could very well afford, and which many now living will not hesitate to acknowledge they granted on principles of economy.

In respect to the fourth, it is suggested, that the ease or difficulty which labourers frequently have in finding constant and regular employment; or, in other words, when labourers are only partially employed, the rate of wages must be affected by that circumstance. It has already been observed, that those who live by labour must receive such a compensation as is more than sufficient for their subsistence. When a labourer has constant employment, whatever be the rate of wages, as it must be equal to the price of the ordinary articles of provisions in whatever part of the island he is situated, his incomings and outgoings will be nearly the same. Hence it follows, that when, from the difficulty of finding employment, he can only procure work for three, four, or five days in the week, he must receive the same sum for the three, four, or five days that in the other cases he would do for the labour of six; otherwise his incomings must be less than he is necessarily called to expend. When that happens, labourers are often obliged to remove occasionally to another quarter, or betake themselves to some mechanical employment; and in either case, their services are lost to the farming part of the community where they resided. The want of constant employment, therefore, it is conceived, operates in two ways to raise the price of labour; first, by the necessity the labourer is under while he continues in that capacity of demanding as much for the work of three, four, or five days, as is fully equal to his subsistence for a week; and secondly, many of them being obliged to betake themselves to other means for providing for themselves and families, the number of labourers becomes greatly diminished, and the remainder of course more in request.

And on the last point, it is supposed that the various modes in which farm-servants and labourers maintain their families must necessarily have a very great influence on the expence of agricultural labour in different parts of the island. In a great part of England, butcher's-meat, dumplings or puddings, bread made of fine flour, with beer, ale, and very commonly tea, are reckoned indispensable articles of cottage house-keeping; while in Scotland, oatmeal, cooked in various ways, vegetables, and now and then a little butcher's-meat, are the chief articles which constitute the food of the people employed in husbandry, even in the best cultivated parts of the kingdom. This essential difference in the mode of living must, it is conceived, be a great additional expence in the article of labour to the English farmer beyond what those in Scotland are subject to, and might induce such as are not acquainted with the various circumstances connected with the husbandry of both kingdoms, to give a decided preference in favour of Scotland. It should, however, be remembered, that this kind of additional tax paid by the English farmer more properly affects the landlord, and is one of the principal reasons why lands in England are rented lower than those of the same quality in Scotland; it being an indisputable fact, and which, in Scotland, daily experience proves well-founded, that a great proportion of what the farmers save in the article of labour, or by the introduction of more improved and less expensive cultivation, sooner or later finds its way into the landlord's pocket.

And a very respectable author, Dr. Smith, in his work on the Nature and Causes of the Wealth of Nations, vol. i. has observed, that "the difference in the mode of labourers' subsistence is not the cause, but the effect, of the difference in their wages; although, by a strange misapprehension, I have frequently heard it represented as the cause." It is farther added, that "it is not because one man keeps a coach while his neighbour walks a-foot, that the one is rich and the other poor; but because the one is rich he keeps a coach, and because the other is poor he walks a-foot."

The author of *Modern Agriculture* thinks it will be admitted, that at the period when a general alteration has taken place for the better in the established mode in which labourers maintain their families (as in the south of Scotland, where the price of labour has nearly doubled within these twenty years), the expence at which a cottager's family is maintained has advanced in the same proportion. They eat better food, wear more expensive clothes, and live in more comfortable dwellings,—all which, he says, no doubt, as Dr. Smith observes, is the effect, not the cause, of the recent increase in the price of labour.

But that in England, where the mode of maintaining a labourer's family has undergone little alteration for ages, it is presumed, that although the difference in the modes of living was, at first, the effect naturally to be expected from a rise in the price of labour, yet it is now one cause why the rate of wages continues in that kingdom to advance. Those articles which with that class were once deemed the luxuries, are now considered only as the bare necessaries of life, and the prices have advanced in nearly the same proportion as their wages. For instance, those who in that country require labourers, must either pay them such an advance of wages as will enable them to subsist according to the general mode established in the country, whatever the additional price of the ordinary articles of provision may be, or compel them to make use of more simple and less expensive kinds of food, which were used by that class of men a century or two ago. As every person who stands in need of labourers, will adopt the first of these alternatives, it follows of course that the difference which has long taken place in the mode of maintaining a labourer's family in England, compared to that of ancient times, is now one cause for the advance in the rate of wages.

It is stated, that it has now become a general complaint among proprietors, merchants, manufacturers, and farmers, that the price of labour is become too high. That, owing to one or all of the causes before-mentioned, it has advanced in many districts to a degree unknown in any former period of the history of these kingdoms, is a fact well known. Those who regret that the price of labour is advanced, (provided it is kept within proper bounds, and does not arise from a national neglect of the situation of the peasantry,) ought to comfort themselves with the reflection, that this never happens in any state which is not increasing in wealth and prosperity. It is owing to that cause, and to no other, that the working-people in any nation are more liberally rewarded for their labour; and in place of regret it ought to give pleasure to every friend to his country, that the great body of the community are enabled, from the fruits of their honest labours, to procure themselves a greater share of the comforts of life. At the same time, let it be observed, that those who have occasion to employ labourers pay attention to the advice of the author of the *Scafons*.

"Be mindful of the rough, laborious hind  
That sinks you soft in elegance and ease."

They should also consider, that there are bounds beyond which they ought not, in prudence, to pass.

But the mode of maintaining farm-servants in many places of England is both absurd, and, it is conceived, expensive in the extreme, and calls as loudly for reform as any error in the whole range of British husbandry. In Northamptonshire, the breakfast consists of cold meat, with cheese, bread, and beer; for dinner, roasted or boiled meat, with pudding; and for supper, the same as at breakfast; and besides ale, which is allowed on extraordinary occasions, they have small beer at command all hours. And in the Rural Economy of the Midland Counties, after noticing that the beer and ale are brewed unreasonably strong, and that the quantity allowed to a man is unnecessarily great, it is stated, that, in hay and corn harvest, the customary allowance is a gallon (upwards of five bottles) of beer a man per day; and that, during winter, the quantity of small beer used is not much less than in harvest. And it is farther noticed, that the increased expence in the mode of maintaining farm-servants, as now too generally practised in England, is attributed to the following causes. Some few farmers in every county, either from a mistaken idea, that the better their servants are fed the more work they will perform, or from pride, and from a desire to gain popularity among that class of people, lead the way, while their more sensible neighbours, and even those whose situations in life but ill accord with such additional expence, are forced to follow the example, by which means extravagance in the maintenance of servants has arrived at its present height, and seems to be daily gaining ground.

It is suggested, that the wages paid for agricultural labour, either to servants by the year, or to labourers by the day, throughout the better cultivated parts of Great Britain, although considerably different, are, nevertheless, much less than might have been expected, and appear by no means sufficient to counterbalance the advantages which are derived from superior climate, and more favourable situations in regard to markets. The expensive manner in which the farm-servants are maintained in the greatest part of England, when compared with that of the more improved parts of Scotland, creates a much greater addition to the expence of cultivation in the former kingdom, than that arising from the difference in the money-price of labour. In forming a just estimate of the difference which takes place in the expence of cultivation, in particular districts, beyond that in others, it is necessary, it is said, to consider not only the sum of money paid as wages, and the expence of maintaining servants, but also the quantity of work performed, and the number of men and horses which, according to the practice of particular districts, are considered as necessary to cultivate the same quantity of land. The following statement will shew at one view the difference of keeping a team by the year, and of ploughing an acre of land, in Gloucestershire, in England, where five horses are commonly used; and in the county of Angus, in Scotland, where only two are considered necessary.

The County of Angus.

	£.	s.	d.
Ploughman's wages	10	0	0
Board, generally under	8	0	0
Maintenance of two horses at 15 <i>l.</i> each	30	0	0
Tear and wear of ditto, and accidents, 2 <i>l.</i> each <i>per annum</i>	4	0	0
	<hr/>		
	52	0	0
	<hr/>		

Gloucestershire.

	£.	s.	d.
Ploughman's wages	10	0	0
Board, 6 <i>s.</i> per week	15	12	0
Boy's wages	5	0	0
Board, 4 <i>s.</i> per week	10	8	0
Maintenance of five horses at 15 <i>l.</i> each	75	0	0
Tear and wear of ditto, and accidents, 2 <i>l.</i> each <i>per annum</i>	10	0	0
	<hr/>		
Annual expence of Angus farmer	52	0	0
	<hr/>		
Yearly difference against Gloucestershire farmer	74	0	0

It is stated, that if these men and horses were employed in ploughing the whole year, and that they ploughed an acre a-day, they would each have ploughed 313 acres in the course of the year. The expence to the Gloucestershire farmer would be 8*s.* each acre, while the Angus farmer would have the same extent of labour performed at about 3*s.* 4*d.* per acre. There is also a great a difference in the expence of thrashing grain. Since the introduction of thrashing-machines in Scotland, the grain can be separated from the straw upwards of 50 per cent. cheaper, and to better purpose, than is to be done in England by manual labour. This comparison might be made to include other operations, which are more or less expensive to perform, in consequence of the peculiar customs and practices of particular districts. But all that is proposed here is to give an idea of the proper mode of calculating the expence of agricultural labour, and an instance or two of the saving which every farmer has in his power to make, by using well-constructed implements of husbandry, and performing the various operations with as few men and horses as possible.

It is added, that the scarcity of farm-servants and day-labourers has of late been considerably felt in many parts of Great Britain, and seems to be gradually increasing. The principal causes to which this evil is to be ascribed are, in the opinion of the above writer, the inclosure bills in England, the enlarging or engrossing farms in both kingdoms, and the general increase of commerce and manufactures. But a more serious and certain cause of this evil is probably to be found in the constant state of warfare in which this country has been engaged for almost the whole of the last half century. The deficiency of labourers is an evil so serious a nature, (from whatever cause it has originated,) as ought to induce proprietors and farmers of all descriptions to adopt such measures as appear most proper for insuring a future and more abundant supply. That which seems the most likely to effect this desirable object with the greatest certainty is the building of cottages on every farm, in numbers proportioned to the extent of hands necessary for its cultivation. Experience has proved that cottages are the best nurseries for useful farm-servants and labourers; and while nothing would tend so speedily or so effectually to supply this defect as affording the labouring class of the people the means of living comfortably in the country, it would also be the means, in a great degree, of silencing the rising clamour against enlarging or engrossing farms. In this view it is suggested, that a tax on every proprietor and farmer in Great Britain, who had not as many cottages erected and inhabited, in a limited time, as there were ploughmen required for the cultivation of the farm; or one cottage for every certain number of acres. Such a tax, if imposed for the express purpose of increasing the population

of the country, and thereby keeping the price of all kinds of labour moderate, could not fail in time, it is supposed, to have the wished-for effect.

However, it is observed also, that the practice of joining two or three, sometimes half a dozen, small farms in one, and the consequent demolition of the cottages, has had the effect of bringing about a great alteration, in many counties, in the description of servants employed in husbandry: as, instead of employing married men living in cottages contiguous to the farm, and paying them partly in necessaries of life, young men, brought up in towns or villages, are employed, and their wages paid wholly in money,—from which many bad consequences proceed. From the advantages to be derived by employing married men, who have families residing on some detached part of the farm, as ploughmen, as well as from the acknowledged scarcity of labourers, may, it is supposed, be inferred the propriety and even necessity of improving, by every proper means, the situation of the peasantry. The labourer's situation would be much improved, were his employers to revert to the old practice of paying him a great part of his wages in the necessary articles of provisions: he would then be prevented from the necessity of having recourse, for every article he requires, to those worse than pawn-brokers, the keepers of little paltry chandler's shops; a set of people who, without remorse, appropriate to themselves, under the name of a reasonable profit, a great proportion of the hard-earned wages of the laborious peasant. And next to getting the great article of provisions on reasonable terms, the allowing every cottager the means of keeping a cow, and of planting a reasonable quantity of potatoes and other vegetables, would tend, more than any other circumstance, in the writer's opinion, to his happiness and comfort; as it would enable him to procure a considerable share of the sustenance of his family, without the expenditure of money, or the risk of imposition. It would also, it is imagined, be a great spring to the industry of the labourer, to let him all his labour by the great, or piece. He would be induced to labour with more steadfastness and perseverance, when he was satisfied that it was in his power to apply the fruits of his extraordinary exertions to the benefit of his family. And, lastly, to encourage, by every proper means, the establishment of friendly societies among the labouring class of people, as a means of provision against accidents, sickness, and old age.

Farm labourers, Mr. Marshall thinks, as being the most valuable class of men that a populous country possesses, should have every comfort provided for them that is compatible with their situation, and conformable to the general interest of the community:—that their wages ought to be every where, and at all times, sufficient for the maintenance of themselves and families while in health, with a surplus to provide against the day of sickness, without their being under the degrading necessity of making application to their neighbours for relief. Persons so essentially useful to society should not merely support existence, but have the comforts of wholesome habitations, with sufficient spaces of ground to furnish them and their families with changes of proper vegetable food, without much expence. It is, after all, this class of men that constitutes the great basis or prop of a country.

Labourers conspiring together concerning their work or wages, shall forfeit 10*l.* for the first offence, 2*cl.* for the second, &c. and if not paid, to be set on the pillory. (Stat. 2 & 3 Edw. VI. cap. 15.) Justices of peace, and stewards of leets, &c. have power to hear and determine complaints relating to non-payment of labourers' wages. (4 Edw. IV. cap. 1. 22 Geo. II. c. 19. 31 Geo. II. c. 11.)

And labourers taking work by the great, and leaving the same unfinished, unless for non-payment of wages, or when they are employed in the king's service, &c. are to suffer one month's imprisonment, and forfeit 5*l.* The wages of labourers are to be yearly assessed for every county, by the sheriff and justices of peace, in the Easter sessions; and in corporations by the head officers, under penalties. (5 Eliz. cap. 4.) And the sheriff is to cause the said rates and assessments of wages to be proclaimed. (1 Jac. I. cap. 6.) All persons fit for labour shall be compelled to serve by the day, in the time of hay or corn harvest; and labourers in harvest time may go to other counties, having testimonials. From the middle of March to the middle of September, labourers are to work from five o'clock in the morning till seven or eight at night, being allowed two hours for breakfast and dinner, and half an hour for sleeping in the three hot months; and all the rest of the year from twilight to twilight, excepting an hour and a half for breakfast and dinner, on pain of forfeiting one penny for every hour's absence. (5 Eliz. c. 4.) By stat. 6 Geo. III. c. 25. artificers, labourers, and other persons, absenting themselves from the service of their employers, before the expiration of the term contracted for, shall be punished by imprisonment, for not less than one month, nor more than three. If any labourer shall make an assault upon his master, he shall suffer as a servant making such assault. (5 Eliz. c. 4.) See MANUFACTURERS and SERVANTS.

LABOUREUR, JOHN LE, in *Biography*, was born, in 1623, at Montmorenci, near Paris. At the age of nineteen he displayed a turn for historical researches by publishing "An Account of the Tombs in the Church of the Celestines at Paris, with brief Memoirs of the Persons entombed;" which was very well received. In 1644, he was at court, in the character of gentleman in waiting, when he was sent into Poland, with the marshalls of Guebriant, on a mission to Ladislaus IV. to whom the duchess of Nevers was contracted. After his return he published a narrative of this embassy. He next entered into the ecclesiastical profession, and was made almoner to the king, and prior of Juvigné, and in 1664 he was created commander of the order of St. Michael, and appointed almoner to the king. He wrote the "History of the Marshal de Guebriant;" and he was editor of a new impression of the "Memoirs of Michael de Castellnau," with several genealogical histories, in three vols. folio, 1731: this performance is reckoned to throw much light upon several parts of French history; "History of King Charles VI. translated from the Latin of a MS. in the Library of de Thou," two vols. folio; "A Treatise on the Origin of Coats of Arms." He left many MSS. among which is "A History of the Peerage." Moreri.

LABOURSOME, among *Seamen*, implies a violent rolling or pitching motion of a ship at sea, by which the masts and even the hull are in great danger. By pitching suddenly the masts are likely to be carried away, and by the heavy rolling motion the masts strain upon the shrouds, and, consequently, upon the sides, with an effort which increases as the sine of their obliquity, and the continued agitation of the vessel gradually loosens her joints, and makes her extremely leaky.

LABRADOR, in *Geography*, an extensive country of North America, so called by the Portuguese, who first discovered its coast, comprehended in New Britain. It is bounded on the N. by Hudson's strait, on the S. by part of Lower Canada and the river St. Lawrence, on the W. by Hudson's bay, on the N. E. by the ocean and Davis's straits, and on the E. by the straits of Bellisle and the gulf

of St. Lawrence. The extent of this country has been but imperfectly ascertained: for our knowledge of the eastern coast and of its inhabitants, we are chiefly indebted to lieutenant Roger Curtis, from whose papers extracts were made and communicated to the Royal Society, in 1774, by the honourable Daines Barrington (Phil. Transf. vol. 64, part 2.) and to Mr. Cartwright, who resided, at different intervals, for sixteen years, in this desolate country, and whose account of it was published at Newark in 1792. But the knowledge thus obtained principally relates to the coast; for the inland territory remains still unexplored. These writers concur in representing the face of the country, as far as they could discover it, not only hilly, but mountainous; some of the mountains being of a considerable elevation. From the sea the fourth coast seemed to be fertile and to be covered with a degree of verdure; but the soil, on examination, was poor, and the verdure was that of coarse plants, which might serve for deer and goats, but was not proper for horses, kine, or sheep. To the improvement even of this part, the depredations of the bears and wolves furnish a formidable impediment; and the cattle, on account of the severity of the climate, must be housed for nine months in the year. The whole of the east coast exhibits a very barren appearance: the mountains rising suddenly out of the sea and being composed of rocks, which are thinly covered with black peat earth, that produce stunted spruces and a few other plants. The adjacent sea, however, the rivers and lakes, which are numerous, abound with fish, fowl, and amphibious animals. Springs are rare, and the water is chiefly supplied by melted snow; nevertheless, it is wholesome, and those swelled throats which frequently occur in the Alpine regions of Europe and Asia, are unknown in this country. On the coast are several spacious and safe harbours; and at a small distance, and within its capacious bays, there are thousands of islands of different sizes, on which eider-ducks breed in large flocks, and which are stocked with a multitude of sea-fowl. On some of the larger isles there are deer, foxes, and hares. All kinds of fish, belonging to the Arctic seas, abound on this coast; and the rivers are frequented by salmon and sea-trout, pike, barbel, river-trout, eels, and other kinds. At a small distance from the coast in the inland territory, the air is milder; the soil is more fertile, and trees, some of which are of a large size, are more numerous. The ground is covered with spruces and firs, with an intermixture of larches, birch, and aspens, particularly near the shores of the bays, rivers, brooks, and ponds, where alone they arrive at any degree of perfection. Other trees are mere shrubs, and they are the alder, osier, dog-berry, pears, currants, raspberries, and a few others. The fruits consist of various kinds of berries, viz. currants, raspberries, partridge-berries, cranberries, apples, pears, whortle-berries, and a small berry, the plant of which resembles the strawberry, each producing only a single fruit, of a bright pink colour, granulated like a mulberry, and having a delicate flavour. The vegetables fit for food are wild celery, scurvy grass, the young leaves of the osier and of the ground whortle-berry, Indian fallad, red docks, and an Alpine plant, of which the rein-deer are very fond. The soil, though of a light kind, is not destitute of clay; no ores, except those of iron, have been discovered; but they are plentiful. White spar is common, and several samples of that called Labrador spar, have been picked up by the Esquimaux. The birds of the country are the white-tailed eagle, falcons, hawks, and owls of various kinds, the raven, white grouse, ptarmigan, spruce game, whistling curlew, grey plover, various species of sandpiper, and other

waders, geese, ducks of various sorts, flags, gulls, divers, swallows, martins, some few species of small birds, snipes and doves, the two last being very scarce. The beasts are white and black bears, rein-deer, wolves, wolverines, various species of foxes, martens, lynxes, otters, mink, beavers, musquash, raccoons, hares, rabbits, and moles, and probably other kinds. The climate, though severe, is salubrious; there is little appearance of summer till about the middle of July; and in September winter indicates its approach, so that this latter season is long and the cold is severe. In summer the heat is sometimes unpleasant, and in that season the weather is very moderate, and remarkably serene, without those fogs which are more prevalent in Newfoundland, and those violent gales of wind, to which some other parts of the globe are subject. At this season, the mosquitoes and sand-flies, which are very numerous, are intolerably troublesome. The winters are said to be less severe than formerly. The greatest heat observed at Nain (N. lat. 57°) in the year 1780, was 84°, and this was in July; the greatest cold in 1779 was - 30°. On the sea-coast it is much cooler than farther inland, more especially when the wind blows from the ocean, on account of the immense quantities of ice that are contiguous to the coast; and which, together with the islands already mentioned, render the navigation dangerous. These shoals of ice set in from the north in spring and summer. It is not an unknown phenomenon in these northern and colder climates, that several beasts, and some of the birds, change their colour with the seasons. In the winter, the prevalent colour is white; and against the rigour of the cold, most animals are furnished by the order of providence with a defence. The quadrupeds are clothed with a longer thicker hair, or fur; and the birds have a softer down and feathers of a closer texture than those of milder countries.

On the coast of this desolate country there were only a few factories, till the Moravian clergy formed small settlements, particularly at Nain, about the year 1764. Upon barren rocks, covered with snow for more than half the year, and where the winters are so rigorous, and of such long continuance, we cannot expect to find that the inhabitants are very numerous. The native inhabitants of this country are mountaineers and Esquimaux, between whom there subsists an invincible aversion. The mountaineers inhabit the interior parts of the country, towards the north, and with respect to colour resemble our gypsies, which is probably acquired by their being exposed to the weather, and to the smoke of their wigwams. They are of a robust constitution, though their limbs are small, and their frame is well adapted to the rocky country, which they are continually traversing. They have no hair except on the head; and for many years they have dressed their food, which they boil to a jelly, whereas the other Indians eat every thing raw. They chiefly subsist on rein-deer, which they are very dextrous in killing. They also kill foxes, martens, and beavers. As they have a wandering kind of life, they never build houses; but they construct a kind of tents, covered with deer-skins and birch, and called wigwams; the skins which they use for this purpose, as well as for clothes, are tanned in order to take off the hair, then washed in a lather of brains and water, and afterwards well dried and well rubbed; but for winter use they have jackets of beaver, or deer-skins, with the hair on. They traverse the country by the assistance of canoes in the summer; and of rackets, or snow-shoes, in the winter. Their canoes are covered with the rind of birch; and though they are so light as to be easily carried, they are large enough to contain a whole family, and the materials of their traffic.

traffic. By means of the numerous ponds which are found in this country, they thus convey themselves to a great distance in a short time; travelling by water or by land, as circumstances require. They bear fatigue with incredible resolution and patience; and will travel two days successively, without taking any sort of nourishment. They are esteemed an industrious tribe; and for many years they had been known to the French traders. Their chief employment is to procure fur, and the necessaries of life; they are very illiterate, but generally good-natured, and said to be less ferocious than other Indians; and this softness of manners they have probably acquired by their long intercourse with Europeans. They come every year to trade with the Canada merchants, who have seal fisheries on the southern part of the coast, and they bear the character of just dealers, says Curtis, though Cartwright charges them with a proneness to theft. They are, without doubt, immoderately fond of spirits, for which, blanketing, fire-arms, and ammunition, they truck the greatest part of their furs. With regard to religion, they profess themselves Roman Catholics; but know no more of it than merely to repeat a prayer or two, count their beads, and see a priest whenever they go to Quebec. It is their custom, says Curtis, to destroy the aged and decrepid, when they become useless to the society, and burthenome to themselves. This practice they vindicate from their mode of life; alleging that those who are unable to procure necessaries, should not live merely to consume them.

The *Esquimaux* (see that article) who inhabit the northern part of Labrador, are indistinctly Greenlanders. They are of a deep-tawny, or rather copper-coloured complexion; they are inferior in size to the generality of Europeans, and there are but few of them who are of a good stature. They are flat-visaged, and have short noses; their hair is black and very coarse; their hands and feet are remarkably small. The women load their heads with large strings of beads, which they fasten to their hair above their ears; and they are fond of a hoop of bright brass, which they wear as a coronet. Their dress is entirely of skins; and consists of a sort of hooded close shirt, breeches, stockings, and boots. The dress of the different sexes is the same, except that the women wear very large boots, and their upper garment is ornamented with a tail. In the boots they occasionally place their children; but the youngest is always carried at their back, in the hood of their jacket. They have no sort of bread, but live chiefly on the flesh of seal, deer, fish, and birds. In the winter they live in houses, or rather caverns, which are sunk in the earth. In the summer they occupy tents, made circular with poles, and covered with skins. They have no sort of beverage among them except water, and are not fond of spirituous liquors. They seem to have no sort of religion, nor to have any object of adoration among them. They have no kind of government; and no man is superior to another, but as he excels in strength or in courage, and in having the greatest number of wives and children. They have no marriage ceremony; a wife is considered as property; and a husband lends one of his wives to a friend. The women marry young. The men are extremely indolent, and the women are mere drudges, doing every thing except procuring food. They sew with the sinews of deer, and their needle-work is very neat. They have few diseases, and are consequently without physicians; but they imagine, that tying to their neck or wrists the particular part of some fish or animal, according to the complaint, will effect a cure. They have never been visited with the small-pox. These Indians cannot reckon numerically beyond six; and their compound numbers reach no far-

ther than 21; every thing beyond this is a multitude. Their dread of the mountaineers makes them live always upon the sea-shores. Their canoes are extremely long in proportion to their breadth, being upwards of 20 feet by two, and contain only one person; they are covered with skins, and extremely light, so that they are easily overset, and yet there is not one among these people who can swim. They navigate their shallows without a compass, in the thickest fogs, and are very good coasters. Their dogs, of which they have a great number, serve as a guard, and as food; their skins supply them with clothing; and in winter they draw their sledges. They cannot bark, but make a most hideous howl; they are large, and have a head like a fox, whereas the dogs of the mountaineers are very small. The weapons of these Indians are the dart, and the bow and arrow, but they are not very expert in the use of either. Their number cannot be accurately ascertained; Mr. Curtis made some attempt for this purpose by counting the number belonging to each tribe, estimated by the number of boats, and by that of the men, women, and children belonging to each boat; estimating them in this way, he reckons their number to be 1623. Mr. Cartwright says, that these Esquimaux were the best tempered people he ever met with, and the most docile; nor, as he says, is there a nation under the sun with which he would trust his person and property in preference to them; although till within these few years they were never known to have any intercourse with Europeans, without committing theft or murder, and generally both.

The business carried on by the English with Labrador is the same with that on the island of Newfoundland. The exports are cod-fish, salmon, oil, whalebone, and furs; but the latter are much better than any of the same kind obtained upon that island, nor do few parts of the world produce better. N. lat. 50° 30' to 62° 30'. W. long. 55° 30' to 78° 30'.

LABRADOR *Lake*. See *St. Peter's Lake*.

LABRADOR *Spar*, in *Mineralogy*. See *FELDSPAR*.

LABRADOR *Stone*. See *FELDSPAR*.

LABRADOR *Tea*, in *Gardening*, the common name of an evergreen plant of the more hardy kind. See *LEDUM*.

LABRISULCIUM, a term in *Surgery*, derived from *labrum*, or *labium*, a lip, and *fulcus*, a deep sore, and signifying sometimes a chap of the lip; but frequently the disease well known under the appellation of the cancerum or gangrena oris. See *GANGRENA ORIS*.

LABRIT, in *Geography*, a town of France, in the department of the Landes, and chief place of a canton, in the district of Mont-de-Marsan. The place contains 584, and the canton 44 inhabitants, on a territory of 407½ kilometres, in nine communes.

LABRUS, in *Ichthyology*, a genus of the thoracic order. This tribe of fishes is extremely numerous, and comprehends many species of peculiar beauty and variety both in form and colours; their general aspect is rather more distinguished for elegance than singularity, but the diversity of those brilliant tints with which nature has embellished them is almost endless. We are little acquainted with their manners of life; such as have occurred to our own observation appear to be those of the natural inhabitants of the marine element; some delight to reside in the shallows and rocky bottoms of the sea contiguous to the boldest shores, but the far greater portion of the species are so widely dispersed through the immensity of seas as rarely occur to notice; and few, or indeed scarcely any, are known in the regular fisheries in any part of the globe. The flesh of those occasionally introduced for the table are of an agreeable and excellent flavour, such

as the "old wife," and some others. The smaller kinds are used chiefly by the fishermen as bait.

The confusion prevalent among authors respecting this family of fishes is inconceivably great; a circumstance the more remarkable in our ideas, since the obvious character of the genus does not appear ambiguous. The confusion arises from that want of precision in the definition of the true character which is too perceptible in the writings of ichthyologists in the early part of the last century, and which led them to admit indiscriminately with the Labri many kinds that ought not to have been included in the same genus. Some of these errors have been progressively detected and amended by referring the fishes improperly classed as Labri to other genera. But for others apparently not less exceptionable, we must place our trust in their descriptions only, the objects described being unattainable; and while this uncertainty continues, it will be concluded the whole of the presumed species of Labrus can never be reduced to very satisfactory order.

On a retrospective view we need not perhaps refer beyond the 10th edition of the Linnean "Systema Naturæ;" in this we find the genus Labrus with the following essential character. Teeth acute; gill membrane with six rays, and the covers fealy; and the dorsal fin with a filiform skin extending beyond the end of the posterior rays. This is the Linnean character in its latest state of improvement, excepting only that it is added, with a laudable degree of caution, that the two genera Labrus and Sparus are so closely allied, as to render it difficult to distinguish them: "Labri et Spari genera ob affinitatem etiamnum difficilium distinguuntur." Linneus describes altogether about forty species, some of which had been described in his former works as of the Labrus, Sparus, and Sciæna genera, and for these, with the exception of a few new kinds in Mus. Ad. Fr. he stood indebted to the labours of his friend Artedi, or to those of Gronovius, Ray, and Cateby, by whom some were called Labri and others Spari.

Gmelin endeavoured to amend the essential character of Labrus by rendering it more comprehensive, and for this reason adds to the character before-mentioned that the lips are simple; the pectoral fins pointed, and the lateral line straight. Still this was found insufficient, and is, in our ideas, confessedly inferior to the very excellent and concise character by which Bloch distinguishes the genus, namely, the lips large, the upper one double and extensile: the genus possesses other characters, but this is the most material. Another attentive observer of nature, Monf. Commerfon, has offered some improvements in the institution of the genus Labrus, and has added to the genus many new species. One of the latest and most copious writers on this subject however remains to be noticed, namely, count Lacepede, a naturalist who undertook the task of reforming the whole system of classification, and one to whom science is indebted in a great measure for the number of new species introduced of late years to the knowledge of the world.

To the Linnean naturalist, the arrangement proposed by Lacepede will rather, we apprehend, appear an innovation, than improvement. In this respect, considering the very concise view the limits of our article will allow us to take of this subject, we are not disposed to exercise much critical remark, or we conceive it would not be impossible to ascertain that it partakes of the character both of improvement and innovation. Our own opinion is, that the Linnean definition, though extremely useful, is inadequate, and that the character assigned by Bloch, though still more concise, is better. We allow, moreover, the necessity of reformation; many of the Linnean Labri belong to other genera, and

there are, besides, species more recently referred to the genus Labrus which rather constitute new genera. Hence the necessity of forming a larger number of genera, by dividing the Labri, is admitted; but in allowing this, it still remains a question, whether Lacepede has not fallen into a greater error than that he endeavours to reform; for instead of permitting them to remain in a single genus, he constitutes no less than seven new genera of the Labri, and their immediate dependencies. In extenuation, it may be indeed observed, in the language of one of his continental admirers, "this intelligent writer found the genus (Labre) so vitiated, that he was under the necessity of forming so many new genera. This increase of genera might seem to have diminished the number of species in the Labre to a trifling amount, but, on the contrary, by the introduction of the new kinds very recently discovered, they are again advanced to the number of one hundred and thirty species."

The genera into which Lacepede divides the Labrus of Linneus, and other authors, are LABRUS, HIATULA, OSEPHRONEMUS, CHEILINUS, LUTJANUS, TRICHOPODUS, and CHEILODIPTERUS.

LABRUS, according to this writer, is characterized by having the upper lip extensile; neither incisive teeth nor grinders; gill-covers destitute of spines and denticulations; dorsal fin one, extending nearly from the nape almost to the tail, and composed of rays terminating in a filament. This genus (which Lacepede separates, chiefly according to the furcated or rounded form of the tail, into three sections) includes a great number of the Linnean genus Sciæna, as the species capa, lepisma, unimaculata, gibba, cinerascens, armata, and fusca, with many others; and, on the contrary, the number of Linnean Labri is less extensive than might be imagined, it includes his species lunaris, venosus, and guttatus; but the genus consists principally of new fishes.

HIATULA is a genus established for one species (Labrus hiatula) of Linneus, which, being destitute of any anal fin, cannot, says Lacepede, remain with the rest. This he calls *Hiatula gardenienne*.

OSEPHRONEMUS is a genus instituted by Commerfon, from whom it was adopted by Lacepede. Its character consists in having five or six rays in each thoracic fin, the first of which is a spine, and the second terminated by a long filament. This genus contains only the species Goramy and another.

CHEILINUS is a genus established for the reception of the Linnean Labrus scarus, and a new species observed by Commerfon, the species triohé. The upper lip is extensile; gill-covers destitute of spines or teeth, and a single dorsal fin.

LUTJANUS was originally established by Bloch, from whom it was adopted by Lacepede; it forms a most extensive genus, and comprehends species from several of the Linnean genera, as *Perca digna*, *striata*, *argentea*, and *nobilis*; *Sparus virginicus*, and *Cbetodon arauus*, together with the *Labri striatus*, *scina*, *lappina*, *ramentofus*, *ocellatus*, *adriaticus*, &c. Its character is, that one or more plates of the gill-covers have a small tooth; the back a single dorsal fin, and sometimes a beard to the jaws.

TRICHOPODUS includes part of the Linnean Labri; the character consists in having a single ray longer than the body to each of the thoracic fins, and one dorsal fin.

CHEILODIPTERUS. The upper lip in this genus is extensile; it has neither incisive teeth, nor grinders; the gill-covers are destitute of spines or teeth, and the back is furnished with two fins. This last genus contains nine species.

Having thus far stated the most material alterations that have taken place in this extensive genus, it only remains to enumerate

enumerate the species, the order of which, in conformity with our original plan, will be reduced as nearly to the arrangement adopted in the Gmelinian system, as the introduction of the more recently discovered kinds will permit.

Species.

\* Tail forked.

**SCARUS.** Transverse appendages at the side of the tail-fan. *Scarus Aulorum*, Arted. *Cheiline fars*, Lacepede.

A native of the Mediterranean, where it appears in shoals, and feeds chiefly on fuci, and other marine plants. The length is about twelve inches, the scales large and thin, and the front teeth broad and blunt. The flesh of this species was esteemed a delicacy among the ancient Romans, and in their days of luxury, obtained, if we may credit Oppian, the most extravagant price. It seems to be most abundant near the shores of Greece.

**ANTHIAS.** Body entirely reddish. Art.

Inhabits southern Europe and America. Gmelin conceives, from the ferrated operculum, it may be a perca. Bloch constitutes it a distinct genus, under the name of *Anthias*.

**CRETENSIS.** Teeth four, body greenish. Art.

Inhabits Candia, and the adjacent places.

**HEPATUS.** Lower jaw longer; body with transverse black lines each side. Art.

An European species found in the Mediterranean sea, and sometimes in the rivers adjacent. The dorsal fin has ten spinous rays, and twenty-one soft ones, and behind the former a black spot.

**GISEUS.** Tail sub-bifid; body somewhat greyish. Gmel. *Turdus pinnis branchialis carens*, Catesby.

A native of America. Catesby has figured this species without pectoral fins, says Gmelin, and distrusts his accuracy; from a reference to the preliminary observations, it will be however remarked, that Lacepede admits its correctness, and institutes a new genus of this species only.

**LUNARIS.** Tail-fin truncated in the middle; dorsal and anal with a purple line; lips folded. Gmel. *Labrus oblongus*, &c. Gronov. *Le croissant*, Bonnaterre.

An inhabitant of the South American and Indian seas. The body is oblong-violet, with bands of yellow disposed transversely; the dorsal and anal fin yellow, except the violet line.

**GALLUS.** Caudal fin truncated in the middle; dorsal and anal with violet lines at the base; lower lip with a doubling each side. Gmel. *Scarus gallus*, Forst.

Described by Forstall among the fishes of Arabia; the body is dusky green, with violet lines all over the body, the belly with two blue stripes, and an intermediate one of green; scales lax, striated, membranaceous at the edge, and marked with a transverse purple band; eyes remote, with red pupil; teeth in one row; tail yellow in the middle, violet towards the sides, and edged with blue. The flesh of this kind is accounted poisonous.

**PERCUREUS.** Caudal fin truncated in the middle; dorsal and anal with a longitudinal purple repandate stripe at the base. Gmel. *Scarus purpureus*, Forst.

Inhabits the shores of Arabia; the length eighteen inches; body somewhat lance-shaped and truncated, colour dusky-green, with three purple stripes each side, beneath blue; scales broad, rhombic, striated, and loosely imbricated; crown convex, naked and brown, with a purple triangle each side before the eyes; gill-covers naked, with a square purple spot; lateral line ramose. The flesh of this fish is esteemed good.

**PITTACUS.** Caudal fin truncated in the middle; edge of

the fins, abdominal stripe, and marks on the head black. Gmel. *Scarus pittaureus*, Forst.

The body of this species is greenish, with yellowish lines; eyes small and remote; jaws of two bones, the lower one with one tooth each side, the upper three; gill-cover with loose scales; lateral line somewhat ramose, and double, the first near the back, the other in the middle; fins purple. A native of Arabia. Perhaps of the scarus genus?

**PITTACULUS.** Green, with three longitudinal red stripes on each side; dorsal fin yellow, with longitudinal red band. L. *pernobe*, Lacepede. *Parrakeet labrus*, Shaw.

Described from a drawing by Plumier. The species inhabits the American seas. Over each eye is a black streak; tail yellow, with four or five curved bands of blue and red.

**NIGER.** Tail truncated in the middle; down the chin a dusky green longitudinal stripe. Gmel. *Scarus niger*, Forst.

An Arabian species found near the shores of the sea. The jaws are bifid, the blotches on the head and outer margin of the fins blue-green; lips edged with red, and then greenish-brown; teeth in the upper jaw two, canine and white; fins violet-brown; pectoral obscure, ferruginous and brownish at the base; tail greenish, the angles lanceolate.

**CHANUS.** Head with three bluish rivulets each side, under the eye a blue square spot. Gmel.

Colour above brown, beneath white; lower jaw longer, between the eyes two furrows diverging behind; anterior gill-covers ferrated at the back part, posterior tridentate; pectoral, ventral, and anal fins yellow; dorsal and caudal spotted with red. Inhabits Turkey, near Constantinople.

**OPERCULATUS.** Body with ten brown bands; gill-covers with a brown spot. Linn. Amoen. Acad.

A native of Asia.

**PAVO.** Body varied with green, blue, sanguineous red, and hoary. Gmel. *Labrus pulchre varius, pinnis pectoralibus rotundatis*, Art. *Labrus pavo*, Hasselquist. *Peacock labrus*.

Length twelve inches. Inhabits the Mediterranean sea, near Syria.

**AURATUS.** Gill-covers fin-shaped. Gmel. *Perca fluviatilis gibbosa, ventre luteo*, Catesby.

Native of the fresh waters of North America; the iris is yellow; gill-cover with a long, obtuse, black membrane at the tip; the tail bilobate.

**TRICHOPTERUS.** Ventral fins with one ray. Pallas. *Sparus*, &c. Koelreuter.

Length four inches, the body carinated behind, slightly undulated with brown and pale, the middle of the sides and base of the tail with a round brown black spot, surrounded by a paler circle. An Indian species of the marine kind.

**FALCATUS.** Dorsal and anal fins falcated, the five first rays unarmed. Gmel.

Inhabits America, the colour silvery, and length of the breast; the teeth are acute, and the ventral fins small.

**RUFUS.** Tail lunate; body entirely tawny. Loefl. *Turdus fluxus*, Catesby.

An American species.

**ZELANICUS.** Tail lunate; body above green, beneath pale purple. Ind. Zool.

An edible fish. It inhabits Ceylon. The head is blue, the gill-covers green, with purple lines; pectoral fins with a purple spot in the middle, and edged with blue; ventral blue; dorsal and anal bluish-purple edged with green; tail in the middle yellow, each side streaked with red, at the base blue.

**AVENA.** Body silvery; rays of the dorsal fin two—five, and nearly unarmed. Forst.

Inhabits the sandy shores of Arabia. The length six inches; body oblong; belly straight, and sometimes marked with interrupted stripes; the lips are equal, the upper protractile; teeth numerous and very short; lateral line nearer the back, and almost parallel; tail bilobate, the lobes lanceolate, and the fins glaucous.

**CATENULA.** Lower jaw longer; back elevated; on each side eight series of very small equal spots, and two transverse bands upon the nape. *Le labre chopetet*, Lacepede.

Observed by Commerçon in the Indian seas. This and several of the following new species are probably species of the Linnæan *Sciæna*.

**LONGIROSTRIS.** Snout much advanced; gill-covers of two pieces. *Le labre long-muscau*, Lacepede.

Found with the preceding.

**MELAPTERUS.** Fins black; head bare of scales. *Labrus melapterus*, Bloch. *Le labre à nageoires molles*, Buff.

A native of Japan.

**SEMI-RUBER.** Four teeth in the upper jaw larger; anterior half of the body red, the posterior yellow. *Le labre demi-rouge*.

Observed by Commerçon in the Indian seas. The base of the posterior part of the dorsal fins scaly.

**PUNCTULATUS.** Upper lip large, thick, and plicated; three longitudinal rows of black dots on the dorsal fin, and one on the posterior part of the anal fin. *Le labre tetracanthæ*, Lacepede.

Native country unknown.

**SEMIDISCUS.** Pale, with numerous black transverse bands; tail terminated in a clear pale crescent. *Le labre demi-disque*, Lacepede.

The bands across the body of this fish are about nineteen in number, and the dorsal fin festooned. A species found in the Indian seas.

**DOLIATUS.** Grey, with about twenty-three transverse brown bands; caudal fin crescent-shaped. *Le labre cercle*, Lacepede.

A native of the Indian seas.

**HIRSUTUS.** Six larger teeth in the upper jaw; lateral line hirsute with small spines; body with numerous longitudinal lines. *Le labre hérissé*, Lacepede.

Inhabits the Indian seas.

**FURCATUS.** Lower jaw longer; teeth small; lobes of the caudal fin pointed and very long. *Le labre fourchu*, Lacepede.

Found in the same seas as the former.

**SEX-FASCIATUS.** Opening of the mouth very small; lower jaw longer; body with six transverse bands. *Le labre six bandes*, Lacepede.

Observed with the preceding by Commerçon.

**OCTO-VITTATUS.** Teeth in the upper jaw much longer; on each side the body four somewhat oblique rays. *Le labre huit raies*, Lacepede.

Found in the Indian seas. The tail in this kind is crescent formed.

**LEVIS.** Lower jaw longer; teeth large, recurved, and equal; lateral line nearly straight; body with five large transverse spots or bands. *Le labre lisse*, Lacepede.

A native of the Indian seas.

**GOUANI.** Each gill-cover composed of three plates, and terminating in a large rounded projection; lateral line obsolete; between the thoracic fins a pointed process. *Le labre gouan*, Lacepede.

Country unknown.

**MACROPTERUS.** A black spot on the posterior angle of

the gill-covers; nearly all the rays of the fins terminating in filaments. *Le labre macroptere*.

A species met with in the Indian seas by Commerçon, in his voyage round the world.

**PLUMIERI.** Head rayed with blue; body silvery, with spots of blue and golden-yellow, and curved transverse band on the tail. *Le labre plumierien*, Lacepede.

Found in the American seas.

**ENNECANTHUS.** Lateral line interrupted; body with six transverse bands, and two on the tail. *Le labre enne-cantbe*, Lacepede.

Each jaw is furnished with two or four large and very strong teeth, and the scales are considerable in point of size. Its native place is unknown.

**KISMIRA.** Head with seven small blue rays each side, and four larger of the same colour each side of the body; tail crescent-shaped. *Le labre kismira*, Lacepede.

Native of the Red Sea.

**IRIS.** Gill-covers composed of four plates, and ending in an angular projection; a large oval black spot with white annulation at the posterior part of the dorsal fin.

Inhabits the fresh waters of Carolina, where it is very common, and is esteemed as an edible fish.

\*\* *With tail entire.*

**HIATULA.** Anal fin none; body with six or seven black bands. Linn.

Communicated to Linnæus by Dr. Garden. The species inhabits Carolina, and constitutes the genus *hiatula* of Lacepede. Whether *L. griseus* before mentioned be really of this genus, or is defective only in the representation, appears uncertain. Should it actually be destitute of the anal fin, as described, it must probably be placed in the same genus (*hiatula*) as this species, notwithstanding the difference in the form of the tail.

The lip in the present fish is retractile, and wrinkled within; jaws beset with sharp teeth, those in the palate orbicular; gill-covers punctured at the edge; spinous rays of the dorsal fin equal, on the posterior part black.

**MARGINALIS.** Subfuscous; edges of the dorsal and pectoral fins tawny. Locell. it.

Inhabits the ocean.

**FERRUGINEUS.** Sides blueish, with a longitudinal, tawny, indented stripe each side. Gmel.

An Indian species.

**IULIS.** Body above fuscous and green; beneath white, with a fulvous dentated stripe each side; two fore-teeth longest. *Donov. Brit. Fishes. Labrus iulis; supra fuscus viridisque subtus albus vitta fulva utrinque dentata, dentibus duobus primoribus supra longioribus*, Ibid. *Labrus iulis*, Linn. *Labrus iulis*, Bloch?

“Discovered on the coast of Cornwall in the year 1802. As a native of the Mediterranean sea, this fish is mentioned by various writers; but as a British species it is perfectly new, not having been recorded as such either by Willoughby, Ray, Borlase, Pennant, or any other writer on the zoology of this country.”—“This fish has arrested the attention of many ichthyologists among the ancients as well as moderns, the former of whom pronounced it the most beautiful of European fishes. It may be collected from the works of Ælian, Aristotle, Salvian, Aldrovandus, and others, that this fish is common at certain seasons in the Mediterranean. Ælian speaks of it, however, as a poisonous fish, and of such a venomous nature that it would be unsafe to eat it, or even the flesh of any other fish that had been touched by it. Galen mentions it, on the contrary, as wholesome food. The male of this species is distinguished,

guished, according to some writers, by having the back of a black colour, instead of green, as in the female; but it appears in this and other respects to be an extremely variable species. Neither are its habits and manners correctly known. It is generally asserted that it swims in small shoals: Aristotle speaks to this effect; but this is contradicted by Salvia and others, who describe it as a more solitary fish, &c." Vide Brit. Fishes.

The usual length is about seven or eight inches.

**PAROTICUS.** Lateral line curved; fins rufous; gill-coverers æræulean blue. Linn. Mus. Ad. Fr. Native of India.

**SUILLUS.** Dorsal fin filamentous; above the tail a black spot; dorsal spines nine. Linn. Fa. Suec. *Sparus berg fhytra*, It. Wg.

Inhabits the shores of Europe.

**STRATUS.** Dorsal fin filamentous; body with white and brown lines. Linn.

Native of America.

**GUAZA.** Fuscous; tail rounded, the rays extending beyond the membrane. Loeff.

Inhabits the ocean.

**OCCELLARIS.** Dorsal fin filamentous; an ocellate spot at the base of the tail. Linn.

Country unknown.

**PUNCTATUS.** Dorsal fin filamentous; body with longitudinal lines spotted with brown. Gmel. *Sciæna*, &c. Linn. *Labrus*, Gronov.

Found in Surinam.

**MELOPS.** Dorsal fin filamentous, and with the anal variegated; behind the eyes a brown crescent. Linn.

Inhabits the south of Europe.

**NILOTICUS.** Dorsal, anal, and caudal fins clouded. Linn. *Labrus niloticus*, Hasselq.

Inhabits Egypt.

**OSSIFRAGUS.** Lips doubled; dorsal fin with thirty rays. Linn.

An European species.

**RUPESTRIS.** Dorsal fin filamentous; tail with a brown spot at the upper edge. Gmel. *Sciæna*, &c. Linn. *Caradse*, Ströem.

Found on the rocky shores of Norway.

**ONITIS.** Dorsal fin filamentous; belly spotted with cinereous and brown. Linn.

Country unknown.

**VIKIDIS.** Green, with a blue line each side. Art.

Inhabits the Mediterranean.

**LINÆATUS.** Fins greenish, the dorsal one ramentous; body green, with numerous yellowish longitudinal lines. Donovan. Br. Fishes.

"A new and highly interesting species, described on the authority of an example found by captain Bray on the coast of Cornwall. This specimen, which is in our possession, is seven inches in length; the prevailing colour greenish, with the belly yellowish," &c. Vide Br. Fishes.

**LUSCUS.** All the fins yellow; upper eye-lid black. Linn.

Country unknown.

**LIVENS.** Tail rounded; dorsal fin filamentous; body livid brown. Linn.

**EXOLETUS.** Dorsal fin filamentous; body lined with blue; anal fin with five spines. Müll. Zool. Dan.

Inhabits the Atlantic and Norway seas, and also Greenland, though rarely.

**SINENSIS.** Dorsal fin filamentous; body livid; crown retuse. Gmel.

An Asiatic species.

**JAPONICUS.** Fine yellow. Houttuyn.

Length six inches, and inhabits Japan.

**BOOPS.** Lower jaw longer; dorsal fin two. Houttuyn.

Found in Japan with the latter.

**TINCA.** Dorsal fin ramentaceous; body yellowish, variegated with blue and red spots; fins red, with fuscous margins, and dotted with white. Donovan. Br. Fishes. *Pinna dorsali ramentacea, corpore flavescente cæruleo variegato rubroque maculato, pinnis rubris sifco marginalis albo-guttatis*, Ibid. *Labrus tinca*, Linn. *Labrus vetula*, Bloch. *Turdus vulgatifissimus*, Will. *Vielle, poule de mer, gallat*, Belon. *Wraffe, or old wife*, Ray.

Most writers concur in admitting the labrus tinca as a fish almost, if not exclusively, peculiar to this country. "Habitat in maris Britannici profundis scopulosis," says Gmelin; and this opinion is sanctioned by the countenance of Lacedæpede and others. Hence it cannot be improper to regard it chiefly as a British production; and as such, it will not be amiss to repeat some observations that have been already delivered by us on this subject, in the volumes of British Fishes to which we have before adverted.—"This charming species of wrasse cannot but be considered as one of the most beautiful of the fish tribe observed to this time on the coasts of Britain," &c.—"We have obtained this species from Scarborough, and other eastern coasts of England, more than once; we have received it also from Cornwall, from the Skerry islands, north of Anglesea, and from Scotland; but have been uniformly led to believe it a species not very common on either of these coasts, except near Scarborough. The usual length of this species is about fifteen or eighteen inches, and its form rather bulky in proportion to the length. The prevailing colour is yellowish, inclining to greenish or olivaceous on the back, and white towards the belly; the markings variable in form, and diff ring much in colour. The whole of the back and sides are spotted with red, varying in different specimens from a deep or purplish crimson to a reddish-orange, and even in some varieties almost to fulvous, and curiously marked with irregular lines, dots, and specklings of æræulean blue, especially about the head; the fins are red, with a broad dusky border inclining more or less to purple, and elegantly marked with numerous roundish dots of white. Bloch considers the dusky border of the fins (which in the specimen he delineates is black) as a sufficient indication of the species. In his fish, the black border was distinct only in the ventral, anal, and caudal fins; to which may be added, that the dorsal fin is commonly dusky or purplish, as well as those before mentioned.

"Bloch describes this fish under the title of labrus vetula, and as a native of the coasts of Brittany, Normandy, and the North sea; from the last of which he received it through the medium of his friend, M. Spengler. Gmelin, as before remarked, speaks of it as an inhabitant of the British coasts, probably on the authority of Ray and Willughby. But the species is not confined to Europe; a specimen of it, taken among a variety of other fishes by captain Cook in the South seas, is at this time in our collection.

"The haunts of this fish are deep waters on the boldest rocky shores, where it subsists on crabs and tellaceous animals; for the maceration of which, the three tuberculated bony processes of its throat are admirably constructed. This fish takes bait eagerly, and is more commonly caught with the hook and line than in the net, or by any other mode of capture.

"It appears Mr. Pennant had not considered the varieties of this fish attentively, or, we think, the ballan wrasse would not have been described as a species distinct from the labrus tinca.

tinca. The ballan wrasse of that writer is certainly the same as our fish, from which it differs only in being of a paler colour, and in having the body marked with yellowish instead of orange or red. Such pale coloured varieties occur pretty frequently, and are indeed more common than those of deeper or more lively colours. Dr. Turton suspects the ballan wrasse to be a variety only of the labrus tinca of Linnæus, though he describes it as a species with this distinctive character: "Body yellow, spotted with orange; above the nose a deep fulcus; farther gill-cover with a deep depression radiated from the centre." In these particulars Dr. Turton was misled by the account given by Mr. Pennant, without reflecting that the same characters apply precisely to labrus tinca. Mr. Pennant informs us, the ballan wrasse "was the form of the common wrasse, only between the dorsal fin and tail was a considerable sinking; above the nose was a deep fulcus; on the farthest cover of the gills was a depression radiated from the centre." It is already shewn that the spots on this fish vary considerably; to which may be added, that the sinking between the dorsal fin and tail is conspicuous in all the varieties of labrus tinca, and so also is the fulcus above the nose. With regard to the last characteristic, the radiated depression on the gill-covers, one, two, or more such depressions are apparent on those parts, when divested of the large scales that adhere to them; every scale, of which there are several on the gill-covers, leaving such a radiated depression on the thin membrana eous skin, when taken off. Those particulars inclined us to believe Mr. Pennant was in some measure deceived by the imperfect state of the Scarborough specimen he examined; and our opinion has been since confirmed by various circumstances. Mr. Travis, the son of the medical gentleman who furnished Mr. Pennant with the specimen he describes, informs us the ballan wrasse is the individual fish commonly known by the name of *old wife* among the fishermen on the Scarborough coasts, where it appears in shoals during summer, and that there is only one sort found in those parts. This kind we have examined, and have no hesitation in stating it to be the ballan wrasse of Pennant, and the labrus tinca of every other ichthyologist." Vide Brit. Fishes, vol. iv.

In the details above mentioned we find some further arguments on this subject, which the limits of our article cannot permit us to repeat. For the length of the present digression we must indeed offer an apology, and this will doubtless be accepted on the following grounds. The Ballan wrasse of Mr. Pennant has been almost uniformly admitted as a species by the best writers; when the account from which the preceding extracts were taken was published, we were aware it was received as a species by several respectable writers, and since that period, we have observed it included as such by a modern continental writer, M. de Bosc, under the name of le labre ballan; he speaks of it on the authority of English authors, and as a native of this country only. To correct this error, it will be admitted, was desirable, and it was certainly no less incumbent in declining to describe the ballan wrasse, to explain our motives for such omission.

VARIEGATUS. Red, with about four irregular parallel olive stripes on the sides, and an equal number of blue ones. Donovan. Br. Fishes. *Labrus variegatus*, Gmel. *Striped wrasse*.

A very elegant and local British fish. To Mr. Pennant we are indebted for an account of this species; he was so fortunate as to discover it some years ago; he found it on the coast of Anglesea, off the Sherry islands. The length of his specimen was ten inches, and we procured both sexes at the same place, and of a size rather larger, the female

measuring fourteen inches in length, and the male twelve. Brit. Fishes, vol. i.

CROMIS. Dorsal fin nearly united; second ray of the anal fin very large, thick, and compressed. Linn. Brown, &c. *Caracinus brasiliensis*, Ray. *Guatucepa*, Mareg.

Native of Carolina.

LINEATUS. Oblong; all the rays of the dorsal fin spinous, except the last. Linn.

Inhabits South America and India.

PERDICA. Tail even; back straight; crown smooth; body with indented yellowish stripes each side. Fork.

This and the two following species inhabit the sea about Constantinople.

SCINA. Body greenish, with white and yellow waves; between the eyes an impressed hollow, and before the hollow a groove. Fork.

The middle teeth large; anterior gill-covers slightly serrated behind, posterior unarmed; lateral line interrupted; pectoral fins yellowish and without spots, the rest obscure, yellow, spotted with blue.

LAPINA. Pectoral fins yellow; ventral blue, the rest violet spotted with blue. Fork.

Body oblong-oval, above brown, beneath whitish, the sides greenish-yellow, with three lines each side, each composed of a double row of red spots.

RAMENTOSUS. Greenish-brown; filament of the first dorsal spines twice as long as the ray. Fork.

Native of Arabia; the body lanceolate, spotted with violet on the fins, crown, and under the eyes; or sometimes fine green; scales large, rounded, entire, and disposed in nine rows from the belly to the back.

OCELLATUS. Greenish, with a scarlet ocellate spot behind each eye. Fork.

Inhabits the shores of Syria; the body suboval, back yellowish-brown, and the head marked with blue irregular lines.

LUNULATUS. Greenish-brown with darker bands, scales with each a ferruginous band; breast speckled with red. Fork.

Length one foot; scales broad and entire. This species inhabits Arabia.

TRIMACULATUS. Red; on each side at the base of the dorsal fin two dark spots, and a third between the dorsal fin and tail. Donovan. Br. Fishes. *Labrus trimaculatus*, Gmel. *Labrus carneus*, le Paon rouge, Bloch. *Trimaculatus wrasse*.

"The length of this species is about twelve inches; its form is graceful, and the colours, when recent, of peculiar elegance and delicacy. A fine orange varying to red upon the back, and becoming paler and whiter towards the belly, is the chief and most prevailing colour. The dorsal fin and tail are fine orange, the former strongly marked with dark purplish-black, and prettily edged with blue; and the rest of the fins paler. The three dark spots at the posterior extremity of the back, which principally constitutes the specific distinction of this kind of wrasse, are of a rich blackish purple. There are also four other spots of a delicate rose colour, situated contiguous to these, and which do not appear to have been mentioned by any writer. Two of these spots are disposed in the space between the three darker ones before mentioned, and the third and fourth are placed one at each extremity of the outermost ones, so as to form together a series of seven spots, which are alternately of a pale rose colour and a very deep purple. This species is uncommonly rare. Our specimen was caught on the coast of Cornwall in June 1801." Vide Brit. Fishes, v. ii.

**OLIVACEUS.** Body olive-green; gill-covers blue at the tip; tail with a black spot. Brunn.

Native of the Mediterranean; the length two inches; body oblong, compressed, beneath inclining to silvery.

**FUSCUS.** Body brown, with blue lines and spots. Brunn.

Length three inches, compressed oblong, beneath whitish. The species inhabits the Mediterranean.

**UNIMACULATUS.** Body lined with olive; dorsal fin behind with a black spot. Brunn.

Inhabits the Mediterranean, and a supposed variety of it, which is reticulated with dusky and greenish filvery, occurs in the Adriatic. The body is three inches long, oval, compressed, and marked with about ten pale blue longitudinal lines.

**VENOSUS.** Green, with anastomosing veins; gill-covers and dorsal fin with a black spot. Bloch.

Native of the Mediterranean; body oval, and compressed; sides of the head with a few longitudinal red lines; filaments and band on the dorsal fin red. Length three inches.

**CRISEUS.** Body grey, with darker spots; tail with a black spot at the base. Brunn.

Length three inches, oval; cheeks lined with blue; fins reddish, with dusky yellow spots. Found in the Mediterranean.

**CUTTATUS.** Body reddish, variegated with black; tail with a spot on the middle of the base. Brunn.

Native of the Mediterranean.

**ADRIATICUS.** Body with four broad transverse brown bands; dorsal fin on the anterior part ten-spined; on the posterior part marked with ocellated black spots. Brunn.

Length three inches; body pale; head with oblique tawny lines.

**LEOPARDUS.** Two teeth in the front of each jaw larger; body speckled with brown; from the eyes to the gill-covers a dark line, and on the tail a black band. *Le labre leopard*, Lacepede.

A species found in the Indian seas, and called leopardus, from the colours and markings on the body, tail, the dorsal and anal fin, resembling those of the leopard. It was discovered by Commerçon.

**BIVITTATUS.** Back red, sides yellow, with two longitudinal brown rays, the upper one of which extends from the eye, the lower from the pectoral fin. *Le labre a deux lignes*, &c. Bloch. *Le labre bivaillé*, Lacepede.

The country unknown.

**MACROLEPIDOTUS.** Yellow; scales large; nine spines in the dorsal fin; beneath the eyes two rows of pores. *Le labre a grandes écailles*, &c. Bloch.

Supposed to be an inhabitant of the Indian seas.

**ALBO-RADIATUS.** Lips very thick; body yellowish, with two very long white rays, and a third above shorter. Mem. Acad. Petr.

Country unknown.

**MARMORATUS.** Marbled with brown and whitish. *Le labre marbré*, Lacepede.

A native of the Indian seas; discovered by Commerçon. The teeth are equal and distinct.

**BERGYLLA.** Scales large; the last rays of the anal and dorsal fin much larger than the others. Bloch, &c. *Le labre bergylle*, Lacepede.

Found in deep seas in the north of Europe: feeds on crabs and shells, and grows to the length of ten or twelve inches.

**HORTULANUS.** Body and tail decussated with dark

stripes, and a spot in each division. *Le labre puertere*, Lacepede.

Native of the Indian seas.

**CALOPS.** Scales large; lateral line straight; near the pectoral fins a large brown spot. *Le labre calops*, Lacepede.

Inhabits the seas of Europe, and is known at Dipppe under the name of "brune." The eyes are large and black; the back dusky.

**ASCANI.** Above red, varied with green spots and streaks, and the under parts yellowish, speckled with red. *Le rose ascanius*.

Length seven inches; green stripes on the dorsal and anal fin about two or three in number; tail green, with the tip red.

**CYANOPTERUS.** Above varied with red, green, and yellow; beneath green and brown; fins blue. *Chelodiptere cyanoptere*, Lacepede.

A beautiful species, found in the American seas.

**CINGULUM.** Anterior parts livid, posterior brown, with an intermediate white girdle; dorsal fin edged with white. Lacepede, &c.

Native of the Indian seas.

**DIANA.** Four larger teeth in the upper jaw; in the lower two; centre of each scale marked with a brown crescent. *Le labre diane*, Lacepede.

An Indian species.

**MACHODON.** Scales large; mouth furnished with four larger curved teeth. *Le labre machodonte*, Lacepede.

**NEUSTIHE.** Back varied with brown, orange, and greenish, the sides marbled with brown, orange, and white. *Le labre Neustihien*, Lacepede.

Found in the Seine, where the fishermen distinguish it by the title of "grande vieille," and "bandouliere marbre."

**CRUENTATUS.** Silvery, with large irregular spots of sanguineous. *Le labre ensanglanté*, Lacepede.

Observed by Plumier in the American seas.

**KARUTA.** Body blackish, with a yellow longitudinal stripe each side, and beneath yellowish with rufous fin. *Jobnius karutta*, Bloch. *Le labre karuta*, Lacepede.

An Indian species.

**CUPREUS.** Somewhat silvery; head, back, and fins, tinged with coppery. *Jobnius aneus*, Bloch.

Shape lanceolate. This species inhabits the Indian seas, and is called Anei kattale by the natives of Malabar.

**ANNULATUS.** Body encircled by nine regular straight bands or rings. *Le labre annelé*, Lacepede.

One of the species found by Commerçon in the Indian seas.

**BRAILIENSIS.** Two teeth in the upper jaw longer and recurved; dorsal and anal fin with two or three longitudinal lines. Bloch, &c.

Found on the coasts of Brazil, where it is taken with the hook and line; the flesh is excellent.

**TESSELLATUS.** Back white, sides silvery, and divided into compartments like a waincoat. *Labrus tessellatus*, Bloch. *Le labre boife*, Buff.

This kind inhabits the North seas. Some French authors call it "perroquet boife."

**CORNUBIUS.** Body variegated with green; near the tail a large fuscous spot; anal fin yellow, obliquely banded with fuscous. Donovan. Brit. Fishes. *Labrus cornubius*, Gmel. *Goldfury*, Ray.

This beautiful species is about a palm's length, the back brownish, beneath which the green prevails, and below this the sides and lower part are yellowish silvery; anal fin golden yellow, whence its name.

**COMBER.** Back, fins, and tail red; belly yellow. *I. corpeo miniato, cauda rotundata*, Gmel. *Comber*, Ray, &c.

A small species of an oblong form, recorded by Ray as an inhabitant of the shores of Cornwall.

**COQUEUS.** Purple and dull blue, beneath yellow. Gmel. Inhabits fame place as the former, according to Ray.

**MIXTUS.** Variegated with yellow and blue; anterior teeth larger. Arted.

Found on the shores of Dalmatia.

**FULVUS.** Body fulvous, Gmel. *Turdus cauda convexa*, Cateby.

A native of America.

**VARIUS.** Varied with purple, green, blue, and black. Art.

Native of the Mediterranean.

**MERULA.** Blackish blue. Art.

An European species.

**CYNAEDUS.** Pale yellow; back purple; dorsal fin reaching from head to tail. Art.

Found in the Mediterranean.

**LABURNUM**, in *Botany*. See **CYTISUS** and **ANAGYRIS**.

**LABURNUM**, in *Gardening*, a common name applied to a beautiful, flowering, ornamental tree, for pleasure and other grounds. There are two sorts of this tree in use generally, which, while young, have much the same appearance in the wood and foliage, but are afterwards readily distinguished by the smallness and fineness of the flowers, and of that of the branches. The fine flowered and more branchy sort, is the most proper for situations where ornament is required, such as shrubberies and pleasure grounds; but the more coarse strob growing kind, succeeds best in poor, gravelly, and rocky situations.

**LABY**, in *Geography*, a town of Sweden, in the province of Upland; 12 miles N. of Uplal.

**LABYRINTH**, *Λαβυρινθος*, among the *Ancients*, was a large and intricate edifice cut out into various isles and meanders, running into each other, so as to render it difficult to get out of it.

There is mention made of four celebrated labyrinths among the ancients, ranked by Pliny in the number of the wonders of the world; *viz.* the Cretan, Egyptian, Lemnian, and Italian.

That of Crete is the most famed; it was built, as Diodorus Siculus conjectures, and Pliny positively asserts, by Dædalus, by command of king Minos, who kept the Minotaur shut up in it, on the model of that of Egypt, but on a less scale: but both affirm, that in their time it no longer existed, having been either destroyed by time, or purposely demolished. It was hence that Theseus is said to have made his escape by means of Ariadne's clue.

Diodorus Siculus and Pliny represent this labyrinth as having been a large edifice; while others have considered it as merely a cavern hollowed in the rock, and full of winding passages. If the labyrinth of Crete, says the Abbé Barthelemi (*Travels of Anacharis*, vol. iv. p. 441, &c.), had been constructed by Dædalus under the order of Minos, whence is it that we find no mention of it, either by Homer, who more than once speaks of that prince, and of Crete, or by Herodotus, who describes that of Egypt, after having said that the monuments of the Egyptians are much superior to those of the Greeks; or by the more ancient geographers; or by any of the writers of the ages in which Greece flourished? This work was attributed to Dædalus, whose name, says our author, is sufficient to discredit a tradition. His name, like that of Hercules, had become the resource of ignorance, whenever it turned its eyes on the early ages. All

great labours, all works which required more strength than ingenuity, were attributed to Hercules; and all those which had relation to the arts, and required a certain degree of intelligence in the execution, were ascribed to Dædalus. According to Diodorus and Pliny no traces of the labyrinth of Crete existed in their time, and the date of its destruction had been forgotten. Yet it is said to have been visited by the disciples of Apollonius of Tyana, who was contemporary with those two authors. (*Philoltrat. Vit. Apoll. l. iv. c. 34.*)

The Cretans, therefore, believed that they possessed the labyrinth. At Nauplia, near the ancient Argos, says Strabo (l. viii.), are still to be seen vaulted caverns, in which are constructed labyrinths that are believed to be the work of the Cyclopes; the meaning of which, as Barthelemi understands him, is, that the labours of men had opened in the rock passages which crossed and returned upon themselves as in quarries. Such, he says, is the idea we ought to form of the labyrinth of Crete. He then suggests an enquiry, whether there were several labyrinths in that island? Ancient authors speak only of one, which most of them place at Cnossus, and some few at Gortyna. Belon and Tournefort describe a cavern situated at the foot of mount Ida, on the fourth side of the mountain, at a small distance from Gortyna: which, according to the former, was a quarry, and according to the latter, the ancient labyrinth. Besides this another is supposed to have been situated at Cnossus, and in proof of the fact it is alleged, that the coins of that city represent the plan of it. The place where the labyrinth of Crete was situated, according to Tournefort, was, as Barthelemi supposes, one league distant from Gortyna; and according to Strabo, it was distant from Cnossus six or seven leagues; with respect to which our author concludes, that the territory of the latter city extended to the vicinity of the former. In reply to the inquiry, what was the use of the caverns, denominated labyrinth, Barthelemi imagines, that they were first excavated in part by nature; that in some places stones were extracted from them for building cities, and that, in more ancient times, they served for an habitation or asylum to the inhabitants of a district exposed to frequent incursions. According to Diodorus Siculus, the most ancient Cretans dwelt in the caves of mount Ida. The people, when inquiries were made on the spot, said, that their labyrinth was originally a prison. It might indeed have been applied to this use; but it is scarcely credible that, for preventing the escape of a few unhappy wretches, such immense labours would have been undertaken. See **CRETE**.

The labyrinth of Egypt, according to Pliny, (*N. H. v. ii. l. 36.*) was the oldest of all; and was subsisting in his time, after having stood, according to tradition, as he says, 4600 years. He says it was built by king Petesuchus, or Tithoës; but Herodotus makes it the work of several kings: it stood on the southern bank of the lake Meris, near the town of Crocodiles, or Arinoe, and consisted of twelve large contiguous palaces, in which the twelve kings of Egypt assembled to transact affairs of state and religion, containing 3000 apartments, 1500 of which were under ground.

This structure seems to have been designed as a pantheon, or universal temple of all the Egyptian deities, which were separately worshipped in the provinces. It was also the place of the general assembly of the magistracy of the whole nation; for those of all the provinces or nomes met here to feast and sacrifice, and to judge causes of great consequence. For this reason, every nome had a hall or palace appropriated to it; the whole edifice containing, according to Herodotus, twelve; Egypt being then divided into so many kingdoms.

Pliny makes the number of these palaces 16, and Strabo makes them 27. All the halls were vaulted, and had an equal number of doors opposite to one another, six opening to the north, and six to the south, all encompassed by the same wall. The exits, by various passages and innumerable returns, afforded to Herodotus a thousand occasions of wonder. The roofs and walls within were incrusted with marble, and adorned with sculptured figures. The halls were surrounded with pillars of white stone finely polished; and at the angle, where the labyrinth ended, stood the pyramid, which Strabo asserts to be the sepulchre of the prince who built the labyrinth. According to the description of Pliny and Strabo, this edifice stood in the midst of an immense square, surrounded with buildings at a great distance. The porch was of Parian marble, and all the other pillars of marble of Syene; within were the temples of their several deities, and galleries, to which was an ascent of 90 steps, adorned with many columns of porphyry, images of their gods, and statues of their kings, of a colossal size: the whole edifice was constructed of stone, the floors being laid with vast flags, and the roof appearing like a canopy of stone: the passages met, and crossed each other with such intricacy, that it was impossible for a stranger to find his way, either in or out, without a guide; and several of the apartments were so contrived, that on opening of the doors, there was heard within a terrible noise of thunder. Although the Arabs, since the days of Pliny, helped to ruin this structure, yet a considerable part of it is still standing. The people of the country call it the palace of Charon. See a plan and description of this labyrinth, in the present state of it, in Pouchock's Hist. of the East, vol. i. p. 61, &c. See also Perry's View of the Levant, p. 381, &c.

Strabo, Diodorus Siculus, Pliny, and Mela speak of this monument with the same admiration as Herodotus; but not one of them says that it was constructed to bewilder those who attempted to pass through it; though it is manifest, that, without a guide, they would have been in danger of losing their way. The Abbé Barthelemi (ubi supra) suggests, that this danger introduced a new term into the Greek language. The word labyrinth, taken in the literal sense, signifies a circumscribed space, intersected by a number of passages, some of which cross each other in every direction, like those in quarries and mines, and others make larger or smaller circuits round the place from which they depart, like the spiral lines that are visible on certain shells. Hence it has been applied, in a figurative sense, to obscure and captious questions, to indirect and ambiguous answers, and to those discussions, which, after long digressions, bring us back to the point from which we set out.

The labyrinth of Lemnos was supported by columns of wonderful beauty; there were some remains of it at the time when Pliny wrote. That of Italy was built by Porfenna, king of Etruria, for his tomb.

**Labyrinth, in Gardening,** a sort of maze or wilderness plantation, abounding with hedges and walks, distributed into many windings and intricate turnings, leading to one common centre, extremely difficult to be found out, designed by way of amusement. This is commonly formed with hedges, in double rows, leading in various twistings and turnings, or backward and forward, with intervening plantations and gravel-walks alternately between hedge and hedge. The great object is to have the walk contrived in so many mazy intricate windings, as to cause much labour and difficulty to find out the centre, or out again in the way a person came in. But they are now rarely introduced into modern garden designs; and scarcely to be seen, except in some old Gardens.

The hedges for this use are usually of hornbeam, but may be of beech, elm, or any other sort of tree or shrub that can be kept in neat order by clipping. The walks should be five feet wide at least, laid with gravel, and neatly rolled; and the trees and shrubs to form the thicket of wood between the hedges of any of the hardy kinds of the deciduous tribe interspersed with some evergreens. In the middle, a space should be left open as the centre. The labyrinth which is, we believe, still in existence at Hampton Court, is almost wholly formed of the common elm tree, cut in so as to keep it down to the proper height.

But small labyrinths are occasionally formed with box edgings, and borders for plants, and alleys for walking in, in imitation of the large ones, and which have good effect in small garden-grounds.

**Labyrinth, in Geography,** a cluster of small islands in the Pacific ocean, discovered in 1722, by captain Roggeveen, 75 miles W. from the Pernicious islands.—Also, a chain of shoals, rocks, and small islands on the E. coast of New Holland, extending from Cape Tribulation to Cape York.

**LABYRINTHUS,** in Anatomy, a name given, on account of its apparently complicated structure, to the internal organ of hearing; to the part, indeed, which, from its receiving the auditory nerve, is the true seat of the sense. See EAR.

**LAC,** or **LACCA,** Gum, as it is commonly, though not very properly, denominated, because it is neither a gum nor a resin, is a kind of compound substance, prepared by the female of a minute insect, called by some *Coccus Lacca*, and by others *CHERMES Lacca*, which is found in several species of trees in the East Indies, and particularly on the banyan-tree (*Ficus indica* and *religiola* of Linnæus), several species of Mimosa, and the Biber on *Rhamnus jujuba*. These insects are nourished by the trees on which they are produced, and fix themselves upon the succulent extremities of the young branches; and around their edges they are environed with a spissid sub-pellucid liquid, which seems to glue them to the branch. It is the gradual accumulation of this liquid, which forms a complete cell for each insect, and is what is called Gum Lacca. When the cells are completely formed, the insect is in appearance an oval, smooth, red bag, without life, about the size of a small cochineal insect, emarginated at the obtuse end, full of a beautiful red liquid. When the eggs are hatched, the young insects, or grubs, first feed upon the red liquid above-mentioned, and when this is expended, they pierce a hole through the coat that invests them, and move off one by one, leaving their exuvie behind, which are the white membranous substance found in the empty cells of the Stick lac. The accumulation of lac appears in the economy of this insect to be the substance that answers the double purpose of a nidus and covering to the egg or insect in the first stage of its existence, and of food for the maggot in its more advanced state. The lac is formed into complete cells, finished with as much regularity and art as the honey-comb, but differently arranged. The flies are invited to deposit their eggs on the branches of the trees by besmearing them with some of the fresh lac steeped in water, which attracts the fly, and gives a better and larger crop. For a particular description of these insects, and their cells, we refer to the papers of Mr. James Kerr, of Patna; Mr. Robert Saunders, surgeon, at Boglepore, in Bengal; and Dr. Roxburgh, of Samulcotta, in the Philosophical Transactions, vols. lxxi. lxxix. and lxxxii. Lac is a staple article of commerce in Aflam, a country bordering on, and much connected with, Thibet, which furnishes the greatest quantity of that in use; and it is also found upon the uncultivated

tivated mountains on both sides of the Ganges. The only trouble in procuring it is that of breaking down the branches, and carrying them to market. The price in Daeca, in 1781, says Mr. Kerr, was about 12s. the hundred pounds weight, although it was brought from the distant country of Affan. The best lac is of a deep red colour. If it is pale, and pierced at the top, it is depreciated in value, because the insects have left their cells, and consequently they can be of no use as a dye or colour; though they may be probably better for varnishers. Of lac there are four kinds known in commerce: *viz.* 1. *Stick lac*, which is the lac in its natural state, from which all the others are formed. This is obtained in pretty considerable lumps, with much of the woody parts of the branches on which it is formed adhering to it. 2. *Seed lac*, which is the former broken into small pieces, garbled, and appearing in a granulated form. 3. *Lump lac*, which is *seed lac* liquefied by fire, and formed into cakes. 4. *Shell lac* is the purified lac, or the cells liquefied, strained, and formed into their transparent laminae. Lac is brought into this state, or purified, by the following process. It is broken into small pieces, and picked from the branches and sticks, and then put into a sort of canvas bag of about four feet long, and about six inches in circumference. Two of these bags are in constant use, and each of them held by two men. The bag is placed over a fire, and frequently turned till the lac is liquid enough to pass through its pores, when it is taken off the fire, and squeezed by two men in different directions, dragging it along the convex part of a plantain tree (*Musa paradisiaca* of Linnaeus), prepared for the purpose: while this is doing, the other bag is heating, to be treated in the same manner. The mucilaginous and smooth surface of the plantain-tree seems peculiarly well adapted for preventing the adhesion of the heated lac, and giving it the form, which enhances its value so much. The degree of pressure on the plantain-tree regulates the thickness of the shell, and the quality of the bag determines its fineness and transparency, upon which its value depends.

The lac is applied to various purposes by the natives in India. A great quantity of the *shell lac* is consumed in making ornamental rings, painted and gilded in a variety of tastes, to decorate the arms of the ladies; and it is formed into beads, spiral and linked chains for necklaces, and other female ornaments. It is also used for sealing-wax. For this purpose, take a stick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the shell lac softened above the fire; keep alternately heating and adding more shell lac, until you obtain a mass of three or four pounds of liquefied shell lac upon the end of your stick. Knead this upon a wetted board, with three ounces of levigated cinnabar, and form it into cylindrical pieces; and to give them a polish, rub them while hot with a cotton cloth.

For japanning, take a lump of shell lac, prepared in the manner of sealing-wax, with whatever colour you please, fix it upon the end of a stick, heat the polished wood over a charcoal fire, and rub it over with the half-melted lac, and polish by rubbing it even with a piece of folded plantain leaf held in the hand; heating the lacquer, and adding more lac as occasion requires. Their figures are formed by lac, charged with various colours in the same manner. In ornamenting their images and religious houses, &c. they make use of very thin beaten lead, which they cover with various varnishes, made of lac charged with colours. The preparation of them is kept a secret. The leaf of lead is laid upon a smooth iron heated by fire below, while they spread the varnish upon it.

For grindstones, take of river sand three parts, of feed lac washed one part, mix them over the fire in a pot, and

form the mass into the shape of a grindstone, having a square hole in the centre, fix it on an axis with liquefied lac, heat the stone moderately, and by turning the axis it may be easily formed into an exact orbicular shape. Polishing grindstones are made only of such sand as will pass easily through fine muslin, in the proportion of two parts of sand to one of lac. The sand is composed of small angular crystalline particles, tinged red with iron, two parts to one of black magnetic sand. The stone-cutters, instead of sand, use the powder of a very hard granite, called *Corundum*. These grindstones cut very fast: when they want to increase their power, they throw sand upon them, or let them occasionally touch the edge of a vitrified brick. The same composition is formed upon sticks; for cutting stones, shells, &c. by the hand.

For painting, take one gallon of the red liquid from the first working for shell lac, strain it through a cloth, and let it boil for a short time, then add half an ounce of fossil alkali; boil an hour more, and add three ounces of powdered load (bark of a tree), boil a short time, let it stand all night, and strain next day. Evaporate three quarts of milk, without cream, to two quarts, upon a slow fire, curdle it with some milk, and let it stand for a day or two, then mix it with the red liquid above-mentioned; strain them through a cloth, add to the mixture 1/2 oz. of alum, and the juice of eight or ten lemons; mix the whole, and throw it into a cloth-bag strainer. The blood of the insect forms a coagulum with the calcous part of the milk, and remains in the bag, while a limpid acid water drains from it. The coagulum is dried in the shade, and is used as a red colour in painting and colouring.

For dyeing, take one gallon of the red liquid prepared as before without milk, to which add three ounces of alum. Boil three or four ounces of tamarinds in a gallon of water, and strain the liquor. Mix equal parts of the red liquid and tamarind water over a brisk fire. In this mixture dip and wring the silk alternately, until it has received a proper quantity of the dye. To increase the colour, increase the proportion of the red liquid, and let the silk boil a few minutes in the mixture. To make the silk hold the colour, they boil a handful of the bark called load in water; strain the decoction, and add cold water to it; dip the dried silk into this liquor several times, and then dry it. Cotton cloths are dyed in this manner; but the dye is not so lasting as in silk. The lac colour is preferred by the natives upon flakes of cotton dipped repeatedly into a strong solution of the lac insect in water, and then dried. The Hindoos, as Mr. Charles Wilkins informed Mr. Hatchett, dissolve shell lac in water, by the mere addition of a little borax; and the solution, being then mixed with ivory-black, or lamp-black, is employed by them as an ink, which, when dry, is not easily acted upon by damp or water. Mr. Hatchett found this fact to be exactly as it was stated by Mr. Wilkins.

Besides the lac above-mentioned, there is another sort which is white or yellowish, brought from Madagascar, very much resembling the *pe-la* of the Chinese, which was found lately examined by Dr. Pearson. See *LACTIC ACID*.

Mr. Hatchett (*Phil. Trans.* for 1804, part ii.), has detailed a number of experiments for the analysis of the three common species of lac, with a view of ascertaining its constituent parts and discriminating properties.

Lac, though long known in Europe, has not much attracted the attention of chemists. The first person who subjected it to a regular examination was the younger Geoffroy, the result of which is published in the *Mem. de l'Acad. de Paris* for 1714. He concluded that this substance is not, as some have supposed, a gum or resin, which

has exuded from vegetables simply punctured by insects. Geoffroy and Lemery obtained from lac, by distillation, some acid liquor, and a butyraceous substance; and Geoffroy observes, that when stick-lac was thus treated, some ammonia was also obtained, but not when feed-lac was employed. Geoffroy considered lac as a kind of wax, very distinct from the nature of gum or resin. Since his time it has been little examined, and therefore chemists have entertained various opinions concerning it. Chaptal, adopting Geoffroy's opinion, calls it a kind of wax; but Gren and Fourcroy regard it as a true resin.

Mr. Hatchett found that when water is poured on stick lac, reduced to powder, it immediately began to be tinged with red, and by heat, a deep-coloured crimson solution was formed. Repeated operations of this kind reduce stick-lac to a yellowish-brown substance, and the water no longer receives any colour. The portion separated from the lac has, on an average, amounted to 10 per cent.; but as it cannot be completely separated, considerable variations must be expected in different samples.

Fine feed-lac does not afford more than  $2\frac{1}{2}$  or 3 per cent. of the colouring matter; and shell-lac, when treated in the same manner, *i. e.* merely with water, did not yield more than  $\frac{1}{2}$  per cent. Alcohol dissolves a considerable portion of each of the different kinds of lac; and when heat is not employed, the dissolved part is resin, combined with some of the colouring matter; but if the lac is digested with heated alcohol, the solution is more or less turbid, and it is difficult to obtain it in a state of purity and transparency, either by repose or filtration. The solution obtained by digesting stick-lac in alcohol, without heat, is of a dark brownish-red colour; and the insoluble part subsides, retaining the greater part of the colouring matter, most easily soluble in water. The proportion of resin thus dissolved, when stick-lac is treated with alcohol, amounted to  $57$  or  $68$  per cent. The feed-lac used by Mr. Hatchett was very pure, and yielded to alcohol about 88 per cent. of resin, containing little of the colouring matter. Shell-lac, in small fragments, by simple digestion with alcohol, afforded in the first instance nearly 81 per cent.; but part of the resin required subsequent operations to separate it, so that the total quantity of resin might be estimated at 91 per cent. Sulphuric ether does not seem to act so powerfully upon the varieties of lac as alcohol; and, therefore, ether is not the best menstruum for lac. Concentric sulphuric acid acts first on the colouring matter of lac; and after a short digestion in a sand-bath, the whole is converted into a reddish-brown thick liquor, which soon becomes black; and the chief part of the lac is separated in an insoluble state, resembling coal. During the solution of lac in sulphuric acid, a considerable quantity of sulphureous acid gas is evolved. When lac is digested with nitric acid, nitrous gas is at first produced; the lac swells much, and is converted into a deep yellow opaque brittle substance, which, by a sufficiency of nitric acid, and a continuance of the digestion for about 48 hours, is dissolved.

This yellow nitric solution is converted by evaporation into a deep yellow substance, which burns like resin, but is soluble in boiling water. Muriatic acid dissolves the colouring matter and gluten of lac with a feeble action, unless the resin has been previously separated. Acetous acid much resembles the muriatic in its effects. Stick-lac, feed-lac, and shell-lac are partially dissolved by acetic acid; and the dissolved part consists of the colouring extract of resin, and of gluten; the wax being the only ingredient which is insoluble in this menstruum. A saturated solution of boracic acid in water dissolves the colouring extract; but

the lac is little, if at all, acted upon by this acid. Subborate of soda or borax has a powerful effect on lac, so as to render it soluble in water; and it is concluded from these facts, that the excess of soda in borax is the active substance, which conclusion is corroborated by experiments made with the alkalis. In order to render lac, especially shell-lac, soluble in water, about one-fifth of borax is necessary. The best proportion of water to that of lac is 18 or 20 to 1; so that 20 grains of borax, and 4 oz. of water, are, upon an average, requisite to dissolve 100 grains of shell-lac. The general properties of the solution shew, that it is a saponaceous compound, which, being used as a varnish, or vehicle for colours, becomes (when dry) difficultly soluble in water. The lixivium of pure soda, and of carbonate of soda, completely dissolve the several kinds of lac; and the solutions resemble those formed by means of borax, excepting that they are deeper coloured. Lixivium of pure or caustic potash speedily dissolves the varieties of lac, and forms saponaceous solutions, similar to that with borax, exclusive of the colour, which more approaches to purple. Lixivium of carbonate of potash extracts a great part of the colouring matter, but less completely dissolves the entire substance of lac than pure potash. Pure ammonia, and carbonate of ammonia, readily act upon the colouring matter of lac, but do not completely dissolve the entire substance.

From a variety of other experiments, as well as those, the results of which we have given, but which we cannot recite, it appears that the different kinds of lac consist of four substances, namely, extract, resin, gluten, and wax. The extract, when dry, is of a deep red colour, approaching to purplish-crimson; emitting smoke when laid on a red-hot iron, with a smell like that of burned animal matter, and leaving a bulky porous coal; partially soluble in water, hot or cold; more slowly in alcohol, and with a less beautiful colour; insoluble in sulphuric ether; soluble in sulphuric, nitric, and acetic acid; partially in muriatic acid; not very readily in acetous acid; almost perfectly soluble in the lixivium of potash, soda, and ammonia, with a beautiful deep purple colour. When pure alumine is put into the aqueous solution, it does not immediately produce any effect, but with the addition of a few drops of muriatic acid, the colouring matter speedily combines with the alumine, and a beautiful lake is formed. A fine crimson precipitate is also produced by muriate of tin, when added to the aqueous solution: a similar coloured precipitate is also formed by the addition of solution of iron-glass. These properties of the colouring substance of lac, especially its partial solubility in water and in alcohol, and its insolubility in ether, together with the precipitate formed by alumine and muriate of tin, indicate that this substance is vegetable extract, perhaps slightly animalized by the cocculus.

The resin of lac is of a brownish-yellow colour, emitting on a red-hot iron much smoke, with a peculiar sweet odour, and leaving a spongy coal; completely soluble in alcohol, ether, acetic acid, nitric acid, and the lixivium of potash and soda; precipitated by water from alcohol, ether, acetic acid, and partially from nitric acid; and possessing the other general characters of a true resin.

The gluten is obtainable in two ways; if the pieces of lac, after digestion in alcohol, be digested with dilute acetic, or muriatic acid, most of the gluten is dissolved, and may be precipitated by alkalis, added in due proportion; but is dissolved by an excess of them, and then is separable by acids. It much resembles the gluten of wheat.

The wax of lac is found floating like oil on the surface of a solution of lac, after long and repeated digestion in boiling nitric acid, and may be collected when cold; or it may

be more easily obtained in a pure state, by digesting the residue left by alcohol in boiling nitric acid. The wax, thus obtained, when pure, is pale yellowish-white, and (unlike bees' wax) is devoid of tenacity, and extremely brittle: it melts at a much lower temperature than that of boiling water, and burns with a bright flame, and an odour resembling that of spermaceti. It is insoluble in water and cold alcohol; but the latter, when boiled, partially dissolves it, and upon cooling, deposits the greater part; soluble in heated sulphuric ether, but upon cooling, nearly the whole is deposited. Lixivium of potash, boiled with the wax, forms a milky solution; but most of the wax floats on the surface in the state of white flocculi, and appears to be converted into a kind of soap of difficult solubility; it is no longer inflammable; and, with water, forms a turbid solution, from which, as well as from the solution in potash, the wax may be precipitated by acids. Ammonia, when heated, dissolves a small portion of the wax, and forms a solution similar to the former; nitric and muriatic acids do not act upon the wax. When the properties of this substance are compared with those of bees'-wax, a difference will be perceived; and on the contrary, the most striking analogy is evident between the wax of lac and the myrtle wax which is obtained from the *Myrica cerifera*. The properties of myrtle wax, described by Dr. Boeckl in Nicholson's Journal for March, 1803, coincide perfectly with those of the wax of lac, that Mr. Hatchett is led to consider them as almost, if not altogether, the same substance.

Our author, from his analysis of the three different species of lac infers, that the substances that compose them bear the following proportions: 100 parts of stick-lac gave 68 of resin, 10 of colouring extract, 6 of wax, 5.5 of gluten, and 6.5 of extraneous substances: 100 parts of seed-lac gave 88.5 of resin, 2.5 of colouring extract, 4.5 of wax, and 2 of gluten: 100 parts of shell-lac gave 90.9 of resin, 0.5 of colouring extract, four of wax, and 2.8 of gluten.

We have already specified several uses to which lac is applied in India, and it is no less important, in a variety of respects in Europe. A solution of lac in water may be advantageously employed as a sort of varnish, which is equal in durability, and other qualities, to those prepared with alcohol; and, of course, much cheaper. It will be found, likewise, of great use as a vehicle for colours; for, when dry, it is not easily affected by damp, or even by water. Mr. Hatchett says, that with a solution of this kind he has mixed various colours, such as vermilion, fine lake, indigo, Prussian blue, sap-green, and gamboge; and it is remarkable, that although the two last are of a gummy nature, and the others had been previously mixed with gum (being cakes of the patent water-colour), yet, when dried upon paper, they could not be removed with a moistened sponge, until the surface of the paper itself was rubbed off. In many arts and manufactures, therefore, the solutions of lac may be found of great utility; for, like mucilage, they may be diluted with water, and yet, when dry, are little, if at all, affected by it.

The colour given by lac is less beautiful, but more durable than that given by cochineal. To render the colouring matter of the lac diffusible in water, so as to be applied to the stuffs to be dyed, Mr. Hellot directs the following process:—Let some powdered gum-lac be digested for two hours in a decoction of comfrey-root, by which a fine crimson colour is given to the water, and the gum is rendered pale or straw-coloured. To this tincture, poured off clear, let a solution of alum be added; and when the colouring matter has subsided, let it be separated from the clear liquor, and dried. It will weigh about one-fifth

of the quantity of lac employed. This dried fecula is to be dissolved or diffused in warm water, and some solution of tin is to be added to it, by which it acquires a vivid scarlet colour. This liquor is to be added to a solution of tartar in boiling water; and thus the dye is prepared.

The method of obtaining the fine red lac used by painters from this substance, is by the following simple process:—Boil the stick-lac in water, filter the decoction, and evaporate the clear liquor to a dryness over a gentle fire. The occasion of this easy separation is, that the beautiful red colour, here separated, adheres only slightly to the outides of the sticks, broken off the trees along with the gum-lac, and readily communicates itself to boiling water. Some of this sticking matter also adhering to the gum itself, it is proper to boil the whole together; for the gum does not at all prejudice the colour, nor dissolve in boiling water: so that after this operation the gum is as fit for making sealing-wax as before, and for all other uses which do not require its colour. See LAKE.

A tincture of gum-lac may thus be prepared:—Take two ounces of gum-lac, reduce it to a fine powder, and make it into a stiff paste with oil of tartar *per deliquium*; let this in an open glass to dry by a gentle heat, then remove it to the open air, that it may relent and grow soft; then dry it again, and repeat this two or three times, at the end of which the hard body of this resin will be found resolved into a purple colour. This may yet again be dried, and when dried must be reduced to powder, which powder will afford a fine strong tincture to spirit of wine, being boiled in it in a tall glass in a sand-heat for two or three hours. And by this process strong tinctures may be made from myrrh, amber, gum, juniper, &c. which will yield no tincture of strength to spirit of wine alone, if treated in the usual way.

A spirituous tincture of stick-lac was formerly sometimes given as a mild restringent and corroborant in female weaknesses, and in rheumatic and scorbutic disorders. But the principal medicinal use of this concrete was as a topical corroborant and antiseptic, in laxisities and scorbutic bleedings, and exulcerations of the gums. Some employed for this purpose a tincture of the lac in alum water; others a tincture made in vinous spirits, impregnated with the pungent antiscorbutics. The college of Edinburgh directed an ounce of the powdered lac, with half an ounce of powdered myrrh, to be digested in a sand-heat, for six days, in a pint and a half of spirit of scurvy grass.

The gum-lac has been lately used as an electric, instead of glass, for electrical machines. See LAQUER, LAKE, and VARNISH.

LAC, or LACCA, *Ammoniaci*, in the *Materia Medica*. See GUM AMMONIAC.

LAC, or LACCA, *Artificial*, or LAQUE, is also a name given to a coloured substance, drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The tinctures of these flowers are extracted by digesting them several times in aqua vite, or by boiling them over a stove fire in a lixivium of pot-ashes and alum.

An artificial lacca is also made of Brazil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alum, and arsenic, incorporated with the bones of the cuttle-fish pulverized, and made up into little cakes, and dried.

If it be to be very red, they add the juice of lemon to it; to make it brown, they add oil of tartar.

Dove-coloured, or columbine lacca, is made with Brazil of Fernambuc, steeped in distilled vinegar for the space of a month,

month, and mixed with alum incorporated in cuttle-fish bone. For other processes, see LAKE and Madder.

LAC, *Acid of*. See LACCIC ACID.

LAC, *of Gum Lac*. See CROTON.

LAC LUNÆ. Dr. Platt gives this fossil as a mark of good lime-stone; but it has been observed, that two quarries in Ireland, where lac lunæ was found, were of building stone, but would not burn into lime. Phil. Trans. N° 477. § 9.

There are many varieties of this mineral, differing in their texture and colour. It is found in many parts of Europe, and also in Asia and America. Many of the English quarries in Oxfordshire, Gloucestershire, Northamptonshire, and Derbyshire, afford considerable quantities of it. It adheres to the roofs and walls of grottos and caverns, and is lodged in the fissures of strata of stone, sometimes in form of a farinaceous powder, and sometimes concreted into masses. Its surface is rough and dusky; it colours the hands, adheres to the tongue, melts readily in the mouth, without grittiness, yields an insipid taste, and raises an ebullition in water, which soon dissolves it into a fine white powder. See *Mineral AGARIC*.

LAC Sulphuris, in *Chemistry*, and the *Materia Medica*, denotes sulphur separated by acids from its alkaline solution, which in the process changes its lemon-yellow colour for a grey or yellowish-white like cream. As a medicine it is thought to be somewhat milder. See SULPHUR.

LAC Virginale. See *Virgin's Milk*.

LAC Virginis. See *VIRGIN'S MILK*, and *BENZOIN*.

LACA, in *Geography*, a town of Africa, in the country of the Foulis; 10 miles N.W. of Goumel.

LACABEN, a town of Asiatic Turkey, in the province of Aladulia; 30 miles S.S.W. of Malatra.

LACANITIS, in *Ancient Geography*, a country of Asia, in Cilicia, according to Ptolemy, who places in it one city, viz. Irenopolis.

LACARACOONDA, in *Geography*, a town of Bengal; 10 miles S. of Nagore. N. lat. 23° 48'. E. long. 87° 27'.

LACARIA, a small town of Italy, in the eastern part of Lucania, S. of Heraclea, and near the gulf of Tarentum; founded by a colony of Phocæans, and celebrated for its good wine.

LACAS, LAS, a town of the island of Cuba; 15 miles W. of Villa del Principe.

LACCA. See LAC.

LACCADIVE ISLANDS, in *Geography*, a group of small islands in the Indian sea; the nearest being about 15 miles from the coast of Malabar. They are supposed to be the islands called by Ptolemy "Insulæ numero 19," though in reality they are 32. All of them are small, rocky on their sides, covered with trees, and separated by deep channels. They are visited by English ships in their passage from India to the Persian gulf, or Red Sea. Their principal traffic consists of the produce of the cocoa palm, such as the oil, cables, and cordage, and also of fish, which, being dried, is sent to the continent of India, whence rice is obtained in return. They also trade to Mascate, in large boats, and for their commodities they bring back dates and coffee. Ambergis is often found floating near these islands. N. lat. 10 to 12° 40'. E. long. 71° 15' to 73° 30'.

LACCIA, in *Ichthyology*, a name given by Paulus Jovius to the shad, or, as we sometimes call it, the mother of the pilchards. See CLUPEA *Alola*.

LACCIC ACID, in *Chemistry*, is a substance that was first introduced to the notice of chemists by Dr. Pearson. It is obtained from a peculiar compound called *cubite lac*, which Dr.

Anderfon of Madras discovered to be the product of some insects of the *coccus* tribe. Small quantities of it were sent to Europe about the year 1789; and, at the request of sir Joseph Banks, an examination of it was undertaken by Dr. Pearson, and the result of his inquiries appeared in the Philosophical Transactions for 1794. The lac, in its natural state, is of a grey colour; and occurs in pieces of from three to fifteen grains in weight. Many of its properties present considerable resemblance to those of bees' wax; and Dr. Pearson is of opinion, that these substances are very nearly allied to each other, differing only in the proportion of their constituents. A curious circumstance, connected with this point, is, that the insect which secretes the lac also produces honey; but the phenomena attending the appearance of the latter product have not been examined with the attention which they merit. To procure the laccic acid, it is merely necessary to expose the lac, as afforded by the *coccus*, to a heat just sufficient to liquify it. A reddish watery fluid will separate, having the smell of newly baked hot bread; and it is this substance which constitutes the acid under inquiry. The following are some of its properties. At the temperature of 60°, it has a specific gravity of 1.025. Paper stained with litmus and turfoil is reddened by it. It possesses a saline taste, and is somewhat bitter; but is not in the smallest degree sour. By exposure to the air it becomes muddy, and deposits a small quantity of sediment. Dr. Pearson distilled 250 grains of it, and afterwards evaporated the product until it grew turbid. On standing some hours, acicular crystals were produced, having a bitterish taste, which amounted to about  $\frac{1}{10}$ th of the weight of the fluid employed. The acid dissolves carbonat of soda with effervescence; and by evaporation yields crystals which are deliquescent. It produces a purplish tint on being mixed with lime-water, but no sediment appears. Tincture of galls causes a green precipitate; and with acetat of lead a reddish powder is deposited. This forms nearly the whole of the information that has been conveyed to us with respect to it; and as yet, therefore, nothing either very striking, or very important, has been communicated by the discovery. It is to be lamented that Dr. Pearson had so small a quantity of matter to operate upon in his experiments, as it becomes difficult, from the want of a more complete examination, to ascertain whether the substance is entirely new to us; or whether it is only the modified appearance of some compound with which we had been before acquainted.

LACCOS, *Λακκος*, among the Greeks, a ditch or trench used instead of an altar, when sacrifices were to be offered to the subterranean or infernal gods. See ALTAR.

LACE, in the *Manufactures*, is formed of thread, cotton, or silk, woven into a net, the meshes of which are varied in their figure, according to the design of the pattern, as octagons, hexagons, &c. &c. The lace is also ornamented by a thread, much thicker than the thread forming the net, which is woven in among the meshes, in the figure of flowers, and other fantastic curves; upon the beauty and elegance of which, the value of the lace depends. This thick thread is called the *gimp*.

Lace is made upon a pillow or cushion, upon which a piece of stiff parchment is stretched, having a number of holes pricked through it, to form a pattern of the intended lace. Through these holes, pins are stuck into the pillow; and the threads, wound upon small bobbins, are woven around the pins, and twisted round each other in various ways, to form the required pattern. This process is extremely tedious, particularly for the wide laces, with complicated patterns; and though it is extremely expensive to

the consumer, the people (chiefly in Bedford and Buckinghamshire) who manufacture it can only obtain sufficient to support a wretched existence, by the most incessant exertion. Of late years, the manufacturers of Nottingham have directed their ingenuity to imitate this species of lace by machinery, in which they have succeeded most perfectly: but still it is only an imitation, the knot or loop of the meshes being essentially different. In the pillow lace, the net or meshes may be described, by supposing a number of ropes, each formed of two or more threads twisted round each other: these are extended parallel; but at every two or three spiral turns of these ropes, the strands or threads composing one rope are twisted around with those of its neighbour, and then return to be twisted with its own: and this reciprocally of the whole number forms a netting; the figure of the meshes depending upon the number of turns which are made, before the twist is changed from one rope to the next. To form a lace of this description, it is essential that the ends of each thread be detached, and capable of being twisted over the adjacent threads. This is easily done by the hand upon the pillow, by twisting the bobbins round each other; but has many difficulties which prevent its performance by machinery.

The Nottingham lace is only a modification of the stitch or loop of which stockings are made; all the meshes being formed by a continuance of one thread, which is, by the machine, formed into loops a whole course (that is, length of the intended piece of lace) at once, by pressing it down alternately over and under between a number of parallel needles; a second course is then made of similar loops on the same needles, and the loops of the first are drawn through those of the second, in such a manner as to form meshes by retaining the first loops; the second are then retained by a third course, and this by a fourth, and so on. The machine is very nearly like a common stocking-frame, but provided with an additional apparatus, which can be readily applied. It consists of a frame, containing a number of needles, which we will call points: these are introduced between the fixed needles of the stocking-frame, and a certain number (one half, for instance) of the loops in the thread are taken off the fixed needles upon these points, which are moved endways, the space of two, three, or more fixed needles, and put down upon them again. Another set of loops is now taken upon the points, and moved in the opposite direction; by this means, crossing the loops over each other, and forming meshes, the figure of which will depend upon the number of needles it is thus carried over. But as this admits of no great variety of patterns, another machine has been invented, which is much more extended in its applications. Like the former, it has the parts of the stocking-frame, but differently made. The thread is, in this, rolled upon a cylinder, in the same manner as a weaver's beam; as many threads being wound round it as there are needles in the frame. These threads pass through eyes in the ends of small points, called guides, which are opposite the needles; and these guides are fixed on two bars, each of which has half the guides fastened in it, that is, one guide is fast in one bar, and the next in the other, and so on alternately of the whole. Each of the guides presents a thread to its needle, and are all at once moved by the hand to twist the threads two or three times round the needles which are opposite them: the loop is now made in a manner similar to the other frame. The next time, the alternate guides are shifted endways, so as to apply themselves to other needles than those they were opposite before. This crosses the thread, so as to make a net: but the quantity which is shifted endways is altered every time, by means of the ma-

chinery, so as to move a certain number of needles; which number is altered every time, to produce the pattern. All the parts of this machine, except the guides, are moved by means of treadles, instead of using the hands, as in the common stocking-frame. The net produced by these frames is woven in bands of the width of the intended lace, leaving a wider mesh than the others, through which the division is to be made to separate the lace into narrow strips. Before cutting up in this manner, the lace is spread in a frame, and a common needle with a thick thread is worked in the meshes, to imitate the gimp, according to the pattern for which the lace is intended.

The lace trade of Nottingham has been carried to a very great extent, but is at present in a state of stagnation, being chiefly dependent on foreign trade, as it has never been in such great repute with the British ladies.

Lace is also made of gold and silver thread (which see), much in the same manner as the bone or blond lace above described. The importation of gold and silver lace is prohibited. Great quantities of the finest blond laces have been imported from Flanders. By 3 Geo. III. c. 21. and 5 Geo. III. c. 48. if any person shall import any ribbards, laces, or girales, not made in Great Britain, whether the same shall be wrought of silk alone, or mixed with other materials, the same shall be forfeited, and may be seized by any officer of the customs, in whatever importers', vendors', or retailers' hands they may be found; and the importer, and every person assisting therein, and the vendors and retailers in whose custody they shall be found, or who shall sell or expose the same to sale, or conceal with intent to prevent the forfeiture, shall forfeit respectively 200*l.* with costs; half to the king, and half to the officer who shall inform and prosecute.

LACE is also used for a kind of chord made of silk or cotton, chiefly used in lacing women's stays.

LACE BARK. See DAPHNE.

LACEDÆMON, in *Ancient Geography*, a celebrated town of Greece, in the Peloponnesus, in a country which was originally called Laconia, and afterwards changed into Lacedæmon, or Sparta. See SPARTA. See also LACONIA.

LACEDÆMONIANS, the inhabitants of Laconia, are said to have derived their name from Lacedæmon, heir and successor of Eurotas, whose daughter he married. Their ancient name was *Leleocrates*, which has been found in some ancient inscriptions. The commencement of their history is little known. But their first king, according to the chronology most generally received, was Lelex, surnamed Autochthos, because he was supposed to have been one of the Aborigines; and from him his subjects bore the ancient name of Leleges. He began his reign in the year 1516 B.C., was succeeded by his eldest son Myles, and Myles was succeeded by his son Eurotas, who, having no male issue, appointed for his successor Lacedæmon, the supposed son of Jupiter by Taygeta, to whom he gave his daughter Sparta in marriage. Lacedæmon was the first king of the Lacedæmonian line, which consisted of twelve sovereigns, the last of whom was Tisamenus, who terminated this line in 1104 B.C., upon the return of the Heraclide into the Peloponnesus. In 1102 B.C., upon the division of the Peloponnesus by the Heraclide, the kingdom of Lacedæmon or Sparta commences under Procles and Eurysthenes, the two sons of Aristodemus, the chief of the Heraclide. Eurysthenes was succeeded by his son Agis, from whom the descendants of that line had the appellation of Agidae, or Agiada; and the first princes of the former line were denominated Proclidae, till Eurytion, or Eurypon, the third

## LACEDÆMONIANS.

of this line, exchanged it for Eurytomidæ, or Euryptidæ. In the line of Agis succeeded Pecheltratus 1058 B.C., Labotas 1023 B.C., Doryflus 986 B.C., Ageflans 957 B.C., and Archelans 913 B.C. The fuccellors of Procles were Ivas 1065 B.C., Eurypon 1028 B.C., Prytanis 1021 B.C., Eunomus 989 B.C., and Polydectes 907 B.C. Lycurgus, the fon of Eunomus, fucceeded Polydectes, but he only retained the kingdom till his filler was delivered of a fon, to whom he immediately refigned it; but his fituation being rendered uneasy, he fet out for Crete about eight months after the birth of his nephew. During this voluntary exile of ten years, he meditated that new form of a commonwealth into which he afterwards modelled the government; and for this purpofe he returned to Lacedæmon in the year 884 B.C.

The government of Lacedæmon was, as we have feen, originally monarchial; and though the kings had fome fubordinate magiftrates, chofen by themfelves, of whose counfel they occasionally availed themfelves, yet the will of the fovereign was the fupreme law. Thus the fovereign power paffed through a fucceffion of twelve princes, from Lacedæmon, the fon-in-law of Eurotas, and founder of this monarchy. Under Euryfthenes and Procles the government took a new form, and inftead of having one fovereign, it became fubject to two. Thefe two brothers governed jointly, and with equal power and authority, each bearing the title of king of Lacedæmon, and being acknowledged and obeyed as fuch. In this bipartite condition the government continued under a fucceffion of thirty princes of the line of Euryfthenes, and twenty-feven of that of Procles, and it terminated in both about the fame time. Difcords, however, were unavoidable, and foon commenced. Two parties were formed, and they became turbulent and unmanageable. By the diffentions that were thus occafioned, the regal dignity funk into fuch contempt, that the government was upon the brink of falling into anarchy and confufion, when Lycurgus, as we have faid, undertook the management of it, during fome part of his nephew Charilaus's minority. During the period of his voluntary abfence, when he had travelled through Crete, Afia, and Egypt, the government had become fo corrupt, that not only his friends, but even thofe who had been his moft zealous enemies, were glad to repeat their embaffies, entreating him to return and fave his country from ruin. Thefe were the inevitable confequences of that fatal divifion of the regal authority between two competitors, which Lycurgus took a quite different method of remedying than by confining it again to either of the lines. The plan he adopted was that of reducing their authority, by conflituting a fenate, endowed with the fupreme power in all civil matters, and leaving to the kings, befides the title and honour, only the management of military and religious affairs. In order to qualify him for the important undertaking in which he now engaged, he had paid particular attention to the laws of Minos at Crete, and in Afia he had obferved the effects which are produced by different governments and manners, and he had alfo availed himfelf of the opportunities which Egypt had afforded him of gaining wifdom. With a view of giving greater effect and ftability to his new conftitution, he had, like other legiflators, taken care to fe cure the approbation of heaven. With this view, he confulted the oracle at Delphi, and had received for anfwer: "The gods accept thy worfhip, and under their auspices, thou fhalt frame the moft excellent of political conftitutions." Nor did Lycurgus ever afterwards neglect to maintain a correffpondence with the Pythia, who fucceffively impreffed on his laws the feal of divine authority. He alfo, before he commenced his operations, fubmitted his plan

to the examination of his friends and the moft diftinguifhed citizens; and from thefe he felected thirty, who were to attend him completely armed in the general afsembly, and to defend him from thofe perfonal affaults which he had reafon to apprehend in the promulgation of his laws. At length the new conftitution was approved by all orders of the ftate. Yet, notwithstanding its excellence, it was not affured of duration. Lycurgus, therefore, when the people were afsembled, thus addreffed them: "It ftill remains for me to lay before you the moft important article of my legiflation; but I wifh firft to confult the oracle of Delphi. Promife me that, until my return, you will make no alteration in the laws already eftablifhed." They promifed him. "Swear it," faid he. The kings, fenators, and citizens, called the gods to be witneffes to their words. This folemn engagement could not but be irrevocable, for it was his refolution never more to return to his country. Accordingly he immediately repaired to Delphi, and enquired whether the new laws were fufficient to enfore the happinefs of the Spartans. The Pythia, having anfwered, that Sparta would be the moft flourifhing of cities fo long as fhe fhould continue to obferve them, Lycurgus fent that oracle to Lacedæmon, and condemned himfelf to voluntary banifhment. He died far from the country of whose happinefs he had been the caufe. See LYCURGUS.

In fettling the government of Lacedæmon, Lycurgus was too wife to abandon the admiftration of public affairs to the caprices of the multitude, or to leave it entirely to the will of the two princes on the throne. He fought, as we have already faid, a mean, by which he might refrain and temper power by wifdom; and he thought that he had found it in Crete, where a fupreme council moderated the authority of the fovereign. Such an eftablifhment he introduced at Sparta, under the appellation of a fenate. Twenty-eight aged men, of confummate experience, were appointed to fhare with the two kings the plenitude of power. In this auguft fenate the great interefts of the ftate were to be difcuffed; here the two kings prefided, and every queftion was to be decided by the plurality of voices; and the determinations of this council were afterwards laid before the general afsembly of the ftate, which had the power of approving or rejecting, but not of altering them. For about 130 years the fenate maintained a juft equilibrium between the kings and the people; but the places of the fenators, as well as the authority of the kings being held for life, it was to be feared that, in time, thefe might too clofely unite, and no longer find any oppofition to their will. It was therefore deemed advifable, with the fuffrages of the Delphian oracle, to transfer a part of their functions to five magiftrates, called Ephori, or infpectors appointed to defend the people in cafe of oppreffion. This new intermediate body was inflituted, with the confent of the ftate, by the king Theopompus; or, if it had been originally eftablifhed by Lycurgus himfelf, it was revived, with fome additional powers and prerogatives, by Theopompus. (See EPHORI.) The conftitution of Lycurgus contained a happy mixture of monarchy, ariftoeracy, and democracy. Theopompus added to thefe an oligarchy which afterwards became tyrannical. Although Lycurgus limited the authority of the kings, he left them honours and prerogatives which they enjoyed as the heads of religion, the admiftration, and the army. Befides certain priefthoods, which were exercifed by themfelves, they regulated the public worfhip, and appeared at the head of the religious ceremonies. One of their prerogatives invelted them with the right of maintaining a fecret correffpondence with the priefts of Delphi, the authors of thofe oracles which often decided the fate of an empire; and this may be confidered as one of the

## LACEDÆMONIANS.

the most important privileges in the possession of royalty. As head of the state, the king, upon ascending the throne, might annul the debts which a citizen had contracted either with his predecessor, or with the republic; and he possessed certain portions of inheritances, assigned him by the people, which he might distribute during life in favour of his relations. The two kings presided in the senate, and proposed the subjects for deliberation. Each gave his suffrage in person or by proxy; and this single suffrage was equivalent to two. When the two kings agreed in proposing any project of manifest utility to the public, no person was permitted to oppose it. All causes relative to the maintenance of the highways, the formalities of adoption, or the choice of the kinsman who should be obliged to marry an orphan heiress, were submitted to the decision of the kings. The kings were not allowed to be absent during peace, nor both at once in time of war, unless there were two armies in the field. They had by right the command of the army, with such appendages of splendour and authority that might ensure them respect and obedience. The state provided for the maintenance of the general and his household, with the necessary attendants. Accordingly, he had full leisure to direct the operations of the campaign, to sign truces with the enemy, and to give audience and answers to the ambassadors of foreign powers. In time of peace the kings were considered merely as the first citizens of a free city; appearing in public without a retinue, and without ostentation. As first citizens they occupied the first place, and every person rose in their presence; and in all repairs, public and private, they were allowed a double portion, which they shared with their friends. When the kings died, they were honoured with various tokens of respect.

The senate, consisting of the two kings, and twenty-eight aged persons, were the supreme council, in which were discussed, in the first instance, all questions relative to declaring war, concluding peace, entering into alliances, and other high and important affairs of state. The dignity of a member of this council was never granted but to the citizen who, from his earliest youth, had been distinguished for consummate prudence and eminent virtues; nor could he arrive at it before the age of sixty years, and he retained it till his death. The election took place in the forum, where the people were assembled with the kings, senators, and the different classes of magistrates; and it was attended with various solemnities and acclamations. When it was decided, it was honoured with a kind of triumphal procession, and with ceremonies performed in the temples. Of the functions pertaining to the senator, some respected the state, and others related to particular cases, which were referred to the judgment of the members. On this tribunal depended not only the lives, but the honours of the citizens. When a king was accused of having violated the laws, or betrayed the interests of the state, the tribunal which acquitted or condemned him was composed of the twenty-eight senators, the five ephori, and the king of the other family. However, he might appeal from them to the general assembly of the people.

The ephori were elected by the people from among the citizens of every rank; they were five in number, and changed every year, to prevent their abusing their authority. (See EPHORI.) We shall here add, that the kings in their own name, and the ephori in the name of the people, engaged, by a solemn oath; the former to govern according to the laws, and the latter to defend the royal authority so long as it shall not violate the laws.

As the Spartans had interests peculiar to themselves, they had also others in common to them with the deputies of the different cities of Laconia. Hence there were two kinds of

assemblies, at which were always present the kings, the senate, and the different classes of the magistrates. When the succession to the throne was to be regulated, when magistrates were to be chosen or deposed, when sentence was to be pronounced on public crimes, or the great objects of religion or legislature were to be decided upon, the assembly was only composed of Spartans, and was called the "lesser assembly." The ordinary assembly of this kind was held every month; the extraordinary whenever circumstances required. Every one had a right to give his opinion, provided that he had passed his 30th year, for before that age he was not allowed to speak in public; and it was required also that his manners should be irreproachable. The general assembly was convoked whenever the question related to making war or peace, or contracting alliances. The deputies of the cities of Laconia were then admitted into it, as were also frequently those of the allied states, and of the nations who came to implore the succour of Lacedæmon. On occasions of this kind, the kings and senators frequently spoke, and their authority had great weight; but that of the ephori was greater. When the question had been sufficiently debated, one of the ephori asked the opinion of the assembly; upon which a multitude of voices exclaimed for the affirmative or negative. In order to determine the majority, the same magistrate ascertained it by numbering the two parties, which he caused to separate.

As a general preliminary to the laws of Lycurgus, we shall here observe, that this legislator ordained, that the magistrates should not be appointed by lot, but elected by suffrages. He deprived riches of the influence and respect annexed to them, and divested even love of jealousy. And though he granted some distinctions, the government, having imbibed his spirit, never prodigally lavished them, and virtuous men dared not solicit them. Honour was the most valuable reward, and reproach the most cruel punishment. Death was sometimes inflicted, but a sentence of this kind followed a very careful and rigorous examination, for nothing was regarded so precious as the life of a citizen. Execution was performed in the prison, and during the night, that the firmness of the criminal might not move the commiseration of the people, and his life was taken away by the cord, that the sufferings of the guilty might not be multiplied.

Of all the institutions of Lycurgus, the division of lands was that which required, on his part, the greatest degree of firmness and resolution, because it was likely to be much opposed, and to occasion various and violent contentions. He thought it, however, necessary for establishing peace and good order in the commonwealth. With a view of banishing from the community insolence, envy, fraud, luxury, and at the same time, extreme poverty and excessive wealth, he persuaded the citizens to surrender all their lands to the state, and to allow a new division of them, that they might live together in a perfect equality, and that virtue and merit should establish the only claim to pre-eminence and honours. This scheme was no sooner proposed than executed. The district of Sparta was divided into 900 portions of land, and the rest of Laconia into 30,000. Each portion assigned to a head of a family must have produced, besides a certain quantity of wine and oil, 70 measures of barley for himself, and 12 for his wife. This is Plutarch's account. Others say, that he only bestowed on the Spartans 6000 portions, to which king Polydorus is said afterwards to have added 3000. And others again say, that the Spartans received one half of these 9000 portions from Lycurgus, and the other half from Polydorus. After Lycurgus had made this distribution, he thought it advisable to absent himself, that the passions of the people might have leisure to subside and cool.

On his return, he found the fields of Laconia covered with clusters of sheaves, all of the same size, and placed at distances nearly equal. Accordingly he seemed to behold a large domain, the productions of which had been divided among brethren; while the Lacedæmonians believed they saw in him a father, who had manifested no more fondness for one than for the rest of his children. After having divided their immovables, he undertook likewise to make the same equal division of all their moveable goods and chattels, that he might utterly banish from among them every kind of inequality. But apprehending invincible opposition to this measure, he endeavoured to accomplish his object by sapping the foundations of avarice. With this view he cried down all gold and silver money, and ordained that no other should be current besides that of iron; which he made so heavy, and fixed at so low a rate, that a cart and two oxen were necessary to carry home a sum of 10 minas (equal to about 20*l.* sterling), and a whole chamber to keep it in. He next banished all useless and superfluous arts from Sparta. But without doing this, most of them must have sunk of themselves, and disappeared with the gold and silver money; because the tradesmen and artificers would have found no vent for their commodities; and this iron money had no currency among the other Grecian states, which so far from esteeming it, made it the subject of their banter and ridicule. The importation of all foreign money was prohibited, that corruption might not enter under the name of commerce. Barter or exchange of one commodity for another, was preferred by law in Sparta, long after it had been discontinued in every other state. Interest was also forbidden in the Spartan commonwealth. According to the laws of Lycurgus, the head of a family could neither buy nor sell a portion of land; he could neither give it during his life, nor bequeath it by will to whom he pleased. He was not even permitted to divide it. The eldest of his children was entitled to the inheritance, in the same manner as in the royal family, the eldest son succeeded by right to the crown. In order to provide for the other children, he established other regulations. The land, as well as the persons of the Spartans, were free from all impositions. The state had no treasure. On certain occasions the citizens contributed according to their abilities, and on others they had recourse to means which evince their excessive poverty. The deputies of Samos once came to Lacedæmon to solicit the loan of a sum of money. The assembly of the people, having no other resource, ordered a general fast to be observed by the free citizens, slaves, and domestic animals, and gave the sum thus saved to the Samians.

Another regulation of Lycurgus, was that of public meals. That he might entirely suppress the magnificence and extravagance of public tables, he ordained that all the citizens should eat together of the same common victuals, which the law prescribed, and expressly forbade all private eating at their own houses. By this settlement of public and common meals, and by this frugality and simplicity in eating, he depreciated the value of riches, and made them of no use as means of procuring the luxuries of life. This regulation, however, was very offensive to the opulent. At these meals, each table accommodated about 15 persons; and every person furnished every month a bushel of flour, eight measures of wine, five pounds of cheese, 2½ pounds of figs, and a small sum of money for preparing and cooking the victuals. Every person, without discrimination, was obliged to attend at the common meal. At these public tables the children obtained instruction and improvement; they were likewise trained and accustomed to great secrecy; for as soon as a young man came into the room, the eldest person of the company used to say to him, pointing to the door, "Nothing

spoken here, must ever go out there." The most exquisite of all their eatables was that which they called their "black broth;" and the old men preferred it to every thing else upon the table. Dionysius the tyrant, however, thought otherwise, and complained of it as insipid; upon which he was told that the seasoning was wanting. When the tyrant enquired, what seasoning? he was told, running, sweating, fatigue, hunger, and thirst. These, he was told, are the ingredients with which we season all our food. As they were moderate in their eating, they were no less abstemious in their drinking; the Lacedæmonians only drank to quench thirst; drunkenness was reckoned infamous among them, and severely punished; and that young men might conceive the greater abhorrence of this species of debauchery, the slaves were compelled to drink to excess, that the beastliness of the vice might appear. When they retired from the public meal, they were not allowed any torches or lights, because it was expected, that men who were perfectly sober, should be able to find their way in the dark; besides, this practice gave them a facility of marching without light, a quality very useful to them in time of war.

As to dress, there was no distinction between the rich and poor. Their garments were made for use and not for show; and they were taught betimes to distinguish themselves by their virtue, rather than by their robes. Boys were always used to go without shoes, nor were they permitted to cut or trim their hair. Baths and anointing were not much in use among the Lacedæmonians; the river Eurotas supplied the former, and exercise the latter. Young women wore their vests, or jerkins, only to their knees, or, as some say, not so low; a custom which has been censured both by Greeks and Romans as indecent. Gold, precious stones, and costly ornaments were permitted only to common women; which permission was the strongest prohibition to women of virtue, or such as valued their reputation. Virgins went abroad, without veils, with which, on the contrary, married women were always covered. In certain public exercises, to which girls were admitted, they, as well as the young men, were obliged to perform naked.

Lycurgus had very few written laws, because he did not wish to set bounds to virtues, and left the people, imagining they had done all which their duty required, should desist and not do all which they are able to perform. But he did not conceal them; they were transmitted from mouth to mouth, cited on all occasions, and known to all the citizens, the witnesses and judges of each individual. They were taught and enforced by practice and example. Young persons were not allowed to censure them, nor to submit them to examination, since they had been received as the commands of heaven, and since the authority of the laws was founded only on the profound veneration they inspired. Nor was it allowed to praise the laws and usages of other nations; because, unless the people were persuaded that they lived under the best legislation, they would soon be led to desire a new one. Indeed, obedience was, among the Spartans, the first of virtues.

Lycurgus considered the education of youth, in every stage of it, from the earliest infancy to maturity, as the most important object of a legislator's care. His grand principle was, that children belonged more to the state than to their parents; and therefore he ordered the state to be entrusted with the general care of their education, that they might be formed on constant and uniform principles, by which they might be inspired with the love of their country, and of virtue. As soon as a boy was born, the elders of each tribe visited him; and if they found him well made, strong and vigorous, they ordered him to be brought up at the public charge; but if, on the contrary, they found

him deformed, tender, and weakly, he was cast into a gulf near mount Taygetus. This law, it has been said, seems to have been calculated, in one respect, to render women very careful, when they were pregnant, of eating, drinking, or using exercise to excess; and it also seemed to make them excellent nurses, for which employment they were celebrated throughout Greece. At his earliest age the child was accustomed to the most hardy treatment in his food, dress, rest and general mode of life. He was to be used to solitude and darkness, and to be brought up a stranger to impressions of terror, useless restraints, and unjust reproaches. At the age of seven years his education according to the laws commenced, and he was trained up under the discipline appointed by the state. Education, indeed, in the whole course of it, was, properly speaking, an apprenticeship of obedience. While they were at table, the matter instructed the boys by asking them questions, to which they were to give a quick and concise, or laconic answer. Lyeurgus, it is said, was for having the money bulky and heavy, and of little value, but their language very pithy and short, comprising much sense in few words. To literature they paid little attention; for all the sciences were banished from the country. The principal objects of their study were obedience, the patient enduring of hardship and fatigue, and victory in battle. The superintendent of their education, was one of the most honourable men of the city, and of the first rank and erudition, or one of the ephori, who appointed over every class of boys, into which they were initiated, masters of the most approved wisdom and probity. Strict obedience, and great respect to their elders and superiors, were matters sedulously inculcated in the Spartan system of education. To the old men the youth rose up, whenever they came into any public place; when they met them in the streets they gave way; and they were silent, whenever their elders spoke. All the old men were deemed to have the authority of parents and warranted in the exercise of it; and thus Lyeurgus provided, that as youth are every where too apt to offend, they might be no where without a monitor. The laws went still farther; for if an old man was present when any youth committed a fault, and did not reprove him, he was punished equally with the delinquent. Amongst the youths there was one of their own body, or, at most, two years older than the rest, who was denominated "iren;" he had authority to question all their actions, to watch their behaviour, and to punish them if they did amiss; and their punishments were not slight, but severe. Silence was highly commended at Sparta, where modesty, not only in words and actions, but in looks and gestures, was held to be a most becoming virtue in young people. An inconsiderate person, who would not listen to instruction, and who seemed to disregard what the world might think or say of him, was treated by the Lacedæmonians as a disgrace to human nature.

Occupations among the Spartans that were necessary for the benefit of the community, such as agriculture and the like, were left to their slaves, the Helotes; but arts, subservient to luxury, were wholly interdicted. Thus orators or rhetoricians, augurs, bankers, and dealers in money were excluded. The Spartans admitted no theatrical diversions among them; but other kinds of poetry were allowed, provided the magistrates had the perusal of pieces, before they were introduced to the public. Music was much encouraged, provided that it was such as had been in favour with their ancestors; and they would not permit their slaves to learn either the air or the words of their most admired pieces.

Among the effects of ancient music, in softening the manners, promoting civilization, and humanizing men, naturally savage and barbarous, the most singular and striking

is related by Polybius, the historian, a grave, exact, and respectable writer, who, in speaking of several acts of cruelty and injustice exercised by the Ætolians, against their neighbours the Cynætheans, has the following remarkable passage, which we shall give at full length, from Mr. Hampton's excellent translation.

"With regard to the inhabitants of Cynætha, whose misfortunes we have just now mentioned, it is certain, that no people ever were esteemed so justly to deserve that cruel treatment to which they were exposed. And since the Arcadians, in general, have been always celebrated for their virtue throughout all Greece; and have obtained the highest fame, as well by their humane and hospitable disposition, as from their piety also towards the gods, and their veneration of all things sacred; it may perhaps be useful to enquire from whence it could arise, that the people of this single city, though confessed to be Arcadians, should, on the contrary, be noted for the savage roughness of their lives and manners, and distinguished by their wickedness and cruelty above all the Greeks. In my judgment then, this difference has happened from no other cause, than that the Cynætheans were the first and only people among the Arcadians, who threw away that institution, which their ancestors had established with the greatest wisdom, and with a nice regard to the natural genius, and peculiar disposition of the people of the country; I mean, the discipline and exercise of music: of that genuine and perfect music, which is useful indeed in every state, but absolutely necessary to the people of Arcadia. For we ought by no means to adopt the sentiment that is thrown out by Ephorus in the preface to his history, and which indeed is very unworthy of that writer, that music was invented to deceive and delude mankind. Nor can it be supposed, that the Lacedæmonians, and the ancient Cretans, were not influenced by some good reason, when, in the place of trumpets, they introduced the sound of flutes, and harmony of verse, to animate their soldiers in the time of battle: or that the first Arcadians acted without strong necessity, who, though their lives and manners, in all other points, were rigid and austere, incorporated this art into the very essence of their government; and obliged not their children only, but the young men likewise, till they had gained the age of thirty years, to persist in the constant study and practice of it. For all men know, that Arcadia is almost the only country, in which the children, even from their most tender age, are taught to sing in measure their songs and hymns, and that are composed in honour of their gods and heroes: and that afterwards, when they have learned the music of Timotheus and Philoxenus, they assemble once in every year in the public theatres, at the feast of Bacchus; and there dance, with emulation, to the sound of flutes, and celebrate, according to their proper age, the children those that are called the puerile, and the young men, the manly games. And even in their private feasts and meetings, they are never known to employ any hired bands of music for their entertainment; but each man is obliged himself to sing in turn. For though they may, without shame or censure, disown all knowledge of every other science, they dare not on the one hand dissemble or deny, that they are skilled in music, since the laws require, that every one should be instructed in it; nor can they, on the other hand, refuse to give some proofs of their skill when asked, because such refusal would be esteemed dishonourable. They are also taught to perform in order all the military steps and motions, to the sound of instruments: and this is likewise practised every year in the theatres, at the public charge, and in sight of all the citizens.

"Now to me it is clearly evident, that the ancients by no means introduced these customs, to be the instruments of

luxury and idle pleasure : but because they had considered with attention, both the painful and laborious course of life, to which the Arcadians were accustomed ; and the natural austerity also of their manners, derived to them from that cold and heavy air, which covered the greatest part of all their province. For men will be always found to be in some degree acclimated to the climate in which they live : nor can it be ascribed to any other cause, that in the several nations of the world, distinct and separated from each other, we behold so wide a difference, in complexion, features, manners, customs. The Arcadians, therefore, in order to smooth and soften that disposition, which was by nature so rough and stubborn, besides the customs above described, appointed frequent festivals and sacrifices, which both sexes were required to celebrate together ; the men with women, and the boys with virgins ; and, in general, established every institution, that could serve to render their rugged minds more gentle and compliant, and tame the fierceness of their manners. But the people of Cynætha, having slighted all these arts, though both their air and situation, the most inclement and unfavourable of any in Arcadia, made some such remedy more requisite to them than to the rest, were afterwards engaged continually in intestine tumults and contentions ; till they became at last so fierce and savage, that, among all the cities of Greece, there was none in which so many and so great enormities were ever known to be committed. To how deplorable a state this conduct had at last reduced them, and how much their manners were detested by the Arcadians, may be fully understood from that which happened to them, when they sent an embassy to Lacedæmon, after the time of a dreadful slaughter which had been made among them. For in every city of Arcadia, through which their deputies were obliged to pass, they were commanded by the public cry instantly to be gone. The Mantineans also expressed even still more strongly their abhorrence of them : for as soon as they were departed, they made a solemn purification of the place ; and carried their victims in procession round the city, and through all their territory.

“ This then may be sufficient to exempt the general customs of Arcadia from all censure ; and at the same time to remind the people of that province, that music was at first established in their government, not for the sake of vain pleasure and amusement, but for such solid purposes, as should engage them never to desert the practice of it. The Cynæthians also may perhaps draw some advantage from these reflections ; and, if the deity should hereafter bless them with better sentiments, may turn their minds towards such discipline, as may soften and improve their manners, and especially to music ; by which means alone, they can ever hope to be divested of that brutal fierceness, for which they have been so long distinguished.”

Though Polybius in this passage seems to attribute the happy change that was brought about in the manners of the Arcadians to music alone, it does not appear to merit all the honour, as a considerable part was doubtless due to the poetry that accompanied it ; which being grave, majestic, and full of piety and respect for the gods and heroes, whose glorious actions and benefits were celebrated in it, must have had great influence upon the minds of young persons, in whose education those two arts had so considerable a share.

Thucydides, as quoted by Aulus Gellius (lib. i. cap. 11.) says, when the Lacedæmonians went to battle, a Tibicen played soft and soothing music to temper their courage, left by an ardent temerity they should have rushed on with too great impetuosity ; for, in general, they had more need of having their courage repressed than excited.

However, in an engagement with the Messenians, they

were very near being discomfited, when the celebrated Tyræus, who performed the part of a Tibicen that day, finding the troops give way, immediately quitted the Lydian mode, and played in the Phrygian, which so reanimated their courage, repressed by the preceding mode, that they obtained a complete victory.

The Lacedæmonians, though a military people, of austere manners, appear at all times, notwithstanding their inhospitable law against the admission of strangers, to have invited eminent musicians into their country, and to have encouraged music ; not only in order to regulate the steps, and animate the courage of their troops, but to grace their festivals, and fill their hours of leisure in private life.

Athenæus tells us (lib. xiv.), that they had a flute painted on their ensigns and standards.

There was one kind of theft to which the boys were accustomed, and which was even authorized by the law, and by the consent of the citizens ; and this was their stealing herbs or roots from the gardens and public baths ; but if they were caught in the fact, they were punished for want of dexterity. The design of the Spartan legislator in allowing this practice, was to inspire the Spartan youth, who were all designed for war, with a view to self-defence, and not to extent of dominion, with boldness, subtlety, and address ; to ensure them betimes to the life of a soldier, to teach them to live upon a little, and to be able to shift for themselves. The patience and constancy of the Spartan youth were signally exemplified in Diana's festival, called “ Orthia,” which see. The most usual occupation of the Lacedæmonians was hunting, and other bodily exercises, to which they devoted in private and public much of their time and attention.

Hunting was made a part of the education of the Lacedæmonians, because it had a tendency to prevent corpulence, which incurred public contempt, if not banishment, and to strengthen their limbs, and to render those who practised it supple and fleet. They had a kind of public dances, in which they much delighted, common alike to virgins and young men. Indeed, in all their sports, girls were allowed to divert themselves with the other youths ; inasmuch that, at darting, throwing the quoit, pitching the bar, and the like robust diversions, the women were as dextrous as the men. For the manifest peculiarity of this custom, Lyeurgus assigned no other reason, than that he fought to render women, as well as men, strong and healthy, that their children might resemble them. The laborious life ceased with the age of 30 ; and they then employed themselves wholly either in affairs of state, or of war.

As to the laws relating to religion, they prescribed that the statues of all the gods and goddesses worshipped by the Spartans, should be represented armed, even Venus herself ; that the people might regard a military life the most noble and honourable, and not attribute, as other nations did, sloth and luxury to the gods. Their sacrifices consisted of things of small value ; that indigence might never hinder them from worshipping the gods. They were forbidden to make long or rash prayers to the heavenly powers, and were enjoined to ask no more, than that they might live honestly, and discharge their duty. Graves were allowed in their city, and they buried close to the temples, that all people might be familiar with death, and not conceive of it as a thing dreadful in itself, or that dead bodies defiled the living. Magnificent sepulchres were forbidden, nor was the plainest or most modest inscription permitted, except for such as were slain in the wars, or for women who had devoted themselves to a religious life. Tears, sighs, and outcries were not permitted in public, because they dishonoured Spartans, who ought to bear all things with equanimity. Mourning was restricted to seven days.

Celibacy in men was regarded as infamous, and punished

## LACEDÆMONIANS.

by various tokens of contempt. If a man did not marry when at full age, he was liable to an action; as those also were who married above or below themselves. Such as had three children had certain immunities, and those who had four were free from all taxes. Virgins were married without portions; husbands were allowed to beat their wives; and there were some other laws which we shall not here recite. The men of Sparta are generally said to have been distinguished for their virtue; but the Spartan women have been as generally decried for their boldness, and contempt of decency.

No Spartan was admitted to any concern in their judicial proceedings under 30 years of age; and it was held indecent, and in ill repute, for a man to busy himself at the tribunals, when he had no affairs there of his own. By these regulations, Lycurgus thought to prevent litigiousness, and that multiplicity of suits which are always fatal in a state. Persons of abandoned character lost all right of voting or speaking publicly on public affairs; for it was a perfusion among the Spartans, that a man of a base character in private life could not serve his country from motives of true patriotism.

At Sparta, it has been said, every thing tended to inspire the love of virtue, and the hatred of vice; the actions of the citizens, their conversations and mutual intercourse which frequently occurred, their public monuments, and their inscriptions. Accordingly Lycurgus would not allow all sorts of persons to travel, lest they should bring home foreign manners, and return infected with the licentious customs of other countries, and thus become averse from the life and maxims of Lacedæmon. On the other hand, he would suffer no stranger to remain in the city, who did not come thither to some useful or profitable end, or out of mere curiosity, lest they should disseminate the vices of their own countries. A soldier was the only reputable profession in Sparta; a mechanic or husbandman was looked upon with contempt. War, indeed, was the trade and business of the Lacedæmonians, and the first law of war with them was never to fly, or turn their backs upon their enemies, however superior in number; never to quit their post; never to deliver up their arms; in a word, either to conquer, or to die upon the spot. Hence it is, that a mother recommended to her son, who was going to make a campaign, that he should return either with or upon his shield; and that another, hearing that her son was killed in fighting for his country, answered very coldly, "I brought him into the world for no other end." A Spartan lady, having heard that her son had fled from a battle, wrote him this short letter, "Fame speaks ill of you; efface it, or be no more." In all expeditions, they were careful in the performance of religious rites; and after their evening meal, the soldiers sang together hymns to their gods. When they were about to engage, the king sacrificed to the Muses, that, by their assistance, they might be enabled to perform deeds worthy of being recorded to latest times. Then the army advanced in order to the sound of flutes, which played the hymn of Castor. The king himself sung the Pæan, which was the signal to charge. When their enemies began to fly they pursued no longer than till victory was ascertained; because they would seem to fight rather for the honour of conquering than of putting their enemies to death. After 40 years' service, a man was, by law, no longer required to go into the field, and consequently if the military age was 30, the Spartans were not held invalids till they were 70. It was one of the wisest maxims in the political system of Lycurgus, that he forbade the Spartans to fight often against the same enemy. They were forbidden to meddle with maritime affairs, though in process of time they were forbidden to transgress this inhibition.

It has been said that Lycurgus was the author of that

political expedient for lessening the number of slaves, or Helotes, in Sparta, called "Cryptia;" *i. e.* the ambuscade, when the slaves were thought too numerous. Such as had the care of educating the Spartan youth, selected the stoutest of them, and having armed them with daggers, sent them out to destroy their unhappy slaves, either by surprising them in the night, or falling upon them in the day, when they were at their work and defenceless. Plato condemns this law; and Plutarch denies that it was made by Lycurgus, whereas Aristotle expressly lays it to his charge; but when or however it was made, it was undoubtedly a cruel unnecessary expedient, in all respects unworthy of a virtuous people. The abbé Barthelemi (Trav. Anach. vol. iv. p. 481.) has, in our opinion, satisfactorily vindicated Lycurgus from the charge of having instituted such a practice. Plato himself recommends, that in a well governed state, the youth, as soon as they are of sufficient age, should, during two years, range the country with arms in their hands, braving the rigours of summer and winter, leading a hardy life, and subjected to a strict discipline. As the Cryptia was only practised among the Spartans, Plato has here described the nature of it. In this and another similar passage the object of the Cryptia is described, but not a word is said of the chase of the Helots; of which no mention occurs in any of the now remaining works of Aristotle, nor in those of Thucydides, Xenophon, Isocrates, and other writers of the same age, though they often speak of the revolts and desertions of the Helots, and occasionally censure the laws of Lycurgus, and the customs of the Lacedæmonians. The Abbé concludes, that till about the time when Plato wrote his treatise on laws, the Cryptia was not employed to shed the blood of the Helots. Afterwards, *i. e.* a short time after the death of Plato, the laws lost their force, and the Spartan youth killed those Helots who made too much resistance, and perhaps gave occasion to the decree of the ephori, which imported that the Helots might be murdered with impunity. The abuse increasing from day to day, the Cryptia was at length confounded with the chase of the Helots. According to Aristotle the Cryptia was instituted by Lycurgus. Plato explains its object and believes it to be extremely useful. When the manners of Sparta became corrupted, the youth of Lacedæmon, we are told, abused this exercise to perpetrate horrid cruelties, which cannot be justified, but which have been transmitted to us with exaggeration, and unjustly charged upon the institution of Lycurgus.

The institutions of Lycurgus have been much extolled both by ancients and moderns, but they are unquestionably liable to many objections. The legislator himself, when he framed them, must have been in a great degree devoid of that comprehension and sensibility of mind, which takes an enlarged view of the frame and condition of men, and which duly attends to the feelings of human nature; particularly those of parents and children. The understanding was left in a great degree uncultivated; decency was professed, barbarity rendered familiar; and all those tender sensations that humanize society were smothered, as it were, in the birth. The constitution was a most unnatural effect of speculation, founded upon the misery of the individuals that composed the community: for if the Spartans were free with respect to other nations, they were slaves to their own legislature. In a word, say the authors of the Universal History, it was a discipline calculated, not for a free people who had a right to cultivate the powers of reason, and taste the noblest enjoyments of life, but for the desperate militia of a despotic tyrant, who wants to extinguish every sentiment of humanity, and produce a contempt of life by stripping it of all its comforts.

## LACEDÆMONIANS.

Such an institution as that of Lycurgus, with all its defects and failings, is a just object of admiration: but it would have been less wonderful, if it had subsisted only during the life of the legislator; however, we know that it subsisted many ages after his decease in a greater or less degree of vigour and influence. Xenophon, in the encomium he has left us of Agesilaus, and Cicero, in one of his orations (Pro Flacc.,) observes, Lacedæmon was the only city in the world that preserved her discipline and laws for so considerable a term of years unaltered and inviolate. "Soli," (says Cicero, speaking of the Lacedæmonians), "motu orbe terrarum septingentos jam annos amplius unis moribus ad nunquam mutatis legibus vivunt." In Cicero's time, however, the discipline of Sparta, as well as her power, was very much relaxed and diminished. But all historians agree that it was maintained in a very considerable degree of vigour till the reign of Agis, under whom Lyfander, though himself incapable of being blinded or corrupted with gold, filled his country with luxury and the love of riches, by bringing into it immense sums of gold and silver, which were the fruits of his victories, and thereby subverting the laws of Lycurgus. But the introduction of gold and silver, says Rollin, was not the first wound given by the Lacedæmonians to the institution of the legislator. It was the consequence of a violation of another law still more fundamental: ambition was the vice that preceded and made way for avarice. The desire of conquests drew on that of riches, without which they could not have proposed to extend their dominions. The main design of Lycurgus, in the establishment of his laws, and especially of that which prohibited

the use of gold and silver, was, as Polybius and Plutarch have judiciously observed, to curb and restrain the ambition of his citizens, to disable them from making conquests, and in a manner to force them to confine themselves within the narrow bounds of their own country, without carrying their views and pretensions any farther. Indeed the government which he established was sufficient to defend the frontiers of Sparta, but was not calculated for raising her to a dominion over other cities. That it was not his design to make the Spartans conquerors is evident from his having expressly forbidden them, though they lived in a country surrounded with the sea, to meddle in maritime affairs; to have any fleets, or even to fight upon the sea. Although he made them a nation of foldiers and warriors, it was only that, under the shadow of their arms, they might live in liberty, moderation, justice, union, and peace, by being content with their own territories, without usurping those of others, and by being persuaded, that no city or state, any more than a single person, can ever hope for solid and lasting happiness, but from virtue only. On this subject, see Anc. Un. Hist. vol. v. Rollin's Anc. Hist. vol. ii. Travels of Anacharsis, vol. iv.

The stability, as well as the glory, of the Lacedæmonian government, was derived from the wise institutions of that celebrated lawgiver, of whose government we have given an account. After the death of Lycurgus, the Lacedæmonian history becomes perplexed, being supplied from scanty and scattered materials.

The following table shews the succession of their kings, in both lines, with the duration of their reigns, from Lycurgus until the Achæan league.

Lacedæmon becomes a part of the Achæan league, 191 B. C.

## LACEDÆMONIANS.

It would far exceed our limits to detail minutely the history of the Lacedæmonians during the series of reigns which we have above enumerated. We must content ourselves with marking some of its principal events, and particularly those in which their ambition led them to violate the constitution established by Lycurgus. We shall find that instead of employing their arms and exercising their valour for maintaining their own independence, they were actuated by an ambition for making conquests and extending their territories, by methods directly contrary to the rules of conduct which Lycurgus had prescribed. Charilaus, his nephew and pupil, began with an unsuccessful war with the Argives, and with the Tægentæ, a people of Arcadia; and he then turned his arms against the Achæans, who had taken from the Lacedæmonians several frontier towns, which he and his colleague Teleclus recovered. But a more important event in the Lacedæmonian history was the Messenian war, the foundation of which was laid during the reign, or soon after, the death of Teleclus; but it was actually commenced by Alcamenes, king of Sparta, who made a sudden irruption into the Messenian territory. In the prosecution of this war, the Lacedæmonians and their two kings took a solemn oath not to return till they had thoroughly reduced Messenia, by which oath they entered into an obligation to transgress two of the express laws of Lycurgus; one of which forbade them to make conquests, and the other which prohibited them from prolonging their war against the same people. Polydorus and Theopompus continued the war which had been begun by Alcamenes and Nicander; and constrained the Messenians to fortify a city which was situated on the top of the mountain Ithome, that they might retire into it for safety and self-defence, when they were driven from their other cities and villages, that were more exposed. The Lacedæmonians, regardless of that clause in the laws of Lycurgus, which cautioned them against besieging fortified places, laid siege to Ithome; and altogether destitute of experience in this branch of military tactics, they were under a necessity of continuing the siege for fourteen years before they reduced the place. It was during this expedition that Theopompus is said to have created the ephori, thus altering the original constitution of the Spartan government. The attention of the Spartans was diverted from the Messenian war by a dispute with the Argives, concerning the city of Thyrea, and its district, which, lying on the borders of Argolis and Laconia, occasioned great contentions between those states.

The Argives were defeated with great slaughter; but when Polydorus was urged to pursue his victory, and to attack Argos itself, he declined it with this noble declaration, worthy of the institution of Lycurgus, "that the Spartans sent him to assert their rights, but not to rob others." The Spartans, after having provided for the administration of affairs at home, by the appointment of the ephori, renewed the Messenian war, and marched with a great army towards Ithome, but they were defeated with great loss, and constrained to betake themselves to flight. At length, after an obstinate resistance on the part of the Messenians, they were obliged to surrender Ithome to the Spartans, and they themselves were treated with great rigour. The Spartans, during the Messenian war, having been ten years absent from the city, on account of their oath, which obliged them not to return till they had entirely subdued that country, were reminded by a message from the women, that, whilst they were so careful to subdue their enemies, they neglected the city. In consequence of this message, they decreed that the young men among them who came out of Sparta under age, and on this account were not obliged by the oath, should

return, and associating themselves promiscuously with the unmarried women, preferre the city from falling into decay. This project being executed, those who were born of such young women were called "Partheniæ;" that is, sons of virgins. When the Lacedæmonians returned, after having reduced Messenia, they neglected these young men, who, finding themselves involved in difficulties, for want of parents and an inheritance, intrigued with the Helotes, and formed a plot against the state. The plot, however, was discovered, and they were sent off to Italy, where they settled near Tarentum. In the reign of Anaxander and Anaxidamus, 685 years B. C., the second Messenian war begun, and continued 14 years. It terminated with the capture of Ira or Era, after a siege of 11 years, and by the conquest of Messenia, the inhabitants were made slaves, and the whole country was divided by the Spartans among their own citizens, the district of Methone excepted, which they gave to the Argives. Nothing of any great importance occurred in the history of the Lacedæmonians until the Persian war. When Miltiades, the Athenian, fought the famous battle of Marathon, and defeated the Persians, in the 490th year B. C., the Spartans had promised an army, but sent none; some time after the battle their troops arrived, contemplated the spot where it had been fought, and after having highly commended the Athenians, returned home again to Sparta. When this battle at Marathon excited the Persians to attempt again the conquest of Greece, the Spartans, with a resolution worthy of the disciples of Lycurgus, determined to oppose them. The states of Greece, apprized of the hostile intentions of Xerxes, unanimously joined in a general assembly to defend its liberty against the Persians; but in the event, of all the confederates, the Spartans and Athenians were the only states that seemed prepared to execute their purpose. A resolution was formed to defend the straits of Thermopylæ; and when 6000 foot were appointed for that service, the command of them was given to Leonidas, who had succeeded Cleomenes in the kingdom of Lacedæmon. Of the 6000 foot, 300 only were Spartans. Leonidas himself considered it as a desperate undertaking, but was determined either to succeed, or to die in the attempt. The issue of this conflict was the death of Leonidas with all his Spartans; but the victory on the part of the Persians cost them 20,000 men. The Grecian fleet, which lay at Artemisium, was entrusted to the command of Eurybides, a Spartan, possessed of great personal courage, but timorous as a commander, and unexperienced in maritime affairs. When Mardonius attempted the conquest of Greece, Pausanias, the son of Cleombrotus, who assumed the character of tutor or protector to Plistarchus, the son of Leonidas, had the command in chief of the whole Grecian army, which amounted to 100,000 men. The Persians were undoubtedly double this number. But both armies were afterwards greatly diminished by desertion. At length the Lacedæmonians and Tegetæans were forced to engage Mardonius's army without assistance. The Persians, it is acknowledged, behaved well on this occasion; but being neither so well armed, nor so well disciplined as the Greeks, their valour was of no use but to expose them to slaughter. The Persians were defeated and Mardonius killed. The Persian camp was forced; the Lacedæmonians opened a passage; and then a merciless slaughter ensued. Of 300,000 men, whom Mardonius brought into the field, scarcely 3000 escaped. The number of Greeks that fell is uncertain; Plutarch reckons them at 1360, but Diodorus Siculus affirms positively, that they were very few less than 10,000. On the same day in which the battle of Plataea was fought, (479 B. C.) Leotychides, king of Sparta, with Xanthip-  
pus,

## LACEDÆMONIANS.

pus, the Athenian, gained a glorious victory at Mycale, where the last remains of the Persian fleet, and of the Persian armies, which had been drawn together for the destruction of Greece, were utterly defeated, and Pausanias was afterwards sent to take the command of the fleet, with strict orders to free the Grecian cities from the Persian garrisons. But he soon after intrigued with Artabazus, and engaged in a scandalous treaty with the Persians; affecting, by the assistance of the great king, to make himself sovereign of Greece. The allies took umbrage at his conduct, and privately sent to accuse him at Sparta. He was induced, however, by delusion to return to Sparta; where he was seized by the ephori, but for want of sufficient evidence, or dreading his influence, they released him. He nevertheless pursued his negotiations with Artabazus, till his intrigues were discovered. Upon his retiring to the temple of Minerva Chalcedica, in order to take sanctuary there, the Spartans blocked up the gate, and thus preventing his escape, reduced him to the necessity of starving in the temple. At the end of the 77th olympiad (465 B.C.) a most dreadful earthquake happened at Sparta. Diodorus says, that 20,000 persons lost their lives, and Plutarch affirms, that only five houses in the city escaped ruin. In this year, 465 B.C., the third Messenian war commenced, by the instigation of the Iclotes, and lasted ten years. The next war which the Lacedæmonians undertook, was that styled the "Sacred," by some the "Phocian" war; begun in the 448th year B.C. The design of it was to put the temple of Delphi into the hands of the inhabitants of the country, whereas it had before belonged to the Phocians; this design the Spartans effected; and they were recompensed by a decree on the part of the Delphians, that they should have a right of first consulting the oracle; which decree was engraven on the forehead of a brazen wolf, consecrated in the temple. The Athenians soon after, having restored the temple to the Phocians, obtained the same privilege, and the decree which granted it was engraven on the right side of the wolf. The Lacedæmonians having induced the Boeotians to revolt from the Athenians, and Eubœa at the same time shaking off the yoke, availed themselves of this opportunity for giving a mortal blow to Athens; for which purpose Plistoanax was ordered to invade their territories, at the head of a great army. He was persuaded, however, by his guardian Cleonrides, who accepted a bribe from Pericles, to return home, without effecting any thing, for which corruption the Spartans punished Cleonrides with death, and sentenced their king to exile. Soon after a peace was made between the Spartans and Athenians. This peace was of no long duration; for in the year 431 B.C. the Peloponnesian war began. Archidamus, the king of Lacedæmon, wished to avoid this war, and sent a messenger to Athens, with a commission to this purpose; but he was sent back unheard. After several incursions into Attica, Archidamus died. He is said to have been one of the best kings that ever reigned in Sparta. Being asked, "who were governors of Sparta?" he replied, "the laws, and the magistrates according to these laws." During the reign of his son and successor Agis, who invaded Attica, the Athenians took several towns; but at length they were routed with great slaughter by the Spartans under the command of Brasidas, one of the most celebrated men of Sparta. In the year 421 B.C. a peace was concluded, after the war had raged for ten years. But in order to prevent too intimate an union between Sparta and Athens, several of the Peloponnesian states leagued themselves with Argos, which was a very powerful republic, and hostile at this time to the Lacedæmonians. After some flights and affronts, the Spartans, much irritated, resolved on a war

against them and their allies; and entered the territory of Argos with a large army. The Argives, being ill prepared for a conflict, declined it, and obtained from Agis a truce of four months; which gave great offence to his allies, and for which he was severely mulcted and opprobriously treated on his return to Sparta. The Athenians, having obtained a supply of troops, renounced the treaty made with Agis, and the two armies engaged at Mantinea. The Spartans under Agis, though inferior in number to the Argives and their allies, and very obstinately resisted, gained a complete victory. This happened in the year 418 B.C. In the year 414 B.C. Agis entered the territories of Elis, in order to revenge the dishonour that had been done some years before to the republic, by forbidding them to be present at the Olympic games. After repeated interruptions into the country, the Eleans treated with the Spartans, and a peace ensued. At this time the Peloponnesian war was renewed. The Athenians having sent a great army into Sicily, the Lacedæmonians sent Gylippus to assist the Syraculians; among whom he gained great reputation at first, though it was afterwards ruined by his avarice. About this time Alcibiades repaired to Sparta, having been expelled his country by a prevailing faction. By adopting the Spartan mode of living, he became a great favourite, and was treated with particular respect by Agis, who received him into his house; but in return for the hospitality he experienced, he basely debauched the wife of Agis, and was obliged to quit Læconia, and to seek among the barbarians a place of safety. Whilst king Agis managed the war in Attica, the conduct of maritime affairs was committed to Lyfander, who proved the great hero of Sparta, and brought to a termination the Peloponnesian war. Lyfander was supposed to be of the royal family, and of the Herculean race; he passed his younger years under all the restrictions of the institutes of Lycurgus, and was thus rendered bold, hardy, patient, and resolute; his genius was extensive, and in his disposition and manners, he was affable, modest, vigilant, and indefatigable; but with these great qualities he cherished the most dangerous ambition, in order to gratify which he stooped to every species of flattery and dissimulation; so that to accomplish his ends, he made no scruple to violate the most solemn oaths. When he entered on his command, he found the Athenians greatly superior at sea; but in a few years he deprived them of all power; but, above all things, he fought to advance his own credit and authority. Lyfander soon perceived, that without the Barbarian gold, Sparta could not carry on the war; and he therefore insinuated himself into the favour of Cyrus, who was then at Sardis, and obtained from him 10,000 pieces of silver, which he applied to the purpose of supporting his soldiers, and refitting his fleet. Whilst he lay at Ephesus, repairing his ships and keeping his soldiers and mariners to their exercise, he projected a scheme for making himself, in a manner, sovereign of Greece. After several previous manoeuvres and changes of position, he attacked the Athenians, whose fleet was under the command of Conon, both by sea and by land, and completely defeated and routed them; so that, in a single hour, he put an end to the Peloponnesian war, and to the maritime power of Athens. After this victory (405 B.C.), and the power acquired by it, Lyfander acted rather as an universal monarch than a general from Sparta. He immediately visited all the neighbouring cities, and changed their government, placing in each of them a Spartan magistrate, and with him ten of his friends from Ephesus, where he erected a kind of political university. These men conducted themselves with haughtiness and severity, and the Lacedæmonian government was thus rendered ungrateful; so that the people were univer-

sally

verfally difpofed to fhake it off as foon as they could. Lyfander collected the wealth which his victories had put into his power, and deftined it to be fent to Sparta, whither he had before fent a meffenger with the news of his victory over the Athenians, together with an affurance that he would foon be before Athens with a fleet of 200 fail; upon which, Agis and Pauſanias, the two kings of Sparta, were fent, with a very large land army, into Attica. Lyfander entered Athens in triumph, on the anniversary of the great victory at Salamis, April 24, in the year 404 B.C., which completely finiſhed the Peloponneſian war. (See ATHENS.) Lyfander, having accompliſhed this object, ſent the immense treaſures which he had collected to Sparta, under the care of Gylippus, whoſe avarice and fraudulent diſpoſition led him to open the bags which contained them, and to take out what he thought proper. Upon his arrival at Lacedæmon, their contents were examined, and compared with a ticket which Lyfander had put into each ſealed bag. The deficiency was ſoon diſcovered; Gylippus was impeached by his fervant, and his crime being proved, he was exiled under the ſcandalous imputation of being a detected cheat. This influx of wealth occaſioned great diſputes at Sparta: thoſe who were beſt acquainted with the nature of their conſtitution regarded the receipt of it as an open violation of the laws of Lycurgus, and they expreſſed their apprehenſion, that in proceſs of time they would have reaſon to repent this acceſſion of opulence. It was at laſt determined, as a compromise of the ſubſiſting diſputes, that the ſtate might make uſe of the gold and ſilver, but that private perſons ſhould poſſeſs neither, on pain of capital puniſhments. Lyfander, while he remained in Greece, amply evinced his imperious diſpoſition; ſetting up his own ſtatue, and thoſe of his commanders, who were his favourites, and dedicating two ſtars in honour of the deities Caſtor and Pollux, two ſtars which his ſycophants pretended had been ſeen in the rigging of his ſhip, at the battle of Ægos. The range of his ambition in Aſia was ſtill leſs reſtrained. At length the ephori and ſenate of Sparta diſpatched a *ſyſtala* (which ſee) to recall him. After ſome tokens of diſpleaſure, the Spartans became reconciled to him, and in proceſs of time extolled him for a man of integrity and true public ſpirit, to the mortification of their king Pauſanias, who had endeavoured to humble his pride and reſtrain his influence. Before Ageſilus was well ſettled on the throne (397 B.C.), the king of Perſia declared war againſt the Spartans: the king was, not without reaſon, jealous of the power of Lyfander; and a miſunderſtanding between them taking place, Lyfander reſolved to overturn the government of his country. But new diſturbances occurring in Greece, he perſuaded the ephori and ſenate once more to entruſt him with an army. An army was ſoon raiſed, to the command of which he was appointed; and another army was put under the command of king Pauſanias. Lyfander, haſtening by quick marches to Halartus, and unsupported by Pauſanias, who was more dilatory in his progreſs, was attacked by the Thebans and Halartians, and killed on the ſpot, and the Spartans were defeated. A treaty was concluded with Pauſanias, on condition of his retiring out of Bœotia. But on his return to Sparta, ſuch a ſpirit of reſentment appeared againſt him, that he was afraid to undergo his trial, and therefore retired to Tegææ, where he led a private life. The memory of Lyfander was held in great veneration, not only for the ſervices which he had rendered his country, but on account of his dying poor, notwithstanding the opportunities he had of enriching himſelf.

Ageſilus, having ſubjected the greateſt part of the coaſt, determined to march into Perſia, and revenge the cruelties

perpetrated by Xerxes, when he invaded Greece; but being recalled, he returned without heſitation; preferring his duty towards the conſtitution of his country to the proſpect of ſubduing the whole Perſian empire. During the reign and military exploits of Ageſilus (B.C. 393), Conon, the Athenian, threatened the Spartans with the loſs of their ſovereignty by ſea; upon which it was reſolved at Sparta to ſend Antalcidas into Perſia, to appeaſe the great king, and to detach him from the intereſts of their rivals. The negotiations of Antalcidas prevailed, ſo that a peace was concluded (387 B.C.), called the peace of Antalcidas, by which the ſovereignty of Greece was, in a manner, guaranteed to Sparta, but upon very diſhonourable terms, the Greek cities in Aſia being entirely abandoned to the Perſians, notwithstanding all the promiſes which had been made to them, and although Ageſilus himſelf had fought in their quarrel. The Lacedæmonians became haughty and inſolent, and reſolved to puniſh all who had injured them. They began with the Mantineans, who had been their confederates, and had done them great ſervices. They next extended their arbitrary power to the Phliſians, and then to the Olynthians, who were reduced to ſuch diſtreſs, that they made a treaty with the Spartans, by which they engaged to have the ſame friends and enemies with them, and to follow them as associates in their wars, whitherſoever they ſhould lead them. Sparta exerciſed a government that was arbitrary and cruel over all whom ſhe had brought moſt unjuſtly under her dominion; for, by the peace of Antalcidas, ſhe had engaged that all the cities ſhould be left free. The Perſian king perſiſted in his deſign to bring about a ſettled tranquillity, which, in the beginning of the 102d olympiad, (372 B.C.) ſeemed to be nearly effected; the Athenians heartily concurring with the Lacedæmonians, and giving no countenance to the Thebans, who reſuſed to hear of peace, becauſe the Spartans inſiſted they ſhould ſet the cities of Bœotia at liberty. In this oppoſition they were encouraged by Epaminondas, who demanded that, before the Lacedæmonians gave laws to others, they ſhould ſhew a proper regard to thoſe maxims of equity themſelves, by giving up Meſſenia to its ancient proprietors, and ſetting Laconia free. This obſtinity violently incenſed Sparta, and offended Athens. Cleombrotus, with an army of 12,000 men, penetrated into Bœotia, and advanced towards Leuctra. A truce, however, was concluded by the mediation of Jaſon, a powerful prince of Theſſaly. But as Cleombrotus was retiring, he met Archidamus, the ſon of Ageſilus, with a reinforcement from Sparta; and theſe princes, notwithstanding the truce, marched back to Leuctra, in order to fall on the Bœotians, where they found Epaminondas ready to receive them. The Spartans, in the battle of Leuctra, (fought July 8th, 371 B.C.) were defeated with great ſlaughter; and thus they loſt the empire of Greece, which they had held near 500 years. Epaminondas afterwards entered Laconia, and appeared before Sparta; but Ageſilus compelled him to retire, though not without deſolating the country in his retreat. Epaminondas, when he quitted the territories of Sparta, rebuilt the city of Meſſene, and recalled the ancient inhabitants of Meſſenia from the ſeveral countries where they had taken refuge, and reſtored them to the poſſeſſion of their ancient patrimony, after they had loſt it 300 years. Having accompliſhed this object, he offered the Lacedæmonians peace, on condition that they ſurrendered all pretenſions to Meſſenia, and left Laconia free; terms which they rejected with diſdain. At length the Perſian king diſpoſed almoſt all Greece to think of peace; and this was effected, after the Laconian or Bœotic war had laſted about five years. In the ſecond year

of the 104th olympiad (363 B. C.) new commotions arose in Peloponnesus. Epaminondas made an unsuccessful attempt to surprize Sparta, and afterwards Mantinea; mortified by these disappointments, he determined to attack Agesilaus, who was at the head of the Lacedæmonians and Arcadians, with the rest of their allies; but in his charge against the Lacedæmonians, he exposed his person too much, and fell under a cloud of darts, and was at length killed by a Spartan javelin. Pyrrhus of Macedon, interfering in a dispute about the succession to the throne of Sparta, made several attempts against the city, but was as often repulsed; and before he quitted Greece he was killed in a battle with Areus the Spartan king. Cleonidas II., who succeeded Areus II. in the year 257 B. C. had long lived in the court of Seleucus, and acquired a taste for pomp and grandeur. At Sparta he had an opportunity of indulging this taste, for the maxims of Lycurgus had sunk not only into disuse, but into contempt. One of the ephori, who had gained influence, and who had conceived a prejudice against his own son, procured a law, by which all men were left at liberty to dispose of their lands by gift or sale, or by testament at the time of their decease. In consequence of this law, which subverted the original constitution, most of the lands were, by degrees, transferred from the ancient Spartan families; and thus the credit and glory of the Spartan state declined. Agis, the colleague of Leonidas, and a perfect counterpart to him in disposition and character, attempted to counteract his conduct, and to restore the constitution of Sparta. Cleombrotus, who succeeded Leonidas, after he had been set aside, concurred with Agis in all his designs; but when Agis was obliged to go with a body of Spartan troops to the assistance of the Achæans, his colleague abused his power to such a degree, that Leonidas was restored; upon which Agis, when he returned, fled to the temple of Minerva, and could not be drawn out of his sanctuary by any methods which Leonidas could practise. He was at length treacherously seized, tried, and condemned by the ephori, and at last put to death. On the death of Leonidas, Cleomenes ascended the Spartan throne; and resolved to suppress the ephori, and to restore the ancient constitution of Sparta. In the course of his reign he invaded Achæa, and took several cities. Being informed that Areus and the Achæans were preparing to give him disturbance, he marched a body of troops into their territories, and gained many advantages over them. At length the Achæans, disheartened by their ill success, offered to submit to any terms which Cleomenes proposed. He acted like a generous victor, declaring that he merely fought to be acknowledged general of the Greeks, and that he was ready to deliver up the prisoners without ransom, and to restore the cities he had taken. But being seized with a disorder, which induced for a time a disability for service, Areus suffered jealousy, envy, and self-conceit to triumph over his virtue and love for his country; and he, who in his youth had expelled the Macedonians out of Peloponnesus, merely from the love of freedom, now privately recalled them, fearing that Cleomenes, the most worthy of the Spartan kings, should be raised to that dignity which he so highly merited. When Cleomenes recovered from his disorder, he advanced towards Argos, where the Achæans held their assembly; but when he drew near, Areus sent to inform him, that he must either enter the city alone, or he content to treat without the place. Cleomenes, in consequence of this treatment, invaded Achæa, and took several cities. He soon after surprized Argos, and advanced himself to greater power than any of his predecessors had possessed; and his city to greater pre-eminence than he had ever held in Greece. At a subsequent period, viz. in the

year 222 B. C. he gave battle to Antigonus at Sallafia, where, from the superiority of the Macedonian troops, and the treachery of Damoteles, the Lacedæmonians were defeated with a great slaughter of their mercenary troops, and an almost total destruction of their own. After this disastrous defeat, Cleomenes fled to Egypt, where he put an end to his life. With him terminated the Herculean race of Spartan kings, if we except the short reign of Agesipolis. After the fatal battle of Sallafia, Sparta fell into the hands of king Antigonus, who treated the inhabitants with great kindness, and they for a time behaved very quietly. Lycurgus, the Spartan king, invaded Messenia, and defeated the Messenians. After he had obliged Philip of Macedon to retire from Laconia, the ephori, pretending to have received information that he wanted to make himself absolute, attempted to surprize and murder him; but he withdrew into Æolia, and when the iniquity of the ephori was discovered by the people, he was recalled. Machanidas, the successor of Lycurgus, ejected the ephori, averfe from having any either equal to, or greater than, himself in Sparta. Abroad, he made all Peloponnesus tremble, and would probably have subdued it, if Philopœmen, the chief of the Achæans, had not opposed his designs. This leader engaged all the cities in that league to furnish troops for reducing the power of Machanidas; an engagement took place between the contending parties at Mantinea, in which the Spartans were defeated, and Machanidas was killed. Nabis, a cruel tyrant, succeeded Machanidas; and upon his death, by the hand of violence, the chief of the Ætolians broke into his palace at Sparta, and rifled all his treasures. The soldiers followed his example, so that the Lacedæmonians, who had suffered so much from the wanton and savage tyranny of Nabis, looked upon his murder as their misfortune; and a multitude of them assembled, and put many of the Ætolians to death without mercy. In the midst of their confusion, Philopœmen arrived, and having convinced the Lacedæmonians of the madness of their act, engaged them, since they had so happily recovered their freedom, to unite themselves to the Achæans, B. C. 197. (See Achæans.) In the year 188 B. C. upon a quarrel between the Lacedæmonians and Achæans, Philopœmen destroyed the walls of Lacedæmon, abrogated the laws of Lycurgus, and compelled the Spartans to adopt those of the Achæans. Upon their preferring a complaint to the senate of Rome, Callicrates ordered the walls of their city to be re-built; and according to the opinion of Meursius, which is the most probable, the laws of Lycurgus were not restored till after the Romans had vanquished Perseus, and Achæa was joined to their empire. Lacedæmon was placed under the protection of the Romans. During the civil wars of the Roman empire, the Lacedæmonians attached themselves to the party of Cæsar and Augustus, to whom they consecrated temples. Nero, in his expedition into Greece, durst not enter Sparta, by reason of the severity of its laws. Pliny the elder speaks of Lacedæmon as a free city under Vespasian. Apollonius Tyaneus, if we may credit Philostratus, found the laws of Lycurgus in full vigour in the time of Domitian; but it is probable, that this emperor diminished the liberty of the Lacedæmonians, for Pliny the younger, writing under the reign of Trajan, says, that there only remained the shadow of liberty. From that time no vestige remains of the institutions of Lycurgus; at least Meursius could not discover any. When Christianity became the religion of the empire, the residue, if any, of these institutions must have been abolished. Meursius cites a passage from Theodoret, which proves that they were entirely abolished by the Romans before his time, that is, before the 5th century.

Although, in the preceding article, we have used the appellation

pellations Lacedæmonians and Spartans as synonymous; yet when they are distinguished, the Spartans denote the citizens of Sparta, and the Lacedæmonians are the inhabitants of the province. The number of the former anciently amounted to 10,000. In the time of XERXES their number was 8000; but by their continued wars they were so much reduced, that very few ancient families were found at Sparta. The new families were descended from the Helots, or slaves, who, being first rewarded with their liberty, afterwards acquired the title of citizens. These were not called Spartans, but were differently denominated according to the various privileges they had obtained, and their several names bore some reference to their former condition. The Lacedæmonians, properly so called, formed a confederation, the object of which was to unite their forces in war, and to maintain their rights in time of peace. When the interests of the whole state were to be discussed, they sent their deputies to the general assembly, which was always held at Sparta. There were settled the contributions which each city should pay, and the number of troops it should furnish. The inhabitants of the cities of Laconia did not receive the same education with those of the capital. Their manners were more rude, and their courage less brilliant; and hence Sparta obtained an ascendancy over the other cities. *Anc. Univ. Hist. vol. v. Rollin's Anc. Hist. vol. ii. Trav. of Anacharisis, vol. iv.*

**LACEDÆMONIUM MARMOR**, in the *Natural History of the Ancients*, the name of a species of marble very hard, and of a beautiful green colour; it is a very close, even, and compact marble; of a fine strong and bright green, and when polished, is the brightest of all the green marbles, and is remarkable for this, that the colour is not regularly and equally diffused through the whole mass, but leaves in it many spots and lines very bright and pale, and some much deeper than the general colour, though there is no colour but green in the whole, only in different shades and degrees, some parts approaching to black, and others to whiteness.

It was originally found only in Egypt, and there not in entire strata, but in large pieces washed off from the strata, and sometimes left on the surface, sometimes buried in the earth, and was greatly valued. It has been since found in Italy and Germany, and in England. About five miles from the Hot-Wells at Brillol there is a stratum of it, whence it might be had in considerable quantities. Its beauty would soon recommend it, if it were once known; and though hard to cut, it would make amends for that by the high polish it would take.

**LACERATED WOUNDS.** See **WOUNDS**.

**LACERNA**, a thick coarse sort of military garment worn by the ancients.

The lacerna was a kind of cloak of woollen, only used by the men; who wore it over the toga, and when that was not on, over the tunica. It was at first very short, but growing popular in the Roman army, it was soon lengthened.

The lacerna was scarcely known in Rome till the time of the civil wars, and the triumvirate; then indeed it came into fashion; for the soldiers being then frequently in the city, or at the city gates, the sight became familiar to the citizens, and they fell into the use of it; inasmuch that it became the common dress of the knights and senators, till the time of Valentinian and Theodosius, when the senators were prohibited the wearing of it in the city.

The lacerna appears to have been much the same with the *elblamy* and *birrus*.

Martial mentions lacernæ of ten thousand sesterces price.

**LACERTA**, **LIZARD**, in *Astronomy*, a constellation of the northern hemisphere, including, according to Hevelius,

ten stars, and in the British Catalogue sixteen. See **CONSTELLATION**.

**LACERTA**, in *Zoology*. See **LIZARD**.

**LACERTI**, a division of the reptiles, comprehended under the genus of *Lacerta*.

**LACERTUS**, and **LACERTULUS**, in *Anatomy*, names sometimes applied to the bundles of fibres, of which the muscular organs are composed.

**LACERTUS**, in *Zoology*. See **MANIS**.

**LACERTUS**, in *Ichthyography*, the lizard-fish, a name given by some writers to a fish of the cuculus kind, much resembling the common mackerel in shape and in taste, and more usually called trachurus.

**LACERTUS** is also used for a fish of the gar-fish kind, or *acus Oppiani*, but larger than the common species, and called by the Italian fishermen *aguglia imperiale*, or the imperial gar-fish, and by the fishermen of England, particularly in Cornwall, the *gerrack*, in distinction from the common kind which they call *kipper*. It is thicker in proportion to its length than the common gar-fish, and has a shorter and sharper snout, and instead of teeth, has only its jaws serrated like a file. It is a fierce fish, but is more firm in its flesh than the common gar-fish. See **ESOX**.

**LACERUM**, in *Anatomy*, an epithet applied, from their irregular figures, to two foramina of the skull; one in the orbit, the other in the basis crani. See **CRANIUM**.

**LACERUM FOLIUM**, among *Botanists*. See **LEAF**.

**LACHAS**, in *Geography*, a town of South America, in the audience of Quito; 60 miles N. of Quito.

**LACHELA**, a town of Sweden, in East Bothnia; 13 miles S.S.E. of Wafa.

**LACHELLO**, a town of France, in the department of the Sèna; nine miles W.S.W. of Verceili.

**LACHEN**, a town of Switzerland, in the canton of Schwetz, on the S. side of the lake of Zurich. Near it are some mineral springs, and also crystals and petrifications; eight miles W. of Utznach.

**LACHENALIA**, in *Botany*, so named by professor Jacquin, jun. in honour of Werner de Lachenal, professor of botany and anatomy at Basil, a distinguished pupil of Haller and friend of Linnæus, eminent for his knowledge of European plants, and still more estimable for his candour and liberality. Several of his dissertations occur in the *Acta Helvetica*, which throw great light upon the botany of Switzerland, and were intended as preparatory to a *Flora* of that country, disposed according to the Linnæan system; but this work has never yet appeared. Whether its author be still living, we have not lately heard. He was born in 1730.—Jacq. fil. in *Act. Nov. Helvet. v. 1. 38. t. 2. f. 3.* Murr. in *Linn. Syst. Veg. ed. 14. 314.* Schreb. 799. Willd. *Sp. Pl. v. 2. 171.* Mart. *Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 284.* Lamarck. *Dict. v. 3. 372.* *Illustr. f. 1. t. 237.* (Phormium; *Juss. 52.*)

*Gen. Ch. Cal. none. Cor. of six oblong unequal petals, approximated into the form of a tube, united at their base; the three outer ones shortest, and often callous at the tip. Stam. Filaments six, erect, awl-shaped, attached to the base of the petals, various in length; anthers erect, oblong. Pisl. Germen superior, nearly ovate; style awl-shaped, as long as the stamens; stigma simple, obtuse. Peric. Capsule nearly ovate, with three wings, and three cells. Seeds several, globose, attached to the central column.*

*Ess. Ch. Corolla inferior, regular, of six petals; the three inner ones longest. Stamens erect. Capsule somewhat ovate, with three wings. Seeds globose.*

*Obs. Jussieu and Lamarck, following the younger Linnæus in his Supplementum, confound this genus with the*

## LACHENALIA.

*Phormium* of Forster, or New Zealand flax, the former retaining this name, while the latter adopts that given by Jacquin as above; but these genera are no less distinct in habit than in their essential characters. See PHORMIUM.

The species of *Lachenalia* are beautiful bulbous plants, with the habit of a Hyacinth, having all radical oblong leaves, a simple racemose flower-stalk, and variously-coloured, more or less spreading or drooping flowers. Willdenow has 24 species; the 2d edition of *Hort. Kew.* enumerates 17 as cultivated in that noble collection; but we would presume to remove two species from both these lists. *L. fruticosa*, which is *Hyacinthus serotinus* of Linnaeus, a native of Spain, figured in *Curt. Mag.* t. 859 and t. 1185, is referred by Mr. Ker, in the last-mentioned work, to *Scilla*, a measure to which we cannot but readily accede; and *L. viridula* may as well, in our opinion, continue in *Hyacinthus*, where Linnaeus has placed it; at least it cannot well be made to agree with *Lachenalia*; see *Jacq. Ic. Rar.* t. 66. The remaining species are all natives of the Cape of Good Hope, and, as far as we know, of no other part of the world. Such as we have in gardens are cultivated in the green-house, being treated like other Cape bulbs, and flowering chiefly in the early spring, a few of them in autumn. Good examples of this genus are,

*L. orchisoides*. Orchis-like *Lachenalia*. *Jacq. Ic. Rar.* t. 390. *Curt. Mag.* t. 854. 1269.—Flowers bell-shaped, sessile. Inner petals obtuse, expanding. Style the length of the stamens. Leaves oblong-lanceolate, with a crenate cartilaginous edge.—This is the oldest inhabitant of the English gardens among the whole genus, having been cultivated by Miller in 1752. It appears to be a very variable species, at least if more than one be not confounded under this name. The leaves are more or less speckled, like the flax. Flowers numerous, varying with pale yellow or purple mingling into shades of brown.

*L. contaminata*. Mixed-coloured *Lachenalia*. *Curt. Mag.* t. 1401. (*L. hyacinthoides*; *Jacq. Ic. Rar.* t. 382. Willd. n. 4. *L. orelioides*; *Jacq. Hort. Vind.* v. 2. 83. t. 178.)—Flowers bell-shaped, somewhat cylindrical, on short stalks, erect. Inner petals lanceolate, obtuse, erect. Leaves linear-awl-shaped, channelled, lax, longer than the stalk.—This has long been at Kew, having been sent from the Cape, by Mr. Masson, in 1774. The long taper-pointed leaves, deeply-spotted stalk, and speckled flowers, in which white, brownish purple, and tints of green, contend for the superiority; but the two former generally prevail, characterize this species.—Nearly akin to it is *L. angustifolia*, *Jacq. Ic. Rar.* t. 381. *Curt. Mag.* t. 735. Redout. *Liliac.* t. 162; chiefly distinguished, according to Mr. Ker, by the broader proportion and spreading posture of the inner petals. The leaves also are narrower, but the whole habit and colours of the plant are very similar.

*L. orbiculata*. Straight-petalled *Lachenalia*. *Jacq. Coll.* v. 3. 240. *Ic. Rar.* t. 383.—Flowers cylindrical, slightly funnel-shaped, on short stalks, erect. Petals all lanceolate, straight. Bractæes cup-shaped. Leaves linear-awl-shaped, channelled, lax, longer than the stalk.—Of this we have seen no specimens, but Jacquin's figure proves it abundantly distinct from the *contaminata*, with which, as Mr. Ker observes, it has been confounded by Willdenow and in the *Hortus Kewensis*. The petals are white, with a green spot at the base, near the point of each. The above character expresses their form and position.

*L. pusillula*. Blistered *Lachenalia*. *Jacq. Coll.* v. 3. 244. v. 4. 220. t. 2. f. 5. *Ic. Rar.* t. 386. *Curt. Mag.* t. 817.—Flowers bell-shaped, somewhat cylindrical, on very short stalks. Inner petals dilated and obtuse. Stalk triangular,

reclining. Leaves two, lanceolate, blistered.—The leaves are remarkable for their blistered upper surface. The flowers are pallid and unornamented; their inner petals, at first cream-coloured and spreading, become twisted together and yellowish in decay.

*L. purpurascens*. Purple-blue *Lachenalia*.—*Jacq. Ic. Rar.* t. 388. *Curt. Mag.* t. 745; *Andr. Repof.* t. 251.—Flowers bell-shaped, stalked. Inner petals obtuse, revolute. Stamens prominent. Stalk angular above. Leaves two, lanceolate, blistered.—One of the more handsome kinds, conspicuous for its copious flowers, which are variegated with blue and purple, and smell like hawthorn. Their colours and expanded form give them a resemblance to some species of *Scilla*. The leaves are short and broadish, occasionally destitute of blisters.

*L. lanceolata*. Spotted copperas-leaved *Lachenalia*.—*Jacq. Ic. Rar.* t. 402. *Curt. Mag.* t. 643. Redout. *Liliac.* t. 59.—Flowers somewhat bell-shaped, spreading, on stalks thrice their own length. Petals linear, blunt, nearly equal. Leaves numerous, ovate, pointed.—Chiefly remarkable for its numerous, broad, taper-pointed leaves, spreading in the form of a star, of a glaucous hue, more or less speckled with a darker green. The flowers are numerous, pendulous, variegated with dull purple and green.

*L. tricolor*. Broad-leaved three-coloured *Lachenalia*.—Murray in *Lin. Syst. Ved.* ed. 14. 314. Redout. *Liliac.* t. 2. *Curt. Mag.* t. 82. (*L. luteola*; *Jacq. Ic. Rar.* t. 395. *Phormium aloides*; *Lin. Suppl.* 105.)

♀. *luteola*; *Curt. Mag.* t. 1020. (*L. flava*, *Andr. Repof.* t. 456.)

γ. quadricolor; (*L. quadricolor*; *Curt. Mag.* t. 588 and 1097. *Jacq. Ic. Rar.* t. 390. *Andr. Repof.* t. 148. *L. tricolor*; *Jacq. Ic. Rar.* t. 61. *L. pendula* β; Willd. *Sp. Pl.* v. 2. 181.)

Flowers cylindrical, pendulous, stalked. Inner petals twice the length of the outer, dilated, slightly spreading, somewhat emarginate. Bractæes taper-pointed. Leaves two, lanceolate.—This is one of the most common and generally cultivated species. We are so well satisfied of the truth of Mr. Ker's remark, that the *quadricolor* of the above authors, referred by some to the *pendula*, is most akin to *tricolor*, that we cannot consider it otherwise than as a variety, certainly not more specifically distinct than the *luteola*. We conceive therefore that either these three plants must constitute one species, or they ought all to be considered as alike distinct. Cultivation by seed must in time decide this question. The leaves in all of them are in pairs, and recurved; those of the first are broad and spotted; the others longer and narrower, generally without spots. Spike in all somewhat comose, many of the uppermost flowers being abortive, and their pointed bractæes crowded into a tuft. The outer petals of all are tipped with green; those of the first and third varieties more or less tinged with red, those of the second plain yellow. The inner petals of the first are variegated with green and pale yellow; those of the second are of a plain full yellow, being moreover rather broader and more expanded; those of the third are lemon-coloured, elegantly tipped with deep crimson or purple.

*L. rubida*. Dotted-flowered *Lachenalia*. *Jacq. Ic. Rar.* t. 398. *Curt. Mag.* t. 903.

♀. *tigrina*; *Jacq. Ic. Rar.* t. 399.

γ. punctata; *ibid.* t. 307.

Flowers cylindrical, drooping, on short stalks. Inner petals one-fourth longer than the outer, spatulate, somewhat unequal, obtuse. Bractæes scarcely pointed. Leaves two, elliptic-oblong.—This is said to be rather rare in our collec-

tions. The leaves and stalk are speckled with purple, and the flowers dotted with red, in all the three varieties, which have no pretensions to be reckoned species. They differ only in luxuriance, *virgata* being the strongest plant, *punctata* the weakest and most slender.

*L. pendula*. Four-coloured Pendulous Lachenalia.—Ait. Hort. Kew. ed. 1. v. 1. 461. Jacq. Coll. v. 3. 239. 12. Rar. t. 400. Curt. Mag. t. 590. Andr. Repof. t. 41. Redout. Liliac. t. 52.

Flowers cylindrical, pendulous, on very short stalks. Inner petals nearly one-fourth longer than the outer, wedge-shaped, obtuse. Bractees scarcely pointed. Leaves two, obovate-lanceolate.—One of the most commonly cultivated and most beautiful species, flowering in the green-house or frame in February. The leaves are broad. Flowers numerous, drooping and somewhat curved, of a fine red at their base, their segments tipped with various degrees of purple and green, the middle part yell-w. The main stalk is stout and straight, speckled; the partial ones very short.—Willdenow makes the *quadricolor* a variety of this, in which he is inadvertently copied by the editors of the second edition of *Hort. Kew.*; an error corrected by Mr. Ker in *Curt. Mag.* v. 26. p. 1020. See also v. 16. p. 588, of the same work.

LACHENALIA, in Gardening, comprises plants of the bulbous-rooted kinds, of which the species mostly cultivated are the spotted-leaved lachenalia, *L. orchioidea*, the pale-flowered lachenalia, *L. pallida*, the three-coloured lachenalia, *L. tricolor*.

The third sort varies with yellow, saffron-coloured, blood-red purple at the tip, and greenish-yellow corollas; also in the proportion between the inner and outer petals; and in the breadth of the leaves.

*Method of Culture*.—All these plants may be increased by cffsets from the bulbs, and by seeds, when they are produced in perfection.

The cffsets should be planted out in pots of light fresh earth, when the bulbs are in a state of inactivity of growth, placing them in a warm border to be covered with hand-glasses, or, what is better, in a dry stove or green-house.

These plants bear forcing tolerably, and their flowering is much promoted by being preserved in the warmth of the stove.

They all afford variety among collections of potted bulbous-rooted flowering plants.

LACHES, from the French *lacher*, i. e. *laxare*, or *lache*, *ignavus*, in our *Lacus*, signifies slackness or negligence; as it appears in Littleton, where laches of entry is a neglect in the heir to enter, and probably it may be an old English word: for when we say there is laches of entry, it is the same as if it were said, there is lack of entry; and in this signification it is used. (Litt. 136.) No laches shall be adjudged in the heir within the age; and regularly laches shall not bar either infants or femes covert for non entry or claim to avoid d. scents: but laches shall be accounted in them, for non performance of a condition annexed to the state of the land. (Co. Litt. 146.) The law also determines, that in the king there can be no negligence, or laches; and therefore no delay will bar his right. Co. Litt. 90.

LACHESIS, in Zoology. See COLUBER.

LACHEZE, in Geography. See LA CHAISE.

LACHESH, in Scripture Geography, a town of Palestine, in the tribe of Dan, S.W. of that of Judah, on the frontiers of this tribe, to which Senacherib laid siege, when he sent his haughty message to Hezekiah. It was a small town,

or village, about 7 miles S. from Eleutheropolis, in the time of Eusebius and Jerom. Joh. x. 23. xv. 39. 2 Kings, xviii. 17. xix. 8. 2 Chron. xxiii. 9.

LACHNÆA, in Botany, from *λαχνη*, soft hair or down, alluding to the fine hairy clothing of the corolla. The name seems to have been given by the elder Van Royen.—Linn. Gen. 194. Schreb. 261. Willd. Sp. Pl. v. 2. 434. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 415. Juss. 77. Lamarek. Illust. t. 202. Class and order, *Orchandiæ Monogynia*. Nat. Ord. *Vespetulæ*, Linn. *Thymelææ*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, coloured, permanent; tube long and slender; limb in four deep unequal segments, the uppermost of which is much the smallest and erect, the other three reflexed, the middle one largest. Cor. none. Stam. Filaments eight, bristly-shaped, erect, inserted into the upper part of the tube, and nearly as long as the limb; a little unequal; anthers simple, roundish. Pist. Germen superior, ovate; style thread-shaped, longer than the tube, attached laterally to the germen; stigma capitate, hispid. Peric. none, except the permanent base of the calyx. Seed solitary, coated, ovate, with an oblique point.

Eff. Ch. Calyx tubular, coloured, with a four-cleft unequal limb. Stamens inserted into the mouth of the tube, permanent. Seed one, coated.

Obs. This genus differs from *Passerina* in having an irregular flower only. We follow Linnæus in his *Gen. Pl.* as to the denomination of the parts of the flower, though in his *Syst. Veg.* he subsequently termed corolla what he had before called calyx; but the analogy of *Daphne* compared with *Gnidia*, (see those articles), confirms his original phraseology.

1. *L. erioccephala*. Woolly-headed Lachnæa. Linn. Sp. Pl. 514. Andr. Repof. t. 104. Curt. Mag. t. 1295. (*Passerina erioccephala* and *cephalophora*; Thunb. Prod. 75.)

—Leaves opposite, imbricated in four rows, pointless, keeled underneath. Flowers woolly; segments acute.—Native of the Cape of Good Hope, like all the other species. This is said in the *Forstus Kewensis* to have been introduced into England in 1793, by Messrs. Lee and Kennedy. It is a green-house shrub, flowering all summer long. The short slender smooth leaves, standing in four rows, resemble those of some kinds of beech. The flowers are large and white, in terminal solitary heads, subtended by bractees broader than the leaves, of an elliptical figure, and tinged with red. The stalk and base of each flower, as well as the outside of its limb, are all very woolly. Nothing is recorded respecting the scent of these flowers, nor have we had an opportunity of examining them sufficiently to ascertain this point; but we should expect them, from analogy, to be fragrant at some time of the day or night. An authentic specimen shews this to be *Passerina cephalophora* of Thunberg, and we presume it must be his *erioccephala*.

2. *L. purpurea*. Purple-flowered Lachnæa. Andr. Repof. t. 293. Leaves opposite, imbricated, in four rows, obtuse, keeled underneath. Segments of the calyx smooth. This elegant species, distinguished by its larger size, and rose-coloured or light purple flowers, whose outside is smooth and naked, except a short pubescence on the tube, was gathered at the Cape by Mr. James Niven, an indefatigable collector sent out by Gen. Hilbert, esq. M. P. It flowers in June and July, and is sheltered in the green-house in winter, where it is liable to perish from damps. The tube of each flower is white, with a woolly tuft at its base, like the former. The bractees are broad and almost round.

3. *L. glauca*. Glauous-leaved Lachnæa. Salisb. Parad. Leaves

t. 109. (*L. buxifolia*; Lamarek. Dict. v. 3. 373. Andr. Repol. t. 524. *Gnidia filamentosa*; Linn. Suppl. 224.) Leaves scattered, elliptical, glaucous. Segments of the calyx downy on both sides. — This beautiful species was communicated to Linnæus by his friend Bæck. Mr Niven sent it to Mr. Hibbert about the year 1800. Its broad elliptical glaucous leaves at once distinguish it. The flowers are white, fragrant, excessively copious in each round terminal head, their segments downy on both sides, pointed, and not very unequal. Minute glands alternate with the stamens, are found in the orifice of the tube, as in *Gnidia*, but smaller.

Some excellent remarks are given by Mr. Salisbury, in his *Paradisus*, in favour of the latter opinion of Linnæus concerning the calyx of this genus, which he therefore terms *cololla*, but the point seems to us still doubtful, at least, and we therefore adhere to what we have always maintained.

4. *L. conglomerata*. Crowded Lachnæa. Linn. Sp. Pl. 514. (*Passerina glomerata*; Thunb. Prodr. 75.) — Leaves opposite, imbricated in four rows, abrupt. Flowers opposite, crowded about the ends of the branches. Bractæes elliptical, three ribbed. — Gathered by Sparmann and Thunberg at the Cape, but as yet unknown to our cultivators. It is a small branching shrub, very closely resembling *Passerina filiformis*, but the leaves are shorter, and much more remarkably abrupt or retuse, nor are they at all incurved. The upper ones insensibly become bractæes, being dilated, elliptical, concave, with three, sometimes five, strong projecting ribs; their inner side is clothed with dense prominent wool. These bractæes continue, in three or four opposite pairs, to the end of each little branch, every one of them being accompanied by an axillary, solitary, small flower, whose tube, longer than the bractæa, is woolly, its limb nearly or quite smooth and naked. The colour of the flowers is apparently purplish; their segments are sufficiently unequal to make the plant a *Lachnæa*, though they and every other part are so very like *Passerina filiformis*, in whose segments likewise we think we perceive an inequality, that we are certain these two plants ought to be placed in one genus. They differ, however, specifically in their bractæes, which in *P. filiformis* are ovate, pointed, strongly keeled, with numerous smaller lateral ribs. We recommend this last to the notice of botanists who publish figures of plants. Of *L. conglomerata* we can find no representation in books. The synonyms quoted by Linnæus and copied by Willdenow, belong to a very dissimilar shrub, from which nevertheless the specific character seems to be taken, and which appears to be the following.

5. *L. physocides*. Physica-leaved Lachnæa. Lamarek. Dict. v. 3. 374. (*Saurunda tertie Classi affinis, foliis polii, capitibus bonæ spei*; Breyn. Cent. 18. t. 7?) — "Leaves linear-ovate-shaped, smooth, loosely imbricated. Heads small, clustered, white and downy." Lamarek describes this as "very closely resembling a *Physica*, in which genus he had placed it, till an examination of the flowers set him right. There he found quadrifid and octandrous, with so slight an inequality in the limb, that he doubts whether that character be sufficient to keep the plant distinct from *Passerina*. It is a branching shrub, the branches straight, slender, leafy, smooth, except the youngest shoots. Leaves numerous, sessile, linear-ovate-shaped, nearly triangular, quite smooth, straight, loosely imbricated, somewhat resembling *Diosma rubra*. The flowers are collected, from five to eight together, into cottony white heads, the size of a pea, terminating the numerous, very short, crowded little branches, which form a sort of corymb at the end of the principal ones.

The calyx is white, downy; its tube a line and half long, its limb in four oval, concave, unequal segments, nearly as long as the tube." The author received it dried from M. Thouin, as a native of the Cape. He objects to the synonym of Breynius, which we have, with great doubts, transferred hither from the preceding species. To this plate, in his own copy, Linnæus has written the name of *Physica imberbis*, a plant adopted in his *Montissa*, p. 209. from Bergius, without having seen a specimen himself; and he there copies this very synonym of Breynius, without recollecting that he had cited it already as *Lachnæa conglomerata*. Lamarek thinks it belongs to *Physica stipularis*. The plant of Bergius is certainly, by his description, a *Physica*, and if that of Breynius be the same, it must be erased from *Lachnæa*. We have one more error to correct concerning *L. conglomerata*, which is, that Thunberg thinks it the same with *Passerina ericoides*, though nothing can be more distinct than the latter in the Linnæan herbarium, with the ovate tube and small regular limb of its flower, so exactly resembling some species of *Erica*. This *Passerina* is, therefore, it seems, erroneously omitted in Thunberg's *Prodromus*. — The author last named, regardless of the irregularity of the flower, unites *Lachnæa* altogether with *Passerina*, a measure we are very unwilling to adopt. It is an opinion of the ingenious Correa de Serra, that, in every natural order, there are one or more genera, differing from the rest in the regularity or irregularity of the flower. *Lachnæa* then is the only genus of the *Thymelææ*, or Mezereon tribe, with an unequal or irregular flower. S

LACHNIS, in *Natural History*, the name which some have given to a genus of fossils, attributed to the class of the *fibræes*; the characters of which are, that they are fibrous bodies, not elastic, and composed of short and abrupt fibres, or filaments.

The word is derived from the Greek λαχν, a hair or short capillament or fibre.

The bodies of this genus have been divided into those which are composed of larger and broader, and those which are composed of smaller and narrower filaments. Hill's Fossils. See FIBRILLÆ.

LACHNOSPERMUM, in *Botany*, a genus so called by professor Willdenow, from λαχν, wool, and σπερμα, seed; indeed that author distinguishes this plant from *Stachelina*, on account of the wooliness which invests its seed. — Willd. Sp. Pl. v. 3. 1787. (*Stachelina* species; Thunb. Prodr. 143.) Class and order, *Syngenesia Polygamia-Æqualis*. Nat. Ord. *Composita Discoides*, Linn. *Cinaracephale*, Juss.

Ess. Ch. Receptacle hairy. Seeds invested with hairs. Calyx cylindrical, imbricated.

1. *L. crispifolium*. Willd. (*Stachelina fasciculata*; Thunb. Prodr. 143.) — A native of the Cape of Good Hope. — The branches of this shrub are divaricated, rigid, and downy. Leaves very small, about half a line in length, fasciculated, round, obtuse, invested with down. Flowers solitary, at the tops of the little branches, on short footstalks, 1 sometimes in pairs, the size of *Stachelina frutescens*. Calyx cylindrical, downy; scales ovate, acute, with a naked, elongated, spreading point. Seeds without a proper crown, unfolded with hairs. Receptacle hairy, the hairs as long as the florets.

LACHOW, in *Geography*, a town of Poland, in Volhyma; 28 miles N.W. of Constantinow.

LACHOWICZE, a town of Lithuania, in the palatinate of Brzesc; 28 miles S.W. of Pinsk.

LACHRYMA JOEL, in *Botany*. See COIX.

LACHRYMÆ BATAVICÆ. See RUPERT'S *Drops*.

LACHRYMAL. See LACRIMALIS.

LACHRYMAL *Ducts, Puncta, and Sac, Disease of.* See EPIPHORA, and FISTULA *Lachrymalis.*

LACHRYMAL *Fistula.* See FISTULA *Lachrymalis.*

LACHRYMAL *Gland, Disease of.* The lachrymal gland, lodged in the fossula of the anterior and external part of the roof of the orbit, and enveloped in the fat which surrounds the globe of the eye, is not frequently met with in a state of disease. Doubtless, it is often involved in the general inflammation, which affects all the contents of the orbit in cases of ophthalmia; but instances of this individual gland suffering inflammation by itself, must be regarded as extremely uncommon.

The lachrymal gland, however, is subject to scirrhus induration, which is more frequently noticed in dissections, than practice. We allude to cases, in which the gland is the only part thus diseased; for it is well known by all experienced surgeons, that when the eye-ball is affected with carcinoma, the lachrymal gland is very liable to participate in the dilemma, and for the sake of security, ought generally to be extirpated together with the eye.

A remarkable case is related by M. Guérin, where he extirpated a scirrhus lachrymal gland, which was so much enlarged, that it covered the whole of the eye-ball. The latter part, indeed, was entirely concealed, and might have been supposed to be confounded with the swelling, had not circumstances existed, which tended to shew, that the organ in question was found and situated under the tumour. M. Guérin successfully detached the swelling from the eye and eye-lids without injuring the rectus externus muscle.

If this can be received as really and unquestionably an example of a scirrhus lachrymal gland being found diseased quite alone, and extirpated by itself, it is a case which, perhaps, has not its fellow in the records of surgery. Possibly, the swelling might be nothing more than an encysted tumour.

LACHRYMATORIES, in *Antiquity*, small glass or earthen phials, with a long neck, found in the sepulchres of the ancients. Many antiquaries have supposed that these vessels served to collect the tears of the weeping friends that visited, or of persons hired for that purpose. This belief was grounded on the appearance of the opening of those phials, which is generally furnished with a round concave part well adapted for embracing the convexity of the eye-ball. On some lachrymatories are even found impressions of an eye, and sometimes of a pair of eyes. But here, as in many other cases, the eye appears to be merely emblematical. It may also be said that the opinion of tears being preserved in those vessels is unsupported by any ancient custom we are acquainted with, or by any well interpreted passage in ancient authors. This opinion was first broached by Chifflet; it soon spread over Europe, and was, in spite of its improbability, adopted and supported by Kirchmann, Kipping, and many other antiquaries. At last it was combated by Schoepflin and Paciaudi; so that at present it appears to be agreed on all sides that the lachrymatories did never contain any thing but balsms destined to moisten the funeral pile or the ashes of the dead, or else the blood of martyrs. There is in the Capitol a bas relief which is much in favour of this idea: on this marble, which represents the funeral rites at the death of Meleager, a woman approaches the pile, holding in one hand a large bellied vessel, and in the other a long slender phial with elongated neck and bottom, and in every respect similar to several earthen lachrymatories preserved in collections. This woman is in the act of pouring out of the large into the small vessel what may be supposed to be balsms or odoriferous oil for the purpose of perfuming the funeral pile of Meleager. If we may

believe Dumolinet, there have small spoons been found in lachrymatories, which may have served for distributing into several small phials the contents of a vessel of greater dimensions. Millin Dict.

LACHSA, denominated also *Hadjar*, and sometimes *Bahbrein*, in *Geography*, a province in Arabia, bounded towards the E. by the Persian gulf, towards the S. by Oman, towards the W. by the province of Nedsjed, and towards the N. by the territories of the wandering Arabs in the vicinity of Bassora. This province affords no great variety of productions. Its asses and camels are esteemed to be of an excellent breed; and of the latter some thousands are annually sold into Syria. In the interior parts the inhabitants subsist very much upon dates. Upon the coasts pearl-fishing is pursued with advantage; and there is a considerable trade in foreign commodities. The inhabitants of Lachsa are very much divided with regard to religion. Those who live in the towns are Shiites; but the peasants are, like the Bedouins, Sunnites. Here are also some Jews, and many Sabaeans, or Christians of St. John.

Lachsa was once a province of the empire; but the Arabs have long since shaken off the Ottoman yoke. Many Turks, descended from the ancient Pacha's, still remain in the province, and possess considerable estates, but have no share in the government. At present the sovereignty of this province belongs to the schiech of the Arabian tribe of Beni Khaled, which is one of the most powerful tribes in Arabia. The greater part of Lachsa is inhabited by Bedouins, and other petty tribes; but they all acknowledge the dominion of the schiech of Beni Khaled. The cities in the interior parts of this province are little known. Niebuhr.—Also, a town of Arabia, capital of this province, where the schiech resides, situated on the river Aftan, near the Persian gulf. N. lat. 26 50'. E. long. 48 34'.

LACHWA, a town of Lithuania, in the palatinate of Brzesc; 50 miles E. of Pimk.

LACING, in *Ship Building*, the name of one of the pieces composing the knee of the head, which is continued up to the top of the hair-bracket, and to which the figure and the ends of the head-rails are secured.

LACINIATED LEAF, in *Botany*. See LEAF.

LACINIAE PROMONTORIUM, in *Ancient Geography*, *Capo delle Colone*, a promontory of Italy, at the eastern part of Brutium, and bounding on the south the gulf of Tarentum. This cape was much celebrated on account of a temple of the Lucinian Juno, which was an object of great veneration, and which received many rich offerings from various parts. Authors report that here might be seen a large column of massive gold. The Romans report, that Hannibal, when he was forced to quit Italy by an order of the senate of Carthage, assembled in this place all his Italian allies, and massacred all who would not accompany him into Africa.

LACIPPO, or LACIFUS, a town of Spain, in Beticæ.

LACIS, in *Botany*, so named by Schreber, and derived from *lacis*, to *tear*, or *lacerate*, because the herbage of this genus exhibits a singularly jagged or lacerated appearance. Schreb. 366. Willd. Sp. Pl. v. 2. 1225. Mart. Mill. Dict. v. 3. (Mourera; Aubl. Guian. v. 1. 582. Juss. 421. Lamarck Illustr. t. 480.)—Class and order, *Polyandria Digynia*. Nat. Ord. uncertain.

Gen. Ch. Cal. Perianth none. Cor. none. Stam. Filaments numerous, about 40, capillary, winged on each side at the lower part, inserted into the receptacle which is surrounded by 12 spines; anthers oblong, cloven at the base, acute, incumbent. *Pist.* Germen superior, oblong, angularly striated; styles two, incurved; stigmas obtuse. *Peric.* Cap-  
sule

file ovate, with eight furrows, of one cell and two valves. Sucle numerous, very small, affixed to an ovate, unconnected receptacle.

Eff. Ch. Calyx none. Corolla none. Capsule of one cell, two valves and many seeds.

1. *L. fluviatilis*. Willd. (*Mourera fluviatilis*; Auhl. Guian. t. 233.) A native of rivers in Guiana, flowering and bearing fruit in November. Its Caribbean name is *Mourou*.—*Root* creeping. *Stems* herbaceous, simple, rough. *Leaves* alternate, divided into numerous, repeatedly jagged, lobes, dark green, curled and veined at the margin, rough, with minute points. *Flowers* in spikes, terminal, each one, before expansion, invellid with three small deciduous leaves. *Filaments* violet-coloured; anthers yellow.

We know not how Willdenow came to describe the leaves as smooth, for in Aublet's own specimens we find them extremely rough with minute points.

LACISTEMA, so denominated by Dr. Swartz, from *lacis*, a cleft, or *sfurro*, and *stema*, a stem, alluding to the division in the filament. Swartz. Prodr. 1. Fl. Ind. Occ. v. 2. 1091. Schreb. 783. Willd. Sp. Pl. v. 1. 27. Mart. Mill. Dict. v. 3.—Class and order, *Monadelphia Diandria*. Nat. Ord. *Amniaceae*, Linn. Juss.

Gen. Ch. Cal. a common Catkin, cylindrical, imbricated on all sides; scales single-flowered, ovate, concave, with two smaller, linear, lateral, internal scales under the corolla. *Cor.* of one petal, in four deep, nearly equal, lanceolate, acute, ascending segments, shorter than the internal scales, without any tube. Nectary of one orbicular, concave, entire, central leaf, less than the petal. *Stam.* Filament solitary, from the centre of the nectary near the germen, erect, cloven in the upper part and incurved over the pistil; anthers solitary on each branch of the filament, minute, roundish. *Pist.* Germen superior, globose; styles two, very short, recurved; stigmas simple. *Peris.* Berry stalked, obovate, of one cell. *Seed* solitary, oblong.

1. *L. myricoides*. Swartz. Prodr. 12. Fl. Ind. Occ. v. 2. 1093. Ic. Plant. 5. t. 1. (Piper aggregatum; Berg. in Act. Helvet. v. 7. 131. t. 10.)—Received by Bergius from Surinam. Swartz found it in bushy parts of mountains, on the western side of Jamaica, but sparingly, flowering in spring, and ripening fruit in summer. This is a *shrub*, or small *tree*, with a smooth bark. The principal *branches* are round, lax, and smooth, with a few alternate zig-zag subdivisions. *Leaves* alternate, stalked, two or three inches long, elliptical, pointed, entire, very smooth, brownish-green, with one rib and several transverse veins. *Stipulas* none. *Catkins* axillary, several together, sessile, loosely spreading, a little curved, about half an inch long, whitish, many-flowered, hairy at the base. The *flowers* are extremely minute; the *corolla* white. *Berry* black and soft, the size of a red currant, with a sweetish insipid taste. There is some difficulty in describing the parts of the flower, especially the inner scales, which Swartz incautiously named *bractææ*, though situated within each proper scale of the catkin. *Nematosperrum* of Richard in the *Actes de la Societé d'Hist. Nat. de Paris*, v. 1. 105, is justly indicated as nearly allied in description to this plant, except that it is said to have three stigmas (or rather styles), and a capsule with three seeds, suspended from its valves by threads. We presume therefore they cannot be the same genus. See NEMATOSPERMUM.

LACK, in *Geography*, a township of America, in Mississipp county, Pennsylvania, containing 1071 inhabitants.

LACK OF RUPEES. See RUPEE.

LACKAH, in *Geography*, a small river of Ireland, in the county of Donegal, which flows into Sheeplaven.

LACKANWADDY, a town of Hindoostan, in the circar of Aungmyahad; 45 miles E. of Jafferabad.

LACKAR, an island in the East Indian sea, about 30 miles long and six broad. S. lat. S 18'. E. long. 128° 14'.

LACKARAGO, a town of Africa, in the kingdom of Kaffon.

LACKARI, a town of Persia, in the province of Irak; 120 miles N.W. of Ispahan.

LACKER. See LAQUER.

LACKERGAUT, in *Geography*, a town of Thibet; 45 miles S. of Deuprag.

LACKI, a town of Hindoostan, in Bengal; 56 miles N. of Dacca.

LACKIPOLE, a town of Bengal; 16 miles N.E. of Calcutta.

LACKRICOTTA, a town of Hindoostan, in the circar of Cicacole; 24 miles S.W. of Vizianagram.—Also, a town of Hindoostan, in Coimbatore; 13 miles S.W. of Coimbatore.

LACKRITAPILLA, a town of Hindoostan, in the circar of Cuddapa; 20 miles S.W. of Cuddapa.

LACMUS. See LIMUS.

LACOBENA, in *Ancient Geography*, a town of Asia, situated between the mountains N. of Comagene, on a small river, which ran into the Euphrates, S.E. of this town.

LACOBIRIGA, a town of Spain, upon the Pisoraca, S. of Juliobriga and N.E. of Pallantia, belonging to the Vaccii.

LACOCK'S BAY, in *Geography*, a bay on the N.E. coast of Barbadoes; one mile N.W. of Cuckold's Point.

LACONCAVAN, a town of Upper Siem, on the Mecon; 80 miles S. of Porcelan.

LACONDY ISLES, two small islands among the Laccadives, about three miles apart. N. lat. 10 33'. E. long. 71° 40'.

LACONIA, in *Ancient Geography*, a country afterwards called Sparta and Lacedæmon, was situated on the S.E. point of Peloponnesus, and bounded on the N. by Argos and Arcadia, on the W. by Messenia, on the E. by the bay of Argos, and by the Mediterranean on the S. On the W. were the mountains named Taygetus, from some of the summits of which, which are said to have risen above the clouds, the eye might survey the whole of Peloponnesus. The sides of these mountains were every where covered with woods, which were the asylum of a great number of goats, bears, wild boars, and stags. The extent of Laconia from E. to W. where it reached farthest was 1° 45', but it became narrower towards the north, and its extent from N. to S. was about 50 miles. As the fourth part of this kingdom was encompassed by the sea, and the east and north-east part by the Argolic bay, it had a great number of portuories, the chief of which were those of Melea and Tanara, now capo Malio and capo Matapan. These two being situated on the Mediterranean form the large Laconian gulf, which lies between them, and is now called the Golfo di Colochina, into which the famed river Eurotas, better known by the name of Basilipotamo, or Royal river, discharged its waters with an easy and gentle course. The sea-coasts of Laconia were furnished with a considerable number of sea-ports, towns, and commodious harbours, of which the largest and most convenient were those of Trinassus and Acria, situated one on each side the mouth of the Eurotas, and Gythium, at a small distance from Trinassus; which last is said to have been built by Apollo and Hercules; but the most noted was Epidaurus, now Malvesia, seated on the gulf of Argos, now Golfo di Napoli, a well-built town, famous for its excellent wine

wine called Malvesy, or Malmesey, which was produced from grapes that grew round it. There were about 12 more sea-port towns along the Lacedæmonian coasts; and they were rendered particularly famous on account of a shell fish caught in the neighbourhood, which yielded a purple dye, inferior to none but that which was brought from the Red sea. Inland towns likewise abounded in this kingdom, the most considerable of which was the metropolis *Sparta*, which see. Other cities of note were *Amyclæ*, *Helvæ*, *Thulana*, and *Leuctrum*. The mountains of Lacedæmonia were numerous. Its most considerable rivers, besides the Eurotas, were the *Simenus*, the *Thiasus*, and the *Seyras*. The soil was very rich, especially in the low and flat grounds, and being well watered, it was excellent for pasture; but the number of its mountains and hills prevented its being so well tilled, as it might otherwise have been. It was much better situated for trade and navigation, by having the sea round above half the kingdom, and so many good havens about it. How well the inhabitants improved these advantages, how powerful they became, what fleets they maintained, and brave experienced admirals they bred, may be seen in their history. We shall here only observe, that the Lacedæmonians were a courageous people, hardy, and inured to war both by sea and land, averse from sloth and luxury, jealous of their honour and liberty, as well as the power of their neighbours; nor were they wanting in any military discipline, in order to secure the one, and curb the other. By these means they became so powerful, and made so considerable a figure in Greece, that the kings of Egypt and Phœnicia did not disdain to pay a kind of homage to them, and own their superiority by solemn embassies. See *LACÆDÆMONIANS*.

*LACONIA*, in *Geography*, a tract of land, extending from the river Merrimack to Sagadahock, and from the ocean to the lakes and rivers of Canada, so called in the grant of lands, in 1622, from the council of Plymouth to Capt. Mason, and Sir Ferdinand Gorges. See *IROQUOIS*.

*LACONIC STYLE*. See *STYLE*.

*LACONICA SCYTALA*. See *SCYTALA*.

*LACONISM*, *Λακωνισμός*, a short, pithy, sententious speech, in the manner of the Lacedæmonians, who were remarkable for the closeness and conciseness of their way of delivering themselves.

*LACOVIA*, in *Geography*, a town of Jamaica; 55 miles W. of Kingston.

*LACQUER*, or *LACKER*, is a varnish applied upon tin, brass, and other metals, to preserve them from tarnishing, and to improve their colour. The basis of lacquers is a solution of the resinous substance called seed-lac, or rather shell-lac, in spirit of wine. This spirit ought to be very much dephlegmated in order to dissolve much of the lac. For this purpose, some authors direct dry pot-ash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that subsides distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation. By this method the spirit is much dephlegmated; but at the same time it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum, the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the dephlegmated and purified spirit, about three ounces

of powdered shell-lac are to be added; and the mixture to be digested during some days with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour, from certain resinous colouring substances, the principal of which are gamboge and anotto, the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of anotto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver-leaf, or tin, are to be lacquered, a larger quantity of the colouring materials is requisite than when the lacquer is intended to be laid on brass.

There are sundry other materials, from a due mixture of which a like colour may be produced, as turmeric, saffron, dragon's blood, &c. See *Gold Coloured VARNISH*, and *Japanner's GILDING*.

Instead of shell-lac, used in the composition of varnishes for lacquering, resin or turpentine is substituted for the coarser uses. The following composition for brass-work, designed to resemble gilding, has been much recommended: take of turmeric ground, as it may be had at the dry-stalls, one ounce, and of saffron and Spanish anotto each two drams: put them into a bottle with a pint of highly rectified spirit of wine, and place the bottle in a moderate heat, occasionally shaking it, for several days; then strain off the yellow tincture thus obtained, through a coarse linen cloth, and putting it back into the bottle, add three ounces of good seed-lac grossly powdered; place the bottle again in a moderate heat and shake it, till the seed-lac be dissolved. The lacquer strained as before will be fit for use, and must be kept in a bottle carefully stopp'd. By increasing or diminishing the proportion of anotto, the lacquer will be rendered warmer and redder, or cooler and nearer a true yellow. A cheaper composition little inferior to the former, may be formed of one ounce of turmeric root ground, half a dram of the best dragon's blood, and a pint of spirit of wine, managed as the former.

The varnish for tin may be made of one ounce of turmeric-root, two drams of dragon's blood, and one pint of spirit of wine, prepared in the same manner with the other. The dragon's blood may be increased or diminished, as the red or yellow is to be the most prevalent; and for a coarser lacquer the quantity of shell-lac may be lessened, and the deficiency supplied by the same proportion of resin. The lacquer for locks, nails, &c. where little or no colour is desired, may be either shell-lac varnish alone, or with a little dragon's blood; or a compound varnish of equal parts of shell-lac and resin; with or without the dragon's blood. The manner of laying on the lacquer is as follows: the pieces to be lacquered must first be made thoroughly clean; and if they be new founded, aquafortis must be used for this purpose. When they are afterwards heated by a small charcoal fire, the lacquer is laid on with a proper brush, like other varnishes, and the pieces restored to the heat. After the lacquer is thoroughly dry and firm, the same operation must be renewed for four or five times, or till the work appears of the required colour and brightness.

The lacquering of leather, improperly called gilding, is performed by means of leaf-silver, coloured by a yellow varnish. (See *Japanner's GILDING*.) For this purpose, calf or goat-skins are procured in a dry state, after the common dressing and tanning. They are softened by being immersed and stirred about for some hours in a tub of water; and afterwards beaten against a flat stone and smoothed, by spreading them on the stone and rubbing them

them over with an iron instrument: the skins, thus prepared, are joined together in pieces of the dimensions required; and then fixed on the grain of the leather with a kind of soft glue, or stiff size, that answers to the gold-size used in other kinds of gilding or silvering, prepared from parchment or glover's cuttings. The workman next proceeds to cover the whole surface of the fixed skin, before it be quite dry, with leaf silver, and with a fox's tail, made into the form of a ball at the end, settles the leaves, by pressing and striking them; and closes this operation with gently rubbing the whole surface with the tail. When the skins are silvered, they are hung to dry first on cords, and the drying is completed by putting them over a board joined together, with the silvered side next the boards, where they must be kept stretched out by means of some nails. They are then burnished with a flint burnisher, which operation is performed by spreading the skin even on a smooth stone, and sliding the burnisher backwards and forwards over every part of the skin, with a considerable degree of pressure. In some manufactures the burnishing is performed, by passing the silvered skins betwixt two cylindrical rollers of steel, with polished faces. The skins are now prepared for receiving the yellow lacquer or varnish, which gives the appearance of gilding. Different artists have different recipes for compounding this lacquer. The following is said to be equal to any hitherto used: take of fine white resin,  $4\frac{1}{2}$  pounds; the same quantity of common resin; of gum sandarac,  $2\frac{1}{2}$  pounds; and of aloes, two pounds: bruise and mix them; and put them into an earthen pot over a good fire of charcoal, or over any other fire which has no flame: when all the ingredients are perfectly melted and mixed, add gradually to them seven pints of linseed oil, and stir the whole well together with a spatula: let the whole boil, stirring all the time, to prevent a kind of sediment, that will form, from sticking to the bottom of the vessel. When the varnish is almost sufficiently boiled, which will generally require seven or eight hours, add gradually half an ounce of litharge, or half an ounce of red lead; and when this is dissolved, pass the varnish through a linen cloth, or flannel bag. A pint of oil, and a corresponding proportion of fine resin and aloes, have produced a very good varnish in an hour and a half. This lacquer or varnish is laid on the silvered leather in the open air; and is best done in summer, when it is hot and dry. For this purpose, the skins are stretched and fastened with nails to the boards, on which the drying was finished, with the silvered side outwards. And when these boards are properly disposed on trestles, the workman generally spreads some white of eggs over each skin; and when this is dry, the varnish, which is nearly of the consistence of a thick syrup, is repeatedly spread with the four fingers of one hand, moved so that each finger paints a kind of S with the varnish, from one end of the skin to the other: and it is then diffused evenly over every part with the flat of the hand: after this it is to be immediately beaten by strokes of the palms of the hands, and principally where the varnish is observed to lie thickest. When this coat of varnish is sufficiently dry, which may be known by the fingers making no impression upon it, another coat is laid on in the same manner. When this coat is dry, the varnishing for producing the appearance of gilding is completed; and if it has been well performed, the leather will have a very fine gold colour, with a considerable degree of polish or brightness. When there is an intention to have one part of the leather silver, and the other gold, a pattern is formed on the surface, by printing, calking or stamping, a design on

the surface after the silvering. The skin is then to be varnished, as if the whole were intended to be gold; but after the last coat, instead of drying the varnish, it is to be immediately taken off that part, which is intended to be silver, according to the design printed or calked upon it, by a knife; with which the workman scrapes off all that he can without injuring the silver, and afterwards by a linen cloth, with which all that remains is to be wiped or rubbed off. The skins thus silvered and varnished, are made the ground of various designs for embossed work and painting. The embossed work or relief is raised by means of printing with a rolling press, such as is used for copper plates; but the design is here to be engraved on wood. The painting may be of any kind; but oil is principally used, as being durable and more easily performed. Doffie's Handmaid to the Arts, vol. i. p. 454, &c.

**LACRIMOSO**, *Ital.* a musical term, seldom used now, which implies a plaintive movement, in a style as if *suspecting*.

**LACRYMA CERVINA**, in *Natural History*, a little round and hard bone, said to grow in the great corner of a stag's eye after a certain age. Some also preserve under this name a thickened excretion from the inner angle of that creature's eye, in colour and consistence resembling myrrh, or ear-wax, long hardened in the ear. This is of a strong and very disagreeable smell, like the sweat of the same animal, and is affirmed to be sudorific and alexipharmic.

**LACRYMÆ CHRISTI**, the name of a sort of wine produced by grapes on the lower part of Mount Vesuvius; so called from the drops of juice oozing from the grapes, when fully ripe.

**LACRYMAL**. See **LACHRYMAL**.

**LACRYMALIS**, in *Anatomy*, an epithet applied to several parts about the eye. The lacrymal gland is the organ secreting the fluid which composes the tears: the puncta lacrymalia are the orifices of two small ducts, by which this fluid is absorbed from the surface of the eye; and the lacrymal sac or bag is the cavity in which the tears so absorbed are received. See **EYE**.

The os lacrymale is a name applied to the bone in which the lacrymal bag is lodged; it is called also os unguis. See **CRANIUM**.

The lacrymal nerve is a branch of the ophthalmic or first branch of the fifth pair. See **NERVE**.

**LACSUR**, in *Geography*, a town of Persia, in the province of Korafan; 50 miles N.E. of Herat.

**LACTANTIUS**, generally called **LUCIUS CÆLIUS**, or **CÆLIUS FIRMIANUS**, in *Biography*, the most eloquent of the Latin fathers, flourished towards the close of the third and the beginning of the fourth century. Some have conjectured that he was born at Firmum, now Fermo, in Italy, and hence called Firmianus; but as he was a disciple of Arnobius, who taught rhetoric at Sicca in Africa, this was probably the country of his nativity. This latter opinion is confirmed by his itinerary from Africa to Nicomedia, which contained, as we may reasonably imagine, an account of his own journey, when he was sent for by Dioclesian. Whilst he was young, he wrote his "Symposium," or Banquet, and thus acquired a degree of reputation, which occasioned his being sent for to teach rhetoric at Nicomedia, when Dioclesian proposed to render this city a rival to Rome. Some have supposed that Lactantius was in his youth a heathen, and converted to the Christian faith; but it is most probable, from the arguments alleged by Dr. Lardner, that he was educated in Christian principles, and that he was a

Christian when he taught rhetoric at Nicomedia, at the commencement of Diocletian's persecution, though it does not appear how he escaped the danger to which his Christian profession must have exposed him, at a time when the church of the Christians in that city was destroyed. Nicomedia was at this time chiefly inhabited by Greeks, who had no great taste for Roman eloquence; and the religious profession of Lactantius, notwithstanding his learning and talents, rendered him unpopular, so that the number of his scholars was small, and he was under the necessity of writing, in order to procure a scanty subsistence. As he was much addicted to reading, and books in MS. were costly, his library must have exhausted his pecuniary supplies. These circumstances will account for the poverty of his condition; without supposing with Dupin and Tillemont that it was voluntary. His situation, however, was improved, when he was invited by the emperor Constantine into Gaul, and appointed preceptor to his son Crispus; but when Crispus was put to death by his father, he lost the benefit of this office; nor does it appear that Constantine made any permanent provision for him, which might reasonably have been expected. It is generally allowed, that, during the greatest part of his life, Lactantius was in indigent and even destitute circumstances, often wanting necessaries. Of other particulars of Lactantius's life, which was prolonged to a very advanced period, no records remain; nor has the time of his death been ascertained. It does not appear that he ever pleaded as an advocate at the bar. From his works, which are allowed to be authentic, we may collect his sentiments with regard to some of the distinguishing tenets of theology. Lactantius often speaks of the nature and design of the Christian revelation, as suited to promote the general good of all, of every age, sex, and condition; so that all may attain to just sentiments of God, and be directed and assisted in the way of holiness, and obtain everlasting happiness. And he asserts it to be in the power of the meanest and poorest of men to attain to righteousness. He sometimes glories in the great and happy effects of the Christian doctrine upon the minds and lives of men; and he recommends this divine religion, as the medicine of the soul, effectual for healing all its diseases. He asserts the freedom of man's will, or his power to do good or evil. He openly asserts the innocence of Christian people, all whose religion, he says, consists in good works, or a care to live unblameably and inoffensively. And the criminals, who fell under the sentence of the magistrate for robbery and other offences, he observes, were not Christians, but of the same religion with their enemies. He expresses himself as if in his time Christians performed miracles in dispossessing demons. Lactantius was of opinion, that another life, or a future state of happiness for good men, may be proved by reason. He did not deny the eternity of hell torments. With regard to repentance he often asserts its great value, and maintains, that whenever sinners repent, they are pardoned. He also thinks, that the divine displeasure against men ceases immediately upon their repentance and amendment. True virtue alone, as he alleges, recommends man to the divine acceptance; and God desires nothing of man but sincere virtue, or true holiness. As to the ends and views of Christ's coming, and particularly of his death, he asserts, that Christ came to be a teacher and a pattern of virtue; and that he died and rose again, to assist men in overcoming death, and give them also hopes of rising again, and obtaining the reward of immortality. Christ, he says, lived in a mean condition, and underwent the ignominious death of the cross, that he might be a complete example of virtue, and of pa-

tience under sufferings; and that he might more especially lead and encourage such as are poor and mean in this world. In a word, he says, Christ came, and was made like unto man, lived, and died, and rose again, that he might clearly teach the precepts of virtue, and afford the best motives to the practice of it, and effectually help frail man to conquer the desires of the flesh, and the fears of present evil, and to overcome all the temptations of this life, and thus obtain a happy immortality.

Lactantius has strenuously asserted the right of private judgment for every man in things of religion, and he exhorts all men to the resolute and diligent exercise of it. He also argues excellently against perfection; esteeming it the greatest absurdity that can be conceived, for any to impose on others a worship contrary to their conscience, or to deny men the liberty to choose their own religion; and expressly affirming, that it is not zeal for religion, but a love of power. For religion, he says, is the freest thing in the world; nor can it be promoted by force and violence. Compulsion may make men hypocrites, but it cannot make them religious. He also maintains, that it is no just reason why men should be persecuted, because they desert or oppose ancient and established religions. For there can be no proscription against truth; and every man has an unalienable right to search after truth, and to profess it, when he has acquired the knowledge of it;—with much more, admirably expressed, to the same purpose. Of the numerous errors, real or imaginary, charged upon Lactantius, we shall enumerate the following: the first and principal is that of Manichæism, from which he is vindicated by Lardner. It is well known, that he denied the existence of Antipodes. He adopted the common notion of the age in which he lived concerning the fall of many of the angels; and he expected a terrestrial reign of Christ for 1000 years before the general judgment, and he thought it to be very near, within a period of 200 years. (See MILLENNIUM.) Lactantius denied the personality of the holy ghost; nor did he consider Christ's death as a propitiatory sacrifice for sin, or a satisfaction made to divine justice for the sins of the human race. These opinions, in which he differs from many others, and some of which are undoubtedly erroneous, have occasioned several reflections upon his judgment and character. Dr. Heumann, in particular, acknowledges that he was pious, learned, and eloquent; though chargeable with several faults and defects; he was no critic, nor philosopher, and but a poor divine. Bull says, that he had very little knowledge of the Christian doctrine; and Warburton asserts, that he knew but little of Christianity.

As a writer, Lactantius has been highly commended. Dupin says, that he is justly esteemed the Christian Cicero for his style, whilst he greatly surpassed him in his thoughts. Some authors have not only found a striking resemblance between the style of Cicero and that of Lactantius, but have even preferred the latter to the former. Dr. Lardner says of him, "that the time in which he lived secures him a kind of veneration. He saw the quiet and peaceful state of the church before Diocletian's persecution; he was also witness of that dreadful scene, and afterwards saw the flourishing condition of Christians under Constantine. His eminent abilities recommended him to the esteem of two great emperors, of different religions. His uncommon honesty and simplicity, and earnest zeal for the Christian religion, and all truth in general, appear in his works, where also his learning is very conspicuous." He had, as it seems, a certain vehemence and impetuosity of natural temper not uncommon in Africans, which on some occasions hindered

his considering and weighing what might be said on both sides of a question. At the same time, possibly we are indebted to that fire, which supported him in the fatigues of acquiring knowledge, and then communicating it to others. Upon the whole, he was "an honour and ornament to the Christian profession in his day;" for "he employed his fine parts and extensive learning in the service of religion, without worldly views of any kind." "A part," it will be allowed, "of this writer's reputation is owing to the charms and beauties of his style; but the matter of his works is also a just recommendation."

The principal work of Lactantius is intitled "Institutionum, libri vii." which was occasioned by the writings of two heathens of note, who published their pieces against the Christians at the beginning of the persecution under Dioclesian, and was also intended as a general answer and full confutation of all others, who already had opposed, or hereafter might oppose, the Christian doctrine. The learned are not agreed about the time when this noble work was written. Dr. Lardner, after having examined different opinions on this subject, concludes, that Lactantius formed the design of this work in the year 303, that he composed the greatest part of it under the persecution of Dioclesian, and that, probably, it was not published till that persecution terminated. We have also an "Epitome" of the Institutions, inscribed by Lactantius to his brother Pentadius, which is supposed to have been written not later than the year 311, 312, or 313. This work was imperfect, until a copy of it was found in the library of the king of Sardinia at Turin, by Dr. Christopher Matthew Pfaff, and published by him in 1712, or nearly so, at Paris in 1712, to the great joy of the learned world. This abridgment is an useful book, and contains some things not to be found in the Institutions themselves. His book "De Ira Dei," *i. e.* of the wrath or anger of God, which is still extant, is particularly commended by Jerom, as a learned and elegant performance, and a complete treatise on the subject. In this work he endeavours to prove that God is capable of anger, as well as of mercy and compassion. In his treatise "De officio Dei," *i. e.* of the workmanship of God, he establishes the doctrine of God's providence, by demonstrating the excellence of man, his principal work, giving an elegant description of the parts of the human body, and the properties and faculties of the soul. Of the genuineness of another work, usually ascribed to Lactantius, and intitled "De Mortibus Persecutorum," *i. e.* of the deaths of persecutors, different opinions have been entertained. Dr. Lardner has referred to the writers who have espoused both sides of the question; and as for himself, he seems to incline to the opinion of those who do not allow it to have been written by Lactantius. He allows, however, that it is a very valuable work, containing a short account of the sufferings of Christians under several of the Roman emperors, from the death and resurrection of Christ to Dioclesian; and then a particular history of the persecution excited by that emperor, with the causes and springs of it; as well as the miserable deaths of its chief instruments. In this work occur also several remarkable facts, that are recorded no where else. This is a work which none of the ancients, after the time of Jerom, have noticed; it was first published by Stephen Baluze in the second volume of his *Miscellanea*, in the year 1679. It is needless to say any thing of the poems de Phœnice, de Pasche, de Passione Domini, which some have ascribed to Lactantius, and which are joined to his works in most editions. They are not mentioned by Jerom, and are now generally supposed not to belong to this author. The "Itinerary" and "Grammaticus," mentioned by Jerom, are irrecoverably lost. A work, under the title of the "Symposium," or Banquet, long supposed to have been lost, was not long ago published by Dr. Heumann, who asserts its genuineness. It is a collection of 100 trifling epigrams, with a prologue. All our author's books of Epistles are entirely lost. The editions of Lactantius are very numerous. Fabricius has given a full and copious catalogue of them. The first edition was published at Rome, in 1468, fol. by Conrad Lewenheim; and the last, which is the most correct, was edited at Paris in 1748, in two vols. 4to, by the Abbé Lenglet.

Lactantius has, in his various works, references to the gospels, the Acts of the Apostles, and some of the epistles, and to the book of the Revelation, which he expressly quotes as sacred scripture, and written by John. It appears also, that he had a collection of scriptures, consisting of the Old and New Testament; which he esteemed sacred and divine, and of the highest authority. His quotations of Sibylline books, and other writings, ascribed to heathen vates or diviners, such as Hydaspes, and Hermes Trifmegillus, were intended to serve the cause of Christianity; but he did not reckon them a part of those books which were of authority with Christians. Nor does it appear, that he placed the preaching of Peter and Paul in the rank of sacred scripture, though he has once quoted it. Fabr. Bibl. Eccl. fol. Hieron. cap. lxxx. Cave's H. L. vol. sub sæc. Arian. Dupin. Lardier's Works. vol. iv.

LACTARY, in *Rural Economy*, a term frequently applied to a milk-house, or place where milk is kept.

LACTARY Column. See COLUMN.

LACTATION, the act of giving suck.

The word is also applied to the time during which the mother doth that office to her young.

LACTEA VASA, or *Lacteals*, in *Anatomy*, are those absorbing vessels which take up the chyle, or the nutritive matter furnished by the food, from the surface of the intestines. As this fluid is of a white colour, the vessels, when filled with it, appear quite white, and hence their name. They may be seen in vast abundance in an animal killed a few hours after a meal. See ABSORBENTS.

LACTEA Via, the milky way. See GALAXY.

LACTEAL Fevers, a term used by *Medical Writers*, to express what the women call *milk fevers*, that is, such fevers as attend the difficult ingreſs of milk to the breast of lying-in women. See LABOUR.

LACTEALS of Birds. See *Anatomy of BIRDS*.

LACTEUS LAPIS, in *Natural History*, a name given by some authors to the galacites.

LACTIFERI DUCTUS, in *Anatomy*, the tubes of the mammary gland, in which the milk is secreted. See BREAST.

LACTIFEROUS, an epithet applied to such plants as abound with a milk-like juice, such as the tithymal, fowthistle, and many others.

LACTOMETER, in *Rural Economy*, the name of an instrument for the purpose of ascertaining the different qualities of milk. It was invented by Mr. Dicas, mathematical instrument maker, in Liverpool; and the following description of it is given in the Survey of the County of Lancaster. This lactometer is contrived so as to ascertain the richness of milk from its specific gravity, compared with water, by its degree of warmth taken by a standard thermometer, on comparing its specific quality with its warmth, on a scale constructed for this particular purpose, and by which, if the principle be right, may be discovered not only the qualities

of the milk of different cows, pastures, food, as turnips, potatoes, grains, &c. but also probably, which may be the best milk or best pastures for butter, and which for cheese. This instrument, however, is but in its infancy. At his own house, the writer has made a number of varied experiments upon different milks from different farms.

It is stated to be constructed with ten divisions upon the stem, similar to the patent brewing hydrometer, and with eight weights, which are to be applied only one at a time upon the top, to obtain the weight of milk; an ivory sliding-rule accompanies the instrument, upon the middle or sliding part of which is laid down the lactometer weight of the milk, going from 0 to 80; and opposite thereto are placed the various strengths of the milk, from water to 160; 100 having previously been fixed upon, from a number of experiments, as the standard of good new-milk, and each of the other numbers bearing a proportionate reference thereto. At one end of the sliding-rule the degrees of heat, from 40 to 100, are placed with a star opposite, as an index to fix the slide to the temperature of the milk; the whole being graduated to shew the exact strength of the milk, as it would appear in the temperature of 55 degrees of heat, although tried in any inferior or superior temperature between 40° and 100°: thus the great inconvenience which would attend bringing the milk at all times to one temperature is avoided, and a simple mechanical method of allowing for the contraction and expansion substituted. And as skimmed milk, being deprived of the particles of butter which existed before skimming, appears to have a less degree of affinity with that than the new milk has, one side of the ivory sliding-rule is adapted to skimmed, and the other to new. This simple contrivance is represented in the annexed plate.

*General Rule.*—First, find the temperature of the milk with the thermometer, and fix the sliding-rule so that the star shall be facing the degree of heat the mercury rises or falls to; then put in the lactometer, and try which of the weights, applied to the top, will sink it to some one division upon the stem; add the number of the weight upon the top and that of the division together, and opposite the same, formed upon the side, will be shewn the strength of the milk.

*Examples of New milk.*—If in the temperature of 72°, the lactometer with the weight 40 sinks to 9 upon the stem, fix the slide so that the star shall be facing 72°; then opposite 49 will be found 100, the strength of the milk. Again, if in 66°, the lactometer with 50 on the top sinks to 6 upon the stem, the slide being fixed for new-milk, so that the star shall be at 66° of heat, then facing 50 will be found 110, the strength of this milk in proportion towards the other, provided it is equally replete with cream. To discover which, it becomes requisite these two samples being stand a certain time, that the cream may rise, which being taken off, they are to be tried with the lactometer again; and as the cream is evidently the lighter part, the milk will appear by the lactometer denser or better in quality than before. Suppose the milk in the first example to be 57 by the lactometer in 60 degrees of heat, then the strength by the skimmed-milk side of the rule will be 112. And admit the second example of new-milk to be 58 in 64° when skimmed, the strength would be 116.

As a comparison say,

No. 1. New-milk	-	100
Ditto skimmed	-	112
		—
Difference		12
		—

No. 2. New-milk	-	110
When skimmed	-	116
		—
Difference		6
		—

From which it appears, that No. 1. has produced a larger quantity of cream than No. 2, and consequently may be deemed the better milk. Some instances have occurred where the strength of new-milk has only been about 80, and when skimmed near 100. Thus it may, without the least impropriety, be called a milk much better adapted for making butter than cheese; the serum or whey in general being near the same density.

The instances in which the lactometer may be useful, are, according to the same writer, in discovering what breeds of cattle are most advantageous; what food in the winter season, whether carrots, turnips, potatoes, &c. are best; what the effects of different pastures may be; how far particular farms are best adapted to making butter and cheese; how far the inconvenience of large cheeses in some dairies being too rich to stand may be prevented, by discovering when this redundancy of richness exists in the milk; and in fixing a standard for the sale of this useful article of life.

A standard for skimmed milk may readily be fixed, by saying what strength the common saleable skimmed milk shall be by the lactometer, or what its specific gravity shall be in relation to that of water in the temperate degree of heat, and that an easy comparison may be made between the specific gravity of any milk, and its lactometer strength; this instrument is so constructed, that one of specific gravity shall exactly correspond with three of strength; that is, the strength of 90 by the lactometer is a milk whose specific gravity is 1030, to common pump water 1000. From a number of experiments and observations, it is observed, that the common saleable skimmed milk in Liverpool is from 52 to 64 of strength, and that of new-milk from 70 to 80; but it would be difficult to fix any standard for the latter, unless some mode could be devised to discover whether it was mixed with old milk or not. The only method would be, after fixing the strength of it, to try, by letting it stand, to discover if it produced that quantity of cream, which as new-milk it might reasonably be expected to do.

This ingenious contrivance is made use of in the Liverpool workhouse, with great success in ascertaining the goodness of the milk which is there employed.

**LACTUCA**, in *Botany*, so called by the Latins, from *lac*, milk, because of its milky juice; the Lettuce.—Linn. Gen. 400. Schreb. 528. Wild. Sp. Pl. v. 3. 1523. Mart. Mill. Diét. v. 3. Art. Hort. Kew. v. 3. 117. Sm. Fl. Brit. 819. Juss. 169. Tourn. t. 267. Lemarec. Illustr. t. 649. Gærtn. t. 158.—Class and order, *Syngenesia Polygamia equalis*. Nat. Ord. *Composita Semisibiculae*, Linn. *Cichoraceae*, Juss.

Gen. Ch. *Common Calyx* imbricated, nearly cylindrical, of numerous pointed scales, with membranous edges. *Cor.* compound, imbricated, uniform; the florets hermaphrodite, numerous, equal, each of one petal, ligulate, abrupt, with four or five teeth. *Stam.* Filaments five, capillary, very short; anthers united into a cylindrical tube. *Pist.* Germen nearly ovate; style thread-shaped, as long as the stamens; stigmas two, reflexed. *Peric.* none, except the permanent clored calyx, become rather ovate at the base. *Seeds* foliary, obovate, pointed, striated, compressed; down capillary, supported by a long stalk tapering at its base. *Recept.* naked.

Eff. Ch. Receptacle naked. Calyx imbricated, cylindrical,

cal, with pointed, membranous-bordered scales. Seeds compressed, striated. Down simple, stalked.

This genus is most naturally allied to *Sonchus*, the Sow-thistle, in habit and qualities, as well as fructification, the stalked seed-down, and much more slender and cylindrical calyx, constituting its chief marks of distinction. The 14th edition of *Syll. Veg.* enumerates ten species; Willdenow has 21. Three of them are natives of Britain, occurring chiefly in warm dry spots, where the soil is calcareous. These are *L. virgata*, Engl. Bot. t. 1957. Woodv. Med. Bot. Suppl. t. 250, celebrated for its opium-like scent and soporiferous quality; *L. Scariola*, Engl. Bot. t. 268, a more slender and less active plant, distinguished by the vertical posture of its leaves, of much more rare occurrence, being scarcely found wild except in the isle of Ely; and *L. falkna*, Engl. Bot. t. 707. Jacq. Austr. t. 250, the most slender of all, which ever since the time of Ray has been stationary about Pancras, and near the Small-pox Hospital. These are all biennial plants, three or four feet high, more or less glaucous, with small sulphur-coloured flowers, which expand only in bright sunny mornings. The Rev. Mr R. B. Francis found the last-mentioned at South-end, Essex, but it is among the most uncommon of English plants.

Of the foreign species, *L. fativa*, Linn. Sp. Pl. 1118. Ger. em. 366, is well known as the Garden Lettuce, rendered luxuriant, mild, and wholesome by culture; for though we know it not in an actually wild state, some idea of its nature may be discovered by allowing it to sow itself spontaneously for two or three generations, the produce of which will be found much more bitter and acrid, as well as far less luxuriant, than the cultivated plants. Of this species the *L. crispa*, Willd. n. 2. Ger. em. 366. Dod. Pempt. 644, appears to be a variety, as it has always been thought, till Roth distinguished it. Such is the case with *L. palmata* of Willdenow, who quotes for this the *L. crispa non capitata*, Lob. Ic. 242, which is the very identical wooden cut he had just before cited from Dodonæus for the preceding.

*L. quercina*, Linn. Sp. Pl. 1118, has always been a very obscure plant, scarcely known but in the Linnaean herbarium. The synonym of Ray is, at best, doubtful, and the figure given by Sir John Hill, in his cumbrous Vegetable System, is altogether a deception, drawn from description or imagination. What the German writers intend under this name, we have no information. The following is a translation of Linnaeus's account of the *L. quercina*, from his Swedish Travels to Oeland and Gothland.—“*Lactuca* with leaves sinuated in a pinnate form, finely toothed, acute, without prickles at the back, and a smooth stem. Fl. Succ. ed. l. n. 646. Found on the fourth side of the lesser isle of Carlsoen, towards the east. I never had an opportunity of seeing this plant before; and Ray is the only author whose description is sufficiently clear to prove, beyond a doubt, that the *Lactuca foliis quercinis*, of his Hist. Plant. v. 1. 219, is a similar plant. The root of ours is fleshy and obtuse. Stem a cubit high, erect, round, smooth, simple. *Clusters* of flowers terminal, close, narrow and long. *Leaves* like *Sonchus oleraceus*, but having sharper teeth, as if bitten or jagged. *Calyx* nearly cylindrical, scaly, smooth, with scattered rusty spots; the scales erect, furnished at the back with an additional spreading scale.”

*L. canadensis*, Linn. Sp. Pl. 1119, is rightly removed to *Sonchus* by Willdenow, under the name of *pallidus*. The same author, on the contrary, removes the Linnaean *Sonchus tuberosus* to *Lactuca*, calling it *sonchifolia*, and he appears to be right in this instance also, the seed-down being supported by a considerable stalk.

*L. perennis*, Linn. Sp. Pl. 1120. (*Chondrilla cærulea*; Ger. em. 286.), is one of the more handsome species of this genus, on account of its elegantly pinnatifid leaves, and large blue flowers. It grows in the warmer parts of Germany, Switzerland, and France, and is perennial.

—A typographical error in our account of *Hieracium*, column 3, line 6 from the bottom, demands correction. The comma after *remarks*, and the word *these*, both require to be expunged.

LACTUCA, in Gardening, comprehends a plant of the herbaceous annual kind, of which the species usually cultivated in the garden, is the common garden lettuce, *L. fativa*, which has several varieties; the principal of which are;—of the cabbage-lettuce kind, the hardy green, white honey, great admirable white, brown Dutch, small early, white ball, green ball;—and of the coss-lettuce kind, the green coss, white coss, Egyptian coss, spotted coss, black coss, brown Cilicia, green Cilicia, red Capuchin, green Capuchin, large imperial, the Roman, the prince; but the three or four first of the different sorts are the most valuable, and it is of much consequence to have the best kinds employed in cultivation.

*Method of Culture*.—This species, and all the varieties, are raised by sowing the seed annually, at different times, as in February and the three following months, for the summer supply of plants; and in August and the following month, for the autumn, winter, and very early spring supplies. And all these different sowings should be performed upon beds of fine light dry earth, in an open situation, and exposed to the sun. Some of the late sowings may be made under hand-glasses, or in frames or boxes, in order to have the young plants protected from the frosts. Each of the varieties or sorts should be sown separately, and distinct from the others, and be slightly raked into the soil.

It is sometimes the practice to sow them among other low growing crops, such as radishes, spinach, onions, &c. to save ground; but this should always be avoided as much as possible, as a very small portion of land is sufficient for raising large supplies of plants.

For the very early spring use, as open lettuces, the early white cabbage sorts are the most proper; but for the main crops, to remain for full growth, the principal sorts of the coss and cabbage kind must be employed.

When the plants appear, they must be kept perfectly free from weeds, and properly thinned out. As they attain a proper growth, as three or four inches in height, some of the different sorts must be planted out into beds in the open ground, drawing them up carefully, and planting them immediately. This work should be performed by a line and small dibble, in rows, a foot or more distant, with the same space from plant to plant. The quincunx mode is mostly adopted, which affords the most room, and at the same time has the neatest appearance. As soon as the planting is finished, the whole should be well watered; and when the weather is dry, repeated once or twice.

By this planting out the several sorts at different times, at the distance of three weeks or a month, from the early spring till the latter end of the autumn, due successions of good lettuces may be provided. In the summer plantings out, when the weather proves very dry, it is sometimes the practice to plant them in small drills, in order to preserve the moisture more effectually.

After the beds of the different principal sowings have been considerably thinned by the several transplantations that have been made from them, the plants that remain may be set out

to proper distances by the hoe, and left to take their full growth.

As soon as the plants of the main spring and summer crops have attained a pretty full growth, especially those of the cofs kinds, it is necessary to tie the leaves of them up with bafs pretty close, when the plants are quite dry, in order to blanch the inner parts, and render them perfectly crisp, sweet, and tender.

*Mode of Culture in the Winter and very early Spring Crops.*—For this purpose, some seed of the hardy green and white cabbage sorts, and the brown Dutch, and white and green cofs kinds should be sown about the middle of August, and beginning of September, in open situations, when the plants will come up in a week or ten days, and about the end of September; and in October, a parcel of the best plants of each sowing should be planted out in a warm dry situation, five or six inches asunder; and at the latter period some in shallow frames, to be covered with glasses on cold nights, and in bad weather; or under hand-glasses, or in a bed arched over with hoops or rods, to be covered with mats in winter frosts. Under either of the above shelters the plants should have the free air in the day-time in mild dry weather, covering them in cold nights with proper covers, especially after this month; also, in all very cold, and in very wet weather, day or night, particularly those in the frames and under glasses; and those in hand-glasses may have the glasses almost constantly over them in winter, tilting up one side in mild weather, only setting them entirely off in fine mild or dry days; but in sharp frosty weather keeping those under every kind of shelter quite close; allowing also additional covering of mats or litter, when the frost is very intense. Those in the borders may be defended by some light litter; but the covering should never be suffered to remain longer on any of the crops than the bad weather continues, the free air being admitted every mild day.

In this method lettuces may be had the greatest part of the winter and early in the spring, particularly the cabbage sorts: those planted out first will be fit for use in November and December, and the second plantings come in towards Christmas, and being sheltered by the glasses, continue coming in for use till succeeded by the other latter autumn sowings; being careful that, as any are gathered out of the frames or glasses, others be removed from the borders to fill up the vacancies, whereby the glasses may be constantly supplied during the winter season.

It is sometimes the practice where lettuces are intended to be planted in frames late in autumn, for winter use, to have a moderate hot-bed made for their reception, in order that they may be well forwarded in the beginning of winter; and if the heat is continued moderately by aid of linings, allowing plenty of air in mild weather, the plants may be very fine by Christmas, or a little after.

*Mode of Culture in the Winter standing Spring Crops.*—In order to have good lettuces for spring use, some seed should be sown toward the middle and latter end of August, for the plants to stand the winter, some where sown, others transplanted into warm borders, to stand without any other shelter than that of the walls or other fences; and another sowing should be performed about the middle of September, to provide plants for pricking out under frames, to have the shelter of the glasses all winter, as a reserve in case those in the borders are destroyed; where both stand, one may succeed the other as crops. In the first case a quantity of the best plants, when two or three inches high, should be planted out towards the latter end of October, into a south border, under a wall, &c. and in some other warm dry situation,

in rows six inches asunder, and four inches in the rows; or some close under a fourth wall, or other fence, in a foot wide space all the way along, pricking them therein four or six inches distant; as they will have a better chance of standing the winter than those situated more distant from the shelter of the wall. In each method the plants are to remain to take their chance all winter; out of the whole many of them will probably escape the frost; but in very severe weather they may be protected by a light covering of dry long litter, which should be removed again in due time when the frost breaks. In March or April, if they remain too thick, some should be thinned out and planted in another place, in rows twelve or fifteen inches asunder; the crops thus wintered in the open ground, come in for use in April and May, to succeed those sown in autumn, and sheltered occasionally all winter, and will remain good till the spring-own plants are ready for use.

But in the latter case, or those sown in September, to be wintered in frames, they should be planted about the latter end of October, or the beginning of the following month, in rows, from the back to the front of the frame, three inches distant, closing the earth well about each plant, finishing with a moderate watering all over the plants, and putting on the glasses to promote their more speedy rooting afresh, pushing the lights, however, two or three inches down, to give vent to the moist vapour arising from the mould. But when the plants have taken fresh root, and are set to growing, the full air should be admitted every mild dry day, by taking the glasses entirely off, which must be continued throughout the winter season, in all dry mild weather, but putting them on every night in cold or very wet weather; also in the day-time when great rains prevail; and in frosty weather keeping the glasses always on, except in the middle of sunny days, and when the frost is but slight; using also other coverings of mats or long litter over the glasses, and around the sides of the frame, when the frosts are very severe; during the winter keeping all decayed leaves clean picked off; and as the spring and warm weather advance, letting them have the benefit of warm showers. In this way they may be effectually preserved, if those in the open ground should be destroyed by the frost or excessive moisture. About March some of them should be transplanted into a warm situation in the open ground, in rows, a foot asunder, watering them moderately till fresh rooted; leaving a crop remaining in the frames or winter-bed, a foot apart, to stand to cabbage; which will arrive to perfection a considerable time before the transplanted ones, and those that have been fully exposed all winter, are ready. Where frames cannot be spared, a quantity of the plants may be pricked out under hand or bell-glasses in autumn, to stand the winter, either by themselves for a full crop, or some under the hand or bell-glasses that are placed over early cauliflowers, as practised by the London gardeners, planting them round just within the glasses, and managing them as directed for those in the frames; or for want either of a sufficiency of frames or hand-glasses, a quantity may be planted out in October, in four-foot wide beds, in a warm situation, arched over with hoops or rods, to cover with mats and litter in bad weather. In this way they have a better chance of surviving the winter than those fully exposed; and in spring transplanting a quantity, by way of thinning, into other beds, as directed already.

*Manner of sowing Seed.*—With this intention some of the best cabbaged early plants of all the sorts should be chosen, as those of the latter crops rarely run soon enough to ripen seeds perfectly before they are attacked by the autumnal rains

rains and cold, which greatly retard the ripening of the seed. And it is of much importance to have the different varieties intended for seed at some distance from each other, as, when too near together, the farina of the different sorts may mix and fecundate one another, and thereby degenerate plants be produced, instead of such as are perfect in their nature.

The feed usually ripens in August and September, but that of different plants rarely equally together; so that, as it arrives to perfection, the respective stems, &c. of ripe feed should be pulled up or cut off in dry days, and spread upon a cloth, or tied in small bunches across lines in a dry airy place for a week or two, for the feeds to harden and become dry; then beaten or rubbed out, and cleaned from the down and other rubbish, and exposed upon cloths a few days to dry for keeping; being afterwards put up in bags for use, and hung in a dry room or other place.

In general these plants may be considered as annuals and biennials; as those sown in spring and summer attain perfection, run up to seed, and perish the same year; while the autumn sowings stand all winter until the spring following, when they attain perfection, shoot up to seed, and perish root and branch. All the sorts are sufficiently hardy to grow in any good dry common soil, in a free situation open to the sun and air.

In regard to the use of these plants it is principally in salads, when arrived at full growth and cabbaged, that the inner leaves become blanched, crisp, and sweet; and sometimes, also, the young open plants of the cabbage-lettuce sorts are used in winter and spring, till the other general crops arrive at perfection. Young open lettuces are also often used as small salad herbs, sowing them thick in rows, like cresses, &c. and gathering them in the same manner; but this mode is more particularly practised in winter and early spring. They, however, in general, do not eat any way so crisp, sweet, and palatable, as when fully cabbaged. The fully cabbaged-lettuces are also excellent for stewing and for soups, as well as many other culinary uses.

*LACTUCA Marina*, sea-lettuce, in *Botany*, a name used by some authors for the *lichen marinus*, commonly called *oyster-green*.

*LACTUCA Virosa*, in the *Materia Medica*, a species of lactuca, which grows about ditches, banks, borders of fields, and old walls, flowering in July and August. The plant has a strong ungrateful smell, resembling that of opium, and a bitterish acid taste. It abounds with a milk juice, in which its sensible qualities seem to reside, and which seems to have been noticed by Dioscorides, who represents its odour and taste as agreeing with that of the white poppy; and Haller says, that its effects are powerfully narcotic. Dr. Collin, at Vienna, first brought this plant into medical repute, and it has been lately inserted by the College of Physicians at Edinburgh in the catalogue of the *Materia Medica*. Dr. Collin mentions more than twenty-four cases of dropsy that have been treated with success by employing an extract prepared from the expressed juice of this plant, which is stated to be, not only powerfully diuretic, but to promote all the secretions, and to remove visceral obstructions. In the more simple cases, proceeding from debility, doses of the extract, from eighteen to thirty grains a day, proved sufficient to accomplish a cure; but as the disease was inveterate, and accompanied with visceral obstructions, the quantity of extract was increased to three drams; nor did larger doses produce any bad effect besides exciting a nausea. The patients, it is said, continued so strong under the use of this remedy, that it was seldom necessary to em-

ploy any tonic medicines. In Germany, few physicians have, since the year 1771, when Dr. Collin made his experiments with the lactuca, adopted the use of this plant; and hence Dr. Woodville (*Med. Bot.*) takes occasion to observe, that the recommendation of Dr. Collin will be scarcely thought sufficient to establish its use in England.

*LACTUMEN*, from *lac*, milk, in *Surgery*, a name sometimes given to tinea capitis, or the scald head, on account of the white scabs which are formed in this disease.

*LACTUMINA*, from *lac*, milk, little ulcers, or crusty scabs in the skin, chiefly occurring in children at the breast.

*LACUNA*, ANDREW, in *Biography* an eminent Spanish physician was born at Segovia, in Old Castile, in the year 1499. He studied philosophy at Salamanca, and afterwards went to Paris, partly for the purpose of improving his knowledge of the Greek language, and partly for the study of medicine. He took a degree in that capital, but probably only that of master of arts. In 1536, he returned to Spain, and followed the courses established in the colleges of Alcala, Henarez, and Toledo, in the latter of which he received the honours of the doctorate. After this he immediately repaired to the Low Countries, in consequence of a command from the emperor Charles V. and he passed the greater part of his life at the court of that monarch. In 1540, he went to the imperial city of Metz, and resided there five or six years, rendering great services to the citizens during the prevalence of an epidemic pestilence; and by his influence, thus acquired, he contributed to strengthen their adherence to the church of Rome and to the emperor. He visited Italy, Germany, and France again, where he received many honours from the learned corporations, and at Rome was created count palatine, and knight of the order of St. Peter. He died in his native country in the beginning of the year 1560.

He proved himself a learned critic by the corrections and commentaries on the works of Dioscorides, and on many parts of those of Hippocrates, Aristotle, Galen, &c. His own works are numerous, consisting of a treatise on anatomy; an account of the epidemic at Metz; a life of Galen, an epitome of his works, and notes on the labours of his translators, &c. He likewise published a treatise on gout, on excrescences in the neck of the bladder, and on diet, and an epistle to Cornaro; and he translated the works of Dioscorides into Spanish. Eloy. Dict. Hist. de Med.

*LACUNE*, in *Anatomy*, small cavities in some of the mucous membranes, in which a secretion of mucus is carried on; as in the urethra of the male and female. See a description of them in those organs under *GENERATION*.

*LACUNARS*, in *Architecture*, are the panels or coffers formed on the ceilings of apartments, and sometimes on the soffits of the corona of the Ionic, Corinthian, and Composite orders.

In the temple of Minerva at Athens, the lacunars are placed immediately above the frieze within the portico, and formed with a single recess, having an ovolo at the top, which moulding terminates the vertical plane sides, and the horizontal heads of the lacunars. The lacunars are not square, but longer in the longitudinal than in the transverse direction of the building.

In the temple of Theseus at Athens, the lacunars are formed above the frieze, in two rows, between large beams which reach from the rear to the front of the pronaos; their figures are of a square horizontal section, and have only a single recess upwards, with an ovolo above the recess. The side of the square of each coffer is about one-fifth part of the diameter of the column, and their recesses upwards half the side

of their square. The distance between the beams is equal to the breadth of the antæ at the bottom, or nearly equal to the diameter of the columns. The beams are not regulated by the columns, but placed at equidistant intervals, to receive the two rows of lacunars or coffers. Within the temple or cella, the beams reach transversely from side to side; but without, and under the soffit of the pronaos, they extend longitudinally from the front to the rear of the pronaos, and the lacunars in the same direction.

*Temple of Minerva at Athens, Plates IV., VII.*—The lacunars are placed above a frieze highly decorated with historical figures.

In this they are formed in one recess, with a moulding ovolo at the top of the recess, or the farthest extremity of the sides. The lacunars are not square, but longer from front to rear of the portico, than in the transverse direction of the building. Chap. ii. *Plate XVIII.*

In the soffit of the temple of Pandrosus at Athens, the lacunars are formed immediately above the architrave, each into three recesses, with an ovolo at the bottom of each, nearly as broad as the perpendicular surface. The whole depth of the recess is nearly half the side of the square of the lower part of the said recess. Each part diminishes gradually in breadth in a sloping straight line, till the side of the square of the upper part is so contracted as to be only half that of the lower. Each succeeding third part diminishes regularly in altitude, so that accounting the bottom the first, the altitude of the second, or the one next above, is something less, and the third about the same quantity less than the second. Each ovolo is something less in height than the vertical surface below it, and has the same ratio to its respective surface.

The cella of the temple of Vesta at Rome is surrounded with a circular colonnade. The ceiling of the portico has a double row of lacunars, being two in the breadth of the portico. The lacunars approach as nearly to a square as is consistent with their diminution, formed by radiations towards the centre of the building, and are constructed in two recesses. The greatest breadth of the outside lacunar is about nine thirteenths of the diameter of the columns. The whole depth of the recess upwards is about one-seventh of a diameter. The radiating sides of the lacunars or coffers are in vertical planes, and the other two sides of each are vertical cylindrical concentric surfaces. The greatest breadth of the upper recess is about two-thirds of the lower. The hollow of this recess is occupied by a rose of a circular form. The recess or cradle vaults of the temple of Peace at Rome are arched and enriched with octagonal lacunars, each formed in three recesses, which diminish in their margins as they recede upwards. Between the octagonal lacunars are others of a square form in a diagonal position. The ceiling of the middle of the chapel of the said temple is comparted with hexagonal and rhomboidal lacunars.

The lacunars of the arch of Titus at Rome are each square, the side of which being about three quarters of the diameter of the column.

The entablatures of the Ionic, Corinthian, and Composite orders, are generally enriched with lacunars between the moldings.

LACYDES, in *Biography*, a Greek philosopher, and native of Cyrene, was a disciple of Arcelaus, whom he succeeded in the academic chair. He was brought up in very humble circumstances, but acquired great reputation by intense application to his studies, and a graceful elocution. He was highly esteemed by king Attalus, who gave him a garden where he might devote himself to study, and to the instruction of others: this was afterwards known by the

name of the Lacydean garden. Attalus wished Lacydes to come and reside at his court, to which he respectfully replied, that the portraits of kings should be viewed at a distance. He taught his disciples never to be hasty in their judgments, and never to speak positively. Having taught philosophy twenty-six years, he resigned the employment to his scholars Telesus and Evander, in the second year of the 141st Olympiad. In old age he disgraced himself by giving a favourite goose a most magnificent funeral, and he fell a victim to excessive drinking. Bayle. Enfield.

LAD, in *Geography*, a town of Moldavia, on the Reut; 36 miles E. N. E. of Stephanowze.

LADA, in *Botany*, a name given by some authors to the plant which produces the common black-pepper.

LADAK, or LAUTA, in *Geography*, a province of Thibet, bounding on Cashmir towards the west, towards the east on Ngari, and towards the north on the Uzbeks. See THIBET.

LADANUM, in *Botany*. See CISTUS.

LADANUM, or *Ladbanum*, in *Pharmacy*, a gumitious or a resinous matter, oozing out of the leaves of a shrub called *cistus creticus*, or *ladanifera*, which is very common in the hot countries of the Levant, particularly in Candia, and of which there are various kinds. The shrub is also plentiful in Spain, though no ladanum is brought from thence.

Dioscorides says, they gather the ladanum by means of goats, which, browsing on the leaves of this shrub, return to the stable with their beards loaded with a fat substance, which the peasants rake off with a kind of combs made for that purpose. This matter they thus collect into lumps, and, as it is mixed with the goats' hair, and other impurities, call it *ladanum in the beard*, or *natural ladanum*. Others are said to draw cords over the leaves, and other parts of the shrub; and, scraping off what had stuck to the cords, they make up the ladanum into little balls.

Tournefort assures us, that the common way of gathering the ladanum at this time is, by brushing it off the leaves with a sort of whip, composed of many lashes, or straps; after it is scraped off the straps, they make it into cakes of different sizes.

Pietro delle Valle tells us, he was informed by the Indians, that ladanum is formed like dew, and falls from heaven like manna; that it is gathered on the leaves of a plant a palm and a half high; that, after gathering, they boil it, by which means it becomes soft, like wax.

Bellonius says that this juice is collected by lightly brushing the shrub, in the summer heats, with a kind of rake, called in Candia "Erga-tiri," having several straps or thongs of leather fixed to it instead of teeth; the metuous juice adheres to the thongs, and is afterwards scraped off with knives, and formed into regular masses for exportation.

There are two sorts of ladanum in the shops: the best, which is very rare, is in dark-coloured masses, of the consistence of a soft plaster, which becomes still softer on being handled. The other is in long rolls, coiled up and much harder than the preceding, and not so dark. The first has commonly a small, and the last a very large admixture of fine sand, blown upon the juice from the sandy soil where it is found.

Ladanum has been sometimes exhibited as a pectoral and astringent in catarrhal affections, dysenteries, and several other diseases, but it is at present wholly employed in external applications and perfumes. The soft kind, which has an agreeable smell, and a lightly pungent bitterish taste, makes an useful ingredient in the cephalic and stomachic plasters of the

the snags. Rectified spirit of wine dissolves nearly the whole of the pure ladanum into a gold-coloured liquor. Water acquires by infusion much of its smell and taste: and, by distillation in water an essential oil arises, leaving a brittle almost insipid resin and a pale-coloured liquor, which, inspissated, yields a weakly bitterish extract. Heat soon destroys the specific flavour of this juice. Lewis.

**LADANUM**, *Liquid*, more properly called *clear* or *purified* ladanum, is a preparation of the natural ladanum, by melting and purifying it from the hairs, &c.

This hardened is sometimes sold for a sort of black ambergris.

**LADDER** is *Heaven*, in *Botany*. See *LILY* of the *Valley*.

**LADDERS**, *Scaling*, in the *Military Art*, are used in escalade. They are of various sorts; some are of ropes and some of wood; some are made of several joints, so as to be capable of being put together, and to form ladders of different length, according to the service required. There is a sort used in England, much of the same make as the common ladders, except that the steps turn about wooden pegs, so that the poles may be brought near each other, or to shut like a parallel ruler. These are very convenient for carriage.

**LADDERS**, in a *Ship*, derive their names from the several hatchways or other parts where they are situated. Besides these, there are some of a particular construction, as the accommodation-ladder, and the quarter-ladder. The accommodation-ladder is a sort of light staircase, occasionally fixed on the gang-way of the admiral, or commander in chief of a fleet. It is furnished with rails and entering ropes, covered with red baize, and the lower end of it is kept at a proper distance from the ship's side by iron-bars or braces, to render the passage more convenient to those who enter or leave the ship. Quarter-ladders, are two ladders of rope, depending from the right and left side of the ship's stern, whereby to descend into the boats which are moored astern, in order to bring them up along-side of the ship, or to use them for any other occasion.

**LADDER Ways**, the openings in the decks where the ladders are placed.

**LADENOEPOLI**, in *Geography*, a town of Russia, in the government of Olonetz; 56 miles S. of Petrozavodsk. N. lat. 61° 56'. E. long. 33° 50'.

**LADEN**, in *Sea Language*, denotes the state of a ship when she is charged with a weight or quantity of any sort of merchandize or other materials, equal to her tonnage or burthen. If the cargo with which she is laden be extremely heavy, her burthen then is denominated by the weight of the goods; if it be light she carries as much as she can stow, so as to be fit for the purposes of navigation. A ton in measure is generally estimated at 2000lb. in weight, and therefore a vessel of 200 tons ought to carry a weight of 400,000lb. when the matter of which the cargo is composed is specifically heavier than the water in which she floats.

**LADEN**, in *Bulk*, denotes the state of being freighted with a cargo, which is not in casks, boxes, bales, or cases: but lies loose in the hold, being defended from the moisture or wet of the hold, by a number of mats and a quantity of dunnage. Such are usually the cargoes of corn, salt, or such materials.

**LADENBURG**, in *Geography*, a town of Westphalia, in the bishopric of Osnabruck; nine miles S.S.E. of Osnabruck.—Also, a town of the duchy of Baden; six miles E. of Mannheim. N. lat. 49° 27'. E. long. 8° 40'.

**LADETSCH**, a town of Bohemia, in the circle of Casslau; 12 miles S.S.W. of Casslau.

**LADJA**, in *Hindoo Mythology*, a being produced by Brahma, similarly with Lalha: a being which Brahma, or the creative power of the deity, produced from his loins when peopling the world. Lalha is a personification of appetite or passion, and the word in Sanscrit has, as in many other languages, a libal meaning, indicating the source of the being thus produced. On that occasion Kama, a personification of love or desire (see *KAMA*), sprung from his heart in the form of a beautiful female, and Brahma, locking on her with amorous emotions, was informed by the Munis, (*See MUNI*), that she was his own daughter: he shrunk back, and Ladja, a personification of shame, a bustling virgin, was produced. Brahma, deeming his body defiled by its emotive toward Kama, purified it by partial metamorphosing it into ten females, who were respectively espoused by the Munis.

**LADKIEH**, in *Geography*, a town of Asiatic Turkey, in Caramania, anciently Laodicea; 20 miles W. of Cegai.

**LADING**. See *BILL* of *Lading*.

**LADISLAUS I**, in *Biography*, king of Hungary, son of Bela I. born in 1041, was a martial prince, and joined his brother Geysa in a war against Solomon, whom he was the chief cause of defeating, at the bloody battle which deprived him of his crown, and placed it upon the head of Geysa. Upon the death of the latter in 1078, Ladislaus was chosen to succeed him. He immediately attacked and defeated the rebellious Wallachians, and annexed to his dominions Dalmatia and Croatia, through the gift of his sister, who was widow of the last king of Dalmatia. He reduced the Bohemians who had revolted, expelled the Huns, and conquered part of Bulgaria and Russia. He defeated also the Tartars, and having made his dominions secure on all sides, he studied to render them flourishing and happy by the arts of peace: he encouraged commerce, and published an improved code of laws. He built several new churches, and made considerable preparations for joining in the first crusade, when in an expedition into Bohemia he was attacked with a disease, which put an end to his life in the year 1095, after a glorious reign of seventeen years. He was distinguished for piety as well as valour, and was canonized in 1198 by pope Celestine III. Univer. Hist.

**LADISLAUS III**, king of Hungary. The second prince of this name reigned but a few months, and did nothing worthy of record. The third Ladislaus, the subject of this article, surnamed Chun, came to the throne in 1272, after the death of his father, Stephen IV. He obtained the name of Chun from the barbarity of his disposition. Soon after his accession to the throne, he, in conjunction with the emperor Rodolph, defeated the Bohemian king Othogar, who was slain in battle. After this success, he gave himself up to all manner of voluptuousness; divorcing his own wife, that he might indulge his passion with women of the Tartar nation of Cumans. His general conduct was so base, and his oppression of the Christians so enormous, that the pope, at the desire of the principal people of Hungary, excommunicated him: upon which he feigned a sincere repentance, and built an hospital for strangers. His total neglect of the government, and the disaffection of his subjects, invited the incursions of the Tartars, by whom Hungary was so dreadfully desolated, that, for want of beasts, men, and even those of the higher ranks, were obliged to draw the plough. Hence the Hungarian proverb, "The ploughs of Ladislaus." After a second invasion, which Ladislaus took no measures to repel, he was stabbed, while sleeping in his tent, by some of the Cumanian women in whom he confided, but whom he had offended. Univer. Hist.

**LADISLAUS IV**, king of Hungary, also king of Poland, under the title of Uladislavus V., was son of Jagello, or

Uladiſlaus IV., whom he ſucceeded on the Polish throne in 1435, being then only in the ninth year of his age. He was elected king of Hungary in 1440. As the famous crown of St. Stephen was in poſſeſſion of the late queen, he was crowned with a diadem taken from the cheſt containing the relics of that ſainted monarch. He declared war againſt the Turks, and employed as his general John Huniades, who was very ſucceſsful in the cauſe. Ladiflaus made peace, which gave much diſſatisfaction to the pope, and other Chriſtian princes; ſo that he was induced to break it. A battle ſoon after ensued, in which he loſt his life at Varna, in the year 1444. His death occaſioned the complete ruin of his army. Univer. Hiſt.

LADISLAUS V., king of Hungary, was born in 1440, and ſucceeded to the crown in 1444, when he was only in the fifth year of his age. He was, at this time, at the court of the emperor Frederic III.; and it was not till 1452 that he was reſtored to his country. It was agreed that, during his minority, Hungary ſhould be governed by John Corvin, ſon of Huniades; Bohemia by George Podiebrad; and Auſtria by Ulric count of Ciley, the king's uncle, who was appointed guardian of his perſon. The count endeavoured to ſupplant John Corvin, but in vain; and he obtained great honour by the defeat of the Turks before Belgrade. At the death of John, the government was transferred to his ſon Ladiflaus, to the great mortification of the count of Ciley, who endeavoured to procure his aſſaſſination; but he was himſelf killed at Belgrade by the friends of that family. In 1457, Ladiflaus went to Prague, in order to celebrate his nuptials with Magdalen of France, daughter to Charles VII.; but in the middle of the ſeſtivities, he was taken ſuddenly ill, and died, not without ſuſpicion of poiſon. Mod. Univer. Hiſt.

LADISLAUS VI., king of Hungary, ſon of Caſimir IV. of Poland, was choſen king of Bohemia in 1470, and was ſoon involved in a war with Matthias king of Hungary, which was terminated by a peace in 1475. At the death of Matthias in 1490, Ladiflaus was elected to ſucceed him. He had, however, to make his way to the throne againſt the hoſtile oppoſition of his competitors, one of whom was his own brother. At length he was quietly ſeated; but being of an indolent and pacific diſpoſition, he was ill fitted to contend with the diſorders which haraſſed his kingdom; and from his great bulk and inactivity, he acquired from his ſubjects the appellation of an *ox*. The Turks having threatened Hungary, he was, during his whole reign, conſtantly at war with the Turks, and other neighbouring powers. Ladiflaus, though not warlike, was attentive to the duties of his high ſtation, and employed much time in collecting all the Hungarian laws, and the decrees of the monarchs, into one body, which has ever ſince formed the baſe of the conſtitution and jurisprudence of the country. He died in 1516. Univer. Hiſt.

LADISLAUS, kings of Poland. See ULADISLAUS.

LADISLAUS, or LANCELOT, king of Naples, called the liberal and victorious, ſucceeded his father, Charles Duras, in 1386. He was before count of Provence and king of Hungary. He obtained the latter crown in 1403, during the impriſonment of Sigismund, who compelled him to return to Italy. On the death of his father, he was oppoſed by Lewis II. duke of Anjou, which occaſioned ſome bloody wars. The pope at firſt eſpouſed the cauſe of Lewis, but afterwards took the part of Ladiflaus, who, however, marched againſt Rome, and having taken it, turned his arms on the Florentines, whom he compelled to flee for peace in 1413. He died in 1414, aged 38, being poiſoned, as it was reported, by his miſtreſs, who had been bribed to

perpetrate the bloody deed by the Florentines. Univer. Hiſt. Tablettes Chronologiques, par Du Frefnoy.

LADIZIN, in *Geography*, a town of Poland, in the palatinate of Braclaw; 14 miles S. of Braclaw.

LADLE of a Gun, the inſtrument wherewith the powder is put into the piece.

It is made of a plate of copper bowed in form of a half-cylinder, rounded at one end, the other being fixed upon a long ſtaff: this filled with powder, the gunner carries, with his left hand under the end of it, to keep the powder from falling out, till he enters it in the muzzle of the piece; when he has carried the powder home to the charged cylinder, he turns the ladle, that the powder may fall out, and withdraws it.

Lades are fitted to the bore of each gun, and hold powder ſufficient for the charge.

Small lades, with ſhort handles of wood, are alſo uſed in filling the fuzes of ſhells, or any other compoſition for filling the caſes of rockets, &c.

LADLE-Boards, thoſe boards diſpoſed on the circumference of the water-wheels of over-ſhot mills; forming hollows, or receptacles, not unlike lades, to receive the water that falls upon the wheel. See Water-WHEEL.

LADOCO, *Los Cados* is, in *Geography*, mountains, which commence in Portugal, and are continued into Spain, ſeparating Galicia from the Asturias.

LADODA, a town of Hindooſtan, in the ſubah of Agimere; 20 miles S.E. of Roepnagar.

LADOGA, Nov, a town of Ruſſia, on the ſouth coaſt of the lake Ladoga; 56 miles E. of Petersburg N. lat. 60° 2'. E. long. 21° 44'.

LADOGA, or *Ladoskoi*, Lake, lies in the government of Vyborg, between the gulf of Finland and the lake of Onega; its ſouth-weſt extremity lying about 30 miles eaſt from Peterburg. In ancient times it is ſaid to have been called Nebo. Being in length 175, and in breadth 105 verſts, it is reckoned one of the largeſt lakes in Europe. It produces a great number of ſeals. On account of the perilous ſtorms to which it is liable, and the ſeveral ſand-banks that are ever ſhifting their poſition, Peter the Great, in 1718, cauſed the famous Ladoga canal to be dug along its ſhore, from the Volkhof into the Neva. It was begun by order of Peter, and finiſhed under the reign of the empreſs Anne. This canal is 104 verſts long, 10 ſajenes broad, 1½ ſajene deep, and has 25 fluices. By the Neva the Ladoga is connected with the Baltic; by the Svir, with the Onega; and by the Volkhof, with the Ilmen. Into the canal flow the rivers Lipke, Naſa, Sheldika, Lava, and Kabona; into the lake the rivers Pasha, Sias, Oiat, &c.; whereas the Neva alone runs out of it. Both ſhores of the lake belong to Ruſſia, which has every where a flat coaſt and a ſandy beach. On this ſhore it has alſo a few low fiſhery iſlands, and a ſandy bottom. That part of the northern ſide which lies in the government of Olonetz has marble on its eaſt, whence ſome of theſe beautiful kinds of Finnish marble are brought to St. Peterburg. As the bed of this lake, for a great extent, is in the loweſt part of the country, it receives, beſides the above-mentioned rivers, the waters that come from the Alum hills; all of which have no other outlet than the Neva. Tooke's Ruſſ. Emp. vol. i.

LADONIS, in the *Materia Medica of the Ancients*, a name given by ſome to the laurus or bay-tree. We find the word in a compoſition preſcribed in Galen, from the works of ſome of the empirics of his time; but it never was uſed by the more regular authors.

LADOS, in *Geography*, a ſmall iſland in the Eaſt Indian ſea. N. lat. 6° 11'. E. long. 99° 40'.

LADRE, in the *Manege*, denotes *dull*. See *Horse*.

LADRONES, MARIAN, or *Mary-Anne*, *Islands*, in *Geography*, a group of islands in the North Pacific ocean, forming a chain of 200 leagues, and occupying a space of about 450 miles in extent. Magellan, who discovered this archipelago in 1521, imposed on them the name of Ladrones, (*Thieves* or *Robbers*,) because the natives, like those of many other islands, who had no idea of the exclusive right of property, manifested a disposition to pilfer, and a considerable degree of address in the execution of their designs. These islands were also called "Isas de las Velas," from the great number of sailing craft which came from these islands to meet ships, when they presented themselves there for the purpose of anchoring. Towards the middle of the 17th century, in the reign of Philip IV. of Spain, these islands were called the "Marians," in honour of Mary-Anne, the queen of Philip. In 1564 or 1565, Andreas Miguel Lopes Legaspi took possession of them in the name of the crown of Spain; but he neglected them as unworthy of his attention, and pursued his voyage to the Philippines. The islands of Ladrones were forgotten till the zeal of a celebrated Jesuit, Sanevares, interested the devotion of queen Mary-Anne of Austria, regent during the minority of her son Charles II., and excited her to cause the gospel to be carried into these islands, which Magellan had found means to annex to the possessions of Spain, by discovering a new route, that eluded the ridiculous line of demarcation established by the see of Rome, in the plenitude of its power. In 1688, the Spaniards presented themselves at the Mary-Anne islands, with the cross in one hand and the sword in the other; and with these two weapons, which lent one another mutual aid, their pretended right to the possession of these islands could not fail to be acknowledged. They had no difficulty in making themselves masters of Guahan or Guaham (now called Guam), the principal of these islands, and the most southern of the Archipelago; and by degrees they subdued all the others. Pigafetta, who accompanied Magellan, describes the people of these islands as naked, their hair and beards long, tall, and well-proportioned, with an olive complexion. They coloured their teeth black, like the inhabitants of the Pelew islands; and in their manners and customs they resembled one another. Till the arrival of the Spaniards, the inhabitants of these islands considered themselves as the only men in the world, being assured that the first man was made of a piece of rock taken from Funá, a little island near Guam; but, according to others, he was made of earth in the latter island. When they were visited by the Spaniards and Dutch, they inferred that these strangers were brethren, who had lost the primitive Guamefe language. In colour, speech, manners, and government, they much resemble the Tagals, or people of the Philippines, before the Spanish conquest. They were then very populous; Guam, which is 40 leagues in circuit, having 30,000 inhabitants. The women employed themselves in dyeing their teeth black, and their hair white. The nobles were treated with great respect, and thought it criminal to connect themselves in marriage with a common girl; nevertheless, the people were not enslaved, or even subjects, though they treated their nobles with great reverence.

Their houses were divided into four apartments, separated by palm-leaves. In their absolute independence each man avenged his own quarrel; but though wars were frequent, they were not sanguinary; the loss of a man or two deciding the battle. Their magicians invoke the anitis, or the dead, whose skulls were preserved in the house; and they manifest an anxiety lest the anitis, or ghost, should disturb their sleeping, or nocturnal repose. Although Guam is the largest of

these islands, Tinian has attracted the greatest degree of attention in consequence of the romantic description given of it in Anson's voyage. (See GUAM and TINIAN.) The number of these islands has been differently stated from 9 to 16; but it does not appear that above three or four are inhabited. Their sailing vessels, called *proas*, evince considerable skill in naval architecture. For an account of them, see the article BOAT. La Perouse leads us to conclude that these islands are volcanic; but their natural history is little known. They cultivate various seeds and fruit, and particularly the bread-fruit. For their productions of this kind, see TINIAN. In Sir George Staunton's account of the embassy to China, we have some information of a recent and authentic kind with respect to these islands. The grand Ladrone he represents as a high-peaked island; and he mentions another near it, whose summit is somewhat lower and more level. The latitude of the grand Ladrone appeared to be 21° 52' N., and the longitude 113° 36' E. of Greenwich. The latitude of another island, called *Chookteho* was 21° 55' N., and its longitude 113° 44' E. The observations from which these latitudes and longitudes are deduced were carefully made, and therefore they may be deemed correct; though they differ from those stated by other geographers. The margins, or rocks, of the Ladrone islands next the sea are of a black, or dark brown colour, owing to the action of the salt-water; and the spray and dashing of the waves have corroded their surface, so as to give them a honey-comb appearance. Some springs are found on these islands; and the water is neither brackish nor chalybeate, nor in any respect mineral in its taste. The soil upon the surface appears to be of the same nature with the component parts of the rocks below, and, indeed, is merely the upper layer of the rock, decomposed and pulverized by the joint action of the sun and rain in a succession of ages. The rock consists of a mixture of clay, calc of iron in a small proportion, and a great deal of siliceous earth and mica. The sea all round is of a dirty-yellowish muddy colour, and of no great depth. The bottom is mud and clay.

The Ladrones, and clusters of islands between them and the southern extremity of China, are so near to each other, and to the main land, and are also so broken, as well as so irregular in their form and position, as to appear like fragments, disjointed from the continent, and from each other, at remote periods, by the successive violence of mighty torrents, or in some sudden convulsions of nature. These fragments have now a very barren and unpromising aspect. In particular spots, however, there are some scattered patches of pleasing verdure; but, in general, little better than naked rocks appear; and scarcely ever a tree or shrub is visible among them. These islands serve chiefly as retreats for pirates, and for the temporary abode of fishermen. To the north of the Ladrones are many small islands, extending to Todos los Santos, N. lat. 30°; those further to the N. belonging to Japan. This group may either be arranged, says Pinkerton, among the Ladrones, or night, perhaps, admit of a distinct appellation. For a more ample account of the Ladrones, we refer to the Supplement of De Brosse, vol. ii. p. 492, and to the article TINIAN.

LADRONES, three small islands in the Pacific ocean, on the coast of Veragua; 8 miles S.E. of Cape Boruca, N. lat. 8° 20'. W. long. 83° 16'.

LADROON, a river of Africa, which runs into the Indian sea, S. lat. 22° 36'.

LADVOCAT, JOHN BAPTIST, in *Biography*, a man of letters in France, was born in 1709. He was, at the usual age, admitted a member of the society of Jesuits, and for

some time occupied the cure of Domremi, the birth-place of the celebrated Joan of Arc; but in 1740 he was appointed royal professor at the Sorbonne, and in two years after he was elected librarian. The good duke of Orleans having founded a Hebrew professorship in the Sorbonne, Ladvocat was appointed, in 1751, to fill that office, which he kept till his death, in the year 1765. His works are "A Geographical Dictionary;" "An Historical Dictionary;" "A Hebrew Grammar," and several theological tracts. He is represented as remarkably mild, humane, and undistinguished in his manners.

LADVOCAT, LEVIS FRANCIS, a philosophical writer, and dean of the chamber of accounts at Paris, where he died in 1735, in the ninety-first year of his age. As an author, his principal work is entitled "Entretiens sur un nouveau Systeme de Morale et de Physique," which abounds in solid reflections, and well digested reasonings. Some objections being made to the principles contained in these conversations, Ladvocat, in 1728, replied by publishing "A new System of Philosophy founded on the indisputable Nature of Things, compared with the Opinions of the ancient Philosophers relating to the first Principles of Nature, &c.:" to which is added a treatise on the nature of the soul, and the existence of God. Ladvocat was an able magistrate, and a good man. Mereri.

LADY, in *Geography*, a town of Russia, in the government of Smolensko, and before the late dismemberment of Poland, a Russian frontier town.

LADY'S *Island*, an island in the Atlantic, near the coast of S. Carolina, in America, between Port Royal island and St. Helena. N. lat. 42° 30'. W. long. 80° 32'.

LADY'S *Bed-Straw*, or *Cheese-Rennet*, in *Botany* and the *Materia Medica*. See GALIUM.

LADY'S *Bower*. See CLEMATIS.

LADY-BIRD, in *Zoology*. See HEMISPHERIA, and SCARABÆUS. *Coccinilla punctata*.

LADY-CHapel, a name invented by modern architects and virtuosi to signify the chapel which is generally found in our ancient cathedrals behind the screen of the high altar. It is so denominated from its being generally dedicated to the blessed Virgin Mary, called *Our Lady*.

LADY'S *Comb*, in *Botany*. See SHEPHERD'S *Needle*.

LADY'S *Cushion*. See SAXIFRAGE.

LADY-DAY, in *Laws*, the 25th of March, being the Annunciation of the Holy Virgin.

LADY'S *Finger*, in *Botany*. See ANTHYLLIS.

LADY'S *Mantle*. See ALCHENILLA.

LADY'S *Seal*. See TAMUS.

LADY'S *Slipper*. See CYPHOPEDUM.

LADY'S *Smock*, the common name of a perennial weed often met with in pasture grounds. The stalk is upright, found, and smooth, the leaves are winged, with the lobes of the lower ones roundish, and those on the stalk oblong. The flowers are large, handsome, and white, or purplish, consisting of four obtuse veined petals. The seeds are contained in erect compressed pods, about an inch in length, divided into two cells, which, when ripe, burst with a touch, and throw out their seed to a considerable distance. It has sometimes the vulgar names of cuckow-flower, Canterbury-bells, &c.

LADY'S *Tracts*. See TWYBLADE.

LADY of the *Thistle*. See THISTLE.

LADY, *Presentation of our*. See PRESENTATION.

LADYKIRK, in *Geography*, a town of the island of Ronaldsna. N. lat. 58° 38'. W. long. 2° 49'.

LÆLIUS, CAIUS, in *Biography*, a noble Roman, the particular friend of the first Scipio Africanus, accompanied

that commander to Spain, and was instrumental in the capture of New Carthage. When Spain was reduced under the Roman power, Lælius was sent by Scipio to treat with Syphax, and after this he was employed to ravage the coast of Africa. In conjunction with Massinissa, he defeated Syphax, and brought him prisoner to Rome. He commanded the Italian horse at the battle of Zama, and had a considerable share in the success of the day. He was made consul in the year 160 B. C.

LÆLIUS, CAIUS, surnamed *Sapientis*, supposed to have been the son of the preceding, was equally distinguished with the former by his friendship with the second Scipio Africanus, so that Cicero represents him in his treatise "De Amicitia," as explaining the real nature of friendship with its attendant pleasures. In this work, which is known to every well educated youth, Lælius appears as the chief speaker. He was an eminent orator, and a successful cultivator of polite literature. He was signalized by his prowess in the war with Spain, but is chiefly celebrated by the civil honours to which he attained. His oratory is described as of the mild and elegant kind. He was a member of the college of augurs, and pronounced one of the most famous orations in that capacity. He was consul in the year B. C. 140. When his friend Scipio quitted all concern in public affairs, Lælius accompanied him to his country retreat, preferring the pleasures of retirement and friendship to the honours of the world. He is supposed to have had a share in the composition, or, at least, in the correction, of Terence's comedies. His modesty, humanity, and the manner in which he patronized literature and learned men, are as illustrious as the greatness of his mind, and the integrity which he displayed as a statesman. Univer. Hist.

LÆNA, among the *Ancients*, a thick, shaggy, upper garment. See CHLENA.

LAER, PETER VAN, in *Biography*, a landscape, cattle, and conversation painter, known in Italy by the name of Bamboccio, from the nature of the subjects he frequently painted during a long residence at Rome, such as vintagerevels, drolleries, quarrels, mummeries, &c. which are termed by the Italians Bambocciate. He was a native of Laeren, near Narden, was born in 1613, and being endowed with excellent faculties of perception and imitation, he practised the art he adopted with very great success. His hand and his imagination were equally rapid; and so readily would the former execute the dictates of the latter, that he rarely found it necessary to make previous studies for his pictures; but sketching slightly the subject on his canvass, he finished the work without more delay. He had the great advantage of possessing an excellent memory, and if he considered any object with an intention to insert it in a picture, it became so imprinted in his mind, that he could represent it with great truth without its being placed again before his eyes.

His pictures are of a small size, but very pleasingly executed, with an excellent tone of colour.

In the latter part of his life he was severely tormented with an asthma, of which (not being endued with patience enough to bear his miseries tranquilly), he contrived to rid himself by drowning, in the 60th year of his age.

LÆERTA, in *Natural History*, a name given by authors to a species of vespa or wasp, whose sting is said to be fatal; but this is an erroneous opinion. This wasp is larger and longer bodied than the common kind, but smaller than the hornet. It seems of a very irritable disposition, attacking animals of any kind that come in its way.

LÆET, JOHN DE, in *Biography*, director of the East India company, was born at Antwerp, where he died in

1649. He was a great proficient in the languages, and composed or edited several works relating to geography and civil history, as "Novus Orbis;" "Historia Naturalis Brasiliæ;" "De regis Hispaniæ Regnis et Opibus;" "Reipublica Belgarum;" "Gallia;" "Turcici imperii Status;" "Perficiæ imperii Status." These works are still in considerable repute, as well on account of the historical and geographical information which they contain, as on account of the great beauty of the Ezevir types. They are known generally under the name of the Republicæ. Laet gave a new edition of the works of Vitruvius, enriched with notes of various critics. Laet's account of America, which is found in his "Novus Orbis," involved the author in a controversy with Grotius respecting the origin of the inhabitants. It has been much used by more modern geographers.

LAETIA, in Botany, named by Loeffing, in memory of John de Laet of Antwerp, who published a Latin history of America in folio, in 1633, dedicated to king Charles I. of England. Haller speaks with respect of his botanical remarks, as throwing light upon the plants of Maregrave, and tending to reconcile his descriptions with those of Clusius and the Spanish botanists.—Linn. Gen. 267. Schreb. 355. Willd. Sp. Pl. v. 2. 1163. Mart. Mill. Dict. v. 3. Juss. 293. (Guidonia; Browne Jam. 249. Linn. in Loell. t. 190. Thammia; Browne Jam. 245.)—Clas and order, *Polyandria Monogynia*. Nat. Ord. *Tiliaceæ*, Juss.

Gen. Ch. Cal. Perianth inferior, of five oblong, concave, reflexed, coloured, withering leaves. Cor. either wanting, or of five petals. Stam. Filaments numerous, capillary, rather shorter than the calyx; anthers roundish. Pist. Germen superior, oblong; style thread-shaped, longer than the filaments; signa capitate, depressed. Peric. Capsule roundish with three or four angles and as many furrows, fleshy, of one cell and three or four valves finally recurved. Seeds numerous, angular, each clothed with a pulpy tunic.

Eff. Ch. Corolla of five petals, or wanting. Calyx inferior, of five leaves. Capsule fleshy, of one cell, and three or four valves. Seeds numerous, with a pulpy tunic.

Obs. We have endeavoured to profit by the observations of Swartz, compared with those of Browne and Loeffing, in order to give a just idea of the fruit, of which we regret having never examined any specimen. Neither is any sufficient representation of it extant.

1. *L. apetala*. Linn. Sp. Pl. 733. Jacq. Amer. 167. t. 1c8. Swartz. Obs. 219. Loell. It. 190 n. 65.—Petals none. Stalks axillary, three-flowered. Leaves elliptic-oblong, obtuse, minutely serrated, smooth and shining.—Gathered by Jacquin in woods at Carthagena, South America, flowering in April and May, bearing fruit in August. A tree 20 feet high, throwing out spreading branches from the very bottom of its trunk. Leaves about the ends of the short alternate tapering lateral shoots, stalked, above an inch in length, elliptic-oblong, or obovate, obtuse, smooth and shining, very minutely serrated. Flowers white, compared by Jacquin to those of Hawthorn, both in appearance and scent, standing mostly three together, on solitary axillary stalks, not half so long as the leaves. Fruit, according to Jacquin, ovate with three blunt angles, the size of an olive, generally found more or less eaten by birds or insects, but he seems to speak of it as smooth; Loeffing describes it as yellow and downy, nearly globose, with four obscure angles and as many furrows. We are unable to determine whether these writers both speak of the same species, though such is the general opinion. Loeffing found his near Comana.—Lamarck suspects the *L. apetala* to belong to the *Ludia* of Commerçon. See *LUDIA*.

2. *L. Guidonia*. Swartz. Prodr. 83. (Guidonia; Browne Jam. 249. t. 29. f. 4.)—Petals none. Stalks terminal, single-flowered. Leaves oblong, pointed, serrated and downy.—Native of Jamaica. Swartz. Browne calls his plant Rod-wood, and says it "grows to a considerable size, being esteemed a fine timber, and much used in all sorts of buildings. The lines between the valves of the fruit are of a beautiful red, as well as the *placenta*." We know not why Swartz quotes him with a mark of doubt, nor have we ever seen any specimen of this species from either of these botanists.

3. *L. Thammia*. Swartz. Prodr. 83. Fl. Ind. Occ. v. 2. 950. (Thammia; Browne Jam. 245.)—Petals none. Stalks axillary, forked, many-flowered. Leaves elliptic-oblong, somewhat crenate, smooth and shining.—Native of Jamaica. Browne gathered it on the red hills above the *Angels*, but says it is not common. His own specimen is before us. This is a *shrub*, six feet high, with roundish, smooth, slightly zigzag branches, whose young ends are compressed and coloured. Leaves alternate, on round smooth stalks half an inch long, elliptic-oblong, with a blunt point, smooth and shining, slightly crenate, two or three inches in length, marked with pellucid dots readily seen when the leaf is held against the light. Flower-stalks from the young shoots, axillary, much shorter than the leaves, forked and as it were jointed, minutely downy, as are the calyx-leaves. The flowers are not numerous, larger than the common Myrtle, the two outer leaves of the calyx purplish, inner white, all reflexed. Stamens downy. Anthers yellow. Fruit with four, rarely five angles, and as many valves, which are revolute when ripe. Seeds numerous, with a purplish tunic. Swartz found this plant on the south coast of Jamaica, in bushy chalky spots, flowering in the spring. We have borrowed most of his description, comparing it with Browne's specimen.

4. *L. completa*. Linn. Sp. Pl. 733. Jacq. Amer. 167. t. 185. f. 60. Lamarck. Dict. v. 3. 374.—Petals five. Stalks many-flowered, axillary. Leaves ovate-oblong, finely serrated, rugose, smooth.—This was gathered in woods at Carthagena by Jacquin, from whose book alone we have any knowledge of it. The stem is shrubby, branched, nine feet high. Leaves about three inches long, of a broad ovate somewhat oblique figure, rugose, veiny, finely but sharply serrated, smooth, stalked. Common flower-stalks downy. Fruit yellowish red, often slightly triangular, ripening in August and September. The flowering season is June. The petals are as long as the calyx, but nothing is said of their colour, Jacquin having seen them in a faded state only.

Not one of this genus is known in the gardens of Europe, nor have any dried specimens, except the above-mentioned, fallen in our way.

LAEUANGER, in Geography, a town of Norway, in the diocese of Drontheim; 45 miles E.N.E. of Drontheim.

LEVIUS, in Biography, a Latin poet, who probably flourished about the time of Cicero. He wrote a poem entitled "Erotopagnia," or "Love games," which is quoted by Aulus Gellius, and Apuleius. He composed also a poem entitled "The Centaurs," which is quoted by Pectus under the title of Petrarum.

LA FERRE, in Geography. See *La FERRE*.

LAFITAU, JOSEPH FRANCIS, in Biography, born at Bourdeaux, entered the society of Jesus, and became a missionary among the uncultivated nations of North America. On his return home he wrote a work entitled "Les Mœurs des Sauvages Américains comparées aux Mœurs des premiers tems," in two volumes 4to.: "A History of the discoveries of the Portuguese in the New World," in two vols.

vols. 4to. which maintains a high reputation. He died about the year 1740.

**LAFITAU, PETER FRANCIS**, brother of the above, was a native of Bourdeaux, and became distinguished as a preacher among the Jesuits. Being sent to Rome on various negotiations he became a great favourite with pope Clement IX. who promoted him to the bishopric of Sisteron in Provence. He died in the year 1764, at the age of seventy-nine. He was author of the "History of the Constitution Unigenitus," two vols. 12mo.; "History of Clement IX.," in two volumes, and "Sermons," in four volumes, besides several devotional and practical treatises.

**LA FORCE**, in *Geography*. See *La Force*.

**LAFORDSWICK**, (Saxon, *blaford*, i. e. *dominus*, and *fwic*, *proditio*, *infidelitas erga deum*;) the betraying of a lord or master. This word is found in king Canute's laws. c. 61. and in the laws of king Henry I.

**LA FRESNAYE**, in *Geography*. See *La Fresnaye*.

**LAFVENSARI**, a small island in the gulf of Finland. N. lat. 59° 57'. E. long. 45° 32'.

**LAGA**, in *Antiquity*, denotes *lex* or *lax*: whence are deduced *Saxon-lage*, *Dane-lage*, &c.

**LAGA**, in *Geography*, a river of Sweden, which runs into the North sea; four miles W. of Laholm.

**LAGAMAN**, a town of Candahar; 60 miles N.E. of Cabul.

**LAGAN**, or **LAGON**, in our *Ancient Sea Laws*, shipwrecked goods, left by the sea, lying on the sand, either ashore, or out at sea.

The word seems formed from the Saxon *legan*, or *lugan*, *jacere*, to lie. Though others deduce it from the Latin *ligare*, to bind; and suppose it to denote goods tied together with a buoy, or the like, to hinder their sinking to the bottom, that they may be found again.

**Lagan** is usually joined with *jetson* and *stotson*; which see.

**LAGAN**, in *Geography*, a river of Ireland, which rises in the Sliebh-droob mountains, in the centre of the county of Down, and making a sweep to the west by Dromore, becomes the boundary between the counties of Down and Antrim, from the neighbourhood of Moira until it flows a little below Belfast into that large estuary called Belfast Lough. There are many villages, besides the considerable towns of Lisburne and Belfast, on this river, and its banks are adorned with numerous bleach greens. Great exertions have been used to improve the navigation of this river, and a canal joins it to Lough Neagh.

**LAGANUM**, in *Natural History*, the name of a genus of the echini marini, of the general class of the placentæ. The characters of the lagana are, that they have their mouth in the centre of the bale, and their aperture for the anus in its third region; that their superficies is whole, and their edges waved. Of this genus there are five known species.

**LAGARES**, in *Geography*, a town of Portugal, in the province of Beira; 14 miles S.S.W. of Viseu.

**LAGAU**, a town of Brandenburg, in the New Mark; 25 miles S.E. of Cultrin. E. lat. 52° 28'. E. long. 15° 26'.

**LAGEMAN**, (*Lagamannus homo habens legem*, or *homo legalis seu legitimus*: such as we call now good men of the jury. The word is frequently used in Domestday, and the laws of Edward the Confessor, cap. 38.

**LAGEN**, **LAGENA**, in ancient time, was a measure of wine, containing six sextarii: whence probably is derived our *flaggon*. The lieutenant of the Tower has the privilege to take *unam lagenam vini ante ma'um et retro*, of all wine ships that come up the Thames; and sir Peter Leicester, in his Antiquities of Cheshire, interprets *lagena vini*, a bottle of wine.

**LAGEN Bay**, in *Geography*, a bay on the W. coast of the island of Ila, S. of Lagen point.

**LAGENS**, a town of the island of Flores, one of the Azores, containing near 1400 inhabitants.

**LAGENULA**, in *Botany*, from *lagena*, a bottle, because the form of the fruit is like that of a little bottle or flaggon. Lourc. Cochinch. 88.—Class and order, *Tetrandra Monogynia*. Nat. Ord. *Cucurbitaceæ*, Linn. Juss.?

Gen. Ch. *Cal.* Perianth inferior, of four ovate-oblong, reflexed, permanent leaves. *Cor.* Petals none. Nectary fleshy, with four erect, somewhat approximated, lobes. *Stam.* Filaments four, awl shaped, equal to the calyx; anthers ovate, incumbent. *Pist.* Germen concealed by the nectary; style thick, shorter than the filaments; stigma simple. *Peris.* Berry small, bottle-shaped, with a narrow neck, of two cells, and containing two seeds. *Seeds* solitary, convex on one side, angular on the other.

Eff. Ch. *Cal.* Calyx of four leaves, inferior. Petals none. Nectary four-lobed. Berry of two cells. *Seeds* solitary.

1. *L. pedata*. Called by the Cochinchinese *Cây rât nhô lô*. A moderate-sized shrub, found on the hills of Cochinchina. The stem climbs by means of tendrils, and is branched, destitute of prickles. *Leaves* pedate, of five ovate, crenate, downy leaflets. *Flowers* whitish green, in terminal, spreading, subdivided clusters.

Such is Loureiro's description, which in most respects indicates a plant of the Gourd or Bryonia tribe, except the germen being superior. It should seem therefore to range with a few more genera, mentioned by Jussieu, at the end of his *Cucurbitaceæ*, which differ from the character of that order in the situation of their germen.

**LAGERSTREEMIA**, so called by Linnæus, in commemoration of his friend Magnus Lagerstræm, a director of the Swedish East India Company, member of the Royal Societies of Upsal and Stockholm, who communicated to him many natural productions, and some other curiosities, described in the fourth volume of the *Amenities Academicæ*, under the title of *Chinensis Lagerstræmiana*. Amongst these was an exquisitely carved horn of a Rhinoceros, now in the hands of the writer of this article, which represents a leaf of the *Cyamus Nelumbo*, accompanied by the flower and fruit in a smaller size, with other memorable plants, and several half-formed lizards, crawling as it were out of their native mud, and seizing on the grape, the Litchi, the Mango, and the Mangolian, celebrated oriental fruits. This seems to express the supposed beginning of animal life, with its dependence on the vegetable kingdom, and throws light on the mythological history of the *Cyamus*, to which article, written by our lamented friend the late Rev. Mr. Wood, in our 10th volume, we refer the reader.—Linn. Gen. 269. Schreb. 361. 833. Willd. Sp. Pl. v. 2. 1178. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 230. Juss. 331. Lamarck Dict. v. 3. 375. Illustr. t. 473. (Munchausia; Linn. Mant. 153. Schreb. 515. 833. Mart. Mill. Dict. v. 3. Juss. 331. Murr. Gott. Præf. t. 1. Adameba; Lamarck Dict. v. 1. 39.)—Class and order, *Isoandra Monogynia*. Nat. Ord. *Calycaethes*, Linn. *Sauricæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, angular, permanent, with six deep, sharpish, triangular teeth. *Cor.* Petals six, roundish or obovate, wavy; their claws thread-shaped, inserted into the calyx. *Stam.* Filaments numerous, thread-shaped, unequal, inserted into the calyx, and exceeding it in length; anthers roundish, incumbent. *Pist.* Germen superior, roundish; style thread-shaped, declining, longer than the filaments; stigma obtuse.

*Peric.* Capsule ovate, pointed, of six cells and six valves, rarely but four. *Seeds* numerous, angular, compressed, attached to the central hexagonal column.

*Eff. Ch.* Petals six, their claws inferted betwixt the teeth of the bell-shaped fix-cleft calyx. Stamens unequal. Capsule of four or six cells, with many angular seeds.

*Obf.* *L. parviflora* has but four, or occasionally only three, cells and valves to the capsule.

1. *L. indica.* Linn. Sp. Pl. 734. Curt. Mag. t. 405. J. Miller Ic.—(Tsjin-ki; Rumph. Amb. v. 7. 61. t. 28.)

—Petals pointed, crispd. Six flamens much longer than the rest. Panicle terminal. Leaves roundish-oval, smooth.

—Native of China, Cochinchina, and Japan. Kæmper says it is very rare. The *Hortus Keewensis* records its having been introduced into this country by the late duke of Northumberland, in 1759. Nothing could be a more desirable acquisition to the green-house or stove. In the latter it blooms most freely, and is increased readily by cuttings.

The *shrub* is about the size of a Pomgranate-tree, rather fraggling, smooth, with angular twigs. *Leaves* opposite or alternate, nearly sessile, an inch or two in length, of a broadish dotted elliptical form, slightly pointed, entire, finely rounded, smooth, except some short pubescence at the rib and veins on both sides. *Stipulas* none. *Buds* axillary, ovate, compressed. *Flowers* in a large, terminal, somewhat racemose panicle, of a fine rose-colour, not unlike a double stock at first sight, but far more delicate and without scent.

The *petals* are heart-shaped, pointed, excessively crumpled and curled, with long slender claws. *Anthers* yellow.

2. *L. Regina.* Roxb. Coromand. v. 1. 46. t. 65. (*L. Flus Regina*; Retz. Obf. faic. 5. 25. Adambæ glabra; Lamarck Dict. v. 1. 39. Adambæ; Rheed. Hort. Mal. v. 4. 45. t. 20, 21.)—Petals bluntnish, wavy. Stamens all nearly equal. Panicle terminal, much branched. Leaves oblong, pointed, smooth—Native of woody mountains in Malabar and Java, flowering during the hot season, and ripening seed in August. A moderate-sized tree, with spreading branches, angular and winged when young. *Leaves* from three to five inches in length, elliptic-oblong, entire, smooth, generally opposite, on very short stalks. *Panicle* compound, spreading. *Flowers* two inches broad, with rose-coloured, round, bluntnish, short-clawed petals, and very numerous, purplish, almost equal flamens, with yellow anthers. *Capsules* the size of a large oblong acorn, pointed, woody, smooth, accompanied by the reflexed calyx at their base, which is downy while in flower.

3. *L. hirsuta.* Willd. n. 3. (Adambæ hirsuta; Lamarck Dict. v. 1. 39. Katou-Adambæ; Rheed. Hort. Mal. v. 4. 47. t. 22.)—Petals pointed. Six flamens much longer than the rest. Panicle terminal, much branched. *Leaves* oblong, pointed, hairy.—Native of the provinces of Mala and Poiga in Malabar, according to Rheede, from whose work alone we have any knowledge of this species, and who represents it as the wild state of the preceding, differing in being taller, with downy or hairy leaves and branches. The *fruit* also is roughish with fine hairs. In his plate moreover the *petals* are less wavy and much more pointed, and he mentions that five flamens (we have ventured to preface six from analogy) are alone conspicuous in each flower. The flamens of *L. indica* enable us to understand this, and it is probable that the rest of the filaments are shorter than the calyx, so as to have passed unobserved. Lamarck, after having first, on Rheede's authority, defined and named this species, suggests in his Dictionary, v. 3. 376, that it may probably be only a variety of the last. We must leave this point in doubt, after having collected all the information in our power.

4. *L. Munchaufsa.* Lamarck Dict. v. 3. 375. Willd. n. 4. (*Munchaufsa speciosa*; Linn. Mant. 243. Murray Gott. t. 1.)—Petals bluntnish, wavy. Stamens all nearly equal. Cluster terminal, many-flowered, nearly simple. *Leaves* ovate, pointed, almost entire, smooth.—Native of China, according to Linnæus. His specimen is marked as coming from India. Lamarck, in his Dict. v. 3. 375, confounds this with *L. Regina*, from which it is nevertheless very distinct. The *leaves* are not half so long, much thinner, and are ovate, with much longer and slenderer foot-stalks. The only leaf we have seen agrees precisely with that drawn by Murray, except in being still less entire, the upper part being bluntly serrated. The *flowers* are copious, racemose rather than paniced, but they appear to differ very little in themselves from those of *L. Regina*, the petals in Murray's plate being erroneously made flat, obovate and obtuse. Willdenow probably took his specific character from thence, the plant being very rare, even in dried collections.

5. *L. parviflora.* Roxb. Coromand. v. 1. 47. t. 66. Willd. n. 5.—Petals wavy, blunt. Six flamens much longer than the rest. Flower-stalks axillary and terminal, about three-flowered. Leaves oblong, obtuse, downy beneath.—Native of the Circar mountains of India, flowering during the hot season, ripening seed in August and September. The inhabitants call it *Chinamghie*, and use the wood for various economical purposes. This is a little tree, differing from all the foregoing in the smallness of its flowers, which are less than the common Myrtle, white, chiefly axillary, usually three on each of the stalks, which grow in pairs, and are (like the leaves) about two inches long. The petals are six, round, with an undulated edge. The capsule has but three or four cells. Six of the flamens are as long as the corolla. Professor Willdenow, from misunderstanding the English description, describes the leaves as scabrous. They are smooth and shining above, downy at the back. S.

*LAGERSTROMIA*, in Gardening, contains a plant of the exotic tree kind, for the green-house, of which the species cultivated is *L. indica*.

*Method of Culture.*—This plant is capable of being increased, either by layers or cuttings of the young branches. The layers should be made from the young shoots of the preceding summer, and be laid down in the autumn. When they are well rooted in the succeeding autumn, they should be taken off and planted out in separate pots.

The slips or cuttings should be made from shoots of the same year's growth, and be planted out early in the summer, in pots of light earth, being plunged in a bark hot-bed, and covered with small bell hand-glasses, due shade and water being given. When well-rooted in the spring following, they may be taken up and planted in separate pots, filled with light mould, being afterwards managed as other green-house plants.

These plants afford variety in collections of potted plants of different kinds.

*LAGETTA*, in Botany, the Lagetto or Lace-bark of Jamaica. Juss. 77. Lamarck. Dict. v. 3. 376. Illustr. t. 289. (*Daphne Lagetto*; Swartz. Ind. Occ. v. 2. 680. Willd. Sp. Pl. v. 2. 419. Frutex foliis majoribus, cordatis, nitidis, petiolis semiopticaribus insidentibus; Browne Jam. 371. t. 31. f. 5. Laurifolia arbor, folio latiore, longo, mucroato, laevi, splendente; cortice inferiore in telas plurimas, linearum æmulas, extensili; Sloane Jam. v. 2. 22. t. 108. f. 1, 2, 3. t. 169. f. 1.) See *DAPHNE*.

This tree is a native of the loftier mountains of Jamaica and Hispaniola. Swartz says it is thirty feet high, with a trunk

stunk as thick as a man's thigh, the wood white and solid, the outer bark cracked and greyish; branches round and smooth. *Leaves* alternate, on short stalks, ovate or somewhat heart-shaped, more or less pointed, entire, from four to six inches long, evergreen, very smooth and shining, veiny, flat except a slight undulation at the edges; the under side pale. *Spikes* or *clusters* terminal, either simple or panicle, each scarcely a finger's length, of few flowers, which are white, four lines long, ovate, four-cleft, the mouth below the filaments closed with wool. *Stamens* eight, very short. *Germs* clothed with long upright hairs. *Drupe* involved with the permanent calyx, its pulp sweet and whitish, its coat rough with pungent bristles. *Seed* ovate, brittle.

We cannot find sufficient reasons to make this a distinct genus from *Daphne*, but having seen only a single leaf, without any parts of fructification, we presume not to decide with positiveness. The inner bark of this tree is very beautiful and remarkable, consisting of many layers, which are easily pulled out laterally, into a fine white silky reticulated web, like lace or gauze, three or four feet wide, which has been used in ladies' drels on many occasions; and Charles II. is said to have had a cravat made of it, presented to him by Sir Thomas Lynch, then governor of Jamaica. Swartz asserts that articles of drels made of this web, may be washed in soap and water without injury.

LAGGA, in *Geography*, a town of Sweden, in the province of Upland; 9 miles S.E. of Upfal.

LAGHI, a town of Arabia, in the province of Hadramaut, on the coast of the Arabian sea; 12 miles N.E. of Aden.

LAGNASCO, a town of the Ligurian republic; 11 miles N.W. of Genoa.

LAGNEUX, a town of France, in the department of the Ain, and chief place of a canton, in the district of Belley; 22 miles N.E. of Lyons. The place contains 2551, and the canton 10,266 inhabitants, on a territory of 207½ kilometres, in 14 communes.

LAGNY, THOMAS FANTET DE, in *Biography*, an eminent mathematician, was born at Lyons in the year 1660. He was intended for the bar, and was sent to pursue his studies for that purpose, first at the college of Lyons, and next at the university of Thoulouse; but having accidentally met with Fournier's Euclid, and a treatise on algebra, his genius for mathematics was developed, and he resolved to devote himself to the pursuit of his favourite science. He came to Paris in the year 1686, and was soon after appointed tutor to the duke de Noailles. He became a member of the Academy of Sciences, and was appointed by Louis XIV. royal hydrographer at Rochefort, but sixteen years afterwards he was recalled to Paris, and made librarian to the king with a considerable pension. He died in the year 1734, and in his last moments, when he no longer knew the persons who surrounded his bed, one of them, through a foolish curiosity, asked him "What is the square of 12?" to which he replied, as it were mechanically, 144. His works are, 1. *New Methods for the Extraction and Approximation of Roots*: 2. *Elements of Arithmetic and Algebra*: 3. *On the Cubature of the Sphere*: 4. *A general Analysis, or Method of resolving Problems*: and 5. *Several Papers in the Memoirs of the Academy*. Lagny excelled in arithmetic, algebra, and geometry, in which he made many important discoveries. He delivered the measures of angles in a new science, called "Goniometry;" in which he found the value of angles to great accuracy by means of compasses, without scales or tables of any kind. He paid great attention to "Cyclometry," or the method of measuring the circle, and calculated by means of infinite series the ratio of the circum-

ference of a circle to its diameter to 120 places of figures. Moreri.

LAGNY, in *Geography*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Meaux, seated on the Marne, and containing three parish churches; 15 miles E.N.E. of Paris. N. lat. 48° 53'. E. long. 2° 46'. The place contains 1836, and the canton 12,257 inhabitants, on a territory of 157½ kilometres, in 31 communes.

LAGO, a town of Italy, in the department of the Lower Po; 4 miles N. of Comacchio.

LAGO Maggiore. See LANGENSSE.

LAGO Nero, a town of Naples, in Basilicata, at the foot of the Apennines, near a lake from which it receives its name; 12 miles N.E. of Policastro.

LAGOIA, a town of the island of May, one of the Cape Verde islands.—ALFO, a town of Portugal, in Algarva; 5 miles N.E. of Silves.—ALFO, a river of Africa, which runs into the Atlantic. N. lat. 6° 55'.—ALFO, a bay of the Indian sea, on the coast of Africa. S. lat. 33° 16'.

LAGOIA. See DELAGOIA.

LAGOIA d'Albafeira, a lake on the W. coast of Portugal, near the sea; 12 miles S.S.W. of Lisbon.

LAGOIA d'Obidos, a lake on the W. coast of Portugal, which discharges itself into the sea, four miles N.E. from Cape Carvaciro, in the province of Estramadura.

LAGOIA de Patos, a bay on the coast of Brazil. S. lat. 29° 25'.

LAGOIA de Pescara, a bay on the coast of Brazil. S. lat. 21° 30'.

LAGOAS, As, a town of Africa, in the country of Matamba, on the Sierra Leone. N. lat. 8° 40'. W. long. 10° 50'.

LAGOCHEILOS, (from *λαγως*, a hare, and *χειλος*, a lip), denotes, in *Surgery*, the deformity more commonly named a hare-lip. See HARE-LIP.

LAGODIA, in *Geography*, a town of Brazil; 85 miles W. of Fort Rio Negro.

LAGOECIA, in *Botany*, so named by Linnæus, from *λαγως*, a hare, and *ωνος*, a dwelling, or seat, the plant being, according to Bellonius, Obs. 32, (in Clus. Exot.) called in the isle of Lemnos *Lagochymen*, which means the form or seat of the hare.—Linn. *Gen.* 112. Schreb. 156. Willd. Sp. Pl. v. 1. 1184. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 2. 53. Sm. Prodr. Fl. Græc. v. 1. 162. Juss. 227. Lamarck Illust. t. 142. Gært. t. 23. (Cuminoides; Tourt. t. 155).—Class and order, *Pentandria Monogynia*. Nat. Ord. *Umbellata*, Linn. *Umbellifera*, Juss.

Gen. Ch. *Cal. General involucre* of eight leaves, cut like a feather, fringed, reflexed, containing a small umbel; *partial* one of four leaves, in feather-like capillary segments, surrounding a solitary flower-stalk, shorter than itself. *Perianth* superior, of five leaves, in many capillary segments. *Cor.* Petals five, two-horned, shorter than the perianth. *Stam.* Filaments five, capillary, the length of the corolla; anthers roundish. *Pist.* Germen roundish, under the base of the perianth; style as long as the filaments; stigma two, one of them abrupt. *Peric.* none. *Seed* solitary, ovate-oblong, crowned with the perianth.

Obs. Gartner remarks that there are the rudiments of two seeds, though one only comes to perfection.

Ess. Ch. *Involucre* both general and partial, pinnatifid. *Perianth* of five leaves, in many capillary segments. *Petals* cloven. *Seed* solitary, inferior.

1. *L. Cuminoides*. Wild Cumin. Linn Sp. Pl. 294. (Cuminum sylvestre; Matth. Velgr. v. 2. 117. Camer. Epit.

519. *Κυμίστος αγρίος*; Diosc. lib. 3. cap. 69.)—This is the only known species of its singular genus, found in fields and vineyards, not uncommonly in Greece and the Levant. Its name in modern Greek is, according to Dr. Sillthorp, *Αγριοκίμων*, or Wild Marjoram; and Bellonius describes its scent and taste as like that of *Origanum heracleoticum*. Dioscorides speaks of the seed as a warm, rather acrid carminative, more powerful than the Garden Cumin. The root is annual, tapering. Stem ten or twelve inches high, branched, zigzag, round, striated, smooth, leafy. Leaves pale green, smooth, roundly, simply pinnate, with about a dozen pair of sessile, roundish, deeply cut, nearly opposite leaflets, and an odd one; the upper leaves become very much diminished, and bristle-pointed. Umbels terminal, globose, dense, half an inch wide, beset with shining, silvery, bristly points.—A figure of this is destined to appear in the *Flora Græca*, v. 3. p. 243.—We know not how the idea of a hare's form can bear any analogy to this plant, except it alludes to the seed, nestling amongst the fine bristly coverings of the flowers like a hare amongst grass.

LAGOECIA, in *Gardening*, contains a plant of the herbage kind, of which the species cultivated here is the wild or bastard cumin, *L. cuminoides*.

*Method of Culture*—These plants may be increased by sowing the seeds in autumn, on a warm border, soon after they are ripe, or where they are to remain; or when permitted to feather, they come up and form good plants. They afterwards require only to be kept clean from weeds, and in the former cases planted out when of sufficient growth where they are to grow.

Plants of this kind afford ornament and variety in the borders and other parts of shrubberies and pleasure grounds.

LAGOON ISLAND, in *Geography*, an island of the Pacific ocean, discovered in lieutenant Cook's voyage in 1769. It is of an oval form, with a lagoon in the middle, which occupies much the larger part of it: the border of land circumfering the lagoon is in many places very low and narrow, particularly on the S. side, where it chiefly consists of a beach or reef of rocks: it has also the same appearance in three places on the N. side: so that, the firm land being disjointed, the whole looks like many islands covered with wood. On the west end of the island is a clump of trees, appearing like a tower, and about the middle are two coconut trees, which rise above all the rest, which in approaching the island appear like a flag. The whole island is covered with trees of different verdure; but none could be distinguished except cocoa-nuts and palm-trees. The natives appeared to be tall, and to have remarkably large heads; they were of a copper colour, and had long black hair. Whilst they walked on the beach they seemed to be naked; but when they retired they covered themselves with something of a light colour. Their habitations were under some clumps of palm-nt trees, which appeared to Cook and his companions, who had long seen nothing but sea and sky, except the dreary hills of Terra del Fuego, to be a terrestrial paradise. S. lat. 18° 47'. W. long. 139° 28'. Variation 2° 54' E. Hawke'sworth's Voyages, vol. ii.

LAGOONS, *Middle*, a gulf on the coast of Yucatan, in the bay of Honduras. N. lat. 18° 7'. W. long. 83° 50'. *North Lagoon* is a gulf in the same bay. N. lat. 18° 40'. W. long. 83° 54'. *South Lagoon* in the same bay lies in N. lat. 17° 54'. W. long. 83° 50'.

LAGOPHTHALMIA, or LAGOPHTHALMUS, (derived from *λαγώς*, a hare, and *ὀφθαλμός*, an eye,) denotes, in *Surgery*, a particular case, where the patient experiences an inability of closing the eye-lids so as to cover the eye. It is the defect to which the term *oculus leporinus*, or *hare-eye*, has

sometimes been applied. The ectropium, or gaping of the eye-lids, if the affection is confined to the upper palpebra, now and then receives one of the foregoing appellations. Some writers, however, with much reason, are desirous of restricting the term *lagophthalmus*, or *lagophthalmus*, to cases of simple retraction of the eye-lid, unattended with any degree of eversion.

Various and many are the inconveniences which may be the consequence of this incapacity of properly covering the eye with the eye-lids. The tears are incessantly dropping over the cheek, because the alternate opening and closure of the eye-lids, so essential to the propulsion of this secretion into the puncta lachrymalia, are impeded. In a strong light the patient is quite blinded; for it is impossible for him to lessen the quantity of rays which fall upon the eye, by making the eye-lids approach each other. From this cause vision gradually becomes very much weakened. Nor can the patient sleep well in any apartments which admit the light. And, in addition to these unpleasant circumstances, we must mention the painful inflamed state of the eye, frequently induced by the irritation which it suffers from the lodgment of dust, and other extraneous substances upon it.

A preternatural swelling, or protrusion of the eye from the orbit, is sometimes the cause of lagophthalmus, which in this circumstance is to be regarded only as a symptom of another disease, and generally gets well with the primary affection. In the majority of cases the defect is situated in the upper eye-lid.

Several species of lagophthalmus are noticed by Richter. In some, though not many instances, the disease depends upon a weakness, or paralysis, of the orbicularis palpebrarum muscle. Here the upper eye-lid may readily be brought down over the eye with the fingers; but the patient is quite incapable of doing this without external aid. The cure can in general only be accomplished with difficulty. The treatment most likely to prove beneficial consists in applying corroborant and stimulating applications. Rubbing the skin of the eye-lids once or twice a day, with a drop or two of fennel-oil, electricity, frictions upon the eye-lids with the tinctura cantharidis, blisters near or immediately upon the eye-lids, the application of cold water to the eye by means of compresses wet very often in the course of the day; &c. are plans in repute. Letting the water of a shower-bath fall upon the hinder part of the head; cold applications assisted with the internal employment of bark, and camphorated remedies, are all likely means to do good in cases of the paralytic lagophthalmus.

A fissure in the lower, and especially in the upper eye-lid, whether an original malformation, or the consequence of a neglected wound, may produce a considerable exposure of the eye-ball, when the patient attempts to shut his eye; for at this period the margins of the slit will be drawn further asunder. This particular case requires a similar operation to that for the hare-lip. (See HARE-LIP.) But instead of the twisted suture, the surgeon is to employ the interrupted. See STURIE.

The most common kind of lagophthalmus is undoubtedly that which originates from a contraction of the integuments of the upper eye-lid, in consequence of wounds, abscesses, burns, &c. Here the observations, elsewhere made concerning the diagnosis and cure of an analogous case, are strictly applicable. See ECTROPIUM.

Sometimes lagophthalmus appears to depend upon an indurated thickening and contraction of the levator palpebræ superioris, and of the skin of the eye-lid together. In this case no surgical operation will avail in curing the disease, and every chance of benefit lies in a trial of other plans.

In order to preserve the sight, it is proper to guard the eye with a green shade from the effects of strong light, until the infirmity is completely removed.

**LAGOPODES**, in *Ornithology*, a name given to a division of the genus *Tetrao*, distinguished by a naked spot above the eyes, and hairy legs. See **TETRAO**.

**LAGOPUS**, in *Botany*, from  $\lambda\alpha\gamma\omega\varsigma$ , a hare, and  $\pi\upsilon\varsigma$ , a foot, a name which has been applied to several different plants, whose soft hairy heads of flowers have suggested the idea of a hare's foot. Among these are a species of *Plantago*; one of *Gnaphalium*, called by Linnaeus *disicum*; some grasses; and several of the *Diadelphica* class. There are grounds of suspicion that the *Lagocchia*, (see that article,) might primarily have been named with some allusion to the foot rather than the form of a hare, which its round hairy tufts of flowers might very well justify.

**LAGOPUS**, in *Ornithology*. See **GROUS**, **Red**, **PTARMIGAN**, and **TETRAO**.

**LAGOPUS**, in *Zoology*, is the name of a species of the canis, with a straight tail throughout of the same colour. It is sometimes called the white fox, the isatis, and the scy-coloured fox. It is found in Lapland and Siberia. See **FOX**.

**LAGOR**, in *Geography*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the district of Orthés; 8 miles S.E. of Orthés. The place contains 1700, and the canton 10,588 inhabitants, on a territory of 177½ kilometres, in 23 communes.

**LAGOS**, a sea-port of Portugal, in the province of Algarve, situated in a bay of the Atlantic, to which it gives name, defended by several forts; the harbour is deep, but full of rocks. This place is the residence of the viceroy of Algarve, and contains two parish churches, four convents, and about 4600 inhabitants; 96 miles S. of Lisbon. N. lat. 37°. W. long. 8° 39'.—Also, a river of Africa, which rises in Beniù, and runs into the Atlantic, N. lat. 5° 10'. Its navigation is obstructed by a bar at its mouth.—Also, a town of Mexico, in the province of Guadalajara; 36 miles N.E. of Guadalajara.

**LAGOSTOMA**, (from  $\lambda\alpha\gamma\omega\varsigma$ , a hare, and  $\sigma\tau\omicron\mu\alpha$ , the mouth,) is a term in *Surgery*, signifying the hare-lip.

**LAGOUSA**, in *Geography*, a small island in the gulf of Engia; 3 miles N. of Engia.

**LAGOW**, a town of Austrian Poland; 16 miles N. of Sandomirz.

**LA GRAVE**. See **La GRAVE**.

**LAGRIMOSO**. See **LACRIMOSO**.

**LAGUA**, in *Geography*, a town of the island of Cuba; 80 miles W.N.W. of Villa del Principe.

**LA GUAYRA**. See **GUAYRA**.

**LAGUEN**, one of the small Philippine islands, near the north coast of Samar. N. lat. 12° 43'. E. long. 125° 9'.

**LAGUERRE**, **LOUIS**, in *Biography*, a painter of histories on ceilings, staircases, halls, &c., and an assiduous imitator of Verrio; with whose name his own has been most inappropriately immortalized by Pope, in that characteristic verse,

“Where sprawl the faints of Verrio and Laguerre.”

Laguerre, though the son of a Catalan, was born in France; and his father being master of the menagerie at Versailles, he had the honour of having Louis XIV. for his god-father, and after him he was named. At first he was intended for the church, and was placed in the Jesuits' college for education; but having a hesitation in his speech, and therefore not suited to support their ambitious projects, and

having exhibited some taste in drawing, the god-father recommended to his parents to bring him up to the profession of painting.

He then studied in the school of Le Brun, and in the Royal Academy of Paris; and made so much progress, that, in the year 1683, at the age of 20, he came to England, and was immediately employed by Verrio upon the large work at St. Bartholomew's hospital; in which he succeeded so well, that he soon obtained considerable employment on his own account, and executed a great number of ceilings, halls, and staircases, in the houses of the principal nobility of the country, particularly at lord Exeter's at Burleigh, at Devonshire House, Piccadilly, Petworth, and Blenheim. King William gave him lodgings at Hampton Court, where he painted the “Labours of Hercules,” and repaired the large pictures called “The Triumphs of Cæsar,” by Andrea Mantegna.

His talents were not of a cast to demand very high respect, but they were fully equal to the mode in which they were employed,—which requiring a certain portion of ingenuity, is a certain walt of talents of a superior class. In a few years, it is probable his name will repose for perpetuity on the records of history, and the unlucky satire of Pope above mentioned.

His death happened in the year 1721, and in a place very seldom disturbed by such an event, viz. in the theatre of Drury-lane. He had gone there to see the Island Princes acted for the benefit of his son, who was newly entered upon the stage as a singer; but before the play began, he was seized by an apoplexy, and carried away senseless.

**LAGUNA**, in *Botany*. See **LAGUNÆA**.

**LAGUNA**, in *Geography*, a town of South America, in the province of Venezuela, on the west side of lake Maracaybo; 80 miles S. of Maracaybo.

**LAGUNA**, or *St. Christofal de la Laguna*, a city of Tenerife, so called from an adjoining lake, which does not now remain, about four miles from Santa Cruz. It used to be reckoned the capital of the island, the gentry and lawyers living there, and the courts of justice being held in this town; though the governor-general of the Canary islands resides at Santa Cruz, as being the centre of their trade both with Europe and America. The place, though pretty extensive, scarcely deserves to be dignified with the name of a city. The disposition of its streets is very irregular; but some of them are of a tolerable breadth, and have some good houses. In general, however, Laguna is inferior in appearance to Santa Cruz, though the latter is small compared with the former; and it is said to be in a declining state; vineyards being now planted where houses formerly stood; whereas Santa Cruz is daily increasing. Laguna is situated on an eminence, in a fertile plain of considerable extent. Beside vines, it bears wheat, Indian corn, potatoes, and a species of bean not unlike a lupin. From grounds still higher, water is conveyed to a variety of fountains in this city, as at Santa Cruz, in an aqueduct composed of wooden troughs, and supported by poles fixed into the earth. To the plain now mentioned succeeds a ridge of hills, of gentle ascent, from the summit of which may be easily traced the windings of a pleasant valley, stretching to the westward, along the feet of a range of hills that separate it from the sea-coast. The town of Ticonorta and numerous little villages form a scene agreeable and picturesque. The bosoms of the mountains are well cultivated, and their more rugged sides are chiefly covered with the spontaneous plants of warm regions, such as the *Cacalia kleinia*, the *Agave americana*, the *Cactus tuna*, besides others of little ornament or use. N. lat. 28° 28'. W. long. 16° 20'.

LAGUNA *Efcura*, a cape of Portugal, in the province of Beira; 7 miles S.W. of Guarda.

LAGUNÆA, in *Botany*, named by Cavanilles in memory of Andrew Laguna, a Spanish botanist and physician of the 16th century, who made a translation of Dioscorides, with a commentary, into his own language, and wrote also some botanical as well as medical works.—Schreb. 463. Willd. Sp. Pl. v. 3. 733. Mart. Mill. Dict. v. 3. (Laguna; Cavan. Diff. 173. Juss. 275. Lamarek Illustr. t. 577. Solandra; Murr. in Linn. Syst. Veg. ed. 14. 623. Juss. 273. Lamarek Illustr. t. 580. Cavan. Diff. 55. Triguera; Cavan. Diff. 41. t. 11.)—Class and order, *Monadelphina Polyandria*. Nat. Ord. *Columiferæ*, Linn. *Malvaceæ*, Juss.

Gen. Ch. *Cal.* Perianth simple, inferior, of one leaf, bell-shaped, slightly angular, but about half way down into five segments, permanent. *Cor.* Petals five, ovate-oblong, obtuse, spreading, attached to the base of the tube of the flaments. *Stam.* Filaments numerous, 25 to 30, united below into a tube, at the top of which, as well as at its sides, they become separate and distinct; anthers roundish. *Peric.* Germen ovate-oblong, superior; style thread-shaped, longer than the flaments, either with five spreading branches at the top, or only five notches; stigmas capitate. *Peric.* Capsule ovate-oblong, obscurely five-sided, with five cells and five valves; the partitions contrary to the valves. *Seeds* several, roundish, with three angles.

Obs. The *Solandra* of Murray has a deeply five-cleft calyx, and five distinct stigmas; *Laguna* of Cavanilles has a five-toothed calyx, bursting at one side, and a stigma with five notches or teeth. Schreber has very judiciously united the two, from observing similar differences among many species of the genus *Hibiscus*.

Ess. Ch. Calyx simple, five-cleft. Stigmas five-cleft. Capsule of five cells, with contrary partitions.

1. *L. lobata*. Lobed Lagunæa. Willd. n. 1. (*Solandra lobata*; Murr. in Comm. Goett. for 1784. 21. t. 1. Cavan. Diff. 279. t. 136. f. 1. Hibiscus Solandra; L'Herit. Stirp. v. 1. 103. t. 49. Ait. Hort. Kew. ed. 1. v. 2. 455.)—Leaves heart-shaped, three-lobed, unequally serrated.—Native of the Isle of Bourbon. *Root* fibrous, annual. *Stem* branched, two feet high, round, clothed, like every other part of the herbage, with prominent hairs. *Leaves* alternate, on long stalks, heart-shaped, more or less deeply three-lobed, acute, unequally cut or serrated, two or three inches long, and nearly as wide, of a light green. *Stipulas* linear-oblong. *Flowers* on long stalks, in long terminal clusters, with bractæas like the stipulas. *Corolla* white, about half an inch or more in diameter. It is a plant of little beauty, compared at least with the generality of its natural order.

2. *L. ternata*. Ternate Entire Lagunæa. Willd. n. 2. (*Solandra ternata*; Cavan. Diff. 279. t. 136. f. 2.)—Leaves ternate and simple, entire.—Native of Senegal, whence Adanson brought specimens, the only ones of which we have any account. The *root* appears to be annual. *Stems* several, about a foot high, slender, round, downy, like the other parts. *Leaves* alternate, distant, on long stalks, mostly ternate, the upper ones simple; leaflets oblong, narrow and entire, the side ones smallest. *Stipulas* small, acute. *Flowers* on longish, simple, solitary, axillary or lateral stalks, shorter than the leaves. Of the *corolla* we have no information.

3. *L. aculeata*. Prickly Lagunæa. Cavan. Diff. 173. t. 71. f. 1.—Leaves ternate, cut. *Stem* prickly.—Found near Pondicherry. The *stem* is a foot and half high, muri-

cated. *Leaflets* nearly equal, obtuse, cut. *Flowers* yellow. Sometimes the leaflets are more than three.

*L. Paterfonis*, Sims in Curt. Mag. t. 769. (*L. squamea*; Venten. Malmais. t. 42. Hibiscus Paterfonius; Andr. Repof. t. 286.) found in Norfolk island by Col. Paterfon, a very handsome shrub with a large purple flower, appears to us at best but a doubtful *Lagunæa*, nor is the account of the fruit given with sufficient accuracy in Andrews, for us to judge respecting this matter.

LAGUNILLA, in *Geography*, a town of South America, in the vice-royalty of New Granada; 14 miles S.W. of Merida.—Also, a town of South America, in the province of Cordova; 30 miles E. of Cordova.

LAGUNILLAS, LAS, a town of Peru, in the diocese of La Paz; 30 miles N. of Potosi.

LAGURUS, in *Botany*, from *λαγωρος*, a hare, and *ουρα*, the tail, alluding to the appearance of the spike or head of flowers. Hare's tail Grass.—Linn. Gen. 37. Schreb. 52. Willd. Sp. Pl. v. 1. 453. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 173. Sm. Prodr. Fl. Græc. v. 1. 68. Fl. Brit. 143. Juss. 30. Lamarek Illustr. t. 41. Gærtn. t. 1. Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*, Linn. Juss.

Gen. Ch. *Cal.* Glume single-flowered, of two long, linear, very thin, spreading, feathery valves. *Cor.* of two firmer valves; the outermost longest, terminating in two small straight awns, with a third awn from the middle of the back, twisted and more or less bent backward; inner valve smaller, narrower, pointed, beardless. Nectary of two lanceolate blunt scales, tumid at their base. *Stam.* Filaments three, capillary; anthers oblong, pendulous, cloven at each end. *Pist.* Germen superior, oblong; styles two, short; stigmas long, cylindrical, feathery. *Peric.* none, except the permanent corolla attached to the seed. *Seed* solitary, obovate, clothed with the corolla and its awns.

Ess. Ch. Calyx of two valves, single-flowered, feathery. Outer valve of the corolla with two terminal awns, and a dorsal twisted one.

1. *L. ovalus*. Linn. Sp. Pl. 119. Sm. Engl. Bot. t. 1334. Fl. Græc. Sibth. v. 1. 71. t. 90. Schreb. Gram. t. 19. f. 3.—Native of sandy open places in the south of Europe and north of Africa, flowering early in summer. Being found in Guernsey, it is admitted into the list of British plants. The *root* is annual, composed of downy fibres, like all grasses that grow in driving sand. *Stem* solitary, various in height, downy and soft like the leaves, whose sheaths are long and rather tumid. *Spikes* ovate, at first erect, but soon bent to one side, or drooping, from the power of the wind; it is not unaptly compared to the tail of a hare, which it resembles in density, shape, lightness, and whiteness. The name in modern Greek, *λαγυρίτζα*, expresses the same idea.

*Lagurus cylindricus* of Linnæus being properly removed to *Saccharum*, the above stands a solitary species of its genus. We know not of its having any useful property, except serving to decorate flower-pots in winter, mixed with any everlasting flowers.

LAGUNUS, in *Zoology*. See *Mus*.

LAGUYO, in *Geography*, a town of Africa, on the Gold Coast, in the country of Fantin.

LAHAAR, a town of Hindoostan, in the circar of Gohud; 40 miles E. of Gwalior. N. lat. 26° 9'. E. long. 79 31.

LAHADSI, a town of Arabia, in the province of Yemen; 16 miles N.W. of Aden.

**LAHALL**, a town of Sweden, in the province of West Gothland; 10 miles N. of Gothenburg.

**LAHAWANNOCK CREEK**, a river of Pennsylvania, which runs into the Susquehanna, S. lat. 41° 20'. W. long. 57° 58'.

**LAHAGIAN**, or **LANGIGEN**, a town of Persia, in the province of Ghilan, on the Isperrud, situated on an eminence; eight miles E. of Reshd.

**LAHISZIN**, a town of Poland, in the palatinate of Brzele; 12 miles N. E. of Pinfk.

**LAHMEDIE**, a town of Egypt; 14 miles S.S.W. of Damietta.

**LAHN**, a town of Silesia, in the principality of Jauer, on the Bober. N. lat. 50° 58'. E. long. 15° 44'.—Also, a river of Germany, called Lohm, which rises in the N.E. part of the principality of Siegen, about 10 miles E.N.E. from the town of Siegen, and runs into the Rhine near Lohrstein.

**LAHNSTEIN**, or **LOHNSTEIN**, a town of Germany, at the conflux of the Lohm and Rhine; four miles E. of Coblenz.

**LAHO**, a town of Africa, on the Ivory Coast, which has been represented as a large and populous place, extending a league along the coast; the shore being composed of a beautiful yellow sand, against which the sea beats with great violence. The natives, who are well supplied with all kinds of provisions, are of a mild, tractable, and gentle disposition; but ready to seize any opportunity for raising the price of their ivory, according to the demand, and the number of ships they observe on the coast. They are visited by interlopers of all nations, the free ships of England, Holland, Denmark, and formerly the Hanse towns, whence the occasions of raising their price frequently occur. Laho is planted, like Axim, with a great number of cocoa-trees; and thus the neighbouring countries of both districts very much resemble one another. Cape Laho is situated in N. lat. 5° 10', equally distant from Cape Palmas and Cape Tres Puntas, and the western frontier of that district, called the country of the "Good People." Beyond Cape Laho the coast falls in directly N.E., forming a fine bay, at the head of which opens the mouth of the little river, called Jaque Lahu, or Das Balbas, running directly N. and S. but not navigable. Farther eastward is Korbi Laho, the little pool, called the "Bottomless pit," so called both by the English and Dutch, because several unsuccessful attempts had been made to found it; but at last it was found to be no more than 60 fathoms; the difficulty of sounding it resulting from a tide at the bottom which carried away the lead faster than they could furnish line. Excepting this pool, there is no anchorage for several leagues along the coast. The produce of the adjacent country consists of cloths and stuffs of Quaquas, ivory, and provisions. The negroes of this part are singularly skilful in swimming and diving; for if any pieces of coral, iron, glass, &c. are thrown over board, the negroes will dive after them with such rapidity as to catch them before they reach the bottom.

**LAHOLM**, or **LAGEHOLM**, a sea-port town of Sweden, in the province of Halland, at the mouth of the Laga, near the sea, with a good salmon fishery, fortified by the Danes, and ceded to Sweden by the peace of Brønnebro; 12 miles S.S.E. of Halmstad. N. lat. 56° 40'. E. long. 12° 45'.

**LAHOOR**, a town of Thibet, on the Setlege; 24 miles N.W. of Gangotri. N. lat. 23° 10'. E. long. 76° 25'.

**LAHORE**, or **PANJAB**, a subah or province in the N.W. part of Hindoostan, bounded on the N. by Cashmere, on the E. by the mountains of Thibet, on the S.E. by

Delhi, on the S. by Moultan, and on the W. by the Indus, which separates it from Cabul and Candahar; about 300 miles in length from E. to W. and about 100 miles from N. to S. This country, which is now occupied by the Seiks, is extensive, and very fertile; affording, in addition to all the necessaries of life, wine, sugar, and cotton-wool: the last of which supplies the manufactories of the province. It is watered by the Indus on the W., and the Setlege on the E., and also by the Behut, Chunaub, Rauvee, &c. In the tract between the Indus and Jhylum (Behut) there are salt-mines, which are wonderfully productive, and which afford fragments of rock salt, hard enough to be formed into vessels, &c. Gold (according to the Ayin Acbaree) was found in the channels of its rivers; and the same is related of those of Kemaon, which proceed from the same ridge of mountains. See **PANJAB**.

**LAHORE**, a city of Hindoostan, and capital of the country above described, situated on the Rauvee. This city was the residence of the first Mahometan conquerors of Hindoostan, before they established themselves in the central parts of the country. It owes its modern improvements, however, to Humaion, the father of Achar, who made it his residence during a part of his troublesome reign. Thevenot says, that, including the suburbs, it was three leagues in length at that period, and when he saw it, about the year 1665, the city itself was above a league in extent. Schauguive, son of Achar, allowed the Portuguese to build a church there; and some of its furniture remained at the time of Thevenot's visit. It has 12 gates. It is now the capital of the Seiks; but by the desertion of its inhabitants, it has lost not only a considerable part of its population, but much of its ancient splendour. Here are manufactures of carpets, cotton, &c. Ice is brought from the northern mountains to Lahore, and sold there all the year. The famous avenue of shady trees, so much spoken of by the early Indian travellers, began at Lahore, and extended to Agra, near 500 English miles. N. lat. 31° 50'. E. long. 73° 50'. See **SEIKS**.

**LAHOREY**, a town of Hindoostan, in Baglana; 20 miles S. of Bahbelgong.

**LAHORPORUM**, a town of Hindoostan, in Oude; 25 miles W.N.W. of Kairabad.

**LAHR**, a town of Germany, in the bishopric of Munster; 12 miles N.W. of Munster.

**LAHR**, or *Lohr*, a town of the principality of Nassau Saarbruck Ufingen, the capital of a lordship, on the river Schutter; 18 miles S.S.E. of Straiburgh. N. lat. 43° 21'. E. long. 7° 55'.

**LAJA, LA**, a town of Peru, in the diocese of La Paz; 14 miles N.W. of La Paz.

**LAJAPOUR**, a town of Hindoostan, in Guzerat; 10 miles S. of Surat.

**LAIBEEDY**, a town of Africa, in the country of Tunis; 18 miles S.E. of El Jemna.

**LAICA**, a town of Abyssinia; 100 miles S. of Miné.

*LAICA vi remota.* See **VI**.

**LAID-UP** is applied to a ship, when she is either moored in a harbour during the winter season, or laid by for want of employment; or when she is become incapable of farther service.

*Laid under metal.* See **METAL**.

**LAIDA**, in *Geography*, a town of Bengal; 14 miles S. of Curuckdeagh.

**LAIDLIA**, a town of Hindoostan, in Golconda; 24 miles N. of Warangole.

**LAIGLE**, a town of France, in the department of the Orne, and chief place of a canton, in the district of Montagne.

Mortagne. The place contains 5947, and the canton 14,386 inhabitants, on a territory of 207½ kilometres, in 19 communes.

LAIGNES, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Châtillon; 19 miles W.S.W. of Châtillon-sur-Seine. The place contains 1559, and the canton 11,103 inhabitants, on a territory of 497½ kilometres, in 23 communes.

LAILAKARI, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 14'. E. long. 25° 9'.

LAINIZ, JAMES, in *Biography*, a Spanish Jesuit, and the first general of the order after the death of the founder, (see LOYOLA), was born in the year 1512. He studied theology at Paris, became the intimate friend of Loyola, and was one of seven who bound themselves by a vow at Mont-Marte to erect the new community; he is said to have had a great share in drawing up the constitutions for their government. Upon the death of the general, he succeeded as superior of the society, but was not formally elected till the year 1558. He assisted at the council of Trent, where he supported the papal authority to a very extravagant degree. He obtained from pope Paul IV. the perpetual generalship of the order, together with the following extraordinary privileges, *viz.* the right of making all manner of contracts, without the privity or consent of the society; that of giving authority and authenticity to all comments and explanations of the constitutions; the power of making new, and altering the old ones, and also to establish prisons, for the confinement of refractory and disobedient members, independently of the secular power. In 1561, he went to France in the suit of cardinal de Ferrara, the legate of pope Pius IV., and attended the conference at Poissy, where he disputed with Beza and Peter Martyr. After his return to Rome, he refused a cardinal's hat, which was offered him by the pope. He died in 1565, leaving behind him some theological and moral treatises. Moreri.

LAINO, in *Geography*, a town of Naples, in Calabria Citra; 10 miles W.N.W. of Cassano.

LAJOUN, a town of Persia, in the province of Mazanderan, near the coast of the Caspian sea; 12 miles E. of Reshd.

LAIR, in *Agriculture*, a term applied to land in a state of grass or fward. See LAY and LAYER.

LAIR, *Lays*, or *Layer*, among *Sportsmen*, denotes a place where deer harbour by day.

LAIR, or *Layr* of a deer, is the impression which the beast has made on the grass and ground where he has lain down, or reposed.

LAIR, among *Husbandmen*, also denotes a place where cattle usually rest, under some shelter; the ground being enriched by their dung.

LAIRE, FRANCIS XAVIER, in *Biography*, who was born at Vadans, in France, in 1739, and died at Sens in the year 1800, was celebrated for his knowledge of bibliography, and published, 1. *Memoirs towards the History of great Men of the 15th and 16th Centuries*, with a Supplement to *Mataire's Annals of Typography*. 2. *Specimen Historicum Typographicæ Romanæ cum Indice Librorum*. 3. *Epitola ad Abbate Ugolini*. 4. *On the Origin and Progress of Printing in Franche Compté*, and other pieces.

LAIRESSE, GERARD, a painter of history and portraits, born at Liège in 1640. His father first instructed him in the art, and he is supposed also to have been a disciple of Bertholet, whose manner he very much followed in his practice.

For a long time the art of painting was an unprofitable pursuit to him; but as he made his pictures gay and agree-

able, he at last, by the help of Vytenburgh, a picture merchant at Amsterdam, acquired considerable credit.

His style of painting was a compound of those of Poussin and the old French school. While he aimed at imitating the best Italian masters, he never avoided those false airs of the head and limbs, which seem rather taken from the stage than from nature; so that his works do not rise to the level of true merit.

He was blind for some years before his death; but having reflected upon the principles of the art, and being a communicative man, he was constantly attended by artists and amateurs, who were gratified by his instructions. Those treatises on design which go under his name were not written by him, but collected from his observations, and published after his death, by a society of artists. He died in 1711, at the age of 71.

LAIS, the famous courtesan, born at Hyccara, a small city in Sicily; and being carried into Greece by Nicias the Athenian general, began her conquests by music. We mention it not among the encomiums of the art; but almost all the celebrated courtesans of antiquity were originally musicians. According to Athenæus, (lib. xiii.) music was thought a necessary female accomplishment in the time of Darius; for Parmenio wrote Alexander word, that he had taken at Damascus three hundred and twenty-nine of the Persian monarch's concubines prisoners, who were all well skilled in music, and performed on the flute, and other instruments. Laïs was supposed to be the daughter of the courtesan Timandra and Alcibiades. She began first to exercise her powers of enchantment at Corinth, in Greece. She is often called the Corinthian, from having passed great part of her life in that voluptuous city. She set so high a price on her favours, that Demosthenes, of whom she required for one night ten thousand drachmas, refusing to comply with her demands, said, "he would not buy repentance at so high a price." As a caprice, she was more indulgent to the disgusting Cynic Diogenes. Aristippus, another philosopher, but much more amiable, almost ruined himself in sacrifices to this terrestrial divinity, who loved him less than Diogenes. When he was rallied on her coldness, he said, "I cannot flatter myself that either wine or fish is in love with me, yet I enjoy, and feed on them both with great pleasure." This female sometimes ridiculed the frailty of the philosophers whom she had captivated. "I do not understand what is meant by the austerity of philosophers; but with this fine name, they are as much in my power, as the rest of the Athenians." After having corrupted all the youth of Corinth and Athens, she went into Theffaly, to see a young man with whom she was in love, when, it is said, that some women, jealous of her beauty, assassinated her in the temple of Venus, about 340 years B.C. Greece erected statues to her memory.

LAISBY, in *Geography*, a town of Swedish Lapland, in the lap-mark of Umea; 100 miles N.W. of Umea.

LAISCHEV, a town of Russia, in the government of Kazan, at the union of the Kama and Volga; 20 miles S. of Kazan. N. lat. 55° 20'. E. long. 49° 14'.

LAISSAC, a town of France, in the department of Aveyron, and chief place of a canton, in the district of Milhau. The place contains 1083, and the canton 7453 inhabitants, on a territory of 172½ kilometres, in 12 communes.

LAIT-CHEOU, a city of China, of the first rank, in the province of Chantong, is built on a promontory, and has a convenient harbour, a numerous garrison, and several armed vessels to defend the coast. The jurisdiction extends over seven cities, two being of the first class. N. lat. 37° 9'. E. long. 119° 46'.

PLAITY comprehends such of the people as are not included under the denomination of clergy; and may be divided into three distinct states, *viz.* the civil, the military, and the maritime. For the origin of this distinction, see CLERGY.

LAK, in *Geography*, a town of Hungary; 18 miles E.S.E. of Canifcha.

LAKE, in *Physical Geography*, a body of water, mostly of considerable extent, situate, unconnected with the ocean, in an inland place, and commonly in the immediate neighbourhood of lofty mountains. The form of these collections of waters is various; but those that receive and emit rivers, are generally of an elongated shape, and their longest diameter is in the direction of the rivers that traverse them. Lakes are generally divided into four classes: 1. Such as neither receive nor emit rivers. 2. Such as emit rivers, without visibly receiving any. 3. Such as receive one or more rivers, without emitting any. And, 4. Such as both receive and send forth rivers.

1. *Lakes which neither receive nor emit rivers*, are not frequently seen of any considerable extent; but there are countries where they occur in great number, and as it were in groups. This is the case in the deserts northward of the Caspian sea, and in the plains between the Ural mountains and the Irtysh, and in the vast desert of Baraba, between the Irtysh and the Obb. The soil of these countries is described by the accurate Mr. Patrin as being uniformly composed of a marl, varying only in the proportion of the admixed clay and sand. The numerous lakes found in that tract of country are for the most part only depressions or basins filled by the rains and melted snow: their greatest extent is scarcely ever above three leagues in circumference, and generally they are much smaller. Their depth, too, is usually very inconsiderable, for it seldom exceeds a fathom, and is frequently not beyond a few feet. Most of them are only temporary; for towards the end of the summer they are generally found dry.

A remarkable circumstance, as observed by the same naturalist, is that in the same plain, at the distance of a few hundred paces, some of these lakes are fresh-water lakes, while the water of others is abounding either with sea salt, or with sulphat of magnesia (Epsom salt); or they are impregnated with both those salts, either uniformly mixed, or each of them in a separate part of the lake; in some cases the sea-salt and the Epsom salt are formed at the same period; in others the latter of these salts manifests itself only towards the end of the summer.

The cause of the saltness observable in some lakes has been by most authors on this subject ascribed to salt springs at their bottom; and probably they are in the right with regard to most of them; but in the above instance, several circumstances unfavourable to that hypothesis exist in the nature of the soil, and the mode and determinate quantity in which those salts are deposited at the bottom; whence Patrin conceives that the lakes in question, as well as most other salt lakes of the same kind, owe their saltness to principles or particles, with which they are furnished immediately from the atmosphere, in the same manner as nitre is formed in particular situations in warm climates, ceasing to be generated as soon as the soil has taken up the quantity of saline matter suitable to its nature. The general rule laid down by Buffon, that lakes which emit rivers are fresh-water lakes, and that such as do not send forth any are salt lakes, appears to be inconsistent with experience; since, on one hand, the great lake Titicaca, in Peru, supposed to be eighty miles in circumference, and giving out no river, is by Lact, Acofta, Garcialfo della Vega, and others, described as a fresh-water

lake; while the largest of all salt lakes, the Black sea, discharges its redundant waters, with a rapid course, through the Bosphorus into the Mediterranean.

Dr. Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltness increases with time; and on this foundation, he proposes a method for determining the age of the world.

To the lakes of this first class likewise belong those lodged in the craters of extinct volcanoes, or at least in depressions considered by most geologists as the remains of volcanic energy. One of the most remarkable, on account of its elevation, is that which travellers relate to exist on the summit of the Adam's peak in Ceylon. This mountain is seen at a distance of forty leagues; which appears to indicate its height to be at least that of Mount *Ætna*. Its cone, which is difficultly accessible, has 200 paces in diameter at its summit, and in the middle of the platform is situated a lake of considerable depth. Ribeiro's Hill, of Ceylon.

Dolomieu, in a letter to Fanjas Saint-Fond, inserted in this naturalist's work, "Sur les Volcans éteints du Vivarais," describes a lake filling up the crater of an extinct volcano in the Serra de Eltrella; a ridge of mountains in the north of Portugal, denominated *Mons Herminius* by the ancients.

All the lakes of *Agnano* and *Averne*, near Naples, are supposed by many authors to have been craters of volcanoes. The former of these lakes, we are told by Lalande (*Voyage*, t. 6. p. 27.) appears sometimes to boil at its borders, especially when its waters are high. This ebullition, like that of the *Acqua Zofa* near Rome, is occasioned by gaseous fluids traversing the water. On the borders of this lake are the vapour-baths of San-Germano.

2. *Lakes which emit rivers without receiving any.*—These are more numerous than the preceding. The more copious the subterraneous waters by which they are supplied, the more considerable are the rivers sent forth by them. The *Seliger lake*, in the government of Twer, 60 leagues N.E. from Moscow, gives origin to the largest river in Europe, the Volga; although no river is visibly received by that lake. The same may be said of the lake called *Koko-nor*, at the foot of the eastern ridge of the Tibetan Alps, from which issue two of the largest rivers of Asia, the Hoanho, or Yellow river, and Kiam, or Blue river, which, after having traversed part of the Chinese empire, empty themselves into the Japanese sea.

Of the same kind are the two small lakes in New Castile, in Spain, called *los ojos de la Guadiana*, situated near the Alcazar mountains, and considered as the sources of the Guadiana.

The *lake of Mont-Cenis*, though it does not emit a considerable river, is yet remarkable on account of its great elevation, which is 6000 feet perpendicular above the level of the sea. This lake (together with the Cenis, which issues from it) is supplied by waters conveyed to it by subterraneous channels, and which descend from the neighbouring mountains, which are as elevated above the lake as this latter is above the plains of Piedmont. This lake is three quarters of a league long, and from 1800 to 2400 feet broad. Saussure is of opinion that it has formerly been situated at a greater elevation; since, at a height of more than thirty feet above its present level, traces of erosion produced by the Cenis are still remaining, as well as calcareous layers, exactly like those still deposited by the waters of that river.

There are in the Pyrenees lakes which appear to have exactly the same origin as the lake of Mont Cenis, and which equally emit rivers; and several of these lakes occur

even at a greater elevation, (about 700 feet above the level of the sea,) such as the lakes of *Liens, las Gougous,* and *Onet,* in the mountains above Bargey. They are frozen over for the greatest part of the summer, and are only partially deprived of their icy covering in the interval between the months of June and August. The lake of Mont Ceuis, on the other hand, had, at the end of September, when Saussure observed it, a very mild temperature. It is so well stocked with fish, especially trouts, that, in the year 1780, it produced a yearly rent of 636 livres.

3. *Lakes which receive one or more rivers, without emitting any.*—Most of these formerly both received and sent forth a river; but the one emitted has become dry, on account of the diminution of the influent river; or the cavity that contains it may have enlarged to such a degree, that the river it receives is barely sufficient to repair, by new supplies, the loss which the lake sustains by evaporation. To this class belong, among others, the *Caspian sea,* as it is improperly called, which receives the waters of the Volga, of the Ural, and of some other rivers. This vast lake, which formerly occupied a much more considerable space than at the present day, and not only included the *lake of Aral,* but probably had even a communication with the Euxine sea, (see CASPIAN,) still continues to decrease, in proportion as the capacity of the rivers which supply it is found gradually to diminish. Another lake of this kind is the *Dead sea,* or lake Asphaltites, in Palestine. See ASPHALTITES.

Such was the lake that formerly covered *Cashmere,* which see. Lakes of this kind will be naturally formed in every case, where the waters of a river are inclosed, in any part of their course, by elevated lands. The first consequence of this stoppage is, of course, the conversion of the inclosed lands into a lake; and if this happens near the fountains of the river, and the ground is solid, it is likely to remain a lake for ever; the river not having force enough in its infant state to work itself a passage through the mountains. Hence it is that more lakes are found near the sources of rivers than in the lower parts of their course. If the river be inclosed after it has gained a great accession of water, and, of course, strength; it will, indeed, at first, form a lake, as before; but in time, the place at which it runs over, will be gradually fretted away, as in the case of the Behut. The Euphrates, in like manner, opens itself a passage through mount Taurus; and the Ganges through mount Imaus; and even though the base of the mountain be of the firmest texture, it will give way to the incessant friction, through a course of ages; for either of these passages may have been an operation of many thousand years. In the case of the Ganges, which passes through mount Imaus, it may be supposed that the lower strata were softer than the upper; for the upper still remain to a great height. In that of the Behut, the latter appears to have exited long enough to deposit a vast depth of soil, before it dispersed. Rennell's Memoir.

In the interior of Africa a vast lake is said to exist, which is supposed to receive the Niger. In America we have the lake Titicaca in Pern, into which runs a river, the source of which is near Casco.

4. *Lakes which both receive and send forth rivers,* are the most numerous of all. They are generally found in vallies, or in plains, in the proximity of great chains of mountains. The most remarkable among those of the Alps are—

The *lake of Geneva,* traversed by the Rhone. Its elevation above the level of the sea, according to De Luc, is 126 feet, according to Shuckburgh 1152, and according to the observations of professor Pictet 1134 feet. The Rhone enters it in the neighbourhood of Villeneuve: at its leaving it, near Geneva, it divides into two branches, which encom-

pass an island, and soon again unite. This lake formerly extended as far as Bex; and the village Port-Valley, which is at present at the distance of more than an English mile, was situate close to its banks. The lake of Geneva is subject to an annual swelling, by which its waters are raised from five to six feet above the ordinary water-mark. But besides this periodical rising of its waters, a fluctuation is sometimes observed, not unlike that produced by the flux and reflux of the sea. This motion, which generally continues for some hours, is in those parts called *Seiches.* It is most striking in the neighbourhood of Geneva. The cause of this phenomenon is not well understood. Fatio attributed it to gusts of wind, by which the water of the smaller lake is protruded beyond the sand-bank that separates it from the larger; and on falling back produces a fluctuation. Jallabert, observing that the *Seiches* take place without any gusts of winds, looked for the cause of this phenomenon in the sudden dissolution of snow by which the river Arve, becoming suddenly turgid, retards the course of the Rhone which issues from the lake. Saussure, on the other hand, has witnessed the sudden swelling of the Arve, without any accompanying *Seiches* in the lake. Bertrand is of opinion that electrical clouds attract and raise the waters of the lake, which, on falling back, produce that undulation; and Saussure and Vaucher add, that sudden local variations in the pressure of the atmosphere, may contribute to the production of this phenomenon. Patrin is inclined to attribute such sudden fluctuations of lakes to the development of subterranean gases, which also, by mixing with the atmosphere, produce that violent agitation, which, according to him, cannot be the effect of a simple disturbance of the equilibrium, but must be looked for in a chemical fermentation taking place in the atmosphere. An oscillation similar to the *Seiches* of the lake of Geneva, though in a less degree, has been observed also in some other lakes of Switzerland. To the same cause Patrin ascribes the hollow sound which some lakes are known to emit, and which is not unlike the noise that precedes the eruption of volcanoes. Some writers inform us that several lakes of Switzerland, and among them the lake of Geneva, give out a grumbling noise of this kind. Pallas has seen, in the Saïan mountains, near the source of the Yenisei, a lake called *Boudamy-Koul,* which, according to the account given of it by the Tartars of its neighbourhood, emits, at the approach of winter, sounds compared by them to howling. Also the inhabitants of the borders of the lake Baikal have informed Patrin, that they have often heard a dreadful howling proceed from that lake.

The *lake of Lucern,* in the Swiss canton of that name, (also called the Vierwaldtâder sea,) is situated 1320 feet above the level of the sea, according to Pfyster; 1314, according to De Luc; 1350, according to Trembley; and 1392 feet, according to Wyfs. The river, Reufs enters it at Fluelin, and is again emitted near Lucern. This most romantic of all lakes is surrounded by rocks consisting partly of limestone, partly of the calcareous breccia, called Nagelfluhe, and by sand-stone mountains. The line of demarcation between these two formations of rocks runs in a direction from E. to W.; to the S. of this line nothing is seen but lime-stone, and nothing but calcareous breccia and sand-stone in a northern direction. See more of this lake in Ebel "über die Schweiz, &c." 1805.

The *lakes of Brienz and of Thun,* in the canton of Berne, are both traversed by the river Aar, which enters the former of these lakes at its N.E. extremity, and leaves it at its southern end; when, at the distance of about two miles, its waters unite with those of the lake of Thun. The rocks of both sides of the lake of Brienz consist of lime and clay-stone.

Dr. Ebel tells us, that on the N. side formerly large masses of the most beautiful varieties of red and white fluor spar were found, which, from the pure fluxure of lime, passed into blackish-grey granular carbonate of lime. The lake of Thun is situated about 1780 feet above the level of the sea, and a few fathoms higher than the lake of Brienz. Its northern banks are entirely mountainous; half of the southern bank is flat and level. The rocks on the north side consist chiefly of the remarkable breccia and sand-stone formation, of which Mount Rigi, in the canton of Schweiz, is composed. The breccia is made up of rolled pieces of all dimensions, from 50 cubical feet, down to the size of large grains of sand; the whole cemented by a coarse grained calcareous grit possessing great tenacity, so that on the application of blows, the included stones, instead of becoming detached from their cells, are generally seen cloven asunder. These rolled pieces consist of various kinds of granite, gneiss, porphyry, flint, and flint-slate, horn-stone, granular and compact lime-stone, and a variety of red, clayey, ferruginous boulders, which, on further decomposing and dissolving, stain the cement in which they are imbedded with a red colour. The mountains on the S. and E. sides consist of lime-stone. The temperature of the lake of Thun, in the beginning of the month of July, at a depth of 350 feet, was found by Saussure to be 4° Reaumur, while, at the surface, the same thermometer indicated 15°. The water of the lake of Brienz, at the same time of the year, at the depth of 500 feet, shewed the temperature of 3 $\frac{1}{2}$ °, while that of the surface was 16°, and that of the atmosphere 15°.

*The Lake of Zurich.*—The principal river which enters this lake, is the Linth or Limmat, which, after having received the Mag, sent forth by the lake of Wallenstadt, falls into the lake of Zurich, near a mountain called the Bush-berg. The elevation of this lake above the level of the sea is 1270 feet. During the hot weather of the summer months its waters are seen to rise higher, and to overflow its banks, owing to the influence of the heat on the vast glaciers, and masses of snow of the Alpine chain of mountains. Several geognostic facts render it highly probable that formerly the Rhine, in its course to Germany, traversed both the lake of Wallenstadt and that of Zurich.

*The lake of Constance, or the Boden See,* is traversed by the Rhine, which enters it at the S.W. extremity, and is again given out near Constance. Its elevation above the level of the sea is 1089 feet. It is navigable for vessels of 3000 cwt. Within a period of eight centuries, it has only twelve times been covered with ice. This beautiful expanse of water formerly extended as far as the Rheinthal, or the valley of the Rhine: a change effected by the slow but uninterrupted deposition of alluvial land at the mouth of that river.

*The Langen-See, or Lago Maggiore* of the Italians, the *Lacus Verbanus* of the Romans, a lake on the borders of Switzerland, Piedmont, and the Milanese territory, receives and sends forth the river Tessin. Its length from Tenero to Sesio, is 44 Italian miles; its greatest breadth, between Luino and Ferriole, is above seven Italian miles; its elevation above the level of the sea 762 feet, according to Pini, but only 636 according to Saussure; its depth, at the chapel of la Bardia, opposite Locarno, is 335 feet. Many considerable rivers empty themselves into this lake, such as the Tessin, the Verasca, the Maggia, the Tofcina, and the Tresa; in short it receives all the waters of the immense group of mountains that encompasses it.

The natural character of the Lago Maggiore is a sublime wildness, blended with the milder beauties of the Italian soil; a narrow compass gradually widening into a vast ex-

panse. Towards the north and westward it is surrounded by elevated granitic mountains; while the east and north sides exhibit a series of smaller hills, which gradually lose themselves in the plain of Lombardy. From Magadino to Luina, on the N.E., the dark and rugged mountains of Gamborogno rise 6000 feet above the surface of the lake; and the wooded Pino, with the mountain of Canobbio, which appear to close the lake, form a long basin, abounding with fish, and known by the name of *Lago di Locarno*.

On the Piedmontese side of the Lago Maggiore, at Baveno and its neighbourhood, are the quarries of granite, which have furnished the magnificent columns that decorate the churches and palaces of Milan. In these parts are likewise found the beautiful crystals of felspar, that were first discovered by Pini. At the mouth of the river Toccia are the quarries of red and white granite, and behind Mergozzo those of the beautiful variety of marble, of which the cathedral of Milan is constructed. At Grantola are seen the vestiges of an extinguished volcano, which is, however, not considered as such by the learned Abbate Pini, who visited it in 1790.

*The Lake of Como,* about 24 miles from Milan, receives, among other smaller rivers, the Adda, which is again sent forth at its eastern extremity. The elevation of this romantic lake, the favourite spot of the younger Pliny, is, according to Oriani, 654 feet above the sea.

*The Garda,* a lake of Italy, between the Veronese and Bressan, is traversed by the Mincio.

A remarkable lake belonging to this class, on the French side of the Alps, is the *Lac de Joux*, in the Jura mountains. It is traversed by the river Orbe, which on issuing from this lake, is engulfed in vault funnels, hollowed out by its own waters in the calcareous strata, which at present are seen in a vertical position, owing to the effects of the rupture they experienced at the time when the revolution took place, which produced the lake; and this same river, after a hidden course of three quarters of a league, re-appears in a valley, 680 feet below the funnel-shaped cavities that conveyed it to its subterranean channel; from whence it proceeds towards and traverses the lakes of Neufchatel and Bienné.

Sweden, and other mountainous parts of Europe, likewise abound with lakes traversed by rivers. Of this kind is the lake of Bala, in North Wales. See *BALA-pool*.

Northern Asia has two very considerable lakes of this description, viz. the *lake Norzajins*, in Chinese Tartary, at the southern base of the Altaic chain, where it is traversed by the Irtsch and the Baikal, in East Siberia. This latter is traversed by the river Angara. (See *BAIKAL*.) M. Patrin, who has twice visited this remarkable lake, has described the highly destroying effects which its waters, in their gradual formation of the basin, have produced in the stratified mountains that bound its western shores. But it is not the Baikal alone which has thus formed its own bed, for the same cause has prevailed at the formation of those vast Canadian lakes, the lake Superior, Huron, Erie, and Ontario, connected together by the river St. Laurence, which takes its course through their stupendous basins.

We are indebted to Saussure for some very interesting observations respecting the *temperature* of the waters of the principal Alpine lakes. It appears from the experiments of this celebrated naturalist, made with a thermometer of his own invention, that even in the hottest summer months, the cold which prevails at the bottom of those lakes far exceeds that observable in the depth of the sea. The following are among the results he obtained.

In the *lake of Geneva*, on the 6th of August, at a depth of 312 feet, the thermometer (having Reaumur's scale) indicated

rated a temperature of  $8\frac{1}{2}^{\circ}$ ; that of the surface was  $15^{\circ}$ , and that of the atmosphere  $20^{\circ}$ . On the 11th of February, in a depth of 950 feet, (namely, near the rock of Meillerie, being the deepest part of the lake,) the temperature was  $4\frac{1}{2}^{\circ}$ ; that of the surface  $4\frac{1}{2}^{\circ}$ ; that of the atmosphere  $13^{\circ}$ . It is to be observed that as the elevation of this lake (according to Deluc) is 1126 feet above the level of the Mediterranean, the bottom of its basin is situated only 176 feet above the same level.

The waters of the *lake of Anney*, situated 210 feet above the lake of Geneva, had, on the 14th of May, and at a depth of 163 feet, the temperature of  $4\frac{1}{2}^{\circ}$ , while that of the surface was  $11\frac{1}{2}^{\circ}$ , and that of the air  $10^{\circ}$ .

In the *lac du Bourget* in Savoy, the thermometer, on the 6th Oct., at the depth of 240 feet, indicated  $4\frac{1}{2}^{\circ}$ ; at the surface  $14\frac{1}{2}^{\circ}$ ; in the air  $10\frac{1}{2}^{\circ}$ . Saussure observes, that the cold of the water of this lake cannot be ascribed to any foreign cause, since it receives no stream from the Alps, and its communication with the Rhone furnishes it with water only during the turgidity of that river in summer.

In the *lake of Thun*, in the canton of Berne, elevated about 630 feet above that of Geneva, the temperature, on the 7th of July, at the depth of 350 feet, was observed to be  $4^{\circ}$ ; the temperature of the surface was  $15^{\circ}$ , and that of the atmosphere  $16^{\circ}$ . At the same time the temperature of the lake of Brienz, which is contiguous to the lake of Thun, was  $3\frac{3}{4}^{\circ}$  at the depth of 500 feet.

The waters of the *lake of Lucern*, situated 191 feet above the lake of Geneva, had, on the 28th of July, and in a depth of 600 feet, the temperature of  $3\frac{9}{10}^{\circ}$ ; temperature of the surface  $16\frac{1}{10}^{\circ}$ ; of the air  $18\frac{6}{10}^{\circ}$ .

*Lake of Constance*.—The temperature on the 25th of July, at the depth of 370 feet, was  $3\frac{4}{10}^{\circ}$ ; on the surface of the water  $14^{\circ}$ ; in the air  $16^{\circ}$ .

*Lago Maggiore*.—On the 19th of July, at the depth of 335 feet, the temperature was  $5\frac{4}{10}^{\circ}$ ; at the surface  $20^{\circ}$ ; in the air  $18^{\circ}$ . It is remarkable that though the temperature at the bottom of this lake is so low, yet olive and orange trees are seen to thrive on its borders in the open air.

The comparative experiments which Saussure made on the temperature of the sea, gave the following results. On the 8th of October, the same thermometer, immersed at Porto Fino, on the coast of Genoa, to the depth of 886 feet, indicated  $10\frac{6}{10}^{\circ}$ , while the temperature at the surface was  $16\frac{7}{10}^{\circ}$ , and that of the atmosphere  $15\frac{3}{10}^{\circ}$ . At Nice, on the 17th of October, and at the depth of 1800 feet, the temperature proved to be  $10\frac{6}{10}^{\circ}$ , while that of the surface of the water was  $16\frac{4}{10}^{\circ}$ . From this difference between the temperature in the depth of the sea, and that of the bottom of lakes, it has been inferred that it is not the bulk of the mass of water which proves an obstacle to the free communication of the external caloric, and that the low temperature observed in the lakes of the Alps is owing to a particular and local cause.

Besides the general cause which produces a gradual *diminution* in the extent and depth of all lakes, there are others, which, operating on particular lakes, effect a more or less sudden change in that respect, according to the circumstances under which they take place. All rivers emptying themselves into lakes, convey thither more or less of the substance of the mountains from which they descend, and of the soil of the tracts of country which is traversed by them. The nearer, therefore, a lake is to those high mountains from which streams, in their descent, may carry away the *detritus* of rocks, the more speedily its basin will be filled up; while, on the other hand, a lake situated at a greater distance, in the middle of a plain, and receiving only sand

and mud, part of which is carried off again by its outlet, will experience a much less rapid diminution. Some naturalists have thought it possible to determine the relative antiquity of lakes, by the extent of the alluvial land deposited in their basins by those rivers which enter them; but, according to Patin, it is a matter of great difficulty to obtain satisfactory *data* on this head, and no general rules can possibly be laid down without a previous and careful examination of all the circumstances attending the locality of each particular lake. Thus; for instance, (says the same author,) we see that the lake of Neufchatel, at the foot of the Jura mountains, has already experienced a very considerable diminution through the mechanically forming effects of the waters of the Orbe, while those produced by the Rhone are scarcely perceptible in the lake of Geneva, although this lake is probably of greater antiquity than the other. The lake of Anney, which is wedged in between mountains, is already in a great measure choked up with their *detritus*. The valley of Chamouni, according to Saussure's observations, was also formerly a lake; but situated at the foot of the highest mountains of Europe its basin has long since been levelled by the alluvial land carried into it from all sides by the Aveiron and other streams. The lac du Bourget, on the other hand, which occupies the middle of a vast basin, where it receives its calm waters unfringed with foreign matter, is less than many others subject to the influence of this particular cause of the diminution of lakes.

The large lakes, with which the northern regions abound, serve for very good purposes, inasmuch as the warm vapours arising from them serve for a defensive against the pinching cold of those climates. To this it is owing, that Ireland, Scotland, &c. are less affected with frosts than much warmer countries.

They also furnish exhalations and vapours, which distil on the countries bordering upon them in refreshing showers, and prevent their being barren deserts.

The lake Nefs, in Scotland, has been commemorated by many writers, but never with any degree of judgment, till Mr. Frazer gave a perfect account of it to the Royal Society. It never freezes though the winters be ever so severe, and is full of springs in almost every part; and its waters, in the time of the severest frosts run fluid, and smoking for six miles down the river into which they are discharged, while every thing is frozen about them. The river runs very slowly notwithstanding, and from this smoke of the water there is raised a sort of fog which overspreads the whole country for several miles. There is a mountain near its side, of two miles perpendicular height from the surface of the lake; and on the summit of this mountain there is another lake, which has no spring visibly running into it, nor any outlet, and yet always keeps of the same degree of fulness, summer and winter. Due west from the river into which the lower lake discharges itself, there is an opening of sea, or frith, of two miles long and six miles wide; the middle of this is sometimes dry, and it is then easily seen that this was once dry land, and an inhabited country. There are found there large bodies of trees felled, and lying straight along; the wood of these is black, but it is very found, and there are many tumuli, or heaps of stones, to be seen under water in different parts of the frith, one of which is accessible at low water, and there have been found in it urns, which prove that they have been all burying-places. Phil. Trans. N. 255. p. 231.

As the sea washes away the banks of this frith, there is found in many places a large quantity of wrought timber; beams of fourteen, or more feet long, with the marks of the axe, and other instruments upon them; and at the depth

of sixteen feet, in the steep banks of the neighbouring river Bouly, there are found oak-trees and pieces of burnt timber. We find by this, that the face of the whole country about this lake is very different from what it was some ages ago; and there seems some resemblance between the present face of things here, and that in the bogs of many parts of England. The trees found buried in these were felled by the conquering Romans, and perhaps these are of some such origin.

We have many singularities offering themselves to our view in the lakes of our own country; that of their freezing at peculiar seasons is not one of the least. Philosophical Transf. N<sup>o</sup> 114.

*Lake Bituminous.* The existence of an expanse of mineral pitch, sufficiently extensive to merit the appellation of a lake, is a circumstance so very remarkable, that it will not be deemed improper to set apart an article for the description of the bituminous lake of the island of Trinidad. A description of this celebrated pitch lake was first given by Mr. Anderson, in the Philosophical Transactions for 1780, and some notices relative to it were communicated by Mr. Tobin, in the eighth volume of the Linnaean Transactions; but we now possess a more complete account of it by Dr. Nugent, who visited it in October, 1807, and whose memoir is published in the first volume of the Transactions of the Geological Society.

The pitch lake of Trinidad, by the French called La Braye, is situated on the north side of the gulf of Paria, on the high point La Braye, a considerable head-land, principally composed, at its southern side, of a kind of porcelain jasper. It is not easy to state precisely the extent of the collection of pitch; the lines between it and the neighbouring soil not being always well defined; and indeed Dr. Nugent supposes it to form the substratum of the surrounding tract of land. It may, however, be said, that it is bounded on the north and west sides by the sea, on the south by the just mentioned rocky eminence of porcelain jasper, and on the east by the usual argillaceous soil of the country; the main body may, perhaps, be estimated at three miles in circumference; the depth cannot be ascertained, and no subjacent rock or soil can be discovered. That part of this expanse, which may properly be called a *lake*, is situated higher than the adjoining land, and you descend by a gentle slope to the sea, where the pitch is much contaminated by the sand of the beach.

On approaching the lake a strong sulphureous and pitchy smell is perceived; and on a nearer approach, the bituminous plain itself opens to the view, appearing at first sight to be an expanse of still water, frequently interrupted by clumps of dwarf trees, or islets of rushes and shrubs. Dr. Nugent (from whose memoir this article is abstracted) was so struck by the singularity of the scene, that it was some time before he could recover from his surprize so as to investigate it minutely. The surface of the lake is of the colour of ashes; and at the season when this traveller visited the lake, not sufficiently smooth to be slippery; it was not adhesive, though it received the impression of the foot, and the confluence was such as to bear the travellers without any tremulous motion whatever; but in the dry season the surface is probably in a state approaching fluidity, as is shewn by pieces of wood and other substances being enveloped in it: different bodies have been known slowly to sink into it. If a quantity be cut out, the cavity left will be shortly filled up. Numberless proofs are given of its being at times in this softened state; the negro houses of the vicinage, for instance, built by driving posts in the earth, frequently are twisted or sunk on one side. In many places it seems to have actually overflowed like lava, and presents

the wrinkled appearance which a sluggish substance would exhibit in motion.

This bituminous plain is intersected by numerous interstices or chafms, filled with water in the wet season; they are generally deep in proportion to their width, some being only a few inches in depth, others several feet, and many almost unfathomable. The people of the neighbourhood derive their supply of water from this source, and refresh themselves by bathing in it; the water is perfectly uncontaminated by the pitch, and fish are caught in it. The arrangement of the chafms is singular; the sides are invariably shelving from the surface, so as nearly to meet at the bottom; but they bulge out towards each other with a considerable convexity. These crevices will now and then close up entirely; when marks or seams are left behind.

The bituminous substance forming this lake presents different appearances in different spots; in some parts it is black, with a splintery or a conchoidal fracture, of considerable specific gravity, and with little or no lustre, resembling particular kinds of coal, and so hard as to require a severe blow of the hammer to break it; in other parts it is so much softer as to be easily cut with a knife or spade, when the interior appears vesicular and oily. In one place it bubbles up in a perfectly fluid state, and in one of the neighbouring plantations it is said to occur of a bright colour, shining, transparent, and brittle, like bottle glass or resin. The odour in all these instances is strong, and like that of a combination of pitch and sulphur, which latter substance, however, is nowhere to be perceived. A bit of the pitch held in the candle melts like sealing-wax, and burns with a light flame, which is extinguished whenever it is removed, and in cooling the bitumen hardens again. It may be converted to many useful purposes, and is, indeed, universally used in the country wherever pitch is required. The reports of naval officers who have tried it are favourable to its more general adoption; in which case this vast collection of bitumen would afford an inexhaustible supply of an essential article of naval stores, and being situated on the margin of the sea, would be wrought and shipped with little inconvenience or expence.

Immediately to the southward of this bituminous lake, the face of the country, as seen from La Braye, is a good deal broken and rugged, which Mr. Anderson attributes to some convulsion of nature from subterranean fires, in which idea he is confirmed by having found in the neighbouring woods several hot springs. He is of opinion, that this tract has experienced the effects of the volcanic power, which, as he supposes, elevated the great mountains on the main and northern side of the island. As the production of bituminous substances has been attributed to the action of fire on beds of coal, Dr. Nugent was particular in his inquiries with regard to the existence of such beds, but could not learn that there was any certain trace of coal in the island.

Dr. Nugent, in attempting to explain the origin of this bituminous lake, inclines to the side of the Huttonian geologists, grounding his opinion on the general character of the country, and several local appearances, such as the amazing quantity of alluvial soil and bituminous substances brought down by the river Orinoko, and deposited on the shores of the gulf of Paria, and the west side of Trinidad; as also the traces of subterranean fire, such as hot springs, vortices, frequent earthquakes, and two singular volcanic mounds at Point Icaque.

“A vast river like the Orinoko,” he says, “must for ages have rolled down great quantities of woody and vegetable bodies, which, from certain causes, as the influence

of currents and eddies, may have been arrested and accumulated in particular places; they may there have undergone those transformations and chemical changes which various vegetable substances similarly situated have been proved to suffer in other parts of the world. An accidental fire, such as is known frequently to occur in the bowels of the earth, may then have operated in separating and driving off the newly-formed bitumen, more or less combined with siliceous and argillaceous earths, which forcing its way through the surface and afterwards becoming insipidated by exposure to the air, may have occasioned such scenes as I have ventured to describe. The only other country accurately resembling Trinidad, of which I recollect to have read, is that which borders on the gulf of Tama, in Crim Tartary. From the representations of travellers, Springs of naphtha and petroleum equally abound, and they describe volcanic mounds precisely similar to those of Point laque. Pallas's explanation of their origin seems very satisfactory, and I think it not improbable that the river Don and sea of Azof may have acted the same part in producing these appearances in the one case, as the Orinoko and gulf of Paria appear to have done in the other. It may be supposed that the destruction of a forest, or perhaps even a great savanna on the spot, would be a more obvious mode of accounting for this singular phenomenon; but all this part of the island is of a recent alluvial formation, and the land all along this coast is daily receiving a considerable accession from the surrounding water. The pitch-lake, with the circumjacent tract, being now on the margin of the sea, must, in like manner, have had an origin of no very distant date; besides, according to the representation of captain Mallet, which has been frequently corroborated, a fluid bitumen oozes up and rises to the surface of the water on both sides of the island, not where the sea has encroached and overwhelmed the ready-formed land, but where it is obviously in a very rapid manner depositing and forming a new soil."

The observations of captain Mallet, above-mentioned, but the accuracy of which Dr. Nugent had no opportunity of ascertaining personally, are, that "near Cape la Brea (La Braye) a little to the S.W. is a gulf or vortex, which in stormy weather gushes out, raising the water five or six feet, and covers the surface for a considerable space with petroleum, or tar."—"On the E. coast," he adds, "in the bay of Magaro, there is another gulf or vortex similar to the former, which, in the months of March and June, produces a detonation like thunder, having some flame with a thick black smoke, which vanishes away immediately; and in about twenty-four hours afterwards, is found along the shore of the bay a quantity of bitumen or pitch, about three or four inches thick, which is employed with success." The same author likewise quotes Gumball as stating, in his Description of the Orinoko, that "about seventy years ago, a spot of land on the western coast of this island, near half way between the capital and an Indian village, sunk suddenly, and was immediately replaced by a small lake of pitch, to the great terror of the inhabitants." Mallet's Topographical Sketch of the Island of Trinidad.

LAKE of the *two Mountains*, a piece of water, that lies westerly from Montreal, being properly the mouth of Ottawa river; 20 miles long, and 5 broad. It is surrounded by cultivated fields of the Iroquois and Algonquin Indians, whose village stands on a delightful point of land, that projects into the lake. Each tribe has a Roman Catholic missionary. They attend public worship in the same church. Their pastors have taught them to read and write. Their warriors are about 500.

LAKE of the *Woods*. See WOODS.

LAKE *River*, a river of America, which runs into the Mississippi, N. lat. 46° 33'. W. long. 95°.

LAKE *River, Little*, a river which runs into the Mississippi, N. lat. 45° 36'. W. long. 94° 23'.

LAKEs, *Subterranean*. That there are in many places immense subterranean lakes, can scarce be doubted, because we see them in some places; but their effects are often perceived where they are not seen, and puzzle the people who attempt to account for those effects upon other principles. The famous Zirchnitzer lake in Carniola, which fills and empties itself, at times, in an impetuous manner, bringing up with its waters fish, and even wild fowl, communicates with another immense subterranean lake in the mountain Savornick; and according to its filling or emptying, the upper one is also filled and emptied. See DUCK.

The grotto Podspetselio, in the same country, gives another instance of such a subterranean lake. The people of the neighbouring country enter the side of the mountain where this lake is, by a small opening, through which they go to a cavern of a great width and height; and at the end of this is a small opening again, through which they go on to the edge of a vast subterranean piece of water. They go with torches, and find the water very clear and fine. It is ten cubits deep at the edge, and doubtless is much more in the middle. The water runs into this lake by a large channel, and runs out of it again by another, falling down a precipice into another lake, and that with such a noise, that the report of a pistol cannot be heard near it. Stones thrown in every way are heard to fall into water, and there is great reason to suppose the lake a German mile long; for at this distance there is another water discovered through such another cleft of the rock, which stands at the same horizontal height as this, and is subject to the same accidents at the same time. This vast body of water sometimes all runs off in a few minutes, and leaves the basin dry, and after some weeks it fills again with a frightful noise. As these accidents always happen to both the waters above mentioned, at the same time, they appear very plainly to be only the two sides of the same lake. Phil. Trans. N° 191.

We have in England many of these reservoirs, the water of which is always remarkably clear and cold, and is so loaded with spar, that it generally incrusts things very quickly that are put into it; and when raised into vapours, as a part of it sometimes is, by the subterranean heat, or carried up with other vapours, stops at the ceiling of the vaults, and there forms stalactite, and other such concretions. In many of these lakes also are found the round balls of spar, called *stalagmite*. They are composed of several crusts gathering round some central nucleus, and often exceed the size of a school-boy's marble. Phil. Trans. N° 144.

In Pen-Park hole, in Gloucestershire, there is a remarkable instance of this, that strange cavern containing one of the largest of the lakes in our kingdom.

It was accidentally discovered by some miners: it is twenty-nine fathoms deep from the surface, being a vast cavern of the shape of a horse-shoe, surrounded with rugged rocks and rough walls of earth, containing in the midst of it a river or subterranean lake, twenty fathom broad and eight fathom deep, of the same cold and petrifying water with the other reservoirs of this kind.

LAKE, or LAQUE, a preparation of different substances into a kind of magistry for the use of painters, dyers, &c. One of the finest and first invented of which was that of *gum lacca* or *laque*; from which all the rest, as made by the same process, are called by the common name *laques*. See LAC or LACCA.

We may observe more generally, that all vegetable colours, which are soluble in water, are found to have a certain degree of affinity for some earths and metallic oxyds. These combinations are called lakes. Thus, if a solution of alum is added to an infusion of madder, a mutual decomposition takes place, and part of the alumine falls down intimately united with the colouring matter of the madder: the separation is much assisted by the alkali. They are chiefly of two colours only, red and yellow: the red owing their colour to madder, Brazil wood, or cochineal; and the yellow to the different yellow infusions used in dyeing. Both are generally used for water colours, and in oil painting as transparent colours. These pigments are almost invariably composed either of alum, or sometimes the solution of tin, and some other watery solution of a colouring matter.

Of the red lakes, that made with cochineal is the most beautiful, and of the greatest value. It is called *carmine*, from its being applied to imitate the colour of the flesh. For the method of preparing it, see COCHINEAL. See also CARMINE.

On the receipt for making carmine, introduced under the article COCHINEAL, a correspondent has made the following observation.

The carbonat of soda and alum, added in the first instance, would be mutually decomposed, and the alumine, with the colouring matter, would be precipitated with the dregs, which are afterwards separated from the clear liquor; so that when the white of egg came to be added, the earth of the alum and a portion of the colouring matter, said to be carried down by the albumen, cannot be present. Should the process here given have any analogy to that which is practised, it would appear that the solution of cochineal in water has the white of egg added to it, in the first instance, if it is at all necessary, for the purpose of clearing the coloured solution, a property for which that substance is remarkable. That after the liquid becomes clear, and is separated from the dregs, the carbonat of soda and alum are added, when a precipitate, consisting of the alumine united with the finer parts of the colouring matter, may be expected. The remaining colouring matter, which is of less beauty, is then used for the red lake.

Instead of using cochineal for making carmine, a much clearer colour may be extracted from the refuse of scarlet cloth. The bits of cloth are boiled in a solution of potash, which extracts the colour, and holds it in solution. If to this a certain portion of alum be added, the colouring matter will be precipitated with the alumine, of a greater or less intensity, proportionate to the quantity of this earthy basis. In Doffie's *Handmaid to the Arts*, we are told that the best of the lakes commonly sold is made from the colour extracted from scarlet rags, and deposited on the cuttle-bone; and that it may be prepared in the following manner: dissolve a pound of the best pearl ashes in two quarts of water, and filter the liquor through paper; add to this solution two more quarts of water, and a pound of clean scarlet shreds, and boil them in a pewter boiler, till the shreds have lost their scarlet colour; take out the shreds and press them, and put the coloured water yielded by them to the other; in the same solution boil another pound of the shreds, proceeding in the same manner; and likewise a third and fourth pound. Whilst this is doing, dissolve a pound and a half of cuttle-fish bone in a pound of strong aqua-fortis, in a glass receiver, adding more of the bone, if it appears to produce any ebullition in the aqua-fortis; and pour this strained solution gradually into the other; but if any ebullition be occasioned, more of the cuttle-fish bone must be dissolved as before, and added, till no ebullition appears in the mixture. The crimson sediment deposited by the liquor thus prepared

is the lake: pour off the water, and stir the lake in two gallons of hard spring water, and mix the sediment in two gallons of fresh water; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum should be added to each quantity of water before it be used. Having thus sufficiently freed the lake from the salts, drain off the water through a filter, covered with a worn linen cloth. When it has been drained to a proper dryness, let it be dropped through a proper funnel on clean boards, and the drops will become small cones or pyramids, in which form the lake must be suffered to dry, and the preparation is completed.

Lakes are also made from madder and Brazil wood. The former is much more permanent than the latter, but does not possess the same beauty of tint. In order to make these lakes, strong infusions of these substances are first obtained. The Brazil wood infusion is best made by boiling the chips in pure water, and filtering the solution. (See BRASIL WOOD.) The infusion of madder (see MADDER) is best made in cold water, by which the purest part of the colour is only dissolved. To each of these solutions are added a clear solution of alum, and then as much of an alkali as will precipitate so much of the alumine as will make the colour of the precipitate of proper intensity. A small quantity of muriate of tin increases the brilliancy of these lakes.

A beautiful lake, it is said (*ubi infra*), may be prepared from Brazil wood, by boiling three pounds of it, for an hour, in a solution of three pounds of common salt, in three gallons of water; and filtering the hot fluid through paper, add to this a solution of five pounds of alum in three gallons of water. Dissolve three pounds of the best pearl ashes in a gallon and a half of water, and purify it by filtering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourless. But if any appearance of purple be seen, add a fresh quantity of the solution of alum by degrees, till a scarlet hue be produced. Then pursue the directions given in the first process with regard to the sediment. If half a pound of feed-lac be added to the solution of pearl ashes, and dissolved in it before its purification by the filter, and two pounds of the wood, and a proportional quantity of the common salt and water be used in the coloured solution, lake will be produced that will stand well in oil or water, but it is not so transparent in oil as without the feed-lac. The lake with Brazil wood may be also made by adding half an ounce of annatto to each pound of the wood; but the annatto must be dissolved in the solution of pearl ashes. There is a kind of beautiful lake brought from China; but as it does not mix well with either water or oil, though it dissolves entirely in spirit of wine, it is not of any use in our kinds of painting. This has been erroneously called *safflower Handmaid to the Arts*, vol. i. p. 61, &c.

In making yellow lakes, the coloured infusions must be such as to make the most permanent dye. (See DYEING.) The precipitation of the colour is performed precisely in the same way, and by the same substances, as the red lakes. A very excellent yellow lake may be made from the infusion of *querciron bark*. That from *turmeric* is very beautiful, but is not permanent. The process for the making of this is as follows: take a pound of turmeric-root in fine powder, three pints of water, and an ounce of salt of tartar; put all into an earthen glazed vessel, and let them boil together over a clear, gentle fire, till the water appears highly impregnated with the root, and will stain a paper to a beautiful yellow. Filter this liquor, and gradually add to it a strong solution of roch-alum in water, till the yellow matter is all curdled, together, and precipitated; after this pour the whole into a  
filter

filtrate of paper, and the water will run off and leave the yellow matter behind. It is to be washed many times with fresh water, till the water comes off insipid, and then is obtained the beautiful yellow, called *laque of turmeric*, and used in painting.

In this manner may a laque be made of any of the tinging substances that are of a somewhat frothy texture, as madder, logwood, &c.; but it will not succeed in the more tender species, as the flowers of roses, violets, &c. as it destroys the nice arrangement of parts in those subjects, on which the colour depends.

A yellow lake for painting is to be made from broom-flower in the following manner: make a ley of pot-ashes and lime reasonably strong; in this boil, at a gentle fire, fresh broom-flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen vessels over the fire; add as much alum as the liquor will dissolve; then empty this ley into a vessel of clear water, and it will give a yellow colour at the bottom. Let all settle, and decant off the clear liquor. Wash this powder, which is found at the bottom, with more water, till all the salts of the ley are washed off; then separate the yellow matter, and dry it in the shade. It proves a very valuable yellow.

All the lake colours are changed by acids and alkalis. An acid renders the red lake more scarlet, and the yellow paler; while an alkali gives a purple tint to the red, and an orange or brown tint to the yellow. Artists sometimes take advantage of this property to change their colours. The acid used for this purpose should be the muriatic diluted, and the alkali aqua ammonia.

**LAKE, Orange,** is the tinging part of anatto precipitated together with the earth of alum. This pigment, which is of a bright orange colour, and fit for varnish painting, where there is no fear of flying, and also for putting under crystal to imitate the vinegar garnet, may be prepared by boiling four ounces of the best anatto and one pound of pearl-ashes half an hour in a gallon of water; and straining the solution through paper. Mix gradually with this a solution of a pound and a half of alum in another gallon of water; desisting, when no ebullition attends the commixture. Treat the sediment in the manner already directed for other kinds of lake, and dry it in square bits or round lozenges. Handmaid to the Arts, vol. i. p. 119.

**LAKE, Rose.** See *ROSE PINK*.

**LAKE of Madder.** See *MADDER*.

**LAKE, Siberia,** in *Rural Economy*, a common name applied to such as are carried on in lakes, or other stagnant waters. See *FISH and PONDS*.

**LAKE-weed,** in *Botany*. See *ARSMART*.

**LAKEN,** in *Geography*, is a town of Prussia, in the province of Oberland; eight miles E. of Mulhausen.

**LAKSHIMAN,** in *Hindoo Mythology*, an incarnation of the mighty serpent *Sesha*, (which see,) born of Sumitra, second wife of Dasaratha, raja, or king of Ayadela (Oude): Lakshiman was thus the half brother of Rama, and became incarnate for the purpose of assisting him in his wars against Ravana, the tyrant of Lanka. (See *LANKA, RAVANA, and RAMA*.) Lakshiman was farther connected with Rama by espousing Urmila, daughter of Janaka, the adoptive parent of Rama's wife Sita. See *JANAKA and SITA*.

**LAKSHMENI,** one of the eight regular wives of Krishna; and he being the Apollo of the Hindoos, these eight wives may possibly be only a personification of the natural notes. (See *KRISHNA*.) Her name is sometimes written Lakshimany.

**LAKSHMI,** is the faksi or consort of Vishnu, the pre-

servative power of the deity. (See *SAKTI and VISHNU*.) The extensive sect of Vaishnavas, or worshippers of Vishnu, esteem Lakshmi as mother of the world, and then call her *Ada Maya*; and such Vaishnavas as are faksats, that is, adorers of the supremacy of the female energy, or nature-active, worship her extensively as the type of the eternal Being, and endow her with suitable attributes. (See farther hereunder *LINGA, MAYA, and SAKTA, SECTS of Hindoos; VAISHNAVA, and the articles before referred to*.) She is represented by the poets and painters as of perfect beauty. Hindoo females are now commonly named after her: and there are few in the long catalogue of their deities whose various names and functions are so frequently alluded to in conversation and writing, either on theogony, mythology, poetry, or philosophy. Her terrestrial manifestations have been frequent, and her origin various. As Rhemba, the sea-born goddess, she arose one of the fourteen gems from the ocean when churned by the good and evil beings for the amrita or beverage of immortality. (See *RHEMBA*.) She then assumes the character of *Venus Marina*, or *Aphrodites of the Greeks*; who, as Hesiod and Homer sing, arose from the sea, ascended to Olympus, and captivated all the gods. The operation of churning the ocean is noticed under *Kurmatavara*, and the production of Rhemba, Sri, or Lakshmi is thus described in the 36th section of the first book of the *Ramayana*. (See *RAMAYANA*.) "The gods, the asuras, and the gandharvas, again agitating the sea, after a long time appeared the great goddess, inhabiting the lotus; clothed with superlative beauty, in the first bloom of youth, covered with ornaments, and bearing every auspicious sign; adorned with a crown, with bracelets on her arms, her jetty locks flowing in ringlets, and her body, which resembled burning gold, adorned with ornaments of pearl. Thus was produced the goddess Padma, or Sri, adored by the whole universe, Padma by name. She took up her abode in the bosom of Padma-nabha, even of Heri; that is, of Vishnu, of whom these are names. Sri, as this deity is frequently called, distinguishes her more particularly as the goddess of fortune, the word meaning *prosperity*; but it is not given exclusively to Lakshmi. (See *SRI, PADMA, and KAMALA*.) Others of her names are derived from the lotus, which is the emblem of female beauty, and especially applicable to this goddess. (See under these articles.) Heripriya denotes the wife of Heri or Vishnu. As the deity of riches or fortune Lakshmi would be invoked for increase of wealth, by a desiring Hindoo, rather than Kuvera, the Pluto of their Pantheon. (See *KUVERA*.) In this character she is sometimes called *Lucki*, or *Laki*, meaning *fickle*; and it may be only a shortening or rapid pronunciation of Lakshmi, her most common name, which is derived from the Sanscrit word *laksh*, *light, splendour*; equivalent to the Latin *lux*, and it means farther *luck, luxury, fortune*, &c. This goddess (as the faksi, or consort of Vishnu, or Krishna) being the energy of the sun, is appropriately designated by a luminous appellation derived from such a source.

In images and pictures of her, which are very common in India, Lakshmi is generally represented as a mere woman; sometimes, however, four-armed; often holding a *kumal*, or lotus, in an easy and elegant attitude, and always very handsome. With her lord Vishnu she is frequently seen on the serpent *Sesha*; he reposing, she in respectful attendance, while a lotus springing from Vishnu's navel to the surface of the sea (for this scene is subaqueous) bears in its expanded calyx, Brahma, the creator of the world, about to perform the work of renovation. (See *KALPA and SETHA*.) Sometimes she is seated with her lord on *Garuda*, or *Superna*, cleaving the air, of which Vishnu is a personification. (See *SUTERNA*.)

SUPREMA.) In Vishnu's most splendid avatara, or incarnation of Krishna, she became manifested as Rukmeni, or Radha, the most adored of the amorous deities, and mother of Kama, the god of love; here again corresponding with our popular Venus, the mother of Cupid. (See KAMA, KRISHNA, RADHA, and RUKMENI.) In the avatara of Rama, Lakshmi was his faithful spouse in the form of Sita, as noticed under those articles. In that of Narasingha, she was Narisinh, or Nrisinh; when Varaha, Varahi; and as the Sakti of Narayana she is by her own sectaries called Narayani; and in most of the many incarnations of Vishnu she appears to have defended with him, frequently under her own celestial name: as his consort generally, she is called Vainhavi. See respectively those articles.

The following extract from Moor's Hindoo Pantheon will shew the veneration paid to this popular and beneficent deity, of whom a milch-cow seems an apt symbol. "In the Sradha, or obsequies in honour of deceased ancestors, Lakshmi is, among other deities, earnestly invoked, particularly when, as the ritual expresses, a votary is desirous, by gifts to Brahmans, of obtaining celestial bliss for the defunct." A donation of a milch-cow is attended by many appropriate ceremonies, finishing with the following prayers; the acceptor holding, during the recital, the sacred animal by the tail.

1. May the goddess, who is the Lakshmi of all beings, and resides among the gods, assume the shape of a milch-cow and procure me comfort.

2. May the goddess, who is Rudrani in a corporeal form, and who is the beloved of Siva, assume the shape of a milch-cow and procure me comfort.

3. May she, who is Lakshmi reposing on the bosom of Vishnu; she, who is the Lakshmi of the regent of riches; she, who is the Lakshmi of kings, be a boon-granting cow to me.

4. May she, who is the Lakshmi of Brahma; she, who is Swaha, the wife of fire; she, who is the exerted power of the sun, moon, and stars, assume the shape of a milch-cow for my prosperity.

5. Since thou art Swadha, the food of them who are the chief among the manes of ancestors, and Swaha, the consuming power of them who eat solemn sacrifices; therefore, being the cow that expiates every sin, procure me comfort.

6. I invoke the goddess, who is endowed with the attributes of all the gods, who confers all happiness, who bestows abodes in all the worlds, for the sake of all people.

7. I pray to that auspicious goddess for immortality and happiness. P. 138.

Under the following names and words some particulars will be found of the mythological persons mentioned in the preceding extract, not before referred to from this article. Sradha, or obsequies in honour of departed ancestors. Rudrani, the beloved of Siva, a name of Parvati. Surrabhi, the boon-granting cow. Swadha, Swaha, the fakti, or energy of Pavaka, or fire.

Lakshmi also presides over marriages, and is considered, indeed, among certain sects of Hindoos, as the general source of all happiness. She is found, by mythologists, to have characteristic attributes and powers similar to the Ceres of the Greeks (Sri is, in one case, Sris, corresponding here, likewise, in name), and the Isis of the Egyptians. On these, and other points connected with the subject of this article, see Mr. William Jones, and Mr. Colebrooke, Asiatic Res. vol. i. iii. and vii. Many plates of her in her various forms, and Puranic legends and anecdotes, are like-

wife given in Moor's Hindoo Pantheon, whence this article is chiefly taken. See also GENTOO.

LAKTEA, in *Geography*, a sea-port of Sweden, in East Bothnia, at the mouth of a river near the gulf of Bothnia. N. lat. 64° 25'.

LALA, in *Ancient Geography*, a town of Asia, in the Greater Armenia.

LALADA, in *Geography*, a town of Hindoostan, in Golconda; 15 miles W.N.W. of Calloor.

LALAMSERAI, a town of Hindoostan; 28 miles W. of Benares.

LALAND. See LAALAND.

LALANDE, JAMES DE, in *Biography*, was born at Orleans in 1622, and became distinguished in the profession of the law. He was famed as well for his extensive and very profound erudition, as by the public and private virtues which he manifested, in passing through a long life, in the exercise of various important functions. He attained to the highest rank in his profession in his native place, and was made mayor. He died in 1703, sincerely regretted by all who knew him; he was author of several works, of which the most important were "A Commentary upon the Customs of Orleans;" and "A Treatise on the Bar, and Arricr-bar." His integrity, beneficence, and zeal for the interests of his countrymen, obtained for him the honourable title of "father of the people." Moreri.

LALANDE, JOSEPH, JEROME LE FRANÇAIS, a celebrated French astronomer, was born at Bourg, in the department of P'ain, on the 11th of July 1732, of very respectable parents. His father, who was possessed of property, intended him for the bar, and accordingly sent him to Paris to study the law, to which, for some time, he applied with so much assiduity, as to more than answer the most sanguine expectations of his friends, when the sight of an observatory awakened in him a propensity, which deranged the projects of his parents, and became the ruling passion of his life. He put himself under the instructions of Le Monnier, one of the then most celebrated astronomers of France, and profited so much by the lessons of his able instructor, as to afford him the highest degree of satisfaction, who, on his part, conceived for the young man a truly paternal affection, and was determined to promote his interests. An opportunity soon offered; the great astronomer Leccaille was preparing to set out for the Cape of Good Hope, in order to determine the parallax of the moon, and its distance from the earth. To accomplish this purpose, it was necessary he should be seconded by an observer placed under the same meridian, and at the greatest distance that could be conveniently chosen on the globe. Berlin was fixed on, and Le Monnier signified his intention of undertaking the business himself, but the moment when he should be ready to depart, he had the credit to get his pupil appointed in his stead. Frederic, to whom Maupertuis had explained the delicacy and difficulty of the enterprise, could not forbear shewing some astonishment when the youthful astronomer was presented to him, "However," said he, "the Academy of Sciences has appointed you, and you will justify their choice." From that moment his age, being only eighteen, was an additional recommendation; he was admitted at court, welcomed by the academy, and became intimate with the most distinguished persons at Berlin. On his return, the account which he gave of his mission procured him free access to the Academy of Sciences, and its Transactions were enriched every year by important communications from the young astronomer; "the active part which he took in the labours of the academy, was not confined to the astronomical science, we have from his pen, a description of seven arts, as different from each other, as they are re-

note from the objects of his habitual meditations." He published the French edition of Dr. Halley's tables, and the history of the comet of 1759, and he furnished Clairault with immense calculations for the theory of that famous comet. Being charged in 1760 with the compilation of the "Cronnoique des Temps," he entirely changed the form of that work, and of this collection he published thirty-two volumes, viz. from 1775 to 1807.

In 1764, appeared the first edition of his "Traité Astronomique," which he afterwards completed, and upon which his chief claim to glory rests. Lalande was the first who calculated the perturbations of Mars and Venus, and in the theory of Satellites, in which but little progress had been made, he explained a motion which Baillic claimed as his own discovery. A literary dispute arose out of this circumstance, which, however, was conducted with every regard to decency, and the probable result, as seen by disinterested spectators, was, that both had been led to the same discovery. He composed all the astronomical articles for the "Encyclopædia of Yverdon;" those for the supplements to the "Encyclopédie de Paris;" and those for the "Encyclopédie Methodique," substituting for the articles furnished by d'Alembert, and which he had compiled from the works of Le Monnier, such as were more complete and more modern, from his own observations and improved theories.

To his written works he joined oral instructions during a space of forty-six years; for from the year 1761 he had replaced the first master, De Lisle, in the chair of astronomy, in the college of France, and gave a new lustre to this curious part of public instruction in a celebrated school, which possessed the most distinguished professors of every kind, and which enjoyed and merited the extraordinary privilege of outliving the tremendous storms of a revolution, and escaping the almost universal destruction which levelled all around it. As a professor, he taught with so much ability that his school became a seminary of disciples who peopled the different observatories of the world. In the midst of his other labours he drew up his "Voyage d'Italie," the most complete collection of curious objects that travellers can consult; his "Traité des Canaux;" and his "Bibliographie Astronomique," which is an immense catalogue of all the works that have appeared on the subject of that science.

In the year 1793, Lalande published "Abrégé de Navigation historique, théorique, et pratique," containing many valuable rules and tables; and in 1802 he published a new edition of Montucla's history of mathematics, in 4 vols. 4to. the last two volumes being prepared from Montucla's papers, with the assistance of La Place, La Croix, and other French mathematicians. He published also this year a collection of tables of logarithms, sines, tangents, &c. adapted to the pocket.

Affiliated to almost all the distinguished scientific societies in the world, he was their common bond of union by the correspondences which he maintained; and he promoted a circulation of intelligence from one to another. He employed the credit arising from the universal reputation which he enjoyed, for the general benefit of the sciences and their cultivators. To the extraordinary ardour and activity of his character, he joined a love for the truth, which he carried to the borders of fanaticism. Every degree of concealment appeared to him unworthy of an honest man, and he therefore, without reserve, uttered his sentiments on all occasions, and by the bluntness of his manners, he sometimes made himself enemies, who not only called in question his real merits, but who excited against him a crowd of detractors, and because they could not rival his high reputation, they attempted to blast his well earned fame. He was not without his singu-

larities and failings, but they were trifling in comparison of his commendable qualities, yet his long and important services were frequently forgotten in the recollection of trivial failings.

In a work, not of the most liberal cast, now under publication, in this country, Lalande has been charged with profaneness and atheism, but no authority is produced to support such charges, which, if true, ought to have been sanctioned by some sort of proof, or by well ascertained facts; and if not true, the editors of that work are guilty of a crime against society not easily obliterated. One of his eulogists says, "he always manifested a benevolent disposition, and approved himself a man of honour, probity, courage, full of activity for all useful things, and of love and zeal in behalf of his fellow creatures. To imitate the great benefactor is the most worthy homage we can pay to the infinite goodness; the supreme intelligence which governs the universe." He rendered inextinguishable service to science during his life, and consulted its interests after his death, by founding an annual prize to the author of the best astronomical memoir, or most curious observation. He died April 4th 1807, in the 75th year of his age. Eulogy pronounced over his grave by De-Lambre and Dupont.

LALANDE, MICHEL RICHARD DE, master of the king of France's band, maitre de chapelle, and composer in ordinary of the chapel royal, and chevalier de l'ordre de St. Michel, born in 1657, was the fifteenth son of a tailor at Paris, and brought up a chorister of St. Germain l'Auxerrois. Excited by a strong passion for music, he soon surpassed his master Chaperon. The violin was the first instrument to which he seriously applied; but being recommended to Lulli, as a performer in the opera orchestra, he was so piqued at being rejected, that he broke his fiddle, and renounced the practice of it for ever. The era of his prosperity was, the being employed in teaching mademoiselle de Noailles, who married the Maréchal de Grammont, and the Maréchal paid for many kind things of him to the king, that he was appointed music-master to mademoiselles de Blois, and de Nantes. In 1683, his majesty having created two new places of chapel-masters, gave one of them to Lalande, whose compositions pleased the king so much that he appointed him successively to the two places of chapel-master, that of chamber-musician to his majesty, and master of his band; and soon after conferred on him the order of St. Michel. The king married him to Anne Ribel, who had an admirable voice, and sang wonderfully. He had only two daughters by this marriage, whom he lost in 1711 at 24 years of age. In 1721 he lost his spouse, and the year following, wanting consolation and a companion, he married the demoiselle de Cury, daughter of the furgoon to the prince of Conti, but soon after being seized with a consumptive cough, and pain in his chest, he died in 1726 at 67; 45 years of which time he had spent in the service of Louis XIV. and XV. Lalande left behind him 60 motets, or anthems, which have had the highest reputation, and set several operas, but he never would let any of them be performed under his name. It was under this able master, (says M. Laborde, the zealous defender of French music of every kind,) that a new species of church music had birth, which astonished and ravished the whole court. "He banished the usual monotony and dryness of the chorusses and recitatives. His fugues were composed on lively subjects, and mixed with agreeable symphonies, and agreeable melodies, which, before his time, had no existence. He was the first who had the time beaten by a coryphæus, and composed pathetic recitatives, and airs of spirit. In short, he was the creator of church music, and even foreigners, since the time

of Lalande, give the French the pre-eminence in this kind of music, over all the nations of Europe." *Essai sur la Musique*.

The English, the Germans, and the Italians, we presume, will dispute this point with M. Laborde, and remind him of their Purcell, Handel, Leo, &c. We heard some of this sublime music, at the Concert Spirituel, in 1770; and in looking back at our memoranda for the effect which it had on our feelings, we found that it was coarse and noisy, with scarcely a new passage to make amends for the worst singing which we had ever heard, in or out of the church.

**LALANG**, in *Geography*, an island near the N. coast of Sumatra, in the straits of Malacca. N. lat.  $1^{\circ} 45'$ . E. long.  $99^{\circ} 20'$ .

**LALASIDE**, in *Ancient Geography*, a country of Asia Minor, which, according to Ptolemy, made part of Cilicia, so called from the name of Lalasis, its capital. In the 4th century of the Christian era, when the province of Iauria was formed of a part of Cilicia and Cataonia, this country became a part of Iauria.

**LALASIS**, a town of Asia Minor, in Iauria.

**LALBENQUE**, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Cahors. The place contains 1924, and the canton 9750 inhabitants, on a territory of 305 kilometres, in 13 communes.

**LALCOTTA**, a town of Hindoostan, in Golconda; 17 miles N.E. of Rachore.

**LALI**, a town of Thibet; 90 miles S. of Sarangpou.

**LALIBALA**, a town of Abyssinia; 140 miles S.S.E. of Gondar.

**LALIBALA**, a town of Abyssinia; 90 miles S.S.E. of Gondar.

**LALIM**, a town of Portugal, in the province of Beira; nine miles S.W. of Lamego.

**LALINDE**, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Bergerac. The place contains 1606, and the canton 8208 inhabitants, on a territory of 185 kilometres, in 16 communes.

**LALLARY POINT**, a cape on the S.W. coast of the island of Banca. N. lat.  $2^{\circ} 48'$ . E. long.  $106^{\circ} 2'$ .

**LALM**, a town of Silesia, in the principality of Jauer; 20 miles W. of Jauer.

**LALODA**, a town on the W. coast of the island of Gilolo. N. lat.  $1^{\circ} 48'$ . E. long.  $127^{\circ} 22'$ .

**LALOO**, a town of Hindoostan, in Bengal; 20 miles E. of Silhet.

**LALOUETTE**, in *Biography*, an élève of Lulli, beat the time at the opera in Paris, and composed the music of several ballets and intermedes. He was one of the best performers on the violin of his time, was also music-master at Notre Dame, and died in 1728, aged about 75.

**LALPET**, in *Geography*, a town of Hindoostan, in the Carnatic; 74 miles N. of Arcot.

**LALSK**, a town of Russia, in the government of Volgodga, on the river Luza; 40 miles E. of Ufing. N. lat.  $60^{\circ} 50'$ . E. long.  $47^{\circ} 14'$ .

**LALSOOND**, a town of Hindoostan, in the subah of Aginere; 10 miles N. of Rantampour. N. lat.  $26^{\circ} 44'$ . E. long.  $76^{\circ} 55'$ .

**LALVITON**, a town on the W. coast of the island of Samar. N. lat.  $11^{\circ} 35'$ . E. long.  $124^{\circ} 52'$ .

**LAMA**, a town on the W. coast of the island of Celebes. S. lat.  $1^{\circ} 48'$ . E. long.  $119^{\circ} 15'$ .—Also, a town of Naples, in Abruzzo Citra; 12 miles E. of Sulmona.

**LAMA**, or *Lamas*, the title of an order of priests among

the western Tartars, on the frontiers of China, and particularly in Thibet, who are held in great veneration. Lama, in their language, is a priest or minister of religion; and Lamilla is the wife of the Lama.

About the year 1426, the bonzes of Thibet assumed the title of "Grand Lama." The most powerful among them made Lassa the place of his residence, and was acknowledged chief of all the lamas. He established the law respecting the yellow cap; for it must be observed, that there are two kinds of lamas, distinguished by red and yellow caps. His successor was the first who appointed a "typa," or prime minister, whom he entrusted with the government of his states. The next in order was the first who took the distinguishing title of "dalai-lama," by which he was raised far above the rest; for "dalai" signifies "morally and physically extended, great, and almost without bounds." The lama princes, however, were not sole sovereigns of Thibet. The dalai-lama was indebted to a prince of the Tartars of Kokonor, named Kouchi, for his sovereignty over all Thibet; and in order to continue his protection to him, he established himself, together with his troops, in the neighbourhood of Lassa. In 1714, the Eleuthes made an irruption into Thibet, committed the most horrid ravages, put a great number of the lamas to the sword, and sent several of them into Tartary, inclosed in sacks, and thrown on the backs of camels. Their king pretended to be the only and real sovereign of Thibet; and ordered the lamas to renounce their authority over the people, to retire to their monasteries, and to employ themselves only in saying their prayers. The dalai-lama lost no time to implore the protection of the emperor Kang-hi; who assembled a numerous army, and caused it to march into Kokonor, from whence he drove the king of the Eleuthes, and then entered Thibet; while another body of Chinese troops penetrated thither also by the province of Set-tchuen. The dalai-lama was re-established, and the rest of the lamas were put in possession of their pagodas. Those that remained of the troops of the Eleuthes made their escape through the defiles of the mountains; and as the reigning emperor has ever since protected Thibet, the Thibetians have nothing more to fear from the incursions of the Eleuthes, who, since 1759, have been subjects of the empire. The tribute which the sovereign of Thibet sends to the emperor of China consists generally of gold or copper statues of the god "Fo," perfumes, amber, coral, precious stones, woollen stuffs, and sword-blades. The emperor also requires from the dalai-lama a certain number of vessels or small pitchers, filled with water from the Ganges. Ever since the expulsion of the Eluth Tartars, the kingdom of Thibet is regarded as depending on the emperor of China, which they call Cathay; and at Lassa, the capital, two mandarins reside, with a garrison of 1000 Chinese to support the government; but their power does not extend far; for in reality the lama, whose empire is founded on the surest grounds, personal affection and religious reverence, governs every thing internally with unbounded authority. It is well known, that the dalai-lama is the great object of adoration for the various tribes of Heathen Tartars, who roam through the immense tract of continent which stretches from the banks of the Volga to Corea, on the side of Japan;—the most extensive religious dominion, perhaps, on the face of the globe. He is not only the sovereign pontiff, the vicegerent of the deity on earth; but as superstition has ever the greatest influence, where it is removed farthest from its object, the more remote Tartars absolutely regard him as the Deity himself. They believe him immortal, and endowed with all knowledge and virtue. They annually assemble from different parts to worship

ship and make rich offerings at his shrine; and even the emperor of China does not fail to make acknowledgments to him in his religious capacity, and actually to entertain at a great expence, in the palace of Peking, an inferior lama, deputed as his nuncio from Thibet. According to Mr. Turner's account, the Tibetians conceive of him as immaculate, immortal, omnipresent, and omniscient. They view him only in the most amiable light, as perpetually absorbed in religious duty; and when called to bestow attention on mortal beings, as employed only in the benign office of distributing consolation by his blessing, and in exercising the first of all attributes, forgiveness and mercy. He is also the centre of all civil government, which derives from his authority all its influence. It is the orthodox opinion among the votaries of the grand lama, that when he seems to die either of old age or of infirmity, his soul only quits a crazy habitation to seek another and better; and that it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears. The dala-lama, who presided in Thibet in 1774, when Mr. Bogle was commissioned by the governor-general of Bengal to visit that country, was an infant; and was discovered a few years before by the Teshoo lama, who, in authority and sanctity of character, was next to him; and, consequently, during the other's minority, acted as chief. The residence of the dala-lama is at Pateli, or Pontela, an immense palace on a mountain near the banks of the Burrampooter, about seven miles from Lassa. On this mountain there are many pagodas, in the most sumptuous of which he resides. He passes great part of his life on a kind of altar, where he sits motionless, in a cross-legged posture, on a large and magnificent cushion, and receives with the greatest gravity the adorations, not only of the Thibetians, but of a great multitude of pilgrims, who undertake long and difficult journeys to go and worship him on their bended knees, and to receive his benediction. The grand lama salutes no one; he neither uncovers nor rises up to any person, whatever his rank may be; with the same eyes he beholds at his feet the greatest princes and the meanest of his subjects. He contents himself with laying his hand on the head of his worshipper, who imagines that he obtains, by this imposition alone, the remission of all his sins. His votaries conceive, that all the divinity of "Fo" resides in him; and they ascribe to him all the attributes and prerogatives already mentioned. Their whole care is employed in discovering the place where it shall please him to be born again; and even some of the Tartar princes themselves have assailed in this interesting search; but they are obliged to be directed by certain lamas, who alone are acquainted with the signs by which the new-born god may be discovered, or rather, they only know what child the preceding dala-lama appointed to be his successor. The Teshoo-lama has several palaces or castles. The castle in which the lama resides is built of stone or brick, with many courts, lofty halls, terraces, and porticos; and the apartments are in general rocky, and highly finished in the Chinese stile, with gilding, painting, and varnish. Stair-cases and windows are conveniences to which they are utter strangers. There is no access to the upper rooms but by a sort of ladders of wood or iron; and in lieu of windows they have holes in the ceilings, with pent-house covers, contrived so as to shut up on the weather-side. Firing is so scarce, that little is used except for culinary purposes; and they trust altogether for warmth in their houses to their furs and other clothing. In the northern parts of Thibet there are gold-mines, which are the reserved property of the lama, and rented out to those who work them. Particular and discriminating respect is paid

to the sovereign lamas after their death. The bodies of these are deposited entire in shrines prepared for them, which are ever after considered as sacred, and visited with religious awe; whereas the bodies of inferior lamas are usually burnt, and their ashes preserved with great care in little metallic idols, which have places assigned them in their sacred cabinets.

The lamas, who form the most numerous as well as the most powerful body in the state, have the priesthood entirely in their hands; and besides they fill up many monastic orders, which are held in great veneration among them. The inferior gradations, from the president of a monastery, who is always styled lama, in addition to the name of the station to which he belongs, are Gylong, Tohba, and Tuppa. On the establishment of the monastery of Teshoo Loomboo, there were reckoned at that period no less than 3700 gylongs for the performance of daily service in the Goomba, or temple; and four lamas, chosen from among them, superintend and direct their religious ceremonies. (See GYLONGS.) Youth intended for the service of the monastery are received on the establishment at the age of eight or ten years, and then called "Tuppa;" at fifteen they are usually admitted into the order of "Tohba;" and from that of Tohba, if they are found, upon examination, duly qualified, they are advanced to the class of Gylongs, between the age of 21 and 24; and with sufficient interest, they may then be promoted to the superintendance of some endowed monastery, and obtain the rank of lama. The priests are habited in long robes of yellow cloth, with a conical cap of the same colour, having flaps to fall down and cover the ears. This peculiarity of colour distinguishes one of the two religious sects that divide almost the whole of Tartary, from Turkestan to the eastern limits of this continent. The other colour is red; and the tribes are known as belonging to the red, or yellow cap. The former descends principally from the sectaries of the yellow, in allowing the marriage of their priests. But the latter are considered as the most orthodox, as well as possessed of the greatest influence. The emperor of China is decidedly of this tribe, and has sanctioned his preference of the yellow colour, by a sumptuary law, which limits it to the service of religion, and the imperial use. The two sects are distinguished by the appellations of Gyllookpa and Shammar; the former having adopted the yellow colour, and the latter the red. Three lamas are placed at the head of each sect; Dala-lama, Teshoo-lama, and Taranaut-lama, preside over the Gyllookpa, who have their residence at Pootalah, Teshoo Loomboo, and Kharka. This sect prevails over the greatest part of Thibet, and a division of it is established in a province of the Deccan, called Seerra, or Sirrore. In like manner three lamas also preside over the Shammar, and have their residence in Bootan, in separate monasteries. Great contentions formerly prevailed between these sects; and the Shammar was under a necessity of retiring, and of fixing in a tract of country bordering on Thibet, towards the south, marked by a line, insupportable and intemperate in the extreme. Here they established themselves, as in a secure asylum; while others, styled Dukba, still live in tents and tend their flocks in a vagrant state. But to return from this digression.—The inhabitants of Thibet are not the only people who may attain to the dignity of lama. Tartars, and even Chinese, have aspired to the priesthood, and repaired to Lassa in hopes of obtaining it. If they can be admitted among the disciples of the grand lama, the number of whom is fixed at 200, they consider their admission as the commencement of their promotion, and the first step towards dignity and power; the subaltern grand lama being chosen from among these disciples. When

they have arrived at this dignity, they live in splendour and opulence, and are continually surrounded by a crowd of admirers, who lead them with presents. The richest and most considerable of the Tartar lamas, who inhabit Thibet, are those whom the Chinese call "Mong-fan;" they possess extensive domains to the north of the province of Yun-nan, between the beautiful rivers of Kinche-kiang and Vou-leang. These lands were granted to them by Oufan-guei, who became master of Yun-nan, when the Mantchew Tartars subdued China, in order to bring them over to his party, and that by their means he might gain the support of all the lamas of Thibet. Although the Mantchew Tartars had never any lamas, they no sooner undertook the conquest of China, than they protected them openly through policy; and soon after, government caused magnificent pagodas to be erected for them. The example was followed by a great number of princes, princesses, and wealthy people, who vied with one another in zeal for building temples for them, and thus the lamas greatly multiplied in China. They are also rich there; for most of these lamas appear in public in vestments of red and yellow satin, ornamented with the most valuable furs. They are all mounted on excellent horses, and followed by a number of domestics, corresponding to their rank as mandarins; for the emperor permits them to carry a cushion and the other badges of dignity which belong to the quality of mandarin. The lamas of Thibet are less magnificent in their dress; wearing only a napped kind of woollen stuff, called in China "poulou," which is used for covering seats, because it generally lasts long and retains its colour. Besides a cap, the lamas have several bonnets, or tiaras, that are the distinguishing marks of the different degrees of honour to which they have arrived. The cap, which strikes the European most, very much resembles a bishop's mitre: it is worn by them on horseback as well as on foot. The obligations which the office of lama imposes are neither few nor trifling; but there is not one among them who engages to discharge them all. They divide and share the burden. One takes the charge of observing one precept, and another obliges himself to practise another. They have also certain common prayers, which they chaunt in a very agreeable manner; and they are obliged to renounce the vanities of the world, to live in celibacy, and to have no concern in trade or commerce.

The lamas are extremely superstitious, and much addicted to magic. Großer's China, vol. i. Phil. Trans. vol. lxvii. part ii. Turner's Account of an Embassy to the Court of the Teshoo Lama, in Thibet, 1806.

LAMALMON, in *Geography*, a lofty mountain and spacious district of Abyssinia, where is the pass through which the road of all caravans to Gondar lies; and where they take account of all baggage and merchandise, which they transmit to the Nagadé Ras, or chief officer of the customs at Gondar. Here is also levied, with great rigour, and for the most part with injustice, a payment due to the proprietor of the ground. From its base this mountain has the appearance of being sharp-pointed; but on the top of it is a large plain, called Lama, part laid out in pasture, but the greater part bearing grain. It abounds with springs, and seems to be the great reservoir from which arise most of the rivers that water this part of Abyssinia. A multitude of streams issue from the summit in all directions; the springs boil out from the earth in large quantities, capable of turning a mill. They plough, sow, and reap here at all seasons; and the husbandman must blame his own indolence, and not the soil, if he has not three harvests. In one place, says Mr. Bruce, we saw people

busy cutting down wheat; immediately next to it, others at the plough; and the adjoining field had green corn in the ear, and a little further, it was not an inch above the ground. Lamalmon is on the N.W. part of the mountains of Samen: that of Gingerohla, with two pointed tops, joins it on the north; but neither Lamalmon nor Gingerohla, though higher than the mountains of Tigre, are equal in height to some of those of Samen. The mercury in the barometer on the top of Lamalmon stood at 20½ English inches. The language of Lamalmon is Amharic; but there are many villages where the language of the Falaha is spoken. These are the ancient inhabitants of the mountains, who still preserve the religion, language, and manners of their ancestors, and live in villages by themselves. Their number is considerably diminished, and they are now wholly addicted to agriculture, hewers of wood, and carriers of water, and the only potters and masons in Abyssinia. In general they live better than the other Abyssinians, which they, in revenge, attribute to their skill in magic, not to superior industry. Their villages are generally strongly situated out of the reach of marching armies, or otherwise they would be constantly rilled, partly from hatred, and partly from hopes of finding money. The river Macara is the boundary between Lamalmon and Waggora; and the latitude of some small villages called Macara was 13 6' S. Bruce's Travels, vol. iii.

LAMANON, ROBERT PAUL, in *Biography*, a member of the Academy of Sciences at Paris, and member of the Museum in the same city, was born at Salon, in Provence, in 1752, of an old and respectable family. He was destined for the church, and sent to Paris to complete his theological studies. He rose to the dignity of canon, but by the death of his father and elder brother he came into property, which enabled him to follow the bent of his inclinations, by devoting himself to the physical sciences. He travelled through Provence and Dauphiné, and scaled the Alps and Pyrenees: "at the sight of these vast natural laboratories the bent of his mind burst forth instantaneously; he climbed to the summit of rocks, and explored the abyss of caverns, weighed the air, analysed specimens, and, in this ardent fancy, having attained the secrets of creation, he formed a new system of the world." Upon his return home, he applied with great ardour to the study of meteorology, natural philosophy, and the other branches of the history of nature. He spent three years at Paris, and gave to the learned societies there many very valuable papers, particularly a memoir on the Cretans, a memoir on the theory of the winds, and a treatise on the alteration in the course of rivers, particularly the Rhone. He again visited Switzerland and Italy, going first to Turin, where he allied himself to the learned of that country; after his return, laden with the spoils of the countries which he traversed, he employed himself in the arrangement of the interlocking fruits of his journey. It was at the time when Lamanon was preparing for the press his great work on the "Theory of the Earth," that the French government conceived the vast project of completing the discoveries of captain Cook: the Academy of Sciences was entrusted with the care of selecting men capable of rectifying the common notions of the southern hemisphere, of improving hydrography, and advancing the progress of natural history; they invited, at the recommendation of the illustrious Condorcet, Lamanon to share the danger, and to partake in the glory, of this great enterprise. He eagerly caught at the offer, haled to Paris, refused, in a conference with the minister, the salary offered him, and taking a hasty leave of his friends, departed for Brest. On the 11th of August,

1785, the armament fell under the orders of La Perouse, an experienced commander: the commencement of the voyage was highly prosperous. After some delays, and having embraced every opportunity of making observations, the vessels arrived at the island of Maouina, one of the southern Archipelago. Lamanon, eager to assure himself of the truth of the accounts of that country, debarked with Langle, the second in command. Having explored the place, and being upon the point of returning, they were attacked by the natives; a combat ensued, and they, with several of the boat's crew, fell a sacrifice to the fury of these barbarians. Thus perished Lamanon, a young man ardent in the pursuits of science, disinterested in his principles, and a zealous advocate for the interests of freedom. His eulogist, M. Ponce, said of him, "that he seemed born to bring about a revolution in science; the depth of his ideas, the energy of his character, the sagacity of his mind, united to that lively curiosity, that can draw instruction out of every thing which he saw, and which leaves nothing unexplored, would have led him to the most valuable discoveries."

LAMANTEA, in *Geography*, a town of Naples, in Calabris Citra; 12 miles S.W. of Cofenza.

LAMARCKIA, in *Botany*, is a cryptogramic, and, in every sense, very obscure genus of marine plants, founded by the Abbate Joseph Olivi, in his *Zoologia Adriatica*, an Italian work in quarto, published at Bassano in 1792, and treating of various matters relative to the natural history of the gulf of V-nice. What relates to the present genus is copied into Ulteri's *Annalen*, &c. 7. 76. It was named in honour of the celebrated French botanist John Baptit Monet, Chevalier de la Marck, who, since the French revolution, has adopted *Lamarck* as his surname. His indefatigable application and skill in the science of botany, are evinced by his *Dictionnaire*, and his *Illustration des Genres*, so often quoted by us. He has, however, for some time withdrawn himself from the former work, devoting his attention to conchology. Of his claims to botanical commemoration, there can be no doubt; but he has already received this reward of his labours, in the *Monetia* of L'Heritier, adopted in Willdenow, Sp. Pl. v. 1. 669, and the new edition of Hort. Kew. v. 1. 264; nor can we on any occasion consent to the unauthorised and truly foolish contrivance, of naming two different genera after one and the same person. If we retain the *Butea* of Koenig, for instance, it must be in honour of the late marchioness of Bute, not of the first earl, already justly immortalized in the *Stuaritia* of Linnæus. It is however extremely probable that Olivi might be ignorant of the *Monetia*; or he might prefer for it the name *Azima*, subsequently given by Lamarck himself, but whose meaning we know not. See his *Diët.* v. 1. 343.

The *Bursa marina* of Cæsalpinus and Bauhin, and the *Vermilura retusa* of Imperato, have given occasion to the establishment of the present genus, whose character is thus given by Olivi.

Plant rooted, somewhat coriaceous, soft, composed of minute bladders, perpendicular to the axis, which are membranous, green, cylindrical, approximated, terminating at each end in very slender, tubular, connecting filaments. *Frustrification* consisting of small globes, scattered among the bladders and filaments.

The species are

1. *L. Bursa*. Pouch Lamarckia. (*Alcyonium Bursa*; Linn. Syst. Nat. v. 1. 1295. Pallas Zooph. 352. *Bursa marina*; Cæsalp. 608. Bauh. Pin. 368. *Fucus Bursa*; Tern. Hist. Fucor. v. 3. 6. t. 136. Engl. Bot. t. 2183.)

—Globose, depressed, hollow, with fine, scattered, internal threads.—Found in the sea in various places, especially upon limestone rocks, most commonly attached by its roots to some small calcareous fragments. "Each plant is a hollow spongy ball, from one to ten inches diameter, green, composed of entangled, pellucid, jointed fibres, bearing numerous concentric oblong vesicles, whose obtuse summits, reaching to the outside of the ball, give it a papillary or velvety appearance. Such at least was the structure of the specimens described in Engl. Bot. nor have we found the bladders connected at each end with the filaments. The roots were attached to fragments of shells. No fructification could be detected, and the plant was referred to *Fucus*, after Mr. Turner's example, merely till the whole subject of submarine plants should be better understood. Olivi says, that when cut it contracts mechanically, by means of the internal fibres, which he supposes gave rise to the opinion of its being an animal, or *Alcyonium*."

2. *L. Vermilura*. Branching obtuse Lamarckia. *Vermilura ritula*; Imperat. Hist. Nat. 646. *Ulva decorticata*; Woodw. Tr. of Linn. Soc. v. 3. 55.)—Branched, somewhat forked, cylindrical, and obtuse.—Native of the Mediterranean sea, in deep water.—This has the form of *Fucus loreus*, with a resemblance in its surface and colour to *F. tomentosus*. Mr. Woodward, who saw but one specimen, brought from the Mediterranean, found great difficulty in settling its genus. Its structure resembles an *Ulva* stripped of the cuticle. There can be little doubt of its generic affinity to the above. S.

LAMARCKIA is also the name of a genus established by Moench, and adopted by Decandolle in his new edition of Lamarck's *Flora Française*, v. 3. 30, as well as by Bivona Bernardi, in his *Secularum Plantarum, Centuria 1*, n. 46. This genus consists of one species only, as far as we are informed on the subject, which is *Cynofurcus aureus* of Linnæus, figured in the *Flora Græca*, t. 79, a beautiful grass, but we are at a loss to imagine any character by which it can be separated from *Cynofurcus*; see that article.

A New Holland shrub, belonging to *Tetrandria Monogynia*, has been called *Lamarckia dentata*, in Donn's *Hort. Cantabr.* ed. 5. 32. We are not acquainted with its characters, but presume it is what some have named *Hoya ferrata*.

LAMAS, in *Geography*, a town of Portugal, in the province of Tras los Montes; 18 miles S.W. of Braganza.—Also, a town of Spain, in Galicia; 15 miles E.S.E. of Lugo.—Also, a town of Peru, in the diocese of Truxillo; 180 miles E.N.E. of Truxillo.

LAMB, in *Agriculture*, a general name applied to the young of the sheep kind. When lambs come early in the season, great care should be taken to keep them dry and warm, as well as to provide a plentiful supply of food for the ewes, and always to let them have the driest pastures, as without due attention to such circumstances, much loss will frequently be sustained by their dying, or remaining long in a weakly state, almost without growth.

It is observed by Mr. Young, that "there is no business on a farm that demands more care, attention, and assiduity," than that of ewes in lambing season. "As soon as the farmer looks for the ewes beginning to lamb, they ought, he thinks, every night to be folded in the standing littered fold, on one side of which there should be a small cottage hut, built to be warm, with a chimney and stove for heating milk, and a bed for the shepherd to lie down upon. Here he is to sleep through the lambing season, that he may be ready to watch, assist, and tend any ewes that he sees very near lambing,

ing, and, if necessary, to give the lamb some warm cow's milk. Some of the considerable Norfolk farmers, have, he observes, these huts on four wheels, to draw about with the flock wherever they may be; but to have one littered and well sheltered standing-fold, on a moderate farm, and two or three conveniently placed on a large one, to take the flock to, without any distant driving, is, he supposes, far preferable to that method. And he advises, that upon inclosed farms, where the reserve of roun may be supposed to be much greater than is generally possible on flock-farms, the sheep, as they drop their lambs, should be drawn from the flock of ewes, and put to this food, upon which an entire reliance may be had; and that it should be remembered, that all turnips should be consumed in February, which circumstance proves the vast importance of reserved grafs as a substitute. Towards the close of July the lambs of the flock should be weaned; in this business, it is noticed, that they are much earlier in Suffex, than in Suffol. And that "clover in blossom is, of all other food, the most forcing; faintfoun roun excellent; and if the farmer has neither, he ought to have made a reserve of a sweet good bite of fresh grafs for them;" and that it is essential that due provision should have been made before this period. See SHEEP.

**LAMB-house**, in *Rural Economy*, by the farmer the common name of the place where lambs are fattened. It is sometimes termed fuckle. A proper rack and trough should be fixed up in it. See **LAMB fackling**.

**LAMB-fuckler**, a common name applied to the person who practices or carries on the business of fattening house-lamb. See the next article.

**LAMB-fackling**, a name used to signify the art of fattening house-lamb.

It has been observed by the author of the *Agricultural Report of the County of Middlefex*, that, in the performance of this business, the ewes which begin to lamb about Michaelmas, are kept in the close during the day, and in the house during the night, until they have produced twenty or thirty lambs. These lambs are then put into a lamb-house, which is kept constantly well littered with clean wheat straw; and chalk, previously baked in the oven, both in lump and in powder, is provided for them to lick, in order to prevent looseness, and thereby preserve the lambs in health. As a prevention against gnawing the boards, or eating each other's wool, a little wheat straw is placed, with the ears downwards, in a rack within their reach, with which they amuse themselves, and of which they eat a small quantity. In this house they are kept, with great care and attention, until fit for the butcher. The mothers of the lambs are turned every night, at eight o'clock, into the lamb-house to their offspring. At six o'clock in the morning, these mothers are separated from their lambs, and turned into the pastures; and at eight o'clock such ewes as have lost their own lambs, and those ewes whose lambs are sold, are brought in, and held by the head till the lambs by turn suck them clean: they are then turned into the pasture; and at twelve o'clock the mothers of the lambs are driven from the pasture into the lamb-house for an hour, in the course of which time each lamb is suckled by its mother. At four o'clock all the ewes that have not lambs of their own are again brought to the lamb-house, and held for the lambs to suck; and at eight the mothers of the lambs are brought to them for the night. And where an ewe gives more milk than her lamb will suck, the superabundance is given to the twins, or to any other lamb whose mother may not be able to furnish it with sufficient food. The shepherd must in this case hold the ewe, or she would not suffer the strange lamb to suck. From their timid nature, it is extremely essential

that they should be kept free from every species of unnecessary disturbance. This method of suckling is, it is observed, continued all the year. The breeders select such of the lambs as become fat enough, and of proper age (about eight weeks old) for slaughter, and send them to market during December, and three or four succeeding months, at prices which vary from one guinea to four, and the rest of the year at about two guineas each. This is severe work for the ewes, and some of them die under excess of exhaustion. However, care is taken that they have plenty of food: for, when green food, *viz.* turnips, cole, rye, tares, clover, &c. begins to fail, brewer's grains are given them in troughs, and second-crop hay in racks, as well to support the ewes, as to supply the lambs with plenty of milk; for if that should not be abundant, the lambs would become flunted, in which case no food could afterwards fatten them. It is remarked, that grains were first given to ewes by the late Mr. Naylor, of this county, and that he also was the first person who pulled out all the remaining front teeth of a broken mouthed ewe; observing that they fed much better without teeth than with the loss of one or two.

The ewes for this purpose should be kept free from the foot-rot and scab; and if they have any pitch-mark on them when they lamb, it must be cut off before the lambs be taken into the house, or they will eat it, and thereby greatly prejudice their future growth.

And these ewes are always, the author of the *Middlefex Report* says, without exception, of the Dorsetshire breed; and even of these there is not more than one in three that will lamb sufficiently early for the purpose of house-lamb. The early lambing ewes are sought for by the breeders of this county with great diligence throughout the county of Dorset, and at the fairs where such flock is usually sold. The prices vary from 35s. to 42s.

Such lambs as can be warranted of a fair complexion after being butchered, are held in the highest esteem, which those bought promiscuously in Dorsetshire, or at the fairs, cannot be: this preference induces those breeders and sucklers who are in the secret, to select rams which they can depend on for getting lambs whose meat shall be of that quality. The sucklers, salefmen, and butchers of London, he asserts, are aware that such lambs as have sharp barbs on the inside of their lips are certainly of a deep colour after being butchered; and all those whose barbs are naturally blunt do as certainly produce fair meat. This knowledge has been the occasion of many lambs of the latter kind being kept for rams, and sent into Dorsetshire, expressly for the purpose of improving the colour of the flesh of the house-lambs. The issue of such rams can generally be warranted fair, and such meat always sells at a higher price: hence he supposes arose the mistaken notion, that Middlefex rams were necessary to procure house-lambs. And it has been further observed, that, "in order to conduct this sort of fattening with profit and success, a lamb-house or fuckle of proper dimensions must be provided." And that, "it is found from practice, that a range of building from sixty to seventy feet in length, and fifteen or eighteen in breadth, with three or more coops or divisions of different sizes at each of the ends, for separating the lambs according to their ages, is sufficient for containing and conducting the business of from one hundred and sixty, to one hundred and eighty lambs. That the lambs may be enabled to find their mothers with facility, the ewes, when they are separated from them, should be kept apart with deal hurdles in the middle of the house, so that they may be convenient for the lambs in the coops at the ends.

But this is a practice which can only be undertaken with advantage,

advantage, in situations at no great distance from large towns, where there is great demand for early lamb; as upon their being ready at an early period, as towards the latter end of December, depends the great profit to be derived from the tyllen.

The principal objects in this sort of management are those of attending to the regular feeding of the ewes, the varying of their food with propriety, and keeping the house perfectly warm, clean, and sweet, so that the process of fattening may proceed in a regular manner without any check being sustained.

The writer of the Middlesex Report observes, that a friend of his, who is well acquainted with the subject, says, the farmers of Middlesex do not now rear half so many house-lambs as they did about forty years ago. In Surrey they are likewise falling off. The suckling system is removing to a greater distance from the metropolis, to which place many fat lambs are now sent alive, in light four-wheeled covered carriages.

LAMB, *Grass*, the name of such lamb as is principally fattened while the ewes are at grass, or other kinds of green food. In the Report of Middlesex, it is remarked, that the vicinity of Smithfield market, makes early grass-lambs an object of considerable importance to the farmers of that county. The Dorset ewes are chiefly selected for this purpose. They are purchased at Weyhill, Kinglton, and other fairs, forward enough to drop their lambs in January. The price from 30s. to 35s. The breeders keep the ewes and lambs principally on turnips and second-crop hay. They sell the lambs in the months of April and May, fat, at from 25s. to upwards of 35s. each. The ewes, being dried early, are fattened and brought to market about Michaelmas, and sold at the same prices. The wool is about three pounds, which, at 10*s.* amounts to 2*s.* 6*d.* The whole of the flock is cleared within the year, and the profit or loss thereby ascertained. The account in general is as follows:

Statement.			
The lamb sells for	-	-	1 10 0
The ewe for	-	-	1 10 0
The wool at 2 <i>s.</i> 6 <i>d.</i> or	-	-	0 2 0
Together			3 2 0
Deduct prime cost			1 12 0
Remains the increase of a ewe in one year			1 10 0

LAMB, *House*, a term applied to that sort of lamb that is fed and fattened in houses constructed for the purpose. The principal art in this business, as has been seen above, is to have the lambs such as will turn out of a fair delicate colour on being killed, and having them ready at an early period of the season. See LAMB-SUCKLING.

LAMB-*Earth*, in *Husbandry*, is a whitish stony loam. The name seems only a corruption of the word *loam-earth*.

LAMB *Head*, in *Geography*, a cape of Ireland, forming the northern point of the entrance to Kenmare river, in the county of Kerry. N. lat. 51 41'. W. long. 10° 1'.

LAMB *Head*, a cape on the S.E. coast of the island of Stronfa, one of the Orkneys. N. lat. 58° 57'. W. long. 2° 25'.

LAMB *Island*, a small island of Scotland, in the mouth of the Forth; one mile N.N.W. from North Berwick.

LAMB'S *Lectuce*, in *Gardening*, the common name of an early, well-known, herbaceous plant. See VALESIANA.

LAMB, *Paschal*. See PASCUAL.

LAMBA, in *Geography*, one of the smaller Shetland islands, between Shetland and Yelle. N. lat. 60 45. W. long. 1° 39'.

LAMBALE, a town of Africa, in the country of the Foulis, on the Senegal; 75 miles S.E. of Goomal.

LAMBALLE, a town of France, in the department of the Northern Coasts, and chief place of a canton, in the district of St. Brienc. The place contains 3803, and the canton 12,685 inhabitants, on a territory of 225 kilometres, in 14 communes.

LAMBAN, a town of Asia, in the country of Guriel, on the Black Sea; 50 miles S.W. of Cotatis.

LAMBANESS, a cape on the N.E. coast of the island of Unli. N. lat. 61 10. E. long 1 4'.

LAMBANLAOTE, a small island on the east side of the gulf of Bothnia. N. lat. 61° 39'. E. long. 21 15'.

LAMBASSA, in *Ancient Geography*, a town of Africa, in Numidia, which became an episcopal see.

LAMBATIVES, or rather LAMBITIVES, in the *Materia Medica*, a form of medicine to be licked off the end of a liquorice-stick.

Lambatives amount to the same with *linzuses, lobocks, and cecemata*.

LAMBAY, in *Geography*, an island belonging to the county of Dublin, Ireland, situated in the Irish sea; 2 miles east from the Mainland. It is about three miles in length, and 14 mile in breadth, and is remarkable for vast quantities of rabbits and sea-fowl. Crabs, lobsters, and oysters are taken in great plenty; and abundance of kelp is made on it. N. lat. 53° 30'. W. long. 6. Carliste, &c.

LAMBAYQUE, a town of the vice-royalty of Peru, and capital of the jurisdiction of Sana. in the diocese of Truxillo, in a pleasant and fertile situation, and containing about 1500 houses, some of which are built of brick, some of cane and plaiter, and others altogether of cane. The inhabitants amount to about 8000; some are opulent; but the greater number consists of poor Spaniards, Mulattoes, Mestizos, and Indians. The parish church, constructed of stone, is large and beautiful, and splendidly adorned. It has four chapels, called "Ramos," with an equal number of priests. This town is the residence of a corregidor, who has many other towns under his jurisdiction. It is washed by a river of the same name, 95 miles W.N.W. of Truxillo. The high road from Piura to Lima passes through this town. Some wine is made in the vicinity, and the poor are occupied in weaving coarse cotton cloths. S. lat. 6 40'. W. long. 79° 56'.

LAMBDOIDES, in *Anatomy*, the future connecting the occipital to the two parietal bones, and so named because it consists of two lateral divergent branches like those which compose the Greek capital lambda. See CRANIUM.

LAMBECIUS, PETER, in *Biography*, was born at Hanburgh in 1628, where he received the early part of his education, and from whence he proceeded to the universities of Holland and France to pursue and complete his studies. He made great progress in polite literature and the law, and at the age of nineteen he became known by a work on Aulus Gellius. He was elected licentiate-in-law at Toulouse; he spent two years at Rome with cardinal Barberini; and on his return to Hanburgh he was appointed to the professorship of history in 1652; and in 1660 was made rector of the college in that city. He was rendered extremely uneasy by being charged with scepticism, and by the temper of his wife, whom he had married probably because she was rich, but who refused to let him share in her abundance. In 1662, he therefore abandoned his family and country, and went first to Vienna, and from thence to Rome, where he

was favourably received by Christina, queen of Sweden, and pope Alexander VII. He now openly abjured Lutheranism, and declared himself a Catholic, to which religion he had been converted many years before. Returning to Vienna, he was appointed sub-librarian, and then librarian-in-chief to the emperor, in which post he died in 1680. Lambæcius was author of many works, as "Origines Hambergensis," in 4to.; "Codmæ et alterius anonymi excerpta de Antiquitatibus Constantinopol." Greek, with a Latin version and remarks, fol. 1655; "Prodrus Historiæ Litterariæ," fol.; "A Collection of Latin Discourses on various Occasions," 4to. 1666; but the most laborious of his performances was entitled "Commentariorum de Augusta Bibliotheca Cæsaria Vindobonensi," in eight volumes, folio. This work contains a history of the imperial library at Vienna, with a descriptive catalogue of its numerous MSS. upon a critical and historical plan. Moreri. Bayle.

LAMBERT FIRE. See FIRE.

LAMBERT, ANNA-TERESA DE MARGUESOT DE COCKELLES, *Marchioness of*, in *Biography*, a celebrated literary lady, was born at Paris in 1647. Her father died while she was an infant, and her mother took for a second husband M. Bachaumont, who was exceedingly careful to cultivate the promising talents of his daughter-in-law. She married Henry Lambert, marquis of St. Brie, in 1666, who died in 1686, leaving her with one son, and a daughter. She was involved in tedious law-suits, which, by her great address, were brought to a happy conclusion. When she felt herself unembarrassed, and mistress of a considerable estate, she fixed her residence at Paris, and devoted herself to letters, and the society which cultivated them. The latter days of this lady were crowded with sufferings, which the consolations of religion enabled her to endure with fortitude. She died at a very advanced age in 1733. Her principal works are "Les Avis d'une Mère à son Fils; et d'une Mère à sa Fille;" "Nouvelles Reflexions sur les Femmes, ou Métaphysique d'Amour;" "Traité de l'Amitié." Of these, and of her other works, the style is elegant, and the thoughts ingenious. The "Advice" to her children breathes all the tenderness of a parent, joined to the correctness of sentiment of a philosophical moralist. The heart of Madame de Lambert was as warm as her understanding was enlarged; she served her friends with zeal, and delighted in acts of generosity.

LAMBERT, FRANCIS, a French monk, who quitted his convent to embrace the reformed religion, descended from a noble family, was born at Avignon in the year 1487. At the age of fifteen he entered himself among the Franciscan friars, and continued in the community twenty years; during which time he acquired celebrity as a preacher, and was made general of the order. He was a thoughtful man, and a diligent enquirer after the truth; and in the course of his investigations he saw reason to renounce the doctrines of the Catholic church, and to adopt those of the Reformation. He, of course, found it necessary to withdraw from his native country, and in 1522 he went into Switzerland. He became a popular preacher among the Protestants, and having continued some time at Basil, he set out for Wittemberg to visit Luther, in the year 1523. With that eminent reformer he grew into high esteem, and it was determined he should go to Zurich, to assist in disseminating the principles of the reformation through France. The project was abandoned, and he was settled in some employment in the university of Wittemberg, where he most probably continued till the year 1526. In the following year he was appointed divinity-professor at the university of Marburg, and in 1530

he died at the age of forty-three. He was author of commentaries on almost all the parts of the Old and New Testament, and of many theological and controversial pieces. Bayle. Moreri.

LAMBERT, JOHN HENRY, an eminent mathematician and astronomer, was born at Muhlhausen, in the Sundgaw, a town in alliance with the Swiss cantons, Aug. 29th, 1728. His father was by trade a stay-maker, and with difficulty provided for the wants of his family. Having no better prospects for his son than by bringing him up to his own business, he endeavoured to obtain for him an education suitable to his situation, and sent him to a public school, where he was taught the rudiments of learning, at the expense of the corporation, till he was twelve years old. Here he distinguished himself among his school-fellows, and some attempts were made to provide him with the means of studying theology as a profession. Encouragement sufficient for the purpose could not be obtained, and he was under the necessity of relinquishing all thoughts of a studious life, and obliged to begin learning his father's trade. Though occupied all the day, yet he devoted a considerable part of the night to the prosecution of his studies; and to furnish himself with candles, he sold for half-pence or farthings small drawings which he delineated while employed in rocking his infant sister in a cradle. He met with an old book on the mathematics which gave him inexpressible pleasure, and which proved that he had a genius for scientific pursuits. Seeing the turn which the young man had for knowledge, several learned men afforded him assistance and advice, and they had the pleasure of finding him improve, under their patronage, with a rapidity beyond their most sanguine expectations. He was now taken from the drudgery of the shop-board, and M. Iselin, of Basil, engaged him as his amanuensis, a situation which afforded him an opportunity of making further progress in the belles-lettres, as well as philosophy and mathematics. In 1748, his patron recommended him to baron Salis, president of the Swiss confederacy, to become tutor to his children, in which office he gladly engaged. His talents as a philosopher and mechanic began to display themselves in his inventions and compositions. After living eight years at Coire, he repaired, in 1756, with his pupils, to the university of Göttingen, where he was nominated a corresponding member of the Scientific Society in that place, and from thence he removed, in the following year, to Utrecht, where he continued twelve months. In 1758, he went with his pupils to Paris, where he acquired the esteem and friendship of D'Alembert and Messier; and from thence he travelled to Marcellis, where he formed the plan of his work "On Perspective," which he published in the following year at Zurich. In 1760, he published his "Photometry," and was elected a member of the Electoral Bavarian Scientific Society. Lambert was author of many other pieces besides those which have been already mentioned: among these were his "Letters on the Construction of the Universe," which were afterwards digested, translated, and published under the title of "The System of the World." In the year 1764, he made an excursion to Berlin, where he was introduced to Frederick II., who, sensible of his great services to science, gave directions to have him admitted a regular member of the academy; this appointment enabled him to devote himself wholly to the pursuit of his favourite studies. He enriched the transactions of several learned societies with his papers and treatises, some of which he published separately. He died Sept. 25th, 1777, when he was in the 50th year of his age. Most of his mathematical pieces were published in a collective form by himself in three volumes, in which almost every branch

of mathematical science has been enriched with additions and improvements. Eulogy prefixed to "The System of the World." London, 1800.

LAMBERT, JOHN, a distinguished general on the side of parliament during the civil wars of Charles I., was defended of a good family, and was, at the commencement of the troubles, a student of law. He had a superior command at the famous battle of Naseby, and on account of his skill and prowess he became a favourite of the independent party, who endeavoured to obtain for him the lieutenancy of Ireland, but the Presbyterians carried it against him in favour of Waller. He was confined in by Cromwell, to whom he was considered as second in rigour and military talents, and whom, it is said, he equalled in ambition. He opposed the project of making Cromwell king, though he had a great hand in placing him protector at the head of the state. He fell into disgrace, and retired with a pension to Wimbledon, where he employed himself in cultivating his garden; but upon the death of the protector he returned to public life, and was extremely useful to the party of Richard. Monk was the great rival of Lambert, and as the former was successful, the latter was not only humbled, but made prisoner and committed to the Tower. At the restoration, he and Sir Henry Vane were excepted from the act of indemnity: he was brought to trial and condemned, but by humble submission he was relieved at the bar. He was banished to Guernsey, where he survived forty years. Hume.

LAMBERT, GEORGE, was among the first English artists who obtained celebrity upon the revival, (if it may be so called), of painting in this country; which now stands so justly exalted in arts as well as arms, among the nations of Europe.

Lambert's taste led him to admire and to imitate the style of Gaspar Poussin in landscape; and he has produced several works of considerable merit; which, if they have not the brilliancy and force of Gaspar, are rich, and abound with beauties of a gentler kind. He also painted scenes from common nature, and at the Foundling hospital may be seen one he presented to that institution, which is deserving of very great praise. He was engaged to paint scenes for the play-houses, for which his pencil was peculiarly qualified, and, in concert with Scott, painted six large pictures of their settlements for the East India Company, which are placed at their house in Leadenhall-street. He died in 1765.

LAMBERT, MICHEL, was the favourite singing maller, and composer of songs in France, about the middle of the seventeenth century. He had for many scholars, that he was obliged to teach a considerable number at a time, and at his own house, where he formed a kind of academy, and where he finished every lesson with singing, to his own accompaniment, several songs to a brilliant and enraptured audience. Marcel, the celebrated dancing-maller, did the same, dancing with his best scholars at the end of the lessons which he gave at home on his public days. The reputation of Lambert, like that of Abelard, was so great, that his pupils followed him into the country as far as Puteaux, where he had a villa. Lulli married the daughter of this musician, who was born in 1610, and died in 1669.

LAMBERT, ABBÉ DE ST. BERTIN, in 1095 taught grammar, dialectics, theology, and music.

These sciences, at that time, were equally respected, music having no other object than the praises of the divinity.

LAMBERT, DE, SAINT, published, in 1702, "Les Principes du Clavecin," or Instructions for the Harpsichord, containing a clear explanation of all that concerns the clavier, or keys, in their rotation on that instrument; and "A Treatise of Accompaniment," for many instruments. St. Lambert,

in his instructions for the harpsichord, proposes the reducing all clefs to one, in order that the two hands should play from the same clef. Montclair has new-modelled this system, to adapt it to the five lines, or flaff, and general compass of the voice; and the abbé de la Cassagne, in his Elements of Singing, has adopted this system and extended it. The basis of which being nothing more than transposition, it is now become wholly useless, by the clear and simple manner in which music is taught, that is, without transposition, and by playing every thing just as it is written. Thus M. Laborde's account of these publications, in which he seems not to know, that the plan of abolishing all clefs but one, belongs not to any of the gentlemen who have published it in France, but to our countryman Salmon, who, in the time of Charles II. published "An Essay to the Advancement of Music, by casting away the Perplexity of different Clefs, &c." and when M. Laborde says, that such a reformation is not wanted, because music is now taught in so clear and simple a manner, as to render all clefs but the treble and base used in harpsichord pieces unnecessary; that intelligent author forgets to tell us how performers on keyed instruments are to be enabled to play, from the score of a chorus for voices and instruments, in which the vocal-parts and many of the instrumental are all written in different clefs. But for a further discussion of this subject, see the article CLEF.

LAMBERT, in *Geography*, a town of Canada, on the river St. Lawrence. N. lat. 45° 34'. W. long. 73 14'.

LAMBERT Bay, a bay on the N.E. coast of the island of St. Christopher; two miles S.W. of Maddy Point.

LAMBERT'S Point, a cape of the island of Barbadoes, on the W.S.W. coast.

LAMBERT'S Blaz. See AZURE, and BLUE ultramarine.

LAMBERTIA, in *Botany*, received its name from the writer of the present article, in honour of his highly valued friend Aylmer Bourke Lambert, esq. F.R.S. and F.A.S. a vice-president of the Linnæan Society, one of the most ardent and experienced botanists of the present age, whose ample herbarium and library are ever open to the cultivators of his favourite science, as his heart is to the best feelings of friendship.—His botanical treatise on *Cinchona*, his sumptuous work on the Fir tribe, and his various essays in the Transactions of the Linnæan Society, are amply sufficient to assert his claim to the honour in question.—Sm. Tr. of Linn. Soc. v. 4 214. t. 20. Cavan. Ic. v. 6. 31. Brown Tr. of Linn. Soc. v. 10. 187. Prodr. Nov. Holl. v. 1 386. Art. Hort. Kew. ed. 2. v. 1. 241.—Class and order, *Tetrandra Monogynia*. Nat. Ord. *Aggregata*, Linn. *Protea*, Juss.

Gen. Ch. *Cal.* Involucrum of many oblong, imbricated, coloured leaves, the inner ones gradually the largest, containing from one to seven flowers, deciduous. Perianth none. *Cor.* Petals four, coloring at the base, linear-lanceolate, equal, revolute from above their point of union bearing the stamens. Nectary of four glandular scales at the base of the germen, sometimes united. *Stam.* Filaments none; anthers four, sessile at the inner side of the revolute-part of each petal, linear, at length recurved. *Pist.* Germen superior, turbinate, fringed at the top; style thread-shaped; stigma rather thicker, prominent, awl-shaped, furrowed. *Peric.* Follicle roundish-wedge-shaped, somewhat woody, more or less horned or tubercular, of one cell. *Seeds* two, orbicular, compressed, each encompassed with a rounded wing. *Common receptacle* flat, without scales.

Ess. Ch. Petals four, coloring, spirally revolute, bearing the stamens. Nectary of four scales. Stigma awl-shaped. Follicle woody. Seeds two, bordered. Involu-

erum of many leaves, imbricated, coloured, deciduous. Receptacle flat.

Obs. We have borrowed several corrections of the original characters of this genus, from the able performance of our friend Mr. R. Brown, published in the Transactions of the Linnean Society, v. 10, illustrative of this whole natural order of *Proteaceæ*. If we differ from him in terming *corolla* what he calls *calyx*, it is a matter of opinion, attended with much doubt. The late Mr. Dryander, however, agreed in this point with us.

One species of *Lambertia* only was originally known, the *formosa*, to which Mr. Brown adds three others. We shall give them in the order he has chosen. He remarks, that "they are all very beautiful shrubs, with whorled branches. The leaves are three in a whorl, mostly undivided, entire. Involucrum terminal, solitary, coloured, mostly seven-flowered, rarely single-flowered; in the former case the flowers are ranged in two whorls, corresponding with the disposition of the foliage, and having an odd terminal one; hence it is probable some species with four flowers only may exist. The foliole is almost wedge-shaped, furnished at the edges, upwards, with points, sometimes elongated into horns, and sometimes the sides are armed with prominences."

1. *L. uniflora*. Brown Tr. of Linn. Soc. v. 10. 158.—"Flowers solitary in each involucre. Leaves obovate, with a point, smooth, reticulated. Follicle pointed at one side, without horns."—Gathered by Mr. Brown in Lewin's Land, on the fourth coast of New Holland, growing about rocky inlets, near the shore.

2. *L. inermis*. Ibid.—"Flowers seven in each involucre; twice as long as its inner leaves. Style smooth. Follicles pointed at one side, without horns. Leaves oblanceolate or obovate, pointless."—Native of the stony sides of hills in Lewin's Land.—*L. formosa*, var. *longifolia*, Andr. Repert. t. 69, agrees in most respects with this, though not cited by Mr. Brown's *Prodromus*, where he has omitted it as a synonym of true *formosa*. The fruit drawn in this plate may belong to the latter. The involucre is represented green.

3. *L. formosa*. Sm. Tr. of Linn. Soc. v. 4. 223. t. 20. Cavan. Ic. v. 6. 32. t. 547. (*Protea nectarina*; Wendl. Sert. Hannov. fasc. 4. 5. t. 21.)—"Flowers seven in each involucre; the length of its inner leaves. Style hairy. Follicle pointed at one side, two-horned at the other. Leaves linear-lanceolate, sharp-pointed, recurved at the edges."—Native of stony heaths near Port Jackson, New South Wales, from whence we received specimens among the first that were sent to Europe by Dr. John White. The leaves are green and smooth above; white, and reticulated with veins, beneath. Involucre and flowers of a fine rose-colour or crimson.

4. *L. echinata*. Brown n. 4.—"Leaves linear, smooth, reticulated; dilated, lobed and pointed at their extremities. Follicles two-horned, thorny all over."—Native of the stony sides of hills in Lewin's Land, where Mr. Brown gathered it in fruit, but never saw the flowers. Hence its genus remains doubtful, especially, as that intelligent writer observes, on account of the leaves being lobed, which is contrary to the nature of the other species.

LAMBESA, or LAMBESSE, in *Ancient Geography*, (*Tex-zoute*), a town of Mauritania Sitifensis, situated on mount Audus. It was the most considerable town of the country, and the third legion of Augustus was quartered in it. Its ruins and inscriptions are still noticed.

LAMBESC, in *Geography*, a town of France, in the department of the mouths of the Rhone, and chief place

of a canton, in the district of Aix; 12 miles N.W. of Aix. The place contains 4000, and the canton 10,530 inhabitants, on a territory of 257½ kilometres, in 7 communes.

LAMBESSE, a town of Algiers, in which are magnificent ruins of an amphitheatre, a temple of Efculapius, &c.; 45 miles S. of Constantine. See LAMBESA.

LAMBETH, an extensive parish, seated on the fourth bank of the river Thames, in the hundred of Brixton, and county of Surrey, England. It is directly opposite to Westminster, to which city it is connected by a handsome stone bridge across the river. The whole is bounded by Southwark to the east, Newington Butts and Camberwell to the south, and Battersea to the west. The circumference is about 16 miles. In Domesday-book, it is said to contain 20½ plough-lands. At the beginning of the seventeenth century, it appears, by the churchwardens accounts, to have consisted of 1262 acres of arable land, 1026 of pasture, 125 of meadow, 13 of ozier, 27 of garden ground, and 150 of wood, making in the whole 2603; the commons and waste land, supposed to be about 330 acres, not being charged, will increase it to 2933 acres. At present, the whole extent is about 4000 acres; of which about 1390 are occupied by houses and other buildings, wharfs, manufactories, streets, and roads; 415 by pleasure gardens, including those of Vauxhall; 80 by market gardens; 300 by farming gardens; 40 by nurseries; 250 are now inclosing from common; and 30 are to remain common. The parish is divided into six liberties or precincts, respectively called the Bishop's, the Prince's, Vauxhall, Marsh and Wall, Lambeth-Dean, and Stockwell; the whole containing, according to the return to parliament in the year 1800, 5009 houses, and 27,085 inhabitants, of whom 5148 were stated to be employed in various trades and manufactures, and 955 in agriculture. Archbishop Hubert Walter obtained from king John a grant of a weekly market, and a fair of fifteen days, upon condition that the same should not be detrimental to the interests of the city of London. In the archbishop's MS. library, is a charter from the city, signifying their consent, stipulating only, that the fair should begin on the morrow after the anniversary of St. Peter ad vincula. The market and fair are both discontinued. The earliest historical fact on record relating to Lambeth, is the death of Hardicanute, which happened here in the year 1041, while he was celebrating the marriage feast of a noble Dane. Here also, Harold, who usurped the throne on the death of Edward the Confessor, is said to have placed the crown on his head with his own hands. Henry III. held a solemn Christmas here in the year 1231; and a parliament on September 14, in the year following. A most violent outrage was committed in Lambeth church, on Sunday February 19, 1642-3. The story is variously told by the different parties; but it stands on record as an instance of the fatal effects of civil discord, from the outrages of which no place, however sacred, is exempt.

Of the archbishop's palace, the chief object of note in the parish, it will be proper to state a few particulars. It is situated near the river; and is certainly a very large pile of building, exhibiting the architectural styles of various ages. It appears that this palace was, in a great measure, if not wholly, rebuilt by archbishop Boniface in the year 1262. If any part of this structure now remains, it is the chapel; the architecture of which might induce one to ascribe it to a more early period. Under the chapel is a crypt, the arches of which are built with stone, as is the chapel; the roof of the latter is of wood and flat; the windows were formerly of painted glass, put up by cardinal Morton. In the chapel were interred the remains of archbishop Parker. The great hall

hall was rebuilt by archbishop Juxton, after the civil wars, at an expence of 10,500*l.* It is 93 feet long by 38 wide; and has a fine carved wooden roof. The guard room, built before the year 1428, has a roof similar to that of the hall. Cardinal Pole is said to have erected the long gallery, which measures 90 feet by 16. In this room are several portraits of archbishops, and other illustrious characters. In the great dining-room, 38 feet by 19, are also portraits of all the archbishops from Laud to the present time; this series is particularly interesting, as, among other things, they shew the gradual change of the clerical dress. Archbishop Tillotson was the first to wear a wig; which however resembled the natural hair, and was worn without powder. A noble library occupies four galleries, over a small quadrangular cloister. The first collection of books was bequeathed by archbishop Bancroft; but these were seized in the civil wars, and though much injured, and some lost, yet the chief stock was restored by archbishop Juxton, after the restoration. Archbishops Sheldon, Tenison, and Secker augmented the library; and the number of books is now supposed to be, at least, 25,000 volumes. In the windows is some fine painted glass. (See Brayley and Herbert's Illustrations of Lambeth Palace, 4to. 1806, for various views of this palace, and portraits, &c. from the painted glass.) The MS. library contains a large and valuable collection of records and MSS. At the west end of the chapel is a lofty building, called Lollards' tower, built by archbishop Chichele in the years 1434 and 1435. At the top is a small room called the prison, in which it is said the Lollards were confined. The gateway, and the adjoining tower, which are of brick, were built by archbishop Morton about the year 1490. The gardens and park, which contain nearly thirteen acres, are laid out with great taste; they were much improved by the late archbishop, who made a convenient access to the house, for carriages, through the park. It has been said, but erroneously, that Stephen Langton is the first archbishop upon record who resided at Lambeth. Hubert Walter was there in 1198; and many of the public acts of the metropolitan were performed at Lambeth prior to that period.

Contiguous to the palace is the parish church, which was rebuilt between the years 1374 and 1377. The tower, which is of free-stone, still remains; the other parts of the present structure appear to be about the age of Henry VII. The church now consists of a nave, two aisles, and a chancel. Two chapels, called Howard's and Leigh's, were built in 1522; they were incorporated with the church when it was repaired in 1769. Among the numerous sepulchral memorials in this church, those most worthy notice are for the archbishops Tenison, Hutton, and Cornwallis, and a marble slab to the memory of the celebrated antiquary Elias Ashmole.

In this parish are situated the Asylum, instituted in 1758, for the reception of female orphans; and the Westminster Lying-in-Hospital, built in 1765.

About the end of the seventeenth century, a manufacture of plate glass was established at Vauxhall, in this parish, under the patronage of the duke of Buckingham; the principal artist was Rossetti. It was carried on with great success, and the glass was thought to excel that made at Venice. (See GLASS and LOOKING-GLASS.) The importation of foreign timber, which for many years has formed a considerable and important branch of our commerce, has been a source of wealth to this parish, where are several wharfs for that trade, supplied with stores which are almost incredible. At Vauxhall are some very large distilleries, and several potteries; the manufacture of stone earthenware pots is said to have been first introduced here from

Holland. On the site of Cuper's gardens (formerly a place of public entertainment,) are Messrs. Brauhy's extensive vinegar works. Mr. Pennant, who went over the premises, mentions a vessel full of sweet wine, containing 58,109 gallons, and another full of vinegar, containing 56,799 gallons; besides these enormous vessels there are several others which contain from 32,500 to 16,974 gallons each. In the year 1766, Mrs. Coade established in this parish, near Westminster bridge, a manufacture of artificial stone, which is cast in moulds and burnt. It is intended to answer the purpose of stone, for every species of ornamental architecture, at a much cheaper rate than carving. Where it has been placed in exposed situations it has been found to endure the frost. Messrs. Watts have lately established a manufacture of porcelain in this parish: the principle of making this sort is, to let it fall from a great height into the water, that it may cool and harden in its passage through the air, and thereby better retain its spherical shape. The height of the tower at this manufactory is about 140 feet; the shot falls 123 feet six inches. About the same time Messrs. Bolton, Morgan, and Co. established a manufactory here under the title of the woollen yarn company; every branch of the clothing manufacture, from sorting the wool to making the cloth, was carried on entirely by machinery; but the undertaking was soon given up. About a century ago, there was a place of entertainment called Lambeth Wells, situated in what is now called Lambeth Walk. A riding-school, for the exhibition of feats of horsemanship, was opened in this parish about the year 1768, by Mr. Philip Alley. At first it was an open area; in 1780 it was converted into a covered amphitheatre, and divided into boxes, pit, and gallery. Spring Gardens, Vauxhall, (which is mentioned in the Spectator as a place of great resort,) is open during the great part of the summer, being illuminated with a great number of lamps; the entertainment consists of a concert of music performed, in fine weather, in the open air; the price of admission, till 1796, was one shilling; it is now three shillings and open three times each week during the summer months. Lysons's Environs of London, vol. i. 4to.

LAMBIN, DENNIS, in *Biography*, an eminent critic was born at Mostreuil-sur-Mer in the year 1516. He appointed professor of the belles lettres at Amiens; and this he resided long in Italy with cardinal de Tournon, on his return to Paris obtained the Greek professorship of the royal college. He acquired a great reputation as the learned by his commentaries on Lucretius, Cicero, Virgil, and Horace. He translated from Greek into the language, the Ethics and Politics of Aristotle, and the orations of Demosthenes and Æschines. He died in the occasion of his death was the great shock which he received from the news of the murder of his friend Raimond, the massacre of St. Bartholomew. He was a man of found erudition and great industry. Moreri.

LAMBOURNE, or LAMBORN, in *Geography*, an ancient market town of Berkshire, England, is about 15 N.E. of Hungerford, and 65 W. of London. A fair was established here at a very remote period; an charter of 1227, it is called Chompe-Lanbourn, a fair was granted to the family of Fitzwarren. In the reign of Henry VI. the charter was renewed, and tw additional fairs granted in favour of the dean and chapter of Paul's, London. The market is much declined; here are still held three fairs annually. In the market place is a stone cross of a tall, plain shaft, on steps. The parish is co-extensive with the hundred to which it gives name. In the year 1800, the population of the town, with its dependent hamlets, was 2045. The parish church is spacious and

and handsome building, in the form of a cross; on its southern side are two chanting-chapels, one of which was founded by John Ellbury, who died in 1372, and the other by his descendant of the same name, who died in 1485. Near the church is an almshouse, or hospital, founded by John Ellbury, for ten poor men. In the north transept of the church is a monument for Sir Thomas Effex, who died in 1558, with effigies of himself and his lady, in alabaster. Lyons's Magna Britannia, vol. i.

**LAMBRA**, a town of European Turkey, in Livadia; 14 miles S.S.E. of Athens.

**LAMBSDORFF**, a town of Silesia, in the principality of Neisse; 9 miles N.E. of Neisse.

**LAMCAL**, a town of Pegu, on an island in the Ava; 56 miles N.E. of Peraiam.

**LAME**, in the *Manege*, is used in several phrases of that art; as *lame of an ear*, called in French *boiteux de oreille*, is said of a horse, when he halts upon a walk or trot, and keeps time to his halting with the motions of his head; for all lame horses do not keep time in that manner. See **HALTING**.

**LAME** of the *bridle*, is used by way of raillery, to signify the same thing.

**LAMECH**, in *Scripture Biography*, the son of Methuselah, of the race of Cain, the fifth in descent from him, and the father of Jabel, Jubal, Tubalcaim, and Naamah. He married two wives, Adah and Zillah, and is supposed to have introduced polygamy. To his wives he said, "Hear my voice, ye wives of Lamech: for I have slain a man to my wounding, and a young man to my hurt: if Cain shall be avenged seven-fold, surely Lamech seventy and seven-fold." (Gen. iv. 24, 25.) These words have perplexed Biblical critics. Some interpretations have been given of this passage which must be considered as founded on mere fables, and they are not worthy of recital. Onkelos, who wrote the first Chaldee paraphrase on the Pentateuch, reads the words with an interrogation: "Have I slain a man to my wounding, and a young man to my hurt?" and accordingly he paraphrases it thus: "I have not killed a man, that I should bear the sin of it; nor have I destroyed a young man, that my offspring should be cut off for it." Dr. Shuckford has improved this interpretation, by supposing that Lamech was endeavouring to reason his wives and family out of their fear of having the death of Abel revenged upon them, who were of the posterity of Cain. As if he had said, "what have we done, that we should be afraid? We have not killed a man, nor sinned any injury to our brethren of any other family; and God would not allow Cain to be killed, who had murdered his brother, but threatened to take seven-fold vengeance on a man that should kill him; doubtless they must expect much greater punishment, who should presume to kill any of us. Therefore we may surely look upon ourselves as safe under protection of the law and of the providence of God."

**LAMECH** was also the son of Methuselah, and father of Noah; at whose birth he was 182 years of age; and he after it 595 years, so that his whole life was 777 years; born A.M. 874, and dying 1651. See **ANTE-DILU-**

**MEGAL**, in *Geography*, a town of Portugal, in the Prince of Beira; 9 miles N.W. of Pinhel.

**MEGO**, a city of Portugal, in the province of Beira, the see of a bishop, suffragan of Braga; situated on a plain near the Duero, and surrounded with mountains. It contains two cathedral churches, an hospital, four convents, and about 4500 inhabitants. The adjacent country pro-

duces excellent wines; 36 miles E. of Porto. N. lat. 41° 7'. W. long. 7° 27'.

**LAMELAN**, an island in the Baltic, near the S.E. coast of the island of Aland; eight miles long and four wide. N. lat. 60° 5'. E. long. 37° 45'.

**LAMELLEÆ**, derived of *lamina*, and signifying as much as *little laminae*; little, thin plates, or laminae; whereof the scales and shells of fishes, &c. are composed.

**LAMELLÆ**, in *Botany*, the gills, or thin vertical plates which compose the *hymenium*, or fructifying membrane of that great genus of fungi called *Agaricus*, to which the common eatable mushroom belongs. (See **HYMENTUM** and **AGARIC**.) Schaeffer and Hedwig have found the seeds to be lodged copiously in the substance of these plates.

**LAMENESS**, **CLAUDICATIO**, in *Surgery*, Lameness arises from a variety of causes. From native deformity, or from the thigh being put out of joint in the birth; from the bad conformation of the cotyloid cavity of the ossa innominata; from the weakness of the hips; from external accidents; and from diseases. See **LEG** and **LUXATION**.

**LAMENTATIONE**, *Ital.* applied to a musical movement, requires that it should be sung or played in a plaintive and mournful manner.

**LAMENTATIONI**, in the plural, implies complaints and lamentations. Between the time of the reformation and Charles I., there was a kind of maudlin piety, which had seized Christians of all denominations. Among Calvinists, it exhorted itself in psalmody, and in others in lamentations. The Scots, among their old pathetic airs, have many laments. The Italians sung them in Latin, like the Salmi penitential; and in their own language. The sixteenth century was very prolific in lamentation. But in England even the lute was to weep, and be sorrowful: for Dowland, the famous lutenist, published *Lachrimæ*, or "seven tears, figured in seven passionate Pavins." The poetry of these whimpering seems much inferior to that of Sternhold and Hopkins. However, the best English composers of the times thought them worthy of the best music which they could set to them, in four and five parts. Sir William Leighton, knight, who set many of them himself, was the editor of a collection of lamentations to four and five voices, with an accompaniment for the lute; and in the list of the composers we have Bird, Dr. Bull, Orlando Gibbons, Dowland, Robert Jhonson, Forde, Hooper, Kindersley, Nat. Gyles, Coppario, Pilkington, Luffo, Peirson, Jones, Alfonso Ferrabosco, Ward, Weekes, Wilbye, and Milton, the father of the great poet.

**LAMENTATIONS**, a canonical book of the Old Testament, written by the prophet Jeremiah, according to archbishop Usher and some other learned men who follow the opinion of Josephus and St. Jerom, on occasion of Josiah's death. But this opinion does not seem to agree with the subject of the book, the lamentation composed by Jeremiah on that occasion being probably lost. Some have supposed that the fifty-second chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations.

The learned bishop Lowth, in his admirable book entitled "*Prælectiones de Sacra Poëti Hæbræorum*," has treated at large of this elegiac poem; illustrating its general nature and form, its metre or versification, and its subject, sentiments, and imagery. The Lamentations, he says, consist of a number of plaintive effusions, composed upon the plan of the funeral dirges, all upon the same subject, and uttered without connection as they rose in the mind, in a long course of separate litanies. These were afterwards put together, and formed into a collection, or correspondent whole. In the character

character of a mourner he celebrates, in plaintive strains, the obsequies of his ruined country; whatever pretended itself to his mind in the midst of desolation and misery, whatever struck him as particularly wretched and calamitous, whatever the instant sentiment of sorrow dictated, he pours forth in a kind of spontaneous effusion. He frequently pauses, and, as it were, ruminates upon the same object; frequently varies and illustrates the same thought with different imagery, and a different choice of language: so that the whole bears rather the appearance of an accumulation of corresponding sentiments, than an accurate and connected series of different ideas, arranged in the form of a regular treatise. The nature and design of the poem neither required nor admitted of a methodical arrangement. The whole poem, however, may be divided, according to our author, into five parts; in the first, second, and fourth, the prophet addresses the people in his own person, or else personifies Jerusalem, and introduces that city as a character: the third part is supposed to be uttered by the chorus of Jews, represented by their leader, after the manner of the Greek tragedies; and in the fifth, the whole nation of the Jews, on being led into captivity, pour forth their united complaints to Almighty God. This last, as well as the other, is divided into twenty-two periods, according to the number of the letters of the alphabet with this difference, that in the four other parts the initial letters of each period exactly correspond with the alphabetical order. The form of composition employed in this poem is a specimen of the acrotic or alphabetical poetry of the Hebrew: and the manner and order of this kind of verse are as follow: Each of the five parts, or grand divisions, is subdivided into 22 periods, or stanzas; these periods in the three first parts are all of them triplets, or they consist each of three lines, only in each of the two former parts. There is one period consisting of four lines. In the four first parts, the initial letter of each period follows the order of the alphabet; but the third part is so very regular, that every line in the same period begins with the same letter, so as necessarily to ascertain the length of every verse or line in that poem: and though the lines are not thus distinctly marked in the other parts, their limits may be ascertained by resolving the sentences into their constituent members. By this method of computation it appears, that in the fourth part all the periods consist of distichs, as also in the fifth, which is not acrotic; but in this last the lines are extremely short, whereas in all the rest they are long. In this poem there are lines and verses which are longer by almost one-half than those which occur usually, and on other occasions. The length of them seems, on an average, to be about twelve syllables: and the prophet seems intentionally to have adopted this kind of metre, as being more diffuse, more copious, more tender, in all respects better adapted to melancholy subjects.

That the subject of the Lamentations is the destruction of the holy city and temple, the overthrow of the state, the extermination of the people, and that these events are described as actually accomplished, and not in the style of prediction merely, must be obvious, as our author conceives, to every reader. The prophet has so copiously, so tenderly, and poetically bewailed the misfortunes of his country, that he seems completely to have fulfilled the office and duty of a mourner. In the opinion of the learned prelate, there is not extant any poem, which displays such a happy and splendid selection of imagery in so concentrated a state. What can be more elegant and poetical than the description of that once flourishing city, lately chief among the nations, sitting in the character of a female, solitary, afflicted, in a state of widowhood, deserted by her friends, betrayed by her dearest

connections, imploring relief, and seeking consolation in vain? What a beautiful personification is that of "the ways of Sion mourning because none are come to her solemn feasts?" How tender and pathetic are the complaints that occur in ch. i. 12 and 16? But to detail its beauties, says Lowth, would be to transcribe the entire poem. Gregory's Transl. sect. 22. vol. ii.

Indeed the subject of this book is of the most moving kind; and the style throughout lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great master, according to the character which Grotius gives him: "Mirus in affectibus concitandis." See JEREMIAH.

LAMENTIN, L.A., in *Geography*, a town of the island of Martimo, on the W. coast. N. lat. 14° 36'. W. long. 66° 57'.

LAMENTUNG, a town of Thibet; 25 miles E. of Jhanf Jeung.

LAMETOUNAH, a town of Africa, in Sahara, about seven days' journey S. of Tripoli.

LAMETUK, a town of the state of New Jersey; 15 miles N.W. of New Brunswick.

LAMGI, a petty kingdom of Asia, that lies to the west of Nipal or Napaul; which see.

LAMIA, in *Biography*, the most celebrated female flute-player in antiquity. Her beauty, wit, and abilities in her profession made her regarded as a prodigy. The honours she received, which are recorded by several authors, particularly by Plutarch and Athenæus, are sufficient testimonies of her great power over the passions of her hearers. Her claim to admiration from her personal allurements, does not entirely depend, at present, upon the fidelity of historians; since an exquisite engraving of her head, upon an amethyst, with the veil and bandage of her profession, is preserved in the late king of France's collection, which, in some measure, authenticates the account of her beauty.

As she was a great traveller, her reputation soon became very extensive. Her first journey from Athens, the place of her birth, was into Egypt, whither she was drawn by the fame of the flute-players of that country. Her person and performance were not long unnoticed at the court of Alexandria; however, in the conflict between Ptolemy Soter, and Demetrius, for the island of Cyprus, about 312 years B. C. Ptolemy being defeated in a sea-engagement, his wives, domestics, and military stores fell into the hands of Demetrius.

Plutarch, in his life of this prince, tells us, that "the celebrated Lamia was among the female captives taken in this victory. She had been universally admired, at first, on account of her talents, for she was a wonderful performer on the flute; but, afterwards, her fortune became more splendid, by the charms of her person, which procured her many admirers of great rank." The prince whose captive she became, and who, though a successful warrior, was said to have vanquished as many hearts as cities, conceived so violent a passion for Lamia, that, from a sovereign and a conqueror, he was instantly transformed into a slave; though her beauty was now on the decline, and Demetrius, the handsomest prince of his time, was much younger than herself.

At her instigation, he conferred such extraordinary benefits upon the Athenians, that they rendered him divine honours; and as an acknowledgment of the influence, which she had exercised in their favour, they dedicated a temple to her, under the name of "Venus Lamia."

Athenæus has recorded the names of a great number of celebrated Tibicinæ, whose talents and beauty had capti-

vated the hearts of many of the most illustrious personages of antiquity.

Horace speaks of bands of female flute-players, which he calls *Amphibatarum collegia* (*Amphibia* is said, by the commentators, to be a Syrian word, which, in that language, implies a *flute*, or, *the sound of a flute*), and of whom there were still colleges in his time. But the followers of this profession became so numerous and licentious, that we find their occupation prohibited in the Theodosian code; however, with little success: for Procopius tells us, that in the time of Justinian, the sister of the empress Theodora, who was a Thibician, appeared on the stage without any other dress than a slight scarf thrown loosely over her. And these performers were become so common in all private entertainments, as well as at public feasts, obtruding their company, and placing themselves at the table, frequently unasked, that, at the latter end of this reign, their profession was regarded as infamous, and utterly abolished.

LAMIA, in *Ancient Geography*, a town of Greece, in Thessaly, famous for the war which the Greeks waged against the Macedonians, after the death of Alexander the Great.

LAMIA, in *Icthyology*. See SQUALUS *Carbarias*.

LAMIÆ, *Azazi*, among the *Ancients*, a kind of dæmons, or evil spirits, who, under the form of beautiful women, are said to have devoured children.

Horace makes mention of them in his *Art of Poetry*.—Some authors call them *Lamie*, à *laniando*. Philostratus says, they are also called *Luræ*, or *Lenures*, as if they were all the same. Bochart will have the word to be Phœnician, and derives it from  $\text{למית}$ , *to devour*; alleging, that the fable of the Lamie came from Lybia. See LAMUM.

LAMINA, in *Anatomy*, a term applied in anatomical descriptions to parts which take the form of thin plates. In this sense we speak of laminae of cellular substance, of membrane, of bone, &c.

LAMINA, in *Botany*, the expanded part of each petal of a polypetalous corolla, supported by the *unguis* or claw, and analogous to the limb of a monopetalous one. (See LIMBUS.) It generally spreads, so as to form a considerable angle with the claw, in order that its upper surface may be presented to the strongest light, as in the pink, and wall-flower, or stock. The term *lamina* is also used by Forskäll, and adopted by some others, for the expanded part of a leaf, that is, for the leaf itself; such application of the word is therefore altogether superfluous. See LEAF.

LAMINÆ, in *Phylogogy*, thin plates, or tables, whereof any thing consists.

LAMIODONTES, is the name given by Dr. Hill to the gloffopetræ.

LAMIOLA, in *Icthyology*, is the name given by the modern Italians to a fish called in Cornwall the *tope*. See SQUALUS *Galeus*.

LAMIRAS, in *Biography*, a famous poet and musician of Thrace, who, according to some authors, was the inventor of the Dorian mode. He lived before Homer, and is said to have been the first musician who united the voice to the sound of the cithara.

LAMISA, in *Geography*, a town of the principality of Georgia, in the province of Carduel; 60 miles W. of Teflis.

LAMIUM, in *Botany*, a Latin word of disputed meaning and derivation, used by Pliny to designate the Dead Nettle, for which it has ever since served as the botanical generic name. Some derive it from the supposed place of growth of the plant or plants in question, *ad lamas*, that is, about ditches or puddles by the way side; but this is by no

means appropriate. Linnæus in his *Philosophia Botanica*, p. 167, explains the word by *Lamia larvata*, a masked forcerefs, as if the shape of the flower, resembling a mask, or rather a gaping mouth beset with sharp teeth, had suggested that idea. Ambrosinus, however, indicates the most direct etymology, from  $\lambda\alpha\mu\alpha\iota$ , *the throat*, alluding to the shape of the flower, from which word also that of *lamia* itself, as the appellation of a certain voracious beast or fish, or of a forcerefs supposed to devour children, evidently originated.—Linn. Gen. 202. Schreb. 288. Willd. Sp. Pl. v. 3. 86. Mart. Mill. Diæt. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 392. Sm. Fl. Brit. 626. Juss. 113. Tourn. t. 85. Lamarck Illust. t. 506.—Class and order, *Didymia Gymnospermia*. Nat. Ord. *Verticillata*, Linn. *Labiata*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, dilated upwards, with five, nearly equal, awned teeth, permanent. *Cor.* of one petal, ringent; tube cylindrical, very short; limb gaping; throat inflated, compressed, gibbous, its margin furnished, at each side, with one or more little reflexed teeth; upper lip vaulted, roundish, obtuse, undivided or two-lobed; lower lip shorter, inversely heart-shaped, emarginate, more or less reflexed. *Stam.* Filaments four, awl-shaped, concealed by the upper lip, two of them longer than the others; anthers incumbent, oblong, hairy. *Pist.* Germen in the bottom of the calyx, four-cleft; style thread-shaped, of the same length and situation as the stamens; stigma cloven, acute. *Peric.* none, except the open-mouthed calyx, containing the seeds at the bottom. *Seeds* four, level-topped, short, triangular, convex at one side, abrupt at each end.

Ess. Ch. Calyx five-cleft, with spreading, bristle-pointed teeth. Upper lip of the corolla vaulted; lower two-lobed; throat inflated, its margin toothed at each side.

A very natural genus, well distinguished by its essential character, of the mouth of the flower being furnished with one or more teeth at each side. These are sometimes slender, and almost capillary; sometimes dilated and oblique. Linnæus thought the upper lip was necessarily undivided, or at most only toothed; but in some recently discovered species it has a two-lobed termination, above the vaulted part. The species of *Lanium* are as yet but imperfectly ascertained, notwithstanding what has been done in Willdenow and the new edition of the *Hortus Kewensis*. The 14th edition of *Syst. Veg.* enumerates but eight; Willdenow has thirteen. To these we have some to add, even from the gardens; and many mistakes to correct, respecting species already established. A review of the whole is necessary, though some may be less particularly mentioned than others. Our whole list amounts to twenty.

1. *L. Orvala*. Great Dead Nettle, or Balm-leaved Archangel.—Linn. Sp. Pl. 808. Curt. Mag. t. 172. (*L. pannonicum*; Scop. Carn. ed. 2. v. 1. 406. t. 27. *L. mellifæolium*; Mill. 1c. t. 158. *Galeopsis maxima* panonica; Clus. Hist. v. 2. 35.)—Leaves heart-shaped, unequally and sharply toothed. Throat of the corolla inflated; upper lip sharply toothed. Calyx coloured. Stem nearly cylindrical, smooth.—Native of Hungary, Carniola, and Italy. We have gathered it, of a very large size, near Castello Nuovo, 10 miles from Rome. The magnificence of its great crimson inflated flowers entitles it to a place in the flower-garden, where it is a hardy perennial, blooming in April or May, and sometimes suffers from our inclement springs. The stem, two or three feet high, is remarkable for its roundness and polished smoothness. The leaves are three or four inches long, and nearly as broad, rugose, dark, scarcely at all hairy. *Orvala* is an old name for Clary, used by Dodonæus; we know not why it was applied to this plant.

plant. If *Lanium montanum*, *favatile*, *fermè globrum*, *florè amplo*, *purpureo*, *cum labio superiori crenato*; Till. Pif. 92. t. 34. f. 1; quoted with doubt by Linnaeus, be this present species, the figure is very bad, yet we know no other to which it is more appropriate.

The *Orvala garganica*, Linn. Sp. Pl. 807. (*Papia garganica*, foliis urticae, altiùs et eleganter incisais, florè purpureo; Mich. Gen. 20. t. 17.) is now acknowledged to be a variety of *L. Orvala*, differing only in an accidental deeper division of the corolla, as well as of the leaves. Curtis in his specific character of the species in question, copied from *Syl. Veg.* ed. 14, retains an error of the transcriber or printer, *caulibus coloratis* for *calyce colorato*.

2. *L. levigatum*. Smooth Dead Nettle.—Linn. Sp. Pl. 808. Krock. Silf. n. 926, by the description. Sabbat. Hort. Rom. v. 3. t. 34. Willden. (*L. purpureum* fœtidum, folio parvo acuminato, fl re majore; Pluk. Phyt. t. 198. f. 1. *L. folio oblongo, florè rubro*; Segn. Veron. v. 3. 131. Galeopsis five urticae iners, florè purpurascente majore, folio non maculato; Bauh. Hill. v. 3. 321.)—Leaves heart-shaped, pointed, strongly serrated, nearly smooth as well as the stem. Upper lip of the corolla abrupt, entire. Calyx nearly smooth, with taper teeth much longer than its tube, and almost equal to the corolla.—Native of Italy. Pallas mentions finding it in Siberia, Krockner in Silesia. The Linnaean specimen was sent by Segnier, with his own synonym and that of J. Bauhin, the latter being verified by the place of growth, near Vicenza. The root is perennial, in some degree creeping. Stem a foot high or more, square, purplish, leafy, smooth, or slightly besprinkled with soft hairs curved downward. Leaves broad-heart-shaped, strongly and unequally serrated, with an elongated entire point, scarcely rugose, very little downy, rarely if ever spotted; the lower ones on long stalks, upper on short ones. Flowers eight or ten in a whorl. Tube of the calyx curved, but little dilated, pale, veiny, smooth or slightly downy, about a quarter of an inch long; teeth almost twice that length, very taper, somewhat hairy, extending beyond the full-grown unopened corolla, widely spreading. Corolla about the size of the common *L. album*; upper lip blunt, entire, gibbous, slightly downy, and bright purple externally, pale and smooth within; throat wide, often spotted, with one short narrow tooth, and the rudiment of another, at each side; lower lip small, of two rounded serrated spreading lobes.—Such is the plant of the Linnaean herbarium, but the long description in the *Spec. Plant.* seems to agree better with the *mofchatum* hereafter described, which therefore some have taken for the *levigatum*. Plukenet's figure is totally erroneous as to the calyx. Willdenow retains Boccone's synonym, misapplied to this plant by Linnaeus, and repeats it under *rugosum*, to which it properly belongs! Haller mistook his own N 270, which is *L. maculatum*, for *levigatum*, and transcribes from Linnaeus *caule brevis* instead of *levi*.

3. *L. rugosum*. Wrinkled Dead Nettle.—Ait. Hort. Kew. ed. 1. v. 2. 206. Willd. n. 3. (*L. hirsutum*; Lamarc. Dict. v. 3. 410. *L. amplo, serrato, nigricante, subrotundo, rugoso folio*; florè rubro; Bocc. Mus. 35. t. 23. *L. montanum hirsutum, folio oblongo, florè purpureo*; Till. Pif. 93. t. 35. f. 1.)—Leaves heart-shaped, acute, roundly serrated, rugose, hairy as well as the stem. Upper lip of the corolla abrupt, notched; lateral teeth solitary, bristle-shaped. Calyx slightly hairy, with teeth shorter than its tube.—Native of Italy, Sicily, and France; cultivated in our more curious gardens for at least 45 years past. It is perennial, flowering in July and August. The whole plant is much more hairy than the last. Leaves rather

crenate than serrated, all on longish stalks, dark, rugose, and hairy. Flowers purplish red; tube of the corolla smooth, curved, longer than the calyx-teeth; throat and upper lip hairy; teeth at each side of the mouth solitary, very long and narrow; lower lip small. There can surely be no doubt of Tilli's synonym, though hitherto neglected.

4. *L. garganicum*. Woolly Dead Nettle.—Linn. Sp. Pl. 808. Trew. Ebrat. t. 75. Sm. Exot. Bot. v. 1. 93. t. 48. (*L. garganicum subnucanum, florè purpurascente, cum labio superiori crenato*; Till Pif. 93. t. 34. f. 2.)—Leaves heart-shaped, bluntly serrated, rugose, downy as well as the stem. Corolla inflated; with a straight tube, much longer than the calyx; orifice with two teeth at each side.—Native of Italy. It has been cultivated in Chelsea garden ever since 1729, and flowers in May. Its soft downy greyish aspect, and finely rugose leaves, at once distinguish this species. The stem is thick and clumsy, two feet high. Flowers large, copious, and handsome, with a pale tube streaked with red, and light purple lips, the upper one cleft at the summit; the throat is nearly as much inflated as that of *L. Orvala*. Trew's figure was overlooked, or there would not have been another of this plant given in *Exotic Botany*, the latter work being intended for species not properly represented already. It is much to be wished that other periodical publications would so far pay regard to the same principle, as to give such plants a preference.

5. *L. maculatum*. Spotted Dead Nettle.—Linn. Sp. Pl. 809. (*L. Plinii campoclarensis et montanum*; Column. Ephr. 190. t. 192. f. 1. *L. n. 270*; Hall. Hill. v. 1. 118.)—Leaves heart-shaped, strongly serrated, acute, hairy. Tube of the corolla curved, longer than the calyx; upper lip entire; lateral teeth solitary, slender. Flowers about ten in a whorl.—Native of Italy, France, Greece, Switzerland, and Germany, flowering in the spring; it is imperfectly naturalized about Baywater, having probably escaped formerly from the neighbouring garden of Sir John Hill. Its natural situation is in waste ground, or about banks and hedges, where the radical leaves, distinguished by a broad irregular central stripe, make an elegant appearance through the Italian winter; but this mark commonly disappears from the upper leaves. The root is perennial, somewhat creeping. Stems a foot high, rather hairy. Leaves heart-shaped, rather acute but not pointed, strongly but bluntly serrated. Flowers purplish red, downy. Calyx tumid, nearly smooth, with fringed teeth about its own length, and much shorter than the tube of the corolla. The lower lip of the flower is concave and finely crenate.

Haller properly, perhaps, quotes the *Galeopsis* of Rivinus for this species; but the *Galeopsis* of Camerarius, Epit. t. 865, though said to have a red flower, is manifestly a representation of *Galeobdolon luteum*, Sm. Fl. Brit. 631. Both these are cited by Linnaeus under *Lanium album*; Rivinus having confounded *album* and *maculatum*. Pallas, as appears by his herbarium in the hands of A. B. Lambert, equally mistook *maculatum* for *purpureum*.

6. *L. album*. White Dead Nettle.—Linn. Sp. Pl. 809. Curt. Lond. fasc. 2. t. 45. Engl. Bot. t. 708.—Leaves heart-shaped, pointed, strongly serrated, hairy. Flowers about twenty in a whorl. Tube of the calyx shorter than its teeth. Upper lip of the corolla notched; lateral teeth solitary, lanceolate.—Native of waste ground, almost throughout Europe, flowering in spring, summer, and autumn. The leaves are more pointed than in the last, and unspotted; the flowers white and more numerous, rarely assuming a blush or pale purple. There is commonly a considerable distance, or naked part of the stem, between the stalked lower leaves, and

and the more fertile upper ones where the flowers are situated. The summit is overtopped by one or two pair of leaves without flowers. The tube of the corolla is longer than the calyx; its lower lip flattish, wavy, scarcely crenate.

7. *L. cabitatum*. Muffin Dead Nettle.—Leaves heart-shaped, bluntish, crenate, hairy, on longish stalks. Flowers overtopping the stem. Tube of the calyx equal to its teeth. Upper lip of the corolla notched; lateral teeth solitary, very slender.—We know not the native country of this species, which we obtained from Chelsea garden, and have long cultivated. It is sometimes overlooked as a variety of the last; sometimes sold for *L. mollis* hereafter mentioned; yet no species can be more distinct. It is perennial, flowering in July; when the copious and delicate semitransparent white flowers, which rise in two whorls above the top of each stem, look as if a thin muffin veil had been thrown over the plant, especially while the dew is upon them. The lateral teeth are peculiarly slender; the anthers pale, with fearful pollen. The leaves are small, roundish, light green, speckled with paler or whitish spots. Stems rather decumbent. We can find no synonym for this plant.

8. *L. Ariatum*. Pencilled Dead Nettle.—Sm. Prodr. Fl. Græc. Sibth. 405. Fl. Græc. ined. t. 557.—Leaves heart-shaped, bluntish, ferrated, on longish stalks. Upper lip of the corolla cloven; its segments spreading and toothed; lateral teeth double. Found by Dr. J. Sibthorp, (who suspected it to be the *Βαλλάνης* of Dioscorides), plenty in all the waste ground of Greece and the Archipelago; yet no other modern botanist appears to have noticed this elegant and striking plant. Its habit is not unlike *L. album*, but the leaves are rounder, with longer stalks, and the stem is more uninterruptedly leafy. The flowers are singularly large and handsome, white striped with crimson, composing several whorls, the upper ones rising above the top of the stem, as in the last. Their upper lip ends in two oblong toothed divaricated lobes; the lower is convex and crenate; the lateral teeth are in pairs, acute and spreading.

9. *L. bifidum*. Cloven White Dead Nettle.—Cyrill. Rar. fasc. 1. 22. t. 7. Willden. (L. parvum, flore albo, cum labio superiori bifido; Till. Pil. 93. L. æquicolum; Column. Ecephr. 191. t. 192. f. 2.)—Leaves triangular-heart-shaped, deeply cut and crenate; the upper ones crowded. Calyx tumid, with shortish triangular teeth. Upper lip of the corolla cloven; its segments spreading, emarginate, lateral teeth solitary.—Found in waste ground about Naples, towards the sea, where the writer of this gathered it in March 1787. Its general habit approaches to *L. purpureum*, but the flowers are snow-white, with a cloven summit, and the floral leaves, crowded (as in that species) about the top of the stem, whose middle part is almost naked, are of a triangular heart-shape, deeply cut and lobed as well as crenate, hairy, and marked with a narrow central white stripe, just as Columna represents them, concerning whose synonymy we presume there can be little doubt, though he appears not to have seen the corolla. Spirits of wine extract an orange colour from these flowers, which we do not perceive in any other *Lamium*.

10. *L. moschatum*. Mucky White Dead Nettle.—Mill. Dict. ed. 8. n. 4. Ait. Hort. Kew. ed. 2. v. 3. 394. (L. orientale, nunc moschatum nunc festidium, magno flore; Tournef. Cor. 11.; according to Miller, but the Hort. Kew. rejects this synonym, without assigning a reason.)—Stem very smooth. Leaves heart-shaped, obtuse, crenate; the floral ones nearly sessile. Calyx-teeth nearly equal to the corolla. Upper lip of the corolla entire; lateral teeth solitary, dilated.—Native of the Levant. Miller cultivated it

in 1739, but it found no place in the first edition of Hort. Kew. This we believe arose from its having been taken for, or confounded with, the *levigatum*. Into this error we ourselves have formerly fallen, misled by the long description in Linn. Sp. Pl. 808, which so precisely accords with the *moschatum*, rather than with *levigatum*, that we have no doubt from which of the two it was made. This is an annual species, cultivated, or rather spontaneously found itself, from time immemorial in Chelsea garden near the entrance, and flowering in the spring. The leaves of the young plants that come up in autumn remain through winter, and according to Miller, are prettily marked with white like the Cyclamen. The stems, from 10 to 20 inches high, are remarkably smooth, with blunt edges, and purplish. Leaves of the stem heart-shaped, approaching to triangular, rather elongated but obtuse, veiny, of a light glaucous green, smooth or finely downy, the margin crenate rather than ferrated; the floral ones nearly sessile. Whorls several, not reaching to the top of the stem, each of about ten white flowers, whose calyx is pale and smooth, with very long tapering rough-edged teeth, extending beyond the mouth of the corolla. The upper lip of the latter is downy, convex, abrupt, and entire; lower of two rounded, flattish, slightly crenate lobes; lateral teeth solitary, broad, pointing forward. We have not noticed the mucky feces.

11. *L. plechonoides*. Ground-ivy-leaved Dead Nettle.—(Moldavia orientalis, hederæ terrestris folio; Tourn. Cor. 11.)—Leaves heart-shaped, strongly crenate, on long stalks. Calyx-teeth short, triangular. Corolla longer than the leaves; upper lip notched; lateral teeth in pairs.—Gathered in the Levant by Tournefort, one of whose specimens is before us. No recent author seems to have known this species, which is perhaps more akin to our *Ariatum*, N° 8, than any other. The leaves are small, not an inch long, correctly heart-shaped, strongly crenate, or ferrated, slightly hairy, on footstalks mollly twice their own length, except those of the floral ones, which scarcely exceed the calyx. The teeth of the calyx are short, triangular, awnless, roughish. Corolla purple, downy; tube full twice the length of the calyx; throat inflated; lateral teeth small, double; upper lip abrupt and deeply notched; lower of two rounded wavy lobes. Anthers very hairy.

12. *L. tomentosum*. Downy Dead Nettle.—Willd. n. 11. (L. orientale incanum, flore albo, vel purpurascente, cum labio superiori crenato; Tourn. Cor. 11.)—Leaves roundish-heart-shaped, strongly crenate, downy on both sides, stalked. Calyx-teeth lanceolate, very hairy. Upper lip of the corolla crenate, very hairy; lateral teeth solitary, awl-shaped, narrow.—Gathered by Tournefort in Armenia. This is remarkably downy and hoary, especially the younger foliage, the calyx, and the upper lip of the corolla. The leaves are much under an inch in length, very deeply and sharply crenate, the upper ones most pointed, all densely villous, on stalks of various proportions. Teeth of the calyx as long as its tube, lanceolate, narrow, acute, densely villous. Corolla about the size of *L. album*, purplish or white; its tube as long as the calyx, smooth; throat but little inflated; lateral teeth solitary, long and slender; upper lip much arched, minutely crenate, villous; lower of two rounded, flat, entire lobes.

13. *L. molle*. Pellitory-leaved White Dead Nettle.—Ait. Hort. Kew. ed. 1. v. 2. 297. ed. 2. v. 3. 394. (L. parietarie facie; Moris. Hort. Blæs. 278. L. album, parietarie folio, virginianum; Pluk. Almag. 203. Phyt. t. 41. f. 1.)—Leaves pointed, stalked, nearly entire; the lower ones heart-shaped, the upper ovate. Calyx-teeth brittle-shaped. Upper lip of the corolla crenate, hairy; lateral teeth

teeth solitary, awl-shaped.—Native of Virginia, as appears by Plukenet's synonym, overlooked by succeeding writers. This plant seems to have been early in our gardens, but is now little known, if not totally lost. Another species, hereafter described by the name of *ocymifolium*, is generally mistaken for it, and is referred to as *molle* in *Fl. Brit.* under *L. purpureum*. The true *molle* is, however, now well known to us, by dried specimens from the French gardens. Its habit and size approach to the *album*, but the *leaves* are remarkable for being either quite entire, or very slightly toothed about the middle part only; they are an inch and a half long, broad at the base, and often heart-shaped, the extremity pointed and acute; both sides somewhat downy, veiny, even, not rugose. The *stalks* of the floral leaves are very short; those of the rest longer. *Flowers* the size of *L. album*, white; their tube as long as the calyx-teeth, which are bristle-shaped, narrow and hairy. *Seeds* very smooth.

14. *L. ocymifolium*. Basil-leaved Red Dead Nettle.—(*L. pusillum rubrum*, *parietaria facie*, *americanum*; Pluk. *Almag.* 204. *Phyt.* t. 41. f. 2.)—Leaves ovate, obtuse, entire, stalked; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate.—This has long been in Chelsea garden, where it is almost a weed. From Plukenet's synonym it appears to have come from America. No succeeding author has noticed the plant. The root is small and annual. Stem a foot high, or something less, simple, except a small branch or two near the base, erect, square, smooth, leafy at the bottom and top only, being for the greater part of its length entirely naked, like the stem of *L. purpureum*, but still more remarkably so. The lower leaves are few, roundish-ovate, slightly crenate, on longish stalks, and nearly smooth; floral ones about six or eight pairs, crossing each other, crowded together at the top of the stem, composing a sort of pyramid, each leaf about three quarters of an inch long, stalked, ovate, obtuse, tapering at the base, entire, except here and there a casual notch in some of them, all slightly hairy, paler underneath. Whorls crowded, of numerous small purple flowers, much like those of *L. purpureum*. Calyx nearly smooth, its teeth as long as the body, spreading, broad at their base, with taper rigid points. *Seeds* curiously besprinkled with pale, prominent, minute, tubercles, as is more or less the case in the three following.

15. *L. purpureum*. Common Red Dead Nettle.—Linn. *Sp. Pl.* 809. *Curt. Lond. fasc.* 1. t. 42. *Engl. Bot.* t. 769. *Fl. Dan.* t. 523.—Leaves heart-shaped, obtuse, unequally crenate, stalked; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. Tube of the corolla closed with hairs near the bottom.—Very common, in waste as well as cultivated ground, throughout most parts of Europe, flowering at various seasons. The root is annual. Stem from six to twelve inches high, square, ascending, often branched at the bottom, naked in the middle, crowded with leaves and flowers at the top. Leaves broad-heart-shaped, bluntish, rugose, unequally crenate, downy, on stalks of various lengths. Flowers in whorls among the upper leaves, reddish-purple, variegated with white, and spotted with dark purple, their lateral teeth small, in pairs, very near the under lip. The inside of their tube was found by Mr. J. D. Sowerby to be closed near its base with a dense circle of hairs; see *Engl. Bot.* t. 1933. The calyx is like the last species.—A curious variety was found near Sudbury, by Mr. Joseph Andrews, who communicated it to the late professor Martyn, sen., and whose original specimen is in our hands. In this the margin of all the leaves is perfectly entire. The flowers are rather smaller than ordinary, and were said to produce no seed. This variety is in *Engl.*

*Bot. p.* 769, at the end, mistaken for our *ocymifolium* last described.

16. *L. incisum*. Cut-leaved Red Dead Nettle.—Willd. n. 9. *Engl. Bot.* t. 1933. (*L. diffusum*; With. 527. *L. purpureum*  $\beta$ ; Sm *Fl. Brit.* 627. *L. rubrum minus*, *foliis profunde incisis*; Raii *Syn.* 240. Pluk. *Phyt.* t. 41. f. 3.)—Leaves heart-shaped, dilated, obtuse, stalked, irregularly cut; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. Tube of the corolla pervious.—Found in cultivated ground in France and England. We have it from Norfolk and Suffolk. This is so like the last, except the leaves being more deeply cut, that we should have still considered it as a variety, but for the want of hairs in the tube of the flower. The whole shape of the corolla, indeed, is more slender, approaching to that of *L. ocymifolium*, or of the following *amplexicaule*.

17. *L. amplexicaule*. Common Henbit Dead Nettle.—Linn. *Sp. Pl.* 809. *Curt. Lond. fasc.* 2. t. 46. *Engl. Bot.* t. 770. *Fl. Dan.* t. 752. (*Galeopsis folio caulem ambiente*, *major et minor*; Rivin. *Monop. Irr.* t. 63.)—Floral leaves sessile, kidney-shaped, obtuse, strongly crenate, or somewhat lobed, embracing the stem. Teeth of the calyx linear-awl-shaped, as long as its tube.—Native of sandy fields of Europe, flowering in the spring. Easily distinguished by the rounded, sessile, strongly crenate, and often in some degree lobed, leaves of the stem, in which it essentially differs from the two last. The calyx, moreover, differs in being extremely hairy, with more upright teeth, as long as the body, and of a very narrow awl-shaped, almost linear, figure, by which latter character it is also distinguished from two hereafter described. The little red flowers are angularly pretty, the bright crimson of their downy upper lip, while the rest of the corolla is smooth and paler, glitters, like minute rubies, when moist with dew, and attracts the eye at a considerable distance. A small undivided tooth stands at each side of the mouth, though Willdenow once thought otherwise, and on account of that supposed deficiency, founded a new genus on this plant and *Galeobdolon luteum*, by the name of *Pollichia*; a measure now happily abandoned, as those two plants have scarcely any character in common. Some of the earlier flowers of *L. amplexicaule* never expand, but the internal organs are perfect, and produce good seed. Linnaeus says all its flowers are generally thus closed in Sweden, owing, probably, to the coldness of the season when it blooms.

18. *L. palmatum*. Palmate Henbit Dead Nettle.—(*L. multifidum*; Pallas. *It.* v. 1. 168.)—Floral leaves sessile, embracing the stem, palmate; lobes three or five-cell. Teeth of the calyx lanceolate, pointed, as long as its tube.—Gathered on the banks of the Wolga by Pallas, who, as appears from his specimens lent us by Mr. Lambert, first took it for *amplexicaule*, which it most nearly resembles, and afterwards for *multifidum*, under which name it is mentioned in his travels, quoted by Willdenow. From the latter it differs totally in size and aspect, as well as in the character of its leaves and calyx. From the former it is satisfactorily distinguished, however like at first sight, by the deeply palmate floral leaves, whose lobes are subdivided into three or five broad spreading segments; and still more decidedly by the broad base of the calyx-teeth, which contract suddenly into a sharp point. The corolla varies in size, or degree of expansion, as in the preceding. The root, like that, appears to be annual, throwing up several stems about a span high. The lower leaves are stalked, but otherwise resemble the upper ones, except, indeed, those near the root, which are smaller and less cut.

19. *L. multifidum*. Finely-cut Oriental Dead Nettle.—Linn.

Linn. Sp. Pl. 809. (L. orientale, foliis eleganter laciniatis; Tourn. Cor. 11. Comnel. Rav. 26 t. 26.—Floral leaves sessile, divided to the base, into many lobed or pinnatifid segments. Teeth of the calyx triangular, pointed, one-fourth the length of its tube.—Gathered by Tournesort in the Levant. He probably brought home seeds, by which it was introduced to the gardens of France, Holland, and, if Miller be correct, Chelsea physic-garden. On his authority this species has found a place in the new edition of Hort. Kew, though long since a stranger amongst us. Indeed the plant is very little known to botanists. We have an indubitable specimen, but whether wild or cultivated we know not. It is in all its parts thrice the size of the two last. The root seems to be annual, throwing up several square, leafy, finely downy, often branched stems. The floral leaves are an inch or inch and half long, sessile, nearly smooth, divided almost, or quite, to the bottom into five segments, the middle one being the largest, all narrow at the base, dilated outwards, deeply lobed or pinnatifid, the lobes rounded or bluntnif. Flowers many in each whorl, as large as those of *L. album*, or larger, of a fine red, with fo very hairy an upper lip as to resemble some kind of *Phlomis*. The lateral teeth are solitary and acute. Calyx densely clothed with silky hairs, its teeth broad, about a quarter as long as its tube, pointed, one rather wider than the rest.

20. *L. ? bipidulum*. Rough-stalked American Dead Nettle.—Michaux Dorcal-Amer. v. 2. 4.—Stem rather brittle. Leaves on long stalks, broad-heart-shaped, slightly downy. Flowers axillary, solitary.—Found in shady woods about the river *Tennafsee*, by Michaux, who mentions that the *corolla* is moderately large and white. The flowers being solitary in the bosom of each floral leaf, excites a great doubt of its genus, but having no other information respecting this species, we here subjoin it to the rest, till further information can be procured. S.

LAMJUNGH, in *Geography*, a country of Asia, dependent on Thibet, N. of Gorkah.

LAMLASH, or HOLY ISLAND, an island situated before the bay of Lamash, about two miles long and half a mile wide; the whole being a mountain covered with heath, but having sufficient pasture and arable land to feed a few cows, sheep, and goats, and to raise a small quantity of corn, and few potatoes. N. lat. 55 34'. W. long. 4° 58'.

LAMLASH, a town or village of Scotland, on the E. coast of the island of Arran, situated on a bay to which it gives name, and which, according to Pennant, forms the safest harbour in the globe, with depth of water for the largest ships. N. lat. 55 35'. W. long. 5° 59'.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying *loaf-mass*, because on that day our forefathers made an offering of bread prepared with new wheat.

On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high mass.

It is celebrated by the Romish church in memory of St. Peter's imprisonment.

LAMMERMUIR, in *Geography*, a mountainous district of Scotland, forming the N. part of the county of Berwick, about 16 miles long and six broad.

LAMNE, in *Ichthyology*, a name given by Appian, and some other of the old Greek authors, to the common shark, or, as we usually call it, the *robite shark*, the *lamia* and *canis carcharias* of authors. See *QUALUS Carcharias*.

LAMNICKII, in *Geography*, a town of the duchy of Stiria; 10 miles N. of Cilley.

LAMO, a sea-port of Africa, on a small island formed by a river on the coast of Zanguebar, dependent on the Portuguese. S. lat. 1° 55'. E. long. 41 27'.

LAMOIGNON, WILLIAM DE, in *Biography*, marquis of Balville, descended from an honourable family, was born at Nivernois in 1617. He was admitted a counsellor of Paris in 1635, made matter of requests in 1644, and in 1658, on account of his great probity and honour, he was raised to the office of first president of the parliament. Upon his nomination to the presidentship, cardinal Mazarin said to him, "If the king had known a worthier and fitter man, he would not have appointed you;" but he paid him a much higher compliment, by refusing a large sum of money, offered by another person for the situation, at the same time observing, "Whatever occasion his majesty may have for money, it would be better to expend it for a good president, than receive it." Lamoignon did not disappoint the expectations formed of him: he fulfilled all the duties of the situation with equal zeal and prudence, supporting the dignity and privileges of the body over which he presided, discouraging the chicanery of the bar, raising his voice for the people, and devoting his health and life to the public service. He was once sounded with regard to his opinion of a criminal, over whose trial he was to preside as judge, by Colbert the minister, to which he replied, "A judge gives his opinion but once, and that is from the bench." He died at the age of sixty, in the year 1677. His "Arrests," on various important points of French law, were first published in 1702, and again reprinted in 1781. In his manners he was simple, in his conduct rather austere, but to the widow, the orphan, and the friendsless, he was the mildest of all human creatures. He relaxed from the toils of his office, in the pleasures of literature, and literary men. Boileau, Racine, Bourdaloue, &c. were his particular friends. Moreri.

LAMOIGNON, CHRISTIAN FRANCIS DE, eldest son of the preceding, was born at Paris in 1644: of his education the most exact care was taken by his father, and at a proper age he was placed in the Jesuits' college, under the particular tuition of the celebrated father Rapin, whose favourite disciple he was. Having finished his studies, he travelled through different countries for the improvement of his mind, and in 1666 he was admitted a counsellor of parliament. In 1674, he was appointed to the office of advocate-general, which he held during the space of 25 years, with the highest and most unblemished reputation, distinguished as much for his eloquence, as by his zeal for justice and the public good. In 1690 the king nominated him to a post of more ease, and better adapted to his health, but his love of employment retained him several years longer at the bar, till at length, being urged as well by his own feelings, as the representations of his family and friends, he sought for an honourable repose. He then indulged in the love of letters, and, in 1704, was admitted a member of the Academy of Inscriptions, of which he was soon appointed the president. In this station he displayed as much talent and readiness in discussing a literary question, as he had formerly done a point of jurisprudence. He died in 1709. Many of his speeches were published, but the only work which he sent to the press was "A Letter on the Death of Father B. urdaloue." Moreri.

LAMOILLE, in *Geography*, a river, which runs into lake Champlain, 28 miles N. of Newhaven, N. lat. 44 37'. W. long. 73 14'.

LAMORRAN CREEK, a creek in the English channel,

on the coast of Cornwall, at the mouth of a small river, which joins the Fal; 3 miles S. of Truro.

LAMOTIS, in *Ancient Geography*, a small country of Asia, in Cilicia, which took its name from the town of Lamus. Ptolemy.

LA MOTTE, in *Biography*, an admirable violinist, born in Flanders: when very young, he was regarded as the first solo player at Vienna. In 1777 he came to England. He had his first regular instructions from Giardini, and it is related of him, that when he quitted Giardini, he travelled through Italy, full in search of another master; and being arrived at Leghorn, where Nardini then lived, he would have become his scholar; but after hearing that celebrated performer execute one of his own solos, of the most difficult kind, and being, in his turn, asked to play, he desired leave to perform the same solo which he had just heard, and which was new and in MS. so that he never could have practised it; however, he acquitted himself so well, that Nardini declined taking as a *scholar* one who was already to be a *master* of his instrument.

The concertos which he played at the Pantheon concerts were full of new difficulties of execution, expression, and double stops, which he performed with such grace and seeming facility, that none but fiddle-players, who know the finger-board of the violin, and the difficulty of bowing certain passages, would imagine that he had any difficulties to encounter. His tone was not very powerful, but perfectly sweet and even, from the lowest note on the violin, to the end of the finger-board. His high notes were of the flute kind, nearly as sweet as the *sons harmoniques*.

This performer, whose constitution was very delicate, seemed consumptive, when he left England in 1779, at which time he returned to the continent, where he died.

LAMOTTE, WILLIAM, an eminent French surgeon and accoucheur, was of Valogne, in Normandy. He studied his profession at Paris, where he attended the practice of the celebrated hospital, l'Hotel-Dieu, during five years: He was distinguished particularly by his skill and success as an accoucheur, not only at his native town, but throughout the neighbouring country, during a long period. He left three sons, two of whom were physicians, and the third succeeded him in his own department.

His first publication, entitled "Traité des accouchemens naturels, non naturels, et contre nature," was first published in 1715. It went through many editions, and was translated into several languages; and was generally deemed the best treatise of the time, after that of Mauriceau, which Lamotte censured. It contained an account of four hundred cases, with judicious practical reflections, the result of thirty years' practice. His next publication was a "Dissertation sur la Generation, et sur la Superfetation;" containing also an answer to a book, entitled "De l'Indecence aux Hommes d'accoucher les Femmes, et sur l'Obliquité aux Mères de nourrir leurs Enfants," Paris, 1718. He denied the occurrence of superfetation, and combated the opinions of the ovarists, and the doctrine of animalcules: and in his reply to Hecquet, he relates a number of untoward accidents, occasioned by the ignorance of midwives. In 1722, he published, "Traité complet de Chirurgie, contenant des Observations sur toutes les Maladies chirurgicales, et sur la Manière de les traiter," which has been several times reprinted. The last edition was published in 1771, with notes by professor Sabatier. This was a valuable practical work, but disfigured by the egotism of the author, and his contempt for his professional brethren; whence Haller observes, "laudes suas non negligit, non

perinde famæ collegarum studiosus." Haller *Bibl. Chir. Eloy. Dict. Hist. de Med.*

LAMP, an instrument used for the combustion of liquid inflammable bodies, for the purpose of producing artificial light.

The most simple lamp consists of a vessel of almost any shape, containing oil or alcohol, with a tube projecting a little above the surface of the liquid, and containing any fibrous substance capable of raising the liquid to the top of the tube, by capillary attraction. The oil, thus raised and diffused through the fibrous substance, is so detached from the main body of the liquid, as to admit of being heated to a temperature sufficient to volatilize the oil, the vapour of which, in a state of combustion, constitutes the flame of the lamp.

In the management of the lamp of the most simple kind, so far as relates to the supply of oil, three things are necessary to be observed. 1. The wick must be of such a substance as best to promote capillary attraction. 2. It should not be twisted too much, in which case its capacity for the oil is too little; nor should it be so loose as to diminish materially its capillary attractive power. This is frequently the case, when the wick has been too long immersed in the oil. 3. With regard to the distance of the flame from the surface of the oil.—If the flame be too near the surface, a lesser quantity of oil will acquire the intense heat necessary to raise it into vapour, since the heat communicates with the fluid. On the contrary, when the flame is too high above the oil, the capillary attraction, which decreases in some ratio of the distance, is insufficient to supply the necessary quantity of oil.

Experience has long ago established, that cotton is the best medium for the transmission of the oil, which is prepared in a particular way for the purpose.

During the slow combustion of oil, as observed in the common lamp, as well as that of tallow in candles, the fatty matter is decomposed, producing a quantity of vapour, which inflames in contact with oxygen; and a cloudy exhalation in the form of smoke, consisting of numerous small particles of carbonaceous matter, which, if collected, constitute the article called lamp-black. Besides the offensive smell and appearance of this substance, there is an evident waste of combustible matter, capable of producing both light and heat.

The evil arising from the smoke and smell of lamps was formerly so great, as to prevent their introduction into domestic use, notwithstanding the strong inducement of convenience and economy.

The public have long been in possession of a complete remedy for this, and several other disadvantages in lamps, by the invention of the Argand lamp. This invention embraces so many improvements upon the common lamp, and has become so general throughout Europe, that it may be justly ranked among the greatest discoveries of the age. As a substitute for the candle, it has the advantage of great economy and convenience, with much greater brilliancy; and for the purpose of producing heat, it is an important instrument in the hands of the chemist.

We may with some propriety compare the common lamp and the candle to fire made in the open air, without any forced method of supplying it with oxygen; while the Argand lamp may be compared to a fire in a furnace, in which a rapid supply of oxygen is furnished by the velocity of the ascending current. This, however, is not the only advantage of this valuable invention. It is obvious that if the combustible vapour occupies a considerable area, the oxygen

gen of the atmosphere cannot combine with the vapour in the middle part of the ascending column. The outside, therefore, is the only part which enters into combustion; the middle constituting smoke. This evil is obviated in the Argand lamp, by directing a current of atmospheric air through the flame, which, instead of being raised from a solid wick, is produced from a circular one, which surrounds the tube through which the air ascends. Before we enter more fully into the merits of the Argand lamp, we shall give a description of it, with reference to drawings of its different parts. These drawings are taken from the lamps of modern construction, which have recently been much improved. The wick is now raised by a screw, instead of the rack and pinion; which is so great an improvement upon the latter, both in simplicity and convenience, that it is becoming general.

*Fig. 1. (Plate Lamp)* is a view of the lamp complete, to a scale of one-third the real size. A is a reservoir, which is on the principle of the bird-fountain, keeping the oil always at the same height in the burner B, through the communication C.

The burner B is composed of three tubes, *a*, *b*, and *s*. The two first are seen in section only; while the whole of one side of *c* is seen.

*Fig. 2.* The tube *c* is soldered into the bottom of the tube *a*, and open throughout, communicating with the receptacle D, which screws on the outside of the tube *a*, and serves at once to catch the oil which may accidentally run over the tube *a*, and admit the air through the apertures *n*, *p*, which has to ascend through the tube *c*.

The oil which comes in through C will occupy the cavity *g b*, between the exterior surface of the tube *c*, and the interior of *a*, which must, of course, rise to the height of the aperture *t*, in the reservoir A, as seen in *fig. 3*. The part *d e*, *fig. 2*, called the bucket, is a short tube to receive the circular wick. This part is seen in *fig. 4*, with the wick upon it, *d f*. It is made to work freely upon the tube *c*. The latter has a spiral groove cut upon it, into which a pin at *e* enters; so that when the bucket is turned round by a catch *r*, which works in a longitudinal slit in *b*, it will be raised or lowered by turning the tube *b* in different directions, and is, therefore, the means of raising or lowering the wick.

A wire, *s*, is attached to the tube *b*, which bends down parallel to, and touching the outside of, the tube *a*. The part *k l x z y* fits upon the tube *a*. The part *k l* is provided with shallow sides to receive the glass E, and is connected with a ring *y*, by wires *x*, *z*, *fig. 1*. The whole of this part turns with the glass E, and at the same time carries round the tube *b*, by means of the wire *s*, which is connected to *k l* and *y*, for the purpose of raising or lowering the wick. When oil is to be introduced into the reservoir, A is screwed off, and inverted. The aperture *t*, *fig. 3*, is then opened, by pushing down the sliding socket *v*, which ought to fit the interior cylinder pretty accurately. The globe must now be filled at the hole *t*: the socket *v* is next pulled over the hole. The ball may now be held in an erect position, and replaced in the lamp; after which the socket *v* may be pushed below the hole *t*, by means of the handle *w*. The oil will now rise to a height in F, and in B, till it reaches the higher part of the aperture *t*, *fig. 3*, and will maintain the same height till the oil in the globe gets to the same level. The reason of this hydrostatical phenomenon will be easily perceived. When the oil in B and F gets a little below the aperture *t*, a bubble of air enters and ascends into the globe, the same quantity of oil descending to give it place.

This reservoir, although it is fully fitted for giving a re-

gular supply of oil, is attended with one disagreeable property. The air in the upper part of the globe being much more expandible by heat than liquid bodies in a warm room, its spring becomes greater than the pressure of the exterior air; in consequence of which, the oil is apt to flow over the tube *a*, and liable sometimes to overflow the vessel D. Another disadvantage is also attendant on this bulky reservoir. When the lamp is used on a table, the shadow renders one side of it useless. The above inconveniences in the Argand-lamp have been, in some measure, obviated by the invention of Mr. Peter Kier of Kentish Town. He raised the oil by means of a column of a heavier fluid. In the plate, *figs. 5* and *6*, are exhibited an elevation and section of one of these lamps; the section only requires to be explained. From the slender figure of the vase, it is evident that the flame is permitted to throw its light in all directions, downwards and upwards, nearly in the same manner as a candle. The interior part is divided into several compartments by the diaphragms at F and C. The space A A above F is open to the atmosphere; but the space B B, beneath C, is close. A tube F G proceeds from the space A A to the space B B, so as to reach nearly to the bottom at G, and another tube, CD, proceeds from B B upwards through A A, without communicating with this last space, and is enlarged at the upper part, so as to receive a wick with the apparatus of Argand, or any other. A solution of sea-salt, or the mother water of salt, being first poured in, by measure, at E, flows down the tube into B B, and fills that space. A like measure of oil is next poured, which also descends into B B, and forces the dense saline liquor upwards through G F into the space A A. The specific gravity of this last is adjusted by dilution; so that when the space A A is properly filled, the oil shall stand in equilibrio at the requisite height near E, viz. the surfaces in A and at E are elevated above the lower orifice at G, in the inverse proportion of the specific gravities.

This proportion is usually about three to four; so that if any of the oil be taken away from E by combustion, or otherwise, there will be a subsidence of the heavy fluid in A A to preserve the equilibrium; and during the whole subsidence in A A, there will be a correspondent depression of the upper surface of oil, near E, which will be measured by four-thirds parts of the first elevation of the dense fluid above the partition F D. Now, the fall in A A may be rendered very small, by enlarging the diameter of the vessel at that part, and at B B; and the elevation of E above A, and, consequently, the insulation of the radiant flame, may be governed at pleasure by prolonging the interval D C.

It is possible, in the manipulation of this lamp, that some oil, or pieces of snuff, may fall into the space A A, and float upon the liquid. This effect is, to a certain extent, beneficial, because the covering of oil prevents evaporation; but if this should require to be remedied, it is easily done, by pouring the whole contents of the lamp into a basin, and after a few moments repose, or straining, returning the liquids again into the lamp at E by a syphon, or funnel, in which they will take their proper places by means of their relative weights. We may recapitulate the good qualities of this lamp in a few words. 1. It is capable of any form or apparatus for the burners. 2. It prevents no obstacle to intercept the emitted light. And, 3. As it raises the oil by the mere gravitation of a non-elastic fluid, it cannot, in any case, like the fountain lamp, raise more than is wanted.

A great variety of other lamps are at present exposed for sale, having different means of supplying the oil, but none so sufficiently striking as to merit minute description.

The grand and most essential properties of the lamp are confined to the means of supplying the flame with oxygen, so as to produce the most perfect combustion, and for which we are almost entirely indebted to *Argand*. We shall therefore conclude this article with some remarks upon the merits of this valuable invention, and shew in what instances it has been improved in its most essential points.

In the original lamp of *Argand*, a perpendicular column of air was perpetually ascending through the glass chimney of the lamp; one part of it passing through the central tube *c*, *figs. 1* and *2*; and the rest through the holes *q* and *m*, round the circular plate *k l*. This part was formerly a cylinder extending down to the receptacle *D*.

With this perpendicular current alone, it is well known that the *Argand* lamp would not burn *walpole* oil, and the purification of this oil, to render it fit for the purpose, became a desideratum, on account of the high price of the *Spermæti* oil. This great object was not accomplished by purifying the oil, but an improvement was made in the lamp itself, which effectually answered the desired purpose. For this discovery we are indebted to an ingenious and scientific manufacturer of Derby. It is curious to observe, however, that no advantage was taken of this invention for twenty years, during which time it had been used in the cotton mills of this discoverer, and now the same end is accomplished by a simpler contrivance. The above improvement consisted in placing over the mouth of the tube *c* a plate of metal about the diameter of the tube, and at such a height as to be a little short of the apex of the flame. By this means the ascending column of air was turned out of its perpendicular course, and thrown immediately into that part of the flame where the smoke was formed, and which, by this means, was completely consumed, producing at the same time a more than ordinary brilliant light.

The same effect is now produced by the shape of the lamp glasses *E*, in the figures already alluded to. The exterior current of air which enters the holes *q, m*, &c. rises with a velocity proportioned to the length of the glass chimney, and to the rarefaction of air in the same, strikes upon the shoulders *N* and *O*, by which it is propelled into the upper part of the flame. This happy form in the glass appears to have been the result of accident. Had the manufacturer been aware of its importance, it would have either been the subject of a patent, or at least strongly recommended to the public in the way of puffing. We see at the present time different shaped glasses, some of which are rather worse than the original plan, instead of improvements.

The theory of the action of the chimney lamp, is so nearly allied to the principles of furnaces, which we have given under that article, that the reader will no doubt get some useful hints, relative to the construction of lamps, by perusing the same.

The hydro-pneumatic lamp is constructed upon similar principles to the celebrated water engine erected by father *Hell*, at *Chrennitz*, in Hungary; the descent of one-half of the fluid to a certain depth below the source, raises the other half an equal height above the source. This principle has been, with great success, applied to the lamp, we believe at first by the French, but has lately been brought to perfection by Mr. R. W. King, of *Holborn*, who manufactures these articles. *Figs. 1, 2, and 3, of Plate II.* explain the construction of this ingenious contrivance. *Figs. 1 and 3* are sections to which our description will principally apply; *A A* is a cylindrical vessel, divided by horizontal partitions into four chambers, *viz. B, C, D, and E*. The upper one, *B*, is to contain the oil which is for the immediate supply of the

flame; the next, *C*, is for the portion of oil which descends into the inferior chamber *E*, through the pipe *a*, and forces the contained air up through the pipe *b*, into the upper chamber *B*, and pressing upon the surface of the oil contained therein, causes it to ascend the pipe *d*, to the lamp *F*, which is on *Argand's* principle, and of the same construction as before explained; *e* is a pipe to conduct the external air down into the chamber *C*; and *f* is a pipe to convey the waste oil, which may drip down from the lamp, into the middle chamber *D*, which is merely a reservoir for such waste oil. *G* is a tube passing down to the second chamber *C*, to fill it with oil; it is closed at pleasure by an air-tight plug *h*, fitting into the end of it; the lower orifice of the pipe *a* is closed by a piece of hat *i*, acting as a valve, which is shut by a spiral spring beneath it, but opened by a wire passing down the tube *a*, and also through the filling tube *G*, the plug of which, when in its place, presses down the wire, and opens the valve: suppose the plug removed, the spring will close the valve *i*. Oil is now poured in at the end of the pipe *G*; it runs down into the chamber *C*, and fills it, then rises in the pipe, which having a hole in one side, near its upper end, the oil also flows into, and fills, the upper chamber *B*. The plug *h* is now inserted into its place; this shuts off the communication of the open air, both with the chambers *B* and *C*, but depressing the wire, as before explained, opens the valve *i*, and the oil in the middle chamber *C* descends, by its gravity, through *a*, as shewn by the arrow, and enters the lower chamber *E*, from which it expels the air by the pipe *b*, into the chamber *B*. The end of this pipe being covered by an inverted hood, the air ascends by bubbles, through the oil, into the top of the chamber, and pressing on the surface of the oil, forces it up the pipe *d*, to the lamp in which it stands at the level of the dotted line *k*, at which level it will evidently continue, till the upper chamber is exhausted, and the contents of *C* descended into *E*. The lamp is now replenished by the following means; the whole apparatus is inverted, as shewn in *fig. 3*; the oil now runs down the pipe *b*, and filling its hood, flows over into the upper chamber *B*, which it fills, the atmospheric air entering the pipe *e* into the chamber *C*, and thence by the pipe *a* into the chamber *E*, the air contained in the chamber *B* escaping at the pipe *d*. The lamp is held inverted for about a minute, and is then set upright. Fresh oil is now poured in at the plug *h*, to fill the second chamber *C*, and then the plug being put in, the above operation is repeated.

By this ingenious application of the principles of hydrostatics, the lamp *F* is constantly supplied with oil at precisely the same level, which does not vary by any diminution of the quantity of oil, or by the expansion of the air by heat, as in the fountain lamp, the included air being only applied as the medium to transmit the pressure of one column of oil, from *C* to *E* to act upon, and raise a similar column from *B* to the dotted line *k*. The lamp is furnished with a glass chimney *H*, similar to that before described, and for some purposes this is surrounded by a glass globe *K*, ground within-side to take off the glare of the light. The cylindrical vessel *A A* is included in an elegant columnar pedestal, shewn in *fig. 2*, where the ring *L* is that which is turned round to elevate the wick. *Fig. 4.* is a cap to cover the top, when the glass chimney is removed. The principal objection to this lamp, as originally constructed, was, that after inverting it, the oil would, in certain positions of the lamp, return down the pipe, and fill the lower chamber again, in which state it would not burn. Mr. King has completely remedied this, by bringing all the tubes, except the air and filling tubes, as near as possible into the centre of the lamp. Lamps of this

kind have been made to contain a sufficiency of oil to last two months, the vessel having the appearance of an elegant pedestal to ornament a hall or staircase.

A patent lamp, invented by John Barton, esq. is delineated in *fig. 5*, of our plate; it is contrived so as to always have a supply of oil maintained at a level, very near the point of combustion, by floating the oil upon a fluid of greater specific gravity. The oil is contained in a cylindrical vessel *A*, *fig. 5*, having a pipe, *B*, extending upwards from it to the burners at *a, a, a*, where the wicks are placed. The bottom of the vessel takes off with a screw joint similar to a snuff-box, that the inside of the vessel may be cleaned; and in the centre of the bottom is an aperture of about half an inch in diameter always open. This oil-vessel is immersed in a heavier fluid, contained within the external vessel *D E F G*. A float is attached to the oil-vessel at *H*, and another, in addition to it, is fixed to the tube *B* at *I*. In this situation of things, the column of heavy fluid, (which may be salt water,) from its surface at *c* to *d*, where the oil presses upon it, (through the hole in the bottom of the oil-vessel,) will support a column of oil, of a greater height, in proportion to the difference of their specific gravities, from *d* up to *e* for instance, within an inch of the burners *a, a*, which is a sufficiently small distance for the capillary attraction to draw up a supply of oil to the wick. As the oil diminishes by burning, the water enters the hole in the bottom of the oil-vessel, and still continues to support the column of oil, as at first, the oil-vessel floating in the water by the floats at *H* and *I*. By this means it is freed from the inconvenience we have before ascribed to Mr. Kier's lamp, because the burners descend as the oil is consumed; and therefore, though the oil is not maintained at the same identical level, yet, with respect to the burners, it is always at the same distance below their wicks. The external vessel unscrews at *F*, to get in the oil-vessel *A*. The enlarged part or vase *D*, at the top, should contain very nearly, but not quite, as much as the oil-vessel. In preparing the lamp, the external vessel is first filled with the water (poured in at the top of the vase *D*) as high as *E*: the oil-vessel is now full of water, and rests upon the bottom, because the upper float *I* is not supported. The oil, being poured in at the top of the tube *B*, expels the water from the vessel, and fills it at the same time, raising the water in the vase *D*, and floating the oil-vessel. In this state the lamp will continue, with the oil standing at *e*, until it is all consumed.

A very simple and efficacious lamp has been lately presented to the public, under the title of the Automaton lamp, having something ingenious in the manner of supplying it with oil. We have given three figures of it at *figs. 6, 7, 8*, of the last plate; it consists of a tin box, *abcd*, with a burner consisting of two wicks of cotton at *a*. The box is suspended upon pivots at *e*, entering eyes in the wire *f*, which is similar to the suspension part of a scale-beam. When this lamp is full of oil, which is poured in at *d*, it assumes the horizontal position *fig. 6*, because the mass of oil, *a b c d*, is chiefly situated behind the centre *e*, and balances the weight of the wick at *d*; but as the oil diminishes by burning, the weight behind the centre is lessened, whilst that of the wick continues without alteration. This occasions the lamp to librate, as in *figs. 7* and *8*, so that the oil is always kept very near the wick, by which means it will burn oil which is too impure for the capillary action of a common lamp. The nicety of its performance depends upon the figure of the vessel, and the place of the centre *e* corresponding with the weight of the tubes at *d*. This the makers have by experience determined to the greatest accuracy.

The Automaton lamp is in very general use in the north of England in cotton-mills, and other manufactories where the gas-lights are not introduced, which is undoubtedly the best method.

LAMP, *Cardan's*, is a contrivance of an author of that name, which furnishes itself with its own oil.

It consists of a little column of brass, tin, or the like, well closed every where, excepting a small aperture at bottom, in the middle of a little gullet or canal, where the wick is placed.

Here the oil cannot get out, but in proportion as it wastes, and so opens the passage of that little aperture.

This kind of lamp was much in use some years ago; but it has several inconveniences: such as that the air gets into it by starts and gluts; and that when the air in the cavity comes to be much rarefied by heat, it drives out too much oil, so as sometimes to extinguish the lamp.

Dr. Hooke, and Mr. Boyle, have invented other lamps that have all the conveniences of Cardan's without the inconveniences.

The flame in a lamp never consumes the wick, till the wick be exposed to the air by the flame's falling downward; and from thence it may be inferred, that a way found out to keep the fuel, and consequently the flame, at the same height upon the wick, would make it last a long time. Many ways have been devised to arrive at this, but it seems only possible to be done, in any degree of perfection, by hydrostatics. Thus, let a lamp be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel; let it be filled so high with water, as to cover the hole of the pipe at the bottom, to the end that the oil may not get in at the pipe, and so be lost. Then let the oil be poured in, so as to fill the vessel almost brimful, which must have a cover, pierced with as many holes as there are wicks designed. When the vessel is thus filled, and the wicks are lighted, if water falls in by drops at the pipes, it will always keep the oil at the same height, or very near; the weight of the water being to that of the oil as 20<sup>3</sup> to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height. *Phil. Trans. No. 245, p. 388.*

The access of air is of the greatest importance in every process of combustion. When a lamp is fitted up with a very slender wick, the flame is small and of a very brilliant white colour: if the wick be larger, the combustion is less perfect, and the flame is brown: a still larger wick not only exhibits a brown flame, but the lower internal part appears dark, and is occupied by a portion of volatilized matter, which does not become ignited until it has ascended towards the point. When the wick is either very large or very long, part of this matter escapes combustion, and shews itself in the form of coal or smoke. The different intensity of the ignition of flame, according to a greater or less supply of air; is remarkably seen by placing a lamp with a small wick beneath a shade of glass, not perfectly closed below, and more or less covered above. While the current of air through the glass shade is perfectly free, the flame is white; but in proportion as the aperture above is diminished, the flames become brown, long, wavering, and smoky; it instantly recovers its original whiteness when the opening is again enlarged. The inconvenience of a thick wick has been long since observed, and attempts have been made to remove it; in some instances by substituting a number of small wicks instead of a larger; and in others, by making

making the wick flat instead of cylindrical. The most scientific improvement of this kind is the lamp of Argand, described in the preceding part of this article. In this the wick forms a hollow cylinder or tube, which slides over another tube of metal, so as to afford an adjustment with regard to its length: when this wick is lighted, the flame itself has the figure of a thin tube, to the inner as well as the outer surface of which the air has access from below. And a cylindrical shade of glass serves to keep the flame steady, and in a certain degree to accelerate the current of air. The inconvenience of a long wick, which supplies more oil than the volume of flame is capable of burning, and which consequently emits smoke, is seen at once by raising the wick; and on the other hand, the effect of a short wick, which affords a diminutive flame merely for want of a sufficient supply of combustible matter, is observable by the contrary process. The most obvious inconvenience of lamps in general, arises from the fluidity of the combustible material, which requires a vessel adapted to contain it, and even in the best constructed lamps is more or less liable to be spilled. When the wick of a lamp is once adjusted as to its length, the flame continues nearly in the same state for a very considerable time. Nicholson's Journal, vol. i. 410.

By 17 Geo. II. cap. 29. a convenient number of glass lamps shall be put in such places of the city of London, as the mayor, aldermen, and commonalty shall think fit; to be kept lighted and burning from sun set to sun-rising throughout the year; and rates shall be made not exceeding 6d. in the pound, nor above 50s. a year on any one person, for defraying the charges of them. Every alderman, with consent of his deputy and common council, may contract yearly for the setting up lamps, and their lighting, trimming, &c. and persons maliciously breaking down or extinguishing the lamp, shall forfeit 40s. for the first offence; 50s. for the second; and 3*l*. for the third, leviable by justices, or to be sent to the house of correction. By stat. 11 Geo. III. c. 29. for paving and lighting London, the wilfully breaking or extinguishing of any lamp incurs the penalty of 20s. for each lamp or light destroyed or extinguished. None but British oil is to be used for lamps in private houses, under penalty of 40s. 8 Ann. cap. 9.

The use of lighted lamps in churches, and places of devotion, is very ancient. In the city of Fez is a mosque, wherein are 900 brazen lamps burning every night. In Turkey, all the illuminations are made only with lamps. Polydore Virgil ascribes the first invention of lamps to the Egyptians; and Herodotus describes a feast of lamps held annually in Egypt.

Kircher shews the manner of preparing lamps, which shall diffuse a light so disposed, as to make the faces of those present appear black, blue, red, or of any other colour.

There has been a great dispute among the learned about the sepulchral lamps of the ancients: some maintain, they had the secret of making lamps that were inextinguishable, alleging several that have been found burning, at the opening of tombs fifteen or sixteen hundred years old. But others treat these relations as fables; and others think, that the lamps, which were before extinguished, took light afresh upon the admission of fresh air.

Dr. Plott, however, is of opinion, such perpetual lamps are things practicable, and has himself made some proposals of this kind. The lium abetlinum, he thinks, may do pretty well for the wick, and that the naphtha, or liquid bitumen, constantly springing into some of the coal-mines, would answer for the oil.

If the asbestos will not make a perpetual wick, he thinks

there is no matter in the world that will; and argues, that the tradition of fuel lamps must be fabulous, or else that they made them without wicks.

Such a lamp he thinks it possible to make of the bitumen springing into the coal-mines at Pitchford, in Shropshire; which, he says, like other liquid bitumen, will burn without a wick.

Those lamps that kindle on the immision of fresh air, the same author thinks, might be imitated by inclosing some of the liquid phosphorus in the recipient of an air-pump; which, under those circumstances, will not shine at all; but on letting the air into the recipient, there will possibly, says he, appear as good a perpetual lamp as some that have been found in the sepulchres of the ancients.

LAMP, *Rolling*, in *Mechanics*, is a Lamp A B (*Plate I. Lamps. fig. 7.*) that has within it the two moveable circles D E and F G, whose common centre of motion is at K, where their axes of motion cross one another, in which point also is their common centre of gravity. If to the inward circle you join within the lamp K C, made pretty heavy, and moveable about its axis H I, whose centre of gravity is at C, the common centre of gravity of the whole machine will fall between K and C, and by reason of the pivots A, B, D, E, H, I, will be always at liberty to descend; and, therefore, let the whole lamp be rolled along the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot be spilt. In this manner the compass is hung at sea; and thus should all the moon-lanterns be made that are carried upon a pole before coaches or carriages which travel in the night. *Desag. Exp. Phil.* vol. i. p. 57.

LAMP-black. Of this kind there are two sorts; one of which is the light foot, obtained from burning pine and other resinous wood; and another, which is the heavy black, obtained by calcining bones in close vessels. See BLACK. See also BONE and CHARCOAL.

LAMP-blowers are persons who form various articles of glass for toys, and for more important philosophical purposes, from tubes, &c. by means of the *blow-pipe*; which see.

The apparatus of these artists consists of a solid table, to the bottom of which is fixed a double bellows with a foot-board, from which proceeds a pipe that conducts the blast to the lamp. This lamp is a large bundle of cotton threads, placed in a tin vessel in the shape of a horse-shoe, and supplied by lumps of tallow deposited by it, and pushed into the flame as the continued combustion requires. The smoke is conveyed away by a small chimney suspended over the lamp. The blast-pipe in front of the table, at which the artist is seated, drives the jet of flame away from him, so that he suffers no inconvenience from it.

The other articles of his apparatus are glass tubes of various dimensions, and two or three very simple iron tools, such as a small forceps, files, &c. The flame in full vigour is about four inches in length, which near its extremity is of a clear light blue, when it is the hottest, and beyond of a pale yellow. The tubes, before the operation commences, are well dried, so as to be quite free from moisture. They are then gradually heated by being first held in the flame of the lamp without blowing, and then at the edge of the outer yellow part of the jet of flame, and slowly brought to a state of fusion. The flame is sufficiently strong to bring to a very white-red heat a solid mass of glass, about the size of a playing marble, or even larger; and this, when blown out very thin, will make a bulb of the capacity of three ounces, which is nearly the extent of the power of the common lamp-blowing. The bulbs for thermometers and other philosophical

lofophical purposes are much lefs. (Aikin's Dict. vol. i. art. *Glaſt*.) For an account of the operation of hermetical fealing, performed by the lamp-blowers, fee HERMETICAL *Sealing*. For bending and joining glaſs-tubes, forming bulbs to tubes, and ſpinning out glaſs-threads, fee TUBE, THERMOMETER, and THERMADS.

LAMP FURNACE, is a furnace, in which the heat is produced and maintained by the flame of a lamp introduced within it. This furnace has no occasion for an aſh-hole, a grate, or a fire-place. It has only one opening below, through which the lamp is introduced, and a kind of ſmall chimney in its upper and lateral part, for circulation of air, to keep up the flame of the lamp, and to give vent to the ſmoke. For the deſcription of an improved furnace of this kind, fee Lewis's Com. Phil. Techn. p. 29. See FURNACE.

LAMPÁ, in *Geography*, a town of Chili, ſituated on a lake; 20 miles N. of Valparaiſo.—Alſo, a town of Peru, and capital of a juriſdiction of the ſame name, in the biſhopric of Cuſco, 90 miles S. of Cuſco. The ſoil is partly fertile and partly unproductive: the vicinity abounds with ſilver mines. S. lat. 14° 55'. W. long. 81° 44'.

LAMPACAN, a ſmall iſland in the Eaſt Indian ſea, a little S. of Junkfeilon.

LAMPADARIUS, EMANUEL, in *Biography*, an author who adorned the muſic of the Greek church. “De Pfallicis arte, et iſtius et aliorum Poemata Ecclēſiaſtica, ad notas Muſica accomodata.” The Abbatte Martini of Venice, to whom we have aſſigned an article, found this book, and made extracts from it, in Greece; but we never met with it in any public library, either at home or on the continent, except the royal library at Turin. The title of the Greek treatiſe, by Lampadarius, is the following: “Τραχολογία τῆς μουſικῆς τέχνης.” The extract from it by the Abbatte Martini, which is in our poſſeſſion, is too long for inferſion here, nor would it be of much uſe could we allow it room, as no equivalents to the Greek characters are given in modern notation; but with reſpect to the author, we find among the memoranda made in the king of Sardinia's library at Turin, in 1770, an account of a Greek MS. of the 15th century, No. 353. b. i. 24. in which Lampadarius is often mentioned as author of the muſic to the hymns and prayers it contains. Fabricius, likewiſe, Bibl. Græc. vol. ii. p. 269. 564. and 586, ſpeaks of a MS. in the Selden Collection at Oxford, and another in the Jeſuits' library at Louvain, in which there are explanations of the notes uſed by the modern Greeks, and muſical compoſitions by ſeveral authors, particularly Lampadarius.

LAMPADARY, LAMPADABUS, an officer in the ancient church of Conſtantinople, whoſe buſineſs was to ſee the church well lighted, and to bear a taper before the emperor, the emperreſs, and the patriarch, when they went to church, or in proceſſion. The taper borne by the lampadary before the emperor was emcompaſſed with divers circles of gold, in manner of crowns; thoſe held before the emperreſs and patriarch had but one. It ſeems they were of emblematical uſe, and were intended to keep thoſe great perſons in mind, that their light was to illumine thoſe in inferior ſtations.

There were alſo lampadaries in the emperor's palaces; and others in the houſes of the grandees. At firſt, the privilege of having a lampadary, or torch-bearer, was only granted to the principal officers of the crown, and the chief magiſtrates; but afterwards the emperor allowed it to other inferior officers, as queſtors, treaſurers, &c. They alſo bore before the magiſtrates the emperor's image, &c. And it was probably on account of this image, that they were firſt permitted to have a lampadary.

LAMPADIAS is uſed by ſome authors for a kind of bearded comet, which, as they pretend, reſembles a burning lamp, being of ſeveral ſhapes; its flame or blaze tapering upward ſometimes like unto a ſword, and being at other times double or triple pointed.

LAMPADIUS, in *Biography*, a chanor of the church at Luneberg, published a ſmall work in Latin, intitled “Compendium Muſicæ,” 12mo. 1537. This ſhort tract, which is in dialogue, and a kind of muſical catechiſm deſigned for incipiens, has, at the end, a few ſhort rules for compoſition, with examples.

LAMPAS, or LAMPERS, a kind of ſwelling in the palate of a horſe; ſo called, becauſe it is cured by burning with a lamp, or a hot iron; and ariſing from abundance of blood reſorting to the firſt furrow of the mouth, near the fore-teeth, which cauſes that furrow to ſwell as high as his gatherrers; it hinders the beaſt's feeding, and makes him let his meat fall, half chewed, out of his mouth.

LAMPASKE, in *Geography*, a town of Pruffia, in Na-tangen; 20 miles S.E. of Konigberg.

LAMPE, FREDERICUS ADOLPHUS, in *Biography*, pallor of St. Stephen's church in Bremen, became an antiquary at 15 years of age; and in 1703 published, in 12mo., a work of great learning and reſearch, intitled “De Cymbalis veterum, Libri tres, in quibus quæcunque ad eorum Nomina, Differentiam, Originem, Hiſtoriam, Miniſtros, Ritus pertinent, elucidantur, cum Figuris æreis Trajecti ad Rhenum,” 1703.

This author, in a way ſimilar to Bartholinus, in treating of the flutes of the ancients, has given us all the information which could be gleaned from antiquity on the ſubject of the cymbal, which is hardly a muſical inſtrument, but rather a chronometer to meaſure and mark the time, in its military uſe. In its religious employment, indeed, before large bells were caſt, it ſerved both Pagans and Chriſtians as a ſignal and call to temple worſhip. Its clashing tone in the field may regulate the ſteps of the ſoldiery in their march; but even this purpoſe ſeems better performed in China by the gong and *pierre ſonore*, or muſical ſtone, uſed in proceſſions, as well as in the army: for theſe have real muſical tones, to which there is no difficulty in tuning other inſtruments. Our author, by his claſſical knowledge and diligence, has nearly found as many names in ancient authors for the different kinds of cymbals, as the Perſian language furniſhes for a horſe or lion. As nothing on the ſubject has eſcaped the notice of the author, this little book will be found to contain much precious information for a claſſical antiquary in muſic. Its learned author died of a hæmorrhage at Bremen, in 1729, at the age of 46.

LAMPE, JOHN FREDERIC, a Saxon, who arrived in England about the year 1726, began firſt to be noticed as a compoſer about the year 1732. On the 25th of February of that year, the following paragraph was inferſed in the “Daily Poſt.” “We hear that there is a ſubſcription for a new English opera, called “Amelia,” which will ſhortly be performed at the new theatre in the Haymarket, by a ſet of performers who never yet appeared in public.” This opera, written by Harry Carey, and ſet to muſic by Lampe, was firſt performed March 15th, 1732; in the principal character of which, Miſs Arne, afterwards ſo celebrated as a tragic actreſs, by the name of Mrs. Cibber, firſt appeared on the ſtage as a ſinger. The muſic, which, according to the advertisement, was ſet in the Italian manner, having been much applauded, was ſoon avowed by Lampe; and Miſs Arne's performance intereſted every hearer. The year

year 1737 was rendered memorable at Covent-Garden theatre by the success of the burlesque opera of the "Dragon of Wantley," written by Carey, and set by Lampe, "after the Italian manner." This excellent piece of humour had run twenty-two nights, when it was stopped, with all other public amusements, by the death of her majesty queen Caroline, November 20th; but was resumed again on the opening of the theatres in January following, and supported as many representations as the "Beggar's Opera" had done, ten years before. And if Gay's original intention in writing his musical drama was to ridicule the opera, the execution of his plan was not so happy as that of Carey; in which the mock heroic, tuneful moniter, recitative, splendid habits, and style of music, all conspired to remind the audience of what they had seen and heard at the lyric theatre, more effectually than the most vulgar street tunes could do; and much more innocently than the tricks and transractions of the most abandoned thieves and prostitutes. Lampe's music to this farcical drama was not only excellent fifty years ago, but is still modern and in good taste.

In 1741, his wife, (the second daughter of Charles Young, sister to Mrs. Arne,) with Miss Young, Sullivan, the two Messings, and Jenny Worfdale, went to Preston Guild, and afterwards to Chelster, where they performed the "Dragon of Wantley," "Margery," the "Sequel to the Dragon of Wantley," &c. all composed by Lampe. He set "Nancy, or the parting Lover," "Pyramus and Thisbe," which had great success; and published, in an octavo volume, a tract, intitled "The Art of Music," in 1740. But in 1737 he had published a treatise, under the title of "A plain and compendious Method of teaching Thorough-Bass," &c. 4to.; a work of great merit, and the first in our language, by which a student can profit much without a master, as the chords, engraved on copper-plates, are all placed over the figured bass, and the examples transposed into different keys.

Lampe was a truly ingenious man, well versed in the theory of the art, with a most happy turn for humour, without buffoonery, in his comic operas; and, moreover, a man of probity, with great simplicity of manners, and possessed of a kind and benevolent heart. This excellent musician and worthy man, quitting London, with his family, in 1748, resided two years in Dublin; and in 1750 went to Edinburgh, where he was settled very much to the satisfaction of the patrons of music in that city, and of himself; but in July 1751, he was seized with a fever, which put an end to his existence at the age of fifty-nine.

LAMPE, in *Geography*, a town of Sweden, in the government of Wafra; 28 miles E. of Gamla Karleby.

LAMPEDOSA, an uninhabited but pleasant and fertile island in the Mediterranean. The Catholics and Mahometans visit a building upon it, which is divided into a church and a mosque. Near it is a magazine, containing the deposits of the visitants, which are taken up by some Sicilian monks, and applied to the hospital at Trapani. The island is about 12 miles in circumference, has a good port, is well supplied with fresh water, and has, on the coast, an excellent fishery; 63 miles W. of Malta. N. lat. 35° 40'. E. long. 12° 24'.

LAMPERN, in *Ichthyology*, a river fish, being the petromyzon branchialis of Linnæus, found in many parts of England, particularly in Oxfordshire, and the neighbouring counties, and there called the *pride of the Iffs*. The Latin authors call it the lampetra minima and muscula fluviatilis. See PETROMYZON Branchialis.

The word lampern is used by the common people in Eng-

land for one species of the lampetra, and is not to be confounded with the other called the lamprey, or the lamprey-eel. See PETROMYZON.

No lamperns are to be taken in the river Thames and Medway, except from August 24 to March 30. 30 Geo. II. cap. 21.

LAMPETER, in *Geography*, a township of America, in Lancaster county, Pennsylvania, containing 2028 inhabitants.

LAMPETER. See LLANBEDER.

LAMPETIA, in *Ancient Geography*, a town of Italy, in Magna Græcia, in the country of the Brutii.

LAMPETIANS, LAMPETIANI, in *Ecclesiastical History*, a sect of ancient heretics, in the seventh century, who fell in with some of the opinions of the Aerians.

Their founder, Lampetius, is said to have been one of the chief of the Marcionites. They condemned all kinds of vows, particularly that of obedience, as inconsistent with the liberty of the sons of God.

LAMPETRA, LAMPREY, à *lambendo petras*, because this species is supposed to lick the rocks, in *Ichthyology*, belongs, in the Artedean and Linnæan systems, to the genus of petromyzon. See PETROMYZON Marinus.

This is a fish that equally lives in salt and fresh water. In the month of March it commonly runs up into the rivers, and is then most valuable for the table, as being fat and full of eggs; so that the best season for lampreys is in the months of March, April, and May, because they are most firm when they first leave the salt water, and become wast and flabby at the approach of hot weather; they are found in several of our rivers, but the Severn is the most noted for them. They are taken in nets along with salmon and shad, and sometimes in weels laid in the bottom of the river. It has been an old custom for the city of Gloucester, annually, to present his majesty with a lamprey pyc, covered with a large raised crust; and as the gift is made at Christmas, the corporation procure fresh lampreys at that time with great difficulty. They are reckoned a great delicacy, either potted or stewed; but are a surfeiting food, as one of our monarchs fatally experienced, Henry the First's death being occasioned by a too full meal of this fish. They are sometimes found so large as to weigh four or five pounds. The lesser lamprey, or petromyzon fluviatilis of Linnæus, sometimes grows to the length of ten inches. These are found in the Thames, Severn, and Dee, and are potted with the large species, and are reckoned of a milder taste. They are sold to the Dutch as bait for their cod-fishery. Above 450,000 have been sold in a season at 40s. per thousand. Of late, above 100,000 have been sent to Harwich for the same purpose. It is said the Dutch have the secret of preserving them till the turbot fishery. Another species is the *lampetra*, which see.

LAMPETRA Indica, the name of an East Indian fish of the lamprey kind, caught in standing waters, and called by the Dutch there *bont ael*, and *neegen oog*, or *nine eyes*.

LAMPI, in *Geography*, a district or country of Guinea, governed by a king, subject to Aquambo.

LAMPICHELEON, a town of Hindoostan, in the circar of Adoni; 10 miles E. of Candanore.

LAMPIS, a town of Sweden, in Tavastland; 25 miles E. of Tavasthus.

LAMPO, a town on the west coast of Celebes. S. lat. 3° 55'. E. long. 120° 4'.

LAMPOCARYA, in *Botany*, so denominised by Mr. Robert Brown, from *λαμπε*, to *shine*, and *καρυον*, a *nut*, or any fruit with a hard shell, alluding to the hard and polished seeds.—Brown. Prodr. Nov. Holl. v. 1. 238.—Clafs and order,

order, *Tetrandria Monogynia*. Nat. Ord. *Calamariæ*, Linn.  
*Cyperoides*, Juss.

Eff. Ch. Spikelets imbricated on all sides, single-flowered, the outer scales being empty. Stamens four, sometimes three or six, with permanent elongated filaments. Style awl-shaped, three-cleft. Stigmas undivided. Nut boay, shining, pointed with the permanent base of the style, its shell thickened upwards; the kernel smooth.

Obf. This genus is intermediate between *Cladium* of Browne's Jamaica, and *Gabnia* of Forster, differing from the former in having the filaments elongated after flowering, and a sharp-pointed nut; from the latter in having a smooth or even kernel. *Gabnia jebanoides* of Forster appears, by a specimen in the Bankian herbarium, to be a *Lampocarya*.

1. *L. aspera*. Stamens four. Spike compound, leafy; the partial ones feacely divided. Spikelets clustered. Inner scales obtuse, smooth.—Gathered by Mr. Brown near Port Jackson, as well as in the tropical part of New Holland. The four stamens are a very unusual number in this family.

2. *L. hexandra*. (*Gabnia trifida*; La Billard. Nov. Holl. v. 1. 89. t. 116.)—Stamens six. Panicle close; branches slightly divided. Spikelets collected into round heads. Scales all sharp-pointed.—Gathered by La Billardiere in Van Diemen's land. The stems are two feet high, round, leafy, smooth. Leaves sheathing, awl-shaped, long, and slender. Panicle slender, erect, composed of several stalked heads of flowers, with two or three lanceolate bractees at the base of each. Mr. Brown doubts whether this second species be properly referred to the genus in question. We should be much inclined to reduce both of them to *Gabnia*.

LAMPOL, in *Geography*, a town of Poland, in the palatinate of Braclaw, near the Dniefler; 56 miles S.S.W. of Braclaw.

LAMPON, in *Biography*, a performer on the cithara, who taught Socrates music in his old age, and who sung at a festival which Xenophon gave to the philosophers. Socrates tells us, that he only began to compose verses, after he was imprisoned, on account of the many dreams, in which he was advised to attach himself to music; believing that it was impossible to arrive at one without the other.

He composed hymns in praise of Apollo, and let them to music; but he was put to death some days after. Others tell us, that Damon was the music-master of Socrates. See DAMON.

LAMPON, or *Lampoon*, in *Geography*, a country of Sumatra, which is a portion of the southern extremity of the island, beginning, on the west coast, at the river of Padang-goochie, dividing it from Passumnah, and extending across as far as Palembang, on the north-east side, at which last place the settlers are mostly Javans. On the south and east sides it is washed by the sea, having several ports in the straits of Sunda, particularly Keyfen and Lampon bays; and the great river *Toolang-bouang* runs through the heart of it, rising from a considerable lake between the ranges of mountains. That division of Lampon, which is included by Padang-goochie and a place called Nassall, is distinguished by the name of *Briaran*; and from thence fourthward to Flat-point, by that of *Laout-cacour*, although *Cacour*, properly so called, lies in the northern division. The country of Lampon is best inhabited in the central and mountainous parts, where the people live independent, and in some measure secure from the inroads of their eastern neighbours, the Javans, who, from about Palembang and the straits, frequently attempt to molest them. If you ask the Lampon people of these parts, whence they originally

came? they answer, from the hills, and point out an inland place near the great lake, whence, they say, their forefathers emigrated. These, of all the Sumatrans, have the strongest resemblance to the Chinese, particularly in the roundness of face, and construction of the eyes. They are also the fairest people of the island; and the women are the tallest, and esteemed the most handsome. Their language differs considerably from that of the *Rejangs*, and they use characters peculiar to themselves. The titles of government are *Pangaran* (from the Javans), *Carceoo*, and *Kiddinang* or *Nelchee*; the latter answering nearly to *Dusatty* among the *Rejangs*. The district of *Crooe*, near mount Poogeng, is governed by five magistrates, called *Pangoro-lemo*, and a sixth, superior, called by way of eminence *Pangoro*; but their authority is said to be usurped, and often disputed. The word, in common, signifies a gladiator, or prize-fighter. The *Pangaran* of *Soko* in the hills is computed to have four or five thousand dependants; and sometimes, on going a journey, he levies a *talle*, or eighth part of a dollar, on each family; which shews that his government is more arbitrary, and more strictly feudal, than among the *Rejangs*, where the government is rather patriarchal. The Javanele banditti often advance into the country, and make depredations upon the inhabitants, who are not, in general, a match for them. They do not use fire-arms, though in the northern part of the island they are manufactured. Beside the common weapon of the country, they fight with a long lance, carried by three men; the foremost guiding the point, and covering himself and his companions with a large shield. Inland of *Samanki*, in the straits of Sunda, there is a district, as the Lampons say, inhabited by a ferocious people, who are a terror to the neighbouring country. Their mode of atoning for offences against their own community is by bringing to their doosoon the heads of strangers. These reports, however, depend on the credibility of a people who are fond of the marvellous, and addicted to exaggeration. The manners of the Lampons are more free, or rather licentious, than those of any other native Sumatrans. An extraordinary liberty of intercourse is allowed between the young people of different sexes, and the loss of female chastity is not a very uncommon consequence. Both men and women await themselves before company, when they prepare to dance; the women their necks and arms, and the men their breasts. They also paint each others' faces, making fantastic spots with the finger on the forehead, temples, and cheeks, of white, red, yellow, and other hues. In every doosoon there is appointed a youth, well fitted by nature and education for the office, who acts as master of the ceremonies, regulating every circumstance that pertains to the dances and the assembly. The Lampons eat almost all kinds of flesh indiscriminately; and their goolies (curries or made dishes) are said by connoisseurs to have no flavour. They entertain strangers with greater profusion than any that is met with in the rest of the island. One man has been known to entertain a person of rank and his suite for sixteen days, during which time there were not less than 100 dishes of rice spread each day. Their dishes of china or earthen ware are very costly, being valued at 40 dollars a-piece. The terms of the *joosoor*, or equivalent for wives, is here the same nearly as with the *Rejangs*. The father of the girl never admits of the *poosoo talle kooloo*, or whole sum being paid; and thus withholds from the husband, in every case, the right of selling his wife, who, in the event of a divorce, returns to her relations. Where the *poosoo talle* is allowed, he has a property in her little differing from that of a slave. The value of the maiden's golden trinkets is nicely estimated, and her *joosoor* regulated according to that, and the rank of her

her parents. The fines and compensation for murder are, in every respect, the same as in other countries of the island. The Mahometan religion has made considerable progress among the Lampoons, and most of their villages were mosques; nevertheless, an attachment to the original superstition of the country induces them to regard with particular veneration the *crammats*, or burying-places of their fathers, which they pliously adorn, and cover in from the weather. The Dutch have a resident here. S. lat. 5° 40'. E. long. 105° 15'. Marfden's Sumatra.

LAMPON Bay, a bay on the east coast of the island of Luzon. N. lat. 14° 45'. E. long. 122° 14'.

LAMPREY, BLIND. See EINBLINDER and PETROMYZON *branchialis*.

LAMPRIDIO, BENEDICT, in *Biography*, a distinguished Latin poet, who flourished at the commencement of the sixteenth century, was born at Cremona. He went to Rome in his youth, and was first domesticated with Paul Cotesi. He then became a teacher in the Greek college, instituted by John Lascaris, in the pontificate of Leo X. After this he went to Padua, and was employed many years as private teacher of the learned languages, and much esteemed by persons of eminence. He was afterwards appointed, with a liberal salary, to undertake the education of the son of the duke of Mantua. Lampridio died in the year 1540: he is known as an author by his Greek and Latin poems, consisting of epigrams and odes; in the latter he was an imitator of Pindar. There are extant three Italian letters written by him to cardinal Bembo, and one to cardinal Pole. An edition of his Latin poems, together with those of J. Bapt. Amaltheus, was printed at Venice in 1550.

LAMPRIIDIUS ÆLIUS, was a Roman historian in the fourth century under Dioclesian and Constantine. He is supposed to have been the author of the lives of Commodus, Antoninus, Diadumenus, Heliogabalus, and Alexander Severus. The style and arrangement of Lampridius will not allow him a place among historians of the superior class, but he is valuable for his facts. His lives make a part of the "Historiæ Augustæ Scriptores." Moreri.

LAMPRIILLON, or LAMPRELON, a name by which some authors have called the particular species of lamprey, which we, by way of distinction, call *lamperna*.

LAMPROPHORUS, an appellation anciently given to the neophytes, during the seven days that succeeded their baptism.

In the ceremony of baptism, the new Christian was clothed with a white robe, which he wore for the week following; and was thence called *lamprophorus*, which signifies a person wearing a shining garment; from λαμπροσ, shining, and φορο, I bear.

The Greeks also gave this name to the day of the resurrection, because their houses were adorned and illuminated on that day with a great number of torches, as a symbol of the light which that mystery diffused in the world.

LAMPUSACUS, in *Ancient Geography*, a town of Asia, on the banks of the Hellespont, more anciently called *Pityoufa*, which was founded by the Phocæans. The object of worship in this place was Priapus, the god of the gardens. This town rose from the ruins of Pæfos, whose inhabitants established themselves here. Its territory was fertile; and it was assigned by Artaxerxes to Themistocles, in order to furnish his table with wine.

LAMPUSAKI, in *Geography*, a town of Natolia, celebrated for its wine, anciently *Lampusacus*; 40 miles W. of Artaki. N. lat. 40° 20'. E. long. 26° 44'.

LAMPSAMANDUS, in *Ancient Geography*, a small

island of Asia, on the coast of Caria, in the Ceramic gulf. Pliny.

LAMPUSANA, in *Botany*. See LAPSANA.

LAMPUGA, in *Ichthyology*, a name given by some authors to the fish more usually known by the name of *Bromateus*.

LAMPUGNANI, JOHN BAPTIST, in *Biography*, of Milan, an opera composer of great fancy and spirit. He was not a deep contrapuntist, but there was a certain gaiety and spirit in his style, which amused his hearers and engaged attention. He came into England in 1742, during the regency of lord Middlesex, and while Monticelli was the chief singer, for whom he composed some very captivating airs. The English, long accustomed to a more solid, grave, and learned style, thought him inaccurate, wild, and frivolous, and his style was only tasted by such of our nobility and gentry as had been in Italy, and had been initiated into the new opera style. The character of this composer is drawn with so much judgment, taste, and discrimination in M. Laborde's "Essai for la Musique," and so exempt from the national prejudices with which that work abounds, that we shall venture to translate it, and guess at the name of the author.

"Lampugnani was a professor much esteemed among the moderns. He excelled much in his melodies, and owed more to nature than to study. He applied with great perseverance to produce new effects from instruments. Consequently to him has been ascribed the new manner of using the opera orchestra. Instrumental music, and its performers, have doubtless greatly increased their importance by this innovation. But, how has it been abused! It sometimes happens, that the noise of the orchestra is all that can be heard, from the beginning of the opera to the end. And that a beautiful passage can only now and then penetrate through the instrumental phalanx, to convince us that a voice has any concern in the business. There are certain composers, who have no resource but in noise. There are others, likewise, who have no time allowed them for any thing else." Voiture, in one of his letters, begs pardon of a friend for writing him so long a letter, as he has not time to write a shorter. But in Italy, an opera must be composed in a fortnight, so that the composer loads his instruments as much as he can, and leaves the voices at full liberty to do nothing, or to do as much as they please. In the operas of Lampugnani, the voice governs the orchestra, and upon her all the instruments wait, as on a superior. He is author of a great number of works, that have had complete success in Italy; but it is in vain to name them, as music of more than a year old, is as difficult to be found as a coin of the emperor Otho.

We saw Lampugnani at Milan, nearly thirty years after he had been in England, where, as a composer, he was laid on the shelf. He taught ladies to sing, and had gained great credit from some of his scholars. He resided constantly in that city, where he played the first harpsichord at the opera, in the absence of the composer, and arranged the passiccios. He was a pleasant old man, with the spirits and good nature of a young one.

LAMPUGO, in *Ichthyology*, a name given by many to the *hippurus*, a sea fish, caught on the coast of Spain. See CORYPHÆNA.

LAMPYRIS, in *Entomology*, a genus of the coleoptera order. The most familiar species of this kind, and which may be considered as an instructive example of the genus in general, is that known in our own language by the name of glow-worm, and in other counties by names of similar tendency, the female being destitute of wings, the body elongated,

gated, and the posterior part beneath emitting, during the night time, a brilliant phosphoric light. The species of this genus are rather numerous; the greater part are natives of Africa and America; a few only inhabit Europe, and of these but three kinds are found in Britain, two of which are rare.

The females of the species most commonly known are destitute of wings; all the lamproyrides of the latter sex shine during the obscurity of the evening, or at night, and some of the males possess the same ability, while others are in this respect deficient. The males throughout all the species are furnished with wings; the females, on the contrary, are always apterous. The luminous property in the lamproyris tribe resides in the two or three posterior rings of the abdomen, and is only visible on the under surface. In the day time the luminous space appears paler, and more inclining to yellow than the rest of the insect: the light, when emitted, partakes of various hues, being either a clear brilliant white, or white tinged with greenish or blueish, and this it can vary or heighten in brilliancy at pleasure, as it does not depend on any external cause: it is an inherent ability, governed only by the will or caprice of its possessor, and, according to the general persuasion of naturalists, is an ordinance of nature, by means of which the males, in their excursions through the air, can readily discover their apterous crawling mates among the grass and herbage beneath them.

This luminous appearance of the glow-worm has at various periods excited considerable curiosity in the minds of speculative men. Forster first announced that this extraordinary property was so strong and retentive, that he could distinctly read by the light emitted from glow-worms plunged into oxygen gas. The same experiment was verified by Beckerhiem, who proved besides that they live a long time in other kinds of gas, and continued to shed their light vigorously, as in the oxygen gas. With the acid, the nitrous, muriatic, and sulphurous gases, he did not however succeed so well; when placed in either of these, the insects died in a few minutes. A variety of other experiments have been made on the lamproyrides by Spallanzani, Carradori, and others, the result of which proves, among other curious circumstances, that this luminous property is inherent. These insects were observed to possess the power of moving various portions of the viscera, independently of the others; and it was likewise ascertained that a portion of the luminous rings of the abdomen, when cut out of the insect, retained its brilliant appearance for some seconds afterwards. These experiments were made chiefly on the *L. italica*, the luminous properties of which are more conspicuously brilliant even than that of our common glow-worm.

The lamproyrides are found most commonly about the months of June and July, appearing among the bushes, the grass and herbage on the skirts of lanes leading through meadows, and woody situations. The males of some kinds, as before intimated, are luminous; and these, when on the wing during the night time, exhibit a most lively and splendid aspect, like so many sparks of fire darting through the air. The females nearly resemble the larvæ, being of a lengthened form, divided into a number of distinct segments, the head scaly, and the anterior part of the body furnished with six scaly feet. The larvæ feed on leaves. The eggs, which are numerous, are usually deposited near the roots of grass.

Among the ancients, the names lamproyris, noctiluca, cicindela, &c. were bestowed, without discrimination, on almost every creature of the insect tribe, possessing the luminous property of the glow-worm. Geoffroy endeavoured to unite the lamproyrides together, but with these he confounded some other genera. Linnæus also blended them with the

lycus and pyrochroa; and Schæffer followed Geoffroy. Fabricius has adopted the lamproyris genus, with some material deviations from either, and his authority is, in this respect, rather generally approved. Linnæus, so lately as the 10th edition of Syst. Nat. confounds the lamproyrides under the genus cantharis; it is in a subsequent edition they appear under the name of lamproyris, with the following essential character. Antennæ filiform; wing-cases weak and flexible; thorax flat, semi-orbicular, surrounding and concealing the head; segments of the abdomen terminating in folded papillæ; females in general destitute of wings. This is the character admitted by Gmelin, who, besides the true lamproyrides, by this means includes the genera omalyfus of Geoffroy, collyphus of Olivier, pyrochroa of Geoffroy and Fabricius, and the lycus of Olivier and most other modern authors. The Fabrician character of the lamproyris genus consists in having four sub-clavated feelers; jaw bifid; lip horny and entire; antennæ filiform.

## Species.

**NOCTILUCA.** Oblong, brown, shield cinereous. Linn. *Cantharis noctiluca*, Fn. Succ. *Glow-worm*, Donov. Br. Inf. &c.

Frequent in meadows, and near woods in Europe: the female is rather larger than the male.

**SPLENDIDULA.** Oblong, brown; shield hyaline at the tip above the eyes. Mark. Ent. Brit. *Lamproyris splendidula*, Linn. Donov. Br. Inf. *Cantharis noctiluca*, Scop. *Le ver luisant à femelle sans ailes*, Geoffr.

"An European species, very rarely found in Britain; the specimens recorded (in Brit. Inf.) were received by Mr. Drury from Yorkshire, and are preserved in his cabinet now in our possession. It resembles the common glow-worm in size and appearance, but is distinguished from that insect principally by the hyaline spot at the anterior apex of the shield above the eyes." This kind is observed by Fabricius to be most replendent in showery weather.

**CORRUSCA.** Dull black; shield with a rosy crescent each side. Linn.

Inhabits North America. Fabricius speaks of a variety twice the ordinary size.

**OBSCURA.** Black; shield with a rufous spot each side. Fabr.

Described from a specimen in the Banksian cabinet, a native of Terra del Fuego. The shield is entire, and depressed at the sides; wing-cases brown and without spots; abdomen and legs black.

**LATICORNIS.** Ovate, black; shield with rufous margin; antennæ compressed. Fabr., Olivier, &c.

A species of moderate size; the shield rounded; wing-cases somewhat striated; abdomen with two or three white pellucid dots on the left segment.

**PYRALIS.** Shield rufous; in the middle black; wing-cases black, the edges with the abdomen white. Linn. Native of South America.

**CINCTA.** Fuscous; thorax, edge of the wing-cases, and tip of the abdomen fulvous. Olivier.

Native of Pulkicador. The head brown; abdomen black, the last segment but one fulvous; legs black; and thighs fulvous.

From the Banksian cabinet.

**MARGINATA.** Oblong, black; margin round the thorax, wing-cases, scutell, and posterior part of the abdomen yellow. Linn.

Native of America; the antennæ fuscous, with the base yellow; the legs variegated.

**PECTINATA.** Black; outer base of the sides of the shield,

shield, and apex of the abdomen and wing-cases, white; antennæ pectinately. Fabr.

An American species. The antennæ nearly as long as the body.

**FLABELLICORNIS.** Black; shield before the margin, with marginal line at the base of the wing-cases and tip of the abdomen, white. Olivier.

Native of the Brazils; the antennæ very large, and fan-shaped; wing-cases slightly striated.

**HESPERA.** Ovale; wing-cases brown, with a triangular marginal yellow spot. Olivier.

Inhabits America.

**IGNITA.** Ovale; wing-cases brown, with an ovate marginal yellow spot. Linn.

Native of South America.

**LUCIDA.** Oblong; wing-cases brown, the outer margin pale yellow; abdomen yellow. Linn.

Inhabits South America, and resembles the common glow-worm.

**NITIDULA.** Oblong, fuscous; thorax yellowish, with a black spot in the middle; apex of the abdomen with two yellow spots.

An African species.

**PHOSPHOREA.** Oblong, sub-testaceous; abdomen black, behind fine yellow. Degeer, &c.

Native of America.

**JAPONICA.** Yellow; last segment but two of the abdomen black. Thunb. Nov. Sp.

This species inhabits Japan, and, according to Thunberg, flies about in the evening during the months of May and June, and emits a vivid phosphoric vapour from two vesicles at the end of the tail. The antennæ, eyes, wings, and last segments of the tail, except the two at the apex, black.

**ATRA.** Deep black; margin of the thorax rufous. Fabr. *Lampyris atra*, Olivier.

A North American species. The antennæ serrated.

**CAPENSIS.** Livid; thorax yellowish; posterior part of the abdomen fine yellow. Olivier.

Antennæ fuscous; scutell yellowish.

**AUSTRALIS.** Yellowish; head and wing-cases brown; tip of the abdomen clear white. Fabr.

Resembles the following species; the thorax and scutell ferruginous; ends of the legs black, the rest yellow. Inhabits New Holland.

**ITALICA.** Black; thorax transverse, and with the legs rufous; abdomen clear white at the tip. Linn.

Inhabits among trees in Italy; the antennæ are black; thorax without spots.

**VITTATA.** Rufous; wing-cases black, with a yellow margin, and abbreviated fillet in the middle. Olivier.

Found in Guadeloupe.

**MAURITANICA.** Wing-cases livid; body yellow. Linn. Native of Africa.

**HEMISPÆRA.** Black; wing-cases very short. Geoffr.

A small species found in France; the antennæ are compressed; shield rounded, entire, black, and without spots; wing-cases ovate, very short, and black; abdomen flat, and with the legs black.

**PUSILLA.** Deep black; tip of the antennæ, with the wing-cases, sanguineous. Marsh. Ent. Brit. *Lampyris nigro-rubra*. De Geer.

This appertains to the lycus genus of Fabricius, in which it occurs under the specific name minutus; it is also pyrochroa minuta of that author's Mantissa. The species is two lines and a half in length.

**LAMSPRINGE,** in *Geography*, a town of Westphalia, in the bishopric of Hildesheim, at the source of a small river

called Lame, which soon after runs into the Inner-see; 14 miles S. of Hildesheim.

**LAMUS,** in *Ancient Geography*, a small river of Greece, in Bœotia, which had its source on the summit of mount Helicon. Pausanias.—Also, a town and river of Asia, in Cilicia. Ptolemy places the mouth of the river between Sebaste and Pompeiopolis, and the town in a canton, which takes from it the name of Lamotie. This town was episcopal, and is placed by Leon-le-Sage and Hierocles in Iffauria, under the metropolis of Seleucia.

**LAMUZO,** in *Geography*, a town of Asiatic Turkey, in Aladulia, on a river of the same name; 24 miles W. of Tarsus.

**LAMY, BERNARD,** in *Biography*, who flourished in the seventeenth and eighteenth centuries, was of noble descent, and born at Mans in the year 1640; having been carefully initiated in the elementary parts of learning, he entered among the religious of the congregation of the oratory at Paris; from thence he went to Saumur to study philosophy. From 1661 to 1667, he was employed in giving instructions in the classics and the belles lettres, and in the latter of these years he was ordained priest. He now taught philosophy at Saumur and at Angers, till the year 1676, and while instructing others, he applied himself with the utmost intenseness to the study of every branch of literature and science, and made a very considerable proficiency. He was now directed by his superiors to go to Grenoble, where cardinal le Camus had established a seminary, for the education of ecclesiastics, in which Lamy was appointed professor of divinity. In every duty in which this excellent priest engaged, he was indefatigable; and as an author he published a great many valuable works; of these the most valuable, and which engaged his attention for thirty years, was entitled “*De Tabernaculo Fœderis de Sancta Civitate Jerusalem, et de Templo ejus, Lib. septem*,” illustrated with many plates. This work, which was replete with valuable information and very curious discussion, was not published till the year 1720, five years after the author's decease. The death of father Lamy was occasioned by the bursting of a blood-vessel, though he had been in a declining state some years previously to that accident. He was much esteemed for the modesty of his manners; for his unaffected piety and deep learning. Among the numerous works which he left as memorials of his industry, may be mentioned his “*Reflections on the Art of Poetry*;” “*A Treatise on the Equilibrium of Solids and Fluids*;” “*A Treatise on Magnitude in general, comprehending Arithmetic, Algebra, and Analysis*;” “*Dialogues on the Sciences and the best Manner of studying them*;” “*Elements of Geometry*;” and “*A Treatise on Perfection*.”

**LAMY, FRANCIS,** a French Benedictine monk, born at Montyreaux, in the diocese of Chartres, in the year 1636, was intended for the military profession, which, at the age of twenty-three, he exchanged for the ecclesiastical. He made a rapid progress in the several departments of literature, and his writings shew that he was deeply skilled in the knowledge of the human heart. He died in the year 1711, at the age of seventy-five. His biographers have highly praised him for the benevolence which he manifested on all occasions, and likewise for his candour, amiableness, and extraordinary piety. One of his most popular pieces was, “*A Treatise on Self-knowledge*,” in six volumes, which passed through several editions. Many of his other works were highly esteemed as good defences of natural and revealed religion; such were his treatise “*On the evident Truth of the Christian Religion*;” “*The New Atheism overthrown*,” in answer to Spinoza; “*The Unbeliever conducted to Religion by Reason*.” Lamy wrote on natural as well as theological subjects;

subjects; such is his work entitled "Physical Conjectures on the Effects of Thunder, and on other Subjects in Natural Philosophy." His style, though not wholly free from faults, is said to be more correct and polished than that of any writer in the French language of that class to which he belonged.

**LAN**, in *Geography*, a town of Persia, in Oberland; 14 miles N.N.E. of Joldau.—Also, a city of China, of the second rank, in the province of Pe-tcheli, on the river Lan; 113 miles E. of Peking. N. lat. 39° 48'. E. long. 118° 24'.—Also, a city of China, of the second rank, in Chen-fi, on the Hoang. It is situated near the great wall, and in the vicinity of the principal ports on the western coast, and it is therefore classed among the most important cities of the empire, and has been made the capital of the western part of the province, and the seat of government. The trade of this city consists only in skins, which are brought from Tartary, and different kinds of woollen stuffs. A coarse kind of stuff is made here of cow's hair, which is used by the inhabitants for making great coats to defend themselves from the snow. N. lat. 36° 6'. E. long. 103° 29'.—Also, a river of China, in Pe-tcheli, which runs into the gulf of Leaotong, N. lat. 39° 18'. E. long. 118° 36'.  
**LANÆ PETRA**. See **PETRA**.

**LANAGLA**, in *Geography*, a town of the island of Fortaventura, situated on the E. coast.

**LANARIA**, in *Botany*, so called from *lana*, wool, on account of the wooliness of the flower.—Ait. Hort. Kew. ed. 1. v. 1. 462. v. 3. 510. ed. 2. v. 2. 289. Schreb. 799. Willd. Sp. Pl. v. 2. 181. (Argolana; Juss. 60. Lamarek. Illustr. t. 34.)—Class and order, *Hexandria Monogynia*. Nat. Ord. *Enjateæ*, Linn. *Iridibus affine*, Juss.

Gen. Ch. Cal. none. Cor. superior, of one petal, somewhat bell-shaped, clothed externally with feathery wool; tube short; limb in six deep, linear-lanceolate, slightly spreading, equal segments, coloured within. Stam. Filaments six, thread-shaped, shorter than the corolla, inserted into the base of its segments; anthers ovate, somewhat incumbent. Pist. Germen inferior, turbinate, externally woolly; style thread-shaped, erect, the length of the stamens; stigma three-cleft. Peric. Capsule ovate, of three cells. Seeds two or three in each cell.

Eff. Ch. Corolla superior, externally woolly, longer than the filaments; its limb in six deep spreading segments. Capsule of three cells.

1. *L. plumosa*. Woolly Cape Hyacinth.—(Hyacinthus lanatus; Linn. Sp. Pl. 455.)—Native of the Cape of Good Hope, from whence it was sent to Kew in 1787; by the late Mr. Masson, and is kept there in the green-house, but has not yet flowered. Its habit is that of a *Diluvius*; see that article. Root fibrous, perennial. Stem erect, angular, hairy, most leafy in the lower part, terminating in a dense corymbose tuft of numerous flowers. The leaves are linear, keeled and channeled, smooth. The whole inflorescence is densely clothed with white feathery hairs.

**LANARIA** has formerly been applied as a name to several plants, either on account of their wooliness, as the larger kinds of *Verbascum*; or of their use in dyeing, or dressing, wool, or woollen cloths. Of the former description is the Dyer's-weed, *Reseda Luteola*; of the latter the Teasel, *Dipsacus fullonum*. Perhaps *Saponaria officinalis*, Soapwort, was called *lanaria radix* from its foaming quality.

**LANARIUS**, in *Ancient Geography*, a river of Sicily, placed by Antonine in his Itinerary on the route between Agrigentum and Lilybæa, between Ad aquas and Mazara.

**LANARIUS**, in *Ornithology*. See **FALCO**.

**LANARK**, in *Geography*, a royal borough, and the county-town of Lanarkshire, in Scotland, is situated about

30 miles to the W. of Edinburgh, near the left bank of the river Clyde. It is a place of great antiquity, having received its original charter as early as the reign of Alexander I. The government is vested in a provost, two bailiffs, a dean of guild, thirteen merchant-counsellors, and seven deacons of trades. The town consists of one principal street, which descends towards the Clyde, and five inferior ones branching off from it, besides lanes and closes. Many new buildings have been added within these few years. The streets are in general well paved with whinstone, and exhibit, especially near the centre of the town, a considerable degree of neatness. In early times Lanark appears to have been a place of some note. The eminence called Castle-hill, which lies between the town and the river, was the site of a castle, which, according to tradition, was built by king David I. and was for several centuries the residence of the Scottish monarchs. The charter of the town of Ayr, granted by William the Lion, is dated from this place, and many spots in the neighbourhood are distinguished by names of royal origin. The first assembly or parliament mentioned in the history of Scotland was convened in this town by Kenneth II. in the year 978. It is also rendered remarkable as the scene of the first great military exploit of the celebrated Sir William Wallace, that patriot having here commenced his glorious but unfortunate career by the defeat and death of William de Heselrig, or Heselrope, the English sheriff of Lanarkshire. It is said that this town was formerly fortified, but no traces of such works can now be discovered. The rising ground, named Castle-hill, however, bears some resemblance to an artificial mound, and may probably have been fortified in the time of the Romans, as a fine silver coin of Faustina was found on it several years ago. The old parish church lies in ruins about a quarter of a mile to the south-east of the town, and retains considerable marks of former elegance. The hospital of St. Leonard's, which stood to the eastward of the town, was founded by king Robert I. Upon digging up its ruins some time since, to prepare the ground for the plough, an urn, together with a variety of carved stones and other curiosities, were discovered under them. The same monarch was also the founder of a monastery of Franciscan, or Grey friars, situated to the west of the present church, where a general chapter of all the Grey friars in the kingdom was held on the 11th July, 1400. This town unites with Linlithgow, Selkirk, and Peebles in sending one member to parliament. The population of the town and parish, as ascertained in the parliamentary census of 1800, was 4692 persons, who occupied 643 houses. Sinclair's Statistical Account of Scotland.

**LANARK**, *New*, is described in the course of the following article.

**LANARKSHIRE**, an inland county in the south of Scotland, is frequently denominated *Clydedale*, from the river Clyde, which flows through it longitudinally in a winding course of more than sixty miles. The situation of this county is between 55° 22' and 55° 58' north latitude, and between 3° 15' and 4° 19' west longitude. It is bounded by Dumfriesshire on the south, by the shires of Ayr and Renfrew on the west, by the counties of Dumbarton and Stirling on the north, and by those of Linlithgow, Edinburgh, and Peebles on the east. Its length from north to south is about forty-seven miles, and its breadth nearly thirty-two. The parishes it contains are forty-eight in number, inhabited, according to the parliamentary returns in 1800, by a population of 150,600 persons. The surface contents are 927 square miles, or 593,280 statute acres. Lanarkshire anciently formed a great portion of one of the principalities into which Scotland was divided at the time of the Roman invasion. The name given to this kingdom was Strathclyde, which comprehended, besides the county of Lanark, those

## LANARKSHIRE.

of Stirling, Dumbarton, and Renfrew. This shire is divided into three districts, or wards, formerly known by the appellations of Clydesdale, Douglafdale, and Avondale, but these are now more frequently termed the upper, middle, and lower wards. Each of these districts is subject to the particular jurisdiction of a substitute appointed by the sheriff-depute of the county.

With respect to the *soil* and *appearance* of this county, the upper parts of it, except in the vicinity of the Clyde, are so hilly and moorish, as scarcely to be susceptible of any improvement from agriculture. The elevation of the hills is in general very great; some of them rise to the height of 600 feet above the level of the sea. Notwithstanding this, they exhibit but little grandeur, the perception of their size and altitude being much modified by the closeness with which they are crowded together. The chief part of the arable lands in the upper district, lies in the parishes adjoining to the hill of Tintoe, round which the Clyde flows with a slow and gentle current, washing, in its course to Lanark, twelve miles of the finest meadow-fields in Scotland. In the neighbourhood of Biggar, one of the towns in this district, the soil is uncommonly rich and fertile. This fertility is in many places principally owing to the inundations of the Clyde, which are likewise often the source of irreparable damage, by carrying off, not only the crops, but even the very soil it had formerly enriched. Proceeding down the river, the soil is found to be dry, light, and friable, but less productive than in the vicinity of Tintoe. Carlicke parish is of a clayey soil, but excellent in quality. This parish, and indeed all the parishes situated along the river, are particularly distinguished for the richness and variety of their scenery. Within this district are the falls of the Clyde, celebrated both by the poet and the painter. Above, as well as below these falls, the banks of the river are adorned with numerous country seats, and villages filled with industrious inhabitants.

The middle ward, or district of this county, is not nearly so elevated as that above mentioned. When viewed from any considerable height, indeed, it has the appearance of a level country, though in fact it is much diversified with hill and dale, the former being much less abundant than the latter. The soil of this ward is in general of a clayey texture, and within six miles of the river extremely fertile. The scenery here is no less beautiful than that of the upper ward, the banks of the Clyde being covered with hamlets, orchards, and plantations of various kinds: beyond the range of six miles, however, the country is of a very different description. It is supposed that there are not less than 40,000 acres of moor-land within this district, and such spots as are free from that covering, display a soft clayey soil, formed from a sort of hard clay, lamellated in a horizontal direction, which is called by the farmers *till*, and is known to mineralogists by the name of *schistus*.

The lower ward is extremely limited in extent, but may rank as the most important of the three, on account of its containing the city of Glasgow, which is justly denominated the Manchester of Scotland, and is perhaps scarcely inferior to Liverpool in point of commercial importance. The lands in this district are naturally barren and unproductive, but in the neighbourhood of Glasgow, the overflowings of a very prosperous commerce have added greatly both to its scenery and fertility. See GLASGOW.

The chief towns in Lanarkshire are Glasgow, Lanark, Rutherglen, Hamilton, Douglas, Biggar, and Carnwarth. Of these the three first are royal boroughs, and will be found described under their respective names. Many considerable villages are likewise scattered throughout the county. The most worthy of notice among these are those of Leadhills and

Wilson-town, which are indebted for their prosperity to the mineral productions of the county. *New Lanark*, which owes its origin to the cotton works established there by David Dale, esq. of Glasgow, is also a thriving and populous place. These works were first erected in the year 1785, and are perhaps the most extensive of their kind in Scotland. They afford employment to upwards of 1500 persons, many of whom are children. Great attention is paid to their morals and education. The situation of the mills is extremely singular and romantic, being nearly surrounded by high grounds of very steep ascent. They were built on this spot chiefly on account of the great command of water that could be obtained. For this purpose a subterraneous aqueduct has been cut through the solid rocks, for the space of several hundred yards. Both the works and the scenery around are objects of peculiar interest and curiosity. One of the mills contains no less than 6080 spindles.

Besides the Clyde, already so often mentioned, there is a number of other streams in this county, all of which, however, discharge themselves into that river. The chief of those on the northern side are, the Elwin, Glegonnan, the Little-Clyde, the waters of Duneaton and Coutten, and the two Calderns. None of them are remarkable, except that the two latter are well shaded with wood, and adorned with a number of neat villas. The streams on the southern side of the river are rather more deserving of attention. The Mous-water is particularly remarkable for that part of its banks called Cartlane-Craigs. These form a curious and romantic den, or dell, somewhat more than a quarter of a mile in length. The rocks on either side rise to the height of four hundred feet, exhibiting a terrific and rugged appearance in one spot, while, in another, the eye is relieved by a pendent covering of coppice wood. At the bottom runs the river Mous, so closely confined as scarcely to allow room for the lonely traveller to traverse the den. At all the windings of this river the scenery varies, and whenever a rock is found to project on one bank, a corresponding recess may be seen on the other. One of these caverns is still called "Wallace's Cave," from a tradition of its having been for some time the place of that hero's concealment. Logan-water, which rises in the mountain separating the parish of Lesmahago, from that of Muirkirk in Ayrshire, is a beautiful pastoral river. The Avon, which likewise takes its rise on the confines of Ayrshire, after being joined by several minor streams, empties itself into the Clyde near the town of Hamilton. In its course it passes through the inclosures of the duke of Hamilton, where its bold and lofty banks, covered with a variety of shrubs and trees, afford many extremely fine and picturesque views.

No county in Great Britain is more interesting to the geologist, or abounds with a greater variety of *mineral productions*, than Lanarkshire. The surface of the upper division of the county generally rests upon whinstone, standing in perpendicular columns. The middle and lower districts, for the most part, exhibit some kind of freestone for their base, but are intersected, at different points, by ridges of whinstone running off from the rocky mountains, downwards, throughout the whole extent of the county. Under the strata of freestone immense strata, or beds of *coal*, are discovered, extending over all the plain country, and branching out, more or less, along the course of the principal waters. The seams of this useful mineral are not entirely of one kind. Where the whole strata remain untouched, a variety of thin and less valuable seams, or strata, present themselves in digging down to what is commonly called the *upper coal*, because it is the first that is found to be worth mining for to any extent. This stratum is composed of the *rough coal*,  
except.

except a small portion in the middle of it, which is of the kind called splint. After this, comes the *ell coal*, which is much esteemed for the blacksmith's forge. At from ten to seventeen feet beneath this stratum, the seam called the *main coal* is found. It is so named because it possesses all the good qualities of the other strata, and is preferred, by consumers in general, to every other species of this mineral. Below the main coal are four more seams. The highest of these is composed of the *bump coal*, the second of the *barid coal*, the third of the *soft coal*, and the fourth and last seam of the *lean or four-milk coal*. Beneath all are found several strata of excellent limestone, probably as extensive and inexhaustible as the valuable mineral which covers it. Independently of these strata of coal in the plain, there are others in the higher grounds, but of a dissimilar nature and arrangement. The hills in the parish of Shotts, like the tracts of the same elevation in the upper ward, are found to consist of an enormous bed of whinstone, but in descending along their sides, the freestone rock shows itself lying in a horizontal position beneath the whinstone. Below the free-coal, ironstone and limestone are discovered in such vast profusion, as seemingly to defy the utmost efforts of human industry to exhaust them. Near the Douglas river also, extensive collieries, similar in quality to those of Shotts, are wrought, which supply the higher districts of this county and Tweeddale, where no coal has yet been discovered. To the vast supplies of this valuable mineral, and its consequent cheapness, the manufacturing prosperity of the west of Scotland is to be principally attributed, as, without abundance of fuel, scarcely any manufacture can be carried on.

**Lead and Iron.**—Another great source of industry and opulence bestowed on this county by nature, is derived from its mines of lead and iron. The former of these metals is chiefly wrought at Lead-hills, a range of mountains in the uppermost part of the county, immediately adjoining to Nithsdale. These mines belong to the earl of Hopetoun, and are carried on by two separate companies. The number of miners employed in them is very great. They work only six hours out of the twenty-four, so that they have much leisure time, a great portion of which is dedicated to reading. To facilitate this worthy employment of their time, a library was established many years ago by an overseer named M<sup>r</sup> Sterling, who prevailed on the workmen to subscribe for that purpose. Since that event the miners have been remarkable for industry and sobriety of manners, the usual concomitants of a taste for literature; and the example has been followed with similar effects at the neighbouring mines of Wanlockhead.

The iron of this county is found every where in the same tract with the strata of coal. In many places it is imbedded between the different seams of that mineral, and is usually wrought at the same time with it. Iron ore, that is, the metal in its richest state, has not yet been discovered here in any great quantity, but ironstone exists in great profusion. It is found either in the form of beds of rock, or in collections of nodules or ironstone balls, as they are called by the workmen, of various shapes, sizes, and qualities. Among these balls is the curious fossil called *ludus Helmontii*, *septuarium*, or *swazen veins*. It is of a spherical shape, more or less oblate or depressed. Above and below them are alternate strata of ironstone and schistus. They lie on their depressed sides, in a regular direction, making a sort of interrupted stratum, one stone being several inches and some even a foot or two distant from the other. The ironstone of which they are composed is of excellent quality, yielding sometimes fifty per cent. of iron.

The *Antiquities* in this county are not so numerous, in pro-

portion to its extent, as in some other counties of Scotland. The Roman road, which formerly crossed the parishes of Lamington and Biggar, and descended along the south bank of the Clyde, is now only visible in a few detached spots. Different parts of the upper wards, in particular, abound with excavations in the earth, or vaults which were used as strong holds by the aboriginal inhabitants, when the haughty chieftains of Clydesdale and Annandale were engaged in mutual hostilities and depredations. At Cold-chapel are the remains of a Roman station, and in the same neighbourhood is a spot called Wallace's Camp. It is said that a chair, which formerly belonged to that hero, is still preserved at Biggerton.

Near Biggar are several artificial mounds. The church of that town is one of the most venerable relics of monastic architecture in Scotland. Here is preserved an ancient vase or urn, supposed to be Roman, which was usually appropriated to sacred purposes by the Popish priests. Boghall castle, about a mile from this church, was formerly surrounded by a marsh, and accessible only by a causeway or mound of earth. The entrance is through a large and magnificent gate-way, which leads into a spacious court in the centre. This castle is flanked with towers. It was formerly the residence of the Flemings, earls of Wigton, and has evidently been one of the most extensive and splendid fortresses in Scotland. This neighbourhood is represented in the popular histories of sir William Wallace, as having been the scene of a sanguinary conflict between his band of patriots and the army of Edward I.

Cuthally castle, or, as it is vulgarly called, Cowdally castle, the seat of the ancient family of Somerville, is situated in the parish of Carnwarth, and appears to have been formerly a place of great strength. At the foot of Tintoe is an artificial mount, and near it a circle of large stones set up perpendicularly. On an adjacent farm is a place called Sheriffs' flats, where it is supposed the sheriffs anciently held their courts. Tradition reports, that a bullock's hide, full of gold, is buried under this spot. Here are also the walls of a castle which belonged to the family of Lindsay. In Pittinair parish are the vestiges of a large encampment, the figure of which approaches to a circular area. A small fort belonging to it is still distinctly visible at a little distance from the walls. Several urns have been lately found here inclosed within four large flag stones. At Douglas are the remains of a castle belonging to the powerful family of that name. The greater part of this building was unfortunately consumed by fire about fifty years ago. In the old church of St. Bride's, in Douglas, are a number of monuments in honour of the Douglases. The parish of Carlairs, in the vicinity of the Clyde, contains the vestiges of a Roman camp, the causeway leading to which can still be traced for many miles. Pots and dishes of different kinds, as well as various instruments of war and sacrifice, have been discovered here. A number of coins have also been dug up, bearing the inscription of Marcus Aurelius, and Marcus Antoninus. At Cleghorn is another Roman camp, supposed by general Roy to have been the work of Agricola. Besides these remains of antiquity there are a number of others; as the priory of Lesmahago, the castles of Cudzow and Avondale, &c. but the limits of this article will not allow us to particularise the whole. Many of them, however, will be found either described or noticed in our accounts of the respective places. Rothwell castle, in this district, is one of the most magnificent ruins in Scotland. The structure itself is superb, and all the objects around have an aspect of grandeur. The whole work is executed with smooth stone of a red colour. It is adorned with lofty towers at both ends,

ends, and has undoubtedly been a place of considerable strength.

The principal seat in Lanarkshire is the palace of Hamilton, belonging to, and the occasional residence of, the Hamilton family. It is a large massive pile, of a dull and heavy appearance, situated in the neighbourhood of the town, from which it derived its name, and deserves notice chiefly on account of the beauty of its scenery, and the valuable collection of paintings it contains.

Lanarkshire has long been celebrated for its horses, which are reckoned among the most powerful in the world. As containing the town of Glasgow, it must be ranked among the first manufacturing and trading counties in Great Britain. Forsyth's Beauties of Scotland, vol. iii.

LANAWEN, in *Geography*, one of the smaller Sooloo islands, in the East Indian sea. N. lat. 6° 15'. E. long. 122° 3'.

LANCARIM SPRING, the name of a medicated water of Glamorganshire. It has its name from a village near which it rises, and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About twelve yards from this spring the rill falls from a rock of about eight or nine feet high, with a considerable noise. The spring is very clear and rises out of a pure white marle. The cures that have been performed there are proofs of a real power in the water; but there is some question, whether the water, or its motion and coldness, does the good; for the people, who come for relief, always drink of the spring, and bathe the part afterwards in the fall below. It is generally supposed that the lime-stone rocks communicate a virtue to it, by which it cures internally; but it has been often found, that the holding a limb disordered with the evil, in the strong current of a mill tail, has cured it; and there is the same advantage in the fall of this water. Phil. Trans. N° 233, or Abr. vol. ii. P. 233.

LANCASHIRE, in *Geography*, a county palatine in the northern part of England, surrounded by Cumberland and Westmoreland to the north, by Yorkshire to the east, Cheshire to the south, and the Irish sea to the west. Its area comprises about 1,130,000 acres of land, of which above 350,000 are in a state of tillage, 450,000 in pasture, and about 400,000 in wood-lands, moors, &c. According to Mr. Yates, who has published an Agricultural Survey of Lancashire, the greatest length, from north to south, is 74 miles, by about 44 in breadth: the circumference is 342 miles, and surface 1765 square miles. It is divided into the six hundreds of Amounderness, Blackburn, Leyland, Lonsdale, Salford, and West-Deby; and contains six boroughs, *viz.* Clitheroe, Lancaster, Liverpool, Newton, Preston, and Wigan; 21 market towns, *viz.* Blackburn, Bolton, Burnley, Bury, Cartmel, Chorley, Colne, Dalton, Eccleston, Garlang, Hallingdon, Hawthhead, Hornby, Kirkham, Manchester, Ormskirk, Poulton, Preaton, Rochdale, Ulverston, Warrington; and 62 other parishes. The whole contains, according to the return to parliament in the year 1800, 117,664 houses, and 672,731 inhabitants, of whom 269,259 were slated to be employed in various trades and manufactures, and 52,018 in agriculture.

In the ancient history of this county, we find that it was originally inhabited by the Setantii, or Segantii, who were succeeded by the Brigantes, who also had a very extended tract of country. (See BRIGANTES.) The Romans, under Julius Agricola, appear to have conquered this district in A. D. 79: and soon afterwards, according to Mr. Whitaker, that general established the following stations within the

limits of this county: "Ad-Alaunum and Bremetonacæ in the north; Portus-Siluntiorum in the west; Rerogorium and Coccium about the centre; Colonea in the east; and Veratinum and Mancunium in the south." The precise sites of all these stations are not satisfactorily ascertained: nor is it generally admitted, by other antiquaries, that there were so many permanent stations in the county. In the Itinerary of Antoninus only three are specified: *viz.* Bremetonacæ, xxvii. m. p. from Galacum in Westmoreland; Coccium, xx. m. p. from the former; and Mancunium, xvii. m. p. from the latter. To connect these towns or stations, roads or military ways were formed, and these were disposed in the most direct line from one place to another, and constructed in the most scientific and skilful manner. Mancunium, now Manchester, was a station of large extent and importance; and from it roads branched off northward to Coccium, (Ribechester,) two north-eastward into Yorkshire, one south-westward to Condate, now Middlewich in Cheshire, and a fifth south-eastward to Derwentio, Derby. The whole of this county was denominated by the Romans, Maxima-Cæsariensis, or Britannia-Superior. The Saxons included it in Northumbria; and, according to Mr. Whitaker, "formed it into a separate county about 680, and soon after the conquest of it by Egfrid." At this period, the Roman Alauna was "made the metropolis of the shire, and lent its own appellation to the county." Soon afterwards the whole was divided into hundreds, tythings, &c. That part called South Lancashire was first divided into three; and subdivided into six just before the Norman conquest: these are called Blackburn, Derby, and Salford; Newton, Warrington, and Leyland.

The ecclesiastical history of this county commences with the Anglo-Saxons; after the see of York was established, the kingdom of Northumbria was speedily subdivided into several dioceses, and the whole of North Lancashire was connected with the see of York. But soon after the consolidation of the seven kingdoms into one, the south of Lancashire was severed from the diocese and province of York, and annexed to the province of Canterbury and diocese of Lichfield; and thus continued till the year 1541, when the two parts were again combined, as they have ever since continued, under one bishop, and reunited to their ancient and original see of York. At the first partition of the bishopric into archdeaconries, the principal towns of the latter would naturally be constituted the capitals of them: and the Roman colony of Chester was made the metropolis over the south of Lancashire, as the archdeaconry of Richmond was over the north. The next ecclesiastical division of the county was into rural deaneries, and by the "Valor Beneficiorum," which was taken in 1292 by command of pope Nicholas IV., the whole county of Lancaster, exclusive of Furness, which then belonged to Westmoreland, was partitioned into thirty-six parishes only. By the same record it appears, that these parishes were included in the four deaneries of Blackburn, Leyland, Manchester, and Warrington; all in the archdeaconry of Chester. The deanery of Amounderness and Furness is in the Richmond archdeaconry.

The landed property, which the king possesses in this county, as duke of Lancaster, is of great extent; but the revenues arising therefrom are but small. The principal part of this property consists in what are generally styled the forests of Myerfough, Fulwood, Blearfield, Wyerfdale, and Quern, all situated in the most northern parts of the county. In these his majesty is intitled to the estrays and the game, and the right of holding courts, &c.; and must be considered as lord of the manor of all the forests. The township of Quernmore is situated in the hundred of Lonsdale;

dale, and contains above 3000 acres of inclosed and walle land. Wyerdale, which is similar in situation, contains more than 20,000 statute acres; the greater part is mountainous land, not worth inclosing, but producing abundance of game. Blearfdale is in the hundred of Amounderness, and contains nearly 4000 acres of inclosed land, and about the same quantity not inclosed. Myerfough is situated about eight miles from Preston; and consists of nearly 2200 acres, all inclosed; of which about 1600, belonging to the king, is called Myerfough Park, and is held under a lease by Mr. Heatly. The ancient forest of Fulwood comprised a large quantity of land which is now inclosed: the uninclosed parts are about 908 acres. Preston race-ground is a portion of the forest. Besides the duchy lands, a few large proprietors hold extensive estates in this county. But the prevalence of trade, manufacture, and commerce has tended greatly to subdivide the property, in the vicinity of the large towns especially, and hence Lancashire has a greater number of landowners than any other county in England, excepting Middlesex. Camden remarked, that Lancashire was distinguished for the number of ancient families whose names were the same as their manorial estates. This remark still applies, though not to the same extent, as many old family manions are now deserted. Previous to, and under the Norman dynasty, this county was distinguished as an *honor*, and was of the superior class of feignories, on which inferior lordships and manors depended, by the performance of certain customs and services to the lords who held them. Landed honors originally belonged to kings exclusively, but were afterwards granted in fee to noblemen. These kept their honor courts "every year at least, or oftener if need be; at which court all the freeholders of all the manors that stand united to the said honor, shall make their appearance, which suitors shall not fit, but stand bareheaded." That the honor of Lancaster existed before the conquest, is demonstrated by an agreement, still preserved, between king Stephen and Henry duke of Normandy. From this period till the reign of Henry III. the honor was held by several great persons. That monarch conferred it on his second son Edmond, when it became an earldom. The title of *duke of Lancaster* was created by Edward III. in favour of Henry Plantagenet, whose daughter and heiress, Blanche, married John of Gaunt, fourth son of Edward III., for whom the privileges and revenues were considerably increased: he, being created duke of Lancaster on the death of his father-in-law, obtained a patent for advancing this county to the dignity of the palatinate. The court belonging to this duchy has the power of deciding every cause relating to it: the officers are, a chancellor, attorney-general, king's serjeant, king's counsel, receiver-general, clerk of the council and register, surveyor of lands, attorney in the exchequer, attorney in chancery, four counsellors, &c. The offices of the duchy court are at Somerset place, London.

The soil and surface of Lancashire are various; and its features in some parts, particularly towards the north and along the eastern border, are strongly marked. Here the hills are bold and lofty, and the valleys narrow and irriguous. On the sea-coast, and nearly the whole of the southern side of the county, following the course of the river Mersey, the land is low and flat. In the district which lies between the Ribble and the Mersey, the greater part of the surface is a sandy loam, well adapted to the production of almost every kind of vegetable, and that to a degree which renders it impossible to estimate the advantages which might be derived from an improved cultivation. The substratum is generally the red rock, or clay marl, one of the most desirable soils that can be found. Moor-lands which are in a state of na-

ture, and produce heath and other wild plants, are of various qualities; and are much more extensive than might have been expected in a county so populous, where land must consequently be very valuable.

The mineralogical history of this county has never been publicly developed; and though the internal contents are singularly rich, the varied peculiarities and characteristics of these riches have not been made known. With singular advantages of natural and artificial navigation, the *coals*, which constitute its most prolific and useful production, are cheaply conveyed to the various manufactories of Manchester, Bolton, &c. and also to the coal. Coal is found in immense beds, both on the southern part and towards the middle of the county, but chiefly in the hundreds of West Derby and Salford, and in part of Blackburn. It is not obtained much farther north than Chorley and Colne; but great abundance of this useful fossil is again procured at Whitehaven, and about Newcastle-upon-Tyne. At Haigh, near Wigan, a species of coal is produced, similar in appearance to black marble, and of a very bituminous quality. It is called *Cannel Coal*, and burns with a peculiar clearness of flame, consumes very rapidly, and is apt to fly in pieces in the fire; but if previously immersed in water, it is said to lose this property. It is of a dull black colour, breaks easily in all directions; and if broken transversely, presents a smooth conchoidal surface. Towards the north and north-eastern parts of the county, lime-stone is very abundant. It is found at Halewood, near Liverpool, at various depths, but inconsiderable in quantity. In the vicinity of Leigh, and also at Ardwick, near Manchester, is lime-stone of such peculiar quality, as to resist the power of water: it is therefore applied to the construction of cisterns, and to making mortar for building under water. *Stone* of various denominations is produced in this county. Upon the common, near Lancaster, is a large quarry of excellent free-stone, which bears a fine polish, and of which that town, equalled by few in the kingdom for neatness, is wholly built. Flags and grey slates are found at Holland, near Wigan. The mountains, called Conistone and Telberthwaite fells, near Hawkhead, afford a large quantity of blue slates, of which there is a considerable export: they are divided into three classes, called London, Country, and Tom slate, of which the first is esteemed the best. Scythe-stones are obtained at Rainford, and are well wrought on the spot. Iron-ore is found in abundance between Ulverstone and Dalton, in Low Furness. In the north, some copper mines have been worked; but they have not been productive. At Anglefack, near Chorley, is a lead mine belonging to sir Frank Standish, bart.: it consists of several veins, which intersect the strata of the district almost perpendicularly, and run in various directions. The matrix of these veins is formed of carbonat and sulphuret of barytes. The former, which is a very rare mineral, is found in the greatest abundance near the surface; and as it descends, it becomes progressively contaminated by the sulphuret, which, in the lowest strata, seems completely to usurp its place. The existence of carbonat of barytes, as a product of nature, was first distinctly ascertained by Dr. Withering; but he seems to have been mistaken as to the place where his specimens were obtained. To James Watt, jun. esq. the public are indebted for a description of the external character of this substance, and its effects on the animal body, when taken internally. See Manchester Memoirs, vol. iii.

The principal rivers in this county are the *Loyne* or *Lune*, the *Wyer*, the *Ribble*, the *Calder*, the *Douglas*, the *Irwell*, and the *Mersey*. Besides these there are several smaller streams or rivers, all which, directing their courses

towards

## LANCASHIRE.

towards the west, empty their waters into the Irish sea. The Loyne or Lune, emanating from the fells of Westmoreland, enters this county near Kirkby Lonsdale. Soon afterwards its stream is augmented by the waters of the Greta and the Wenning from Yorkshire; and the expanded river then passes through the much admired valley of Lonsdale. Pursuing a south-westerly course, it reaches the county town, where it becomes navigable; and at the distance of two miles from Lancaster, is calculated to bear ships of considerable burthen. The approach to Lancaster is indescribably striking, where the river becoming wider, and winding in several bolder sweeps, opens to the view of that singular town, descending from a lofty hill, whose summit is crowned by the battlements of its castle, and the lofty tower of its church. The Wyer, which has its source among the moors on the north-eastern part of the county, meanders through a very romantic district; and pursuing a south-westerly course towards the sea, receives the waters of several other mountain-streams before it reaches Garstang-church town. Near this place its current is greatly increased by the waters of the rivers Calder, &c.; and passing near the town of Poulton, expands into a broad basin, called Wyer-water; and, again contracting its banks, joins the Irish sea between Bernard's-Wharf and the North Scar. The Ribble, like the Loyne, unites to the sea by a very broad estuary; and, like that also, has a Roman station on its banks. "This river," Dr. Whitaker observes, "by the general consent of most antiquaries, has been understood to be the *Belisima* of Ptolemy." The Ribble is one of the largest rivers in the north of England, and has its source in the high moors of Craven in Yorkshire. Taking first a southerly course, it passes by the town of Clitheroe, and, forming the boundary of the county for a short space, is joined by the Hodder and the Winburne from Whalley. The chief course of this river is through a highly commercial and well cultivated country; and near the thriving town of Preston, its banks are bold, and adorned with hanging woods. A little to the west of this place, the Ribble forms a spacious estuary, which is enlarged by the mouth of the river Douglas. The latter has its source in the vicinity of Rivington-pike, and, after passing the town of Wigan, proceeds north-westerly by Newburgh, and near Rutford is joined by the Elder-brook from Ormskirk. After receiving the united streams of the Yarrow and Lostock rivulets, it empties itself into the estuary of the Ribble, at a place called Muck-Stool. The Irwell originates in the moors, near the Yorkshire and Lancashire boundaries, whence it flows, swelled by other streams, through the manor of Tottington to Bury. Hence it proceeds to Manchester, where it unites with the Medlock and the Irk. Passing through Barton, where the duke of Bridgewater's canal is carried over it by means of a grand aqueduct, it falls into the Mersey below Flixton. The Alt, rising near Knowley, and flowing in a north-westerly direction, joins the Irish sea near Formby Point. The Crake connects the lake called Thurston-water with the sea at Leven Sands. The waters of Winandemere lake join the sea through the channel of the Leven nearly at the same place.

Although canals in a commercial and manufacturing country are of almost incalculable utility and importance, yet their origin in this kingdom is but recent; and from the best authority it appears that the first complete artificial canal was planned and formed in Lancashire. This was known by the name of the Sankey; but long previous to the making of this canal, different acts of parliament had been obtained, and companies formed, for rendering the rivers Irwell and Mersey, also the Weaver, &c. navigable. By the assist-

ance of the tide, which flows with rapidity up the channel of the Mersey, vessels were enabled, without any artificial help, to navigate nearly to the town of Warrington. To render the higher parts of the river, through its communicating branch the Irwell, accessible for vessels as far as Manchester, was an improvement much wanted by the manufacturers of that town and its vicinity. To effect this, an act of parliament was obtained in 1720, whereby certain persons of Manchester and Liverpool, but mostly those of the former town, were empowered to make the Irwell and Mersey navigable beyond those towns. Though the act specified this extent of river, yet as the Mersey was already navigable from Liverpool to Bank-key, near Warrington; and as all the stipulated demand for tonnage was confined to the navigation between that place and Manchester, it appears that the projectors meant only to open the upper part of the river. This has been effected by means of weirs, locks, &c.; and in places where the stream formed considerable curvatures, cuts were made across the necks of the principal bends. While the navigation of the Mersey was thus an object of commercial speculation, that of the Douglas was equally attended to. The country round Wigan being particularly rich in coal, the proprietors of the mines in that district obtained an act, in 1719, for rendering that river navigable. This being completed in 1727, enabled the speculators to convey their coals to the mouth of the Ribble, and thence coastwise to the northern parts of Lancashire, Westmoreland, &c. The Douglas navigation has since been purchased by the proprietors of the Leeds and Liverpool canal, who have in part substituted an artificial cut for the natural channel of the river. The Sankey canal originated with a company of gentlemen and merchants, who, in 1755, obtained an act of parliament, authorising them to make Sankey brook navigable from the Mersey river, which it joins about two miles west of Warrington, to near St. Helen's. This act empowered certain commissioners to purchase lands and other requisites for the intended navigation. It was, at first, designed to extend and deepen the bed of the brook; but, after due deliberation, it was ultimately determined to cut a detached channel or canal. To effect this more completely, a new act was obtained in 1761, which empowered the undertaker to make a canal; to extend from a place called Fiddler's Ferry, on the Mersey, to a spot about 250 yards from the lowest lock. Thus navigable canals had their rise in England; and the peculiar advantages and success of this at Sankey led to many other similar undertakings; in the execution of which, the genius of the engineer, and the speculating spirit of the nation, were fully brought into action. But many things which were then imagined to be unattainable, and insurmountably impracticable, have been recently effected. The chief article conveyed by the Sankey canal is coal, of which, in the year 1771, according to an account laid before parliament, were carried to Liverpool 45,568 tons, and to Warrington, Northwich, and other places, 44,152 tons. Some of the first collieries on its banks are worked out, and others have been opened. Its business has been increased by the large copper-works belonging to the Anglesea company, erected on one of its branches; and by the plate-glass manufactory, and other works founded near it, in the neighbourhood of the populous town of St. Helen's. Besides the Sankey, this county is intersected by nine other canals, of which four communicate with Manchester. Of all these canals an account has been given under CANAL, to which we shall here add some further particulars and local circumstances not already detailed. The Ashton-under-Line canal, which communicates between Manchester and the town of

## LANCASHIRE.

Ashton, was made in consequence of an act of parliament passed in 1792. The whole length of this canal is eleven miles, with a rise of 152 feet. Bridgewater's canal originated, in 1759, with the late patriotic duke of Bridgewater, who devoted an immense fortune to the effecting his plan. That part of the canal more immediately connected with this county, commences at the Cattle-field, in the suburbs of Manchester, and terminates at Pennington, near the town of Leigh. At Worsley is a short cut to the entrance basin of the underground tunnels. Here it buries itself in a hill, which it enters by an arched passage, partly bricked, and partly formed by the solid rock, wide enough for the admission of long flat-bottomed boats, which are towed by means of rings and hand-rails on each side. The canal, or tunnel, penetrates above three quarters of a mile before it reaches the first coal-works; where it divides into two channels, branching to the right and left. In the passages, at certain distances, are funnels cut through the rock, and issuing perpendicularly at the top of the hill. The arch, at the entrance, is only about six feet wide, and five in height, above the surface of the water. In some places within it widens, to accommodate two boats to pass each other. To this subterraneous canal the coals are brought from the mines in low waggons which hold about a ton each, and these are easily pulled down a gentle declivity, on an iron railway by one man. Lancaster canal takes its course through nearly the whole county. Commencing at Kirby Kendal, in Westmoreland, it enters Lancashire near Burton, having passed under ground about half a mile near Medway. At Borwick, a little south of Burton, it sinks to its mid-level, which it preserves for several miles, making for this purpose a very winding course, in some places approaching almost close to the sea-beach. After passing Preston, it ascends through a series of locks to its highest level, on which it proceeds across the Douglas, and arrives at its termination at West Houghton. The principal object of this canal is to open a ready communication between the coal and limestone countries, thereby interchanging and conveying these articles to different places, and to open the port of Lancaster to other populous towns. All the county north of Preston is destitute of coal, and the canal is directed through a district abounding with this valuable mineral from West Houghton to Whittle Hills. From Kendal to Lancaster, the whole country consists of lime-stone; and on Lancaster Moor some good freestone is obtained. The Leeds and Liverpool canal enters Lancashire a little north of the town of Colne, near which it crosses the grand ridge by means of a subterraneous tunnel at Foulridge, 1630 yards in length. Near Bark Mill, not far from Wigan, it crosses the Lancaster cut by means of an aqueduct bridge sixty feet above that canal. A navigation between the eastern and western seas had been often proposed: this great desideratum has been at length effected; and a canal has now been made between the towns of Liverpool and Leeds, including a line of 107½ miles, and communicating at the latter place with the river Aire, and at the former with the river Mersey, both of which are navigable to the German ocean on the east, and to the Irish sea on the west. The fall of water in this course, from the high ridge of mountains which divide Lancashire and Yorkshire, is 527 feet westward, and 446 eastward. Manchester, Bolton, and Bury canal takes a north-westerly direction from the former to the latter town. Its northern end is considerably elevated, and its whole course comprehends a line of fifteen miles one furlong. The Rochdale canal opens a navigation from the Bridgewater canal at Manchester, to the Calder at Sowerby-bridge, near Halifax. At the commencement of this scheme it encountered much

opposition; and the proprietors, in obtaining their acts, were obliged to bind themselves not to use any of the waters of the Irk, Calder, and Rouch rivers, so as to affect their mills, &c. They were, therefore, obliged to make several large reservoirs on the hills to supply the waste of lockage and leakage. At Ulverstone is a short cut or canal of about one mile and a half, communicating from that town to the Irish sea. Douglas River Navigation commences in the tide-way, in the estuary of the river Ribbles, near Hesketh, and terminates in the Leeds and Liverpool canal. Haslingdon canal, not yet completed, is intended to communicate, in a distance of about thirteen miles, between Bury, where it joins the Bolton and Bury canal, to Church, where it joins the Leeds and Liverpool. The commercial and speculating spirit of the inhabitants of this populous county, is strongly exhibited in the construction of these canals and navigable rivers; the good effects of which are especially felt by the manufacturing towns. To that of Manchester, in particular, the canals have proved eminently beneficial, and the thriving ports of Liverpool and Lancaster, with the central towns of the county, have all derived from the same source many important advantages. Whilst the natural produce of the county is readily and cheaply conveyed to various markets, and the coals sent to the devouring factories; the manufactured goods of the latter are thereby distributed over the kingdom, and to the sea-ports for foreign exportation.

Peculiarly characteristic of this county are the bogs and morasses with which it abounds, and which bear the provincial name of Mosses. The principal of these are called, from the chief places in their vicinity, Chat, Pilling, Trafford, Risley, Ashton, Road, Bickerstaff, Rainford, Marton, St. Michael's, and Catforth. The component parts of these chiefly consist of a spongy soil, containing roots of decayed vegetables, intermixed with a sort of rotten mould. The origin and peculiarity of mosses have occasioned much difference of opinion with the writers on agriculture and natural history, but when their precise situations are accurately defined, it seems easy to account for the latter, and thereby to discover some clue for the former. The laws of nature are immutable; and when certain natural causes are known to produce certain effects, and these are invariable, it does not appear difficult to ascertain the primary source. Thus, mosses or bogs are always found near spring-heads, and in such hollows as prevent a regular and constant discharge of the oozing waters. These must consequently remain stagnant, and from the perpetual generation and decomposition of vegetable matter, must progressively acquire substance. Among the most common vegetables in these situations, are the *Erica vulgaris*, the *Ornithogalum luteum*, and the different species of *Eriophorum*, or cotton-grass; also, bilberry, cranberry, crowberry, *Andromeda polifolia*; Lancashire aphodol, sun-dew, and the fragrant *myrica-gale*, or bog-myrtle. As these plants decay, and deposit their substances, a considerable addition is annually made to the moss, in cutting a section of which, in some places, the progressive stratification or lamina may be distinctly discovered. These plants, and particularly the mosses, seem to derive their nutriment and fructification from their own ruins, and grow more luxuriant as the substance increases: at length the whole takes the appearance and consistency of a large fungus; and continuing to increase, it at length grows greatly above the level of the adjacent lands, till the weight of the surface becoming too great to be supported by the spongy substance below, it overflows its original boundary, and covers the adjoining grounds. A remarkable instance of this occurrence, in the year 1771, is related of Solway-moss in Scotland; and, according to some

of our ancient chronicles, a great portion of Chat-mofs was carried into the Irwell, thence into the Merley, and on to the fea. (See Leland's Itin. vol. vii. p. 46.) It may be proper juft to mention three of the mofes in this county which have been brought into a ftate of improvement. Trafford-mofs, on the fourth fide of the river Irwell, containing about five hundred acres, has been brought into cultivation by Mr. Wakefield and Mr. Rofcoe of Liverpool. They began their improvements about the year 1793; and the whole of this hitherto ufelefs tract of land is converted into excellent arable and palture ground, worth four or five pounds per acre, *per annum*; but previous to that period it was wholly unproductive. The manures ufed in the improvement have been blue marle, of a ftiong calcareous quality, which is found under the mofs itfelf, and compoft brought by the canal from Manchester. Chat-mofs, which lies on the north fide of the river, and contains fome thoufands of acres, has been brought into a ftate of progrefive improvement, with every profpect of fimilar fuceefs, by Mr. Rofcoe, who commenced the drainage in the year 1805. Rainford-mofs, near Prefcot, has alfo been amazingly ameliorated under the judicious management of Mr. Chorley, who began his operations on this apparently ftérile wafte in 1780, and has rendered it capable of bearing oats, barley, clover, potatoes, &c.

The agricultural productions of Lancashire are principally oats and potatoes; both which are ufed for human fultenance; and many of the labouring claffes, in the northern and eaftern parts of the county, are chiefly fupported by this food. A confiderable quantity of barley, and fome wheat, are cultivated in Low-Furnefs, the Filde, and in the fouth-weftern parts of the county; but it is fuppofed that Lancashire does not produce one quarter of the grain confumed by its own inhabitants. The firft potatoes laid to be cultivated in England were grown in this county. They were originally introduced into Ireland from North America, about the year 1565; and in confequence of an Irish veffel being caft away on the weftern coaft, near North Moofs, in Lancashire, fome of thofe roots were planted in that part of the county; but it was not till many years after that they were adopted as an article of food in London. They are now grown in amazing quantities in this county; and many are annually exported hence to Ireland. They are produced both from cuttings, and from the apple, or feed. The ox-noble and clufter potatoe are chiefly grown for the cattle; and the pink-eye, with various kinds of the kidney, are ufed for the table. The produce of a crop of potatoes in this county is generally from two to three hundred bufhels per acre. Many ufeul particulars relating to the beft mode of planting, growing, and preferring potatoes, are detailed in Holt's "General View of the Agriculture of Lancashire."

This county boatts a peculiar breed of horned cattle, which forms a variety with thofe of Lincolnshire. The cows are rather fmaller than thofe of the latter county, and are known by their wide-spreading horns and fraight backs.

The climate of Lancashire is proverbially *wet*, and this feems a natural confequence of its peculiar fituation, between the broadeft part of the Irifh fea and the high ridge of hills which form its eaftern border. All this fide of the county is more fubject to rains than the fide bordering on the coaft; for as the clouds are wafed over the Irifh fea from the Atlantic ocean, they are firft checked and broken by the mountainous ridge, which has a direction north and fouth; and hence the rains are almoft perpetually falling on the weftern fide of thefe intercepting eminences. At Town-

ley, near Burnley, it has been found by experiment, that forty-two inches of rain fall annually, at a medium; while the annual fall at Manchester has been only thirty-three inches. At Liverpool the average has been confiderably lefs, while that at London has been ftill lower.

Lancashire fends fourteen members to parliament; two knights for the ftire, and two representatives for each of the boroughs of Lancaster, Liverpool, Prefcot, Newton, Wigan, and Clithero: one of the members for the county is returned through the intereft and influence of the earl of Derby; the other by what is termed the independent intereft. The county is included in the northern circuit, and the affizes are held at Lancaster, as are alfo the quarter-feffions.

This county, though not abundant in antiquities, formerly poffeffed a few caftles and monaftic buildings: *viz.* caftles— at Clithero, Gleanon, Holland, Hornby, Lancaster, Peefe, and Thurland. Religious houfes—at Burfough, Cartmel, and Coninghead. Auguline priory—at Cockerland; a Premonftratian abbey; Furnefs and Whalley, Ciftertian abbies; Holland, a Benedictine priory; Hornby, a Premonftratian priory; Lancaster, Latham, and Penwortham, Benedictine priories; Manchester, a college.

Lancashire contains 490 public bridges; of which nine are repaired by the county, and the others by the different hundreds.

The manufactures and commerce of this populous county, are both of great extent and importance. Many particulars refpecting the former have been already narrated under the article COTTON. Further details will be given under MANCHESTER, and the commerce of the county will be defcribed at LIVERPOOL. Beauties of England, vol. ix. Aikin's Hiftory, &c. of the Country round Manchester, 4to. Whitaker's Hiftory, &c. of Manchester, 2 vols. 4to. Whitaker's Hiftory of Whalley, 4to. Holt's Agricultural Report relating to Lancashire, 8vo.

LANCASTER, *County Palatine of*. See COUNTY.

LANCASTER, *Duchy Court of*. See COURT.

LANCASTER, in *Geography*, a fea-port, market, and the county town of Lancashire, England, is fituated on the banks of the river Loyne, or Lune, 239 miles diftant from London. Few of the county-towns in England have been more neglected by the hiftorian, or more inaccurately defcribed by the togographer, than this of Lancaster. That it was a Roman itation is evinced by the Saxon termination *cafter*, or *caftre*; and the fame is confirmed by the various remains of the domeftic economy of the Romans that are continually difcovered in the town and its vicinity. Camden contends that the Roman name of this place was Longovicium; and Mr. Whitaker afferts, it was the Ad-Alaunum of Richard of Cirencefter's Itinerary. Reynolds, in his "Iter-Britanniarum," identifies this place as the Bretonacis of Antoninus; but this is improbable; though we do not hesitate in confidering it to be the feite of one, if not both, the other names. Dr. Leigh, in his "Natural Hiftory of Lancashire, &c." defcribes and refers to various coins, pieces of pottery, burnt bones, &c. that have been found in this town. In 1772, an altar-ftone, with an infcription, was dug up here. In the Archæologia, vol. v. is a difertation, by the Rev. Mr. Leigh, on certain Roman veftigia belonging to Lancafter. This place was a fortrefs of confiderable confequence alfo under the Anglo-Saxon dynasty. Indeed it appears to have been the chief obftacle and barrier to the Picts, or Scots, in the progrefs of their conquefts in England. Having being demolifhed by thefe marauders after the retreat of the Romans, it lay a confiderable time in ruins, but was at laft rebuilt by the Saxons, who, foon

after their settlement in Britain, perceived the importance of this post, and the facility of defence afforded by its commanding site. That it was constituted the chief and designating town of the county, is a sufficient indication of its consequence. This event is stated by Mr. Whitaker to have occurred in the seventh century, when he observes, the "Roman Alanna received the honour which it retains at present, and was made the metropolis of the shire." During the Saxon heptarchy we have no records whatever of this town, but soon after the Norman conquest it assumes some historical consequence. In Domesday-book, however, Lancaster and Cherca-Longcaestre appear simply as two villas, or *Berwic*, among the twenty-two which then composed the manor of Halton. At this time there was no church at Lancaster, but the name Cherca-Longcaestre, affixed to one of the villages, renders it probable that it had a church during the time of the Saxons, which had probably been destroyed during the ravages of the Danes. Lancaster, it is likely, was granted either by the Conqueror or his successor, William Rufus, to Roger de Poitou, for the purpose of erecting a castle upon its hill. This person also founded the church of St. Mary, and granted it as a cell to the abbey of Sees, in Normandy. To this monastery it continued annexed till the abolition of alien-priorities, in the reign of Henry V. when it was given to the Carthusian abbey of Sion, in Middlesex, and remained attached to that institution till the general dissolution of monastic establishments by Henry VIII. The great tower of the castle, which is still standing, is an excellent specimen of the massive style of architecture adopted in that age. The walls are of uncommon thickness, and the buttresses have narrow projections, whilst the lower windows have short rounded arches, with single shaft columns on their sides. This castle was besieged by Hubert, archbishop of Canterbury, in the year 1199, at which time it was held by the brother of king John, in trust for that monarch when he came to the throne. In the seventh year of the reign of the same prince, it was in possession of Ranulph Blundevil, earl of Chester, and in the early years of the reign of Henry III. was held by William de Ferrars, earl of Derby.

Lancaster, however important it may have been as a military station, owes its chief celebrity to Edward III., who, upon the completion of the fiftieth year of his reign, solemnly, and in full parliament, created his third son, John of Gaunt, duke of Lancaster. By the charter granted at this period, the duchy of Lancaster was constituted a sort of petty kingdom, and all the privileges of royalty conferred upon the duke within the county. During the civil wars between the houses of York and Lancaster, this town suffered so much by its adherence to the Lancastrian line, that it was nearly depopulated, and even in the time of Camden was only the residence of a few husbandmen, Charles II. having confirmed its ancient charter with additional privileges, it began again to revive, and has ever since been increasing in trade, extent, and population.

The castle, which has successively been the safeguard, terror, and glory of the town, is now fitted up as the county-gaol, with its necessary appendages of a gaoler's house, prisoners' rooms, cells, work-shops, courts of justice, &c. From the appearance of its present remains, and the commanding situation on which it stands, it must, doubtless, have been a grand and magnificent object in former times. Much as it has suffered from the changes it has more recently undergone, its architectural features are still entitled to general admiration. The encircling walls embrace an area of 380 feet from east to west, by 350 from north to south. Within this space is a large court-yard,

with several of smaller dimensions, and a number of towers of various shapes. The chief entrance is towards the east, and communicates with the town. It is a strongly fortified tower gateway, consisting of two semi-octangular projections, which are perforated, near the bottom, with apertures for the discharge of arrows, and on the summit are several bold machicolations with embrasures, &c. Within this entrance is the large court-yard already mentioned, surrounded with towers and fortified walls, and on the opposite side is a large square keep, the walls of which are of amazing thickness, and its apartments of grand dimensions. One of the rooms is nearly sixty feet long, by about thirty in width. The floors are arched, and covered with composition, forming flat surfaces. From the summit of this tower, the views are very grand and impressive. To the north of the keep are the shire-hall and county-courts, with several apartments and offices connected with them. These have been recently erected at the expense of the gentlemen of the county, and from the designs of Mr. Harrison of Chester, an architect, who has displayed so much classical taste and scientific knowledge in the construction of a county-gaol in that city. The finishing of these works has been from the designs of Mr. Joseph Gandy, of London, an artist of eminent talents. The grand jury room here, and shire-hall, are peculiarly elegant and novel: the first being of circular form, and the second being semi-circular; but both finished with clustered columns, panelling, tracery, &c. partly in imitation of the elegant ecclesiastical architecture of the fifteenth century. Over the judges' seats are two full-length portraits of the county members, by Mr. Allen; and a full-length of George III. on horseback, by Northcote. This grand and spacious pile of buildings, whether viewed as an ancient baronial fortress, as a picturesque object, or as a suite of public structures for the gaol and courts of the county, must demand our admiration. An engraved ground plan of this castle is published in a small History of Lancaster, 8vo. 1807. On an eminence near it is the parish-church, a spacious building, with a lofty tower, which serves as a land-mark for vessels coming up the river. At the east end of the church is a wooden screen most elegantly carved. Among the monuments, is one by Roubiliac, for William Stratford, L. L. D. In the church-yard is the shaft of a stone cross, with carving, and an inscription in Runic letters.

The other public edifices of this town, are a town-hall, a chapel of ease to the parish church, a theatre, an assembly-room, a range of shambles, a Quakers' meeting-house, and chapels to the following classes of dissenters, Presbyterians, Quakers, Independents, and Methodists. An ancient bridge, now in ruins, connected the opposite shores of the Lune, near St. George's Quay, but the increasing opulence and population of the town rendered a new and more commodious one necessary. This was erected from the extremity of Cable Street to Skerton, at an expense of nearly 12,000*l.* paid by the county. The length of this superb structure is 549 feet; the arches, five in number, are equal and elliptical; the design was by Mr. Harrison. Among other benevolent institutions in this town are several alms-houses for men and women, a free-school for the education of 60 boys, and two charity schools for 50 boys and 40 girls. The manufactories of the town are inconsiderable, and chiefly consist of cabinet-making, spinning of twine, cotton-printing, and weaving of sail-cloth. Ship-building has been greatly encouraged, and many large vessels constructed, particularly by Mr. Brookbank, who has sent ships, launched at his dock-yard, to London, of 450 tons burthen. Lancaster trades to America with hard-ware and woollen manufac-  
tures,

tures; and a considerable quantity of candles is exported to the West Indies: 40 or 50 ships trade also to Norway. It appears from the Custom-house entries, that in the year 1799, 52 vessels cleared out for the West Indies, with cargoes to the value of two millions and half pounds sterling. The Custom-house is a small neat building, with a portico supported by four Ionic columns, fifteen feet in height, each a single stone. The Town hall is a large commodious edifice; in the council room is a full-length portrait of Lord Nelson, painted by Mr. Lonfdale, an artist of talents, who is a native of this town. He presented it to the corporation, who have also a similar portrait of Mr. Pitt. The borough of Lancaſter originated from a grant, made in the 4<sup>th</sup> of Richard I. and members were first ſent to parliament 23 Edward I. Returns were alſo made at various periods in the two ſucceeding reigns; after which there were none till the reign of Edward VI., when the privilege was reſtored. The corporation is compoſed of a mayor, recorder, 12 aldermen, two bailiffs, 12 capital burgeſſes, 12 common burgeſſes, a town clerk, and two ſerjeants. In the vicinity of the town is an excellent ſalt marſh, adjoining the banks of the Lune: this marſh is paſtured and divided into what are termed *ori graſſes*; that is, a privilege for the inhabitants of turning a horſe or two cows to ſummer on the common. By the late inland navigation, Lancaſter has communication with the rivers Merſey, Ribble, Oufe, Trent, Derwent, Severn, Humber, Thames, Avon, &c., which navigations extend above 500 miles, into the counties of Lincoln, Nottingham, York, Weſtmoreland, Cheſter, Warwick, Leiceſter, Oxford, Worceſter, &c. About one mile north-eaſt of the town is a grand aqueduct-bridge, which conveys the Lancaſter canal over the river Lune. This ſtupendous fabric was deſigned and ſucceſsfully executed by Mr. John Rennie, civil engineer, who has hereby diſplayed much ſkill and ſcience in this and ſeveral other ſimilar works. The bridge conſiſts of five circular arches, each of 70 feet ſpan, riſing 39 feet above the ſurface of the river. The peculiar difficulties which the architect had to encounter, in the bed of the river, made it neceſſary to have a foundation, a flooring of timber, which alone coſt 15,000*l*. The ſuperſtructure came to double that ſum.

In the return to parliament in the year 1801, Lancaſter is ſtated to contain 1611 houſes, and 9030 inhabitants. Markets are held on Wednesday and Saturday; and here are three annual fairs.

About three miles ſouth of the town is Aſhton Hall, the ſeat of the duke of Hamilton and Brandon. Two miles further is Thurham Hall, the ſeat of John Dalton, eſq. In the vicinity of the town are Quo Wyerfield, the ſeat of John Fenton Caſtborne, eſq.; Quermore Park, the ſeat of Charles Gibſon, eſq.; Graſs-yard Hall, the property of Thomas Edmondſon, eſq.; Halton Hall, the ſeat of W. B. Bradſhaw, eſq.; and Halton Park, the ſeat of Thomas Bate-man, eſq.

Five miles north of Lancaſter, is a cavern, called Dunald Mill-hole, of a peculiarly grotesque and awful appearance, which, probably, from its obſcure ſituation, has been but little noticed by topographers. An Hiſtorical and Deſcriptive Account of the Town of Lancaſter; with four engravings, 8vo. 1807. Beauties of England, vol. ix.

LANCASTER, a populous and wealthy county of America, in the interior part of Pennsylvania, extending S. to the Maryland line. It is about 42 miles ſquare, is divided into 25 townſhips, and contains 566,240 acres of land, and 43,303 inhabitants, including 178 ſlaves. The lands of this county are rich and well cultivated. The hills in the northern parts abound with iron ore; for the manufacture of

which two furnaces and eight forges have been erected, Copper and lead, and abundance of limellone, have been found here.—Alſo, a county of Virginia, bounded E. by Cheſapeak bay, and S.W. by Rappahannock river. It is about 40 miles long, and 15 broad, and contains 2249 free inhabitants, and 3126 ſlaves. The lands are generally poor.—Alſo, a diſtrict of South Carolina, containing 5012 inhabitants, of whom 1076 are ſlaves.—Alſo, a poſt-town in Gerrard county, Kentucky, 621 miles from Waſhington.—Alſo, a handſome and flouriſhing poſt-town, the capital of Lancaſter county, in Pennsylvania, and the largeſt inland town of the United States. It is pleaſantly ſituated upon the deſcent of a hill, 1½ mile W. of Coneſoga creek, which falls into Suſquehanna river, nine miles S. by W. of the town. Its trade is already great, and muſt increaſe in proportion to the increaſing population of the ſurrounding country. It contains about 900 houſes, chiefly of brick and ſtone. The legiſlature meet here till a permanent ſeat of government ſhall be eſtabliſhed. The public buildings are, a handſome court-houſe of brick, a market-houſe of the ſame materials, and a ſtrong ſtone gaol. Here are ſix places of worſhip for German Lutherans, German Calviniſts, Preſbyterians, Episcopallians, Moravians, and Roman Catholics. The manufactures of this town are carried on by individuals. There are three breweries, and two or three valuable tanneries. Franklin college is eſtabliſhed here for the Germans. Its endowments are the ſame as thoſe of Dickinſon college, at Carlisle. The truſtees conſiſt of Lutherans, Calviniſts, Preſbyterians, and Episcopallians, of each an equal number. The principal is a Lutheran, and the vice-preſident a Calviniſt; 58 miles W. by N. from Philadelphia. N. lat. 40° 3'. W. long. 76° 20'.—Alſo, a poſt-town of South Carolina, 36 miles from Camden.—Alſo, a pleaſant poſt-town in Worceſter county, Maſſachuſetts, ſettled in 1645, and incorporated in 1633. It is ſituated on two branches of Naſhua river, which runs into the Merrimack: over theſe branches are nine large bridges, and on their banks the land is excellent. Many perſons of education and fortune have been induced, by the pleaſantneſs of this town, to make it the place of their reſidence. It is famous for its abundant ſupply of good ſlates and of ſtones for tombs and graves, which are articles of exportation. Camberry pond in this town is obſerved to riſe as much as two feet before a ſtorm, and Sandy pond riſes in a dry ſeaſon. It contains 1584 inhabitants.—Alſo, a poſt-town in Graſton county, New Hampshire, on the E. bank of Connecticut river, about 41 miles above Hanover; incorporated in 1763, and containing, in 1800, 440 inhabitants.—Alſo, a fine town, the capital of Fairfield county, in the ſtate of Ohio, on a branch of the Hockhocking river, about 25 miles N.E. from Chillicothe.—Alſo, a townſhip of Upper Canada, in Glengury county, on the river St. Lawrence, and the loweſt in the province adjoining Lower Canada. Morſe.

LANCAT, a river on the N.E. coaſt of Sumatra, which runs into the Eaſt Indian ſea, N. lat. 4° 5'. E. long. 98° 2'.

LANCAVY, LANCAKUY, or *Pulo Lada*, an iſland in the Eaſt Indian ſea, near the coaſt of Queda; about 16 miles long, and from three to eight broad. N. lat. 6° 19'. E. long. 99° 40'.

LANCAYAN, a ſmall iſland in the Eaſt Indian ſea, near the N. coaſt of Borneo. N. lat. 6° 25'. E. long. 118° 9'.

LANCE, LANCEA, a ſpear, an offensive weapon, borne by the ancient cavaliers, in form of a half pike.

The lance conſiſted of three parts, the ſhaft or handle, the wings, and the dart. Pliny attributes the invention of lances.

lances to the *Ætoliæns*. But Varro, and Aulus Gellius say, the word lance is Spanish; whence others conclude the use of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gauls, and Festus from the Greek *λάνχη*, which signifies the same.

The lance, or spear, is among the oldest weapons recorded in history, and is nearly coeval with the sword or bow; it probably originated in a pole or stake, sharpened at one or both ends, afterwards armed with a head of flint, and in process of time, on the discovery and use of metals, with copper, brass, and iron. Flint heads for both spears and arrows are frequently found in England, Scotland, and Ireland, and so are also spear, javelin, and arrow heads of a metal nearly resembling brass. The spear, lance, javelin, darts of different kinds, and even the more modern pikes, are all comprehended under one common description of a long staff, rod, or pole, armed with a pointed head of stone or metal at one or both ends, constructed for the purpose of piercing, or wounding with their points only, either by being pushed or thrown with the hand. Long spears and lances were used by the Saxons and Normans, both horse and foot, but particularly by the cavalry of the latter, who, in charging, rested the butt end of the lance against the arçon or bow of their saddle; the mail-armor not admitting of the fixture of lance-rests, as was afterwards practised on the cuirass. A lance-rest was a kind of moveable iron bracket, fixed to the right side of the cuirass, for the purpose of supporting the lance. It does not appear that there was any established standard for the length or thickness of the ancient lances, or the size or form of their heads; but it rather seems, that every military man had his lance, as well as his other arms, constructed of the dimensions that best accorded with his strength and stature. It is certain, however, that the heads of lances and spears were always made of the best tempered steel, and their staves of the soundest ash, whence the writers of Latin verse used the word *fraxinus* (Latin for ash) to express a lance or spear. Although lances and spears were chiefly the weapons of horsemen, they were also used by the infantry and dismounted knights, to keep off the cavalry; for this purpose they fixed the butts in the ground, their points sloping towards the breasts of the enemy's horses. In tournaments, the knights sometimes fought on foot with their lances, in which case it was customary to shorten them, by cutting off part of the shaft. Tilting lances differed from those used in war, both in their heads and raves; the heads of tilting being blunt, or occasionally fitted with a contrivance to prevent penetration, called a coronel or coronel, from its resemblance to a crown. The staves were thick at the butt end, tapering off gradually to the point, and generally fluted; near the butt end they had a device for the reception of the hand. The front of it was defended by an iron-plate, called a vam-plat, that is, an avant-plate, and behind it was a broad iron ring, called a burr. These handles were not confined to the tilting lance, but were made also on those designed for war. Fauchet says, they were not in use before the year 1300. Lances were ornamented with a banderole near the point, which gave them a handsome appearance; these were also called pennells. Grose on Ancient Armour, vol. ii.

*LANCE, Holy*, the lance which, in legendary story, is said to have pierced the side of our Redeemer. In the time of the Crusades, when Antioch was besieged, a priest of the diocese of Marseilles, called Peter Bartholomy, pretended to have received from St. Andrew, during his sleep, the following instruction. "At Antioch," said the apostle, "in the church of my brother St. Peter, near the high altar, is

concealed the steel-head of the lance that pierced the side of our Redeemer. In three days that instrument of eternal, and now of temporal salvation, will be manifested to his disciples. Search, and ye shall find; bear it aloft in battle; and that mystic weapon shall penetrate the souls of the miscreants." This revelation was respectfully received by count Raymond, whom his faithful subject, in the name of the apostle, had chosen for the guardian of the holy lance. After some previous ceremonies, the ground was opened at the appointed place; and search was unsuccessfully made for the lance. After the count and his companions had withdrawn, the artful priest descended into the pit; and, availing himself of darkness and solitude, contrived to secrete and deposit the head of a Saracen lance; and the first gleam of the steel was saluted with a devout rapture. The holy lance was drawn from its recess, and exposed to the veneration of the crusaders, and we may well imagine that the depending troops would again be inflamed with the enthusiasm of valour. Preparation was made for a conflict, and it may be supposed that the potent energy of this relic or trophy, aided by another miraculous delusion, would ensure victory. In the season of danger and triumph, the revelation of Bartholomy of Marseilles was unanimously asserted; but as soon as the temporary service was accomplished, the personal dignity and liberal alms which the count of Thoulouse derived from the custody of the holy lance, provoked the envy, and awakened the reason of his rivals. Incredulity, with regard to the truth of the legend, succeeded suspicion and examination, and the author was obliged to submit his life and veracity to the judgment of God. A pile of dry faggots, 4 feet high and 14 long, was erected in the middle of the camp; the flames burnt fiercely to the height of 30 cubits, and a narrow path of 12 inches was left for the perilous trial. The unfortunate priest of Marseilles traversed the fire with dexterity and speed; but his thighs and belly were scorched by the intense heat; he expired the next day, protelling his truth and innocence. Such were the origin, influence, and termination of the legend of the holy lance. Gibbon's Hist. vol. xi.

*LANCE la Grace*, in *Geography*, a town of Louisiana; 75 miles S.S.W. of New Madrid. N. lat. 35° 25'. W. long. 90° 27'.

*LANCE'S Bay*, a bay on the N.W. coast of Jamaica. N. lat. 18° 27'. W. long. 78 14'.

*LANCEA CHRISTI*, in *Botany*, a name given by some authors to the *ophioglossum*, or adder's tongue, a small herb found in moist places, with a single stem of seeds.

*LANCEARII*, in *Middle Age Writers*, soldiers whose chief weapon was the lance. They were in great esteem formerly.

*LANCEBEARERS*, *Island of*, or *Isle des Lanciers*, in *Geography*, a small island in the S. Pacific ocean, so named by M. Bougainville, in 1768. S. lat. 18° 28'. W. long. 138° 10'.

*LANCELOTTI, GIANPAOLO*, in *Biography*, an eminent jurist, was born at Perugia about the year 1510. He was first noticed as a teacher of the law at his native place, and was engaged by pope Paul IV. to draw up an institute of canon law, in imitation of Justinian's Institutes of civil law. This was published in 1563; and went very quickly through several editions. It was annexed to the body of canon law, and still retains its place in the modern editions of that compilation. He was author of other treatises on legal subjects, and of a life of Bartolus. He died at Perugia in 1591. Moreri.

*LANCELOT, CLAUDE*, was born at Paris in 1615; at a fit age he was persuaded to join the devout solitaires of

the Port-Royal, by whom he was employed in teaching mathematics, and the languages in their schools, till government thought proper to suppress them. He was afterwards appointed tutor to the young princes of Conti, but upon the death of their mother, he took the habit of St. Benedict, in the abbey of St. Cyran. In 1680, he was exiled to Quimperlé, in Lower Brittany, where he continued the same ascetic course which he had been used to in the seminary. He died in 1695. He was author of many excellent works, among which may be noticed "Nouvelle Methode pour apprendre la Langue Latine;" "Nouvelle Methode pour apprendre la Langue Grecque." These have been frequently reprinted, and abridgments have been made of both. His "Grammaire generale et raisonnée," is said to be a very excellent work, and has been translated into several languages.

**LANCEOLA**, in *Botany*, a name given by some authors to that species of plantain called *rib-wort*, or *plantago quinquerivra*, by most authors.

**LANCEOLATED LEAF**. See **LEAF**.

**LANCEROTTA**, in *Geography*, one of the Canary islands, about 30 miles in length, and eight in its greatest breadth, containing 800 inhabitants. It is divided by a ridge of mountains, which afford nothing but pasture for cattle, though the vallies are fruitful, but sandy and thin in soil. A principal article of trade is goat's flesh, which the inhabitants sell to the neighbouring islands, under the name of Tuffinetta. In 1730, a volcano broke out in this island. Cayas, called also Rubicon, and Lancerotta, the principal town, contains about 200 houses. The island has several havens or roads; and at the N.E. extremity is one, where ships may come in from the northward, and lie land-locked from all winds in 10, 15, and 20 fathoms. The E. point of the island is in N. lat. 29° 8'. W. long. 13° 26'.

**LANCET**, a well known surgical instrument, the common form of which is represented in the plates of this work. See the Surgical Plates.

**LANCET Arch**, in *Architecture*, the same as the pointed arch.

**LANCET Windows**, those with lancet arches; but the term is more generally applied to windows which are long and narrow, than to those which are wide and low.

**LANCETI**, a name given by the ancient laws of England to a kind of vassals, who were obliged to work for the lord one day in a week, from Michaelmas to autumn, either with fork, spade, or flail, at the option of the lord.

**LANCH** is a sort of long boat belonging to ships; it is not built upon sailing principles, it being flat-bottomed and broader, and is more useful for weighing small anchors than the long boat, and watering and carrying the ship-flores.

**LANCH of a Ship**. See **LAUNCH**.

**LANCHE**, in *Geography*, a town of Anterior Pomerania; 11 miles S. of Bergen.

**LANCIANO**, a town of Naples, in Abruzzo Citra, of which it is the capital; the see of an archbishop; S4 miles N. of Naples. N. lat. 42° 12'. E. long. 14° 20'.

**LANCIEGO**, a town of Spain, in the province of Alava; 18 miles S.S.E. of Vittoria.

**LANCISI**, **JOHN-MARIA**, in *Biography*, a celebrated physician, was born at Rome in October 1654. His parents were rather low in rank, but cherished the disposition for learning which he early displayed; and having finished his classical studies, he went through the course of philosophy in the Roman college, and then commenced the study of divinity. He had always evinced a great taste for natural history, which was so strongly awakened during his theolo-

gical researches, that it induced him to abandon the study, and apply himself entirely to that of medicine. He pursued the fundamental branches, anatomy, chemistry, and botany with great ardour, as well as the more important object, the observation of diseases; and was created doctor in philosophy and medicine in 1672. In 1675, he was appointed physician to the hospital of the Holy Ghost, in Saffia, where he pursued his clinical enquiries with great accuracy and acuteness: but he quitted this situation in 1678, when he was received a member of the college of St. Saviour, in Lauro, where he read with zeal all the best authors from Hippocrates downwards. His talents and achievements were now known and acknowledged, and he was appointed professor of anatomy in the college de la Sapienza, in 1684, and continued his duties as a teacher for thirteen years with great reputation. In 1688, pope Innocent XI. chose Lancisi for his physician and private chamberlain; and some time afterwards gave him a canon's stall in the church of St. Lawrence: but on the death of the pope, in 1689, he resigned it. He was now in high public estimation, and when Innocent XII. fell sick in 1699, Lancisi was called upon, and was never absent from him during his whole illness. He was elected physician to the conclave, and was immediately appointed first physician and private chancellor to the perion of the succeeding pope Clement XI. He was indefatigable in the discharge of all his duties, as well as in the pursuit of his studies, reading and writing at every interval of leisure, and in his attendance on the learned societies of the time. He died in January, 1720, at the age of 65. He was a man of small stature, with a lively countenance, and cheerful disposition; his manners were extremely engaging; and he was possessed of much knowledge of mankind. His ardour for the advancement of his art was extreme and unceasing. He collected a library of more than twenty thousand volumes, which he presented in his life-time to the hospital of the Holy Ghost, for the use of the public, particularly the young physicians and surgeons who attended the patients in that hospital. This noble benefaction was opened in 1716, in the presence of the pope, and a great number of cardinals.

Lancisi left a considerable number of works, many of which have been printed, but several in MS., which he bequeathed to the hospital, and which are deposited in its library. Among his lesser productions, were a synopsis of anatomy; an epistle to Fantoni on the same subject; an epistle to Bianchi on the secretion of the bile; an essay on the atmosphere and climate of Rome; on physiognomy and the seat of the soul; on the proper method of studying in medicine; on the origin and structure of fungi, in a letter to count Marfigli; and some others, in the Latin language; and also an address to the academy of Sienna, "Del modo di filosofar nell' Arte Medica." His more important works are his treatise "De subitaneis mortibus, Libri duo," Romæ 1707. — "Tabule Anatomice Clariss. viri Bartholomæi Eustachii, quas à tenebris tandem vindicatas, et sanctiss. Dom. Clementis XI. Pontif. Max. munificentia dono acceptas, præfatione notique illustravit," ibid. 1714, folio. — "Dissertatio Historica de Bovilla Peste ex Campinjs finibus, anno 1713, Latio importata. Accedit Consilium de Equorum Epidemia," ibid. 1715. — "De noxiis Paludum Effluviis, Libri duo," ibid. 1717. — He likewise edited, in the same year, under the patronage of the pope, a posthumous work of Michael Mercati, entitled *Metallotheca*, with plates; and afterwards published, "Appendix ad Metallothecam Vaticanam Michaëlis Mercati," 1719. After his death, a treatise, "De motu cordis et aneurysmatibus," was printed in folio at Rome, 1728: — and a collection of cases from his MSS.

MSS. in the library of the hospital, entitled "Confilia XLIX posthuma," Venice, 1747. All his works, with the exception of the two last, were collected in his life-time, and printed at Geneva, with the title of "Joannis Maria Lancisi Opera quæ hæcenus prodierunt omnia, Dissertationibus nonnullis adhuc ineditis completata," 1718; which, as well as most of the separate treatises, have passed through several editions. Eloy Dict. Hist.

LANCISIA, in *Botany*, so named by Pontedera, in honour of John Maria Lancisi, physician to pope Clement XI. Ponted. Diff. 203. Lamarec. Illustr. t. 701. See LIDBECKIA.

LANCKAW, in *Geography*, a town of Prussia, in the palatinate of Culm; 10 miles E.N.E. of Thorn.

LANCKE, a town of Prussia, in Pomerelia, on the borders of Pomerania; 32 miles N.N.W. of Fredeland.

LANCPOU, a lake of Thibet, about 30 miles long and nine wide. N. lat. 32° 36'. E. long. 84° 32'. — Also, a mountain of Thibet. N. lat. 32° 55'. E. long. 84° 34'.

LANCTAN, a mountain of Thibet. N. lat. 31° 52'. E. long. 85° 54'.

LAND, in a general sense. See EARTH, SOIL, &c.

Dr. Davenant, from a scheme of Mr. King, states the quantity of land in England and Wales to be thirty-nine millions of acres; which, reckoning the number of inhabitants, as he does, to be 5,500,000, will at an average be 7½ acres per head. Davenant's Works, vol. vi. § 3. See ACRE, and EXPECTATION of Life.

LAND, in a legal sense, includes not only the face of the earth, but every thing under or over it; so that if a man grants all his lands, he grants thereby all his mines of metal and other fossils, his woods, his waters, and his houses, as well as his fields and meadows.

LAND, in *Agriculture*, the earth or soil in which plants fix themselves and grow, or which produces crops of different kinds.

It is stated in an able work on the landed property of England, that "land, viewed in the light of agriculture, is the foundation on which it rests, the materials on which it operates, and the visible source of its productions. And that it may generally be considered as being composed of three distinct parts; the soil, the sub-soil, and the base, or sub-structure, on which they rest." It is added, that "the soil, or plant-feeding stratum, is not more various in quality than it is in depth. The soils of cultivated lands, however, have their limits as to depth. These limits may, it is conceived, be fixed at three and fifteen inches. For although, in many instances, the component parts of land are pretty uniform, to a greater depth than fifteen inches, a uniformity of colour and vegetative quality seldom reaches to that depth. The influence of the atmosphere, the fibres of vegetables living and decayed, the operations of animalcules, and larger animals, that inhabit soils, and, above all, the powerful effects of manures, tend to furnish the surface mould with qualities which the substrata have not the means of acquiring. The medium depth of cultivated soils, in England, may, it is imagined, be set down, with sufficient accuracy for this purpose, at nine inches. For although a majority of the cultivated soils of the kingdom may not reach that depth, the writer is of opinion that the major part of them might, under proper management, be sunk to nine inches deep, with advantage in many respects." See SOIL.

And it is further stated, that "the subsoil, or intervening stratum of land, is still less definite with regard to depth. In some instances, as where the cultivated soil rests upon rock, it may be said to be wanting; though, in most cases of this kind, a stratum of a gravelly nature, composed of broken

rock and earth, is found between them. And in many cases, a regular bed of gravel, sand, or other earth, intervenes between the soil and the substructure. While in others, an uniform mass of earthy materials reaches to a great depth. If, therefore, a definite thickness, or depth, may be assigned to the subsoil, it must be, in a degree, arbitrary," or without any degree of accuracy or correctness.

It seems evident, that "the soil affords nourishment and stability to agricultural plants, and that the subsoil assigns them temperature, with respect to moisture and internal warmth. If the subsoil is of such a nature, or is so situated as to receive and retain more moisture than is requisite for the natural growth of plants, their health is injured. If it not only holds water in its own pores, but freely communicates it to those of the soil, the more valuable plants in agriculture give place to ranker herbage, let the surface soil be what it may. On the contrary, if an open stratum of sufficient depth intervenes between the cultivated soil and the base, to permit the superfluous moisture which filters through the soil, or which is communicated subterraneously, to pass off, the plants in cultivation will be relieved from collected moisture, in the immediate region of their feeding fibres; though the substructure may be charged to the fill with water. Hence, where nature has not furnished land with this valuable interstratum, it is the business of art to remedy the defect," in some way or other, and which in general "is to be done by draining off the superfluous moisture to a sufficient depth to prevent its evil effects on the soil, and thereby supplying the required stratum." It is however well observed, that "in doing this, the artist must be led by the given properties of the base, and can seldom lower it to any determinate or arbitrary depth. Nevertheless, it will be right, before he proceeds further, to endeavour to form an adequate idea of the medium depth required;" in doing which, much, he says, depends on the specific quality of the subsoil. Sand will hold up water that is lodged at its base to a much greater height than gravel. A stratum of gravel of one foot in depth forms a drier subsoil, than a bed of sand of twice or three times that thickness. But clean sand or gravel is rarely found in land; sand and gravelly loams being the more ordinary materials of absorbent subsoils: and these are capable of raising and holding up water to a considerable height. "Let us, therefore, admit that effective subsoils may vary from one to two feet, and fix the medium depth at eighteen inches." And "by thus fixing the mean depth of soils at nine inches, and that of subsoils at eighteen inches, place the base or substructure of the land at twenty-seven inches beneath its surface; which is a depth of land that is equally conformable with theory and with practice. To this depth drains may be sunk, at a moderate expence: and covered stone drains of this depth may be rendered effectual, yet free from injury by the operations of tillage. In the practice of skilful workmen, the depth of ordinary subsoil-drains varies from eighteen inches to three feet, according to the circumstances of the given case, and the method of draining employed."

After this general view of the component parts of land, and of their due arrangement, the common varieties of it, as they are given by soil, subsoil, and base, may be enumerated and considered. In the execution of which it may be proper to divide lands into classes, and mark the varieties of each.

*First Class*.—This comprehends, according to the above writer, such lands as are liable to surface water only with their absorbent strata (if any) open, so as freely to discharge the superfluous water they receive upon them: the varieties

of which are first, where "the soil, the subsoil, and the base are repellent, or in a state of moistness, impenetrable by water, as clay and strong deep clayey loam." The second, where "the soil is repellent, the subsoil absorbent, the base repellent." The third, where "the soil is repellent, the subsoil and base absorbent, or in a state of moistness, conducting water; as sand, gravel, open rock, and the lighter more open loams." The fourth, where "the soil, the subsoil, and the base are absorbent." The fifth, where "the soil and the subsoil are absorbent, but the base repellent." And the sixth, where "the soil is absorbent, the subsoil repellent, and the base absorbent or repellent."

*2d Class.*—This includes such lands as are liable to surface-water only, with their absorbent strata closed, or permitting an imperfect discharge, either for want of sufficient descent, or by reason of impervious strata, or beds of impenetrable materials. The varieties of which are, first, where "the soil is repellent, the sub-soil absorbent, and the base repellent or absorbent." The second, where "the soil and the sub-soil are absorbent, but the base repellent, or absorbent." The third, where "the absorbent and repellent strata, or masses, are thrown together irregularly; or not disposed in regular strata, which correspond with the surface," or upper part.

*3d Class.*—This comprises such lands as are liable, not only to surface-waters, but to those which are subterranean, and which either descend from higher grounds in their respective neighbourhoods, or rise beneath them from subjacent reservoirs; the absorbent strata of this class being closed, and thereby rendered retentive, as in the second class, or kind of land. The varieties of which are, first, where "the soil is absorbent or repellent; the sub-strata absorbent and closed, and uniformly charged with descending waters, by an even stratum of gravel, free-sand," or some other similar material. The second, where "the same soil and sub-strata are partially charged with descending waters, through veins of sand or gravel, or fissures of rock, &c." The third, where "the soil is repellent or absorbent, the sub-soil absorbent and closed, and uniformly charged with descending waters; the base repellent, with a sub-base freely absorbent and open." The fourth, where "the soil is absorbent or repellent, the sub-strata uniformly absorbent and closed, and charged with rising waters." And the fifth, where "the soil is repellent or absorbent, the sub-strata complex and closed, and charged with rising and descending waters."

It may be observed, that the nature of these different kinds, or classes of lands and their varieties, with that of their different constructions, the effects to which they are each particularly exposed from a superabundance of water, the methods of removing such wetness, both with the view of ameliorating the lands for the purposes of cultivation, and that of providing supplies of water for economical uses, as the working of light machinery, the consumption of pasturing-stock, and in particular cases, where a sufficient quantity can be procured, for the watering of land, will be fully considered in their proper places; and many useful observations may be found in the work here alluded to, especially in what relates to draining. The two objects of applying water to the use of live-stock, and that of irrigation, should constantly be kept in the mind of the improver of the soil. See *SOIL, WATERING of Land, and DRAINING of Land.*

It is sufficiently evident, from various circumstances in the management of lands, that some sorts are much better calculated for the production of grain crops than those of the grass kind; while, on the contrary, others are much more suitable and better adapted to the raising of grass than those of the corn kind; and that there are still others that may

be cultivated under a convertible system of corn and grass, with more success than either of the methods separately.

It may be remarked, that all those lands which possess a sufficient degree of dryness, whether they have much depth of mould or not, and which, in their natural state, have but little tendency to produce good herbage, such as those covered with different sorts of coarse plants and vegetable productions, whether in an open or inclosed state, are proper for tillage. And it has been well observed by Mr. Davis, that grounds of this nature are of considerably more value when in a state of tillage than in pasture; as they are particularly adapted to the improved methods of cultivation, and in addition to the quantity of grain to be produced from them, will afford a greater quantity of vegetable food for animal stock, when in a tillage state, than they did when kept entirely in that of pasture or sward. The same writer likewise states, that there are various other descriptions of light lands that may be kept in a state of tillage with more advantage than in that of grass, as they are peculiarly suited to those improved modes of cultivation that are necessary for raising large supplies of green-food for the support of live-stock of different kinds. That the poorer sorts of sand-lands, where marl, clay, chalk, or other similar substances, can be readily procured, are much more proper for the purposes of tillage than those of grass, is sufficiently shewn by the improvements that have been made in many of the more southern districts of the kingdom. And that lands of the chalky kind, whether of the more superficial or deep descriptions, are, in most cases, better suited for tillage than grass, is proved from their wetness in the winter season, and their openness and friability in the summer, rendering it almost impossible to establish good herbage upon them. Beside these, there is another sort of land that is better for the purposes of tillage than those of grass, which is that which, in the state of grass, is constantly so disposed to the production of moss, as to afford but a very scanty share of good herbage in any circumstances.

It has been stated by the author of "Practical Agriculture," that "moist of the clayey and more heavy descriptions of land, especially when situated in vallies, or other low confined exposures, though they may be capable of affording good crops of particular kinds when under the plough, as those of the wheat and bean kind, are, on account of their retention of moisture, the increased expences of labour, and the uncertainty of season for tilling them, as well as their inaptitude for most other sorts of crops, and their fitness for the production of good herbage, much more beneficial in the state of grass than in that of tillage. When there is an opportunity of procuring sea-sand, and of applying it at an easy expence, they may, however, it is observed, be converted to the purposes of tillage in a profitable manner. Most of those strong cold grass-lands which, in a state of tillage, would be improper for the growth of turnips, and other applications of improved cultivation, should also constantly remain in a state of grass. And likewise those lands that are situated near large towns, where manure is plentiful, and, of course, capable of being procured at a reasonable rate; and where the produce of such lands is always in great demand, and therefore capable of being disposed of to great advantage. Such lands as are situated on the banks of large rivers or brooks, which are capable of being improved by means of watering, are likewise more beneficial when kept constantly under the grass system than any other mode of cultivation that can be practised. The lands of a calcareous nature, which are distributed in the vallies of the more mountainous districts, where old grass-land is scarce, and of much importance, and most part of that in the state of tillage incapable of being converted to the condition

of good grass, may also, it is believed, be the most advantageous when continued in a permanent state of herbage."

But that "the sorts of lands that are the most adapted to the practice of convertible husbandry are those of the loamy kinds, which are not too strong for the growth of turnips. These, in all their different varieties, are capable of being changed from the state of tillage to that of grass, and the contrary, not only without sustaining any injury, but frequently with the most evident advantage, as the practice of some of the western and midland districts has fully proved." And "the richer kinds of sandy lands are, in most cases, also well suited to this sort of husbandry; especially where marl is at hand, to be applied at the time of laying them down to grass. Grounds of the peaty sort may likewise, in many cases, be the most beneficially employed in this mode of culture, as, from their producing little else than plants of the aquatic kind, it is obvious that they must be completely destroyed, and those of the proper grass kind be introduced, before any useful herbage can be produced. And this is capable of being accomplished in by much the most perfect manner under the state of tillage. But as they are, in most instances, much too tender and moist for the purpose of remaining long in the state of tillage, as soon as the above intention has been fully effected, they should be restored to the state of permanent grass," either as meadows or pasture-lands. See **GROUND and SOIL**.

**LAND Carriage**, in *Rural Economy*, that sort of conveyance which is performed on land, which, in many cases, is highly inconvenient, and always greatly expensive and troublesome to the farmer. It should, of course, be lessened as much as possible, in situations that will admit of it, by the substituting of water-conveyance, by the forming of small narrow canals, which may, in many instances, be done at a trifling expence, and thus much lessen the extent or distance of land-carriage. Much has been done in this way, with considerable effect, within the last twenty-five years, in different parts of the country. See **CANAL and INLAND Navigation**.

**LAND-Guard**, a sort of fence or embankment constructed of stones, wood, or other materials, on the borders of rivers and brooks, in order to prevent their overflowing and carrying away the land. The cases in which they become more particularly necessary, are where they are confined in the parts where they are required to bend, by rocks or other means, to an unaltered channel; it often takes place in hilly situations, and where deep pools occur in such parts at low water, so as to render it difficult or impossible to provide a good foundation for a pier. The mode of applying and forming these sorts of guards, will be explained in considering the nature and manner of guarding river-banks, and confining streams of other kinds. See **EMBANKMENT, and RIVER-BANKS, Guarding of**.

**LAND Mark**, in *Agriculture*, any thing placed as the division of land. These marks were formerly chiefly used for shewing the different lots or divisions in common field-lands, and other sorts of commonable land.

**LAND-Reeve**, in *Rural Economy*, a person whose business it is to overlook certain parts of a farm or estate; to attend, not only to the woods and hedge-timber, but also to the state of the fences, gates, buildings, private roads, drift-ways, and water-courses; and likewise to the stocking of commons (where there are any), and encroachments of every kind; as well as to prevent, or detect waste and spoil in general, whether by the tenants of the estate, or others; and to report the same to the manager or land-steward. It has been observed, that "the utility accruing from these inferior officers of an estate occurred to the writer in the Highlands of Scotland; where they have been commonly appointed on every estate, it is believed, from time immemorial, under the name of

ground-officers." And he has "since experienced their utility so fully in England, as to induce him to recommend their appointment on every large estate; not merely as help-mates to the acting-manager, but as authentic evidences in matters of dispute, and as intelligent informants to a proprietor in going over, or inquiring after, the affairs of his estate. Active intelligent tenants, of known integrity, are generally the most suitable persons for having the management of this sort of trust confided in them."

**LAND Springs**, such as rise, or are produced in lands, at some considerable depth, from the water being obstructed in its descent by some sort of impenetrable material, such as clay, &c., and thus forced up to the surface, where it breaks or oozes out, having different appearances, according to the nature of the soil and situation in which it occurs. See **SPRING, and DRAINING of Land**.

**LAND Steward**, the common name of a person who overlooks, or has the management of a farm or estate. The number, description, and qualities of land stewards must be regulated according to the nature and extent of the property, and the particular circumstances of the proprietor. In order to be fully qualified, according to the author of "The Modern Land Steward," for the proper management of large estates, the stewards should have attained that thorough and correct knowledge of the business of life, that full-tried experience in men and things, which ought not to be expected earlier than the middle age. No material part of their time or attention should be engrossed by their own private concerns, as, in such cases, they must evidently neglect their own, or the business of their employers; and it would be paying human nature too great a compliment to suppose the former. To an ample share of agricultural knowledge, they ought to have a thorough insight into the nature of every improvement of which estates may be capable, whether upon or beneath the surface; or from its local situation, whether inland or upon the sea-coast. Their attention should be also directed to the useful sciences of political economy and political arithmetic, as there is a strict and happy coincidence between public and private wealth. They should be well versed in, and qualified to superintend, the culture of waste lands, the disposal of timber, the eradication or planting of woods, irrigation and warping, drainage, embankment, and the recovery of land from the sea, the cutting of canals, the laying out and repairing of roads, the construction of bridges, mills, and engines; and be possessed of a considerable skill in rural architecture of every kind. Nor is it less necessary that they thoroughly comprehend the nature of all the various methods in which money business is transacted; together with the advantage of bargaining in the purchase or sales of estates. Their intelligence ought also to extend to the valuable inventions and improvements of other countries, as well as those of their own; which, whether in the mechanic or agricultural relation, they should use their best means to introduce, and fairly experiment upon the estates under their care, with the honourable and patriotic views both of private and national benefit. In short, with sufficient honesty, a mind amply replenished, a cool, deliberate, and calculating head, a quick discernment, they should lay hold of every occasion, as it springs, to enhance the worth, the reputation, and the embellishment of the property committed to their charge.

For these qualifications and endowments they should have full and adequate allowances, in the way of salaries or wages, according to the service to be performed. Their practical skill in agriculture should particularly extend to the management of cattle, and the common outlines, at least, of rural architecture, as far as regards repairs, or ordinary new erections; and they should be thoroughly masters of common

accounts, and able to describe or correspond by letter intelligibly, and with propriety. When thus qualified, they may make very capable and respectable stewards; but they would not be the less eligible for a sufficient portion of mathematical and mechanical knowledge, and the practical habits of mensuration both of timber and land: though a defect of these branches of science ought not to operate to the rejection of those otherwise well qualified; since they are acquired by a very moderate application and practice; and since there are always at hand professional men in these sciences, whose services are, perhaps, after all, the most eligible and proper. Land stewards should have the care and management of every thing that relates to the farm or estate, of which they have the superintendance. It is also further advised, that "every estate should be accurately surveyed, and correctly described in a map, of which the tenant also should have one. It is supposed particularly necessary, both to steward and tenant, to keep an exact terrier of all common fields; and where the bounds and abutments of any single parcel of land are dubious, to have them defined and ascertained with durable land-marks, by a jury purposely impanelled at the manor-court: and in order to preserve the bounds and precincts of a parish, with the particular property of the lord, entire, and free from encroachment, and to preclude the necessity of quarrels and suits at law, it is good to keep the ancient custom of annual perambulation." And it is considered as "the duty of stewards to ride over, and make actual personal surveys of the estates in their trust, sufficiently often to offer timely advice, to obviate any dangers, and nip any irregularities or encroachments in the bud: to have in their possession duplicates of all leases, covenants, deeds, &c." And that, "where the case of default or danger does not admit of immediate remedy through their own means," to exonerate themselves by instant application to their employers.

And it is likewise their business "to inspect all repairs, that they be duly and substantially performed; fencing regularly kept up, according to covenant; ditches cast and scoured, water-courses free, and common rights fairly enjoyed, according to the custom of the manor; the larger tenants not overtocking, to the prejudice of the inferior: in which case, the stewards are bound to interfere.—To observe that the cutting of underwood be at the regular, customary, or covenanted periods; that the lopping of pollards be fair, and no damage done, in any wise, to the proprietor's timber or woods; to mark the spots where new plantations may be necessary or advisable; woodwards to be admonished of their duty,—that they report all persons who trespass, either with their cattle, under colour of cutting up hand-sticks, faggot-bands, or similar pretences." And "to discourage poaching and destruction of the game, rather by rational and moderate indulgences, than either by the threat or exertion of the excessive rigour of the law, which, according to the complexion of the present times, can have no other possible effect than to detract from the popular character of the proprietor, and from the safety of that which such measures are intended to ensure." Further: "to caution the tenants that they do not suffer the land to be overrun and rutted up by moles, or the commons or woodlands by unrung swine." And that "the strictest caution be observed, that all materials produced by the farm or estate, in any respect fit for manure, or other useful purpose, such as marle, lime-stone, coal, or kelp-ashes, weeds, shells, sand, clay, virgin-earth, &c. be disposed of and used among the tenants of the estate only, and by no means alienated from it; since such practice would be to rob the soil of a natural and most valuable mean of improvement."

It is, on the whole, concluded, that "there is great convenience in land stewards being surveyors of the highways for the parishes in which they reside; in which case, it lies in their own power to preserve them in a condition creditable to the county and the proprietors for whom they act. Nor ought they ever to be inattentive to the conduct of the surveyors of other parishes, in which they are concerned; never permitting the least neglect, nuisance, decayed bridge, or dangerous way; but occasionally, and according to the necessity of the case, making a few examples in a genteel and temperate, but firm tone, always pleading for their punctiliousness, the strict and peremptory orders of their employers, which they dare not disobey." And "the like strictness is, it is supposed, necessary with respect to trespasses from neighbouring cattle; for some farmers are so excessively dilatory in this respect, that they will take no kind of pains either for the security of their own or their neighbour's crops."

It is remarked by the writer of the work on "Landed Property," that on a large estate a resident manager is generally found,—a land steward, a man who has some knowledge of what is termed country business, and who acts under the controul of his employer, or of a confidential friend who is more conversant in rural concerns, or perhaps of a law-agent who knows less of them: and that such residing steward, especially of a detached estate, which lies at some distance from the residence of its proprietor, acts without controul. In this case, if he is a man of judgment and integrity, he becomes, at least in the eyes of the tenantry, a superior being; frequently, in their minds, a more exalted character than their landlord,—than the proprietor himself, who, perhaps, never deigned to glance his eye upon them or their lands." But that, "on the contrary, if such possessory manager wants those requisite qualifications, the consequence becomes mischievous to the lands, their occupiers, their proprietor, and the community. If this unprincipled agent has an interest in the derangement of the estate, and the ruin which will follow, and is suffered to make use of it,—the crime of neglect, on the part of the proprietor, might well be cognizable as a crime against the public." And further, that "similar evils are liable to befall an estate which lies round the residence of its proprietor, if he is equally inattentive" to its proper management and regulation.

Agriculture is considered as the oily firm foundation on which the other acquired attainments can be securely reposed. It is not more essentially valuable in the superintendance, than in the improvement of an estate. "It is difficult to become an accurate judge of the value of lands, without a practical knowledge of their uses: nor can any man, without it, properly appreciate the management of occupiers; much less assist them in correcting their errors, and improving their practice." And that "land surveying is another requisite qualification: not so much, however, for the purpose of mapping and measuring an estate at large, as for checking and correcting the works of professional men; as well as to assist in laying out its lands to the most advantage," and with the greatest propriety. Further: that "some knowledge of mechanics, and the other sciences that are requisite to the business of an engineer, may be highly useful in prosecuting the improvements incidental to landed property, in various ways; as well as a competent knowledge of rural architecture, and the superintendance of artificers, as they may be said to be of daily use. The nature of planting, and the management of woodlands, are acquisitions that cannot be dispensed with. Nor should his knowledge and attention be confined to the surface of the

pasturage by consequence. The ordinance was, that all houses of husbandry, with twenty acres of ground to them, should be kept up for ever, together with a competent proportion of land to be occupied with them, and in no wise to be severed from them. By these means, the houses being kept up, did, of necessity, enforce a dweller; and the proportion of land for occupation being also kept up, did, of necessity, enforce that dweller not to be a beggar. This statute was renewed in king Henry the Eighth's time; and every person who converted tillage into pasture subjected to a forfeiture of half the land, till the offence was removed. In a law of the 25th of the same reign, it is set forth, that many farms, and great plenty of cattle, particularly sheep, had been gathered into few hands, whereby the rents of lands had been increased, and tillage very much decayed; churches and towns pulled down; the price of provisions greatly enhanced, and a marvellous number of people rendered incapable of maintaining themselves and families; and, therefore, it was enacted, that no person should keep above two thousand sheep, nor hold more than two farms. In the third of Edw. VI. a bill was brought in for the benefit of the poor, for re-building decayed farm-houses, and maintaining tillage against too much inclosing. In the year 1638, there was a special commission from Charles I. for enforcing the statute of the 30th of Elizabeth, by which no cottage was allowed in any country place, without at least four acres of land to it, to prevent the increase of the poor, by securing to them a maintenance; nor were any inmates allowed in any cottage, to secure the full cultivation of the land, by diffusing the people more over it. And by an act in Cromwell's time, no new house was to be built within ten miles of London, unless there were four acres of land occupied by the tenant. Thus did the policy of our ancestors discourage inclosing and engrossing, upon the same general view of their depopulating tendency; and though the increase of trade and manufactures in more modern times has produced a considerable alteration in the state of our country, and may require some change in our internal policy, yet it is easy to foresee, because facts justify the apprehension, that inclosing and engrossing, to the degree in which they have lately prevailed, will annihilate the small occupiers of land, and reduce the inhabitants of the kingdom to two classes, *viz.* gentry and beggars, or grandees and slaves. See this subject more amply discussed, and the arguments for and against inclosures and large farms, stated under FARM, and INCLOSING of Land.

As in former times the number of the occupiers of land was greater, and all had more opportunities of working for themselves, it is reasonable to conclude, that the number of people willing to work for others must have been smaller, and the price of day-labour higher. The nominal price of day-labour, says an author who wrote a few years ago, is at present no more than about four times, or at most five times, higher than it was in the year 1514. But the price of corn is seven times, and of flesh-meat and raiment about fifteen times higher; therefore the price of labour has been so far from advancing in proportion to the increase in the expences of living, that it does not appear to bear now half the proportion to these expences that it did formerly. What alteration has taken place since these observations were made, we leave others to determine. See on this subject Price's Observations on Reverfionary Payments, Supplement, p. 383, &c. Appeal to the Public on the Subject of the National Debt, p. 93, &c. See LABOUR, and LABOURERS.

LAND, Laying the, in Sea Language, denotes that motion of a ship which increases its distance from the coast, so as to make it appear lower and smaller, a circumstance arising from the intermediate convexity of the sea. This is used in contradistinction to *raising the land*, which is produced by the opposite motion of approach towards it. When a ship is got out of sight of land, they say the land is laid.

LAND, To make the. See MAKE.

LAND-Mark, at Sea, is any mountain, rock, steeple, wind-mill, tree, or the like, near the sea-side, which serve to direct ships passing by how to steer, so as to avoid certain dangers, be they rocks, shoals, whirlpools, &c.

LAND, Setting the, is observing by the compass how it bears.

LAND, Shut in. When another point of land hinders the sight of that which a ship came from, then they say the land is shut in.

LAND-To. When a ship lies so far from the shore, that she can but just ken land, then she is said to lie land-to.

LAND-Turn, is a wind that blows from the shore in the night, at certain times, in most hot countries.

LAND, Head, or Point of land, in the Sea Language, is that which lies farther out into the sea than the rest. See POINT, CAPE, &c.

LANDA, in Geography, a kingdom of Borneo, ceded, in 1778, to the Dutch company, together with Succadana,

dana, by the king of Bantam, to whose crown they were appendages.

**LANDAFF.** See **LLANDAFF.**

**LANDAFF**, a township of America, in Grafton county, New Hampshire; incorporated in 1774, and containing 461 inhabitants.

**LANDAU**, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Willimbouurg, situated on the river Queich, which runs into the Rhine; containing four churches; formerly imperial. The place contains 5123, and the canton 15,246 inhabitants, on a territory of 487½ kilometres, in 18 communes. N. lat. 49° 13'. E. long. 8° 10'.—Also, a town of the county of Waldeck; 12 miles N. of Waldeck.—Also, a town of Bavaria, on the Iser; 32 miles W. of Passau. N. lat. 48° 36'. E. long. 12° 37'.

**LAND-CHEAP**, an ancient customary fine, paid either in cattle or money, upon the alienating or selling of land in certain manors, or within the liberty of certain boroughs.

At Malden in Essex, a payment is still made of 13*d.* in every mark of the purchase-money for lands and houses fold in that town; which is called land-cheap.

**LANDE**, in *Geography*, a town of Norway; 36 miles N. of Christiania.

**LANDECK**, a town of the duchy of Warfaw; 48 miles N. of Gnesna.—Also, a town of the county of Tyrol, on the Inn; 39 miles W.S.W. of Inspruck.—Also, a town of Prussian Pomerelia; 64 miles S.W. of Dantzic.—Also, a town of Silesia, in the county of Glatz, on the Biela; 8 miles S.E. of Glatz. N. lat. 50° 15'. E. long. 16° 40'.

**LANDED INTEREST**, a term opposed to monied interest, in political considerations; though there is a near connection between them: for the landed interest is affected by foreign trade. See **MONIED INTEREST.**

The foreign trade of every country must decline, that, 1. Lays unequal taxes in general on its people. 2. That cramps its commerce, the fountain of riches, by high duties, and impolitic prohibitions. 3. That suffers many monopolies. 4. That oppresses its people by prohibiting the importation of victuals, under the pretence of raising the value of its lands. 5. That encourages idleness, by bad laws relating to its poor. 6. That tempts foreigners to carry away its coin for less than its intrinsic value. 7. That makes the obtaining justice chargeable. 8. That suffers a heavy national debt, contracted in time of war, to continue unpaid in time of peace.

The reason why the decline of foreign trade sinks the value of land is, 1. Because it sinks the markets at home. For, the produce of land being rendered excessively dear from the causes above enumerated, foreigners will not take its superfluities; and labour being by the same causes rendered excessively dear, we cannot manufacture or improve that produce, because nations which can afford cheaper supply the markets abroad; so that the produce of the lands, not being carried off as usual, must become a dead stock on the farmer's hands, and cause great quantities to be crowded into markets, where, being encouragement but for few buyers, the price naturally falls; as, for instance, the declining demand of our woollen goods abroad falls the price of wool at home.

2. Because it increases the number of poor, to burden the land.

3. Because it diminishes the number of people: for, as employment lessens, the most indolent, rather than starve here, will fly to other countries, where trade can maintain

them. So the consumption of these being taken away, the demand at market must grow less, and of course rents must fall, yet the farmer's charges must grow greater; for the fewer the hands, the higher wages are: this must break him in the end, and produce all the consequences following that misfortune. Besides, men who trade bring in money; therefore the fewer they are, the less money will be brought; and the less money, the less rent can be given for land.

4. Because the decline of trade diminishes *our riches*. This is a consequence of the above remarks; for having fewer goods capable of being exported by reason of their dear price, and our manufactures declining, must in time be lost: therefore the importation of foreign goods must naturally increase, and more money go out to pay for them.

Nations that have no mines of gold and silver, have no means to get them but by foreign trade; and according to the quantity of these metals they possess, the price of their commodities, and therewith the value of their lands, rise and fall in proportion, which shall now be proved.

According to Dr. Davenant, the whole rental of England, in 1600, did not exceed six millions *per annum*, and the price of land was twelve years purchase; in 1688, the rental was fourteen millions, and the price of land was eighteen years purchase: so that, within this period, the landed interest rose from seventy-two to two hundred and fifty-two millions, and this advance was owing to an increase of trade.

The Britannia Linguens, page 12, says, if there were but five hundred pounds in England, an ox could hardly be worth a penny; therefore the rent must bear its proportion to the riches. This appears by Maitland's History of London; for he says that, in the year 661, land sold at one shilling *per acre*. The reason that land then bore so low a price, was the low price the produce sold at; for he says, that, in the year 1000, an ox sold for 2*s.* 6*d.*, a cow for 2*s.*, a sheep for 1*s.*, and a swine for 8*d.* In 1445, wheat was at 4*s.* 6*d.* *per quarter*; in 1447, at 8*s.*; in 1448, at 6*s.* 8*d.*; in 1449, at 5*s.* A bullock, in 1445, was 5*s.*; a sheep 2*s.* 5*d.*; a hog 1*s.* 11½*d.*; clothing for a year, at the same period, of a common servant of husbandry, 3*s.* 4*d.*; of a chief carter and shepherd, 4*s.*; of a bailiff of husbandry, 5*s.* In 1512, the mean price of wheat in Yorkshire was 6*s.* 2*d.*; the price of malt was 4*s.*, and of oats 2*s.*; so that the nominal price of grain at this time was about a seventh of its nominal price for the last twenty years; reckoning from the time when the author below cited wrote. The price of a fat ox, at the same time and in the same county, was 13*s.* 4*d.*; of a lean ox, 8*s.*; of a wether, 1*s.* 5*d.*; of a calf, 1*s.* 8*d.*; of a hog, 2*s.*; so that the nominal price of meat was no more than about a fifteenth of its present price, and bore the same proportion to the price of corn that it would now bear, were it at half its present price. In an act of parliament of the 25th of Henry VIII. beef, veal, pork, and mutton, are mentioned as the food of the poor, and their price limited to about a halfpenny a pound. Beef and pork in particular were sold in London at 2½ lb. and 3 lb. for a penny; at the same time that wheat was at 7*s.* and 8*s.* a quarter, and bore the same proportion to the price of flesh as it would bear now, were it about 4*s.* a quarter. In 1549, wheat was in London 12*s.* *per quarter*, malt 10*s.*, barley 9*s.*, rye 6*s.* 6*d.*, oats 4*s.*, a middling ox 1*s.* 18*s.*, a wether 3*s.*, butter ¾*d.* and a penny a pound, and cheese a halfpenny a pound. See the citations in the Supplement to Price's Obl. on Reversionary Payments, &c. p. 385, &c. This could be only owing to the little foreign trade the nation had

had at these respective periods, and consequently, to the little quantity of gold and silver which trade had then brought in.

But if it should be asked, What is the reason that, at present, all things are naturally so much advanced in price, to what they were in those days? the answer is, that the quantities of gold and silver brought to Europe since the progress made by the Spaniards and Portuguese in America, have made those metals more common, and of less value than formerly; so that *20s.* will hardly purchase what *1s.* would before the discovery of the West Indies. On this subject, see the article *INTEREST*. To which may be added, the great increase of our national debt and taxes, together with the circulation of the interest of the principal money of the public funds; and likewise that great circulation of paper credit in trade occasioned by notes and bills, which, by promoting an artificial circulation of property, raise the price of commodities, and give the appearance of wealth to the nation; though they are really the characteristics of a declining state. *Post. Dict. Com.*

The dearth of commodities and the cheapness of money are the same things.

**LANDEGODE**, in *Geography*, a small island in the North sea, near the coast of Norway. N. lat.  $67^{\circ} 25'$ .

**LANDEN**, JOHN, in *Biography*, a celebrated mathematician, was born at Peakirk, near Peterborough, in Northamptonshire, in January 1719. He became an early proficient in mathematical science, was a contributor to the *Ladies Diary* in the year 1744, and was one of the most ardent friends to that very useful publication. He contributed to this annual work till within a few years of his death. The life of Mr. Landen was far from an eventful one. He passed the earlier part of his life, as a farmer, at Walton, near Peterborough, at the same time he gave mathematical instructions to several young persons in the neighbourhood. From Walton, Mr. Landen, in 1762, removed to Milton, the seat of earl Fitzwilliam, to undertake the business of land steward to his lordship; and in this situation he remained till within a year or two of his death. To return to the mathematical labours of our author.—He published, in the *Philosophical Transactions* for the year 1754, “An Investigation of some Theorems, which suggest several very remarkable Properties of the Circle, &c.” and in the following year he published a volume, intitled “*Mathematical Lacubrations.*” This title was intended to inform his friends and the public, that the study of mathematics was at that time rather the pursuit of his leisure hours, than his principal employment. They contain a variety of tracts relating to the rectification of curve lines, the summation of series, the finding of fluents, and many other points in the higher parts of mathematics. From this time to the year 1766 he gave the world several valuable works; and on the 16th of January of this year, he was elected a fellow of the Royal Society: soon after which he inserted in the *Philosophical Transactions*, “A Specimen of a new Method of comparing curvilinear Areas;” by means of which, many areas are compared, that did not appear to admit of comparison by any other method; a circumstance of considerable importance in that part of natural philosophy which relates to the doctrine of motion. These are but a small part of the works which he produced, and which have given celebrity to his name. In the years 1781, 1782, 1783, he published three small tracts “On the Summation of converging Series,” in which he explained and shewed the extent of some theorems which had been given for that purpose by De Moivre, Sterling, and Thomas Simpson, in

answer to what he conceived to have been written in disparagement of those excellent mathematicians. Mr. Landen was author of a work published in two volumes, and at different times, intitled “*Memoirs.*” The second volume contains his last labours on the solution of the general problem concerning rotatory motion. It comprises also a resolution of the problem relating to the motion of a top; with an investigation of the motion of the equinoxes, in which Mr. Landen has, first of any one, pointed out the cause of sir Isaac Newton’s mistake in his solution of this celebrated problem. He lived to see the volume completed, and received a copy of it the day before his death, which happened January 15, 1799, at Milton, in the 71th year of his age. Mr. Landen was not only distinguished by his eminent talents as a mathematician, but by the excellence of his moral character. His temper, however, was not a good one; and he was too apt to look with contempt on those whom he deemed his inferiors. His MSS. were sold for waste paper; a circumstance that did not reflect much credit on those persons who came in possession of them.

**LANDEN**, in *Geography*, a town of France, in the department of the Ourte, and chief place of a canton, in the district of Huy, seated on the river Becke; 17 miles W.S.W. of Liege. The place contains 642, and the canton 9265 inhabitants, on a territory of  $82\frac{1}{2}$  kilometres, in 25 communes.

**LANDERNEAU**, a town of France, in the department of Finistere, and chief place of a canton, in the district of Brest. The place contains 3577, and the canton 13,804 inhabitants, on a territory of 180 kilometres, in 9 communes. N. lat.  $48^{\circ} 27'$ . W. long.  $4^{\circ} 10'$ .

**LANDERON**, a town of Switzerland, in the principality of Neuchatel, situated at the S.W. extremity of the lake of Bienne, and inhabited by Roman Catholics; 7 miles N.E. of Neuchatel.

**LANDES**, LES, a department of the S.W. region of France, formed of Landes and Chalosse, districts of Gascony, in N. lat.  $44^{\circ}$ , a maritime territory between Lower Pyrenées and Gironde; bounded on the N. by the department of the Gironde, on the E. by that of Lot and Garonne, and Gers, on the S. by the Lower Pyrenées, and on the W. by the sea, containing 468 square leagues, and 228,899 inhabitants, and divided into three circles or districts, *viz.* Mont-de-Marian, which has 72,968 inhabitants, St. Sever, including 78,125, and Dax, with 77,796 inhabitants, 28 cantons, and 368 communes. Its contributions amount to 145,376 fr. and its expenses charged on the departments are 203,769 fr. 02 cents. The soil of this department is for the most part sandy and unfruitful, the N. and W. parts consisting of heath and marshes, and poorly cultivated. Some parts, however, towards the S.E. are more fertile; and this department yields some grain, fruits, and excellent pastures. It has also forests of pines, quarries, and mineral springs. Its chief town is Mont-de-Marian.

**LANDESHUT**, a town of Silesia, in the principality of Schweidnitz, on the Bober. The town was founded in 1292, and it has a Latin school, a Roman Catholic church, and by permission and purchase a Lutheran church. Its linen trade is flourishing; 18 miles W.S.W. of Schweidnitz. N. lat.  $50^{\circ} 30'$ . E. long.  $15^{\circ} 55'$ .

**LAND-FALL**, is a sea-term, signifying to fall in with the land, or the first land discovered after a sea-voyage.

**LAND-FALL**, *Good*, is when a ship makes or sees the land, as she expected, according to her reckoning. The contrary is called a *bad land-fall*.

**LAND-GABLE**, an ancient term for a tax or rent, issuing

iffuing out of land; answering to what we now call *ground-rent*.

**LANDGRAVE**, formed of the German *land, earth, and grass, or grave, judge, or count*, a name formerly given to those who executed justice on behalf of the emperors, with regard to the internal policy of the country. The title does not seem to have been used before the eleventh century. These judges were first appointed within a certain district of Germany; a process of time the title became hereditary, and these judges assumed the sovereignty of the several districts or countries over which they presided. Landgrave is now applied, by way of eminence, to those sovereign princes of the empire who possess by inheritance certain estates, called *landgraviates*; and of which they receive the investiture of the emperor. There are four princes who have this title, *viz.* those of Thuringia, Hesse, Alsace, and Leuchtenberg. There are also other landgraves who are not princes, but counts of the empire. See **COUNT**.

**LANDGUARD FORT**, in *Geography*, an English fort, situated on a point of land at the S.E. extremity of the county of Suffolk, at the mouth of the rivers Orwell and Stour, opposite to Harwich; furnished with a garrison, under the command of a governor, and a platform of guns to defend the coast.

**LANDGUARD**, a point on lake Erie, in Upper Canada; formerly called *Point aux Pins*, situated in N. lat.  $42^{\circ} 7' 15''$ . To this place there is a great resort of Indians in the spring, on account of the abundance of fish and fowl, which may be then taken. This point is about twenty miles E. of the South Foreland, and bears the only pine-timber on this coast.

**LANDI, ORTENSIO**, in *Biography*, was born at Milan about the middle of the sixteenth century: he was educated at his native place, and at Bologna. Being in necessitous circumstances, he attempted to gain a maintenance by the practice of physic, which he exchanged, in a very short time, for theology, and entered into the order of St. Augustine. It has been said by some writers that he apostatized from the church, but others say that in this particular he has been mistaken for a different person. While at Milan, he published two dialogues, entitled "Cicero relegatus," and "Cicero revocatus," which he feigns to have been held by a company of learned men in 1533. His next work was entitled "Forcianæ Quaestiones," in which, under the feigned name of Philalethes, he treats, in an entertaining manner, on the customs, dress, diversions, and inhabitants of the different cities of Italy. It was published at Naples in 1536. He now travelled into France, and contracted a close friendship with Stephen Dolet, who was afterwards burnt as an atheist. Upon his return to Italy, he entered successively into the service of the bishops of Trent and Catauia. In 1540, he published a dialogue against Erasmus, who had been dead four years, and on account of which he was severely handled by an able antagonist. While he was at the court of Francis I. in 1543, he published his two books of "Paradoxes;" these he soon found had been written with too great freedom, and as they began to excite considerable attention, he thought proper to answer them himself anonymously, and in his reply he is said to have treated himself with as little ceremony as any real opponent would have done. In 1544, he travelled through Germany, and afterwards through the different provinces of Italy, which he described in a work entitled "Commentario delli più notabili et mostuose cose d'Italia et altri luoghi." He is supposed to have died soon after the year 1560, leaving behind him many other works besides those which have been enumerated. He lived in friendship with several of the learned

men of that age, by whom he has been much praised. Gen. Biog.

**LANDINGS**, in *Architecture*, the first part of the floor at the head of a pair of stairs.

**LANDINO, CHRISTOPHER**, in *Biography*, an Italian scholar, was born at Florence in 1434. He studied first at Volterra, under Angiola da Todi, by whom he was so much beloved, that he not only maintained him a long time at his own expence, but at his death bound his heirs to support him three years longer. He was intended by his father for the law, and was by him obliged to pursue it till he obtained the liberal patronage of Cosimo and Peter de Medici, by which he was enabled to return to his favourite pursuits, and indulge himself in the study of the Platonic philosophy. He became one of the chief ornaments of the Platonic academy at Florence, and lived in strict friendship with Poliziano, Ficino, and others of its members. In 1457, he gave public lectures in polite literature at Florence, which contributed to the progress of learning in that period. At an advanced age he obtained an office in the state, and was presented with a palace for his residence. He died in 1504, at Prato Vecchio. His "Latin Poems" will bear a comparison with the most able compositions of that age. He wrote commentaries on Virgil and Horace, and Dante, which went through several editions. He translated Pliny's "Natural History" into Italian, and was author of "Dialogues on the Nobility of the Mind," and other pieces connected with moral philosophy. He composed some Latin and Italian orations, which were printed.

**LANDIVISIAN**, in *Geography*, a town of France, in the department of Finisterre, and chief place of a canton, in the district of Morlaix; 10 miles W.S.W. of Morlaix. The place contains 2124, and the canton 11,460, on a territory of 150 kilometres, in 7 communes.

**LANDIVY**, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne; 18 miles N.W. of Mayenne. The place contains 1872, and the canton 11,223 inhabitants, on a territory of 187½ kilometres, in 8 communes.

**LAND-LOCKED**: a ship is said to ride *land-locked*, when she is surrounded with land, that is, is at anchor in a place where there is no point open to the sea, so that she is safe from the violence of winds and tides.

**LANDO**, pope, in *Biography, a Sabine by birth, succeeded to the pontifical throne on the death of Anastasius III. in the year 913. He was indebted for his elevation to Theodora, and her daughters Marozia and Theodora, all of them no less famous for their beauty, their wit, and address, than infamous for the scandalous lives which they led. Lando died within about six months of the time that he was elevated to the papal see, and during that short reign he did nothing worthy of note, or that need be recorded in this work. Moreri. Bower.*

**LANDRECIES**, in *Geography, a town of France, in the department of the North, and chief place of a canton, in the district of Avesnes, seated on the Sambre. It was taken from the Spaniards by the French in 1655, and continued in their possession by the peace of the Pyrenees, when they enlarged its fortifications, and made it one of the strongest places in the country. It has only two gates, one towards the east, called the "Gate of France," and the other towards the west, called the "Gate of Quefnay." It suffered severely by the siege of 1794, and surrendered to the allies; but in the same year the garrison, consisting of 20,000 men, surrendered to the French. The place contains 2867, and the canton 8865 inhabitants, on a territory of 90 kilometres, in 9 communes. N. lat.  $50^{\circ} 7'$ . E. long.  $3^{\circ} 45'$ .*

LANDRIANO, a town of Italy; 11 miles S.S.E. of Milan.

LANDROAL, a town of Portugal, in Alentejo; 13 miles N. of Mourao. N. lat.  $38^{\circ} 35'$ . E. long.  $7^{\circ} 12'$ .

LANDSBERG, a town of Prussia, in the province of Natangen; 26 miles S. of Königsberg. N. lat.  $54^{\circ} 14'$ . E. long.  $20^{\circ} 30'$ .—Alfo, a town of the duchy of Stiria; 24 miles S.W. of Gratz.—Alfo, a town of Germany, in the county of Hoya, on the Wefer; 6 miles S.S.W. of Nieuburg.—Alfo, a town of Silefia, otherwise called *Gorzovo*, in the circle of Oppeln, on the borders of Poland; 30 miles N.E. of Oppeln. N. lat.  $51^{\circ} 3'$ . E. long.  $18^{\circ} 20'$ .—Alfo, a town of Bavaria, on the Lech; 18 miles S. of Augsburg. N. lat.  $48^{\circ}$ . E. long.  $10^{\circ} 51'$ .—Alfo, a town of Saxony, in the circle of Leipzig; 14 miles N.W. of Leipzig. N. lat.  $51^{\circ} 34'$ . E. long.  $12^{\circ} 11'$ .—Alfo, a town of Brandenburg, in the New Mark, on the Warta; containing three churches, a royal magazine, and feveral manufactures of fluff and cloth, with a confiderable trade in wool; 20 miles E.N.E. of Cuftrin. LANDSCAPE, or LANDSHIP, the view or profpect of a country, extended as far as the eye will reach.

LANDSCAPE *Painting*, is that peculiar application of the art of painting, which represents extended views of whatever is attached to the furface of the earth; as mountains, rocks, woods, buildings, &c. It is even applied to views of the fea, particularly when any portion of the land is feen; and, in the general divifion of the practice of the art into four principal branches, landscape-painting includes all representations of the fea alone; although, in common difcourfe, they are generally termed according to their character: as a calm at fea, a ftorm, a fea-light, &c. &c.

The great points which the artift ought to aim at, who practices landscape-painting, are, to mark juft proportion and true perspective; to obtain a free and varying touch, which may fully characterize the various objects he muft of neceffity be called upon to imitate; and to produce the effect of fpace, or what is technically termed diftance.

There are two kinds of proportion which require attention in order to produce a pleafing landscape. One is, between the quantum of the furface of the picture appropriated to the fky, and that allotted to the earth or the figures intended to be introduced, be they mountains, houfes, rocks, or trees: and the other is that of the various parts of the picture, reciprocally, according to their various diftances in the fcene. Of the latter, after the fize of the objects on the fore-ground is determined, perspective is the fole regulator: therefore a knowledge of the principal rules of that fcience is here abfolutely requifite.

With regard to the former of thefe proportions, the fubject of the picture will undoubtedly furnifh the beft means of deciding juftly. If the fcene be mountainous, viewed from below, and at a fhort diftance, the fpace allotted to the fky muft be fmall and near the top of the picture. If, on the contrary, the view be of an open champaign country, the reverse will be the juft characteristic of the picture; and the fky will occupy by far the larger part. It is by no means afferted that this will always be the cafe, as for inftance, if the view of a plain be taken from a great height, then of courfe the horizon will rife very high; but this would have more the character of a plan, than a picturefque or natural view. Common fenfe points out the rule in the two fupposed cafes; but it is not eafy to regulate this matter in ordinary compositions, whereas, to make the work captivating, it is of much more importance than is generally imagined,

and a large demand is made upon tafte to regulate it. In general, much more grandeur is acquired by a low horizon, and an ample fpace of fky, than by any other proportion; and next in effect to that, is the direct reverse. In both, it is the quantity doublets that produces the impreffion; and this principle holds good, not only in landscape, but in all other fubjects on which the art is employed. In fact, the general principles of the art of painting are alike applicable in all its different branches. The fame felection in ftyle of defign, or rather choice of nature; the fame aims in compofition; the fame contrals in arrangements of colour, except that they can never, or very rarely, be fo powerful in landscape, as where the picture represents animated or artificial objects. In landscape not only are the objects fit to be introduced, of a clafs which are not fraught with ftrong colours, particularly of red or blue, but being furrounded by open air, and receiving reflections of light and colour in every direction, their natural vividnefs is diminiſhed; and as they recede from the eye, the density of the atmosphere intervening between them and the fpectator, envelopes them in a mift, and renders them indiftinct in various degrees; till in the extreme diftance it reduces all colours to one hue of a light greyifh blue, almoft intermingling them with the fky.

It is by the intervention of this grey hue in the atmosphere, which arifes from reflections of light thrown off by particles floating in the vapours which hover upon the furface of the earth, (aided by diminution of form,) that the effect of diftance is produced; and to imitate this with truth, and in a tone correfpondent to the kind of day or feafon which is felected for representation, is one of the principal difficulties of landscape painting.

It is vain to attempt to give rules for overcoming this difficulty. Different matters have proceeded by different ways to gain poffeffion of this desideratum. Claude in one ftyle, and Wilfon in another, have both admirably effected it. One by feumbling a grey, or air-tint, over the diftant parts; the other by working the tint in the body of colours. Obfervation of their pictures, with tafte cultivated by a long continued obfervance of nature, is the only means of acquiring a juft feeling of the fimplicity and purity exhibited in her works, and the confequent power of representing them in all the varied effects the exhibits; either in her more gay, or fombrous moments; when the face of the earth is illumined with funfhine, and fparkling with luftre; or when clouds bedim and envelope its beauties in fhade, and the forms of diftant objects are loft in the whirlwind and the ftorm.

Though landscape-painting has not the fame powerful means to work with as hiftoric painting, which enjoys the great advantage of animation and expreffion in its fubjects, and likewise presents the greateft difficulty to overcome; yet no true and enthuſiaſtic lover and obferver of nature, can avoid acknowledging, that it poffeffes the power of exciting great intereft in the mind. A ftorm represented by the pencil of Gaspar Pouſſin, or a calm by that of Claude, will not fail to impreſs the obferver with ideas of terror, or gentleneſs. The one, who skillfully traced the paths of the wind in its ravages, and the deformity produced by the falling ſhower; and the other, who loved to dwell upon the beauties of the earth, in moments of undifturbed tranquillity, equally intereft our feelings, and excite thoſe emotions which fuch varied circumſtances in nature are calculated to infpire. Compared with fuch views of the higher objects and airs of art, the practitioner in landscape-portrait painting, or one who paints views of particular ſpots, ſinks into about the fame ratio, as the portrait painter of mankind holds to him who engages his talents in the representations of hiftory. Yet ſtill his talk is not devoid either of pleaſure or intereft.

The same principles are required for practice, but they are unfortunately often obliged to yield to peculiarities which destroy their simplicity and prevent their effect; unless the artist has obtained that extraordinary talent of introducing casual circumstances, such as ideal shadows, accidental reflections, and agreeable figures, in such a manner as to unite or improve imperfect forms, and guide or attract the eye from disagreeable parts. As is the aim of the improver of grounds, or, as he is now termed, the landscape gardener, such ought to be that of the landscape painter. Whenever blemishes in form occur, they should be hidden, and where natural beauties are bestowed, they should be exhibited to view; and adorned with proper adjuncts of trees, water, clouds, or figures. A person not conversant with the powers of combination and contrast in design, can have no conception of their extraordinary power to heighten the effect of the dulcist scenes, and the meanest objects. It should therefore be the principal task of the artist to observe those which are constantly occurring among natural objects, their effects, and the different sentiments they excite; so that he may possess a store to recur to, in time of need.

The beauty of landscape-painting depends very much upon simplicity of selection, and clearness and freshness of colour. The former should not only govern the choice of objects or scenery, but also the manner of representing them, *i. e.* the artist must not attempt to delineate all the forms he sees in a tree or a rock; that would not only be an almost endless labour, but an imperfect one, even when the greatest skill was exhibited; his duty is rather to select those forms which more immediately characterize the object, and mark them only; taking care to avoid heaviness.

Of this kind was the practice of Titian, Claude, Domenichino, Poussin, Mola, and all the best landscape-painters of the Italian school, and Rubens and Rembrandt adopted it; whilst Hobbema, Ruysdael, Both, Wynants, and almost all the Flemish school, by attempting too minute an imitation in smaller matters, lost dignity and even interest.

Among those who have profited with success this delightful branch of the art of painting, the name of Claude Gellee, usually known by that of Claude de Lorraine, deservedly stands pre-eminent. He may have been surpassed by Titian in wild and romantic scenery, and grandeur of style in design, but neither he nor any other has ever equalled Claude's truth and purity of colour and effect. Hitherto the perfection with which he has represented the effect of the atmosphere is unrivalled. Even Cuypp and our own Wilson, who have arrived the nearest to him, still lack his completion of effect. Their art is more apparent than his in his best works; and great chastity and sweetness of taste appear generally to have governed his choice of scene and of parts. Nicolo Poussin has left a great number of highly interesting landscapes, in a style peculiarly his own. He appears to have delighted in the hues of the earth and trees after wet, and without sun; and in the tones of twilight; which admirably coincides with his choice of scenery and the classic objects he introduced into it. His nephew Gaspar proceeded in another track, and made pictures from the scenes which the Apennine mountains afforded him; which, while they are wrought with great freedom, still bear too much the air of portraiture, and too often lack atmosphere. The same may be said in a greater degree of the works of Salvator Rosa, who delighted to represent the most wild and desert scenes of nature; which he executed with a touch in perfect consonance with their character. It was with Wilson, as we have above mentioned, that the taste and talent of Claude for producing the air-tint, (as that which produces the effect of

the atmosphere is technically termed,) was most powerfully revived: and of him it may truly be said, that had his patience in completing his pictures been equal to his taste in colour, composition, and effect, the ancient master might have fallen under the modern one; and we should have had to boast, that the greatest painter of landscapes the world ever produced, was an Englishman.

**LANDSCRON**, a town of Bohemia, in the circle of Chrudim; 27 miles E. of Chrudim. N. lat. 49° 50'. E. long. 16° 23'.

**LANDSCRON**, a town of Prussia, in Natangen; 18 miles N.E. of Heilperg.

**LANDSCRONA**, a fortified sea-port town of Sweden, on the W. coast of the province of Skoue, on an island near the Sound: a staple town, with a good harbour. The harbour lies between the continent and a small island, and is 20 feet deep; 12 miles S. of Helsingborg. N. lat. 55° 52'. E. long. 12° 36'.

**LANDSELE**, a small island in the East Indian sea, near the N. coast of the great Andaman. N. lat. 13° 38'. E. long. 93° 7'.

**LAND'S-END**. See **CORNWALL**.

**LAND'S-END**, a cape on the N. coast of the island of Sheppey; 4 miles N. of Sheerness.

**LANDSER**, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Altkirch. The place contains 651, and the canton 106,629 inhabitants, on a territory of 150 kilometres, in 22 communes.

**LANDSHAAG**, a town of Austria, on the Danube; 19 miles S.W. of Freustadt.

**LAND'S-HEIGHT**, or the high ground, in North America, that which lies on the chain of lakes between lake La Pluie and lake Superior, where is a portage of 7 miles; 80 miles E. of the great portage from the W. end of lake Superior.

**LANDSHUT**, or **LANDSUT**, a town of Moravia, in the circle of Brunn; 16 miles S.E. of Aufpitz.

**LANDSUT**, a town of Bavaria, on the river Isar; an open well-built town, and the capital of a government; containing two palaces and a college with a church in it, the steeple of which is reckoned the highest in Germany; 52 miles N.E. of Munich. N. lat. 48° 29'. E. long. 12° 51'. Also, a town of Austrian Poland, in Galicia; 72 miles W. of Lemberg.

**LANDSKIP**. See **LANDSCAPE**.

**LANDSORT**, in *Geography*, a small island in the Baltic, near the coast of Sweden. N. lat. 58° 52'. E. long. 17° 10'.

**LANDSTHUL**, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the district of Deux Ponts. The place contains 705, and the canton 7910 inhabitants, in 32 communes.

**LANDSTRASS**, or **LANDTREST**, a town of Carniola, situated on an island in the river Gurek, with a cathedral; 18 miles S. of Celley.

**LAND-TAX**, is one of the usual annual taxes, which has superseded all the former methods of rating either property, or persons in respect of their property, whether by tenths, fifteenths, subsidies on land, hidage or hidage, scutage or escuage, or talliage. Tenths and fifteenths were temporary aids issuing out of personal property, and granted to the king by parliament, being the real tenth or fifteenth part of all the moveables belonging to the subject. We meet with the payment of fifteenths as far back as the statute of Magna Charta; in the conclusion of which, the parliament grants to the king, for the concessions made by him, a fifth part

of all their moveable goods. This taxation was originally charged upon the several individuals, but in the eighth year of Edward III. a certain sum was rated in every town, &c. In process of time this fifteenth being insufficient for the public exigence, the number of fifteenths was augmented to two or three fifteenths. Whenever, in later years, the commons granted the king a fifteenth, every parish in England knew their proportion of it; *i. e.* the same identical sum that was assessed by the same aid in the eighth of Edward III. and then raised it by a rate among themselves, and returned it to the royal exchequer. (See FIFTEENTH. See also TENTH.) The other ancient levies were in the nature of a modern land-tax; for we may trace the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for forty days in every year. In lieu of this personal attendance, a pecuniary satisfaction came to be levied by assessments, at so much for every knight's fee, under the name of feutages. (See ESCutage.) Of the same nature with these were the assessments of hydage or hidage upon all other lands, and of tallage upon cities and boroughs. But they all gradually fell into disuse, upon the introduction of subsidies, about the time of king Richard II. and king Henry IV. (See SUBSIDY.) In lieu of subsidies, which were usually raised by commissioners appointed by the crown, or the great officers of state, the parliament, in the beginning of the civil wars, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom, to be levied by a pound rate on lands and personal estates; which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000*l.* a month, sometimes at inferior rates. After the restoration the ancient method of granting subsidies, instead of these monthly assessments, was twice, and twice only renewed, *viz.* in 1663, when four subsidies were granted by the laity and four by the clergy; and in 1670, when 800,000*l.* was raised by way of subsidy, which was the last time of raising supplies in this manner. The monthly assessments being established by custom, raised by commissioners named by parliament, and producing a more certain revenue, subsidies were discontinued, and occasional assessments granted as emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient feutage, hydage, and tallage, says judge Blackstone, were to all intents and purposes a land-tax; and the assessments were sometimes expressly called so. However, in the year 1692, a new assessment or valuation of estates was made throughout the kingdom, which, though by no means a perfect one, had this effect, that a supply of 500,000*l.* was equal to 1*s.* in the pound of the value of the estates given in. And, according to this enhanced valuation, from the year 1693 to the present, the land-tax has continued an annual charge upon the subject; above half the time at 4*s.* in the pound, sometimes at 3*s.*, sometimes at 2*s.*, twice, *viz.* in 1732 and 1733, at 1*s.* but without any total intermission. The medium has been 3*s.* 3*d.* in the pound, being equivalent to twenty-three ancient subsidies, and amounting annually to more than a million and a half of money. The method of raising it is by charging a particular sum upon each county, according to the valuation of 1692; and this sum is assessed and raised upon the personal as well as the real estates of individuals by commissioners appointed in the act, being the principal landholders of the county, and their officers.

It is observed by Dr. Smith, in his "Nature and Causes of the Wealth of Nations," (vol. iii.) that a land-tax, like that of Great Britain, assessed upon each district according

to a certain invariable canon, though it should be equal a its first establishment, necessarily becomes unequal in process of time, according to the unequal degrees of improvement, or neglect in the cultivation of the different parts of the country. In England, the valuation according to which the different counties and parishes were assessed to the land-tax by the 4th of William and Mary, was very unequal even at first establishment. This tax, therefore, offends against the first of those four maxims which this ingenious writer proposes, with regard to taxes in general. (See Tax.) This maxim is, that the subjects of every state ought to contribute towards the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. However, it is perfectly agreeable to the other three. It is perfectly certain, and not arbitrary. The time of payment for the tax, being the same as that for the rent, is as convenient as it can be to the contributor. Although the landlord is in all cases the real contributor, the tax is commonly advanced by the tenant, to whom the landlord is obliged to allow it in the payment of the rent. Moreover, this tax is levied by a much smaller number of officers than any other which affords nearly the same revenue. As the tax upon each district does not rise with the rise of the rent, the sovereign does not share in the profits of the landlord's improvements. It does not therefore obstruct the industry of the people; nor subject the landlord to any other inconvenience besides the unavoidable one of paying the tax. The advantage, however, which the landlord has derived from the invariable constancy of the valuation by which all the lands of Great Britain are rated to the land-tax, has been principally owing to some circumstances altogether extraneous to the nature of the tax. It has been owing in part to the great prosperity of almost every part of the country: the rents of almost all the estates of Great Britain, having, since the time when this valuation was first established, been continually rising, and scarcely any of them having fallen. The landlords, therefore, have almost all gained the difference between the tax which they would have paid, according to the present rent of their estates, and that which they actually pay according to the ancient valuation. But if the state of the country had been different, and rents had been gradually falling in consequence of the declension of cultivation, the landlords would almost all have lost this difference. As the tax is made payable in money, so the valuation of land is expressed in money. Since the establishment of this valuation, the value of silver has been pretty uniform, and there has been no alteration in the standard of the coin, either as to weight or fineness. But if silver had risen considerably in its value, the constancy of the valuation might have proved very oppressive to the landlord. In circumstances, somewhat different from those which have actually taken place, this constancy of valuation might have been a great inconvenience, either to the contributors, or to the commonwealth. A tax upon the rent of land which varies with every variation of the rent, or which rises and falls according to the improvement or neglect of cultivation, has been recommended by those philosophers called economists in France, as the most equitable of all taxes. In the Venetian territory, all the arable lands leased to farmers are taxed at a tenth of the rent. The leases are recorded in a public register, kept by the officers of the revenue in each province or district. A proprietor cultivating his own lands is allowed a deduction of one-fifth of the tax, and pays only 8 instead of 10 *per cent.* of the supposed rent. A land-tax of this kind, says Dr. Smith, is certainly more equal than

than the land-tax of England, but it might not, perhaps, be altogether so certain, and the assentment of the tax might frequently occasion more trouble to the landlord, and the levying of it might be more expensive. In the ancient dominions of the king of Prussia, the land-tax is assessed according to an actual survey and valuation, which is reviewed and altered from time to time. According to that valuation, the lay proprietors pay from 20 to 25 per cent. of their revenue. Ecclesiastics from 40 to 45 per cent. In some other countries the same method is pursued. A land-tax assessed according to a general survey and valuation, how equal soever it may be at first, must, in the course of a very moderate period of time, become unequal; and to prevent its becoming so would require the continual and painful attention of government to all the variations in the state and produce of every different farm in the country.

The sum fixed by 38 Geo. III. c. 5. f. 1. to be paid for the land-tax in Great Britain is 2,937,627*l.* 9*s.* 4*d.*, which is now made perpetual. To this time the land-tax acts had been annual; but by 38 Geo. III. c. 60. after reciting, that it may materially conduce to strengthen public credit, that the duty now payable for one year on land should be made perpetual, subject to redemption by purchase on conditions herein set forth; it was enacted, that the several sums charged by virtue of an act (38 Geo. III. c. 5.) granting an aid for the service of the year 1798; on the respective counties, &c. in respect of the manors, messuages, &c. to be raised and paid within one year, from the 25th of March, 1798, shall, after the expiration of the said term (allowing for certain specified exceptions) continue, and be raised and paid after the 25th of March in every year for ever. And all powers and provisions contained in the said act shall be in full force, and be duly executed; subject to the regulations and conditions of redemption or purchase mentioned in it. Provided always, that none of the provisions herein contained shall extend to any sums charged by the said act upon personal estates and perquisites of office; which sums shall, after the 25th of March, 1799, be ascertained, raised, collected, and paid, according to the directions of an act to be passed for that purpose. (39 Geo. III. c. 3.) It is also enacted, that the land-tax not purchased by proprietors shall be sold to other persons, subject to redemption by the person in possession, or having any beneficial or future interest in the lands: provided that in such cases, all such lands whereon the land-tax so purchased shall be charged, shall, until such redemption take place, be subject to a new assessment of the said land-tax from year to year, by an equal rate, according to the value thereof, in common with each other, without any power in such purchaser to exonerate the same from such land-tax, or to fix the rate of land-tax to be charged thereon. Also, where the whole tax in any place shall not be sold, such lands as are not exonerated by this act from such land-tax, shall continue subject to a new assessment yearly, and from year to year, by an equal rate, according to the value thereof, not exceeding in any year 4*s.* in the pound on such annual value. It is also enacted, that in case persons entering into any contract for the redemption or purchase of any land-tax, shall neglect to complete their contract, such contract shall be void, and the tax be revived, and again assessed and collected; and the persons thus making default shall forfeit not exceeding one-fifteenth part of the consideration. Where land-tax, remaining unsold, shall exceed 4*s.* in the pound on the annual value, the same shall be subject to an abatement in the manner directed by the said act. (38 Geo. III. c. 60. f. 103. 42 Geo. III. c. 116. f. 181.) By this last act, the provisions of the several acts for the

redemption of the land-tax are repealed from the 24th of June, 1802, from which date all contracts are to be entered into and made according to that act, and the 43 Geo. III. c. 51. to render the same more effectual. As the land-tax not purchased will remain to be collected as before, it may not be improper or unuseful to detail the following particulars relating to it. By 38 Geo. III. c. 5. the general qualification of commissioners in counties, with some few exceptions, is 100*l.* a-year of landed property: these commissioners, before they can act, are required to take the oaths of allegiance, supremacy, and abjuration, under a penalty of 200*l.* to the king: and by 28 Geo. III. c. 2. f. 40. an oath, if required, specifying in writing the parish, situation, quantity of land, whether freehold or copyhold, of the premises which entitle them to act as commissioners. When they first meet, they direct the return and appointment of proper assessors: and by 20 Geo. III. c. 17. they shall cause to be delivered to each assessor a printed form of assessment, according to which they shall make their assessments. At their second meeting they direct the assessors how to proceed in settling the several rates and charges. By 39 Geo. III. c. 3. the several sums charged upon estates in ready money, debts, goods, wares, merchandizes, chattels, or other personal estate, by the act of 38 Geo. III. c. 5. and which were not authorized to be sold by the said act of 38 Geo. III. c. 60; and also the several sums hereby charged in respect of any public office or employment, or any annuity, pension, stipend, or other annual payment, shall be assessed and paid in the following manner. That is to say, the several sums charged by virtue of the said act on personal estates as aforesaid, shall be, and are hereby set and imposed on the respective parishes, constablewicks, divisions, allotments, and places, wherein the same have been, or shall be so charged by virtue of the said act, and towards raising the several sums hereby charged on the same respectively, all persons, bodies politic and corporate, guilds and fraternities within such places respectively, having any estate in ready money, or in debts owing to them, or having any estate in goods, wares, merchandize, chattels, or other personal estate belonging to, or in trust for them, (except such sums as they may *bona fide* owe, and such debts owing to them as shall be by the commissioners adjudged desperate, and also except stock upon lands, and such goods as are used for household stuff; and also except such loans and debts as are owing from his majesty,) shall be charged with as much equality and indifferance as is possible by a pound rate, *viz.* for every 100*l.* of such ready money and debts, and for every 100*l.* worth of such goods, wares, and merchandize, or other personal estate, and so in proportion for more or less, towards the said respective sums by this act imposed upon every such parish or place charged therewith as aforesaid, so that by the said rates so to be assessed as aforesaid, upon such personal estates as aforesaid, the full sum hereby set upon the same, shall be completely assessed, collected, and paid. f. 2.

And towards raising the sums charged on persons in respect of public offices, or employments of profit, all persons, having, using, or exercising the same, which are assessed by virtue of the said act of 38 Geo. III. c. 5; and all clerks, agents, secondaries, substitutes, and other inferior ministers whatsoever, (such military officers as are mustered by the muster-master general of the army, or in pay of the army or navy in respect of such offices, only excepted,) shall pay any sum not exceeding what such office or employment shall be assessed in the year commencing 25th March, 1798, by virtue of the said act of 38 Geo. III. c. 5. And all persons, guilds, fraternities, bodies politic and corporate, having any annuity,

ansuity, pension, or other yearly payment, either out of the exchequer, or any branch of the revenue, or payable, or secured to be paid by any person whatsoever, (not issuing out of any lands, tenements, or hereditaments, or charged upon the same, nor included in any assessment made thereon by the said act of 38 Geo. III. c. 5. and not being annuities or yearly payments which by any act of parliament shall be exempted from the payment of taxes,) shall pay 4s. for every 20s. by the year for the same, to be levied and collected in like manner, and by the same persons as the land-tax. s. 3, 4.

It is provided that nothing in this act shall extend to the queen or royal family; nor to charge the pensions of superannuated sea-officers or their widows, poor knights of Windsor, or poor clergy of the Isle of Man, or tolls on turnpike roads. By 38 Geo. III. c. 5. the charge upon real estates shall be as follows: That the entire sum may be raised, all manors, messuages, lands, and tenements; all quarries, mines of coal, tin and lead, copper, mundick, iron, and other mines, iron-mills, furnaces, and other iron-works; salt-springs, and salt-works; all alum mines and works; all parks, chafes, warrens, woods, underwoods, coppices; all fishings, tithes, tolls, annuities, and all other yearly profits; and all hereditaments whatsoever—shall be charged with as much equality and indifferance as possible, by a *pound rate*, to make up the several sums charged by the act on each county or place.

A parson who lets to each parishioner his own *tithes* is properly the occupier, and ought to be rated. 16 Viner, 427.

But if a parson makes a lease of his tithes to one person, and that person afterwards lets to each parishioner his own tithes, in that case the lessee is the occupier, and ought to be rated. 8 Mod. 61.

Colleges and hospitals are exempted, together with the buildings that are within the walls or limits of the same. The act 38 Geo. III. c. 5. s. 25. also exempts any master, fellow, or scholar, or exhibitioner of any such college, or hall, or any reader, officer, or master of the said universities, colleges, or halls, or any masters or ushers of any schools; or for in respect of any stipends, wages, rents, profits, or exhibitions whatsoever, arising, or growing due to them in respect to the said several places or employments; or any of the lands which before March 25, 1693, did belong to the feices of any college or hall, or to Christ's hospital, St. Bartholomew, Bridewell, St. Thomas and Bethlehem hospitals in London and Southwark; or any other hospitals or alms-houses, in respect of any rents, or revenues, which, before March 25th, 1693, were payable to them, being to be received and disbursed for the immediate use and relief of the poor of the said hospitals and alms-houses only. Id. s. 25.

But this shall not discharge any tenants of any houses or lands belonging to the said colleges, halls or hospitals, alms-houses, or schools, who, by their leases, or other contracts, are obliged to pay and discharge all rates, taxes, and impositions. Id. s. 26.

All such lands, revenues, or rents belonging to any hospital or alms-house, or settled to any charitable or pious use as were assessed in 4 W. & M. shall be liable; and no other lands, revenues, or rents, then belonging to any hospital, or alms-house, or settled to any charitable or pious use, shall be charged or assessed: but lands given to charities since the 4 W. & M. shall not be exempted. No poor person shall be charged, whose lands, &c. are not of the full yearly value of 20s. in the whole. The assessors themselves are assessed by the commissioners. The land-tax shall be paid by the tenant, who shall deduct it out of his rent. Papiists

and reputed papists, being 18 years of age, who shall not have taken the oaths of allegiance and supremacy, shall pay double land-tax. By 10 Geo. III. c. 6. s. 113. estates doubly taxed, coming to Protestants, are to be discharged. At the third meeting of the commissioners, the assessors shall deliver duplicates of the assessment in writing, signed by them, to the commissioners, with the names of proper collectors, for whom the parish or place shall be answerable. One of the duplicates, signed by three or more commissioners, shall be delivered to the collectors, with warrant for collecting; and the time and place of appeals shall then be appointed. The fourth meeting is that of appeal, notice of which shall be given in the church; and every person intending to appeal shall give a written notice to one or more assessors, that they may attend to justify the assessment. The commissioners are empowered to give relief in case of overcharge, and cause the sum abated to be re-assessed: and when the appeal is determined, it is absolutely final. If any person refuse or neglect to pay to the collector on demand, he may levy the sum assessed by distress and sale of the goods of the person neglecting or refusing to pay; and for want of distress he may be committed by warrant of two commissioners to the common gaol, until payment of the money assessed and of the charges. The collector is required to pay the money received to the receiver-general, or his deputy, quarterly, on or before June 24th, Sept. 29th, Dec. 25th, and March 25th; who shall give a receipt gratis: the collectors are allowed 3d. in the pound, which they may detain out of the last payment; but if any collector detains the money longer than the time appointed, or pays it otherwise than directed, he shall forfeit not exceeding 40s. nor less than 5s. to be levied by distress; and if he refuse to pay it, two commissioners may imprison him, seize his estates real and personal, and sell them for payment. The receiver-general is appointed by the king, or in pursuance of his directions, and has a salary allowed him by the lords of the treasury, not exceeding 2d. a pound: notice of his appointment is to be given to the commissioners, before the time of the first quarterly payment. The receiver, within twenty days after the receipt, shall pay the money into the exchequer, or forfeit 500l. to him who shall sue. The clerks of the commissioners are allowed 1½d. in the pound for writing the assessments, duplicates, &c. to be paid by the receiver-general, according to the warrant of two commissioners. Assessors, collectors, &c. not doing their duty may be fined by three or more commissioners, in any sum not exceeding 40s. 38 Geo. III. c. 5. Blackst. Com. vol. i. Burn's Justice, art. LAND-TAX.

LANDVELLER, in *Geography*, a town of Sweden, in West Gothland; 9 miles E. of Gothenborg.

LAND-WAITER, an officer of the custom-house, whose duty is, upon landing any merchandize, to examine, taste, weigh, measure them, &c. and to take an account thereof. In some ports they also execute the office of a coal-waiter. They are likewise occasionally styled searchers, and are to attend and join with the patent searcher, in the execution of all cockets for the shipping of goods to be exported to foreign parts; and in cases where drawbacks or bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent searchers, are to certify the shipping thereof on the debentures.

LANE, in the *Military Art*, is used when men are drawn up in two ranks facing one another. This is called *marching a lane*, and is generally done in the streets through which a great person is to pass, as a mark of honour. But soldiers are often drawn up in this manner, when an offender is to run the gantlope. See *Military EXECUTION*.

LANE, in *Geography*, an island in the Atlantic, near the coast of America, a little to the east of Scuttock Point. N. lat. 44° 18'. W. long. 67° 56'.

LANE, a river of Ireland, in the county of Kerry, which rises in Maglicuddy's reeks, and receiving several streams from Mangerton, and other adjoining mountains, and the river Flesk from the westward, flows north-westward to Calkemain harbour. The expanse of the waters of this river, confined by a great ledge of rocks, forms the two lakes, so well known and so justly celebrated as the upper and lower lakes of Killarney, from the town of that name being near them. See KILLARNEY.

LANEL, a town of Africa, and capital of the kingdom of Galam, on the S. side of the Senegal.

LANERK. See LANARK.

LANES, a town of Sweden, in the province of Angerman-land; 30 miles N. of Hernösand.

LANESBOROUGH, a post-town of America, in Berkshire county, Massachusetts, N. of Pittsfield six miles. It has two quarries of marble, and contains 1448 inhabitants.

LANESBOROUGH, a small town of Ireland, in the county of Longford, on the bank of the Shannon, over which there is a bridge into the county of Roscommon, in which it has a suburb. This is a borough town, which was disfranchised by the Union, and is 62½ miles W.N.W. from Dublin.

LANFRANC, in *Biography*, archbishop of Canterbury in the eleventh century, was a native of Italy, and born at Pavia, at which place his father was keeper of the public archives; he pursued his academical studies at Bologna, paid particular attention to rhetoric and civil law, and on his return to his native city, he commenced advocate in the courts. He removed to France, under the reign of Henry I., taught publicly in the school of Avranches, and was attended by a crowd of students of high rank. In a journey from that place to Rouen he was beset by robbers, who plundered him, and left him bound in a forest near the abbey of Bec. Here he remained, in a most deplorable state, till next day, when he was released, carried to the abbey, and soon after he took the monk's habit. While he resided in this place, his literary fame and excellent character recommended him to the esteem of William I., duke of Normandy, who made him one of the counsellors of state. Under the pontificate of Leo IX. he went twice to Rome; the principal object of his second journey was to solicit a dispensation for the marriage of William with the daughter of the earl of Flanders, his first cousin, which was granted upon the condition that the duke and his lady should build a monastery. They accordingly gave directions for the building of that named St. Stephen, at Caen, of which Lanfranc was appointed abbot in the year 1063. Soon after William was seated on the throne of England, he sent Lanfranc to Rome, to negotiate with Alexander II. about the mission of legates to England, to crown him, and to regulate the affairs of the church. After the coronation of William, he formed the design of depriving many of the English clergy of their dignities, in order that he might bestow them on his countrymen, or on others, on whose attachment he could depend: in conformity with this principle, Stigand, archbishop of Canterbury, was deposed, and Lanfranc raised to the high office in his stead: he would gladly have declined the honour, but an express order from pope Alexander II. obliged him to accept it. He was accordingly consecrated archbishop of Canterbury in 1070, and in the following year he went to Rome, in company with the archbishop of York, and was received with uncommon respect by his holiness, who had formerly been his pupil at the abbey of Bec. Lan-

franc defended before the pope the claims of his see to superiority over that of York. Alexander, however, unwilling to offend either of these prelates, or to disoblige the king of England, refused to give judgment in the matter, and declared that it ought to be determined by an English synod. Two councils were held for this purpose in 1072, in which the question was debated with much warmth, in the presence of the king, queen, and the whole court, and at length determined in favour of Canterbury. After this, Lanfranc presided at different councils, in which several ecclesiastical canons were made, by some of which a change was produced in the condition of the clergy, as well as in the creed of the church of England. By one, the secular clergy who had wives were allowed to keep them; but those who had not wives were forbidden to marry, and bishops were prohibited in future to ordain any man who had a wife. By another, the doctrine of transubstantiation was promulgated, which before this period was but little known in our island: Lanfranc was, however, one of its most zealous champions, and employed the weapons of dialectics, with great ingenuity and address, in defence of it, both before and after his elevation to the see of Canterbury. Having presided over the diocese nineteen years, he died in 1089, leaving behind him a high character for wisdom, learning, munificence, and other virtues. His munificence in the way of alms-giving has been very highly extolled; he is said to have given away upwards of five hundred pounds a year, a sum which must have been equal to eight or nine thousand pounds at present. As an author, the archbishop maintained a high rank for the age in which he lived, and his works are written in good Latin: these are "Commentaries upon the Epistles of St. Paul;" "A Commentary on the Psalms;" "A Treatise on Confession;" "A Dissertation concerning the Body and Blood of Christ in the Eucharist;" and a collection of letters to pope Alexander II.; to Hildebrand, while archdeacon of Rome, and to several bishops in England and Normandy. They were collected, and published in 1648, in a folio volume. Moreri. Mosheim. Henry's Hist.

LANFRANC, a physician and surgeon of Milan in the thirteenth century. He left his native country, in consequence of some persecutions that he had suffered during the troubles of the times, and went to France; and in the year 1295, having already obtained considerable reputation, he was invited to Paris by many members of the faculty. His dexterity as an operator, his candour, and the energy with which he communicated his knowledge to others in his lectures, gained him the respect and esteem of his professional brethren; and he certainly contributed to the advancement of surgery, which was at that time at a very low ebb in France. Nevertheless he held some opinions adverse to the progress of the art; he condemned the use of the trepan, and absolutely forbade the operation of lithotomy, alleging that the extraction of a calculus rendered the patient impotent. He pointed out in strong terms the impropriety and danger of tents, which were generally employed at that time; the practice, however, continued to be resorted to long after his animadversions were made.

He left two works in MS., which were deposited in the king's library at Paris; the one entitled, "Chirurgia parva," the other, "Ars completa totius Chirurgiæ, sive Practica major." They were printed at Venice in 1490, with the title of "Chirurgia magna et parva," in folio; and have undergone several subsequent editions, and have been translated into the French and German languages. Eloy. Dict. Hist.—Hutchinson Biog. Med.

LANFRANCO, GIOV. MARIA DA TERENTIO, in 1538 published his *Scintille di Musica*, or "Sparks of Music," a work.

a work which, notwithstanding its quaint title, is often quoted with great praise by subsequent writers. It is now so scarce, that it would be difficult to find a copy of it throughout Italy.

LANFRANCO GIOVANNI, a painter of history, whose principal merit was the freedom and ease with which he managed large compositions in their colour and execution, but to the great loss of character and expression. He was born at Parma in 1581, and was at first a disciple of Agostino Caracci, but afterwards studied under Annibale, and having obtained a great proficiency of handling, was employed by that master in his great work in the Farnese palace at Rome, part of which he executed so well, that the difference between his painting and that done by Annibale himself is scarcely to be discerned.

Endowed by nature with a lively imagination, and having, after he left the Caracci, (under whom he had learnt the art of composition,) paid great attention to the artificial style of Correggio, particularly in the Duomo at Parma, and in the cupola there, he obtained a fondness for fore-shortening, losing sight of the simplicity of nature, and indulging his fancy in ideal forms and groups, which, while they exhibit his skill, deprive him of a reputation for judgment or true taste. He was, as M. Fuseli has observed, "a machinist in art of the first order, and taught his successors the means of filling the eye at a great distance, by partly painting and partly leaving it to the air to paint."

His colour was powerful and rich, but not pure. He most frequently employed very dark shadows, which give his pictures a heavy and sombrous appearance; and not being well versed in chiaro-scuro, the lights in them are not frequently ill connected, or rather lack connection, and are too much in detached spots. With those who prefer spirit and dash to more studied perfections, Lanfranco will, notwithstanding his deficiencies, be always a favourite.

He was engaged by Urban VIII. to paint the miracle of St. Peter walking on the water for the grand cathedral, dedicated to that saint in Rome, and he afforded his patron so much pleasure by his labour, that his holiness conferred the honour of knighthood upon him.

His pencil being exceedingly rapid, and his life prolonged to the age of 66, his works are by no means scarce, but are to be met with in most collections. He died in 1647.

LANG, JOHN MICHAEL, a German Protestant divine, was born at Ezelwangen, in the duchy of Sultzbach, in the year 1664. Having received a good classical education, he was sent to the university of Altdorf, in 1682, and there applied himself with great ardour to those studies which were to fit him for his future profession. He excelled particularly as an oriental scholar, and was admitted to the degree of M.A. in 1687, and then went to the university of Jena, where he delivered public lectures on ethics and natural theology. He officiated several years as pastor to a country church in the palatinate, but becoming dissatisfied with a country life he removed to Altdorf, where he was created doctor, and admitted into the academical senate in 1697. Here he was elected to the professorship of divinity, and appointed pastor of one of the churches. After some years he was involved in theological disputes, which ended in his quitting Altdorf, and removing to Prentzlow, in the year 1710, where he obtained an appointment, in which he remained till 1737, when he died, at the age of sixty-seven. He was author of the following among other works then held in high estimation: "Disertationes Botanico-Theologicæ;" "Philologia Barbaro-Græca;" "De Fabulis Mohammedicis." Moreri.

LANG, in *Geography*, a narrow island of Denmark, some-

what more than two miles in length, situated in the Baltic, near the S. coast of Laaland. N. lat. 54° 42'. E. long. 11° 20'.

LANGANICO, or SUNNI, anciently Olympia, a town of the Morca, on a small river called Carbon, the ancient Alpheus, once a city of great note, near which were celebrated the "Olympian games," which see. See also OLYMPIA. It is now an inconceivable place; 60 miles S.W. of Corinth.

LANGAROOD, a town of Persia, in the province of Ghilan, near the S. coast of the Caspian sea, which gives name to a road for ships. The cove has 10 feet water, but the entrance is narrow. The silk manufacture is here in high estimation; 20 miles S.E. of Reshid. N. lat. 27° E. long. 50° 15'.

LANGASCHANTZ, a town of Sweden, in the province of Harjedalen; 110 miles S.W. of Sundswall.

LANGBAINÉ, GERARD, in *Biography*, was born at Barton-kirk, in Westmoreland, about the year 1608. In 1626, he was admitted a servitor of Queen's college, Oxford, of which he became a scholar and afterwards a fellow. He took his degree of M.A. in 1633, and of D.D. in 1646. He had, however, some years previously to his taking the last degree, made himself known as a man of erudition, by an edition of Longinus, Greek and Latin, with notes, printed at Oxford in 1636. This work was followed by others of an historical and critical kind, displaying much sound learning, and an ardent attachment to the existing order of things in church and state. He was in habits of correspondence with the learned Usher and Selden, and is referred to by bishop Nicholson as a person admirably skilled in the antiquities and laws of England. In 1644, the university, of which he was a member, appointed him keeper of its archives, and in the following year he was made provost of his college. He readily submitted to the changes which took place at this period, and was accordingly allowed to remain in peace, employing his time and talents in the promotion of learning, and the maintenance of academical discipline. He died in the enjoyment of both his offices, in the year 1658. He had a son of the same name, who is known by his "Appendix to a Catalogue of Oxford Graduates;" and "A New Catalogue of English Laws."

LANGDON, in *Geography*, a township of America, in Cheshire county, New Hampshire, incorporated in 1787, and containing 484 inhabitants.

LANGE, or LANGIUS, JOHN, in *Biography*, a physician of reputation, was born at Loewenburg, in Silesia, in the year 1485. He pursued his studies with singular zeal at Leipzig, Bologna, and Pisa, in the latter of which universities he was honoured with the degree of M.D. He then settled in the practice of his profession at Heidelberg, where he soon acquired the esteem of the public, and was nominated first physician to four successive electors palatine; one of whom, Frederic II., he accompanied in his travels through the greater part of Europe. He attained the age of eighty, notwithstanding his excessive use of cheese, which made a part of all his meals, asserting that physicians were mistaken in decrying, as indigestible, this his favourite nutriment. He died at Heidelberg in June, 1565.

The most esteemed of his works is entitled "Medicinalium Epitolarum Miscellanea," first published at Basle, in 1554, 4to. This edition contains but eighty-three pills; but these were greatly multiplied in the subsequent editions. The work was full of the various learning of the times; and he in a great measure anticipated Sydenham in recommending the cool regimen in inflammatory diseases. He likewise published the following works: "De Syrmaismo et ratiore purgandi

purgandi per vomitum, ex Egyptiorum invento et fornicula," 1572, 8vo—"De Scorbuto Epitolaræ duæ," 1624; together with the treatise of Sennertus on the same subject.—"Confilia quædam et experimenta," 1676, 4to. together with the Confilia Medicinalia of Velschius. Eloy. Dict. Hill.

LANGEAC, in *Geography*, a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Brioude; 12 miles S. of Brioude. The place contains 1807, and the canton 9753 inhabitants, on a territory of 232½ kilometres, in 16 communes.

LANGEAIS, a town of France, in the department of the Indre and Loire, and chief place of a canton, in the district of Chinon, seated on the Loire; 12 miles W. of Tours. The place contains 2229, and the canton 9465 inhabitants, on a territory of 324½ kilometres, in 12 communes. N. lat. 47° 18'. W. long. 0° 1'.

LANGEDORF, a town of Germany, in the duchy of Wurzburg; 7 miles S.W. of Kissingen.

LANGEFORD, a small island near the coast of Lapland. N. lat. 69° 38'.

LANGELAND, a fertile island of Denmark, situated in the south part of the Great Belt, between the islands of Laaland and Funen, about 30 miles in length, and from three to five in breadth. It was formerly a principality, but is now only a county, the best in the kingdom, and under the same government as Funen. The chief town is Rudkiøping. N. lat. 55°. E. long. 10° 50'.

LANGELMAKI, a town of Sweden, in the province of Tavastland; 42 miles N. of Tavasthus.

LANGELSHEIM, a town of Westphalia, and principal place of a bailiwick, in the principality of Wolfenbuttle; 6 miles N.W. of Goslar.

LANGENAU, a town of Prussia, in the province of Oberland, the church of which is celebrated for beautiful paintings; 8 miles N. of Bischofswerder.—Also, a town of Prussia, in the province of Ermeland; 25 miles N.W. of Heilsberg.—Also, a town of Bavaria, situated on a small river, which runs into the Danube; 11 miles N.E. of Ulm.

LANGENBERG, a town of the duchy of Berg; 15 miles N.E. of Duffeldorf.

LANGENBURG, a town of Germany, in the principality of Hohenloe, on the Jaxt; 32 miles W. of Anspach.

LANGENES, an island in the North sea, near the coast of Norway, about 24 miles in circumference. N. lat. 59° 20'.

LANGENFELD, a town of Saxony, in the Vogtland; 40 miles S.S.W. of Zwickau.

LANGEN-SALZA, a town of Saxony, the capital of Thuringia, on the Salza. Its environs are pleasant and manufactures flourishing. It contains about 900 houses, two churches, a college, and a castle; 14 miles W. of Erfurt. N. lat. 51° 4'. E. long. 10° 42'.

LANGENSCHWALBACH, a town of Westphalia, in the county of Katzenhogen, celebrated for its mineral waters; 9 miles N.W. of Mentz.

LANGEN-SEE. See LAKE.

LANGENTHAL, a town of Switzerland, in Berne, advantageously situated for commerce with France and Germany; for the convenience of which it has three fairs, at which are annually sold from 10,000 to 11,000 pieces of linen, 8000 of which are whitened; these are exported to Spain, Portugal, America, &c. Cheese is likewise sold here in great quantities, besides horses, cattle, grain, and many other articles, both of agriculture and manufacture.

In its vicinity are mineral springs; 18 miles N.E. of Berne. N. lat. 47° 12'. E. long. 7° 33'.

LANGENZENN, anciently called *Cinna*, or *Cenna*, a town of Germany, on the river Zenn; 12 miles W. of Nuremberg.

LANGEROGE, a small island in the German sea, near the coast of East Friesland, with a small town. N. lat. 53° 42'. E. long. 7° 24'.

LANGESCHEED, a town of Westphalia; 25 miles W. of Brilon.

LANGESUND, a sea-port town of Norway, in the diocese of Christiania; 50 miles S.S.W. of Christiania.

LANGEWANG, a town of the duchy of Stiria; 16 miles N.E. of Pruck.

LANGFORD, a town of America, in the state of Kentucky; 25 miles E.S.E. of Stamford.

LANGFORD Bay, a bay of the island of Antigua, on the N. coast, W. of Peyerlon's Point.

LANGHOLM, a small island on the E. side of the gulf of Bothnia. N. lat. 65° 45'. E. long. 21° 40'.

LANGHOLM, a market-town and burgh of barony under the duke of Buccleugh, is situated in a parish of the same name, in the district of Eskdale and county of Dumfriess, Scotland. The population of this town is stated, in the parliamentary reports of 1801, at 2039 persons, but it is presumed, this number includes the whole parish. A market is held here every week, and four fairs annually; that held on the 26th of July is considered as the greatest in Scotland for lambs. At a short distance from the town is the village of New Langholm, which has been erected by the duke of Buccleugh for the establishment of an extensive cotton manufactory. The country along the banks of the Esk is generally flat, well sheltered with woods, and yield luxuriant crops, particularly of oats and barley. The other parts of the parish consist chiefly of small hills, covered with verdure, and affords excellent pasture for sheep. The duke of Buccleugh has built in this neighbourhood a very handsome mansion called Langholm-lodge, which stands in a delightful valley.

LANGHORNE, JOHN, in *Biography*, an excellent English poet, was born at Kirkby-Stephen, in Westmoreland, in 1735. By the death of his father, the education of John and three other children devolved upon his mother, who fulfilled the task with great assiduity and affection. He received his school-learning at Appleby under Mr. Yates, who joined elegance of taste to the acquirements of a classical scholar. Langhorne continued under his tuition till the age of eighteen; when the narrowness of his circumstances obliged him to engage himself as domestic tutor in a family, near Ripon. He made himself known as a poet, by a poem entitled "Audley-park," descriptive, as its title imports, of the beauties of that place. He soon after became an assistant at the free-school of Wakefield, and taking orders, acquired popularity as a preacher. In 1759, he undertook the tuition of the sons of Robert Cracroft, esq., of Hackethorn, near Lincoln, and while in this situation he made a collection of such miscellaneous poems as he had written, and published them in a volume for the benefit of a friend in distress. In the year 1760, he entered himself at Clare hall, Cambridge, for the purpose of taking a degree, and dated from that place a poem on the king's accession, printed in the University collection of verses on that occasion. In 1761, he officiated as curate to the clergyman of Dagenham, in Essex, and at the same period he published several poems, which made him generally known among the votaries to the Muses, and in 1762, he appeared as a prose writer by his "Letters on religious Retirement, Melancholy, and Enthusiasm."

fiain,' and by his eastern tale of "Solyman and Almehna." He was, at this time, likewise a writer in the Monthly Review. His next work, published in 1763, entitled "Letters supposed to have passed between Theodosius and Conflantia," founded on a story in the Spectator, became popular, and obtained for the author much applause. Mr. Langhorne, in the following year, removed to the metropolis, where he was appointed curate and lecturer of St. John's, Clerkenwell, and in the same year he published two volumes of sermons, which he entitled "Tracts of religious Philosophy." Dr. Hurd now appointed him assistant preacher at Lincoln's-Inn, and Mr. Langhorne soon after gave the public his "Letters on the Eloquence of the Pulpit;" and "Letters to and from select Friends, or Effusions of Friendship and Fancy." He is said to have published a defence of lord Bute; but a pastoral poem, entitled "Genius and Valour;" he avowed, the object of which was to vindicate the natives of Scotland from the rancorous abuse thrown upon them by Churchill. This obtained for the author a complimentary letter from the university of Edinburgh, with a diploma of doctor of divinity. He had, in the year 1760 or 1761, quitted the family of Hæckthorn, on account of being refused the hand of one of Mr. Cracroft's daughters; in 1767, when he had obtained a station of much greater respectability, and when he was looked up to as an author and clergyman, he renewed his suite, and was successful. The living of Blagdon, in Somersetshire, was purchased, which afforded the newly-married couple a desirable residence, but this happy union was fatally dissolved by the death of Mrs. Langhorne in child-bed, in the ensuing year. Life now seemed to have lost its charms on the survivor, he quitted a place which served only to remind him of his heavy affliction, and retired to the house of his brother William, a clergyman at Folkestone, in Kent. In this retreat, instead of giving himself up to melancholy, he very wisely occupied his mind with a literary talk of some labour and extent, and the two brothers jointly produced a new version of Plutarch's Lives, with notes critical and explanatory, and a life of the author, which was published in 1771, and met with a favourable reception. He had published, previously to this, "Letters supposed to have passed between St. Evermond and Waller," two vols.; and "Frederic and Pharamond, or the Consolations of Human Life," a philosophical discourse. His "Fables of Flora" were published in 1771, as was another poem, entitled "The Origin of the Veil." In 1772, he paid a visit to his native country, which produced a second matrimonial connection, and having indulged himself and his lady with a continental tour, he sat down again at his living of Blagdon. To the duties of the church he added those of a magistrate, and at the desire of his friend Dr. Burn, he gave the world accurate ideas of this important office in a poem, entitled "The Country Justice." The first part appeared in 1774, and was greatly admired for the manly strain of its sentiments, and the beauty of its descriptions. The two other parts were of inferior merit, and published at different periods. In 1776, he lost his second wife in child-bed, which must, to a man of feeling, have been an unusually severe calamity, and from the effects of which he probably never wholly recovered. His affliction was in a degree alleviated by the connexions that he had acquired in the great world, one of the fruits of which was, the presentation to a prebend in the cathedral of Wells, in 1777, by the bishop of that see. His health was, however, declining, yet he continued to amuse himself and the public with writings of different kinds, the last of these was a romantic tale, entitled "Owen of Carron." He died at Blagdon, in April 1779, in the

forty-fifth year of his age. He was amiable in his manners, but is said to have been rather too much addicted to convivial indulgences: if this habit was incurred by domestic misfortunes, though not to be justified, it may, in a measure, be palliated, and the subject of it is to be truly pitied. "His poetry," says an able critic, "is generally harmonious, abounding in pleasing imagery, but over-loaded with ornament, and not free from obscurity and affectation. His prose writings are rather light and flowery than solid and natural. His sermons have been censured for the loose soft texture of their style, and the false pathos of their sentiment. In religion he was inclined to enthusiasm, but the morality of all his works is pure and rational."

LANGIN, in *Geography*, a town of France, in the department of Mont Blanc; 6 miles N. of Bonne.

LANGINES, a small island of Denmark, in the North sea, near the west coast of South Jutland; 2 miles N.W. from the island of Nordstrand.

LANGIONE, a town of the kingdom of Laos, considered by some as the capital. N. lat. 22° 30'.

LANGLE'S BAY, a bay on the west coast of the island of Saghalien, so called by M. La Perouse. N. lat. 47° 49'. E. long. 142° 49'.

LANGLE'S Peak, a mountain on the north coast of the island of Jesso, said to be more than 1200 toises above the level of the sea. N. lat. 45° 25'. E. long. 142° 20'.

LANGLEY ISLAND, a small island, near the south coast of Newfoundland, about 3 miles S. from the island of Miquelon. N. lat. 46° 42'. W. long. 56° 5'.

LANGOE, a small island of Denmark, near the north coast of the island of Funen. N. lat. 55° 35'. E. long. 10° 11'.—Also, an island in the North sea, about 80 miles in circumference, and 40 from the coast of Norway, celebrated for its marble quarries. N. lat. 68° 16'.

LANGOGNE, a town of France, in the department of the Lozère, and chief place of a canton, in the district of Mende; 21 miles N.E. of Mende. The place contains 2923, and the canton 7450 inhabitants, on a territory of 250 kilometres, in 8 communes. N. lat. 44° 44'. E. long. 3° 54'.

LANGON, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Bazas; 9 miles N. of Bazas. The place contains 3208, and the canton 10,602 inhabitants, on a territory of 130 kilometres, in 13 communes.—Also, a small island in the north part of the gulf of Bothnia. N. lat. 65° 32'. E. long. 22° 26'.

LANGORAN, a small island on the east side of the gulf of Bothnia. N. lat. 63° 32'. E. long. 22° 18'.

LANGPORT, a market-town and parish in the hundred of Pitney, and county of Somerset, England, is situated upon the banks of the river Parrot, near its confluence with the Irwell. It was formerly a royal borough; and the inhabitants, by immemorial custom, still claim several borough-privileges. This town consists chiefly of two streets, and is divided into two parts, called Langport-Eastover and Langport-Westover. The government is vested in a portreeve, a recorder, two capital bailiffs, and nine common-council men. The river Parrot being navigable by lighters, a considerable trade is carried on, between this place and Bridgewater, in timber, stone, coal, iron, and salt. The church, dedicated to All-Saints, is adorned with a very fine tower, which has several niches on the west side, formerly ornamented with handsome statues. Adjoining to the town are two large commons, called *Common-Moor* and *Ragg-Common*; the former consisting of 150, and the latter of 70 acres of good meadow ground, upon which all the inhabitants not only assume the right of feeding cattle, but even of building

as they deem most convenient for themselves. The houses in Langport, according to the parliamentary returns of 1800, amounted to 126 in number, and were occupied by 754 inhabitants. Here are a weekly market and three annual fairs. Collinson's History, &c. of Somersetshire, 3 vols. 4to.

LANGRAVA, a town of Portugal, in the province of Beira, having a medicinal spring; 12 miles N.W. of Pinhel.

LANGREL-SHOT, is a sort of shot sometimes used at sea, made of two bars of iron, with a joint, or flackle, in the middle; by which means it can be shortened, and so put the better into the gun; and at each end there is a half bullet, either of lead or iron.

This shot, when discharged, flies out expanded, and so does more execution among the enemies rigging, &c. It is never used in royal ships, but very often by privateers and merchantmen.

LANGRES, in *Geography*, a town of France, and chief place of a district, in the department of the Upper Marne. In the time of Julius Cæsar, this was the capital of the Lingones. On the irruption of Attila, it was taken and burnt; and after having been rebuilt, the Vandals destroyed it. It was, at an early period, erected into a bishopric; and from the reign of Philip Augustus to the revolution, the prelates were peers of France. It afterwards belonged to Burgundy, and fell with the rest of that kingdom to France. N. lat. 47° 52'. E. long. 4° 25'.

LANGRISH, BROWN, in *Biography*, a physician of the last century, who distinguished himself as an advocate for the mechanical theories of physiology and medicine, and by the numerous experiments with which he supported those doctrines. A more accurate investigation of the nature of the animal economy has exploded them; but Dr. Langrish had the merit of ascertaining several interesting facts in respect to the nature of the circulating powers. He died in London, on the 29th of November 1759, and left the following works: "A new Essay on Muscular Motion, founded on Experiments, &c." 1733, 8vo.; "Modern Theory of Phytic," 1738, 8vo.; "Physical Experiments upon Brutes," 1745, 8vo.; "Croonian Lectures on Muscular Motion," 1747. Eloy. Dict. Hist.

LANGSELE, in *Geography* a town of Sweden, in Angermannland, on a river of the same name; 45 miles N.W. of Hernösand. N. lat. 63° 14'. E. long. 16° 49'.

LANGSKAR, a small island on the east side of the gulf of Bothnia. N. lat. 63°. E. long. 21° 9'.

LANGTON, STEPHEN, in *Biography*, archbishop of Canterbury in the 13th century, was a native of England, but was educated at the university of Paris, where he afterwards taught divinity, and explained the Scriptures with much reputation. His character stood so high, that he was chosen chancellor of that university, canon of Paris, and dean of Rheims. He was afterwards sent for to Rome by pope Innocent III., where he was created a cardinal. In the year 1207, the monks of Canterbury having, upon a vacancy taking place in that see, made a double return, both parties appealed to the pope, and sent agents to Rome to support their respective claims. His holiness not only determined against both the contending candidates, but ordered the monks of Canterbury, then at Rome, immediately to proceed to the election of an archbishop, and, at the same time, commanded them to choose cardinal Stephen Langton. After various excuses, which the pope knew how to get over, by absolving the agents in the business from all sorts of promises, oaths, &c. and by threatening them with the highest penalties of the church, they complied, and

Langton was consecrated by the pope at Viterbo. As soon as the news arrived in England, king John was incensed in the highest degree both against the pope and monks of Canterbury. The last, being within the reach of his power, experienced the effects of his indignation. He sent two officers with a company of armed men to Canterbury, took possession of the monastery, banished the monks out of the kingdom, and seized all their property. He wrote a spirited letter to the pope, whom he accused of injustice and presumption, in raising a stranger to the highest dignity in his kingdom, without even his knowledge; and he added, that if his holiness did not instantly repair the injury, he would break off all communication with Rome. John, unfortunately for himself and his kingdom, was unfit for so arduous a contest; and he, in the end, submitted to the most disgraceful terms. (See JOHN, and INNOCENT III.) In 1213, cardinal Langton arrived in England, and took possession of the see; and though he owed all his advancement to the pope, yet the moment he became an English baron, he was inspired with a zealous attachment to the liberties and independence of his country. In the very year in which he came over, he and six other bishops joined the party of the barons, who associated to resist the tyranny of the king; and at length they were successful in procuring the great charter. Langton was equally zealous in opposing the claims of the papal agents, particularly of the pope's legate, who assumed the right of regulating all ecclesiastical affairs in the most arbitrary manner. In the grand contest which took place between king John and the barons about the charter, the archbishop's patriotic conduct gave much offence to the pope, that, in 1215, he laid him under a sentence of suspension. Nevertheless, in the following year, we find Langton assisting at a general council held at Rome; and during his absence from England at this time, king John died. In 1222, he held a synod at Oxford, in which a remarkable canon was made, prohibiting clergymen from keeping concubines publicly in their houses, or from going to them in other places so openly as to occasion scandal. In the following year, he, at the head of the principal nobility, demanded an audience of king Henry III., and demanded of him a confirmation of the charter of their liberties. Their determined manner convinced the king that their demand was not to be refused, and he instantly gave orders for the assembling of parliament. The archbishop shewed, in several instances, that he was friendly to the legal prerogatives of the crown; and by a firm and impressive conduct, in a case of great difficulty, he prevented the calamity of a civil war. He died in the year 1228, leaving behind him many works, which prove that he was deserving the character of being as learned and polite an author as any of the age in which he flourished. He wrote "Commentaries" upon the greatest part of the books of the Old and New Testament. He was deeply skilled in Aristotelian dialectics, and the application of them to the doctrines of Scripture. The first division of the books of the Bible into chapters is ascribed to this prelate. The history of the translation of the body of Thomas à Becket was printed at the end of that archbishop's letters, at Brussels, 1682. His letter to king John, with the king's answer, may be seen in d'Archevry's Spicilegium. Moheim's Eccl. Hist. Henry's Hist. of Eng.

LANGTON, in *Geography*, a town of Scotland, in the county of Berwick; 2 miles S.W. of Greenlaw.

LANGUAGE, a set of words which any people have agreed upon, whereby to communicate their thoughts to each other. Or, language, in general, signifies the expression of our ideas by certain articulate sounds, which are used as the signs of these ideas. See ARTICULATION.

Whatever be our opinion respecting the progressive amelioration of brutes, if the capacity of language were communicated to them, there can be no hesitation in admitting the progressive deterioration of the human species, if they were deprived of it. If man had not possessed this, or some other extensive power of communication, that astonishing system, which we call the human mind, would have remained in inactivity, its faculties torpid, its energies unexcited, and that capacity of progressive improvement, which forms so important a part of the mental constitution of man, would have been given in vain, would have been unknown, except to him who gave it. But in every part of the creation we discern a unity of design, which equally proves the wisdom and benevolence of the great First Cause. The means of bringing his powers into activity are bestowed upon man, as well as the powers themselves; and it is a position which will bear a vigorous examination, that the accuracy of human thought and the extent of human intellect generally proceed in equal steps with the accuracy and extent of language. "This ineliminable prerogative," says Smellie, "is perhaps one of the greatest secondary bonds of society, and the greatest improvement to the human intellect. Without artificial language, though nature has bestowed upon every animal a mode of expressing its wants and desires, its pleasures and its pains,—what a humiliating figure would the human species exhibit, even upon the supposition that they did associate. But when language and society are conjoined, the human intellect, in the progress of time, arrives at a high degree of perfection. Society gives rise to virtue, honour, government, subordination, arts, sciences, order, happiness. All the individuals of a community conduct themselves upon a regulated system. Under the influence of established laws, kings and magistrates, by the exercise of legal authority, encourage virtue, repress vice, and diffuse through the extent of their jurisdiction the happy effects of their administrations. In society, as in a fertile climate, human talents germinate and are expanded; the mechanical and liberal arts flourish; poets, orators, historians, philosophers, lawyers, physicians, and theologians, are produced. These truths are pleasant, and it were to be wished that no evils accompanied them: but through the whole extent of nature it appears to our limited views, that good and evil, pleasure and pain, are necessary and perpetual concomitants." It will not appear too much to affirm, when we consider the influence of language on the intellect, that if that genius, which has dazzled the world with its splendour and extent, had been originally destitute of the power of communication, he would not have risen above the level of the least cultivated of his fellow-mortals. Conceive him (to use the ideas of Condillæ) bereft of the use of visible signs, how much knowledge would be concealed from him, attainable even by an ordinary capacity! Take away from him the use of speech,—the lot of the dumb teaches you in what narrow bounds you enclose him. Finally, deprive him of the use of all kinds of signs; let him not know how to make with propriety any gesture;—you would have in him a mere idiot.

We are far, however, from believing, with Lord Monboddo, that the human race have actually risen from the very lowest stage,—that of mere brutality. His lordship's opinion is too singular to be omitted here. He supposes, on the authority of several travellers whom he quotes, (and of whose passion for the marvellous his quotations leave no room to doubt,) that there are nations without laws, or any of the arts of civilized life, without even language; and that some of them, to complete their relationship to the monkey tribe, had actually tails. This, with other opinions, which

display rather the credulity of the man of system than the sober and cool judgment of the philosopher, has been exposed to the lively ridicule of Horne Tooke: and though we will never to countenance the idea, that ridicule is a proper test of truth,—we are willing to admit, that there are some opinions which it is below the dignity of reason to refute.

We see in language a complicated whole, which we have been accustomed to consider as it is, without attempting to ascertain what it has been. We see all regularity and beauty; and we do not ask ourselves the question, has language always been thus regular and beautiful? When we look back into the earlier periods of human nature, we find that that which now wears the appearance of art was early the invention of necessity, gradually perfected and brought to a systematic form, by causes which have operated generally, but have received modification from the influence of local or temporary circumstances. A complete system of the origin and progress of language would be a history of the progress of human intellect. This we shall not attempt; perhaps our resources of knowledge are not sufficient to render the attempt in any degree successful; but a short outline of the early history of language, particularly of written language, will be neither uninteresting nor useless.

Our direct evidence is not extensive, and we are too much obliged to have recourse to hypothesis, in tracing the progress of improvement in any department of science. We are unable always to ascertain (as Mr. Stewart observes) how men have actually conducted themselves on particular occasions; and we are then led to inquire in what manner they are likely to have proceeded from the principles of their nature, and the circumstances of their external situation. In such inquiries, the detached facts which the remains of antiquity, or the narration of travellers, afford us, or the actual appearances of language at present, serve as landmarks for our speculations. "In examining the history of the human mind, as well as in examining the phenomena of the natural world, we cannot always trace the progress by which an event *has been* produced; and it is frequently of importance to discover how it *may have been* produced, by causes known to exist. The steps in the formation of language cannot probably be determined with certainty; yet if we can shew the known principles of human nature, how the various parts may naturally have arisen, the mind is not only to a certain degree satisfied, but a check is given to that indolent philosophy which refers to a miracle whatever appearances, either in the natural or moral world, it is unable to explain."

Diodorus Siculus (lib. i.) and Vitruvius (*Archit.* lib. ii. c. 21.) supposed that the first men lived for some time in the woods and caves, like the beasts, uttering only confused and inarticulate sounds; till associating for mutual assistance, they came by degrees to use articulate sounds, mutually agreed upon for the arbitrary signs or marks of those ideas in the mind of the speaker, which he wanted to communicate to the hearer. By what degrees they proceeded from inarticulate to articulate sounds, these writers do not attempt to point out; and unless we admit that these articulate sounds were connected with certain feelings, in the same manner as what are called the natural signs, or that they were easily produced, which will not be allowed by those who have attended to the structure of the organs of speech, the account we have received from a better informed historian will not lose ground.

Plato, in *Cratyl.* p. 383. p. 425. ed. Serrani, seems to maintain, that the first language was of divine formation; for he supposes that the names of things had originally some natural connection or congruity with the things themselves,

and that the first names must have been justly imposed, because they were imposed by the gods.

Moses, however, on whose authority we may more confidently depend, gives us to understand that the rudiments of language were begun by man, under the superintendence of his Maker. The Supreme Being caused all the animal creation to pass before their lord, to receive from him their names. If we consider that the numerous varieties which we observe in the subordinate classes of the brute creation probably originated in a comparatively small number of individuals, as the almost equally numerous varieties of men sprang from our great progenitor, this almost endless task, as it at first sight appears, is very much reduced in its magnitude. Here is the first step. Miracles are never used except when they are necessary, that is, when the same effect cannot be produced by the common laws of nature: and hence we feel inclined to believe, that here the divine communication ceased; and that what man had been instructed to begin, he was left to complete for himself. Indeed, if we suppose that more than the application of names to natural objects had been divinely taught, yet we must admit that these communications would be bounded by the wants of the being to whom they were made. It is not probable that the divine instructor would lead man to fix upon words, to denote things then unknown, or to denote ideas which were not then acquired. "It is not necessary to suppose," says Kett, "that the Creator inspired the first parents of mankind with any particular original or primitive language; but that he made them fully sensible of the power with which they were endued of forming articulate sounds, gave them an impulse to exert it, and left the arbitrary imposition of words to their own choice." This seems to be intimated Gen. ii. 19. See Shuckford's Connection, vol. i. book ii. p. 111.

Let us then suppose the use of articulation given, and its application in some instances pointed out, in the invention of the names of animals; which, we may observe, is, in fact, the first step that would probably have been taken, presupposing the power of articulation, if no divine direction had been given. Words would originally be simply the signs of things, and farther of individuals. Every new object, for which necessity required a name, would receive a different name from others: but if there were a striking similarity between this new object and one which had already received a name, the old one would be transferred. One of the principles of association is similarity; and this new impression would recal the idea of the former object which it resembled, and consequently the word with which it was connected: and thus what originally was a name only for an individual, would gradually become the name of a multitude. Thus Lee Boo, who had been taught by his fellow-voyagers to call a great Newfoundland dog by the name of Sailor, used to call every dog he saw Sailor. There is little or no difficulty attending the application and classification of sensible objects: it seems to be an operation simple and easy, if we presuppose (as we have done) that some articulate sounds were known.

When several objects had received the same name, it would be sometimes necessary to distinguish them. Our procedure in such cases is to connect with the name of the object, the name of a distinguishing quality, or to specify some relation it has with other objects; but this supposes that to be already done, which we must consider as yet to be done. Now we must bear in mind that similarity, (sensible external similarity,) and local connection, are those principles of association, which are known to be most active at present in the minds of the illiterate and uncultivated; they must also have

been most active in the minds of all men in the rude states of society. A peculiar colour, (which would furnish one principle of distinction,) would naturally be denoted by the name of an object remarkable for that colour, and this name, joined with the general term, would confine it to the particular object it was meant to specify. This is a procedure so simple, that one may expect to find some traces of it still remaining, and it is what we actually do in common language. An orange ribbon will precisely explain our meaning. We wish to distinguish a ribbon from others by its colour; in this instance we are able, agreeably to the custom of our language, to employ the name of an object remarkable for that colour, to denote the colour itself; and it is to be observed, that sensible qualities were those, and those only, which would be first noticed, and most requisite to be noticed.

Local situation, or vicinity to some object, would furnish another ground for distinction; the fountain near the cave, for instance. Now in order to express this, the procedure would be simple and intelligible, if immediately preceding or following the term employed to denote fountain, the term denoting cave were added. As we should at present use the expression, the barn-yard, for the yard near to, or adjoining the barn; the hermitage-walk, for the walk leading to the hermitage. This juxtaposition of the signs, to signify the congruity or similarity of the objects they denote, is the most natural, and in a language little extended, sufficiently adequate for all the purposes of common life; but it is obvious that it would allow very great latitude of interpretation; and hence, as language became more copious, contrivances were used to denote the nature of the connection which subsisted between the objects denoted by the signs employed. The chief of these is the employment of prepositions, at first separately, and afterwards, in some cases, coalescing with, and forming a part of the word; and the origin of these furnishes additional proof that the procedures we have spoken of were in reality those of the early framers of language (see GRAMMAR); but these were contrivances of a late date than those of which we here speak.

By degrees it was found convenient, at least by some tribes, to designate those names which were employed, in connection with other names with a view to point some quality or restricting circumstance of the thing signified, by some note that they were so employed. The speaker might certainly have left the inference to simple juxtaposition; but this appears to have been done in few languages, after improvements began to take place; and to effect such designation words (in some cases denoting *add, join, like, &c.*) were subjoined to the particularizing names, and they then were used only as adjectives, (or, to use a more general term, as adnouns.) The Chinese, however, still make no distinction in form, between words when employed as nouns and as adnouns; the same word when placed first being an adjective, and when placed last a substantive; thus *hao gin* is a good man; and *gin te hao* is the goodness of a man. We use the same word in many instances both as a noun and an adnoun; but a large proportion of our simple adjectives are formed as above, and are never employed as substantives; the Chinese, on the other hand, when a substantive is not to be used as an adjective, add the designating syllable *ca* to it.

As far as the processes we have described regard sensible objects and their connections, all seems very plain; and we find so many traces of similar modes of proceeding in languages at present in use, that we can scarcely doubt that at least it strongly resembles the actual procedure in the early stages of language. And we may remark, as we go on,

that.

that every procedure, in order to be probable, should be simple, and such as might easily be adopted. It would not be long before art was applied to perfect and correct that which necessity began; but even this must have had the features of simplicity, must have been directed by circumstances which would not be under the controul of man. It is not probable that any variations would be formed by regular analogies, except such as really existed in the situation or connection of the object; nor that they would form any combinations of words, excepting when the objects they signified had some real or apprehended connection.

In order to express objects which were not sensible, so as to convey to others notions or feelings which existed in the mind of the speaker, words would be used which had previously been appropriated to objects to which those objects of the mind's eye appeared to have some resemblance, or other connection. This resemblance or connection was frequently forced, and to those whose situation was different would not be at all striking; in other cases it was correct, and the justness of application is proved by a similar procedure of unconnected inventors. We may derive great light here from the hieroglyphics; for there cannot be a doubt that where the visible sign which originally represented only a sensible object, was applied to denote some quality discovered by reasoning and observation, or some internal feeling, the audible sign or word was applied in a similar manner. The writing would, of course, as Warburton very justly observes, be that very picture which was before painted by the fancy, and thence delineated in words. Some instances will be adduced, when we come to consider the hieroglyphic mode of communication; at present we will add one or two as illustrations of the principles we have laid down. The term used to denote the *mouth*, denoted also *speech*; this, connected with the *dog*, signified the *dog's voice*. They proceeded further, and used this compound, at least the hieroglyphic denoting it, to signify *lamentation* and the *sorrow* which produced it. At first view this procedure appears extraordinary; to enter fully into the resemblance, we must remember that in uncultivated minds grief is loud and clamorous; and it is to a similar resemblance, that the same term has, in our own language, been applied to the cry of a dog in pain, and to the expression of lamentation among the lower classes of the Irish. It was a procedure much more natural when the term *dog* joined with the word denoting a field was made to signify *hunting*. Our readers will be able, even in the present refined period of our language, to trace numerous instances, in which the names of intellectual things have been obviously transferred from sensible things; and to those who have attended much to the subject, it will not appear too much to affirm, that in every instance where a word is not the name of a sensible object, it has acquired its present force by a gradual transition from its primary application to sensible objects. Mungo Park has furnished us with some good specimens of the commencement of this transition in the Mandingo language; thus *tellingabalid*, literally *straight-bodied*, signifies *proud*; *juju bota*, literally *the heart c me out*, signifies *angry*; a *beegee*, literally *is here*, signifies *alive*; &c. In every known language the transition has been begun; but it is only among the more refined that it has been complete. In our own, we find abundance of instances in almost every intermediate stage of the progress, as well as in its termination.

Language would proceed but awkwardly without those wheels which have been gradually made for it; but all which can be thought necessary for communication are the noun and the verb; and even of the latter, as a distinct class of words, the necessity may justly be doubted. We regard it as next to

certain that the whole of what is now (by association) implied or denoted by the verb, beyond what is denoted by the acknowledged noun, was originally mere inference from the juxtaposition of the verb-noun with another noun. We cannot indeed advance one step in oral communication, without leading our hearers to the inference that certain ideas are connected in our minds, or that we believe certain objects, properties, or events, to be connected. The connecting link, however, need not always be stated; in the first stage of language it would not exist, because the *first* words could only be names without the idea of affirmation being appropriated to any of them; and in the language of childhood it does not exist. Words are placed together; and it is easily understood that the corresponding ideas are connected in the mind. "Mamma, milk—good," would surely be understood by any one; and depending upon the ease of inference, the ancient writers (long after words had been appropriated to express affirmation) continually left their readers to make it for themselves. But how slowly, and how ambiguously, communication would, in many cases, proceed, without some appropriated link of connection, any one may be convinced by attempting to express a train of thoughts without those words which have the idea of *affirmation* associated with them, in the forms so expressing affirmation.

The chief difficulty opposing the admission of the opinion that verbs were originally nouns, arises from the peculiarities existing in the external character of verbs, the notion of time and of modes of existence and action having become associated with them, and the subject in numerous instances, and occasionally the object, having coalesced with the verb; but these are all accidental circumstances; and the mere English scholar has here advantages which the learned do not possess, because he continually meets with verbs in his own language the same in every external character as the noun, and frequently used as nouns. The point, however, to be carefully kept in view, and what must gradually remove every difficulty, is, that the only essential difference between the noun and the verb is, that the latter (of course by association) expresses affirmation; all the superadded circumstances may be convenient for communication, but are in no way necessary; and in our own language, those superadded circumstances are in most cases expressed by adjuncts and not by the verb itself. If, in any form, a word employed to express affirmation, does not express it, it ceases to be a verb. For grammatical convenience we may arrange such forms with those which express affirmation, but it is merely for convenience; *γράφω, γράφω, scribe, scribere*, are no more verbs than *γράφω, scribens, scribendi*, &c. It would prevent much mistake as to the nature of the verb, if the infinitive and imperative moods were always arranged together under the class of the *noun-state* of the verbs. The infinitive is the *verb-noun* with a termination (originally, without a doubt, *expressive* by itself, as all terminations must have been), denoting that it is to be employed as a verb; thus in the Anglo-Saxon verb *dean*, *de* is the *verb-noun*, and *an* is the verbalizing adjection; so *ναύτης, αμα*, &c. are the *verb-nouns*, and *ναυτιμους, αμα*, &c. are the *verb-nouns*, and *ναυτιμους, αμα*, &c. and *αμα*, have the respective verbalizing adjections joined to them. In short, in our opinion, the imperative is the verb-noun itself; and the notion of command, entreaty, &c. conveyed by it, is merely the inference of custom; whether we say to a servant *bread*, or, *bring some bread*, we merely specify, in the latter case, the action and the object of the action, and, in the former, the object alone; the rest is *inferred* from tone, manner, &c. The fact indisputably is, that in every department of language, fully as much is done by inference as by actual expression; and even

as it is, thought is by far too quick for words. Though we are now encroaching on the department of grammar, we must add as one confirmation of our ideas, that the Hebrew imperative is the same with what is called the radical form of the verb, in its several conjugations, except in *niphal*, where it is the same as the infinitive. But to proceed;

*Mens, fighi*, are names, and are still acknowledged as such; when they are placed together, especially if accompanied by distinguishing tones of voice, it would be naturally inferred that the speaker intended to raise in his hearer's mind that belief which exists in his own; or at least, to inform his hearer of a connection which circumstances had formed in his mind. By degrees, at least in most nations, some of those names which were frequently thus employed with the inference of affirmation, became appropriated to convey this inference, and it would then be made whenever the word was employed; but in the more simple languages, a large proportion of those verbs which are employed as verbs, (*i. e.* conveying the inference of affirmation,) are still immediately recognized as nouns. In the Chinese, very few names are appropriated as verbs, but are used indiscriminately, and without any variation of form, either as nouns or verbs; in the Hebrew, the root, (which does not, like every part of the indicative in the Greek and Latin verbs, include a pronoun,) is a simple name, and is used, in many cases, as a noun; and in our own language, many names are used either as nouns or as verbs. When we have advanced to the frequent use, and gradual appropriation of some names to convey the inference of affirmation, the rest is easy and almost certain. With respect to the simple affirmation, the subject of it would, in the case of the first and second persons, always be a pronoun, and, in the same district, the same pronoun. This, where *spoken* language made material progress, would gradually coalesce with the verb; and the word so formed would be completely invested with the verbal character, and never be employed but with the inference of affirmation. The Hebrew presents us with this coalescence in its incipient and obvious state; the Greek and Latin shew it in a much more complete state, and the component parts cannot always be detected; no reasonable doubt can however exist but that the procedure has been the same in all. The same might also be the case respecting the third person, but the coalescence would, in this instance, be more slowly formed; and in some languages where the coalescence took place in the other persons it did not in this; it must, however, be admitted that, in others, the contrary is the fact.

Respecting the changes of the verb, to make it express other circumstances besides those of affirmation, we must refer to GRAMMAR and the connected articles, and shall content ourselves with the following general remarks. There appears to us to be little or no reason to doubt, but, that all the common changes, which have taken place in the verbs of all languages, to denote the time or mode of existence and action, (as well as those of number and person,) have been formed in consequence of the coalescence of words of appropriate signification; and though the gradual refinement of language may have greatly varied the associations of words, from what they originally possessed, yet that those changes were originally found sufficient to answer their respective purposes. In some cases the contrivances adopted can be still traced; and from the new turn which has lately been given to philological speculation, we may expect other discoveries respecting the causes or origin of particular flexions. We shall only mention two instances, which will serve to shew how simple those contrivances originally were. The future of the French verb is nothing more than the infinitive of the verb, with the present tense of *avoir*;

thus *aimerai* is *ai aimer*; and *j'aimerai*, means, *I have to love*, which mode of expression is, in our own language, used with a future force. This leading distinction between the past and the future tense of the Hebrew verb is, that in the past tense the verb is placed before the fragment of the pronoun forming the person, and in the future after it; to intimate (as may be reasonably supposed) that the action has passed the subject in the first case; in the second, that it is yet to come.

The force of the pronouns (the legitimate substantive pronouns) is very clear. *I* means the person speaking; *thou*, the person spoken to; *he, she, it*, the said person or thing, the person or thing before mentioned or referred to; and so on in the plural. When this simple view of the subject is taken, no one can feel any mystery in the origin of pronouns. The first plan would undoubtedly be, to use the names themselves; and such is the first procedure in childhood; "Mamma loves Mary, and hopes Mary will be a good girl." Children use pronouns by degrees only; and those of the first and second persons much later than those of the third, for the obvious reason that these latter are the most convenient in their limited intercourse. The pronouns of the third person identify the object now spoken of, with that before spoken of, and save much circumlocution, and still more ambiguity; the pronouns of the first person are of great convenience, in cases where the name of the speaker or hearer is unknown, where there are others of the same name, and in the plural especially where several names must otherwise be often repeated.—The pronoun is then a very valuable, but not a necessary part of speech. How it might be formed, the very probable procedure in a few instances will sufficiently shew. Horne Tooke shews that *it*, formerly written *bit*, is the past participle of the verb  $\epsilon\beta\alpha\tau\alpha$ , *to name*, and therefore means the person or persons, thing or things named or *afforsaid*; and accordingly it was applied by all our old writers indifferently to plural and to singular nouns. We do not know whether a similar opinion as to the origin of pronouns had been previously laid before the public, but the philosophical Greek professor of Glasgow (who in his very interesting and important investigations, has often anticipated Horne Tooke) long ago delivered it as his opinion, that some, at least, of the pronouns, are participles, and, if we mistake not, traced the origin of *ego* and *ipse* as follows:  $\epsilon\gamma\omega$ , in one of its earlier forms, was  $\epsilon\gamma\omega\omega$ , which is an obvious abbreviation or corruption of  $\lambda\epsilon\gamma\omega\omega$ , so that *ego* (whence the Latin and other languages have their first pronoun) signifies the person speaking. *Ipse* is the Latin past participle from  $\epsilon\pi\omega$ ; and though this verb is not to be found in Latin writers, those who know how much the Latin is a dialect of the Greek, will not feel this to be a material difficulty: on this derivation *ipse* signifies the said person, &c. Whatever be the origin of *ille*, it is obvious that it is in itself merely an adnoun, (exactly corresponding to our *that*;) employed to point out, and probably accompanied in the first instance by the action of pointing out: now from this demonstrative adnoun, (a pronoun only by a subauditor,) the French have taken not only their demonstrative *le*, but also their legitimate pronoun *il*. *Ille* is never employed without a substantive expressed or understood; *il* will not admit of a substantive; and this fact, among many others which meet us at every step of our investigations, should prevent us from imagining that a procedure cannot have been, because we can now find no traces of it: the origin of *il* was an adnoun; it is itself a pronoun. We shall add one more example of the probable origin of pronouns. *Tu* is found in the form *tute*; *tute* is the vocative of *tuitus* or *tutus*, from *tuor*, *to see, to observe*, and signifies a *seen* person: we look at the person

we speak to, and, by direct inference, *tu* denotes the person *spoken to*. It may be objected that *tu* is from *tu*, a form of *tu*; it appears to us in no way unreasonable to suppose that the Latin has preserved a verb from the early Greek dialect which the common forms of the Greek have lost.

We do not think it necessary to enter any farther into the subject of the origin of oral language. It can scarcely be doubted, by those who have studied the nature of the other parts of speech, by means of the light which the researches of Horne Tooke and others have afforded, that all have been derived from the noun and the verb; and, admitting this, all that is incumbent upon those who profess to shew the original causes of language, is to present a probable origin of those classes of words. In those procedures which have been here stated, there is nothing which supposes metaphysical research, or much observation; and to render any procedure probable, it must wear the marks of simplicity. In the present period of the language, we see the grammarian pointing out the analogies which are found to exist in language, and thence proceeding to the formation of new words upon these analogies: this is art; but the early formers of language, in their inventions, followed only the dictates of circumstances; and whatever regularity we may perceive in their inventions, must be attributed to the similarity of those circumstances. We see the philosopher inventing a new term, agreeably to prevailing analogies, to express more power of the mind, or some emotion which had not received any denomination; but those who originally gave names to mental feelings, derived them simply from some analogy, fancied or real, between the internal and an external object, and those names which now suggest to us ideas the most subtle and refined, were originally only the names of objects obvious to the senses. The reasoner, when he uses a word whose meaning has not been accurately ascertained, defines the ideas which he intends to attach to it, and uses it accordingly; in the early and even in the more refined periods of language, the ideas connected with words have been the result of casual associations, produced by local circumstances, by the customs of the age, or the appearances of nature in particular situations.

In languages in which the coalescence between the verb and its adjuncts has taken place, and also the coalescence between nouns and their connective words, much greater liberty of inversion is practicable than in those in which such coalescence has not at all occurred, or but incompletely. In other words, where the noun, adnoun, and verb, admit of flexion, there the arrangement depends, in many instances, more upon the found than upon the sense; and nearly in all cases may be made subservient to the former. This gives such languages considerable advantage over those which admit of but few changes, so far as respects their modulation; and farther, the coalescence renders them much more forcible, where emphasis or any of the fractional parts is not required. Whenever flexion increases perspicuity, the advantage is decisive and obvious; with respect to modulation, though an object of some consequence (since we may sometimes find the way to the head and heart by pleasing the ear), yet all cultivated languages will be found to possess sufficient power of pleasing the native ear; and among those who made found to much an object, sense was often sacrificed to it; with respect to force it may fairly be doubted whether the advantage of greater precision by means of more accurate emphasis, does not counterbalance it. We are willing to admit, on the whole, that the advantage is somewhat in favour of those languages in which flexion is extensively adopted; but we can by no means admit the opinions of those, who think it necessary to a perfect lan-

guage. That language is not the most perfect, which enables us to express our thoughts in a great variety of ways, but that which enables us to express any thought with precision and perspicuity; and contemptible as our own uninflected language may appear to those, who can think nothing good, but what accords with the objects of their early taste, we are disposed to believe that in its real powers, it rises beyond all the ancient languages and most of the modern.

Before we leave the subject of oral language, we must pay some attention to the following inquiries; whether words are originally imitative; whether they were long; and of what kind of articulations they were composed. The latter are of importance in tracing the gradation from hieroglyphics to alphabetical writing.

Words in their present state are simply arbitrary marks, used to denote ideas, or combinations of other words; the found of some appears to be "an echo of the sense," but in the greater number of instances in which there is supposed to be this resemblance, very much may be attributed to the fancy of the observer. It is obvious, however, that there are some words which are formed upon found, and are truly imitative; such, for instance, as denote the various sounds of animals. When we carry our enquiries further back, we are led to suppose that this might be the case in the earlier stages of language; that the original words would be formed from some resemblance, real or imagined, between the found and the thing signified. What else, at first, could induce them to fix upon one found rather than another? We have already seen that sensible objects were the first which obtained names; and of sensible objects, the number is considerable which either emit some imitable sound, or perform such motions as have generally some connection with found. Of these latter the number is evidently small; waving and regular, rapid and slow motion, violent and smooth motion, appear to be all the varieties which found would denote. With respect to sounds, whether produced by animate or by the motion of inanimate objects, these might and probably would be imitated; and the names of those objects which were connected with the sounds would be derived from those imitative sounds. The Otaheitanians give to the gun the appellation of *tick-tick-bow*, evidently imitative of the cocking and report of the gun; and the Kamtschatkans denominated the Russian clergyman *bog-bog*, because he often repeated the found *bog*, which in the Russian language signifies God. With respect to qualities totally unconnected with found, particularly mental qualities, this principle of imitation is not directly applicable. We immediately see the incongruity of colour and found, when, for example, we call to mind the idea of the blind man, that a scarlet colour was very much like the found of a trumpet. A circumstance which appears to have misled several ingenious writers on this subject, is, that observing certain letters applied to denote a class of ideas which have, among others, some common features of resemblance, they have supposed that those letters were significant of that common feature; for example, that *c* denotes cavity or hollowness. Now supposing that there is that general idea, variously modified, in every word in which the *c* forms a principal part, does it follow from this that the *c* signified by its *found* cavity or hollowness? We can discover no such similarity. We apprehend that the coincidence may be better accounted for in a different way, that the original word denoting hollowness, which has entered, variously modified, into the words in question, was *c* with some vocal found. That is the extent of the inference which may be justly drawn from the coincidence; that it was so applied, but not that it was significant of the quality. We have been accustomed to use sounds in given connections with

with such regularity and consistency, that they appear to us to have a connection of real signification instead of merely arbitrary institution. Frequently, from our acquaintance with the sense, we read a combination of words as the sense dictates, and suppose that imitation in the words, which in reality exists only in our mode of enunciation; but it is only with words separately, considered from their connection with other words, that we are here concerned; and with respect to them we cannot but confine the resemblance of their sound to their sense, to cases in which they denote either sound, or motion, usually accompanied with sound.

In tracing the transition from hieroglyphics to alphabetical writing, the probability of the theory advanced will much depend upon the shortness of the words of that language in which the transition was made. It is generally supposed that this was the Egyptian; but of the ancient Egyptian we have no remains, excepting some words which the modern Egyptian or Coptic has preserved, many of which, however, are monosyllabic. It will be worth while, therefore, to state it as a general enquiry, whether the original words of original languages were long or short. Lord Monboddo supposes that all human sounds were originally inarticulate cries; and that the first articulate sounds were imitations of the cries of animals, and consequently were of great length. "For such cries of almost all animals have a certain tract and extension (as his lordship expresses himself) such as the lowing of an ox, the neighing of a horse, the braying of an ass, the roar of a lion, &c. And that we may not think them an exception to this rule, we need only attend to the dumb persons among us who utter inarticulate cries, sometimes very loud, but always of a considerable length." There are few looser reasoners than his lordship, at least among those who possess such a fund of information as his lordship certainly did. To adduce dumb persons as an example of what men possessed of the powers of articulation would do when they first began to use those powers, seems a very incorrect mode of argument. We must, however, remember that lord Monboddo supposes men to have arisen from the state of mere brutality. We suppose, and on far better authority than that on which he rests his faith, that man was never a brute, and that the first man was led by divine interposition to use his powers of articulation. We have already seen that it is probable that the sounds to denote objects emitting sounds, would be significant; and the cries of different animals would therefore furnish names for those animals. If we confine imitation to this, great length of words is unnecessary and improbable: unnecessary because one or two distinct articulations would generally be sufficient for distinction; thus, *bow-wow* would answer the purpose to denote a dog, as well as a continuation of the sound to a hundred syllables. It is improbable, because articulation is at first very difficult, and it is therefore scarcely supposable that more articulations would be used, than were necessary to express distinctly what object they were intended to denote. If we extend the principle of imitation further, and suppose that man imitated those cries in order to express his feelings merely, his cries would have no claim to the higher title of words, and at any rate would throw no light on our inquiries.

At first sight, the hypothesis that the original words of language were long, appears to draw considerable confirmation from the vocabularies of the North American Indians. Of three that are given us by Mackenzie, two appear to be composed of words, of from two to seven syllables; with scarcely any of one. The third, on the other hand, is composed solely of words of one or two syllables.

With respect to the former, even where words actually denote objects of sense, our inferences that they are uncompounded should be carefully drawn. The moon is expressed by two words, *Tilijca-pesim*, signifying the *night-sun*; and several others appear clearly to be circumlocutions. In like manner the savages on the river St. Laurence, near Montreal (who are Catholics) give the French priests the appellation of the *maître of life's man*; and it is by far the most probable supposition, that, in uncultivated nations, names of new objects would, when possible, be formed rather by significant combination of words in use, than by the formation of new words. Thus, as we learn from Mr. Park, the Mandingo nation use the following (among many) circumlocutions: *fruit is eree-cing, child of the trees; noon, teleekoniat, the sun over head; finger, boullakonding, child of the hand or arm; brother, ba-ding-kea, mother's male child; sister, ba-ding-moota, mother's female child.* Some others we have already noticed.

Lord Monboddo is very unfortunate in the choice of examples of his theory; for not one is of that class of names, which, in all probability, were the original ones, names of sensible objects. They are the following: *wonnanawuktuck-luit*, signifies *much*, and *mikkeuawukrook*, *little*, in the Esquimaux language; and *pollarrararocwacrae*, is the name for three among some South American Indians. With respect to the two former, the examples above adduced, authorize us to conclude that they are circumlocutions, descriptive of the signification. With respect to the last we may observe, that the names of numbers were, probably, originally significant in all languages; and that the length of those names would depend upon the length of the original words, and the manner adopted in combining them. Thus *six* is, by the Kamtschatskans, denoted by *innen-milchin*, i. e. *one and five*. Numbers are so familiar to us, and so distinctly arranged in groups, that perhaps in no instance are our ideas more clear. Yet this clearness entirely depends upon the distinctness of the signs we use to denote them. We speak of ten and twenty, &c. and all seems very clear; but it is evident that if we attempt to form a conception of ten, twenty, &c. we must pass over every one singly, and endeavour to combine them together by processes which will be varied by the habits of the individual. If we give a fresh name to every group of objects, and then consider those groups as units, and so on, we are capable of extending our ideas of number indefinitely, and of speaking and thinking of them with accuracy; but if the small extent of our intellect, or the circumlocutions of our situation, prevents this grouping, and we confine our attention to individuals, our arithmetic must be very confined. Those nations which reckon only by a computation with their fingers, carry their ideas of numbers no farther than ten; those who with the Kamtschatskans take in the toes, go as far as twenty; these people can reckon no farther, and when they have advanced to this limit, they say "where shall we go now?" It is difficult to conceive what circumstances could bound the arithmetic of lord Monboddo's Indians to three, or rather what should induce them to choose so troublesome a mode of procedure; but it appears probable that they joined the names of three different men or other animals; and if they had proceeded further, would have joined four together, &c. Why they did not use shorter words to form the combination, we cannot conjecture, unless it were that their tribe was originally very small, and that they mentioned the names of one, two, or three in order to denote those one, two, or three; and that these names, being proper names of persons, would be somewhat long. But this is entirely hypothetical. It seems a more

natural procedure to repeat the word as often as there were numbers to be denoted, but the ear would not readily follow this repetition.

If lord Monbodo had looked into the vocabulary of the Mexicans, he would have thought that his theory derived great confirmation from their words. Clavigero informs us, that they had words of fifteen or sixteen syllables; but he expressly says that they are compounds. He gives us one specimen of their mode of combination. It is a title of address, *Nelazomabuitztopiscatalzin*, and signifies *my very worthy father, or, revered priest*. It is compounded of five words (taking away eight consonants and four vowels), prefixing *no*, which corresponds to *my*, and adding *tzin*, which is a particle expressive of reverence; so that there are no fewer than seven words compounded together. Their language is very copious; and one cause of the length of their words is probably the deficiency of consonants, which would render a combination of sounds necessary for distinction. It is entirely destitute of the *b, d, f, g, r, s*, but abounds with *h, x, l, z, tl, tz*.

We have before remarked, that the importance of the enquiry to us results principally from its connection with the origin of alphabetical writing. Now we may admit that the languages of these North American Indians favours the hypothesis of long words without any injury, for among them alphabetical writing never existed; and we should have enlarged less on this point, if it had not led us to notice some curious procedures of language. Yet it seems reasonable to admit, as an inference, that the original, or rather secondary words of language, would have been long (though not to the degree lord Monbodo supposes), if the circumstances of man had not required a varied vocabulary; for the more confined the number of articulations, the more extent must be given to some words to distinguish them from others. But when we advance further, and inquire of what kind the original words of man really were, we shall see sufficient reason to conclude them to be short. Language was first used in the East, and there, too, writing was first invented. We have already mentioned, that of the ancient Egyptian words which are preserved in the Coptic, a considerable number are monosyllabic. The Chinese, which, as far as original language is considered, appears to have undergone little alteration, or combination, and is probably nearly an original language, is composed entirely of monosyllables. Probably, indeed, this was the very cause that the Chinese never advanced into the alphabetical mode of writing. They had no compounds of sounds; and they varied their words by inflection of voice instead of additions of articulation. The original words of the Hebrew, Greek, &c., that is, those which are not varied by the addition of other words, are short, frequently only of one syllable, seldom of more than two. And of the vocabularies which we have had an opportunity of consulting, of the uncivilized nations of the East, the words are generally monosyllabic or disyllabic.

Having now attended to the two former of the inquiries with which we proposed to finish the subject of oral language, we shall proceed to the last—Of what kind of articulations the early languages were composed. It appears that in the early languages consonant sounds were at least generally accompanied by vowel sounds; but though this is a material point in tracing the transition from hieroglyphic to alphabetical writing, it will not be necessary to enlarge much upon it. We think this position proved, by the following, in some measure unconnected, considerations. 1. Vowel sounds are by far the most easy; and consequently they constitute the earliest vocal sounds of children, and a large pro-

portion of the vocal sounds of uncivilized nations. Several words among the South Sea islanders are composed entirely of vowel sounds; and so great is the difficulty which these people find in pronouncing consonants together, that they called Sir Joseph Banks, *Opano*. From this consideration we may fairly infer, that vowel sounds would be frequent in the original words of the early languages, which were formed before articulation was become easy. 2. Yet as the shades of distinction between them, when employed alone or together, are too nice to furnish, at least to the unpractised ear, many obviously different words; and as man was not at first in that low state of intellect in which he has sometimes appeared, a vocabulary formed of such sounds would be very inadequate to his wants; and, therefore, we must suppose that in the early languages there would be very few words without consonant sounds. 3. Some of the first articulations of man were without doubt employed in naming those of the inferior animals with which he was concerned. Now their names would almost certainly be given from their distinguishing cries, and the cries of such animals consist of consonant sounds, each followed by a vowel sound. 4. Its articulation would at first be nearly as difficult as we now perceive it to be in children, the first words would be composed of simple articulations, that is, of consonant sounds, each followed by a vowel; and new words would be formed by the combination of such; so that in the early languages all compounds would be formed by the combination of simple articulations. 5. The greater part of consonant sounds, cannot be founded singly without vowels, nor together without vowels intervening. In many cases this is evident to the ear; and when it is not perceived, it often is the fact, though the acquired rapidity of utterance may render it very little perceptible. 6. Some languages do not admit of any two consonant sounds together. The Tartar language always requires a vowel between two consonants. The Russians, we believe, does the same. The Chinese never join two consonants, unless we must except *ng*; but this appears to be only a simple sound, though represented by two of our letters. With respect to the Chinese the point is of consequence, because there is great reason to believe that they came from the stock of the Egyptians, before there had been any considerable addition to their vocabulary by combinations of sounds, and before the transition had been made from hieroglyphical to alphabetical writing. It is true many of the Chinese words end in consonants, which seems to render improbable the position advanced; but it is to be observed, that in such cases the words should be considered as of two syllables; for it is impossible, in continued speaking, to utter a complete consonant sound at the end of a word, without emitting a vowel sound. 7. That the Hebrew (which is to be considered as a representative of all the cognate eastern languages) never founded a consonant without a vowel, may be inferred from this circumstance, that those who invented the denotements of vowel sounds, while at least the leading features of the pronunciation remained, thought it necessary to add or suppose understood a vowel sound after every consonant.

Having gone over the principal topics relative to oral language, we proceed to written language. Writing has been justly considered as one of the most noble and beneficial inventions which human ingenuity can boast. We shall not expatiate upon its advantages in embodying and perpetuating our thoughts, but shall proceed to give a history less enveloped in obscurity in most of its stages than that of oral language. Difficulties indeed attend it, as mult occur in every investigation into antiquity; but we have here data

which to found our conclusions, which the fleeting nature of oral language would not permit.

Visible language first used marks as the signs of things; and we can trace it through its various stages from the simple picture to the arbitrary mark. The rudest species of visible communication with which we are acquainted, is that of the Peruvians; it was by means of knotted cords of various colours. We have reason to believe, however, that this was not the only species of visible communication among them; and it was evidently very defective. The Quipos, as they are called, have been celebrated by authors fond of the marvellous, as if they had possessed regular annals of the empire; but it seems reasonable to hesitate here. They might have some significance by agreement, but without oral interpretation they could denote little more than that something was to be remembered, in the same manner as persons of weak memories sometimes adopt the contrivance of tying a piece of string round their finger to remind them that recollection is necessary. According to the opinion of the best informed judges, they seem to have been a device for rendering calculation more expeditious and accurate. By various colours, different objects were denoted, and by each knot a distinct number: so that they might serve as a kind of register of the number of inhabitants in each province, or of the quota they furnished to the general treasury of the nation. As they had picture-writing, though to no great extent, and numbers must be denoted by arbitrary signs to render calculation at all extensive, this account is by far more probable than that of those who suppose them designed for historical purposes. In this view they could answer no farther purpose than the twelve stones which Joshua set up after the passage of the Israelites over the Jordan.

The Mexican picture-writing was the first step in the progress towards alphabetical writing. The essential difference which it will be desirable to keep in mind between the latter and all the intermediate steps, is, that in alphabetical writing we use signs for sounds only; except with the deaf, they are in the first instance significant of things or ideas only by an intermediate step: picture-writing, in all its various stages, presents signs for things or ideas directly, and only for sounds as being the denotement of them.

The simplest species of picture-writing was that in which a mere delineation of the thing to be denoted was employed; thus, to express man or dog, &c. a drawing of the animal would be given. This we learn from sir William Johnson is the procedure of the North American Indians: when they go to war they paint some trees with the figures of warriors, often the exact number of the party, and if they go by water they delineate a canoe. When they gain a victory, they mark the handle of their tomahawks with human figures, to signify prisoners; and draw the bodies without heads to express the scalps they have taken. To these simple annals the warrior trusts for renown; and pleases himself with the belief, that by their means he shall receive praise from the warriors of other times. Thus, too, the Mexicans, when the Spanish invaders first arrived on their coasts, sent large paintings on cloth as expresses to their emperor Montezuma. But the Mexicans had made much greater advances than their savage countrymen; except in some few instances they did not indeed go further than simple delineation, but by a proper disposition of their figures they could exhibit a more complex series of events in historical order. They could describe, for instance, the occurrences of a king's reign from his accession to his death; the progress of an infant's education from its birth to the years of maturity; the different recompences and marks of distinction conferred upon war-

riors, in proportion to the exploits they had performed. Some very curious specimens of this picture-writing are preserved; the most valuable one has been published, and may be found in Purchas's Pilgrim. It is divided into three parts. The first contains a history of the Mexican empire under its ten monarchs; the second is a tribute roll, representing what each conquered town paid into the royal treasury; the third is a code of their institutions, domestic, political, and literary.

The defects of this mode of painting must have been early felt. It was, where applicable, a tedious operation; and no objects but those of sense could be denoted by it. The human intellect, stimulated by the necessity of improvement, would probably have gone through the same course in the new world as it had done in the old, and have proceeded from the picture to the simple hieroglyphic, then to allegorical symbols, and lastly, to arbitrary characters; but a step was early put to the progress of their improvement by the destruction of their most cultivated empires. In the simple hieroglyphic, a principal part or circumstance of the subject is made to stand for the whole; and to this the Mexicans had made approach. In the historical painting before mentioned, the conquered towns are uniformly denoted by the rude delineation of a house, to which is added some distinguishing emblem. The kings themselves, or the leaders of their armies, are in like manner denoted by heads of men with some emblematic mark conjoined. These emblematic marks were denotements, not of their qualities, but of their names, as we learn from Clavigero, who farther informs us, that the names of places were formerly significant compounds. They advanced still further, and made use of the mere figurative hieroglyphic. When they wished to express a monarch who had enlarged his dominion by force of arms, they placed the representation of a target, ornamented with darts between the figure of the king and that of the towns which he had subdued. To denote numbers, arbitrary signs were used. It will be seen from this account, that the Mexicans had actually in some instances passed through all the intermediate stages of writing, though the short duration of their empire prevented them from extending those rudiments to a regular system. Indeed Clavigero justly complains, that injustice is done his countrymen. They evidently made considerable use of the simple hieroglyphic; their marks for months and other portions of time, for the air, the earth, &c. were symbolical, and their cyphers were arbitrary; yet they are generally supposed to have made no advances beyond mere picture-writing. Their manner of denoting numerals was as follows. They painted as many points as there are units to twenty; this number had its proper character; then they doubled it, &c. for 20 times, that is, to 400, which had a new character; this they doubled, &c. in like manner, that is, to 8000, which again had a new character, and which they doubled, &c. as before. So that with these three characters, and the points, they expressed numbers as far at least as 20 times 8000, *i. e.* 160,000. At least, however, it must be acknowledged, that the annals of a nation, conveyed in the manner we have described, must be very scanty and imperfect. And accordingly Clavigero admits, that their paintings ought not to be considered as a regular full history, but only as monuments and aids of tradition. The parents and masters took the greatest pains to instruct the rising generation in the history of the nation. They made them learn speeches and discourses which they could not express by the pencil; they put the events of their ancestors into verse, and taught them to sing them. This tradition dispelled the doubt and ambiguity which painting alone would have occasioned; and by the assistance of these

monuments perpetuated the memory of their heroes, their mythology, their laws, and their customs. See Robertson's *America*, vol. iii. p. 173—180, and Clavigero, vol. i. p. 409—11.

This simple picture-writing would soon be contracted by necessity; parts of the object, or the principal circumstances of the action, would be delineated to denote the whole of the object or action which it was intended to represent. This would correspond to what we should call in writing a plain style; but it is obvious, that language, whether written or spoken, if confined to words denoting objects of sense merely, would be very meagre and imperfect. To enlarge the powers of visible communication, the real or supposed instrument of a thing was placed for the thing itself. And a still more refined species of hieroglyphic is, where qualities, &c. were represented by objects which had some real or supposed analogy to them; this corresponds to a figurative style. We here speak of hieroglyphics as intended for the purpose of communicating, not concealing knowledge. It was long supposed that the latter was their first and only purpose; but bishop Warburton has satisfactorily proved that this use was not made of them after the former was rendered unnecessary by the invention of alphabetical writing. It is for the purpose of communication that we wish to consider them. Warburton seems to consider these three kinds of hieroglyphics as in reality three distinct species of communication; but as De Guignes justly observes, this difference regards the style alone. And though probably the most simple hieroglyphics were those first used, yet as language must have made some progress by the use of permanent visible communication, it was found necessary, and consequently must have given metaphorical meanings to the names of many sensible objects, it is not to be supposed that the hieroglyphics would be confined thus even in their very earliest stages. We must remember, too, that even the rudest kind is an improvement upon the picture-writing; so that we are not to consider them as the first attempts of men to embody their thoughts.

The most simple species of hieroglyphics was when the delineation of part of the object or action represented the whole; thus the ancient Egyptians painted a man's two feet in water to represent a fuller; smoke ascending, to denote fire; two hands, one of which held a buckler, the other a bow, to denote a battle, &c. Now if we direct our attention to oral language, we shall perceive that it still retains many of these contractions, particularly in poetry. The sail, for instance, to denote the whole ship; the hand, to denote the whole man, &c.; where, however, it must be remarked, that these contractions are for the purpose of denoting the part of the object, &c. which is most to be attended to in the given circumstances, and therefore come under the second kind of hieroglyphics, where the real or supposed instrument is used to denote the performer or the thing performed. And indeed so long as oral language denotes sensible objects, there is no advantage with respect to brevity in placing the name of a part to denote the whole, since, except in peculiar cases, the name of the whole may be pronounced with as great facility as of the part. Examples of this second class of hieroglyphics, are the eye and the sceptre to denote a king; a sword to denote a bloody tyrant; the mouth for speech and voice; an eye placed in an eminent position, to denote the presence of God; and the sun and moon in like manner were used to denote the succession of time. Instances of similar metaphors in common language are very numerous; to take the last two instances, we say the eye of God is upon us, meaning that the omniscience of the Supreme Being extends to us; and though perhaps it would be too bold even for our poetry to use the expression

of fun for the time of his apparent revolution; yet we might employ moon to denote the time of a lunation. The last kind we mentioned, was that which employed, to represent one thing, another which had some resemblance or analogy to it. Hence was the last professed in the invention of oral as well as pictured language, and it is perfectly similar to what at present we consider as an ornament, figurative language. For it must be observed, that what we consider as a beauty, was originally the invention of necessity. For instance, among the Egyptians the dog's head, (as among the Chinese the dog's voice,) was the symbol for sorrow; science was denoted by dew falling from heaven. This very metaphor is expressed in the form of a simile, in Deut. xxxii. 2. "My doctrine shall drop as the rain, my speech shall distil as the dew, as the small rain upon the tender herb, as the showers on the grass." These symbolical hieroglyphics would be very frequently derived from very fanciful analogies, founded frequently on the popular prejudices of the times. As an instance, may be mentioned the figure of an hyæna, which was used to denote a man who supported his misfortunes with courage, and rose superior to them. This took its rise in the opinion that the skin of the hyæna rendered the wearer fearless and invincible. The last we shall mention, is the famous inscription at the temple of Minerva at Sais, where we find the figures of an infant, an old man, a hawk, a fish, and a river horse. The hawk and fish were one character; this kind destroys fish, and is therefore the symbol for hatred. The river horse was the symbol for impudence, and the infant and the old man were intended to denote all men. The hieroglyphic therefore means "young and old hate impudence;" or, more literally, "old man, infant, hatred, impudence." It has been more diffusely rendered; "all ye who enter into the world, and who go out of it, know that the gods hate impudence." We may remark, as we proceed, that this tends to confirm the hypothesis, that originally all words, even verbs, were nouns. This hieroglyphic was a plain admonition, designed for the instruction of the people; for it was engraved on the vestibule of a public temple; and is therefore justly considered by Warburton, as one proof that the original hieroglyphics were for the purpose of communication, not of concealment. If the Scythian king had been able to delineate objects, he would perhaps have lent as painting to Darius instead of the real objects. The picture of a mouse, a frog, a bird, a dart, and a plough would have answered the same purpose as the things themselves, and have been less inconvenient. They would then have been real hieroglyphics.

The first object of those who invented hieroglyphics, was to preserve the memory of events, and to make known laws and regulations for the conduct of the citizen and the man. Such symbols therefore would first be employed as were of obvious interpretations. Figures founded on their language (which, as we have already observed, must have made considerable advances towards improvement,) would be readily understood, even if the analogies which gave birth to the words were forgotten. By degrees they were employed for the more refined purposes of philosophy; and analogies and resemblances were the foundation of hieroglyphics, which would be intelligible only to those who were acquainted with the sciences from which those analogies were deduced. This progress, as we shall afterwards see, is the same with that of the Chinese language, which in all its stages is an object worthy of our curiosity. Still, however, there was nothing done for concealment. The purpose of communication was still kept in view, and knowledge of the theories of the times alone was sufficient for their interpretation. But, by degrees superstition appropriated them for the purpose of concealment,

concealment, and those whose dominion over the vulgar consisted in the possession of mysteries, after the invention of alphabetical writing, which would otherwise have annihilated the use of hieroglyphics, still employ'd them to keep the secrets of the priesthood from the eyes of the profane vulgar. Their symbols, which for the purposes of communication should have had an obvious analogy, were introduced from far-fetched resemblances. A cat was used to denote the moon, because they perceived a difference in the size of its pupil at the full moon, and in different periods of its apparent magnitude. Egypt (which in the common hieroglyphic was denoted by a crocodile,) was in the sacred hieroglyphic denoted by a burning censer with a heart upon it. In the natural progress of hieroglyphics, qualities would be denoted by the objects which would be considered as possessing them in a great degree; as we have seen in the inscription at Sais. But to make the hieroglyphic a real mystery, one animal or sensible object was made to denote a variety of contrary qualities; thus the hawk denoted sublimity, humility, victory, excellence, &c. And on the other hand, the same idea was denoted by various hieroglyphics. It was this use, which was probably posterior to the invention of alphabetical writing, that has attached to the hieroglyphical system the character of mystery.

It is obvious that the exact manner of delineation would be tedious, as well as voluminous. The more use was made of visible communication, the more we may expect to find the written characters depart from the simple picture, and become arbitrary marks. Not, indeed, arbitrary in their original invention, but perfectly arbitrary to those who afterwards used them. We see, from the remains of the Egyptian hieroglyphics in their early stages, that they paid considerable attention to the delineation of their figures: they filled up the outline of their pictures; in process of time they used only the outline; and these, again, they changed, as the convenience of the writer dictated, till at last it lost every resemblance to the object which it originally represented. The changes that our written characters have undergone, and are continually undergoing, might be adduced as an exemplification of this procedure, from delineation to the curvish hieroglyphic. The mark for *and*, for example, was originally significant; it did not, indeed, represent an object, but it was a correct picture of a word. Some of the forms yet shew its derivation; & is obviously *et*; but continual changes have been made upon it, till the & of the writer no longer bears marks of its origin. We cease now to consider the letters of which it is composed; it is the representative of an idea, and, consequently, of the word denoting it in the respective nations that use it. We use it for *and* without considering at all the meaning it originally had. The use of the curvish hieroglyphics would, in like manner, take off the attention from the symbol, and fix it upon the thing signified; a progress which we equally observe in oral language, where the words employed to denote mental affections were originally denotements of sensible objects; then of mental affections bearing some resemblance to them; and, lastly in many instances, of those mental objects, without any reference to the original meaning.

We have now advanced to the verge of alphabetical writing. So far has generally been regarded as simple, and as the actual procedure; but it is imagined that still there is a great gulf, whose depth is unfathomable. Many of the preceding observations have been made with a view to this discussion; and by their means it does not appear difficult to ascertain the exact procedure. Perhaps we shall not be able to trace all the minute steps of the mind's march; but the general tract we shall find no difficulty in pursuing.

Truth, Horne Tooke observes, has generally been supposed to be at the bottom of a well; he thinks it lies much nearer the surface. More has been supposed necessary than could have been done, at least than is probable, at the periods of which we speak; and this has deterred those who saw the necessity of simplicity from attempting any thing. We shall see that much was not necessary; certainly not so much as to render requisite the exertions of genius, aided by the light of philosophical research. Signs, we have seen, become at last arbitrary marks for ideas or words. From this stage we may consider written language as taking two different courses; in one the sign became merely the sign of the *sound*, and its combinations the signs of those of sound; in the other the sign was considered as the sign of the *idea*, and its combinations did not correspond with any combinations in oral language, but were representative of combinations of ideas. The former we may expect to occur where oral language was copious, the latter where it was scanty; the former where learning was considerably diffused, the latter where it was confined to a small proportion of the persons using the language. Where the visible signs became merely signs for sounds, alphabetical writing, as we shall hereafter see, easily followed; where they were arbitrary signs for ideas, every new combination not attended by a correspondent combination in oral language, placed the introduction of alphabetical writing at a greater distance than ever. This latter we shall find to be the case with the Chinese language, to which, as far as respects the objects of the present discussion, we wish now to call the attention of our readers; as presenting some most important features in the history of language.

We have seen that written language originally consisted of pictures of the things to be denoted; then of abbreviated forms of the same; that these pictures and abbreviations were employed to denote, not only the objects they represented, but others which had some real or supposed resemblance to them; and finally, that through gradual changes and abbreviations of the written character, it became at last, instead of a picture, a mere arbitrary character. Through all these stages has the written language of China passed: from causes, some of which we can trace, they here stopped. Other nations proceeded further, and used these marks as the signs of sounds and of ideas through their intervention; the Chinese employ them as the signs of ideas, without the intervention of sounds, and their combinations and changes have no corresponding combinations and changes in their spoken language.

Before the time of Fohi, the first Chinese emperor, the Chinese used knotted cords, similar to those of the Peruvians. Fohi, in the place of these knots, employed two horizontal lines, the one whole, the other divided, and by their various combinations in threes, formed the text of the most ancient work among the Chinese, known under the name of Ye King, or the book of production. The Chinese regard this work as a precious monument of the most ancient philosophy; but, notwithstanding the numerous commentaries which have been published upon it, some so early as 1100 years before Christ, it is still unintelligible. They are, however, supposed to contain, in a few lines, the most sublime truths, and are still employed for the purposes of divination. Subsequent to the trigrams of Fohi, Xin-nang, the next in succession, is said to have invented sixty-four hexagrams, which are supposed to express the whole circle of human knowledge, and, together with the trigrams, are to be considered as the most ancient written characters of the Chinese. It is supposed that these characters were taken from the knotted cords; and it appears

to us highly probable that they expressed no more. It does not appear at all likely that these marks should be intended to denote the mysteries of philosophy, whether we consider the time of their invention, which is carried back to the age of Noah, or their inadequacy to express any thing but numbers. It is allowed that the earliest writing of the Chinese was the result of the rotation of numbers by the knotted cords. In fact, the present numerals of the Chinese appear to have an equal right to be considered as the mysterious denotements of mysteries. The present Chinese characters are not to be deduced from these combinations of lines, but from pictures and symbols. Their present form does not present any objection to this supposition. Many of them, indeed most of them, bear little or no resemblance to their original form; but the progress can be traced in very many cases, and hence it is a fair inference that they were deduced from pictures and symbols, even where the connecting steps are lost. Several examples of this are given in the Philosophical Transactions for 1769, vol. lix.

Before we proceed further in the consideration of the written character of the Chinese, we shall find it expedient briefly to consider the singular structure of their oral language. This, as we have before observed, is entirely monosyllabic; and every word may be expressed by an European consonant and a vowel, and about one-third of the words end with *n*, or the nasal sound of *n*. We must not expect to find a monosyllabic language very copious in sounds; and we shall expect a still smaller variety of words when we find that their consonant sounds are less numerous than ours, as they are destitute of the *h*, *d*, *r*, and *x*; in fact, the number of their words is not more than 330. This number is so small, that we should suppose it inadequate to the purposes of life, much more so to those of science. The capabilities of their oral language are, however, very much increased by the variation their words undergo by means of tones, or other inflections of the voice. For instance, the word *Fu*, differently pronounced, denotes a husband, to help, a town, a father, and to conceal. There are other modifications of sound which the same word undergoes, which enables them to extend its meaning without confusion, and this to things very opposite, or at least very different in their nature. These nice distinctions certainly require a very discriminating eye to perceive them, and very flexible organs to express them; but we know the power of habit.

We have in our own language instances of words approaching so nearly to sound, that many never pronounce them correctly, yet seldom leave any room for ambiguity; for instance, *hair*, *air*, *heir*, *are*, *hare*, are all different sounds, but their similarity is so great, that many confound them in pronunciation. Staunton observes, that synonymous words are very much used in conversation; and this must materially lessen the ambiguity. This, however, must be only for the sake of those who have any difficulty; for it seems to be the genius of the Chinese language to express the ideas of the speaker in as few words as possible. "The Chinese," says a writer in the Philosophical Transactions, vol. lix, p. 495. "speak as fast as we do, say more things in fewer words, and understand each other." The last resort to diminish the occasional difficulty in conveying their ideas by oral language is to trace the written sign in the air, or in a more permanent manner.

A language in which we find not more than 1500 distinct sounds cannot be considered as copious. It is probably sufficient for all the purposes of life, but for the purposes of science very inadequate. Most nations have improved their oral language; the Chinese have directed all their attention to the improvement of their written language.

They have refrained from combinations of words to express combinations of ideas; and what appears still more singular, the combinations which have been formed in their visible, have not been carried into their oral language. In fact, the Chinese writing may be considered as totally distinct from their oral language. One might have supposed, as Ferret says, that it was invented for those who do not possess the capacity of speech. The written not having been founded on the spoken language, the improvements and changes of each are independent of the other. Their characters were originally signs of ideas; and as it is much more easy to introduce changes in the language of science, than of the vulgar, the philosophers combined, and combined their combinations of characters, but did not, perhaps could not, carry their combinations into oral language. Thus, for instance, the character for *house* named *mien*, and that for *fire* named *ho*, when combined denote *calamity*, expressed in oral language not by *mien-ho*, but by *tsai*. On the other hand, as our writing is a denotement of sound, every combination of written words will have a correspondent combination of sound: and no combinations will be formed except such as can be spoken. We may compare the Chinese characters to the arithmetical cypher, or to algebraic or astronomical characters, which may be understood by those who are unacquainted with the words we express to denote them. Present an arithmetical calculation, or algebraic demonstration, to ten mathematicians of ten different countries, every one understands it immediately. In the same manner the Chinese characters are intelligible not only in all the provinces of this vast empire, but farther in Japan and Cochinchina, whose spoken languages are totally different from that of the Chinese. If these nations converse they employ an interpreter, but the obstacles to communication vanish, as soon as they trace their written character. There appears, however, a considerable difference between the common use of the arithmetical cypher, and the use of the Chinese philosophers make of their characters. We always think of *one*, *two*, &c. if we use 1, 2, &c.; at least this must be the case with all who are not in the habit of calculation; and the visible sign is so strongly associated with the audible, that we apprehend few persons read to themselves without the intervention of sound, real or conceived. When we think in words (as we always do when we reason, and frequently when we feel), it is to the audible and not to the visible sign that we attend: and we apprehend that it is generally the case where the habit of solitary study and seclusion from the world has not been formed. Our written words are more or less exact representatives of the sound, and it is therefore difficult to separate them even in imagination: but the Chinese characters have no connection with sound, except by their common connection with ideas. And as they have no visible representation of the sound, its intermediate association cannot be sufficiently strong in the minds of their literati to render it necessary in the train of reasoning to use the sound at all.

All the Chinese characters are composed of 214 *keys*, *keys*, or *tribunals* (as the Chinese themselves call them). These represent the most simple ideas, and by their combinations are produced, expressions for the more complex ideas. In fact, these keys express *fire*, *water*, *earth*, *air*, *wood* (which are the five elements of the Chinese), *the sun*, *the moon*, *bird*, *man*, different kinds of *animals*, *mountains*, *valleys*, &c. *father*, *mother*, *son*, *life*, *death*, *the body*, and different *parts of it*, and some *vessels* and *instruments*, and many other things similarly simple. All these can be traced to simple paintings or symbols; and hence the whole written language may be justly considered as deducible from the

## LANGUAGE.

more simple writing of the Mexicans and the Egyptians. Indeed, the resemblance between the ancient Chinese character and the Egyptian hieroglyphics is so striking, and this in cases where the analogy on which both are founded is not an obvious one, that De Guignes considers them as derived from the same source. The actual number of the keys at present is 214; and anciently they were more or less numerous, but this has been owing rather to the different opinions of the philologists of the time, than to any real change in their number. These keys are formed at present from six simple strokes, a horizontal line, two perpendicular lines, the one pointed at the bottom, the other blunt, a point, a line curved to the right, and another to the left. We are not, however, to suppose, that the inventors of the Chinese characters fixed upon these six elements, and composed all the characters from them methodically: this is the procedure of art. But as writing gradually passed from painting, it lost its correctness of delineation, and then the object was to facilitate, as much as possible, the labour of writing. It reduced all the characters by degrees; the more compounded, to others less so; and these again to simple strokes, such as have been mentioned. These 214 keys are each employed alone, as a character serving to express an idea, or differently combined one with another when they are considered only as parts of a group. The several parts of this group, or combination, form a kind of phrase expressive of the idea it is intended to communicate. Thus, the Chinese character for *night*, is composed of three characters, signifying *darkness*, the *action of covering*, and *man*, which rendered literally, signifies *darkness covering man*; a phrase which perfectly expresses the idea of night, and which is similar to the language of poetry. Both, in fact, issue from "the cradle of the human race." This figurative kind of language (the offspring of necessity) is what we admire so much in the sacred writings; it comes home to our feelings and our bosom; it points to our minds, and calls up their conception forcibly and correctly. Hence it is justly deemed a beauty, and whenever the language of feeling is necessary to excite the mind to activity, will generally be found a prevailing trait.

We might suppose that all the Chinese characters, being composed of simple characters, might be easily understood, when the meaning of the keys composing them is known; as is the case in the two examples which have been given. If it were actually so, the Chinese would be the most easy of all languages, and might be adopted as a general or philosophical language; but the analogies and metaphors on which the composition is founded, are often forced and often erroneous. Their principles of philosophy furnished a wide field for combination; but frequently these are absolutely false: their ancient customs and their popular superstitions all afforded scope for the invention of new characters; and to understand the compound characters of the Chinese, without the aid of oral instruction, we must understand their ancient physical and religious dogmata, and join to this an acquaintance with the fleeting customs and opinions of the times in which they were formed. This is not peculiar to the Chinese language; in order to trace the origin of words, the same references are often necessary, but we have more frequently the data requisite to enter into them. For instance, *candidus* in Latin signifies *white*, *candidatus*, a *candidate* (a person who offers himself to fill a lucrative or honourable situation), a *person dressed in white*. We should have been unable to follow this analogy if we had not been informed by history, that among the Romans all *candidates* for places wore white robes. In a similar manner the Chinese character, *two*, *rua*, is composed of two, that of

*wrapping*, and that of *feet*; this is not an obvious procedure, and the Chinese do not retain any explanation of it; but we know that the savages of Louisiana, when about to undertake a long march, *wrap* up their *feet* in cloth to prevent their being torn; and it is highly probable that the combination of *two* must refer to a similar custom.

We have now traced the various procedures which have been adopted to perpetuate the remembrance of actions or opinions. We have seen the artless contrivances of men in early stages of cultivation; we have observed the progress of the art of visible communication from the rude *quipos* of the Peruvians to the curvilinear hieroglyphic of the philosophic Egyptians. We have found that when the visible marks lost their original correctness of delineation, they became mere arbitrary characters. From this stage two procedures have been pursued; some nations have ceased to consider them as signs for things, and have retained them as signs for sounds; others have continued to use them as signs for things without any immediate connection with sound. The latter have combined, and combined these combinations to form expressions for ideas without any regard to analogous combinations of sound; the former have combined them to express combinations of sound, and of ideas only by their intervention. In the one the written language is a picture of the spoken, in the other it is a picture of thought. We now proceed to the object we have all along had in view—the investigation of the other procedure, where visible marks became signs for elementary sounds.

In tracing the origin of oral language, we derive some assistance from the Mosaic records; we ascertain the degree of divine interference. In tracing the origin of alphabetical writing we must expect no such assistance; the art of writing is no where referred to a divine original, and while revelation is thus silent it becomes us to be silent too. Upon the principle that we ought not to suppose miraculous interposition merely from the difficulty of accounting for a phenomenon, we should argue *a priori*, that no miraculous interposition took place in the present instance. This would not weigh in the least if we were assured by the scriptures of the reality of that interposition; but it weighs very much against all presumptive arguments for it. However, though revelation is silent on this head, yet there are some arguments in favour of the theory of the divine origin of alphabetical writing, which it will be desirable to consider. After stating these and the answers which occur to obviate or lessen the difficulties they present, we shall point out what appears the most probable account of the transition of hieroglyphics to letters.

It. Alphabetical writing may be traced to one source. Now if it were an invention of man, especially if it be a simple invention (as it must be shewn to have been, in order to give any plausibility to the hypothesis), there is no reason why it should not have been an independent invention.

Two answers may be given to this argument. 1. If we examine the alphabets of Asia, we shall find it difficult to admit that they may be traced to one source; there is so great a degree of dissimilarity among them, that it requires stronger evidence than any we have yet seen to prove it. When, however, we consider the changes that we know have actually taken place in the same character, we may admit the possibility of the original identity, and perhaps other circumstances may induce us to admit its probability; but this probability cannot, we apprehend, become so great as to give any force to the argument in question. But even admitting its certainty, we observe, (2) that this can only prove the high antiquity of the invention. That it originated before mankind were much separated from each other;

other; and that the ground-work being laid by those who had made the greatest advances in cultivation, was built upon by those people who afterwards penetrated to a distant part of the continent.

But it is urged, in the *second* place, that we have not only no instance of independent discovery, but have even an example of a nation, which had no communication with the original inventors, remaining in total ignorance of it, and employing a procedure which now incapacitates them for the reception of alphabetical writing; and the force of this objection is materially increased by the circumstance, that their writing, equally with the alphabetical, originated in hieroglyphics, and actually went through the same stages, viz. from the simple picture to the arbitrary mark.

This singular procedure of the Chinese, which certainly presents a difficulty against the theory of the human origin of alphabetical writing, may probably be obviated by the four following considerations: (1) The written language of China was cultivated more for the purposes of philosophy than of common life. Their combinations were founded on their philosophy; and it probably would not have been in their power to have carried these combinations into the oral language of the vulgar. A complete nomenclature of chemistry has been introduced, founded on the prevailing theory of chemistry. This is universally received, wherever the new system is embraced; but it would have been impossible for the philosophers, who invented this beautiful specimen of philosophical language, to have induced the illiterate of a whole nation to change their language, or adopt a new one, however expressive and correct. The philosophers of China might indeed have formed an oral language upon their characters; but the genius of the Chinese seems rather to direct them to study than to conversation, and abstract philosophy is better taught to the studious by written than by oral communication. Besides, (2) the spoken language of China did not favour the plan of making their writing representatives of sound; for their words being all monosyllabic, and not very numerous, there would not be the same necessity for attention to elementary sounds: and what is more important, they did not vary the *articulation*, but the *tone*, in order to express a variation of meaning. It appears to us, that alphabetical writing could not, from the very nature of their spoken language, have originated among the Chinese: and to these considerations we may add, (3) that the empire of China, with its dependencies, was so extensive, that there must be a very great variety in the Chinese dialects; and this would contribute to increase the attention of their literati to the written language, since this (as we have seen it actually is) might be understood independently of their spoken words. (4) If we admit the very probable hypothesis of De Guignes, that the Chinese characters were brought from Egypt, and that they had originally no connection whatever with the spoken language of the country into which they were introduced,—that, in fact, they were applied to denote names different from those with which they had before been connected,—we shall perceive at once the reason why, originally, the combinations of the characters were not attended with similar combinations of sound. After this, there is no difficulty in admitting that the written must continue independent of the spoken language, especially among people so little addicted to innovation as the Chinese appear to be.

It is urged, in the *third* place, that the invention of writing is, by many of the ancients, ascribed to the gods; and that Pliny, in particular, expressly says that the use of letters was eternal.

To this it is replied, that the ancients universally ascribed

to the gods all inventions of which they knew not the origin; and that as for Pliny, he expressly says elsewhere, that the Phœnicians were famed for the invention of letters. The merit that this argument can prove is the antiquity, but not the divine origin, of this invention.

Such appear to be the principal arguments from fact, in favour of the divine origin of alphabetical writing. There are some arguments *à priori*, which remain to be considered: these are, *first*, the difficulty of the invention in any stage of human progress; and, *secondly*, its antiquity, which very much increases the improbability of its human origin.

*First*, With respect to the difficulty of the invention, it is observed, that we are to suppose that the inventors decomposed the sounds of words, not only into syllables, but into letters; observing the component parts of syllables, and denoting these parts by appropriate marks; and using marks for these elementary sounds in the visible representation of other words, into which those sounds were found to enter. This distinction of the articulate sounds of man, tracing them through all their various combinations, and expressing them by a few simple marks, whose combinations may express every possible combination of sound, appears to suppose a habit of patient experiment, of discriminating examination, and of generalization, which ill accords with the uncultivated state of the human intellect in the early periods of society. But, *secondly*, when we consider the antiquity of the invention, when we are forced to carry it so far back as to have been in a state of perfection as early as the time of Moses, this difficulty appears insuperable. We must admit, it is urged, that men, in the earliest ages, stepped at once from a tedious and awkward, frequently unintelligible, method of communication, to a method which answers every purpose of communication, in the shortest way; and that, unlike all other inventions, it was brought at once to such a state of perfection, that no succeeding alphabet has any real superiority over the ancient Hebrew.

This objection against the human origin of letters is more weighty in appearance than in reality. With respect to the difficulty of the invention, the objection loses all its force, as soon as a simple and easy procedure, such as might be adopted in the circumstances of the case, can be pointed out. To obviate the difficulty arising from the *apparent perfection* of the original invention, we may observe, (1) that if the perfection of an alphabet consists in its capability of expressing all the sounds of spoken language, there is no known alphabet which is perfect. Every letter should express only one definite sound, and every known sound should have a corresponding letter. We do not mean that it is necessary that the alphabet of one language should be capable of expressing all the sounds of another, but of its own. Now we have no instance of this among living languages; and we cannot, therefore, suppose that it was the case in any former language. But even admitting this, we may observe, (2) that no known alphabet, however ancient, is in the state of its original invention. Cadmus, who was born in the East, carried with him into Greece only sixteen letters; the least curious alphabets we are acquainted with have twenty-two. It is not in the least probable that Cadmus would introduce fewer than he possessed: it is more probable that he introduced more, to express sounds of which he had no representation, but which were found among the Aborigines of Greece.

We have said, that if a procedure can be pointed out, simple as the intellect of the inventors of language, and capable of easy introduction in the early periods of mental culture, all arguments *à priori* fall to the ground. It has generally been supposed of late that alphabetical writing was  
formed

formed from hieroglyphics: it appears nearly certain that it was so; but the transition was never, we apprehend, explained with probability before the time of De Guignes. His hypothesis appears to have been unobserved by subsequent writers, who have attempted to trace the transition; and the only satisfactory statement which we have noticed in our own language is in a paper in the Irish Philosophical Transactions, by Dr. Hearney, who advances one important step, by supposing that letters originally represented syllables. Dr. Hearney, however, speaks of the human mind as accustomed to analysis, when the transition took place; and supports his hypothesis on the subject with arguments which appear little conclusive.

"Perhaps," says De Guignes, "we have done too much honour to the inventor of letters (whoever he was), in supposing that he dissected the voice into two parts, and invented marks of two kinds, some to express consonants, the others vowels. It is more natural to suppose that the hieroglyphical writing was abridged by little and little, by suppressing a great number of figures; and that those which they adopted preserved always the sounds which they had before; that they read them as they had read hieroglyphics; that they were always words, but very simple, and words whose base was a single consonant; that finally reduced into a regular order, (which we call the alphabetical,) they were regarded as consonants, capable of being differently modified by a simple vowel found."

Our ideas on the transition from hieroglyphics to letters, (derived in a great degree from De Guignes,) may be thus stated:—The hieroglyphics, with their exactness of delineation, lost their original significance, independent of spoken language. This must first be the case with words of the most frequent recurrence, and which entered most into combination with other words. Having become simple denotements of sound, they were employed to express their respective sounds in combination of other monosyllabic words, which in like manner had lost their original significance. Hence, by degrees, they would become representative of the component parts of all words into which their respective sounds entered. They were always words, but very simple, consisting only of a consonant and a vowel. Variation in the pronunciation of the vowel would occur in different dialects; and hence these marks would gradually be regarded as consonants, capable of being differently modified by simple vocal sounds. Letters, at first monosyllabic words, then became marks for the component parts, or syllables of dissyllabic or polysyllabic words; and then for the unchangeable part of those syllables, that is, for consonants. In the most ancient state of the oriental languages, vowel sounds had no distinct marks; in the latter, marks were joined to the consonants, to express the different sounds with which the radical consonant was invested. Among the western nations, a different procedure was adopted. In some cases, they used the marks which they had received from the oriental nations, for an *aspirate and vowel*, to denote the *vowel itself*; and having once commenced the use of distinct marks for vowels, the procedure was continued, and new marks adapted to express noticed variations of vocal sounds.

In support of this hypothesis, may be adduced the following observations:

1st. We have seen that hieroglyphics did become significant of *sounds*; and that words originally significant of one class of ideas being applied to a second, lost their connection with the former, and became directly significant of the latter.

2. We have reason to believe that words were originally

monosyllabic in those nations where alphabetical writing was invented, and that the combination of old sounds, or the use of them uncombined, to express new ideas, was the mode employed to extend the capabilities of their language. Hence the same word would frequently occur in combination, and though its different significations must originally have been represented by different hieroglyphics, yet as these lost their significance, they would easily become as extensive in their meaning as the sounds themselves. And it is obvious that the most simple of those hieroglyphics which were used for the same found, would be employed to represent the found.

3. It has been shewn to be highly probable that originally every consonant had its vowel found. Hence all syllables might be represented by two, or at most, three European letters. This circumstance would materially diminish the varieties of syllabic sounds.

4. The probability of the theory advanced depends greatly upon the hypothesis that originally letters were syllabic. The following facts appear to prove this. The ancient oriental alphabets had no denotements for vowels; and even if this be disputed, it must be admitted that they had many words into which none of the supposed vowel marks entered. The Ethiopian alphabet is entirely syllabic. The simple letters denote a consonant and a short *a*, and marks were added to them to denote other vowels, where used. What is doubly singular and important, they have in many cases added marks to these syllabic characters, to denote that they have no vowel belonging to them. In the Coptic and Arabic, there are syllabic characters. The alphabets of the eastern Asiatics are principally syllabic, some with *z*, others with *z* joined to a consonant. These circumstances render very probable the account here given of the transition from hieroglyphics to letters. The following observations more directly tend to ascertain its high probability.

5. The letters of some of the ancient alphabets have so great a resemblance to the hieroglyphical characters, indeed are such exact transcripts of them, that a simple inspection is sufficient to convince us that hieroglyphics were the origin of letters, and this point is almost universally admitted. This however proves little as to the nature of the invention of alphabetical writing, except that it was subsequent to the use of hieroglyphics. But,

6. These characters in many instances retained their original significance, which proves them to have been, as De Guignes supposes, denotements for words. We must not expect to find this significance in all words of which they form component parts; but in such only in whose visible representation the original hieroglyphic formed a component part. Now we must observe, first, that the names of several of the oriental letters are still by themselves significant, and that some of these letters are similar to the Chinese characters which have the same signification. Thus the Hebrew *yod*, signifies the *hand*. Its form in some alphabets resembles the Chinese character for *hand*. The *7*, *daleb*, of the Hebrews, Phœnicians, and Ethiopians, signifies a *gate*, and the *action of opening*. The hieroglyphic which among the ancient Chinese represented a *gate*, is exactly similar to this letter. The *2*, *phi*, of the Hebrews, and of the Ethiopians, signifies the *mouth*. The Chinese characters for the mouth all resemble it. The *3*, *ain*, signifies the *eye*. The Phœnicians and Chinese employed the outline of the eye as a denotement of the object. The *4*, *sin*, in Hebrew signifies the *teeth*, and its figure is still found among the Chinese, with the same signification. The *5*, *mem*, signifies *water*. The corresponding Samaritan and Ethiopian characters have a clear resemblance to the Chinese hieroglyphic for water. Lastly, the *N*, *aleph*, (originally perhaps signifying *ox*) signi-

fies unity, the action of conducting, pre-eminence. The Plectrician form of this letter exactly represents the Chinese character for one, and every action by which we are at the head of others. But these letters are not only significant by themselves, but secondly in combinations. Thus 一 was expressed by the monosyllable *ya*, *ye*, or *yo*; to this another monosyllable, which had equally a signification relative to the figure being added, formed a word of two syllables. For instance, instead of the present denomination of 一, *dalet*, we may reasonably suppose its original found to have been *de*. The word 一, *yad*, hieroglyphically represented by a gate and a hand, is found in the Hebrew with a signification derived from that of the letters composing it; *to cast out*, (as we might say, hand him to the door,) *to extend*. Ad to this the word 一, *ain*, (originally, probably, founded *ho*), which signifies the eye, and we have *yadho*, which should signify *to open the eyes, to extend the view*, &c. and metaphorically, *to know, to understand*; and in fact this is the signification of 一 in Hebrew. But this is not all, for exactly the same procedure has been adopted by the Chinese. *Ki*, which signifies *to examine*, is composed of three radical characters, of which the first signifies the hand, the second a gate, the third the eye. So also *Kia* is composed of three characters, one signifying the teeth, the other two, gate or opening, which signifies *to break through, to make a great opening*. In Hebrew, 一 is similarly composed, and signifies *to plunder, to lay waste*.—*Tebi* is a large collection of water. It was composed of the characters for hand and water. The same compound was formed among the Hebrews, and 一, *gam*, signifies a great collection of water, or the sea. In Arabic the letters *th*, i. e. earth, and *nim*, i. e. water, form the word *tham*, and signify a flood. The Hebrew *tham* is composed of the *th* or earth, and the *nim*, which signifies man, i. e. man of the earth, and further, *to form, to create*. In both these instances the Chinese correspond in their combinations with the alphabetical writing.—Many other instances might be brought. We will adduce one, to which there is no corresponding combination in the Chinese language. *Ab* or *Haba* signifies father; the component parts of it signify principal of the house.

The papers of De Guignes, to which we are very greatly indebted on this subject, are to be found in *Memoires de l'Academie des Inscriptions et des Belles Lettres*, vol. 34, &c. See ALPHABET, HIEROGLYPHICS, LETTERS, WORDS, and WRITING.

LANGUAGE, *Structure* of, comprehends the nature and arrangement of the different parts of speech. See each under its proper head. (See also GRAMMAR.) No grammatical rules, however, have sufficient authority to controul the firm and established usage of language. Established custom, says Blair (Lectures, vol. i.), both in speaking and writing, is the standard to which we must at last resort, for determining every controverted point in language and style. But it will not follow from this, that grammatical rules are superfluous as useless. In every language, which has been in any degree cultivated, there prevails a certain structure and analogy of parts which is understood to give foundation to the most reputable usage of speech; and which, in all cases, where usage is loose or dubious, possesses considerable authority. In every language, there are rules of syntax which must be inviolably observed by all who would either write or speak with any propriety. For syntax is no other than that arrangement of words in a sentence, which renders the meaning of each word, and the relation of all the words to one another, most clear and intelligible. See SYNTAX.

Usage and custom, says F. Buffier, are the rule of a language; and these hold their empire independent of reason,

or any other cause: nor has reason any thing to do in language, unless to study or teach it, such as it is. Here then commences grammar; a just plan of which supposes a language already introduced by use, and, without pretending to alter or amend a title, only furnishes reflections, called *rules*, to which the manners of speaking used in that language may be reduced; which assemblage of reflections is what we call the *grammar of that language*. This remark may obviate an abuse introduced among grammarians, who are ever crying out, "Usage is, in this point, opposite to grammar; or the language here frees itself from the rules of grammar, &c."

It is chance then to which we owe usage, and usage that makes the rules and measures of language. Usage, indeed, is somewhat dubious, and may be divided into *good* and *bad*. If it be asked, wherein the difference between these lies? it is in this; that the one is better established, or authorized, than the other; and if it be asked, wherein that difference of authority consists? it is answered, that in dead languages, that which makes the good usage is the writings of the best authors in that language; and if it be further questioned, which are the best? those are allowed such, who wrote when the state was in its greatest glory. Thus the age of Augustus, being the most distinguished by great men, who then flourished, we call that good Latin which is conformable to the manners of speaking used by authors, who wrote within fifty years before, and fifty after, the reign of that emperor. As to living languages; the good usage, or mode, is that which obtains among the most eminent persons, whether as to quality and authority, or as to learning and the reputation of writing well.

With this view it is, that M. Vaugelas defines usage of a language, the manner of speaking used by the soundest or best part of the court, conformable to the manner of writing among the best part of the authors of the time. But this definition, how judicious soever, may occasion infinite doubt; for which is to be deemed the best part of the court, and of the writers? Each party, doubtless, thinks itself the best. F. Buffier, therefore, very justly, instead of the best part, substitutes the greatest part, which brings the matter nearer to a certainty: the most numerous part being something fixed and palpable; whereas the most found part may be insensible or arbitrary. There is found a constant resemblance between the genius or natural complexion of each people, and the language they speak. Thus the Greeks, a polite, but voluptuous nation, had a language perfectly suitable, full of delicacy and sweetness. The Romans, who seemed only born to command, had a language noble, nervous, and august; and their descendants, the Italians, are sunk into softness and effeminacy, which is as visible in their language as in their manners. The language of the Spaniards is full of that gravity and laughtiness of air which make the distinguishing character of that people.

The French, who have great vivacity, have a language that runs extremely brisk and lively. And the English, who are naturally thoughtful, and use few words, have a language more concise and laconic, though far from being deficient in respect of copiousness.

LANGUAGES, the Diversity of, is generally allowed to have taken its rise from the confusion at the building of the tower of Babel. See CONFUSION OF TONGUES, and DISPERSION OF MANKIND.

As to the point of antiquity and priority among languages, that has been extremely controverted. Herodotus tells us, that in the dispute between the Egyptians and Phrygians about the antiquity of their languages, Psammethichus, king of Egypt, ordered two children to be brought up, with  
express

express prohibition not to have one word pronounced before them, but to leave nature to speak of herself; and the first word they spoke happened to be *becos*, which, in the Phrygian language, signifies *bread*. The Egyptians, however, were not convinced with this proof. The Arabs dispute the point of antiquity with the Hebrews; but the Jews, jealous, even to excess, of the honour of their nation, positively insist on it, that the Hebrew tongue, such as it is found in the Holy Scriptures, is the primitive language, and that spoken by the first man. For the arguments alleged in favour of this opinion, see *HEBREW Language*.

Of all the oriental languages, except the Hebrew, the Syriac has had the greater number of advocates, especially among the eastern authors. They have alleged, that a dialect of this language was spoken in Mesopotamia, Chaldæa, and Assyria, where mankind first settled after the flood, and where, it is presumed, the language of Noah and his sons remained: to which argument they add, that the names of persons and places mentioned by Moses are easily derived from that language. Besides those kindred languages, which are commonly called the oriental tongues, the Armenian, the Celtic, and the Coptic, pleading the antiquity of their nations; and the Armenians, that the ark first rested in their country: the Greek, on account of its great extent and copiousness, the Teutonic, from which some have pretended to derive even the Hebrew itself, and the Chinese, have aspired to preference, in point of antiquity.

The pretensions of the Chinese, in particular, have been supported not only from the great antiquity of that nation, their early acquaintance with arts and sciences, and their having preserved themselves so many ages from any considerable mixture or intercourse with other nations; but also from the singularity of the tongue itself, which consists of few words, all monosyllables, and is most simple in its construction, having no variety of declensions, conjugations, or grammatical rules. Besides, it is urged, that the Chinese are the posterity of Noah, and that Fohi, the first king of China, was Noah.

Mr. Webb, an ingenious writer in the reign of Charles II., strenuously maintains that this is the only original language, and that they now talk in China the language of Paradise.

Others maintain, that the language spoken by Adam is lost; and that the Hebrew, Chaldee, and Arabic, are only dialects of the original tongue. So far are they from giving the priority to the Hebrew, that they maintain Abraham spoke Chaldee before he passed the Euphrates; and that he first learned the Hebrew in the land of Canaan; so that this was not a special language consecrated to the people of God, but was originally the language of the Canaanites.

M. Le Clerc is of opinion, the Hebrew is far inferior to the Greek, both in copiousness, elegance, and perspicuity; it is dry, and destitute of ornaments, inasmuch that, wanting expressions to vary the phrase, the same periods are perpetually returning. The rabbins, converting its poverty into an excellence, say, it is so pure and chaste, that it has no proper names for the parts of generation, nor for those by which the excrements are discharged. See *HEBREW*.

The Arabic is held the most copious of all languages. See the Preliminary Discourse to Sale's Koran.

*LANGUAGE, Euphony of, for Singing.* It seems as if the vocal music of every country depended on the purity of the vowels, neat articulation of the consonants, and easy utter-

ance of the words of which a language is composed; and there can be doubt but that the dialect which has the greatest number of open vowels mixed with its consonants, is the most favourable for vocal purposes. The tones of voice can only be heard with purity and clearness by the assistance of vowels: as the words, *vowels* and *voice*, are equally derived from *vocalis*, which implies a *sound*, a *musical tone*, vocal melody, or modulation. And it is not only from the general facility with which the syllables of a language can be uttered with neatness and articulation that it is rendered favourable to the singer, but from the number of *vocal terminations*, or words ending with vowels, which allow the voice to expand, and finish a musical phrase with ease and purity.

It is generally allowed that the French language is *nasal*, the German *guttural*, and the English *silulating*, and loaded with consonants, nasal syllables ending with *ng*, and other harsh and mute terminations. We have, indeed, filed off the Saxon roughness in words where *gh* occur: as *cough*, *trough*, *laugh*, *plough*, *through*, *eight*, *freight*, *enough*, &c. which used to be pronounced in the Teutonic manner, and which are still guttural words in Scotland, and some parts of England.

But besides the obstructions which the voice meets with in its passage, from clashing consonants in the middle of words, we have a greater number of terms that end with absolute mute and abrupt consonants, than either the French or Germans: such are those which terminate in *b*, *d*, *g*, *h*, or hard *c*, *p*, and *t*. And it is not easy to defend our language from the *hissing* of which it is accused by foreigners, on account of the frequent use of the letter *s* at the end of words, and the great number of words which terminate with a double *s*. For though the plural number of French nouns is distinguished in writing by an *s*, as well as the English, yet the final *s* is never pronounced. The German plurals too are terminated by the letter *n*: as *haus*, *hausen*; *strass*, *strassen*; *pserd*, *pserden*; &c. in the same manner as *hous* is used to be *hausen* in the plural, *hose*, *hosen*; and as the substantives *ox* still has *oxen* in the plural. And the letter *n* being a liquid, renders the words which it terminates less difficult to utter, as well as less offensive to the ear, than the letter *s*, with which we have more words begin and end than with any other letter in the alphabet. Indeed, modern refinements or corruptions in pronouncing our language have greatly augmented the sibilation with which we are justly charged, by changing the *eh* and *ah* of verbs into *es* and *as*; and saying *gives* for *giveth*, *has* for *hath*, &c.

The learned Dr. Wallis, a profound musician, in his treatise "De Loquela," prefixed to his Grammar of the English Tongue, has considered with great exactness the accurate formation of all sounds in *speaking*, to which few have attended before; but with respect to *singing*, the work is still to be done.

Dr. Holder, who was a very learned musician and a composer, though he has admirably analysed the principles of pronunciation, and described the organs of utterance, with respect to colloquial language (Elements of Speech; an Essay of Inquiry into the natural Production of Letters, 1669), has not pointed out the means by which the musical voice in articulating words is assisted or impeded in its formation and delivery, or the causes of its arriving at the ear with more or less clearness and purity. It was a subject that did not immediately concern the purport of this excellent essay, which was written with the benevolent intention of assisting persons born deaf and dumb to comprehend the speech of others by the eye, from its effect on the external organs; and, therefore, the omission of such en-

quires as seem necessary in this place cannot be termed a defect.

Rouffleau, in his ingenious and spirited "Lettre fur la Mufique Françoife," has confined his remarks chiefly to the vices of the French language; but to all, except the natives of France, a lefs eloquent and forcible writer might eafily have proved it unfit for every kind of vocal mufic, fuperior to a "Vaudeville," or "Chanson à table:" for the words of thefe compositions being their principal merit, the hearer is the lefs inclined to judge feverely of the mufic, or the finger, provided he lofes none of the wit or ingenuity of the poem. And, indeed, it is at the *serious* French opera, and by the performance of *flow mufic*, and *airs tendres*, that thofe accuftomed to good finging are moft offended. However, in the parallel which Rouffleau has drawn between the languages of France and Italy, after defcribing all the inconveniences arifing to a finger from the compound, mute, nasal, and dead fyllables, of the French language; he afferts, that the paucity of fonorous vowels, and abundance of confonants and articulations, force the lyric poet to exclude many words, and allow the mufical compofer to give only elementary, or fhort and fingle founds, to the others. There is no language in which *all* the words of its vocabulary are equally fit for mufic, or lyric poetry; according to Salvini, out of forty thoufand words in the Italian language, only fix or feven thoufand can be adopted by the writers of *serious* mufical dramas. Indeed, fome of thefe rejected words, by their want of dignity, as well as foftnefs, may be unfit for lyric compositions. Hence, the melody neceffarily becomes infpid and monotonous, and its movement flow and tirefome; for if the time of fuch mufic be at all accelerated, its velocity refembles that of an angular body rumbling on a pavement. He goes on with his itricures, and fuppofes, that "fuch a language as he hath been defcribing, has a bad profody, unmarked, without exactitude and precifion; that the long and fhort fyllables have no fenfible and determinate proportion between them in duration, or numbers, by which the rhythm can be rendered agreeable, exact, and regular; that it has both long and fhort fyllables of an uncertain duration, with others that are neither long nor fhort; and that the difference between them is wholly incommenfurable.

"Thefe vices and inconveniences," he adds, "have fuch an effect upon the time or meafure of mufic, when applied to fuch words, as to render it wholly unmarked, irregular, and difjointed.

His character of the Italian language, and defcription of its beauties, and advantage over all others, for vocal purpofes, are fo appofite to the prefent enquiries, that we fhall faithfully tranflate the whole paffage.

"If it fhould be asked what language is the moft grammatical, I fhould answer, that of the people who reafen the beft; and if it fhould be asked what people are likely to have the beft mufic, I fhould fay, thofe that have the beft language for it. Now if there is in Europe one language more favourable to mufic than another, it is certainly the Italian: for this language is foft, fonorous, melodious, and more accentuated than any other; four qualities peculiarly important to vocal mufic. It is *foft* from its articulations being un-compounded; from the infrequency of claffing confonants; and from every word in the language being terminated by a vowel. It is *fonorous* from moft of its vowels being open; its diphthongs un-compounded; from having no nasal vowels; and from its articulations being few and eafy, which render the found of each neat and full. It is *melo-dious* from its own native fweetnefs, which renders it vocal even in declamation and common fpeech, without the affift-

ance of mufical notes. But what renders the Italian language more peculiarly mellifluous, as well as more expreffive of fentiment, than any other, is the great compafs and variety of its tones, and the choice it allows in painting the paffions. To prove this, let any one who imagines it to be only the language of love and tendernels, take the trouble of comparing the two following ftanzas of Tafto."

"Teneri fdegn i e placide è tranquille  
Repulle e cari vezzi e liete pace,  
Sorrisi, paretette, e dolce ftille  
Di pianto e fofpir, tronchi e molli bacci  
Fufe tai cofe tutte, e poefcia unille,  
Et al foce tempo di leute finto;  
E ne formo quel fi mirabil cinto  
Di ch' ella avena il bel fianco fuccinto."

Canto IV. Stanza xxxiii.

"Chiama gl' abitator de l' ombre eterne  
Il rauco fuon de la tartarea tromba;  
Treman le fpaziofe atre caverne,  
E l' aer cieco a quel romor rimbomba;  
Ne fi fridendo mai de la lugerne  
Regione del cielo il folgor piomba,  
Ne fi cofcia giammai tremare la terra  
Quando i vapori in fen gravida ferra."

Canto XVI. Stanza xxv.

It will be found, perhaps, equally difficult to exprefs in any other language the fweetnefs of the one or the vigour of the other of thefe ftanzas. But the roughnefs of the laft ftanza does not confift in hard and uncouth words; they are all fonorous, and, though rough to the ear, eafy of utterance.

Thefe ftanzas, however, which Rouffleau, and, after him, almoft all mufical writers have inftanced as of remarkably eafy utterance, fhould have been confined to reading and declamation; for better lyrical or vocal verfes may be found in Metaftafio, and, indeed, in almoft all Italian lyric poets, fince it has been found that the vowel *a* is the beft for divifions, and all the other vowels have been long in difufe for fuch purpofes, by the beft Italian compofers for the ftage. In the ftanza cited as a model of foftnefs, in vocal verfes, there are but two words, to which, in a lively air, divifions would be given: *Caris, pace*. But even thefe, in which the vowel *a* occurs in the *firft* fyllable, would have no long divifions affigned them, if there was a *final* fyllable terminated by that letter, as in the third perfon fingular of the future tenfe of verbs, *vedrà, ucciderà, farà, darà, parlerà, canterà, fuggirà*; in the elifion of the infinitive mood, *trionfar, fipofar, fcordar, hifingar, naufragar*; and in the fubftantives, *fedità, pietà, felicità, libertà, erudetlà, and Mar*.

In fetting Metaftafio's early operas, till about the middle of the prefent century, we find the beft compofers giving divifions to the vowels *o* and *e*; as in *morirò, dovrò, fugirò, re, te, fe, fremè, vender, voler, è, mercè*, &c. but never to *i* or *u*.

Rouffleau declined difcuffing the accents of the Italian tongue; but if, as has been imagined, the Greek accents were ufed as a notation of the tone or tune of voice in reading or fpeaking; the acute accent raifing the voice, the grave deprefing it, and the circumflex keeping it at a middle pitch or tone, the Italian would afford a more varied and pleafing melody than any of the other European dialects.

All *tunable founds*, fays Dr. Holder, of which the human voice is one, are produced by a regular and equal vibration of the fonorous body and undulation of the air, proportioned

to the acuteness or gravity of the tone. And, according to Dr. Wallis, this gravity, or acuteness of tones in speech, depends on the openness of the aperture in the larynx, which is the seat of the voice; and roughness and smoothness of vocal tones, he refers to the state of this organ.
