POSITIVE *Institutions*, or *Precepts*, in *Theology*, are those which are not founded upon any reasons known to those to whom they are given, or discoverable by them, but which are observed merely because some superior has commanded them. Positive precepts may be plainly distinguished from *arbitrary* precepts, *i. e.* those which are founded upon the mere will of the commander, and for which he himself can see no reason. Accordingly positive institutions may be allowed, without just objection, in a religion of which God is the author; because there are various relations of things unknown to us, and beyond the discovery of our natural faculties; and it is possible these relations, unknown to us, but most clearly known to God, may render some things fit to be done by us, which we cannot perceive ourselves to be under any obligation to perform, previously to a divine order and appointment. In other instances there may be a general reason for appointing some test of our obedience, when there is no peculiar reason for preferring one to another. Humility, and consequently virtue, may be in some circumstances more effectually promoted, when we are required to obey commands founded on reasons unknown to us, than if these commands carried their own apparent reason along with them; and it may be with this view that God sees fit to conceal from us the foundation of the commands in question. Civil governors may make laws founded on reasons unknown to their subjects, and proper to be concealed from them. God, as our creator and constant benefactor, has a right to command us incomparably superior to that of any civil governor. Besides, circumstances of worship will appear more solemn, when considered as matters of divine institution, than merely as matters of human invention, and a greater solemnity may thus be added to the worship itself; by which means they may have a remoter tendency greatly to promote those several virtues, which such acts of religious worship are intended to subserve. Upon the whole we may conclude, that a religion, of which God is the author, may comprehend positive institutions. See Butler's *Analogy*, part ii. ch. 1. Foster against Tindal, p. 281—284. Browne against Tindal, p. 194.

POSITIVE *Theology*. See THEOLOGY.

POSITIVE, in *Music*, denotes the little organ usually behind, or at the foot of the organist, played with the same wind, and the same bellows, and consisting of the same number of pipes with the large one, though those much smaller, and in a certain proportion. See ORGAN.

In the organs of the Jesuits, the positive is in the grand body.

POSITIVE *Levity*. See LEVITY.

POSITIVE *Proof*, in *Law*. See EVIDENCE.

POSLANSKOI, in *Geography*, a town of Russia, in the government of Archangel, on the Mezen; 220 miles E.S.E. of Archangel.

POSNECK, a town of Saxony, in the principality of Altenburg; 9 miles N.N.E. of Saalfeld. N. lat. 50° 40'. E. long. 11° 39'.

POSON. See PRESBURG.

POSOQUERIA, in *Botany*, Aubl. Guian. t. 51. Juss. 201, is *Cyrtanthus* of Schreber.

POSOYSCIE, in *Geography*, a town of Lithuania, in the palatinate of Troki; 12 miles N.W. of Troki.

POSSE, a land measure in Switzerland, 1232 of which are equal to 10 English acres, and each equal to 3927 English square yards.

POSSE Comitatus, *Power of the County*, a phrase in law, signifying the aid and attendance of all knights, gentlemen, yeomen, labourers, servants, apprentices, villains, and other persons, above the age of fifteen years, within the county; because all above that age are bound to have harness, by the statute of Winchester: only women, ecclesiastical persons, and such as are decrepid and infirm, are excused.

All persons under the degree of a peer are bound to attend upon warning of the sheriff or justices, under pain of fine and imprisonment, to defend the country against the king's enemies when they come into the land, as well as for keeping the peace and pursuing felons.

It is also used where a riot is committed, a possession kept upon a forcible entry, or any force of rescue used, contrary to the command of the king's writ, or in opposition to the execution of justice. Stat. 2 Hen. IV. c. 8.

POSSECK, or **POTZEL**, in *Geography*, a town of Saxony, in the Vogtland; 6 miles E. of Oelsnitz.

POSSEGA, a town of European Turkey, in Servia; 24 miles N.N.W. of Jenibafar.

POSSESSIO FRATRIS, in *Law*, is where a man hath a son and a daughter by one woman or *venter*, and a son by another *venter*, and dies; if the first son enters and dies without issue, the daughter shall have the land as heir to her brother, although the second son by the second *venter* is heir to the father: but if the eldest son dies without issue, not having made an actual entry and seisin, the younger brother by the second wife, as heir to the father, shall enjoy the estate, and not the sister. 1 Inst. 11. 15.

POSSESSION, **POSSESSIO**, *quasi pedis positio*, an action by which we hold or occupy any thing, either *de jure* or *de facto*.

POSSESSION de Facto, is when there is an actual and effectual enjoyment of the thing. See **DE FACTO**.

POSSESSIO de Jure, is the title a man has to enjoy a thing, though it be sometimes usurped, and in the actual possession of another. See **TITLE**.

This right of possession is of two sorts: an *apparent* right of possession, which may be defeated by proving a better; and an *actual* right of possession, which will stand the test against all opponents. Thus if the disseisor, or other wrong doer, who having obtained the possession by either fraud or force, hath only a *bare* or *naked* possession, without any shadow of right, dies possessed of the land of which he so became seized by his own unlawful act, and the same descends to his heir; by the common law the heir hath obtained an *apparent* right, though the *actual* right of possession resides in the person disseised; and it shall not be lawful for the person disseised to divest this *apparent* right by mere entry, or other act of his own, but only by an action at law. (Litt. § 385.) For until the contrary be proved by legal demonstration, the law will presume the right to reside in the heir whose ancestor died seized, rather than in one who has no such presumptive evidence to urge in his own behalf. But if he who has the actual right of possession puts in his claim, and brings his action within a reasonable time, and can prove by what unlawful means the ancestor became seized, he will then by sentence of law recover that possession, to which he hath such actual right. Yet, if he omits to bring this his possessory action within a competent time, his adversary may imperceptibly gain an *actual* right of possession, in consequence of the other's negligence. And by this and certain other means, the party kept out of possession may have nothing left in him but the mere *right* of **PROPERTY** (which see), without either possession, or even the right of possession. Thus, if a disseisor turns me out of possession of my lands, he thereby gains a *mere naked* possession, and I still

retain the right of possession and right of property. If the disseisor dies, and the lands descend to his son, the son gains an *apparent* right of possession; but I still retain the *actual* right both of possession and property. If I acquiesce for thirty years, without bringing any action to recover possession of the lands, the son gains the actual right of possession, and I retain nothing but the mere right of possession. And even this right of property will fail, or at least it will be without a remedy, unless I pursue it within the space of sixty years. Blackst. Comm. book. ii.

POSSESSION, *Estates in*. See **ESTATE**.

POSSESSION, *Property in*. See **PROPERTY**.

POSSESSION, *Unity of*, makes what the civilians call *consolidation*; which see. See also **UNITY**.

By the French laws, a possession of three years, in matters personal, begets a right; and in real estates, a possession of ten years, among persons living near the premises, and twenty years among those that live elsewhere.

POSSESSION, *Writ of*. See **EJECTIONE Firme**.

POSSESSION, *Annual*, is the *usucaptio* (which see), which gives a right to moveables: a triennial and peaceable possession of a benefice is sufficient to maintain it, provided it be founded on a plausible title.

POSSESSION is sometimes also used for the act of taking possession, which is performed with certain formalities, by which a person is justified to be in the enjoyment of any thing.

Anciently, upon buying an estate, possession was taken with much ceremony; in some places, by a stick, a branch, or a straw, put into the hands of the buyer by the seller. See **INVESTITURE**.

POSSESSION of a Benefice, in some customs, is taken by entering the church, kneeling down, kissing the altar, and ringing the bell. See **INDUCTION**.

In some cases, possession is taken by the sight of the steeple.

POSSESSION is also used for the state of a person said to be possessed by the devil. See **DÆMONIAC** and **DÆMONIACAL Possession**.

POSSESSION, in *Mining*, is the right to a meer of ground, which the miners enjoy, by having stones upon that ground; and it is taken generally for the stones themselves, for the stones give possession.

POSSESSION, *La*, in *Geography*, a town of the island of Bourbon; 6 miles W. of St. Denys.

POSSESSION Bay, a bay in the straits of Magellan. The point of land at the entrance is situated in S. lat. 52° 23'. W. long. 68° 57'.

POSSESSION Island, an island in the South Pacific ocean, near the N. point of New Holland; where captain Cook hoisted English colours, and took possession of the whole E. and N.E. coast of New Holland, with its bays, &c. in the name of George III. king of Great Britain, by the name of New South Wales; 20 miles N. of York Cape. S. lat. 10° 33'. W. long. 218° 21'.

POSSESSION Sound, a bay in **ADMIRALTY Inlet**; which see. N. lat. 47° 52'. E. long. 237° 48'.

POSSESSIONEM, *Habere facias*, in *Law*. See **HABERE**.

POSSESSIVE PRONOUNS, in *Grammar*. See **PRONOUN**.

POSSESSO, a name given to one of the grandest processions at Rome, which is a ceremony that is performed by every pope, as soon as convenient after the conclave has declared in his favour. It is equivalent to the coronation in England, or the consecration at Rheims. On this occasion the pope goes to the Basilica of St. John Lateran, and, as

the phrase is, takes possession of it. This church, it is said, is the most ancient of all the churches in Rome, and the mother of all the churches in Christendom; and therefore, when the pope has got possession of this, he must be the real head of the Christian church, and Christ's vicegerent upon earth. From St. John Lateran's he proceeds to the Capitol, and receives the keys of that fortress; after which it is equally clear, that as an earthly prince he ought, like the ancient possessors of the Capitol, to have a supremacy over all kings. At the entrance of the Capitol he is met by the senator of Rome, who, falling on his knees, delivers the keys into the hand of his holiness, who pronounces a blessing over him, and returns him the keys. Proceeding from the Capitol, the pope is met by a deputation of Jews, soon after he has passed through the arch of Titus; and the chief rabbi presents him with a long scroll of parchment, on which is written the whole law of Moses in Hebrew. This procession is said to be the most showy and magnificent which takes place, on any occasion, in this city. Moore's View of Society, &c. in Italy, vol. i.

POSSESSORY ACTIONS, in *Law*, are those which serve only to regain that possession, of which the demandant, (that is, he who sues for the land,) or his ancestors have been unjustly deprived by the tenant or possessor of the freehold, or those under whom he claimed. These are the writs of *entry* and *assize*; which see.

POSSET, BEER. See ZYTHOGALA.

POSSEVINO, ANTONIO, in *Biography*, a Jesuit distinguished for learning and political abilities, was born in 1534 at Mantua. At an early age he went to Rome, where he was taken into the service of cardinal Hercules Gonzaga, who employed him in the education of his nephew Francesco, whom he accompanied to the universities of Ferrara and Padua. After the death of Francesco's father, the widow called her son, and with him his tutor Possentino, to Naples. The latter formed the design of entering into the society of the Jesuits, which he effected at Padua, in 1559. After he had passed his noviciate, he was sent by his superiors to the court of Emanuel Philibert, duke of Savoy, on affairs relative to the Catholic religion. From this period his life was spent in the continual exercise of his apostolical functions, and in transacting concerns entrusted to him by the court of Rome. In his missions he displayed the most active zeal in combating heresy, without any regard to the principles of moderation and humanity; and thus approved himself, according to the maxims of his order, a faithful and devoted servant to the interests of the holy see. He laboured to promote the reconciliation of Henry IV. with the Catholic church, by which he gave so much displeasure to the court of Spain, that he was ordered to quit Rome, where he then was. He retired to Ferrara, where he died in 1612, at the age of 78. Notwithstanding the many public affairs in which he was engaged, he wrote a number of books, which have given him a place among the most learned authors of that age. Of these the most considerable is entitled "Bibliotheca de Selecta Ratione Studiorum," in 2 vols. folio. This is an introduction to all the sciences, containing a summary of their principles, with an enumeration of the chief authors who treat of them. It is characterised by Dupin as displaying a great fund of erudition, and having much useful matter; but he adds, that it is overcharged with controversial pieces, and that the choice of authors is not always the best. Another important work is his "Apparatus Sacer," 2 vols. folio, which is a descriptive catalogue of writers in all the branches of theological science. His residence in Muscovy gave occasion to his composing a work, entitled "Muscovia,"

containing a detailed account of all that he had observed or learned relative to that country. He had a nephew, Antonio, who wrote in Latin a history of the Gonzagas, lords of Mantua, and of the war of Montferrat from 1612 to 1618.

POSSIBILITAS, POSSIBILITY, in our *Old Law Books*, is sometimes used for a thing done wilfully or wittingly.

In which sense it stands opposed to *impossibilitas*, a thing done against the will. "Si autem oculos asnaslet, reddat veram ejus, & impossibilitatis accusetur in eo facto." Leg. Alfred. Again: "Si quis agat impossibilitate, non est omnino simile ac si voluntarie faciat." Leg. Canut. cap. 6.

POSSIBILITY, in *Law*, is used in the same sense with contingency, or for that which may or may not happen. With respect to possibilities it is observed, that though they may be released, or devised by will, or may pass to the heir or executor, yet they cannot be assigned to a stranger, unless coupled with some present interest.

POSSIBILITY, Possibilitas, among the *Schoolmen*, denotes a non-repugnance to existing in a thing that does not any way exist. See **POSSIBLE**.

This non-repugnance to existing is no other than the producibility of any thing; which consists in this, that there are sufficient causes actually existing, or at least possible, whereby the thing may be produced, or be brought to exist; principally as there is a God, or an almighty cause.

So that possibility does not imply any thing in the thing possible, but it is a mere extrinsic denomination taken from the power of the cause, and principally of God.

In effect, if a creatable thing had any intrinsic possibility, it would follow, that such a thing must exist even without the cause.

And yet we may allow an intrinsic possibility of a thing, if by possibility we do not understand its producibility, or its non-repugnance to exist; but only the non-repugnance of the attributes contained in its idea. But such possibility is merely logical.

POSSIBLE, POSSIBLE, is sometimes opposed to real existence, and understood in the schools, of a thing, which, though it does not actually exist, yet may exist; as, a new star, another world, &c. which are particularly said to be *physically* possible.

It is also opposed to *impossible*. In which sense it is applicable to any thing that does not contradict itself, or involves contradictory predicates; whether it actually exist or not; as a man, fire, &c. These are also said to be *logically* possible.

It is a great point of controversy among the school-philosophers, whether and how far things may be said to have entity, while only in a state of possibility.

Possibles are ordinarily conceived to be threefold; *future*, *potential*, and *merely possible*.

POSSIBLE, Future, is that whose production is decreed and ascertained; *v. gr.* the futuration of all those events fixed by the immutable decree, or the immutable will, of the Almighty.

POSSIBLE, Potential, is that which is contained, or lies hid in its causes: as the tree in the seed, the fruit in the tree, &c.

POSSIBLE, Mere, is that which might exist, though it never shall.

Others distinguish possibles, into *metaphysical*, *physical*, and *ethical*.

POSSIBLE, Metaphysical, is that which may, at least, be brought

brought to being by some supernatural and divine power; as the resurrection of the dead.

In which sense the word is opposed to an impossible, even as it respects God himself; as a crooked straightness, a square circle, an infinitely perfect creature, a mortal God.

POSSIBLE, *Physical*, is that which may be effected by a natural power; in opposition to such things as cannot be produced by any finite power; as to restore the dead, &c.

POSSIBLE, *Ethical*, is that which may be done by prudent persons, using all the proper means they have for the same. Again, it is used for any thing done according to right reason, and consistently with the laws.

POSSIBILITY of *issue extinct*. See TAIL.

POSSIDONIA, in *Ancient Geography*. See PÆSTUM.

POSSINHO, in *Geography*, a town of Portugal, in Estramadura; 15 miles N.E. of Santarem.

POSSIRA, in *Botany*. See RITTERA.

POSSOMY, in *Geography*, a town of France, in the department of the Aveyron; 12 miles S.W. of Vabres.

POSSUM, in *Zoology*. See OPOSSUM.

POST, in the *Military Art*, is any spot of ground capable of lodging soldiers.

The word is formed from the Latin *positus*, *placed*; some derive it from *potestas*, *power*.

A post denotes any ground or place, fortified or not, where a body of men may make a stand, and fortify themselves, or remain in condition to fight an enemy.

A spot of ground seized by a party, to secure the front of an army, and to cover the posts that are behind, is called an *advanced post*.

The advance-guard, or the right of the two lines of an army, &c. is called the *post of honour*, and is always given to the eldest regiments.

A sentinel placed before the colours, and at the door of the commanding officer, is said to be in a post of honour.

POSTS, in *Building*, large pieces of timber, placed upright in houses, &c.

The corner posts are called the *principal* or *fencing* posts; the posts framed between the principal posts for strengthening the roof of a house, are called the *queen* posts.

An excellent method to preserve posts from rotting, is to burn the outside of the ends that are to be set in the ground to a coal.

POST, *Crown*. See CROWN *Post*.

POST also denotes the dispatch a courier or letter-carrier makes, by changing horses from time to time.

The name is borrowed hence, that the horses are *positi*, placed, posted, or disposed, from distance to distance.

The word is also applied to the person himself; the houses where he takes up, and lays down his charge; and the stages, or distances between house and house. Hence the phrases, *post-boy*, *post-horse*, *post-house*, &c.

We find mention made of post-horses in the Theodosian Code, *de cursu publico*; but these were very different from the present establishment, and were only public horses first appointed by Trajan; till whose time, the messengers seized any horses that came in their way.

Lewis Hornigk has an express treatise on posts, of which he makes four kinds; *viz.* on *horseback*, in *chariots*, in *boats*, and on *foot*: which last kind is in use in Italy, Turkey, and Peru: but in 1740, the Turks began to establish regular posts like those of Christian countries.

Herodotus ascribes the origin of posts to Cyrus, or Xerxes; but the posts instituted by those princes were no more than couriers.

In effect, posts on the present footing are but a mo-

dern invention; though some go back as high as Charlemagne.

It is certain it was the policy, or rather the diffidence of Louis XI. of France, which they owed their rise to; that uneasy prince first settled them by an ordonnance of the 19th of June, 1464, to be the sooner, and the more surely advertised of what passed in his own kingdom, and in the neighbouring states.

But these posts were only for the particular use of the court; for the author of the Life of the Duke d'Espernon says, that the packet or letter office was not set up in France anno 1619.

From France the institution propagated itself, by degrees, through the several other parts of Europe. In Germany, Hornigk observes, posts were first settled by the count de Taxis at his own expence; in acknowledgment of which, the emperor Matthias, in 1616, gave him, in chief, the charge of post-master under him and his successors.

In England, posts were first established by act of parliament 12 Car. II. anno 1660, which enabled the king to settle a post-office, and appoint a governor: though there had been posts in England from the time of Charles I. and probably somewhat earlier. For by 2 & 3 Edw. VI. c. 3. A.D. 1548, the rate of post-horses is fixed at one penny *per* mile. And in the twenty-sixth year of queen Elizabeth, anno 1581, we find mention of the office of chief post-master of England; and in 1631, of the office of post-master for foreign parts, which office we also learn from the *Fœdera*, tom. xix. fol. 385, had been first created by king James.

In earlier times the business of post-masters seems to have been confined to the furnishing of post-horses to persons who were desirous of travelling expeditiously, and to the dispatching of extraordinary packets upon special occasions. The post-office erected by James I., and placed under the controul of one Matthew de Quester, or de l'Equeter, served for the conveyance of letters to and from foreign parts; which office was afterwards claimed by lord Stanhope: but it was confirmed and continued to William Frizell and Thomas Witherings by king Charles I. A.D. 1632, for the better accommodation of the English merchants. (19 Rymer, *Fœd.* 385.) In 1635 the same prince erected a letter-office for England and Scotland, under the direction of the same Thomas Witherings, and settled certain rules of postage (Rym. 650. 20 Rym. 192.): but this extended only to a few of the principal roads, the times of carriage were uncertain, and the post-masters on each road were required to furnish the mail with horses at the rate of 2½*d.* a mile. Witherings was superseded for abuses in the execution of both his offices, in 1640; and they were sequestered into the hands of Philip Barlamachy, to be exercised under the care and oversight of the king's principal secretary of state. (20 Rym. 429.) On the breaking out of the civil war great confusion and interruption were necessarily occasioned in the conduct of the letter-office. And about that time the outline of the present more extended and regular plan seems to have been conceived by Mr. Edmond Prideaux, who was appointed attorney-general to the commonwealth after the murder of king Charles. He was chairman of a committee in 1642, for considering what rates should be set upon inland letters (*Com. Journ.* 28 Mar. 1642); and afterwards appointed post-master by an ordinance of both the houses (*ibid.* 7 Sept. 1644), in the execution of which office, he first established a *weekly* conveyance of letters into *all* parts of the nation (*ibid.* 21 Mar. 1649.); thereby saving to the public the charge of maintaining post-masters to the amount of 7000*l.* *per annum*. And, his own emoluments being probably

bably very considerable, the common council of London endeavoured to erect another post-office in opposition to his, till checked by a resolution of the house of commons (ibid. 21 Mar. 1649), declaring that the office of post-master is and ought to be in the sole power and disposal of parliament. This office was afterwards farmed by one Munday in 1654. (Scobell. 358.) And in 1657, a regular post-office was erected by the authority of the Protector and his parliament, upon nearly the same model as has been since adopted, and with the same rates of postage as continued till the reign of queen Anne. (Com. Journ. 9 June 1657. Scobell. 511.) After the Restoration, a similar office, with some improvements, was established by statute 12 Car. II. c. 35; but the rates of letters have been altered, and some farther regulations in the conduct of the post-office added, by 9 Anne c. 10. and several subsequent statutes, too numerous to be here recited.

The privilege of franking letters, claimed by members of parliament, was coeval with the establishment of the post-office in 1660. (See FRANK Letters.) The acts specifying the persons to whom the privilege of franking letters belongs, and the circumstances by which they are restricted and regulated, are the following: 4 Geo. III. c. 24. 24 Geo. III. c. 37. 26 Geo. III. c. 63. 35 Geo. III. c. 53. 42 Geo. III. c. 63. 43 Geo. III. c. 119. 44 Geo. III. c. 84. 46 Geo. III. c. 61. 48 Geo. III. c. 90.

At this time it appears, that the revenue of postage brought in 21,500*l.* whereas in 1653, the postage of England, Scotland, and Ireland, was farmed at 10,000*l.* yearly, By 15 Car. II. cap. 14. the revenue of the general post-office was settled on the duke of York and his heirs male: and by 1 Jac. II. c. 12. it was enacted by parliament, that this revenue, amounting at that time to 65,000*l.* *per annum*, should belong to the king and his successors; whence it was made a part of the king's private estate for ever, and not to be accounted for to parliament, as other public revenues are. In 1699, the net revenue of the post-office is said to have been 90,504*l.* 10*s.* 6*d.* By the tenth act of the ninth year of queen Anne, the former laws for establishing the post-offices in both kingdoms of England and Scotland were repealed; and one general post-office, and also one general post-master, was appointed for the united kingdoms: and by this act the postage of letters was increased by one-third: it appears also from this act, that the gross amount of the revenue for one year, ending at Michaelmas, 1710, was 111,461*l.* 17*s.* 10*d.*; and on a medium of three years, *viz.* 1708, 1709, 1710, the net income, according to Dr. Davenant, was 56,664*l.* 19*s.* 10½*d.*; but according to the report of the commissioners of the equivalent (anno 1718), to the house of commons, the medium then amounted to 62,000*l.* for England, and 2000*l.* for Scotland. On a medium of four years, *viz.* 1711, 1712, 1713, 1714, the net revenue was 90,223*l.* The net annual produce of the post-office at Michaelmas, 1722, was 98,010*l.* 8*s.* at which time the gross amount is stated to have been 201,804*l.* 1*s.* 8*d.*; the deduction for frank covers, 33,397*l.* 12*s.* 3*d.*; and the expence of management, 70,396*l.* 1*s.* 5*d.* In 1744, the gross amount of the inland and foreign offices was 235,492*l.* and in 1764, it was 432,048*l.* For the year ending 5th January 1813, the gross produce of the inland office for England, was 1,458,834*l.* 7*s.* 9*d.*; and of the foreign 95,797*l.* 15*s.* 4*d.*; for Scotland, 178,897*l.* 7*s.* 9*d.*; and for Ireland, 56,112*l.* 2*s.* 4*d.*

The English post-office is now managed by two post-masters general, with an annual salary of 5000*l.* a-year, who have under them many other officers of their own appointing. These are all sworn, and give security for their faithful discharge, &c., and are liable to the penalty of 20*l.*

and forfeiture of office, if they violate the duties specified in their oath; as the secretary and resident surveyor, assistant secretary, two chief clerks of the first and second branch, with subordinate senior and junior clerks and surveyors; receiver-general, with a salary of 800*l.* a-year; chief clerk, at 500*l.* a-year; and six subordinate clerks; accomptant-general, whose salary is 700*l.* a-year; his deputy, at 500*l.* a-year; and six clerks, surveyor, and superintendant of mail coaches, at 700*l.* a-year; two assistants, and three clerks; the inspector of the mis-sent and dead letters, with assistant and clerks; solicitor to the post-office; superintending president of the inland office, with three presidents and vice-presidents; six clerks of the roads; two senior clerks and assistants; twenty-one sorters; twenty-four junior sorters; four probationary sorters; four window-men; four inspectors of franks; three clerks to the superintending president; superintendant of letters, bill clerk, clerks, and messengers; and his deputy and assistants; one hundred and forty-four letter-carriers.

For bye and cross-road letters there are an accomptant, and three clerks: and for the foreign letter-office a comptroller with his deputy, six clerks, eight sorters, a messenger, inspector of letter-carriers, and twenty-four letter-carriers. There are also an inspector of ship-letters, with two clerks, and an inspector of packets, with a clerk. There are also agents for the packet-boats at Falmouth, Weymouth, Harwich, Holyhead, and Milford; besides agents and post-masters at several foreign ports.

On this grand office depend a great number of post-masters in England and Scotland, who keep regular offices in their several stages, and sub-post-masters in their branches.

A daily post is established (Sunday excepted) to and from this office, and most of the principal towns in England, and places in their respective districts.

For this purpose, Mr. Palmer's modern invention of mail-coaches has been found highly convenient and useful, not only for the safe and expeditious conveyance of letters, but also of passengers. Those who have travelled in these vehicles need not be informed of their rapid motion; and of the assiduity of the coachman, the guards, and the officers of the different post-towns, to expedite their progress. At 8 o'clock in the evening the mail-coaches depart from London, freighted with such letters and packets as have been conveyed in the course of the day either immediately to the general office in Lombard-street, or to the same place by means of the various receiving offices established in different parts of the town, whence they are transmitted by letter-carriers who perambulate various districts within the limited hour. And even after 7 o'clock, letters will be received for a trifling gratuity, when delivered before the several bags for the evening's post are made up. The coaches which proceed from London at 8 o'clock regulate their progress so as to arrive at the particular places to which they convey the mail at fixed hours; and those coaches that return to London with equal steadiness and celerity of motion arrive at the post-office in London at the early hour of six in the morning, so that the sorters have time to arrange the letters for the carriers, who wait to receive them, so as to allow of their completing their delivery soon after twelve at noon.

The general post-office in Scotland, at Edinburgh, is under the direction of a post-master-general, secretary, solicitor, accomptant, two surveyors, an inspector of dead and mis-sent letters, and three clerks of the English, Welsh, and North roads.

The general post-office of Ireland, at Dublin, is under the conduct of two post-masters general, a secretary, resident surveyor, accomptant-general, treasurer, and comptroller.

Letters to all parts of Europe are dispatched from London every Tuesday and Friday, except those to Portugal, which are forwarded by the Lisbon mails on Tuesday only. For this purpose, there are seven packet-boats at Dover, which sail every Wednesday and Saturday for Ostend and Calais; and five between Harwich and Helvoetsluys, which sail from Harwich every Wednesday and Saturday, and from Helvoetsluys on the same days: and five between Falmouth and Lisbon, which sail from Falmouth on Saturday, but the time of their sailing from Lisbon is uncertain. There are also several packet-boats between Falmouth and the Mediterranean, the West Indies, for which a mail is made up at London the first Wednesday in every month, and the packet sails from Falmouth on the Saturday following, and North and South America. The packet-boats on the Weymouth station, which are four in number, sail for Guernsey and Jersey every Wednesday and Saturday evenings. There are likewise seven packet-boats which sail daily between Holyhead and Dublin: and six between Milford and Waterford. See PACKET.

By 41 Geo. III. c. 7. the rates of postage are as follow: for every single letter, not exceeding 15 measured miles from the office where put in, to the office where delivered, 3*d.*; double letter, 6*d.*; treble, 9*d.*; an ounce, 1*s.*; and so in proportion for any greater weight. Above 15, and not exceeding 30 miles, a single letter, 4*d.*; double, 8*d.*; treble, 1*s.*; an ounce 1*s.* 4*d.*; and so in like proportion. Above 30, and not exceeding 50 miles, a single letter, 5*d.*; double, 10*d.*; treble, 1*s.* 3*d.*; an ounce, 1*s.* 8*d.*; and so in like proportion. Above 50, and not exceeding 80 miles, a single letter, 6*d.*; double, 1*s.*; treble, 1*s.* 6*d.*; an ounce, 2*s.* 6*d.*; and so in like proportion. Above 80, and not exceeding 120 miles, a single letter, 7*d.*; double, 1*s.* 2*d.*; treble, 1*s.* 9*d.*; an ounce, 2*s.* 4*d.*; and so in like proportion. Above 120, and not exceeding 180 miles, a single letter, 8*d.*; double, 1*s.* 4*d.*; treble, 2*s.*; an ounce, 2*s.* 8*d.*; and so in like proportion. Above 170, and not exceeding 230 miles, a single letter, 9*d.*; double, 1*s.* 6*d.*; treble, 2*s.* 3*d.*; an ounce, 3*s.*; and so in like proportion. Above 230, and not exceeding 300 miles, a single letter 10*d.*; double, 1*s.* 8*d.*; treble, 2*s.* 6*d.*; an ounce, 3*s.* 4*d.*; and so in like proportion. Where the distance above 300 miles is not 100 miles, for a single letter, 1*d.* more; double, 2*d.*; treble, 3*d.*; an ounce, 4*d.*; and so in proportion for every letter or package above an ounce. But where the distance above 300 miles is more than 100 miles, a further sum of, for every single letter, 1*d.*; double, 2*d.*; treble, 3*d.*; an ounce, 4*d.*; and so on progressively for every further distance of 100 miles, a like further sum for a single letter, 1*d.*; double, 2*d.*; treble, 3*d.*; an ounce, 4*d.*; and so in proportion. For all letters to and from Ireland, conveyed by packet-boats, shall be paid, above all other rates, for every single letter, 2*d.*; double, 4*d.*; treble, 6*d.*; an ounce, 8*d.*; and so in proportion for more than an ounce. By 45 G. III. c. 11. the following additional charges are payable: within Great Britain, and also from Great Britain to Ireland, for every single letter, 1*d.*; double, 2*d.*; treble, or other letter under an ounce, 3*d.*; an ounce in weight, and every packet not exceeding an ounce, 4*d.*; and so in proportion for every other letter or packet of greater weight than an ounce. Also, for the conveyance of every packet or cover, containing therein, or having affixed thereto, one or more papers with patterns, or one or more patterns of cloth, silk, stuff, or other goods, or one or more samples of any other sort of thing, not exceeding together one ounce in weight, sent agreeably to the provisions of 26 Geo. III. c. 13. and 35 Geo. III. c. 53, the sum of 1*d.* And for the con-

veyance of every letter, originally sent by the two-penny post, and not first passing, and afterwards to pass by the general post, directed to or sent from places beyond the delivery of the general post letter-carriers, 1*d.*; for every letter originally passing by the general post, directed to places beyond the delivery of the general post, and afterwards delivered by the two-penny post, 2*d.*

Also, by 41 Geo. III. c. 7. for every letter or packet to or from any port of Great Britain, to or from Portugal or the British dominions in America, a single letter, 1*s.*; double, 2*s.*; treble, 3*s.*; an ounce, 4*s.*; and so in proportion for any greater weight. And for the conveyance of letters to or from any port of the united kingdom of Great Britain and Ireland, from or to any place out of the said kingdom not within his majesty's dominions, in addition to all other rates now payable for every single letter, 4*d.*; double, 8*d.*; treble, 1*s.*; an ounce, 1*s.* 4*d.*; and so in proportion. And all such foreign letters shall also be charged with the full inland rates of postage as aforesaid. (37 Geo. III.) Provided that no letter or packets shall be rated higher than as a treble letter, unless one ounce weight, and if an ounce then as four single letters, and so in proportion, reckoning each quarter of an ounce as a single letter. By the 45 Geo. III. c. 11, from March 12, 1805, the following additional sums are made payable for the conveyance of foreign letters, viz. for the conveyance of letters by post from and to Great Britain, to and from parts beyond the seas, not within his majesty's dominions, for every single letter, 2*d.*; for every double letter, 4*d.*; for every treble letter, or other letter under an ounce in weight, 6*d.*; and for every packet not exceeding an ounce in weight, 8*d.*; and so in proportion for every other letter or packet of greater weight than an ounce. And over and above the rates and duties hereby granted, all letters and packets passing from Great Britain to the British dominions in America, to or through the kingdom of Portugal, to the islands of Guernsey and Jersey, and the Isle of Man, and all letters and packets from those respective countries to Great Britain, shall be charged with the inland rate of postage hereby established, of 1*d.* for each single letter, and so in proportion for double, treble, and other letters, according to the weight thereof, for their inland conveyance. But nothing herein shall alter the rates of postage upon single letters sent by the post by or to seamen or privates in the navy, army, militia, fencible regiments, artillery, or marines, upon their own private concerns only, whilst such seamen and privates shall be employed in the public service, made payable by the 35 Geo. III. c. 53. And all printed newspapers sent by the two-penny post, to places beyond the delivery of the general post, shall be chargeable with a duty of 1*d.* only; provided such newspapers be sent in the manner prescribed by an act passed in the 42 Geo. III. c. 63.

By 46 Geo. III. c. 73. is granted (over and above all other rates for such letters and packets within the united kingdom), for every letter and packet carried or conveyed by packet-boats from or to the port of Falmouth, or from or to any other convenient port in the united kingdom, to or from the town and fortrefs of Gibraltar, a packet postage according to the rates and sums in sterling money herein-after-mentioned, the same being rated either by the letter or the ounce. For every single letter, 1*s.* 9*d.*; double, 3*s.* 6*d.*; treble, 5*s.* 3*d.*; and for every ounce, 7*s.*; and so in proportion for every packet of greater weight than an ounce. And to or from the island of Malta, for every single letter, 2*s.* 1*d.*; double, 4*s.* 2*d.*; treble, 6*s.* 3*d.*; ounce, 8*s.* 4*d.*; and so in proportion for every packet of greater weight than

an ounce. And between Gibraltar and Malta, every single letter, *6d.*; double, *1s.*; treble, *1s. 6d.*; ounce *2s.*; and so in proportion for every packet of greater weight than an ounce. And by 48 Geo. III. c. 116, to or from the port of Falmouth, to or from Madeira, single letter, *1s. 6d.*; double, *3s.*; treble, *4s. 6d.*; ounce, *6s.*; and so in proportion for every packet greater than an ounce. And to or from Brasil, or any of the Portuguese territories in South America, single letter, *2s. 5d.*; double, *4s. 10d.*; treble, *7s. 3d.*; ounce, *9s. 8d.*; and so in proportion for any packet greater than an ounce.

By 46 Geo. III. c. 92, seamen, whilst actually employed in his majesty's service, may send single letters on their own private concerns only, at the rate of *1d.* each, to be paid upon putting them into the post-office. Provided that the name of the writer, and his class and description in the vessel to which he shall belong, shall be superscribed; and also in the hand-writing of, and signed by, the officer at the time commanding the vessel, his name, and that of the vessel. And by § 7, such seamen may receive such letters free of postage, provided that *1d.* for each shall be paid upon putting the same into the post-office; and the name of the vessel to which they belong shall be superscribed; provided also that such letters shall be only delivered to the seamen to whom directed, or to persons appointed to receive them by writing under the hand of the commanding officer of the vessel; commissioned officers, or warrant officers, midshipmen, or masters mates, not included in this. By § 8 and 9, the same provisions are extended to every serjeant, corporal, drummer, trumpeter, fifer, and private soldier, in his majesty's regular forces, militia, fencible regiments, artillery, or royal marines, within any part of his majesty's dominions. By § 10, the sections 8 and 9 are not to extend to commissioned officers or warrant officers. By § 11, any such commander wilfully and knowingly writing his name upon any letter that is not from such seaman, &c. shall forfeit *5l.* And by § 12, a like penalty is imposed upon persons not being such commanders writing their name upon any letter, that it may be sent at a lower rate of postage than by law established. And by § 13, a like penalty is imposed upon those who knowingly address a letter to any such seaman, &c. which shall be intended for another person, or concerning the affairs of another person, for the purpose of evading legal postage. By § 14, if any shall procure any such seaman, &c. to obtain the signature of his commanding officer to any letter to be sent by post which shall not be on the private concerns of such seaman, &c.; or if any such seaman, &c. shall himself obtain such signature upon any letter not from such seaman, &c., and upon his own private concerns only, in order to avoid the payment of legal postage, he shall forfeit *5l.* By § 15, one moiety of the penalties imposed by this act to be to the use of his majesty, and the other to him who informs and sues for them.

Bills of exchange, written on the same piece of paper with a letter, and several letters to several persons written on the same piece of paper, shall pay as so many distinct letters. (6 Geo. c. 21.) Writs or other proceedings at law inclosed, or written on the same piece of paper with a letter, shall pay as so many distinct letters. (26 Geo. II. c. 13.) And all merchant's accounts, bills of exchange, invoices, and bills of lading, shall be rated as so many several letters, or by the ounce, according to the rates by this act made payable on letters conveyed by the general post. (41 Geo. III. c. 7.) But patterns and samples of goods inclosed in any cover open at the sides, and without any letter or writing therein, and not exceeding one ounce, shall not be charged with a higher postage than a single

letter. (35 Geo. III. c. 53.) Foreign letters suspected to contain prohibited goods, may, in the presence of a magistrate, be examined by means of a slit not exceeding two inches in length, and if the suspicion be confirmed, they may be opened, the goods taken out and destroyed, and the cover, with a proper attestation, sealed and forwarded to the commissioners of the customs, who shall pay to the said officer any sum not exceeding *5l.*, nor less than *10s.* (24 Geo. III. c. 37.) But if no prohibited article be found, the magistrate shall inclose the letter in a cover, with an attestation that the opening in it was made in his presence, and deliver it so sealed up to the said officer, who shall forward it in the ordinary course without any charge of additional postage.

None but the post-master shall carry letters; on pain of *5l.* for every offence, and *100l.* a week besides; half to the king, and half (with full costs) to him that shall sue in any court of record. (9 Ann. c. 10. § 17. 19.) Except in certain cases, which are also specified in stat. 42 Geo. III. c. 81. § 6. And except in the two universities; to and from which letters may be sent in manner as heretofore hath been used. (§ 32.) The post-master-general may undertake the conveyance and delivery of letters directed to persons abiding in towns and places (not being post-towns), from the respective town to which such letters should be carried by the post in the usual manner, and also the collection of letters from towns, villages, and places to be sent by the post, and may take such sums of money for such extra service as may be agreed upon between him and the inhabitants of such place. (41 Geo. III. c. 7. § 5.) Provided that nothing herein shall prevent the inhabitants of any such towns and places from carrying or employing servants or other persons to carry letters to or from the post-town in like manner as they have been heretofore accustomed to do. And by 46 Geo. III. c. 92. § 2, the post-master-general is authorized to do the same where the towns from whence the letters are to be conveyed are not post-towns. And § 3. contains the same proviso as § 5. of 41 Geo. III. c. 7. And no person shall send or tender or deliver to be sent otherwise than by the post, or by the authority of the post-master-general or his deputy or deputies, or to the nearest and most convenient post-town, to be from thence forwarded by the post, any letter or packet, on pain of *5l.* for every offence, with full costs to the informer in any court of record at Westminster; one moiety thereof to the king, the other moiety to the informer. (42 Geo. III. c. 81. § 5.) Provided, that nothing herein shall extend to any letter concerning goods sent by any common carrier, and to be delivered with such goods, without profit or advantage for receiving or delivering the same; nor any letter of merchants, owners of ships, or merchant vessels, nor any the cargo therein sent on board such vessels to be delivered by the masters thereof, or by any other employed by them for the carriage thereof, without hire or reward for the same; nor any commission or return thereof; affidavits, writs, process, or proceedings, or return thereof, out of any court; nor any letter sent by any private friend in their way of journey, or by any messenger sent on purpose, concerning the private affairs of any person. (§ 6.) If any post-boy shall quit the mail before his arrival at the next stage; or shall suffer any other person (except the person employed to guard the mail) to ride on the horse or carriage; or shall loiter on the road; or shall not in all possible cases convey the mail after the rate of six miles an hour at least; he shall, on conviction by confession, or oath of one witness, before one justice, be sent to the house of correction, to be there kept to hard labour,

labour, not exceeding one month, nor less than fourteen days. (5 Geo. III. c. 25. § 20.) And if any post-boy shall by himself, or in combination with others, unlawfully collect any letters, or convey, or cause them to be conveyed, he shall on conviction by confession or oath of one witness before one justice, forfeit for every letter or packet 10s. to the informer; if not forthwith paid on conviction, to be committed to the house of correction to hard labour, not exceeding two months, nor less than one. (§ 21.) If any person entrusted to take in letters and receive the postage thereof, shall embezzle or apply to his own use any money received by him with such letters for the postage thereof; or shall burn or otherwise destroy any letter or packet by him so taken in or received; or who, by virtue of his office, shall advance the rates upon letters or packets, and not duly account for the money received by him for such advanced postage; he shall be deemed guilty of felony. (§ 19.) And by the 7 Geo. III. c. 50, if any person employed in any business of the post-office, who shall take any letter or packet to be forwarded by the post, and receive any money therewith for the postage, shall burn or destroy any such letter or packet; or shall advance the rate of postage upon any letter or packet, and not duly account for the money by him received for such advanced postage; he shall be deemed guilty of felony. (§ 3.) All sums not exceeding 5*l.* that shall be due from any person for letters, or which shall be received for the carriage of letters, without answering the same to the receiver-general, shall be recovered before justices of the peace in the same manner as small tithes; and such debt shall be preferable in payment before any debt to any private person. (9 Ann. c. 10. § 30.) By the 7 Geo. III. c. 50. § 1. (which re-enacts more at large the provisions of 5 Geo. III. c. 25. § 17.) it is enacted, that if any deputy, clerk, agent, letter-carrier, post-boy, or rider, or any other officer or person whatsoever, employed in receiving, stamping, sorting, charging, carrying, conveying, or delivering letters or packets, or in any other business relating to the post-office, shall secrete, embezzle, or destroy any letter, packet, bag, or mail of letters which such person might be entrusted with, or which shall have come to their hand or possession, containing any bank-note, bank post-bill, bill of exchange, exchequer-bill, South Sea or East India bond, dividend, warrant of the bank, South Sea, East India, or any other company, society, or corporation, navy or victualling or transport-bill, ordnance debenture, seamens' ticket, state lottery ticket, or certificate, bank receipt for payment on any loan, note of assignment of stock in the funds, letter of attorney for receiving annuities or dividends, or for selling stock in the funds, or belonging to any company, society, or corporation, American provincial bill of credit, goldsmiths' or bankers' letter of credit, or note for or relating to the payment of money; or other bond or warrant, draught, bill, or promissory note whatsoever, for the payment of money; or shall steal, or take the same out of any letter or packet that shall come to their hands or possession, such offender or offenders shall be guilty of felony without benefit of clergy. By 42 Geo. III. c. 81, if any deputy, clerk, agent, &c. &c. in the post-office shall secrete, embezzle, or destroy any letter or packet, bag or mail of letters, with which he is entrusted, or which may come into his possession, containing any part or parts of any such security or instrument as in the said act are mentioned, or shall steal or take out of any letter or packet that shall come to his possession, any part or parts of any such security or instrument, every such offender shall be guilty of felony without benefit of clergy. (§ 1.) And if any person whatsoever, whether employed in any business relating to the

post-office or not, shall counsel, command, hire, persuade, procure, aid, or abet any such deputy, &c. or other officer employed, &c. in the post-office, to commit any offence in the said recited act, or in this act before mentioned; or shall with a fraudulent intention buy or receive the whole or any part of such security, &c. which he shall know to have been contained in any such letter, &c. so by any such deputy, &c. secreted or embezzled, or stolen, or taken out of any letter, &c. that shall come to his possession, or which he, at the time of buying or receiving, shall know to have been contained in, and stolen or unlawfully taken out, of any letter, &c. stolen and taken by any person whatsoever, from or out of any mail, bag, &c. or from or out of any post-office, or house or place, for the receipt or delivery of letters, &c.; each and every person so offending shall be deemed guilty of felony, without benefit of clergy; and may be tried and convicted as well before as after the trial or conviction of the principal felon, and whether the principal felon shall have been apprehended, or shall be answerable to justice or not. (§ 2.) If any person shall rob any mail of any letter, packet, or bag; or shall steal and take any letter or packet from or out of any mail or bag, or from or out of any post-office, or house or place for the receipt or delivery of letters, sent to or to be sent by the post, although the same shall not appear to be a taking from the person, or on the king's highway, or to be a robbery committed in a dwelling-house, or a coach-house, stable, barn, or out-house belonging to a dwelling-house; and although it shall not appear that any person was put in fear by such robbery, stealing, or taking; he shall be guilty of felony, without benefit of clergy. (7 Geo. III. c. 50.) This statute, after reciting the stat. 7 Geo. III. c. 50, enacts, that the offences therein mentioned may be laid and tried (if committed in England), either in the county where the offence is committed, or wherein the offender is apprehended; if in Scotland, either in the justiciary court of Edinburgh, or in the court of the circuit within which the felony is committed, or the offender apprehended.

By stat. 42 Geo. III. c. 81. § 4. it is enacted, that if any person shall wilfully secrete, keep, or detain, or being required to deliver up by any deputy, clerk, agent, letter-carrier, post-boy, rider, driver, or guard of any mail-coach, or any other officer or person whatsoever employed in any business relating to the post-office, shall refuse or wilfully neglect to deliver up any mail or bag of letters sent or conveyed, or made up in order to be sent or conveyed by the post, any letter or packet sent by the post, or put for that purpose into any post-office, or house or place for the receipt or delivery of letters, &c., and which letter or packet, bag, or mail of letters, shall have been found or picked up by the same, or any other person, or shall by or through accident or mistake have been left with or at the house of the same, or any other person; each and every person so offending shall be deemed to be guilty of a misdemeanor, to be punished by fine and imprisonment.

The post-masters may charge 3*d.* a mile for each horse riding post, and 4*d.* a mile for the person riding as guide; and shall not charge for any bundle or parcel of goods not exceeding 80*lbs.* weight, to be laid on the horse rid by the guide; and shall not be obliged to carry above that weight. (9 Ann. c. 10.) And whereas by several acts for repairing particular roads, carriages, horses, and other cattle employed in conveying the mail, are exempted from the payment of tolls, and by several other acts horses only are exempted, it is enacted, that all carriages, of what description soever, or horses employed in conveying the mail, shall be exempted from tolls at every turnpike gate; and all gate-keepers

keepers are required to permit such carriages and horses to pass through such toll-gates without demanding any toll. (25 Geo. III. c. 57.) No post-master shall, by word, message, or writing, or in any other manner, endeavour to persuade any elector to give or dissuade any elector from giving his vote for the choice of any person to serve in parliament, on pain of 100*l.*; half to the informer, and half to the poor, and likewise of being incapacitated. 9 Ann. c. 10.

To prevent abuse in the privilege of franking, it is enacted, that if any person shall counterfeit the hand-writing of any person in the superscription, in order to avoid the payment of postage; (or shall alter, or cause to be altered, the date upon such superscription, or write or send any letter, the cover whereof shall be forged, counterfeited, or altered, knowing the same), he shall be guilty of felony, and transported for seven years. 4 Geo. III. c. 24. § 8. 24 Geo. III. c. 37. sess. 2. § 9. 42 Geo. III. c. 63. § 14.

The Great Mogul performs part of his postage by pigeons, kept in several places, for the conveyance of letters on extraordinary occasions. They will carry them from one end of that vast empire to another. The same vehicles have been used by the Dutch in sieges. And Tavernier observes, that the consul of Alexandretta used to send news daily to Aleppo, in five hours time, by means of pigeons; though those two places are three days journey on horseback apart.

POST, *Penny*, or rather now *Two-penny*, a post established for the benefit of London, and the parts adjacent; by which any letter or parcel, not exceeding four ounces weight, unless it be passing to or from the general post-office, is speedily and safely conveyed to all parts within the bills of mortality, to most towns and villages within ten miles of London, for one penny (the original charge) each packet, letter, &c. upon putting in the same, and also a penny (by 34 Geo. III. c. 17. an additional penny, and by 41 Geo. III. c. 7. two-pence) upon the delivery of such as are directed to any place beyond the cities of London and Westminster, the borough of Southwark or suburbs, and within the district of the penny-post delivery. 9 Ann. cap. 10. 4 Geo. II. cap. 33.

The useful conveyance of letters and parcels by the penny-post, was first set up in London and its suburbs, in or about the year 1683, by a private undertaker, to whose assigns government allowed a yearly pension of 200*l.* a-year for life, in lieu of the revenue arising from it. It is said, however, that after a trial in the court of king's bench, the projectors had the mortification to find this office adjudged to belong to the duke of York, as a branch of the general post-office. But the first mention of the penny-post in the statute-book, occurs in the ninth of queen Anne. And though it may be said to have been originally established in 1683, it was very essentially improved in 1794.

By 5 Geo. III. cap. 25. the post-master-general and his deputies may appoint a penny-post office in any city or town, or places adjacent, where they shall judge convenient, and charge therein the same rates as within the limits of the post-office in London. The benefit of this establishment having been long experienced, it was determined, towards the close of the last century, to double the charge, in consequence of which it was denominated the two-penny post.

This office is managed by a comptroller, whose salary is 500*l.* a-year, his clerk, four presidents, six clerks of divisions and six assistants, four sorters, four window-men, six sub-sorters, seven stampers, two inspectors of dead letters, two letter-bill clerks, 257 letter-carriers, a collector, and two sub-collectors, an accomptant, and two clerks. There are five principal offices from which letters are forwarded at certain hours. The two chief offices are, the general-post-

office yard in Lombard-street, and Gerard-street, Soho. There is also a great number of receiving-houses in various parts of London and Westminster, and in the suburbs and villages comprehended within the range of this post; and to the greater number of them it makes three deliveries in a day. The two-penny post rates are as follow: for every letter or packet passing from any part of the cities of London or Westminster, the borough of Southwark, and not beyond the limits of the delivery of the general-post letter-carriers, 2*d.*; for every letter or packet put into the said post to be forwarded to the general post-office, and thence to be conveyed by that post, or coming by the general post-office, 2*d.*; for every letter or packet, passing to or from any part or place within the district of the two-penny post, and not within the delivery of the general-post letter-carriers, 3*d.* It has been already observed, that no letters or packets exceeding four ounces in weight, can be sent by the two-penny post, unless such letters or packets shall have first passed by, or shall be intended to pass by, the general post. The gross produce of the two-penny post for the year ended 5th of January 1813, was 93,629*l.* 11*s.* 11*d.*

Post *Horses, Duty on, &c.* By 44 Geo. III. c. 98. the duties on horses travelling post are as follow: Post-masters, or others, letting horses for this purpose by the mile, or from stage to stage, or letting to hire for a day, or any less period of time than 20 successive days, any horse for drawing any carriage used in travelling post, or otherwise, shall pay annually 5*s.* for a licence, and renew the same ten days before the end of the year, on pain of forfeiting 10*l.* Nor is he allowed to keep more than one horse or carriage with one licence. If the use of such carriage be discontinued, previous notice of seven days shall be given. For every horse hired by the mile or stage in travelling post, shall be charged a duty of 1½*d.* for every mile such horse shall be hired to go; and for every horse hired for a day, or any less period of time, shall be charged, if the distance be ascertained, 1½*d.* per mile, and if the distance be not ascertained, 1*s.* 9*d.* for each horse. (25 G. III. c. 51.) By 42 G. III. c. 100. any horse may be let by a licensed person for any time not exceeding 28 successive days, and every horse hired for a less time, where the distance shall not be ascertained, shall be deemed a hiring for the day; and when the period of hiring shall exceed 28 days, it shall be reckoned as for two or more days; and the persons letting to hire and the persons hiring, shall be liable to the regulations of the 25 Geo. III. c. 51; and the tickets shall be filled up accordingly. Persons letting to hire for any time exceeding 28 days, shall enter in a book provided annually, a memorandum of every ticket issued, with the day of the month, the number of horses, and the period of hiring, together with the name and place of abode of the person hiring the same, to which shall be annexed the name of every servant hired with such horses, and the description of every carriage, on penalty of 50*l.* Where the stamp-office duty is paid, no assessed duty is to attach. Persons letting to hire servants, carriages, or horses, shall annually return lists on pain of 50*l.*, and the hirers of servants, carriages, and horses, shall return lists on pain of 50*l.* and surcharge. Proper forms are to be delivered to persons applying for them, and 50*l.* penalty is charged on those who neglect to deliver accounts within the time prescribed. A list of licensed persons shall be transmitted to the tax-office. Every horse hired by the mile or stage shall be deemed to be hired to travel post, although the person hiring the same do not travel several stages on a post-road, or change horses, and although at the stage or place to which such horses shall be hired there shall not be any post-house, or any post established on such road.

No person unlicensed shall let out any horse for hire, either by the mile or stage, or to draw any carriage used in travelling post, or otherwise by what name soever they may be called for a day, or any less period of time, on pain of 10*l.* Every such licensed person shall cause the words "Licensed to let Post-horses" to be legibly written on his premises, on pain of 5*l.*; and his carriages shall be marked with his christian and surname, and the name of the place of his abode in distinguishable characters, &c., on pain of 5*l.* If the plate bearing his name, &c. shall be taken off for the purpose of evading the payment of the duty, or the sum of 1*s.* 9*d.* for each horse to be paid at the turnpike gates, he shall forfeit 10*l.*; and if a carriage without such plate shall pass through any turnpike gate, the driver shall forfeit 40*s.* Forms of weekly accounts shall be delivered to persons licensed, and also a number of tickets, which shall be duly accounted for. Tickets shall be delivered by every post-master, inn-keeper, &c. letting horses by the mile or stage, to persons so travelling, which tickets shall be delivered by travellers at the first turnpike. A person travelling by the day shall receive a *day-ticket*, which he shall exchange at the first turnpike for another called an *exchange-ticket*, and this ticket shall be shewn by such person at every turnpike through which he shall afterwards pass on that day. A person hiring horses for less than two days, shall have a ticket specifying the place to which the horses are to go, and the true number of miles, both going and returning; and in default of it, the person letting to hire shall forfeit 10*l.* and be liable to the duty. And every person letting to hire horses for two days or more, shall deliver to the traveller or driver of the carriage a note or certificate, expressing "Hired for two or more days," &c. which the traveller shall deliver at the first turnpike, and in return he shall receive a ticket called the "check ticket," which shall be shewn to the gate-keeper at every turnpike through which the said horses shall pass; and in default thereof, every such traveller shall pay for every horse 1*s.* 9*d.* before he be permitted to pass any such turnpike, which the gate-keeper shall retain to his own use. The penalty on delivering false certificates is 20*l.* Horses hired for less than two days are to be deemed as hired for a day; and no horses are to be let to travellers except by the mile or stage. Persons taking the hire for horses shall be accountable for the duty. Every gate-keeper who shall neglect his duty, or transgress with regard to these tickets, &c., shall forfeit 40*s.* Licensed persons are to deliver in their accounts every month, or at the times specified in their licenses, as they reside *within* or *without* the bills, on pain of 10*l.* for every default, and double the amount of the money so due for the non-payment of it. Licensed persons guilty of fraud respecting these duties incur a forfeiture of 50*l.* Their accounts are to be delivered in upon oath. The award to the gate-keeper for his trouble in delivering the day-tickets and posting-tickets which he has received is an allowance after the rate of 3*d.* for every pound which the duties upon any such tickets shall amount to over and above the money returned by him in respect to travellers; not having delivered the tickets to him as aforesaid. Penalty for neglect of duty is 5*s.* for every ticket not delivered to the collector appointed by the commissioners. If he shall wilfully neglect to ask and demand, or refuse to receive, any ticket which should be delivered to him, and to fill the same, he shall for every such offence forfeit 5*l.*; and if he shall fraudulently accept less than he is authorized to demand and receive, he shall in like manner forfeit 20*s.* Nothing in this act shall extend to horses used in licensed hackney coaches, employed to go to no greater distance than 10 miles from London or West-

minster, or the suburbs thereof. (25 Geo. III. cap. 51.) Forging tickets incurs a forfeiture of 50*l.* All pecuniary penalties on this act shall be distributed (if sued for within six calendar months) half to the king, and half (with full costs) to him who shall inform and sue; but if not sued for within six months, they shall belong to the king. Penalties, amounting to 50*l.* or more, shall be sued for in the courts at Westminster; and those under 50*l.* may be recovered before one justice residing near the place where the offence was committed; against whose determination an appeal to the next sessions is allowed.

As for the regulations peculiarly attached to stage-coaches and other carriages, referred to from the article *Stage-Coach*, and in which persons of almost every description are interested, we shall here give a summary of them. By 44 Geo. III. c. 98. every person who shall keep any carriage with two or more wheels to be employed for the purpose of conveying passengers for hire, and accommodating not more than four inside passengers (children in lap excepted), shall take out a licence for each such carriage, and pay yearly 5*s.*; if it carry more than four, but not more than six inside passengers, with the same exception, for each such carriage, 6*s.*; for more than six, but not more than eight (except as before) 7*s.*; for more than eight, but not more than ten, with the same exception, 8*s.*; for more than ten (except as before) each such carriage is to pay yearly 9*s.*

By the 50 Geo. III. c. 48, the 28 Geo. III. c. 57, 30 Geo. III. c. 36, and 46 Geo. III. c. 136, are severally repealed, and various new regulations are enacted. A carriage with four or more wheels, and drawn by four or more horses, shall be allowed to carry ten outside passengers and no more, exclusive of the coachman, but including the guard; and one passenger only shall be allowed to sit upon the box with the coachman, three on the front of the roof, and the remaining six behind, on any part, except on the luggage, or that part of the roof allotted for the same. Carriages drawn by two or three horses shall be allowed no more than five outside passengers, exclusive of the coachman; and all stage coaches, called long coaches, or double-bodied coaches, shall carry no more than eight outside passengers, exclusive of the coachman, but including the guard, if there be any, under such fines and penalties as are imposed by the act; provided that no child in the lap, or under seven years, shall be accounted one of this number, unless there be more than one; and if more, two such children shall be accounted equal to one grown person, and so on in the same proportion; and that no person paying as an outside passenger shall be permitted to sit as an inside passenger, unless with the consent of one at least of the inside passengers, next to whom he shall be placed; provided also, that when the construction is peculiarly wide or commodious, and being so found shall be duly licensed for that purpose, four outside passengers shall be allowed to sit on the front of such carriage; but outside passengers shall never exceed ten in all. No proprietor or driver of any such carriage, travelling for hire, shall permit any luggage to be carried on the roof, or any person to go as outside passenger on or about the outside of any such carriage, the top of which shall be more than eight feet nine inches from the ground, or the bearing of which on the ground shall be less than four feet six inches from the centre of the track of the right or off wheel, to that of the track of the left or near wheel, under the penalty of 5*l.* for each offence. No luggage whatever, exceeding two feet in height, shall be conveyed on the roof of any carriage, if drawn by four or more horses; and when drawn by two or three horses, such luggage shall not exceed eighteen inches above the roof, under the penalty of forfeiting 5*l.* for

POST.

for every inch above two feet or eighteen inches respectively; if the driver so offending shall be the owner, he shall forfeit 10*l.* for every inch above the measure above assigned, and in default of payment, the person or persons so offending shall be committed to the common gaol or house of correction of the county, &c. where the offence was committed for two months, unless such penalties be sooner paid; provided always, that all packages be so placed on the roof, that no passenger shall sit on them, under the penalty of 50*s.* for each offence, to be paid by each such passenger; and the division or space on the top allotted for luggage, shall be distinctly separated from the other part of the top, by some railing or otherwise. However, luggage may be carried of a greater height than two feet, if not more than ten feet nine inches from the ground. The number of passengers permitted to be carried, shall be specified in the licence, and painted on the doors of the coach in legible characters; and commissioners for granting licences may order a cross plate on the side of each coach, with the owner's name, &c. instead of the above inscription; the penalty for defacing, &c. such inscription is a forfeiture of 5*l.*; and every person offending against the provisions of this act, by not having a licence, by omitting the inscription, or carrying more outside passengers than are specified in the licence and in the inscription, as above, shall for every offence forfeit 10*l.* for each outside passenger beyond the number allowed, and double that sum if the driver or coachman be owner or part-owner. The owners of stage-coaches shall be liable to penalties if drivers cannot be found, provided that the owners cannot prove to the satisfaction of the magistrates before whom the information is laid, by sufficient evidence independent of his own testimony, that the offence was committed by the driver without his knowledge, and without any profit accruing to himself; and the driver, when found, shall pay the penalty, or be committed to the common gaol or house of correction, for not less than three, and not more than six months. Drivers who leave their horses or box before they are committed to the care of a proper person, when they stop, shall forfeit not less than 10*s.* nor more than 5*l.* for each offence; and if any driver shall, by intoxication or otherwise, endanger the safety of the passengers, or not take due care of the property with which he is entrusted; or if any driver of any mail-coach, or any guard shall loiter on the road, and retard the arrival of the mails at the next stage; or, if the driver of any mail-coach shall not in all possible cases convey such mails at the speed of any such a number of miles an hour, as are fixed by the post-master general for its conveyance, allowing for weather, bad roads, or any accident to the coach or horses; or, if he shall not duly account to his employer for all monies received on account of passengers or parcels; the driver, in any such case, shall forfeit and pay not less than 5*l.* nor more than 10*l.* for every such offence, and return the money embezzled; and in case of non-payment be committed to the common gaol, &c. for any time not exceeding six months, nor less than three months, at the discretion of a justice or other magistrate. The penalty on a driver for using abusive or insulting language to any passenger, or exacting more than his fare, is a forfeiture of not less than 5*s.* nor more than 40*s.*, or a commitment for any time not exceeding one month, nor less than three days, at the discretion of the magistrate. Passengers are empowered to require toll-collectors to count the number of passengers, and to measure the height of the luggage; and the driver refusing to stop for this purpose, shall forfeit 5*l.* for every such refusal, and if more passengers are carried than the act allows, or the luggage exceed the height assigned by it, he shall forfeit double the penalty imposed by this act for such

offence, one-half to the collector for his trouble, and the other half to the passenger; and if the toll-collector, upon being required by such passenger, shall refuse to make such examination, he shall forfeit 5*l.* for every such offence; and if any person shall endeavour to evade such examination, by descending from such carriage previously to its reaching any turnpike gate, and re-ascending after it has passed such gate, he shall forfeit 10*l.* If the coachman or any other person, having the care of the mail-coach or any other carriage, shall permit any other person, without the consent of a proprietor, or against the consent of the passengers, to drive the same, or quit the box without reasonable occasion, or for a longer space of time than such occasion may require, (though the reins be left for the time in the hands of the passenger on the box); or, if the coachman, or person having the care of the coach, shall by furious driving, or any negligence or misconduct, overturn the carriage, or in any manner endanger the persons or property of the passengers, or the property of the owners or proprietors of such carriage, (unavoidable accidents excepted,) every such coachman or person so offending, shall for every such offence forfeit not exceeding 10*l.*, nor less than 5*l.* If the guard of a mail-coach or other carriage shall fire off his arms, except for self-defence, he shall forfeit 5*l.*

All stage coaches (long-bodied coaches included,) carrying no parcels or luggage, excepting in the inside, or in the front boot, or in a boot behind, and under the body of such carriage; and where the top of such boot behind, when the coach is empty, is not more than six feet from the ground, having obtained a special licence for that purpose, and having the name of the owner, and the number of outside and inside passengers thereby allowed, painted or inscribed thereon, shall be permitted to carry two outside passengers more than the number limited, with respect to other coaches or carriages already described, without subjecting the drivers, &c. to any of the penalties of this act. All prosecutions under this act must be commenced within fourteen days after the commission of the offence. Hackney coaches are exempted from this act. Persons aggrieved may appeal to the quarter-sessions. This act is a public act.

For every coach or other carriage employed as a public stage coach, for the purpose of conveying passengers for hire, shall be charged a duty of 1*d.* (and by 27 Geo. III. c. 16, 1*d.* more) for every mile such carriage shall travel, payable by the owner. (25 Geo. III. c. 51.) As it may be difficult to ascertain the number of times, which licensed carriages which pass from London or Westminster to any place in the country, and from the country again to London or Westminster, making short stages, may go in a day, the commissioners, or any officers appointed by them, may make such allowances as shall appear just, to any licensed person, upon oath made by the owner, of the number of journies actually made in a day, when the same shall differ from the number expressed in the licence. Such carriage shall be marked on the outside pannel of each door by the licensed person, with his christian and surname, and the place from which it sets out, and to which it is going, in large and legible characters, under the penalty of 10*l.*; and the proprietor shall, on the first Monday in every month, or if that be a holiday, on the next day, pay the duties to the receiver-general, or proper officer, at the head-office; and if licensed from any town in the country to any other town beside London, then he shall pay the same to the person authorized to receive it, under the hands and seals of three commissioners; on pain of 5*l.*

By 27 Geo. III. c. 26, the commissioners of the treasury, or those of the Stamp-duties, being authorized by them, may let

let to farm the duties granted by 25 Geo. III. c. 51, upon horses travelling post, and by time, and on stage-coaches. The said duties shall be let for any term not exceeding three years, and the highest bidder shall be the farmer of them for the time appointed. Licensed persons shall deliver their accounts to the contractors. These contractors shall not be disqualified from voting for members of parliament. No licensed persons shall be farmers of the duties.

POST, *Writ of Entry in*, in *Law*. See ENTRY.

POSTS, in *Sculpture*, &c. denote ornaments formed after the manner of rolls, or wreathings; thus called, because they seem to run after one another.

Some are simple; others enriched, or flourished.

POST, *After*, is also a Latin preposition, used in composition with several English words, and generally implying a relation of *posteriority*.

POST, in *Rural Economy*, a strong upright piece of timber, either in a building, fence, or any other situation. Thus we have gate-posts, fence-posts, &c. See GATE-POSTS, and PALING Fence.

POST and Paling, in *Agriculture*, a kind of close wooden fence, constructed by means of posts set into the ground, and pales nailed to rails between them. See FENCE.

This sort of fence can seldom be had recourse to for common farm purposes, except about the buildings or home-stalls. The only circumstances concerning it, which seem to require any notice in this place are, that the posts, whether of rough or sawn timber, should be charred or burnt in a superficial manner, in the parts which are designed to be set in, or nearly on a level with the surface of the ground, in order to prevent their decay in these places. The posts should also be well and firmly put into the earth; and the sawn rails, whether for close or open paling, should be cut triangularwise, by slitting square scantlings diagonally: likewise, the pales of open paling should be cut in the same manner; the broadest sides of the pales being firmly nailed against the broad flat sides of the rails, at such distances from each other, and of such height and strength, as the given purpose may stand in need of or require.

POST and Railing, another sort of open wooden fence, often used for protecting young quick-hedges, consisting of posts and rails, &c. See FENCE.

These sorts of fences, or protections, should likewise have constantly the parts which are set into the ground, and the rails, prepared in the same manner as directed above.

POST and Pan, in *Rural Economy*, a term provincially applied to half timber buildings.

POSTA, LA, in *Geography*, a town of Naples, in Abruzzo Ultra; 11 miles W.N.W. of Teramo.

POSTA St. Lufia, a town of Naples, in the province of Capitanata; 13 miles S. of St. Serviero.

POST-BILLS, BANK, in *Commerce*. See NOTE.

POST-BOOK. See BOOK.

POST-COMMUNION, a prayer which the priest recites after the communion.

POST-DATE. See DATE.

POST-DIEM, a fee by way of penalty, on a sheriff, for his neglect in returning a writ after the day assigned.

For this the custos brevium has four-pence; whereas he has nothing if it be returned at the day.

POST-DISSEISIN, a writ given by the stat. of Westminster, for him who, having recovered lands or tenements by præcipe quod reddat, upon default of redition, is again disseised by the former disseisor: upon which he shall recover damages, and the party suffer imprisonment. See ASSISE of *Novel Disseisin*.

VOL. XXVIII.

POSTE, in *Geography*, a river of Brandenburg, which runs into the Warta; 10 miles E. of Custrin.

POSTEA, in *Law*, a return or certificate of the proceedings by nisi prius in the court of common pleas, after a *verdict*, which see; and there afterwards recorded.

If the issue (see ISSUE) be an issue of fact, and upon trial, it be found for either the plaintiff or defendant, or specially; or if the plaintiff makes default, or is non-suit; or whatever, in short, is done subsequent to the joining of issue and awarding of trial, it is entered on record, and is called a "postea." The substance of which is, that *postea*, afterwards, the said plaintiff and defendant appeared by their attorneys at the place of trial; and a jury being sworn, found such a verdict; or, that the plaintiff after the jury sworn made default, and did not prosecute his suit; or, as the case may happen. This is added to the roll, which is now returned to the court from which it was sent; and the history of the cause, from the time it was carried on, is thus continued by the "postea."

POSTEL, WILLIAM, in *Biography*, a celebrated French writer of the sixteenth century, famous for his extraordinary learning and ingenuity, combined during many years of his life with the wildest fanaticism, was born at Barenton, in Normandy, in the year 1505. When he was only eight years of age he had the misfortune to lose both his parents by the plague, and at the age of fourteen he was reduced to such distress for want of means of subsistence, that he was compelled to quit his native place to seek a livelihood among strangers. In these circumstances he undertook to keep a small school at a village near Pontoise, and when he had saved a little money he determined to go to Paris, that he might gratify his avidity for learning, by pursuing his studies in the university of that city. Here, through motives of economy, rendered necessary by his circumstances, he was induced to share with some other scholars the same apartment; but he was so unfortunate in the election of his associates, that during the first night which he spent in their company they deserted him, carrying off with them his money and clothes. Sickness, induced by want, and the extreme of poverty, first threw him into an hospital, where he languished two years, and then left Paris, and obtained admission into the college of St. Barbe, in the humble capacity of a servitor. Here he became, in a short time, conversant with every branch of learning, and his extraordinary acquirements and abilities being made known to the king, Francis I., he was taken under royal patronage, and was appointed to travel into the eastern parts of the world for the purpose of collecting valuable and curious MSS. On his return the monarch was so well pleased with his services, that he gave him the appointment of professor-royal of mathematics, and of the languages, with a considerable salary. He became addicted to judicial astrology, and obtruded his peculiar opinions in his lectures. Postel became attached to the chancellor Poyet, and with him was, through the influence of the queen of Navarre, the king's sister, banished the kingdom. He went to Vienna, and on account of some offence, was soon obliged to quit the Austrian dominions. He now went to Rome, where he was received by Loyola into the newly-formed society of Jesuits, but before his noviciate had expired, he avowed his adherence to the opinion, that the power of councils is superior to that of the popes, and was expelled from the society, and committed to prison in the year 1545. After his liberation, in about twelve months he retired to Venice, where he exhibited many proofs of a deranged mind, and was again thrown into prison for opinions which he propagated. He returned to Paris, where, having undergone a variety of fortunes, he died in 1581, at the age of 76. He was author

of a great number of works: of these, one of the most valuable is entitled "De Orbis Terræ Concordia," the object of which was to contribute his efforts towards bringing the whole world into the belief of the Christian religion. The first book contains proofs of the truth of Christianity; the second a refutation of the doctrines of the Koran; the third treats of the origin of false religion and idolatry, and of the methods to be adopted to convert the Mahometans, Pagans, and Jews. Another of his works was, "A Harmony of the Four Evangelists, or a Discourse concerning the Life of our Saviour Jesus Christ, with the Order of the Gospels, Epistles, &c. together with a brief Description and Map of the Holy Land." "Descriptio Syriæ," 1540. "Of the Republic of the Turks, with an Account of the Laws and Manners of the Mahometans," 1560. "Cosmographicæ Disciplinæ Compendium, cum Synopsi Rerum in toto Orbe Gestarum," 1561. "Alphabetum Linguarum XII. Characteribus differentium, necnon Introductio ac legendi modus," 1538. "De Originibus, seu de Hebraicæ Linguae et Gentis Antiquitate, deque variarum Linguarum affinitate;" and forty or fifty other pieces. Moreri.

POSTEL, in *Geography*, a town of France, in the department of the Two Nethes; 10 miles E. of Tarnhout.—Also, a town of America, in South Carolina; 25 miles S.E. of Queenborough.

POSTËNEIN, a town of Prussia, in Natangen; 24 miles S.E. of Königsberg.

POST-ENTRY, in *Commerce*, an additional entry made by a merchant at the Custom-house, when the first entry which he had made is found to be too small.

POSTENZA, in *Geography*, a town of Naples, in Basilicata; 11 miles S.W. of Cirenza.

POSTERIOR, a term of relation, implying something behind, or that comes after another. In which sense it is used in opposition to *prior* and *anterior*.

POSTERIOR, or *Posteriores Auriculæ*, in *Anatomy*, the muscular fibres usually described under the name of retrahentes auriculares. See EAR.

POSTERIOR *indicis*, POSTERIOR *medii*, and POSTERIOR *annularis*, three interossei muscles of the hand, inserted in the ulnar sides of the respective fingers. The first belongs to the internal interossei, and the two last to the external. See INTEROSSEI.

POSTERIOR *Penis*, a name given by many authors to a muscle more generally known at this time by the name of the erector.

POSTERIOR *Ramus*. See RAMUS.

POSTERIORITY, in *Law*, a term of comparison, and relation in tenure, opposite to *priority*.

A man holding lands or tenements of two lords, holds of his ancient lord by *priority*, and of his later lord by *posteriority*.

POSTERN, or SALLY-PORT, in *Fortification*, a small gate, usually made in the angle of the flank of a bastion, or in that of the curtain, or near the orillon, descending into the ditch; by which the garrison may march in and out, unperceived by the enemy, either to relieve the works, or to make private sallies, &c. See SALLY-PORT.

The word is also used in the general for any private or back-door. "Potestas habere posternam in omni curia penitus inhibeat, sed unicus sit ingressus, &c." Fleta.

POSTEWAR, in *Geography*, a town of Norwegian-Lapland; 100 miles S.W. of Porfanger.

POST-FACTO, Ex. See Ex *Post Facto*.

POST-FINE, a duty belonging to the king for a fine formerly acknowledged before him in his court; paid by the cognizee after the fine is fully passed, and all things touch-

ing the same are accomplished. It is also called the "king's silver."

The rate is so much, and half so much, as was paid to the king for the *præ fine*, or primer fine; or 10s. for every five marks of land, *i. e.* three-twentieths of the supposed annual value; and is collected by the sheriff of the county where the land lies, and to be answered by him into the exchequer.

POSTHORSES, in *Geography*, a rocky islet in the East Indian sea, near the W. coast of the island of Celebes. N. lat. 5°. E. long. 119° 18'.

POSTHUMOUS, or POSTHUMUS, composed of *post*, and *humus*, ground, a child born after the death of his father, or taken out of the body of a dead mother.

By 10 & 11 Will. III. cap. 16. it is enacted, that posthumous children shall be capable of taking in remainder, in the same manner as if they had been born in their father's life time; that is, the remainder is allowed to vest in them while yet in their mother's womb.

In this point the civil law agrees with ours. Ff. 1. 5. 26. Accordingly, an infant *in ventre sa mere*, or in the mother's womb, is supposed in law to be born for many purposes. It is capable of having a legacy, or a surrender of a copyhold estate made to it. It may have a guardian assigned to it. Stat. 12 Car. II. c. 24.

Among the Romans, posthumus was also used for a child born after the making of a testament, which occasioned the testator to alter it.

POSTHUMOUS is also applied figuratively to the works of an author that were not published till after his death, or interment.

POSTICUM, in *Architecture*, the postern gate or back-door of any fabric.

POSTICUS PERONÆUS, *Serratus posticus*, *Tibialis posticus*. See PERONÆUS, SERRATUS, TIBIALIS.

POSTIGLIONE, in *Geography*, a town of Naples, in Principato Citra; 15 miles W. of Cangiano.

POSTIL, POSTILLA, a name anciently given to a note, or remark, written in the margin of the bible; afterwards also to a note written in any other book posterior to the text.

Trivet in his Chronicle, speaking of Step. Langton, archbishop of Canterbury, says, "Super bibliam postillas fecit, &c. eam per capitula, quibus nunc utuntur moderni, distinxit:" that Alexander, bishop of Chester, "super psalterium postillas scripsit." Knighton, another of our historians, speaking of one Hugo, a Dominican and cardinal, says, "totam bibliam postillavit."

POSTILIONS, in *Geography*, a chain of rocks in the East Indian sea, about 60 miles in length, from N.W. to S.E. S. lat. 6° 15' to 6° 48'. E. long. 119° 18' to 119° 54'.

POSTING, among *Merchants*, the putting an account forward from one book to another; particularly, from the journal or waste book into the ledger.

POSTIQUE, formed from the Italian *posticcio*, added, &c. in *Architecture*, &c. An ornament of sculpture is said to be postique, when it is superadded after the work itself is done.

A table of marble, or other matter, is also said to be postique when it is incrustated in a decoration of architecture, &c.

POSTLETHWAYTE, MALACHI, in *Biography*, a merchant of London, published a "Commercial Dictionary," in two vols. folio, which is a work of great labour and utility.

POSTLIMINIUM, POSTLIMINY, among the Romans, the return of one who had gone to sojourn elsewhere, or had been

been banished, or been taken by the enemy, to his own country and state.

It was thus called, according to Aul. Gellius, from *post*, after, and *limen*, threshold; *q. d.* a return to the same bounds, or threshold. Though others after Amm. Marcellinus, will have it so denominated, because persons were restored into the house through a hole in the wall, *post limen*, not by going over the threshold, which was esteemed ominous.

POSTLIMINIUM was also a law or action, by which one recovered an inheritance, or other matter, that had been lost, from a stranger or enemy.

POSTLIMINIUM, *Right of*, in the *Law of Nations*, is that in virtue of which persons and things, taken by the enemy, are restored to their former state, when coming again under the power of the nation to which they belonged.

In order to illustrate and ascertain the foundation of this right, it should be considered, that the sovereign is obliged to protect the persons and goods of his subjects, and to defend them against the enemy; therefore, when a subject, or any part of his substance, is fallen into the hands of the enemy, should any fortunate event bring them again into the sovereign's power, it is certainly incumbent on him to restore them to their former state; he ought to re-establish the persons in all their rights and obligations, to give back the effects to the owners, and, in a word, to settle all things as they were before they fell into the enemy's hands. The justice or injustice of the war makes no difference in this respect; not only because, according to the voluntary law of nations, the war, as to its effects, is reputed just on both sides, but likewise because war, whether just or not, is a national cause; and if the subjects fighting or suffering for it, when fallen themselves (or their effects) into the enemy's hands, are by some fortunate incident returned under the power of their own nation, there is no reason why they should not be restored to their former condition. It is as if they had never been taken. If the war be just, they were unjustly taken: and thus nothing is more natural than to restore them as soon as it becomes possible. If the war be unjust, they are not bound to bear the calamities of more than any other part of the nation. The evil falls on them in being taken; and by their escape or release they are delivered. Here it is again as if they had never been taken; neither their sovereign nor the enemy has any particular right over them. The enemy has lost by one accident what he had gained by another.

Persons return, and things are recovered, by the right of postliminium, when, after being taken by the enemy, they were again under the power of their own nation. Thus this right takes place, as soon as such persons or things taken by the enemy fall into the hands of soldiers belonging to the same nation, or are brought back to the army, the camp, their sovereign's territories, or the places under his command. Our allies, who join with us in a war, make but one party, jointly with us; the cause is common; the right one and the same; they are considered as making but one body with us. Therefore, when persons or things taken by the enemy are retaken by our allies, or our auxiliaries, or in any other manner fall into their hands, this is exactly the same thing with regard to right, as if they were come again into our own power: the power of our allies being in this case but one and the same. The right of postliminium therefore takes place in the hands of those who join with us in the war; the persons and things recovered by them from the enemy, are to be restored to their former condition. Moreover, the right of postliminium necessarily takes place for us within their territories, no less than within our own,

when these allies make one common cause with us and are associates in the war. But if, as in our times is frequently the practice, an ally only furnishes us the succours stipulated in the treaties, without coming to a rupture with our enemy, their two states continuing in their immediate relations to observe the peace, then only those auxiliaries sent by him are partakers and associates in the war. His dominions adhere to their neutrality. The right of postliminium is of no force among neutral nations, for the power inclined to remain neuter in a war, must look on it, as to the effects, equally just on both sides, and consequently, consider whatever is taken by either, as a lawful acquisition. To allow in his dominions that one may claim things taken by the other, or to grant him the right of postliminium in prejudice to the other, would be to declare in his favour, and depart from the neutrality.

If it be inquired what things are recoverable by this right, it may be observed that naturally, goods of all kinds are recoverable by the right of postliminium, and could they be certainly known again, there is no intrinsic reason why moveables should be excepted. Accordingly the ancients, on recovering these things from the enemy, have restored them to their former owners. See several instances in Grotius, b. iii. chap. 16. § 2. But the difficulty of knowing again things of this nature, and the endless disputes which would spring from the re-vindication of them, have in most parts introduced a contrary practice. Farther, from the little hope of recovering effects taken from the enemy, and once carried into a place of safety, the former owners are supposed to have relinquished and given them up. It is therefore with reason that moveables or booty are excepted from the right of postliminium, unless taken from the enemy immediately after the seizure of them; in this case it is neither difficult for them to be known again, nor can the proprietor be supposed to have relinquished them. A custom being once admitted, and well established, it would be unjust to trespass on it. Among the Romans indeed slaves were not treated like other moveables; they, by the right of postliminium, were restored to their masters, even when the rest of the booty was detained; for one manifest reason, it being always easy to know a slave again, and to whom he belonged; the owner also, as he entertained hopes of recovering him, is not supposed to have relinquished his right. Prisoners of war, who have given their parole; territories and towns which have submitted to the enemy, who have sworn or promised allegiance to him, cannot of themselves return to their former condition, by the right of postliminium, for faith is to be kept even with enemies. But if the sovereign retakes these towns, countries, or prisoners, who had surrendered to the enemy, he recovers all his former rights over them, and is to re-establish them in their former condition: they then enjoy the right of postliminium without any breach of their word or violation of faith. The enemy loses by arms the right he had gained by them. But, concerning prisoners of war, a distinction should be made. If they were entirely free on their parole, it is not only coming again under the power of their nation, which can deliver them; because if they had even returned to their home they would still have been prisoners. The will of him who took them, or his total submission, can alone discharge them; but if they have only promised not to run away, a promise they frequently make in order to avoid the evils of a prison, all they are bound to is that of themselves, they shall not quit the enemy's country, or the place assigned for their dwelling: and if the troops of their party should get possession of the place where they dwell, they are by the laws of arms released and restored to their nation, and to their

their former state. Should it be asked, whether a town, surrendering to the enemy's arms, and retaken by those of its sovereign, and thus restored to its former rights, thus recovers such of its possessions as had been alienated by the enemy, when he became master of it? The answer requires us to distinguish between moveable goods, not recoverable by the right of postliminium, and immoveables. As for immoveables, it should be remembered, that the acquisition of a town taken in war is not complete till confirmed by a treaty of peace, or the entire submission or destruction of the state to which it belonged. Till then the sovereign of that town has hopes of retaking it, or recovering it by a peace. And from the moment it returns into his power, he restores it to all its rights, and consequently it recovers all its possessions, as far as in their nature they are recoverable. Therefore it reassumes its immoveables from the hands of those who were precipitate in purchasing them. But if this town had been ceded to the enemy by a treaty of peace, or was absolutely fallen into his power by the submission of the whole state, it has no claim to the right of postliminium; and the alienation of any of its possessions by the conqueror is valid and irretrievable. Should some subsequent fortunate revolution deliver it from the conqueror's yoke, it can revindicate them. When Alexander made a present to the Theffalians of the sum due from them to the Thebans, he was so absolutely master of the republic of Thebes, that he destroyed the city, and sold the inhabitants. The same decisions take place with regard to the immoveables of individuals, prisoners, or not, which have been alienated by the enemy while he was master of the country. A sovereign, taking a prisoner of war, has no other right than to detain him till the end of the war, or till he be ransomed; and has none or any of his rights, unless he can seize them. It is impossible to produce any natural reason why he who has taken a prisoner can have a right to dispose of any goods or possessions but those which the prisoner has about him.

When a nation or state has been entirely subdued, it may be asked whether a revolution can entitle it to the right of postliminium? If this state has not acquiesced in its new subjection, and ceases to resist from mere inability; if the sword of conquest is not laid aside by the victor, and he has not taken up the sceptre of peace and equity, it is only conquered and oppressed, and on being delivered by an ally, it returns without doubt to its former state. He who rescues it from the yoke of the oppressor, should generously restore it to all its rights. But if a state has voluntarily surrendered to the conqueror, and if the people, no longer treated as enemies but as good subjects, have submitted to a lawful government, they are incorporated with the conquering state; they make part of it, and share its fate, their former state is absolutely effaced: whoever the new conqueror be, that afterwards subdues the state to which the vanquished are united, they undergo the destiny of the former. If these people shake off the yoke and recover their liberty by their own virtue, they regain all their rights; they return to their former state, and foreign nations have no right to determine whether they have withdrawn from a legal authority, or whether they have broke their chains. Thus the kingdom of Portugal, which had been invaded and subdued by Philip II. king of Spain, under pretence of an hereditary right, but in effect from avidity aided by a superior force, after groaning under all the miseries of tyranny, recovered the independency of its crown, and regained its ancient rights by driving out the Spaniards, and placing the duke of Braganza on the throne.

Provinces, towns, and countries, which the enemy re-

stores by the treaty of peace, are certainly entitled to the right of postliminium. For the sovereign, in whatever manner he recovers them, is on their returning under his power to restore them to their former state. But whatever is ceded to the enemy by a treaty of peace is truly and fully alienated. It has no longer an affinity with the right of postliminium, unless the treaty of peace be broken and annulled. Moreover, the right of postliminium is secluded after the signature of the peace: this right entirely relates to the state of war. For this very reason there is always an exception in favour of prisoners of war. If the enemy who should have released the prisoners when the war is at an end, having no longer any thing to fear from them, continues the state of war by detaining them in captivity, and more especially if he reduces them to slavery; they have a right, when an opportunity offers, to assert their liberty, to escape from his injustice, and to return into their country, equally as in time of war, since, with regard to them, the war continues; and then the sovereign, from his obligation to protect them, is to restore them to their former condition. They are free even by escaping into a neutral country. Prisoners are to be considered as citizens, who one day may return into their own country, and on their return the sovereign is obliged to restore them to their former state; and therefore the right of those prisoners and the obligations to which they are bound, with the rights of others over them, still subsist entire, and only suffer a suspension in the exercise of part of them, during their imprisonment. The prisoner of war retains therefore a right to dispose of his possessions, particularly in case of death; and the will of a prisoner of war is of force in his own country, unless annulled by some inherent defect. In case of marriage, the captivity of one of the parties does not affect the tie, and on his return home, he, by postliminium, is again entitled to all his matrimonial rights. Among the Romans the right of postliminium was of force even in profound peace, relatively to nations with which Rome had neither connections of friendship, right of hospitality, nor alliance. This was because those people were considered in some measure as enemies. Milder manners have almost every where suppressed this remainder of barbarism. Vattel's Law of Nations, b. iii.

POSTMAN, in the *Court of Exchequer*. See PRECEDENCE.

POST NATI, in *Our Statutes*, is particularly used for such persons as were born in Scotland, after the accession of king James I. to the crown of England.

7 Jac. I. it was by all the judges solemnly adjudged, that such persons were no aliens in England; as, on the contrary, the *ante-nati*, or those born in Scotland before that accession, were aliens here in respect to the time of their birth.

POST-NATUS is also used by Bracton, Fleta, Glanville, &c. for the second son, as distinguished from the eldest. Thus in Brompton, lib. ii. "Est consuetudo in quibusdam partibus, quod post-natus præfertur primogenito."

POST-OFFICE. See Post, *supra*.

POSTOFITTO, in *Geography*, a town of Naples, in Capitanata; 6 miles S. of Monte d'Angelo.

POSTOMIS, among the *Ancients*, a barnacle or iron instrument fixed on the nose, or put into the mouth of a horse, to make him quiet.

POSTPONING, the putting any thing after, or behind another, with regard either to the order of time or place. Sometimes it is taken in an ill part; as when we say, the bookbinder has postponed a sheet, &c. out of a book.

POST-PREDICAMENTS, in *Logic*, are certain general

neral affections, or properties arising from a comparison of predicaments with each other; or modes following the predicaments, and often belonging to many.

Such, according to Aristotle, are *oppositum*, *prius*, *simul*, *motus*, and *habere*: the three first of which are in all predicaments.

POSTSCENIUM, in the *Ancient Theatre*. See PARASCENIUM.

POSTSCRIPT, an after-thought, or article added to a letter, or memoir; containing something learnt or recollected after the subscription or conclusion of the piece.

It is usually marked thus, P.S. The Spectator observes, that a woman's mind is ever better learnt from her P.S. than her letter.

POST-TERM, or POST-TERMINUM, in *Law*, a fee, or penalty, taken by the custos brevium of the court of common pleas, for the return of a writ, not only after the day, but after the term or time in which such writs are returnable; for which the custos brevium has twenty pence.

POSTULATE, POSTULATUM, in *Mathematics*, a clear, evident proposition; wherein it is affirmed, or denied, that something may, or may not be done. See PROPOSITION.

A thing immediately deduced from the consideration of one single definition, if it expresses something to agree or disagree to another, is called an *axiom*. If it affirm, that something may or may not be done, it is called a *postulate*.

Thus, *e. gr.* from the genesis of a circle, it is evident, that all right lines drawn from the centre to the circumference, are equal; since they only represent one and the same line in a different situation: this proposition, therefore, is esteemed an axiom. See AXIOM.

But, since it is evident from the same definition, that a circle may be described with any interval, and from any point, this is accounted a postulate.

Axioms and postulates, therefore, according to some, seem to have nearly the same relation to each other that theorems and problems have: axioms being considered as indemonstrable theoretical truths, and postulata as indemonstrable practical truths.

But others will have it, that axioms, or common notions, are primitive, and common to all things partaking of the nature of quantity, and which, therefore, may become the objects of mathematical science, such as number, time, extension, weight, motion, &c.; and that postulata relate particularly to magnitudes strictly so called, or to things having local extension, such as lines, surfaces, and solids; so that in this sense of the word postulatum, Euclid, besides axioms, or those principles which are common to all kinds of quantity, has assumed certain postulata to be granted him, peculiar to extensive magnitude. Hence several of the principles assumed in his elements, and ranked among the axioms by the moderns, are by Proclus ranked among the postulata; which has induced Dr. Wallis to judge, that the last of the two senses given to the term postulatum is most agreeable to the meaning of the ancient geometers. And those who contend for this sense of the word, add, that Euclid, in postulating to draw a right line from one point to another, does not mean that any man can actually do this, but only that it may be conceived as possible. So that postulata are axioms no less than the other principles assumed in the elements of geometry, but axioms relating to a particular subject, and not common to all. Wallis's Oper. vol. i. p. 667, 668. See PRINCIPLE.

POSTULATION, POSTULATIO, in the *Common Law*, the nomination of a person to a dignity in the church, to which, by the canons, he cannot be elected; as, for want

of age, of birth, because already possessed of a benefice incompatible therewith, or for the like impediment.

Thus the formal election of such a person being faulty, they are obliged to proceed by way of postulation; that is, the chapter beseeches the person, to whom the confirmation of the election belongs, to approve of it, though it be not canonical. See ELECTION.

The person to whom the supplication is made by the Protestants in Germany, is the emperor; by the Papists, the pope.

Wicquefort observes, that when a part of the chapter elects, and another postulates, the number of postulants must be twice as great as that of the electors, to bring the matter to a postulation.

POSTURES of the Body. The continued unnatural postures of the body are the occasions of many very unhappy effects in the human frame; crookedness in shape is very frequently the consequence of them.

And it is no uncommon thing to see school-boys, who are forced to be continually bending to write upon their knee, or upon a low form, very terribly afflicted by means of the compression which that unnatural and continued posture has given the lower part of the breast, and the viscera contained in the epigastrium; and particularly those unhappy youths, who, from being short-sighted, are exposed to a greater degree of stooping than the rest, have been found terribly afflicted with disorders of the breast and of the lower belly.

On applying for relief in these complaints, the physician usually forgets to inquire into the cause, and hearing nothing of the continued bending posture of the body, which is the occasion of all the disorders, the medicines he gives prove ineffectual with some, and with others greatly heighten the disorder.

But when the prescriber will be at the pains of informing himself of the cause in these cases, and forbid the continuance of the posture, which has been the sole occasion of them; nature alone will often make the cure, or if not alone, yet very often with this caution the methods will prove successful, which were ineffectual, or even hurtful without it.

POSTURE, in *Painting* and *Sculpture*, the situation of a figure with regard to the eye, and of the several principal members of it with regard to one another, by which its action is expressed.

A good part of the painter's art consists in adjusting the postures; in giving the most agreeable postures to his figures; in accommodating them to the characters of the respective figures, and the part each has in the action; and in conducting and pursuing them throughout.

Postures are either *natural* or *artificial*.

The *natural* are such as nature seems to have had a view to in the mechanism of the body; or rather, such as the ordinary actions and occasions of life lead us to exhibit while young, and the joints, muscles, ligaments, &c. are flexible.

Artificial postures are those which some extraordinary views or occasions lead us to exhibit. Such, *e. gr.* are those of our balance and posture-masters.

A painter would be strangely puzzled with the figure of Clark (a famous posture-master of Pall-mall), in a history-piece. This man, we are told in the *Philos. Trans.*, had such an absolute command of his muscles, &c. that he could disjoint almost his whole body; so that he imposed on that great surgeon Mullens, who looked on him to be in such a miserable condition, he would not undertake his cure. Though a well-made man, he would appear with all the deformities

formities imaginable; hunch-backed, pot-bellied, sharp-breasted, &c. He disjoined his arms, shoulders, legs, and thighs; and rendered himself such an object of pity, that he has frequently extorted money, in quality of a cripple, from the same company he had the minute before been in, in quality of a companion. He would make his hips stand a considerable way out from his loins, and so high as to invade the place of his back. Yet his face was the most changeable part about him, and shewed more postures than all the rest.

POSURE, in *Geography*, a town of New Navarre; 220 miles S.S.E. of Casa Grande.

POSZEGA. See **POSEGA**.

POT, in our *Old Writers*, a head-piece of war. It is mentioned stat. 13 Car. II. c. 6. The pot was an iron hat with broad brims. See *Grofe's Mil. Ant.* vol. ii.

POT, a liquid measure at Paris, and in other parts of France, called also quarte, 144 of which are equal to 36 fetiers = a muid. At Lyons, the wine measure, called "anéé," or "afnée," contains 88 pots, each equal to a Paris pint; so that the afnée is = $24\frac{3}{4}$ English gallons very nearly. The pot is divided into 2 chopines, or 4 demi-fetiers. At Bourdeaux, 181.18 pots = 100 English gallons, and each = $127\frac{1}{2}$ cubic inches. At Dunkirk, 167.39 pots = 100 English gallons, and each = 138 cubic inches. At Geneva, 401.74 pots = 100 English gallons, and each = $52\frac{1}{2}$ cubic inches. At Lyons, 403.49 pots = 100 English gallons, and each = $57\frac{1}{2}$ cubic inches. At Marfeilles, 380.75 pots = 100 English gallons, and each = $60\frac{3}{4}$ cubic inches. At Montpellier, 358.14 pots of wine = 100 English gallons, and each = $64\frac{1}{2}$ cubic inches; and 363.78 pots of oil = 100 English gallons, and each = $63\frac{1}{2}$ cubic inches. At Paris, 201.75 pots = 100 English gallons, and each = $114\frac{1}{2}$ cubic inches. At Rouen, 232.16 pots = 100 English gallons, and each = $99\frac{1}{2}$ cubic inches. At Strasburg, 197.43 pots = 100 English gallons, and each = 117 cubic inches.

POTS, Fire. See **FIRE-Pots**.

POTS, Garden, such as are made use of for plants and flowers.

Pots of these kinds are particularly necessary in the culture of numerous sorts of plants, such as all tender exotics of the green-house and stove sorts; which must be planted in them, for the convenience of moving them in and out of their departments, as there may be occasion.

They are also exceedingly useful in raising many young seedlings and cuttings, that require moving to occasional shade, shelter, and artificial heat; likewise for many young plants that are tender whilst young, and require to be removed under shelter for the first two or three winters, but become hardy enough afterwards to bear the full air the year round; and likewise to plant many of the more curious hardy flowering plants, and others, and choice flowering shrubs, &c. in, to remove occasionally, to adorn particular compartments or situations.

In general there are about eight different sizes of this sort of pots made use of, which are necessary in order to suit the different sorts of plants, as well as all sorts in their different stages of growth: as when the plants are young, and of small size, they may be first planted in small ones; and as they increase in bulk, be shifted into those a size larger, repeating it as often as necessary. See **PLANTING in Pots**.

The several sizes are in regular gradation, each size having its name, for the convenience of readily supplying the sizes wanted for particular uses, being always reckoned by the cast at the houses, from two to sixty pots to each,

according to their sizes; the largest having only two to a cast, and the smallest sixty; so that, being of eight different sizes or casts, they are distinguished by the following terms, twos, eights, twelves, sixteens, twenty-fours, thirty-twos, forty-eights, and sixties; the several casts from the twos being in a gradual diminution in size, and the price of the different casts is the same; those of two, &c. being as much as those of sixty, and so of the rest. From two to three shillings is the general price *per* cast, at the potteries in the vicinity of London.

In garden pots there is also a particular shallow sort of a wide, squat, pan-form make, used on some occasions, especially among the myrtle-gardeners in the neighbourhood of London, in raising great quantities of these plants annually, in order to have always a regular succession advanced to proper growth for the markets. These kinds of wide shallow pan-pots are employed to prick or plant out the requisite supplies of numerous small myrtle-cuttings, in summer, &c. for annual propagation, and which are commonly called store-pans.

In these store-pans they generally prick a great number of such small slips or cuttings, at only about an inch or two apart, often to the amount of hundreds in each, just to strike them, and remain two or three months, or more, till advanced a little in growth; in which time the pans thus stored are convenient for removing to different situations required, such as, at first planting or afterwards, either into a hot-bed, whereby to strike the cuttings more expeditiously, or, for the same advantage, when in want of hot-beds, to be placed under a garden-frame and lights, or under hand-glasses, either with or without a hot-bed; and also for removing to a green-house or garden-frame, for protection in winter, &c. all of which being thus continued in them, according to the progress of growth which they make; so that when they discover themselves to be well struck in bottom radicles, and have shot a little top, they may be pricked out separately into small pots, or occasionally three, four, or five in larger ones, for a year, then separated as above; or sometimes bedded out in the spring, in beds of natural earth, six or eight inches apart, to acquire an advanced state of growth till autumn, and then potted off singly.

The same kind of pan-pots are also useful for several other purposes of propagation, both to sow seeds and plant small cuttings, slips, &c. in, of tender exotics, and of various other sorts of curious or particular kinds of plants, both of the green-house, hot-house, and the open ground, in order to have similar culture as the above. These pan-pots are from ten to twelve or fourteen inches in width, and about six inches deep, having holes at bottom, as in the common kind. And another sort of pot, of different make from the general kind, is sometimes used for planting some kinds of bulbous roots in, for blowing in the apartments of the house: they are narrow and upright, of equal width from bottom to top, six, eight, or ten inches deep, or a little more, and from three to four or five inches in width; and are occasionally used for planting bulbs of the Guernsey lily, and some other similar kinds, to blow in autumn and winter, in the windows, or on the chimney-piece of the dwelling or sitting-room, or in a green-house, or hot-house, &c. as they appear neat, and admit of being placed close, or in a smaller space than the common pots, one bulb being planted in each; they being previously filled with light sandy earth to near the top. See **PLANTING in Pots**.

All these several sorts of pots may be obtained at the potteries in the different parts of the kingdom.

In choosing the pots, it is necessary to see that they are burnt

burnt sufficiently hard, and so perfectly found as to ring, when struck with your knuckles; and that they have all holes at the bottom, to discharge the superfluous moisture from the earth about the roots of the plants; the larger sorts having generally four holes, one in the middle of the bottom, and three around the circumference, at equal distances; but the smaller kinds commonly only one in the middle of the bottom.

In respect to the sizes of pots that are proper for the different sorts of plants, it is commonly mentioned in the culture of the plants where any particular sizes are necessary.

Where small pots are advised, it is generally to be understood either as sixties, forty-eights, or thirty-twos, according to the sorts or sizes of the plants that are to be potted.

POTS, *Glass*. See GLASS-Pots.

POT, *Hotch*. See HOTCH-Pot.

POT, *White*. See WHITE.

POTABLE, POTABILIS, somewhat that may be taken, or swallowed by way of drink.

The alchemists talk much of potable gold, *aurum potable*. See AURUM.

POTALIA, in *Botany*. See NICANDRA.

POTAM, in *Geography*, a town of New Mexico, in the province of Hiaqui; 54 miles S.W. of Riochico.

POTAMI, a town of the island of Corfu.

POTAMO, in *Biography*, a Platonic philosopher of Alexandria, and the first projector of the Eclectic sect, is said to have flourished under the reign of Augustus; but according to Diogenes Laertius, he commenced his design towards the close of the second century. This author says, that not long before he wrote his "Lives of the Philosophers," an Eclectic sect had been introduced by Potamo of Alexandria, which was to embrace tenets collected from every former sect. Potamo, it should seem, endeavoured to reconcile the precepts of Plato with those of other masters. Attempts of the same kind had been made by other Alexandrian philosophers, from the first commencement of their schools; but he was probably the first who attempted to institute a new sect upon this principle, in which it is almost certain he failed of success. This philosopher is to be distinguished from a rhetorician of the same name, who was a native of Lesbos, or Mitylene, and flourished under the reign of Tiberius. He was the author of "A History of Alexander the Great;" "Panegyrics" on Brutus and Tiberius Cæsar; a treatise "Concerning a perfect Orator," &c. Enfield's Hist. Phil.

POTAMOGETON, in *Botany*, Pond-weed, *ποταμογεῖτων* of the ancient Greeks, so called from *ποταμος*, a river, and *γεῖτων*, a neighbour or ally, because it grows in water.—Linn. Gen. 67. Schreb. 92. Willd. Sp. Pl. v. 1. 712. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 193. Ait. Hort. Kew. v. 1. 279. Brown Prodr. Nov. Holl. v. 1. 343. Juss. 19. Lamarck Illustr. t. 89. Gærtn. t. 84.—Class and order, *Tetrandria Tetragynia*. Nat. Ord. *Inundatæ*, Linn. *Naiades*, Juss. *Alismaceæ*, Brown.

Gen. Ch. *Cal.* none. *Cor.* Petals four, roundish, obtuse, concave, erect, with claws, deciduous. *Stam.* Filaments four, flat, obtuse, very short; anthers short, of two round lobes. *Pist.* Germens four, ovate, pointed; styles none; stigmas obtuse. *Peric.* none. *Seeds* four, roundish, pointed, gibbous at the outer side, compressed and angular at the inner.

Eff. Ch. *Calyx* none. *Petals* four. *Styles* none. *Seeds* four, naked.

This genus is entirely aquatic, floating for the most part

under the surface of fresh-water pools and rivers, only throwing up its flowering spikes to a small height above that level, in order that the pollen may escape injury. The herbage of all the species is semipellucid, and highly vascular, imbibing and exhaling moisture with great facility from every part; their general colour is a dull olive-green, verging, in some instances, to a brighter green, in others to a reddish hue. They are all herbaceous, perennial, branched, devoid of pubescence. Linnæus, in the second edition of Sp. Pl., reckons up twelve species, of which *pedunculatum* and *marinum* prove to be one and the same, and *ferratum* is not well understood. Except perhaps this last, all are natives of Britain, as are the new ones added by Willdenow. We shall therefore treat of the whole fourteen species of this author. Four of them have been observed in New South Wales, by Mr. Brown, but no new ones.

1. *P. natans*. Broad-leaved Pond-weed. Linn. Sp. Pl. 182. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1822. Fl. Dan. t. 1025. Mill. Illustr. t. 11. (*P. latifolium*; Ger. Em. 821.)—Upper leaves oblong-ovate, stalked, floating; those below the surface linear.—Common in the ponds and rivers of Europe, and found also in New South Wales and Van Diemen's land. With us it flowers in July. The root consists of long simple fibres, running deep into the mud. Stems many feet in length, much branched, round, leafy. The broad, dark-green, floating upper leaves cover the surface of the water, being each about three inches long, and one and a half broad, on longish stalks. Stipulas almost equal in length to the footstalks, and placed between them and the stem, linear, acute. Bractæas like them, one to each solitary thick flower-stalk. Spike simple, raised two or three inches above the water, and composed of several brownish-green, sessile, vertical flowers.

2. *P. fluitans*. Long-leaved floating Pond-weed. Roth. Germ. v. 1. 72. v. 2. 202. Willd. n. 2. Fl. Brit. 1391. Engl. Bot. t. 1286.—Lower leaves lanceolate, pointed, membranous; upper elliptic-lanceolate, somewhat coriaceous; all of them stalked.—Native of pools and slow rivers in Germany and some parts of England; also in North America. The whole of the herbage is nearly under water, the uppermost leaves only being somewhat floating, but scarcely horizontal. Their shape is much more oblong than in the former, and their colour reddish, like that of the spikes of flowers. Willdenow suspects this to be a variety of the preceding, but surely without reason. He allows it to remain permanently distinct about Berlin.

3. *P. heterophyllum*. Various-leaved Pond-weed. Schreb. Lips. 21. Willd. n. 3. Fl. Brit. 1390. Engl. Bot. t. 1285. (*P. palustre*; Teesdale Tr. of Linn. Soc. v. 5. 43. *P. gramineum*; Fl. Dan. t. 222, wanting the upper leaves.)—Leaves under water membranous, linear-lanceolate, sessile; the upper ones floating, coriaceous, elliptical, stalked. Flower-stalks swelling upwards.—Native of ditches and still pools in Germany and Britain. This bears most resemblance to the first, but is in all its parts scarcely half so large. The colour is bright olive. The floating leaves are chiefly produced in autumn, when the flowers most abound, and the whole plant is very much branched. The flower-stalks are club-shaped.

4. *P. perfoliatum*. Perfoliate Pond-weed. Linn. Sp. Pl. 182. Willd. n. 4. Fl. Brit. n. 2. Engl. Bot. t. 168. Fl. Dan. t. 196. (*P. tertium Dodonæi*; Ger. Em. 822.)—Leaves heart-shaped, clasping the stem, all below the surface.—Frequent in ditches and pools throughout Europe, especially on a clay soil. It occurs also at Port Jackson. The whole plant, except the short brown spikes, is immersed in the water. The leaves are scarcely two inches long,

long, of a broad heart-shaped form, ribbed, brittle, and highly vascular. They are not truly perfoliate, but, from clasping the stem, have that appearance.

5. *P. densum*. Close-leaved Pond-weed. Linn. Sp. Pl. 182. Willd. n. 5. Fl. Brit. n. 3. Engl. Bot. t. 397. (*P. feu Fontinalis media lucens*; Bauh. Hist. v. 3. 769.)—Leaves ovate, pointed, opposite, crowded. Stem forked. Spike of four flowers.—Native of pools, ditches, and slow rivers, in England, France, and Italy, flowering in June. The leaves are numerous, crowded, scarcely above an inch long. Flower-stalks solitary from the forks of the stem, recurved. Spike very short, pale green, of four, sometimes only two, flowers, which are all that appears of the plant above the water, and for a short period only.

6. *P. lucens*. Shining Pond-weed. Linn. Sp. Pl. 183. Willd. n. 6. Fl. Brit. n. 4. Engl. Bot. t. 376. Fl. Dan. t. 195. (*P. longis acutis foliis*; Ger. Em. 822.)—Leaves ovato-lanceolate, flat, tapering at their base. Spike dense, many-flowered.—A very frequent plant in the ponds, ditches, lakes, and rivers of Europe, growing entirely under water, except the flowers, which appear in June and July, and compose dense, longish, pale-olive spikes. The stipulas are large, clasping the stem. Leaves a span long, and about an inch, or more, in breadth.

7. *P. lanceolatum*. Lanceolate-leaved Pond-weed. Engl. Bot. t. 1985. (*P. setaceum*; Linn. Sp. Pl. 184? Fl. Brit. n. 10? *P. ramosum angustifolium*; Bauh. Pin. 193. Prodr. 101?)—Leaves lanceolate, membranous, flat, entire; contracted at their base. Spike ovate, dense, of few flowers.—Native of ditches in turfy bogs, or of alpine lakes, in Europe. The Rev. H. Davies sent the plant of Engl. Bot. from Wales, and the more we consider the characters and descriptions of the Linnæan *P. setaceum*, the more we are convinced of our's being that obscure species, of which no specimen exists in the herbarium of Linnæus; and which is therefore to be made out from Bauhin only. Nevertheless, we cannot be quite certain, and therefore dare not adopt the name of *setaceum*, which is indeed very inapplicable to the Welsh plant. What Hudson intended is not to be ascertained. Our *lanceolatum* is, in all its parts, but about one-fifth the size of *lucens*. The stipulas are involute and tubular. Flowers small, few, in a short ovate spike. The stem is round, and almost capillary.

8. *P. crispum*. Curled Pond-weed. Linn. Sp. Pl. 183. Willd. n. 7. Fl. Brit. n. 5. Engl. Bot. t. 1012. Curt. Lond. fasc. 5. t. 15. Fl. Dan. t. 927. (*Tribulus aquaticus minor, quercus floribus*; Ger. Em. 824.)—Leaves lanceolate, alternate, wavy, ferrated.—Common in European rivulets and clear ditches, flowering with us in June and July. It occurs also in New Holland. Larger than the last, with an angular stem. Leaves obtuse, much curled or waved, all immersed, mostly alternate; but in a variety, which is Hudson's *ferratum*, the upper ones are opposite. Flower-stalks above the surface, each bearing a lax spike of reddish flowers, not ill-compared by old writers to oak blossoms.

9. *P. ferratum*. Serrated Pond-weed. Linn. Sp. Pl. 183. Willd. n. 8?—Leaves lanceolate, opposite, obtuse, serrated, slightly wavy.—Native of rivulets in Europe. Linn. The Linnæan specimen is but imperfect, yet it seems different from the foregoing. We have found nothing in Britain exactly like it. The leaves are sharply and thickly serrated. Willdenow says his *ferratum* has perfectly entire leaves, which is rather paradoxical. The matter must for the present still remain in doubt.

10. *P. compressum*. Flat-stalked Pond-weed. Linn. Sp. Pl. 183. Willd. n. 9. Fl. Brit. n. 6. Engl. Bot. t. 418.

Fl. Dan. t. 203.—Leaves linear, obtuse. Stem compressed.—In the ditches and slow rivulets of England, and other parts of Europe, flowering in the middle of summer. The stem is remarkably flat, zigzag, floating entirely under water. Leaves bright green, long, narrow, obtuse, grassy; alternate, except under each flower-stalk. Stipulas broader than the leaves, flattened, and somewhat angular, pale, often cloven. Flower-stalks flat, rising out of the water, each bearing about four or six flowers, in distant pairs.

11. *P. gramineum*. Grassy Pond-weed. Linn. Sp. Pl. 184. Willd. n. 12. Fl. Brit. n. 7. Engl. Bot. t. 2253. (*P. gramineum latiusculum, foliis et ramificationibus densissime stipatis*; Dill. in Raii Syn. 149. t. 4. f. 3.)—Leaves linear-lanceolate, alternate, sessile, broader than the stipulas. Stem round, somewhat forked.—Native of ditches and pools in Europe, but rare. Mr. Brown found it at Port Jackson. Lightfoot erroneously cites, with commendation, the t. 222 of Fl. Dan. which undoubtedly represents our *heterophyllum*, n. 3, without its upper leaves. The present species has often been supposed not to differ from the last; but it is larger, more dense in foliage, and, if we are not much mistaken, the above specific characters will always distinguish the two.

12. *P. pusillum*. Small Pond-weed. Linn. Sp. Pl. 184. Willd. n. 14. Fl. Brit. n. 8. Engl. Bot. t. 215. (*P. pusillum, gramineo folio breviori*; Vaill. Paris. t. 32. f. 4.)—Leaves linear, opposite or alternate, narrower than the stipulas, spreading at their base. Stem round. Flower-stalks axillary.—In clay ditches and pools, sometimes on turfy bogs, throughout Europe, flowering in summer and autumn. The whole herb is immersed in water, except the flowering spikes, as usual in this whole genus. The stem is slender, alternately branched, striated. Leaves linear, very narrow, hardly above an inch long, and greatly exceeded in breadth by their stipulas. Spike ovate, dense, small, of few flowers.

13. *P. pectinatum*. Fennel-leaved Pond-weed. Linn. Sp. Pl. 183. Willd. n. 10. Fl. Brit. n. 9. Engl. Bot. t. 323. Fl. Dan. t. 186. (*P. marinum*; Linn. Sp. Pl. 184. Willd. n. 13. *P. ingens, gramineo folio longiori*; Vaill. Paris. t. 32. f. 3.)—Leaves in two ranks, crowded, parallel, bristle-shaped, sheathing at their base.—Common in ditches and rivers, either of fresh, or partly salt, water, flowering, but not constantly, in July. The creeping root springs from a small knob. Herb immersed far under the surface, bushy and much branched. Leaves copious, three or four inches long. Stipula united to the base of the leaf internally, membranous at the edge, cloven. Spikes interrupted, many-flowered, often supported by long slender stalks, to elevate them above the water. The lowest flowers are very remote. The *P. marinum* of authors is actually not to be distinguished, even as a variety.

POTAMOPHILA, from ποταμος, a river, and φιλεω, to love, alluding to its watery place of growth.—Brown Prodr. Nov. Holl. v. 1. 211.—Class and order, *Hexandria Digynia*. Nat. Ord. *Gramina*.

Ess. Ch. Flowers polygamous; mostly monoecious; the males superior, with rudiments of pistils; females with rudiments of stamens. Calyx, in both, minute, single-flowered, of two valves. Corolla of two valves, awnless, membranous; the outer valve with five ribs, inner with three. Nectary of two scales. Stigmas feathery.

1. *P. parviflora*. Gathered by Mr. Brown at Port Jackson, New South Wales. This is a perennial aquatic grass, from three to five feet high, forming dense, and often broad, tufts in the rivers. The stems are somewhat branched. Leaves narrow, slightly involute. Stipula long,

torn. *Panicle* loose, erect. The genus is closely allied to *Oryza* and *Zizania*. *Brown*.

POTAMOPITYS, *Buxbaum's* name for the *Elatine* of *Linnæus* and all other authors, expressing its native situation, in rivers, and its *fir-like* aspect; from *ποταμος* or *πίλις*.

POTAMOS, or POTAMUS, in *Ancient Geography*, a maritime place of Asia, in Galatia, between *Stephanæ* and *Leptisæra*.

POTAPAUGE, in *Geography*, a town of America, in Middlesex county, and state of Connecticut.

POTAPOVA, a town of Russia, in the government of Irkutsk, on the Lena; 52 miles S. of Kirensk.

POTASH, *Vegetable fixed alkali*; in French *la potasse*. The term potash is commonly applied, in commerce, to the impure carbonate of potash, which is obtained from the ashes of vegetables. The history of potash in this state, and the various modes by which it is procured, are detailed at full length under the head CARBONAT of Potash. It remains now for us to consider the substance called *potash*, in a *chemical* sense, that is, separated not only from carbonic acid, but also from all the foreign ingredients with which common potash is contaminated.

It may be proper to premise, that although all the potash of trade is obtained from the vegetable kingdom, yet the term *vegetable*, as applying exclusively to this alkali, is not strictly correct, since potash has been found to enter into the composition of various earthy minerals, and has also been proved to exist in the blood of animals.

Potash may be obtained in a state of purity, by various methods. The following process, recommended by *Berthollet*, is perhaps, upon the whole, the most easy and the most effectual. One part of pearl-ash is mixed with one part and a half of quick-lime, and ten parts of water, and the mixture is boiled for some hours; it is allowed to stand for a day or two, and afterwards filtered. It is then quickly concentrated by evaporation in a silver vessel, till it assumes the consistence of honey; and upon this evaporated mass alcohol is poured, to the amount of one-third in weight of the pearl-ash used. This solution is then boiled for a minute or two, and inclosed in a glass vessel. The liquor soon separates into two strata. The inferior stratum contains the impurities, partly dissolved in water, and partly in a solid state. The superior stratum is the solution of potash in alcohol, which has a brown colour. The liquor is then decanted and rapidly evaporated in a silver vessel, till a crust begins to form on its surface, and being now poured into a porcelain vessel, it concretes in a white mass, which is pure potash.

The theory of this process is obvious; the lime separates the carbonic acid, for which it has a stronger affinity than the potash; and the alcohol, by dissolving the potash, separates the other impurities which are not soluble in this menstruum.

But without the assistance of alcohol, potash may be, in a great measure, purified from the other salts mixed with it, by solution in water and evaporation. The potash being much more soluble than the other salts, the latter crystallize, and, with proper management, may be almost entirely removed.

The pharmacopeia of Berlin directs, at *Klaproth's* suggestion, to prepare caustic potash, by boiling for a quarter of an hour, in an iron kettle, two pounds of potash obtained from calcined tartar, with three pounds of pulverized quick-lime, and a sufficient quantity of water. The mixture is then filtered and evaporated till the liquor acquires the specific gravity of 1.33. In this state, it is preserved in close vessels, under the name of *lixivium causticum*, and is sufficiently pure for most purposes.

Pure potash is a white brittle substance, having a slightly urinous smell, and an exceedingly acrid taste; it is eminently caustic, so that when applied to any part of the body, it destroys it almost instantaneously, and is often used by surgeons, under the name of *potential cautery*, to open abscesses, and to destroy excrescences. Its specific gravity is 1.7.

The nature of the change which causes common potash to acquire such powerful caustic properties, either by the processes above-mentioned, or simply by exposure to heat, is evidently the expulsion of the carbonic acid gas, the presence of which, in carbonate of potash, renders the alkali mild and inoffensive. This, however, was for a long time entirely misunderstood, and it was not until the masterly researches of *Dr. Black* in 1756, that distinct notions were formed on the subject.

When heated, potash fuses. At a red heat it swells and slowly volatilizes with a white acrid smoke. In an intense heat it becomes greenish, but without undergoing any other change. When exposed to the air, it quickly attracts carbonic acid and moisture.

Cold water dissolves about two parts of potash; the solution is transparent, and of a thick oily consistence. By slowly evaporating this solution, crystals of pure potash may be obtained, which sometimes assume the form of octohedral groups, or at other times that of thin transparent laminæ, according to the degree to which the evaporation has been pushed.

When four parts of pulverized potash are mixed with one of snow, the mixture becomes liquid, and a considerable degree of cold is produced; whilst, on the contrary, if cold water be poured upon dry potash, a considerable heat is evolved, phenomena which afford a striking illustration of the doctrines of latent heat.

Potash is capable of entering into combinations with sulphur and phosphorus, forming sulphurets and phosphurets; and it also unites with several of the earths. With siliceous earth, in particular, it forms glass, and with the various kinds of oils and fat, it forms soap. It also combines with all the acids; but the history of these interesting compounds will be found treated of under their respective names.

Such is the attraction of potash for water, that no degree of heat known can entirely deprive potash of moisture. On the contrary, it has been shewn by *Davy* and others, that the driest potash prepared by the processes above described, is a true *hydrat of potash*, containing at least 17 or 18 parts of water in 100 of potash. This water, however, may be expelled by chemical affinities; thus, for instance, if the potash be made to act upon iron turnings, at a dull red heat, the iron becomes oxydated, hydrogen is given off, and the alkali is found to have become harder, less fusible, more opaque, and of greater specific gravity.

Potash, until *fir Humphry Davy's* memorable discovery of its chemical nature, was considered as a simple body, though strong suspicions were entertained of its being of a compound nature. From that philosopher's researches, however, potash appears to consist of a metallic basis, which he called *potassium*, united with oxygen, in the following proportions:

Potassium	83
Oxygen	17

	100

The particulars of this discovery will be found fully stated under the head POTASSIUM. M.

To the account that is given under the article CARBONAT of Potash, of the various methods by which this substance

POTASH.

is obtained, we shall here subjoin some further particulars. Mr. Birch, who some years ago carried on an extensive manufactory near Manchester, and who bleached his own yarn, was induced to try whether the dunghill-water might not be converted into potashes. He accordingly evaporated a large quantity of it, and burnt the residuum in an oven; the event so far answered his expectations, that he ever since continued to prepare these ashes, and to employ them in the operation of bucking: and with a liberality which betokens true greatness of mind, he made this lucrative discovery public.

The process is extremely simple, and may be easily understood by viewing *Plate XXIV. Miscellany, fig. 6*, in which N^o 1 represents the dunghill; 2, a fough or drain round it; 3, a reservoir for the dunghill-water; 4, a well communicating with the reservoir, in which a pump is fixed, to convey it to N^o 7, which is a pan, in which the water is boiled to the consistence of treacle, and afterwards burnt in an oven. The pan is made of iron plates, turned up a little at the edges. To these are screwed planks of wood, in order to make it about twenty inches deep. From a quantity of muck-water, equal to twenty-four wine pipes full, the quantity of ashes made was 9 cwt. 1 qr. 12 lb. valued at two guineas *per* hundred; in the manufacture of which, allowing for every expence attending it, there is a clear profit of 15*l.* 4*s.* deducting a trifle for the wear of the pan and oven. Dr. Percival suggests, that this profit, considerable as it is, may admit of increase by future improvements: for in spring and summer seasons, the evaporation might be carried on without the aid of fire, by conveying the dunghill-water from the reservoir through proper sluices into shallow troughs or ponds, of such extent as to afford a sufficient surface for the action of the sun and wind. These might be covered in rainy weather with awnings of canvas painted on the outside black, and white on the inside; the former with a view to absorb, the latter to reflect, the rays of light.

From the experiments of Dr. Percival, it appears that this potash is of a greyish-white appearance, deliquesces a little in moist air; but if kept in a dry room, near the fire, acquires a powdery surface. It is hard, and of a spongy texture when broken, with many small crystals in its substance. The colour of its internal part is dusky and variegated. To the taste it is acrid, saline, and sulphureous. It emits no smell of volatile alkali, either in a solid form, dissolved, or when added to lime-water; neither does it communicate the sapphire colour to a solution of blue vitriol. Silver is quickly tinged black by it, a proof that it contains much phlogiston. Ten grains of this potash required eleven drops of the weak spirit of vitriol to saturate them. The like quantity of salt of tartar required, of the same acid, twenty-four drops: a strong effervescence occurred in both mixtures; from the former a sulphureous vapour was exhaled. A tea spoonful of the syrup of violets, diluted with an ounce of water, was changed into a bright green colour by five grains of the salt of tartar; but ten grains of this potash were necessary to produce the same hue, in a similar mixture. Half an ounce of the potash dissolved entirely in half a pint of hot water; but when the liquor was cold, a large purple sediment subsided to the bottom: and it was found that this sediment amounted to about two-thirds of the whole quantity of ashes used.

The same ingenious writer concludes with observing, that this potash is a true fixed vegetable alkali, produced by putrefaction; that the quantity of alkali contained in it may be estimated at one-third of its weight, whereas the white Muscovy ashes are said to yield only one-eighth

part; that no quick-lime appears to be contained in this potash, for a solution of it poured from its sediment, remained clear, though long exposed to the air: that it would be worth trying, whether the large purple sediment, which subsides when this potash is lixiviated, might not be applied to the manufacture of Prussian blue, or used in the manner recommended by Macquer for dyeing wool and silks; and that this manufacture will furnish the farmer for top-dressing for his garden and land, of great fertilizing powers.

Dr. Watson (the present bishop of Landaff) suggests, that the investigation of a method of extracting its alkaline part from rock-salt, would be a most serviceable discovery. We have inexhaustible mines of rock-salt in this country, which, (he observes) the proprietors can afford at ten shillings a ton. A ton of rock-salt contains about half a ton of mineral alkali, which is for most purposes far preferable to potash. To those who have leisure to attempt such a discovery, he gives the following hint: whether the alkaline part of rock-salt may not be obtained by calcining it in conjunction with charcoal in open fires? His reason for this conjecture is founded upon the following experiment: upon burning sea-wrack to a black coal, and stopping the process at that point, he has obtained great plenty of common salt, but no mineral alkali from the black ashes; though we are certain, that when the black ashes are thoroughly calcined, or reduced to white ashes, mineral alkali may be obtained from them. This makes it probable, that the common salt contained in the black ashes of sea-wrack is decomposed, and changed into a mineral alkali, during the burning of the black ashes. There are reasons to suppose, that the cinder of pit-coal would answer the purpose better than charcoal. *Chem. Ess. vol. i. p. 136, &c.*

POTASH, in *Agriculture*, as a manure, is beneficial in some cases of grass land. It is stated that, in the county of Essex, Mr. Tweed, at Sandon, has a potash fabric on his farm; the value of the ashes *6d. per* bushel. He spreads on his grass-lands 160 bushels to the acre, once in five years. It more than doubles the produce. And Mr. Vaizey, of Halstead, in the same county, has manufactured it largely. When he uses the ashes alone, he also spreads 160 bushels, or thereabouts, on the acre; but he prefers mixing them with his yard-dung. Mr. Porter, of Little Leighs, in that district, has likewise remarked that these ashes sink *like quicksilver*, as readily as clay: shallow tillage is, therefore, good after them.

Other sorts of ashes are also frequently employed in this tract of country. At Chesterford, many coal-ashes are brought from Cambridge, at the distance of eleven miles, for clover, sainfoin, and grass: the price *2d.* a bushel, besides carriage. The Rev. Mr. Macklin uses a waggon-load to the acre. And lord Braybrook, at Audley-End, manures largely with these ashes; 38 acres of sainfoin in one year, 60 bushel to the acre, costing, carriage included, nearly *6d.* the bushel. His tenant and steward, Mr. Nockold, likewise manures ten acres of sainfoin with them every year. Another very spirited tenant and improver, Mr. Clayden, also laid down 50 acres to sainfoin; and in three months he brought from Cambridge 6200 bushels of these ashes, and in the same year dunged all his meadows besides. Such exertions are truly meritorious. These ashes are constantly attended with the best effects in this application. *Corrected Agricultural Report.*

In the county of Sussex, too, they have found this sort of ashes a great improvement to grass. Lord Egremont has doubled the value of his park, by draining and these
coal-

coal-ashes, which before was covered with moss, rushes, and rubbish. The difference of the grass, where the land has been covered with ashes, and where it has not, is most striking. They have created a sweet bite of white clover and trefoil, liked much by sheep. Corrected Agricultural Report. See MANURE and TURF-Ashes.

POTASSÆ *impura carbonas*, called also *Cineres clavelati*, and *kali impurum*, impure potash, carbonate of potash, potashes, and pearl-ashes, in the *Materia Medica* and the *Arts*, enters under a variety of forms into preparations for medicinal use, and for many mechanical purposes.

As to the origin of that fixed vegetable alkali called potash, it is disputed whether it exists ready formed in vegetables previously to their combustion, by which it is obtained, but which only disengages substances which envelope and disguise it; or whether vegetables contain only the materials proper for its formation, which consequently takes place in the act of burning, and whether it be, properly speaking, produced by fire.

The author of the Chemical Dictionary, art. ALKALI, *fixed vegetable*, says, that the reasons for and against these two opinions are so strong on both sides, that there are grounds to believe both of them to be true; or, that the fixed alkali, obtained after burning a vegetable, did partly exist ready formed in that vegetable before it was burnt, and that the other part was produced by the very act of combustion. The alkali prepared by the incineration of vegetable substances, and by lixiviating and evaporating to dryness, is far from possessing that degree of purity, which is always requisite in exact chemical experiments. It is almost always altered, 1. By some remaining inflammable principle,

from which it may be purified either by calcination or applying to it a body on which it cannot act, and which has a stronger affinity than itself with this inflammable matter: 2. By a portion of super-abundant earth, which may be easily separated from it by drying it once or twice, by solutions and filtrations; 3. By the mixture of different saline matters, which can be separated by no chemical process but crystallization: 4. By mixture with iron, for purifying it from which no practical method is known.

Besides referring to the preceding articles POTASH, CARBONAT of Potash, and PEARL-ASH, we shall select some other specimens of its combination.

It has accordingly been supposed that in living plants, the base only of potash exists as an element, and is oxydized so as to form the alkali during the combustion. Such is the conjecture of Mr. Murray (Chem. ii. 193.), and this may take place during the spontaneous decomposition of plants, where much water is present, for potash can be obtained, as we have already stated, by the evaporation of dunghill-water.

The pearl-ash of commerce is a very compound mass, containing, besides the sub-carbonate of potash, sand, sulphate of potash, muriate of potash, oxyd of iron, and oxyd of manganese, to the last of which Scheele attributes its blueish or greenish colour. Different parcels of pearl-ash must undoubtedly contain different quantities of potash; and, therefore, no accurate standard of the proportion of the ingredients can be fixed. M. Vauquelin has examined samples from different countries, and the result is exhibited in the following table.

N.B. The quantity of each was 1152 parts. *Annal. de Chimie*, xi. 284.

Kinds of Potash.	Real Potash.	Sulphate of Potash.	Muriate of Potash.	Insoluble Residue.	Carbonic Acid and Water.
Russian Potash -	772	65	5	56	254 = 1152
American Potash -	857	154	20	2	119 = 1152
Pearl-ash -	754	80	4	6	308 = 1152
Potash of Treves -	72	165	44	24	199 = 1152
Dantzic Potash -	603	152	14	79	304 = 1152
Potash of Vosges -	444	148	510	34	304 = 1152

The proportion of real alkali in any quantity of pearl-ash, may be ascertained in the following manner: pulverize 500 grains of the pearl-ash, and digest in successive portions of hot water, as long as any thing is dissolved. Mix the solutions, and drop in some diluted sulphuric acid, (previously prepared by mixing one part of concentrated acid with thrice its bulk of water), from a phial containing a known quantity of it, until litmus paper indicates the slightest possible excess of acid. Then heat this mixture to expel the carbonic acid; and on trying it again with the litmus paper, if it shew any excess of alkali, add a few drops more of acid. Ascertain now, by weighing the phial of acid, how much acid has been expended in saturating the alkali; and for every 100 parts of real acid set down 121.2 of pure potash. The value of the diluted acid must be previously ascertained, (see Aikin's Dict. i. 263.) by adding to 100 grains of it muriate of barytes as long as any precipitate falls. This forms sulphate of barytes, which, when washed and dried

at a low red heat, contains 83.3 per cent. of sulphuric acid; by which the proportion of real acid in the diluted acid may be known. See PEARL-Ash.

POTASSÆ *Acetas*, *Acetate of potash*, is prepared, according to the directions of the London pharmacopeia, by mixing together in a large glass vessel, 1½ lb. of subcarbonate of potash, and a gallon of (diluted) acetic acid; and having evaporated the solution to one-half over the fire, add gradually as much more (diluted) acetic acid as may be required for perfect saturation. Let the solution be again evaporated to one-half, and strained; then let the evaporation be continued in a water-bath, so that, on being removed from the fire, crystals shall form.

The *Acetis potassæ*, or acetite of potash, of the Edinburgh pharmacopeia, is obtained by the following process: take of pure carbonate of potash, 1 lb.; boil it with a very gentle heat, in four or five times its weight of distilled acetic acid; and add more acid at different times, until the watery

POTASSÆ.

part of the former portion, being nearly dissipated by evaporation, the acid newly added occasions no effervescence, which will be the case when about 20 lbs. of acid have been consumed; then evaporated slowly to dryness. Liquefy the remaining impure salt with a gentle heat for a short time; then let it be dissolved in water, and filtered through paper. If the liquefaction has been properly performed, the filtered fluid will be limpid; but otherwise, of a brown colour. Afterwards evaporate this fluid in a shallow glass vessel, with a very gentle heat, occasionally stirring the salt as it concretes, that it may the more quickly be brought to dryness. Finally, the acetite of potash ought to be preserved in closely shut vessels, to prevent its being liquefied by the air. This salt was first clearly described by Raymond Lully, and has at different periods assumed the following different names; "arcanum tartari, secret foliated earth of tartar, essential salt of wine, regenerated tartar, diuretic salt, digestive salt of Sylvius, and acetated kali."

It has a slight peculiar odour, and a warm sharp taste. It is usually in white masses, of a foliated soft texture, and becomes soon moist when exposed to the air: one fluid-ounce of distilled water at 60° dissolves 504 grains; or 100 parts of it are soluble in 105 parts of water, and in twice its weight of alcohol. In the watery solution it is spontaneously decomposed; and it is also decomposed by the strong acids, by a decoction of tamarinds, the sulphates of soda and of magnesia, the muriate of ammonia, the tartrate of potash and soda; and also by solutions of oxymuriate of mercury, and of the nitrate of silver; and consequently these cannot enter into formulæ with it. According to the experiments of Dr. Higgins, its constituents are 38.5 of acid, and 61.5 of alkali, in 100 parts. In medical use, acetate of potash is mildly cathartic and diuretic; and is found to be occasionally beneficial in febrile affections and jaundice; but it is principally employed in dropsies and other diseases, in which a copious discharge of urine is required. For producing the latter effect, the dose may be from ℥j to ʒj, given every three or four hours, in any bland fluid. Doses of ʒjj or ʒjjj open the bowels.

POTASSÆ Carbonas. See CARBONAT of Potash.

POTASSÆ Liquor, solution of potash. See LIXIVIUM. See also ALKALI and CAUSTIC.

The *lixivium causticum*, caustic ley, is described in the Edinb. phar. under the denomination of *aqua potassæ*, and in the Dublin phar. under that of *aqua kali caustica*, water of caustic kali. This solution of potash, prepared according to the formulæ of the pharmacopeias, is not simple, but contains small portions of muriate and sulphate of potash, silica, and generally some lime; however, these contaminations do not alter its effects as a remedy, nor as a pharmaceutical agent. This solution is diuretic, antacid, and lithontriptic. As a solvent of calculus, both in the kidneys and bladder, this alkali has been long celebrated; it has been observed, however, that it acts only on calculi composed of uric acid, or of urate of ammonia; and there is reason to believe, that its solvent effects on these calculi in the bladder are not equivalent to the irritation it excites both in the stomach and bladder: as a prophylactic its place can be better supplied by magnesia and the alkaline carbonates. Dr. Willan has perceived that the internal use of this solution produced the most beneficial effects in lepra. It is also used as a local stimulant, much diluted, in the form of lotion, to the joints, in rachitis and gouty swellings; and in its concentrated state as a caustic, to destroy the poison introduced by the bite of rabid or venomous animals. The dose may be from ℥x to ʒʒ, taken in chicken-

broth, milk, or almond mixture; or in cases of acidity of the stomach, in some bitter infusion.

POTASSA Fusa, or fused potash, of the Lond. phar. is prepared by taking a gallon of solution of potash, and evaporating the water in a clean iron vessel over the fire, until the ebullition having ceased the potash melts, and then pouring it out upon a clean iron plate into proper forms. This preparation of potash was formerly called *causticum commune acerrimum*, or stronger common caustic: it is in the Edinb. phar. described under the name of *potassa*, and in the Dublin phar. under that of *kali causticum*. In order to procure it as free as possible from carbonic acid, the evaporation should be performed very quickly, and in a deep vessel, so that the watery vapour which rises may exclude the atmospheric air. It is generally run into moulds, which form it into solid cylinders, which are covered with paper, and kept in well-stopped bottles. Berthollet's method of obtaining it in perfect purity is described under the article POTASH; but the following process of Lowitz is said to be more economical. Evaporate a solution of potash until a pellicle forms on its surface, and then let it cool; and carefully separate the saline deposit. Renew the evaporation, skimming off the pellicles that form on the surface, and as soon as they cease to be formed, and the ebullition is ended, let it be removed from the fire, and constantly stirred till it is cold. The mass is then to be dissolved in twice its weight of distilled cold water, the solution filtered, and evaporated in a clean iron or silver basin (a glass retort would be dissolved by pure potash, when hot) until crystals are deposited. If the heated fluid consolidates into a mass, in any degree, a small portion of water must be added, and the mass again heated to fluidity. The supernatant liquor is left of a brown colour, which, after being kept for some time at rest in well-stopped phials, deposits the colouring matter, and may be again evaporated and crystallized as before. The crystals obtained in the various evaporations are colourless pure potash. (See Nicholson's Journ. 4to. vol. i. 164.) This concrete potash is a white brittle substance, having the peculiar odour of slaking quick-lime, and a degree of causticity which will not allow its being tasted. It attracts water rapidly from the atmosphere, and is completely soluble in less than its own weight of that fluid at 60°. When heated to 360° it melts, and at a red heat is volatilized. It unites with sulphur, the acids, many of the metallic oxyds, and the fixed oils. Its constituents, according to the analysis of Sir H. Davy (Elem. of Chem. Phil.), are in 100 parts, 83 of potassium and 17 of oxygen. See POTASH, supra, and POTASSIUM.

This substance is used only as an escharotic, for forming issues in diseases of the hip-joint, the spine, and deep-seated inflammations. It has been lately much recommended for the removal of strictures of the urethra.

POTASSA cum Calce, potash with lime, is formed, according to the Lond. phar. by taking three pints of solution of potash and a pound of fresh burnt lime. Boil the solution down to a pint, then add the lime previously slaked by the water, and intimately mix them. This was the former *causticum commune mitius*, or milder common caustic; it is the caustic kali with lime of the Dublin college. The addition of the lime in these preparations makes the potash less deliquescent, and consequently more manageable as an escharotic.

POTASSÆ Nitras, nitrat of potash, nitre, or saltpetre, is a neutral salt, composed of nitric acid and potash in a state of perfect mutual saturation. The most usual form which this salt assumes is that of the common quartz crystal, or that of a straight six-sided prism, terminated at each extremity by a six-sided prism. Its specific gravity, according

POTASSÆ.

to Newton, is 1.9, according to Muschenbroek 1.901, and according to Hassenfratz, 1.9369, which latter is said to be the least correct. Nitre, when fully crystallized, is very brittle; and if the large prismatic crystals are held in the warm hand, they will crack transversely with a very audible noise. The moisture which it generally attracts on being exposed to the air is probably owing to the casual mixture of a small portion of deliquescent salt. Some differences of opinion subsist with regard to the solubility of nitre in water of different temperature. According to Bergman, this salt is soluble in seven times its weight of water at the usual temperature, and in about its own weight of boiling water; but from the experiments of Hassenfratz it appears, that a hot saturated solution of nitre, after being cooled down to 61° Fahr., and remaining at this temperature 24 hours, holds nearly a fourth of its weight of salt, and at 54° Fahr. about a sixth of its weight. According to Beaumé, 4 oz. of boiling water will take up 10 oz. of nitre when the solution is made in a matras, but if a basin or other open vessel be used, a pellicle begins to form at the surface of the liquor, when it contains water and salt in equal proportions. Hassenfratz has constructed the following table of the specific gravity and composition of solutions of nitre in water at 61° Fahrenheit.

Sp. gr. of Solution at 61° Fahr.	Proportion of Nitre in 100 parts of Solution.

Ann. Chim. xvii. p. 135.

Nitre is easily fusible at a heat almost equal to that of melting zinc, or somewhat below that of ignition, and at this temperature it undergoes no change except a slight loss of weight by parting with its water of crystallization; and a piece of charcoal may be immersed in it without producing any detonation. Poured on any flat surface it presently congeals into a white translucent mass, commonly known by the name of "crystal mineral." (See CRYSTAL.) But with a heat more than sufficient to maintain its liquidity, a decomposition commences; bubbles of gas are disengaged; and if the heat be continued as long as any air escapes, the acid is entirely decomposed, and nothing remains but the alkaline base of the salt: the gas that first comes over dur-

ing the process is tolerably pure oxygen, but the latter portions are largely mixed with azot. When the fusion is not continued long enough for the total decomposition of the nitre, the residue consists of free alkali, and a variable proportion of nitrite of potash.

The decomposition of nitre is more rapid, if some inflammable substance be present; in this case a detonation of nitre takes place; the added inflammable matter combines with the greater part of the oxygen of the nitric acid, and is converted into an oxyd or acid; if the latter, it generally unites with the alkaline base of the nitre in proportion as its own acid is decomposed or driven off. Accordingly, if a few grains of sulphur be projected on red-hot nitre, the former immediately takes fire, burns rapidly with a reddish-purple flame, and is converted into sulphuric and sulphureous acid, at the expense of the nitrous acid, which is more or less decomposed: the sulphureous acid mixed with nitrous vapour flies off, while the sulphuric acid remains in combination with the disengaged potash of the nitre, forming "sulphat of potash." When the quantity of sulphur added is not sufficient to effect a total decomposition of the nitre, the result is a mixture of the two neutral salts, and was known among the old chemists by the name of "Glafer's polychrest salt."

The detonation of nitre with charcoal is very rapid; whether the charcoal is added to the nitre brought previously to a state of fusion, or the two ingredients are mixed together by pulverization, and then thrown into a crucible, or any other vessel heated red-hot, an intense blue flame is disengaged, accompanied by a great heat and a white vapour, the nitric acid disappears, and the residual salt is "subcarbonate of potash." In this case, the charcoal combines with the oxygen of the nitric acid, and is converted into carbonic acid, a portion of which unites with the alkaline base of the nitre, whereby the rest is volatilized, together with the azot produced by the decomposition of the nitric acid. Sir H. Davy's experiments, detailed in his "Researches," throw farther light on this subject. Having filled a glass tube with a mixture composed of six parts of nitre and one of charcoal, he detonated it, and received the product into a jar inverted over mercury, and containing a little water; which, after the operation, was so much acidulated as to restore the colour of red cabbage juice that had been rendered green by an alkali, thus indicating the presence of a little nitrous acid; but the same liquor, when supersaturated by caustic potash or quick-lime, gave out a very sensible odour of volatile alkali, so that it appears to have contained acidulous nitrate of ammonia. The gas produced by the detonation being mixed with the carbonic acid, separated by muriatic acid from the alkaline residue, was found to be composed of carbonic acid, nitrous gas, and azot, in the proportion, by bulk, of twenty of the first, three of the second, and seven of the third. The presence of ammonia in this experiment is attributed by Mr. Aikin to the decomposition of the water of crystallization by the charcoal, and the combination of its hydrogenous base with the azot of the nitric acid.

Those compound acids into which carbon enters as an essential constituent, decompose nitre with nearly the same energy as charcoal does: thus, if equal parts of nitre and crude tartar are mixed together and ignited, a detonation takes place; the tartareous and nitric acids mutually decompose each other into carbonic acid, and other gaseous products, and there remains sub-carbonate of potash, being the alkaline base of both salts. Among the old chemists this alkali was much esteemed, and by them it was named

"white

POTASSÆ.

“white flux,” “extemporaneous alkali,” and “nitre fixed by tartar:” but it is not in any respect different from purified pearl-ash, if the nitre has been all decomposed.

Most of the metals, as Aikin observes, if reduced to filings or powder, and mixed with nitre, will produce a detonation at a red heat; the metal in a state of high oxydation unites with the alkali, and the nitric acid is more or less completely decomposed. The most inflammable metals, such as zinc, antimony, tin, iron, and bismuth, produce the most violent detonation. The effect of pure hydrogen on nitre has not been examined; but those readily-fusible inflammable bodies, into the composition of which it largely enters, are not capable of detonating with nitre, except in exact proportion to the amount of carbon which they contain beyond what is requisite for the production of carburetted hydrogen; or as Macquer, who made the discovery, states it, no detonation will happen till the inflammable matter be burnt and reduced to a coal; then the detonation commences, and is always proportionable to the quantity of coal produced by the inflammable matter.

Nitre is entirely decomposed by distillation at a moderate heat with sulphuric acid, and at a higher temperature with phosphoric, boracic, and arsenic acids. These combine with the alkali of the salt, while its acid passes over in the state of vapour. A similar effect is produced by flint or alumine, or a mixture of both; but the heat requisite in this case being considerably higher than in the former, a proportionably larger quantity of nitric acid is decomposed during the process. Strong muriatic acid will also in part decompose nitre. The only substance capable of decomposing nitre, so as to liberate its alkali, is caustic barytes; a quantity of each in fine powder being mixed together, and then moistened with a little water, re-act on each other, and produce nitrate of barytes and caustic potash, of which the latter alone (if too much water is not used) remains in solution.

The exact analysis of nitre is difficult, and hence the most able chemists have varied in their statements of its composition. Bergman found that 49 parts of potash, when saturated with nitric acid, afforded 100 of crystallized nitre; and accordingly he gives the proportions of this salt at

49 potash
33 nitric acid
18 water

100

According to Wenzel, 100 parts of nitre contain

48.13 potash
51.87 acid and water

100.00

But according to Kirwan, 100 parts of crystallized nitre, dried at 70° Fahr., are composed of

51.8 potash
44.0 acid
4.2 water

100.0

And as this estimate is incidentally confirmed by other experiments of Berthollet and of Keir, it is probably, says Mr. Aikin, very near the truth. Macquer's Chem. Dict. Aikin's Dict. of Chem. and Min., to which we are chiefly indebted in the compilation of the preceding article.

For the natural history and manufacture of nitre, and its various uses in the arts, we refer to the article SALTPETRE.

As to its medical properties and uses, it is considered as refrigerant and diuretic; and externally applied, it is cooling and detergent. When taken in repeated small doses, it abates heat and thirst in diseases of increased excitement, diminishes the force and frequency of the arterial action, and increases the secretion of urine, in which the salt may be detected by chemical tests. It is efficaciously given in all inflammatory cases, active hæmorrhages, and in herpetic eruptions. Although diuretic, it is of little use in dropsies, and is contraindicated in typhus and hectic fevers; in the latter of which, as Dr. Percival has justly observed, it lowers the pulse at first, but afterwards raises it higher than before. A small portion of it allowed to dissolve slowly in the mouth often removes incipient inflammatory sore throat; and hence its utility in gargles for that complaint. It is most advantageously given dissolved in mucilaginous fluids, as almond emulsion, in moderate doses not exceeding grs. xv, frequently repeated. In large doses it excites nausea; and ʒj given for a dose, which has sometimes occurred for sulphate of soda, occasions vomiting, hypercatharsis, bloody stools, convulsions, and sometimes death. Opium and aromatics are the best antidotes. Thomson's Lond. Disp.

POTASSÆ *Subcarbonas*, subcarbonate of potash, is prepared, according to the directions of the London pharmacopœia, in the following manner: take of impure potash (pearl-ashes) reduced to powder, 3 lb.; and boiling water, 3½ pints. Dissolve the potash in the water, and filter; then pour the solution into a clean iron pot, and evaporate the water with a gentle heat until the liquor thickens; then withdraw the fire, and stir assiduously with an iron spatula, until the salt concretes into small grains. A pure subcarbonate of potash may be prepared in a similar manner from tartar, previously burnt till it is of an ash-colour. (See CARBONAT of Potash, and TARTAR.) Its constituents, according to Berard, are 29.79 acid, and 70.21 alkali and water, in 100 parts. (Annal. de Chim. lxxi. 55.) As an article of the Materia Medica, it is deobstruent, diuretic, and antacid. In small doses, it is sometimes given in cases of glandular obstructions of the abdominal viscera, particularly hepatic obstructions, with seeming advantage; but it is not certain, that the benefit does not arise from the effects of the remedy in correcting acidity of the primæ viæ. Its effects on the kidneys are considerable, when aided by plentiful dilution. The principal use of this salt in medicine is in the formation of saline draughts, for which purpose it is given in combination with a solution of citric acid, or with recent lemon juice, in the proportion of ʒj of the salt to fʒiv of the lemon juice, or the acid solution, in febrile affections: when given as an antacid, its taste and acrimony are most perfectly covered with milk.

POTASSÆ *Sub-carbonatis, liquor*, a solution of subcarbonate of potash, is prepared by dissolving 1 lb. of subcarbonate of potash in 12 fluid-ounces of distilled water, and filtering the solution through paper: Lond. pharm. The medical properties and uses of this solution are the same with those of the concrete salt. The dose may be from ℞ to fʒi, in any convenient vehicle.

POTASSIUM, or basis of potash. The splendid discovery which brought to light this extraordinary substance, is so much connected with the history and progress of electro-chemistry, that it is impossible to enter into the former subject without, in some degree, encroaching upon the latter.

Immediately after the discovery of Volta's pile, philosophers began to make some observations respecting its agency in producing chemical effects. Messrs. Carlisle and Nicholson, and Mr. Cruickshank, were the first chemists who turned their attention to the subject. On the continent, Messrs. Fourcroy, Vauquelin, Thenard, Ritter, Berzelius, and Volta himself, followed up the inquiry, and many interesting facts on the chemical effects of electricity were soon established. It was by the British chemists just mentioned, however, that the important fact of the decomposition of water by electricity was first discovered. Mr. Nicholson shewed, that by introducing wires, connected with the two extremities of the Volta pile, into a tube filled with water, a stream of hydrogen gas arose from the wire connected with the negative pole, and the wire connected with the other pole became oxydated; but when the latter was of a metal not susceptible of oxydation, oxygen issued from it.

It is about this period (in 1806) one of the most memorable in the annals of natural philosophy, that sir H. Davy began his researches. He had no sooner turned his fertile genius to this inquiry, than a number of new and interesting facts were added to this department of science. He shewed in particular, that whenever a saline substance is exposed to the action of the Volta pile, it is invariably decomposed, the alkali being attracted towards the negative pole, and the acid towards the positive.

Similar experiments were instituted upon a variety of substances, and a sufficient number of facts were obtained to enable sir H. Davy to conclude, in general, that hydrogen, the alkaline substances, the metals, and certain metallic oxyds, are attracted by negatively electrified metallic surfaces, and repelled by positively electrified metallic surfaces; whilst oxygen and acid bodies are attracted by positively electrified metallic surfaces, and repelled by negatively electrified metallic surfaces; the electrical attractions and repulsions thus affording a new and powerful means of chemical decomposition.

These were the important results which sir H. Davy laid before the public in 1806. For some time the philosophical world waited in silence; and although Davy had advanced in his first paper the conjecture that many bodies, hitherto considered as simple, might probably be decomposed by electricity, no one ventured to take up the subject; and it was not until a twelvemonth afterwards that Davy himself resumed his researches, and obtained those results which placed him amongst the first discoverers of the age. The fixed alkalies were the bodies to which he first directed his attention; and, after a few days' labour, he was able to demonstrate that the alkalies are compound bodies, and that they consist of a new and highly curious metallic substance, combined with oxygen. His first experiments, which were upon potash, are thus related in his own words. Phil. Trans. 1807.

"A small piece of pure potash, which had been exposed for a few seconds to the moisture of the atmosphere, so as to give conducting power to the surface, was placed upon

an insulated disk of platina, connected with the negative side of the battery in a state of intense activity; and a platina wire, communicating with the positive side, was brought in contact with the upper surface of the alkali. The whole apparatus was in the open atmosphere.

"Under these circumstances, a vivid action was soon observed to take place. The potash began to fuse at both its points of electrization. There was a violent effervescence at the upper surface; at the lower, or negative surface, there was no liberation of elastic fluid; but small globules having a high metallic lustre, and being perfectly similar in external appearance to quicksilver, appeared, some of which burnt with explosion and bright flame, and others remained, and were merely tarnished, and finally covered by a white film which formed on their surface."

"These globules," continues Davy, "numerous experiments shewed to be the substance I was in search of, and a peculiar inflammable principle, the basis of potash."

It is to this metallic substance that the illustrious discoverer has given the name of *Potassium*, and it now remains for us to describe its properties, which we shall do nearly in sir H. Davy's own words. See Davy's Elements of Chemical Philosophy.

Potassium is lighter than water; its specific gravity is between 8 and 9, water being 10. It is a solid at common temperatures; it is very soft, and easily moulded by the fingers. It fuses at about 150° Fahrenheit, and rises in vapour in a heat a little below that of redness. It is perfectly opaque. Its colour is white, like that of silver when it is newly cut, but it rapidly tarnishes in the air; and to be preserved from change must be kept under naphtha. It is a conductor of electricity. When thrown upon water it acts with great violence, swims upon the surface, and burns with a beautiful light, which is white, mixed with red and violet; the water in which it burns is found alkaline, and contains a solution of potash. It inflames when gently heated in the air, burns with a red light, and throws off fumes, which are alkaline. It burns spontaneously in chlorine, or oxymuriatic acid gas, with intense brilliancy. It acts with energy upon all fluid bodies containing oxygen or water; and in attracting oxygen from water, it disengages hydrogen.

Potassium combines with oxygen in different proportions; if gently heated in common air, or in oxygen, the result of its combustion is an orange-coloured fusible substance, which, as Messrs. Gay Lussac and Thenard have shewn, is an oxyd of potassium, containing a larger proportion of oxygen than that which constitutes potash. When thrown into water, this oxyd effervesces, and oxygen is disengaged. If heated strongly upon platina, oxygen is expelled from it, and pure potash remains, which dissolves in water without effervescence, but with much heat. This oxyd of potassium is not to be confounded with pure potash, dried by mere ignition, since, as was observed in the article POTASH, the latter never contains less than 17 or 18 per cent. of water.

The inflammation produced when thin pieces of potassium are introduced into chlorine, is very vivid. The attraction of chlorine for potassium is much stronger than that of oxygen; so that potash and the orange oxyd of potassium are immediately decomposed by chlorine, the chlorine combining with the metal, and the oxygen being set free.

The result of the combination of chlorine and potassium is the substance called muriate of potash, a nomenclature to which sir H. Davy strongly objects; since, according to his view of the subject, this compound contains neither muriatic acid nor potash, but potassium and chlorine. As, however, some of the most eminent chemical philosophers

of the age still entertain great doubts respecting the accuracy of sir H. Davy's views in regard to the nature of oxymuriatic acid, this part of the subject may be considered as still *sub judice*; and until the point is proved or controverted by more decisive arguments, it would be better to postpone the proposed changes of nomenclature.

Potassium and sulphur combine with great energy when they are heated together, producing much heat and light, and forming a *sulphuret of potassium*, which is of a grey colour, and appears to consist of 30 parts of sulphur to 75 of potassium.

A *phosphuret of potassium* may be produced in a similar manner, which burns with great brilliancy when exposed to air, and when thrown into water produces explosions, with disengagement of phosphuretted hydrogen.

From the excessive attraction which potassium has for oxygen, it may be used as a general agent for detecting the presence of that principle in bodies; and a number of substances, undecomposable by other chemical agents, are readily decomposed by this body.

Such are the principal circumstances relating to the history of this extraordinary substance. It will be seen under the article SODIUM, how soda, the other fixed alkali, yielded to the same powers of chemical decomposition; so that this important class of bodies, the nature of which had evaded the researches of all former chemists, and was deemed an almost insoluble problem, suddenly yielded to a bold effort of British genius. Davy seized upon the powerful instrument which others had discovered, but which he knew best how to use and appreciate. With this wonderful agent he brought to light bodies which the human eye had never beheld, and which, without him, might have remained eternally concealed under their impenetrable disguise.

An important circumstance remains to be mentioned. When the bases of alkalies were discovered, it was thought that they could be obtained by means of the Voltaic electricity alone, and could be procured that way only in very minute quantities. But Messrs. Gay Lussac and Thénard discovered, in 1808, that potassium might be procured, by chemical means, without electricity. If iron turnings be heated to whiteness in a curved gun-barrel, (*Plate XXIV. Miscellany, fig. 7.*) and if melted potash be made slowly to come in contact with the turnings, air being excluded, potassium will be formed, and may be collected in a cold part of the tube. Potassium may in this way be now prepared in almost any quantities, and it is peculiarly satisfactory to observe, that when sir H. Davy's experiments could be repeated at pleasure upon a large scale, his conclusions were confirmed in all the important particulars.

POTATOE, in *Gardening*, a well-known, useful, and common root. See SOLANUM.

POTATOE, in *Agriculture*, the name of a well-known plant of the knobby-rooted kind, much used as human food in most places. It may be noticed, that the discovery of this inestimable root has been of the greatest consequence to mankind, as it is now almost generally cultivated, though at first its introduction was very much opposed. Mr. Donaldson says, that it may with the greatest propriety be denominated the *bread-root* of Great Britain and Ireland. It was first brought from Virginia by the memorable, but ill-fated, sir Walter Raleigh; who, on his return homeward, in the year 1623, stopping at Ireland, distributed a number of potatoes in that kingdom. These having been planted, multiplied accordingly; and in a few years, the cultivation of them became general. And they became soon of the greatest benefit to the people, in the scarcities of grain that have since occurred in that country, as well as in

this, especially in the last severe famine. They were brought from Ireland into Great Britain; and owing to a ship, loaded with potatoes, being wrecked on the coast of Lancashire, the cultivation of that root, in the field, was first generally established there. Further, that within these last fifty years, the culture of potatoes has been introduced and extended in every part of the kingdom; but it is now much more general in Scotland than in England, except in a very few counties.

During the great scarcity of grain which happened in the north of Scotland, in consequence of the failure of the crop of 1782, many thousands of the inhabitants must have been reduced to the greatest distress, but for the relief which potatoes afforded them. And although the crop of potatoes failed to a considerable degree in 1795, every one knows how much the miseries, consequent on so great a failure of the crop of grain as then happened, were alleviated, in consequence of this root being so generally cultivated, and in such abundance. The culture of a root so highly valuable as the food of man should, of course, be particularly attended to by the farmers in all places.

It is now well known that there are two general kinds of this plant, which are distinguished into the *red-rooted*, which has purple flowers, and the *white-rooted*, which has white flowers; but in raising the root from the seed, or apple, numerous varieties have been introduced, and are daily introducing themselves to the planter.

It is supposed by the writer just noticed, that great improvements may still be made, both in the quality and productiveness of this plant, by raising it from seed, as will be fully shewn below. It is obvious, therefore, from the mode of raising the plants by seed, that the varieties in cultivation must be extremely numerous, and be liable to continual change. The following sorts have been distinguished by an extensive cultivator in Lancashire, where this kind of culture is in general well managed.

Early Kinds.

Smooth yellows,	Mather's seedlings,
Red champions,	Kerkham marbles,
White ditto,	Donbobin's seedlings,
Lady queens,	Poor man's profit,
Drunken landlord,	Golden gulleons,
Birchal's golden yellows,	Invincible,
Smith's seedlings,	Broughton's dwarfs,
Foxe's ditto,	Hatley's nonsuch,
Boskow's kidneys,	Early perrins,
English champions,	Forcing dwarfs,
Britain's dwarfs,	Early manleys.
Bates's ditto,	

Late Kinds.

American white rangers,	Ox noble,
American red ditto,	Lords,
Derbyshire reds,	Seedling varieties,
Late champions,	Balmer's seedlings,
Late kidneys,	Budworth's dusters,
Pink eyes,	Irish apples,
Pink-nosed kidneys,	Winter kidneys.

There are also other varieties of the late sort.

White Scotch,	Common wise,
Magpie,	Apple,
Rough red,	Red sprout,
Purple,	Munster white,
English white,	Crons,
Silver skin,	Spanish.

These

POTATOE.

These last six were formerly much in cultivation in this district; but the pink eyes, champions, and duns, are now a great deal more in estimation.

But for use as human food, the old winter red has been found highly useful, as keeping well to a late period in the spring, when most other sorts are unfit for the table. As cattle potatoes, the ox noble and cluster sorts have been most commonly employed. The first, though formerly very productive, has lately been found to decline in some degree; it is, however, a good sort. The latter is also a very productive sort in this view. The royal, or Cumberland early, is likewise an useful sort, being both large in size, and more productive. A late writer states, that the pink eyes and copper plates are of a hardy nature, and probably capable of being grown with less perfect culture than most of the other varieties. The white and the apple sorts are only proper to be used in the early part of the season.

Various attempts have been made by different cultivators, to ascertain the difference of productiveness in the different sorts; but the matter has not yet been decided with any degree of accuracy. But in Mr. Young's trials under the drill system, the results were these:

Kinds.	Produce.
Cluster	360 bushels <i>per</i> acre
Red-nosed kidney	144
Golden tags	207

And with Mr. Baker in Ireland, the results, as stated in the report on potatoes, published by the Board of Agriculture, were these, on a similar space of ground:

Sorts.	Produce.
Common wife	21 lb. 6 oz.
Apple	20 2
Red French	15 12
Munster white	16 0
Crones	16 6
Spanish	15 10

But on repeating the experiment, they stood thus:

Sorts.	Produce.
Black	111 barrels <i>per</i> acre.
Quaker wife	108
Red French	88
White ditto	85
Common wife	103
Apple	76
English white	83
White Munster	79
Spanish	70
Crones	60

In Cheshire, there are different kinds of both the early and the late sorts made use of, in different parts. Among the early varieties, in the Frodsham district, they chiefly employ the Foxe's seedlings, and the perrins; but in the tract about Wirrall, the early manleys, Foxe's seedlings, and Broughton's dwarfs, none of which ever blossom; and in the Altringham range, the principal kinds are the Foxe and the green seedling. Some other early sorts are, however, occasionally had recourse to in these situations, though they are seldom such free bearers.

Among the later kinds, in the first of these districts, are the ox noble and the Irish apple, the kidney potatoe being now wholly given up here; in the second, the sorts commonly grown for winter use are the pink eyes, the ink eyes, the Scotch white, the ox noble, &c.; and in the last situa-

tion, the sorts mostly had recourse to are the white and red champions for the more early, and the dark coloured potatoe, called the sweep, for the later winter months.

About Ilford, in Essex, the favourite potatoe, for the general crop, was formerly the red-nosed kidney; but this is now much neglected, in consequence of its being almost sure to curl; and the champion very much preferred, as it does not curl.

Soil and Preparation.—In regard to soil, the potatoe will grow in almost any, even in that of the most indifferent quality; but that in which it thrives best, and where potatoes of the best quality are produced, is a light loam, neither too dry nor too moist; but if rich, so much the better. They may, however, be grown well on many other sorts of land, especially those of the mossy, moory, and other similar kinds, where they are free from stagnant moisture, and have had their parts well broken down by culture. And the differences in the produce, as depending on soil, are in some manner shewn below, in the result of Mr. Townley's trials, detailed in the report of potatoes by the Board of Agriculture; though the very stiff sorts of land do not seem to have been tried. The experiments were made by planting four eyes or buds of the cluster variety on four different descriptions of land.

Kinds of Soil.	Produce.
Strong rich loam	34 lb.
Light rich loam	29
Good gravel	19
Sand	15

From this it is evident, that though this sort of crop succeeds in the most perfect manner in the light friable sorts of soil, it does not answer on those of the purely sandy descriptions, as they are apt to become too dry in hot seasons, and to have too little of the earthy material in their composition. The wires of these roots have been found to shoot and extend, and the roots to distend themselves, and become of the largest sizes, in such soils as abound the most in good rich mellow mould. In cultivating this root in the field, it is of course of much advantage to have the land well broken down and divided by repeated ploughings and harrowings in the autumn and early spring months, being careful never to stir the land when it is wet. It may likewise be of utility in this view, to have recourse to the culture of this root, after such sorts of crops as have a tendency to loosen and render the land mellow and friable.

In Cheshire a considerable depth of dry, light, or loamy soil, is thought the most suitable to the cultivation of the potatoe, though other sorts of land may answer the purpose very well. But whatever is the nature of the soil, the ground should be well laid up in the autumn, to receive the beneficial action of the frosts, and in the spring be ploughed in a cross direction, torn well to pieces, and completely pulverized by the harrows; after which, about the end of April, or beginning of the following month, it is dunged and ploughed in a deep manner, into the form in which it is to be planted. In the Altringham district of this county, a dry sandy soil, and tolerably warm situation, is always preferred for the early sorts; but for the later kinds, a cooler bottom, if not clayey, is more generally chosen.

In Essex likewise, the potatoes are put into the ground after it has been prepared by an autumnal breaking up, and spring ploughings and harrowings for the most part two or three times.

However, where the practice of putting this sort of crop

POTATOE.

in upon fward or lay ground is employed, which by some is supposed advantageous, the best method of preparation is that of paring and burning, or the use of the skim-coulter plough, the dung and ashes being ploughed in together, in the first case by a light furrow. In the Survey of the North Riding of Yorkshire, the land intended for potatoes, if wheat, bean, or oat stubble, should, it is observed, be ploughed before Christmas, or as soon after it as possible, about the middle of April; if the land has got well dried, it should be harrowed well, repeating the operation, and also using the roller till the land is become fine. In a few days afterwards it should be ploughed again, being harrowed and rolled, as in the former case, and where the land is in a bad condition, it may be necessary to give it one or two ploughings more, with suitable harrowings and rollings, working it according to its particular state, letting it remain a few days between the ploughings; then it should be ridged up according to the state of the land in respect to fertility for being planted.

Manuring.—It is probable from the nature of this root, and the circumstance of its produce being formed in the soil, that it can never be cultivated to advantage without the use of manure. In some sorts of the more heavy kinds of land, such as is of the long littery kind may be made use of, as keeping such sorts of land more dry and open, but in those of the light, dry, friable kinds, the more reduced sort of manure may be better. Mr. Young considers farm-yard dung the best, and the more the better, unless the soil be very rich, and upon an average of soils, less should not be laid than twenty-five or thirty large loads to the acre, being spread equally that it may plough in well. But Mr. Billingsley, in his Survey of Somersetshire, supposes rotten horse dung as the best manure for this crop, after which he

advices hogs' dung, and then all sorts of farm-yard dung; but he observes, that lime, marle, soapers' ashes, and rags, make the potatoes scabby. In Lancashire, the good littery stable dung is mostly set apart for this crop. In an excellent report on the culture of the potatoe, presented to the public by the Board of Agriculture, the comparative advantages of different sorts of manure, have been in some measure shewn in different experiments as below.

Quantity of Manure *per Acre.*

	Crop: Bushels.
Exp. 1. 53 Loads (cubical yards) farm-yard dung	400
160 Bushels, foot	360
160 Ditto, wood-ashes	240
32 Loads of dung	280
42 Ditto	360
No manure	180
Exp. 2. 32 Loads of dung, and 40 bushels of wood-ashes	400
No manure	280
160 Bushels of flaked lime	380
1½ Ton of barley straw	300
340 Bushels of potash	380
32 Loads of dung	400
32 Ditto, and 160lb. salt added at time of spreading	400
32 Ditto, and 160 bushels of lime	480
32 Ditto, and 480 gallons urine	520

And the same thing has been attempted by Mr. A. Young, the results of which are these:

Manures.	First Year.	Second Year.
No. 1. No manure	produced 120 bushels <i>per acre</i> ,	140
2. Night-soil - 10 waggon loads	600	640
3. Ditto - 6 ditto	650	500
4. Ditto - 2 ditto	500	300
5. Bones - 10 ditto	650	640
6. Ditto - 6 ditto	640	560
7. Ditto, - 2 ditto	560	240
8. Hog dung - 60 one-horse cart-loads	480	300
9. Ditto - 30 ditto	480	160
10. Yard compost 60 ditto	300	240
11. Ditto - 120 ditto	480	300
12. Ditto - 30 ditto	140	140

In the trials of the Rev. Mr. Cartwright, made with a view of ascertaining the use of salt as a manure, with mixtures of twenty-five different substances, on a ferruginous sandy soil, enriched by pond mud in single rows, with the same number of sets in each, they are found productive in the following order.

Kinds of Substances.	Produce.
1. Salt and foot	240
2. Chandlers' graves	220
3. Salt and wood-ashes	217
4. Salt, gypsum-peat, lime	201
5. Salt, lime, dung	199
6. Salt	198
7. Salt, graves	195
8. Soot	192
9. Fresh dung	192

Kinds of Substances.	Produce.
10. Salt, malt-dust	189
11. Wood-ashes	187
12. Salt, decayed leaves	187
13. Salt, peat-ashes	185
14. Malt-dust	184
15. Salt, lime, peat	183
16. Salt, saw-dust	180
17. Salt, peat, bone-dust	178
18. Decayed leaves	175
19. Salt, lime, sulphuric acid	175
20. Salt, peat	171
21. Salt, lime	117
22. Peat	159
23. No manure	157
24. Saw-dust	155
25. Lime	150

And

POTATOE.

And with Mr. Townley in Lancashire, the manure being placed in furrows of five-foot ridges, the results stood in this way :

No.	Manures.	Produce.
1.	Coal-ashes only	produced 211lb., rather small.
2.	Stable dung and coal-ashes mixed	344 very fine.
3.	Stable dung alone	315 ditto.
4.	No manure	134 very small.
5.	Compost dung-lime, and soil	204 middling.
6.	Stable dung covered with common yellow mofs	438 remarkably fine.
7.	Soapers' waste	383 very fine.
8.	Stable dung and lime	268 tolerable.
9.	Lime alone	187 ditto.
10.	Coal-ashes and lime	19 ditto.
11.	Stable dung and soapers' waste	298 very good.
12.	Soot, foil, and coal-ashes	271 ditto.
13.	Salt and foil	200 ditto.
14.	Saw-duft and coal-ashes	190 smaller.
15.	Stable dung and saw-duft	307 very fine.
16.	Dung of poultry and coal-ashes	236 pretty fine.
17.	Dung of poultry and sand	156 rather small.
18.	Saw-duft and lime	197 ditto.
19.	Decayed rushes and lime	208 very good.
20.	Tanners' bark and lime	76 very poor.
21.	Bark and stable dung	141 rather larger.
22.	Bark alone	35 very poor.
23.	Stable dung and lime spread over the land	230 pretty fine.
24.	Chopped whins, with a covering of lime over them	256 very fine.

But in the culture of this kind of root on the heavier kinds of loamy lands, various sorts of littery materials have been made use of on the principle of preserving the soil in a more open and porous condition for the knobby roots to extend themselves. With this view, wheat-straw, stubble, furze, broom, heath, sea-weed, and other similar materials, have been made use of after being reduced by chopping, with good success, being laid in the bottom of the drills to be planted upon. Various kinds of luxuriant green vegetable crops have likewise been turned into the soil, and planted upon as a manure with success in some instances, where that substance could not be procured. And also substances of the peaty kind have been found advantageous in the same way, as well as in keeping the drier sorts of land in a better state of moisture, and those of the heavy sort in a more light and open state, and of course more free from stagnant moisture. Good rich mould and decayed leaves may be of use in cases where they can be had in sufficient quantity. All the trials that have been made with lime, seem to shew, that it has a tendency to induce the *curl* and *canker* in whatever state it is employed.

A curious practice in manuring for potatoes is had recourse to about Welton, in the county of Chester, which is situated close to the junction of the two rivers, the Mersey and the Weaver. Sea-mud is there made use of as manure for crops of this sort; twenty loads being the quantity usually laid upon the acre. The ground thus manured, not only, it is said, gives a large produce of potatoes, but is in a state of excellent preparation for a succeeding crop of either wheat or barley. And the adoption of this practice has increased very greatly the value of the land thereabouts.

The quantity of common manure which is used all about Frodsham for this crop, is various, from twenty to thirty tons to the acre. This is there procured at the rate of six or seven shillings the ton, and it is spread upon the land previously to the last ploughing. In all the other parts of this

district, they also constantly manure the land for the growth of this root, except in some particularly and naturally rich spots.

Near Ilford, in the county of Essex, as well as in most other parts, they manure their potatoe land by dunging in the spring, at the rate of about fourteen loads to the acre, which costs five shillings a load; they are spread upon the field just before the second ploughing, on which they plant.

In some parts of Lancashire, rape-duft is found a good manure for potatoes; but night-soil, both there and in Essex, makes them scabby.

But the ashes of burnt land are found highly beneficial in producing good crops of this root, which affords an opportunity of cultivating the coarse and waste sorts of grass land to much advantage, as by a crop or two of this sort they will mostly be in a condition to afford those of the grain kind.

Whatever sort of material may be made use of as a manure for this kind of crop, a sufficient proportion should always be employed to afford a due supply of nourishment to it while upon the ground. In the drill method of putting in crops of this kind, the manure is usually placed in the bottom of them in an even manner, but in the other methods, it is usually spread out evenly over the surface, and then turned down. It has been supposed by some, that for the early crops of this root, it is better to apply the manure to the crop that precedes them, as by that means the danger of their over-luxuriance may be prevented, and the crops be better in their quality. In general it is, however, the best practice to apply the manure to the crop.

The manner of placing the manure so as to afford the greatest advantage, has been a disputed point by different cultivators. The following experiments, made by a correct farmer, however, shew the propriety of placing it below the set, and not upon it, as is often done.

POTATOE.

Experiments made by Mr. Baker on Potatoes planted in an under-plantum of poor yellow Earth, April 27th and 29th, 1771, with the Rows 20 Inches asunder, and the Sets 12 Inches apart in the Rows, and 30 Sets in each Row.

* Some error of the men suspected in this sort.

Whoever casts an attentive eye over the preceding table, will see that several circumstances of information are immediately pointed at; there are very many others which are omitted; those before us appear to be so satisfactory, in the several variations which arise upon the face of the table, that he shall, at convenient time, pursue all the changes which the subject will admit of. In the mean time he proceeds upon the present information.

The first question is this, whether planting potatoes under or over the dung, is most advantageous to the crop? This question appears to be conclusively answered by every species of potatoe in the first and second set; and the totals of each clearly determine in favour of putting the seed over the dung.

N ^o 1 to N ^o 6, over dung, gross produce	lb. oz.
— 7 to — 12, under dung, ditto	105 4
	84 3

Over dung superior to under, by 21 1

This difference of 21 lb. upon so small a quantity of ground, would be a very great object upon an acre. Happily in this kingdom (Ireland) the potatoes are chiefly laid over the dung. In England they practise the contrary in many places.

The second object in this enquiry was, to determine, by fair experiment, whether the small seed is equally prolific, as thousands assert it to be, with that which is reasonably large. For this purpose, he cut single eyes with his own hands, and

POTATOE.

was careful not to cut them thin, but like pellets. This set was planted under dung; and therefore we must compare it with our second set of experiments.

N ^o 7 to N ^o 12, under dung, gross produce	lb.	oz.	
— 13 to — 18, under dung, gross produce	84	3	
	64	12	

Reasonably large seed preferable to very small, by 19 7

This upon an acre would be a prodigious difference: and seems decisive in favour of seed moderately large. Whereas, N^{os} 19 to 24, both inclusive, seem by no means to prove very large seed to be necessary: for if we compare those numbers with N^o 7 to 12, both inclusive, we see the greater

produce from the larger seed is by no means regular, and therefore that point is not decisive in the present enquiry; and the remark upon N^o 22 should not be forgotten.

Our third object in this enquiry is a truly important one to the poor labourer of Ireland, *viz.* to ascertain, with accuracy, which kind is most prolific upon poor broken ground. As N^o 25 and 26 did not come to hand time enough to introduce them in the whole set of experiments, he must throw this part of his enquiry into two divisions, as there is so material a difference between planting over and under dung. To do this in the shortest manner, he shall only throw the several kinds into two little tables, according to their merit in quantity; the quality is a consideration chiefly at the gentleman's table.

Sorts.	Modes of planting.	Produce.						
		Merchantable.			Small.		Total.

7. Spanish.		54.	7	12	3	8	11	4

Here we always have the order of merit in point of quantity of the merchantable potatoes, from equal culture. The totals vary a little, as in the preceding table. The wise and apple potatoes keep their places in both tables, as to produce; but the red French and Munster white, and crones, contend pretty closely as to produce; and in the second table vary in their places of merit. Hence we may conclude, that some of these kinds agree better by being put under the dung than others; but every examination of the latter point clearly proves, that under dung lessens the crop. The Spanish potatoes, which are certainly the best in the world

for eating, uniformly keep their place, of being last in point of produce. There is another very material point, worthy of the cultivator's attention in his choice of his potatoes in these tables. He will observe, doubtless, that he has given the number of the merchantable potatoes of each kind; he will therefore see that there is a prodigious difference in their sizes, a circumstance that comes strongly against the wise potatoes. A table upon that point, framed from the preceding ones, according to the order in point of size, is given below.

No.		No.		lb.	oz.		oz.
6.	Apple	50.	Weight	15	8	Average weight per potatoe	5
26.	French White	45.	Ditto	13	4	Ditto	4 ³ / ₄
4.	Crones	53.	Ditto	12	4	Ditto	3 ³ / ₄
2.	Red French	63.	Ditto	13	8	Ditto	3 ³ / ₄
5.	Munster white	62.	Ditto	12	8	Ditto	3 ¹ / ₄
25.	English white	71.	Ditto	13	0	Ditto	2 ⁷ / ₈
3.	Common wise	103.	Ditto	16	2	Ditto	2 ¹ / ₂
1.	Spanish	94.	Ditto	12	4	Ditto	3 ¹ / ₂

The following table shews the quantity and quality in the different sorts of produce.

Quantity of Produce.	Quality.
1st. Common wise.	1st. Spanish.
2d. Apple.	2d. English white.
3d. Red French.	3d. Munster white.
4th. Crones.	4th. White French.

Time Sets and Method of planting.—Mr. Donaldson says it has been proved from long and general experience, that the month of April is the best season for planting the root, so as to produce a farinaceous or mealy crop. Potatoes are frequently planted in the end of May, and sometimes even in June; but the crops, although often as abundant, are neither so mellow nor so mature, as when the sets are planted in April, or in the first eight or ten days of May. A late

prae-

POTATOE.

practical writer, however, contends, that this sort of work should constantly be performed as soon as possible after the danger of the frost is over, which, in the more northern districts, is generally from about the middle of March till the latter end of April; and in the northern ones, from about the middle of April till towards the close of May, according to the differences in the state of the climate. The earlier the crop can be got into the ground, the better it becomes. Besides, the potatoes have a better chance of being taken up and removed from the land, while the season is dry; and there is less risk of injury from moisture and frosts, after they are fit for taking up. It may also be added, that the land will derive much advantage from being ploughed up while it is in a dry condition, after the potatoes have been removed, as in this way it is preserved in a less moist state during the winter, and the weeds are more effectually destroyed. But at whatever period the crop may be put into the ground, the business should be performed as much as possible when the weather is dry, and the land not too much soaked with moisture, as under such circumstances the early vegetation of the crop always proceeds in a more regular and expeditious manner, by which the produce is generally rendered better in quality, and more abundant.

In the Present State of Husbandry in Great Britain, it is observed, that there are a number of what are called *eyes* in every root, each of which produces a separate plant. This points out the propriety of planting the large and middle-sized roots, properly cut, in place of the smallest, uncut; as when the larger potatoes are properly cut, one, or at most two eyes only, being left in each set, there is no danger of too many plants springing from the same root, which must often happen, when small potatoes, with a great number of eyes, are set whole. It is the common practice, and against which there appears no well-founded objection, to cut potatoes, intended for feed, into small pieces, about half an inch square; in the course of which operation, attention is paid to single out the eyes that appear strongest, and most vigorous.

In this way, one root of ordinary size furnishes three or four sets, or pieces proper for planting. This, for the reason above-mentioned, is a better method than setting either large or small potatoes uncut. There has, however, been much difference of opinion in respect to the best sort of sets for the raising of this crop, whole potatoes and large cuttings having been contended for by some cultivators, while others, on the ground of experience, are equally strenuous in support of small cuttings, sprouts, shoots, or even only the eyes or buds. With all these different sorts of sets, good crops are stated to have been raised; though tolerable sized cuttings of pretty large potatoes, with two or three good eyes or buds in each, are probably to be preferred. Independent of the increased expence of the seed, it is never a good practice to make use of whole potatoes as sets. The experiments of the Rev. Mr. Campbell, of Argyleshire, as stated in the ninth volume of the Bath Papers, not only throw much light on this subject, but also on the most proper distances of planting in regard to the rows.

Rows.	In 1790.	Inches distant in the Rows.	Value per Acre of the Produce after the Seed is deducted.
			£ s. d.
1.	Small whole potatoes	- 6	16 6 7 $\frac{1}{2}$
2.	Large pieces	- 3	15 16 6
3.	Large pieces	- 6	15 8 6
4.	Large pieces	- 12	13 4 1 $\frac{1}{2}$

Rows.	In 1791.	Inches distant in the Rows.	Value per Acre of the Produce after the Seed is deducted.
			£ s. d.
1.	Large whole	- 6	18 18 1 $\frac{1}{8}$
2.	Small whole	- 3	18 1 4 $\frac{1}{8}$
3.	Small whole	- 6	17 11 9 $\frac{3}{4}$
4.	Small whole	- 12	17 3 6
5.	Small pieces	- 6	16 1 5 $\frac{1}{4}$

Rows.	In 1792.	Inches distant in the Rows.	Value per Acre of the Produce after the Seed is deducted.
			£ s. d.
1.	Small whole	- 6	19 7 1 $\frac{1}{8}$
2.	Large whole	- 6	18 18 1 $\frac{1}{2}$
3.	Large whole	- 12	18 9 9 $\frac{1}{2}$
4.	Large pieces	- 6	18 3 0
5.	Small whole	- 12	18 1 5 $\frac{1}{4}$
6.	Large pieces	- 12	16 19 6

In 1794.—Table I.

1.	Undunged potatoes, after dunged turnips	25 19 8 $\frac{3}{4}$
2.	Undunged, after dunged fallow	27 10 2 $\frac{6}{12}$
3.	Undunged, substituted for a summer fallow	14 10 6 $\frac{1}{12}$

2.	Large pieces	12	26 1 10 $\frac{5}{12}$
4.	Small whole	12	24 2 11 $\frac{8}{12}$
5.	Middle-sized whole	12	24 2 11 $\frac{3}{12}$
6.	Middle-sized whole	9	23 19 5 $\frac{1}{12}$
3.	Large whole	12	23 10 8 $\frac{10}{12}$
1.	Shoots	12	15 11 9 $\frac{6}{12}$

The real produce from 50 yards of row, planted with shoots, was only two pecks $\frac{5}{12}$ ths, but only 63 of 150 came up; if none had failed, the produce would have been more than what is stated in the table. This calculation, then, it is supposed, goes on the supposition that the 150 shoots had borne in the proportion in which the 63 did. And further, that each of the experiment rows in 1790, was 75 yards in length; in 1791 and 1792, 200 yards; in 1794 and 1795, 50 yards. And that the numbers prefixed to the rows in 1794, Table II., and in 1795, point out the order, or juxta-position, in which they were planted.

POTATOE.

Extract from Experiment on Potatoes in 1794.

A specimen of the manner in which the experiment tables were originally constructed is given in this instance.

These potatoes were planted in rows upon dung, except where it is otherwise mentioned, and then covered up with a double earth-board. In 1790, 1791, and 1792, the rows were three feet; and in 1794 and 1795, two feet and a half asunder. This, with the difference of seasons, will account, it is supposed, for the greater produce in the last two years. The distances at which the potatoes were planted in the rows, were measured by a stick with notches, and taken from the centre of the potatoe-fets. Care was taken to have the rows as equal in quality of soil as possible, and to have equal justice done them in manuring, where manure was applied, and in horse-hoeing them. The quantity planted and raised was carefully marked in the field by the author of the experiment, and no part of the process of management was intrusted to any other person. It is likewise noted that, in the experiments, the acre is the English statute acre of 4840 square yards; so that when the rows are three feet asunder, 4840 yards of row make an acre. When the rows are two feet and a half asunder, it will take 5808 yards of row to make an acre. The bolls and pecks are the Linlithgow measure, and the Amsterdam pound is used as a measure of compound parts, being the nineteenth of this peck; the value affixed to potatoes is the price they produce, *communibus annis*, at the Edinburgh market.

From the comparatively small produce of potatoes confined to one eye and stem, (see experiments in 1794, Table II. row 2, it is supposed, that the method recommended by some writers on farming, to pull away the supernumerary stems, is evidently improper. The potatoes in row 2, were not only confined to one eye, but to one stem, by pulling up the supernumerary ones. This last precaution became the more necessary, as stems were found issuing in abundance from potatoes which had been deprived of all the eyes; and even from two out of twelve potatoes, which had been planted after all the outer surface was pared off. The result was, that row the 2d, though it had most weight of seed, had the least produce of all the experiment rows; it had more than four times the quantity of seed contained in row 4, the produce of which, however, exceeded it at the Edinburgh prices, by more than 6l. per acre. The productiveness of potatoes, then, it is observed, is probably not occasioned by the weight or quantity of the sets planted, but by their having that number of sound and perfect growths, which the soil they feed in can bring to perfection. The general result of the experiments is unfavourable to the opinion, that the weight of bulb has any effect in determining the quantity of produce; in most of the five years experiments, the produce from pieces of potatoes was inferior both to large and to small whole potatoes; yet, in general, the pieces exceeded the small potatoes in weight of seed.

Though the large and small potatoes, mentioned in the experiments, were relatively so, compared with one another, yet some of those, called large ones, might perhaps, with more propriety, be denominated middle-sized potatoes. An acre of very large potatoes would require a quantity of seed so great as to deter any person from planting them; nor is it likely, that the productiveness of potatoes will continue to increase with their size. There is certainly, the writer thinks, a *maximum* and *minimum*, a *ne plus ultra* in the quantity of potatoe seed, as well as in every thing else. The middle-size of the human species, as well as of the different species of other animals, are the best calculated to undergo fatigue and labour; they are therefore more perfect in their kind, and consequently fitter to answer all the purposes of their creation. May we not argue from analogy, that potatoes of a moderate size are the most perfect in their kind, and consequently the best fitted to send forth those vigorous shoots, which insure a well-sized and healthy progeny? And that, the greater the number of strong fibres and roots, the more do they search for food, and the more earth do they displace in the course of their growing; which divides the soil more minutely, and gives it the advantage of better pulverization; and the greater abundance there is of leaf, the more nourishment is extracted from the air and dews, which are thus made to co-operate more with the vegetable pasture in the soil, in bringing the plants to perfection; and the thick foliage of the crop, by its umbrageous shade, has the same ameliorating qualities with a heavy crop of peas or beans, in destroying weeds, retaining the dews, and preventing the drought from penetrating and exhausting the soil. The writer says, however, it is to be observed, that too many, as well as too few, stems are unfavourable to the prevalence of fibres, and to the luxuriance of the leaves. Perhaps pieces about 2 oz. weight are the most proper for being planted, and whole potatoes from that weight to one ounce; these may be called large pieces and small potatoes; and from them, it is probable, there will issue a sufficient number of stems to produce as many roots as the immediately surrounding earth can bring to perfection. To produce more would make the roots small: to produce fewer, would give a less quantity of root from the acre. The roots procured from small whole potatoes, and from large pieces, both planted at twelve inches distance in the row, were better sized than those from large whole potatoes; and the roots from plants at twelve inches were larger than from plants at six. And large potatoes planted whole at any distance, and whole potatoes or pieces at a nearer distance than twelve inches in the row, send forth so many stems, that, like cattle upon over-stocked pastures, they starve each other, and the produce is dwarfish. And it is supposed that shoots, small pieces, and potatoes confined to one stem, or a very few, resemble cattle upon pasture not nearly stocked;

POTATOE.

stocked; which, therefore, cannot make the proper returns to the owner. Large potatoes are more easily disengaged from the soil than small ones, and are more readily perceived at the time of taking them up; and therefore are in less danger of being left ungathered. They take less time in gathering, which makes the expence of that operation smaller; and they sell better in the market. An objection to them, that they are not so easily boiled, is removed by splitting them, which will likewise make them drier, and better tasted. These advantages attending the produce of small potatoes and large pieces, added to the economy in the article of seed, and the saving of time in planting them, seem to balance any little superiority, in point of quantity, gained by planting large whole potatoes at twelve inches, or any size of potatoes or pieces at a nearer distance in the row; and roots, so small as not to be distinguishable from the produce of curled potatoes, ought never to be planted where potatoes are subject to that disease. From eight potatoes, the produce of one curled one, planted in 1795, three came up curled, and that in a farm where it was a matter of difficulty to find a curled plant upon which to make the experiment. This fact deserves the attention of cultivators in general.

A disadvantage attendant upon planting shoots instead of potatoes is, that they do not ripen near so soon, and are therefore more exposed to injury from the equinoctial gales, and from early frost; neither do they admit of being planted so early as potatoes, as they are more delicate, and more apt to be hurt by the cold. But the chief disadvantage is, that many of them fail entirely, or become such bad plants as to have very little produce. Other writers seem, however, to have been more successful with shoots.

The following are some observations offered on the experiments stated above, in Table I., in 1794.

Observation 1.—It is of great consequence to the farmer to pay attention to the kind of potatoe used for planting: see the amazing difference between N^o 4 and N^o 5. Though the most productive kind should not be the best tasted, it ought, however, to be planted for the use of horses, cows, hogs, and poultry. The potatoe in N^o 8 is the best eating potatoe of those mentioned in the experiments; yet the produce from it, with little dung, exceeded that from N^o 6, with much dung.

Observation 2.—From the difference between N^o 6 and N^o 7, the former of which had three times the quantity of dung that was applied to the latter, the farmer will judge whether it is his interest to dung sparingly or plentifully; always paying a due regard to the condition of his soil, and the expence at which he can provide manure.

Observation 3.—From the produce of N^o 3 it appears, that undunged potatoes are preferable to a summer-fallow without dung. And from comparing N^o 1 with N^o 2, it is clear, that a dunged summer-fallow is not so profitable as a dunged crop of turnips, both followed by a crop of potatoes with dung. An acre of potatoes at 27*l.* 10*s.* 2½*d.* after a dunged fallow, will bear no comparison with an acre of potatoes at 25*l.* 19*s.* 8¼*d.* added to a crop of turnips, the produce of the preceding year, of 30 tons.

Observation 4.—From a comparison between rows 5 and 6, planting potatoes upon dung in the row seems to be a better method than dibbling them in the top of the row, after the dung is covered up. But where the farmer is so situated, as to be under a necessity of planting them in a wet soil, perhaps it may be his interest to place them in the top of the row, as this method will keep them from the cold and moisture at the bottom, which would be apt to destroy them.

It is supposed by different writers, in the second volume of Transactions of the Dublin Society, that in scarce seasons, the shoots and the eyes or buds, scooped out by an implement for the purpose, are capable of being set with equal advantage as the cuttings; but they are obviously liable to many objections, and should never be had recourse to, but from necessity. They want that proportion of matter about them, which is essential to the health, generation, and establishment of the plants. The following interesting experiment on scooping potatoes, made by the Rev. Mr. Findlater, of Fundale, and inserted in the Farmer's Magazine, is highly deserving the cultivator's attention.

He chose a number of potatoes of the same species, similar in size as might be; he scooped out a parcel of the best looking eyes with cutler Wright's hemispherical scoop; he cut also out a number of equally good looking eyes with a knife, taking as much as possible of the mother potatoe to the eye; he chose out nine of the best looking scoopings, and an equal number of the best looking cuttings,—these he planted in alternate drills upon a border, three in each drill. His whole sets sprouted, and no accident occurred; but the scoopings came up, and continued perfectly dwarfish in comparison of the cuttings. They were raised in two separate baskets in the beginning of November, and laid by in a closet to be weighed. The weighing was neglected to the middle of December; but the result was what might be expected from inspection at raising: the produce of the cut ones weighed a stone and a half tron; that of the other, three quarters of a stone, without reckoning very inconsiderable fractions. The experiment was merely made to ascertain which throve best. Anxious to do the scoopings justice, he pressed the scoop deep in, with considerable violence; and probably the forcing of the scooped piece into the narrow contraction of the hemisphere, bruised and damaged its substance. Would not an opening answer better? And he adds, that captain Mackay, of Scotton, in this parish, cut one peck with the knife; he scooped also an equal quantity; (the scooped ones were not weighed before and after scooping, which would have ascertained the saving of potatoe substance in the seed). They were set in the same field; no difference was observable in their growth; at raising, the difference of the produce, by measure, was in favour of the cuttings by one peck and a half: the deficiency in produce of the scoopings being probably more than compensated by the saving of substance in the seed. He apprehends, that the writer's error in the mode of scooping had been avoided. It is, however, observed, that the produce of the scoopings were the best sized potatoes.

But in speaking of the difference of opinion in respect of scooped cuttings, Mr. Young remarks, that from some experiments carefully made, the result of which he is well acquainted with, it appeared, that these contradictory opinions might be equally just, when founded on variations in practice. When the soil is sandy, or in a very light pulverized, or highly manured state, and every other requisite for success beneficially secured, these scooped cuttings succeeded just as well as larger sets; but when the soil was more stiff, unfavourable, in worse tilth, or not equally manured, or the sets ploughed in, under circumstances not very favourable, then the larger cuttings had a considerable superiority. The propriety, therefore, on any future occasion, of having recourse to this expedient, will depend on the state of the lands, the soil, the manuring, &c. If no cutting be done by the bushel, two-pence is a fair price, where woman's labour is eight-pence a-day. This sort of work is, however, seldom well performed when left to women.

Therefore

POTATOE.

Therefore it may on the whole be concluded, with respect to the proper seed or sets for the raising of potatoe crops, that though the quantity of produce does not, as has been commonly supposed, bear any exact ratio to that of the weight of the set, yet that it in some measure depends upon that circumstance, and there being a suitable number of eyes as well as of pulpy material about them.

The proportion of ground that can be advantageously cultivated under this root, must depend wholly upon the circumstances of the farmer. Mr. Young strongly cautions those farmers who are unacquainted with the culture of it, against applying too much land to it. If they have a great plenty of dung at command, they may enter largely into the husbandry; but they should determine to plant no more land than can be manured at the rate of twenty-five or thirty large loads *per* acre; for one acre well cultivated, will pay better than five or even ten indifferently managed. But besides this, there are many other points to be considered before he fully decides, such as those of the number of acres of carrots he has sown; for if his soil be suitable to that crop, they are greatly to be preferred to this root, being cheaper, not requiring dung, and being applicable to all the uses to which potatoes are applicable. They do not at all impoverish the land, whereas potatoes scourge it, if the expression be permitted, more than any other crop the farmer puts in. These are very material motives to influence a preference. But if the soil will not suit carrots, then it will be necessary to plant so much the more potatoes. The same observation may be applied to cabbages, which also, in a great measure, answer the purposes of potatoes. If he deals largely in that crop, it lessens the necessity of having this root; and ruta бага is as useful to hogs as the potatoe itself; but being far more uncertain, and the difficulty of securing a crop of it being greater, it cannot be depended on like potatoes. The fly and drought, &c. are so fatal to it, that many farmers in Norfolk have sowed in vain for several years together. But whatever the extent of land may be that is appropriated to this sort of crop, such of it as is designed to be planted early, should in the latter end of April all be hand-hoed over the whole surface, to cut up weeds clean, and loosen the earth. This management is known only in the neighbourhood of London, but it should be extended over the whole kingdom, for the excellence of it is indisputable. The expence of hoeing, when there is a clear space to cut, is trifling, and the succeeding cleaning which the potatoes receive after they are up, is performed at a much less expence on account of this operation, and at the same time in a more effectual manner. And the cheapest and most effective method of performing this necessary operation is by a large shim, which cuts three or four feet of surface. For this purpose, there should be a small broad wheel at each end of the beam, to regulate the depth. The work is confined to the surface, the intention of it being merely to cut up weeds and to loosen the earth, which rain and succeeding sunshine may have encrusted. The operation is of great importance, and lessens the expence of the hoeings that may be afterwards given very greatly.

Where land is scarce, and of course dear, the borders near hedges, and other waste parts, may also be converted to the raising of this crop with advantage in many instances.

With respect to the planting of this root, there are many different methods in use, in different districts; but the great object should constantly be, to preserve the plants, as much as possible, in a medium state of dryness. They

are likewise grown after different sorts of crops and on different sorts of land. The author of *Modern Husbandry* states, that they are cultivated by farmers in general, after every sort of white-corn crop; but in Lancashire, for the most part, on lands broken-up from grass for the purpose. This practice was no doubt borrowed from Ireland, where it appears to have been generally established soon after the introduction of potatoes into that country. And that there are different methods of applying the dung, which however ought always to be done with a liberal hand. Sometimes the field is formed into one-furrow ridges at the second ploughing. The dung is then laid in the furrows; and the potatoes being planted by hand on the dung at the distance of eight, ten, or twelve inches asunder in the furrows or drills, they are then covered up with the plough, which is done by splitting the one-furrow ridges. In Lancashire, where this sort of business is well performed, in planting, the practice is, after the land has been made fine and perfectly level on the surface, to make equidistant drills the whole length of the field, in doing which, the plough, after making a furrow up the field, is drawn down again on the contrary side close by the same, throwing the soil equal heights on each side. These drills are made as wide and deep as to render them capable of containing the dung, which is laid in the bottom of each. The distance of the drills is such, that when the horses stand in one, each wheel of the cart or tumbril may be in the middle of the next drill on each side. The next operation is to carry in the manure, and as the horses stand in one drill, and each wheel of the cart in a similar situation, the neatness and order of the land is little injured. The dung is then thrown out of the cart in small heaps, sufficient to supply the three drills or furrows which the horses and the wheels of the cart occupy, a moderate scattering of which is put into the bottom of each; the whole being completed in a very short time by persons with forks with two tines or prongs. The long strawy dung lately thrown out of the stables or cow-houses, or collected from the farm-yard, is always employed where it can be had. When the drills are thus prepared, the sets are put into them upon the dung, about six or eight inches distant from each other. After this the plough is run on each side of each drill, to throw the earth, that was raised out of it, upon the potatoes, and cover them, which operation elevates it in the middle, and causes it to lie sloping on each side like the roof of a house, when the business is completed until the stems of the potatoes begin to make their appearance above the surface.

But according to the author of the *Agricultural Report* of the West Riding of Yorkshire, where the culture of this root is likewise well performed, after the land has been properly prepared, the best cultivators begin to ridge it up, by ploughing a furrow round it down, and then taking a suitable distance according to the nature and qualities of the soils, as from about two feet eight inches to three feet, such as are rich and fertile requiring more space of ridge, than such as are poor and exhausted. The manure, where necessary, is deposited with regularity in rows by means of a labourer with a fork, in the ridges, the potatoe sets being then placed at proper distances upon it and covered with the plough.

And another method of ridging, which has been found beneficial in some of the northern districts, is, as soon as the land has undergone a full preparation, and is made perfectly fine and level, by repeated ploughings and harrowings in different directions, to draw straight parallel furrows by means of a double earth-boarded plough, drawn by a single horse, at the distance of two feet and a half from each

POTATOE.

other. This operation is performed in the most correct manner, by passing the plough twice in the same place, which, when the land lies sloping or uneven, should be down hill the first time. The manure is then brought on in carts from the higher sides of the fields, where they are hilly, the horses passing in one furrow, and each of the wheels in others on the different sides; they are then emptied by the drivers, who walk behind them with crooked three-pronged forks, constructed for the purpose, leaving it in small heaps in the furrows in which the horses go, in sufficient proportion for the three drills. It is then divided and spread out in the different rows, in as equal a manner as possible, by women and children, the sets being put in upon it at the distances of about eight or twelve inches from each other, the whole being afterwards covered in by the plough, by splitting or dividing the ridges betwixt the rows, and passing twice in the same track, as in the work of opening the furrows for the rows of the crop.

There is still another raised mode of planting this useful root, which is stated in the original Agricultural Report of the County of Cheshire. It is the custom there to form the land into narrow beds, of about three, four, or five feet in breadth, by the plough; the manure, when necessary, being previously spread out evenly upon the ground, and turned down. The sets are then planted by means of a dibbling-stick to the depth of about three inches, in rows ten inches apart, and alternately eight or ten and twelve inches in them, so as that the root-shoots of the plants may occupy the ground as completely as possible, without interfering with, or injuring the other. When the shoots of the plants first appear upon the surface, each of the furrows or divisions between the beds is dug out to the depth of about one spit; the loose earth thus raised being cast as evenly as possible over the plants in the beds, by which they, as well as any weeds that may have sprung up, are covered, and the growth of the former greatly promoted, while the latter are in a great measure destroyed. And in cases where the staple of the land will admit of it, in about a week or ten days afterwards a second covering is dug out, and thrown over the crop in the same manner, by which its growth is still farther promoted. In this mode of planting, as much fresh earth is from time to time applied to the plants, their vigorous vegetation is not only secured, but the extension of the roots rendered more full and complete. As a quantity of fresh earth is thus annually furnished for the growth and support of the potatoe, it is asserted in the first volume of the Agricultural Magazine, that repeated crops may be taken from the same land, even where manure is not made use of, without its being exhausted in any great degree. It is therefore supposed, that it may be had recourse to with advantage where manure cannot be easily procured. And from such lands as are inclined too much to the retention of moisture, for the perfect growth of crops of this sort.

But the raising of the land into high ridges is not adapted to every sort of soil. It is obvious that such sorts of land as are very dry, and of a sandy nature, should have the surface kept as level as possible, in order that the proper degree of moisture may be more effectually retained and preserved for the support of the crops.

In moist situations, and where the soils are less subject to be injured by parting with their moisture, it may, however, be the most suitable practice to raise them into ridges, as by such means the depth of the staple is augmented, the manure more concentrated for the support of the crop, a better bed provided for the fibrous roots and wires of the plants to establish and extend themselves in, the danger of stagnant moisture guarded against, and the after-culture of the crops

rendered more easy, beneficial and convenient, by which they may be kept more clean and free from weeds, and be earthed up at different times, so as to insure the most full and perfect extension of the roots in the fine mould that is thus constantly laid up to them. And as the whole of the process is capable of being performed by means of the common plough, with a horse or two, it is probably the most advantageous where such crops are cultivated on land that has been some time in the state of tillage. In cases where the ridges are only required to be small, the operation is completed in one bout of the plough, or by going up with one furrow, and laying another up to it in returning, so as to produce a ridge in the middle between them.

And where the method of horse-hoeing this sort of crop is in use, by which great crops are in many cases obtained, the practice in respect to distance is various; but whatever mode is adopted, the land must be ploughed into proper ridges for them accordingly. Mr. Young says they have been tried in equi-distant single rows, at two, three, four, and five feet; in double rows at one foot, on four-foot ridges; these, and also three rows on five-foot ridges. But though attended with success, these wide distances between the single rows certainly lose too much ground. When equally distant rows are employed, he thinks three feet preferable. And double rows on four feet have been successful. Equal distant rows, at two feet, with a neat horse-hoe, which turns no furrow, only cutting the surface of the earth, and earthing up afterwards with a double mould-board, have likewise answered very well.

Also in planting this kind of crop upon the plain surface, there are likewise different modes made use of in different districts, and under different circumstances. In districts where the soils are inclined to be dry, it is in some cases the practice, after the land has been brought into a proper condition by ploughing over twice, or oftener, and well harrowed, to spread the manure regularly over the whole surface, the sets being planted in every third furrow, and the dung with the fine earth turned upon them by the next furrow of the plough. In this way the manure is however placed upon the sets, which has on experiment been fully shewn to be injurious to the produce. Besides, from the whole of the surface of the ground being covered with dung, a considerably larger proportion must be requisite, than when deposited only in the drills, and of course the crop be cultivated to disadvantage in that respect.

In the above-named district, on shallow soiled land, potatoes are, however, generally planted and soiled with the plough, a method which is said to consume less manure than others. In this mode of planting, the land being first prepared as above, a furrow about four inches deep is turned; the manure is spread lightly in the hollowed space, the potatoe sets having been previously dropped into it, at the distance of about eight or ten inches asunder, or, which is as commonly practised, put upon the dung after it has been put into the furrow in the same manner, by which they are supposed to vegetate more speedily; the same furrow is then turned back upon the sets: the next row of sets is dropped and covered with the manure, or put upon it, in the hollowed space of a furrow, which is turned towards the first row, at the distance of about eighteen inches from the first line of sets for instance, leaving something more than two furrows width of soil untouched by the plough; the sets and manure are then covered as before, and the same method pursued till the whole of the ground intended to be planted is finished. The soiling with the plough is performed in this way. As soon as the plants begin to appear, the ground, which had previously been left untouched, is split

POTATOE.

or turned to each side upon the young plants with a long wrested plough, so as to effectually cover them. After this has been done, the crop is to be kept clear of weeds by the hand and hoe.

But in other cases, as soon as the land has been properly ploughed and harrowed in a smooth even manner, the manure is spread equally over the whole surface, as above, and then ploughed well in, when the planting is immediately begun, and executed in the following way: a man has a dibble with an iron point, and a place for him to set his foot upon to strike it into the ground, in order to make a hole for the set. He is followed by a woman or boy with the sets, who drops one into each hole; after which the land is harrowed over once or twice, or more, when the work is finished. In this way they are set promiscuously, at from nine inches to a foot apart; and the business is effected with expedition, and without much expence, from fifteen to twenty bushels of potatoes being sufficient for setting an acre of land.

About Ilford, in Essex, they plant immediately after the plough; a man dibbles across the land, followed by a woman who drops the sets, for both which operations they are paid seven shillings or eight shillings the acre; the rows twelve inches by fourteen or fifteen, and some twelve square. Early in the spring, sixteen or eighteen hundred weight are planted on an acre; they are hand-hoed twice, each time at the expence of four shillings.

In other parts of the same district they are sometimes planted on three-foot ridges, one-bout ridges, and in rows at eighteen and thirty inches.

In planting this sort of root on sward land, after it has been prepared by the use of a plough that just pares off the surface, and deposits it in the furrow, it is advised by Mr. Somerville to place the sets upon the inverted sod, and cover them with the loose mould from below, by means of a common plough. Or, the trench plough may be used with perhaps more advantage. But the best method is that of paring and burning, as has been shewn above.

In some cases the practice is, however, to turn down the turf with or without manure, and then to put in the sets by a dibble; though the former is probably the better practice, as the turfy material on which the sets are put soon begins to decay, and the purpose of manure is in some measure answered by it. It is a plan that may be adopted with advantage where manure is scarce, as in bringing waste and other coarse grass lands into the state of preparation for grain crops.

And Mr. Donaldson states it as the custom in the neighbourhood of towns and villages in Scotland, for the farmer to let a field to the inhabitants at a certain rate by the rood or perch. The renters or hirers of the land pay a specified rent, and agree to furnish a sufficient quantity of dung. The farmer is at the expence of carrying the dung, and of ploughing and harrowing the field. The renters attend at the last ploughing, and plant the sets in the bottom of every furrow.

However, though these are the common modes of setting potatoes where that sort of husbandry is carried on upon an extensive scale in the field, there are others with the spade which are probably preferable on soils of proper depth where labour is cheap; the first of which is pretty commonly adopted in Lancashire, and in some districts in the north-east of Scotland; which is, to trench the land. The farmer having carried the dung, and laid it on the field in heaps, at proper distances, the operation is performed by the manufacturers and people who rent the field, and in the following manner: across the end of the ridge a trench is formed, about three feet wide, and from ten to fourteen inches deep, according to the depth and quality of the sub-

soil. That being done, a second trench of the same breadth is marked off, and the surface-soil, to the depth of six or eight inches, is thrown into the bottom of the former trench, over which a sufficient quantity of dung being laid, the potatoes are planted at the distance of eight or ten inches from each other, and then as much earth is taken from the bottom of the second trench, as is necessary for covering the potatoe-sets, and of making up the first trench to its former level. Thus the field being completely trenched, well manured, and kept thoroughly clean by repeated hand-hoeings, must not only produce an abundant crop of potatoes, but also be in high condition for receiving whatever kind of seed may be afterwards sown.

And another mode of setting the root with the spade is that which is termed the lazy-bed method, which was formerly well known in many parts of England, as well as all over Scotland, although now confined to the very remote districts of the latter kingdom. The term applied to this mode of culture, indicates that it was invented to save labour, and must have been adopted for any length of time by those only whom indolence and ignorance precluded from following other methods. These beds are formed of such a breadth, as that any man used to the spade, can with ease throw earth almost from one side to the other. The manner of forming them is as follows: the size of the bed is first marked off with a line, and from two to four feet left on each side for trenches. The surface of the bed being then dug, or turned over with the spade, the dung is spread, and the sets planted, at about the distances last mentioned, after which earth from the trenches on each side of the bed is thrown over the dung and the plants, so as to cover them to the depth of three or four inches. Mr. Young, however, advises a neater mode of executing this business, in which the land is marked into beds five feet wide, with narrow slips between them two feet wide. These are then dunged about fifteen loads *per* acre; on the dung are laid the potatoe slices, after which the turf is dug thinly up in the two-foot intervals, and laid on the sets, which, with another spit, and the loose mould, completes the covering. This mode is not equal to digging all the ground, on account of its being left whole for the succeeding crop, but the crop of potatoes is generally good; for, besides the dung, they have the turf below to spread upon, and are partly covered with that from the trenches, so that they lie hollow, and in a rich bed of mould.

And in planting the shoots as sets for this crop, the best practice may perhaps be that of putting them in slight shallow sorts of drills, made by a very small light plough for the purpose, at the distance of eight or ten inches from each other, and seven or eight in the rows, putting the root part downwards, which may be readily executed by women or children. After this has been performed, a small proportion of dung is to be laid thinly over them, and the earth from the sides of the drills lightly drawn over so as to protect them against any frosts that may happen. As soon as they have thrown out the leaves and are about four inches above the surface of the ground, a second covering is to be applied, so as to leave about two inches above the surface; and as they advance in growth, continuing to cover them in the same way, until the earth between the ridges elevates the drill at least twelve or fourteen inches in height. It is observed that the shoots that are made use of in this way should be strong and vigorous, about five or six inches in length, and planted while perfectly fresh and in a state of full growth. In respect to keeping the shoot sets, they may be preserved for planting by taking them off from the potatoes either at once or occasionally as they are wanted,

POTATOE.

without bruising, and placing them across upon each other, spreading a light covering of earthy materials over them. By this means they may be kept a month, six weeks, or longer, until the land is in a proper state of preparation for their being planted out. Another method has likewise been proposed for raising this sort of root, which is that of transplanting such young plants as have come up by chance on grounds that have had this sort of crop, or been prepared for the purpose, in beds of rich earth, or mould and dung, or by planting seed in dung-hills a few weeks before they are set out. However, as much injury must be done to the shoots of the young plants in the taking them up, and as this sort of root seldom grows well after being transplanted, it is probably a method of planting that can seldom or ever be practised with benefit, unless it be in the filling up the rows, when broken and defective, or in procuring more early crops, whether in the field or garden practice of cultivating such sorts of crops. But whatever methods are employed in putting them into the earth, it has been stated that it is necessary that the greatest care be taken not to deposit the sets to too great a depth in the soil, as the potatoe root has a tendency always to rise towards the surface of the ground; three, four, or five inches at most is sufficient in all the light dry sorts of soil, and in those of a moist and heavy nature less may be fully adequate to the purpose. And another circumstance deserving of much attention in the planting of this useful root, is that of all the sorts of sets being set in and covered by such mould as is in a fine state of friability and mellowness, as when the earthy material by which they are covered is of a lumpy and un-reduced quality, the crops are never found to be so fine or so productive. Many facts of this nature have been mentioned by writers on husbandry. Some likewise suppose that where this sort of crop is planted in the row method on a fine mouldy preparation of the land, without any manure being applied, or where it has been incorporated with the soil some time before, the drills should be made in a more light and shallow manner than where the common methods are pursued; otherwise mischief may be done by the sets being deposited to such a depth as to cause them to rot and be destroyed.

In the Lancashire original agricultural report, it is stated, in respect to the raising of early potatoes, that upon the same ground from which a crop has already been taken, the early seed potatoes are in some places afterwards planted; which, after being got up about November, are immediately cut up into sets, and preserved in oat shells, or saw-dust, where they remain till March, when they are planted, after having had one spit taken off, and planted with another, of a length sufficient to appear above ground in the space of a week.

But that the most approved method is, to cut the sets, and put them on a room-floor, where a strong current of air can be introduced at pleasure, the sets laid thinner, as about two lays in depth, and covered with the like materials, (shells or saw-dust,) about two inches thick; this screens them from the winter frosts, and keeps them moderately warm, causing them to vegetate; but at the same time admits air to strengthen them, and harden their shoots, which the cultivators improve by opening the doors and windows on every opportunity afforded by mild soft weather; they frequently examine them, and when the shoots are sprung an inch and a half, or two inches, they carefully remove one-half of their covering, with a wooden rake, or with the hands, taking care not to disturb or break the shoots. Light is requisite as well as air, to strengthen and establish the shoots; on which account a green-house has the advan-

tage of a room, but a room answers very well with a good window or two in it, and if to the sun still better. In this manner they suffer them to remain till the planting season, giving them all the air possible by the doors and windows, when it can be done with safety from frosts; by this method the shoots at the top become green, leaves are sprung, and are moderately hardy. They then plant them in rows in the usual method, by a setting-stick; by this method they are able to bear a little frost without injury. The earliest potatoe is the superfine white kidney; from this sort, upon the same ground, have been raised four crops; having sets from the repository ready to put in as soon as the other were taken up; and a fifth crop is sometimes raised from the same lands the same year, of transplanted winter lettuce. The first crop had the advantage of covering in frosty nights. It is remarked that this useful information was communicated by I. Blundell, of Ormskirk, and has hitherto been known only amongst a very few farmers.

In the neighbouring district to the south, in the mild warm tract about Wirrall, there is also an improved practice in raising the early kinds of potatoes, which has some resemblance to the above. In this situation the potatoes which are designed for the sets are got up in September or the following month, or even before; the sooner after they are mature, the better; and in November are laid up in a warm dry room, where they are spread rather thinly, not more than two, or at most three potatoes in thickness, and covered with wheat chaff, or dry sand. They are further protected from frost, whenever it is necessary, by a blanket or rug spread over them. By this mode of management, they are generally well sprit by the month of February or the beginning of the following one; but if this should not be the case, the sprouting is accelerated by sprinkling them from time to time with a little water. A potatoe is said to be well sprit, when it has a shoot from two to four inches long, as thick as a small quill, and terminated by two little leaves. In this state they are planted whole; all the shoots being cut off, except one, as early in February as the season will allow; they are set not more than five or six inches asunder, the tops just within the ground. As long as there is any danger from an exposure to the frosts, they are carefully protected by a covering of straw or pease-haum; which is taken off in the day, unless the weather be extremely severe, and put on again at night. By these means it is asserted that potatoes are now as plentiful in the Liverpool market, in the middle of May, or even sooner, as they were, before they were practised, in the middle of June. At the same time the culture of this vegetable is productive of very considerable profit to the farmer; a second crop being, in almost every instance, raised from the same land in the same year.

And it is stated by Mr. Marshall in his Rural Economy of Yorkshire, that in raising potatoes from seed there, the following method is pursued.

In autumn, when the apples are beginning to fall spontaneously, they are gathered by hand, and preserved in sand until spring, when they are mashed among the sand, or among fresh mould, separating the seeds, and mixing them evenly with the mould. As soon as spring frosts are judged to be over, they are sown in fine garden mould, and as fast as the plants get into rough leaf, and are strong enough to be handled without injury, they are transplanted from the seed-bed into another bed of fresh, rich mould, in rows, which are kept clean during the summer. In autumn bunches of small potatoes are found at the roots of these plants, varying in size the first year, from the hazel-nut to the crab. These being planted next spring produce potatoes

of

POTATOE.

of the middle size; but they do not arrive at their fullest bulk until the third or the fourth year.

Where the use of the stove or the garden-frame can be had, this process may be shortened. The seeds being sown within either of these, early in spring, the plants will be fit to be planted out as soon as frosts are gone; by which means the size of the roots will be much increased the first year; and will, in the second, rise nearly to perfection. And it is added that potatoes raised from seed are a miscellany of endless varieties. Sometimes these varieties are planted miscellaneously; sometimes particular varieties are selected.

In selecting varieties from seedling potatoes, two things are to be attended to; the intrinsic quality of the potatoe, and its productiveness. If these two desirable properties can be found in one plant, the choice is determined. To this species of attention and industry we are indebted for the many valuable kinds, which have been, and now are, distributed throughout the island.

It is observable, however, that varieties of potatoes, like those of corn, are partial to particular soils and situations. Hence the propriety of husbandmen raising potatoes from seed; as by this means they obtain, he says, with a degree of moral certainty, a sort adapted to their own particular soils and situations.

In Cheshire, it is remarked that the various kinds of potatoes which were formerly known and cultivated, are now almost totally lost; and that other kinds have been substituted by raising new varieties from seed. And in doing this, some mystery is pretended; but it is clear, that, in truth, there is none. The potatoe apple is gathered when ripe, and is kept dry during the winter; the seeds are sown in the spring, and the plant transplanted, after it has obtained a certain size. The varieties thus produced are infinite; but their real value is never perfectly ascertained during the first year or two of their cultivation. This is only known by time and a full trial of them. It has likewise been noticed, that the produce from seed partakes frequently of the qualities not only of the mother plant, but of other kinds which may have been propagated in the neighbourhood. And farther, that a singular idea is prevalent here, among many who cultivate this root, that by planting the green tubers, which sometimes proceed from the stem, the sort is renewed, if wearing out; but upon enquiry no facts sufficiently substantiated to confirm the opinion have been found. Besides, T. A. Knight, esquire, a gentleman of superior information on this subject, expresses it as his decided opinion, that no benefit can possibly arise from the pursuance of such a practice.

Also, in answer to a query put to the same gentleman by Mr. Wilbraham, whether artificial heat might not be of use in raising potatoes from seed, as this plant was originally a native of a warmer climate than our own; he states it as his practice to raise them in a hot-bed, to harden them by degrees, and plant them out in May; by which means he has had a very considerable produce even the first year. He has likewise discovered a method of making the early kinds of potatoes blossom and bear seed, which they do not in general. This is effected by planting cuttings from the roots at the foot of a strong stake, and washing away the mould from the base and the stems, whence the tubers would have sprang.

A conjecture is also offered by the same person, that varieties of the potatoe, still earlier than those now in cultivation, may be obtained; and that it might be expedient to attempt this by the insertion of the farina into a larger, and moderately early variety, with the view of producing an early kind of a larger size. If success attended such an experiment,

its utility would be very great; as in the event of a failure in the corn crop, the planting a small additional portion of land with potatoes would afford a very seasonable relief during the summer months, when the grain is usually at its highest price. These opinions may be seen more fully explained in the various papers of the same writer, inserted in the Transactions of the Philosophical Society; those of the Society of Arts; and in the Transactions of the Horticultural Society.

After-culture.—There cannot be any doubt, but that by proper attention to the keeping the crops of this kind in a suitable state of cleanness and culture, after they have been put into the soil, much advantage must result both in the goodness and abundance of the produce. The manner in which this is effected is different, according to the mode in which the crops have been planted and the nature of the land. It is, however, mostly applied, by hoeing with the common or horse-hoe, and by hand-weeding. The first is the method usually followed where the old modes of planting are practised, the second where the drill system is had recourse to, and the last occasionally in both cases. The horse-hoeing mode has been applied on the principle of saving a part of the expence of hand-weeding the crops, as well as with a view of promoting in a more effectual manner the growth of the roots. It is admitted by the advocates of this husbandry that there are more plants in the old practice; but they contend, that the tillage by the use of the plough, is so much more complete and effectual than that of the hand method, and the admission of air among the plants so much more free and extensive, that the loss in respect to number is much more than supplied by the augmentation in size. But whatever may be the advantages of the drill culture in this sort of crop, there cannot be any dispute, but that the finer and more loose and mellow the mould is kept during the time in which the plants are forming their wires and knobby roots under the ground, by frequent stirring, the better and more abundant the crops must be, from their growth and distention being more perfect and complete.

With the intention of effecting these purposes in the best manner, it is the usual practice in those districts where this root is much cultivated, to have recourse at different times to such means as are capable of cleaning, mellowing, reducing, and bringing up to the roots of the plants the fine mould which has been in this way produced. And the implements commonly made use of in this intention, are the harrow and the hoes just noticed, by the first of which the particles of the soil are broken down and reduced into a fine state, and by the latter laid up to the roots of the plants.

In the ninth volume of the Bath Papers, it is stated that the potatoe land is harrowed, when the growths from the sets under the surface are about an inch long; this can be known only from inspection. It is impossible to say, in how many days it will happen after their being planted, as it will depend on a variety of circumstances; such as the season of planting, the quality of the soil, the state of the weather, the kind of potatoe, the nature and quantity of the manure, &c. Harrowing potatoe land destroys the first crop of weeds, and creates a fine pulverized soil for the plants to feed in, when they arrive at the surface. And by delaying this operation till the above time, the vegetation of the weed is more advanced, and consequently more effectually destroyed; but by delaying it much longer there would be a danger of breaking off the potatoe shoots. The harrow used by the writer is a folding-harrow, invented by himself, drawn in the intervals by a single horse; it applies stuff to the opposite side of two contiguous rows, destroys the weeds, and pulverizes the soil without levelling the row, which would tear up many

POTATOE.

of the potatoes, or break off their shoots, and deprive the land of the advantages it has, by lying dry when the shapes of the rows are preserved. A lighter harrow, on the same plan, is employed in smoothing the rows intended for turnips and other small seeds, immediately before they are sown. When the potatoe plants are all early seen, the earth and weeds are removed from them, going as near as possible to them with a shallow furrow, and turned into the middle of the intervals by a horse-hoe; which is the same with the writer's large plough, on a smaller scale, with a very narrow earth-board. If it be done sooner, there will be danger of tearing away those which are not seen, if the hoe be allowed to come near enough to the rest. If it be delayed longer, there will not be the same benefit derived from horse-hoeing. Any weeds and grass which shall have escaped the plough, both now and to the time of taking up the potatoes, are carefully to be pulled up by the hand. And in a few days after the first hoeing, the same instrument is to go deeper in the former track. This stirring will make the earth in the intervals free, that has been trampled down by the weeders, and it will bury the weeds they have pulled up. When the weeds, buried in the intervals, are rotted or converted into vegetable food, the earth is returned to the plants with a double earth-board plough, going twice in the same track with a shallow furrow; the first of these times down hill, if the land be hilly, a boy following the plough to uncover any plants that have been buried in the row; for, if left in that situation, their growth would be entirely stopped, or very much retarded. If, by avoiding to bury the plants, they should be left in some places without the mould touching them, it is drawn towards them in those places with a hand-hoe. And that when the plants are about six inches in length, the earth is raised higher towards them, by the double earth-board going twice in the track of the former earthings, but much deeper than before; which finishes the horse-hoeing of the crop.

Mr. Young advises that, some time in May, the early planted potatoe crop should have a hand-hoeing, which should be done with good attention, that not a weed may be left, and the surface of the land be left well cut, and in fine order. And that the crops in rows should receive, besides this hand-hoeing, the first horse-hoeing, which should be given with a common swing-plough drawn by two horses, one before the other, and turn a furrow from the rows, throwing up a small ridge in the middle of each interval. These operations should be well and attentively performed; for the weeds grow at a great rate, and, without such an attention, will destroy, or at least greatly damage the crop. And another hand-hoeing should be given in June, and so effectually executed as to render any succeeding ones unnecessary, as the plants may be so grown as to be injured by it. The crops planted for horse-hoeing must also have that operation now again performed with the double mould-boarded plough, splitting the ridges before thrown up, and applying them to the rows in an equal manner. And in July, in some cases, the crops in rows should have a third horse-hoeing. But that the common mode of ploughing backwards and forwards every time of performing the operation is not well suited to the crop; as cutting the roots when the plants are in full growth hurts the crop, and destroys the runners that would afford potatoes. The third horse-hoeing should therefore be executed with the shim, which loosens and cuts the surface of the ground, without turning it over or forming any ridge. Some of these tools work with many little triangular shares, others with single flat ones, and still others hoe with coulter; however, any that cut up fresh mould at the bottom of the furrows do very well. They should be fol-

lowed, in about a week, by the double mould-board plough, striking the furrows, and throwing up all the loose mould to the ridges, banking them up. This is useful by affording fresh mould for the roots to shoot into, which is better than the practice of taking it away from them, when they have begun to advance in growth. And in August the rows of this sort of crop should be hand-weeded when necessary, as it is probably too late to horse-hoe them. But when the intervals are very weedy or much bound, or the plants not sufficiently earthed up, he advises the shim to be carefully run through them to destroy the weeds and loosen the earth, so as that they may be stricken clean by the double mould-board plough, and well earthed up for the wiry roots to extend into and increase the produce.

And this sort of crop is shewn to have attained a sufficient degree of ripeness, as well as full size, by the decay of the leaves, and their dropping off the stems. And they should be taken up as soon as possible after the appearance of frost in the autumn, as in the latter end of September, or beginning of the following month at latest.

Taking them up.—In the taking up of potatoe crops, the modes that are followed are different according to the nature of the culture under which they have been managed; when they have been planted in drills, and horse-hoed, the common method is, first to turn a furrow from each side of the drill, and then to turn over with the plough that part of the drill in which the potatoes are lodged, and which are afterwards gathered by women and children hired for the purpose. Sometimes the middle part of the drill, after the two-side furrows are taken from it, is turned over by men with three-pronged forks. In other places the three-pronged fork entirely supplies the place of the plough, which is never introduced. Where a sufficient number of women and children can be procured for gathering the crop, using the plough is certainly the most expeditious and least expensive mode. In order to avoid the risk of cutting the potatoes with the coulter, it is commonly taken out, and the plough with only a share, or fock, is used for turning over the middle part of the drill, which, as it performs the operation as effectually, is no doubt an improvement, and may be considered the best implement that can be used in taking up a crop of horse-hoed potatoes. When potatoes are planted with the spade or the plough, and with an intention of hand-hoeing the crop only, the common method of taking up the potatoes is with the spade, one gatherer attending every person who is employed in turning over the ground. Crops of potatoes thus cultivated, are sometimes, however, taken up with the plough. When that happens, it is found necessary to plough the field two or three times over, otherwise it is scarcely possible to get the crop properly collected. Mr. Campbell remarks, that in his district the roots are taken up with a fork with three prongs. And that, to make this operation easier where the land is stiff, the outside of the row, in which there are no potatoes, is pared away by going round every other row with the horse-hoe, and when these are dug, returning to the remaining ones; that is, the earth is removed from the 1st, 3d, 5th, 7th, &c. and when the potatoes are taken out of these, it is removed from the 2d, 4th, 6th, 8th, &c. The injury done to the roots by the plough and harrow, and the great number unavoidably left in the foil, is not, he supposes, compensated by the saving of time and labour in taking up with those instruments.

Mr. Young, however, thinks, that there is not the same reason for digging up this crop as for carrots; the plough among the latter is apt to cut, break, and bury them; but not so with potatoes, for it turns them over, damaging scarcely any. In performing this work, first, says he, let
a number

POTATOE.

a number of women, preceded by a cart, pull up the tops, and throw the potatoes that adhere to them into baskets, and the stalks into the carts, which should convey them to the hog-yards, where they will presently be trampled into dung: then each plough taking its ground, attended by six or eight women, or more, if the crop is very large, each with a basket, divide the furrow, by setting up white sticks into as many parts as there are women, that each may pick her own share; a range of bushel skeps being placed at a small distance, for the baskets being emptied into, and three or four carts ready for men who do nothing else, one to eight or ten women, to take the skeps to the carts. The furrow being picked, he used many years ago to work it with men with three-pronged forks, each with a woman, or boy, to pick up the roots; but finding this expensive, he contrived a diagonal harrow in a slim beam, with two or three teeth, drawn by one horse, which tears the furrows in pieces, and lays bare the mass of the crop: the women then pick again; and another common cross-harrowing, with a second ploughing and harrowing, all three attended with two women to each plough, will finish the business, and clean the roots all away; so that he has found the pigs, when let in, make but very poor gleanings. The use of the little harrow saved him from 14s. to 20s. *per acre* in labour, which would otherwise have been necessary. An implement of this sort is shewn in the plate on agriculture, under the title of *Potatoe Harrow*.

Storing.—As soon as potatoes are gathered they should be allowed to remain some days to dry, before they are stored up, as it will give them a much better chance of keeping. There are several ways of storing up potatoes; the best is certainly that by which they can be kept most effectually dry, and at the same time free from the influence of frost. Putting them into close houses, and covering them well up with straw, is the most effectual mode, and that which is generally adopted. In Lancashire, and some parts of Scotland, it is a common practice to dig pits in the potatoe field, when the soil is dry and light, and, putting in potatoes to the depth of three or four feet, to lay a little dry straw over them, and then cover them up with earth, so deep that no frosts can affect them. Another method, which is practised in England as well as Scotland, is to put them together in heaps, and cover them up with straw, in the manner for preserving turnips, with this addition, that the heaps are afterwards well covered with earth, and so closely packed together as to exclude frost. The farmers in Lancashire sort and separate their potatoes in the course of taking them up, according to their sizes, and are particularly careful to throw aside all those that are spoiled before raising, or that are cut in the taking up. This is a very necessary and proper precaution, (although by no means generally attended to,) as the crop must have a much better chance for keeping, than when diseased or cut potatoes are stored up with it. It is also of great advantage to have the work performed in a dry season, as the potatoes seldom keep well when taken up wet, or when placed in any sort of repository for keeping while in that state. But the best way of storing the roots is, Mr. Young says, in what are called potatoepies. A trench, one foot deep and six feet wide, is dug, and the earth clean shovelled out, and laid on one side; this has a bedding of straw, and the one-horse carts shoot down the potatoes into the trench; women pile them up about three feet high, in the shape of a house-roof; straw is then carefully laid on six or eight inches thick, and covered with earth a foot thick, neatly smoothed by flat strokes of the spade. In this method he never lost any by the severest

frosts; but in case of its freezing with uncommon severity, another coat of straw over all gives absolute security.

But these pies, when opened, should each be quite cleared, or they are liable to depredation. To receive one at a time, besides also being at first filled for immediate use, he has a house that holds about 700 bushels, formed of posts from fir plantations, with wattled sides, then a layer of straw, and against that earth six feet thick at the bottom, and eighteen inches at top; the roof flat, with a stack of beans upon it. This he has found frost tight. The beans keep out the weather, and yet admit any steam which rises from the roots, which, if it did not escape, would rot them.

However, besides these, there are several other modes of preserving potatoes in use in different places. In Rutlandshire, Mr. Marshall says, the method of laying up potatoes, is, universally, that of *camping* them; a method somewhat similar to the above, but which requires to be described. Camps are shallow pits, filled and ridged up as a roof with potatoes; which are covered up with the excavated mould of the pit. This is a happy mean, between burying them in deep pits, and laying them upon the surface. The camps are of various sizes; being frequently, too, made in a long square form like a corn-rick, and of a size proportioned to the quantity to be laid up. It has, however, been found, by experience, that when the quantity is large, they are liable to heat and spoil; much damage having sometimes been sustained by this imprudence. Experienced campers hold, that a camp should not be more than three feet wide, (four feet is, perhaps, as wide as it can be made with propriety,) proportioning the length to the quantity; or, if this be very large, forming a range of short ones, by the side of each other. The usual depth is a foot. The bottom of the trench being bedded with dry straw, the potatoes are deposited; ridging them up as in measuring them with a bushel. On each side the roof, long wheat straw is laid, neatly and evenly, as thatch; and over this the mould, raised out of the trench, is evenly spread; making the surface firm and smooth with the back of the spade. A coat of coal ashes is sometimes spread over the mould; as a still better guard against frost. It is needless to observe, that a camp should have a dry situation; and that the roots ought to be deposited in as dry a state as possible. These camps are tapped at the end; some battens, or a quantity of loose straw, being thrust close in the opened end, as a bung or safeguard.

And as it is a matter of the highest importance, to preserve this root without spoiling the whole year, it has been suggested, that the best method yet discovered for keeping potatoes sound for the longest period, is to spread them on a dry floor early in the spring, and to rub off the eyes occasionally, as they appear to have a tendency to push out; by using these precautions, Mr. Donaldson has frequently seen potatoes kept in good condition till the month of June.

The following is an ingenious method of procuring a supply from the new crop, which merits attention. It is to take up carefully with the hand the potatoes that lie nearest the surface; this, in place of injuring the crop, will rather improve it. If this practice were generally adopted by the poor people, who are often obliged, from necessity, to have recourse to the new crop at a very early period, and to dig up a considerable part of it before it comes to maturity, that diminution of the crop would, the above writer says, be in a great measure prevented.

Diseases.—Potatoe crops are exposed to the attacks of disease, and that of the *curl* or *blight* is the distemper to which this plant is most liable. It shews itself very early

POTATOE.

in the season, by a curling in the leaves, and sometimes to such a degree, that whole fields are rendered thereby in a great measure unproductive. The cause of this disease is not yet perfectly understood, but the remedies most likely to prevent the evil, are those of frequent changes of seed, using large sets, cultivating and manuring the land in a proper manner, and not repeating this species of crop too often on the same land.

Mr. A. Knight says, that the disease of curled leaves in potatoe crops, appears to be occasioned by moulding the plant; and that the way to prevent it is, to allow the potatoes to remain in a moderate heat during the winter; somewhat late in the spring they begin to shoot; let these young shoots be taken off, when two or three inches long, from the tuber, and planted as sets, and the plants thus afforded will be entirely free from the curl.

These sorts of crops have likewise enemies of other kinds, which attack them in their growth; the fly called the thousand legs sometimes eats and makes them scabby, and the large bottle-green grub often eats out the hearts of them. See CURL.

Expences of Raising and Produce.—The expences of cultivating, and the produce of this sort of crops, have been differently stated, and they must obviously differ greatly, according to the soil, and the manner in which they are grown, as well as other circumstances that attend them.

In the Report of the West Riding of Yorkshire, Mr. Brown, in 1799, states them in this way.

Expences upon an Acre of Potatoes.

	£	s.	d.
Land rent	1	5	0
Working and ridging	1	5	0
Six sacks of potatoes at 7s.	2	2	0
Cutting ditto. and setting	0	2	0
Manure and leading	2	2	0
Hoeing, weeding, and taking up	1	5	0
	8	1	0

Produce of an Acre of Potatoes.

Sixty sacks at 5s. 6d. per sack	16	10	0
	8	1	0
	8	9	0

It is supposed, that the small that dresses out of what is shipped to London, will deliver them, or rather more. And in the North Riding of the same district, from 200 to 300 bushels per acre are stated to be considered as a good crop of the sorts for the table, and that those kinds raised for the purpose of cattle, will generally afford more by 50 or 100 bushels, on the same extent of land. And the same is considered as a good produce in the Lancashire mode of cultivating the root.

In the county of Essex, about the town of Ilford, the common calculation of the expence of producing an acre of potatoes is about fifteen pounds, which may be made out somewhat in this way.

	£	s.	d.
To rent, tithes, and rates	2	2	0
To manure	4	0	0
To tillage	0	13	0
Carry over	6	15	0

	£	s.	d.
Brought over	6	15	0
To fifteen cwt. of seed potatoes, at 5s.	3	15	0
To cutting, at 4d. per cwt.	0	5	0
To planting	0	8	0
To two hoeings	0	8	0
To digging up, 6d. a rod	4	0	0
	15	11	0

This is exclusive of the expence of picking, sorting, packing, and carrying to the market. The prime cost to farmer in his barn 50s. a ton, at ten tons an acre; at seven tons and an half, 40s. a ton, or 1s. 3d. a bushel: six tons at 4s. per cwt., which is 24l. per acre, will leave a good profit; but crops will rise much higher, and the price likewise. It is evidently an exceedingly profitable culture; and when the wheat is considered, will be found to rank amongst the most advantageous classes of British agriculture, according to the opinion of the writer of the Corrected Agricultural Report of the district.

In Young's Survey of Norfolk, it is stated that Mr. Cubit, at Cutfield, had an acre two years ago which produced forty-eight sacks, at 6s. a sack.

In Cheshire, the produce of those crops of potatoes, which acquire their full growth, varies from one hundred and fifty to two hundred and fifty bushels, of ninety pounds weight each, on the statute acre. The pink eyes generally give the smallest, the ox noble the largest produce. But there is a great variation in different places, as in the Altringham district; three hundred bushels the acre is only considered a fair crop.

In Lancashire, the produce of these sorts of crops is from two hundred and fifty to three hundred bushels, and sometimes even so high as three hundred and fifty and four hundred bushels.

In Essex, from two hundred to three hundred bushels, and occasionally more. About Ilford, when the crops stand to full perfection, the produce is from eight to fifteen tons on the acre.

F. Kirchaffer, esq. of Dublin, in a paper in the fourth volume of Communications to the Board of Agriculture, observes, that of the seed potatoes that were planted in a field, there were just 32 hundred-weight, which he procured from the south of Scotland, at a very considerable expence. These were a clean white and good kind, a little flattened, and had been raised in a moist soil. They were planted in some of the drills. Some were planted with white seed, raised in the bog of Allen; some were also planted with black, and a few with very fine apple potatoes, from the same quarter. The remaining drills were planted with white, black, and apple potatoes, all of which had been raised on land very similar to that in which they were now put; in fact, had grown in the very next field. He found that in their growth the Scotch seed made the earliest, and by much the most luxuriant shoots; the bog's whites and blacks were the next best; the home blacks and bog apples were the next; and the home apples were the worst of all. It is added, that as the Scotch whites were the earliest, so they were the first that were dug out; and here the produce was astonishing to the workmen, and to numbers of strangers who came to see the digging. They lay in the drills like hanks of onions, from the bottom, on which the seed had been laid, to the crown. There was very little difference in their sizes, none either remarkably large or small; and they turned out of the ground as clean and beautiful as possible.

POTATOE.

possible. A great number of the roots produced from two to three and four pounds each, and several were more abundant. He had scales brought to the field; and before respectable witnesses, six perches of each kind of potatoes were dug out of the drills, three of which were such as were supposed to be the best, and the other three the worst; but in fact they seemed to be pretty equal. The weights of the produce of the six perches of each kind were as below:

Produce *per* Perch, of seven Yards.

Sorts.	lbs.	which averaged	lbs.	
The Scotch whites	312		52	each perch.
Bog whites	246	—	41	ditto.
Bog blacks	210	—	35	ditto.
Bog apples	138	—	23	ditto.
Home whites	192	—	32	ditto.
Home blacks	162	—	27	ditto.
Home apples	108	—	18	ditto.

And as all the drills were 38 perches long, and 5 feet distant from centre to centre; of course they were 18 times 38 perches of drills in an Irish acre, or 684 perches of 7 yards running measure. This number, multiplied by the average of each sort of seed produced in a perch, gives the acreable produce of every kind in pounds, which, reduced into barrels of two hundred and a half, is as follows, viz.

The Scotch whites gave 126 of these barrels *per* acre.

Bog whites	100 barrels.
Bog blacks	85 barrels.
Bog apples	56 barrels.
Home whites	78 barrels.
Home blacks	66 barrels.
Home apples	44 barrels.

But Mr. Donaldson says, that the multiplicity of weights and measures, by which potatoes are sold in the various market-towns in the kingdom, renders it almost impossible to give an accurate account of the value of the crop by the acre. It varies, he supposes, in weight from five to eight, and sometimes ten tons: probably the general average may be nearly six tons the English acre. The medium price of potatoes shipped at Dundee has been, for some years, about 35s. the ton, equal to 10l. 10s. the acre.

These roots may be readily sorted, by having recourse to a sort of wide riddle made for the purpose.

Application as Food.—It has been stated that this sort of root, joined with hay, straw, chaff, and other similar matters, has been found useful in many cases, especially in the later winter months, as a food for horses, cows, and other sorts of live stock; and with these substances, as well as in combination with other materials, as bean or barley-meal and pollard, in the fattening of neat cattle, sheep, and hogs. But as there is considerable trouble and expence in preparing them, it being found that they are much more safe and nutritious for such animals when boiled, they do not appear to have paid greatly, when employed in this way. The results of numerous trials, detailed by different writers in the Annals of Agriculture, do not shew them to have been in this mode of application worth more, in general, than from 4d. to 5d. the bushel. When given to horses, it may be something more, as there is more difficulty in ascertaining the savings in other articles of fodder that are thereby made, and the advantages that are gained by the animals: it has been stated to be about 10d. the bushel.

It is stated in the Cheshire Corrected Agricultural Report, that when the crops are favourable, very considerable quantities of the potatoes raised about Frodsham, and particularly of the ox-nobles, are given by the farmers in the neighbourhood to different kinds of stock; feeding cattle,

milch cows, horses, hogs, sheep, &c. The success which has attended this practice, and the extent to which in many instances it has been carried, renders it, in the writer's opinion, an interesting subject of inquiry. Mr. Antwis informs him, that he frequently applies not less than 2000 bushels of potatoes in a year to this purpose; and states it as his opinion, that it is as good, if not a better, food for cattle of every description than turnips. This, however, is by no means the general idea on the subject. Some variety of opinion exists there as to the most eligible manner of giving this root; whether boiled, which may be done either in steam or water, or unboiled. Both of these modes are practised, and have their respective advocates. Cattle are more partial to the food in the former state: to horses, however, potatoes are frequently given raw, among other provisions of the provender kind, and answer extremely well in this way. An addition of chaff, or rough oats, is commonly made to counteract their laxative effect; about two quarts of this provender being usually mixed with six pounds of potatoes, and so on in proportion. And it has been remarked to the writer, by a gentleman whose opinion on this subject is entitled to great deference, that, if eaten raw, potatoes are much the most nutritious, when they have begun to sprout. This certainly holds good in the instance of barley and malt, and, in all probability, may be further extended to other vegetables secreting a saccharine juice at this period.

They are applied to the same purposes, and in much the same ways, in many parts of Essex; but some do not approve of them raw, as they are liable to scour too much. Mr. Pittman, an extremely large cultivator of them, finds nothing better for fattening bullocks, hay being given at the same time. They are also excellent for cows, and will fatten hogs very well, with a small mixture of barley-meal.

J. C. Curwen, esq. M.P., in a paper in the fourth volume of Communications to the Board of Agriculture, observes, that his former success in feeding horses with steamed potatoes and cut straw, has encouraged him to attempt to remove the only inconvenience he found attending it,—the length of time and labour requisite to steam any considerable quantity. He consumed last year at his works upwards of 60,000 stone. The washing was an operation of great labour, and, if not particularly attended to, was often ill done. But in a steaming-house, which he has contrived, there is a washing-machine, which will most completely clean eleven stone in two minutes, and requires only a trifling exertion.

He gives this statement of the expence of feeding his work and carriage-horses. The work-horses are employed from eight to ten hours, and, from the nature of their work, are obliged to travel quickly: these horses stood their work remarkably well the last year, and continue to do so at present. He began to feed with potatoes the 5th of October: to each horse is given daily one stone and a half of potatoes, mixed with cut straw, in the proportion as one is to ten.

	s.	d.
The average cost of potatoes 3d. <i>per</i> stone, one and a half	0	4½
Oats, at 2s. 4d. <i>per</i> Winchester bushel, weighing from 39 lb. to 40 lb., 8 lb. of ditto	0	6
Hay, at 6d. <i>per</i> stone, 7 lb. of ditto	0	3
Cut straw, 4 lb.	0	1
Steaming the potatoes	0	0½
<i>Per</i> day	1	3

POTATOE.

But horses of great draught, and such as cannot be allowed to rest at noon, will require 12 lb. of oats, which will make the cost of feed *per day* 1s. 6d. These horses consume rather less hay, but have double the quantity of cut straw with their oats, (which are bruised,) which makes the expence nearly equal. And the steaming 120 stone of potatoes requires two and a quarter Winchester bushels of coals = 137 lb., the weight of the bushel 61 lbs.

	<i>s.</i>	<i>d.</i>
The coals cost - - - - -	0	6 $\frac{3}{4}$
The labour costs - - - - -	1	8
120 stone steaming, at 1 $\frac{1}{4}$ d. - - -	2	2 $\frac{3}{4}$
	2	6
The difference	0	3 $\frac{1}{4}$

This 3 $\frac{1}{4}$ d. *per day* may be applied towards the first cost, and the necessary repairs of the machinery, and will in seven months amount to 2l. 16s. 10 $\frac{1}{2}$ d.

It is supposed that one acre of potatoes is equal to four of hay, and, under proper management, the ground will be in as good condition for wheat as if it had been under fallow. The potatoe crop will not in general pay the expence, but there will be a considerable saving in putting in the wheat, compared with a fallow, equal to 40s. *per acre*.

No pains have been spared in having the estimate made as accurate as possible; he has, therefore, taken the price of hay and potatoes on the average of common years. He has seldom, if ever, cut less than 300 acres of grass, and has found that quantity inadequate to his annual consumption; and has always been obliged to purchase hay, and has paid from 8d. to 1s. *per stone*, besides the expence of carriage, which would make the average cost 10d. *per stone*. On the whole, he is fully persuaded that work and farming-horses may be fed with potatoes at a much easier rate than with hay. The waste in steaming this root is about one-eighth part. And that lately straw has been substituted instead of hay, and the horses have kept their condition, and done their work equally well.

The baking of potatoes, for the purposes of feeding lean, and fattening other sorts of stock, has been suggested by Mr. Pierrepont in a letter to the Society for the Encouragement of Arts, as another and preferable mode of preparing this root, to that of the above. Not altogether satisfied, says he, with the system of curing or preparing potatoes by steam from heated water, which he had practised, and conceiving that some better method might be found out, he, in 1801, made several experiments, and bestowed much attention and trouble upon it, before he brought his plan to bear, which is that of having an oven, and a proper digester placed in it for containing the roots, which is shewn in the plate, on steaming, roasting, and preparing cattle food. It is observed that potatoes cured in this way are not near so apt to turn sour or scour the cattle, are more dry, so that the animals fed with them drink a deal more, and they become more hard when cold, so as to be flung to the stock with more convenience than when steamed. In 1802 the writer fattened fifteen brace of bucks chiefly with them. He says chiefly, as after the potatoes were gone, they had a few beans. They were very fine, and peculiarly fine flavoured. He also fattened the same year with them two oxen, three cows, and two pigs, which were equally well flavoured, particularly the first. The pigs had, towards the latter end, a few whole peas after each meal. The bucks had six pounds *per day*, each at an average. The lean deer in the parks do very well, with a little more than a pound

per day instead of hay. And this year (1803) he has fattened two very large oxen, and twenty Welsh wethers. The wethers, with which there were two South Down rams, and one ewe, had eighty pounds of the potatoes *per day*, with a little cut hay. The ewe was put with them, to teach the other sheep to eat them, she has since had twin lambs, and the bailiff acknowledges that the lambs do better than the other at turnips, though he, with some others, dissuaded the writer from trying more ewes, under the idea that the potatoes would dry up their milk. Four dairy cows never did so well with very good hay, as they did last winter, with about four pounds of potatoes, and about five pounds of rubbish hay and straw cut. One of the oxen weighed, on the 22d of March, 343 stones alive, upon a weighing machine; he had about forty pounds three times a day. It is observed by the earl of Egremont, that he knows nothing of the expence of preparing potatoes in this way; but they appear to him to be more nutritious than in any other mode of dressing, and much better tasted for the table. He adds that he did not think it possible to bring such large oxen to such a state of fatness upon potatoes. In the feeding of milch cows, they have been found useful in some cases, even when given without being prepared by being exposed to the heat of boiling, or any other means.

And they are stated by Mr. Young to be sometimes given to horned cattle in the cribs that hay is given in. Giving hay in the morning, about ten o'clock potatoes, at noon hay, about two o'clock potatoes, and at night hay. An ox of one hundred and forty stones (eight pounds to the stone) will eat one bushel and a half *per day*; from eighty to one hundred stones, one bushel, with about ten pounds of hay; they will not eat much hay if they have that quantity of potatoes. They get very fat cattle with hay and potatoes. Mr. Clofe also states, that he has, for several years, kept his hogs entirely upon his refuse potatoes, and can always, without difficulty, or the expence and trouble of confining them, sell those of about seven or eight stone weight, to the butchers, for roasting meat, at 4s. 6d. *per stone*; pork fed in this method is remarkably sweet, the flesh delicate and moist. This food succeeds admirably, except for bacon-hogs, and he finds, from experience, that it is necessary to keep those intended for that purpose about a fortnight upon ground pease mixed with boiled potatoes. If the hogs are forwarded with potatoes before they are confined, two bushels of pea-meal, and four bushels of boiled potatoes, well incorporated, will fat a hog of twelve stone, fit for hams or bacon; this method greatly reduces the expence commonly attending the fattening of swine. The best way is, however, to give this sort of food to the store hogs.

In the survey of Norfolk it is observed that Mr. Repton has raised potatoes for the consumption of his farm; but not when he has any prospect of buying them, which he has done at 1s. 6d. to 2s. 6d. a sack. He steams them for young cattle, &c. having a very complete apparatus for the purpose; boils five coppers, which steam 50 or 60 bushels a day, and answers well; also turnips, and pours their liquor on to cut chaff, giving the whole mixed together; it answers extremely well; the cattle licking it up with great avidity, and doing perfectly well on this food.

And Mr. Newman of Bayford, Hertfordshire, has fed cattle on potatoes, but as they were too watery, they would not answer; he therefore left off the practice. But Mr. Rooper, of Berkhamsted, who has usually had four or five acres for fifteen years past; thinks very differently from Mr. Newman, and uses them raw for fattening beasts, as he assures Mr. Young, with much success; for hogs also they answer very well. He plants them after oats in every

POTATOE.

third furrow; and ridges up the stubble soon after harvest; he harrows it down in the spring, and spreads eight loads of long fresh dung *per acre*; then plants near 20 bushels *per acre*; he horse-hoes and ploughs up the crop, which produces from 150 to 200 bushels *per acre*, on a flinty loam, on a chalk bottom. Wheat will not do after them; but the barley is good. They are, he is clear, a very exhausting crop.

And Mr. Hill has a field of uniformly light sand loam, on the ridge or highest land in the parish of Kempton, containing about two acres and three quarters; this field was cropped with potatoes in 1794, when he saw it, and the year before produced about 400 bushels *per acre*, worth on the average 1s. 9d. *per bushel*, 35l. *per acre*; every attendant expence about 5l., 30l. clear. He fed his milch cows and store pigs with the potatoes in winter; the cows gave abundance of milk, but not cream in proportion.

According to the first of the above writers, by much the most general as well as the most useful application of this sort of crop is in that of human food, for which purpose the roots are rendered mealy, nutritious, and fit for undergoing the different processes of digestion, by means of heat, either dry, or in water, or steam. Their acrid juices being in this way converted into mucilage, and probably some portion of that into a fine farinaceous or starchy substance. Experience seems to prove, that where the heat is properly applied through the medium of steam, the potatoes become more mealy and nourishing than where water is made use of for the same purpose. But the differences in the mealiness produced by the boiling of this root is supposed by some to depend more upon the nature of the soil on which it is grown than on any other circumstance. And it has been suggested by Dr. Darwin, that the mealiness of some potatoes that have undergone the operation of boiling, may be sometimes affected by the acidity of the water in which they have been boiled; but it is believed to depend more generally upon the mucilage in some of them being more coagulable than in others, a circumstance the cause of which has not yet been fully investigated.

Washing.—The cleaning of this root, where it is made use of upon an extensive scale, is frequently considered as a troublesome operation; it may, however, be performed with great ease and convenience, by having a vessel constructed in the form of a barrel, with small strong narrow laths on the sides nailed to the solid boards, forming the ends at such distances as may be sufficient for preventing the potatoes or other roots from falling through, and at the same time for admitting the water to pass freely. The potatoes are to be introduced and evacuated by means of a door fixed in one of the sides. The vessel being thus prepared it is to be hung upon a frame of wood over a large square tub containing water, in such a manner as that about one-half of it may be immersed; a crooked handle projecting at one of the ends, by quickly turning which, when the potatoes are put in, a large quantity may be expeditiously washed. There should likewise be a contrivance in the frame higher up and nearer the side of the cistern for lifting the barrel from the place in which it turns into, in order that, by opening the door and turning it round, the washed roots may be easily delivered into a barrow or other vessel placed below, so as that it may receive them. A more expeditious mode of doing this may be seen under the head *steaming and washing apparatus*.

Effects on Land.—In regard to the effects which are produced on the soil by this sort of crop, it seems probable, the author of Practical Agriculture says, that both from the nature of the root and the large portion of manure that is

necessary to ensure a great crop, except under particular circumstances of the land, that the potatoe is a sort of plant that has a tendency to draw a large quantity of nourishment from the soil on which it is grown, consequently to exhaust and impoverish it in a considerable degree, though these injurious effects are in some measure counteracted by the great abundance of the stem and the closeness of the foliage, producing a stagnated state of the air, and a considerable deposition of vegetable and other matter on the surface, as well as by the pulverization and aeration that is afforded in the culture and removal of the crop from the ground. It is perhaps in this way only that the contradictory accounts of the effects of this sort of crop on the soil, and the occasional successive production of full crops on the same land, can be well reconciled. The experience of potatoe cultivators in general appears to support the conclusion; as upon more strong and heavy sorts of soil, where benefit can be produced in the above manner, full crops may often be taken in succession without much injury being sustained; while on the lighter kinds, where much less advantage is derived in this way, they become too open and exhausted for the successful repetition of this sort of crop, and even for the growth of wheat. And that in Mr. Young's trials with the potatoe, introduced in a great many courses of crops, it was found that the state of deterioration of the soil was in proportion to the frequency of the occurrence of such crops in the rotations. In the experience of the writer of the report of the North Riding of Yorkshire, this kind of crop does not impair the fertility of the soil on which it is produced; as he has always found that the crop of corn succeeding the potatoes, and the feeds after the corn have been equal to those succeeding a crop of turnips. And it is well known and generally allowed, that a well-managed crop of potatoes, leaves the soil in a mellow and more fertile state than any summer fallow, or any present mode of cultivation of any other crop. This arises from the frequent stirrings in the fore part of summer with the plough and hoes for the destruction of weeds; the thick shade of the plants which keeps a perpetual moisture in the soil, and the decay of so large a quantity of leaves and stalks, before and after the crop is taken up, all tend to enrich the soil. A question also arises on the food and support of this plant; do not all succulent plants derive a greater proportion of their nourishment from the atmosphere by their tops, than those of a drier texture? This, though not capable of proof, is probably the fact; and it is confirmed by the circumstance of all meliorating crops being of a more succulent nature, as beans, peas, vetches, turnips, and clover, than wheat, oats, or barley, which are exhausting crops.

The facts stated on this subject in the Hertfordshire report are these; Mr. Penrose, of Hatfield, has often sown wheat after potatoes, but very rarely gets a good crop; finding this culture, as the reporter was informed, a bad preparation for that grain.

Mr. Cassmajor, at North Mims, has cultivated this root, and has had considerable crops, but he uniformly found it so exhausting, that he could never get such crops of corn after them as satisfied him; he therefore gave up the culture. And Mr. Marsh, near Hatfield, a very improving farmer, has cultivated this root for some years: he manures with horse-dung; plants chiefly the champion sort, and gets 600 or 700 bushels *per acre*. He has had good wheat after these, but little crops of barley.

Mr. Hill, of Whittle, has generally four acres: he has had 1100 bushels on two acres and a half. He finds that giving them to store hogs is the most profitable application. His men dig up the crop with four-pronged forks, at 1d.

per bushel; which crop is easily measured by a fifteen-bushel cart. Mr. Roper finds them a very exhaulting crop.

Mr. King, of Barkway, has had wheat after potatoes, but not good crops: this year he will take barley, which he is well convinced is the most profitable management.

In Norfolk, Mr. Everit has found that they exhaust the soil more than any thing.

But the dispute respecting their effects on the soil may, Mr. Marshall supposes, perhaps, be settled satisfactorily in this manner. The potatoe contains, indisputably, a great quantity of nourishment; and is therefore, perhaps, as indisputably a great exhauster of the soil. But the quantity of vegetable nourishment carried off in the potatoe crop is not the only cause of exhaustion: it is notorious to common observation, that this crop leaves the soil in a singularly friable fertile state, causing an abundant produce of the crop which succeeds it. If taking the advantage of this prodigality of the soil, the husbandman keeps cropping it year after year with corn; and, when it will no longer answer his unreasonable expectations, lays it down to grass, it is no wonder that it should be unproductive: for, having lavished all its riches on an ungrateful occupier, it is, of course, reduced to extreme poverty.

On the contrary, if, after a crop of potatoes, well dunged for, only one or two crops of corn be taken, and the land be laid down to grass, while yet in a state of fertility, the potatoe crop is, to vulgar appearance at least, friendly to the crop which succeeds it.

Hence it follows, that land which has been cropped with potatoes should presently afterwards be laid down to grass, or should be timely replenished with a quantity of manure proportioned to the degree of exhaustion it has undergone.

The value of potatoes as a fallow crop, and as an article of food for cattle, compared with turnips and cabbages for the same purposes, may be considered thus: potatoes are more nutritious; and, in the opinion of those who have used them, fat cattle much quicker than either turnips or cabbages. Potatoes, too, being secured from the severities of winter, are a more certain article of fattening than turnips or cabbages; both of which are liable to perish under an alternacy of frost and thaw; and the turnip, more particularly, is locked up, or rendered more difficult to come at, during a continuance of snow or frost. Turnips and cabbages, if they out-weather the severities of winter, occupy the soil in the spring when it is wanted to be prepared for the succeeding crop; while potatoes, if properly laid up, are a food which may be continued without inconveniency until the cattle be finished, or the grass has acquired the requisite bite for finishing them in the field.

On the other hand, potatoes are a disagreeable crop to cultivate: the planting is a tedious dirty business; and taking them up, may be called the filthiest work of husbandry, especially in a wet autumn.

POTATOE, *Canada*. See *HELIANTHUS Tuberosus*.

POTATOES, *Spanish*, a name given to several species of the convolvulus, or bind-weed.

POTATOE Harrow, in *Agriculture*, an implement of the drag kind, made use of for harrowing out the potatoes after the plough. Mr. Young, as has been seen, used formerly to work the furrows after the plough by men with three-pronged forks, but that finding the method expensive, he contrived a diagonal harrow in a slim beam, with two or three teeth, to be drawn by one horse, managed by a man or boy, which tears the furrow to pieces, and lays the potatoes bare, and by repeating the operation clears the ground of the crop. It saved him from fourteen to twenty shillings *per* acre in labour. It is seen in the

plates on agriculture, under the head *Potatoe Harrow*, at *figs. 2* and *3*; in which the following are the dimensions in the first figure.

		ft.	in.	
From	1 to 2	5	8	
—	1 — 3	4	6	
—	4 — 5	2	6	
—	5 — 4	0	5	
—	4 — 6	0	5	
—	7 — 8	1	9	
Plate	- -	9	0	3 broad
Same	- -		0	0 $\frac{1}{2}$ thick
	From 10 to 11	0	5 $\frac{1}{2}$	
Breadth of iron plate		0	3	
In the curve		0	7	
Breadth of curved iron		0	3	
	From 12 to 13	straight line across.		

At *fig. 3*. is a side view of the harrow-part of the implement.

In working with this tool, the curved iron slides against the unploughed land, at the bottom of the open furrow, and thereby keeps the teeth diagonally placed, to avoid driving the earth in heaps in their work. In loose friable soils three teeth may be employed, but in stiffer ones only two. The tool performs its work well.

POTATOE Sets, the cuttings of the potatoe which are made use of as sets for planting. They should always have one or more eyes, and be from a quarter to half an ounce in weight, being cut from good sound roots. Small sets seldom succeed so well.

POTATOE Scoop, a sort of scoop made use of for taking out the eyes or buds of the potatoe for the purpose of sets; they are made of different sizes, according to the intention of the cultivator. Scoops of this sort are represented in the plate on agriculture, under the head *Potatoe Harrow*, at *figs. 4* and *5*. They are chiefly employed when potatoes are scarce.

POTATOE Bay, in *Geography*, a bay on the S. coast of the island of St. Christopher's.

POTCHENSKOI, a town of Russia, in the government of Archangel; 32 miles N.N.W. of Kola.

POTCHINKI, a town of Russia, in the government of Niznei Novgorod; 112 miles S. of Niznei Novgorod. N. lat. 54° 24'. E. long. 44° 14'.

POTEE, a town of Candahar; 25 miles E.N.E. of Candahar.

POTEMKIN, GREGORY ALEXANDROVITCH, in *Biography*, a favourite of Catharine II., who governed Russia with no less despotic authority than other ministers of that barbarous country, was descended from an ancient and noble family, established in the province of Smolensko. At an early age he entered the army, and soon became distinguished as an adherent to the empress. He served with applause under marshal Romanzoff, in the campaign against the Turks, and was deputed to deliver the keys of Bender to the empress, when it capitulated to the Russians in the year 1770. Before this period Potemkin affected a violent attachment to the empress; but Catharine paid little attention to mere marks of passion, and after having occupied a post at court about fifteen months, he received the usual order to absent himself; but he soon contrived to regain his political influence, though compelled to yield to a new favourite. From this period he maintained an ascendancy over the counsels of the empress, and introduced and dismissed successive favourites, according to his own caprice. He was perfectly well acquainted with the temper and disposition

disposition of the empress. In his correspondence with her he affected a great spirit of independence; returned the most laconic answers to letters written by her own hand; and governed her, it is said, no less by remonstrating against her weakness, than by indulging her passions. His honours, titles, and employments, now exceeded in number and distinction, those ever before possessed by any Russian subject. He was dignified by all the Russian orders of knighthood, and the principal orders of Prussia, Poland, and Sweden: he was field-marshal, and commander-in-chief of the Russian army; grand admiral of the Euxine and Caspian seas, and created a prince of the German empire. His revenues corresponded to his dignities: besides large estates, he received nine millions of rubles in money; he was lord over 40,000 peasants in Polish Russia, and 5000 in Russia; he had also a pension of seventy-five thousand rubles, and thirty thousand for his table. This income, extraordinary as it may appear, was found to be inadequate to his expences. During his campaigns, his march was constantly preceded by an English gardener, and several hundred labourers, who formed a garden on the spot where the tent of the prince was pitched, if he continued ever so short a space of time. He purchased enormous quantities of diamonds, with which he ornamented his dress; he lavished vast sums on his numerous mistresses; and expended still more on buildings, which he either never inhabited, or never used, but for the purpose of giving a magnificent entertainment or fête. To supply these expences, and gratify his passion for accumulating riches, he drew on the treasury for sums to an unlimited amount, and none of his drafts were ever rejected. He died at the close of the successful campaign against the Turks. He had been attacked at Yassy by an epidemic distemper, which he increased by every species of intemperance; and on his journey from Yassy to Nicolaief, he was seized with a violent fit of the colic, that carried him off. When the empress heard of his death, she was at first much affected with the news, but recovering from her first grief, she seemed pleased with her emancipation from his influence. Potemkin was clumsy in his person, but of herculean size and strength. In mixed companies he was silent and reserved; but among those with whom he was intimate, he was affable, cheerful, and indulged in mimicry and sarcastic raillery, in which he was thought to excel. He was attached to religious ceremonies, particularly to the pomp of the Greek church, and was well versed in ecclesiastical matters. In domestic life he was kind and liberal. He was voracious as well as capricious in his appetite. By nature and habit he was extremely indolent, and frequently neglected important business; but when roused to exertion his activity was as remarkable as his supineness. With all his faults and vices, he encouraged commerce and manufactures, was a great patron of learning, and promoted, as far as he was able, the study of Greek literature. He possessed a quick comprehension and a surprising memory; yet his knowledge of books was superficial. His reading was confined chiefly to the French, the belles lettres, and translations of the classics, and to Russian authors who had written on religious ceremonies; but the information which he drew from persons of eminence in every profession was prodigious. See Tooke's Translation of Caltera's Vie de Catharine II.

POTENDORF, in *Geography*, a town of Austria; 4 miles N.E. of Steyregg.

POTENGER, JOHN, in *Biography*, an English writer, was born at Winchester in 1647. He was educated at Corpus Christi college, Oxford, after which he entered himself of the Temple, and was called to the bar. He died at

Dorchester in 1733. He was author of a poem on Death, and translated the life of Agricola from Tacitus.

POTENT, or POTENCE, in *Heraldry*, a term for a kind of a cross, whose ends all terminate like the head of a crutch.

This is otherwise called the *Jerusalem cross*.

He beareth sable, a cross potent, or, by the name of *Aleyn*.

POTENT, *Counter-potent*. See COUNTER-potent.

POTENTIA, POTENZA, in *Ancient Geography*, a town of Italy, in Picenum, towards the S.E., at the mouth of a river of the same name, which became a Roman colony in the year 568.—Also, a town of Italy, in Lucania, S.W. of Opinum.

POTENTIA, *Power*, that whereby a thing is capable either of acting or being acted upon. See POWER.

POTENTIA, *To exist in*, is used among school-writers to denote that existence which a thing has in a cause capable of producing it, but which has not as yet actually produced it. In which it stands opposed to existence *in actu*.

POTENTIAL, POTENTIALIS, in the *Schools*, is used to denote and distinguish a kind of qualities, which are supposed to exist in the body *in potentia* only; by which they are capable, in some manner, of effecting and impressing on us the ideas of such qualities, though not actually inherent in themselves.

In this sense we say, potential heat, potential cold, &c. Brandy and pepper, though cold to the touch, are, as they say, potentially hot.

POTENTIAL *Cold* is a relative term, by which we mean, that such a thing is not actually cold to the touch, but in its effects and operations, if taken inwardly.

This quality is supposed, by those who have adopted the terms, to arise from the size, shape, &c. of the component particles of a body, which give some check or retardation to the blood's motion, whereby it is less agitated, and upon which the sensible parts of the body are not so briskly struck by it; the perception of which diminution or change of motion in the organs of feeling, is called *cold*.

Hence every thing that lessens the blood's motion, with relation to the sensation before made, is cold; and every thing which increases it, may be called potentially *hot*.

POTENTIAL, in *Medicine*, &c. Causteries are either actual, viz. a button of red-hot iron; or potential, as lime, and other caustic drugs.

POTENTIAL is also used by *Schoolmen*, for something that has the quality of a genus.

A potential whole is that which has its parts under it, as a genus has its species; to distinguish it from an *actual* whole, which has its parts in itself; as a body composed of matter and form.

Grotius, with a view to this distinction, uses the phrase, *potential parts of a state*, in opposition to the *subjective parts*.

By potential, he means those parts possessed of the sovereign power; by subjective, those subject to it; which are such with regard to the sovereign power, that several species are with regard to the genus of which they are the subjective parts.

Grotius maintains, that though the sovereign power be one and indivisible, yet it may have several potential parts: for as in the Roman empire there have been two potential heads, the one ruling in the East, the other in the West; yet the imperial authority, all the while, single and indivisible; so is it possible, the subjective parts combining to give away their sovereignty, may not give it entire, but reserve a part of it for certain emergencies. In which case the subjective

part becomes potential: and thus there are two potential parts, and yet the sovereignty single.

POTENTIAL, in *Grammar*, gives the denomination to one of the moods of verbs.

The potential mood is the same, in form, with the subjunctive; but differs from it in this, that it hath always implied in it, either *possim*, *volo*, or *debeo*; as *roget*, that is, *rogare potest*, the man may ask.

It is sometimes called the *permissive* mood, because it often implies a permission or concession to do a thing; as *habeat*, *valeat*, *vivat*, *cum illa*. Terent.

POTENTILLA, in *Botany*, so called, as it is said, from *potentia*, power, in allusion to its reputed virtues; but these are truly of a diminutive kind, like the name.—Linn. Gen. 255. Schreb. 342. Willd. Sp. Pl. v. 2. 1094. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 547. Ait. Hort. Kew. v. 3. 273. Juss. 338. Lamarck Illustr. t. 442. (Pentaphyllum; Gært. t. 73.)—Class and order, *Icosandria Polygynia*. Nat. Ord. *Senecioideæ*, Linn. *Rosaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, nearly flat, divided half way down into ten segments; the alternate ones smaller and reflexed. *Cor.* Petals five, roundish, or inversely heart-shaped, spreading, attached by their claws to the calyx. *Stam.* Filaments twenty, awl-shaped, shorter than the corolla, inserted into the calyx; anthers elongated into the form of a crescent. *Pist.* Germens numerous, minute, collected into a head; styles thread-shaped, the length of the stamens, inserted laterally into the germens; stigmas obtuse. *Peric.* none. *Common receptacle* of the seeds roundish, dry, minute, permanent, covered with the seeds, and enclosed in the calyx. *Seeds* numerous, ovate, rather compressed, pointed, generally transversely corrugated.

Ess. Ch. Calyx in ten segments, inferior. Petals five. Seeds roundish, naked, transversely corrugated, affixed to a small dry receptacle.

The species of this pretty genus are all, except the first, herbaceous, and for the most part perennial. Their flowers are generally yellow, sometimes white, very rarely with a tinge of pink. The leaves are compound, and mostly cut or serrated; more or less sparingly hairy, or silky. Inflorescence axillary or terminal, simple or forked. Linnæus describes twenty-seven species in his Sp. Pl. Willdenow has forty-one. They are natives of cold or temperate climates, and rather mountainous situations. The genus is divided into three sections.

Section 1. *Leaves pinnate*. Thirteen species, three of them British.

P. fruticosa. Shrubby Cinquefoil. Linn. Sp. Pl. 709. Willd. n. 1. Ait. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 88.—Leaves pinnate. Stem shrubby.—Native of mountainous bushy places in the north of Europe, but rarely. It has been found in Siberia, the south part of the Swedish isle of Oeland, and about the river Tees, in Yorkshire. In our gardens and shrubberies it is frequent, forming a bushy shrub, three or four feet high, covered throughout the summer with solitary terminal flowers of a golden yellow, the calyx of which has five of its segments remarkably large and leafy. The leaves of the plant are alternate, stalked, composed of five, rarely seven, oblong entire leaflets. *Stipulas* solitary, oblong, membranous, placed within each footstalk, and united to its base.

P. anserina. Silver-weed, or Wild Tansey. Linn. Sp. Pl. 710. Willd. n. 2. Ait. n. 2. Fl. Brit. n. 2. Engl. Bot. t. 861. Curt. Lond. fasc. 3. t. 31. Fl. Dan. t. 544. (Argentina; Ger. Em. 993.)—Leaves interruptedly pinnate, serrated, silky beneath. Stem creeping. Stalks axillary, single-flowered.—Native of pastures, osier-holts, and

low commons, in England, and other parts of Europe, flowering through the summer. It prefers a clay soil, though it often grows in peat earth. Linnæus says this species always indicates the presence of clay under the surface. His translators have by mistake referred this remark to *P. argentea* hereafter described, see Rose's Botany, 382; and indeed Linnæus himself is partly responsible for this error, which has crept into Engl. Bot. at p. 89. *P. anserina* is a very handsome plant, conspicuous for its ample silvery foliage, and large golden flowers.

P. rupestris. Strawberry-flowered Cinquefoil. Linn. Sp. Pl. 711. Willd. n. 8. Ait. n. 6. Fl. Brit. n. 3. Engl. Bot. t. 2058. Jacq. Austr. t. 114. (Pentaphyllum fragiferum; Ger. Em. 991.)—Leaves pinnate, lyrate, of seven, five, or three, ovate, serrated, hairy leaflets. Stem erect.—Found in shady alpine spots, in Sweden, Siberia, Germany, Switzerland, and, according to Ray, on the sides of Craig Wreidhin, Montgomeryshire; but we have never seen a wild British specimen. In gardens it is a hardy perennial, of easy culture, flowering copiously in the early part of summer. The stems are about a foot high, branched. Leaflets obtuse, hairy, not hoary. Flowers remarkably like the hautbois strawberry, copious, somewhat panicled. The seeds too are smooth, as in *Fragaria*, not rugged.

P. pensylvanica. Pennsylvanian Cinquefoil. Linn. Mant. 76. Willd. n. 12. Ait. n. 9. Jacq. Hort. Vind. v. 2. 89. t. 189. Figured also in Gmel. Sib. v. 3. t. 34. f. 1.—Leaves pinnate, with deeply toothed decurrent leaflets; the uppermost only ternate. Stem erect, downy.—Native of North America, as well as of Siberia. Miller cultivated it at Chelsea, and Jacquin at Vienna; but this is one of those ordinary looking plants, which, unless they can take care of themselves, seldom remain long in any garden. The stem is a foot or two high. Leaves deeply cut, of a hoary green. Flowers small, yellow, not ornamental, disposed in a kind of downy panicle.

P. supina. Trailing Cinquefoil. Linn. Sp. Pl. 771. Willd. n. 13. Ait. n. 10. Jacq. Austr. t. 406. (Pentaphyllum supinum, potentillæ facie; Ger. Em. 988.)—Leaves pinnate, deeply toothed. Stem prostrate. Flowers axillary, solitary.—Native of Siberia and Germany; cultivated in England before 1696, but it has as few attractions as the last, from which it differs in having a prostrate stem and perfected flowers. The root is tapering, singular in this section for being annual.

Section 2. *Leaves digitate*. Twenty-one species, six British.

P. recta. Upright Cinquefoil. Linn. Sp. Pl. 711. Willd. n. 14. Ait. n. 11. Jacq. Austr. t. 383. (Quinquefolium majus rectum; Ger. Em. 987.)—Leaflets five to seven, obovato-lanceolate, coarsely toothed. Petals inversely heart-shaped, larger than the calyx. Stem erect, corymbose, forked, many-flowered.—Native of Italy, France, Switzerland, and Germany, in stony dry places, flowering copiously in summer. It has long been cultivated in botanic gardens, and sometimes finds a place in flower borders, being recommended by its copious yellow blossoms, which often assume a pale sulphur-like hue. The plant is a hardy perennial, very hairy, and grows in a corymbose manner, to the height of two feet.

P. argentea. Hoary Cinquefoil. Linn. Sp. Pl. 712. Willd. n. 17. Ait. n. 12. Fl. Brit. n. 4. Engl. Bot. t. 89. Fl. Dan. t. 867. (Quinquefolium tormentillæ facie; Ger. Em. 988.)—Leaflets five, wedge-shaped, cut; downy beneath. Stems ascending.—Native of open, dry, gravelly pastures in Europe: not rare in England, flowering in June. This is much smaller, and less upright, than the last-

POTENTILLA.

last-mentioned, distinguished by the snow-white cottony hoariness of the *stalks* and backs of the *leaves*, to which the name *argentea* does not well apply. Indeed we are persuaded that Linnæus, in his recollection at least, confounded this with the *anserina*, a species very widely different in all but whiteness; and that is cottony in the present, silvery in the *anserina*. The *flowers* of the *argentea*, though small, are conspicuous for their golden colour.

P. opaca. Saw-leaved Hairy Cinquefoil. Linn. Sp. Pl. 713. Willd. n. 23. Ait. n. 16. Engl. Bot. t. 2449. Jacq. Ic. Rar. t. 91. (*Pentaphyllum incanum*, minus, repens; Ger. Em. 989.)—Radical leaves of seven hairy, linear-wedge-shaped, deeply serrated leaflets; stem-leaves mostly opposite, of three items, slender, decumbent.—Native of Germany and Switzerland; found, since the publication of Fl. Brit., on the mountains of Scotland, flowering in June. The *opaca* of Hudson was only *verna*. The present bears many spreading, partly decumbent, *stems* from the crown of the perennial *root*, which compose a lax tuft, a foot wide, or more, green and hairy. The radical *leaves* grow on long *stalks*; the rest are nearly sessile, and mostly opposite; leaflets so deeply serrated as to be almost pinnatifid. *Flowers* handsome, of an orange yellow, on long, hairy, lateral *stalks*.

P. verna. Spring Cinquefoil. Linn. Sp. Pl. 712. Willd. n. 24. Ait. n. 17. Fl. Brit. n. 6. Engl. Bot. t. 37. (*Fragaria verna*; Crantz Austr. fasc. 2. 12. t. 1. f. 1.)—Radical leaves of five wedge-shaped, serrated, furrowed, fringed, rather coriaceous leaflets; stem-leaves of three. Stem reclining.—Found in dry pastures of the north of Europe, where the ground is barren, and chalky or gravelly; flowering with us in April or May. Its growth is humble, and texture more coriaceous than the last. The *leaflets* are nearly obovate. *Flowers* about the ends of the *stems*, on longish *stalks*; their *petals* yellow, scarcely so long as the *calyx*.

P. aurea. Golden Cinquefoil. Linn. Sp. Pl. 712. Willd. n. 25. Ait. n. 18. Fl. Brit. n. 5. Engl. Bot. t. 561. Fl. Dan. t. 114. (*Quinquefolium minus*, flore aureo; Ger. Em. 990.)—Radical leaves of five obovate, deeply serrated, hairy, somewhat membranous leaflets; stem-leaves of three. Stem nearly erect.—Native of the mountains of Norway, Germany, Switzerland, Italy, &c. as well as of the Scottish alps, flowering in July. This is larger, more erect, and far more handsome than the last, with more conspicuous golden *flowers*, and less coriaceous *leaves*. The segments of the *calyx* are all nearly equal in length, though not in breadth.

P. alba. White Cinquefoil. Linn. Sp. Pl. 713. Willd. n. 28. Ait. n. 20. Fl. Brit. n. 7. Engl. Bot. t. 1384. Jacq. Austr. t. 115. (*Quinquefolium sylvaticum majus* flore albo; Ger. Em. 989.)—Leaflets five; silky beneath; with converging serratures at the summit. Stems thread-shaped, procumbent. Receptacles very hairy.—Native of the alps of Germany and Hungary, in shady places. Hudson records it as a Welsh plant, on the authority of a Mr. Haviland; but his assertion has never been confirmed. This *Potentilla* is a favourite decoration for rock-work in most gardens, flowering from May to August. The glaucous silvery *leaves*, and abundant snowy *blossoms*, each on long slender *stalks*, are elegant and uncommon. The *receptacle* is remarkable for long dense hairs. *Seeds* slightly corrugated.

P. nitida. Peach-blossom Cinquefoil. Linn. Sp. Pl. 714. Willd. n. 32. Ait. n. 23. Jacq. Austr. append. t. 25.—Leaflets five or three, downy, with three converging teeth. Stems single-flowered. Receptacles woolly.—Native of Austria, as well as of mount Baldus, and of the

Tyrol. Sir Joseph Banks procured it for Kew garden in 1798, and it flowers there in the middle of summer. Nothing can be more elegant than the silvery *leaves* and pink *flowers*; which last are well compared by Pona, Bauhin, and Ray to the blossoms of a peach. This humble plant forms dense tufts, from one to two inches only in height, though the *flowers* are nearly an inch wide.

P. reptans. Common Creeping Cinquefoil. Linn. Sp. Pl. 714. Willd. n. 34. Ait. n. 24. Fl. Brit. n. 8. Engl. Bot. t. 862. Curt. Lond. fasc. 1. t. 37. Woodv. Med. Bot. t. 59. (*Quinquefolium vulgare*; Ger. Em. 987.)—Leaflets five, obovate, serrated. Stem creeping. *Stalks* single-flowered.—Native of open places, on a clay soil, as well as in waste ground by way-sides, in England and other parts of Europe, flowering from June to August. The long, trailing, creeping *stems*, the upright, deep-green rather hairy leaves, and large yellow *flowers*, whose *stalks* are taller than the foliage, readily distinguish this common species.

Section 3. *Leaves ternate*. Seven species, one of them British.

P. nivea. White-leaved Cinquefoil. Linn. Sp. Pl. 715. Willd. n. 37. Fl. Dan. t. 1035.—Leaflets three, cut, downy beneath. Stem ascending.—Native of the alps of Norway, Lapland, and Siberia; a stranger to our gardens. The structure of the herbage, as Linnæus observes, resembles *P. verna*, but the *leaflets* are only three, broader and much more hairy than in that species, very downy and white beneath. *Petals* yellow.

P. speciosa. Silvery Cretan Cinquefoil. Willd. n. 38. Sm. Prodr. Fl. Græc. Sibth. v. 1. 352. Fl. Græc. t. 484. unpublished.—(*Fragaria cretica saxatilis fruticosa*, folio subtus argenteo; Tourn. Cor. 21.)—Leaflets three, elliptical, obtuse, toothed, downy beneath. Stem shrubby.—Native of the hills of Crete, as well as of mount Parnassus. *Sibth.* The *stems* are a span high, rigid, and rather woody, with a deciduous bark. *Leaves* resembling the wild strawberry, but snow-white at the back. *Flowers* on very downy corymbose terminal *stalks*, accompanied by one or two simple *leaves*. *Calyx* woolly. *Petals* white.

P. tridentata. Trifid-leaved Cinquefoil. Soland. in Ait. Hort. Kew. ed. 1. v. 2. 216. t. 9. ed. 2. v. 3. 279. Willd. n. 39. Sm. Tr. of Linn. Soc. v. 10. 343. Engl. Bot. t. 2386.—Leaflets three, wedge-shaped; smooth above; hairy beneath; three-toothed at the summit.—Native of Newfoundland; and discovered by the late Mr. Geo. Don, on a mountain called Werron, in Angushire. It has, for nearly 30 years, been cultivated in our more curious gardens, and flowers early in summer. The *stems* are erect, three or four inches high, herbaceous, though the *root* is woody. *Leaves* several, stalked, dark green and smooth above; pale and rather hairy beneath. *Flowers* few, terminal, pure white with purple *anthers*.

P. grandiflora. Great-flowered Cinquefoil. Linn. Sp. Pl. 715. Willd. n. 40. Ait. n. 28. Curt. Mag. t. 75. (*Fragaria*; Hall. Hist. n. 1114. t. 21.)—Leaflets three, toothed, somewhat hairy on both sides. Stem reclining, longer than the leaves.—Native of Siberia, Switzerland, Italy, and the Pyrenean mountains, long cultivated in the gardens of Britain, where it decorates rock-work, flowering in June and July. The aspect of the *flowers* and *herbage* is not very unlike our common *P. reptans*, but the *stems* do not creep, and the *leaflets* are only three. In a wild state, the plant has a more elegant appearance and brighter colours.

POTENTILLA, in *Gardening*, contains plants of the herbaceous and shrubby kinds, of which the species cultivated are, the shrubby cinquefoil (*P. fruticosa*); the strawberry

berry cinquefoil (*P. fragarioides*); the upright cinquefoil (*P. recta*); the Montpellier cinquefoil (*P. montpelienfis*); and the great-flowered cinquefoil (*P. grandiflora*).

Besides these, other species may be cultivated for variety.

Method of Culture.—The first sort may be readily increased by suckers, layers, and cuttings, which may be laid down or planted out in the autumn or spring season, and be removed into the nursery in the spring following; and after having two or three years growth in that situation, they will be fit for planting out in the clumps or shrubby borders.

When removed from their natural situations into these places, the best season is in the autumn, before the frosts begin, that they may get well rooted. They should be watered occasionally in dry weather.

They succeed best in a cool moist soil and shady situation.

All the other kinds may be increased by parting the roots, and planting them out in the autumn, or by sowing the seeds either in the autumn or spring seasons.

They all afford ornament and variety in the different parts of pleasure-grounds.

POTENZA, PASQUALE, in *Biography*, an opera singer, with a feeble and uncertain soprano voice, and an affected actor, not without vocal taste, supplied the place of Ricciarelli as first man in our serious opera, when the Mattei was first woman, from 1757 to 1759.

POTENZA, in *Geography*, a town of Naples, in Basilicata, the see of a bishop, suffragan of Matera; built on the ruins of an ancient town, which was destroyed in the year 1250; 54 miles S.E. of Benevento. N. lat. 40° 40'. E. long. 14° 4'.—Also, a river which rises in the marquisate of Ancona, and runs into the Adriatic, N. lat. 43° 22'. E. long. 13° 45'.

POTERII ANTIHECTICUM. See ANTIHECTICUM.

POTERIUM, in *Botany*, an ancient name, adopted by the Latins from the Greeks, whose *ποτήριον*, at least that of Dioscorides, evidently appears to have been a species of *Astragalus*, confounded by Linnæus with *A. Tragacantha*, but distinguished by Lamarck under the denomination of *creticus*; see Sm. Prodr. Fl. Græc. Sibth. v. 2. 91. Perhaps Linnæus, in the choice of the name in question for the genus of which we are about to treat, had in view *ποτήριον*, a cup; the herb being, in some countries, infused, along with borage, in cooling potations.—Linn. Gen. 495. Schreb. 645. Willd. Sp. Pl. v. 4. 421. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 1024. Ait. Hort. Kew. v. 5. 286. Juss. 336. Lamarck Illustr. t. 777. (Pimpinella; Tourn. t. 68. Gært. t. 32.)—Class and order, *Monocœcia Polyandria*. Nat. Ord. *Miscellanea*, Linn. *Rosacea*, Juss. Gen. Ch. Male, *Cal.* Perianth of three or four ovate, coloured, deciduous leaves. *Cor.* of one petal; tube cylindrical, about the length of the calyx; limb in four deep, ovate, concave, spreading, permanent segments. *Stam.* Filaments numerous, from thirty to fifty, capillary, very long, flaccid; anthers roundish, of two lobes.

Female, in the upper part of the same spike. *Cal.* Perianth inferior, resembling the male. *Cor.* of one petal, wheel-shaped; tube short, roundish, contracted at the mouth; limb in four deep, ovate, flat, reflexed, permanent segments. *Pist.* Germens one or two, ovate-oblong, within the tube of the corolla; styles one or two, capillary, coloured, flaccid, the length of the corolla; stigmas tufted, coloured. *Peric.* Drupa formed of the thickened, hardened, closed tube of the corolla. *Seed.* Nut of two cells.

Eff. Ch. Male, Calyx of three or four leaves. Corolla deeply four-cleft. Stamens thirty to fifty.

Female, Calyx of three or four leaves. Corolla deeply

four-cleft. Pistils one or two. Nut of two cells, invested with the hardened tube of the corolla.

Linnæus describes three species of *Poterium*, to which Willdenow adds three more. The most remarkable are

P. Sanguisorba. Common Burnet. Linn. Sp. Pl. 1414. Willd. n. 1. Ait. n. 1. Engl. Bot. t. 860. Curt. Lond. fasc. 2. t. 64. Mart. Rust. t. 69. (*Pimpinella hortensis*; Ger. Em. 1045.)—Spines none. Stem herbaceous, somewhat angular.—Native of exposed limestone or chalky situations, in the more temperate parts of Europe; plentiful on the chalk hills of England, flowering in July. The root is woody and perennial. Stems branched, leafy, more or less angular, many-flowered, smooth, often reddish. Leaves pinnate; of several pairs of roundish or elliptical, serrated, smooth, rather glaucous leaflets, with a terminal one about the same size. Heads of flowers stalked, terminal, solitary. Calyx and corolla greenish. Stamens like a tassel of purple silk. Fruit rugose. Some of the male flowers have occasionally an abortive pistil. The leaves possess a flavour like cucumber, which they communicate to any liquor in which they are infused. They are also an ingredient in fallads.

Willdenow's *P. polygamum*, adopted from Waldstein and Kitaibel's *Plantæ Hungaricæ*, v. 2. 217. t. 198, seems a very trifling variety, some of the intermediate flowers of whose spikes, or heads, have both stamens and pistils.

P. spinosum. Prickly Shrubby Burnet. Linn. Sp. Pl. 1412. Willd. n. 6. Ait. n. 5. (*P. Dalechampii*; Clus. Hist. v. 1. 108.)—Stem shrubby, with branched spines. Branches villous, somewhat angular. Spikes oblong, lax.—Native of the Levant. A bushy prickly shrub, with abundance of small, round, pinnate leaves, and oblong purplish spikes.

POTERIUM, in *Gardening*, contains plants of the herbaceous and shrubby perennial kinds, of which the species cultivated are, the lesser upland, or common garden burnet (*P. sanguisorba*); the sweet burnet (*P. hybridum*); and the prickly shrubby burnet (*P. spinosum*).

Method of Culture. The first sort may be readily increased by seeds and parting the roots.

The seeds should be sown in the autumn, on a bed or border of light mould, when they are perfectly ripened. When the plants have attained two or three inches in height, they should be planted out on a bed, at the distance of a foot, when for salads, or in the borders where they are to remain.

The roots may likewise be parted in autumn, and planted where they are to remain, in the same manner as above.

The second sort may be increased in the same way. And the last sort may be raised from slips or cuttings, which should be planted in a bed of light earth during the summer season, and covered with glasses or in pots, and placed under a frame and glasses, giving shade and water occasionally.

They may also be had more forward by plunging the pots in a moderate hot-bed under glasses. They should be removed into separate pots when they have stricken good root, and are well established. They should afterwards be protected from frosts in the winter, by being placed in a mild hot-bed, and have but little water in the winter season.

The first sorts are ornamental in the borders, clumps, and other parts; and the last, among other potted green-house plants.

POTERIUM is also used by many for the prickly pimpinella. See Burnet, SAXIFRAGE.

POTES, in *Geography*, a town of Spain, in Asturia; 25 miles S.W. of Santillana.

POT-HERBS, in *Gardening*, such as are used for different culinary purposes, consisting of different sorts of the small

small aromatic kind, and some others. But in a more general signification, they comprehend many of the other kitchen garden vegetables, but are principally understood to be such as are in request to improve soups, broths, and some other similar culinary preparations, in which, sometimes, several different kinds of small herbs are used in different proportion, both in composition and singly.

They are chiefly the following sorts: thyme, marjoram, favory, sage, parsley, mint, penny-royal, sorrel, chervil, basil, coriander, dill, fennel, marigold, borage, burnet, tansy, tarragon, chives, leeks, onions, green beet, white beet, spinach, celery, endive, lettuce, love-apple, capsicum, and purslane.

Those made use of separately, as fallad-herbs, are green and white beet, to-boil as separate dishes; celery, endive, and lettuce, as choice fallad-herbs, and sometimes to stew. But of the above, the thyme, marjoram, favory, parsley, sage, mint, marigold, penny-royal, leeks, celery, and onions, are in the greatest request.

Proper supplies of the different sorts may be raised in the manner directed under their particular heads. See AROMATIC and KITCHEN GARDEN Plants.

POTHERIE, LA, in *Geography*. See CHALAIN.

POTHERY, in *Rural Economy*, a provincial word signifying close, muggy, or sultry, in speaking of the weather.

POTHIER, ROBERT-JOSEPH, in *Biography*, a considerable French writer on legal subjects, was born at Orleans in the year 1699; of the university of which city he became professor of the law. He, at first, directed his studies to Roman jurisprudence, and for the elucidation of which he held weekly meetings of the learned on the subject at his own house. He next applied himself to the French law, and was, without any solicitation on his part, appointed professor by the chancellor d'Aguesseau; and in order to excite the emulation of students, he established prizes for proofs of great proficiency. He died in 1772, with a character not less respectable for morals than for learning and industry. His works on French and Roman law were numerous. Among the principal are "Pandectæ Justinianæ," 3 vols. folio, 1748; "Traité des Fief," 2 vols. 1776; Posthumous Works, in 3 vols. 4to.

POTHOLT, JACOB, organist and carillonneur in 1772, in the old kirk at Amsterdam. He was blind, having been deprived of his sight at seven years old by the small-pox; and this misfortune suggested to his friends the idea of making music, which had hitherto given him pleasure, his profession; but it afterwards became his darling amusement.

The organ at the old kirk is what organ builders call a 16 feet instrument, from the length of the lowest pipe in the open diapason, or Bordoun stop. This instrument is very full of work, and has 64 stops, three sets of keys, both in the manuals and pedals, with nine pair of bellows.

Potholt was organist of the Wester Kirk 22 years before he obtained this place; his hand, taste, and abilities in every particular, were truly astonishing; the touch of this instrument was the heaviest that we ever felt; each key requiring almost a two-pound weight to put it down; and to play it full, there was a spring of communication, by which the keys of the great and choir organ were moved at the same time, which likewise added very much to the stiffness of the touch; however, such was the force of M. Potholt's hand, that he played this organ with as much lightness and rapidity, as if it were a common harpsichord.

This admirable organist was never out of Amsterdam, except for a few days at the Hague, many years ago; and yet his taste was of the best modern kind; his appoggiaturas were well taken, and admirably expressed; his fancy was extremely

lively; and though he played very full, seldom in less than five parts, with the manuals and pedals together, yet it was neither in the dry nor crude way, which we had so frequently heard in Germany. He discovered, though not injudiciously, by many of his passages, that he was a harpsichord player; but so well was he acquainted with the different genius of the organ, that his most rapid flights, of which he had many, occasioned none of those unpleasing vacuities of sound, which so commonly happened, when this instrument was touched by mere harpsichord players.

M. Potholt played two fugues in a very masterly manner, the subjects of which he reversed, and turned to a thousand ingenious purposes.

He published, in 1777, a work for young organists, with the following Dutch title: "Musyk (de) van de CL Psalmen mit Interluden in Bassen doer," Jacob Potholt, Amsterdam, 4to.; the CL psalms harmonized, with interludes.

POTHOS, in *Botany*, *πῶθος*, an old Greek name for some plant unknown to us, and which signifies *desire* or *love*. Some have applied it to the Columbine, *Aquilegia*. Perhaps Linnæus adopted it in the bad sense of certain ancient writers, as meaning *noxious*, or *offensive*, because of the intolerable fœtor of some species, and the acrimony of others.—Linn. Gen. 472. Schreb. 85. Willd. Sp. Pl. v. 1. 684. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 268. Juss. 24. Lamarck Illustr. t. 738.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Piperitæ*, Linn. *Aroideæ*, Juss.

Gen. Ch. *Cal.* Sheath globose, of one leaf, bursting at one side, enclosing a simple, oblong, thick *receptacle*, entirely covered with sessile flowers. *Perianth* none, unless the corolla be taken for such. *Cor.* Petals four, wedge-shaped, oblong, erect. *Stam.* Filaments four, flattish, erect, narrower than the petals, but of the same length; anthers minute, in pairs. *Pist.* Germen superior, oblong, angular, abrupt; style none; stigma simple. *Per.* Berry roundish, of two cells. *Seeds* roundish, solitary in each cell.

Ess. Ch. Sheath of one leaf. *Receptacle* oblong, covered with flowers. *Perianth* none. Petals four. Berry with two seeds.

The plants of this genus are mostly of tropical origin, with the habit of *Arum*, perennial, smooth, often coriaceous in texture. Linnæus enumerates but six of them in his Sp. Pl. but Willdenow has twelve. The Hortus Kewensis contains ten. The following will serve as examples.

P. cannaefolia. Sweet-scented Pothos. Sims in Curt. Mag. t. 603. Ait. n. 4.—Leaves elliptical, with simple parallel veins.—Native of the West Indies; sent to Kew in 1789, by Mr. Alex. Anderson, under the name of *P. odorata*, alluding to the sweet scent of its flowers, unusual in this tribe. It blooms in the stove in April and May. The leaves are radical, pointed, much resembling those of *Canna indica*. Flowers whitish, as well as the inner surface of their sheath. The latter, like the *receptacle*, is three or four inches long.

P. macrophylla. Large-leaved Pothos. Swartz Ind. Occ. 269. Willd. n. 8. Ait. n. 7. (*P. grandifolia*; Jacq. Ic. Rar. t. 610.)—Leaves heart-shaped, with divaricated lobes. *Receptacle* much longer than the sheath.—Native of the West Indies. Flowering in our stoves in June. This, like the foregoing, is destitute of a stem. The leaves are about two feet long, ribbed and veiny. *Receptacle* above a foot long, covered with brown flowers, and subtended by a green recurved sheath.

P. digitata. Fingered Pothos. Jacq. Coll. v. 4. 119. Ic. Rar. t. 611. Willd. n. 11.—Leaves digitate; of about nine oblong sharpish leaflets.—Native of the warmest parts of South America. This has a thick climbing stem, throw-

ing out long thick radicles. *Leaflets* a span long, obovate, pointed, on short partial footstalks. *Flowers* axillary, solitary, whitish, with a small red *sheath*.

P. fatida. Stinking Pothos, or Scunkweed. Ait. n. 9. Sims in Curt. Mag. t. 836. (*Dracontium fœtidum*; Linn. Sp. Pl. 1372. Willd. Sp. Pl. v. 2. 288.)—Leaves heart-shaped, acute. Sheath nearly globose, inflated, with an incurved point.—Native of North America, a hardy perennial with us, flowering in March and April, before the leaves appear. The *flowers* exhale a very fœtid odour, and are sessile, close to the ground, consisting each of a globular *receptacle*, covered with white *petals* and yellow anthers, and enveloped in a large, ovate, concave *sheath*, variegated with dull purple and a dirty yellow. The *leaves* are of a fine green.

POTI, in *Geography*. See PUTI.

POTICARA, in *Ancient Geography*, a town of Asia, in the interior of the Perside, between Cotamba and Ardea, according to Ptolemy.

POTIDŒA, a town of Macedonia, and one of the five places which Scylax, in his Periplus, has assigned to the peninsula of Palléné. According to Thucydides, it was situated on the isthmus which joined the peninsula to Macedonia. Livy says that this town had been built, or as he should have said, repaired, by king Cassander, from which circumstance it took the name of Cassandria.

POTIERS, in *Geography*, a town of France, in the department of the Coté d'Or; three miles from Molefmes.

POTIGNY, a town of France, in the department of the Calvados; 5 miles N. of Falaise.

POTIJI, a river of Brazil, which runs into the sea, S. lat. 5° 43'.

POTINCOBA, in *Botany*, a name by which some authors call water-pepper, or the sharp arsmart.

POTION, PORIO, a liquid medicine, in the quantity of a draught, or so much as is to be taken at one time.

A potion only differs from a julep, or a mixture, in the quantity, as being confined to one dose.

There are purging potions, emetic potions, diaphoretic, pectoral, cephalic, cardiac, stomachic, hysterical, vulnerary, carminative, &c. potions.

POTIRONE, in *Botany*, a name given by the people of Burgundy to a stinking kind of fungus, found about the roots of trees. They have also extended the name much farther, and use it for a sort of touchwood, or rotten wood of the oak, and other trees common in the forests of those countries, which shines in the night, and has the same smell with that fungus.

POTITII, in *Antiquity*. See PINARII.

POT-METAL is formed of lead mixed with copper, in the proportion of one part of lead to four of copper. This metal is harder than copper, or even brass.

POTNIÆ, in *Ancient Geography*, a town of Bœotia, N.E. of Platæa, and S.W. of Thebes. It was ruined in the time of Pausanias. Here still remains a grove, consecrated to Ceres and Proserpine; and in this grove are some statues denominated "Potniades." Although the town is destroyed, the site of it is still held in veneration, and at a certain time of the year, sacrifices are offered to Ceres and Proserpine. Near this sacred grove is a temple of Bacchus, surnamed "Egobolus."

POTOKA, in *Geography*, a river of America, which runs into the Wabash, N. lat. 38° 18'. W. long. 88° 28'.

POTOSI, a celebrated city of the viceroyalty of La Plata, or Buenos Ayres, and next in importance, if not superior, to Buenos Ayres, the capital. It is situated in a district, inclosed by the province of Porco,

which is mountainous and cold, and consequently very barren; the valleys are entirely destitute of wood, and nothing grows on the shelves and declivities of the mountains but moss. The summits of the mountains are covered with perpetual snow, nevertheless it affords a scanty supply of sheep, and some vicunas; and in this desolate country nature has placed some of the richest mines of silver in the world. The district of Potosi is bathed by the river Pilcomayo, which joins the Parana not far above Corrientes, so that there is a natural connection between this province and Buenos Ayres. The mine of Potosi was discovered in 1545, and the city, which stands on the S. side of a mountain of the same name, in a glen formed by a rivulet, was founded in the year 1547. The mint was established in 1562, and has continued richly to supply all Europe with silver. By a census of its inhabitants, made in 1611, its population is said to have amounted at that time to 160,000 souls. If this account, extracted from the "Mercurio Peruviano," be correct, Potosi must have greatly declined from its ancient state, though Helms, a late writer, ascribes to it a population of 100,000. Dr. Robertson, from the best Spanish authorities, assigned to it 25,000, and the same number is given by Alcedo. According to the report of the "Mercurio Per." its whole population in 1792 consisted of only 18,181 souls; of whom 256 were ecclesiastics and persons under vows; 3482 Spaniards; 4872 Mestizoes; 8559 Indians; 1012 Negroes and Mulattoes. The wealth of Potosi produced the establishment of numerous convents, a vow of poverty not at all interfering with great riches. Within the city and district there were 14 curates; but in the year 1759, seven curacies were abolished. In the neighbourhood of the city there are warm medicinal baths, called those of Don Diego, and highly esteemed. As soon as the mines of Potosi were discovered, and the town was established, it became a place of great resort; and in process of time it reckoned among its inhabitants many noble families, particularly those concerned in the mines; and it is estimated to be about two leagues in circumference. By the Spanish writers it is styled an imperial city; it is the residence of a corregidor, and of a tribunal of finance, composed of a comptroller and treasurer. Its commerce was formerly compared with that of Lima, and in time became superior to it, consisting in the exchange of ingots of silver for the articles imported; but it is now said to be upon the decline. A cold and violent wind, called "tomahavi," prevails during the months of May, June, July and August. Although the air of the mountain, on the declivity of which it is situated, being cold and dry, renders the adjacent country remarkably barren, so that it produces neither grain, fruits, herbs, nor other esculents, the town is so plentifully provided, as to enjoy abundance of every kind; and the trade for provisions is greater here than in any other place, Lima alone excepted. This may be naturally ascribed to the attraction of a mountain of silver, and to the number of people employed in the mines. Some provinces send the best of their grain and fruits; others their cattle; others their manufactures; and those who trade in European goods resort to Potosi, as to a market where is a great demand, and no want of silver to give in exchange.

The celebrated *mines* of Potosi were discovered, as we have said, in 1545, by an accident seemingly fortuitous. An Indian, called by some Gualca and by others Hualpa, pursuing some wild goats to the mountain of Potosi, and arriving at a very steep part, laid hold of a small shrub in order to ascend with the greater security and speed, but the shrub, unable to support his weight, was torn up by the roots, and discovered a mass of fine silver; and at the same time he

found

POTOSI.

found some lumps of the same metal among the clods which adhered to the roots. This Indian, who lived at Porco, not far distant, hastened home with the fruits of his discovery, washed the silver and used it, repairing, when his stock was nearly exhausted, to his perpetual fund. At length an intimate friend, named Guanca, observing the happy change that had taken place in his circumstances, became solicitous to investigate the cause, which Guanca disclosed to his friend. For some time they retired in concert to the mountain for fresh supplies of silver, till Guanca refusing to discover his method of purifying the metal, Guanca revealed the whole secret to his master, Villaroel, a Spaniard who resided at Porco. Immediately on this information he went, on the 21st of April 1545, to view this fortunate breach in the mountain, and the mine was worked without delay and with immense advantage. This mountain, which had been assiduously worked from its first discovery, and which is said to produce weekly about 5000 marks of silver, that is from 30 to 40,000 dollars, is of a conic form, about 20 British miles in circumference, and perforated by more than 300 rude shafts, through a fine yellow argillaceous schistus. Here are veins of ferruginous quartz, interspersed with what are called the horn and vitreous ores, of a peculiar dark-reddish colour. This mountain rises void of all vegetation, blasted by the numerous furnaces, which in the night form a grand spectacle. These mines are distant 1873 English miles from Buenos Ayres: and the greatest part of the journey to them lies through a barren uncultivated country, and the last 400 miles of it are across mountains very difficult to pass, the bed of a torrent being in many places the only road. To an enemy, therefore, it must be a very hazardous enterprise to penetrate from Buenos Ayres to Potosi, and quite impossible, if any resistance be opposed to it. The true road to Potosi is not through Buenos Ayres, but by Peru; not through the country to which it has been artificially annexed, but through that on which it depends for its subsistence. The benefit of the mines is open to all who chuse to avail themselves of it; but labourers are not easily procured. On account of the small population, scarcely one quarter can be found of the necessary number, Indians being always employed; and in this view no mine is so useful as that of Potosi; for every 18 months there are sent from the provinces of the viceroyalty 6000 Indians, enrolled and divided into parties, in order to work in the mines. This expedition of Indians is called "Mita;" and they are distributed by the governor of Potosi according to the funds of the several mines, each being paid four reals a day, and treated according to the ordinance, till they complete their periods of labour. Without this measure the benefits of the mine would cease, as no labourers could be found; the great, and sometimes useless expences incurred, and the loss which the royal treasury would sustain, if these mines were abandoned, having rendered the "mita" indispensable, and it is said to be conducted with all possible humanity. See PERU and LA PLATA.

The annual produce of these mines, at present, does not equal 550,000 or 600,000 marks of silver; but Mr. Helms is of opinion, that if they were wrought with barely moderate skill and diligence, they would yield, every year, 20, and even 30, millions of dollars. The ignorance of the Spaniards at Potosi, in the art of mining, he describes as excessive; and he represents their mode of conducting the operations of stamping, sifting, washing, quickening, and roasting the ore, as the most slovenly, wasteful, and unscientific. Their process of amalgamation is so defective, that they are scarcely able to extract two-thirds of the silver contained in the ore; and for every mark of pure silver which they obtain, they lose one, and frequently two marks of quicksilver. According to Helms there were coined, from Ja-

nuary 1, to December 31, 1790, in the royal mint at Potosi, 299,846 dollars in gold, and 3,983,176 dollars in silver. We shall here subjoin a more minute statement of the produce of these mines.

The produce of the royal duties from the mines of Potosi, between 1556 and 1780, 224 years	Dollars.	Reals
	150,570,743	2
The produce of the same from 1545 to 1556, estimated at	5,500,000	0

Corresponding produce of silver from the mines	156,070,743	2
	2,400,000,000	0

But, as great part of the silver of Potosi is known not to have paid the duties, but to have been smuggled out of the kingdom, the real produce of its mines must have been greater than what appears by the preceding estimate. It is supposed, that for more than half of the eighteenth century, the contraband trade of Potosi with the Brasils was such, that only a third of the silver from its mines paid the royal duties.

The coinage of gold in the mint of Potosi, from 1780 to 1790, a period of 11 years, was equal to	Dollars.	Reals.

It may not be unacceptable to introduce in this place, for the information of our readers, some account of the three descriptions of persons, who find employment in the business of mining, in South America, with which we are furnished by the "Mercurio Peruviano." The first person is the speculator in the mines, who is often a practical miner; this person in Mexico is usually a man of considerable property, who can afford to make large advances from his own funds for carrying on his works, and to whom the whole profit of his speculation, when it succeeds, reverts. But, in Peru, he is in general a person in necessitous circumstances, who begins by borrowing money at an exorbitant interest, and ends by selling the produce of his mines at a disadvantageous rate, in order to procure the means of carrying them on. The second person is the "habilitador," who is a merchant and money-lender: he supplies the miner with the capital necessary for commencing and carrying on his speculations; and this he advances on the hardest and most oppressive terms. He obliges the miner to take one-half of the advance in money and the other half in goods, which he may not want, and which are always overcharged. He binds him also to repay the advance in "pina" or "pigna," at the end of a short period, generally of four months. "Pina" is silver bullion, freed from the quicksilver with which it has been amalgamated, but not melted. In this transaction he receives a dollar for the loan of six dollars and a half for

POTOSI.

four months, and he has other means of exaction, which he uses without much consideration. By this complicated system of usury and oppression, a miner, who has borrowed 325 dollars from an "habilitador," one half in money, and the other half in goods charged above their value, may find himself compelled, at the end of six months, to pay fifty-seven and a half marks of pina, worth 411 dollars, in order to obtain an acquittance of his debt. The "rescatador," or "rescatiri," is a third person, who buys "pina" from the miner, and gives him money in exchange for it. A stronger proof cannot be given of the want of spirit and activity in Peru, than that evils affecting so materially the vital interests and prosperity of the kingdom, should have been suffered to continue for so many ages without any effort to remove them. It is only since the establishment of the Royal Tribunal of Mines in 1786, that banks "de rescate," or redemption, as they are called, have been erected for that purpose in the principal mines. These banks purchase "pina" from the miners on account of the Royal Tribunal of Mines; and as they give always a fair price for it, they keep down the profits of the "rescatadores," and secure the miners from their extortions. The banks "de rescate" are also of essential service to the miners, by supplying them with quicksilver in small quantities as they have occasion for it. In the metallurgy quicksilver is indispensable, an arroba and a little falt being used for every fifty quintals of the mineral. The houses where the rock or stone is powdered are called "ingenios," a name also given by the Spaniards to fugar-mills. Those of Potosi are magnificent and extensive, and are moved by water, though it be scarce, and occasion many disputes.

To estimate the riches of the mine or pit, if a certain proportion of the mineral yield ten marks, it is esteemed rich; if eight or six, middling; or if less, poor; but at Potosi even two marks are advantageous to the adventurer. As quicksilver is absolutely necessary to the miner, he had formerly no other resource, when it was wanted, but to apply for it to the "caxas reales," which are at a great distance from many of the mines; or to purchase it from the "rescatadores," who charged most exorbitantly for it. The profits of the "rescatadores" have been so much reduced by the operation of the banks "de rescate," that a great part of the capital employed in that trade has been withdrawn from it, and laid out in advances to the miners. This increase of capital, on the part of the miners, has diminished the profits of the "habilitadores," and relieved them from the oppressions of these avaricious money-lenders. Hence the operations of mining are prosecuted with greater activity and success, and the number of bankruptcies among the miners is diminishing, so that in the end the merchants themselves will be gainers. Instead of exorbitant profits and great risks, they will have moderate gains without danger.

The banks "de rescate" in the provinces, borrow what

money they have occasion for from the collectors of the taxes, and the Royal Tribunal of Mines repays these loans to the treasury at Lima. This arrangement saves the trouble and expence of remitting the produce of the taxes in money from the provinces to the capital, which, for want of bills of exchange, was the former practice; and it prevents the provinces from being annually drained of their circulating specie by such remittances; an inconvenience to which they appear to have been subjected till the erection of the banks. Such a clumsy and inartificial system in the operations of the treasury, is a striking illustration of the little progress which commerce has made in Peru.

The banks "de rescate" in Peru, are private establishments, without any monopoly or exclusive privilege; so that the private "rescatador" is still at liberty to follow his occupation. But the great bank "de rescate" at Potosi, called the bank of San Carlos de Potosi, belongs to the crown, and enjoys exclusive privileges of purchasing "pina" from the adventurers in that celebrated mine. The bank of San Carlos was founded in 1747, by a voluntary association of the miners of Potosi, in order to liberate themselves from the intolerable oppression of the "rescatadores." In 1779, they were prevailed upon by D. Jorge Escovedo, governor of Potosi, to transfer their shares and property in the bank to the crown; notwithstanding which, the bank, in 1793, was still in a prosperous state. Besides purchasing "pina," the bank of San Carlos makes advances of money and other articles to the miners, and thus exercises at once the trades of "habilitador" and of "rescatador." These two professions are also not unfrequently conjoined by private adventurers in Peru.

We subjoin a list of the mines of Peru wrought in 1791, with an account of the quantity of gold and silver obtained from them since 1780.

The

The "moneda macaquina" is a provincial money which the government was at that time calling in. The surplus of silver, not carried to the mint, was probably used in plate; and the excess of the coinage of gold above the produce of the mines, was probably occasioned by the introduction of gold in bars from Potosi.

Potosi is distant 50 miles W.S.W. from La Plata. S. lat. $19^{\circ} 50'$. W. long. $67^{\circ} 36'$. Helms's Travels from Buenos Ayres by Potosi to Lima, 1806. Mercurio Peruana, &c. Lima, 1791, 1794. Pinkerton's Geography, vol. iii.

Percunos and Picosos were idols of the same kind.

POTSCHAKIN, or POCATSKY, in *Geography*, a town of Bohemia, in the circle of Bechin; 56 miles S.S.E. of Prague. N. lat. $49^{\circ} 18'$. E. long. $15^{\circ} 8'$.

POTSCHERNITZ, a town of Bohemia, in the circle of Kaurzim; 8 miles E. of Prague.

POTSIA TAM BAY, a bay on the S. coast of the island of Java. S. lat. $8^{\circ} 10'$. E. long. $111^{\circ} 21'$.

POTSTONE, *Lapis Ollaris*, *Topfstein* of Werner, in *Mineralogy*, a species of stone of the muriatic genus in the arrangement of Kirwan; the colour is greenish-grey or greenish and reddish-grey, or yellowish-grey, or sprinkled with red, or leek-green. It occurs in masses; its internal lustre is glistening and pearly; its fracture undulatingly foliated, or the folia thin, and discovering rugosities; often also slaty; fragments, long splintery, or plated; often translucent on the edges; soft and greasy to the touch; frangible with difficulty; it is found in beds with serpentine at Como in the country of the Grisons, and in Saxony. The specific gravity of that of Como, which is the most famous of this species, is 2.8729, and by the analysis of Weigleb, this contains about 0.38 of siliceous, 0.38 of magnesia, 0.07 of argill, 0.5 of iron, 0.01 of aerated calx, and still less of the sparry acid; but this analysis, as the quantity of air and water is not given, cannot be depended on. The fluor acid and calx are in too small proportion to affect the essence of the stones. This is often confounded with indurated steatites, but differs from it principally in this, that the magnesia and siliceous are in a larger proportion to each other, and the iron to both. It is distinguished from shistose talc with greater difficulty than from steatites, whose characters are very different, especially when the potstone is slaty; nevertheless their lustre, specific gravity, and feel are different. The slaty abounds in common talc. According to Sauffure, the specific gravity of that of Switzerland is 3.023. Some of these minerals absorb water; the specific gravity of the potstone of Dauphiné, which is of slaty structure before the admission of water, is 2.7687, after water has been admitted, 2.8214; that of the Swedish, before the admission of water, 2.8531, after admission, 2.8629. This substance may be turned in a lathe, and made into a variety of vessels. It is also used as a lining for furnaces, being remarkably refractory.

POTT, PERCIVAL, in *Biography*, an eminent surgeon, was born in Threadneedle-street, London, in December, 1713. His father dying in his infancy, and his mother being

left in indifferent circumstances, he was indebted to the patronage of Dr. Wilcox, bishop of Rochester, a distant relation, for the means of a good literary education, which he obtained at a private school at Darne, in Kent. Although this patronage induced his friends to recommend the church as his profession, yet he was so strongly predisposed to that of surgery, that no advice or persuasion could alter his determination. He was accordingly, in 1729, bound an apprentice to Mr. Nourse, one of the surgeons of St. Bartholomew's hospital. In this situation, he had peculiar opportunities of improvement, especially in regard to anatomy, which was at that time little cultivated in London; for Mr. Nourse was one of the few who then gave lectures upon that subject, and Mr. Pott was employed in preparing the subjects for demonstration, which laid the foundation of his accurate acquaintance with that art, which is the basis of chirurgical knowledge. While he was availing himself of the unlimited opportunities of studying the nature and progress of diseases in the hospital, and attending to practical operations, he was at the same time perusing the early writers on the art of surgery with great diligence and discrimination; often remarking that, though no great instruction was to be derived from them in respect to the practical part, yet the labour of perusal was amply repaid by the accurate description of diseases, which they drew from nature.

In 1726, at the termination of his apprenticeship, he settled in Fenchurch-street, with his mother, and rapidly multiplied his connections and friends; in 1744 he was elected assistant surgeon, and in 1749 one of the principal surgeons of St. Bartholomew's hospital. He had now before him sufficient scope for the exercise of those abilities, by which mankind have been since so much benefited. The state of surgery was still very imperfect: the severe treatment of the old school, in the operative part and local applications, continued in force; the first principles of the art, founded on the natural process and powers of healing, were not understood, and altogether overlooked; painful and escharotic dressings were continually employed; and the actual cautery was in such frequent use, that at the times when the surgeons visited the hospital, it was regularly heated and prepared as a part of the necessary apparatus. Mr. Pott's tutor rigidly adhered to the established practice, and treated with supercilious contempt the endeavours of his pupil to recommend a milder and more natural system. But the dictates of truth soon found a welcome reception with the profession, and with the world in general; and Mr. Pott lived to see these remains of barbarism exploded, and a more humane and rational plan, of which he was the chief author, universally adopted.

After the death of his mother, in 1746, he married, and removed to Bow-lane, where he carried on his professional career with increasing success. His time, indeed, was almost exclusively occupied in his professional duties, until a severe accident, occasioned by a fall from his horse, in 1756, interrupted his practical labours, and occasioned a long confinement. This was a compound fracture of the leg, which was expected to require amputation; but on the suggestion of Mr. Nourse, a successful attempt to save the limb was made. The appearance of Mr. Pott as an author was the immediate consequence of this confinement; for during this period he conceived, and partly executed his "Treatise on Ruptures," which was completed by the latter end of the year. In the following year, he published an account of the hernia congenita, a complaint not then well understood, which brought forth a paper in the Medical Commentaries from Dr. William Hunter, who claimed the priority of discovery. Mr. Pott
inserted

inserted a reply, written with elegance and urbanity, in the second edition of his Treatise on Ruptures. In 1758 he produced a sensible and well-written essay, "on Fistula Lachrymalis," which was the principal cause of the discontinuance of the operation by the actual cautery, recommended by Cheselden. In 1760, his elaborate dissertation "on Injuries in the Head" appeared, in which, with a perspicuity till then unknown, he arranged the symptoms of each particular species of injury, and pointed out the appropriate means of relief. In 1762 he published "Practical Remarks on the Hydrocele," and on some other diseases of the testis, as a supplement to his general Treatise on Ruptures.

In 1764 Mr. Pott was elected a fellow of the Royal Society, and at the same time he presented it with a singular case of hernia of the urinary bladder, which included a stone. (See *Philos. Trans.* vol. lv.) His zeal and activity for the advancement of his profession increased, rather than abated, with his increasing avocations; and, with the view of directing students to the proper objects of their inquiry, he instituted about this time a course of lectures on surgery, in which he took great pains to impress upon the minds of his pupils, that the prevention of the necessity of operations should be the first consideration of the surgeon. He was still also actively engaged with his pen, and in 1765 he published his treatise "on Fistula in Ano," a disease which had been much misunderstood, and the operations for which had been horridly severe, and destructive of the parts they were intended to relieve. The simplicity of the operation which he recommended, can only be valued by those who are acquainted with the severities till then practised in this country, and even now continued in some others. In a new edition of his book, "on Injuries to which the Head is liable from external violence," printed in 1768, he first published what he modestly called "a few general Remarks," but which is in reality a complete system, "on Fractures and Dislocations." His doctrine at first met with some opposition, but is now become almost the universal practice.

In 1769, finding a more central situation necessary, from the increasing extent of the town to the west, he purchased a house in Lincoln's-inn-Fields, in which he resided seven years. He still employed his leisure in committing to paper his observations and reflections, and in 1775 published "Chirurgical Observations relative to the Cataract, the Polypus of the Nose, the Cancer of the Scrotum, the different kinds of Ruptures, and the Mortification of the Toes and Feet," which were valuable additions to his former publications, and were marked with that spirit of observation, perspicuity of reasoning, and candour in discussing controverted points, which distinguish his other productions. In 1777 he removed to Hanover-square, and now, in consequence of the retirement of sir Cæsar Hawkins, he was led into more active professional occupations than ever. But, though he was engaged also in an extensive correspondence with different parts of the world, he still found time to add to his former publications, a "Treatise on the Necessity of Amputation in certain Cases," which he seems to have been induced to write in answer to a work of M. Bilguer, surgeon to the Prussian army, who had denied the necessity of amputating in almost any case, and to another by Tissot, "sur l'Inutilité de l'Amputation des Membres." In 1779, Mr. Pott published his "Remarks on the Palsy of the Lower Limbs," which is connected with a particular curvature of the spine; a subject which he treated with more confidence, in a subsequent publication in 1783, after a more ample experience. This was the last of his literary productions; though some other topics had occupied his attention, which,

had his life been prolonged, he would probably have committed to the press.

But, while he was in the possession of the highest professional reputation, sought after and employed by persons in the first degree of rank and power, and universally consulted by his brethren in cases of uncommon difficulty and danger, he fell a sacrifice to his own active disposition, and to a neglect of the first attack of disease. In December, 1788, he was seized with a fever, after exposure to severe cold during a visit to a patient in the country, which in a few days terminated his life, at the age of seventy-five. He was buried near his mother, in Aldermary church, Bow-lane, where a tablet was affixed, inscribed by his son, the Rev J. H. Pott, archdeacon of St. Alban's. See Earle's edition of Pott's Works, 1790; and Hutchinson's *Biog. Medica*.

POTTAGIEN, in *Geography*, a town of Samogitia; 15 miles S.S.W. of Miedniki.

POTTENDORF, a town of Austria; two miles E. of Ebenfurth.

POTTENHEIM, a town of Austria; three miles S.W. of Baden.

POTTER, CHRISTOPHER, in *Biography*, a learned divine, was born in Westmoreland in 1591. He studied at Queen's college, Oxford, of which he was afterwards a fellow. In 1635 he obtained the deanery of Worcester, and in 1646 the king nominated him to the deanery of Durham. He died the same year. He published a sermon preached at the consecration of his uncle Dr. Barnaby Potter, bishop of Carlisle. He also published some pieces on predestination, against the Calvinists.

POTTER, FRANCIS, an ingenious divine, a native of Wiltshire, was educated at Oxford; after which he took orders, and in 1637 he succeeded his father in the living of Kilmington. He had an excellent taste for painting and mechanics, and having presented an hydraulic machine to the Royal Society, he was chosen a member of that learned body. He was author of a curious book on the mystic number 666, in the Revelations, and died in 1678.

POTTER, JOHN, archbishop of Canterbury, was born, about the year 1674, at Wakefield, in which town his father kept a linen draper's shop. He received the elements of learning at his native place, and at the age of fourteen was entered of University college, Oxford. So early as 1693 he appeared as an author, and displayed the great progress which he had made in Greek literature, by a publication for the use of students, consisting of notes and various readings to Plutarch's treatise "De Audiendis Poetis," and Basil's "Oration on the most advantageous mode of studying Greek authors." He was soon after chosen fellow of Lincoln college, and taking the master's degree, he went into orders. In 1697 he published an elaborate edition of Lycophrion, which he followed by his "Archæologia Græca," which has ever since been regarded as a standard work upon Grecian antiquities, and of which there has lately been published a new edition. By these valuable writings he established his reputation at home and abroad, as a man of classical erudition, and paved the way for advancement in his own profession. In 1704 he was appointed chaplain to archbishop Tennison, with whom he resided at Lambeth, and in 1706 he proceeded to the degree of D.D., and was made chaplain in ordinary to queen Anne. He now turned his attention to topics immediately connected with his situation, and in 1707 published "A Discourse on Church Government," the object of which was to support ecclesiastical authority as distinct from that of the state, and to prove the divine institution of episcopacy. Notwithstanding this assertion of high-church principles, Dr. Potter was still regarded

as a whig, and when, in the following year, he was chosen, through the duke of Marlborough's interest, Regius professor of divinity at Oxford, and canon of Christ-church, against the competition of Dr. Smallridge, the circumstance was considered as a triumph by the whig party. In 1715 he was appointed bishop of Oxford by George I., at the same time retaining his divinity chair, the duties of which he fulfilled with great assiduity. In this same year he published a valuable edition of the "Works of Clemens Alexandrinus." He was one of the combatants in the Bangorian controversy, and wrote against Hoadly on some particular points. On the accession of George II., Dr. Potter was appointed to preach the coronation sermon, and was considered to stand high in favour with the king and queen. In 1736-7, he succeeded Dr. Wake in the archbishopric of Canterbury, which station he occupied till his death, in 1747. He was married and had a numerous family, of whom two sons and three daughters survived him. Dr. Potter was a man of order and regularity, who governed his affairs with due economy, yet was not negligent of the dignity belonging to his station. His "Theological Works" were published collectively, in three vols. 8vo. 1753. Biog. Brit.

POTTER, ROBERT, an English divine, was educated at Emanuel college, Cambridge, where he took the degree of M.A. Late in life he obtained the living of Lowestoffe, in Suffolk, and a prebend in the cathedral of Norwich. He is known as an author, by his translations of the Greek tragedians Sophocles, Euripides, and Æschylus. He wrote a vindication of Gray the poet, against Dr. Johnson. He died in 1804.

POTTER, PAUL, was born at Enkhuyfen in 1625, and learned the principles of painting from his father, Peter Potter, who was but a moderate artist; yet by the power of uncommon capacity, which he discovered even in his infancy, his improvement was so extraordinary, that he was considered as a prodigy, and appeared an expert master at the age of 15.

His subjects were landscapes, with different animals, principally cows, oxen, sheep, and goats, which he painted in the highest perfection. His colouring is pure and brilliant, and very like to nature, though sometimes not harmoniously chosen; his touch is free, and exceedingly delicate; and his figures are drawn with great skill, and finished with infinite animation. He constantly studied out of doors, making even his hours of amusement useful, by sketching the scenery and objects by which he was surrounded. He frequently etched his designs, and his prints are held in great estimation.

The pictures of Potter have obtained a price far above all proportion with their merit, in comparison with those of many of his ingenious countrymen; to which, probably, the circumstance of his dying at the age of 29 not a little contributes, as, consequently, he can have left but few pictures. Lord Grosvenor has in his collection a small work of his, for which his lordship gave 900 guineas; and has been offered, as we have heard, 1000.

POTTER, in *Geography*, a county or township of Pennsylvania, containing, in 1810, 1584 inhabitants.

POTTER'S *Clay*. See CLAY.

POTTERY, the art of making earthen pots and vessels; or the manufacture of earthen-ware.

Vessels capable of holding liquid food, and drink for the use of man, would be so essential to his immediate necessities, that their fabrication would doubtless be prior to the invention of the humblest cottage. Vessels formed by excavating pieces of wood and leather, were in all probability prior to those of earthen-ware. This manufacture,

however, is so ancient, that we have no traces to the period of its invention.

From the great perfection in which we find the porcelain of China, as far back as history will inform us, there is great reason to believe, that many centuries must have elapsed in bringing it to that state, could we even ascertain when it arrived at its climax. It is remarkable, that the oldest specimen of Chinese porcelain does not differ in its essential qualities from the most recently manufactured.

There is strong ground to suppose, that the art of pottery had been long brought to great perfection in the East, before it was known in Africa and Europe. It was afterwards cultivated by the Egyptians, from whom it descended to the Greeks and Romans.

A species of earthen-ware was manufactured in Persia, which was considered a great curiosity, on account of its metallic lustre. Something similar has lately been manufactured in this country, to which the metallic lustre is given by gold; and another with platina, having the colour of that metal.

The Romans appear to have cultivated this art to a considerable extent. The taste and elegance displayed in their form and ornamental decoration, were doubtless borrowed from what the Greeks had long before practised: the country most celebrated for this art was the ancient Etruria. It was the ambition of that enlightened manufacturer, the late Mr. Wedgwood, to equal the manufacture of Etruria, after which he named the village that has grown out of his genius and industry; let it, however, be said to the praise of this great man, that in his attempt to equal the ancients, he has very far excelled any thing of the kind yet produced, in the firmness and compactness of body, in colour, and in elegance of form. It may be truly said of Mr. Wedgwood, that he has increased the value of the raw material in a greater degree than any other manufacturer. The potteries of this country, prior to his exertions and example, produced nothing but of a flimsy fabric, destitute of taste, and scarcely fit for domestic use. Their best production was the common white ware, richly daubed with blue, to imitate the unmeaning scenes painted on the Chinese porcelain: since his time the manufactures of Staffordshire have become celebrated at home and abroad. Among these, however, the modern Etruria, occupied at present by the sons of Mr. Wedgwood, still bears a distinguished sway, and must continue to be conspicuous, so long as they possess the same spirit of improvement, to which their present establishment owes its existence.

Although very different combinations of the earth, and sometimes metallic oxyds are employed in the manufacture of earthen-ware, the ductility of these compounds, or that which admits of their being moulded into different forms, is peculiar to alumine or argillaceous earth. The natural compounds, commonly called clays, consist of pure clay or alumine, combined with flint, lime, and sometimes magnesia, and frequently also with oxyd of iron. In this latter case the pottery burns to different shades of red, proportionate to the quantity of iron. When magnesia is combined, it gives to it a soapy feel, from which it has obtained the name of soap-rock. A marked variety of this is called steatite.

The clay from which the Staffordshire ware is manufactured comes from Dorsetshire, and another variety of inferior quality from Devonshire. These are both of excellent quality for working, and possess great whiteness when burnt. These clays are valued particularly for the latter property, which arises from their being free from iron, which would give them a yellow or reddish colour.

POTTERY.

The clay undergoes such preparation at the place where it is procured, as to free it from stones and many other impurities. In the manufactory of Mr. Wedgewood, the most complete in the kingdom, the clay is thrown into a cylinder of cast metal, four feet high and twenty inches in diameter. In the middle of this cylinder runs a perpendicular shaft, with knives as radii at right angles to the shaft. These knives are so arranged upon the shaft, that their flat sides are in the plane of a spiral thread, so that by the revolution of the shaft the knives do not only cut any thing in their way, but constantly force downwards what may be in the cylinder, agreeably to the nature of the screw. Another set of knives is inserted in the interior surface of the cylinder, and extend to the shaft in the centre: these correspond with, and are parallel to, the moveable knives. The two sets, the one active, the other passive, have the effect of sheers in cutting the clay into small pieces, while the spiral form of the active knives forces the clay in its reduced state out at an aperture at the bottom of the cylinder, from whence it is transferred to a vat, for the purpose of mixing the clay with water. This vat is of a cylindrical form, the diameter being about four times the height. In the centre of this vat turns a perpendicular shaft, having cross arms or radii one below the other. These are connected by perpendicular staves, giving the moveable part the appearance of two opposite gates, upon the central shaft. These gates revolve in the cylinder just immersed in the pulp, the constant agitation mixing all the fine particles completely with the water, while the stony particles of greater magnitude remain at the bottom. The pulp is now passed off from this vat through a series of sieves of different degrees of firmness, which work backward and forward by machinery: this separates the gross parts from that which is fitted to enter into the composition of the ware. We will here leave this refined pulp, to go to the preparation of the flint, a certain portion of which is necessary to be united with the clay pulp, in order to constitute the potter's mass.

The flint in its crude state is the common flint used for striking fire, which principally consists of pure flint. It is first placed in a kiln and heated to a red heat; and while red-hot thrown into cold water. This process is to lessen its aggregation, and make it easier to reduce to powder. Mr. Wedgewood reduces the flints into small pieces by means of hammers, which are worked by machinery. The pieces are laid upon a strong grating, so that as they become of a certain size, they are driven through the divisions of the grate. After this process they are taken to a mill, which consists of a cylindrical pan, similar to that used for mixing the clay with water, but the arms of the upright shaft are made to carry large stones of great hardness: the stone is known by the name of *chert*. These stones are fastened to the arms of the upright shaft, so that the under side, which is perfectly flat, may move over similar passive stones. This cylindrical pan contains a certain quantity of water when the small masses of flint are introduced. The flint soon gets between the chert surfaces, which from their great hardness reduce the flint to a pulpy consistence. The finer particles become suspended in the fluid, and are run off from time to time near the top of the pan. This pulp is then passed through lawn or silk sieves in a manner similar to the clay, the part which remains in the sieve being returned to the mill to be ground over again. The pulp is always made to a certain consistence, with a view to know what quantity of flint is contained in a given measure, and the same with regard to the clay in the same state. The two pulps are now mixed together in such proportion

by measure, that the flint bears a proportion to the clay of about one to five, and sometimes one to six. They are now intimately mixed together, by an apparatus similar to that employed for mixing the clay with the water in the first instance.

It is a well-known fact that clay, when exposed to the fire, continues to shrink to the greatest heat of the best furnaces. This contraction doubtless goes on till the whole of the water is dissipated, and the clay undergoes fusion. This phenomenon is more conspicuous when the clay is pure alumine. Hence we should expect, if the clay were pure, that the same degree of heat in such clay ought to produce the same decrease of volume. The application of this principle to measure high temperatures, did not escape the sagacity of the late Mr. Wedgewood. He constructed a thermometer which measured the degree of heat in which bits of pure clay had been exposed, by their shrinkage. Plausible, however, as this idea may appear, it became almost impracticable, from the circumstance of the shrinkage of different bits, made from the same mass of clay, not being uniform.

It is found that, in proportion as pure clay is combined with the other earths, it undergoes less shrinkage; and since the great shrinkage in the manufacture of earthen-ware is attended with other inconveniences, the flint is added for the purpose of preventing the shrinkage to a certain extent. It will appear that when the shrinkage is the greatest, the ware will be the most dense, and will afford a closer fracture. Under these properties the articles are less fitted to withstand sudden changes of temperature. The shrinkage may also be diminished by pounding pieces of well-burnt clay, and mixing them with the clay that would be liable to shrink. This expedient is often resorted to in making crucibles, which require to be made of the purest clay, on account of their essential property of infusibility.

When the flint and clay, in their pulpy state, have been intimately mixed, the next process is to separate the excess of water, which is effected by evaporation. The vessel in which the pulp is placed for evaporation should expose a great surface, its breadth being about five or six feet, its length 20 to 30, and very shallow. The bottom is made of fire-bricks, and the flame of the fire, which is at one end of the brick-work, passes along a flue under the bottom. The evaporation is slow, on account of the bricks being bad conductors of heat. This inconvenience, however, is compensated by the uniform consistence which the evaporating mass acquires. When the evaporation has been continued till the mass is sufficiently stiff, it is cut out in cubical masses, and is next subjected to a process, by which the mass is rendered of uniform stiffness throughout, and fit for working. This change is brought about in the most complete manner, by allowing it to remain in a heap for a considerable time. The water in the clay may be considered as a chemical compound. Hence we may conceive that the water, by time alone, will constantly be tending to uniformity throughout the whole mass.

The operations by which this effect is facilitated, are, first by hand, and secondly, by a machine for the purpose. The first is called *sloping* or *wedging*, and consists in taking a mass of clay in both hands, and with a twist of both at the same time, the piece is separated into two pieces. They are now brought together with greater violence, but in different parts to those just separated. The piece is now separated at right angles, and two new surfaces brought in contact. This change of surface every time, sometimes 20 or 30 times, effects the uniform mixture of the different parts so completely, that if, at the commencement of the operation, the mass consisted of two distinct pieces, one black and the other

other white, at the end of the operation the mass would become of an uniform grey colour.

This latter process is usually practised immediately before the clay is made in masses of proper size for working into different articles.

This change is also effected with more dispatch by a machine, very similar to that first used for cutting the crude clay into pieces.

An upright shaft works in a cylinder of cast iron; from this the radiant knives work in the plane of a spiral thread, extending to the circumference of the cylinder. The pieces of clay are thrown into the cylinder in the state they are cut out of the evaporating vessel. The knives first act by cutting them in pieces, and force them down the cylinder like a screw. From the bottom of the cylinder extends an horizontal opening in the form of a parallelepipedon, the section being about six inches square. The clay is forced through this opening, and cut off in lengths of about one foot each. These masses are again thrown into the cylinder, and passed through in the same way several times, till they are deemed in a proper state. The masses are now, when time will admit, laid together for some time, as the workmen find that they work much better for lying longer. This we have accounted for from the equal force of affinity, which tends to establish an equilibrium of the attractive force of the clay for water in every part of the mass.

Having prepared the material, we will now proceed to describe the methods of forming it into articles of various forms. This is so very similar to the methods used in the manufacture of porcelain, which we have already described, that we shall merely state some improvements in the machinery introduced by Mr. Wedgwood. The potter's lathe, which is used for throwing the different articles of a circular form, consists of a perpendicular shaft about three feet high, having a circular piece of wood at the top, the face of which, by the shaft, turns parallel to the horizon. The lower end of the shaft runs in a step; the upper part has a neck a little below the circular piece of wood, which works in a socket. Formerly this perpendicular shaft was put in motion by a wheel, with spokes fastened upon it, which the workman moved with his foot. In others the shaft has a crank in the middle, with a long rod working upon it. This being pushed backward and forward by a second person, gave motion to the lathe. In the *porcelain* works of this country, as has been described under that article, the lathe is generally turned by a rope passing from a pulley upon the perpendicular shaft to a large wheel at a distance, which is turned by a boy. The first of these methods is convenient, as the workman can best suit the velocity to the state of the work, which varies very considerably in throwing the smallest article. The labour, however, is so great, that in throwing large articles there would be great time lost. The two other methods, although they afford much ease to the workman, are very inconvenient, as the thrower has constantly to be speaking to the turner, in order to get the proper increase of speed. Mr. Wedgwood has the whole of his lathes, both for throwing and turning, turned by the steam-engine. The perpendicular shaft of the lathe is moved by an horizontal one, which is connected by two bevel wheels. The horizontal shaft is provided with a long drum, from which a strap ascends to two conical drums reversed, and working together: this allows the strap to keep at the same degree of tightness, while it traverses from one end of the drum to the other. From these drums, which are moved by the principal one, motion is given to the lathe. During the throwing of any article, a separate piece of machinery is turned by a boy, which causes the strap to move, parallel to itself, along

the drum of the horizontal shaft, and at the same time along the conical drum. This changes the velocity very gradually to its maximum, and returns to its slowest motion, when the workman is finishing the article thrown; the strap is then thrown on to a loose pulley, which stops the lathe. The clay is first portioned into pieces sufficient for the article intended. At the same instant that the thrower places the pieces of clay on the face of the circular board, the strap is transferred from the loose pulley, and the motion commences. The boy, by turning a winch, begins to move the strap from the small end of the conical drum to the large end, when the velocity is at its maximum, and when the thrower, by means of his wet hands and a thin piece of wood, is giving the proper shape to the clay. At this point he begins to finish the article, and the strap is caused to move back from the large to the small end of the drum, when the work is finished, the machine is stopped, and the thrown article cut off at the base with a piece of small wire. It is now carried to a proper place to be dried. When it has been dried to a certain extent, which the workmen call the green state, it is then taken to the turning lathe, which is similar to the common lathe used for turning wood. These lathes, in Mr. Wedgwood's works, are turned by the steam-engine, and as, during the turning of each vessel, the velocity requires to be varied, the motion is communicated from two conical drums, similar to the throwing lathe, and the strap is made to traverse the drums by a motion given by the foot of the turner. There is also a contrivance for reversing the motion, by which the turned surface is polished.

The same degree of dryness which admits of the clay being turned in the lathe, to give it its proper finish and smoothness, is also the proper state for fixing on the handles or other appendages, which cannot be effected in the lathe. The parts to be added are previously made, and at a proper degree of dryness are attached to the round work by means of a pulpy mass, formed by clay mixed with water, which the workmen call *slip*. The joined parts are then smoothed off with a wet sponge. In this state they are taken to a stove, which is nothing more than a room provided with shelves, raised from 80 to 90 degrees of temperature. When they are fully dried, if the articles be of superior quality, they are rubbed over with a small bundle of hemp, in order to take off any small bits left after the turning and handling, and to smooth those parts which cannot be turned. The ware is now ready for the kiln, which is to convert it from a soft and tender state to a hard substance, called *biscuit*.

A great variety of pottery cannot be made on the lathe, its not being of a circular form. This is made by two different methods, the one called press-work and the other casting. The press-work is formed in moulds made of plaster, one half of the figure being on one side of the mould, and the other half on the other side: these fit accurately together. The clay is first made into two flat pieces, of the thickness of the articles: one of these is pressed into one side of the mould, and the other into the other side, the superfluous clay being cut away, leaving it a little flush above the mould. The two sides of the mould are now brought together to unite the two halves of the article. The mould is now to be separated from the clay, and the article is finished as to form. It is now dried to the green state, when it is completed with any other parts to be added. All vessels of an oval form, or such as have flat sides, are made in this way. The spouts of tea-pots, and all similar articles, are made in two halves in a similar way, and are attached to the vessels in the green state, when the handles are also put on. The handles, which are sometimes of an oval shape in their section, others fluted

and otherwise ornamented, are formed by a machine which consists of an iron cylinder, about 10 or 12 inches high and six inches in diameter. A piston is made to fit the cylinder, and works up and down by means of a screw, similar to a screw-press. In the bottom of the cylinder is a hole, filled up by a piece of metal, with an opening through it, having the figure of the handle, or other thing to be formed, in section. The cylinder is first filled with clay, and the piston introduced upon it: the latter, being forced down by the screw, forces the clay through the hole at the bottom. This is cut into proper lengths as it comes through. In this way tubes may be formed, by placing a pin in the centre of the hole at the bottom of the cylinder, equal to the interior diameter of the tube. The handles are cut from the above pieces, bent into their proper shape, and at a proper degree of dryness are attached to the vessels. The different articles formed by moulds called press-work, are finished before biscuiting, similar to those made on the lathe.

The third method of forming earthen-ware is that of casting, and is perhaps the most elegant of the three for forming articles of irregular shape. This process, in common pottery, is so similar to that employed in the porcelain manufacture, which has been described under that article, that we think it unnecessary to enter minutely into it here. The clay is used in its pulpy state, called *slip*. The moulds are made of plaster, and fit so close when put together in parts, as to hold the pulpy liquid. The plaster immediately begins to absorb the moisture contiguous to it, making a stiff mass capable of supporting itself. The liquid part is now poured out: that which remains continues to get stiffer, by more of its water being transferred to the plaster, so that in a few minutes the articles, completely formed, may be removed from the moulds. They are now dried to the green state, and finished for the biscuit kiln, in the same manner with those made by the two former methods.

When the ware is thoroughly dry, and a sufficient quantity is accumulated to fill the kiln, the next process is placing the articles in cylindrical and sometimes oval-shaped vessels, called sagars. These vessels are about six inches deep, and of different diameters, from twelve to eighteen inches. These vessels, containing the ware, are piled up in the kiln, the bottom of the superior sagar serving as a lid for the inferior one. The use of these vessels is, first, to keep fire from immediately acting upon the ware, but principally to prevent the smoke injuring its colour, previously to laying one sagar upon another. A ring of soft clay is placed round the lower one, on which is fixed the bottom of each superior sagar. This is more completely to secure the goods from the foot and the intense fire.

The kiln for porcelain is so exactly similar to that used for the species of earthen-ware of which we are treating, that we have omitted to describe the kiln under PORCELAIN, and have referred the reader to this article, to which is annexed a plan and section of the elevation. See *Plate Pottery*. The potter's kiln is generally a cylindrical cavity, covered by a flattish dome. This was formerly surrounded by a conical building, reaching something higher than the buildings adjacent. The great space between the cylindrical part, which is the proper kiln, and the surrounding circular wall, used to be considerably greater than at present, and even now is much too great. For this reason we have ventured to contract it, especially in the upper part. On this account the form in our drawing differs much from the cone, as may be seen in the elevation. This tends to obviate an evil, which is equally conspicuous in glass-houses and in potters' kilns. The great quantity of cold air which is con-

stantly ascending the cone, tends much to check the draught, and by that means renders the fuel less efficacious and economical. The cylindrical portion, L, should so nearly touch the surrounding wall at *tt*, as only just to carry off the waste smoke. *WW* is a cylindrical wall, forming the space *K*, which is the cavity in which the sagars are piled, marked with the same letters in the plan. *D* is a door-way, through which the sagars are conveyed, the space being built up with bricks when the kiln is filled. The plan is a section taken at the height *V V*. The elevation is a section at *XX*, dividing the area into two equal portions. The part from *A*, down to the opening *e*, is not comprised in the section, and is shaded lighter, to show that it is a portion of the front. It is given to represent the front view of the openings where the fire is introduced. The same is seen in the plan at *a*, and in the side view at *aa*, on each side of the elevation. *P*, in the elevation, is the space occupied by the fire, which is introduced at the opening *a*, which opens into the arched recess *A*, formed in the surrounding wall. The hole, *a*, is surrounded by a frame, made of earthen-ware or cast metal, in the shape of an horse-shoe. The flame of the fire enters the horizontal flue *g*, from whence it is free also to ascend through the chimney *b*, or branch into the circular flue *f*, by which it has access, by the intermediate flues *g*, to the central opening *l*, from whence it rises perpendicularly to the top of the kiln, where it escapes into the chimney *C*, through the openings *o*. The fire in these furnaces does not rest upon a grate, but lies upon the ground. The opening at *e*, during the firing, is built up with bricks, leaving a number of openings for the air to pass through the fire, which is piled up as high as *a* in the elevation, and sometimes a little higher: *c, c, c, c*, are large fire-bricks, forming a sort of bridge or arch over the opening *a*, and coming close up to the wall *W*. At this place a groove made in the bridge forms a perpendicular opening, which is closed by the flat brick *b*, when this opening is closed. The current of flame is more considerable through the upright chimneys *b, b*, and less through the horizontal flues *f* and *g*. The former of these currents, however, is diminished, and the latter increased, by removing the brick *b*, by which a current of cold air descends through the opening below. By means of this brick the heat is increased at top or bottom of the kiln at pleasure, the uniformity of which is of great consequence. In the plan, the upper floor of the kiln is removed, to show the direction of the flues, the fourth quarter being covered with bricks, as when the sagars are piled upon the floor. In the direction of each of the flues every other brick is left out, as may be seen by the dark shades. This gives the upper floor the appearance of being full of holes, through which the flame rises among the piles of sagars. The sagars, being of a circular or elliptical form, can be piled close together, leaving sufficient interstices for the flame to pass through. The piling is commenced at the opposite side of the kiln to the door-way *D*, and continued till the last pile is raised close to the entrance, which is then closed up with bricks, till the firing is completed. This is continued from twenty to thirty and sometimes to forty-eight hours. The whole is allowed to cool before the sagars are removed. This kiln, which has undergone trifling improvement, has many defects, as stated under the article PORCELAIN. The principal of these defects are, the fire being allowed to escape at the top of the kiln instead of the bottom, and the want of a proper supply of common air to burn the smoke.

The state in which the ware is drawn from the kiln is called biscuit: it is yet unfit for vessels, being so permeable to moisture as to allow water and other liquids to run through

POTTERY.

through it. This valuable property of biscuit earthen-ware has lately been applied to the construction of vessels for cooling wine and other liquids. The water passes from the inner to the outer surface, and constantly presents a humid surface to the atmosphere, which by evaporation carries off much more heat than would be carried off from dry surfaces. Mr. Leslie has lately made an useful instrument, by taking advantage of this property of the biscuit for shewing the evaporating power of the air.

The next process is to render the biscuit fit to hold liquids, by filling up the pores, and coating the surface with a vitreous substance. This process is called glazing. A great variety of substances may be used for this purpose. Pounded glass would constitute a glazing for earthen-ware, where the colour of the body is wished to be seen through the glazing. The composition for earthen-ware, which we have given in this account, is capable of forming two varieties merely from the nature of the glazing. When the glazing is transparent and colourless, the colour of the body is seen, which having a yellowish tint from the presence of a small quantity of oxyd of iron, it is called cream-coloured ware. When the glazing is rendered a little opaque and of a blueish tint, by the presence of tin or arsenic, and a small portion of oxyd of cobalt, it acquires a milky or opal appearance of a blueish-white colour. The glazing formed with pounded glass, may be considered as a compound of flint and potash, or soda; hence it can be made of different degrees of fusibility by the addition of flint or alkali. These glazes are found to have some inconveniences, the principal of which is their not expanding and contracting equably with the body. The glaze is liable to crack and sometimes peel off. Earthen-ware glazed with this substance may be frequently observed to abound with innumerable cracks on the surface, which are permeable to grease or any other fluid. Such vessels soon become very disagreeable, especially when heat is applied to them, capable of burning the substances by which they have been penetrated.

No glazing has yet been discovered for common earthen-ware which is free from the above objection, without the use of lead, which, on account of the poisonous quality of that metal, should, if possible, be avoided. The oxyd of lead, even in its vitreous state, and combined with flint or clay, is so completely soluble in acids, that bad consequences have arisen by eating pickles from jars glazed with lead.

The transparent glaze used for the cream-coloured ware, is generally composed of oxyd of lead and ground flint, in equal weights. White lead is preferred, but it is not so economical as litharge or minium. In the commonest earthen-ware, galena (sulphuret of lead) is made use of. The oxyd of lead and the flint are first ground to an extremely fine powder, and then mixed with water, to give the whole the consistency of cream. The biscuit, being first made clean, is dipped into the pulp, and drained out: it is then turned about rapidly into various positions, to prevent the glaze from lying thicker in one place than another. During this change of position the water of the glaze is absorbed by the biscuit, leaving the solid matter of uniform thickness upon the surface. This part of the process is called dipping. The ware is now placed in the sagars and put in the kiln, exactly the same as in the biscuiting process. The fire is not raised so high, nor so long continued, being only sufficient to bring the glaze into perfect fusion. Dishes and plates, when placed in the sagars for glazing, may be put one upon another, by placing small stands of earthen-ware between them, presenting three small points only to each of the surfaces. When this ware is brought from the kiln, it is considered finished.

The ware called white ware is made of the same material, and manufactured precisely in the same way, as far as the biscuiting. Formerly it used to be painted after glazing, and had a second firing, similar to porcelain. It is now printed with copper-plate prints almost always with oxyd of cobalt, which makes the figures of a blue colour. It is in this state called blue and white ware, and constitutes an important branch of the Staffordshire pottery. The subjects of the prints are generally vile imitations of the paintings on the Chinese porcelain, which are of themselves shocking.

The printing is performed while the ware is in the state of biscuit, and the glazing laid over the colouring matter. The designs for the ware are engraved upon copper-plates, and prints taken from these, as in common copper-plate printing. The surface of the paper to receive the impression is first smeared over with soft soap. The plate and the rolling-press are constantly kept warm. The colouring, which for the *blue* and *white ware* is oxyd of cobalt, is greatly diluted with some colourless earthy matter: it is ground up with boiled linseed oil, such as is used for printing ink: its consistency, when laid on the plate, being that of soft paste. The paper, prepared as above mentioned, is now laid upon the plate, and passed through the rolling-press. The printed part is now cut out of the paper, and being moistened is laid upon the biscuit. The colouring matter is now instantly absorbed by the biscuit. This being done, the paper is washed from the biscuit in a tub of clean water. The colouring matter will now be seen very plain on the surface of the pottery.

The ware, having received the colouring matter, is now set to dry up the water, and is then dipped in the glazing pulp precisely in the same way as the cream-coloured ware. The glazing material, it will be remembered, differs a little from the latter, in containing a little oxyd of cobalt, which gives it a blueish tint, and gives the idea of greater whiteness. The goods are fired in sagars, as has been already described. The oxyd of cobalt now becomes of a beautiful blue, under the glaze. If, instead of the cobalt, a mixture of the oxyds of iron and manganese be employed, the figures will appear of a black colour, which gives the effect of an engraving, and is much more beautiful and consistent than the cobalt. In some potteries *penciling* is practised to great extent. This consists in laying on the colours with enamel, after the glazing. This work is very expensive, and is not so general as formerly. This process is so similar to that used in painting *porcelain*, that we shall refer the reader to that article.

Lately, another variety of ware has been introduced, which is by the potters called *lustre*: it consists in fixing gold or platina upon the surface of the glazing. The substance from which the platina lustre is procured, is obtained by dissolving platina in equal parts of the nitric and muriatic acids with heat. When the whole is dissolved, add to the solution a solution of muriat of ammonia, but yellow precipitate will fall to the bottom: continue to add the latter till no more is precipitated: decant off the clear liquor, and add fresh portions of hot water, till it becomes tasteless: drive off the first portion of water by heat, and preserve the dry powder for use: let this powder be ground, with a small portion of enamel, in oil of turpentine: spread this thinly over the glazed surface of the plain earthen-ware above described. The ware is now to be exposed to the heat of an enamel kiln, which is a red heat. The platina assumes its metallic form, which acquires greater brilliancy by the presence of the glaze.

The precipitates from gold may be laid on in the same way. The glazed ground, however, on which the gold is laid,

POTTERY.

laid, is of a brown colour by adding the oxyds of iron and copper to the glazing matter. By this means the yellow colour of the gold with the brown glaze, gives the lustre the colour more of copper than of gold. It is probable that the lustre is, or may be produced by smearing the glazed surface with the liquid solution of the metal, in a very dilute state. The liquid may contain a little gum, and a little enamel mixed with it, when spread upon the articles to be lusted.

A very coarse earthen-ware made in Persia, which we have alluded to in a former part of this article, possesses metallic lustre, which is doubtless given by gold in the way just described.

The most perfect pottery, particularly so far as regards excellence of workmanship, has been manufactured by the late Mr. Wedgwood, and since by his sons. Among the most superb of their productions are their imitations of jasper, manufactured into vases, medallions, and other ornamental forms. The substance of which they form their mortars, and a variety of chemical utensils, is extremely hard, and is not acted upon by acids.

The black and the yellow ware made by Messrs. Wedgwoods, of which the late Mr. Wedgwood was the inventor, possesses great elegance, and a very compact body. The black ware owes its colour to the presence of oxyd of iron, and a small portion of oxyd of manganese. The yellow ware, which is similar in texture, owes its colour to the presence of a little iron alone. A great number of places furnish natural products capable of assuming this yellow tint. The compactness of the body is effected by using less flint in the composition, and giving it more heat in the burning. This biscuit is so compact that it does not require to be glazed, and this is what constitutes its great excellence. Its beauty is much greater in being destitute of the glaze or vitreous coating, which, when it is managed in the best way possible, is but a miserable imitation of a polished surface. That species of ware which, from its great hardness, has been called stone-ware, is not encouraged so much as it deserves. It is employed for the most common, and the cheapest articles, when it ought to be used for all domestic pottery. Every other kind, excepting the true porcelain, is objectionable on account of its porous texture, and the lead contained in their glaze. Every species of clay capable of bearing a great heat, may be employed in the manufacture of stone-ware. Those which contain much oxyd of iron cannot be employed, as they would be liable to soften, and even to melt in the heat required for glazing.

This manufacture is at present almost entirely confined to bottles, particularly those used for soda water and artificial mineral waters, their texture being sufficiently close to hold gas compressed to several atmospheres.

The clay is prepared in the same way with that used in making the pottery already described. Indeed, there would be no difference in preparing the vessels for the kiln, whether formed by throwing, pressing, or casting. It is simply in the burning and glazing that the difference consists. In making the common articles, the vessels are piled up in the kiln, and exposed to the naked fire, without being defended by sagars. It is on this account that they receive a much greater heat than the common earthen-ware. When the heat has arrived at its maximum, a quantity of common salt (muriate of soda) is thrown into the body of the kiln. The salt rises in vapour, which speedily envelopes the hot ware, and glazes it as completely as in any other way, if the heat be sufficient. It is likely that the salt is decomposed, the acid flying off, while the soda combines with the earths of the pottery, forming a vitreous coating. The smoke being in

contact with the ware, gives it a brownish colour. The fracture is close and compact, and its strength much greater than the common white ware. This pottery might be extended to a variety of other articles for culinary purposes, and with proper contrivance in the construction of the kiln, articles might be made with as much taste and elegance as any other.

When the Dorsetshire clay is employed, and the ware defended from the smoke while burning, and at the time the salt is thrown in, the colour of the ware would be white, and the glaze transparent. When the clay is not sufficiently white, it may be rendered so superficially by dipping the dry ware, before it goes into the kiln, into a mixture of Cornwall clay and water in the state of a thinnish pulp. It is taken out, and turned about, as in glaze dipping, in order to spread the coating uniformly. The water is absorbed by the dry ware leaving a coating of the white Cornwall clay upon the surface. A dip made with water and a fine powder of the Cornwall stone, would answer better than the latter, as it would more easily fuse with the sublimed salt. The whiteness of the Dutch tiles is produced in this way, as the body will be found of a dirty grey colour.

The most common and worst kind of earthen-ware made in this country is formed of common clay used for bricks. The ware, after being rudely formed, is very slightly burnt, and afterwards glazed with a composition of galena (sulphuret of lead), oxyd of manganese, and the clay of the ware. The glaze is of a dark colour, approaching to black. The lead in this ware is easily attacked by acids, and should not be used where they are liable to be present. The same earthen-ware, unglazed, is used for garden pots, tiles, and tubes for draining land.

We shall conclude this article with some account of the methods of forming crucibles, retorts, and tubes of earthen-ware.

These vessels are required to possess two very essential qualities; first, they should bear the naked fire without cracking; and, secondly, they should bear the heat of the hottest furnaces without fusing. The retorts and the tubes should at least possess the first property, and require a greater closeness of body more than that required for crucibles.

The crucibles called Hessian crucibles have held a high character, both on the continent and in this country, but they are not useful for all purposes. The Dutch crucibles, which contain plumbago, are well calculated to bear sudden changes of temperature, but become very tender, and fuse at a high temperature.

A similar manufacture is carried on at Chelsea; the crucibles are quite as good as the Dutch ones, and of a much better form.

Very excellent crucibles are made of the Stourbridge clay, particularly for melting cast-iron and steel. This clay is worked up with the powder of the broken pots, which has the effect of making the pots stand sudden changes of temperature. It has been lately found, in the cast-steel works at Sheffield, that the best crucibles for their purpose are formed of the Stourbridge clay, worked up with powdered coak of pitcoal. This enables the crucibles to bear sudden changes of temperature, and at the same time to bear the greatest heat of our best air-furnaces. The Cornish clay might be used with pounded coak with similar success, and might perhaps be superior to the Stourbridge clay for earthen retorts and tubes. None of these articles should be very hard burnt, as they will, in consequence, be more liable to crack with sudden heat, and even in the regular way of bringing them up with the fire.

POTTERY, *Chinese*. See PORCELAIN.

POTTERY.

POTTERY, *The, or The Potteries*, in *Geography*, an extensive tract of country in the hundred of North Pyrehill, and county of Stafford, England, comprehends an area of about eight miles long and six broad, and is perhaps the most populous and busy of any district of similar extent in Great Britain. It derived its name from being almost exclusively appropriated to extensive manufactories of earthen-ware, for which its situation and peculiar characteristics are excellently adapted. The soil presents, in almost every part, a great variety of clays; covering rich and productive strata of coal, which lying in general near the surface, are wrought at a comparatively small expence. These strata are usually divided by veins of clays, most of which form excellent fire-bricks for constructing potter's kilns and sagars, to burn the ware in. Finer clays also are plentiful in many places; of which in former times the bodies of the wares themselves were wholly manufactured. To these advantages, joined to the inaptitude of the soil for husbandry purposes, this district is doubtless indebted for its selection as the site of its present staple manufactories. When this originally occurred is utterly unknown, but the existence of some kind of earthen-ware manufactory can be traced at least two centuries back. Its principal seat at that period was the town of Burslem, which was called a butter pottery; that is, a manufactory of pots for the preservation of butter; and under that name it is marked in several old maps: but this establishment seems to have been, even so late as the year 1686, very inconsiderable, as Dr. Plot, in his "Natural History" of the county, says, that the sale of its products was chiefly "to the poor crate-men, who carried them *at their backs* over all the country." All the ware was then of a coarse yellow, red, black, and mottled kind. The common glaze was produced by lead ore finely powdered, and sprinkled upon the pieces of ware before firing; sometimes with the addition of manganese. Occasionally, when the potter wished "to shew the utmost of his skill," he employed, instead of lead ore, calcined lead itself, but still sprinkled it on, in the same rude manner.

The era of improvement commenced about the year 1690, when two ingenious Dutchmen, of the name of Elers, settled here, and introduced the practice of adding common salt to the clay when at its highest heat, in order to give it a superficial vitrification. The same individuals also introduced the manufacture of a new species of ware, in imitation of the unglazed red china of the East; and the clays here being suitable for the purpose, they succeeded wonderfully for a first attempt, so that many of their tea-pots are said to have sold as high as a guinea each. The next improvement was made in the substance of the ware itself by a Mr. Astbury, as tradition asserts, through this incident. Being on his way to London, he happened to have powdered flint recommended to him to cure some disorder in his horse's eyes, and accordingly a flint stone was thrown into the fire, to render it more easily pulverable, which changing to a pure white by the influence of the heat, the potter was struck with the idea, that his ware might be improved by an addition of the same material to the whitest clays. He tried the experiment with tobacco-pipe clay, and the event proved fully answerable to his expectation. Thus originated the *white* stone wares, which soon supplanted the coloured ones, and continued for many years the staple branch of pottery in this country.

It was, however, about the year 1760, that the most important improvements began to be made in the Staffordshire potteries, by the late Josias Wedgewood, esq. This gentleman not only improved the composition, forms, and colours of the old wares; but likewise invented, in 1763, a new

species of ware, for which he obtained a patent, and which being honoured by her majesty's approbation and patronage, received the name of Queen's ware. Continuing his experimental researches, Mr. Wedgewood afterwards invented several other species of earthen-ware and porcelain, of which the principal are: 1. *A terra cotta*; resembling porphyry, granite, Egyptian pebble, and other beautiful stones of the siliceous or crystalline order. 2. *Basaltes*, or *black ware*; a black porcelain biscuit of nearly the same properties with the natural stone, receiving a high polish, resisting all the acids, and bearing without injury a very strong fire. 3. *White porcelain biscuit*; of a smooth wax-like appearance, of similar properties with the preceding. 4. *Jasper*; a white porcelain of exquisite beauty, possessing the general properties of basaltes; together with the singular one of receiving through its whole substance, from the admixture of metallic calces, the same colours which those calces give to glass or enamels in fusion; a property possessed by no porcelain of ancient or modern composition. 5. *Bamboo*, or cane-coloured biscuit porcelain, of the same nature as the white porcelain biscuit. And 6. *A porcelain biscuit* remarkable for great hardness, little inferior to that of agate; a property which, together with its resistance to the strongest acids, and its impenetrability to every known liquid, renders it well adapted for the formation of mortars, and many different kinds of chemical vessels. For some further account of this gentleman's discoveries; see WEDGEWOOD, JOSIAS.

The above six distinct species of ware, together with the queen's ware first noticed, have increased, by the industry and ingenuity of different manufacturers, and particularly by Mr. Wedgewood and his son, into an almost endless variety of forms for ornament and use. These, variously painted and embellished, constitute nearly the whole of the present fine earthen-wares and porcelains of English manufacture.

The number of persons who derive their support from the manufacturing part of the pottery business alone, including the wives and children of those employed in it, is computed to exceed 25,000 persons; and probably three times that number depend for bread on the labour it creates, particularly in the collieries, in procuring the raw material from several distant parts of the kingdom, and in the inland navigation connected with the same, and of the manufactured product. The pottery district lies chiefly in the parishes of Burslem and Stoke; and, as happens in most manufacturing districts, it is remarkable for the great diversity of opinion which prevails among its inhabitants on the subject of religion. Of the various sects, however, the Methodists claim a decided superiority, in point of number, over all the others. The principal towns and hamlets comprised within the limits of The Pottery, are Stoke, Hanley, Shelton, Golden-Hill, New-Field, Smith-Field, Tunstall, Long-Port, Burslem, Cobridge, Etruria, Lane-End, Lower-Lane, and Lane-Delft.

Stoke, or, as it is commonly called, Stoke-upon-Trent, has recently been constituted a market-town; and has a market-house furnished with all the accommodations requisite for its object. The church is an ancient and spacious edifice, in the later Norman style of architecture. Like most other parts of The Pottery, this town has increased in size and importance since the Staffordshire canal was cut. It contains many handsome buildings; and from its proximity to a wharf upon the canal, is most conveniently situated for trade. At this place the first steam-engine for grinding burnt flints, erected in this country, was established about twenty years ago by a gentleman named Spode. The earthen-ware manufactories here are numerous; and many of them are upon

an extensive scale. Close to the town the canal is carried over the river Trent, by means of an aqueduct constructed entirely of brick.

Hanley is situated about two miles northward from Newcastle-under-Line. This town also has a weekly market on Monday; and is distinguished for the neatness and regularity of its streets, and the elegance of many of the houses which compose them. Here is a church, which was founded in 1788; also several chapels and meeting-houses appropriated to the worship of dissenters.

Shelton is a very extensive place, but has not hitherto been constituted a market-town. It is particularly deserving of notice on account of its china manufacture, which rivals the famed porcelain of the East. The ingenious Mr. Champion of Bristol, who discovered the art of making this species of ware, expended an ample fortune in various trials, but having succeeded ultimately in bringing it to perfection, he obtained a patent for it, which he sold to the firm of Hollins, Warburton, and Co. As the canal passes Shelton, there are a public wharf and store-houses upon it, for the landing and safety of goods.

Golden-Hill, from its name, one would suppose to be a considerable and even splendid place; but on comparison it is found to be the least so of any in The Pottery. Its valuable mines of coal, however, make ample amends for its other deficiencies, and from the richness of those mines it derived its name. At the upper end of this village is Green-lane, which commands a most unbounded and beautiful prospect, on the one side over the greater part of Cheshire, and on the other over the whole extent of The Pottery, and a large portion of the country adjoining.

New-Field is well situated for manufacturing purposes, from the great plenty of coal in its immediate vicinity, but as it belongs wholly to one person, who has a handsome seat close to the village, there are fewer pottery establishments here than would otherwise have been the case.

Smith-Field, like *New-Field*, is well situated for carrying on pottery manufactories, having several strata of coal and clay close adjoining; but similar reasons prevent their being increased and extended in the same proportion as in some of the other villages in the district.

Tunstall, including its environs, is the pleasantest village in The Pottery. It stands upon high ground, at the distance of four miles northward from Newcastle, and appears to have been formerly the site of a religious institution, of which some remains were visible about the middle of the last century. These, however, are now completely gone; and a neat chapel has been erected on or near the spot which it occupied. The principal works here are for bricks and tiles; the clay being of a very superior kind for the manufacture of such articles. The tiles made from it, indeed, by good management take a blue colour, which renders them almost as fit for roofing as slates.

Long-Port is situated in a valley between Newcastle and Burslem. It has many good buildings in it, and several large and extensive manufactories; but owing to its low position, it is at times disagreeable from the smoke hanging upon it longer than it commonly does upon higher ground. The Staffordshire canal passes this village, and has a public wharf upon it.

Burslem, as already stated, is the most ancient town in the whole Pottery, and was undoubtedly the first seat of the earthen-ware manufacture in Staffordshire, and perhaps in Great Britain. Plot, in his "Natural History" of the county, makes particular mention of the potteries at this place, and points them out as the greatest of the kind then known. This author likewise gives an ample detail of the

process of making the ware in his days. Burslem has two markets weekly on Monday and Saturday, but that on Monday is by far the most considerable. Here are also regular annual fairs, established about twenty years ago, for the sale of cattle. The church, which is parochial, is an ancient structure, but has been much altered, enlarged, and modernized within the last twenty years. The Methodists have two chapels in Burslem, and are very numerous. In this town is a great variety of other sectarians.

Cobridge, which is situated partly in the parish of Burslem, and partly in that of Stoke, is a very large and populous village, and possesses spacious manufactories "of the staple articles of the country earthen-ware in it."

Etruria is a large village, in which is a seat belonging to Josias Wedgewood, esq., who has the most extensive manufactory here of any in The Pottery. The name Etruria was bestowed upon it by the father of the present proprietor, whose inventions and discoveries have not only, as before mentioned, advanced his own particular art, but have contributed in a high degree to the enlargement of natural knowledge in general.

Lane-End, *Lower-Lane*, and *Lane-Delft* adjoin, and conclude The Pottery on its eastern boundary. The first mentioned of these townships is by far the most considerable of the three, containing, according to the returns for 1811, 1097 houses, and 4930 inhabitants. Here are a chapel of ease to Stoke, a Methodist chapel, and several meeting-houses for dissenters. Among the less important places in this district, where manufactories of earthen-ware are established, are New-Chapel, Wollstanton, Redtreet, and Norton, which are the most considerable. A Description of the Country from thirty to forty Miles round Manchester, by J. Aikin, M.D., 4to. Shaw's History, &c. of Staffordshire, fol. vol. 1.

POTTING of Plants, in *Gardening*, the operation of placing or planting different sorts of plants, roots, slips, and cuttings, &c. in pots. In this business, more care and attention are necessary than is generally bestowed; as unless the work be neatly performed, it seldom succeeds well. The means of performing this sort of work, is fully explained in speaking of planting in pots in the article on planting. See **PLANTING**.

POTTLE, an English measure for corn and other dry commodities, containing two quarts: 16 pottles being = 32 quarts = 8 gallons = 4 pecks = a Winchester bushel.

POTTON, or **POTTEN**, in *Geography*, a market-town and parish in the hundred of Biggleswade, and deanery of Shefford, is situated on the border of the county adjoining Cambridgeshire, at the distance of forty-eight miles from London. The market, though not so great as formerly, is well supplied with all sorts of grain, particularly with wheat and barley, and is held on Saturday. The date of the charter has not been found on record. A fair on the festival of St. James was granted, in 1227, to Henry de Braybroke, one of the justices of the king's bench, who is supposed to have been then possessed of the manor. There are now four fairs. A great fire happened at Potton in the year 1783, when more than fifty dwelling-houses were destroyed, besides out-houses, &c. The damage was computed at upwards of 25,000*l.* Above 6000*l.* were collected for the poorest of the sufferers. Since this accident the market is said to have declined. The number of houses, according to the returns made to parliament in 1801, pursuant to the population act, was 239, that of inhabitants 1103.

The manor of Potton belonged to the family of the Nevills from

from the reign of Edward II. to the year 1431, and was afterwards, for many generations, in that of the Burgoynes of Sutton. It has since been in the Torrington family, and is now the property of Samuel Whitbread, esq. M.P. whose father purchased it in 1795. The De la Poles had a manor in Potten in the fourteenth century, which in the reign of Henry VIII. was in the family of Tanfield, being then called the manor of Potten-Mynchmaured. It has long been united to the other manor.

The great tythes of Potton were appropriated to the priory of the Minories in London, in the year 1394. They now belong to the parish of Thacksted in Essex, having been purchased, under a decree in chancery, with a sum of money bequeathed to that parish by William lord Maynard, in 1698, for charitable uses. The vicarage of Potten is in the gift of the crown. When the parish was inclosed, under an act of parliament, which passed in 1774, an allotment of land was assigned in lieu of the vicarial tythes. Lysons's *Magna Britannia*, vol. i.

POTTS GROVE, a town of America, in the county of Montgomery, and state of Pennsylvania, containing 1571 inhabitants; 27 miles N.W. of Philadelphia.

POTZDAM, a city of Brandenburg, in the Middle Mark, situated on an island, 16 miles in circumference, formed by the Havel and some neighbouring lakes. It was ceded by the family of Rochau, to whom it belonged, in the year 1416, to the electoral house; and it was made a seat of pleasure by Frederick William, who, in 1662, built a castle, afterwards enlarged by king Frederick I, and ornamented it with a fine portal. King Frederick William began to make some costly additions to the town; and he caused several morasses to be filled and built upon, and a canal 50 paces wide, and 2000 in length, to be carried on out of the Havel, through the centre of the town, to a branch of the same river. This canal has plantations of trees on both sides, and it is environed with well-built houses. The town is divided into Old and New, and the Frederickstadt, to which also belongs the Bodengraff. Frederick II. raised the castle one story, annexed to it two wings, and adorned it with magnificent apartments. The old houses near the castle have been taken down, and grand buildings erected in their room, at the king's expence. A pyramidal obelisk of four sides, composed of variegated Silesian marble, 75 feet high, is erected in the market place, having on one side a marble bust of the king; the pedestal being of white Italian marble, and at each corner is a small statue of the same. The town-church, situated not far from the castle, is a fine structure; the garrison church is large, and under the pulpit, which is constructed of marble, lies the monument of king Frederick William. The orphan-house was founded in 1724, and affords maintenance and education to above 2000 soldiers' children, of both sexes; and to this belong one Lutheran and one Calvinist preacher. To this foundation is annexed the neighbouring village of Bornstadt, together with the gold and silver manufacture, and the magazine at Berlin. In this town there are a velvet and silk manufacture, and manufactures of fabrics of other kinds. The king's guards, both horse and foot, with other battalions, have usually garrisoned this town; 15 miles S.W. of Berlin. N. lat. 52° 25'. E. long. 13°.

POTZEL. See POSSECK.

POTZLOW, a town of the Ucker Mark of Brandenburg; six miles S. of Prenzlau. N. lat. 53° 11'. E. long. 13° 54'.

POUANCE, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Segré; 11 miles N.W. of Segré. The place

contains 1306, and the canton 7382 inhabitants, on a territory of 262½ kilometres, in 15 communes.

POUCA, a lake of Little Bucharia. N. lat. 32° 42'. E. long. 89° 14'.

POUCA *Hotun*, a town of Little Bucharia; 10 miles W. of Tourfan.

POUCH, in the *Military Art*, is a square case or bag of leather, with a flap over it, hanging to a buff shoulder-belt of about three inches broad over the left shoulder of the infantry, used for holding cartridges. The cartridge-boxes within the pouches should be made as light as possible, with thirty-six holes in each, in order to prevent the addition of boxes to buckle round the waist, which, by blowing up, have occasioned mischief and confusion.

POUCH, in *Botany*. See SILICULA, and TETRADYNAMIA.

POUCH, *Shepherd's*. See ALYSSEUM.

POUDER, *Pie, Court*. See *Pie powder COURT*.

POUDIME, in *Geography*, a town of Turkish Armenia; 30 miles E.S.E. of Trebisond.

POUDINGORY, a town of Hindoostan, in the country of the Nayrs; four miles N. of Calicut.

POUDRE *des Chartreux*. See KERMES *Mineral*.

POVEGIA, in *Geography*, a small island in the Adriatic, near the coast of the Dogado of Venice, in the podestata of Malanocco. Damaged vessels put in here for repair.

POVENETZ, a town of Russia, in the government of Olonetz, on the N. coast of lake Onezskoe; 120 miles N.N.E. of Olonetz. N. lat. 64°. E. long. 29° 44'.

POVERTY, PENIA, in *Mythology*, was deified among the ancients; accordingly Arrian informs us, that the Gadarians adored Poverty together with "Arts," which they joined in the same worship, because Poverty is the mother of invention. Plautus, in the prologue to one of his comedies (In *Trim.*) makes this goddess one of the persons in the play, and says, that she was the daughter of Debauchery. Plato makes Love to be her son.

POVERTY Bay, in *Geography*, a bay on the E. coast of New Zealand, in the South Pacific ocean, called by the natives "Taoneroa," or Long Sand, discovered by Capt. Cook in the year 1769. The bay is shaped like a horse-shoe, and is known by an island lying close under the N.E. point; the two points that form the entrance are elevated with steep white cliffs, and lie from one another about 1½ or 2 leagues; the water in the bay is from 12 to 5 fathoms, and it has a sandy bottom, with good anchorage; but it is exposed to the wind between the S. and E. In fine weather boats may go in or out at any time of the tide; but the bar at the entrance prevents their going out, when the sea runs high. The shore of the bay, within its entrance, is a low flat sand; behind which, at a small distance, the country exhibits a diversified scene of hills and vallies, clothed with wood and covered with verdure. The country appears to be well inhabited, particularly in the vallies that lead up from the bay, where Capt. Cook daily saw smoke rising in clouds, one behind another to a great distance, till the view terminated in mountains of stupendous height. It owed its name to the inhospitable behaviour of the natives, who afforded to the Endeavour only a little wood, and no other necessary. S. lat. 38° 42'. W. long. 181° 36'.

POUGET, FRANCIS AMÈ, in *Biography*, priest of the oratory, and doctor of the Sorbonne, was born at Montpellier in 1666. He became vicar of St. Roche at Paris, and in that office he is said to have converted La Fontaine, on which subject he wrote a curious letter, published by Desmolets in his "Memoirs of Literature and of History." Among the works of which he was the author, or editor, that in the highest estimation is entitled "Instructions in the

Form of a Catechism, drawn up by the order of M. Joachim Colbert, bishop of Montpellier. He also wrote "Christian Instructions on the Duties of the Knights of Malta:" and "A Letter to M. Cardinal de Noailles, Archbishop of Paris, on the Subject of the Bull Unigenitus."

POUGET, in *Geography*, a town of France, in the department of the Herault; 18 miles N.E. of Beziers.

POUGHKEEPSIC, a town of America, in the state of New York, pleasantly situated on the E. bank of the Hudson river, half way between New York and Albany. It has five churches, and a very flourishing academy. The population in 1810 was 4670. N. lat. $41^{\circ} 41'$. W. long. $73^{\circ} 58'$.

POUGOMO, a river of Africa, which runs into the Atlantic, N. lat. 9° .

POUGUES, a town of France, in the department of the Nièvre, and chief place of a canton, in the district of Nevers, situated at the foot of a mountain, whence issues a medicinal spring; six miles N. of Nevers. The place contains 975, and the canton 9768 inhabitants, on a territory of $272\frac{1}{2}$ kilometres, in 12 communes.

POUGY, a town of France, in the department of the Aube; 13 miles N.E. of Troyes.

POVIGELIO, a town of Italy, in the department of the Panaro; 10 miles N.N.W. of Reggio.

POUILLON, a town of France, in the department of the Landes, and chief place of a canton, in the district of Dax; six miles N. of Dax. The place contains 2718, and the canton 12,830 inhabitants, on a territory of $202\frac{1}{2}$ kilometres, in 11 communes.

POUILLY, a town of France, in the department of the Côté d'Or, and chief place of a canton, in the district of Beaune; 19 miles W.S.W. of Dijon. The place contains 661, and the canton 12,561 inhabitants, on a territory of $332\frac{1}{2}$ kilometres, in 28 communes.—Also, a town of France, in the department of the Nièvre, and chief place of a canton, in the district of Cosne; 7 miles N. of La Charité. The place contains 2648, and the canton 9212 inhabitants, on a territory of $232\frac{1}{2}$ kilometres, in 11 communes.

POULO POINT, a cape on the west coast of Sumatra. S. lat. $4^{\circ} 4'$. E. long. $102^{\circ} 5'$.

POULONG-TCHEN-TANG, a mountain of Thibet. N. lat. $31^{\circ} 36'$. E. long. $104^{\circ} 36'$.

POULOU-TOU, a town of Chinese Tartary, in the country of the Monguls. N. lat. $42^{\circ} 33'$. E. long. $112^{\circ} 43'$.

POULTICE, or **POULTIS**, a form of medicine, called also cataplasm.

POULTING LUG, in *Rural Economy*, a provincial term applied to a long slender rod used in beating fruit off the trees.

POULTNEY, in *Geography*, a considerable and flourishing town of America, in the state of Vermont, and county of Rutland, near Skeelsborough; containing 1904 inhabitants.—Also, a river of Vermont, which falls into East bay.

POULTON, or *Poulton in the Fylde*, a market-town and parish in the hundred of Amounderness, and county palatine of Lancaster, England. The parish comprises the townships of Carleton, Hardhorn-with-Newton, Marton, Poulton, and Thornton; and contained, in the year 1811, 646 houses, and 3390 inhabitants. The town is situated near the mouth of the river Wyre, at the distance of 21 miles S.W. by W. from Lancaster, and $233\frac{1}{4}$ miles N.W. by N. from London. Some time after the conquest, it constituted the lordship of Roger de Poitiers; and was given by him to the abbey of Shrewsbury, together with the manor of

Biscopeham. The vicarage, however, being reserved in this grant, was subsequently impropriated to the nunnery of Sion in Middlesex, but of late years has become private property. Poulton market-day is Monday weekly; and the fairs are on the 13th February, 3d May, and 25th July. Here are three free schools.

Five miles west from Poulton is the village of *Blackpool*, which has attained, within the last 40 years, considerable distinction as a watering or bathing-place, for which its situation and other characteristics are admirably adapted. At the southern end of this village stands a building denominated Vauxhall, which was long a retreat for Popish recusants. It 1715 it was fitted up to receive the Pretender in a state of concealment, till the people should be ready for a general insurrection. Being surrounded by a lofty wall, defended by a pool and a swamp on the south and east sides, and by the sea on the west side, it could only be approached from the north; and having many secret recesses and hiding-places, it was well suited for guarding against surprise. This building is now levelled with the ground. On the sea-beach here is a fine artificial parade; and in the village a news room and coffee-room have been established for the convenience of visitors, who frequently amount to 500 in one season. For many local particulars relating to this place, see *A Description of Blackpool*, by W. Hutton, F.S.A., 1804; also *Beauties of England*, vol. ix. by John Britton, F.S.A.

POULTRY, in *Rural Economy*, a term applied to all kinds of domestic fowls brought up in the farm-yard, as cocks and hens, ducks, geese, turkeys, &c. The farm-yard cannot be said to be complete, till well stocked with these sorts of birds. The advantage of this sort of stock is, however, probably doubtful, except in particular situations, and where there is much grain cultivated. The poor villager may, however, reap in some cases benefit from products of this sort, as they are able to shift for themselves in some measure the greatest part of the year, by their feeding on insects, corn, or any thing of that nature that they can find.

It is well known that there are many different breeds of these sorts of live stock, but those best known of the fowl kind are the *game* breed, the *white* or *English* breed, the *black* or *Poland* breed, the *Darking* breed, the *large* or *shake-bag* breed, and the *Malay* breed.

The two first are much smaller breeds than the others. This sort of stock affords profit in the eggs, as well as the chickens; therefore, such as are the best layers and fitters should be chosen, which are in general the game and Poland breeds; but the other breeds have probably the advantage in respect to the size of the eggs. As food, the game and white breeds are said to be the most delicate. Some advise the choosing those that are the best breeders and best layers; the oldest being always reckoned the best fitters, and the youngest the best layers; but no sort is good for either purpose, if they are kept too fat. The best age to set a hen for chickens is from two years old to five, and the best month to set them in is February; though any month between that and October is good. A hen sits twenty-one days, whereas geese, ducks, and turkeys, sit thirty. While sitting, they should have constantly meat and drink near them, that they may not straggle from their eggs, and chill them. When fowls are fed with buck-wheat, or with hemp-seed, it is said they will lay more eggs than ordinary; and buck-wheat, either whole or ground, made into paste, which is the best way, is a grain that will fatten fowls very speedily; but the common food used is barley-meal, with milk or water; but wheat-flour moistened is by some thought

thought the best. The hen should not differ from the nature of the cock, but both be working, vigilant, and laborious, for their chickens. It is better for the hen to have no hinder claws, because they often break the eggs. Crowing hens are seldom either good layers or good breeders. To have large eggs, and in plenty, some advise the giving the hens plenty of food, and sometimes oats and animal food, with fenugreek to heat them. And to prevent hens eating their nest eggs, plaster or chalk ones may be employed.

Hens may be kept in the proportion of eight or ten to a cock.

Mr. Young notices, that when in the common way the farmer keeps but a few of each sort, that take their chance at the barn-door, for the convenience of eggs, and not to go to market when a fowl is wanted, no particular attention is requisite; but as, in some situations, they may pay well for more food and closer attention, other circumstances may be remarked. The poultry-house should contain an apartment for the general stock to roost in, another for sitting, a third for fattening, and a fourth for food. If the scale is large, there should be a fifth, for plucking and keeping feathers. If a woman is kept purposely to attend them, she should have her cottage contiguous, that the smoke of her chimney may play into the roosting and sitting rooms; poultry never thriving so well as in warmth and smoke; an observation as old as Columella, and strongly confirmed by the quantity bred in the smoky cabins of Scotland and Ireland. For sitting both turkeys and hens, nests should be made in lockers, that have lids with hinges, to confine them, if necessary; or two or three will, in sitting, crowd into the same nest. All must have access to a gravelled yard, and to grafs for range; and the building should be near the farm-yard, and have clear water near. Great attention should be paid to cleanliness and white-washing, not for appearance, but to destroy vermin. See *POULTRY-HOUSE*.

In respect to feeding them, boiled potatoes are the cheapest food; and of corn, buck-wheat. Turkeys, while young, demand incessant attention, and must be fed with alum curd and leeks, or onions; for which purpose, store of those roots should be kept where they will shoot out, and produce much food. If there be not much success in broods, and a certain high price, they will not answer; for the expenses are heavy in the management of this sort of poultry stock.

In respect to sitting hens, the eggs should constantly be such as are new-laid, and in a perfectly fresh state. The number may be ten or a dozen; but it is best not to have too many, as they can only cover a certain number.

And the broods of chickens should be so managed, as to have them coming in as the season begins to get warm in the spring; but by proper attention, they may be had at almost any time of the year. When they are first brought out, they should be attended to with care, where any are weak; and some advise their being removed into warmth, but it is probably best to let them remain with the hen. When they are two days old, rice, split grits, or very small oatmeal, may be given them, some dry, and some steeped in milk, or else crumbs of fine white bread; and when they have gained strength, curds, cheese-parings, white bread, crusts soaked in milk, barley-meal, or wheaten bread scalded, or boiled or roasted potatoes, or any such like soft meat that is small, and will be easily digested. And it is necessary to keep them in the house for some time, especially in bad weather, and not to suffer them to go abroad with the hen. Green chives chopped among their meat is very good, and will preserve them from diseases in the head; and they

should never want clear water, as puddle water is said to be apt to give them the pip.

Where the chickens are confined under coops, they should not be placed too near each other, as the hens are apt to destroy each other's chickens.

The quantity of food which young chickens mostly consume is about one or two ounces in the day, while in their early growth, as from one to two pounds in weight. They should be prevented from picking up slugs, snails, &c. from the earth as much as possible.

In the view of fattening chickens, or other poultry, various modes are used; but the best practice is probably that of confining them for a few days in dry well-ventilated places, covered so as to prevent the entrance of too much light, the fowls being taken in, in good condition, from the poultry-yards. In these situations they should be regularly fed three or four times in the course of a day with well roasted or steamed potatoes, which are probably the cheapest sort of food; as near Liverpool, in Mr. Wakefield's practice, which was upon an extensive scale, it was attended with the most complete success, the poultry thriving perfectly well. Buck-wheat is likewise an useful and cheap food for this purpose, either given whole or ground into flour; barley-meal, ground malt, and also coarse wheat-flour, when mixed up with milk, or, what is better, water, as milk runs quickly into a state of acidity, have been much recommended in this intention. From some experiments, it has been stated that pea-meal, employed in the same way, possesses a still more fattening property, and is at the same time more economical, as going much further. A confinement of eight or ten days in this way will, in general, be sufficient for effecting the business of fattening. When kept up long, fowls are extremely apt to be affected with disease. Whatever sort of food is made use of, full air and a perfect state of cleanliness are essential in all the utensils employed for the purpose, in order to prevent the food becoming sour, and the fowls affected with diseases of the kinds mentioned below.

It is stated in the Suffex Corrected Agricultural Report, that North Chappel, Kindford, and other places thereabouts, are famous for their fowls. They are fattened there to a size and perfection unknown elsewhere. The food given them is ground oats made into gruel, mixed with hog's greafe, fugar, pot-liquor, and milk; or ground oats, treacle, and suet; also sheep's pluck, &c.; and they are kept very warm. They are always crammed in the morning and at night. They mix the pot-liquor with a few handfuls of oatmeal; boil it; it is then taken off the fire, and the meal is wetted, so as to be made to roll into pieces of a sufficient size for cramming. The fowls are put into the coops two or three days before they begin to cram them, which is done for a fortnight, and then they are sold to the higliers. They will weigh, when full grown, seven pounds each, and they are sold at from 4s. 6d. to 5s. a piece; the average weight being five pounds; but there are instances of these fowls weighing double this weight. Mr. Turner, of the first of the above-named places, a tenant of lord Egremont's, crams two hundred a year. And many fat capons are fed in this manner; good ones always look pale, and waste away: great art and attention are requisite to cut them, and numbers are destroyed in the operation. The Suffex breed are too long in their body, to cut them with much success, which is done at three-quarters old.

The Darking fowls, as they are called, are all raised in the weald of Suffex; but the finest market for them is Horsham. The five-clawed breed have been considered as the best sort: this, however, is a great mistake, and it took its

POULTRY.

origin in some fowls with this peculiarity, that happened to be very large and fine, which laid the foundation of what have been since called *the Darking* or *five-clawed fowls*, and considered in other parts of England as the prime stock; but such a thing is hardly known in Suffex: it is a bastard breed. The fowls of the Suffex breed, which are used at the table of lord Egremont, have very frequently, it is said, astonished the company by their size.

All about the neighbourhood of Oakingham in Berkshire, also, the practice of cramming fowls is a lucrative branch of business. They are there put up in a dark place, and crammed with a paste made of barley-meal, mutton-suet, and some treacle, or coarse sugar, mixed with milk, and are found to be completely ripe in a fortnight. If they are kept longer, the fever, which is induced by this continued state of repletion, renders them red in their flesh, and unsaleable, and frequently kills them.

Whether the practice of cramming in these sorts of birds, as well as some other kinds, has any very beneficial effect in promoting the fattening process, is a point in their management which has not yet been, by any means, fully ascertained; but it is a method which, as being attended with considerable trouble, would hardly be had recourse to, in so many places, unless some sort of advantage was derived from it. The fattening would, however, in these cases, seem to depend upon the quantity of nutritious matter which is converted, and taken into the system, as prepared by the process of digestion, and not upon the quantity of food forced into the stomach. See **TURKEY**.

It is stated by a writer in the sixth volume of the Agricultural Magazine, that he has ascertained that three pounds of meal-flour, or grain of such a sort as does not cost more than a penny a pound, or to the farmer and cottager not even so much with water, and what other fare the little creature can find for itself, will feed and fatten a chicken sufficiently from the time of its bursting the shell, till that of its being of a growth, and in a condition suitable for its being carried to market. And that the allowance of another penny is sufficient for the attention and labour which its rearing requires. The prime cost of the egg may be a halfpenny. Thus it is supposed, that even in the neighbourhood of any great town a chicken that shall bring nine-pence, or rather one shilling in the market, and is, in comparison with other things, worth as much for the use of your own table, whether you be a rich or poor man, may be produced and reared at the expence of four-pence halfpenny. And further, that in proportion as fowls are kept for the consumption of the portion of farinaceous food that is daily in waste about farm-houses, the expence cannot be more than one penny; consequently, by attention to this economical mode, abundance of poultry may be had at a reasonable rate. And that old fowls, even though fed with food, for which money proportionate to the just market value must be paid, will, by their eggs, pay annually at least three times the cost of their subsistence, independently of the advantage of the manure which is afforded.

A system of farm-management in this respect is stated by Mr. Young, as practised by Mr. Boys of Kent, which appears to be extremely simple and beneficial. The labourers' wives and families who live on Mr. Boys' farm do the whole; he supplies them with what offal corn is necessary, and they return Mrs. Boys the grown fowls ready for market at three-pence each; six-pence for turkeys and geese; and three-pence for ducks; and the account, well kept, states a profit of twenty pounds a-year, after all the expences are paid, and the family well supplied. And she has likewise all the eggs without any payment. This is a

system equally beneficial to the people who undertake it, and to the farmer.

And a gentleman in that part of Berkshire which is called the "Vale of White Horse," to whose comprehensive mind nothing is too great, and to whom no object connected with the farm appears too little, favoured the writer of the Agricultural Report of that district with an inspection of his bailiff's book, from which he made the following extracts on the produce of the poultry-yard. It was the account for one year:

		<i>£</i>	<i>s.</i>	<i>d.</i>
1293 eggs, at two for 1 <i>d.</i>	-	2	13	10
166 fowls, at 3 <i>s.</i> per couple	-	12	9	0
31 ducks, at 4 <i>s.</i> 6 <i>d.</i> per couple	-	3	9	9
22 geese, at 5 <i>s.</i> each	-	5	10	0
34 turkies, at 7 <i>s.</i> 6 <i>d.</i> each	-	12	15	0
		36	17	7

It is suggested, that the estimated price here is much lower than the average of markets in general; but it will furnish some criterion of the comparative value of domestic poultry in a farming point of view.

It is conceived, that the consolidation of farms, among other ill consequences, has diminished the quantity of poultry, and consequently enhanced the price. And that though the gentleman, the yeoman, and the capital rack-renter, may sometimes rear enough for the supply of their own tables; yet it is an object beneath their notice to produce a supply for the public. Therefore the business of breeding poultry for the market is either left to the cottager, whose means and opportunities are limited, or to the little tradesman and farmer.

Eggs, too, from the same cause, are much dearer than formerly; and yet, when we consider the amazing demand and consumption, it is only wonderful they should be procured on any terms. In every part of this county, however, the supplies are pretty abundant, though rather high, of both poultry and eggs; and as fowls are the least expensive of all kinds of live-stock to a poor man, it is suggested, that he should be encouraged to profit himself and the public, by keeping as many of them as his situation will permit.

The market of Oakingham is particularly famous for fatted fowls, by which many persons in the town and neighbourhood gain a living. They are sold to the London dealers; and the sum of 150*l.* has been returned in one market-day by this traffic. Twenty dozen of these fowls were purchased for one gala at Windsor, at the rate of half a guinea a couple. At some seasons of the year, 15*s.* are paid for a couple. They constitute the principal commerce of the place.

In the county of Chester, the generality of the farmers seem to be of opinion, that it is more profitable to keep fowls for their eggs, than to breed them for the table; a considerable number, however, are brought into the different markets in the county for sale, and a still larger portion is purchased by the higglers, and carried to other markets in the large towns in the neighbouring districts. In most counties where grain is much cultivated, or where other sorts of proper food are in plenty, poultry of the fowl kinds may be advantageously reared, both for the sake of the eggs and the birds.

Birds of the poultry kind are subject to different diseases, as the *pip*, the *roup*, the *flux*, the *stoppage*, and *blindness*. The first is said to be occasioned by eating fowl meat, and drinking dirty water, or the want of water. It is known

POULTRY.

by a thin white scale on the tip of the tongue, which prevents the fowl from eating; and it is cured by taking off the scale with your nail, and rubbing salt upon the tongue.

The second is supposed to be a sort of swelling on the rump, which disorders the fowl prodigiously; and is observable by the feathers on the affected part standing out of their natural position, the quills being full of blood. Pulling out the feathers, opening the sore, forcing out the core, and washing the part with brine or with salt and water, will effect the cure, it is said, in most cases of this nature.

The flux is supposed to depend on eating too great a quantity of moist fermenting food, and which is cured by giving peas-meal and scalded rice with a little wax. The stoppage in fowls is a sort of costiveness, which affects them to such a degree, that they are unable to walk, and is shewn by their not eating as usual. Its cure is effected by anointing the vents, and then feeding them with corn, or small bits of bread soaked in urine; the obstructing surfaces may also be taken out of the crops. The blindness of fowls is best remedied by a change of food, and letting them have a free air.

It is observed, to distinguish whether poultry is good or not, the following circumstances should be noticed: after a chicken is killed, it will be stiff, white, and firm in the vent, if new killed; but tender and green in the vent, if stale; and if you rub your finger on the breast of a chicken, if it be new killed it will feel rough; but if stale, slippery and slimy.

Guinea fowls are a sort of bird of the fowl kind, which lay very abundantly, but which, from their retaining much of their wild nature, are apt to wander much from home, and of course cannot be kept so conveniently as the more domestic sort of fowls. They are likewise remarkably shy, and on that account liable to forsake their nests upon the least disturbance being given them. They are probably better for the table than the common fowl, as being larger, and having more of what is termed the *game* flavour; they have likewise the property of breeding abundantly when properly managed.

Turkeys are a sort of farm-stock that can only be kept with advantage in districts where grain is the predominant article of cultivation. There are two varieties of these birds in this country, the black and the speckled sorts, the former of which is, in general, the larger and more hardy. It is found that they are birds that prosper very well in open countries, where there is not much shelter to harbour vermin to destroy them: for they are naturally inclined to ramble. The hens, likewise, are so negligent of their young, that whilst they have one to follow them, they never take any care of the rest; and therefore there must be a great deal of care taken of them whilst they are young, to watch them, and to keep them warm, as being birds that cannot bear the cold. But some, where they have the conveniency of a small cover near the house, let them take their liberty, and seek their own nests; but it is only in particular places that they do well with such management. It is observed, that a gentleman had a hen-turkey of the wild kind from Virginia, from which, and an English cock, he raised a very fine breed, and much larger than the common, and reared their young ones without any care or trouble, breeding much better than the English sorts. Where they are kept with corn, they are very great feeders, and devour a great deal; but if left to their liberty when grown up, they nearly get their own living, by feeding on herbs, feeds, &c.

This is a sort of bird which breeds without the male

birds being kept constantly with the females during the laying season, as is the case with most other sorts of birds. Turkeys are very apt to straggle, often laying their eggs in secret places; and therefore must be watched, and made to lay at home. They begin to lay in March, and will sit in April. Eleven or thirteen eggs are the most they sit on. They hatch in between twenty-five and thirty days; and when they have hatched their brood they must be carefully kept warm, for the least cold kills them. They may be fed either with curds, or fresh cheese chopped in small pieces with onions or leeks, and their drink may be new milk, or milk and water. Some give them oatmeal and milk boiled thick together, into which they put onions or leeks chopped small, and sometimes eggs boiled hard, and cut in little pieces. They must be fed often, as the hen will not take much care of them, and when they have got some strength, be fed abroad in a close walled place, where they cannot stray; not letting them out till the dew is off the grass, and taking care to have them in again before the night, because the dew is very prejudicial to them.

It is noticed that these birds, when young, may be fattened with great expedition by means of boiled potatoes and good barley meal, mixed well together with chopped onions or leeks, if they be kept fed in a regular manner. The writer of *Practical Agriculture* says, that the practice of cramming them is a piece of stupid and unnecessary cruelty, as it is evident they can only fatten in proportion to the quantity of food which is digested, whatever quantity may be forced upon them; besides, they will consume it fast enough if regularly fed, which is probably the fact, however custom may have sanctioned such a method of fattening them. The author of the original *Report of Norfolk* thinks, that the fineness of the flavour in the Norfolk turkeys depends on the dryness of the soil in that district, and the extensiveness of the range which they are suffered to possess while in their young growth. The difference between the living and dead weight of a turkey, is thus stated by Mr. Young; live weight 21lb., dead weight 14lb.

The farmers in many districts of the country are prevented from the raising and keeping birds of this kind, on account of the great mischief which they do to the different sorts of field crops. They are, however, fine farm-yard birds, wherever they can be kept with propriety.

Ducks are a sort of water-fowl that may be raised with benefit in particular situations, where there is plenty of water for them to rest upon in the vicinity of the farm-stead, as they require little trouble or attention. There are different breeds, but the *English* or *white*, and the *brown* or *speckled* wild breeds, are probably to be preferred. The latter are, however, apt to wander. But it is only in such situations as above, that this sort of stock can be kept with benefit, except it be a few just for the purpose of the table. Ducks mostly begin to lay early in the year, as the latter end of January, or beginning of the following month, especially when well fed, and they require great attention at this period, as they lay a great number of eggs, and are very apt to drop them in the water, or at random in other places. One drake is sufficient for four or five ducks. When set, from ten to a dozen or thirteen eggs are a sufficient number. They sit about thirty days, and, during the time, should be fed, and have water near their nests, to prevent the eggs being injured by their leaving them too long. When hatched, the ducklings should remain with the duck in some inclosed, safe, warm, sunny place, and be well fed with crumbs of bread, grits, or barley-meal, with well roasted or boiled potatoes, well mixed, and used

POULTRY.

in a fresh state, sand and clean water being constantly kept beside them in shallow pans. It is observed that the duck-breeders have in general a provision of worms, snails, and other similar animals, in readiness for them when a little more advanced in their growth, as well as corn either in its ground or natural state, and that it is likewise a point of great importance to keep them perfectly clean, and to let them have plenty of dry clean straw as litter. They should never be left at full liberty till they are become quite strong, as a month or six weeks old, being constantly kept as distinct as possible from the other sorts of poultry.

In the fattening of these birds, which are greedy, but not nice feeders, grain, either in its whole, or reduced mixed state, is probably the best sort of food. The use of boiled potatoes well mixed with oatmeal, is found to be an economical and expeditious method. Much, however, depends on their being fed in an exact and regular manner, and on a proper supply of water and sand being constantly given; while at the same time they are kept in a perfectly quiet detached situation, not too much exposed to the action of light, but well aired. When fattened on animal substances, which are very expeditious in accomplishing the business, they are said to have more resemblance both in the colour and flavour of their flesh to the wild duck, than in the common method. In the acorn season they are also capable of being readily fattened on that sort of food, and are allowed to be well flavoured in their flesh from the use of it. And Mr. Weston has advised the use of malt for this purpose, which, he says, answers in the proportion of something less than a gallon *per* duck. It has an amazing quality in fattening them when young, and causes the flesh to be very delicate; when old, they readily fatten with almost any food; but for the flavour it gives the flesh, he would always prefer malt before any thing else: before they have been put up to fatten, he has likewise given them plenty of lettuces, which they are exceedingly fond of; they are, he thinks, a very cheap food for them, as they need then have but little corn in completing them.

It has been long ago observed that these birds are useful in destroying slugs, caterpillars, &c.; and the author of the Report of Middlesex thinks it is clearly ascertained, that ducks might be kept in such numbers on corn farms, as to prevent any sensible loss or destruction in their crops by worms, slugs, or caterpillars; and yet we are always hearing of great losses occasioned by these vermin. The support of a hundred or two of ducks on a farm is a trifling expence, and might be considered in the light of ensuring the young crops against being cut off. It is thought that many farmers receive more damage to a crop in one season, than would support a sufficient number of ducks to give security for twenty years.

And the establishing of decoys for the taking of wild ducks, is a point that deserves the farmer's notice in particular situations, as where there is a great extent of water in a retired situation, at a short distance from the sea. It is often done in the wilds of Lincolnshire, and in Norfolk, as well as some other districts. Mr. Marshall remarks, that the lakes and large pools, which abound in the southern hundreds of East Norfolk, are the nurseries of innumerable flights of 'wild fowl,' of various species, but principally ducks; which are taken in great numbers in decoys, formed on the margins of these waters; and which, in eligible situations, may well be considered as objects of rural economy. But that judgment is requisite in forming and managing a decoy. A gentleman in this neighbourhood had, says he, a person out of Lincolnshire to make one for him. But after a great expence of cutting pipes, fixing

skreens, nets, &c. it proved unsuccessful. The pipes were too straight, too close and confined, and too narrow at the mouth; without any banks for the wild fowl to bask upon. Upon the whole it was too much like a trap to be taken in.

He notices, that the leading principles of a decoy are these; as the wild duck is a very shy bird, and delights in retirement, the first step, therefore, is to endeavour to make the given water a peaceful asylum, by suffering the ducks to rest on it undisturbed. The same love of concealment leads them to be partial to waters whose margins abound with underwood and aquatic plants; hence, if the given water is not already furnished with these appendages, they must be provided; for it is not retirement alone which leads them into these recesses, but a search after food also. And further, that at certain times of the day, when wild fowl are off their feed, they are equally delighted with a smooth, grassy margin, to adjust and oil their plumage upon. On the close-pastured margins of large waters frequented by wild fowl, hundreds may be seen amusing themselves in this way; and, perhaps, nothing draws them sooner to a water than a convenience of this kind: hence it becomes essentially necessary to success, to provide a grassy, shelving, smooth-shaven bank at the mouth of the pipe, or canal, leading from the water to a tunnel net, fixed at the head of it; but hid from the sight among trees and aquatic plants; the difficulties that remain are those of getting them off the bank into the water, without taking wing; and of leading them up the pipe to the snare which is set for them, in the most easy manner.

With a view to get them off the bank into the water, a dog is necessary, (the more like a fox the better,) which should steal from behind a skreen of reeds, which is placed by the side of the pipe to hide the decoyman, as well as his dog. On seeing the dog, the ducks rush into the water, where the wild fowl consider themselves as safe from the enemy which had assailed them, and of course do not take wing.

Among the wild-fowl, a parcel (perhaps eight or ten) of decoy-ducks should be mixed, which will probably be instrumental in bringing them, with greater confidence, to the bank. As soon as these are in the water, they make for the pipe, at the head of which they have been constantly fed; and in which they have always found an asylum from the dog. The wild ducks follow, while the dog keeps driving behind; and, by that means, takes off their attention from the trap they are entering. When, as soon as the decoyman, who is all the while observing the operation through peep-holes in the reed-skreen, sees the entire shoal under a canopy net which covers and encloses the upper part of the pipe, he shews himself; when the wild fowl instantly take wing; but their wings meeting with an impervious net, instead of a natural canopy formed of reeds and bull-rushes, they fall again into the water, and, being afraid to recede, the man being close behind them, push forward into the tail of the tunnel net which terminates the pipe. He has been told by the proprietor of a decoy, who is himself fond of the diversion, and whose veracity he has no reason to doubt, that he has, in this way, caught 'nine dozen' at a push.

And from this use of the pipe, its form becomes obvious. It ought to resemble the outlet of a natural brook, or a natural inlet or creek of the principal water. The mouth ought to be spacious, and free from confinement, that the wild fowl, on their first rushing into the water, and while they have yet the power of recollection, may be induced to begin to follow the tame ducks; and for the same purpose it ought to be crooked, that its inward narrowness, and nets, may not, in the first instance, be perceived. The lower

part of a French horn is considered as the best form of the pipe of a decoy that can be had.

But a material circumstance remains yet to be explained. It is the invariable nature of wild fowl to take wing with their heads towards the wind; and it is always imprudent to attempt to take them in a decoy, unless the wind blows down the pipe; for, while their enemy is to leeward of them, they have less scruple to go up the pipe, making sure of an escape by their wings. What is of still more consequence, if the wind set up the pipe, when they take wing under the canopy net, some of them would probably escape (a circumstance always to be dreaded), and those which fell again into the water, would fall, of course, with their heads towards the wind, and would with great difficulty be driven into the tunnel. It is also further stated, that this point is so well known by decoymen in general, that every decoy is, when circumstances will admit of it, furnished with three or four different pipes, pointing to distinct quarters of the horizon, that no opportunity may be lost on account of the wind being in any particular point.

Contrivances of this sort for catching ducks and other kinds of birds, are pretty frequently met with in Essex, and it is noticed in the corrected Report on Agriculture for that district, that one of the best, if not the most considerable, decoys in that county, is in the island of Mersea, and rented with a small farm of about sixty acres, by Mr. Buxton, of Layer de la Haye. He was so obliging as to accompany the writer from thence into Mersea, and to shew him his decoy. Not having before viewed a decoy in the taking season, he had not remarked the precaution of each person taking a piece of lighted turf stuck on a table fork in his hand to approach the decoy; as the wild ducks, it is said, would smell the person without this caution, and immediately quit the pond. He found the expences of this decoy considerable; two men attend it, who are paid above 100*l.* a-year; repairs, nets, rent, &c. amount in all to about 300*l.* a-year. Ducks are sometimes so low as 14*s.* a dozen.

Dun birds are also frequently secured by means somewhat of this kind, in this district. The contrivances for taking these birds here were new to him. At the decoy for them near Ipswich, there is a series of very high poles set up, to which the nets are attached, for taking them in their flight; and these poles are permanent. But at this Mersea decoy, to which this bird resorts in large quantities, as well as ducks, the net poles are suspended when not at work. Mr. Lee has a decoy at Goldhanger, in the same county, in which he took, at one haul, one waggon-load and two cart-loads of dun birds; but the disturbance made, frightened such as escaped so much, that he took no more that season.

Though the expence, in some cases, as has been seen, is very considerable, yet there is often no small profit attached to these kinds of decoys.

It may be noticed, that the fattening of ducks at any age is easy, and whether it be the duckling, or the grown duck, the method to be used is exactly the same. See DUCK.

Geese are a sort of bird that will live upon commons, or any sort of pastures, and need little care or attendance; only they should have plenty of water. The largest English geese are reckoned the best, but there is a sort of Spanish geese that are much better layers and breeders. In providing geese for keeping, the author of Practical Agriculture says, great care should always be taken to procure them as large in size as possible, and from places where they have been well kept. Geese, like most other birds, begin to lay in the spring months; and the earlier this happens the better, as the price of early green geese is generally high, and in some cases it may be possible to have a second brood. Both these

purposes may be promoted by letting them be well fed with oats, grains, or some such kinds of food at the period. The goose generally lays from eight to twelve eggs. It may be known when geese are about to lay, from straw being frequently picked up and carried about by them. The length of time of sitting is about thirty days. When geese are inclined to sit, they generally shew it by remaining on their nests after laying a considerable time. In this case a proper quantity of eggs, as from ten to twelve, should be placed in the nests, and something put before them, so as to prevent the geese from being much seen. They should also have plenty of food, sand, and water, near them, in order that they may not remain long off the nests, and in that way let the eggs be too much cooled. The ganders should be left with them as guards. When the weather is warm, they generally hatch sooner than when it is cold. After the goslings are hatched, the best method is to let them remain with the geese, especially where they are strong, in some warm sunny place, that is well secured against the entrance of rats, and all other sorts of vermin, and which is properly supplied with water; being well fed with the crumbs of bread, grits, wheat, and some chopped clivers. They should remain in this confinement until they are grown strong, and capable of following the geese with ease; they may then be put into a small field or paddock, where the grass is short, till they are fit to be turned out with the geese. When they are weakly, it is customary to feed them in the house with bread soaked in milk, or a little barley-meal, and where this is done, they should, however, always be put under the geese again immediately after such feeding, and handled as little as possible: warmth in this stage being the most essential article in rearing them. They should never be suffered while very young to go in the wet, dew, or water, as the cold soon destroys them, by giving them the cramp or other diseases.

In the Lincolnshire Report it is stated to be the practice of that district, where vast numbers of these birds are annually produced, for their nests to be made of straw, and confined, so as that the eggs cannot roll out when the geese turn them, which they do every day. When near hatching, the shell is broken a little against the beak or nib of the gosling, to give air, or to enable it to receive strength to throw off the shell at a proper time: this is, however, seldom necessary. It is added, that the time of plucking them is about the beginning of April, when the fine feathers of their breasts and backs should be gently and carefully plucked: care must be taken not to pull or interrupt their down or pen feathers, and the quills should be pulled five out of each wing. And it is observed that they will bear pulling in thirteen or fourteen weeks again, or twice in a year: the feathers three times a year of the old geese and ganders, seven weeks from each pulling. The young geese may be pulled once at thirteen or fourteen weeks old, but not quilled, being hatched in March. But when late in hatching, the brood geese should not be plucked so soon as April, but the month after. When well fed with barley and oats, they thrive and do better, and their feathers grow faster, and are better in quality than where it is omitted. They must constantly have plenty of grass and water; it is further stated, that in many parts of that fenny district, great advantage is made by the frequent pluckings of the geese. At Pinchbeck, it is the practice to pluck them five times in the year, as at Lady-day, Midsummer, Lammas, Michaelmas, and Martinmas. The feathers of a dead goose are worth sixpence, those giving a pound, but plucking alive does not yield more than three-pence a head *per annum*. Some wing them only every quarter, taking ten feathers from

from each goose, which sells at five shillings a thousand. Plucked geese formerly paid in feathers one shilling a head in Wildmoor fen, but at present it is much more.

In Lancashire no sort of management is pursued with these birds, but those of taking care of their eggs while they lay, and guarding the young goslings from accidents for a week or two, while they get sufficiently strong to take care of themselves. The geese are usually plucked twice in the year, as about Midsummer and at harvest, in each of which pluckings they afford fully one shilling each, producing, on the whole, a profit of about four shillings and sixpence a piece to their owners. When they are killed, each goose yields about half a pound of feathers, independent of the former pluckings.

They are here most commonly fattened with oatmeal and potatoes, in a boiled or steamed state, the two substances being well mixed together immediately before being used. Each goose requires about two pounds and a half of meal, besides the potatoes, to render it quite fat. A good goose, when completely fattened, will weigh about nine pounds.

Vast numbers of geese are reared and kept upon the commons, in this as well as other counties.

In fattening green geese, they may be shut up when they are about two months old, and they will be fat in about a month more. They should have a little grass with their dry food, which may be any sort of grain, malt or carrots.

But in the fattening of older geese, it is commonly done when they are about six months old, in or after harvest, when they have been in the stubble field, from which food some kill them, which is a good way; but those who have a mind to have them very fat, shut them up for a fortnight or three weeks; and feed them with oats, split beans, barley-meal, or ground malt mixed with milk, the best thing to fatten them with being malt, according to Mr. Weston. Green geese will likewise feed on and fatten well with carrots, cut small, and given them. If you give store-geese rye before or about Midsummer, it will strengthen them and keep them in health, that being commonly the time when they become sickly. See CAPON, CHICKEN, COCK, EGGS, HEN, and PHASIANUS *Gallus*.

Poultry House, in *Rural Economy*, that sort of building which is contrived for the purpose of containing poultry, for laying, hatching, fattening, &c. It is observed, in a paper in the first volume of *Communications to the Board of Agriculture*, that this sort of stock, when rightly managed, might be a source of great profit to the farmer; but where many are kept they ought not to be allowed to go at large, in which case little profit can be expected, for not only many of their eggs will be lost, and many of themselves perhaps destroyed by vermin, but at certain seasons they do a great deal of mischief, both in the barn-yard and in the field. No doubt they pick up some grain at the barn-doors that might otherwise be lost, but if the straw is properly thrashed and shook, there would be very little of this. In the common careless way of thrashing, a great deal of corn is undoubtedly thrown out among the straw; but when we consider the dung of the fowls, and their feathers that get among it, and the injury these may do the cattle, this is no object. It is much better, the writer thinks, to allow the poultry a certain quantity of corn and other food, and to let the cattle have the benefit of what corn may be among the straw. He therefore concludes that poultry ought always to be confined, but not in a close, dark, diminutive hovel, as is often the case; they should have a spacious airy place, properly constructed for them. Some people are of opinion, that each sort of poultry should be kept by itself. This, however, is not absolutely necessary, for all sorts may

be kept promiscuously together, provided they have a place sufficiently large to accommodate them conveniently, and proper divisions and nests for each kind to retire to separately, which they will naturally do of themselves. And, he adds, that this mode was practised with great success at Mr. Wakefield's, near Liverpool, who kept a large stock of turkeys, geese, hens, and ducks, all in the same place: and although young turkeys are in general considered so difficult to bring up, he reared great numbers of them, the writer observes, in this manner every season, with little or no trouble whatever. For which purpose he had about three quarters, or near a whole acre, inclosed with a fence only six or seven feet high, formed of slabs set on end, or any thinning of fir or other trees split and put close together. They are fastened by a rail near the top, and another near the bottom, and are pointed sharp, which he supposes prevents the poultry flying over, for they never attempt it, although so low. Within this fence are places done up slightly, but well secured from wet, for each sort of poultry; also a pond or stream of water running through it. These poultry are fed almost entirely with potatoes boiled in steam, and thrive astonishingly well. The quantity of dung that is made in this poultry place, is also an object worth attention; and when it is cleaned out, a thin paring of the surface is at the same time taken off, which makes a valuable compost, for the purpose of manure. But for keeping poultry upon a small scale, it is only necessary to have a small shed or slight building, formed in some warm sheltered sunny situation, if near the kitchen or other place where a constant fire is kept so much the better, with proper divisions, boxes, lockers, or other contrivances for the different sorts of birds, and for their laying in, fitted up in it.

It is, however, stated in the paper before noticed, that the most magnificent poultry place perhaps that ever has been built, is at lord Penrhyn's, at Winnington, in Cheshire: it consists of a handsome regular front, extending about 140 feet: at each extremity is a neat pavilion, with a large arched window. These pavilions are united to the centre of the design, by a colonnade of small cast-iron pillars, painted white, which supports a cornice, and a slate roof, covering a paved walk, and a variety of different conveniences for the poultry, for keeping eggs, corn, &c. The doors into these are all of lattice work, also painted white, and the framing green. In the middle of the front are four handsome stone columns, and four pilasters, supporting likewise a cornice and a slate roof, under which and between the columns is a beautiful mosaic iron gate; on one side of this gate is an elegant little parlour, beautifully papered and furnished; and at the other end of the colonnade a very neat kitchen, so excessively clean, and in such high order, that it is delightful to view it. This front is the diameter or chord of a large semicircular court behind, round which there is also a colonnade, and a great variety of conveniences for the poultry: this court is neatly paved, and a circular pond and pump in the middle of it. The whole fronts towards a rich little field or paddock, called the poultry paddock, in which the poultry have liberty to walk about between meals. It happened while the writer was there to be their dinner time, at one o'clock. At this hour a bell rings, and the beautiful gate in the centre is opened. The poultry being then mostly walking in the paddock, and knowing by the sound of the bell that their repast is ready for them, fly and run from all corners, and rush in at the gate, every one striving who can get the first share in the scramble. At that time there were about 600 poultry of different kinds in the place, and although so large a number,

ber, the femicircular court is kept so very neat and clean, that not a speck of dung is to be seen. This poultry place is built of brick, excepting the pillars and cornices, and, he believes, lintels and jambs of the doors and windows, but the bricks are not seen, being all covered with a remarkably fine kind of slate from his lordship's estate in Wales. These slates are closely jointed and fastened with screw nails, on small spars fixed to the brick; they are afterwards painted, and fine white sand thrown on while the paint is wet, which gives the whole an appearance of the most beautiful freestone. This sort of cleanliness, with as free a circulation of air as possible, and a proper space for the poultry to run in, is essential to the rearing of this sort of stock with the greatest advantage and success, as in narrow confined situations they are never found to answer in so perfect a manner.

POUNCE, among *Artificers*, a little heap of charcoal dust, inclosed in some open stuff, to be passed over holes pricked in a work, in order to mark the lines or designs thereof on a paper placed underneath; which are to be afterwards finished with a pencil, a needle, or the like.

The word is formed from the French *ponce*, pumice-stone; because they anciently used pumice-stone powdered for this purpose.

Pounce is much used by embroiderers, to transfer their patterns upon their stuffs; by lace-makers, and sometimes also by engravers; and a kind made of gum sandarach, by writing-masters, which being rubbed on the paper, makes it less apt to imbibe the ink; it is, therefore, used in this manner by those who are curious in the art of the pen, by which means the writing appears more precise, sharp, and determinate.

The varnish-makers also used to dissolve it in oil of turpentine, or in linseed oil, or in spirit of wine; from which mixture is produced a kind of liquid varnish.

POUNCES, in *Falconry*, the talons or claws of a bird of prey.

POUND, **LIBRA**, a weight of a certain proportion, much used as a standard for determining the gravities and quantities of bodies.

The word is derived from the Saxon *pund*, or *pond*, *pondus*, *weight*.

We have two different pounds in England; the pound *troy*, and the pound *avoirdupois*. The pound troy consisted originally of 7680 grains, but was afterwards reduced to 5760, making 24 grains the pennyweight, instead of 32: these were grains of wheat taken from the middle of the ear. The pound troy is = 7025 French grains = 7766 Dutch ascs = 6948 Hamburgh or Cologne eschen = 7475 Spanish or Castilian grains. The Tower or Moneyers' pound, with which gold and silver were weighed in England before the reign of Henry VIII., and which is still occasionally referred to on the subject of coins, was lighter than the pound troy by 15 pennyweights troy.

One pound avoirdupois is = 7000 grains, troy weight; and, therefore, 144 lb. avoirdupois = 175 lb. troy, or 192 oz. avoirdupois = 175 oz. troy. The pound avoirdupois is = 8537 French grains = 9439 Dutch ascs.

The old commercial weight of England, which is still retained in Scotland, and which is said to have been formerly used at Amsterdam, Hamburgh, and Paris, is about $\frac{1}{12}$ th heavier than avoirdupois weight, the pound being 7600 grains troy; and, therefore, 35 lb. old weight = 38 lb. avoirdupois. This is still the weight in England by which the assize of bread is fixed by the magistrates; the peck loaf, newly baked, being 16 lb. old weight, which answers to 17 lb. 6 oz. avoirdupois. See **WEIGHT**.

For the several pounds of the several cities and countries; their proportion, reduction, division, &c. see WEIGHT.

POUND of France, according to the old system. See **MARK** and **LIVRE**.

POUND, Roman. See **LIBRA** and **LIVRE**.

POUND also denotes an imaginary money used in accounting; containing more or less, according to the several names added to it, and the several countries in which it is used. Thus in England, we say, a *pound sterling*; in France, a *pound*, or *livre Tournois* and *Parisif*; in Holland and Flanders, a *pound*, or *livre de gros*, &c.

The term took its rise hence; that the ancient pound sterling, though it only contained 240 pence, as our's does; yet each penny being equal to five of our's, the pound of silver weighed a pound troy.

The pound sterling, or English pound, contains 20 shillings, the shilling 12 pence, and the penny four farthings. Anciently there were three ways of paying a pound of money into the exchequer. 1. The payment of a *pound de numero*, which was just 20 shillings in tale. 2. *Ad scalam*, which was 6d. over and above the 20 shillings. 3. *Ad pensam*, which was giving the full weight of 12 ounces.

In estimating the fineness of gold, in our coinage, which is expressed in carats and grains, the pound, or other weight, is divided into 24 carats, and the carat into 24 grains; so that the pound carat is the 24th part of a pound troy, or half an ounce; and the carat grain is the 8th part of an ounce, or 2 dwts. 12 grains troy. An ounce carat is 20 grains, and a carat grain, in this case, is 5 grains troy. As standard gold coin is 22 carats fine, so the pound, or other weight, should contain 22 parts of pure gold, and 2 of alloy; the fineness may be expressed $\frac{22}{24}$ or $\frac{11}{12}$. The fineness of silver is expressed in ounces and pennyweights; the pound being 12 ounces, and the ounce 20 pennyweights. Standard silver coin is 11 oz. 2 dwts. fine; so that the pound should contain 222 pennyweights of pure silver, and 18 pennyweights of alloy, that is $\frac{222}{240}$ or $\frac{11}{12}$. From a pound troy of standard gold, 44½ guineas, 89 half guineas, or 133½ seven shilling pieces are coined; so that standard gold is coined at the rate of 3l. 17s. 10½d. per oz., which is called the mint price. From a pound troy of standard silver, 12½ crowns, 24½ half crowns, 62 shillings, or 124 sixpences, are coined; so that the mint price of standard silver is 5s. 2d. per ounce. The remedy or allowance for error in the gold coins is $\frac{1}{8}$ th of a carat in the pound, and the remedy for silver coins is 2 dwts. in the pound. The pound sterling contains 113 grains of fine gold, or 1718½ grains of fine silver; but if the remedy be taken into account, the pound sterling will contain at least 112½ grains of fine gold, or 1704½ grains of fine silver. See **COIN**, **COINAGE**, and **STANDARD**.

Merchants, factors, bankers, &c. use characters, or initial letters, to express the several kinds of pounds of account; as *L.* or *L.S.*, pounds sterling.

In Ireland, accounts are kept in pounds, shillings, and pence, as in England; but Irish currency differs from English in the proportion of 12 to 13. Thus 1s. English is 1s. 1d. Irish; and 1l. English, 1l. 1s. 8d. Irish. The gold and silver coins of Ireland are those of England, but they pass here for $\frac{1}{12}$ th more than their British value. Thus the guinea is worth 1l. 2s. 9d. Irish, the crown 5s. 5d., and the smaller coins in proportion. Hence English money is turned to Irish by adding $\frac{1}{12}$ th, and Irish to English by subtracting $\frac{1}{12}$ th. The copper coins of Ireland are inferior to those of England in the ratio of their currencies, 26 Irish halfpence being equal to 24 English halfpence, which make the British shilling.

In the United States, accounts were formerly kept in pounds, shillings, and pence currency; and this practice is still retained on some occasions; but the value of the currency is not the same in the different states. In Pennsylvania, New Jersey, Delaware, and Maryland, the ratio of currency to sterling is as 3 to 5; and therefore 1*l.* sterling = 1*l.* 13*s.* 4*d.* currency; or 1*l.* currency = 12*s.* sterling. In New Hampshire, Massachusetts, Connecticut, Rhode Island, and Virginia, the ratio is as 3 to 4; and therefore 1*l.* sterling = 1*l.* 6*s.* 8*d.* currency; or 1*l.* currency = 15*s.* sterling. In New York and North Carolina, the ratio is as 9 to 16; and therefore 1*l.* sterling = 1*l.* 15*s.* 6*d.* currency; or 1*l.* currency = 11*s.* 3*d.* sterling. In South Carolina and Georgia, the ratio is as 27 to 28; and therefore 1*l.* sterling = 1*l.* 0*s.* 8*d.* currency; or 1*l.* currency = 19*s.* 3*d.* sterling. Hence the exchange between England and the United States is at par, when, for every 100*l.* sterling, Pennsylvania, Maryland, &c. give 166*l.* 13*s.* 4*d.* currency; New England and Virginia, 133*l.* 6*s.* 8*d.* currency; New York and North Carolina, 177*l.* 15*s.* 6*d.* currency; Georgia and South Carolina, 103*l.* 14*s.* 0*d.* currency. A pound sterling, in the United States, is valued at four Spanish dollars and 44 cents or 1000th parts of a dollar; and no foreign coins, except the Spanish dollar, are deemed a legal tender. But the dollar is valued in the different states according to the currency of each place. Thus, in Pennsylvania, Maryland, Delaware, and Jersey, it passes for 7*s.* 6*d.*; in New England and Virginia, for 6*s.*; in New York and North Carolina, for 8*s.*; in South Carolina and Georgia, for 4*s.* 8*d.* See EXCHANGE.

POUND Flemish, a money of account in Flanders, and a money of exchange at Amsterdam and Hamburgh. The pound Flemish is equal to 6 guilders, and is divided into 20 shillings, 120 stivers, and 240 pence Flemish, also called groats. (See RIXDOLLAR.) The pound Flemish, or pond Vlans, is reckoned, at Antwerp, at 2½ rixdollars, 6 florins, 20 shillings, 120 stivers, 240 groats, or 1920 Brabant pennings. At Hamburgh, accounts are sometimes kept in pounds, shillings, and pence Flemish; the pound consisting of 20 shillings, and the shilling of 12 pence or grotes; but Flemish money is seldom used here, except in exchanges. The pound Flemish is 2½ rixdollars, 7½ marks, 20 shillings Flemish, 120 shillings Lubs, 240 grotes Flemish, 720 dreylings, or 1440 pfenings. The monies of exchange at Amsterdam are florins, stivers, and pennings, or pounds, shillings, and pence Flemish. Accordingly 10 pennings = 1 stiver; 20 stivers = 1 florin or guilder; also 12 grotes or pence Flemish, or 6 stivers = 1 shilling Flemish; 20 shillings Flemish, or 6 florins, = 1 pound Flemish; 2½ florins, or 50 stivers, = 1 rixdollar.

POUND Nails. See NAILS.

POUND, Parcus, is also an inclosure, or strong place, where cattle distrained, or caught in any trespass, are put, till they are replevied, or redeemed.

The pound is either *overt*, that is, open overhead; or *covert*, that is, close.

POUND Overt is an open pound, built upon the lord's waste; and thence also called the *lord's* pound, because he provides it for the use of himself, and his tenants.

Pound overt also includes back-sides, court-yards, pasture-grounds, or any place whatever, to which the owner of beasts impounded may come to give them meat and drink, without offence or trespass.

By stat. 1 & 2 P. & M. c. 12, no distress of cattle can be driven out of the hundred where it is taken, unless to a pound overt within the same shire, and within three miles of the place where it was taken. This is for the benefit of the

tenants, that they may know where to find and replevy the distress. And by stat. 11 Geo. II. c. 19, which was made for the benefit of landlords, any person distraining for rent may turn any part of the premises, upon which a distress is taken, into a pound *pro hac vice*, for securing of such distress. If a live distress of animals be impounded in a common pound overt, the owner must take notice of it at his peril; but if in any special pound overt, so constituted for this particular purpose, the distrainer must give notice to the owner; and in both these cases, the owner, and not the distrainer, is bound to provide the beasts with food and necessaries.

POUND Covert, or *Clofe*, on the contrary, is such a one as the owner cannot come to, for the said purpose, without trespass or offence; as some close house, cattle, fortrefs, &c.

If a distress of animals be impounded in a pound covert, as in a stable, or the like, the landlord or distrainer must feed and sustain them. (Co. Litt. 47.) A distress of household goods, or other dead chattels, which are liable to be stolen or damaged by weather, ought to be impounded in a pound covert, else the distrainer must answer for the consequences. See DISTRESS.

POUND Breach, in Law. If a distress be taken and impounded, though without just cause, the owner cannot break the pound, and take away the distress; if he doth, the party distraining may have his action, and retake the distress wherever he finds it; and for pound breaches, &c. a writ *de parco fracto* may be obtained, or an action on the case lies, whereon treble damages may be recovered, if the distress was taken for rent. 1 Inst. 161. 2 W. & M. cap. 5.

Also it is said, that all pound breaches may be inquired of in the sheriff's tourn, as they are common grievances, in contempt of the authority of the law. 2 Hawk. P. C. 67.

POUND Land; of old extent. See LIBRATA Terra.

POUNDAGE, a subsidy formerly granted to the king *ad valorem*, at the rate of 12*d.* in the pound, upon all manner of merchandize imported or exported, by all merchants, natives, denizens, and aliens. See CUSTOM.

It is called poundage, because fixed at the rate of so much *per* pound; viz. one shilling in every pound, or twenty shillings; and for English commodities exported by aliens, one shilling more.

POUNDER, in Artillery, is used to specify a certain caliber: thus, a twenty-four-pounder, a twelve, or a six-pounder, are those pieces whose balls weigh twenty-four, twelve, or six pounds. See GUNS and CANNON.

POVOA, in Geography, a town of Portugal, in Estramadura, near the Tagus; two miles N. of Lisbon.

POVOAC AON, a town on the S.W. coast of the island of Zanzibar. S. lat. 6° 20'.

POVOCAO DE NORTE, a town of Brasil, in the government of St. Paul, on the N. side of the mouth of the Iguay, or Porto de St. Pedro, and 10 miles N. of it.

POUP. See POOP.

POUPART, FRANCIS, in Biography, a celebrated anatomist and physician, was born at Mans, where he received the rudiments of his education under the fathers of oratory. He afterwards went to Paris, where he applied himself, with great assiduity, to natural history and philosophy; and, notwithstanding his narrow income, and the little prospects which these studies offered for its improvement, he persevered with ardour in the pursuit. In his researches in natural history, he had been led to the examination and dissection of insects, which turned his mind to the study of anatomy and surgery, as the means of support; for which purpose he presented

presented himself at the Hôtel Dieu, and passed his examinations with great applause, which occasioned the more surprise, when he avowed that he had had no opportunity of obtaining practical information, and was even unable to let blood. Here he studied diseases, and pursued anatomy and surgery practically during three years; and subsequently received the degree of doctor in medicine at Rheims, in 1699, and was admitted a member of the Academy of Sciences. He did not long survive to receive the rewards of his industry; for he died at Paris, in October 1708, in a state of considerable poverty, which he supported with cheerfulness. His success in anatomical investigation may be estimated from the transmission of his name, attached to an important ligament. The memoirs of the Academy comprize many of his papers, besides a "Dissertation sur la Sangue," published in the Journal des Savans; viz. a "Mémoire sur les Insectes Hermaphrodites;" "L'Histoire du Formica Leo;" that of the "Formica Pulex;" "Observations sur les Moules;" "Dissertation sur l'Apparition des Esprits," on the occasion of the adventure of St. Maur, and some other papers. He is also considered as the editor of a "Chirurgie complete," which is a compilation from many works upon that art. Eloy Dict. Hist. de la Méd.

POUPART'S *Ligament*, in *Anatomy*, the tendinous cord, which is extended from the anterior superior spine of the ilium to the tuberosity of the pubes. It is the inferior edge of the aponeurosis of the obliquus externus abdominis muscle, which has no bony attachment in the interval between the two points just mentioned. See OBLIQUUS.

POUPARTIA, in *Botany*, so named by Commerçon, because the tree is known in the isle of Bourbon by the name of *Bois de Poupart*.—Juss. 372.—Class and order, *Decandria Pentagynia*. Nat. Ord. *Terebinthaceæ*, Juss.

Ess. Ch. Calyx minute, five-cleft. Petals five. Stamens inserted into a crenate disk, under the germen. Styles converging. Drupa? with a nut of five cells. Juss.

This is a tree, whose leaves are pinnate, usually of about four pair of opposite leaflets and an odd one. Some simple leaves are interspersed. Flowers racemose, axillary and terminal; perhaps monoecious or dioecious. Jussieu took the above characters from Commerçon's papers.

POUPOU-TACLAC, in *Geography*, a mountain of Thibet. N. lat. 31° 36'. E. long. 85° 14'.

POUR faire proclamer, que null inject fines ou ordures en fosses ou river pres cities, &c. in *Law*, an ancient writ, directed to the mayor or bailiff of a city or town, requiring them to make proclamation, that none cast filth into the ditches or places near such city or town, to the nuisance thereof; and if any be cast there already, to remove the same. It is founded on the statute 12 Rich. II. cap. 13. F. N. B. 176.

POUR seiser terres la femme que tient en dower, an ancient writ, whereby the king seized the land which the wife of his tenant in capite had for her dowry, after his decease, if she married without the king's leave; by virtue of the statute of the king's prerogative. Cap. 3. F. N. B. 174.

POURALLEE. See PURLUE.

POURANAM. See VIEDAM.

POURBUS, FRANCIS, in *Biography*, the son of Peter Pourbus, a painter of some renown both in history and portraiture, was born at Bruges in 1540. Having imbibed the rudiments of the art from his father, he afterwards studied under Francis Florus; and such was his proficiency under that master, that he became his rival, and even excelled him, in colouring at least. His principal occupation was in portraiture, in which, however, he was again surpassed by

his own son Francis, called the younger, who was born in 1570, and who practised his art with deserved renown and success. He sometimes painted history, but in a formal and dry manner, united with a pleasing kind of colouring.

His own portrait, painted by himself, is honoured with a place in the Florentine gallery; and in the French collection are still preserved his portraits of Henry IV. and Catherine de Medicis. In the church of the abbey of St. Martin at Tournay was placed a picture of the Crucifixion, painted by Pourbus, which was very highly commended; but what is now become of it is not known. Pourbus the elder died in 1580, his son in 1622, at the age of 52.

POURCHOT, EDMUND, an eminent French professor of philosophy, was born at Poilly, a village in the diocese of Sens, in the year 1651. At an early age he discovered a great thirst for knowledge, and was sent to pursue his studies at the university of Paris. Here he distinguished himself by his talents and great diligence, and in 1673 he was admitted to the degree of M. A.

In the year 1677 he was appointed professor of philosophy in his own college, whither his reputation soon attracted a multitude of students, and at the opening of the "Collège des Quatre Nations," he was appointed to fill the philosophical chair in that seminary. M. Pourchot soon became dissatisfied with the Aristotelian philosophy, embraced the principles of Des Cartes, applying mathematical principles and reasonings to the discovery of physical and moral truths. He now drew up a system of philosophy, in which his object was to substitute good sense and right reason in the stead of the subtleties which he had been accustomed to teach. The philosophy of our author excited a violent opposition among the professors of the university, who employed themselves in founding the alarm of its dangerous and pernicious tendency. Its admirers, however, both within and without the university, rapidly increased in number. The professor now published his system under the title of "Institutiones Philosophicæ," which was very generally applauded, and met with an astonishing sale. His reputation as a philosopher, at this time, stood so high, that his lectures were always attended by a numerous concourse of students. His acquaintance was eagerly courted by the most celebrated literary characters of his time; Racine, Despreaux, Mabillon, Dupin, Baillet, Montfaucon, and Santeul, were his intimate associates. He was honoured with the esteem of M. Bossuet and M. de Fenelon. The latter would have procured for him the appointment of tutor to the younger branches of the royal family, but he preferred to employ his talents in the service of the university; and was seven times chosen to fill the post of rector of that body, and was Syndic for the long space of forty years. At a very advanced age he began to apply himself to the study of the Hebrew language, with a degree of ardour which soon enabled him to deliver a course of lectures upon it at the college of St. Barbe. In the midst of his numerous engagements, he found leisure to improve his "Philosophical Institutions," of which he was preparing the fourth edition for the press, when his eye-sight entirely failed him. This melancholy privation he survived between two and three years, and died at Paris in 1734, in the 83d year of his age. Besides his "Institutions," he was author of numerous "Discourses," which were given to the public in the "Acts of the University," and various "Memoirs." He assisted the learned Masclef in greatly improving the second edition of his "Grammatica Hebraica," and he aided him in drawing up the Chaldee, Syriac, and Samaritan grammars, which are combined in that edition. Moreri.

POURCOLLY, in *Geography*, a town of Bengal; 38 miles N.N.E. of Purneah.

POURHATO, a town of Chinese Tartary, in the country of Hami; 23 miles S.W. of Tchontori.

POURINISONG, a mountain of Thibet; 15 miles S. of Skirom.

POURNA-TOU-HOTUN, a town of Chinese Tartary; 18 miles W.N.W. of Nimgouta.

POUROL, a town of Thibet; 35 miles E.N.E. of Tchontori.

POURO-TCHON-TCHI, a town of Thibet; 40 miles S.W. of Tchontori.

POUROUMA, in *Botany*, Aubl. Guian. t. 341. Juss. 406, a tree of Guiana, with the habit of a *Cecropia* or *Ficus*, alternate palmate leaves, and numerous axillary corymbose flowers, whose structure is not sufficiently explained by the above authors.

POUR-PARTIE, or **POUR-PARTY**, in *Law*, a term used in opposition to *pro indiviso*; denoting the share or part of an estate held in common by parceners; which is by partition allotted to any of them.

To make *pour-partie*, is to divide and sever the lands that fall to parceners; which, before partition, they held jointly, and *pro indiviso*.

POURPRE. See **PURPURE**.

POURPRESTURE, or **PURPRESTURE**, *Pourprestura*, from the Fr. *pourpris*, an inclosure, in *Law*, is defined by Glanville to be, when any thing is unjustly occupied, that properly belonged to the king; as is the case in the encroaching on his grounds, obstructing the highways, diverting public rivers from their proper course, or building any thing over the high streets of a city; and, in the general, where any thing is done to the prejudice of the king's tenements, highways, or cities.

Crompton, in his Jurisd., says, *pourpresture* is properly when a man takes to himself, or encroaches any thing which he ought not; whether it be in jurisdiction, in land, or in franchise; and generally, where any thing is done to the nuisance of the king's tenants.

Some authors divide *pourpresture* into three kinds: the first against the king, the second against the lord, the third against a neighbour.

Pourpresture against the king, Lib. Nig. in Scacc. fol. 38. is that happening through the negligence of the sheriff, or the long continuance of wars, &c. when those that have lands near the crown-lands, inclose part of them, or lay them to their own. *Pourpresture against the lord*, is when the tenant neglects to perform what he is bound to do for the chief lord, or deprives him of his right. *Pourpresture against a neighbour*, is a nuisance against a neighbour, &c. mentioned in the Monast. tom. i.

POURRETIA, in *Botany*, so named by Willdenow, in honour of the Abbé Pourret, a French botanist of great merit, long resident at Narbonne, who has written some papers on the plants of that country, in the memoirs of the Academy of Toulouse. Willd. Sp. Pl. v. 3. 844. (Cavanillesia; Ruiz and Pavon Prodr. Gen. Fl. Peruv. v. 1. 97. t. 20.)—Class and order, *Monadelphica Polyandria*. Nat. Ord. *Columnifera*, Linn. *Malvaceae*, Juss.

Gen. Ch. Cal. Perianth inferior, simple, of one leaf, in five deep, ovate, permanent segments. Cor. Petals five, lanceolate, acute, attached to the tube of the filaments. Stam. Filaments numerous, united below into a cylindrical tube; anthers ovate, erect. Pist. Germen superior, small, ovate, pentagonal; style cylindrical, longer than the stamens; stigma capitate. Peric. Capsule of one cell, not bursting, with five large, rounded, membranous, veiny,

longitudinal wings. Seed solitary, oblong, striated, with plaited rugged cotyledons.

Ess. Ch. Calyx simple, in five deep segments. Petals five, lanceolate. Capsule of one cell, with five rounded longitudinal wings. Seed solitary.

1. *P. arborea*.—Native of Peru.—The wings of the fruit are each four inches long and two wide; the seed measures about an inch. We have no account nor figure of the foliage. The flowers are about an inch long.

POURSUIVANT, or **PURSUIVANT**, from the French *poursuivre*, to pursue, a messenger, anciently attending the king in his wars, or at council table, or in the exchequer, to be dispatched upon any occasion, or message; as, for the apprehension of a person suspected, or accused, &c.

Many of the nobility, too, had their *poursuivants*; a knight banneret was allowed a *poursuivant*, with the consent of a herald.

Upton, De Re Militari, calls the *poursuivants*, *militēs linguarēs*; because, says he, their chief honour was in *custodia linguarū*. He divides them into foot and horse *poursuivants*, *cursores equitantes et profecutores*.

There were also *poursuivants* particularly employed in martial causes, called

POURSUIVANTS at Arms, a term anciently applied to gentlemen who attended the heralds, and aspired to their office; to which they could not rise, till after seven years apprenticeship passed in this quality. See **HERALD**.

They were entirely dependent on the heralds, and assisted at their chapter; officiating for them in preparing and assigning tournaments, and all other parts of their ministry. They were baptized, at solemn feasts, with some gallant name; as Jolicœur, Verluifant, Sansmentir, &c.

Their coats of arms were different from those of the heralds, and they bore plain staves, without ornament.

The term *poursuivant*, or *pur-suivant*, is probably of French extraction, and is derived from *pour*, for, and *suivre*, to follow after; and it is applied to the officers now mentioned, as some say, because they attended in the retinue of princes and followed them into the country, to observe and record the memorable actions that occurred in jousts and other august solemnities; or, as others conceive, because they followed the heralds, to whom they were scribes, actuaries, or amanuenses, a sort of clerks, apprentices, and noviciates, candidates and probationers for the office of herald upon a vacancy. Accordingly they have been denominated "les aides des herauts," from their waiting upon them, and heralds are under an obligation of performing their functions either personally, or by their *poursuivants*, there being formerly one under each herald. Although the original of these officers has not been precisely ascertained, it is reasonable to believe that they are coeval with the heralds, on account of their dependence upon them, and of the ancient institution by which one was made the necessary step to the other. This office hath, for some centuries, been esteemed the lowest degree of the officers of arms, or the next degree under an officer of arms, and the first step of probationship for promotion. Their qualifications, as candidates for future promotion, with regard to parentage and birth, morality, capacity, and competency of age, have been formally and amply stated by ancient authors. These qualifications were formerly so much the objects of attention, that it was necessary for each candidate to produce a certificate attesting them. Anciently the term of noviciate was, as we have already said, seven years; after the expiration of which, and not sooner, the *poursuivant* was eligible to the office of herald; but in later times, and especially in this kingdom, it has been determined by a judgment in Westminster

minster Hall, that a person may lawfully be made directly, "per saltum," an herald, without being ever a pourfuiwant.

Of the great number of pourfuiwants anciently subsisting, there are now only four remaining; *blue-mantle*, *rouge-croix*, *rouge-dragon*, and *portcullice*; who are the lowest order of officers belonging to the college of arms. Their business is, to attend with the heralds in marshalling and ordering public solemnities, funerals, interviews, cavalcades, &c.

The four officers, under these denominations, have had a succession, with little interruption, and have been allowed salaries from the crown for some ages; and their titles are taken from the badges of the sovereign, or of the kingdom, or the mantle, supporter, or device of the king. For the title and office of *Blue-mantle*, see that article.

"Rouge croix," or "Red cross," is, according to sir Henry Spelman, the most ancient title of a pourfuiwant, and was taken, without doubt, from the arms ascribed to St. George, the tutelary saint of this kingdom, being argent, a cross gules. This officer was instituted by Henry V.; and from that time the succession was regularly continued until the month of April 1644, from which year this place lay vacant until the restoration, when it was revived.

"Rouge dragon," or "Red dragon," was instituted by Henry VII. on the day preceding his coronation, and denominated from the ensign of Cadwallader, from whom that king sprung in a male line. Some indeed, as sir H. Spelman, trace its origin to the right supporter of Cadwallader's shield, which supporter was itself assumed from his ensign; and others, to the banner ascribed to St. George. From the first year of Henry VIII., the names of the several officers are regularly mentioned, and it does not appear, that the office itself hath been in abeyance at any time since its establishment.

"Port-cullis" pourfuiwant was likewise erected by Henry VII., and so denominated from that timber instrument or machine, plated over with iron, made in the form of a harrow, hung up with pullies in the entrances of castles, to be let down on any occasion (see PORTCULLIS); and which instrument was one of the badges of that king, the same descending to him from the Beauforts by his mother. The succession in this office has never been interrupted since the institution.

Besides the pourfuiwants already mentioned, several others occur in our records, under titles, the significations of which are as difficult to be explained as it is to ascertain whether the persons so distinguished were English or foreign officers, or belonged to sovereigns or subjects. There have been also pourfuiwants, as well as heralds, belonging to the prince of Wales, and to the nobility.

Stow, speaking of Richard the Third's end, has these words: "His body was naked to the skin; not so much as one clout about him; and was trussed behind a pourfuiwant at arms, like a hog, or a calf."

POURTRAIT, or POURTRAITURE. See PORTRAIT and PORTRAITURE.

POURVEYANCE, or PURVEYANCE, the providing of corn, victuals, fuel, and other necessaries, for the king's house. See REVENUE.

By a stat. 12 Car. II. cap. 24. no person, under colour of pourveyance, shall take any timber, cattle, corn, or other matter, from any subject, without his free consent.

POURVEYOR, or PURVEYOR, an officer of the household, who provides and buys in corn, and other victuals, &c. for the king's house; mentioned in Magna Charta, and several statutes.

Pourveyor became a term so odious in times past, that by

stat. 35 Ed. III. the heinous name pourveyor was changed into that of *achator*, or *buyer*. The office itself was much restrained, and even abolished, by the stat. 12 Car. II. c. 24. See PRÆMUNIRE.

POUSSE PIED, in *Natural History*, the French name for a genus of shell-fish, called by writers of other nations the pollicipes.

POUSSIN, NICHOLAS, in *Biography*. This eminent painter was born at Andille, in Normandy, in 1594. Felibien says that he was descended from a noble family, which was reduced in property during the civil wars of the period preceding. He was first instructed in the art (for which he exhibited an inclination at a very early period) by Ferdinand Elle, a Flemish portrait painter, but his ideas of painting soon outran his master's powers, and having acquired friends who lent him prints from Raphael and Julio Romano, he eagerly studied to acquaint himself with their principles of composition, and soon imbibed sufficient to express his thoughts with ability.

He had, at the age of 18, left his father's house privily; not having the sanction of his parents in the pursuit of his favourite design. He first went to Paris, and afterwards accompanied a young seigneur into Poitou; but a fit of illness obliged him to return home. On his recovery he again reached Paris; and Felibien states, that he then went on towards Rome, but was, by some accident, prevented going farther than Florence. He then remained in France till 1624, and in that year attained the summit of his wishes, by arriving in the grand emporium of the arts, the city of Rome.

During his latter residence at Paris, he had acquired the friendship of Marino the poet, and had resided for some time in his house. He would also have accompanied him on his return to Italy, but was prevented by his engagements. When he arrived at Rome, his friend was unhappily in a severe state of illness, which terminated in death; but before that occurred he placed his favourite artist under the protection of cardinal Barberini, nephew of pope Urban VIII. Of the benefits which Poussin might reasonably have hoped to derive from this advantageous connection he was deprived, by his patron being dispatched on a legation from the pope; and our painter was thus left without friends in Rome. The consequence was extreme distress, and the obligation to dispose of his paintings at very low prices. Felibien says that he sold the two battle pieces which were in possession of the duke de Noailles, at the trifling sum of seven crowns each; and a picture of a prophet for eight livres. Content, however, with the means of satisfying the claims of nature, he eagerly devoted himself to study; copied several of the renowned pictures of his predecessors, those particularly by Titian, Domenichino, and Raphael, and drew stores of materials for his future labours, by giving close attention to ancient sculpture; living a life of privacy and retirement. He lodged with Il Fiamingo, the sculptor, and they together sometimes engaged themselves in measuring antique statues; but most chiefly his studies were solitary; applied to nature or to art, as they presented themselves. By accumulation of means, thus judiciously sought, and afterwards ingeniously applied, Poussin became the admired and original artist we now know him to be; the head of a class distinct from all others, and which has been rarely entered by subsequent professors. His love of simplicity and of nature led him to disregard the false glare of the artists who then held the foremost ranks in reputation; and in whose hands the art had dwindled to a systematic exhibition of the power of the pencil; rather than of sentiment or passion. His meed of

praise is therefore the greater, since he made a certain sacrifice of present profit, in the hope of restoring the art he professed, to a just elevation in the scale of utility.

The learned professor of painting in the Royal Academy has, in his last edition of Pilkington's dictionary, summed up the character of Pouffin with his accustomed acumen. "He was," says he, "on his arrival at Rome, an artist already formed, but soon found that he had more to unlearn than to follow of his former principles; he renounced the national character," (he might have added those of the existing schools of Italy,) and not only with the utmost ardour adopted, but suffered himself to be absorbed by the antique. Such was his attachment to the ancients, that he may be said to have often less imitated their spirit, than copied their relics, and painted sculpture. Their costume, their mythology, their rites, were his elements. His backgrounds are pure classic ground. He has left specimens which prove that he was sometimes sublime in his conceptions, and often in the highest degree pathetic; but history, in its strictest sense, was his department, and in that he ought to be followed. In the dramatic representation of Raphael, the action is introduced merely to shew the actors; the agents of Pouffin only appear to tell the fact; they are subordinate, they are instruments of the story; generally clear, connected, judicious; he has however sometimes attempted to tell a tale that cannot be told; sometimes obscured one that was clear in itself, by an ostentatious display of erudition; and not seldom, sacrificed the principal figures, to collateral and inferior beauties. If the celebrated series of sacraments are models of historic perspicuity; if the Ahasuerus, the deluge, the vision of Coriolanus, the infant Pyrrhus, are full of sublime and pathetic features, the vain attempt to tell by figures, what words only can tell, is proved in the testament of Eudamidas; and in the story of the adulterous woman, Christ is debased to the character and the gesticulations of an Italian juggler.

"Though Pouffin abstracted the theory of his proportions from the antique, he is seldom uniform and pure in his style of design; ideal only in parts, and oftener so in female than in male characters; he supplies, like Pietro Testa, antique heads and torsoes, with limbs and extremities transcribed from the model. As a colourist he was extremely unequal. Into the deluge, and the plague of the Philistines, he transfused the very hues of the elements whose ravages he represented, whilst numbers of his other pictures are deformed by crudity and patches.

"The excellence of Pouffin in landscape is universally allowed, and when it is the chief object of his picture, precludes all censure; but considered as the scene or background of an historical subject, the ease with which he executed it, the predilection which he had for it, often made him give it an importance which it ought not to have; it divides our attention, and from an accessory, becomes a principal part."

On the return of the cardinal Barberini to Rome, the merit of Pouffin was rescued from the oblivion in which it had been sunk. He was liberally employed by his excellence; induced freely to exhibit those treasures which his unceasing studies had accumulated; and from this time enjoyed the just reward of his industry and ingenuity, by a continued series of honours and emolument.

His fame, and many of his Italian pictures, reached his native country, and the king desiring to have his aid in cultivating the arts in France, wrote him a letter desiring his return, with which, after much hesitation, Pouffin complied, and arrived in France in 1640. He was immediately

employed by the court, and experienced the usual accompaniment of court favour, envy, which caused him enemies. Vouet among the painters, and Mercier among the architects, criticized his works with ill-natured severity, because his taste was too pure for their understandings, and by their interest caused him so much disquietude, that he requested, and obtained, permission to return to Rome, which he did in November 1642, and never more re-visited his native country; but lived till he attained his 72d year in his beloved Rome, exercising his art with esteem and respect, till within a few months of his decease.

POUST, an Indian name for a very poor and coarse kind of opium made by boiling the stalks and leaves of the opium poppy in water, and then evaporating the clear liquor to the consistence of a solid extract.

POUSTANG, in *Geography*, a mountain of Thibet. N. lat. $31^{\circ} 46'$. E. long. $97^{\circ} 39'$.

POUTA, a town of Prussian Pomerelia; 20 miles S.S.W. of Dantzick.

POU-TEOU. See Poo-roo.

POUTERIA, in *Botany*, Aubl. Guian. t. 33. Juss. 156, is *CHÆTOCARPUS* of Schreber.

POUTING, or *Whiting Pout*, in *Ichthyology*, a name given to a species of gadus, which seldom exceeds a foot in length. See *GADUS Barbatus*.

POUTON, LA, in *Geography*, a town of France, in the department of Finisterre, and chief place of a canton, in the district of Morlaix. The place contains 212, and the canton 10,361 inhabitants, on a territory of 125 kilio-metres, in seven communes.

POUTROY, LA, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar. The place contains 2064, and the canton 10,603 inhabitants, on a territory of 160 kilio-metres, in five communes.

POUZAUGES-LA-VILLE, a town of France, in the department of the Vendée, and chief place of a canton, in the district of Fontenay-la-Comte; nine miles N.N.W. of La Châtaigneraye. The place contains 220, and the canton 15,538 inhabitants, on a territory of 380 kilio-metres, in 18 communes.

POUZILHAC, a town of France, in the department of the Gard; 8 miles E.N.E. of Uzès.

POUZIN, LA, a town of France, in the department of the Ardèche; six miles N.E. of Privas.

POWANGUR, a town of Hindoostan, in Guzerat; 60 miles S.E. of Amedabad. N. lat. $22^{\circ} 26'$. E. long. $73^{\circ} 32'$.

POWAY, a town of Hindoostan, in the circar of Gurrah; 32 miles W. of Mahur.—Also, a town of Hindoostan, in Allahabad; 24 miles N. of Jioappour.

POWCHEs, in a *Ship*. The seamen call by this name the small bulk-heads made in the hold, to stow corn, goods, or the like, that it may not shoot from one side to the other.

POWDER, or POUDEr, in *Pharmacy*, a dry medicine pulverized, or prepared by being broken and reduced into almost imperceptible atoms, either in a mortar or by chemical operations, &c.

This form of preparing is, upon the whole, the most simple, and in various respects the least objectionable; but many substances cannot be either conveniently or beneficially employed in this manner. Those that are bitter, acrid, and foetid, and of course unpleasant to the taste; those that rapidly deliquesce when exposed to the air, or are very volatile; and those which require to be given in large doses,

or which do not readily dissolve in water, belong to this class. Others cannot be reduced to powder without being much dried, and heat alters their properties; others again, particularly some resinous substances, are injured by the impalpable form of powders; and many are deteriorated by exposing their surfaces, in the operation of pulverizing them, to the action of atmospherical air, such are cinchona, rhubarb, ipecacuanha, and guaiacum. To prevent the injurious effect of air and light, powders should be generally kept in opaque or green-glass bottles: and in forming compound powders, the admixture should be rendered as complete as possible, and the mixed powder, after trituration, should be passed through a sieve. The Dublin college lays down the following general rule for the formation of powders: "Let the substances to be powdered be first dried, and then beaten in an iron mortar; then separate the finer powder by shaking it through a hair-sieve, and preserve it in close vessels."

The lighter powders may be mixed in any agreeable liquor, as tea, or water-gruel. The more ponderous will require a more consistent vehicle, as syrup, jelly, or honey. There are powders of various sorts, the principal of which are mentioned in the following articles and references.

POWDER of Algaroth. See ALGAROTH.

POWDER of Aloes, Compound, is prepared, according to the directions of the Lond. pharmacopeia, by powdering an ounce and a half of the extract of spikenard aloë and an ounce of guaiacum gum-resin separately, and then mixing them with half an ounce of the compound powder of cinnamon. This is the pulvis aloes cum guaiaco of P. L. 1787; pilulæ aromaticæ of P. L. 1745; and pilulæ de diambra of P. L. 1720.

The Dublin college directs this powder, denominated powder of aloes with guaiac, to be prepared by rubbing an ounce and a half of hepatic aloes, and an ounce of guaiac gum-resin separately to powder, and then mixing them with half an ounce of aromatic powder. These powders are warm sudorific cathartics, and may be given in doses from grs. x to ℥j: but are not much in use. See ALOES.

POWDER of Aloes with Canella is prepared, according to the Dublin Ph., by rubbing one pound of hepatic aloes and three ounces of white canella separately to powder, and then mixing them. This is omitted in the last Lond. pharmacopeia. In the shops it has been long known under the name of "Hiera picra," and is used as a domestic remedy, infused in wine or spirits. The dose may be from grs. x to ℥j.

POWDER, Amber, or Pulvis e succino, is a form of medicine prescribed in the late London pharmacopeia, in the room of the troches of amber, or *trochisci de carabe* of former dispensaries. The composition of the powder is this: take prepared amber and gum arabic, of each ten drachms; juice of hypocistis, balauftines, and Japan earth, of each five drachms; olibanum, half an ounce; strained opium, a drachm; mix all these together into a fine powder. Pemberton's Lond. Disp. Amber, though formerly much esteemed as a medicine, is now only used in pharmacy, for obtaining the oil and acid which it yields by distillation.

POWDER, Antimonial. See ANTIMONY and JAMES'S Powder.

POWDER, Aromatic, of the Edinb. Ph., is prepared by rubbing equal parts of cinnamon bark, cardamom seeds, and ginger-root to a very fine powder, which is preserved in a well-stopped phial. That of the Dub. Ph. by rubbing together an ounce of cinnamon bark, and lesser car-

damom seeds freed from the husks, ginger and long pepper, of each an ounce, to a powder. These combinations of aromatics are stimulant and carminative, and may be used to promote digestion and expel flatus in cold phlegmatic habits; but they are more generally employed to give warmth to other compositions. The dose is from grs. viij to ℥j, given in the form of bolus, or distilled in water.

POWDER, Aromatic Purging, is formed by pounding and well mixing the best Turkey rhubarb, cinnamon, and fine sugar, of each two drachms. Where flatulency is accompanied with costiveness, a tea-spoonful of this powder may be taken once or twice a-day, according to circumstances. Buchan.

POWDER of Asarabacca, Compound, is prepared, according to the Edinb. Ph., by rubbing three parts of the leaves of asarabacca and one part of the leaves of marjoram, and the same of those of lavender, together to a powder. The Dublin college directs one ounce of dried leaves of asarabacca and two drachms of lavender flowers dried together to a powder. A few grains of this powder snuffed up the nostrils for several successive evenings at bed-time, excite sneezing and a copious discharge of mucus, which continues to flow on the succeeding days. It has been particularly used in tooth-ache and chronic ophthalmia. See ASARUM.

POWDER, Astringent, is formed by pounding together alum and Japan earth, of each two drachms. If the whole be divided into ten or twelve doses, one of them may be taken every hour in an immoderate flow of the menses, and other hæmorrhages, or every half hour, if the hæmorrhage be violent.

POWDER of Bole is formed by pulverizing the following ingredients, viz. bole armenic, or French bole, two ounces; cinnamon, one ounce; tormentil root, and gum arabic, of each six drachms; and long pepper, one drachm. This warm, glutinous, astringent powder, is given in fluxes, and other disorders, where medicines of that class are necessary, in the dose of a scruple, or half a drachm. A powder of this kind is prescribed in the late London pharmacopeia, instead of the confectio Fracastorii, or diafcardium. If a drachm of opium be added, it will make the powder of bole with opium, which may be taken in the same quantity as the former, but not above twice or thrice a-day. Buchan. See *Compound POWDER of Chalk*, infra.

POWDER, Bezoardic, the name given in the late London Dispensatory to the powder, commonly called Gascoign's powder. This is now ordered to be made only of crab's claws, one pound; prepared pearls and red coral, of each three ounces; and oriental bezoar, an ounce. The amber and hartshorn are left out of the composition, as improper inefficacious ingredients; and the whole ordered to be kept also without the bezoar, and called by the name of *pulvis e chelis canrocom compositus*, the name by which Gascoign's powder used to be known.

POWDER of Carbonate of Lime, Compound, formerly *Cre-taceous powder*, is prepared by the directions of the Edinb. Ph. by rubbing together four ounces of prepared carbonate of lime, one drachm and a half of cinnamon bark, and half a drachm of nutmegs to a powder. See *Compound POWDER of Chalk*, infra.

POWDER, Carminative, is made by reducing half an ounce of coriander seed, one drachm of ginger, half a drachm of nutmegs, and a drachm and a half of fine sugar into a powder; which quantity will be sufficient for twelve doses. It is employed for expelling flatulencies arising from indigestion, particularly those to which hysteric and hypochondriac persons are so liable. It may be likewise given in small

quantities to children in their food, when troubled with gripes.

POWDER, Carthusian. See ANTIMONY, and KERMES Mineral.

POWDER of Cassius. See CASSIUS'S Purple Powder, and GOLD.

POWDER, Cerusse, Pulvis e cerussa, a medicine prescribed in the late London pharmacopœia, in the place of the white troches of Rhazes or Razi. The late compositions of that medicine had been much more complex than the original receipt of that author, and the college have therefore retrenched the number of ingredients in them; and as the medicine is always to be powdered for use, it is now ordered to be kept in the form of powder. It is thus ordered to be made: take cerusse, five ounces; sarcocolla, an ounce; gum tragacanth, half an ounce; and make the whole into a fine powder. Pemberton. It is omitted in the recent dispensatories.

POWDER of Chalk, Compound, is prepared, according to the Lond. Ph. by rubbing separately half a pound of prepared chalk, four ounces of cinnamon bark, tormentil root, and acacia gum, of each three ounces, and half an ounce of long pepper, to a fine powder, and then mixing them. This preparation containing a larger proportion of aromatics than the compound powder of carbonate of lime, above mentioned, and the addition of the tormentil root, is better adapted for checking diarrhœa connected with acidity of the primæ viæ, than that of Edinburgh, which is a simple but grateful antacid. The dose is from grs. v to ℥j, given in the form of mixture rubbed up with mucilage and distilled water.

POWDER of Chalk with Opium, Compound, of the L. P. is prepared by mixing six ounces and a half of compound powder of chalk, with four scruples of hard opium powdered. The addition of opium renders it more proper for diarrhœa than the former, and as the quantity of opium is small, one grain only being contained in two scruples of the powder, this is an useful opiate powder for children, when afflicted with the irritative diarrhœa of teething. The dose is from ℥j to ʒj for adults.

POWDER of Cinnamon, Compound, is prepared, according to the L. P. by rubbing together two ounces of cinnamon bark, one ounce and a half of cardamom seeds, one ounce of ginger-root, and half an ounce of long pepper, to a very fine powder. See Aromatic POWDER, supra.

POWDER of Contrayerva, Compound, is prepared by mixing five ounces of contrayerva root powdered with a pound and a half of prepared shells. (See CONTRAYERVA.) This powder is stimulant and sudorific; and is given with advantage in typhoid fevers, the malignant exanthemata, the sinking stage of dysentery; and in atonic gout. The dose is from grs. x to grs. xl, given either diffused in simple water, or rubbed up with mucilage and mint water.

POWDER, Cornachine. See CORNACHINE.

POWDER, Diuretic, is made by pounding together four ounces of gum arabic, and one ounce of purified nitre. If the whole be divided into twenty-four doses, one may be taken three times a-day, with considerable benefit, during the first stage of the venereal disease. Buchan.

POWDER, Emetic. See EMETIC, and POWDER of Ipecacuanha.

POWDER, Gascoign's. See GASCOIGN, and Bezuardic POWDER.

POWDERS, Gout, by Dr. Dover, and lord Portland. See DOVER'S Powder, GOUT, and POWDER of Ipecacuanha and Opium, infra.

POWDER, or Pulvis Guttetæ. See GUTTETÆ Pulvis.

POWDER of burnt Hartshorn, Pulvis cornu cervini usti, is formed, according to the D. P., by burning pieces of hartshorn until they become white, and then reducing them to fine powder.

POWDER of burnt Hartshorn with Opium, is prepared, according to the L. P., by mixing a drachm of hard opium powdered; an ounce of hartshorn burnt and prepared; and an ounce of cochineal powder. See Hart's-HORN.

POWDER, Opiate, of E. P., is formed by rubbing together, to a fine powder, one part of opium, and nine parts of prepared carbonate of lime. Ten grains of either of these powders contain one grain of opium, and they are intended for exhibiting opium in very small doses. The substances that are used for dividing the opium, are of no consequence as to the effect of the remedy; and, therefore, the burnt hartshorn being more brittle than the chalk, is better fitted for this purpose.

POWDER, Jesuits'. See CINCHONA.

POWDER of Jalap is prepared, according to the E. P., by rubbing together, to a fine powder, one part of jalap root with two parts of supertartrate of potash. The supertartrate serves not only to divide the jalap very minutely, but to modify its purgative operation. This powder is an useful purgative in habitual costiveness: it is also very useful to children with tumid belly, in worm cases, and in dropsy. The dose is from ℥j to ℥ij for adults. See JALAP.

POWDER of Ipecacuanha, Compound, is prepared, according to the L. and D. P., by mixing ipecacuanha root powdered, and hard opium powdered, of each a drachm, with an ounce of powdered sulphate of potash.

POWDER of Ipecacuanha and Opium, formerly DOVER'S powder, (which see,) is directed by the Edinb. college to be prepared by rubbing together into a fine powder ipecacuanha root powdered and opium, of each one part, with eight parts of sulphate of potash. This powder operates as a powerful sudorific, and is often given, with this intention, in acute rheumatism, gout, dropsy, dysentery, and in all cases, whether inflammatory or not, where profuse sweating is required. The dose is from grs. v to ℥j, given diffused in water, or in the form of bolus, and assisted with plentiful dilution of tepid fluids, drank some time after taking the powder, lest it should be rejected from the stomach. Ten grains of this powder contain one grain of opium. See DOVER'S Powder.

POWDER of Kino, Compound, is formed, according to the L. P., by rubbing separately into a fine powder, 15 drachms of kino, half an ounce of cinnamon bark, and one drachm of hard opium, and then mixing them. This is an astringent powder, now first introduced into the pharmacopœia; the proportion of opium it contains is 1 in 20: the dose is from grs. x to ℥j.

POWDER of Myrrh, a form of medicine prescribed in the late London Dispensatory, to supply the place of the troches of myrrh. It is ordered to be made thus: take of dried leaves of rue, of dittany of Crete, of myrrh, each an ounce and a half; of assa-fœtida, sagapenum, Ruffia castor, and opopanax, each an ounce; and beat altogether to a fine powder. Pemberton.

POWDER, Saline Laxative, is prepared of soluble tartar and cream of tartar, of each one drachm, and of purified nitre, half a drachm. In fevers, and other inflammatory disorders, where it is necessary to keep the body gently open, one of these cooling laxative powders may be taken in a little gruel, and repeated occasionally. Buchan.

POWDER of Scammony, Compound, is prepared, according to the L. P., by reducing separately into a fine powder scammony

scammony gum-resin, and hard extract of jalap, of each two ounces; and ginger-root, half an ounce; and then mixing them. This powder differs materially from the "pulvis é scammonio compositus of P. L. 1745," which was then intended to supply the place of the earl of Warwick's powder, and consisted of a mixture of four parts of scammony, and three of burnt hartshorn. In the E. P. it is directed to be prepared by rubbing together, to a very fine powder, equal parts of scammony and supertartrate of potash. These two powders of the L. and E. P. differ very materially in their nature and effect, though they bear the same name. In the first, the activity of the scammony is aided by the jalap, as its griping effect is in some degree mitigated by the ginger. In the second, the supertartrate of potash renders the operation of the scammony less violent and less irritating, and yet more certain. The dose of the first is from grs. x to grs. xv; that of the second from grs. x to ʒiʒ. They are chiefly used in hydropic and worm cases, and to remove mucous obstructions.

POWDER of Squill is directed by the D. P. to be prepared by first drying squill roots (bulbs), freed from their membranous integuments, and cut in transverse slices, upon a sieve with a low degree of heat, and then reducing it to powder, which must be preserved in well-stopped glass phials.

POWDER of Senna, Compound, of the L. P., is to be prepared by reducing to fine powder half an ounce of scammony gum-resin separately, and the other ingredients, viz. senna leaves and supertartrate of potash, of each two ounces, and of ginger-root two drachms, together; and then mixing them. This powder is hydragogue and cathartic; but the bulk of the dose, though it weighs only from ʒj to ʒj, renders it inconvenient for use.

POWDER of burnt Sponge, is prepared, according to the D. P., by cutting a sponge in small pieces, and beating them so as to free it from little stones; then burning it in a covered iron vessel, until it become black and friable, and finally reducing it to powder.

POWDER, Steel, is made by pounding together filings of steel and loaf sugar, of each two ounces, and half an ounce of ginger. In obstructions of the menses, and other cases where steel is proper, a tea-spoonful of this powder may be taken twice a-day. Buchan.

POWDER, Styptic. See STYPTIC.

POWDER, Suffolk. See SUFFOLK Powder.

POWDER of Sulphate of Alum, Compound, formerly called "Styptic powder," is prepared, according to the E. P., by rubbing together, to a fine powder, four parts of sulphate of alum, and one part of kino. This is a powerful astringent, and is sometimes used internally in menorrhagia and diarrhoea; but it is more generally employed as an external application. The dose is from grs. x to grs. xv, to be taken in a dry state, because the kino is decomposed by the alum, when a fluid vehicle is employed.

POWDER, Sympathetic. See SYMPATHETIC.

POWDER of Tragacanth, Compound, is formed, according to the L. P., in the following manner: take of tragacanth powdered, acacia gum powdered, and starch, of each an ounce and a half, and three ounces of refined sugar. Powder the starch and sugar together; then add the tragacanth and acacia gum, and mix the whole. The tragacanth is not reducible to powder without great difficulty. Ten grains of this compound render a bulk of two fluid-ounces of liquid as thick as it can be conveniently taken. The starch, which is insoluble in cold water, might be omitted. This powder is efficaciously used as a demulcent in hectic fever,

and to allay the tickling cough of catarrh; in gonorrhœa and strangury, it is given, combined with nitre, and in dysentery, with ipecacuanha powder. The dose is from ʒiʒ to ʒiij, mixed in water, or any bland fluid.

POWDERS, Worm, are formed by well mixing of tin, reduced into a fine powder, an ounce, and of Æthiops mineral, two drachms. Let the whole be divided into six doses; and one of them may be taken in a little syrup, honey, or treacle, twice a-day. After they have been all used, the following anthelmintic purge will be proper.

POWDER, Purging Worm, is prepared of powdered rhubarb, a scruple; and of scammony and calomel, of each five grains. Rub these together in a mortar for a dose. For children the above doses must be lessened, according to their age. If the powder of tin be given alone, its dose may be considerably increased. Dr. Alston gave it to the amount of two ounces in three days, and says, when thus administered, that it proved an excellent anthelmintic. He used to purge his patients both before they took the powder, and afterwards.

POWDER of Yellow Bladder-wrack, Pulvis quercus marinæ, is directed by the D. P. to be formed in the following manner: take of bladder-wrack, in flower, any quantity: let it be dried, and freed from the fordes, then exposed to heat in an iron vessel, or a crucible, to which is adapted a perforated lid, until the vapour ceasing, it becomes obscurely red-hot: reduce the carbonaceous matter which remains to powder. This powder is a mixture of soda and charcoal. The burnt substance is considered as deobstruent, and has been exhibited in scrophulous affections, and bronchocele; and Dr. Russell found the mucus of the vesicles an excellent resolvent when externally applied to scrophulous swellings.

POWDER for the Hair, is flour of wheat, or beans, well sifted and prepared, to give it an agreeable odour.

That in which starch-grounds are mixed is much used. See STARCH.

POWDER, Fulminating. See Pulvis FULMINANS.

POWDER, Gun. See GUNPOWDER.

POWDER-Cart, in Artillery, a two-wheel carriage, covered with an angular roof of boards; and to prevent the powder from being damp, a tarred canvas is put over the roof. On each side are lockers to hold shot, in proportion to the quantity of powder, which is generally four barrels.

POWDER-Chests, in the Sea Language, are small boxes filled with gunpowder, pebbles, old nails, or splinters of iron, fastened occasionally on the decks and sides of a ship, which they set fire to, when the ship is boarded by an enemy, and soon make all clear before them. These cases are usually from twelve to eighteen inches in length, and about eight or ten in breadth, having their outer, or upper part, terminating in an edge. They are nailed to several places of the quarter, the quarter-deck, and bulk-head of the waist, having a train of powder, which communicates with the inner apartment of the ship, so as to be fixed at pleasure to annoy the enemy. Falconer.

POWDER-Flasks, in Artillery, are most commonly made of horn, of any convenient size and figure, to carry powder for priming of cannon: this is their chief use in armies.

Sometimes they are so made as to have a measure for the charge of the piece at top, but this is of more use to gentlemen in fowling, &c. than to soldiers, who have the charges of their piece put into cartridges, which they bite off, and first prime, and then load.

POWDER-Magazine. See MAGAZINE.

POWDER-Mill. See MILL, and GUNPOWDER.

POWDER-Room, in a *Ship*, that part of the hold in which the powder is stowed. See **MAGAZINE**.

POWDER of Projection. See **PROJECTION**.

POWDER-Triers, in *Artillery*. See **GUNPOWDER**.

POWDERS, Flux. See **FLUX**.

POWDERINGS, in *Building*, a term sometimes used for devices serving to fill up vacant spaces, in carved works; as also in escutcheons, writings, &c.

POWDERINGS, in *Heraldry*. See **FURR**.

POWEL'S CREEK, in *Geography*, a river of America, in the state of Tennessee, which rises in Powel's mountain, runs S.W., and enters Clinch river, through its N. bank, 38 miles N.E. of Knoxville: it is said to be navigable in boats 100 miles. America has also other creeks of the same name; one in Virginia, which runs into James river, N. lat. $37^{\circ} 13'$. W. long. $77^{\circ} 21'$; and another in Pennsylvania, which runs into the Susquehannah, N. lat. $40^{\circ} 23'$. W. long. $77^{\circ} 1'$.

POWEL'S Key, a small island among the Bahamas. N. lat. $26^{\circ} 49'$. W. long. $77^{\circ} 30'$.

POWEL'S Point, a cape on the coast of North Carolina, at the entrance into Albemarle sound. N. lat. $36^{\circ} 1'$. W. long. $76^{\circ} 4'$.—Also, a cape of Virginia, in James river. N. lat. $37^{\circ} 2'$. W. long. $76^{\circ} 24'$.

POWEL'S Valley, a district of America, which lies between Powel and Cumberland mountains, between 80 and 90 miles in length, and from 10 to 18 wide, and which is almost equally divided between Virginia and Tennessee. The soil is easily cultivated, some parts of it being of the best quality. The water is good and plentiful, and the air is salubrious. It produces grain, corn, grafs, flax, hemp, fruit-trees, &c. and the Tennessee part yields cotton. It is furnished with good stone quarries, and good timber for building, and has a good outlet for boats by means of Powel's river, which is well stocked with fish. About the middle of the valley is a natural bridge, over a small creek, formed by three regular arches, 50 feet long, 40 high, and 20 wide.

POWELL, DAVID, in *Biography*, a learned antiquary, was born in Derbyshire about the year 1552, and was educated at Oxford, where he took his degree of D. D. He died in 1590, and was buried in the church of Ruabon, in Denbighshire, of which he was vicar. He published "Caradoc's History of Wales in 1584;" "Annotationes in Itinerarium Cambriæ Scrip per Giraldum;" "De Britannica Historia recte intelligenda."

POWELL, WILLIAM SAMUEL, was born at Colchester in 1717, and educated at St. John's college, Cambridge, of which he became successively fellow and master. In 1766 he obtained the archdeaconry of Colchester, and other preferments. Dr. Powell published a famous sermon on subscription to the articles, and other discourses. The doctor contended that young persons might subscribe on the authority of others; which, says Mr. Archdeacon Blackburne, might be liable to the repartée which was made to bishop Pierce, by a poor man, who was required to assent to the contents of the book of Common Prayer, at the time of the infamous Bartholomew act. The man begged first to read it; "You have already read it," replied the prelate, "by the mouth of the convocation, which is your representative."—"If that be the case," said the man, "let it suffice for me to assent to it by the mouth of the convocation." Blackburne's Works, vols. v. and vii.

POWER, LIONEL, author of one of the Tracts in the celebrated musical MS. of Waltham Holy-Cross, in Essex; which upon the suppression of the monasteries, became the property of the venerable Tallys, whose name appears in

his own hand-writing on the back of the last leaf. Morley seems to have consulted this MS., but to whom it belonged after the death of Tallys does not appear till the reign of king William, when it was among the books of Mr. Powle, speaker of the house of commons. From him it went to lord Somers; and then to sir Joseph Jekyll, at the sale of whose library by auction, it was purchased by a country organist, who in gratitude for some benefits received, presented it to the late James West, esq. president of the Royal Society, and it is now in the possession of the marquis of Lansdown. It contains nine tracts on music, seven of which are in Latin, and two in very old English. That by Lionel Power is the eighth. It is a short treatise in English, which, besides the obsolete words, orthography, and shape of the letters, has several other internal marks of considerable antiquity: such as a mixture of Saxon letters; an oblique stroke instead of a dot over the letter *i*; and the frequency and kind of abbreviations. Though this essay will afford no information of importance to a musician of the present times, except that which will gratify self-complacence, by discovering to him that the author knew less than subsequent improvements in the art of music have enabled him to know himself; yet, as it seems to be the most ancient musical tract that has been written, or at least preserved, in our vernacular tongue, we shall give a quotation from it, not only to shew the state of our music, but our language at the time it was written, which was, probably, during the reign of Edward III.

"This tretis is contynued upon the gamme for hem that wil be syngers, or makers, or techers. For the ferst thing of alle ye must kno how many cordis of discant ther be. As olde men sayen, and as men syng now-a-dayes, ther be nine; but whofo wil syng mannerli and musikeli, he may not lepe to the fyfteenth in no maner of discant; for it longeth to no manny's uoys, and so ther be but eyght accordis after the discant now usid. And whofoever wil be a maker, he may use no mo than eyght, and so ther be but eyght fro unison unto the thyrteenth. But for the quatribil syghte ther be nine accordis of discant, the unison, thyrd, fyfth, sixth, eyghth, tenth, twelfth, thyrteenth, and fyfteenth, of the whech nyne accordis fyve be perfyte and fower be imperfyte. The fyve perfyte be the unison, fyfth, eyghth, twelfth, and fyfteenth; the fower imperfyte be the thyrd, sixth, tenth, and thyrteenth: also thou maist ascende and descende wyth alle maner of cordis excepte two accordis perfyte of one kynde, as two unisons, two fyfths, two eyghths, two twelfths, two fyfteenths, wyth none of these thou maist neyther ascende, neyther descende; but thou must confette these accordis togedir, and medele hem wel, as I shall enform the. Ferst thou shall medele with a thyrd a fyfth, wyth a sixth an eyghth, wyth an eyghth a tenth, wyth a tenth a twelfth, wyth a thyrteenth a fyfteenth; under the whech nyne accordis three syghtis be conteynyd, the mene syght, the trebil syght, and the quatribil syght: and others also of the nyne accordis how thou shalt hem ymagine betwene the playn-song and the discant here folloeth the ensample. First to enforme a chylde in hys counterpoynt, he must ymagine hys unison the eygth note fro the playn-song, benethe hys thyrd; the sixth note benethe hys fyfth; the fowerth benethe his sixth; the thyrd note benethe his eyghth, even wyth the playne song; hys tenth and thyrd note aboue, his twelfth the fyfth note aboue, his thyrteenth the sixth aboue, hys fyfteenth the eyghth note aboue the playne-song."

POWER, Potentia, in *Physics*, a natural faculty of doing or suffering any thing. Accordingly, Mr. Locke explains the origin of our idea of power to the following effect: the mind

mind being daily informed, by the senses, of the alterations of the simple ideas of things without, and reflecting on what passes within itself, and observing a constant change of its ideas, sometimes by the impressions of outward objects upon the senses, and sometimes by the determinations of its own choice; and concluding, from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by the same agents, and by the like ways; considers, in one thing the possibility of having any of its simple ideas changed; and in another, the possibility of making that change; and so comes by that idea which we call *power*. Thus we say, fire has a power to melt gold, and make it fluid; and gold has a power to be melted.

Power, thus considered, is twofold; *viz.* as able to *make*, or able to *receive*, any change; the one may be called *active*, the other *passive* power.

Of *passive* power, all sensible things abundantly furnish us with ideas; nor have we of *active* power fewer instances; since whatever change is observed, the mind must suppose a power somewhere able to make that change.

Yet, if we attentively consider it, bodies, by our senses, do not afford us so clear and distinct an idea of active power, as we have from reflection on the operations of our minds; for all power relating to action, and there being but two sorts of action, *viz.* thinking and motion, it may be considered whence we have the clearest ideas of the powers which produce those actions.

Of thinking, body affords us no idea at all; it is only from reflection that we have that: neither have we from body any idea of the beginning of motion. A body, at rest, affords us no idea of any active power to move; and when it is set in motion itself, that motion is rather a passion than an action in it. The idea of the beginning of motion, we have only by reflection on what passes in ourselves; where we find by experience, that, barely by willing it, we can move the parts of our bodies, which before were at rest.

We find in ourselves a power to begin or forbear, continue or end, several actions of our minds and motions of our bodies, barely by a thought or preference of the mind. This power which the mind has, thus to order the consideration of any idea, or the forbearing to consider it, or to prefer the motion of any part of the body to its rest, and *vice versa*, in any particular instance, is what we call the *will*. And the actual exercise of that power, is that which we call *volition*, or *willing*.

The forbearance or performance of that action, consequent to such an order or command of the mind, is called *voluntary*; and whatsoever action is performed without such a thought of the mind, is called *involuntary*.

The power of perception, is what we call the *understanding*.

Perception, which we make the act of understanding, is of three sorts: the perception of ideas in our minds; the perception of the signification of signs; and the perception of the agreement or disagreement of any distinct ideas.

These *powers of the mind*, *viz.* those of perceiving, and preferring, are usually called by another name; and the ordinary way of speaking is, that the *understanding* and *will* are two faculties or powers of the mind. A word proper enough, if used so as not to breed any confusion in men's thoughts, by being supposed, as there is room to suspect it has been, to express some real beings in the soul, that perform those actions of understanding and volition.

From the consideration of the extent of the power of the mind over the actions of the man, which every one finds in himself, arise the ideas of liberty and necessity.

Such is Mr. Locke's account of the nature and operation of power; and of the manner by which we acquire the idea of it. To this account of its origin, Dr. Reid has suggested several objections. First of all he does not approve of his distinction of power into *active* and *passive*, as he conceives passive power to be no power at all; and therefore, by applying this term to the possibility of being changed, it is used in a sense that is altogether improper and unwarrantable; inasmuch that passive power is a contradiction in terms. Mr. Locke himself acknowledges that active power is more properly called power; and he seems to have been unwarily led to the adoption of the epithet passive by way of opposition to active power; whereas Dr. Reid thinks that certain powers are denominated active in order to distinguish them from those that are called speculative. Our author also is of opinion, that Mr. Locke has imposed upon himself in attempting to reconcile his account of the idea of power to his favourite doctrine, that all our simple ideas are ideas of sensation, or of reflection. The co-operation of other powers of the mind, besides sensation and reflection, is necessary to our forming an idea of power by the process which Mr. Locke has stated. Whilst we observe the present state of things by means of our senses, memory must aid us in the review of those that are past; and it is by such a review that we are able to judge of the change that has taken place, upon which change, thus ascertained to us, our idea of power, according to Mr. Locke's principle, depends. The same observations are applicable to consciousness, by which we determine the change that has occurred in our thoughts. The second part of the process, by which we infer from the changes that are observed the power that produces them, requires the assistance of reasoning, which is the province neither of the senses nor of consciousness. Thus in attempting to derive the idea of power from the two sources of sensation and reflection, Mr. Locke has introduced our memory, and our reasoning faculty, for a share in its origin. Mr. Hume, whilst he professedly adopts Mr. Locke's general principle, that all our simple ideas are derived either from sensation or reflection, boldly affirms that we never have any idea of power, and that we deceive ourselves when we imagine we are possessed of any idea of this kind. He allows, however, that Mr. Locke's opinion of the origin of our idea of power is a popular opinion, and indeed the opinion, that things cannot begin to exist, nor undergo any change, without a cause that hath power to produce that change, is so popular, that few persons have presumed to dispute it. But whether this opinion be true or false, its having prevailed so generally affords a convincing proof, that men have an idea of power, in what way soever it has been acquired. In opposition to Mr. Locke's account of the idea of power, Mr. Hume advances two principles, which he considers as very obvious; one is, that reason alone can never give rise to any original idea; and the other is, that reason, as distinguished from experience, can never make us conclude, that a cause, or productive quality, is absolutely requisite to every beginning of existence. The first of these principles, so far from being obviously true, is obviously false; for we may ask, whence proceed our ideas of reasoning itself, and of all its various modes, but from our reasoning faculty? As for the second principle, nothing can be more certain, than that every change in nature must have a cause, and it is no less undeniable that this maxim is not deduced merely from experience. But this subject has

been already discussed, as far as our limits will allow, under the article CAUSE.

Power, as others have defined it, is that quality or attribute of any being which produces change in the nature, properties, or circumstances of things. Thus we say, clay becomes hard and wax soft by the power of heat; a bee is said to have power to build a cell, a bird to make a nest, and a man to construct a ship or house, &c. But a question here occurs, whether beings that have no will or understanding may have active power? In the solution of this question, we can derive little satisfaction from the consideration of the events that are observed in the course of nature. We perceive innumerable changes, and we know that these changes must be produced by the active power of some agent; but we neither perceive the agents nor the power, but merely the change. Whether the things be active, or merely passive, is not easily discovered; and indeed it concerns us little to know the real efficient, whether it be matter or mind, whether of a superior or inferior order.

According to Mr. Locke, the only clear notion or idea we have of active power is deduced from the power which we find in ourselves to give certain motions to our bodies, or a certain direction to our thoughts; and this power in ourselves can be brought into action only by willing or volition. Hence it must follow, that if we had not will, and that degree of understanding which will necessarily implies, we could exert no active power, and consequently could have none; for power that cannot be exerted is no power; and it follows also, that the active power, of which only we can have any distinct conception, can be only in beings that have understanding and will.

Upon the whole, Dr. Reid thinks it most probable, that such beings only as have some degree of understanding and will, can possess active powers; and that inanimate beings must be merely passive, and have no real activity. Nothing we perceive without us affords any good ground for ascribing active power to any inanimate being; and every thing we can discover in our own constitution leads us to think that active power cannot be exerted without will and intelligence. But if we restrict active power to a subject endowed with will and intelligence, what shall we say of the powers, ascribed by philosophers to matter:—the powers of corporeal attraction, magnetism, electricity, gravitation, and others? In reply to this inquiry, it should be considered, that the ambiguity of the words *cause*, *agency*, *active power*, &c. has led many to understand them, when used in natural philosophy, in a wrong sense, and in a sense which is neither necessary for establishing the true principles of natural philosophy, nor was ever meant by the most enlightened in that science. When philosophers attribute active powers to matter, they teach us, at the same time, that matter is a substance altogether inert and merely passive, and that gravitation, attraction, and repulsion, &c. which they ascribe to it, are not inherent in its nature, but impressed upon it by some external cause, which they do not pretend to know, or to be able to explain. Although on some occasions philosophers speak the language of the vulgar, they think differently from the vulgar, and in order to avoid affectation and ostentation, and to render themselves intelligible, they condescend to use the common phraseology. The word power, therefore, when applied to inanimate substances, like the term principle, &c., is a term invented to express the unknown cause of known effects which are reducible to certain laws. It is difficult to ascertain, says an ingenious writer, whether powers are, properly speaking, attributes

of inanimate substances. To allow that they are seems to imply, that power may exist without an agent, and that beings may act where they do not exist. This absurdity follows, if, *e. g.* gravitation is supposed to be a power inherent in matter, by which bodies act upon each other at immense distances. But, on the contrary, to deny, that powers may be attributes of inanimate substances, leads to the conclusion, that nothing exists in the universe but God and his energies, which coincides with pantheism, and even tends to atheism.

In all languages, action is attributed to many things that are known and allowed to be merely passive; as when we say, the wind blows, the rivers flow, the sea rages, &c. &c. Every body which undergoes any change, must in that change be either active or passive; and the change is always expressed in language, either by an active or a passive verb; nor is there any verb, expressing a change, which does not imply either action or passion. The thing either changes, or it is changed. But in language, when an external cause of the change is not obvious, the change is always imputed to the thing changed, as if it were animated, and had active power to produce the change in itself. So we say, the moon changes, the sun rises and goes down. Thus active verbs, as Dr. Reid has observed, in illustrating the observation at large, are very often applied, and active power imputed to things, which a little advance in knowledge and experience teaches us to be merely passive. To sum up this part of the argument: we see in the theatre of nature innumerable effects, which require an agent endued with active power, but the agent is behind the scene. Whether he be the supreme cause alone, or a subordinate cause or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, their different offices may be, are things hid, for wise reasons without doubt, from the human eye. It is only in human actions, that may be inspected for praise or blame, that it is necessary for us to know who is the agent, and in this, nature has given us all the light that is necessary for our conduct. Every man is conscious of a power to determine, in things which he conceives to depend upon his determination. This observation leads us to consider power, in a more peculiar and distinguishing sense, an attribute of mind; whether we allow it to belong to inanimate substances or not. To the negative in this question we feel ourselves much inclined, as the least objectionable, though it is not without its difficulties. As an attribute of mind, power may be defined the power of carrying into effect the determinations of the will. Those who maintain that power is an attribute of the human mind, argue, 1. From consciousness and observation. I will to walk, to speak, to write; the bodily organs instantly obey; and I am as conscious that I perform the action, as that I form the volition. Other agents possess a similar power. 2. It is affirmed, that we have a conception of power, though we cannot satisfactorily define it. Those who deny that power is an attribute of the mind, contend 1. That we have no consciousness of its existence. We are merely conscious, they say, of volition and the effect produced: that which some call a consciousness of power being nothing more than a belief that the effect will follow the volition. 2. They further argue, that our total ignorance of the manner in which muscular motion is produced, proves that the mind is not the efficient and proper cause of this wonderful effect. POWER.

POWER, in *Arithmetic*, the product of a number, or other quantity multiplied into itself.

Thus the product of the number 3, multiplied by itself, *viz.* 9, is the second power of 3; the factum of 9, multiplied by three, *viz.* 27, is the third power; and the product of 27, again multiplied by 3, *viz.* 81, is the fourth power; and so on to infinity. In respect of these higher powers, the first number, 3, is called the *root*, or first power.

The second power is called the *square*; with respect to which, 3 is the square root.

The third power, 27, is called the *cube*; with respect to which, 3 is the cube root.

The fourth power, 81, is called the *biquadrate*, or *quadrato-quadratum*; with respect to which, 3 is the biquadratic root.

The number which shews how often the root is multiplied into itself, to form the power, or how oft the power is to be divided by its root, to come at the root, is called the *exponent* or *index of the power*.

The moderns, after Des Cartes, are contented to distinguish most of their powers by the exponents; as *first, second, third, &c.*

The particular names of the several powers were introduced by the Arabs, *viz.* *square, cube, quadrato-quadratum* or *biquadrate, surdesolid, square of the cube, second surdesolid, quadrato-quadrato-quadratum, cube of the cube, square of the surdesolid, third surdesolid, &c.*

The names given by Diophantus, followed by Vieta and Oughtred, are the *side* or *root, square, cube, quadrato-quadratum, quadrato-cubus, cubo-cubus, quadrato-quadrato-cubus, quadrato-cubo-cubus, cubo-cubo-cubus, &c.*

The characters with which the several powers are denoted both in the Arabic and Cartesian notation, are as follow:

	2	4	8	16	32	64	128	256	512	1024
Arab. R	q	c	bq	s	qc	Bf	tq	bc	fq	
Cartes. a	a ²	a ³	a ⁴	a ⁵	a ⁶	a ⁷	a ⁸	a ⁹	a ¹⁰	

Hence to raise a quantity to a given power or dignity, is the same as to find the factum arising upon its being multiplied a given number of times into itself; *e. gr.* to raise 2 to the 3d power, is the same as to find the factum 8; whose factors are 2, 2, 2. This operation is called *involution*; which see.

Powers of the same degree are to one another, in the ratio of the roots, as manifold as their exponent contains units: thus, squares are in a duplicate ratio; cubes in a triplicate ratio; quadrato-quadrata, or fourth powers, in a quadruplicate ratio. See **RATIO**.

The powers of proportional quantities are also proportional to one another.

POWER, *Arithmetical*, is used by Mr. Machin for composite numbers or quantities, whose factors are in arithmetical progression. See Dr. Martin's *Abridg. Phil. Transf.* vol. viii. p. 78.

Mr. Machin uses a particular notation for quantities of this kind. The quantity expressed by this notation has a double index; that at the head of the root at the right hand, but separated by a hook to distinguish it from the common index, denotes the number of factors; and that above, within the hook on the left hand, denotes the common difference of the factors proceeding in a decreasing or increasing arithmetical progression.

$$\overbrace{a}^{(m)}$$

Thus the quantity $n + a$ denotes by its index m on the right hand, that it is a composite quantity, consisting of so many factors as there are units in the number m , and the index a above on the left, denotes the common difference of the factors decreasing in an arithmetical progression, if it be positive: or increasing, if it be negative; and so signifies, in the common notation, the common number or quantity, $n + a, n + a - a, n + a - 2a, \&c.$

$$\overbrace{2}^{(6)}$$

For example, $n + 5$ is $n + 5, n + 3, n + 1, n - 1, n - 3, n - 5$, consisting of six factors, whose common difference is 2. After the same manner, $n + 4$, ($5 = n + 4, n + 2, n, n - 2, n - 4$), consisting of five factors. According to which method, it will easily appear, that if a be an integer,

$$\overbrace{2}^{(2a + 2, \&c.)}$$

then $n + 2a + 1$ will be $nn - 1, nn - 9, nn - 25$, continued to such a number of double factors as are expressed by $a + 1$, or half the index, which in this

$$\overbrace{2}^{(2a + 1)}$$

case is an even number. Thus also $n + 2a$ will be equal to $n, nn - 4, nn - 16, nn - 36$, and so on, where there are to be so many double factors, as with one single one n , will make up the index $2a + 1$, which is an odd number.

If the common difference a be an unit, it is omitted: thus $\overbrace{6}^{(6)} = n, n - 1, n - 2, n - 3, n - 4, n - 5$, containing six factors. So $\overbrace{6}^{(6)} = 6, 5, 4, 3, 2, 1$, and the like for others.

If the common difference a be nothing, the hook is omitted, and it becomes the same with the geometrical

$$\overbrace{a}^{(m)}$$

power. Thus $n + a = n + a^m$, according to the common notation.

The learned author above quoted applies this doctrine of arithmetical powers to the investigation of the principal rule in the method of fluxions, and its inverse, which is that if the ordinate $y = m z^{m-1}$, then will the area, or rather the form of the quantity for the area, be $= z^m$; or *vice versa*, that if the area be z^m , the ordinate will be $m z^{m-1}$; on which occasion he observes, that the symbol z , considered as a component part of the rectangle z , may bear a plain interpretation, *viz.* that it is the measure according to which the quantity z is measured. See **FLUXION**.

From a given power to extract the root, or *side*, is the same as to find a number, *e. gr.* 2, which multiplied any number of times, *e. gr.* twice, produces the given power, *e. gr.* the 3d power, or 8. This operation is called **EVOLUTION**, and **EXTRACTION of Roots**; which see.

To multiply or divide any power by another of the same root. 1. For multiplication, add the exponents of the factors; the sum is the exponent of the factum. Thus:

Factors	$\left\{ \begin{array}{l} x^i \\ x^i \end{array} \right.$	$\left\{ \begin{array}{l} y^n \\ y^m \end{array} \right.$	$\left\{ \begin{array}{l} y^m \\ y^n \end{array} \right.$	$\left\{ \begin{array}{l} a^m \\ a^r \end{array} \right.$	$\left\{ \begin{array}{l} x^n \\ x^i \end{array} \right.$
Prod.	x^7	y^{2n}	y^{n+n}	a^{m+r}	x^{n+i}

2. For division, subtract the exponent of the power of the divisor, from the exponent of the dividend; the remainder is the exponent of the quotient. Thus:

$$\begin{array}{l} \text{Divid. } x^7 \left(x^3 \parallel y^{m+n} \left(y^m \parallel a^m \left(a^{m-r} \parallel x^n \left(x^{n-r} \right. \right. \right. \right. \\ \text{Divif. } x^3 \left(\parallel y^n \left(\parallel a^r \left(\parallel x^r \left(\right. \right. \right. \right. \end{array}$$

M. de la Hire gives us a very odd property common to all powers: M. Carre had observed with regard to the number 6, that all the natural cubic numbers, 8, 27, 64, 125, whose root is less than 6, being divided by 6, the remainder of the division is the root itself; and if we go farther, 216, the cube of 6, being divided by 6, leaves no remainder: but the divisor 6 is itself the root. Again, 343, the cube of 7, being divided by 6, leaves 1; which, added to the divisor 6, makes 7 the root, &c. M. de la Hire, on considering this, has found that all numbers, raised to any power whatever, have divisors, which have the same effect with regard thereto, that 6 has with regard to cubic numbers.

For the finding of these divisors, he discovered the following general rule:

If the exponent of the power of a number be even, *i. e.* if the number be raised to the 2d, 4th, 6th power, &c. it must be divided by 2; the remainder of the division, in case there be any, added to 2, or to a multiple of 2, gives the root of this number, corresponding to its power, *i. e.* the 2d, 6th, &c. root.

If the exponent of the power be an uneven number, *i. e.* if the number be raised to the 3d, 5th, 7th, &c. power; the double of the exponent will be the divisor, which has the property mentioned.

Thus it is found in 6, double of 3, the exponent of the power of all the cubes: thus, also, 10 is the divisor of all numbers raised to the 5th power, &c.

If any power of a quantity be divided by a greater power of the same quantity, the quotient must be negative. For the rule for dividing any power of a quantity by another power of the same, is to subtract the exponent of the divisor from the exponent of the dividend, and make the difference the exponent of the quotient.

For instance, $\frac{a^6}{a^4} = a^{6-4} = a^2$; and $\frac{a^m}{a^p} = a^{m-p}$.

Hence if p be greater than m , the exponent $m - p$ must be negative.

Thus if $p = m + n$, then $\frac{a^m}{a^p} = \frac{a^m}{a^{m+n}} = a^{-n}$.

It is obvious that $\frac{a}{a} = a^{1-1} = a^0$. But $\frac{a}{a} = 1$; and therefore $a^0 = 1$. In like manner $\frac{1}{a} = \frac{a^0}{a^1} = a^{-1}$; $\frac{1}{a^2} = \frac{a^0}{a^2} = a^{-2}$; $\frac{1}{a^3} = \frac{a^0}{a^3} = a^{-3}$, so that the

quantities $a, 1, \frac{1}{a}, \frac{1}{a^2}, \frac{1}{a^3}, \frac{1}{a^4}, \dots$ &c. may be expressed thus, $a^1, a^0, a^{-1}, a^{-2}, a^{-3}, a^{-4}, \dots$ &c.

This change of expression is often of great use in the computation of fluxions and infinite series.

When the quantity to be raised to any power is positive, all its powers must be positive. And when the radical quantity is negative, yet all its powers, whose exponents are even numbers, must be positive. For $- \times -$ gives $+$. The power then can only be negative, when the exponent is

an odd number. Thus the powers of $-a$ are $-a, +a^2, -a^3, +a^4, -a^5, \dots$ Those whose exponents are 2, 4, 6, &c. are positive; but those whose exponents are 1, 3, 5, 7, &c. are negative. Maclaur. Algebr. p. 37, 38.

Hence if a power have a negative sign, no root of it, denominated by an even number, can be assigned; since no quantity multiplied into itself an even number of times can give a negative product. Thus the square root of $-aa$ or $\sqrt{-aa}$ cannot be assigned, and is what mathematicians call an *impossible*, or an *imaginary* quantity or *root*. See Root.

Observe, that every power has as many roots, real and imaginary, as there are units in the exponent of the power. This holds true of unity itself. Maclaur. Algebr. p. 128.

POWER, *Imperfect*, in Algebra, is used for a power that has a fractional exponent; thus $a^{\frac{1}{2}}, a^{\frac{2}{3}}, a^{\frac{3}{4}}, a^{\frac{7}{8}}, \dots$ are imperfect powers. Maclaur. Algebr. p. 44.

These are otherwise expressed by placing the given power within the radical sign $\sqrt{\quad}$, and placing above the radical sign the number that denominates what kind of root is required.

Thus $a^{\frac{3}{2}} = \sqrt{a^3}$; $a^{\frac{5}{3}} = \sqrt[3]{a^5}$; $a^{\frac{m}{n}} = \sqrt[n]{a^m}$.

These imperfect powers are also called *surds*; which see.

The powers of numbers have several curious and remarkable properties, the most important of which are as follow:

1. The difference of any two equal powers of different numbers is divisible by the difference of their roots; that is,

$$\frac{x^n - y^n}{x - y} = \text{I an integer, or } x^n - y^n = \text{M}(x - y),$$

where the abridged expression $\text{M}(x - y)$ signifies an integral multiple of $x - y$.

2. The difference of the two equal powers is always divisible by the sum of their roots, when the exponent of the

power is an even number; that is, $\frac{x^{2n} - y^{2n}}{x + y} = \text{I an integer, or } x^{2n} - y^{2n} = \text{M}(x + y)$.

3. The sum of two equal odd powers of different numbers is always divisible by the sum of their roots; that is,

$$\frac{x^{2n+1} + y^{2n+1}}{x + y} = \text{I an integer, or } x^{2n+1} + y^{2n+1} = \text{M}(x + y)$$

And in all these cases it may be demonstrated, that when x and y are prime to each other, the sums, or differences of the powers as above stated, are divisible only once by their respective divisors, unless those divisors are equal to the respective powers, or to some multiple of them.

By means of the above propositions, we are also enabled to ascertain the divisors of the sum or difference of two unequal powers of the same root, *viz.*

$$(x^m - x^n) = \text{M}(x - 1), \text{ and } \text{M}(x + 1),$$

when $m - n$ is even, or of the form $2n'$; for

$$(x^m - x^n) = x^n(x^{m-n} - 1).$$

And since $m - n$ is of the form $2n'$, $(x^{m-n} - 1)$ is divisible both by $x + 1$ and $x - 1$, by prop. 1 and 2.

Again, if $m - n$ be odd, or of the form $2n' + 1$, then,

$$(x^m - x^n) = \text{M}(x - 1)$$

$$\text{And } (x^m + x^n) = \text{M}(x + 1).$$

For $x^m - x^n = x^n (x^{m-n} - 1)$
 And $x^m + x^n = x^n (x^{m-n} + 1)$.

And since by the supposition $m - n$ is odd, or of the form $2n' + 1$, it follows from prop. 1 and 3, that in the first case we have,

$$(x^{m-n} - 1) = M(x - 1)$$

And in the 2d, $(x^{m-n} + 1) = M(x + 1)$.

4. Neither the sum nor the difference of two powers, higher than the square, can produce a complete power of the same denomination; that is, $x^n \pm y^n = z^n$ is always impossible, either in integers or fractions, if x is greater than z .

This is one of Fermat's propositions mentioned by him, but without its demonstration, in the marginal notes of his edition of Diophantus. The impossibility of some partial cases have since been demonstrated by Euler, and other modern analysts: viz. it has been found impossible in the case of $n = 3$, and $n = 4$; but beyond this, the truth of the proposition rests only on the assertion of Fermat, and it would be, therefore, highly interesting to see a complete demonstration of this property. Mr. Barlow, in his Theory of Numbers, has attempted this, but failed in his conclusion, by referring to a proposition which did not apply. He has, however, made a considerable advance towards it, by proving that if there are any cases in which the equation $x^n \pm y^n = z^n$ be possible, n being a prime number, it must necessarily happen that $x - y$, $x - z$, and $y + z$, are all three complete n th powers; or two of them complete n th powers, and the other n times such a power. These limitations are sufficient to indicate the impossibility of the equation; but something farther is necessary for the complete demonstration.

5. If m be a prime number, and x any number not divisible by m , then the remainder arising from the division of x by m , will be the same as that from the division of x^m by m ; that is, $\frac{x}{m}$, and $\frac{x^m}{m}$, will both leave the same remainder.

From the above proposition is readily deduced the following, which is also another of Fermat's propositions, first demonstrated by Lagrange, viz.

6. If m be a prime number, and n any number not divisible by m , then will the formula $x^{n-1} - 1$ be divisible by m .

This is a very important proposition in the theory of numbers, being that on which depend many of the most elegant and interesting properties connected with this subject.

7. From this property we readily draw the following expressions for the forms of the different powers of numbers, and which are frequently very useful in determining *à priori* whether a proposed number be a complete power or not, without the trouble of extracting it, viz.

Since $x^{m-1} - 1$ is always divisible by m , under the limitation of the proposition; therefore, x^{m-1} is of the form $am + 1$, and consequently every power, whose exponent plus 1 is a prime number, as (m) , will be of the form am , or $am + 1$; and thus we may ascertain the forms of many of the higher powers: thus,

x^1	is of the form	$5n$, or	$5n + 1$
x^6		$7n$, or	$7n + 1$
x^{10}		$11n$, or	$11n + 1$
x^{12}		$13n$, or	$13n + 1$

Again, since m is a prime number, if it be greater than 2 it is an odd number, and consequently $m - 1$ is an even number; and therefore,

$$x^{m-1} - 1 = (x^{\frac{m-1}{2}} + 1)(x^{\frac{m-1}{2}} - 1).$$

And since this product is divisible by m , and m is a prime number, one of these factors is divisible by m , and consequently $x^{\frac{m-1}{2}}$, when divided by m , must leave either $+ 1$,

or $- 1$, for a remainder; that is, $x^{\frac{m-1}{2}}$ is of one of the forms am , or $am \pm 1$. And hence, again, we derive the forms of many other of the higher powers: thus,

x^3	is of the form	$7n$, or	$7n \pm 1$
x^5		$11n$, or	$11n \pm 1$
x^6		$13n$, or	$13n \pm 1$
x^8		$17n$, or	$17n \pm 1$
x^9		$19n$, or	$19n \pm 1$
x^{11}		$23n$, or	$23n \pm 1$
&c.		&c.	&c.

The only power under 12 excluded from these formulæ is 7, because neither $7 + 1$ nor $2 \cdot 7 + 1$ is a prime number.

8. All prime powers divided by double their exponent, will leave for remainders the same numbers as their several roots, when divided by the same double exponent. Hence we see why all 5th powers terminate with the same digit as the roots of those powers.

9. The n th differences of any consecutive n th powers is a constant quantity, and equal to the product $1, 2, 3, 4, \&c. n$.

That is, the second differences of consecutive squares = $1, 2$.

The third differences of consecutive cubes = $1, 2, 3$.

The fourth differences of consecutive 4th powers = $1, 2, 3, 4, \&c.$

This property is readily demonstrated for any particular power; but under the general index n , it is attended with some difficulty; the proof is generally made to depend upon the following property, which is not easily demonstrated, viz. that the product $1, 2, 3, 4, 5, \&c. n = n^n - n(n-1)^n + \frac{n \cdot (n-1)}{1 \cdot 2} (n-2)^n - \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} (n-3)^n + \&c.$

There, is however, a very ingenious demonstration of it, depending only upon first principles, given by S. Burke, esq. in vol. ix. of the Transactions of the Irish Academy.

We might have added here many other curious properties of numerical powers, but we prefer subjoining the following table of the first 10 powers of all numbers from 1 to 100, which is remarkably useful in a variety of arithmetical operations; and for farther information relating to the properties of powers, their divisors, forms, &c. we must refer the reader to Legendre's Essai sur la Théorie des Nombres, to Gauss's Disquisitiones Arithmeticae, and to Barlow's Elementary Investigations of the Theory of Numbers. See also vol. ix. of the Trans. Irish Acad.

POWER, in *Mechanics*, denotes a force, which, being applied to a machine, tends to produce motion; whether it does actually produce it or not.

In the former case it is called a *moving power*; in the latter, a *sustaining power*.

If the power be a man, or a brute, it is called an *animate power*; if the air, water, fire, gravity, or elasticity, an *inanimate power*.

POWER, *Attractive*. See ATTRACTIVE.

POWER, *Conspiring*. See CONSPIRING.

POWER, *Repelling*. See REPELLING.

POWER is also used for any of the six simple machines, *viz.* the *lever, balance, screw, axis in peritrochio, wedge, and pulley*; which are particularly called the *MECHANIC powers*, which see.

See also each power under its proper article, LEVER, BALANCE, &c.

POWER, *Maintaining, or Maintaining power*, in *Horology*, is that extraneous force which is applied in a clock or watch, to maintain or perpetuate the natural vibrations of a pendulum, or oscillations of a balance, which would otherwise come to rest, by reason of friction in the mechanism, and the resistance opposed by the air to the parts in motion. This power, in the larger clocks, is usually a suspended weight; but in the portable clocks and watches, it is a spring, coiled in a metallic box, that actuates the wheelwork, by gradually unbending itself: in the former of these cases, the weight is suspended by a cord, or chain, that is coiled round a cylinder when wound up, which cylinder, being of uniform diameter throughout its length, is acted on by the cord, when fast at the interior end, by a similar force in every situation; and, therefore, imparts through the train, that is connected with its great wheel, invariable impulses to the escapement-wheel, at every vibration of the pendulum; which pendulum receives therefrom such a slight push, as is just sufficient to restore the momentum that it loses from friction and resistance of the air; and thus the uniform motion of the pendulum is perpetuated, or would be perpetuated, if no impediment from dirt, from the thickening of oil, or from wear, &c. were to interfere with the regularity of its action. But when a spring is substituted for a weight, its agency is not uniform, without some mechanical correction to equalize it: this correction is effected by the *FUSEE*, which we have already explained in its proper place, but which is seldom so completely proportioned to the varying forces of the opening spring, as to be at all times equal to a weight suspended from an uniform cylinder. Hence have originated various escapements in horological machines, either to correct or to obviate the inequalities of the maintaining power, after it has been modified by transmission through the train of wheelwork, that is necessary both for limiting its quantity, and lengthening the time of its action. The whole quantity of maintaining power that is expended in a given time, when a weight is used, is the product of the weight into its descent, in inches and parts, from its situation at the commencement of action, and therefore the slower the fall is, the greater must be the weight, and *vice versa*, when a given quantity is necessary for maintaining the vibrations in an undiminished state for the requisite duration. Hence a clock may be made to go at one winding, any length of time, from a day to a year, or more; but the most usual time, and perhaps as unobjectionable as any, is something more than a week, for which a weight of from ten to twelve pounds is sufficient, with an ordinary cylinder and double cord. In general, an excess of maintaining power is injurious to the natural motion of a pendulum or balance; but as different escapements require different de-

grees of power to produce the requisite effect, it would not be an easy matter to calculate the exact quantity that would be best in all cases, even if the same power were requisite in all states of foulness of the machine. The best rule in practice is to adopt that weight which experience has pointed out as adequate to its purpose, and if, on trial, a little addition or diminution of the power is found to bring the vibration to the most desirable length; the weight so changed will be proper to make choice of. In those particular escapements which are called *isochronal*, an increase or diminution of the power, though they affect the total length of the vibration, will not alter the time; and, therefore, with respect to them, the exact quantity of power is not of so much importance as in other escapements, provided it be sufficient, under all circumstances, to make the total vibration exceed the arc of escapement, so as to prevent quiescence. In those escapements which are denominated *remontoir*, the maintaining power does not itself act on the escapement-wheel, but serves only to raise a pair of small weights, or to wind up a couple of small springs, that become substitutes for the maintaining power, by giving their small alternate impulses at each vibration or oscillation, without variation in the intensity of each impulse, which is a great improvement in the art of clock-making and watch-making, particularly where the escapement is of the detached description; for whatever irregularities might arise from the transmission of the modified power, through the train, in different states of the weather, or of foulness, these irregularities, not influencing the effective forces derived from the secondary weights or springs alone, do not affect the pendulum or balance, that is actuated solely by one or other of these invariable powers, though these powers are under the agency of the maintaining power themselves, at certain intervals, more or less distant.

It has been asserted, that if the weight of a pendulum-bob be increased inversely as the square of the arc of vibration is diminished, and *vice versa*, the maintaining power must remain the same, but the experiments of F. Berthoud, as reported in his 14th chap. of his "Essai sur l'Horlogerie," prove that this is far from being the case in practice, and that no theory, which has yet been proposed, is competent to the calculation of the exact maintaining power, that shall make a given pendulum move in a given arc, with all the variety of escapements; it appears, however, to be agreed on, that a heavy bob, moving in a small arc, with a comparatively small maintaining power, is most conducive to invariable regulation in a clock; but that in a watch, a large arc of oscillation is necessary, in order to obtain sufficient momentum. See ESCAPEMENT.

POWER, in *Optics*. The *power of a glass* is used by some for the distance of the convexity from its solar focus.

POWER, *Commensurable in*. See COMMENSURABLE.

POWER of the County. See POSSE Comitatus.

POWER, in the *Feodal Jurisprudence*, a right which the lord has to reunite to his fief a dependent fee held of him, when the vassal has alienated it, upon reimbursing the money given for it, with legal costs.

The lord is to exercise his power over the fee within a year after he has notice of the fall; otherwise he loses it. The word is also used for the right a lord has to seize a dependent fee, to compel the payment of all dues, services, &c.

POWERS, *Potentiae*, are also used among the fathers, &c. for the sixth order in the hierarchy of angels, reckoning from seraphim.

These they suppose to be the spirits who bridle and restrain the power of the devils; preside over inferior causes; and prevent

prevent contrary qualities from disturbing the economy of the world. See *ANGEL* and *HIERARCHY*.

POWER, *Balance of*, in *Political Economy*, denotes such a disposition of things in a single state, or among different nations, that no power is able absolutely to predominate, or to prescribe laws to others. The surest means for preserving this balance or equilibrium would be that no power should be much superior to the others, and that all, or at least the greater part, should be nearly equal in force. This project is attributed to Henry IV. ; but it could not be executed without injustice and violence. Besides, if equality had been established, how could it be always supported by lawful means? Commerce, industry, military virtues, would soon put an end to it. The right of inheriting sovereignties, even in favour of women and their descendants, so absurdly settled, and yet if settled, would overthrow this system. It is more natural, easy, and just, to have recourse to the means of forming confederacies for making head against the most powerful, and hindering him from dictating law. This, till the distraction and confusion of the last 20 or 30 years (1813), has been observed by the sovereigns of Europe. They consider the two principal powers, which on that very account are naturally rivals, as destined to be checks on each other, and unite with the weakest, like so many weights thrown into the lightest scale, for keeping one in equilibrium with the other. The house of Austria was long the preponderating power, but of late times France has taken her turn. England, the opulence and fleets of which have had a great influence, without alarming any state with regard to its liberty, has had in the common course of things the glory of holding this political balance. It has been watchful to keep it in equilibrium, which is really a very wise and just policy, and will be ever highly valuable, whilst the means it makes use of are only alliances, confederacies, and others equally lawful. Confederacies would be a sure way of preserving the equilibrium, and supporting the liberty of nations, if all princes thoroughly understood their true interests, and regulated all their steps for the good of the state. But great powers are too successful in gaining over partizans and allies, who blindly surrender themselves to their views. Dazzled by the lustre of a present advantage, seduced by their avarice, deceived by wicked ministers, how many princes become the tools of a power, which at one time or other may swallow up either themselves or their successors? Thus the safest way, when a favourable opportunity offers, and it can be done with justice, is to weaken him who infringes upon the equilibrium; and by every honest method hinder his acquiring too formidable a degree of power. For this purpose the interested nations should be especially attentive not to suffer him to aggrandize himself by arms, and this they may always do with justice. For if this prince makes an unjust war, every one has a right to succour the oppressed. If he makes a just war, neutral nations may interfere as mediators for an accommodation, induce the weaker side to offer a just satisfaction with reasonable terms, and not permit it to fall under the weight of the conqueror. On the offer of equitable conditions to the prince who makes even the most just war, he has all that he can demand. The justice of his cause never gives him a right of absolutely seducing his enemy, unless when this extremity becomes necessary to his safety; or in the want of any other means of indemnifying him for the injury he has received. But this is not the case in the present instance, as the interposing nations can in another manner procure him a just satisfaction, and assurance of safety. If this formidable power should plainly entertain designs of oppression and conquest, and manifest its views by making preparations or other motions, the neighbouring nations have an unquestionable

right to prevent it; but if the fate of war declares on their side, they have a further right to avail themselves of this happy opportunity for weakening and reducing a power too contrary to the equilibrium, and dangerous to the common liberty. This right of nations is still more evident against a sovereign, who from a precipitate ardour of running to arms without reason, or even so much as plausible pretences, is continually disturbing the public tranquillity.

Mr. Hume observes, that in all the polities of Greece, the anxiety with regard to the balance of power, is apparent, or expressly pointed out to us by the ancient historians. Thucydides (lib. i.) represents the league which was formed against Athens, and which produced the Peloponnesian war, as entirely owing to this principle. And after the decline of Athens, when the Thebans and Lacedæmonians disputed for sovereignty, we find, that the Athenians (as well as many other republics) always threw themselves into the lighter scale, and endeavoured to preserve the balance. They supported Thebes against Sparta, till the great victory gained by Epaminondas at Leuctra; after which they immediately went over to the conquered, from generosity as they pretended, but in reality from their jealousy of the conquerors. Upon the first rise of the Macedonian power, Demosthenes immediately discovered the danger, founded the alarm throughout all Greece, and at last assembled that confederacy under the banners of Athens, which fought the great and decisive battle of Chæronea. However, if we attentively consider the state of Greece and the character of its inhabitants, we shall perceive that the balance of power was of itself sufficiently secured in that country, and that it was unnecessary to guard it with that caution which may be requisite in other nations and ages. The Persian monarch was, with regard to his force, a petty prince compared with the Grecian republics, and therefore it behoved him from views of safety to interest himself in their quarrels, and to support the weaker side in every contest; and thus the fate of the Persian empire was prolonged for near a century. The successors of Alexander manifested great jealousy concerning the balance of power; and their jealousy was founded on true politics and prudence, and preserved distinct for several ages the partition made after the death of that famous conqueror. In subsequent times we find, that as the Eastern princes considered the Greeks and Macedonians as possessing the only real military force with which they had any intercourse, they kept always a watchful eye over that part of the world.

It has been supposed, however, that the ancients were entirely ignorant of the balance of power; and this opinion seems to have been formed from an attention to the Roman history more than the Grecian. As to the Romans, it must be allowed, that they never met with any such general combination or confederacy against them as might naturally have been expected from their rapid conquests and declared ambition, but they were allowed peaceably to subdue their neighbours, one after another, till they extended their dominion over the whole known world. Upon Hannibal's invasion of the Roman state, a crisis occurred, which ought to have roused the attention of all civilized nations. Nevertheless, though this was in reality a contest for universal empire, no prince or state seems to have been in the least alarmed about the event or issue of the quarrel. The only prince in the Roman history, who seems to have understood the balance of power, is Hiero, king of Syracuse. Although the ally of Rome, he assisted the Carthaginians, esteeming it requisite, as Polybius says (lib. i. cap. 83.) both in order to retain his own dominions in Sicily, and to preserve the Roman friendship, that Carthage should be safe; lest by its fall the remaining power should be able, without contrast or opposition, to execute every purpose and undertaking. And here he acted, says the same writer,

with great wisdom and prudence. For that is never on any account to be overlooked; nor ought such a force ever to be thrown into one hand, as to incapacitate the neighbouring states from defending their rights against it. Here, says Mr. Hume, the rise of modern politics is pointed out in express terms. In short, as he proceeds, the maxim of preserving the balance of power is founded so much on common sense and obvious reasoning, that it is impossible it could have altogether escaped antiquity, where we find in other particulars so many marks of deep penetration and discernment. If it was not so generally known and acknowledged as at present, it had, at least, an influence on all the wiser and more experienced princes and politicians, and, indeed, even at present, however generally known and acknowledged among speculative reasoners, it has not, in practice, an authority much more extensive among those who govern the world. After the fall of the Roman empire, the form of government, established by the Northern conquerors, incapacitated them, in a great measure, for farther conquests, and long maintained each state within its proper boundaries. But when vassalage and the feudal militia were abolished, mankind were anew alarmed by the danger of universal monarchy from the union of so many kingdoms and principalities in the person of the emperor Charles. The power of the house of Austria succeeded; but its dominions, though extensive, were divided, and supported by riches, derived chiefly from mines of gold and silver; and it was therefore more likely to decay from internal defects than to overthrow the bulwarks raised against it. In less than a century it sunk, and was succeeded by a new power, more formidable to the liberties of Europe, possessing the advantage of the former without its defects, excepting only a share of that spirit of bigotry and persecution with which the house of Austria long continued to be infatuated. Another power has lately sprung up in France, and having risen from a small beginning to an enormous and gigantic size, so that like a large colossus it was bestriding the whole of Europe, it became necessary to form a general confederacy against it, the exertions of which have been attended with signal success, and not only prognosticated but produced a favourable issue at the present moment (1814). Against this ambitious power, extending the observations of Mr. Hume to our own times, Great Britain has stood foremost, and she still maintains her station, in connection with other very powerful and active allies. Besides her advantages of riches and situation, her people are animated with such a national spirit, and are so fully sensible of the blessings of their government, that we may hope their vigour will never languish in so necessary and just a cause. The errors of Great Britain have more frequently proceeded from a laudable excess of ardour, than from a blameable deficiency. Hence it has happened, that our alertness in defence of our allies, in our opposition to French power, has, on some occasions, led them to reckon upon our force as upon their own, and expecting to carry on war at our expence, they have refused reasonable terms of accommodation. Besides, we are such true combatants, that, when once engaged, we lose all concern for ourselves and our posterity, and consider only how we may most effectually annoy the enemy. Vattel's Law of Nations, b. iii. chap. 3. Hume's Ess. vol. i. pt. 2. ess. 7. See BALANCE of the Constitution, BALANCE of Power, and WAR.

POWER of Attorney, in Commerce, an instrument or deed by which a person is authorized to act for another, either generally, or in any specific transaction. By this instrument, a merchant resident abroad empowers and authorizes his agent to accept or negotiate bills of exchange, and to make contracts in the name and upon the responsibility of his principal. A power of attorney is, in its nature, revo-

cable, and its revocation may also be either general or special. See ATTORNEY and LETTER of Attorney.

POWERSCOURT, in Geography, a village of the county of Wicklow, Ireland, near which are the romantic scenes of the Dargle and Waterfall, much frequented by parties from Dublin, and visited by every traveller in Ireland, whose object is to view the beauties of nature. Near it is the feat of that honour to his country, the Rt. Hon. H. Grattan. Powerscourt is $10\frac{1}{2}$ miles from Dublin.

POWHATAN, a county of Virginia, containing 8072 inhabitants. It is bounded N. by James river, which separates it from Goochland, and S. by Amelia county.—Also, the ancient name of James river, in Virginia.

POWICSVISKO, a town of the duchy of Warsaw; 13 miles W. of Gnesna.

POWIS LAND, or Powys Land, in Geography, one of the three districts or territories, anciently called kingdoms, into which Wales was divided by Rodericus Magnus, king of Wales, about A.D. 870; the other two territories were Gwynedd, or North Wales, and Deheubarth or South Wales. In each of these he ordained a princely seat or court; that of Gwynedd was Aberffraw in the isle of Môn, or Anglesey; that of Deheubarth, called in Latin Demetia, Caermarthen, whence it was afterwards removed to Dynefour, at the distance of about eight miles; and that of Powys Land, Pengwern, called Y Mwythig, and in English Shrewsbury, whence it was removed to Mathrafael in Powys land. This kingdom, sometimes called Mathrafael, was divided into Powys Fadoc, containing five cantrefs and 15 comots, and Powys Wenwynwyn, including five cantrefs and 12 comots. To the kingdom of Mathrafael belonged the land between Wye and Severn, containing four cantrefs and 13 comots. See WALES.

POWLAMYA, PULOMAYA, and Powlumi, in Mythology, names of the Hindoo goddesses Indrani, consort of Indra. See those articles.

POWNAL, in Geography, a flourishing township of America, in Bennington county, and S.W. corner of the state of Vermont; containing 1655 inhabitants. Mount Belcher, a portion of which is within this town, stands partly in three of the states, viz. New York, Vermont, and Massachusetts. Mount Anthony, also one of the most remarkable mountains in Vermont, lies between this and Bennington. Hoosack river winds beautifully through the S. part of this town.—Also, a town of Cumberland county, in the district of Maine, containing 872 inhabitants.

POWNAL'S Island, an island near the E. coast of Labrador. N. lat. $57^{\circ} 10'$. W. long. $61^{\circ} 15'$.

POWNALL, THOMAS, in Biography, a miscellaneous writer, was born in 1722, and educated at Lincoln. He went to America in 1753, and was appointed governor of New Jersey, and afterwards of Massachusetts. In 1760 he removed to the government of South Carolina. After his return from America, he became comptroller-general of the expenditure and accounts of the extraordinaries of the army in Germany. He served in three parliaments; after which he retired wholly from public business, and died at Bath in 1805. His works are "Memoirs on Drainage and Navigation;" "Letter to Adam Smith on several Points treated of in his Enquiry into the Wealth of Nations;" "Topographical Description of North America;" "Treatise on Antiquities;" "Memorial addressed to the Sovereigns of America;" "The Right, Interest, and Duty of Government, as concerned in the Affairs of the East Indies;" "Intellectual Physics;" "An Essay concerning the Nature of Being;" "A Treatise on Old Age," and other pieces.

POWOW, in Geography, a small river of America, in Essex county, Massachusetts, which rises in Kingston, New

Hampshire, and runs into Merrimack river, seven miles from the sea, between the found of Salisbury and Amesbury. It is navigable a mile from its mouth, and many vessels are built upon its banks.

POWTER, or *English Powter*, the name of a peculiar species of pigeon, called by Moore the *columba gutturosa Anglica*. See COLUMBA.

It was first bred in England, and is of a mixed breed, between what is called the horseman and the cropper. It is a very beautiful species, and is valued for its length of legs and body, neatness of crop, and slenderness in girth, added to the beauty of its feathers. This species is often eighteen, sometimes twenty inches long from the end of the bill to the extremity of the tail; its legs, from the upper joint of the thigh to the toe-nail, are sometimes seven inches; the crop is large and round, especially toward the beak, filling also behind, and making almost a perfectly orbicular figure. They are either blue-pied, black-pied, red-pied, or yellow-pied; the last colour is most valued. See PIGEON.

POWTER, *Parisian*, a species of pigeon called by Moore *columba gutturosa Parisiorum*.

It was first bred at Paris, and thence sent to Brussels, whence it was afterwards brought into England. It resembles the English powter, but is short-bodied, short-legged, thick in the girth, and long-cropped. It is admired for the beauty of its feathers, which is peculiar to itself; it resembling in this a fine piece of that sort of needlework which the ladies call the Irish stitch, being chequered with various colours in every feather, except the flight, which is white. It has generally a good deal of red intermixed with the other colours, and the more it has of this, the more it is esteemed. See PIGEON.

POWTING HORSEMAN, a name given to a mixed breed of pigeons, produced between those two kinds, known by the names of the *cropper* and the *horseman*, according to the number of times that the young are bred over from the cropper. They are distinguished by the name of the first, second, or third breed.

These are a very agile and nimble pigeon; and by their continually flying up and down about the dove-house, are apt to bring in other stray pigeons; which cannot find their houses. They are observed to breed often, and take great care of their young ones. See PIGEON.

POWZOLS, in *Geography*, a town of France, in the department of the Herault; 18 miles N.E. of Beziers.

POX, in *Medicine*, the plural of *pock*, which signifies a pustula or large vesicle, prominent upon the skin. Whence the term is applied to several diseases, in which different pustular and vesicular eruptions appear on the skin; such as the French pox, great pox, or pox simply, (signifying the venereal disease); the small-pox; chicken-pox; swine-pox; &c.

POX, *Chicken*. See VARICELLA.

POX, *French*. See LUES VENEREA.

POX, *Small*. See SMALL-POX.

POX, *Swine*. See VARICELLA.

POYAIS, in *Geography*, a town of Mexico, in the province of Honduras, on the W. side of Black river; 55 miles S. of Cape Cameron, which forms the N. point of the entrance of the river into the sea of Honduras.

POYAMONY, a town of Hindoostan, in the Carnatic; 11 miles W.N.W. of Trichinopoly.

POYANG, a lake of China, in the province of Kiang-si, the largest collection of waters within the Chinese dominions. It lies in the midst of a great extent of flat and swampy land; and for some miles on every side of it, the face of the country is a wild and morassy waste, covered with reeds and rushes, and entirely inundated for a part of the year.

Not a village is to be seen, nor any traces of habitations, except here and there a mean solitary hut for the residence of a fisherman, accessible sometimes only by a boat. These wretched beings subsist by fishing, and by raising vegetables on hurdles of bamboo resting upon marshes, or floating upon the surface of the water. This lake and the adjacent country may be literally termed the common sewer of China. Rivers flow into it from most points of the compass; several canals have been formed from it, and inclosed within high banks for the security of vessels in the season of tempests and inundations. The billows of the lake rise occasionally to such a height as to render it, in the opinion of the Chinese mariners, no less dangerous than the sea. In the lake are scattered small sandy islands just peeping above the surface of the water, and covered with terrible dwellings, the abodes of fishermen. The Poyang, which is said to be about 200 miles in circumference, after having collected the waters of several rivers, empties itself into the Yang-tse-kiang, and contributes in no small degree to the magnitude of that stream. The adjacent country, consisting of swampy ground to the E. and S. of the lake, is distributed into fishing ponds, in which each proprietor breeds and fattens his fish, of which some are a small species like sprats, which dried and salted, become an object of commerce throughout the empire. Water-fowl are also plentiful in this part of the country, and form a part of its resources. The city Nang-kang is situated on the banks of this lake. Staunton's Emb. vol. ii.

POYERA, or PETRI GRANDE, a town of Africa, in the district of Anta, on the Gold coast.

POYEYSEIE, a town of Lithuania, on the Niemen; 61 miles S.E. of Kowée.

POYNINGS, Sir EDWARD, in *Biography*, a gentleman of Kent, was sent by Henry VII. to Ireland, which he governed with courage and prudence: the object of his mission was to quell the partisans of the house of York, and to reduce the natives to subjection. He was not supported by forces sufficient for that enterprise. The Irish, by flying into their woods and mountains, eluded his efforts. But he summoned a parliament at Dublin, in which he was more successful, and passed that memorable statute, which for more than three centuries was referred to by the name of Poynings' law, and which established the authority of the English government in Ireland. By this statute, all the former laws of England were made to be of force in Ireland; and no bill could be introduced into the Irish parliament, unless it had previously received the sanction of the privy council of England. The UNION (which see) in 1800 has changed the whole system of government. In the reign of Henry VIII. Poynings was made privy counsellor, and appointed governor of Tournay. Hume and Rapin.

POYNINGS' Law, a set of statutes enacted in the 10 Hen. VII. one of which (cap. 4.) in order to restrain the power as well of the deputy as the Irish parliament, provides, 1. That before any parliament be summoned or holden, the chief governor and council of Ireland shall certify to the king, under the great seal of Ireland, the considerations and causes of it, and the articles of the acts proposed to be passed in it. 2. That after the king in his council of England, shall have considered, approved, or altered the said acts or any of them, and certified them back under the great seal of England, and shall have given licence to summon and hold a parliament, then the same shall be summoned and held: and in it the said acts so certified, and no other, shall be proposed, received, or rejected. But it was afterwards provided by 3 & 4 Ph. & M. cap. 4. that any new propositions might be certified to England in the usual forms, even after the summons, and during the session of parliament. By this means, however, there was nothing left to the parliament

liament in Ireland, but a bare negative or power of rejecting, not of proposing or altering any law. But the usage has since been, that bills were often framed in either house under the denomination of "heads for a bill or bills," and in that shape they were offered to the consideration of the lord-licutenant and privy council; who, upon such parliamentary intimation, or otherwise upon the application of private persons, received and transmitted such heads, or rejected them, without any transmission to England. And with regard to Poynings' law in particular, it could not be repealed or suspended, unless the bill for that purpose, before it were certified to England, were approved by both the houses. Irish stat. 11 Eliz. stat. 3. cap. 38.

It was also enacted by another of Poynings' laws (cap. 22.) that all acts of parliament, before made in England, should be of force within the realm of Ireland. But by the same rule that no laws made in England, between king John's time and Poynings' law, were then binding in Ireland, it followed that no acts of the English parliament, made since the 10 Hen. VII. did bind the people of Ireland, unless specially named or included under general words.

These laws took their name, as we have before observed, from sir Edward Poynings, who was lord-deputy at the time when they were enacted; before which time, the original method of passing statutes in Ireland was nearly the same as in England, the chief governor holding parliaments at his pleasure, which enacted such laws as they thought proper.

With respect to the dependent state of Ireland, it was declared by 6 Geo. I. cap. 5. that the kingdom of Ireland ought to be subordinate to, and dependent upon, the imperial crown of Great Britain, as being inseparably united to it; and that the king's majesty, with the consent of the lords and commons of Great Britain in parliament, hath power to make laws to bind the people of Ireland. But this act was repealed in 1782; and a new state of things has taken place since the *Union*; which see.

POYO, in *Geography*, a town of Spain, in Galicia; 21 miles S.E. of Lugo.

POYSIS, a town of Sweden; 22 miles N.N.E. of Abo.

POYUCAR, a town of Brasil; 21 miles S. of Fernambuco.

POZEGI, a town of Russia, in the government of Pskov; 28 miles S.S.W. of Toropeta.

POZOBLANCO, a town of Spain, in the province of Cordova; 28 miles N. of Cordova.

POZON, one of the smaller Philippine islands, near the W. coast of Leyta. N. lat. $10^{\circ} 43'$. E. long. $124^{\circ} 24'$.

POZORUBIO, a town of Spain, in New Castile; 28 miles S.S.W. of Huete.

POZZI, ANNA, in *Biography*, an Italian female singer, who arrived here in the autumn of 1776, as successor to the Gabrielli: but though young, handsome, and possessed of a voice uncommonly clear, sweet, and powerful, her want of experience, both as a singer and actresses, rendered her reception not very flattering, after so celebrated a performer as Gabrielli, though the public had never been in good humour with her during her whole residence in England, nor, we think, ever rendered justice to her talents. Before the season was far advanced, the Pozzi was superseded by Miss Davis; and after this degradation, she generally appeared as second woman, in which character she was always thought as superior to the singers of that rank as any of the first women to whom she was obliged to give the *pas*, were to herself. She left England in 1778; and the spirit and brilliancy of her voice, with more experience, soon rendered her one of the first and most admired singers in Italy; where, by the year 1784, she had sung as first woman in all the great theatres, till she had worked her

way to Naples, which is regarded as the post of honour for singers. But alas! she enjoyed this station only a short time ere she was seized by a fever, which carried her off, in the flower of her age, from the summit of vocal glory.

POZZI, in *Geography*, a town of Naples, in the province of Otranto; 3 miles S.W. of Oria.

POZZO MARICCHIO, a town of Naples, in the province of Bari; 19 miles S.S.W. of Conversano.

Pozzo Negro, a town on the E. coast of the island of Forteventura.

Pozzo Nuovo, a town of Naples, in Lavora; 9 miles N.W. of Naples.

Pozzo Rosso, a town of Naples, in the province of Bari; 9 miles S.W. of Andria.

POZZOLANA, or PUZZOLANA, in *Natural History*, a kind of substance formed of volcanic ashes, more or less compacted together, and so called from Pozzuolo, and pulvis Puteolanus, from Puteoli, situated near mount Vesuvius, from which these ashes are ejected, and in the vicinity of which it abounds. It occurs of various colours, white, red, or black, reddish or reddish-brown, grey or greyish-black; that of Naples is generally grey; that of Civita Vecchia is more generally reddish or reddish-brown. The red variety is the proper puzzolana; the black and the white sorts are called in Italy "lapillo," or "rapillo." The ashes which overwhelmed Pompeii now form an immense bed of white puzzolana. The surface of this substance is rough, uneven, and of a baked appearance. It comes to us in pieces, from the size of a nut to that of an egg. It is wholly destitute of internal lustre and transparency. It is easily frangible, and its fracture is uneven or earthy, and porous; commonly filled with particles of pumice, quartz, scoriae, &c. Hardness, 3. Very brittle. Sp. gravity from 2.570, which is that of the black, to 2.785, rarely 2.8. Its smell is earthy. It is not diffusible in cold water; but in boiling water it gradually deposits a fine earth. It does not effervesce with acids. Heated, it assumes a darker colour, and easily melts into a black slag, or with borax into a yellowish-green glass. Before it is heated, it is magnetic, but not afterwards. By Mr. Bergman's analysis, it contains from 55 to 60 *per cent.* of siliceous, 19 to 20 of argillaceous earth, 5 or 6 of calcareous earth, and from 15 to 20 of iron. When mixed with a small proportion of lime it quickly hardens; and this induration takes place even under water. This singular property proceeds, as Mr. Kirwan supposes, from the magnetic state of the iron it contains; for this iron, being unoxxygenated, subtilly divided, and dispersed through the whole mass, and thus offering a large surface, quickly decomposes the water with which it is mixed, when made into mortar, and forms a hard substance analogous to the specular iron ore, as it does in the iron tubes, in which water is decomposed, in the experiments of M. Lavoisier and Dr. Priestley; for in these the iron swells and increases in bulk; and so does puzzolana, when formed into mortar, as we learn from Higgins on "Cements." One principal use of lime seems to be to heat the water, as while it is hot, it cannot pervade the caked argill that invests the ferruginous particles; yet in time even cold water may pervade it, and produce hardness; and hence, as M. Dolomieu has observed, lavas become harder when moistened. If the mortar be long exposed to the atmosphere, fixed air, as well as pure air, will unite to the iron, rust will be produced, and the mortar will not then harden, as Dr. Higgins has noticed. Clay, over which lava has flowed, is frequently converted into puzzolana; but volcanic scoriae never afford it; either because they are much calcined, or retain sulphur, or its acid. (Kirwan.)

Price of 14lb. is 26s. What is the price of 7lb?

$$\begin{array}{r} 7 \overline{) 22} \\ \underline{14} \\ 8 \end{array}$$

facit 13s.

2. If the first term be 1, and the second an aliquot part of a pound, shilling, or penny, divide the third by the aliquot part: the quotient is the answer.

Note, To find the aliquot part, those who cannot do it otherwise, may see the table of aliquot parts of a pound, under the article ALIQUOT.

E. gr. If one ell cost 10s. What cost 957 ells?

facit 478l. 10s.

3. If the first or third number be 1, the other not exceeding large, and the middle term a compound, i. e. consisting of several denominations, it may be wrought without reduction, thus:

Price of 1lb. is 3s. 8d. 3q. What is the price of 5lb?

$$\begin{array}{r} 3 \text{ s. } 8 \text{ d. } 3 \text{ q.} \\ \times 5 \\ \hline 15 \text{ s. } 7 \text{ d. } 3 \text{ q.} \end{array}$$

For four farthings making a penny, five times three farthings make 3d. 3q., and twelve-pence making 1s., five times eight-pence make 3s. 4d., which, with 3d. from the place of farthings, makes 3s. 7d. Lastly, five times three shillings make 15s., and with the three shillings from the place of pence, 18s. The price required, therefore, is 18s. 7 $\frac{3}{4}$ d.

4. If the middle term be not an aliquot, but an aliquant part, resolve the aliquant part into its aliquot parts, divide the middle term by the several aliquots; the sum of the quotients is the answer. To find the aliquot parts contained in an aliquant, see the table of aliquant parts of a pound, under the article ALIQUANT.

For an instance of this rule.

If 1 ell cost 15s. What cost 124 ells?

$$\begin{array}{r} 15 \text{ s.} \\ \times 124 \\ \hline 180 \text{ s.} \\ 60 \text{ s.} \\ 60 \text{ s.} \\ \hline 1860 \text{ s.} \end{array}$$

facit. 93l.

5. If the first or second term be 1, and in the former case, the second or third, in the latter the first, be resolvable into factors, the whole operation may be performed in the mind, without writing down any figures; as in the following example:

Price of 1lb. is 24s. What is the price of 20lb?

$$\begin{array}{r} 24 \text{ s.} \\ \times 20 \\ \hline 480 \text{ s.} \end{array}$$

facit 480s.—24l.

6. Where one of the given numbers is 1, we have several compendious usages to save multiplication and division.

E. gr. If 9lb. cost 20s. What does 1lb. cost?

It is obvious the sum required is had by adding to the tenth part of 20s. viz. 2s. the ninth part of the tenth, viz. 2 $\frac{1}{2}$ d., and $\frac{2}{3}$ of a penny; the answer, therefore, is 2s. 2 $\frac{1}{2}$ d. and $\frac{2}{3}$.

Again, if 5lb. cost 64s. What costs 1lb.?

Since 5 is half of 10, the double of the tenth part of the given price, viz. 12s. 9 $\frac{1}{2}$ d. and $\frac{2}{3}$ q. is the sum required.

Again, if 1lb. cost 18d. What will 19lb. cost?

Since 19 = 20 - 1, from the given price doubled, and increased by a cipher, viz. 360; subtract the simple 18; the remainder is 342d. = 28s. 6d. the sum required.

7. If two terms of the same denomination differ by an unit, we have a peculiar kind of compend; which will be clear from the following examples: e. gr. if 5lb. cost 30s. What will 4lb. cost? Since the price of 4lb. is one-fifth

part short of that of 5lb. divide the given price 30, by 5; the quotient 6 being subtracted from the dividend, the remainder, viz. 24s. is the sum required.

Again, if 8lb. cost 24s. What cost 9lb.?

Since the price of 9lb. exceeds that of eight by one-eighth part, divide the given price 24, by 8, and add the quotient 3 to the dividend: the sum 27 is the answer.

8. Sometimes one may use several of these compends, or practices, in the same question. E. gr. If 100lb. cost 30s. 4d. What cost 50lb.

$$\begin{array}{r} 30 \text{ s. } 4 \text{ d.} \\ \times 50 \\ \hline 1500 \text{ s. } 20 \text{ d.} \end{array}$$

Again, 60lb. cost 4s. What cost 2520?

PRACTORES, Πρακτορες, among the Athenians, officers appointed to receive the money due to the city from fines laid upon criminals.

PRADA, in Geography, a town of Italy, in the department of Amona; five miles N. of Faenza.—Also, a town of Italy, in the department of the Serio; seven miles N.E. of Bergamo.

PRADAKSHNA, in Mythology, a reverential ceremony, so called by the Hindoos, purporting a circumambulation. It is performed by keeping with closed palms the right hand toward the honoured object, and the face inclined that way. A pupil in this manner occasionally salutes his guru, or spiritual preceptor, or his parents, by several times thus walking slowly round them. It is not unusual to see Brahmans and others circumambulating a temple, or a tree, especially of that species called in Europe the Ficus religiosa, in India pipala. Sometimes this is done with the right hand in a bag, holding a rosary. It is thought to aid abstract contemplation, and is performed in silence, and called Jap. (See that article.) Females also frequently perform this ceremony of pradakshna around a tree, or a linga; the latter especially, if it be in view to offspring, by propitiating a generative deity. (See PARTHA.) It is in the latter cases continued for a considerable time, an hour perhaps, or more, usually at dawn of day, with a quickened pace, and frequently. Certain prayers are mentally recited during the ceremony. It is common to see one of the above-mentioned trees majestically spreading its arms over the roof of an extremely neat and clean house of a Brahman. Around the stem, for two or three yards each way, a mound of earth is often raised three or four feet, with perpendicular sides of brick or stone. This forms a terrace, on which perhaps is placed a linga (see LINGA), or an image, or shrub, according to the sect of the individual. The terrace is frequently smeared over with cow-dung, thinned with water to the consistency of paint, which is a very cool and cleanly application, and keeps away fleas and other insects. Mats or carpets spread on the terrace afford seats for reading or contemplation, or repose. To keep this place neat and in proper order is the province of the females of the family, who at day-break decorate the linga, &c. with chaplets of flowers, water the holy shrub, &c., or perform the pradakshna at the foot of the terrace, around which a path is usually made, and kept very clean, like the top of the terrace, which is called chabutra.

PRADANOZ, in Geography, a town of Spain, in the province of Leon; 60 miles E. of Leon.

PRADELLES, a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Le Puy; 17 miles S. of Le Puy. The place contains 1197, and the canton 6508 inhabitants, on a territory of 240 kilometres, in 15 communes.

PRADES, a town of France, and principal place of a district, in the department of the Eastern Pyrenées, situated on the river Tet; 23 miles W.S.W. of Perpignan. The place contains 2332, and the canton 10,184 inhabitants, on a territory of 295 kilometres, in 23 communes. N. lat. 42° 37'. E. long. 2° 30'.—Also, a town of Spain, in the province of Catalonia, near which is a magnificent abbey, where the ancient kings of Aragon were interred; 12 miles N.W. of Manresa.

PRADO, a town of Portugal, in the province of Entre Duero e Minho; 2 miles N.W. of Braga.—Also, a town of Spain, in Asturia; 32 miles N.E. of Oviedo.

PRADO, *El*, a town of Spain, in New Castile; 27 miles W.S.W. of Madrid.

PRADYAMNA, in *Mythology*, is an avatara or incarnation of Kama, the Hindoo cupid. (See KAMA.) Among a people so addicted to poetry as the Hindoos, we may reasonably expect a great deal of embellishment and extravagance in the amatory line. Such expectations are fully realized by an examination of their writings. The pretty fable of the god of love being reduced from a corporeal form to a mental essence by a flash of fire from Siva's central eye, is very often alluded to. Kama met this fate in punishment of his presumption for wounding the angry god with one of his flowery arrows: but relenting, on the intercession of Parvati, he consoled the afflicted Reti, widow of Kama, in the assurance that she should regain her husband, when he should be born again on earth, as Pradyamna, son of Krishna. (See KRISHNA.) Reti meanwhile was reduced to menial servitude with a tyrant or demon, named Sambara, and her lamentations on her wretched fate fill a whole book in a poem, called the Birth of Kumara, by Kalidas, the author of Sakoontala. The promise of Siva was in due time fulfilled. Pradyamna, soon after his birth, was seized by the tyrant, put in a chest and thrown into the sea, where it was swallowed by a fish, which was caught and purveyed for his table. It fell to the lot of Reti to open the fish, and finding the chest and its contents, she nurtured the infant in private, and educated him, until he had attained maturity, and strength to destroy the malignant Sambara. The youth had before considered Reti as his mother; but their minds being now irradiated, (their *maya* or delusion being dispelled, see MAYA,) the prophetic promise of Mahadeva was remembered, and the god of love was reunited to the goddess of pleasure.

PRÆ, a Latin preposition, literally signifying *before*; it is used in composition with several words in our language, to denote the relation of priority.

Of late, our writers, in Latin words anglicised, for *præ*, usually write *pre*; restraining the Latin orthography to words that are still Latin, or used as such. Hence, for such words beginning with *præ*, as are not found here, see PRE.

PRÆBIUM, a name used by medical authors to express a dose of any thing, or the quantity of medicine to be exhibited at one time.

PRÆCIÆ, among the Romans, the same with *Præclamitatores*; which see.

PRÆCIPE, in *Law*. See PRECIPE.

PRÆCIPE in *capite*, a writ issuing out of the chancery, for a tenant holding of the king in *capite*; viz. in chief, as of his crown.

PRÆCLAMITATOIRES, among the Romans, officers that went along the streets of Rome before the *flamen dialis*, to oblige all people to give over their work on public holidays; for if the flamen saw any one at work, the service of the gods could not be performed.

PRÆCLAVIUM, among the Romans, was used to signify the pretexta.

PRÆCO, among the Romans, the public crier, an officer whose business it was in the assemblies of the people to call the classes and centuries according to their order, and to order silence to be kept in the temples during the time of sacrificing.

The assistance of the *præco*, or public crier, was used on many other occasions, as at public sales or auctions, funerals, games, in courts of justice, or public things lost, &c. See CERYX.

PRÆCOCIA MALA, in *Botany*. See APRICOT.

PRÆCONISSUS, in *Natural History*, the name given by Ludovicus Dulcis, and other writers of his time, to a gem famous for its imaginary virtues: it is described to have been of the nature of the sapphire, but somewhat approaching to the colour of the chalcedony: this seems to make it the leucosapphirus of other authors.

PRÆCORDIA, in *Anatomy*. See PRECORDIA.

PRÆFECTURÆ, among the Romans. See PREFECTURES.

PRÆFERICULUM, among the Romans, a vase with a large prominent mouth, used in the sacrifices of Ops.

PRÆFERNIUM, a word used by chemical writers to express the anterior part of a furnace, by which the coals, or fuel are put in, and the ashes taken out.

PRÆFICÆ, among the Romans, were mourning women hired to attend funeral solemnities; where they praised the deceased, made a lamentation, beat their breasts, and distorted their faces, to excite others to mourn.

PRÆFINE, or PRIMER *Fine*, in *Law*, that fine which upon suing out the writ of covenant on levying *fines of lands*, is paid before the time is past. This is a noble for every five marks of land sued for, *i. e.* one-tenth of the annual value. See POST-fine.

PRÆLUDIUM, Lat. See PRELUDE.

PRÆMIUM. See PREMIUM.

PRÆMORSUS, in *Botany*. See RADIX and ROOT.

PRÆNOTION, is used by lord Bacon for breaking of an endless search, which he observes to be one of the principal parts of the art of memory. For when one endeavours to call any thing to mind, without some *previous notion* or perception of what is sought for, the mind exerts itself and strives in an endless manner: but if it hath any short notion before hand, the infinity of the search is presently cut off, and the mind hunts nearer home, as in an inclosure. Thus verse is easier remembered than prose; because if we stick at any word in a verse, we have a *previous notion* that it is such a word as must stand in a verse. Hence also, order is a manifest help to memory; for here is a *previous notion* that the thing sought for must be agreeable to order. Bacon's Works Abr. vol. i. p. 136. and vol. ii. p. 473. See PRENOTION, and Common NOTIONS.

PRÆPOSITUS *Sacri Cubiculi*, among the Romans, an officer who was to take care of the emperor's bed-chamber. His office was the same with that of our lord chamberlain, and he had the privilege of marching next to the captain of the horse-guards.

PRÆSALTOR, among the Romans, an appellation given to the chief director of the *salii*.

PRÆSEPIA, a word used by authors to express the sockets of the teeth.

PRÆSICIA, in *Antiquity*, those parts of the intrails of sacrifices which were cut off, and offered to the gods.

PRÆSUL, among the Romans, the name of a chief of the salii, or priests of Mars. He was so called a *præsiliendo*; i. e. dancing at the head of the salii.

PRÆTORIUS, MICHAEL, in *Biography*, an ecclesiastic in the Romish church, born at Creutzberg, in Thuringia; and one of the most voluminous writers on music, and composers, in Germany. In 1596, he was the forty-eighth of fifty-three organists appointed to examine the organ newly erected in the castle church at Groningen, in North Holland. His great theoretical work was entitled "Syn-tagma Musicum," which was designed to be extended to four vols. quarto; but he only published three. They contain a kind of history of the progress of ecclesiastical music, from its beginning to the author's own time. Walther has given the contents of each chapter of the three volumes; in which we find that the author had not confined his enquiries to *ecclesiastical* music, but of *secular* music gives the names of the fancied inventors of instruments and melodies; not forgetting the medicinal, or miraculous powers of the music of the ancients.

We fancy the work was not received by the public in a manner which the author expected. In the dedication of the first volume the author complains of his fatigues and trouble, and never published the fourth.

Many of his compositions have fallen into our hands, which having scored, we found to be dry, and totally devoid of genius, though correct in harmony. If ever they may be said to have lived, they have been so long plunged in Lethe, as to be now dead beyond all the power of resuscitation.

PRAG, in *Geography*, a town of the duchy of Wurzburg; 3 miles N. of Kissingen.

PRAGA, or PRAGUE, a town of the duchy of Warsaw, on the Vistula, which separates it from Warsaw, of which it is the fauxbourg.

PRAGELAS, a town of France, in the department of the Po, ceded by France to the king of Sardinia, at the peace of Utrecht; 9 miles from Susa.

PRAGERHOF, a town of the duchy of Stiria; 4 miles E. of Windisch Weifritz.

PRAGMATIC SANCTION, in the *Civil Law*, is defined, by Hottoman, a rescript, or answer of the sovereign; delivered, by advice of his council, to some college, order, or body of people, upon their consulting him in some case of their community.

The word is formed from the Greek *πραγμα*, *negotium*, *business*. It is sometimes also called absolutely, *pragmatic*, το *πραγματικον*.

The like answer given to any particular person, is called simply *rescript*, *rescriptum*.

The term pragmatic sanction is chiefly used, among the modern writers, for that famous ordonnance of Charles VII. of France, drawn up at Bourges, with the consent of the most eminent prelates and grandees of the nation assembled at that place, and published in 1438, containing a regulation of ecclesiastical discipline, conformable to the canons of the council of Basil; and since used by the Gallican church, as a barrier against the enterprizes and encroachments of the court of Rome.

The scope of the pragmatic sanction, which consisted of twenty-three articles, was to regulate the form of elections made by the clergy, to restore to every church its privilege of choosing its bishop, and to every monastery that of electing its abbot or crier; to declare the collations to belong to ordinaries, the prevention alone reserved to establish pre-

bends; to assign a third of the benefices to graduates; and to abolish reservations, annates, and other like grievances.

The pragmatic of St. Lewis in 1268, consisting of six articles, was similar to this in its chief design. The edict of Bourges, in 1438, was drawn up in concert with the fathers of the council of Basil, and the articles it contains were taken from the decrees of that council; though they were admitted by the Gallican church with certain modifications, which the nature of the times and the manners of the nation rendered expedient. See this edict published at large in Hard. Concil. tom. viii. p. 1949.

Pope Pius II. obtained an abrogation of this sanction from Louis XI., on which occasion the court of Rome, transported with joy, dragged the pragmatic through the streets, whipping it all the way, as Xerxes anciently did the Hellepont: and the king obtained for himself and his successors the title of *Most Christian*.

But the parliament opposed this abrogation with a great deal of vigour, and refused its consent to the last. Lewis also perceiving that he had been deluded into this measure by the treacherous insinuations of Geoffroy, bishop of Arras, whom the pope had bribed with a cardinal's cap, and large promises of a more lucrative kind, took no sort of pains to have it executed, but published, on the contrary, new edicts against the pecuniary pretensions and extortions of the court of Rome. So that, in spite of all the efforts of Rome, the sanction still held in force, till the concordat held between pope Leo X. and Francis I. in 1517, when the pragmatic sanction was abolished, and the king was invested with the privilege of nominating to bishoprics and vacant benefices.

The parliament of Paris again opposed the innovation, and refused to confirm the concordat; and was not brought to give its consent at last, till after repeated orders of the king; together with a secret resolution taken always to judge conformably to the tenor of the pragmatic sanction.

PRAGMATICAL, PRAGMATICUS, a term sometimes used in the same sense as *practical*, *mechanical*, or *problematical*.

Stevinus, in his *Hydrostatical Elements*, calls certain of his mechanical or practical experiments, which he undertakes to instruct his reader how to make, by the name of pragmatical examples: and, in the like sense, is the word sometimes used by other naturalists.

PRAGSTAAL, in *Geography*, a town of Austria; 9 miles S. of Grein.

PRAGUE, a city and capital of Bohemia, situated in the circle of Schlan, and almost in the centre of the kingdom. Its fortifications are of little importance; its houses, generally of three stories, are built of stone; it has broader streets, though fewer stately palaces, than Vienna. The number of its churches and chapels is reckoned to be 92, and it has about 40 cloisters. The population of Prague is not duly proportioned to its extent, as it contains only about 79,500 Christians, 9000 Jews, and 8000 in garrison; nor is its commerce considerable, and its inhabitants chiefly subsist on the brewing of beer, independently of some few arts and handicraft trades. Prague consists properly of three towns, each of which has its peculiar magistrate; viz. the Old and New Towns, lying the E. side of the Mulda, and Small-side, on the W. side of that river. The Old Town, less ancient than that called Small-side, but older than the New Town, was first founded in the year 795, and from its ancient citadel called "Wichtered," and the "Great Town" by way of distinction from the lesser Side or Town. The New Town, or "Neustadt," was founded by Charles IV. in the year 1348, and called "Karlow" or "Karl-

“Karlstadt,” having the same privileges with the Old Town. This surrounds the Old Town for a considerable compass, and has broad and straight streets, with 2500 houses. The Small-side, or Lesser Town, is united with the preceding by a stone bridge, erected over the Mulda, and being the oldest, first bore the name of Prague. Prague is the see of an archbishopric. It is besides our purpose to recount the contests in which for several centuries it has taken part. Without the Strahov gate, at no great distance from the city, is situated the eminence, called the “White Mountain,” and rendered remarkable by the battle fought there in 1620, which terminated unhappily on the side of the Palgrave, and crowned Frederick king of Bohemia. Prague has an university, which was founded in 1347. N. lat. 50° 5'. E. long. 13° 28'.

PRAGWALD, a town of the duchy of Stiria; 6 miles W. of Cilley.

PRAHEC, a town of France, in the department of the Two Sevres, and chief place of a canton, in the district of Niort; 6 miles S.E. of Niort. The place contains 744, and the canton 4900 inhabitants, on a territory of 162½ kilometres, in 9 communes.

PRAIRIE *de Rocher, La*, or *the Rock Meadow*, a settlement in the Indiana territory, on the E. side of the Mississippi, on a stream which enters into this river, 12 miles to the S., 15 miles N.W. of Kaskaskias village, and 5 N.E. by E. of fort Chartres. Between 30 and 40 years ago it contained 100 white inhabitants, and 80 negroes.

PRAIRIE, *La*, a populous though small village, with narrow dirty streets, on the river St. Lawrence in Canada; 18 miles N. of St. John. N. lat. 45° 32'. W. long. 73° 15'.

PRAISSAS, a town of France, in the department of the Lot and Garonne; 10 miles S.E. of Tonneins.

PRAKRITI, in *Hindoo Mythology*, is a personification of crude nature, or chaos. It is detailed at great length in the Hindoo theogonies how the divine being, after creating the trimurti, proceeded to the formation of Prakriti, who under different forms and names is the consort of the triad or trimurti. 1. As Saraswati, she is the consort of Brahma, the patroness of learning, the goddess of eloquence, and inventress of the lyre. 2. As Sri, or Lakshmi, she is the beloved of Vishnu, the goddess of abundance and fertility. 3. As Isi or Parvati, she is the companion of Ishwara, and the vanquisher of the giants. These were produced by the volition of the deity. In the Sri Purana it is added, that with Prakriti, a male being called Parusha was created. Prakriti is described as of perfect beauty, with eight arms. They are afterwards called Narayana and Narayani, whence proceeded the elements of created nature, earth, fire, water, &c. From the navel of Narayana a lotus issued, bearing Brahma in its calyx; and from Narayani sprung Vishnu, and Lakshmi and Parvati, and Savitri; the latter a name of the sun; but here apparently the same as Saraswati. We shall here, however, enter no farther on these fables, which require a lengthened and connected detail to render them at all consistent or comprehensible. A reference to the several articles in this work, under the names mentioned above, may perhaps furnish a clue to some of the natural phenomena veiled in these allegories.

PRAM, or PRAME, a sort of lighter used in Holland and the ports of the Baltic sea, to carry the cargo of a merchant ship along-side, in order to lade her, or bring it ashore.

PRAMNION, in *Natural History*, the name of one of the semipellucid gems, so distinct from all the others as to make properly a peculiar genus of fossils. It is called by

many of the ancients *morio* or *morion*, and by our lapidaries the *black agate*.

It is a stone of a very great concealed beauty. Our lapidaries, who know it by the name of the black agate, are very indeterminate in the application of that name, calling not only this, but every black stone capable of a good polish, by the same name, and never looking for its great character, its hidden colour. It is found in the shape of our common flints and pebbles, but seldom larger than an egg; it appears, on a slight inspection, to be of a fine deep black, but held up against the sun, or the light of a candle, it discovers itself to be of a fine strong red, without the least admixture of any other colour. It is most frequently of a purplish tinge, like the amethyst, but is at times found of all the degrees of red, from the pale flower colour of the hyacinth to the deep red of the carbuncle. It is of great hardness, and capable of an elegant polish.

It is produced only in the East Indies; and we sometimes have it thence among other stones, but it is not much regarded with us. The Romans were fond of it for engraving on, as we find by Pliny, and by a much more undeniable proof, many of the valuable antiques being cut on it.

PRAMNOS, a name given by the ancients to a sort of austere wine, which looked of a black colour till held up against the light, and then appeared of a deep purple: it is recommended by Hippocrates in hæmorrhages.

PRAMPAM, in *Geography*, a town of Africa, on the Gold Coast. N. lat. 5° 50'. W. long. 0° 45'.

PRANDNETZ, a town of Prussia, in the palatinate of Culm; nine miles E. of Thorn.

PRANSAGUR, a town of Bengal; 10 miles S. of Dinagepour.

PRAPREDSHOFF, a town of the duchy of Carniola; three miles W.N.W. of Weixelburg.

PRASE, in *Mineralogy*. See QUARTZ, GEMS, and PRASIUS.

PRASINIZZA, in *Geography*, a town of Istria; 14 miles N.N.E. of Pedena.

PRASINUM VIRIDE, a word used by the ancients for verdigris.

PRASION. The ancient Greek writers have expressed three very different plants by this name.

The most common signification of the word is the common *marrubium*, or horehound. It is in many places used also to signify the leek, and often for that sort of marjoram which we call *origanum onitis*, or pot-marjoram. Pliny describes this plant, and says that it was called *onitis* and *prasius*, and had the appearance of hyssop.

Hesychius tells us, that the sea-weeds of the fucus and alga kinds, the sea-oaks, and sea-wracks, are called by some of the Greek writers *prasia*; and Theophrastus in one part of his works seems to have given this name to those substances.

The ancients having used the word *prasion* in this sense, explains a passage in Galen which cannot otherwise be well understood, that is, where he calls the *empetrum marinum*, *prasioides*, like the *prasion*.

Dioscorides had called it *fucoides*, like the sea-fucus, and he was very well understood; but Galen coming after him, and expressing his sense by the word *prasioides*, which was supposed to signify resembling leeks, or horehound, or origanum, his readers were perplexed to find out what alliance the epithet he had chosen to use could have, either to the plant, or to the epithet of Dioscorides; but when it is found that *prasion* signifies the same as *fucus*, the whole is very intelligible.

PRASIS, a word used by some authors to express what they call green chalk, an earth used by the painters, and known among us by the name of the *terre verte*.

PRASIUM, in *Botany*, a name adopted from Dioscorides, though there is little probability of his *πρασινον* being our plant, except so far as it is reported to have some affinity to Horehound or to Marjoram, and our's is a ringent flower, found wild in Greece and other parts of the south of Europe. Linn. Gen. 302. Schreb. 398. Willd. Sp. Pl. v. 3. 179. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. Juss. 117. Lamarck Illustr. t. 516. Gærtn. t. 66.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillatae*, Linn. *Labiatae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, turbinate, erect, two-lipped; upper lip broadest, divided half way down into three acute segments; lower rather smaller, cloven. *Cor.* of one petal, ringent; its upper lip erect, ovate, concave, slightly emarginate; lower broadest, three-cleft, reflexed, the middle segment largest. *Stam.* Filaments four, awl-shaped, rather distant, pressed close to the upper lip, but not so long, two of them shorter than the others; anthers oblong, lateral. *Pist.* Germen four-cleft; style thread-shaped, agreeing with the stamens in length and situation; stigma in two acute segments, one of which is shorter than the other. *Peric.* Seeds four, roundish, in the bottom of the calyx, each pulpy under the skin.

Ess. Ch. Seeds four, with a pulpy coat.

1. *P. majus*. Great Spanish Hedge-nettle. Linn. Sp. Pl. 838. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 584, unpublished. (*Teucrium fruticosum*, amplex. et albo flore, italicum; Barrel. Ic. t. 895.)—Leaves ovate-oblong, serrated.—Native of Italy, Sicily, Barbary, and the Levant. It flowers in our greenhouses from the early spring to the end of summer, and is easily kept, as well as propagated by cuttings without difficulty, but there is nothing in its appearance to excite popular admiration. The stem is shrubby, branched and spreading. Leaves on short stalks, opposite, smooth, dark-green, an inch or more in length. Flowers axillary, solitary, opposite, white, spotted in the mouth with purple. Fruit dark violet, juicy, like four berries, some of which are often abortive.

2. *P. minus*. Small Sicilian Hedge-nettle. Linn. Sp. Pl. 838. Willd. n. 2. Ait. n. 2.—Leaves ovate, with two notches at each side.—Native of Sicily, where it was noticed by Cupani. This species finds a place in Mr. Aiton's work, but seems to be no where figured, nor is it supposed to be more than a small variety of the foregoing, with fewer notches in the leaves. Cupani's description of the flowers betrays no distinction whatever. Linnæus however seems to have, at some time or other, confounded another plant with this, but not perhaps in any of his descriptions.

The *P. majus* bears the name of *φάσσοχορτον* among the modern inhabitants of Zante; which from its resemblance to *πρασινον*, softened, as usual in modern Greek, at the beginning of the word, and combined with *χορτον*, a plant, countenances the Linnæan adaptation of the generic name.

PRASIUM, in *Gardening*, contains plants of the low, shrubby, exotic, evergreen kinds, of which the species cultivated are, the great Spanish hedge-nettle (*P. majus*); and the small hedge-nettle (*P. minus*).

Method of Culture.—These plants may be increased by seeds and cuttings.

The seeds should be sown on a bed of light mould, in the early spring season, as about April, the plants being afterwards kept clear from weeds, and placed in the situations

where they are to remain, or in pots, to be gradually hardened as they advance in growth.

The cuttings should be taken from such plants as are strong, and where the shoots are short and good, and if a joint of the former year's wood be taken to each of them, they succeed better. They should be planted out either in a shady border or in pots in the latter part of the spring season, as about the end of April. When the plants have stricken good root in the borders, they should be removed into the situations where they are to remain, and those in pots into separate ones. Those in pots should be placed under a frame during the winter, or in the greenhouse, where they can have plenty of free air when the season is dry. They only require to be screened from severe frosts. When planted in the open ground they should have a dry poor soil and sheltered situation. These plants afford much ornament in the greenhouse collections, and among other evergreen shrubs of the more hardy kinds.

PRASIUS, in *Natural History*, the name of a gem much approaching to the nature of the emerald, but of a coarser green, and wanting its hardness, and having in its green a cast of yellow.

It is the stone which the ancients called *prasites*; and when of a greater than ordinary admixture of yellow, the *chryso-prasus*, and of which the gem distinguished by later authors under the name of *smaragdoprasus*, is only one of the varieties.

The prasus, even in its most perfect state, is much less beautiful than most of the other gems: it is found of various sizes, and not unfrequently considerably large: it is seldom met with smaller than a pea; from that to the size of a horse-bean is its more usual standard, from this to the size of a nutmeg it is more rarely found; and the larger specimens are coarser and less frequent than these. It is of various figures, but is never found in a columnar or crystal-like form; this is declaring against the sense of our dealers in gems, indeed, who frequently buy and sell columns of the shape of sprig crystals, under the name of the *smaragdoprasus*; but these are all truly no other than crystals tinged to a coarse and dead green, and without any mixture of yellow; so that they are more properly *pseudosmaragdi*, or bastard emeralds, than any thing of the prasus kind. See GEMS and QUARTZ.

PRASLAUKEN, in *Geography*, a town of Prussian Lithuania, on the Rominte; eight miles S.S.E. of Gum-binnen.

PRASLIN, an island in the Indian sea, lofty, mountainous, and covered with trees. Mr. Lewis, commander of the Eagle, one of the Hon. East India Company's cruisers from Bombay, landed here in the year 1771, and found a flag-staff erected by the French on a rock, but the flag was blown away; the arms of the king of France were cut on a sheet of lead, and set in a small place built of brick and mortar, in token of possession, with the date 1768. Port Praslin, on the N. side of the lands of the Arsacides, (see ARSACIDES,) in S. lat. 70° 25'. E. long. from Paris 155° 32', was discovered and entered by M. de Surville, Oct. 12, 1769. The inhabitants of the islands that form this port are represented as being generally of the Negro kind, with black woolly hair, flat noses, and thick lips. Mr. Lewis found on the island which he visited plenty of cocoa-nut trees, and land-tortoises, but neither tents nor appearance of inhabitants. The harbour seemed to be a good one, and well sheltered by small islands from all winds.

PRASLIN, a town of France, in the department of the Aube; nine miles S.W. of Bar-sur-Seine.

PRASONISI, a small island near the N.E. coast of the island of Samos.—Also, two rocky islets in the Grecian Archipelago, near the S. coast of Myconi.

PRASOPHYLLUM, in *Botany*, from *πρασον*, a leek, and *φυλλον*, a leaf, because of the tubular and tapering form of the solitary leaf in every known species, resembling the foliage of a leek. Brown Prodr. Nov. Holl. v. 1. 317.—Class and order, *Gynandria Monandria*. Nat. Ord. *Orchideæ*.

Ess. Ch. Calyx ringent; upper leaf in front, vaulted. Petals inequilateral. Lip ascending, undivided, stalked, without a spur. Column deeply divided; its lateral segments membranous. Anther in front, parallel to the stigma, permanent, with approximated cells. Masses of pollen two in each cell, powdery, attached by their points to the stigma.

This genus is said by its author to be very nearly akin to *Cranichis*, as well as to *Genoplesium*. He describes twelve species, natives of the east and south parts of New Holland; all smooth herbaceous plants, growing on the ground. Their *bulbs* are undivided. *Stem* bearing one or two short sheathing scales and one *leaf*, but no *bractæas*. The *leaf* is cylindrical, tubular, sometimes short, with a very long sheathing base. *Flowers* spiked, among the smallest of this tribe, of various colours. Some have the lateral segments of the *column*, which Mr. Brown regards as abortive filaments, entire at the summit; others have those parts cloven. In the former case the *anther* is without a point; in the latter it has a sort of beak. All the species were seen by this acute botanist in a living state, and appear to have been described by no other writer.

PRASTGRUMDET, in *Geography*, a small island on the W. side of the gulf of Bothnia. N. lat. $61^{\circ} 21'$. E. long. $17^{\circ} 10'$.

PRASTOE, or **PRÆSTOE**, a sea-port of Denmark, with a good harbour in a bay of the Baltic, on the S.E. coast of the island of Zealand; 35 miles S. of Copenhagen. N. lat. $55^{\circ} 10'$. E. long. $12^{\circ} 6'$.

PRESTERGADEN, a town of Sweden, in Warmeland; seven miles N.E. of Carlstadt.

PRAT, a town of France, in the department of the North Coasts; eight miles S.E. of Lanion.

PRATAS, a cluster of islands in the Chinese sea, arranged in a circular form, and about 60 miles in circumference. N. lat. $19^{\circ} 32'$. E. long. $116^{\circ} 43'$. One of these islands, called "Prata," is of considerable extent, being 18 miles from N. to S., according to captain King, but he was not able to ascertain its western limits. Its N.E. extremity was in N. lat. $20^{\circ} 58'$. E. long. 117° ; and its S.W. extremity in N. lat. $20^{\circ} 45'$. E. long. $115^{\circ} 44'$.

PRATENSIS, in *Biography*. See **JOSQUIN**.

PRATICA, in *Geography*, a town of Italy, in Campagna di Roma; eight miles S.W. of Albano.

PRATIQUE, or **PRATIC**, in *Commerce*, a negotiation, or communication of commerce, which a merchant-vessel obtains in the ports it arrives in, and the countries it discovers.

The word is French, and signifies, literally, *practice*.

Hence, to obtain pratique, is to obtain a liberty to frequent a port, to go ashore, to buy and sell, &c.

In the European ports of the Mediterranean sea, it implies a free commercial intercourse with the inhabitants of the country, after a limited quarantine has been performed, in consequence of a voyage to Barbary or Turkey.

PRATIQUE is particularly used for a licence to traffic, granted to the master of a ship in the ports of Italy, upon a

bill of health; that is, a certificate that the place whence he came is not annoyed with any infectious disease.

PRATO, in *Geography*, a town of Italy, in the department of the Serio; 10 miles E.N.E. of Bergamo.—Also, a town of Etruria; five miles N.E. of Florence.

PRATS de Mollo, a town of France, in the department of the Eastern Pyrenées, and chief place of a canton, in the district of Ceret; constructed in the form of an amphitheatre, irregularly fortified. In its vicinity are mines of copper mixed with silver; 12 miles W.S.W. of Ceret. The place contains 3190, and the canton 5954 inhabitants, on a territory of 285 kilometres, in five communes.

PRATS del Rey, a town of Spain, in Catalonia; nine miles W. of Manresa.

PRAVIS, a town of Spain, in Asturia, on a river of the same name.—Also, a river of Spain, which passes by Oviedo, &c. and runs into the sea; 10 miles N. from the town of Pravis.

PRAUL POINT, a cape of England, on the S. coast of Devonshire, in the English channel; five miles S.W. of Start Point.

PRAUSKA, a town of the duchy of Warsaw; 30 miles S. of Siradia.

PRAUSNI, **TEUTSCH**, a town of Bohemia, in the circle of Konigingratz; four miles S. of Trautenau.

PRAUSNITZ, or **PRAUSSIEC**, a town of Silesia, in the principality of Trachenberg; six miles S. of Trachenberg. N. lat. $51^{\circ} 21'$. E. long. $16^{\circ} 58'$.

PRAUST, a town of Pomerelia; seven miles S. of Dantzic.

PRAUTHOY, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Langres. The place contains 654, and the canton 9232 inhabitants, on a territory of $272\frac{1}{2}$ kilometres, in 25 communes.

PRAWN. See **CANCER** and **SQUILLA**, family **PALÆMON**.

PRAXAGORAS, in *Biography*, a physician, born in the island of Cos, and the son of Nearchus. He was of the family of the Asclepiades, and one of the last of them who supported the medical reputation of the line. He was contemporary with Diocles. He studied anatomy assiduously by the dissection of brutes, and left some works on the subject, which are now lost, and of which Galen spoke with some contempt. Nevertheless, his reputation attracted the celebrated anatomists Philotimus, Plistonius, and Herophilus to his school. Some fragments of his medical doctrines, however, which are preserved by Cælius Aurelianus, seem to confirm the opinion which Galen maintained of his skill. See Le Clerc. Hist. de la Med.

PRAXEANS, in *Ecclesiastical History*, a sect of heretics, so called from their author, Praxeas.

This heresiarch was of Asia, and lived in the second century. He was at first a disciple of Montanus, but quitted him, and soon after set up a sect of his own; teaching, that there was no plurality of persons in the Godhead; and that it was the Father himself that suffered on the cross; which sentiment was afterwards adopted by the Monarchists, Sabellians, and Patripassians.

PRAXITELES, in *Biography*, a celebrated sculptor of antiquity, was born in Græcia Magna, and flourished about the year 364 B. C. He excelled particularly in the working of marble, and was the author of some of the most famous statues noticed by ancient writers; among these were two of Venus, one clothed and the other naked. The first was purchased by the Coans, who preferred it as the most decent.

decent. The Cnidians took the other, which was so exquisitely beautiful, that many persons took a voyage to the island for the sole purpose of seeing it. Praxiteles was deeply enamoured of the famous courtesan Phryne, of whom he made several statues, one of which was erected at Delphi. Many of his performances were in the Ceramicus at Athens, among the rest, the statues of Harmodius and Aristogiton, which Xerxes carried away, and Alexander afterwards restored. Many were extant at a later period in Rome. His most noted works were in marble, but he cast many statues in metal, which, as well as those of marble, were greatly admired. He had a son, Cephissodorus, who inherited his skill and fame.

PRAYA, in *Geography*. See PORTO-PRAYA.

PRAYA, a sea-port town of the island of Tercera, situated on a plain, near the gulf, defended by walls and bastions; containing a church, four convents, three hospitals, and about 3000 inhabitants.—Also, a town of the island of Gratiofa, one of the Azores.—Also, a town of Africa, on the Slave Coast, in the kingdom of Ardra, situated on the sea-coast, at the bottom of a bay; 32 miles N.E. of Grand Popo.

PRAYER, in *Theology*, denotes a serious and solemn address of our minds to the Deity, as the fountain of being and happiness, and the parent and governor of the world. The chief parts which it includes are, acknowledgment of our dependence, and of the divine perfections and sovereignty:—thankfulness for the mercies we have received:—a penitential confession of what we have done amiss:—and offering up our desires of favour and happiness for ourselves and others.

Divines distinguish three kinds of prayer:

Vocal, which is clothed in words and sounds to be uttered with the mouth. *Mental*, which is only formed or conceived in the mind, and not delivered in words. *Ejaculatory*, which is a short, sudden flight, without study, order, or method.

Mystic divines, again, distinguish prayer into *active* and *passive*.

Among us, prayer is most frequently considered under the divisions of *preconceived* and *extemporary*.

Under the first come all set forms, whether public or private, by which the mind is directed in the order, manner, expression, &c. of its petitions. See LITURGY.

The second is that where the mind is left to itself, its own conduct, both as to matter, manner, words, &c.

The Romanists also prefer prayers to saints; the Virgin, the angel Gabriel, &c.

We conceive that we shall not deviate from the general plan and design of this work, by availing ourselves of the opportunity that here occurs, of introducing some observations on the duty and efficacy of prayer, with brief replies to the more common objections that are urged against the obligation or utility of this duty.

It has been remarked in general, that it is the usual practice of mankind, when some of them wish to obtain any thing of others, to recur to intreaty. This universal practice must be natural; and it seems probable, says archdeacon Paley, that God, as our supreme governor, should expect that towards himself, which, by a natural impulse, or by the irresistible order of our constitution, he has prompted us to pay to every other being on whom we depend. The same observation is applicable to thanksgiving. Besides, it has been often said, and as generally acknowledged, that prayer is necessary to keep up in men's minds a sense of God's agency in the universe, and of their own dependence upon him. But after all, the duty of prayer depends upon its

efficacy; for it is not easy to conceive, how any man can pray, or be obliged to pray, who expects nothing from his prayers; but who is persuaded at the time when he utters his request, that it cannot produce the smallest impression upon the being to whom it is addressed, or advantage to himself. The efficacy of prayer imports, that we obtain something in consequence of praying, which we should not have received without prayer: against this expectation it has been objected, that if what we request be fit for us, we shall have it without praying; if it be not fit for us, we cannot obtain it by praying. The only reply to this objection is, that it may be agreeable to perfect wisdom to grant that to our prayers which it would not have been agreeable to the same wisdom to have given us without praying for. If it be asked, what virtue prayers possess, which should make a favour consistent with wisdom, that would not have been so without it? In reply to this question, Paley offers the following possibilities: 1. A favour granted to prayer may be more apt, on that very account, to produce good effects upon the person obliged, agreeably to the common maxim in relation to human benefits, that what is obtained without asking is frequently received without gratitude. 2. It may be consistent with the wisdom of the Deity, to withhold his favours till they be asked for, as an expedient to encourage devotion in his rational creation, in order thereby to keep up and circulate a knowledge and sense of their dependency upon him. 3. Prayer has a natural tendency to amend the petitioner himself; and thus to bring him within the rules, which the wisdom of the Deity has prescribed to the dispensation of his favours. If prayer be any thing more than a mere mechanical form, the regular, or even the frequent performance of it, cannot consist with the allowed and habitual practice of iniquity; agreeably to a trite, but true adage, a man must either leave off praying, or leave off sinning. Unless a person is made better by his prayers, they will not long be continued.

Paley concedes to the objection above stated, that prayer cannot reasonably be offered to God with the same view with which our intreaties are addressed to men, *viz.* to inform them of our wants or desires; to tease them out by importunity; to work upon their indolence or compassion, in order to persuade them to do what they ought to have done before, or ought not to do at all. This part of the argument is well illustrated by the author now cited, in the following manner: Suppose there existed a prince, who was known by his subjects to act, of his own accord, always and invariably for the best; the situation of a petitioner, who solicited a favour or pardon from such a prince, would sufficiently resemble ours; and the question with him, as with us, would be, whether, the character of the prince being considered, there remained any chance that he should obtain from him by prayer, what he would not have received without it. I do not conceive that the character of such a prince would necessarily exclude the effect of his subjects' prayers; for when that prince reflected, that the earnestness and humility of the supplication had generated in the suppliant a frame of mind, upon which the pardon or favour asked would produce a permanent and active sense of gratitude, that the granting of it to prayer would put others upon praying to him, and by that means preserve the love and submission of his subjects, upon which love and submission their own happiness, as well as his glory, depended; that beside that the memory of the particular kindness would be heightened and prolonged by the anxiety with which it had been sued for, prayer had in other respects so disposed and prepared the mind of the petitioner, as to render capable of future service, him who before was unqualified

unqualified for any :—might not that prince, I say, although he proceeded upon no other considerations than the strict rectitude and expediency of the measure, grant a favour or pardon to *this man*, which he did not grant to *another*, who was too proud, too lazy, or too busy, too indifferent whether he received it or not, or too insensible of the sovereign's absolute power to give or to withhold it, ever to ask for it ; or even to the *philosopher*, who, from an opinion of the fruitlessness of all addresses to a prince of the character which he had formed to himself, refused in his own example, and encouraged in others, all outward returns of gratitude, acknowledgments of duty, or application to the sovereign's mercy or bounty ; the disuse of which (seeing affections do not long subsist which are never expressed) was followed by a decay of loyalty and zeal among his subjects, and threatened to end in a forgetfulness of his rights, and a contempt of his authority ? These, together with other assignable considerations, and some perhaps inscrutable, and even inconceivable by the persons upon whom his will was to be exercised, might pass in the mind of the prince, and move his counsels ; whilst nothing, in the mean time, dwelt in the petitioner's thoughts but a sense of his own grief and wants ; of the power and goodness from which alone he was to look for relief ; and of his obligation to endeavour, by future obedience, to render that person propitious to his happiness, in whose hands, and at the disposal of whose mercy, he found himself to be."

Our author observes, that the objection to prayer supposes that a being perfectly wise must be necessarily inexorable, which supposition is altogether unwarrantable, as inexorability is not any part of perfect wisdom ; and it also assumes as a principle, that there is *one*, and only *one* mode of action *for the best*, and that the divine will is necessarily determined and confined to that mode ; both which positions presume a knowledge of universal nature, much beyond what we are capable of attaining.

Another evidence of the inefficacy of prayer is deduced from its want of the confirmation of experience. Concerning this appeal to experience, it will be sufficient to remark, that if prayer were suffered to disturb the order of second causes appointed in the universe too much, or to produce its effect with the same regularity that they do, it would introduce a change in human affairs, which, in some respects, will be evidently for the worse. If the efficacy of prayer were so constant and observable as to be relied upon *before hand*, the conduct of mankind would, in proportion to that reliance, become careless and disorderly. Men would depend upon their praying instead of labour for the supply of their wants, and recur to prayer for the restoration of their health, instead of moderating those passions, or abstaining from those pleasures, which in many cases are productive of disease. Upon the whole, we may observe, that our prayers may possibly, in many instances, be efficacious, and yet our experience of their efficacy be dubious and obscure. This obscurity and ambiguity may probably be necessary to the happiness and safety of human life.

Some persons, who would not wish altogether to exclude prayer, object to the mode of it that is often adopted, and to many of the subjects that form a part of public worship, or of private devotion. To pray for particular favours explicitly, is, as they say, to dictate to divine wisdom and goodness ; to intercede for others, especially for whole communities and empires, is still worse : because we thus presume that we have such an interest with the Deity, as to be able, by our applications, to bend the most important of his counsels, and that the happiness of others as individuals, or in the aggregate, is to depend upon this interest and our

choice. To this kind of objection it will be sufficient to reply, that our prayers for ourselves or others, as far as they concern ourselves and temporal interest, should be expressed with great humility and entire resignation to the divine will, and that under this limitation they are highly reasonable and proper ; and they are conformable to that general plan of providence, which renders one man the instrument of happiness or misery to another. "Why may we not be assisted by the prayers of other men, who are beholden for our support to their labour ? Why may not our happiness be made in some cases to depend upon the intercession, as it certainly does in many upon the good offices of our neighbours ? The happiness and misery of great numbers we see oftentimes at the disposal of one man's choice, or liable to be much affected by his conduct ; what greater difficulty is there in supposing, that the prayers of an individual may avert a calamity from multitudes, or be accepted to the benefit of whole communities ?"

If we recur to the authority of divine revelation, this will confirm the conjectures and deductions furnished by natural religion, and afford us direct and positive evidence of the efficacy of prayer. The scriptures not only affirm the propriety of prayer in general, but supply us with precepts or examples, which justify some topics and modes of prayer that have been thought exceptionable. Concerning the duty and efficacy of prayer in general, we may refer to Matt. vii. 7. 11. Luke, xxi. 36. Rom. xii. 12. Phil. iv. 6. 1 Theff. v. 17. 1 Tim. ii. 18. Examples of prayer for particular favours by name occur in 2 Cor. xii. 8. 1 Theff. iii. 10. Directions to pray for national or public blessings may be found in Psalm cxxii. 6. Zech. x. 1. 1 Tim. ii. 1, 2, 3. Examples of intercession, and exhortations to intercede for others, are recorded in Exod. xxxii. 11. Acts, xii. 5. Rom. i. 9. xv. 30. James, v. 16. Moreover, declarations and examples authorizing the repetition of unsuccessful prayers may be found in Luke, xviii. 1. Matt. xxvi. 44. 2 Cor. xii. 8.

The reformed churches of Christendom, adhering to their only infallible guide, have laid aside prayers for the dead ; because they are not authorized by any precept or precedent found in scripture. For the same reason they properly reject the invocation of saints ; and also because such invocations suppose in the saints whom they address a knowledge, which can perceive what passes in different regions of the earth at the same time : and they deem it too much to take it for granted, without the smallest intimation of such a thing in scripture, that any created being possesses a faculty little short of that omniscience and omnipresence which they ascribe to the Deity.

Private prayer, which is recommended by its own propriety, and by advantages not attainable in any form of religious communion, receives a superior sanction from the authority and example of Christ. Matt. vi. 6. xiv. 23.

The peculiar use of family prayer, as a branch of domestic piety, consists in its influence upon servants, and the young members of a family, who may be less disposed than others of maturer years and greater reflection to avail themselves of the exercise of private devotion, and whose attention is not so easily commanded in public worship.

The duty and advantages of public worship require a more distinct consideration, and a more ample discussion, for which we refer to PUBLIC WORSHIP. On the subject of this article, see Paley's Principles of Moral and Political Philosophy, vol. ii. ch. 2. Price's Dissertations, diss. ii. Leechman's Sermon on Prayer.

PRAYER, *Common*. See COMMON PRAYER and LITURGY.
PRAYERS of forty Hours. See HOURS.

PRAYERS, in *Mythology*, were, according to Hesiod, Jupiter's daughters, moaning sisters, who were repulsed oftener than they were heard. Homer, in the speech of Phoenix to Achilles (Il. l. 9.), gives the following description of them :

“ Pray'rs are Jove's daughters, of celestial race ;
Lame are their feet, and wrinkled is their face ;
With humble mien and with dejected eyes,
Constant they follow where Injustice flies :
Injustice swift, erect, and unconfined,
Sweeps the wide earth, and tramples o'er mankind, }
While Pray'rs, to heal her wrongs, move slow behind. }
Who hears these daughters of almighty Jove,
For him they mediate to the throne above :
When man rejects the humble suit they make,
The fire revenges for the daughter's sake ;
From Jove commission'd, fierce Injustice then
Descends, to punish unrelenting men.”

The mythologists give several explications of this allegory : but it requires no great penetration to find out that Homer calls Prayers lame, because they come not always just after the injury that occasions them ; that they are wrinkled and have downcast eyes, to denote how apt men are to defer repentance, and how humble at last, when they want to make their peace with the offended party.

PRAYSSAC, in *Geography*, a town of France, in the department of the Lot ; 12 miles N.W. of Cahors.

PRE', *St. Gervois*, a town of France, in the department of Paris ; 10 miles N.E. of Paris.

PREABOCCO, a town of Italy, in the Veronese ; 13 miles N.W. of Verona.

PREACHING, in *Theology*, the declaration, or promulgation, of the word of God, in public, by a person authorized, and in a place appointed for the purpose.

The word is derived from the Hebrew *parashch*, *expofuit*, *he expounded*.

Anciently none but bishops were allowed to preach ; now, not only priests, but deacons, are qualified.

Any person may preach, whatever be his mental talents and acquirements, who is legally qualified for the exercise of this office, either according to the constitution of the established church, or under the act of toleration. But the honourable, acceptable, and useful discharge of the office of preaching, so as to prevent the office itself from sinking into disrepute and contempt, religion from suffering reproach, and the end of preaching, which is to make men wiser, better, and happier, from being defeated, requires a variety of qualifications, that cannot be attained in an age, when miracles have ceased, and when a spirit of general inquiry prevails, without previous study. It is desirable that the preacher, like the physician, should possess a fund of general knowledge ; but it is indispensable, that he should be well acquainted with those subjects that immediately pertain to his profession. Without a considerable degree of this kind of knowledge, whatever popularity of a particular kind he may acquire, he is not likely to gain permanent reputation among persons of reflection and judgment, or to promote the mental and moral improvement of his auditors. Different situations, however, admit of the exercise of different talents, and preachers, undistinguished by literary, scientific, or even theological acquirements, have been eminently useful in impressing the heart, and regulating the practice, without communicating any great degree of information to the understanding. At the same time, it ought never to be forgotten, that, as Dr. Blair says, “ the understanding must always be applied to in the first place, in order to make a

lasting impression on the heart ; and he who would work on men's passions, or influence their practice, without first giving them just principles, and enlightening their minds, is no better than a mere declaimer. He may raise transient emotions, or kindle a passing ardour ; but can produce no solid or lasting effect.” Nevertheless, it should also be remembered, “ that all the preacher's instructions are to be of the practical kind ; and that persuasion must ever be the ultimate object. It is not to discuss some abstruse point, that he ascends the pulpit ; it is not to illustrate some metaphysical truth, or to inform men of something which they never heard before ; but it is to make them better men ; it is, at once, to give them clear views and persuasive impressions of religious truth. The eloquence of the pulpit, then, must be popular eloquence. One of the first qualities of preaching is to be popular ; not in the sense of accommodation to the humour and prejudices of the people (which tends only to make a preacher contemptible), but, in the true sense of the word, calculated to make impressions on the people ; to strike and to seize their hearts. I scruple not, therefore, to assert, that the abstract and philosophical manner of preaching, however it may have been sometimes admired, is formed upon a very faulty idea, and deviates widely from the just plan of pulpit eloquence. Rational, indeed, a preacher ought always to be ; he must give his audience clear ideas on every subject ; and entertain them with sense, not with sound. But to be an accurate reasoner will be small praise, if he be not a persuasive speaker also.” A preacher, who would deliver a persuasive oration, must himself be a good man. A well-known and approved character for piety and virtue will very much contribute to his success. As no man, on any subject, can be truly eloquent, who does not utter the “ *veræ voces ab imo pectore*,” who does not speak the language of his own conviction and his own feelings, this circumstance is supereminently requisite in preaching. Here, “ it is of the utmost consequence that the speaker firmly believe both the truth and the importance of those principles which he inculcates on others ; and, not only that he believes them speculatively, but have a lively and serious feeling of them. This will always give an earnestness and strength, a fervour of piety to his exhortations, superior in its effects to all the arts of studied eloquence ; and without it, the assistance of art will seldom be able to conceal the mere declaimer. A spirit of true piety would prove the most effectual guard against those errors which preachers are apt to commit. It would make their discourses solid, cogent, and useful ; it would prevent those frivolous and ostentatious harangues, which have no other aim than merely to make a parade of speech, and amuse an audience.” “ The chief characteristics of the eloquence suited to the pulpit, as distinguished from other kinds of public speaking, appear to be these two ; gravity and warmth. The serious nature of the subjects belonging to the pulpit requires gravity ; their importance to mankind requires warmth.” These two qualities should be duly combined ; as “ the grave, when it is predominant, is apt to run into a dull uniform solemnity ; the warm, when it wants gravity, borders on the theatrical and light.” This union should be regarded by the preacher, both in the composition of his discourses, and in his manner of delivery. “ Gravity and warmth united form that character of preaching, which the French call ‘ *onction* ;’ the affecting, penetrating, interesting manner, flowing from a strong sensibility of heart in the preacher to the importance of those truths which he delivers, and an earnest desire that they make full impression on the hearts of his hearers.” Blair's Lectures, vol. ii.

For further particulars relating to the subject of preaching,

see ELOCUTION (*Elocution of the Pulpit*), ORATION, PUBLIC SPEAKING, and SERMON.

Bishop Wilkins has delivered the art of preaching, in a treatise called *Ecclesiastes*, or the Preacher.

The religious of the order of St. Dominic assume the quality of preaching-brothers, friars-predicant, or predicants.

PRÆADAMITE, PRÆADAMITA, a denomination given to the inhabitants of the earth; conceived, by some people, to have lived before Adam.

Isaac de la Pereyra, in 1655, published a book to evince the reality of Preadamites; by which he gained a considerable number of profelytes to the opinion; but the answer of Demarets, professor of theology at Groningen, published the year following, put a stop to its progress; though Pereyra made a reply.

His system was this; the Jews he calls Adamites, and supposes them to have issued from Adam; and gives the title Preadamites to the Gentiles, whom he supposes to have been a long time before Adam.

But this being expressly contrary to the first words of Genesis, Pereyra had recourse to the fabulous antiquities of the Egyptians and Chaldeans, and to some of the idle rabbins; who imagined there had been another world before that described by Moses.

He was apprehended by the inquisitors in Flanders, and very roughly used, though in the service of the Dauphin. But he appealed from their sentence to Rome, whither he went in the time of Alexander VII., and where he printed a retractation of his book of Preadamites.

PREAMBLE, in Law, the beginning of an act of parliament, &c. serving, as it were, for a key to open the intent of the makers of the act, and the mischiefs intended to be prevented or remedied thereby.

PREAUDIENCE. See PRECEDENCE.

PREBEND, PRÆBENDA, the portion which a prebendary receives for his maintenance out of the estate of a cathedral, or collegiate church.

The term prebend is usually confounded with *canonicate*, or *canonica*; yet there is a real difference. A prebend is properly a right which an ecclesiastic has in a cathedral, or collegiate church, where he officiates, to receive certain ecclesiastical revenues, and to enjoy certain dues, either in money or in kind (so called a *præbendo*, q. d. *afforded* or *allowed* him; not à *præbendo auxilium*, or *consilium episcopo*); whereas *canonica* is a mere title, or spiritual quality, which a person enjoys independent of any præstation, or any temporal revenue; so that the prebend may subsist without the canonicate; but the canonicate is inseparable from the prebend.

For it is not to the prebend that the right of suffrage, and other spiritual rights are annexed, but to the canonicate; and when the prebend is joined to the canonicate, it becomes spiritual by virtue of the canonicate to which it is attached.

Anciently the pope created canons with the right of having place in the choir, a deliberative voice in the chapter, and an expectation of the first prebend that should become vacant; but this was prohibited by the council of Trent: yet the pope still confers the canonicate without any prebend, when he would confer a dignity in a church, for the obtaining of which it is required the candidate be a canon.

This they call a canonicate *ad effectum*, and sometimes a *jus ventosum*, which is no more than an empty title, conferred purely to qualify a man for a dignity restrained to the capacity of canon.

Originally the prebend was only a livery, or portion of things necessary to life, given daily; at present the rents and profits of the church are divided into fixed portions, called prebends, which are enjoyed independently. Of common right the bishop is patron of all the prebends, be-

cause the possessions were derived from him. In such case, he prefers to them by collation, which is the same thing with institution, as no presentation is made; but if a prebend be in the gift of a layman, the patron presents to the bishop, who institutes in like manner as to another benefice; and then the dean and chapter induct them, that is, after some ceremonies, place them in a stall in the cathedral church to which they belong; by which they are said to have a place in the choir. Some prebends are donative. At Westminster, the king collates by patent, and by virtue thereof the prebendary takes possession without institution or induction; and the king, at this day, is patron of most of the great prebends.

Prebends are either *simple*, or with *dignity*. The latter are such as, beside their prebends, have some jurisdiction annexed to them.

No person may hold more than one prebend in the same church; and if a prebendary accepteth of a deanery, his prebend is void by cession, the acceptance of a deanery being understood to be in the same church. So if he is made a bishop, the king presents to his prebend.

Neither prebendaries nor canons appear to have any cure of souls; and therefore a prebend and a parochial benefice are not incompatible, but both may be holden together, without a dispensation; nor is he who takes a title to a prebend thereby obliged, by 13 Eliz. cap. 12. to subscribe or read the thirty-nine articles.

No part of the revenue of the church of Canterbury is allowed to any prebend in particular, except the annual stipend of 17*l.* 6*s.* 8*d.*, which by the 16th chapter of the statutes is to be paid to every prebendary "pro corpore præbendæ suæ." The residue of the revenue is the joint property of the dean and chapter, as being an aggregate body; and no member has a right to any part of it.

PREBENDARY, PRÆBENDARIUS, an ecclesiastic who enjoys a prebend.

Prebendaries and canons of cathedral and collegiate churches have this in common, that they have each a portion of the revenues of the church for their subsistence; the one under the title of *præbenda*, prebend; the other under the title of *canonica*, or canonicate; and have each places and voices in the chapter; but they differ in this, that the former receives his portion or prebend in consideration of his officiating and serving in the church; but the latter without any such consideration, merely by his being received into the cathedral or college, *per assignatum stallum in choro, et locum in capitulo*.

Prebendaries and canons are bound to preach in their turns, or provide proper substitutes. By 28 Hen. VIII. cap. 11. the profits of a prebend, during the vacation, shall go to the successor, towards the payment of his first-fruits.

A prebendary leaving a house, by death or cession, out of repair, shall himself or by his executors be liable to a sort of dilapidation, though it was not annexed to the prebendal stall.

No prebendaries nor canons in cathedral or collegiate churches, having one or more benefices with cure (and not being residentiaries in the same cathedral or collegiate churches), shall, under colour of their said prebends, absent themselves from their benefices with cure, above the space of one month in the year, unless it be for some urgent cause, and certain time, to be allowed by the bishop. And such of the said canons and prebendaries, as by the ordinances of the cathedral or collegiate churches do stand bound to be resident in the same, shall so among themselves proportion the times of the year, as that some of them shall always be personally resident there; and all such residentiaries shall, after the days of their residency, appointed by their local statutes or customs expired, presently repair to their benefices or some one of them, or to some other charge

where the law requireth their presence, there to discharge their duties according to the laws in that case provided. And the bishop of the diocese shall see the same to be duly performed and put in execution. Car. 44.

PREBENDARY, *Golden, of Hereford*, called also *præbendarius episcopi*, is one of the twenty-eight minor prebendaries, who has, *ex officio*, the first canon's place that falls.

He was anciently confessor of the bishop and cathedral, and had the altarages; on which account he was called the *golden* prebendary.

PRECARIÆ, or PRECES, in our *Ancient Law Books*, days-works, which the tenants of certain manors are bound to give their lords in harvest-time.

These in some places are corruptly called *bind-days*, for *biden-days*, from the Saxon, *biddan*, to pray.

Magna Precaria was a great or general reaping-day.

The lord of the manor of Harrow, in Middlesex, had, 21 Ric. II. a custom, that by summons of his bailiff on a general reap-day, then called *magna precaria*, the tenants should do one hundred and ninety-nine days work for him; every tenant that had a chimney fending a man.

PRECARIOUS, in *Commerce*, an appellation given to a kind of trade carried on between two nations at war, by the intervention of a third at peace with them both.

Thus the English held a precarious commerce with the Spaniards by means of the Portuguese; when the two former nations being at war, the third lent its vessels, its colours, and name, to continue their trade.

PRECARIOUS *Jurisprudence*, is applied to a fund or stock, of which a person has not the full propriety, whereof he cannot dispose absolutely, and which is most of it borrowed.

PRECATORRES, in *Church History*, a sect of heretics, who, under the pretence of praying always, refused to work.

PRECE PARTIUM, in *Law*, the continuance of a suit by consent of both parties.

PRECEDENCE, PRECEDENCY, or *Præcedency*, a place of honour which a person is entitled to in companies; either sitting, or walking.

With regard to the order of precedency, it may be observed in general, that persons of every degree of honour or dignity take place according to the seniority of their creation, and not of years, unless they are descended of the blood-royal; in which case they have place of all others of the same degree.

Precedency is either of *courtesy*, or *de jure*, of right.

The former is that which is due to age, or estate, &c. which is regulated by custom and civility.

The latter is settled by authority, and where broken in upon, gives an action at law.

Here we may observe, that the younger sons of the preceding rank take place from the eldest son of the next mediate; *viz.* the younger sons of dukes from the eldest sons of earls; the youngest sons of earls from the eldest sons of barons. The whole chain of precedency is founded upon this gradation, and thus settled by act of parliament. (31 Hen. VIII. cap. 11. A.D. 1539.) By subsequent alterations, all the sons of viscounts and barons are allowed to precede baronets; and the eldest sons and daughters of baronets have place given them before the eldest sons and daughters of any knights, of what degree or order soever, though superior to that of a baronet; these being but temporary dignities, whereas that of baronets is hereditary; and the younger sons of baronets are to have place next after the eldest sons of knights. There are also some great officers of state, who take place, although they are not noblemen, above the nobility of higher degree; and there are some persons, who, on account of their dignities in the church, degrees in the universities, and inns of court, officers

in the state or army, although they are neither knights nor gentlemen born, that nevertheless take place among them. Thus, all colonels and field-officers, who are honourable. As also the master of the ordnance, quarter-master general, doctors of divinity, law, physic, and music, deans, chancellors, prebendaries, heads of colleges in universities, and serjeants at law, are, by courtesy, allowed place before ordinary esquires. And all bachelors of divinity, law, physic, and music; masters of arts; barristers in the inns of courts; lieutenant-colonels, majors, captains, and other commissioned military officers; and various patent officers in the king's household, may equal, if not precede, any gentleman that has none of these qualifications. In towns corporate, the inhabitants of cities are preferred to those of boroughs, and those who have borne magistracy to all others. It has been also determined in the earl marshal's court of honour, that all who have been lord mayors of London, shall every where take place of all knights-bachelors, because they have been the king's lieutenants.

The rules of precedence in England may be reduced to the following table: in which, those marked * are entitled to the rank here allotted them, by statute 31 Hen. VIII. c. 10; those marked †, by statute 1 W. & M. c. 21; those marked ||, by letters patent 9, 10, & 14 Jac. I. which see in Seld. tit. of hon. ii. 5. 46. and ii. 11. 3; those marked ‡, by ancient usage and established custom; for which see (among others) Camden's *Britannia*, tit. *ordines*. Milles's catalogue of honour, edit. 1610. and Chamberlayne's present state of England, b. iii. ch. 3.

TABLE of Precedence.

- * The king's children and grand-children.
- * ————— brethren.
- * ————— uncles.
- * ————— nephews.
- * Archbishop of Canterbury.
- * Lord chancellor or keeper, if a baron.
- * Archbishop of York.
- * Lord treasurer
- * Lord president of the council } if barons.
- * Lord privy seal
- * Lord great chamberlain. But }
see private stat. 1 G. I. c. 3.
- * Lord high constable
- * Lord marshal
- * Lord admiral
- * Lord steward of the household
- * Lord chamberlain of the household } above all peers of their own degree.
- * Dukes.
- * Marquesses.
- ‡ Dukes' eldest sons.
- * Earls.
- ‡ Marquesses' eldest sons.
- ‡ Dukes' younger sons.
- * Viscounts.
- ‡ Earls' eldest sons.
- ‡ Marquesses' younger sons.
- * Secretary of state, if a bishop.
- * Bishop of London.
- * ————— Durham.
- * ————— Winchester.
- * Bishops.
- * Secretary of state, if a baron.
- * Barons.
- † Speaker of the house of commons.
- † Lords commissioners of the great seal.
- ‡ Viscounts' eldest sons.

† Earls' younger sons.
 † Barons' eldest sons.
 || Knights of the Garter.
 || Privy counsellors.
 || Chancellor of the exchequer.
 || Chancellor of the duchy.
 || Chief justice of the king's bench.
 || Master of the rolls.
 || Chief justice of the common pleas.
 || Chief baron of the exchequer.
 || Judges, and barons of the coif.
 || Knights bannerets, royal.
 || Viscounts' younger sons.
 || Barons' younger sons.
 || Baronets.
 || Knights bannerets.
 † Knights of the Bath.
 † Knights bachelors.
 || Baronets' eldest sons.
 || Knights' eldest sons.
 || Baronets' younger sons.
 || Knights' younger sons.
 † Colonels.
 † Serjeants at law.
 † Doctors.
 † Esquires.
 † Gentlemen.
 † Yeomen.
 † Tradesmen.
 † Artificers.
 † Labourers.

The ladies take place, or precedency, according to the degree of quality of their husbands.

With regard to the precedency among women, we may observe, that women, before marriage, have precedency by their father; with this difference between them and the male children, that the same precedency is due to all the daughters that belong to the eldest. By marriage, a woman partakes of her husband's dignities; but none of the wife's dignities can come, by marriage, to her husband, but are to descend to her next heir. If a woman has precedency by creation or birth, she retains the same, though she marry an inferior; but if a woman nobly born marry any nobleman, as a baron, she shall take place according to the degree of her husband only, though she be a duke's daughter. A woman, privileged by marriage with one of noble degree, shall retain the privilege due to her by her husband, though he should be degraded by forfeiture, &c. The wife of the eldest son of any degree takes place of the daughters of the same degree, who always have place immediately after the wives of such eldest sons, and both of them take place of the younger sons of the preceding degree. And this rule holds, not only in comparing degrees, but also families of the same degree among themselves. The precedency among women is as follows.

The queen and princesses of Wales; princesses and duchesses of the blood; duchesses; wives of the eldest sons and daughters of dukes of the blood; marchionesses; wives of the eldest sons and daughters of dukes; countesses; wives of the eldest sons and daughters of marquesses; wives of the youngest sons of dukes; viscountesses; wives of the eldest sons, and daughters of earls; wives of the younger sons of marquesses; baronesses; wives of the eldest sons, and daughters of viscounts; wives of the younger sons of earls; wives of the eldest sons and daughters of barons; wives of the younger sons of viscounts; wives of the younger sons of barons; wives of baronets; wives of the knights of the Garter; of the Bath; and of knight-bachelors; wives of the eldest sons and daughters of baronets; wives of the

eldest sons and daughters of knights of the Garter; wives of the eldest sons and daughters of knights of the Bath; wives of the eldest sons and daughters of knights-bachelors; wives of the younger sons of baronets; wives of esquires by creation; of esquires by office; of gentlemen; daughters of esquires; of gentlemen; wives of citizens; of burghesses, &c. The wives of privy-counsellors, judges, &c. are to take the same place as their husbands do. For the precedence and pre-audience among barristers in the English courts, see COUNSEL.

PRECEDENT, in *Law*, frequently denotes an original, authentic instrument, or writing; serving as a form to draw others by.

Hence precedent books, &c. full of draughts of deeds, conveyances, &c. for attornies.

PRECEDENT *Condition*. See CONDITION.

PRECENTOR, PRÆCENTOR, a dignitary in cathedral churches, popularly called the *chantor*, or *master of the choir*.

The præcentor is so called, from the Latin *præ*, and *cano*; because he is supposed to lead the choir, and *sing before* the rest.

PRECEPT, PRÆCEPTUM, in *Law*, a command in writing, sent by a chief-justice, justice of peace, or other like officer, for the bringing of a person, record, or other matter, before him.

PRECEPT is also used for the command, or incitement, whereby one man stirs up another to commit felony, theft, &c. Bracton speaks of three diversities of offending in murder; *viz. præceptio, fortia, consilium*.

Præceptio, is the instigation used beforehand; *fortia*, the assistance in the fact; *consilium*, the advice given either before or after.

PRECEPT of *election to parliament*. See PARLIAMENT.

PRECEPTORY, PRÆCEPTORIA, *Commandry*; a kind of benefice held by the more eminent among the ancient Knights Templars, who were created by the grand master, with the title of *præceptores Templi*, i. e. *masters of the Temple*.

Stephens, *De jurid. lib. iv.* says, the preceptories were only a kind of cells, all subordinate to their principal mansion, the Temple in London.

Of these preceptories, Dugdale says, he finds sixteen recorded, as anciently belonging to the Templars in England, *viz.* Cressing Temple, Balshal, Shengay, Newland, Yevely, Witham, Temple Bruere, Willington, Rotheley, Ovington, Temple-Comb, Trebigh, Ribstane, Mount St. John, Temple-Newsum, and Temple-Hurst. But there were more. See COMMANDRY.

PRECES. See PRECARIÆ.

PRECES *Primariæ*, or *Primæ*, is the denomination of an imperial prerogative, by which the emperor exercises, and hath immemorially exercised, a right of naming to the first prebend that becomes vacant after his accession, in every church of the empire. This right was also exercised by the crown of England in the reign of Edward I. and probably gave rise to the royal corodies. See CORODY and OPTION.

PRECESSION, PRECESSION, in *Astronomy*, a term applied to the equinoxes, which by a very slow insensible motion, change their place, going backward or westward, *i. e. in antecedentia*, as astronomers call it, or contrary to the order of the signs.

It is shewn, in the new astronomy, that the pole, the solstices, the equinoxes, and all the other points of the ecliptic, have a retrograde motion; and are continually moving from east to west, or from Aries towards Pisces, &c. by means of which the equinoctial points are carried farther and farther back, among the preceding signs of stars at the rate of about fifty seconds each year, which retrograde motion is called the *precession, recession, or retrocession of the equinoxes*.

Hence, as the fixed stars remain immoveable, and the

PRECESSION.

equinoxes go backward, the stars will seem to move more and more eastward with respect to them; whence the longitudes of the stars, which are reckoned from the first point of Aries, or the vernal equinox, are continually increasing.

Hence it is, that the interval of time between any equinox and that same equinox, in the following revolution of the earth (which astronomers call the *tropical year*) is some minutes shorter than the *sidereal year*, or the period in which the earth revolves from one point of her orbit to the same point again; and, because the retrograde motion of the equinoctial points thus advances during the time of every equinox a little sooner than it would otherwise have happened, this phenomenon is called the "precession of the equinoxes."

Hence it is that the constellations have all changed the places assigned them by the ancient astronomers: in the time of Hipparchus, and the oldest astronomers, the equinoctial points were fixed to the first stars of Aries and Libra; but the signs are now no longer in the same points; and the stars which were then in conjunction with the sun when he was in the equinox, are now a whole sign, or thirty degrees, to the east of it; thus the first star of Aries is now in the portion of the ecliptic, called Taurus; and the first star of Taurus now resides in Gemini; and Gemini is advanced into Cancer, &c. The equinoxes will have made their revolution westward, and will be returned to Aries again, or the constellations will have made theirs eastward, and will again fall into their former places with regard to the equinoxes, in 25816 years, according to Tycho; in 25920, according to Ricciolus; and in 24800, according to Cassini.

These phenomena may be clearly understood by a view of *Plate XIX. Astronomy, fig. 7.* Let NZSVL be the earth, SONA its axis produced to the starry heavens, and terminating in A, the present north pole of the heavens, which is vertical to N, the north pole of the earth. Let EOQ be the equator, T \ominus Z the tropic of Cancer, and VT \wp the tropic of Capricorn; VOZ the ecliptic, and BO its axis, both which are immoveable among the stars. But, as the equinoctial points recede in the ecliptic, the earth's axis SON is in motion upon the earth's centre O, in such a manner as to describe the double cone NO π and SO σ , round the axis of the ecliptic BO, in the time that the equinoctial points move quite round the ecliptic, which is 25,920 years; and in that length of time, the north pole of the earth's axis produced, describes the circle ABCDA in the starry heavens, round the pole of the ecliptic, which keeps immoveable in the centre of that circle. The earth's axis being about $23\frac{1}{2}$ degrees inclined to the axis of the ecliptic, the circle ABCDA described by the north pole of the earth's axis produced to A, is 47 degrees in diameter, or double the inclination of the earth's axis. In consequence of this, the point A, which at present is the north pole of the heavens, and near to a star of the second magnitude in the tail of the constellation called the Little Bear, must be deserted by the earth's axis; which moving backwards a degree every 72 years, will be directed towards the star or point B in 6480 years hence; and in double of that time, or 12,960 years, it will be directed towards the star or point C; which will then be the north pole of the heavens, although it is at present $8\frac{1}{2}$ degrees south of the zenith of London L. The present position of the equator EOQ will then be changed into eOq, the tropic of Cancer T \ominus Z into V \ominus t, and the tropic of Capricorn V \wp T into v \wp Z; as is evident by the figure. And the sun, in the same part of the heavens where he is now over the earthly tropic of Capricorn, and makes the shortest days and longest nights in the northern hemisphere, will then be over the earthly tropic of Cancer, and make the days longest and nights shortest. So that it will require 12,960 years yet

more, or 25,920 from the then present time, to bring the north pole N quite round, so as to be directed towards that point of the heavens which is vertical to it at present. And then, and not till then, the same stars which at present describe the equator, tropics, and polar circles, &c. by the earth's diurnal motion, will describe them over again.

The ancients, and even some among the moderns, have taken the equinoxes to be immoveable; and ascribed that change of distance of the stars from it, to a real motion of the orb of the fixed stars, which they supposed to have a slow revolution about the poles of the ecliptic; so as that all the stars perform their circuits in the ecliptic, or its parallels, in the space of 25,920 years; after which they should all return again to their former places.

This period the ancients called the Platonic or great year; and imagined, that at its completion every thing would begin as at first; and all things come round in the same order as they have already done.

The physical cause of the precession of the equinoxes, Sir Isaac Newton demonstrates, arises from the broad or spheroidal oblate figure of the earth; which itself arises from the earth's rotation around its axis; for as more matter is accumulated all round the equatorial parts than any where else on the earth, the sun and moon, by attracting this redundance of matter, bring the equator sooner under them in every return towards it, than if there was no such accumulation.

In order further to illustrate the operation of this cause, and to evince its effect, we should consider how the action of the sun produces the retrograde motion of the nodes of the moon; as it will follow, from the same principles, that if a planet revolved about the earth near to its surface in the plane of the equator, its nodes would also go backward, though with a slower motion than those of the moon, in proportion as its distance from the centre of the earth was less than that of the moon. Suppose the number of such planets to be increased till they touch each other, and form a ring in the equator, and the nodes of this ring would go backward in the same manner as the nodes of the orbit of any one planet revolving there. Suppose then this ring to adhere to the earth, and its nodes would still go backward, but with a much slower motion, because the ring must move the whole earth, to which it is supposed to adhere. The elevation of the equatorial parts of the earth has the same effect as such a ring would have, excepting only that the motion of the nodes of the equator, or of the equinoctial points, is slower, because the accumulated parts of the earth, above a spherical figure, are diffused over its surface, and have a less effect than if they were all collected in the place of the equator, in the form of a ring. The moon has a greater force on this ring than the sun, on account of her less distance from the earth; and they both contribute to produce the retrograde motion of the equinoctial points; the motion, however, produced by both is so slow, that those points will not finish a revolution in less than above 25,000 years. Sir Isaac Newton has determined the quantity of this motion from its causes, and finds it, as deduced from the theory, to be consonant with the observations of astronomers. We shall here add, that there is another effect of the action of the sun and moon on this ring, which is too small to be sensible in astronomical observations; their action on the ring makes its inclination to the ecliptic to decrease and increase, by turns, twice every year.

Allowing the case to be as above stated, and since the plane of the moon's orbit is at one time above ten degrees more inclined to the plane of the equator than at another, it is reasonable to conclude, that the part of the whole annual precession, which arises from her action, must in different years be varied in its quantity; whereas the plane of the ecliptic,

PRECESSION.

ecliptic, in which the sun appears, keeping always nearly the same inclination to the equator, that part of the precession, which is owing to the sun's action, may be the same every year; and hence it follows, that, although the mean annual precession, proceeding from the joint actions of the sun and moon, were $50''$, or $50\frac{1}{2}''$, yet the true annual precession might sometimes exceed, and sometimes fall short, of that mean quantity, according to the various situations of the nodes of the moon's orbit; and Dr. Bradley, from a variety of observations, found this to be the case; or, that the precession of the equinoctial points varies; nor are astronomers entirely agreed as to the quantity of the variation, so as to establish what the mean precession is. Dr. Bradley assumes the mean precession to be one degree in seventy-one years and a half. According to this estimate, the Platonic or great year would be equal to 25,740 solar years.

Sir Isaac Newton, in determining the quantity of the annual precession from the theory of gravity, upon supposition that the equatorial is to the polar diameter of the earth, as 230 is to 229, finds the sun's action sufficient to produce a precession of $9\frac{1}{2}''$ only; and collecting from the tides the proportion between the sun's force and the moon's to be as 1 to $4\frac{1}{2}$, he settles the mean precession resulting from their joint actions, at $50''$. But since the difference between the polar and equatorial diameter is found, by the late observations of the gentlemen of the Royal Academy of Sciences at Paris, to be greater than what sir Isaac had computed it to be; the precession arising from the sun's action must likewise be greater than what he has stated it at, nearly in the same proportion. From whence it will follow, that the moon's force must bear a less proportion to the sun's than $4\frac{1}{2}$ to 1. Phil. Trans. vol. xlv. art. 1.

To determine the quantity of the precession, arising from the action of the sun, has been a problem much agitated among modern mathematicians; and although there is no doubt of Newton's mistake in the solution of it, other authors have generally disagreed. M. d'Alembert, in 1749, printed a treatise on this subject, and claims the honour of having been the first who rightly determined the method of solving problems of this nature. The subject has been also considered by Euler, De la Grange, Frisius, Silvabelle, Walmesley, Simpson, Emerson, Landen, Milner, and Vince.

M. de Silvabelle, stating the ratio of the earth's axis to be as 178 to 177, makes the annual precession caused by the sun $13'' 52''' 11''''$; the mean annual precession caused by the moon, the ratio of the lunar force to the solar being supposed $= \frac{5}{2}$, $34'' 16''' 51''''$; and the nutation of the earth's axis caused by the moon, during the time of a semi-revolution of the pole of the moon's orbit, *i. e.* in $9\frac{1}{2}$ years, $17'' 51''' 14''''$. Mr. Walmesley makes the annual precession, owing to the sun's force, on the supposition that the proportion of the earth's diameters is as 230 to 229, and the obliquity of the ecliptic to the equator $23^\circ 28' 30''$, equal to $10''.583$; but supposing the proportion of the diameters to be as 178 to 177, the annual precession depending on the action of the sun will be $13''.675$. And supposing with Dr. Bradley, that the whole mean annual precession is $50''.3$, the mean precession, owing to the force of the moon, will be $39''.717$, and the force of the moon to that of the sun as 3.753 to 1, the diameters being as 230 to 229; but this proportion being $\frac{177}{178}$, the annual precession arising from the action of the moon will be $36''.625$, and the force of the moon to that of the sun as 2.678 to 1. Mr. Simpson, by a different method of calculation, determines the whole annual precession of the equinoxes caused by the sun, to be $21'' 6'''$; and he has pointed out the errors of the computations proposed by Mr. Silvabelle and Mr. Walmesley. Mr. Milner's deduction, and also professor Vince's, agree with that of Mr. Simpson.

The quantity above stated would be the precession of the equinox, arising from the attraction of the sun, if the earth were a solid of an uniform density, and the ratio of the diameters as 229 : 230; but professor Vince has shewn, that, if the greatest nutation of the earth's axis be rightly stated, the precession is only about $14\frac{1}{2}''$; which differences between the theory, and what is deduced from observation, must arise, either from the fluidity of the earth's surface, an increase of density towards the centre, or the ratio of the diameters being different from that which is here assumed; or probably from all the causes conjointly. This regression of the equinoxes, caused by the plane of the equator moving backwards upon the ecliptic, must necessarily cause the poles of the earth to describe circles about the poles of the ecliptic, in a direction contrary to the order of the signs, setting aside the effect of nutation. Our author, having ascertained the precession, shews how to find the corresponding nutation. If we take the whole precession for the time the sun is moving from the equinox to the tropic, to be $\frac{1}{4}$ th of $14\frac{1}{2}''$, the nutation at the tropic $= 1''$, which is the greatest nutation arising from the force of the sun. If y be supposed to denote an arc described by the sun in the ecliptic, to a radius equal to unity, whilst a point of the equator describes an arc about its axis in an indefinitely small given time, which may also represent its velocity, the nutation from the time the sun leaves the equinox $= \frac{1}{2}'' - \frac{1}{2}'' \times \cos. 2y$, and at 45° from the equinoxes, the inclination is the mean, it varying half a second each way from thence. Hence, at the equinoxes, the nutation $= \frac{1}{2}''$, and at the tropic, the nutation $= -\frac{1}{2}''$ from the mean inclination; and the nutation at any time from the mean inclination $= \frac{1}{2}'' \cos. 2y$. The equation of the precession is greatest in the middle point between the equinox and tropic, and is there $= 1'' 9'''$; and it is to be subtracted in the first and third quadrants of the ecliptic, and added in the second and fourth. It appears that the inequality of the precession, and the nutation, may be represented, by supposing the pole of the equator to describe a circle of $1''$ diameter about the mean pole every half year; and therefore the apparent distance of every star from the pole of the equator, will be subject to a variation of $1''$ twice in a year from this cause.

The inequality of the precession of the equinoxes, and the nutation of the earth's axis, arising from the attraction of the moon in different situations of its nodes, was discovered, as we have already suggested, by Dr. Bradley. Dr. Bradley communicated his observations to Mr. Machin, who soon after sent him a table of the annual precession and the corresponding nutation, in the various situations of the moon's nodes. These were calculated upon the supposition that the pole of the equator, during a period of the moon's nodes, moved round in the periphery of a circle of $18''$ diameter, having the centre $23^\circ 29'$ from the pole of the ecliptic, that circle having an angular motion of $50''$ about the same pole. The north pole of the equator was conceived to be in that part of the small circle which is farthest from the north pole of the ecliptic, when the moon's ascending node is in the beginning of Aries; and the opposite point of it, when the same node is in the beginning of Libra. But Dr. Bradley afterwards observed, that the calculations would agree better with observations, if the true pole of the equator described an ellipse instead of a circle, whose minor axis is about $16''$, and lying parallel to the ecliptic. This is confirmed by theory. From all the observations of Dr. Bradley, Dr. Maskelyne fixed the whole nutation at $19''.1$. In the table computed by professor Vince, it is assumed at $19''$. We shall here remark, that sir Isaac Newton had taken notice of the nutation of the earth's axis; and Mr. Flamsteed, in his Hist. Cæl. vol. iii. p. 113, informs

PRECESSION.

forms us that he attempted to discover its quantity, but found his instruments not sufficiently accurate for the purpose. Some hints relating to it have been found by M. de la Lande in the MSS. of Roemer. But though the nutation of the earth's axis had been so long suspected, the discovery of the cause and quantity of it was reserved for Dr. Bradley. See NUTATION, LIGHT, and STARS.

Mr. T. Simpson, in his "Miscellaneous Tracts," has shewn how to find the precession during a revolution of the moon's node, and his method, which is pronounced to be as simple as the subject will admit of, is adopted by professor Vince. Hence it appears, that the whole quantity of nutation during half a revolution of the node from γ : the corresponding quantity of precession :: 10 : 174 very nearly. If the moon's orbit coincided with the ecliptic, the effect of the moon would be to that of the sun, in the ratio of their densities; therefore the mean precession of the moon : that from the sun in a compound ratio of 0.988 : 1, and of the density of the moon : the density of the sun; consequently the density of the moon : density of the sun :: the precession from the moon : precession from the sun \times 0.988. If the annual precession arising from the sun be taken = $21'' 6'''$, and the whole precession = $50''$, then the part arising from the action of the moon will be $28'' 54'''$, hence the density of the moon : the density of the sun :: $28'' 54''' : 21'' 6''' \times 0.988 = 20'' 8'''$, which ratio does not agree with the proportion deduced from

the tides, or with the accurate observations of Dr. Bradley. The best method, says Vince, of settling this point, is from the greatest nutation. The nutation, during half a revolution of the moon's node from Aries, Dr. Maskelyne fixed at $19''.1$, and it may be assumed at $19''$; hence 10 : 174 ::

$19'' : \frac{174 \times 19''}{10}$ the precession from the moon during that time, which we may take equal to 9.31 years; hence the

mean precession from the moon in one year = $\frac{174 \times 19''}{10 \times 9.31}$;

therefore, if we take the whole precession in a year to be $50\frac{1}{4}''$,

we have $50\frac{1}{4}'' - \frac{174 \times 19''}{10 \times 9.31} = \frac{10 \times 9.31 \times 50\frac{1}{4}'' - 174 \times 19''}{10 \times 9.31}$

for the part of the precession arising from the sun. Hence, the density of the moon : the density of the sun ::

$174 \times 19'' : 10 \times 9.31 \times 50\frac{1}{4}'' - 174 \times 19'' \times 0.988 :: 2.44 : 1$. Consequently, the part of the precession arising from the action of the moon is = $35'' 39'''$, and that of the sun = $14'' 36'''$, and the greatest equation of the precession arising from the moon = $17''.7$.

The following table shews the mean precession of the equinoctial points in longitude for complete years.

Years.	Precession.	Years.	Precession.	Years.	Precession.	Years.	Precession.
1	0 50.3	31	26 0.8	61	0 51 11.3	91	1 16 21.8
2	1 40.7	32	26 51.2	62	0 52 1.7	92	1 17 12.2
3	2 31.0	33	27 41.5	63	0 52 52.0	93	1 18 2.5

PREGHAC, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Bazas; 6 miles S.W. of Bazas. The place contains 2664, and the canton 7496 inhabitants, on a territory of 255 kilometres.

PRECIÆ, in *Botany*, the twenty-first among the natural orders of Linnæus, consisting of *Primula*, *Androsace*, *Diapensia*, *Aretia*, *Dodecatheon*, *Cortusa*, *Soldanella* and *Cyclamen*; to which is subjoined, in a separate section, *Limosella*; and in a third division, with a mark of doubt, *Mennyantbes*, *Hottonia* and *Samolus*. See LYSIMACHIÆ.

PRECIGNE', in *Geography*, a town of France, in the department of the Sarthe; 4 miles W.N.W. of La Flèche.

PRECIGNY le Grand. See PRESSIGNY le Grand.

PRECIOUS, or PREVIOUS-stone. See GEM.

PRECIPE, or PRÆCIPE, in *Law*, a species of original writ, called *optional*, which commands the defendant to do the thing required, or shew the reason wherefore he hath not done it. The use of this writ is where something certain is demanded by the plaintiff, which is in the power of the defendant himself to perform; as to restore the possession of land, to pay a certain liquidated debt, to perform a specific covenant, to render an account, and the like; in all which cases, the writ is drawn up in form of a præcipe or command to do thus, or shew cause to the contrary; giving the defendant his choice, to redress the injury, or stand the suit. This writ is distinguished from the peremptory writ, called *si te fecerit securum*.

PRECIPE, or *Præcipe*, is also a name given to a writ of covenant; the foundation of which is a supposed agreement or covenant, that one party shall convey lands to the other; on the breach of which agreement, action of covenant is brought by the party to whom the land is to be conveyed or assured, who thus commences an action or suit at law against the other.

PRECIPE, or *Præcipe quod reddat*, a writ of great diversity, both as to form and use, extending as well to writs of right, as to other writs of entry and possession.

It is sometimes called a *writ of right close*, as when it issues out of the court of chancery close; sometimes a *writ of right patent*, as when it issues out of chancery patent, or open, to any lord's court, for any of his tenants deforced, against his deforcer.

PRECIPE in *Capite*. See PRÆCIPE.

PRECIPITANT, PRÆCIPITANS, in *Chemistry*, a term applied to any liquor, which, being poured on a dissolution, separates what is there dissolved, and makes it precipitate, *i. e.* fall to the bottom of the vessel.

PRECIPITANT is also used, in *Medicine*, for a remedy, which separates and precipitates any heterogeneous matter contained in the mass of blood; and by this means abates any irregular fermentations, effervescences, of the like disorders, which the matter had excited.

Among the number of precipitants are ranked hartshorn, crabs' eyes, ivory, bezoard, barks of oak and guaiacum, iron, quinquina, chalk, &c.

PRECIPITATE, PRÆCIPITATUS, in *Chemistry*, a substance, which, having been dissolved in a proper menstruum,

is again separated from its dissolvent, and thrown down to the bottom of the vessel, by the pouring in of some other liquor.

When a body is decomposed by means of an intermediate substance, and a precipitate is formed by this decomposition, this precipitation can be effected only by the intermediate substance uniting with one of the component matters of that body; and consequently a new compound is always formed in these operations. Sometimes the separated matter, being no longer soluble, becomes sensible, and falls as a precipitate, while the new compound remains dissolved. In other instances, the separated substance remains dissolved, while the new combination, not being soluble, is precipitated. This depends on the nature of the substances which act one upon another in these operations: but we may easily perceive, that the precipitates of the former kind are *simple*, and those of the latter are *compound*. Earth and metals, when separated from acids by means of alkalies, or other metals, are simple precipitates, and when separated from acids by other acids, they are compound. See PRECIPITATION.

PRECIPITATES, *Metallic*. See PRECIPITATION, in *Assaying*.

PRECIPITATE of Gold by Tin, &c. See GOLD, &c.

PRECIPITATE, *White*, *Red*, and *Per se*, are all oxyds, or salts of mercury. See MERCURY.

PRECIPITATION, PRÆCIPITATIO, a process in chemistry, which, in its most extensive sense, is applicable to all chemical decompositions made by an intermediate substance; or, to all operations in which two bodies are dissolved by employing a third body, which has the property of uniting with one of these, and thereby of separating the other; so that every precipitation is effected by means of the affinity of a precipitant much stronger than that of the precipitate with the substance from which it is separated. In a more confined sense, precipitation is a kind of separation, whereby a body, dissolved and suspended in any menstruous liquor, is detached from it, and falls down to the bottom of the vessel.

Precipitation, in its more extended sense, comprehending any visible separation of any substance or compound, from its clear solution, whether it sinks or swims, and whether it be crystallized or pulverulent, forms one of the great operations of chemistry, and is directly opposed to that of solution. Till the late experiments of Berthollet on the subject of affinity (see AFFINITY), all chemists seem to have coincided with Bergman, who maintained, that in cases where a compound was decomposed by the superior affinity of one of its elements for a third substance, there was a total transfer of the base from the substance of the weakest to that of the strongest affinity: and hence originated the term "single elective affinity," which was made use of to signify, that if to the compound A. B. a body C. was added, possessed of a superior attraction for A. than B. has, A. would, by election or choice, as it were, quit B. entirely, and form with C. a new compound, A. C., to the exclusion of B. Berthollet has shewn, in his valuable essays on chemical affinity, and on chemical statics, how philosophers have been led to deduce the supposed order of affinities from the circumstances of precipitation. These changes, which, according to the theory of Bergman, were supposed to be produced by the predominance of certain affinities over others, are ascribed by Berthollet to those circumstances which influence attraction and limit combination. If four substances, for example, be presented to each other, two of which have a greater tendency to cohesion than the other two, so as to form by their union an insoluble compound, instead of one compound being formed by

PRECIPITATION.

By the union of the four, in which the affinities are balanced, this will be averted by the force of cohesion, and the two which form the insoluble compound will unite, and be separated by precipitation or crystallization, leaving the other two in combination in the fluid which has been the medium of action. "If even these four substances were previously in the reverse binary combinations, on presenting them to each other, the affinities within the sphere of action must be reciprocally exerted; and the same extraneous forces will cause an exchange of principles, or the phenomena which have been ascribed to elective affinities will be produced." To avoid the term elective attraction, Berthollet denominates cases of this kind *complex affinity*. The explanation of single elective attraction, or where three substances are presented to each other, is precisely the same; the union which takes place between two of them being determined by the tendency to cohesion, or the disposition of the combination of two of them to form a compound of little solubility.

The proportion also of the substances presented to each other considerably influences these combinations; and the changes produced by the decomposition are scarcely ever complete; especially where the force of cohesion has not been powerfully exerted, so as to render the effect of quantity imperceptible. Elasticity likewise has a considerable influence in determining decompositions where the application of heat is necessary; and, according to Berthollet, the decomposition of a compound body, of which one of the ingredients has a great tendency to assume the elastic form, is to be ascribed to the disposition it has to escape from its combination, when aided by the intervention of even a weaker affinity.

In complex affinities the same cause determines the union of substances disposed to assume the elastic form, and separates them as a volatile compound. "If, therefore," says he, "it be desired to know the result of the exposure of two salts to the action of heat, it is only necessary to consider which of the two bases, and which of the two acids have the greater volatility, if there be a difference: for the more volatile base and acid will escape and enter into combination, and the fixed base and fixed acid will remain behind, and combine with one another."

There are two principal kinds of precipitates which have been distinguished by chemistry, one where to a compound composed of an acid and a base, each highly soluble in water, another acid is added, which has a greater affinity with the base, and forms with it a compound less soluble than the first. In this case the precipitate (which is sometimes crystallized, sometimes otherwise) is composed of the acid last added, in proportions that vary but little. As, for example, when sulphuric acid is added to a saturated solution of nitrate of potash, a crystallized precipitate of sulphate of potash is added, the proportions of which scarcely vary in any circumstances, though the actual quantity of precipitate is determined by the quantity of water and of sulphuric acid present.

Another kind of precipitate is that which has usually been supposed to be simple, and takes place when to a compound of an acid and a base insoluble (or nearly so) in water, an alkali or soluble earth is added, which, by elective affinity, unites with the acid, and displays the former base; and this latter, now supposed to be uncombined and insoluble in the quantity of liquid present, falls to the bottom. This kind of precipitation is constantly resorted to when we wish to obtain the simple earths, as in adding an alkali to a solution of alum, in order to precipitate the alumine, to Epsom salt to precipitate magnesia, &c. But the precipitate in all such cases is not (as has been usually supposed) the simple

earth, but it always retains, after the first operation, a small and variable portion of the acid with which it was before combined. Thus if the alumine, however welledulcorated, be redissolved in muriatic acid, and a salt of barytes added, there will be a sensible precipitate of sulphate of barytes. This *retent* of acid is variable, and may be reduced to an insensible quantity, if not absolutely taken away, by subsequent digestion in very concentrated alkali. Such precipitations, therefore, are not affected merely by simple affinity, but by a division of the acid into two portions, one of which, and by much the largest, goes to the alkali, and the other remains with the earth, and accompanies it in its precipitation. Even when no precipitation occurs, the acid may be proved to distribute itself in this manner, for, as Bergman has remarked, if a calcareous salt is dissolved in fifty times its weight of water, and an excess of potash or soda is added, no precipitation takes place, so that the acid continues in part to act upon the lime, and renders it soluble in a much less quantity of water than the lime alone would require for solution.

It may be assumed, therefore, as a general principle, and one which is of great importance in the explanation of chemical decomposition, that where a salt is composed of an acid and a base, insoluble or little soluble by itself, the decomposition effected by any soluble base is the result not of a simple but a compound action, in which, on the one hand, the decomposing base unites with more or less of the acid and remains in solution, whilst the other base resumes its insolubility by the separation of part of its acid, and forms a precipitate with the remainder. This will be found to apply still more strikingly in the formation of metallic precipitates, and of those salts which (like the sub-sulphate of mercury or turbith) were formerly taken for simple oxyds, but are now found to be salts with excess of oxyd.

Chemical affinity is, in many cases, determined by precipitation; but a contradiction in the mode of applying this principle has been well pointed out by Berthollet.

The orders of affinity which the several bases have for the acids is usually determined by adding any base to a known combination of an acid and another base, and if the latter base is precipitated, it has been inferred that its affinity for the acid is less than that of the other base. Thus, when lime is precipitated by adding potash to muriate of lime, it is inferred that potash has a stronger affinity for muriatic acid than lime, and hence the preference in the order of affinity has been given to the most soluble bases. But, on the other hand, the respective affinities of the acids has been determined in the contrary way, as for example, when oxalic acid is added to muriate of lime a precipitate of oxalate of lime is produced, whence the superior affinity of the oxalic acid over the muriatic for lime has been deduced. Thus, in these cases, the preference in affinity has been given to those acids which have the most disposition to form insoluble combinations.

But many instances may be given to shew that the phenomena of precipitation are distinct from those of chemical affinity, so that the resulting insolubility or force of cohesion which produces precipitations is sometimes superadded to the simple force of affinity, and at other times opposed to it, and ought in strictness to be always considered as a distinct principle.

PRECIPITATION, in *Assaying*, is the separation of any part of a compound body, while melting in the fire, or when cooling from fusion, from the rest of the mass, in such a manner that it sinks to the bottom, while the remainder continues at top, and makes the surface. The heavy part thus

PRECIPITATION.

thus precipitated from the rest is called the *regulus* of that body.

This is an operation which almost always requires the addition of such ingredients, as serve to take away the mutual connection and coherence of the parts of the body to be separated; that is, such as have a menstrual virtue, and keep others in a state of dissolution. For instance, the reguline part of antimony, and mineral sulphur, dissolve each other mutually, and constitute crude antimony; nor can they be separated from each other by fire alone, without destroying the regulus; but if you add iron, copper, silver, &c. which are more thoroughly penetrated by sulphur, and are thus reduced to the state of ore, then the regulus of antimony is freed of its sulphur, and sinks to the bottom, as it is heavier than the additional bodies, when joined to the sulphur.

Such a precipitation by fusion happens in vitrifications, scorifications, and coppelings, while one part of the body turns into dross, or scoriae, and the other metallic part, if there be any, keeping still its metallic form, is collected at the bottom of the spherical vessel. Therefore silver and gold, which are hardly subject to a perfect vitrification, constantly remain and shew themselves in their own form; and on this account, though they were in ever so small a quantity in a coppel, they always shew themselves very clearly to the eye when the scoriae are absorbed: whereas so small a regulus of the other metals would have been as it were buried and hidden under so great a quantity of scoriae.

Nor is precipitation by fusion less necessary to obtain almost all the other metals, which, on this account, are called less perfect, unless perhaps you except a very small quantity of native metal, which nevertheless can scarcely be properly called pure. Besides, they are all to be had either in form of earth, or that of a solid ore. In the first case, you may make a glass by a bare fusion; in the second, if the sulphur and arsenic, which, together with the metallic part, constitute an ore, are dissipated in roasting, the ore, destitute of the oily phlogiston, (says Cramer,) becomes glass in a pure fire, which glass may be mixed with unmetallic stones and earths; but by adding a phlogiston or inflammable principle to it, this metallic glass is again reduced to its metalline form; and so long as it keeps under this form, it cannot be united with the glass of the other species, but sinks to the bottom of it, except only a very small quantity of it, which is detained by the clamminess of the glass. The precipitating body in this case, therefore, is truly the phlogiston, or inflammable principle: any body that takes away the connection, by the removal of which a precipitation is made, is properly called the precipitating body.

Precipitation of solid bodies from fluid menstrua is performed either by extracting, or evaporating over a gentle fire the dissolving menstruum out of the dissolved fixed body, or by adding such a body, as is greedily dissolved by that menstruum: as if one metal dissolved by an acid is precipitated by another metal, or by an alkaline salt; for instance, silver dissolved in aqua fortis is precipitated by copper, copper by iron, iron by zinc, and all metals and semi-metals, either partly or entirely, by pot-ashes, volatile and urinous salts.

A precipitation is also made by pouring on a solution such things as either cannot dissolve the body in hand, whether alone, or joined to a menstruum that contains the said body; or dissolve it in another manner; or in a lesser quantity than if the menstruum had been used pure. In the first case, a total precipitation is performed, as may be seen in the precipitation of silver out of aqua fortis, by means of

spirit of salt. In the second, a great deturbation and precipitation is made; but a second solution soon follows, as it happens when iron being dissolved in aqua fortis, you add to it, in a proper manner, a liquor perfectly free from alkaline fixed salt; but then there remains usually a certain part, which is not perfectly dissolved a second time. In the third case, there is but a partial precipitation made. You have an instance of this, if mercury dissolved in aqua fortis, and the menstruum thoroughly saturated with it, is precipitated either by common salt, or sal ammoniac, or by their acid spirit. A precipitation is also sometimes made only by adding a large quantity of fair water to dilute; such is that made on the regulus of antimony dissolved in spirit of common salt, or in aqua regia, when a large quantity of cold water is poured on this solution; for these menstrua do not dissolve this semi-metal, unless concentrated.

All these precipitations are promoted greatly by a gentle heat, by means of which the precipitating body enters more easily into the menstruum, and a considerable quantity of water is next necessary to dilute with, except in the precipitations of the first kind; for most commonly the more concentrated dissolutions assume the consistence of a paste, so soon as the precipitating body is added to them, which hinders this from mixing equally with the solution. Cramer.

The metal of every metallic solution in any acid is always in the state of an oxyd, so that the solution must contain at least three substances, *viz.* the acid, the metal, and oxygen united with the metal.

A metallic solution may be decomposed, and its metallic part precipitated, either in the reguline state or as an oxyd, and these two methods, which have each been adopted in the analysis of metallic bodies, require to be considered separately.

When a carbonated alkali is added to a metallic solution, the precipitate is a carbonated oxyd of the metal, and, like the other carbonates, effervesces on the addition of a stronger acid. But when a pure alkali is added only to saturation, the precipitate is, in some instances, nearly a pure oxyd, but in the greater number is an oxyd retaining a small portion of the acid with which it was united. This acid, however, is not sufficient to render it soluble, and it may be generally entirely taken away by subsequent digestion in a concentrated fixed alkali, provided the oxyd is not soluble therein.

The first action of alkalies, therefore, on most metallic solutions, is to cause an unequal division of the acid, the greater part of which unites with the alkali, and the remainder falls down along with the oxyd now rendered insoluble. If the ammonia be the alkali employed, there is also in general a partition of the alkali, and the precipitate is a quadruple compound, of the metal, the oxygen united with it, and a small portion of the acid, and of the ammonia; and the solution contains the greater part of the acid, of the alkali, and often a small part of the metallic oxyd sufficient to be very sensible to the taste, and to chemical tests. According to Proust, lime also, when used as a precipitant, enters in a small proportion into the precipitate.

Metallic solutions sometimes yield precipitates on the mere addition of water, by the simple distribution of the constituents into two portions, a soluble and an insoluble one, the former of which has an excess of acid, and the latter of oxyd. Thus, when the clear nitrate of bismuth is diluted with water, a white precipitate falls down, which is chiefly oxyd of bismuth, and the supernatant liquor contains an excess of acid, and a small portion of metal which may be separated by evaporation, or by an alkali. In like manner,

PRECIPITATION.

manner, if sulphuric acid and mercury are treated together, sulphureous acid is given out, and the white mass that remains is an uniform acid sulphate, which deliquesces into a dense solution. But if hot water be added, the *turbith*, or yellow *sub-sulphate* of mercury is precipitated, and the solution contains an acid sulphate. Even the first turbith may be further decomposed by a fresh affusion of hot water, dividing it into a turbith still more loaded with oxyd, and an acid solution.

These, and many other facts which might be adduced, illustrate the general law of decomposition by precipitation, and the constant tendency of metallic salts to divide into two compounds, each consisting of both the constituents of the salt, but distributed in unequal proportions. These phenomena are rendered still more complex by the addition of new substances, most of which, being described under the respective metals, a repetition in this place would be needless.

The second species of metallic precipitates are those in which the metal appears in its reguline form. This takes place when one metal is precipitated by another, as when a piece of iron is immersed in a solution of copper, and also when phosphorus is kept for some time in certain metallic solutions.

Before the discovery of oxygen, and of the oxydation of metals being necessary to their solution in acids, the precipitation of one metal by another was supposed to be produced by simple elective attraction, and the respective affinities of the metals for the acids was put down in the order of the precipitations which they produced. But this explanation, though true in general, does not explain a number of apparent anomalies in metallic precipitation, so that we must take into consideration the force of other agents and other affinities.

The order of the precipitation of one metal by another is the following, among those that have been the most accurately examined, *viz.* zinc, iron, lead, tin, copper, silver, mercury, gold; that is to say, zinc precipitates all the other metals; iron precipitates all but zinc; lead all but zinc and iron, &c.

But sometimes the precipitation fails with solutions in one acid, though it succeeds with others; thus zinc separates iron in the metallic state from muriate of iron, but only as an oxyd from the nitrate. A small excess of acid is necessary to begin the process in all cases.

During this operation, the following affinities must act; namely, that of the precipitant (or metal by which the separation is effected) for the oxygen of the metal already dissolved; that of the oxyd thus produced, for the acid of the solution; and to this Berthollet adds, that of the two metals for each other when in the reguline state. The sum of these affinities must overcome that which exists between the constituent parts of the metallic salt intended to be decomposed.

It is possible, therefore, that no precipitation may take place even when the metal added has a greater affinity for oxygen than that already dissolved, if the oxyd of the former metal has a less affinity for the acid than the oxyd of the latter has. And, on the other hand, a precipitation may be effected, even if the precipitant has less affinity for oxygen than the metal already dissolved, provided its oxyd has a greater affinity for the acid. In this latter case, however, there must be a considerable excess of acid present in order to begin the oxydation of the precipitant. Thus, again, it is explained why a precipitation will take place with the solution in one acid, and not in the other, since the acids themselves differ considerably in their affinity for

the same metallic oxyd, so that in the first case, this affinity may surpass that of the same acid for the metallic oxyd already dissolved, and in the second may fall short of it.

Still, however, (as Berthollet remarks,) if the only active affinities in these cases were those of the metals for oxygen and the oxyds for acids, it is not probable that the reduction of the metal whose affinities were the weakest, would be complete, but in all probability there would be only an unequal partition of the acid and oxygen, so as to produce the *more* oxygenated salts of one metal, and the *less* oxygenated salts of the other metal, which would be agreeable to the usual mode of action in similar cases. Hence it becomes necessary to recur to the well-known affinity which exists between the metals themselves, and many facts shew that this is concerned in these processes.

For example, when a plate of polished copper is dipped into a solution of nitrated mercury, it is instantly whitened by the mercury precipitated upon its surface; but this metal is not merely deposited upon the copper, but amalgamated with it, so that it cannot be scraped or rubbed off, but can only be separated by fire. Here, then, the affinity of the mercury for the copper must act forcibly in causing its separation from the nitric acid which held it in solution. In like manner when copper is immersed in a solution of silver, the precipitated metal is not pure silver, but an alloy, containing a very small portion of copper. As this mutual affinity existing between the metals varies according to the metal employed, this also explains why iron (for example) precipitates silver from its solution with much more difficulty than copper, though iron has a much stronger affinity for oxygen than copper (as is proved by the precipitation of copper by iron), for the affinity between silver and copper is much stronger than between silver and iron.

As, then, metallic precipitates are in fact alloys (though often with such a small proportion of the precipitant as to be scarcely sensible), it is necessary that the combination of the metals must first be made when both are in solution, for we can conceive of no other method by which two solid metals (copper and iron for example) should be alloyed in a common temperature. The whole process, therefore, must be the following, taking the above metals as instances; a portion of the iron must first be oxydated and dissolved in the acid, and by this it difoxydates, and precipitates in the metallic form an equivalent portion of the copper, during which time the dissolved iron must divide itself into two very unequal portions, of which by far the largest part remains in solution, but the remainder must return to the metallic state to unite with the copper, and to be precipitated along with it. This complicated action must take place even from the first, for how else can the union of the two metals be accounted for? and still less can it be explained without this supposition, as the precipitation proceeds, when the surface in contact with every fresh stratum of precipitate is no longer iron, but an alloy of copper and iron, almost approaching to pure copper.

This leads us also to consider what is the affinity that determines the place to which the precipitates attach themselves. In the first instance, that is, when a surface of pure iron is exposed to the cupreous solution, the precipitate may be supposed to attach itself to the iron rather than to fall down loose in the vessel on account of the affinity existing between iron and copper alloyed with a little iron; but after the surface of the iron bar is covered, each successive stratum of precipitate attaches itself, not to the iron (for this is covered), but to the surface of the precipitate already formed, that is to say, to a substance of exactly the same composition

composition as itself. In this latter case, therefore, the same kind of affinity acts as when a saline solution during crystallization deposits its crystals on the portion of salt already separated, rather than on a naked surface. The adhesion in this instance, however, is very slight, and readily broken. The proportion of the precipitant which enters into the alloy is probably greater in the first stratum of precipitate than in the subsequent ones; thus when copper is separated by iron, the part immediately in contact with the iron is visibly browner than the rest, owing probably to a larger admixture of iron.

It has been mentioned that phosphorus will separate some metals from their solutions in the reguline state. These are particularly gold, silver, mercury, and copper. If a stick of clean new-melted phosphorus is immersed in an acidulated solution of sulphate of copper, in a day or two it becomes beautifully spangled with little knobs of bright metallic copper, which gradually increase to a thick crust, after which, if the stick is put into boiling water, the phosphorus will melt out, and leave a delicate hollow cylinder of copper. In this case, however, as in the former, the precipitate is not pure copper, but an alloy of copper with phosphorus, or a phosphuret, in which, however, the quantity of phosphorus is extremely small, and the solution contains phosphoric acid. When phosphorus is introduced into a solution of mercury, only part of this metal assumes the metallic form, and the rest is oxyd combined with phosphorus and phosphorous acid.

From what has been observed above, it is obvious that the method of recovering one metal from its solution by the addition of another, which is so often resorted to in analysis, requires considerable precaution, is liable to many inaccuracies, and can only be employed with propriety in certain cases. The circumstances which forbid its use, or render it inconvenient, are the following. 1st. Where the salt formed by the union of the precipitant in the acid is insoluble in water, and will not mix with the precipitated metal, from which it cannot be readily separated, as when sulphate of copper is decomposed by lead, antimony, or mercury, for the sulphates of these metals are little soluble in water: or, 2dly, where the newly formed salt would be decomposed by the water, as when any nitrated solution is precipitated by bismuth: or, 3dly, when the whole of the new oxyd formed by the transfer of oxygen from the precipitated metal to the precipitant cannot be dissolved by the acid present, as when nitrate of copper is decomposed by lead, in which case the precipitate will be very largely alloyed by the precipitant: or, 4thly, when the affinities of the precipitant are such as more easily to decompose the acid than to absorb the oxygen of the metal already dissolved, as when nitrate of copper is decomposed by zinc, in which case the precipitate is partly reguline and partly oxydated: and, 5thly, where the affinities between the two metals are so strong that the precipitate is largely alloyed with the precipitant, as when a solution of silver is decomposed by mercury.

Of these five cases, the third is probably that which much more contributes to produce a large alloy of the precipitated metal than even the affinity existing between the two metals; thus Vauquelin found that 50 grs. of copper, dissolved in nitric acid, even with excess of acid, required no less than 216 grs. of lead for its complete separation, and the precipitate, instead of weighing only 50 grs., amounted to 128 grs. of which, therefore, 50 were copper, and 78 were lead. Yet these two metals have but little affinity for each other. This inconvenience is corrected, though not entirely

removed, by adding a considerable excess of acid. See Aikin's Dict. art. *Precipitate*.

PRECIPUT, *q. d. precipuate*, formed from *precipuus*, *principal*, in the *French Jurisprudence*, an advantage belonging to any one, in a thing to be divided, or a portion taken off, and set by, in his favour, before the division made.

In noble partition, the eldest has always the principal fief, or manor for his preciput, in which view, the preciput coincides with the right of primogeniture.

PRECISION, *PRÆCISIO*, in the *Schools*, the same with abstraction.

PRECISION, in *Writing*, denotes such a brevity as consists in saying nothing superfluous, and omitting nothing that is necessary. In this sense it is opposed to a tedious prolixity on the one hand, and an obscure conciseness on the other. See *STYLE*.

PRECKOL, in *Geography*, a town of Prussia, in Samland, on the Minia; 10 miles S.S.E. of Memel.

PRECONISATION, a proposition, or declaration, which the cardinal patron makes in the consistory at Rome, of a person nominated by some prince to a prelature, by virtue of letters of which he is the bearer; which the pope complying with, gives his collation.

The date of the bulls is dispatched on the same day with the preconisation.

PRECONTRACT, *PRÆCONTRACTUS*, a contract made before or prior to another; chiefly used in relation to marriages.

PRECORDIA, or *PRÆCORDIA*, in *Anatomy*, a word of rather indefinite import, applied more or less largely to the region of the stomach and heart.

PRECURSOR, *PRÆCURSOR*, *Forerunner*, in *Theology*, a person who goes before any one to notify his coming.

The term is peculiarly applied to St. John Baptist, who is styled the precursor of Jesus Christ, from what is said of him by St. Luke, "Thou, child, shall go before the face of the Lord to prepare his way."

PRECY-SUR-TILLE, in *Geography*, a town of France, in the department of the Côte-d'Or, and chief place of a canton, in the district of Samur; 7 miles S. of Samur. The place contains 609, and the canton 8330 inhabitants, on a territory of 237½ kilometres, in 20 communes.

PREDÀ, *LA*, a town of Italy, in the department of the Panaro; 18 miles W.S.W. of Modena.

PREDÀ *di Marignone*, a town of Sardinia; 33 miles N.E. of Castello Aragonese.

PREDÀ *de Sas Vominis*, a town of Sardinia; 25 miles N.E. of Castello Aragonese.

PREDECESSOR, a person who has preceded another in the same office or employ. See *ANCESTOR*.

PREDESTINARIAN, in *Ecclesiastical History*, a person who adheres to the doctrine of absolute predestination.

St. Augustin is considered as the founder of the sect of Predestinarians, he being the first of the fathers that seems to have asserted the doctrine in such express terms; though the Jansenists and Jesuits are still greatly divided about the real doctrine of St. Augustin, in this article, each interpreting it consistently with their own scheme.

Father Sirmond contends for an ancient sect of Predestinarians, or Predestinians, *Prædestinatiani*, contemporary with St. Augustin himself, and who had their rise in Africa, in the monastery of Adrumetum, from a misunderstanding of St. Augustin's doctrine. Hence they were led into a notion, that God not only predestinated the wicked to eternal punishment, but also to the guilt and transgression for which they are punished; and that thus both the good

and bad actions of all men were determined from eternity by a divine decree, and fixed by an inevitable necessity.

It is added, that the opinion spread thence throughout the Gauls, where one of them, a priest named Lucidus, was condemned by Faustus, bishop of Rheggio, and his sentence was confirmed by two councils.

However, the existence of this Predestinarian sect has been denied by many learned men, particularly the president Mauguin, and considered as an invention of the Semipelagians, designed to decry the followers of Augustin, by attributing to him unjustly this dangerous and pernicious error. Nor does it appear, though there might have been persons who embraced the Predestinarian opinions, that the abettors of them ever formed themselves into a sect.

The doctrine was again broached in the ninth century, by Godeschalcus, a Benedictine; who, as Hincmar, in a letter to pope Nicolas, says, maintained with the ancient Predestinarians, who had been already anathematized, that God predestinated some to eternal life, and others to eternal death; that God did not will all people to be saved; that Jesus Christ did not die for all, but only the elect, or those that are saved, &c.

This doctrine was again condemned in a synod held at Mentz, A. D. 848, and by a council at Quiercy, A. D. 849, in consequence of which Godeschalcus was treated with the utmost barbarity, and compelled to burn with his own hands the justification of his opinion, which he had presented to the council at Mentz. He was then cast into prison, where he died in the year 868 or 869, maintaining with his last breath the doctrine for which he had suffered.

The decrees of the former council were confirmed in a new council which met at Quiercy, A. D. 853; but they were declared null by a council assembled at Valence, A. D. 855, and the decrees of this council were confirmed by the council of Langres in the year 859, and in 860 by the council of Toufi.

This controversy was revived in the 16th century by Calvin, who maintained that the everlasting condition of mankind in a future world was determined from all eternity; and that God, in predestinating from all eternity one part of mankind to everlasting happiness, and another to endless misery, was led to make this distinction by no other motive than his own good pleasure and free will. This opinion was, in a very short time, propagated through all the reformed churches, by the writings of Calvin, and by the ministry of his disciples, and, in some places, was inserted in the national creeds and confessions: and thus made a public article of faith.

The unhappy controversy, which took its rise from this doctrine, was opened at Strasburg in the year 1560, by Jerome Zanchius, an Italian ecclesiastic, who was particularly attached to the sentiments of Calvin, and carried on in a manner that contributed very much to exasperate the passions and foment the discord of the contending parties.

The Predestinarian opinions have been maintained by considerable numbers, both in Popish and Protestant countries: and in our own country in particular, they have had many zealous advocates.

We shall here observe, that they have undergone a kind of relaxation by those who have been denominated *Baxterians*, for an account of whose tenets, see that article.

PREDESTINATION, PREDESTINATIO, in *Theology*, a judgment, or decree of God, by which he has resolved, from all eternity, to save a certain number of persons, hence named elect

Others define predestination, a decree to give faith in Jesus Christ to a certain number of men, and to leave the rest to their own malice and hardness of heart.

According to the Calvinistical scheme, the reason of God's predestinating some to everlasting life is not founded in a foresight of their faith and obedience, considered as independent upon any communication of grace from him, but is to be referred to his sovereign mercy and free grace; nevertheless, it is also maintained on this scheme, that the means are decreed as well as the end, and that God purposes to save none but such as by his grace he shall prepare for salvation by sanctification.

The Remonstrants define predestination more laxly and generally, the decree of saving believers, and damning unbelievers.

Some represent the election and predestination spoken of in scripture, as relative only to nations, and not to particular persons.

The greatest difficulties with which the modern theology is clogged, turn on the article of predestination: both the Romish and reformed churches are divided about it; the Lutherans speak of it with horror; the Calvinists contend for it with the greatest zeal; the Molinists and Jesuits preach it down as a most dangerous doctrine; the Jansenists assert it as an article of faith; the Arminians, Remonstrants, and Pelagians, are all avowed enemies of predestination.

Those strenuous patrons of Jansenism, the Portroyalists, teach, that God predestinates those who he foresees will co-operate with his grace to the end. Dupin adds, that men do not fall into sin because not predestinated; but they are not predestinated, because God foresaw their sins. See ELECTION and REPROBATION.

PREDESTINATION is also used for a concatenation of second causes appointed by Providence: in virtue of which, things are brought to pass by a fatal necessity, contrary to all appearances, and in spite of all opposition. See FATE, NECESSITY, and LEIBNITZIAN *Philosophy*.

The Turks are great Predestinarians; they esteem the slightest accident predetermined, and on this account, are much more daring in battle, and run greater risks of their lives than they would otherwise do.

PREDETERMINATION, PREDETERMINATIO, in *Philosophy* and *Theology*. The schoolmen call that concurrence of God which makes men act, and determines them in all their actions, both good and evil, *physical predetermination*, or *premotion*.

Divines hold, that God hath no part in sin, inasmuch as he only affords his concurrence to the physical part of human action, not to the moral part.

Physical predetermination, or premotion, if there be any such thing, is that action of God by which he excites a second cause to act: or by which, antecedently to all operations of the creature, or before it could operate in consequence either of the order of nature or reason, he really and effectually moves, and occasions it to produce all its actions: that is, whatever the creature does or acts, is really done and acted by the agency of God on the creature, who is all the time passive. So that, without such predetermination of God, all creatures must remain in an eternal state of inactivity; and with such predetermination it is impossible but they should do what they are thus put upon doing.

It is strongly controverted, whether or no such a physical predetermination be necessary to the action of natural causes: the Scotists maintain the negative; urging, that all natural causes are of their own nature determined to a certain

certain action; whence it should seem needless to call in a new predetermination of God, *c. gr.* to fire, to make it warm the hand. For if an object be, by the course of divine Providence, applied to fire; what need a second application of the fire to make it warm the object applied thereto? since beings are not to be multiplied unnecessarily.

And such predetermination some philosophers hold still less requisite to produce the acts of the will: at least, say they, the human mind must be allowed the common power and privilege of a second cause, and therefore be entitled to produce its own acts, as well as other strictly natural agents.

The Thomists, on the other hand, stand up strenuously for the physical predetermination: one of their principal arguments is drawn from the subordination of second causes to the first. Where there are several subordinate agents, say they, the lower agents do not act, unless first moved and determined thereto by the first; this being the very essence of subordination.

Again, the like they argue from the dominion of God over all his creatures: it is of the essence of dominion, say they, to apply and direct things subject thereto, to its own operations; and this, if the dominion be only moral, morally; but if it be also physical, physically. And that this is the case in respect of God and his creatures, is confessed. See LIBERTY and NECESSITY.

PREDIAL TITHES, *Decimæ Prædiales*, are tithes paid of things which grow from the ground only, as corn, grass, hops, and wood. See TITHES.

PREDIATORY DEBT. See DEBT.

PREDICABLE, PREDICABLE, in *Logic*, a general quality, or epithet, which may be predicated of, or applied to, several subjects.

Thus animal is predicable both of man and beast; man is predicable of Peter and James; triangle is predicable of a hundred different kinds of figures, as right-angled, scalenes, isosceles, &c.

The schoolmen reduce the predicables to five classes; *viz.* genus, species, proprium, differentia, and accidens; under one or other of which all that can be predicated of any subject is included.

A predicable is also called *universale logicum*, as having respect to other particular, and inferior or subject things: thus animal is an universal, with regard to man and beast. It is called a *logical universal*, to distinguish it from a metaphysical one, which is a common being considered in itself, and therefore denominated universal in *essendo*; whereas the logical one is only universal as to our conception and application.

Among the schoolmen, predicable is usually defined *unum, aptum prædicari de multis univoce, & divisim*: or, somewhat more clearly, a predicable is a nature which may be predicated univocally of all things to which it is common, and which, as it is dividually multiplied in all its subordinates, may be aptly predicated of them all.

Thus, when the appellation of virtue is attributed to justice, prudence, temperance, fortitude, charity, &c. the same reason may be given why each is distinguished by such name, as being all founded in a mediocrity, and being agreeable to right reason, which is the character of virtue.

Hence, if there be several things called by some common name, but the reason of such name is not the same in all, but different; these do not come under the name of predicables. As in the instance, *canis, dog*, which is both applied to a domestic animal, distinguished by its barking; to a constellation of the heavens; and to a sea-fish.

The way by which the mind comes to form such predicables, or universals, is this: among those things which fall under our observation, we find some characters and properties common to several, and others peculiar to each; what we find common, we consider apart, and thus we form an *universal* equally applicable to all. See UNIVERSAL.

PREDICABLY, PREDICABILITER, is used in the schools in opposition to *predicamentally*. Thus, matter is said to be united to form predicably, or *per accidens*, to exclude the notion of a predicamental accident.

PREDICAMENT, PRÆDICAMENTUM, in *Logic*, a class or order of beings, or substances, ranged according to their natures, called also *category*, and sometimes *catagorema*. See CATEGORY.

The word *prædicamentum* was first introduced by Boethius, in lieu of the Greek *κατηγοριαι*; and is used among the school-writers with a good deal of latitude and variety: for it either signifies the act of predicating, or the common predicate itself; or the genus or basis of any category; or the collection of several common predicates disposed in a certain order; which last is its more usual acceptation.

Hence some define predicament, a series of predicates traced from the genus, or highest term, through all the inferior genera and species. Thus, a series of substance drawn from substance through *body, living, animal, man, to Peter*, is called the predicament of substance.

The usual definition among logicians is, that predicament is a natural order or scheme, of some most general or universal thing, and of all that is contained under the same, that is, all the subordinate genera, species, and individuals.

The properties of a predicament, *ex parte vocis, i. e.* of the term or word by which the predicament or predicamental series is denoted, the logicians hold, are, that it be *one, simple, precise, and concinnous*.

“Vox una, & simplex, rebus concinna locandis.”

The conditions requisite *ex parte rei*, or of the thing to be ranged in a predicament, are contained in the following verse:

“Entia per sese, finita, realia, tota;”

i. e. it must be a *positive being*, in exclusion of non-entities, negations, privations, impossibilities, &c.; and a being *per se*, to exclude accidental things, factitious things, &c.; and *finite*, that is, of a limited nature and extent, to exclude God, and other transcendentals: *real*, since its intention is for the better and more commodious disposing of things in their places, to be the more distinctly known and conceived; and *whole*, or complete, as not being in the relation of a competent part, or as only accessory to some other.

PREDICAMENT, *Post*. See POST Predicament.

PREDICAMENTAL ACCIDENT. See ACCIDENT.

PREDICATE, PRÆDICATUM, in *Logic*, that part of a proposition which affirms or denies something of the subject. Thus, in *God made the world*; *made the world* is the predicate, and *God* is the subject.

A predicate, say the schoolmen, is properly a name predicated or spoken of another, as its subject: as *man*, in the proposition, *Peter is a man*.

It is a celebrated rule or law of predicates, that nothing is esteemed to be absolutely spoken or affirmed of another, unless it be affirmed thereof in such a manner, or by such an affirmation, as wants nothing either in the subject, predicate, or copula, to make it true.

This also is noted properly of a predicate, that it contains,

in some measure, its own subject: thus metal contains gold, copper, iron, &c. of which it is predicated.

The word predicate is sometimes used indifferently with *attribute*; but the more accurate writers make a distinction. Every predicate is indeed an attribute, since whatever is predicated of a thing, is attributed to it: so, if animated be predicated of man, it is also attributed to him; but every attribute is not a predicate: thus soul, learning, &c. are attributed to man, but not predicated of him.

PREDICATING is properly the act of affirming or denying somewhat of something. *As, Man is not a stone; body is a substance.* The thing thus predicated is called predicate.

In the doctrine of universals, or predicables, to predicate is to speak or declare a thing truly, directly, and affirmatively. Thus man is predicated of several, *i. e.* it is truly and directly affirmed that these several are men; as when I say, *Socrates is man, Plato is man, Aristotle is man, &c.*

The things predicated of others are reducible to three classes: *genera*, as animal, of man, &c.; *forms*, as whiteness, of a swan, &c.; and *equals*, of things of equal extent, as species, difference, proprium, &c.

The schoolmen distinguish several ways of predicating, as, 1. *In quod tantum*, which is to predicate essentially, both as to the thing and the manner, as, *justice is a virtue.* 2. *In quale tantum*, which is to predicate accidentally, both as to the thing and the manner, as *Peter is learned.* And, 3. *In quale quid, or in quale post quid*, which is to predicate both essentially and accidentally, as, *man is rational.*

PREDICTION, PRÆDICTIO, divination, prophecy, or foretelling what is to come, either by divine revelation, by art and human invention, or by conjecture. See DIVINATION and PROPHECY.

PREDIERE, LUC ANTONIO, of Bologna, in *Biography*, a musical composer in the service of the court of Vienna, where he spent almost the whole of his life, returning to his own country merely to die. He is regarded as one of the best composers of his school, one of those who best united the ancient taste with the modern. He was endued with a fertile imagination, and great variety of expression. The emperor Charles VI. had an affection for him, and had great pleasure in his conversation, which is no small praise; as that prince, with all his faults of ambition, had excellent moral principles, and was an acute and refined judge of music and dramatic poetry. Prediere first set many of Apostolo Zeno's operas for his imperial majesty, between the years 1711 and 1729, and one oratorio of Metastasio, "Ifacco, figure del Redentore."

PREDMOUTH POINT, in *Geography*, a cape in the English channel, on the coast of Cornwall, on the west side of the entrance of Fowey harbour.

PREDOMINANT, PRÆDOMINANS, that which prevails, appears most, or has some superiority or ascendancy over another thing.

PREDTEGINSKOI, in *Geography*, a town of Russia, in the government of Vologda; 48 miles S.W. of Ustring.

PREDY, in *Nautical Language*, signifying the same as *ready*. Thus, *predy the ship, or predy the ordnance*, is as much as to make things ready for a fight. *Predy the hold*, is to lay or stow every thing there in its due order and proper place.

PRE-EMPTION, PRÆEMPTIO, a privilege anciently allowed the king's purveyor, of having the choice and *first buying* of corn, and other provisions, for the king's house, at an appointed value, and both without consent of the owner.

In those early times the king's household, as well as those

of inferior lords, were supported by specific tenders of corn, and other victuals, from the tenants of the respective demesnes; and there was also a continual market kept at the palace gate, to furnish viands for the royal use. (4 Inst. 273.) This answered all purposes, in those ages of simplicity, so long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another, it was necessary to send purveyors before-hand, to get together a sufficient quantity of provisions and other necessaries for the household; and lest an unusual demand should raise them to an exorbitant price, the powers before mentioned were vested in these purveyors; who, in process of time, greatly abused their authority, and became a great oppression to the subject, though of little advantage to the crown. By degrees the powers of purveyance declined; and were particularly abolished in Sweden by Gustavus Adolphus, towards the beginning of the 17th century. And with us in England, having fallen into disuse, during the suspension of monarchy, they were taken away by the stat. 12 Car. II. c. 24.

The parliament, in part of recompence, settled on Charles, his heirs, and successors, for ever, the hereditary excise of 15*d.* per barrel on all beer and ale sold in the kingdom, and a proportionable sum for certain other liquors. See EXCISE and REVENUE.

PREENING, in *Natural History*, the action of birds cleaning, composing, and dressing their feathers, to enable them to glide more easily through the air.

For their use herein, nature has given them an admirable piece of furniture; *viz.* two peculiar glands, which secrete an unctuous matter into an oil-bag, perforated; out of which the bird, on occasion, draws it with his bill.

PRE-ESTABLISHED HARMONY. See HARMONY.

PREETZE, in *Geography*, a town of the duchy of Holstein, 43 miles N.E. of Hamburgh.

PRE-EXISTENCE, PRÆ-EXISTENTIA, the state of a thing actually in being before another.

The ancient Pythagoreans and Platonists all asserted the pre-existence of human souls, *i. e.* that they were in being before they were joined to our bodies.

Origen also held the eternal pre-existence of souls.

The orthodox believe, that God created the world out of nothing; and not of a pre-existent matter.

Some persons have held mankind pre-existent to Adam. (See PRE-ADAMITE.) Divines of various descriptions maintain the pre-existence of Christ, in opposition to those who have appropriated to themselves the appellation of *Unitarians*. See that article.

PREFACE, PRÆFATIO, formed from *præ* and *fari*; *q. d.* to speak before, an advertisement in the beginning of a book, to inform the reader of the design, order, method, &c. observed in it: of what is necessary to receive its full effect, and facilitate the understanding of it.

There is no part of writing that requires more art and address, or which fewer authors succeed in than prefaces.

Prefacing is, in effect, a particular species of writing, and has its peculiar character and taste to distinguish it from all others. It is neither argumentation, discourse, narration, nor apology.

PREFACE of the Mass. The Romanists call that part of their mass, which precedes the consecration, and which is to be rehearsed in a peculiar tone, *preface*.

The use of prefaces in the church, they contend, is very ancient; and conjecture, from some passages of St. Cyprian, &c. that it was in use in the time of the apostles.

The preface to the mass anciently had, and still has, very different names in different churches. In the Gothic, or Gallican

Gallican rite, it is called *immolation*; in the Mozarabic rite, *illation*; anciently among the French, it was called *contestation*; in the Roman church alone it is called *præfatio*, *preface*.

PREFECT, PRÆFECTUS, in ancient Rome, was one of their chief magistrates, who governed in the absence of the kings, consuls, and emperors.

His power was somewhat different at different times; but was always greatest under the emperors. His principal care was the government and administration of the city of Rome.

He took cognizance of all crimes committed in the city, and within an hundred miles thereof. He judged capitally and finally, no appeal lying from him; and even by the sixty-second Novel, he presided in the senate, taking place before all the patricii and consulares, &c.

He had the superintendance of the provisions, policy, buildings, and navigation.

There is still a prefect in modern Rome, who is a kind of governor, differing little from the ancient prefectus, except that his authority only extends to forty miles round the city, whereas that of the prefect of ancient Rome reached one hundred miles round. With the empire, the prefect of the city had declined to a municipal officer; yet he still exercised, in the last appeal, the civil and criminal jurisdiction; and a drawn sword, which he received from the successors of Otho, was the mode of his investiture, and the emblem of his functions. The dignity was confined to the noble families of Rome; the choice of the people was ratified by the pope; but a triple oath of fidelity must have often embarrassed the prefect in the conflict of adverse duties. A servant, in whom they possessed but a third share, was dismissed by the independent Romans. At length, however, they consented, without reluctance, to the restoration of the prefect. About fifty years after this event (A. D. 1198—1216) Innocent III. delivered himself and the Romans from this badge of foreign dominion; he invested the prefect with a banner instead of a sword, and absolved him from all dependencies of oaths or service to the German emperors. In this place an ecclesiastic, a present or future cardinal, was named by the pope to the civil government of Rome; but his jurisdiction, as we have said, has been reduced to a narrow compass; and in the days of freedom, the right or exercise was derived from the senate and people. About thirty-eight years after the foundation of Constantinople, a similar magistrate was named in that rising metropolis, for the same uses, and with the same powers.

PREFECT of the Prætorium, *Præfectus prætorii*, or *præfectus prætorio*, was the chief or leader of the prætorian bands, or cohorts destined for the emperor's guard.

The prætorian legion, according to Dion, consisted of ten thousand men. Suetonius refers the institution of præfectus prætorii to Augustus. It is added, that he was usually taken from among the Roman knights.

By the favour of the emperors, his authority grew very considerable; insomuch, that he became the arbiter and supreme judge of all affairs.

As the government degenerated into a military despotism, the prætorian prefect, who in his reign had been a simple captain of the guards, was placed, not only at the head of the army, but of the finances, and even of the law. In every department of administration, he represented the person, and exercised the authority of the emperor. The first prefect, who enjoyed and abused this immense power, was Plautianus, the favourite minister of Severus. After his fall, the celebrated Papinius was appointed to the execution of this office. From the reign of Severus to that of Dio-

clitian, the guards and palace, the laws and the finances, the armies and the provinces, were entrusted to their superintendance; and, like the viziers of the East, they held with one hand the seal, and with the other the standard, of the empire.

To reduce this extravagant authority, Constantine, conformably to the plan of government instituted by Diocletian, divided the prefecture of the prætorium into four prefectures; and each of these he again subdivided into civil and military departments; though the name was only reserved to him who was invested with the civil authority; and that of *comes belli* given him who had the command of the cohorts. See COUNT.

The four prefectures of Constantine, which had before been assigned to four princes, were the following. 1. That of the East, whose prefect extended his ample jurisdiction into the three parts of the globe which were subject to the Romans, from the cataracts of the Nile to the banks of the Phasis, and from the mountains of Thrace to the frontiers of Persia. 2. The prefect of Illyrium once comprehended under his authority the important provinces of Pannonia, Dacia, Macedonia and Greece. 3. The power of the prefect of Italy extended beyond the country from which he derived his title, over the additional territory of Rhætia, as far as the banks of the Danube, over the dependent islands of the Mediterranean, and over that part of the continent of Africa, which lies between the confines of Cyrene and those of Tingitania. 4. The prefect of the Gauls comprehended under that denomination the hundred provinces of Britain and Spain; and his authority was obeyed from the wall of Antoninus to the foot of mount Atlas.

Thus the office of prefect of the prætorium, which in its origin, and till the time of Constantine, was military, and succeeded to that of *magister equitum*, now commenced a purely civil magistrature; and at length became the prime dignity of the empire.

The succeeding emperors, following Constantine's division, divided the empire into four prefectures prætorii, as into four dioceses; viz. the Gauls, Illyria, Italy, and the East. See DIOCESE.

The provinces of which these dioceses consisted, had their particular governors; at the head of whom was the prefect, who, though he had not the command of the army, yet had the power of the sword, decided ultimately of all causes, and had all the marks and honours of sovereignty.

Although the prætorian prefects had been deprived of all military command, the civil functions which they exercised over so many subject nations, were adequate to the ambition and abilities of the most consummate ministers. To their wisdom was committed the supreme administration of justice and of the finances, the former including the protection of citizens who were obedient to the laws, which in a state of peace is the distinguishing duty of the sovereign, and the latter, which pertains to the duty of the people, and comprehends the constitution of such a share of their property as is required for the expences of the state. The coin, the highways, the posts, the granaries, the manufactures;—whatever could interest the public prosperity, was moderated by the authority of the prætorian prefects. As the immediate representatives of the imperial majesty, they were empowered to explain, to enforce, and, on some occasions, to modify, the general edicts by their discretionary proclamations. They watched over the conduct of the provincial governors, removed the negligent, and inflicted punishments on the guilty. From all the inferior jurisdictions an appeal in every matter of importance, either civil or criminal, might be brought before the tribunal of the prefect; but his sentence

sentence was not final and absolute; and the emperors themselves refused to admit any complaints against the judgment or the integrity of a magistrate whom they honoured with such unbounded confidence. His appointments were suitable to his dignity; and if avarice was his ruling passion, he enjoyed frequent opportunities of collecting a rich harvest of fees, presents and perquisites. Although the emperors no longer dreaded the ambition of their prefects, they were attentive to counterbalance the power of this great office by the uncertainty of its duration. From their superior importance and dignity, Rome and Constantinople were alone excepted from the jurisdiction of the prætorian prefects.

Justinian created a fifth prefect of the pretorium for the government of Egypt or Africa, which had been torn off from the diocese of the East by the invasion of the Vandals during the empire of that prince, and allowed him a salary of 100 pounds of gold.

Under Augustus, the officer sent to govern Egypt with a proconsular authority, was called *præfectus Augustalis*. There were also several other officers distinguished by this appellation: such as *præfectus ararii*, ordained by Augustus to supervise and regulate the public fund, which he raised for the maintenance of the army; the *præfectus alæ*, appointed by the Roman consul to govern each principal division of the allies; the *præfectus classis*, or admiral; the *præfectus fabrum*, who had the care of the arms, and of every thing that related to military expeditions; the *præfectus frumenti*, appointed by Augustus to inspect and regulate the distribution of corn among the common people; the *præfectus militum*, to which class belonged three different officers, viz. the prefect of a cohort, of a camp, and of a legion; the *præfectus vigiliæ*, appointed by Augustus to command the soldiers who watched the city, and whose business was to take cognizance of thieves, incendiaries, idle vagrants, &c. and to punish all petty misdemeanours that were thought too trivial to fall under the notice of the prefect of the city, &c.

PREFECT of the Sacred Chamber. See PRÆPOSITUS.

PREFECTURES, or PREFECTURÆ, were certain towns of Italy, whose inhabitants had the title of Roman citizens; but were allowed to enjoy neither their own laws nor magistracies, being governed by annual prefects sent from Rome. These were generally such places as were either suspected, or had some way or other incurred the displeasure of the Roman state; this being accounted the hardest condition that was imposed on any people of Italy.

PREFIX, in *Grammar*, denotes letters or syllables prefixed to words: these are common in the Hebrew, and opposed to affixes.

Nouns that are formed from verbs, by the prefixion or addition of servile letters, are distinguished by the technical name of "Heemantic," because the letters which compose the word *קנינין*, *credidi*, are employed in their formation. To these might be added the letter *ך*. See SERVILE.

PREGADI, in *History*, a denomination given to the senate of Venice, in which resides the whole authority of the republic.

At its first institution it was composed of sixty senators, to whom sixty more have been added.

PREGARTIN, in *Geography*, a town of Austria; eight miles N.E. of Steyregg.

PREGEL, a river of Prussia, formed by the union of the Inster and Angerap, which, passing by Welau, Tapiau, Königsberg, &c., runs into the Frisch Haff, five miles below Königsberg, N. lat. 54° 42'. E. long. 20° 27'.

PREGNANCY, the state of a woman who has con-

ceived, or is with child. See GESTATION, CONCEPTION, and BREEDING.

From the original use of the word pregnant, is derived the act of impregnating, in its more general application. See GENERATION, FLOWER, and SEED.

PREGNANCY, *Plea and Trial of*, in *Law*. See *Jury of MATRONS*, and REPRIEVE.

PREGNANT. *Negative PREGNANT*, in *Law*. See NEGATIVE.

PREGNITZ, in *Geography*. See PÆGNITZ.

PREGUISAS, a river of Brasil, which runs into the Atlantic, S. lat. 2° 26'. W. long. 44° 26'.

PREGUNZWOLA, a town of Italy, in the Trevisan; four miles S. of Treviso.

PREHNITE, in *Mineralogy*, a stone of the siliceous genus, and quartz family, which has been denoted by various names; being called by some green shorl, and by others emerald, præsium, or chryso-præsium, and also felspar, chrysolite, and zeolite of the Cape. Its colour is apple-green, or greenish-grey, of various degrees of intensity. Its external lustre, 2. Its internal less, and of the pearly kind. Its transparency, 3.2. This stone is found both amorphous and crystallized; the former presents either a foliated or striated texture, and the crystallized forms either low, small, compressed, flat, quadrangular prisms, or tables, and some with truncated angles, and heaped together, or in groups. The principal fracture is foliated, seldom striated: the cross fracture uneven and fine-grained: its hardness from 9 to 10: brittle: its specific gravity 2.9423. Exposed to the blow-pipe, it swells and foams when heated to redness more than zeolites do, and melts into a brown enamel, smooth on the outside, but spongy and porous underneath. Of the usual fluxes borax is the most effectual; with alkalies it forms only an enamel, but microcosmic salt forces it into an opalescent glass.

By the analysis of Mr. Klaproth, it contains 0.4383 siliceous, 0.3033 argill, 0.1833 calx, 0.0566 iron, and 0.01830 water and air.

By that of Mr. Hassenfratz, 0.50 siliceous, 0.204 argill, 0.233 calx, 0.049 iron, 0.009 water, and 0.005 magnesia.

This stone was first found near the Cape of Good Hope, by Capt. Pehrén, and hence Mr. Werner called it prehnite. It has been lately discovered near Dumbarton in Scotland, and it has also been found in Dauphiné.

In lustre, texture, and intumescence, it resembles zeolites, but differs in hardness, specific gravity, colour, relation to fluxes; and also in constitution, for it contains iron; neither does it gelatinate with acids as zeolites do. On the other hand, it differs from shorls, by its fracture, intumescence when heated, greater fusibility, and the porosity of its enamel. Hence Mr. Werner justly considers it as a particular species, but nearly allied to zeolite. Kirwan's Elem. vol. i. See GEMS.

PREIS, JOACHIM FREDERIC, in *Biography*, Swedish ambassador at the Hague, was born in 1660, at Dorpt, in Esthonia, being the youngest of sixteen children. Having received a good education, partly at home, and partly at the royal school at Riga, he was fitted for public life. In 1689 he repaired to Stockholm, and was presented to Charles XI., who gave him reason to hope that he should soon be employed in some public capacity. Encouraged by this prospect, he determined to travel, in order that he might improve himself by a more extensive acquaintance with mankind. After passing some time in Germany, Holland, and England, he went to Paris in 1695, where he turned his attention entirely to diplomatic affairs, and entered into the service of Palmquist, the Swedish ambassador at the French court, assisting in the duties of the office without any regard

to emolument. In 1703, when Palmquist was appointed by Charles XII. envoy-extraordinary to the Hague, Preis accompanied him thither as secretary, and on Palmquist's being promoted to be chancellor of the court in 1715, he was acknowledged by the states-general as charge d'affaires, without obtaining special letters of credence. The misfortunes into which Sweden had fallen at this period, rendered his situation exceedingly critical and delicate, being often obliged to act according to the circumstances of the moment, without orders or instructions. The arrest of baron Goertz in Holland, contrary to the law of nations, threw Preis into a considerable dilemma, nevertheless he conducted himself with so much address, that he obtained the release of Goertz, though he thereby excited the displeasure of the Dutch minister, who did all in his power to induce Charles XII. to recall him. The attempt did not succeed, the king returning for answer, that "he found his services still necessary." Peter the Great, when at Amsterdam, was desirous to engage Preis in his service, as being a native of Esthonia, and with this view signified that he wished to have a conference with him; but, to the czar's great astonishment, he declined his visit and offer. On the death of Charles XII., this statesman was treated with the same respect by his successor queen Ulric Eleonora, who in 1719 appointed him her resident with the states-general, and in the year following he was confirmed in that quality by king Frederic. In the year 1745 he received letters patent of nobility; in 1748 he was created a knight of the Polar Star; and in 1756 was raised to the rank of baron. He died in the year 1759, having served his country, under five different sovereigns, for seventy years, of which he had been employed fifty-seven in the republic of the United States. Baron Preis possessed a sound judgment, added to great penetration. He was of a serious disposition, but easy in his manners, and could readily adapt his behaviour to that of the persons with whom he was in company. Till a late period in life he applied to business with indefatigable exertion, and his vigilance was directed to every object connected with the department to which he belonged. In his public and private actions, he was guided by the principles of religion, and the integrity of his heart was manifested in every act of his life. He was greatly attached to literary pursuits, and courted the society of learned men, whatever might be their condition, and the hurry of business seldom prevented him from devoting some part of his time to study. His own works were numerous, of which the following may be noticed; "Lettre d'un Ami à Dantzic à un Ami à Amsterdam," 1714. "Seconde Lettre d'un Ami à Dantzic à un Ami à Amsterdam, ou l'on montre que la prétendue Liberté de Navigation, et de Commerce, sur les Villes Suedoises occupées par les Russes, est mal fondée." "Lettre de M. N. N. à une Personne de Distinction qui lui demande ses Sentimens sur les Imprimées qui ont paru au Sujet de l'Arret du Comte de Gyllenborg et Baron de Goertz, Ministres du Roi de Suede." Gen. Biog.

PREISEGG, in *Geography*, a town of Austria: 18 miles S.S.W. of Steyr.

PREISENDORF, a town of Bavaria, in the bishopric of Bamberg; three miles S. of Bamberg.

PREJUDICE, PRÆJUDICIUM, a false notion or opinion of any thing, conceived without a due previous examination thereof.

Prejudice, *q. d.* pre-judgment, does not import a judgment merely as prior to another in respect of time, but as being prior thereto in respect of knowledge, or of sufficient attention to the thing; the preposition *præ* expressing an

anticipation, not so much of time, as of knowledge and due attention.

Hence prejudice is also called among the schoolmen *anticipatio, et præventa cognitio*, a preconceived opinion, &c.

Prejudices which lead to wrong judgments, or which are causes of error, may be considered as disorders of the understanding; the investigation and statement of which may serve to point out appropriate and effectual remedies. Lord Bacon, in his fifth book "De Augmentis Scientiarum," and more fully in his "Novum Organum," has distributed them into four classes, under appellations that are somewhat fanciful; *viz.* "idola tribus," "idola specus," "idola fori," and "idola theatri." To every bias of the understanding, by which a man may be misled in judging, or drawn into error, he gives the name of an idol; the propriety of which may be illustrated and evinced by considering, that the understanding, in its natural and best state, pays its homage only to truth; and the causes of error are regarded by him as so many false deities, who receive the homage that is due only to truth.

The *first* class comprehends the "idola tribus," which beset the whole human species, so that every man is in danger from them; such are exemplified in the following instances: 1. Men are prone to be led too much by authority in their opinions; and when this bias commences with an indifference about truth, its operation will be the more powerful. 2. Another general prejudice rises from a disposition to measure things less known, and less familiar, by those that are better known, and more familiar. This is the foundation of analogical reasoning, to which we are naturally prone, and to which indeed we owe a great part of our knowledge; at the same time it ought to be considered, that the bias of human nature is to judge from too slight analogies. 3. Men are often led into error by the love of simplicity, which disposes them to reduce things to few principles, and to conceive a greater simplicity in nature than there really is. 4. One of the most copious sources of error in philosophy, is the misapplication of our noblest intellectual power, which is that of invention, to purposes for which it is incompetent. 5. In avoiding one extreme, men are very apt to rush into the opposite. 6. Men's judgments are often perverted by their affections and passions.

The *second* class of idols, according to lord Bacon, are the "idola specus:" these are prejudices which have their origin, not from the constitution of human nature, but from something peculiar to the individual. Conceiving the mind of every man to resemble a cave, which has its particular form, and manner of being enlightened, and which, from these circumstances, often gives false colours, and a delusive appearance to objects that are from it, lord Bacon gives the name of "idola specus" to those prejudices which arise from the particular way in which a man has been trained, from his being addicted to some particular profession, or from something particular in the turn of his mind.

The "idola fori" are the fallacies arising from the imperfections and the abuse of language, which is an instrument of thought, as well as the communication of all thoughts.

The *fourth* class of prejudices are the "idola theatri," by which are meant prejudices arising from the systems or sects, in which we have been trained, or which we have adopted. See Reid's Essays on the Intellectual Powers of Man, *ess. vi.*

PREJUDICIAL ACTION. See ACTION.

PRELA, in *Geography*, a town of the principality of Oneglia; eight miles N.W. of Oneglia.

PRELATE, from *prælatus*, of *præ*, before, and *fero*, I bear,

bear, carry, an ecclesiastical superior, raised to some eminent and superior dignity of the church.

Patriarchs, primates, archbishops, bishops, generals of religious orders, certain croziered and mitred abbots, and even deans and archdeacons, are ranked among the number of prelates.

PRELATE of the Garter, is the first officer of that noble order, and is as ancient as the institution itself.

William de Edynton, then bishop of Winchester, was the first prelate at the erection of the order; and it has been continued in that see ever since.

It is an office of great honour, but has neither salary nor fees; only a convenient lodging allowed in Windsor-castle; and as oft as the prelate comes thither (by the sovereign's command), he is to have court-livery allowed for himself and servants. See GARTER.

PRELIMINARY, or PRÆLIMINARY, formed from *præ, before*, and *limen, threshold*, something to be examined, dispatched or determined, before an affair can be treated of thoroughly, and to purpose.

Preliminaries of peace generally take up the greatest part of treaties. They consist in examining of powers, qualities of princes, ranks of ambassadors, &c.

PRELIZ, in *Geography*, a river which rises in Carinthia, and runs into the Moehr, in the bishopric of Salzburg.

PRELUDE, in *Music*, a short symphony or flight of fancy, which serves as a preface or introduction and preparation to a regular composition. Thus, the overture of an opera is a prelude; as are the first symphonies of songs.

PRELUDE is still further a trait of melody or harmony, to try if an instrument is in tune. (See TOCCATA.) To prelude, is in general to play or sing some irregular flights of fancy, in passing through the principal chords of a key, either for exercise, or to prepare the voice or hand before the beginning of a piece of music.

But upon the organ, or other keyed instrument, the art of preluding is more considerable; it is composing or playing extempore whole pieces, replete with every thing that is most learned and curious in composition, design, in fugue, in imitation, in modulation, and in harmony.

It is above all in preluding and giving way to the imagination, that great masters, exempt from the extreme subserviency to rules which the eyes of critics require in written music, display those talents of invention and execution which ravish all hearers far beyond the written labours of meditation and study.

PREM, in *Geography*, a town of Istria; 16 miles N.N.E. of Pedena.—Also, a town of Austria; seven miles W.S.W. of Glaggnitz.—Also, a town of the duchy of Carniola; 17 miles E.N.E. of Trieste; called also *Brem*.

PRÉMAUX, a town of France, in the department of the Côte d'Or, celebrated for its wine, and having in its vicinity a medicinal spring; three miles S.W. of Nuits.

PREMELIOS, a town of Italy, in Friuli; three miles S.W. of Friuli.

PREMERY, a town of France, in the department of the Nièvre, and chief place of a canton, in the district of Cosne; 14 miles N.E. of Nevers. The place contains 1430, and the canton 8449 inhabitants, on a territory of 252½ kilometres, in 14 communes.

PRÉMIA, a town of Spain, near the coast of Catalonia; four miles S.W. of Matara.

PREMIER SERJEANT, in *Law*. See COUNSEL and PRÉCÉDENCE.

PREMIER Point, in *Geography*, a cape on the S. coast of the island of Bourbon. S. lat. 24° 40'.

PREMIERE VUE, a small island on the N. coast of New Georgia, on the land of the Arfacides, discovered by M. Surville in 1769. S. lat. 7° 15'. E. long. 157° 17'.

PREMIERES. See PRIMEIRAS.

PREMISES, PREMISES, *Præmissæ*, in *Logic*, the two first propositions of a syllogism.

When a syllogism is in form, the two premises being granted, the conclusion cannot be denied.

The premises, says Chauvin, are properly the parts of the antecedent of an argument, when complex; and are called *præmissæ*, because premised to the conclusion.

Thus in the argument, *every man is an animal, Peter is a man, therefore Peter is an animal*: the propositions, *every man, &c.* and *Peter, &c.* are the premises.

Premises are the principles of our reasonings; as being clear, evident, and demonstrative propositions, from the relations of which to one another we draw or infer new truths, propositions, &c.

The premises are either *equal*, where neither suffices alone for drawing a conclusion, as in the instance above; or *unequal*, the one *major, greater*, from which alone the conclusion is drawn; the other *minor, or less*, which only serves in applying the antecedent to the consequent.

In the common practice of the schools, however, every syllogism, or formal argument, of what kind soever, is said to have a *major* and a *minor*, how equal soever the premises may be.

PREMISES, in *Law*, the lands, &c. mentioned in the preamble or beginning of a deed, lease, conveyance, or the like.

The premises of a *deed* (which see) may be used to set forth the number and names of the parties, with their additions or titles. They also contain the recital, if any, of such deeds, agreements, or matters of fact, as are necessary to explain the reasons upon which the present transaction is founded; and herein is also set down the consideration upon which the deed is made. And then follows the certainty of the grantor, grantee, and thing granted.

PREMIUM, or PRÆMIUM, literally denotes a reward or recompence.

Among merchants it is taken for that sum of money; viz. 8 or 10 *per cent.* &c. which is given to an insurer, for insuring the safe return of any ship or merchandise.

In a policy of insurance, the insurers bind themselves to the insured for the true performance of their contract, and confess themselves paid the consideration or premium by the insured, after the rate specified. In practice, however, the premium is not always paid, when the policy is underwritten. Insurances are generally effected by the intervention of brokers, and open accounts are usually kept between them and the underwriters, in which they make themselves debtors for all premiums. By the usage of trade, the insurer is to look to the agent who is employed to effect the policy for his premium. Sometimes the credit is given to the insured himself.

If there be no express agreement, it would seem that the agent or broker is *prima facie* liable. Perhaps in such case an action would lie against either, unless the principal has paid the premium to the agent; in which case, the writers on this subject are of opinion that the agent alone is responsible. But whichever is liable, the insurer may recover the premium, and "indebitatus assumpsit" will lie for it, notwithstanding the formal acknowledgment of the receipt of it in the policy, which is not inserted there as conclusive evidence of the actual payment of the premium, but to preclude the necessity of proving it in case of loss. The payment

ment or non-payment of the premium can, therefore, have no effect on the insurance. Every insurer may insist on being paid the premium before he subscribes the policy; but having once subscribed it, and given credit for the premium, to whom being of no consequence, he shall not afterwards be at liberty, when a loss has happened, to object the want of consideration for his promise. There is no fixed rule for ascertaining the premium in any case. This must always depend on the agreement of the parties; and therefore the premium, whatever it may be, is always reputed to be just and fair, if there be no fraud or surprise on either side. If the nature of the risk be fairly and fully declared by the insured, the insurer can never dispute the payment of a loss, on the ground of the smallness of the premium.

The premium paid by the insured, and the risk which the insurer takes upon himself, are correlatives, the mutual operation of which constitutes the essence of the contract of insurance. The insurer shall not be liable to the risk, without receiving the premium; nor shall he retain the premium, which was the price of the risk, if, in fact, he runs no risk at all. In such case he is bound, upon principles of moral honesty and justice, to refund it; and the law implies a debt, "quasi ex contractu," and gives the insured an action against the insurer to recover back the premium. The cases in which the insured shall be entitled to a return of premium are reduced, by serjeant Marshall, to the following heads: *viz.* where the contract is void *ab initio*; where the risk has not been commenced; upon the performance of certain stipulations; and where the deduction of one-half *per cent.* shall be allowed.

The contract may be void for want of interest, which may be either *total*, as where the insured has nothing on board the ship, or *partial*, as where he has an interest in the thing insured, but not to the amount stated in the policy. Upon a wager-policy, which since the stat. 19 Geo. II. c. 37. is illegal and void, the insured cannot recover back the premium, at least after the risk is run. Yet, before the risk is run, and while the contract is executory, the insured may recover back the premium. If the contract be void, as being a re-insurance within the statute 19 Geo. II. c. 37. § 4. there shall be no return of premium. The case is the same, if the insurer could have been called upon to pay the sum insured. Captors likewise having insurable interest in their prize before condemnation, if they insure, shall not have a return of premium, though it should afterwards be adjudged no prize. Although an insurance to protect a trading with the enemy is void, yet the insured shall not recover back his premium. Where the policy is void, and no fraud is imputable to the plaintiff, he is entitled to a return of premium; and when the plaintiff is entitled to a return of premium, he may claim a verdict for it, even after the jury have delivered their verdict for the defendant, on the principal question; but the court will not, on setting aside a verdict for a loss, substitute a verdict for the premium. If the policy be void, on account of fraud on the part of the insurer, the premium shall be returned; but whether the insurer be bound to return the premium, in a case where fraud has been committed by the insured, is a question that has occasioned some doubt and difference of opinion. The court of chancery, however, has in two instances ordered a return of premium, where the policies were declared void for fraud committed by the insured. The same doctrine has been adopted in a court of law. Nevertheless, the courts of law, under the sanction of lord Mansfield, have held a contrary doctrine.

With regard to the second head, where the risk has not

been commenced, foreign authors maintain, that the insured cannot, by his own act, dissolve the contract, and demand a return of premium; excepting only the case, in which it becomes impossible for the insured to ship the goods, or to cause the ship to proceed on her voyage. In Holland and France the law is different; and in England it is a general rule, that if the risk be not begun, whatever be the cause, the premium shall be returned; but where the voyage and premium are divisible, and any part be not commenced, the premium for that part shall be returned. But if the risk be entire, and be once commenced, it is a general rule that there shall be no return of premium.

The third head relates to the performance of some stipulation. If part of the premium is to be returned upon the performance of some stipulation, as in case of a ship's sailing with convoy, this shall be returned, though the insurer be obliged to pay a partial loss.

With regard to the fourth head it is observed, that, as the insurer can never, by his own act, discharge himself from the contract, it seems reasonable that, where the insured thinks proper to put a stop to the adventure, and prevent the risk from ever commencing, he should make some compensation to the insurer for his trouble and disappointment; it is, therefore, the general custom, in all the maritime countries of Europe, to allow him to retain one-half *per cent.* This, according to Emerigon and Le Guidon, is a consideration to the insurer for his trouble in signing the policy, and making the proper entry in his books. This is allowed to the insurer, where the contract is void for some radical defect, provided this was unknown to him when he entered into the contract. But if he was informed of the fault, or must have known it before he subscribed the policy; as if he were to insure a ship or goods, when he hears of their safe arrival, or seamen's wages, or contraband goods, knowing them to be such, he could have no claim to this allowance. Pothier holds, that if the contract becomes void, not by the act of the insured, but by some cause which he could not prevent or controul, the insurer shall not be entitled to the half *per cent.* Emerigon, on the contrary, maintains that in all cases where the policy becomes void, without any fraud on the part of the insurer, he shall have this allowance. Marshall's Treatise on the Law of Insurance, London, 1802. See POLICY.

PREMIUM is also used, in the money and paper-trade, for what is given for a thing above *par*.

Thus lottery-tickets, &c. are said to bear so much, *e. gr.* 10s. or 20s. premium, when they are sold for so much beyond the prime cost, at which the government issued them.

PREMNA, in *Botany*, an unmeaning name, taken from *πρεμνος*, a plant, branch, or stem.—Linn. Mant. 154. Schreb. 413. Willd. Sp. Pl. v. 3. 314. Mart. Mill. Dict. v. 3. Brown Prodr. Nov. Holl. v. 1. 512. Juss. 107. Lamarck Illustr. t. 543. Gærtn. t. 56.—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Personata*, Linn. *Vitices*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, slightly two-lobed, permanent; the upper segment emarginate. *Cor.* of one petal, irregular, tubular; limb four-cleft, obtuse; its two upper segments shortest, erect; the others spreading. *Stam.* Filaments four, erect, of inconsiderable length, the two lowermost shortest; anthers roundish. *Pist.* Germen roundish; style cylindrical, shorter; stigma cloven. *Peric.* Berry rather globular, of four cells. *Seeds* solitary, bony, rounded at one side, angular at the other.

Eff. Ch. Calyx two-lobed. Corolla four-cleft. Berry of four cells. Seeds solitary.

A tropical genus of shrubs, with opposite, simple, entire or somewhat serrated, smooth or downy, fœtid leaves, whose scent, especially in a dried state, is compared by Mr. Brown to that of *Chenopodium olidum*. The flowers are small, terminal; the branches of their cymose panicles opposite and forked. Corolla whitish.

Linnæus describes two species.

P. integrifolia. Linn. Mant. 252. (*Cornutia corymbosa*; Burm. Ind. 132. t. 41. f. 1. Folium hirci; Rumph. Amb. v. 3. 208. t. 134.)—Leaves elliptical, entire, smooth.—Native of the East Indies. Perhaps a variety of the following. Linn.

P. ferratifolia. Linn. Mant. 253. Gært. t. 56.—Leaves smooth, serrated.—From the same country, sent by Koenig. Branches round, purplish, scarred. Leaves stalked, ovate, obtuse, smooth, serrated, except towards their base. Stipulas nearly lanceolate, deciduous. Bractæas linear. Flowers the size of a *Viburnum*.

To these Willdenow adds,

P. tomentosa. Willd. n. 2. (*Cornutia corymbosa*; Lamarck Dict. v. 1. 54.)—Leaves ovate, pointed, entire, downy beneath.—Native of the East Indies. Branches yellowish; downy when young. Leaves remarkably pointed. Cyme downy, dense. Bractæas very minute.

Mr. Brown adds six more species, all found in the tropical part of New Holland, and differing from each other in the shape or downiness of their leaves, or in the density of their inflorescence. These species are named *obtusifolia*, *attenuata*, *media*, *ovata*, *acuminata*, and *cordata*.

PREMONSTRANTES, or PRÆMONSTRATENSES, a religious order of regular canons instituted in 1120, by S. Norbert; and thence also called *Norbertines*.

The first monastery of this order was built by Norbert, in the isle of France, three leagues to the west of Laon; and by him called *Præmonstre*, *Præmonstratum*, whence the order itself was denominated; though, as to the occasion of that name, the writers of that order are divided. At first, the religious of this order were so poor, that they had only a single ass, which served to carry the wood they cut down every morning, and sent to Laon, in order to purchase bread. But in a short time they received so many donations, and built so many monasteries, that, thirty years after the foundation of this order, they had above a hundred abbeys in France and Germany: and in process of time, the order so increased, that it had monasteries in all parts of Christendom, amounting to one thousand abbeys, three hundred provostships, a vast number of priories, and five hundred nunneries. But their number is now greatly diminished. The rule they followed was that of St. Austin, with some slight alterations, and an addition of certain severe laws, whose authority did not long survive their austere founder.

The order was approved by Honorius II. in 1126, and again by several succeeding popes. At first the abstinence from flesh was rigidly observed. In 1245, Innocent IV. complained of its being neglected, to a general chapter. In 1288, their general, William, procured leave of pope Nicholas IV. for those of the order to eat flesh on journies. In 1460, Pius II. granted them a general permission to eat meat, excepting from Septuagesima to Easter.

The religious of this order are clothed in white, with a scapulary before the cassock. Out of doors they wear a white cloak and white hat; within, a little camail; and at church, a surplice, &c.

In the first monasteries built by Norbert, there was one for men, and another for women, only separated by a wall. In 1137, by a decree of a general chapter, this practice was prohibited, and the women removed out of those already built, to a greater distance from those of the men.

The *Præmonstratenses*, or monks of *Premontre*, vulgarly called white canons, came first into England A.D. 1146. Their first monastery, called New-house, was erected in Lincolnshire, by Peter de Saulia, and dedicated to St. Martial. In the reign of Edward I. this order had twenty-seven monasteries in England. They had in England a conservator of their privileges, but were nevertheless often visited by their superiors at *Premontre*, and continued under their jurisdiction till the year 1512, when they were exempted from it by the bull of pope Julius II., confirmed by king Henry VIII.; and the superiority of all the houses of this order in England and Wales was given to the abbot of Welbeck, in Nottinghamshire. It is said there were about thirty-five houses of this order.

PREMOTION, PRÆMOTIO, in the Schools, the action of God co-operating with the creature, and determining him to act. See PREDETERMINATION.

Physical premotion, according to Alvarez, Lemos, &c. is a complement of the active power, whereby it passes from the first act to the second, *i. e.* from a complete, and next power to action. It is an influence or participation of the virtue of the first cause, which makes the second cause actually active.

PREMSKAIA, in *Geography*, a river of Russia, which runs into the Kama, 32 miles W. of Gerdin, in the government of Perm.

PREMSTOLLEN, a town of the duchy of Stiria; 5 miles S.S.W. of Gratz.

PREMUNIENTES, in *Law*, writs formerly dispatched to each bishop to call them to parliament, warning them to bring with them the deans and archdeacons, one proctor for each chapter, and two for the clergy of his diocese.

PREMUNIRE, PRÆMUNIRE, a term used for an offence, for a writ granted thereupon, and for the punishment thereof.

The word is a corruption of the Latin *præmonere*, *q. d.* to forewarn, or bid the offender take care; of which a reason may be drawn from the words of the statute 27 Edw. III. cap. 1. and the form of the writ, “Præmunire facias præfatum propositum, & J. R. procuratorem, &c. quod tunc sint coram nobis.”

In order to understand properly the occasion and origin of præmunire, it will be necessary to trace out briefly the rise and progress of the papal usurpations in England. The conversion of the Saxons in this country to the profession of Christianity, after they had driven the Christians of the ancient British church to the remotest corners of our island, was effected by Augustin the monk, and other missionaries from the court of Rome: and this naturally introduced some few of the papal corruptions in point of faith and doctrine: but we read of no civil authority claimed by the pope in these kingdoms, till the era of the Norman conquest, when the reigning pontiff, having favoured duke William in his projected invasion, by blessing his host, and consecrating his banners, took that opportunity also of establishing his spiritual encroachments, which the policy of the conqueror allowed, in order more effectually to humble the Saxon clergy and aggrandise his Norman prelates. Hence his legates *à latere* were introduced into England to hear and determine ecclesiastical causes; and in the reign

of Henry I. he assumed the disposal of most of the bishoprics, abbeyes, and other ecclesiastical benefices, by mandates or bulls, called *expectative graces*, and *provisions*, before they became void; in the reign of king Stephen, appeals to the court of Rome were established; under Henry II. the pope claimed exemption of clerks from the secular power; and in the time of king John, pope Innocent III. obtained a resignation of his crown to the pope, and compelled him to accept his kingdom from the pope's donation, holding it as a vassal of the holy see, at the annual rent of a thousand marks. Many circumstances concurred, and many contrivances were made use of to extend and establish the papal power in this kingdom.

King Edward I., a wise and magnanimous prince, set himself in earnest to shake off this servile yoke; and in the thirty-fifth year of his reign was made the first statute against papal provisions, which, according to sir Edward Coke, is the foundation of all the subsequent statutes of præmunire.

In the weak reign of Edward II. the pope again endeavoured to encroach, but the parliament resolutely withstood him: and in the reign of Edw. III. several penal laws were enacted against provisors; 25 Edw. III. stat. 6. 27 Edw. III. stat. 1. cap. 1. 38 Edw. III. st. 1. cap. 4. and stat. 2. cap. 1, 2, 3, 4. which ordained, that the court of Rome should present or collate to no bishopric or living in England; and that whoever disturbed any patron in the presentation to a living by virtue of a papal provision, such provisor should pay fine and ransom to the king at his will, and be imprisoned till he renounced such provision; and the same punishment was inflicted on such as cited the king, or any of his subjects, to answer in the court of Rome. And when the holy see resented these proceedings, and pope Urban V. attempted to revive the vassalage and annual rent to which king John had subjected his kingdom, it was unanimously agreed by all the estates of the realm in parliament assembled, (40 Edw. III.) that king John's donation was null and void, being without the concurrence of parliament, and contrary to his coronation oath; and all the temporal nobility and commons engaged, that if the pope should endeavour by process or otherwise to maintain these usurpations, they would resist him with all their power.

In the reign of Richard II. it was found necessary to strengthen these laws, and, therefore, it was enacted by stat. 3 Ric. II. cap. 3. and 7 Ric. II. cap. 12. first, that no alien should be capable of letting his benefice to farm; and, afterwards, that no alien should be capable of being presented to any ecclesiastical preferment, under the penalty of the statute of provisors. By the statute 12 Ric. II. cap. 15. all liegemen of the king, accepting of a living by any foreign provision, are put out of the king's protection, and the benefice made void. To which the statute 13 Ric. II. cap. 2. st. 2. adds banishment and forfeiture of lands and goods; and by cap. 3. of the same statute, any person bringing over any citation or excommunication from beyond sea, on account of the execution of the foregoing statutes of provisors, shall be imprisoned, forfeit his goods and lands, and moreover suffer pain of life and member.

In the writ for the execution of all these statutes, the words *præmunire facias*, being used to command a citation of the party, have denominated, in common speech, not only the writ, but the offence itself of maintaining the papal power, by the name of præmunire. And, accordingly, the next statute, 16 Ric. II. cap. 5. usually called the

statute of præmunire, and generally referred to by all subsequent statutes, enacts, that whoever procures at Rome, or elsewhere, any translations, processes, excommunications, bulls, instruments, or other things which touch the king, against him, his crown and realm, and all persons aiding therein, shall be put out of the king's protection, their lands and goods forfeited to the king's use, and they shall be attached by their bodies to answer to the king and his council; or process of *præmunire facias* shall be made out against them, as in other cases of provisors. By the statute 2 Hen. IV. cap. 3. all persons who accept any provision from the pope, to be exempt from canonical obedience to their proper ordinary, are also subjected to the penalties of præmunire; and this is the last of our ancient statutes touching this offence.

Such is the original meaning of the offence, which we call præmunire; viz. introducing a foreign power into this land, and creating *imperium in imperio*, by paying that obedience to papal process, which constitutionally belonged to the king alone, long before the reformation in the reign of Henry VIII.; at which time the penalties of præmunire were indeed extended to more papal abuses than before; as the kingdom then entirely renounced the authority of the see of Rome, though not all the corrupted doctrines of the Roman church. And, therefore, by the several statutes of 24 Hen. VIII. cap. 12. and 25 Hen. VIII. cap. 19. and 21. to appeal to Rome from any of the king's courts; to sue to Rome for any licence or dispensation; or to obey any process from thence, are made liable to the pains of præmunire. And, in order to restore to the king in effect the nomination of vacant bishoprics, and yet keep up the established forms, it is enacted by statute 25 Hen. VIII. cap. 20. that if the dean and chapter refuse to elect the person named by the king, or any archbishop or bishop to confirm or consecrate him, they shall fall within the penalties of the statutes of præmunire. Also, by stat. 5 Eliz. cap. 1. to refuse the oath of supremacy will incur the pains of præmunire; and to defend the pope's jurisdiction in this realm is a præmunire for the first offence, and high treason for the second. So, too, by statute 13 Eliz. cap. 2. to import any *Agnus Dei*, crosses, beads, or other superstitious things, pretended to be hallowed by the bishop of Rome, and tender the same to be used; or to receive the same with such intent, and not discover the offender; or if a justice of the peace, knowing thereof, shall not within fourteen days declare it to a privy-counsellor; they all incur a præmunire.

Farther, to contribute to the maintenance of a Jesuit's college, or any popish seminary whatever, beyond sea; or any person in the same; or to contribute to the maintenance of a Jesuit or Popish priest in England; is by statute 27 Eliz. cap. 2. made liable to the penalties of præmunire.

Thus far, says judge Blackstone, the penalties of præmunire seem to have kept within the bounds of their original institution, viz. the depressing the power of the pope; but it was afterwards thought fit to apply those penalties to other heinous offences. Thus, 1. By the statute 1 & 2 Phil. & Mary, cap. 8. to molest the possessors of abbey lands granted by parliament to Henry VIII. and Edward VI. is a præmunire. 2. So likewise is the offence of acting as a broker or agent in any usurious contract, where above 10 per cent. interest is taken, by statute 13 Eliz. cap. 10. 3. To obtain any stay of proceedings, other than by arrest of judgment, or writ of error, in any suit for a monopoly, is likewise a præmunire, by statute 21 Jac. I. cap. 3. 4. To obtain an exclusive patent for the

sole making or importation of gunpowder or arms, or to hinder others from importing them, is also a præmunire by two statutes; the one 16 Car. I. cap. 21, the other 1 Jac. II. cap. 8. 5. On the abolition, by statute 12 Car. II. cap. 24. of purveyance, and the prerogative of pre-emption, or taking any victual, beasts, or goods for the king's use, at a stated price, without consent of the proprietor, the exertion of any such power for the future was declared to incur the penalties of præmunire. 6. To assert, maliciously and advisedly, by speaking or writing, that both or either house of parliament have a legislative authority without the king, is declared a præmunire by statute 13 Car. II. cap. 1. 7. By the habeas corpus act also, 31 Car. II. cap. 2. it is a præmunire, and incapable of the king's pardon, besides other heavy penalties, to send any subject of this realm a prisoner into parts beyond the seas. 8. By the statute 1 W. & M. stat. 1. cap. 8. persons of eighteen years of age refusing to take the new oaths of allegiance, as well as supremacy, upon tender by the proper magistrate, are subject to the penalties of a præmunire; and by stat. 7 & 8 W. III. cap. 24. serjeants, counsellors, proctors, attornies, and all officers of courts, practising without having taken the oaths of allegiance and supremacy, and subscribing the declaration against popery, are guilty of a præmunire, whether the oaths be tendered or no. 9. By the statute 6 Ann. cap. 7. to assert maliciously and directly, by preaching, teaching, or advised speaking, that the then pretended prince of Wales, or any person other than according to the acts of settlement and union, hath any right to the throne of these kingdoms; or that the king and parliament cannot make laws to limit the descent of the crown; such preaching, teaching, or advised speaking is a præmunire; as writing, printing, or publishing the same doctrines amount to high treason. 10. By statute 6 Ann. cap. 23. if the assembly of peers of Scotland, convened to elect their sixteen representatives in the British parliament, shall presume to treat of any other matter save only the election, they incur the penalties of a præmunire. 11. The statute 6 Geo. I. cap. 18. the year after the infamous South Sea project had beggared half the nation, makes all unwarrantable undertakings by unlawful subscriptions, then commonly known by the name of bubbles, subject to the penalties of a præmunire. 12. The statute 12 Geo. III. c. 11. subjects to the penalties of the statute of præmunire all such as knowingly and wilfully solemnize, assist, or are present at, any forbidden marriage of such of the descendants of the body of king George II. as are by that act prohibited to contract matrimony without the consent of the crown.

The punishment of præmunire is thus summed up by sir Edward Coke, that, from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body shall remain in prison at the king's pleasure, or (as other authorities have it) during life. (1 Bulst. 199.) And so odious, adds the same author, was this offence of præmunire, that a man who was attainted of the same might have been slain by any other man without danger of law; because it was provided by law (stat. 25 Edw. III. stat. 5. cap. 22.) that any man might do to him as to the king's enemy; and any man may lawfully kill an enemy. But to obviate such mistaken and savage notions, the statute 5 Eliz. cap. 1. provides, that it shall not be lawful to kill any person attainted in a præmunire, any law, statute, opinion, or exposition of law to the contrary notwithstanding. However, such delinquent, though protected as a

part of the public from public wrongs, can bring no action for private injury, how atrocious soever; being so far out of the protection of the law, that it will not guard his civil rights, nor remedy any grievance which he, as an individual, may suffer. And no man, knowing him to be guilty, can with safety give him comfort, aid, or relief. 1 Hawk. P. C. § 5. Blackst. Comm. book iv. cap. 8.

PRÆMUNIRE is now chiefly used for the punishment appointed by the statutes above-mentioned. Thus, when it is said a man for an offence shall incur a præmunire, it is meant he shall incur the penalty appointed by the statute 16 Ric. II., commonly called the statute of præmunire. It is observed, however, to the honour of our courts of law, that prosecutions for a præmunire are unheard of in them. The only instance of one to be found is in the State Trials; when the penalties of a præmunire were inflicted on some persons for refusing to take the oath of allegiance in the reign of Charles II. 2 Hargr. State Tr. 263.

PRENANTHES, in Botany, well named by Vaillant, from *πρηνος*, drooping, and *ανθος*, a flower, in allusion to the pendulous position of the unexpanded blossoms.—Linn. Gen. 401. Schreb. 528. Willd. Sp. Pl. v. 3. 1532. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 821. Ait. Hort. Kew. v. 4. 443. Pursh. 498. Juss. 168. Gærtn. t. 158.—Class and order, *Syngenesia Polygamia equalis*. Nat. Ord. *Compositæ semisflosculosa*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. Common Calyx cylindrical, smooth, its scales equal in number to the florets, with a few unequal, very short, scales at its base. Cor. compound, of a nearly simple circle of florets, which are from five to eight, or more, all perfect and equal, each of one ligulate, abrupt, four-toothed petal. Stam. Filaments five, capillary, very short; anthers united into a cylindrical tube. Pist. Germen nearly ovate; style thread-shaped, longer than the stamens; stigma cloven, reflexed. Peric. none, except the cylindrical calyx, very slightly contracted at its mouth. Seeds solitary to each floret, heart-shaped. Down capillary, mostly sessile. Recept. naked.

Ess. Ch. Receptacle naked. Calyx with scales at the base. Down simple, nearly sessile. Florets in a simple row.

Seven species of *Prenanthes* are mentioned in the *Sp. Pl.* of Linnæus, and one in his *Mantissa*. Willdenow has augmented the number to thirty-three, partly from new discoveries, and partly by removing hither certain plants, which Linnæus and others had referred either to *Lactuca*, *Hieracium*, or *Crepis*. How far he may be right in some of these instances, we have not sufficient materials to judge by; but with respect to *Crepis pulchra*, see Engl. Bot. t. 2325, we cannot help dissenting from his opinion. Michaux and Pursh have added six species to those known to Willdenow, and the latter has corrected him in one or two cases.—Six species occur in the *Hortus Kewensis*.

The following will give an idea of the genus.

P. purpurea. Purple-flowered Prenanthes. Linn. Sp. Pl. 1121. Willd. n. 5. Ait. n. 1. Jacq. Austr. t. 317. (*Sonchus sylvaticus*; Ger. Em. 294.)—Florets four or five. Leaves oblong-lanceolate, toothed; glaucous beneath; heart-shaped and clasping the stem at their base.—Native of groves and thickets in Germany, Switzerland, and Italy, flowering in July and August, and making an elegant appearance amongst alpine bushes. The root is perennial. Stem erect, round, slender, leafy, two or three feet high, panicled, many-flowered. Leaves alternate, horizontal, from three to five inches long, very smooth. Flowers very numerous, crimson or purplish, drooping, on slender stalks.

P. alba. White-flowered Prenanthes. Linn. Sp. Pl. 1121. Willd. n. 12. Ait. n. 2. Sims in Curt. Mag. t. 1079.—Florets numerous. Leaves angular, somewhat hastate, toothed. Flowers drooping, clustered, paniced.—Native of North America. Hardy in our gardens, flowering in July and August. The root is perennial. Stem herbaceous, two or three feet high. Flowers plentiful, white, with a purple calyx. This plant has a peculiar and fragrant smell. The great number of florets in each calyx is an exception to the generic character, but every other part agrees with *Prenanthes*.

P. serpentina. Lion's-foot Prenanthes. Pursh n. 9. t. 24.—“Leaves toothed, rough; radical ones palmate; those on the stem pinnatifid, somewhat three-lobed, their middle segment deeply three-cleft; uppermost lanceolate. Clusters somewhat paniced, drooping. Calyx with eight scales and twelve florets.”—Native of the mountains of Virginia and Carolina.—Perennial, flowering from August to October. About two feet high. Flowers pale purple. The inhabitants know this plant by the name of Lion's-foot, and esteem it a specific for the bite of a rattlesnake. Mr. Pursh, from whose work alone all our knowledge of the present species is derived, says he was a witness of its efficacy. A man being bitten in the foot by a moccasinsnake, a species esteemed the most dangerous, an inflammation and swelling of his whole leg took place immediately. By taking inwardly the milky juice of this herb boiled in milk, and applying the steeped leaves, very frequently changed, to the wound, he was cured in a few days.

P. muralis. Wall Prenanthes, or Ivy-leaved Lettuce. Linn. Sp. Pl. 1121. Willd. n. 30. Ait. n. 6. Fl. Brit. n. 1. Engl. Bot. t. 457. Curt. Lond. fasc. 5. t. 58. Fl. Dan. t. 509. (*Sonchus laevis muralis*; Ger. Em. 293.)—Florets five. Leaves runcinate, toothed, their terminal lobe five-angled.—Native of shady groves, on a chalky soil, and often on exposed walls and cliffs, in England and other parts of Europe, flowering in July. The root is perennial, somewhat woody and knotty. Herb slender, delicate, brittle, smooth, and milky. Stem erect, twelve or eighteen inches high, round, leafy. Leaves rather glaucous, with a red or purple tinge. Panicle much divaricated, with numerous small bracteas. Flowers yellow, drooping before they expand.

PRENDER, formed from the French *prendre*, to take, in Law, a power or right of taking a thing before it is offered.

Such a thing lies in render, but not in prender. Coke's Rep. p. 1. Sir John Peter's case. See RENDER.

PRENDER *de Baron* is an exception to disable a woman from pursuing an appeal of murder against the killer of her former husband, taken from her having married a second. See APPEAL.

PRENESTINÆ SORTES. See SORTES.

PRENOMEN, PRÆNOMEN, among the Romans, a proper name, or name prefixed to the general name of the family; as Caius, Lucius, Marcus, &c.

The prenomen answers to our Christian name, Peter, Paul, &c. It was not introduced among the Romans till long time after the *nomen*.

The name of the family was given by the Romans to their children soon after their birth; but the prenomen was not given them till they took the virile habit, or about the age of seventeen years. See NAME.

Varro reckons up thirty prænomena among the Romans. The usual ones may be reduced to eighteen.

The Greeks had no prænomena; they had but one name.

PRENOTION, PRÆNOTIO, or *Præcognitio*, a notice or piece of knowledge preceding some other, in respect of time.

Such is the knowledge of the antecedent; which must precede that of the conclusion. See Common NOTIONS, and PRÆNOTION.

PRENPERG, in Geography, a town of Austria; 12 miles E.S.E. of Glaggnitz.

PRENSDORF, a town of the principality of Querfurt; two miles N. of Dahma.

PRENZLOW, an independent town of the Ucker Mark of Brandenburg, and capital of the country; also, the chief seat of the court of justice. It is large and well built, with straight and broad streets, seated on a fruitful plain on the lake and river Ucker. It is divided into the Old and New, and its corporation derives considerable revenues from the city mills, its several farms, and large woods. The judge of the numerous French colony established in this town is invested with authority over all the French colonies in the Ucker Mark. Its three convents have been alienated; but its six churches have divine service regularly performed in them. Here is a good Latin school; and the place itself carries on a very large trade in corn, cattle, and tobacco: for the last it is particularly noted, and also for its manufacture of cloth: 48 miles N.N.E. of Berlin. N. lat. 53° 17'. E. long. 13° 53'.

PREOBRAZENIJA, or *Island of Transfiguration*, an island in the North Pacific ocean, about 150 miles from the S E. coast of Russia. N. lat. 58° 30'. E. long. 175° 14'.

PREOBRAZENSKOI, a town of Russia, in the government of Upha; 92 miles E. of Orenburg.

PREPACH, a town of the duchy of Wurzburg; five miles S.S.E. of Geroltzhofen.

PREPARANTIA, or PRÆPARANTIA *Vasa*, in Anatomy, the spermatic vessels; being two arteries, and as many veins of the testicles; thus called by the ancients, from an opinion that the seed began to be prepared in them. See SPERMATIC Vessels, and GENERATION.

PREPARATION, PRÆPARATIO, *Apparatus*, in Mathematics, makes one of the parts or branches of a demonstration.

If it be a proposition in geometry that is to be demonstrated, the preparation consists in certain lines to be drawn in the figure: if a proposition in arithmetic, in some computation to be made to come the more easily at the demonstration.

PREPARATION, in Chemistry and Pharmacy, is applied to the several manners of managing the materia medica, and of disposing it to serve the several purposes.

There are various preparations of mercury, antimony, and other drugs, to purify them, sublimate, calcine, edulcorate them, &c.

PREPARATIONS, in Anatomy, parts of animal bodies prepared and preserved in various ways, in order to exhibit their natural or diseased structure or appearances, in short any facts illustrating their organization, economy, habits, natural changes, pathology, &c.

The knowledge of anatomy is subservient to various purposes, both of pleasure and utility. By investigating the structure of our organs, and the relations of the different parts of the mechanism, and comparing these with what we see of the living actions, we arrive at the most satisfactory knowledge that can be obtained of the latter. These subjects, and the inferences which they lead to, independently of their connection with the various branches of medical science, form as interesting a study to the philosopher as any depart-

department of nature. But the utility of these studies is placed in a much more important light, when we view their bearings on the healing art, and their tendency to illustrate every thing connected with the preservation and restoration of health, to the right understanding of which they are indispensable. An examination of bodies in various states of disease lays the foundation of pathology. It is an important object of this science to ascertain how the structure of our organs is altered by accident or disease, and what symptoms denote these alterations: we are thus enabled to determine during life, how parts which are not visible are affected, and to decide on the chances of restoration. To the surgical operator an acquaintance with the form and relative position of parts is principally useful.

Dissection of recent bodies is the chief method of learning anatomy, as it shews us the organs in the condition most nearly approaching to that of life. Individuals of both sexes and of all ages must be carefully examined, as they exhibit varieties of considerable importance in physiology and pathology. Immediately after death, animal bodies become subject to the chemical changes, which result from the affinities between them, and the surrounding elements. Hence alterations occur, which must be carefully distinguished from the natural living appearances. Our inferences from the subjects ordinarily employed for dissection must therefore be corrected by the occasional opportunities of examining the human subject, or animals while still warm. It would be useless to enter here into practical directions for the conduct of dissections, which the indispensable labours of the dissecting room will supply in a few days: still less can we go through detailed instructions for the exposure of the individual parts, for this would be only repeating what we have already said in the various anatomical articles of the Cyclopædia. We refer on these points to the works of Lieutaud, Bell, Maygrier, Marjolin, and others, enumerated at the end of the present article.

But the labours of the anatomist are not confined to the simple dissection of recent bodies. When he has prepared parts, of which the dissection is difficult and tedious, he preserves them in spirits of wine, which alters them so slightly, that they still exhibit most of the facts that are to be learned from their recent dissection. He fills the vessels with fluids of different kinds, and is thus enabled to ascertain points concerning minute structure, which would otherwise escape notice. He employs mixtures of wax, rosin, tallow, &c. to fill the blood-vessels: these being thrown in warm, become firm when cold, and thus enable him more easily to trace the various ramifications. When the parts are dissected and dried, the course of the vessels is rendered apparent. Such preparations, thoroughly dried and varnished, last for a great length of time. Parts again are often dried and preserved in oil of turpentine. Quicksilver is frequently employed as an injection, and penetrates into the minutest vessels: these preparations are usually dried, and have a beautiful appearance when preserved in oil of turpentine.

When coloured mixtures of wax and rosin are injected into the vessels or cavities of any organ, and the soft parts are destroyed by immersion in the muriatic or nitric acids, complete casts of the tubes or hollows are procured.

Immersion in diluted acids, and other chemical menstrea, long maceration in water, boiling, &c. are all occasionally employed as auxiliary modes of unravelling the texture of parts, or determining their distinguishing characters.

The use of acids is particularly important with respect to the bones: it removes their earthy particles, leaving the animal matter and vascular structure behind.

Delicate animal textures are rendered firm by rectified spirits of wine, which is the best means of accomplishing the purpose. It renders the brain perfectly hard. But it has always the inconvenience of making transparent organs opaque. Solutions of corrosive sublimate, or alum, and mixtures of acid with water, have similar effects, but these substances destroy the edge of the knife, and render the spirits, in which the part is afterwards preserved, turbid.

The bones are preserved by merely immersing them in water, until all the soft parts are rotten, and then exposing them to the sun and air to bleach. The means just enumerated are employed for the purpose of discovering and exposing the structure of the body, and for preserving parts when thus prepared.

The art is still more important in reference to morbid anatomy, because the opportunities of finding diseases are comparatively rare; and no demonstrations of morbid anatomy could be given without a collection of parts thus preserved.

For the detailed instructions concerning the manner of performing the processes just enumerated, we refer to the various publications, of which a catalogue is subjoined, and particularly to the more modern ones.

Lyser, *Culter anatomicus, hoc est methodus brevis, facilis, et perspicua artificiose et compendiose humana corpora incidendi.* Hafniæ, 1653, 8vo.

Bartholin, *Administrationum anatomicarum specimen;* subjoined to the third edition of the work of Lyser, Frankfurt, 1679, 8vo.

Tassin, *Administrations anatomiques,* Paris, 1673; 12mo.

Cassebohm, *Methodus secandi musculos, et methodus secandi viscera.* Halle, 1740, 8vo.

Lieutaud, *Essais anatomiques,* 8vo.

Sue, *Anthropotomie, ou l'art d'injecter, de dissequer, d'embaumer, et conserver les parties du corps humain.* Paris, 1765, 12mo.

Pole, *Anatomical Instructor; or an illustration of the modern and most approved methods of preparing and preserving the different parts of the human body, and of quadrupeds, by injection, corrosion, maceration, distention, articulation, modelling, &c.* London, 1790, 8vo.

Dumeril, *Essai sur les moyens de perfectionner et d'étudier l'art de l'anatomiste.* Paris, 1803, 8vo.

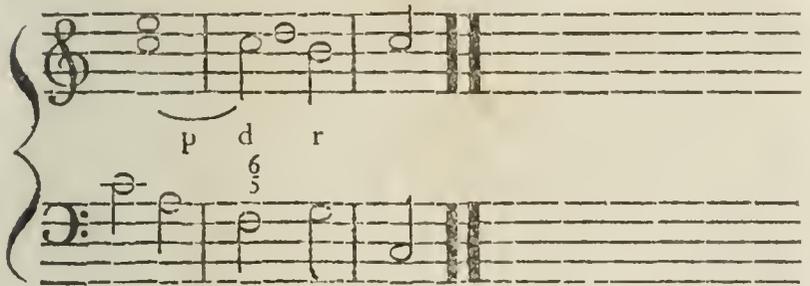

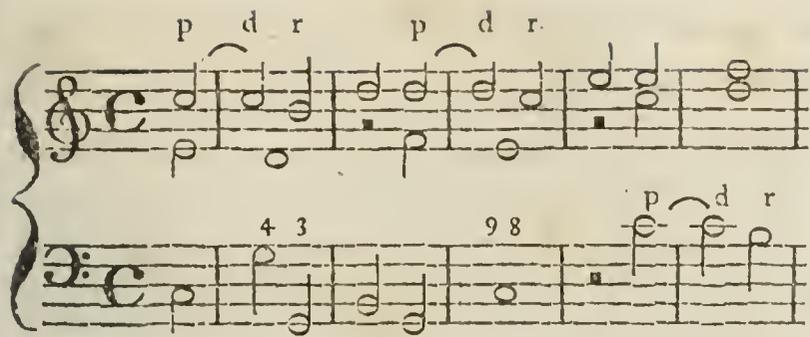

Maygrier, *Manuel de l'anatomiste, ou traité methodique et raisonné sur la manière de préparer toute les parties de l'anatomie.* Paris, 1811, 8vo.

Marjolin, *Manuel d'anatomie, contenant l'exposition des méthodes les plus avantageuses à suivre pour dissequer, injecter, conserver les parties qui composent le corps de l'homme, et pour proceder à l'ouverture et à l'examen des cadavres; ouvrage spécialement destiné à servir de guide aux élèves, qui desirerent faire un étude approfondie de l'anatomie; vol. i.* Paris, 1812, 8vo.

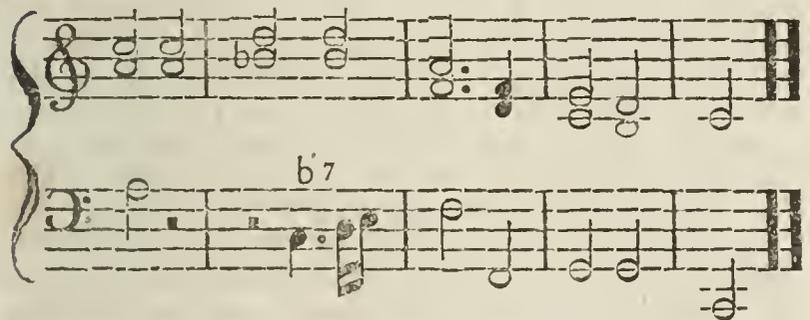

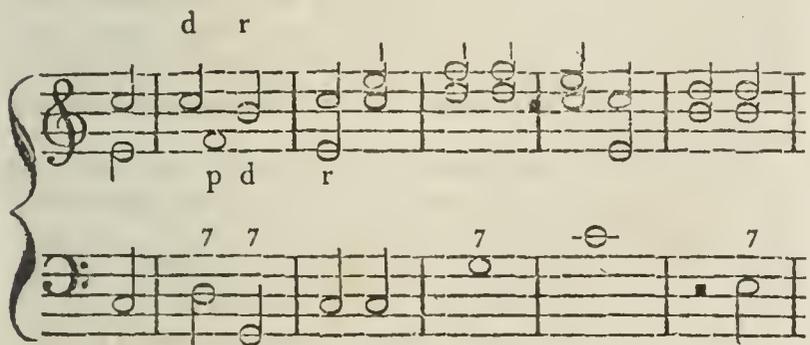

C. Bell's *System of Dissections; explaining the anatomy of the human body, the manner of displaying the parts, and their varieties in disease,* Folio, with plates.

C. Bell's *System of Dissections, &c. &c.;* pointing out to the student the objects most worthy his attention during a course of dissections. 2 vols. 12mo.

PREPARATION of Discords, in Music. Rousseau has made a long article of this term unnecessarily: *to prepare a discord,* is its being a concord to the preceding note or found; and *resolving a discord,* is its being succeeded by a concord. But an example in notes will be the best explanation of these rules. See COUNTERPOINT, COMPOSITION, and explanatory plates.

The above are all the original, prepared, and fundamental discords, except the 7th, which need not always be prepared.

The regular prepared discords are the 2, 4, 7, 9. The rest, as the 4*, 5b, extreme 6*, and extreme b7th, may be used *per saltum*, or by leaps.

PREPARATORY TORTURE. See TORTURE.

PREPARIO, in *Geography*, a small island in the East Indian sea, consisting of a ridge of land, covered with wood; and having a pond of fine fresh water above is very convenient for watering. No animals are visible upon it except rats, squirrels, and monkies. Two ledges of rocks project into the sea at the watering point, and between them is a fine sandy beach, where boats may land very easily with casks to water. N. lat. 14° 50'. E. long. 93° 45'.

PREPENSED, PRÆPENSUS, in *Law*, denotes *forethought*. In which sense we say prepenfed malice, &c.

If, when a man is slain upon a sudden quarrel, there were malice prepenfed formerly between them, it makes it murder; and as it is called in some statutes, prepenfed murther.

PREPIA, in *Geography*, a town of Asiatic Turkey, in Natolia; eight miles S. of Mogla.

PREPOSITION, PRÆPOSITIO, in *Grammar*, one of the parts of speech or discourse.

The preposition is an indeclinable particle, which yet serves to govern the nouns that follow it. Such are, *per, pro, propter, in, with, through, from, by, &c.*

They are called prepositions, because *præposita*, placed before the nouns they govern.

F. Buffier does not allow the preposition to be a part of speech, but merely a modificative of a part of speech; *viz.* of the nouns; serving only to modify or circumstantiate it. See MODIFICATIVE.

The ingenious Mr. Harris ranges the preposition under the class of connectives, and defines it a part of speech devoid itself of signification, but so formed as to unite two words that are significant, and that refuse to unite or coalesce of themselves. Those connectives which join sentences, are called conjunctions. Hermes, book ii. chap. 3.

One great use (says bishop Lowth, Int. to Eng. Gram. p. 114.) of prepositions in English, is to express those relations, which in some languages are chiefly marked by cases, or the different endings of the noun.

Prepositions are also prefixed to words in such manner as to coalesce with them, and to become a part of them. There are also certain particles, which are thus employed in composition of words, yet cannot stand by themselves in construction; which are called inseparable prepositions; as *a, be, con, &c.*

PREPOSITUS VILLÆ is sometimes used for the chief officer of the king, in a town, manor, or village.

In ancient records, the præpositus villæ was no more than the bailiff of the lord of the manor.

Præpositus villæ is sometimes also used, in later writers, for the constable of a town, or petty constable.

PREPOSITUS Ecclesiæ. See CHURCH-REVE.

Quatuor homines Præpositi, in Crompton, &c. denote four men of each town, who are to appear before the justices of the forest in their circuit.

PREPUCE, or PREPUTIUM, in *Anatomy*, the foreskin, is the loose doubling of integuments covering the glans of the penis and of the clitoris. See GENERATION.

PREPUCE, Diseases of, in *Surgery*. See PHIMOSIS, PARAPHIMOSIS, &c.

PRERAU, or PRZEROW, in *Geography*, one of the most ancient towns of Moravia, and capital of a circle to which it gives name, containing about 300 houses; 13 miles S.E. of Olmutz. N. lat. 42° 26'. E. long. 17° 25'.

PREROGATIVE, PRÆROGATIVA, a privilege, or pre-eminence, which one person has over another.

The word is borrowed from the appellation of a century in ancient Rome, which gave the first vote, or suffrage, in the comitia, or assemblies for the election of magistrates; quasi prærogati; because first asked, or their suffrage first required.

Their vote was called *omen prærogativum*, because the rest usually gave their votes the same way.

PREROGATIVE of the King, *Prærogativa Regis*, is that power, pre-eminence, and privilege, which the king hath over and above all other persons, and out of the ordinary course of the common law, in right of his regal dignity. The king's prerogatives are either *direct* or *incidental*: the *direct* are such positive substantial parts of the royal character and authority, as are rooted in any spring from the king's political person, considered merely by itself, without reference to any other extrinsic circumstance; as the right of sending ambassadors, of creating peers, and of making war or peace. But such prerogatives as are *incidental*, bear always

a relation to something else, distinct from the king's person, and are indeed only exceptions, in favour of the crown, to those general rules that are established for the rest of the community; such as, that no costs shall be recovered against the king, that the king can never be a joint-tenant, and that his debt shall be preferred before a debt to any of his subjects, &c. &c. The substantive direct prerogatives are of three kinds; being such as regard, first, the king's royal character; secondly, his royal authority; and, lastly, his royal income. See KING and REVENUE.

It is one of the principal bulwarks of civil liberty, or of the British constitution, that the king's prerogative is limited by bounds so certain and notorious, that it is impossible he should ever exceed them, without the consent of the people, on the one hand; or without, on the other, a violation of that original contract, which in all states implicitly, and in our's most expressly, subsists between the prince and the subject. And it is one of the most manifest proofs of that genuine freedom, which is the boast of this age and country, that the limits of the king's prerogative may be examined and discussed with decency and respect, without offence and danger. This was formerly reckoned among the arcana imperii: and queen Elizabeth directed her parliaments to abstain from discoursing of matters of state; and maintained, both in person and by her ministers, that this august assembly ought not to deal, to judge, or to meddle with her majesty's prerogative royal. And king James I. more than once laid it down in his speeches, that as it is atheism and blasphemy in a creature to dispute what the Deity may do, so it is presumption and sedition in a subject to dispute what a king may do in the height of his power. Good Christians, he adds, will be content with God's will revealed in his word; and good subjects will rest in the king's will, revealed in his law. King James's Works, 557. 531.

PREROGATIVE, *Contempts against the King's*. See CONTEMPT.

PREROGATIVE *Copyrights*, are acts of parliament, proclamations, and orders of council, liturgies, and books of divine service, and grammars, and other compositions, compiled or translated at the expence of the crown, translation of the bible, &c.

PREROGATIVE *Court*. See COURT of Prerogative.

PREROGATIVE, *Felonies and Misdemeanors against the King's*, are those that relate to the coin, not amounting to treason, against the king's council (see PRIVY-council), and those incurred by foreign service, by imbezzling the king's armour or warlike stores (see IMBEZZLE), and by desertion from the king's army or navy, which, by the standing laws of the land, and particularly by 18 Hen. VI. cap. 19, and 5 Eliz. cap. 5, is made felony, but not without benefit of clergy. But by 2 & 3 Edw. VI. cap. 2, clergy is taken away from such deserters, and the offence is made triable by the justices of every shire. The same statutes punish other inferior military offences with fines, imprisonments, and other penalties. See DESERTER, and MUTINY.

PREROGATIVE, *Property by*. See PROPERTY.

PRESA, in the *Italian Music*, is in general a character which shews when and where a performer in concert is to begin to sing or play; but, in particular, in fugues or canons it is thus marked \ddagger over the note at which the second part, which is to follow or imitate the first, must begin. If the mark be repeated a second time, it is to shew the place where the third part must begin, to imitate the second; and so on through all the parts.

It is in fugues and canons a signal for the several parts to begin, after the subject is led off. At present, in catches,

and *canoni chiusi* written in one line, this is done by numbers, or by this *segno*, \S .

PRESAGE, PRÆSAGIUM, an augury, or sign of something to come.

The Romans judged of future events by certain signs, which their superstition, or the artifice of their priests, had invented. Their most celebrated presages were founded on the flight of birds, or the entrails of victims. All night-birds passed for birds of ill presage.

M. Simon, (t. 1. Acad. Belles Lettres, p. 54.) reduces presages to seven kinds; viz. casual words, which were divine voices, when their author was unknown, and human voices when it was known who pronounced them; the startings of some parts of the body, chiefly of the eyes, the eyebrows, and the heart; the tingling of the ear, and those imaginary sounds, which were sometimes heard; sneezings in the morning, which were not good omens (see OMENS), whilst those in the afternoon were favourable; the accidental rencounter of certain persons and certain animals, which presaged either good or evil; and names of good or bad portent; so that those who regarded presages were very scrupulous in observing, that the first soldiers they enlisted, the children who served at the sacrifices, those who performed the dedication of a temple, should have lucky names, and they had an aversion to those which imported any thing sad or disastrous. See PRODIGY. See also AUGURS, AUSPICES, and ARUSPICES.

PRESBURG, or POSEN, in *Geography*, a free and royal town of Hungary, and capital of the kingdom; pleasantly and salubriously situated on the N. side of the Danube, at the foot of a mountain on which is a castle. In the cathedral, from the time of king Ferdinand I., the kings of Hungary have been crowned. From the year 1723 the diets have been held here, the first having been assembled by king Sigismund in 1411. This has also been the residence of the council of the king's lieutenant, of the treasury-office for Hungary, of the archbishop of Gran, and likewise a chapter of 14 regular canons, a college with a gymnasium and church, besides three other convents and churches, a Protestant school, and a Lutheran church. The city is badly built: the houses, properly so called, do not exceed 200, and its fortifications consist merely of a double wall and moat. The suburbs are spacious and handsome, and contain four convents with churches, and two hospitals. The peace of Presburg, as it has been called, between France and Austria, was signed here on the 26th of December, 1805; 23 miles E.S.E. of Vienna. N. lat. 48° 10'. E. long. 17° 15'.

PRESBYS, in *Ornithology*, a name used by many of the ancient naturalists for the *regulus cristatus*, or golden crowned wren. See MOTACILLA *Regulus*.

PRESBYTA, Πρεσβυτης, in *Optics*, a term applied to persons in whom the configuration of the crystalline of the eye is too flat, so that they see distant things clearly; but those near at hand confusedly.

The reason is, that, in near objects, the visual rays passing the retina before they unite, there can be no distinctness, since the distinct base falls too far off beyond the retina.

This defect is helped only with convex glasses or spectacles; which will make the rays converge sooner, and, if they are well fitted, fall exactly on the retina.

The word is formed from the Greek, πρεσβυτης, *senex*, because old people are naturally subject to this defect: time, and

and the friction of the eye-lids, &c. gradually wearing the ball flat.

Presbytæ are opposed to myopes, in whom the crystalline is too round.

If the distance between the retina and the crystalline be too small, the person will likewise be a presbyta. See EYE and VISION.

PRESBYTÆ, or PRESBYTIA, from *πρεσβυς*, *old*, defective sight from flatness of the cornea; an infirmity, to which old persons are particularly subject.

PRESBYTER, a priest, or person in priest's orders.

He is thus called from the Greek, *πρεσβυτερος*, *elder*, of *πρεσβυς*, *old*, because, anciently, none were ordained but such as were advanced in years.

The great dispute between the retainers to the Geneva and the Roman discipline is, about the sameness or difference of presbyters and bishops in the times of the apostles.

Those who consult Acts, xx. 17. 28. Phil. i. 1. Tit. i. 5. 7. and 1 Tim. iii. 1. may perhaps be led to conclude, that these titles were applied to the same persons.

The learned bishop Usher expressly says, "I have ever declared my opinion to be, that *episcopus* & *presbyter gradu tantum differunt, non ordine*; and consequently, that in places where bishops cannot be had, the ordination by presbyters stands valid." And being asked by his majesty at the Isle of Wight, "Whether he found in antiquity, that presbyters alone ordained any?" he replied, "Yes; and that he could shew his majesty more; even where presbyters alone successively ordained bishops;" and instanced in Jerom's words (Epist. ad Evagrium) of the presbyters of Alexandria chusing and making their own bishops from the days of Mark, till Heraclius and Dionysius. Baxter's Life, p. 206.

This was the constant sense of our first reformers, Cranmer, Pilkington, Jewel, Grindal, Whitgift, Bancroft, &c. Bishop Burnet expressly says: "As for the notion of distinct offices of bishop and presbyter, I confess it is not so clear to me; and therefore, since I look upon the sacramental actions as the highest of sacred performances, I cannot but acknowledge those who are empowered for them must be of the highest office in the church." Vind. of the Church of Scotland, p. 336. See BISHOP.

PRESBYTERIANS, a denomination comprehending a very considerable number of persons in Great Britain; but very differently applied in England and Scotland. The English presbyterians do not materially differ from the independents with regard to church-government and discipline, and mode of worship; but they generally allow a greater latitude of religious sentiments and communion in their churches. The appellation, in this restricted use of it, implies no attachment to the authority of synods, presbyteries, or ecclesiastical assemblies composed of deputies from different churches, any more than to episcopacy and the ecclesiastical hierarchy; and, therefore, according to its original use, it is improperly applied to many who are now distinguished by it, and who form a very respectable class of non-conformists, or protestant dissenters in this kingdom. See INDEPENDENTS.

But the presbyterians, properly so called, and with whom the former agree in some particulars, admit, in general, and allowing for that latitude of sentiment, which will ever be the result of unrestrained and liberal enquiry, the doctrinal articles of the church of England; their chief difference lies in the point of discipline, *viz.* who shall appoint the governors of the church, and what subordination there shall, or shall not, be between them.

The presbyterians allow of no hierarchy, no subordination in the persons of their ministers; bishops and priests they maintain, in the times of the apostles, were the same; and therefore, though they allow episcopacy, as now settled in the church of England, to be very ancient, yet they deny it to be *jure divino*.

In lieu of a series of ministers one over another, in quality of priests, bishops, and archbishops, their polity consists in a series of assemblies or synods. Thus every minister is to be obedient to the classis under which he lives; and that class to a synod, provincial, classical, or œcumenical.

The power of ordination, with them, resides in a classis; and none are admitted to administer the sacrament, but those ordained by the imposition of hands of other ministers.

They make use of deacons to take care of their poor; and, in the government of the church they call in lay-elders; whence their name: from the Greek *πρεσβυτερος*, signifying *senior, elder*. See PRESBYTERY.

This is now the established discipline of the church of Scotland, where it was introduced as soon as it began to assume a regular form, about the year 1560. Calvin, whose decisions were received among the protestants of that age with incredible submission, was the patron and restorer of this scheme of ecclesiastical policy. The church of Geneva, formed under his eye, and by his direction, was esteemed the most perfect model of government; and Knox, who, during his residence in that city, had studied and admired it, warmly recommended it to the imitation of his countrymen. But on the first introduction of this system, he did not think it expedient to depart altogether from the ancient form; instead of bishops he proposed to establish ten or twelve superintendants in different parts of the kingdom, who were empowered to inspect the life and doctrine of the other clergy, to preside in the inferior judicatories of the church, and to perform several other parts of the episcopal function; their jurisdiction, however, extended to sacred things only; they claimed no seat in parliament, and pretended no right to the dignity or revenues of the former bishops. The number of the inferior clergy was, at this time, very small; and in a few places only were formed into regular classes or societies. In order to give greater strength and consistence to the presbyterian plan, Knox, with the assistance of his brethren, composed, in 1561, the first book of discipline, which contains the model or platform of the intended policy. However, though the general assembly in the year 1566 had approved of the Geneva discipline, the parliament did not confirm the votes of the assembly, nor formally deprive the bishops of their power; but all church affairs from that time were managed by presbyteries, and general assemblies. In the year 1574 they voted the bishops to be only pastors of one parish; in 1577 they ordained that all bishops should be called by their own names; and in the next year they voted the name of a bishop to be a grievance. In 1580 the general assembly, with one voice, declared diocesan episcopacy to be unscriptural and unlawful. In the same year king James, with his family, and the whole nation, subscribed a confession of faith, with a solemn league and covenant annexed, obliging themselves to maintain and defend the protestant doctrine and presbyterian government. In the year 1584 the bishops were restored by parliament to some parts of their ancient dignity. In 1587 the king consented to an act to take away bishops' lands, and annex them to the crown; and in 1590 it was ordained, that all who bore office in the kirk, or should hereafter do so, should subscribe to the book of discipline. In 1592, all acts of parliament in favour of popery and episcopacy were annulled; and an

act passed for establishing the presbyterian government, its general assemblies, provincial synods, presbyteries, and kirk sessions, with all the different branches of their discipline and jurisdiction, in the most ample manner. This act was again confirmed in 1593 and 1594. King James, during the latter years of his administration in Scotland, revived the name and office of bishops; but they possessed no ecclesiastical jurisdiction or pre-eminence; their revenues were inconsiderable, and they were scarcely distinguished by any thing but by their seat in parliament, and by being the object of the clergy's jealousy, and the people's hatred. The king, delighted with the splendour and authority which the English bishops enjoyed, and eager to effect an union in ecclesiastical policy, resolved to bring both churches to an exact conformity with each other. Three Scotsmen were consecrated bishops at London, from whom their brethren were commanded to receive orders. Ceremonies unknown in Scotland were imposed; and though the clergy, less obsequious than the nobles, boldly opposed these innovations, James, long practised and well skilled in the arts of managing them, obtained at length their compliance. But Charles I. a superstitious prince, unacquainted with the genius of the Scots, imprudent and precipitate in all the measures he pursued in that kingdom, pressing too eagerly the reception of the English liturgy, and indiscreetly attempting a resumption of church-lands, kindled the flames of civil war; and the people being left at liberty to indulge their own wishes, the episcopal church was overturned, and the presbyterian government and discipline were re-established with new vigour. Together with monarchy, episcopacy was restored in Scotland. The aversion of the nation, however, was insurmountable, and it subsisted with difficulty. At the Revolution, the inclinations of the people were thought worthy the attention of the legislature, the presbyterian government was again established (see CONVENTION), and being ratified by the UNION, is still maintained in that kingdom.

The abuse of church power in the beginning of the reign of James I. obliged many learned ministers and their followers to leave the kingdom, and retire to Amsterdam, Rotterdam, the Hague, Leyden, Utrecht, and other places of the Low Countries, where English churches were erected after the presbyterian model, and maintained by the states according to treaty with queen Elizabeth, as the French and Dutch churches were in England.

The first presbyterian church in England was established at Wandsworth, near London, in 1572; and others were afterwards erected in neighbouring counties. After the commencement of the troubles in the reign of Charles I. propositions for establishing presbyterian government in England were made in the treaty of Uxbridge, A.D. 1645; and so zealous were the advocates for it, that many of them maintained the divine right of it. This opinion of its origin was carried in the assembly of divines, but negatived in the house of commons. This form of church government was established, by way of probation, in 1646; though not without considerable opposition and clamour. In the year 1648, an ordinance for more effectually settling the presbyterian government, without limitation of time, received the sanction of both houses, under the title of a form of church government, to be used in the churches of England and Ireland. Under the commonwealth, in 1649, the Presbyterian government was declared by the house to be the established government; it continued, though at a low ebb, under the protectorate of Oliver Cromwell, who was more favourably inclined to the independents, and to the Restoration of Charles II., an event in which the presbyterians and army, under the direction of general Monk, concurred.

At this period episcopacy was re-established; the imprudent zeal of the presbyterians was forgotten, and they suffered in common with others who disapproved the hierarchy, and who scrupled conformity to the established articles of doctrine and discipline, till they were in some measure relieved by the act of Toleration, which has been modified, with considerable improvements, favourable to religious liberty, during the present reign. See TOLERATION of *Dissenters*.

PRESBYTERY, PRESBYTERIUM, πρεσβυτεριον, an assembly of the order of presbyters, or priests, with lay-elders, for the exercise of church-discipline.

The kirk, or church, of Scotland, is divided into sixty-nine presbyteries, each consisting of a number of parishes, not exceeding twenty-four, nor less than twelve.

The ministers of these parishes, with one ruling elder, chosen half-yearly, out of every kirk-session, constitute a presbytery; who, meeting in their chief town, whence the presbytery is denominated, choose a moderator, or, more properly, a prolocutor, who must be a minister, half-yearly.

They determine all appeals from kirk-sessions, *i. e.* from the several parochial assemblies; but can try nothing at the first instance cognizable before a kirk-session.

They compose all differences between ministers and people; for which end, they hold presbyterial visitations in each parish, where they examine the registers of the kirk-sessions, &c.

They enquire into repairs of churches; see that the glebe, &c. suffer no dilapidations; appoint schools in the parishes; and see that the funds be not misapplied.

They alone can exclude from the communion; license probationers; suspend, depose, and, in effect, determine all ecclesiastical matters within their district. From the presbytery there lies an appeal, in all cases, to provincial synods.

PRESBYTERY, *Presbyterium*, is sometimes also used for the choir of a church, because anciently appropriated to the presbyters. In opposition to the nave or body of the church, which was for the people.

PRESCHIEF, in *Geography*, a town of Persia, in Faristan; 18 miles S. of Schiras.

PRESCIANO, a town of Naples, in Principato Citra; 20 miles E.S.E. of Salerno.

PRESCIENCE, in *Theology*, *prevision*, or *fore-knowledge*; that knowledge which God has of things to come.

The doctrine of predestination, as some divines understand it, is founded on the prescience of God, and on the supposition of all futurity's being present to him.

Human reason can scarcely reconcile the prescience of God with the free-agency of man; hence some have been led to deny the divine prescience, and others to maintain the doctrine of necessity. See LIBERTY and NECESSITY.

PRESCOT, in *Geography*, a market-town and parish in the hundred of West-Derby, and county palatine of Lancaster, England. The town is situated on the great road from London to Liverpool, by Warrington, at the distance of 198 miles N.W. from the metropolis; and six miles E. from Liverpool. It consists principally of one long, straggling street, seated upon high ground, in the midst of numerous collieries, some of which extend under the town itself. The church is a large and spacious structure, with a lofty steeple, which constitutes a prominent object of view from all the low parts of this county, and of Cheshire, for an extent of many miles. Here is besides, a meeting-house, appropriated to the worship of dissenters; also a free-school, and several alms-houses. The market day is Tuesday, weekly; and there are three fairs during the year. The principal manufacture carried on here is the making of watch-tools, for

which

which the town has been celebrated for upwards of a century. The drawing of pinion wire originated at Prescot, and is carried as far as to fifty drawings. (See WIRE.) Here are made small files, considered to be the best in the world, and also various component parts of watches.

According to the parliamentary returns of 1811, Prescot town contained 770 houses, and a population of 3675 persons; and the remainder of the parish, including the townships of Bold, Cronton, Cuerdley, Ditton, Eccleston, Parr, Penketh, Rainford, Ramhill, Great-Sanke, Sutton, Whifton, Widness, Appleton, and Windle, 2867 houses, and 16,060 inhabitants. At Ravenhead, close to St. Helens, which Dr. Aikin, in his "Description of the country round Manchester," says, "has of late years risen from a small village to be a well-built and populous market-town," is an extensive manufactory of plate glass. This was first established in 1773, under the authority of an act of parliament, incorporating the proprietors; but that concern having failed in 1794, a new company was incorporated the same year, which has been hitherto eminently successful. Cast plate glass, also concave and convex mirrors, are now made here, of sizes and qualities equal, or superior, to any imported from the continent. Of the former, some have been made to measure 139 inches by 69; and of the latter many are manufactured 36 inches in diameter. In these extensive works, which cover nearly thirty acres of ground, and are inclosed by a wall, upwards of 300 persons are constantly employed in the various processes of melting, casting, blowing, polishing, &c. The room, or hall, in which the glasses are cast, is 200 feet long, by 78 broad; and has its roof entirely supported by pointed arches resting upon the side walls as abutments. Near this manufactory is one for smelting and refining copper ore, brought from Paris mountain in Anglesey; and within the township of St. Helens is another for similar purposes.

Within the township of Sutton, in this vicinity, is found an excellent clay, made use of for making sugar moulds, and coarse earthen-ware; and within the township of Rainford, about five miles to the north, is a good clay for making crucibles and fine bricks. Coal is abundant throughout the whole extent of this parish, and frequently lies under beds of iron-stone, which appear at one time to have been wrought, as on some particular spots, beds of coke, or cinders, are discovered several feet deep. The tradition of the country is, that they indicate the scites of iron-works established by the Danes during their occupation of this district.

The chief seat in the neighbourhood of Prescot is Knowsley-park, the property and principal residence of the earl of Derby. The house stands upon elevated ground, and consists of two divisions, one constructed of stone and the other of brick. The stone division, which has two round towers attached to it, is said to have been built by Thomas, the first earl of Derby, about the year 1480, but there can be little doubt of the greater antiquity of part of it; and indeed, in the history of the house of Stanley, the nobleman above-mentioned is spoken of only as having repaired and beautified the mansion for the reception of his son-in-law king Henry VII. The brick division is of modern date. In this house are various family portraits, and some pictures by the most celebrated among the Flemish and Italian masters. The park is extensive, and abounds with fine plantations of young and old trees. See Beauties of England and Wales, vol. ix. by John Britton, F.S.A.; also a Description of the Country from 30 to 40 miles round Manchester, by I. Aikin, M.D., 4to. 1795.

PRESCRIPTION, PRÆSCRIPTIO, in Law, a right or title acquired by use and time.

Prescription is a sort of title introduced for assuring the property of effects in favour of persons who have possessed them a certain time; and to keep off any who would disquiet them, or recover the thing possessed, after the term fixed by the laws.

Tourelle calls prescription a penalty imposed, by the laws, upon negligence; and adds, that possessors, who have no other title to plead but prescription, are only legal usurpers.

In effect, however, the law of prescription does not punish the indolence of proprietors, but only interprets their silence for their consent; presuming, that a man who neglects to assert his right for a long series of years, gives it up.

There are some of the lawyers who doubt, whether time and unjust prescription be any legitimate means of acquiring. Others, more favourable, call it the *patroness of mankind*; as being a general presumption, under which the law will have men live in peace.

In the common law, prescription is usually understood of a possession from time immemorial, or beyond the memory of man; as, when my ancestors, or his from whom I have an estate, have enjoyed and used it all the time whereof any memory remains.

But in the civil law, and even in our common law, there are prescriptions of a much shorter date; prescription of forty years excludes all actions whatever. Reform. Leg. Eccles.

The distinction between *custom* (which see) and *prescription* is this: that custom is properly a local usage, and not annexed to any person; such as, a custom in the manor of Dale that lands shall descend to the youngest son: prescription is merely a personal usage; as that Sempronius and his ancestors, or those whose estate he hath, have used time out of mind to have such an advantage or privilege. (Co. Litt. 113.) All prescription must be either in a man and his ancestors, or in a man, and those whose estate he hath, which last is called prescribing in a *que estate*. And formerly a man might, by the common law, have prescribed for a right which had been enjoyed by his ancestors or predecessors at any distance of time, though his or their enjoyment of it had been suspended for an indefinite series of years. But by the statute of limitations, 32 Hen. VIII. c. 2, it is enacted, that no person shall make any prescription by the seisin or possession of his ancestor or predecessor, unless such seisin or possession hath been within three-score years next before such prescription be made. This title of prescription was well known in the Roman law by the name of *usucaptio*; so called, because a man, that gains a title by prescription, may be said *usu rem capere*.

As to the several species of things which may, or may not, be prescribed for, it may be observed, 1. That nothing but incorporeal hereditaments can be claimed by prescription; as a right of way, a common, &c. but that no prescription can give a title to lands, and other corporeal substances, of which more certain evidence may be had. 2. A prescription must always be laid in him that is tenant of the fee. A tenant for life, for years, at will, or a copy-holder, cannot prescribe, by reason of the imbecility of their estates. (4 Rep. 31, 32.) For, as prescription is usage beyond time of memory, it is absurd that they should pretend to prescribe, whose estates commenced within the remembrance of man. 3. A prescription cannot be for a thing which cannot be raised by grant. 4. What is to arise by matter of record cannot be prescribed for, but must be claimed by grant, entered on record; such as the royal franchises of deodands, felon's goods, &c. But the franchises of treasure-trove, waifs, estrays, and the like, may be claimed by prescription;

prescription; for they arise from private contingencies, and not from any matter of record. (Co. Litt. 114.)

5. Among things incorporeal, which may be claimed by prescription, a distinction must be made with regard to the manner of prescribing; that is, whether a man shall prescribe in a *que estate*, or in himself and his ancestors. For if a man prescribes in a *que estate* (that is, in himself, and those whose estate he holds) nothing is claimable by this prescription, but such things as are incident, appendant, or appurtenant to lands; but if he prescribes in himself and his ancestors, he may prescribe for any thing whatever that lies in grant; not only things that are appurtenant, but also such as may be in gross. (Litt. § 183. Finch, l. 104.) 6. Estates gained by prescription are not of course descendible to the heirs general, like other purchased estates, but are an exception to the rule. Blackst. Comm. book ii. ch. 17.

The custom of Paris allows of a prescription of ten years, if the parties be present; and of twenty, if absent; in favour of peaceable possessors of an inheritance, if they have any title, however controverted; and of thirty years, in favour of those who possess without any title at all.

In Normandy, a prescription of forty years peaceable possession is equivalent to a title to immoveables; and for moveables, and personal actions, a prescription of thirty years suffices.

In Romish countries, prescription does not avail against the church, if short of a hundred years. In France, prescription of twenty years is admitted against all crimes, except duelling, which was excluded by a declaration of the year 1679. In matters of adultery, five years suffice; *i. e.* provided there have been a discontinuance of prosecution all that time.

By our statutes, a judge or clerk convicted of false entering pleas, &c. may be fined within two years; but those elapsed, he prescribes against the punishment of the statute.

The crime of maintenance or embracery, whereby perjury is committed by a jury, must be prosecuted within six days; or otherwise the parties prescribe.

There is no prescribing against a man's lord; no prescription avails to take off any servitude or tenure; a title is always required there.

The author of the History of the Inquisition observes, that no time of prescription avails in matters of heresy; even death itself does not secure the suspected from the researches of that tremendous court.

PRESCRIPTION, in the *Law of Nations*. See USUCAPTION.

PRESCRIPTION, *Corporations by*, are those which have existed as corporations, time whereof the memory of man runneth not to the contrary; with regard to which the king's consent is presumed. For though the members thereof can shew no legal charter of incorporation, yet in cases of such high antiquity, the law presumes there once was one; and that by the variety of accidents, which a length of time may produce, the charter is lost or destroyed.

PRESCRIPTION, *Modus by*. See MODUS DECIMANDI.

PRESCRIPTION *de non decimando* is a claim to be entirely discharged of tithes, and to pay no compensation in lieu of them. Thus the king is discharged by his prerogative from all tithes. (Cro. Eliz. 511.) So a vicar shall pay no tithes to the rector, nor the rector to the vicar, for "ecclesia decimas non solvit ecclesiæ." (Cro. Eliz. 479. 511. Lev. 3. Moor 910.) But these personal privileges (not arising from or being annexed to the land) are personally confined both to the king and the clergy; for their tenant or lessee shall pay tithes, though in their own occupation their lands are not generally tithable. (Ibid. 479.) And

generally speaking, it is an established rule, that, in *lay* hands "modus de non decimando non valet." (Ibid. 511.) But spiritual persons or corporations, as monasteries, abbots, bishops, and the like, were always capable of having their lands totally discharged of tithes, by various ways, (Hob. 309. Cro. Jac. 308.) as, 1. By real composition: 2. By the pope's bull of exemption: 3. By unity of possession; as when the rectory of a parish, and lands in the same parish, both belonged to a religious house, those lands were discharged of tithes by this unity of possession: 4. By prescription; having never been liable to tithes, by being always in spiritual hands: 5. By virtue of their order; as the Knights Templars, Cistercians, and others, whose lands were privileged by the pope with a discharge of tithes. (2 Rep. 44. Seld. tith. c. 13. § 2.) Though upon the dissolution of abbeys by Henry VIII., most of these exemptions from tithes would have fallen with them, and the lands become tithable again, had they not been supported and upheld by the statute 31 Hen. VIII. c. 13. which enacts, that all persons who should come to the possession of the lands of any abbey then dissolved, should hold them free and discharged of tithes, in as large and ample a manner as the abbeys themselves formerly held them. And from this original have sprung all the lands, which, being in lay hands, do at present claim to be tithe-free; for, if a man can shew his lands to have been such abbey lands, and also immemorially discharged of tithes by any of the means before-mentioned, this is now a good prescription *de non decimando*. But he must shew both these requisites: for abbey lands, without a special ground of discharge, are not discharged of course; neither will any prescription *de non decimando* avail in total discharge of tithes, unless it relates to such abbey lands. Blackst. Comm. b. ii. See TITHES.

PRESCRIPTION, in *Medicine*, the act or art of directing proper remedies for diseases. The word is also applied to the written *formula*, by which the individual substances are directed to be combined or administered.

The art of prescription is of course the result of a knowledge of the nature of the living body, both in a state of health and disease; and of an accurate examination of the symptoms of the disease present, together with an acquaintance with the various articles of the materia medica, and with their operation and properties, chemical and vital. The best prescription is that which directs the most active and appropriate medicines, in the simplest manner, and most natural combination. It was formerly the practice of physicians, to unite in one formula the great farrago of drugs, many of them, indeed, very inert in their agency, but many which differed materially in their properties; a practice, by which the operation of the whole was rendered extremely obscure, and the means of discriminating the powers of medicines in a great measure prevented. Simplicity certainly constitutes the chief elegance of prescription, and if at the same time correctness of combination, and a just application of the most active ingredient, be observed, the full end is obtained. The correctness of combination, however, especially where chemical agencies are introduced, depends upon a knowledge of the affinities which exist between different substances; from the want of which knowledge, it not unfrequently happens, that the substances intended to be administered are neutralised, decomposed, or united in new combinations, and a very different medicine is actually given. *Extemporaneous* prescription, in particular, requires an accurate knowledge of these points. Another object, though commonly of secondary importance, requires to be attended to, namely, to render the medicine as agreeable to the palate, as is consistent with its qualities. This is of importance, at

least in the medicines directed for children, and for those who possess, either naturally, or in consequence of the disease, a great delicacy of stomach, and at all times when a long course of medicine is absolutely necessary, in order to ensure that it shall be taken. It is scarcely necessary to add, that an accurate knowledge of the doses of all the medicines prescribed, is absolutely requisite for salutary, or even safe prescription.

PRESCRIPTION, in *Theology*, was a kind of argument pleaded by Tertullian, in the third century, against erroneous doctors; and which has been urged by Catholics (see **METHODISTS**), and others, in more modern times. With regard to this mode of arguing, we may observe, that there is scarcely any case, in which the plea of prescription can be admitted as a satisfactory argument in favour of religious tenets, or articles of faith; unless by prescription be meant, a doctrine's being established in the time and by the authority of the apostles. In all other cases, prescription is no argument at all; it cannot recommend error, and truth hath no need of its support.

PRESENCE, **PRÆSENTIA**, a term of relation, used in opposition to *absence*, and signifying the existence of a person in a certain place; or the state of a person considered as co-existing with another.

In this sense, an obligation is said to be passed in presence of a notary and witnesses; at the breaking open a seal of a minor, or an absent person, the presence of a substitute is necessary.

The schoolmen hold, that presence, in speaking of bodies, denotes not only a co-existence, but a sort of contact.

They distinguish two kinds of presence; the one *virtual*, in which sense a spirit, or mind, is said to be present to a body when it acts upon it; the other *corporeal*, which consists in a physical contact.

The treasurers, &c. of France have what they call a *right of presence*; a certain sum due on their actual attendance in their offices, to oblige them to be the more assiduous in their function.

A person absent in the service of the king, or a community, is represented as present.

The Roman Catholics believe the real presence of Jesus Christ in the eucharist, both in body and soul. See **TRANSUBSTANTIATION**.

PRESENT, **PRÆSENS**, in *Grammar*, the first tense, or inflexion of verbs; expressing the time present, or that which now is.

It is a particular piece of address in eloquence, to make use of the present for a past tense, in order to express a past action with the more force and warmth. Thus, the fleet is no sooner in full sea, than the heavens begin to lower, the winds rise, the waves dash against each other, thunder rolls, and lightning glares on all sides; the ships lose their masts and rudders, and are driven impetuously against the rocks.

PRESENTATION, **PRÆSENTATIO**, in the *Canon Law*, the act of a patron, nominating and offering his clerk to the bishop or collator, to be instituted in a benefice of his gift, which is void.

The word is formed from the ancient phrase, *praesentare ad ecclesiam*; which originally signified the patron's sending or placing a person in a church; and which itself is formed from *representare*, which, Selden observes, is used in the council of Lateran, and elsewhere, for *praesentare*.

For the difference between presentation and collation, see **COLLATION**.

By common law, a deacon, of any age, might be instituted and inducted to a parsonage or vicarage; but it was

ordained by 13 Eliz. cap. 12. that no persons under 23 years of age, and in deacon's orders, should be presented to any benefice with cure; and if he were not ordained priest within one year after his induction, he should be *ipso facto* deprived. And now, by 13 & 14 Car. II. cap. 4. no person is capable of being admitted to any benefice unless he hath been first ordained a priest; and then he is, in the language of the law, a clerk in orders. Any clerk may be presented to a parsonage or vicarage; that is, the patron, to whom the advowson of the church belongs, may offer his clerk to the bishop of the diocese to be instituted. A layman may also be presented, but he must take priest's orders before his admission. As to the right of presentation, this belongs even to an infant, who is heir of a manor to which an advowson is appendant (3 Inst. 156.); and in case of a patron's bankruptcy, the commissioners may sell the advowson. (Gibf. 794.) If the right of presentation is in coparceners, who agree in the same person, they are to join in the act of presentation; otherwise, the eldest shall have the preference, and afterwards the rest in their turns; but where the right is in joint-tenants or tenants in common, if there hath been no composition in writing to present by turns, they must join in the presentation. (1 Inst. 156. Gibf. 794.) If one be seised of an advowson in fee, and the church becomes void, the void turn is a chattel; and if the patron dies before he presents, the avoidance doth not go to his heir, but to his executor. (Watf. c. 9.) But if the incumbent of a church be also seised in fee of the advowson of the same church, and dieth, his heir, and not his executors, shall present. In the case of a bishop, who holdeth an advowson in the right of his bishopric, the void turn of a church doth not go to his executor, but the king shall present. (2 Roll's Abr. 345.) If a vicarage becomes void during the vacancy of the parsonage, the patron of the parsonage, and not the executor of the deceased parson, shall present. (Ibid. 346.) If a feme-covert hath a title to present, the presentation must be by husband and wife in both their names. And though the right of patronage in the wife descends to her heir, yet the right of presenting during life belongs to the husband, who is tenant by curtesy. (Gibf. 794. Watf. c. 9.) If a man that is seised of an advowson takes a wife, and dieth, the heir shall have two presentments, and the wife the third. (Watf. c. 9.) In case of a mortgage in fee of a manor, to which an advowson is appendant, although the legal right of presentation is vested in the mortgagee, yet a court of equity will compel the ordinary to institute the clerk of the mortgager any time before foreclosure. (Str. 403.) But if the advowson itself only is mortgaged, the mortgagee presents. (2 P. Will. 404.) The king, as patron paramount of all the benefices in England, hath a right to present to all churches not regularly filled by other patrons, whether it happens by lapse, or through incapacity to present, as if the patron be attainted, outlawed, or an alien, or have been guilty of simony, &c. On this ground, the king hath a right to present to all dignities and benefices of the advowson of archbishoprics and bishoprics, during the vacation of the respective sees. (Gibf. 763. Watf. c. 9.) And it is said, that this privilege which the king hath of presenting, by reason of the temporalities of a bishopric being in his hands, shall be extended unto such preferments to which the bishop of common right might present, though by his composition he hath transferred his power unto others. (Watf. c. 9. 2 Roll's Abr. 343.) Upon promotion of any person to a bishopric, the king hath a right to present to such benefices or dignities, as the person was possessed of before such promotion, though the advowson belongeth to a common person. (Gibf. 758. 763.) But by law in Ireland, no person can accept a

bishopric there, until he hath resigned all the preferments which he hath in England; which preferments being void before the acceptance of the bishopric, the king in such case shall lose the presentation. The lord chancellor, or lord keeper of the great seal for the time being, hath right to present to the benefices appertaining to the king, of the yearly value of 20*l.* or under in the king's books. (Gibf. 764.) For a presentee to have another benefice, although it be above the value of 2*l.* a-year in the king's books, is no cause of refusal, for that is at his own peril, and the former benefice only becomes void in such case. God. 271. Watf. c. 20.

It is rule of the canon law, that no person may present himself: in this case, the legal and regular way is to make over the right to some other before the avoidance. Gibf. 794.

The presentation must be tendered to the bishop within a hundred and eighty-two days after the living is vacant, else it lapses to the bishop; and if the bishop do not collate in half a year more, it lapses to the archbishop; and from him, in a like time, to the king; who may stay as long as he pleases; for *nullum tempus occurrit regi*. See LAPSE.

By some customs a lay patron has only four months time to make his presentation in; and if he have presented a person incapable, he may vary it, and make a new presentation within the four months.

It is said that presentation may be made either by word, or by writing. If it be by word, the patron must declare in the presence of the ordinary; if by writing, it is no deed, but in the nature of a letter missive to the bishop. 1 Inst. 120. 2 Roll's Abr. 353.

Where a corporation aggregate of many doth present, it must be under their common seal (Gibf. 794.); and since the statute of frauds and perjuries, (29 Car. II. cap. 3.) it is necessary that all presentations shall be in writing. Thus also by the several stamp-acts, which enact a stamp-duty of 20*l.*, provided that the benefice, &c. presented to, be of the yearly value of 10*l.* or upwards in the king's books; but if under that, only 10*l.*

Presentation may be revoked or varied before admission and institution. But when a clerk is presented, the bishop may refuse him on various accounts: as, 1. If the patron is excommunicated, and remains in contempt forty days. (2 Roll. Abr. 355.) Or, 2. If the clerk be unfit; (Glanv. l. 13. c. 20.); which unfitness is of several kinds. First, with regard to his person; as if he be a bastard, an outlaw, an excommunicate, perjured, guilty of forgery or simony, under age, or the like. (2 Roll. Abr. 356. 2 Inst. 632. stat. 3 Ric. II. c. 3. 7 Ric. II. c. 12.) Secondly, with regard to his faith or morals; as for any particular heresy, or vice that is *malum in se*; but if the bishop only alleges in general terms, as that he is *schismaticus inveteratus*, or objects a fault that is *malum prohibitum* merely, as haunting taverns, playing at unlawful games, or the like, it is not good cause of refusal. (5 Rep. 58.) Or, lastly, the clerk may be unfit to discharge the pastoral office for want of learning. In any of which cases the bishop may refuse the clerk. In case the refusal is for heresy, schism, inability of learning, or other matter of ecclesiastical cognizance, there the bishop must give notice to the patron of such his cause of refusal, who, being usually a layman, is not supposed to have knowledge of it; else he cannot present by lapse; but if the cause be temporal, there he is not bound to give notice. (2 Inst. 632.) If an action at law be brought by the patron against the bishop for refusing his clerk, the bishop must assign the cause. If the cause be of a temporal nature, and the fact be admitted (as,

for instance, outlawry), the judges of the king's courts must determine its validity, or whether it be sufficient cause of refusal; but if the fact be denied, it must be determined by a jury. If the cause be of a spiritual nature (as heresy, particularly alleged), the fact, if denied, shall also be determined by a jury; and if the fact be admitted or found, the court upon consultation, or advice of learned divines, shall decide its sufficiency. (2 Inst. 632.) If the cause be want of learning, the bishop need not specify in what points the clerk is deficient, but only allege that he is deficient (5 Rep. 58. 3 Lev. 313.); for the statute 9 Edw. II. stat. 1. cap. 13. is express, that the examination of the fitness of a person presented to a benefice belongs to the ecclesiastical judge. If the bishop returns the clerk to be *minus sufficiens in literatura*, the court shall write to the metropolitan, to re-examine him, and certify his qualifications; which certificate of the archbishop is final. (2 Inst. 632.) Burn's Eccl. Law, vol. i. art. *Benefice*. Blackst. Com. book i. cap. 11. See INSTITUTION and INDUCTION.

PRESENTATION of the *Virgin*, is a feast of the Romish church, held on the twenty-first of November, in memory of the Holy Virgin's being presented by her parents in the temple, to be there educated.

Emanuel Comnenus, who began to reign in 1143, makes mention of this feast in his Constitution. Some even imagine it to have been established in the 11th century, among the Greeks; and think they see evident proofs of it in some homilies of George of Nicomedia, who lived in the time of Photius. Its institution in the West is ascribed to Gregory XI. in 1372.

Some take it to have been instituted in memory of the ceremony practised among the Jews for their new-born females; corresponding to the circumcision on the eighth day for males.

PRESENTATION of *Our Lady*, also gives the title to three orders of nuns.

The first, projected in 1618, by a maid named Joan of Cambray. The habit of the nuns, according to the vision she pretended to have, was to be a grey gown of natural wool, &c. but this project was never accomplished.

The second was established in France, about the year 1627, by Nic Sanguin, bishop of Senlis. It was approved by Urban VIII. This order never made any great progress.

The third was established in 1664, when Fred. Borromeo, being apostolical visitor in the Valteline, was intreated, by some devout maids at Morbegno, to allow them to live in community in a retired place; which he granted, and erected them into a congregation under the title of *congregation of our Lady*. They live under the rule of St. Augustine.

PRESENTATIVE ADVOWSONS. See ADVOWSON.

PRESENTTEE, in the *Canon Law*, a clerk presented by a patron to a collator. See PRESENTATION.

PRESENTMENT, in *Law*, a denunciation or information of the jurors themselves, which the grand jury find and present to the court, without any indictment delivered to them, which is afterwards reduced into the form of an indictment; or of some other officer, as a justice, constable, church-warden, surveyor, &c. of an offence, inquirable into the court to which it is presented.

Presentments are made in courts leet and courts baron, before stewards; and in the latter of surrenders, grants, &c.

PRESENTMENT, *Affise of Darrein*. See ASSISE.

PRESENTMENT of *copyhold Surrenders*. See SURRENDER.

PRESENTS, PRÆSENTIA, *free gifts*, or *gratuities*, especially

cially those given by the clergy, or the states of a realm, to a king.

They are so called, because given into the hands of a person present; by which they are distinguished from *munera*, *gifts*, which are sent to the party, or delivered by the intervention of a third person.

Thus the eighteenth law, "De verb. signif. Absentibus res donari dicuntur, munera autem mitti, & præsentia offerri." There is no accosting the eastern princes without making them fine presents. Kings usually make rich presents to ambassadors sent to their courts.

PRESENZANO, in *Geography*, a town of Naples, in the Lavora; 11 miles N.E. of Sezza.

PRESEPE, or PRÆSEPE, in *Astronomy*, a name given to three nebulous stars in the breast of the sign Cancer, or the Crab. Two of them are of the seventh, the third of the sixth magnitude.

PRESERVATION of *Vegetables*. This is to be done several ways in the several kinds, and many more might certainly be invented, for we are not yet arrived at the perfect method of preserving vegetables with their colours, odours, and all their sensible qualities, as well as their natural form, for a number of years. Fruits may be long preserved in spirits of wine, first well saturated with the skins and tinged parts of those fruits; and many may be tolerably preserved in perfectly fermented liquors, which generate no more air. The more solid vegetable substances may be preserved by gentle drying in the sun-shade, or other slack heat. Thus peas or beans may be dried young in a slack oven, in their proper season, and may afterwards be boiled in the winter, and will eat young and tender, as if just gathered. The ways of preserving fruit both dry and moist, with sugar, are now universally known; and there are in the several ways many secrets in the hands of particular artists, which it would be well to have generally known. See *Preservation of FLOWERS*.

PRESERVATION of *Provisions*. See PROVISIONS.

PRESERVATIVE, or PREVENTIVE, in *Medicine*, a remedy or expedient employed by way of precaution, or to secure a person from a disease which he is in danger of receiving.

These preservatives have been especially objects of research, during the prevalence of epidemic and contagious diseases; and many medicines have been declared to possess specific preservative powers against the plague, and other fevers. But a more enlightened experience has decidedly exploded these pretended preventives, as possessed only of imaginary powers. We are possessed of no antidote to contagion, which can only be disarmed of its virulency by dilution with fresh air, or by decomposition by chemical fumigations; and all the pretended personal preservatives, such as camphor, vinegar, &c. are totally destitute of any such qualities. The best preservative is a system of diet and regimen, which shall retain the constitution in an equable state of health, and avoid disturbance to any individual function or organ; *i. e.* in other words, a careful avoidance both of the predisposing and exciting causes of disease in general: for under this regular condition of the habit, the particular cause of disease, that may be prevalent, will have less influence upon the health. It is important, therefore, to caution the reader against putting such implicit confidence in any preventive drug, as to induce him to neglect the salutary measure of self-preservation, to which we have just alluded. See CONTAGION and EPIDEMIC.

Dr. Wenceslaus Dobr. Zensky de Negro Ponte gives us an universal preservative against infection in all diseases. "Whoever," says he, "in conversing with patients of any

VOL. XXVIII.

kind, would preserve himself from infection, must, while he is within the sphere of their effluvia, never swallow his spittle, but spit it out." For this author conceives it to be the spittle that first imbibes the infection.

PRESERVING of *Timber*. See TIMBER.

PRESICIE, in *Geography*, a town of Naples, in the province of Otranto; 3 miles W.S.W. of Aleffano.

PRESIDENT, PRÆSES, an officer created, or elected, to *preside* over a company, or assembly; so called in contradistinction to the other members, who are termed *residents*.

It is of some importance to ascertain the powers possessed and exercised by the presidents of the Roman provinces.

From Ulpian, a celebrated Roman lawyer, who flourished in the beginning of the third century, we learn that it was the duty of a good president to preserve tranquillity in his province, and to hunt diligently after sacrilegious persons, robbers, men-stealers, and thieves, and to punish every man according to his guilt; and he expressly ascribes to them the right of power of the sword for the punishment of malefactors, and the highest authority in his province next to the emperor. Hermogenianus says, that governors and presidents of provinces have the cognizance of all causes, which belong to the prefect of the city, or the prefect of the pretorium, and the consuls, and pretors, and other magistrates at Rome. From these, and other authorities that might be cited, it appears that the governors of provinces had not only the power of life and death, but that they were also the supreme judges in matters of property. Accordingly Pilate had the power of life and death in Judea. It was also usual for the presidents to have a council, consisting of their friends, and other chief Romans in the province, of whose advice they availed themselves on particular occasions. We have many authentic testimonies in behalf of the equity of the Roman government in general, and of the impartial administration of justice by the Roman presidents towards all the people of their provinces, how much soever they differed from each other in matters of religion. Although many of these presidents were guilty of extortion, and other acts of injustice, and endeavoured to enrich themselves in the provinces, yet there seems not to have been any one thing, which the Romans were more concerned to preserve inviolable, than the religion of all the people whom they conquered. It is, however, to be lamented that the Romans afterwards departed from those moderate maxims that directed and governed their conduct, as long as the history of the Acts of the Apostles reaches. Nero appears to have been the first emperor that persecuted the Christians; and his persecution was owing, not so much to the differences that subsisted between the principles of religion maintained by the Christians and the Romans, as to his wish to throw off from himself the odium of having set fire to the city, with which infamous action he was generally charged.

Lord President of the Council is a great officer of the crown, who has precedence next after the lord-chancellor and lord-treasurer; as ancient as the time of king John, when he was styled *consiliarius capitalis*.

His office is to attend on the king, to propose business at the council chamber, and to report to the king the several transactions there. See PRIVY-COUNCIL.

PRESIDENT of the *United States of America* is the person in whom the constitution has vested the executive power. He holds his office during the term of four years, and, together with the vice-president, chosen for the same term, is elected in the following manner. Each state shall appoint, as its legislature may direct, a number of electors, equal to the whole number of senators and representatives to which the state may be entitled in the congress; but no senator or

representative, or person holding an office of trust or profit under the United States, shall be appointed an elector. The electors meet in their respective states, and vote, by ballot, for two persons, of whom one at least shall not be an inhabitant of the same state with themselves. Having made a list of all the persons voted for, and of the number of votes for each, they sign and certify this list, and transmit it, sealed, to the seat of the government of the United States, directed to the president of the senate. The president, in the presence of the senate and house of representatives, opens all the certificates, and the votes are counted. The person having the greatest number of votes shall be the president, if such number be a majority of the whole number of electors appointed; and if there be more than one who have such majority, and have an equal number of votes, then the house of representatives shall immediately choose, by ballot, one of them for president; and if no person have a majority, then, from the five highest on the list, the said house shall, in like manner, choose the president. But in choosing the president, the votes shall be taken by states, the representative from each state having one vote. A quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. In every case, after the choice of the president, the person having the greatest number of votes of the electors shall be the vice-president. But if there should remain two or more, who have equal votes, the senate shall choose from them, by ballot, the vice-president.

No person, except a native citizen, or a citizen of the United States at the time of the adoption of the constitution, shall be eligible to the office of president; neither shall any person be eligible to that office, who shall not have attained to the age of 35 years, and been 14 years a resident within the United States. The president shall, at stated times, receive for his services a compensation, to be neither increased nor diminished during the period for which he shall have been elected; and he shall not receive, within that period, any other emolument from the United States, or any of them. Before he enters on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of president of the United States, and will, to the best of my ability, preserve, protect, and defend the constitution of the United States." As to his powers and duties, he shall be commander-in-chief of the army and navy of the United States, and of the militia of the several states, when called into the actual service of the United States. He may require the opinion, in writing, of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices; and he shall have power to grant reprieves and pardons for offences against the United States, except in cases of impeachment. He shall have power, by and with the advice and consent of the senate, to make treaties, provided two-thirds of the senators present concur; and he shall nominate, and by and with the advice and consent of the senate, shall appoint ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States, whose appointments are not otherwise provided for, or shall be established by law. But the congress may, by law, vest the appointment of such inferior officers as they think proper in the president alone, in the courts of law, or in the heads of departments. The president shall have power to fill up all vacancies that may happen during the recess of the senate, by granting commissions, which shall expire at the end of their next session. He shall, from time to time,

give to the congress information of the state of the union, and recommend to their consideration such measures as he shall judge necessary and expedient: he may, on extraordinary occasions, convene both houses, or either of them; and, in case of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper: he shall receive ambassadors, and other public ministers: he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

The president, vice-president, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

PRESIDIAL, a tribunal or bench of judges, formerly established in the several considerable cities of France, to judge ultimately, or in the last resort, of the several causes brought before them, by way of appeal from the subaltern judges. The presidials make one company with the officers of the bailliages and seneschauſſees, where they are established:

The edict of 1551 establishes presidials, under these two conditions: first, that they may judge definitely, and without appeal, to the sum of 250 livres, or 10 livres *per annum*: and, secondly, to the sum of 500 livres, or 20 livres *per annum*, by provision.

When they judge in the former case, they are obliged to pronounce it with these words, *par jugement dernier*; in the latter, *par jugement présidial*.

When they judge finally of appeals from inferior judges, they may not pronounce the sentence or appeal, *au neant*, void; that form only belonging to the sovereign courts; but are to pronounce simply, that *it has been well or ill-judged*. To judge presidially and finally, they must be at least seven in number.

PRESIDII, *Stato di gli*, in *Geography*, a small district or province, situated on the coast of the Mediterranean, in the territory of Etruria, under the dominion of the king of Naples. Its capital is Orbitello.

PRESIDIO de Cerro, a town of Mexico, in New Biscay; 150 miles N. of Durango.

PRESIDIO de Janos, a town of New Navarre; 270 miles S.E. of Casa Grande. N. lat. 30° 95'. W. long. 109° 6'.

PRESIDIO de St. Juan, a town of New Mexico, in the province of New Leon. N. lat. 29° 11'. W. long. 101° 46'.

PRESLE, a town of France, in the department of the Aisne; eight miles E.N.E. of Soissons.

PRESNITZ, a town of Saxony, in Thuringia; two miles S.E. of Camburg.—Also, a town of Bohemia, in the circle of Saatz; 14 miles N.W. of Saatz.

PRESIPA, a town of European Turkey, in Macedonia; 11 miles N.N.E. of Akrida.

PRESQUE ISLE, a small peninsula, on the S.E. shore of lake Erie, S. of Long Point, on the opposite side of the lake; 15 miles from fort Bœuf, and 60 N. by W. from Venango, on Alleghany river. The garrison is upon a commanding spot, just opposite to the entrance of the bay. The town commences 30 yards W. of the old British fort, leaving a vacancy of 600 yards for a military parade and public walk. The town extends three miles along the lake and one mile back. It has the best harbour on the S. side of the lake. N. lat. 42° 45'. W. long. 82° 20'.

PRESQUE Island, an island near the N. coast of lake Ontario. N. lat. 43° 52'. W. long. 78°.

PRESQUE Isle, an island in lake Huron. N. lat. 45° 4'. W. long. 83° 4'.—Also, an island in the river St. Lawrence,

Upper Canada, in Edwardburgh, nearly opposite to Hospital island, and above Pointe au Gallope.

PRESQUE Isle Major, an island in the river St. Lawrence, in front of the township of Matilda, above Point Iroquois.

PRESS, a machine of most extensive use in the mechanic arts, for squeezing or compressing any substance very close, and also to retain the matter under the pressure as long as may be required.

All presses consist of the following parts: 1st, two flat, smooth tables of wood or metal, between which the substances to be pressed are placed; 2dly, the frame, or cheeks of wood or metal, which unite and retain the two together; and 3dly, the mechanical power, by which the pressure is effected. This is generally a screw, or two screws, turned by a long lever, or by wheelwork. At other times a rack is employed, and moved by a pinion turned by wheelwork, to give it a great power. Some presses used for expressing of oils are actuated by a wedge driven by a hammer or stamper, (see *OIL-Mill*), and in others, the pressure is produced by means of a powerful lever, and retained by a rack and click. Of late years the hydrostatic press has been produced, acting by the pressure of water or other fluids in cylinders. We shall now speak of the different kinds of presses.

Screw-presses are those in which the pressure is caused by means of one or more screws; the most common have a single screw, formed either of wood or iron, which at its lower end has a globe-head, with four holes through it, for the reception of the end of the lever employed to turn the screw; the thread of the screw is fitted through a nut, fixed fast in the head of the wood, or iron frame of the press. This frame consists of a lower bed, or horizontal piece, on which the matters to be pressed are laid, two upright cheeks being firmly united with it, and supporting the head, or upper horizontal piece of the press, in which the nut of the screw is fixed; the lower point of the screw is united with the follower, or moving bed of the press, and this rests upon the substances to be pressed, and the power of the screw forces it down upon it.

A drawing of this press, with its lever, and also a windlass to work it with immense power, will be found in *Plate XI. Agriculture*, as applied to express the juice of fruit for cider. The same kind is also employed for expressing some vegetable oils, but generally with iron framing, because of the great strength required; for packing cloth, paper, and other goods; also in the paper-mills, for flattening and rendering paper solid; and in the manufacture of woollen cloth, for glazing and setting a finish upon the article in its last stage.

Two elevations of a very good screw-press for a paper-mill are given in *figs. 6 and 7 of Plate II. Paper-Mill*. *A A* is the bed, formed of an immense beam of oak; and each of the cheeks, *B*, consists of a long iron bar *b b*, (*fig. 7.*), the ends of which are welded together, so that it forms a long link, one end of which receives the end of the bed *A*, and the other the end of a massive cast-iron cross bar or head *D*, through which the screw, *E*, is received, and its nut fixed fast therein. The open spaces of the long links or cheeks, *b, b*, are filled up by rails of wood, *C*, which support the weight of parts of the press when it is not in action, but these bear nothing, when the press has any articles under pressure in it; these articles are laid at *H*, on the bed, and the follower, *G*, is pressed upon them by the screw, when it is turned by a long lever put through the holes in the screw-head *F*. The screws employed for paper presses are generally formed with such coarse threads, and so rapid a spiral, that the elasticity of the paper is sufficient to force it

to run back. To these a ratchet-wheel, *a*, is fixed, and a click, *c*, (*fig. 8.*) is applied to its teeth: to prevent its return, the click is supported on a bar *b d*, which moves on a centre at *B*, but the other end is retained by a catch or lever *f g*. When the press is to be relieved, the end, *f*, of the catch is driven back; this relieves the bar *d b*, and the click no longer detaining the ratchet-wheel, the screw runs back.

The screws for presses were formerly made of wood, with sharp threads, that is, the worm of the screw, if cut across, would make a triangular section, the base thereof abutting upon the cylinder of the screw. In this method it was necessary to have the threads very coarse, to give them sufficient strength, and then the power of the screw was not so great as in the modern presses, where the screws are made of iron, and their threads need not be above one-third or fourth the distance asunder, to have the same strength.

Another advantage of the iron screw is, that the friction is so much diminished, that a far greater pressure can be obtained by the same exertion of the people who work it. The frames of the modern presses are also made of iron, wood being found incapable of resisting the strain of a severe pressure, for any considerable length of time; as all the fibres, even of the hardest oak, become separated into ribbands, and then break one at a time, till the whole beam fails.

Another kind of screw-press consists of two screws, which are immovably fixed in the lower board or bed, and passing through holes in the upper board, have nuts upon them, which being turned by a lever, draw the two boards together, and exert a pressure upon any thing placed between them. Sometimes the screws pass through the upper board, and are tapped into the lower one; then the screws themselves are turned round by a lever put through their heads, instead of turning the nuts. Presses of this kind, when accurately made, have a communication of wheelwork from one screw to the other, so that both shall turn round together, and cause the two boards of the press to advance parallel to each other.

A very ingenious and useful packing press, invented by Mr. John Peck, was, in 1768, rewarded by the Society of Arts. This machine consists of two very strong horizontal beams, one at the bottom for the bed, and the other at the top of the press. These are united by two iron screws, which stand in a vertical position, and therefore serve as cheeks to the press. The follower of this press is a very strong horizontal beam, having two nuts fitted into it at its ends. These nuts act upon the threads of the two vertical screws; and, therefore, it is plain when they are turned round, the follower will rise and fall upon them. The nuts are so fitted into the follower, as to admit of a circular motion round the screws, but are not permitted to rise or fall without the follower, because they have a circular ring or projection in the middle of their length, which is fitted into a proper receptacle in the wood-work. To give them motion, the edges of the circular rings are cut into cogs or teeth, and are turned by means of an endless screw for each, situated at the opposite ends of a horizontal spindle, which revolves in bearings attached to the follower of the press. The spindle has a winch at each end, by turning which, the two endless screws act upon the wheels or teeth of the nuts; and by thus causing them to turn round with equal velocities, raises or depresses the follower, always parallel to itself, and also to the head and bottom bed.

The great utility of this press consists in its being capable of packing two sets of bales at once; thus answering the

purpose of two presses, and with more expedition. It is placed upon the floor of the warehouse in which the packing is to be performed, and behind it a stage is erected, just half the height of the whole press; then one set of the bales are made up on the floor, and the other upon the stage. Suppose the follower raised up above the level of the stage, a bale of goods is placed on the lower bed, and by turning the winches, the follower is forced down upon it, till it is sufficiently pressed: now, while the men below are tying and making the bale fast, the people on the stage place a bale upon the follower; and it is plain, that when the follower is raised up to relieve the lower package, the upper bale will be compressed between the follower and the head of the press; and while this is making fast, the workmen below get another bale of goods loaded in. By this means no time is ever lost in screwing up or opening the press; for it performs work both ways, which is a matter of no small importance in large works, such as the East India Company's warehouses, where such a great number of people are employed in packing.

In the Philosophical Transactions for 1781 is an account of a double screw, applied to a press, by Mr. W. Hunter. To explain this, we must suppose a single screw-press of the ordinary form, such as shewn in *Plate XI. Agriculture*, or *Plate II. Paper-Mill*; but the lower end of the screw, which rests upon the follower or presser, has a second screw of finer thread cut upon it. This thread is received into a nut or barrel, which rests upon the presser. The nut is at liberty to turn round freely upon the presser, except when it is required to be stationary; and then, by a key, it can be fixed fast to it. In like manner, the nut or barrel can, at pleasure, be fixed fast to the lower screw by a key put through a hole in both; and in this state they will of course turn round together. As the nut and lower screw take up some room, the screw is turned by arms fixed in a head, formed on the upper end of it, above the press. In the operation of this press, the nut or barrel is pinned fast to the lower screw by the key; and the screw being turned by the arms at top, the nut is carried round with it, and the effect is exactly the same as an ordinary screw-press. But having by this means given as great a pressure as the single screw is capable of producing, the cross key which unites the lower screw to the barrel is removed, and is put in such a position, that it unites the barrel to the presser, so as to prevent its turning round upon it. The effect of the press now becomes compound, and while the whole screw is carried downwards by the revolution of the great screw, the fine screw at the bottom of it screws down into the barrel or nut, which is attached to the presser; which is, therefore, carried down a quantity only equal to the difference of the thread of the two screws; and if these are made very nearly alike, the descent produced by the difference between them will be exceedingly small, and the power exerted upon the articles under pressure will be in proportion to it. Indeed the effect would be the same, as if a single screw had been employed, having its threads so fine or close together, that the difference between thread and thread is only equal to the difference between the measures of the threads of the two screws.

For example: Suppose it was required to produce a strong pressure, with a screw of ten threads in an inch, it is evident that the metallic protuberance, or helix of the screw, could not be quite so thick as one-twentieth of an inch, and could not, therefore, withstand any considerable force. By the present construction, we may have the thread as strong as can be desired. Thus, if the slightest be a quarter of

an inch, the finest screw must have two turns in the inch, and the coarsest two turns in one inch and one-tenth; or, in other words, it would pass over the same space in ten turns, that the other screw would in eleven.

Upon the invention of the double screw Mr. Nicholson remarks, that from the extreme precision of a simple screw, if commonly well made, it may seem scarcely necessary to use this contrivance in the measurement of small quantities. The finest screws usually to be met with do not exceed 100 threads in the inch, and few have been made finer than of 200 threads in that space. Let us consider by what threads, of usual, or even coarse numbers, we could have a difference *per* turn of above one-thousandth of an inch, and we shall find that the difference between a thread of 32 and one of 33 in the inch, is the 1056th part of an inch; so likewise, the difference between the 60th and 61st parts of an inch is the 3660th part.

The *Hydrostatic* or *Water Press* has, for a great number of purposes, superseded the use of the screw-press, over which it possesses great advantages, in all cases where a strong pressure is required. This machine was invented by Mr. Joseph Bramah, and its principle has been explained in our article *MACHINERY*. (See vol. xxi.) In plate *Press* we have given drawings of one of them, *figs. 1* and *2* being elevations, taken in opposite directions; *A A B c c* is the frame, consisting of a piece of cast iron, *c c*, (see also *fig. 3.*), and a top piece of cast iron, *B*, (see also *fig. 4.*), the two being united by the wrought iron bolts *A, A*, which must have sufficient strength to resist the whole force of the press, the pressure being produced between the under surface of *B*, and the upper surface of an iron table or follower, *E*; *F* is a strong metallic cylinder, in which the rammer or piston, *D*, moves. To the upper part of this piston, the iron table, *E*, is fixed, by the motion of which upwards, the pressure is communicated to the articles placed upon it; *L* represents a cistern containing water; within this cistern is fixed a small forcing or injecting pump, of which *b* is the piston rod, and *H* the lever by which it is worked, a contrivance being introduced for keeping the piston rod vertical during the working: it consists of a guide, formed at the top, of the same standard, *K*, which supports the fulcrum or centre pin, *e*, of the lever *H*; the rod *g*, which is part of the piston rod, slides through the socket; the part, *f*, of the rod is made open, to admit the lever to pass through it, a link being applied to unite the lever to the rod; *I* is a counterbalance for the weight of the lever. *Fig. 5.* is a section of the pump, on a larger scale, to shew its interior structure, *b* representing the lower extremity of the piston rod; it is surrounded by a collar of leather, *s*, which is retained in its place by a tube, or perforated screw, *r*, which admits the passage of the piston rod *b*, but which screws the two-cupped leathers with the metal ring, which is interposed between them, close down to a shoulder, is the body of the injecting pump, and thus renders the junction between the injecting piston *b*, and its cylinder, water-tight: the upper part of the screw, *r*, is excavated, to form a receptacle for oil; *M M* is the barrel, or chamber of the pump, in which the piston rod does not fit; but the collar of leather *s*, closely embracing the rod, will have the same effect of enlarging or diminishing the capacity of the chamber when the rod is moved up and down. In the bottom of the chamber is a suction valve, *N*, which allows the water to enter into the barrel from the cistern, but will not permit it to return in the same direction; it is fitted into the upper part of a tube, *N*, which is screwed into the lower end of the barrel: the valve itself consists

consists of a metallic rod, at one end of which there is a knob turned conical next the stem, so as accurately to fit the conical face of the hole into which it is put; the tail is filed on one side, so that it does not entirely fill the cylindrical hole which it occupies, by which means a passage is afforded for water when the head of the valve is raised. A valve of a similar nature is placed at *t*, in the upper part of the pump, and being in the passage which conveys the water from the pump, and through the copper pipe, *b*, to the cylinder, *F*, it allows the water to pass from the pump to the cylinder, and prevents its returning. At *k*, *fig. 5*, is a safety-valve, which is loaded by a steelyard and weight, as shewn at *k*, *fig. 1*: this keeps the valve shut in the ordinary course of working; but if the pressure should become so great as to endanger the bursting of the pipes, the valve rises, and the water escapes. At *i* is a screw plug, or valve, at which the water is discharged, when the press is to be relieved. When screwed tight, its conical end or point is forced into a corresponding socket, and prevents the escape of the water; but on turning the screw back, the water is permitted to flow back into the cistern. The real situation of this discharging valve is shewn in *fig. 1*, at *i*. The cylinder, *D*, is surrounded by a collar of leather at *o o*; the leather is formed as shewn in *fig. 7*, being turned up to form a double cup, so that it resembles the cuff of a coat sleeve. When in its place it is kept distended by the copper ring, *p*, entering the circular channel, or fold, of the leather. This ring has a lodgment in a recess formed within the cylinder *F*. The leather is kept down by a brass or bell-metal ring, *m*, which is received into a recess formed round within the cylinder, as shewn in *fig. 5*. The interior aperture of this ring is adapted to receive the cylinder *D*, and thus the leather becomes confined in a cell, with the edge of the interior fold applied to the cylinder *D*, whilst the edge of the outer fold is in contact with the interior surface of the cylinder *F*. In this situation the pressure of the water, acting between the folds of the leather, forces its edges into close contact with both, and makes a tight fitting round the cylinder, and as the pressure is increased the leather is applied more closely, so as to prevent leakage under any circumstances. The metal ring, *m*, is truly turned in the lathe, and the cavity or cell formed for its reception; then to get it into its place, it is divided by a saw into five segments, as shewn in *fig. 6*. Three of the lines at which it is divided point to the centre, but the other two are parallel to each other, and the ring is put into its place (after the leather and copper rings are introduced), by putting in the four segments separately, and the one with parallel sides is put in last. The cylinder, *D*, is then put down in its place, and ready for action. This plan of a divided ring was first used by Mr. Peter Kier, who, since the expiration of Mr. Bramah's patent, has made several hydrostatic presses. In the original construction, the ring or head of the cylinder, which kept down the leather cup, was held down in its place by several screw bolts, but as these had to bear a greater force than the whole power of the press, they were frequently torn out, or strained, so as to cause leakage. The upper part of the cylinder above the ring, *m*, is filled with tow, or other soft packing, impregnated with sweet oil, which is confined by a thin plate or ring. This packing serves at once to supply the cylinder with oil, and to prevent the admission of any substance which might injure the surface of the piston.

The pipe, *b*, is made of copper, and its joints are made as shewn in *fig. 5*. The end of the pipe has a projecting piece soldered or screwed upon it, and this fits into a cavity formed in the metal of the pump or cylinder, and it is forc-

bly pressed into its seat by a perforated screw *w*, which screws into the cavity. The joints are rendered tight by a leather ring or washer, interposed between the end of the pipe and the bottom of the cavity in the cylinder or pump.

The hydrostatic press is not liable to get out of order, but if any extraneous matter attaches itself to either of the valves, their action will necessarily be suspended till it be removed; for this purpose the valves can be taken out. The valve at *t* has a screw plug, *g*, fitted over it, and this regulates the ascent of the valve, or by unscrewing the plug the valve can be taken out. To get access to the lower valve, the lower piece, *N*, of the pump must be unscrewed. The discharging valve, *i*, may also be examined by withdrawing its screw.

The operation of this press may be very readily comprehended, by supposing the pump, cylinder, and connecting pipe *b*, to be filled with water, and that an adequate supply of water is contained in the cistern *L*. When the handle of the lever, *H*, is raised, it brings up the piston *b*, which would leave a vacuum beneath, if the atmosphere did not force the water through the lower, or suction valve, of the pump. The lever being then pressed down, the piston rod, by descending, diminishes the capacity of the pump; this causes the lower valve to shut, and forces the water through the valve *t*, whence it passes, by the pipe *b*, into the cavity of the great cylinder *F*, and raises the piston *D*, and pressing-table *E*, together with its load, a distance proportioned to the quantity of fluid injected. On the subsequent rise of the piston of the pump, the descent of the upper valve prevents the return of the water, and consequently the fall of the cylinder *D*. A repetition of the same process injects more water, and the pressure may, in this manner, be carried to a great extent. When it is proposed to relieve the action of the press, the discharge valve, *i*, must be opened by turning the screw back; the water then escapes out of the press into the cistern *L*, and consequently the table *E*, and the cylinder *D*, descend by their own weight, restoring the engine to its original situation.

The mechanical effect of the hydrostatic press will admit of an easy calculation. For it is known, that if there be a mutual communication between two columns of any fluid, whatever pressure or effort may be exerted on the one, will be transmitted to the other in a ratio proportional to the respective area of each column, consequently the proportion of the area of the injecting pump to that of the cylinder constitutes the hydrostatic power of the press, and the mechanical effort exerted on the injecting pump is transmitted to the cylinder *D*, by the intervention of the fluid, in a ratio proportional to their comparative areas.

If the diameter of the piston, *b*, be one quarter of an inch, and that of *D* one inch, that is to say, four quarters of an inch, one pound lodged upon the piston rod, *g*, will be in equilibrio with sixteen pounds lodged upon the table *E*, the weights of the parts of the engine attached to, and moving with each piston, being respectively included. And if the length of the lever, *e H*, be fifteen inches, and the distance between the centres of motion, *e f*, of their action upon the piston rod two inches, one pound at the end of *H* will gain an advantage of $7\frac{1}{2}$ times, when compared with that at *g*. Instead, therefore, of sixteen pounds, upon the table *G*, being equal in effect to counterpoise this last action, there will be required upwards of 120 pounds. But a man in this action of pumping, by a downward pressure, can, without difficulty, apply his whole weight, and with great ease one-third, or one-fourth, of his weight, suppose 50 pounds. In this case the pressure will be equivalent to 50 times 120 pounds, or 6000 pounds, that is to say, nearly three tons.

To compare this engine with a screw in theory, we must enquire what fineness of thread, and length of lever, would afford a purchase of 120 to 1. Let us suppose the thread of a screw, substituted in the place of the cylinder D, to be one-tenth of an inch thick, the distance from the top of one thread to the top of the next, will in this case be one-fifth of an inch. This is the space through which the weight must rise in one revolution of the screw; the power must, therefore, move through 120 times that space, namely, twenty-four inches. A lever or radius four inches long will describe a circle somewhat larger than this, and consequently such an engine would, in theory, be equal in power to the hydrostatic engine we have been describing.

But when the subject is viewed practically, the difference between the two machines appears to be very remarkable. All practical men know how very large a part of the force, operating by means of engines, is employed in overcoming friction. Every one is aware of the extreme friction between solids, and the very slight friction which takes place between the parts of fluids. This is seen in the common expedient of oiling the pivots of wheels, and in the very gradual decay of motion in fluid bodies, while solids moving upon each other stop at once as soon as the force is diminished to a certain degree. The screw is an organ peculiarly liable to friction, and this friction is always much greater than the whole of the re-acting force, for there are few instances where a screw will return from extreme pressure, when the agency upon the lever is withdrawn. It is also to be considered, that the whole force of the weight or resistance acts directly upon the face of the thread of the screw, at the place where the motion is required to take place. It has not been ascertained in what degree this resistance or friction increases with the weight. In lighter actions the simple ratio has been inferred, but under more severe pressures, the two metallic faces exclude the greater part of the half fluid matter between them, and appear, by the magnitude of their resistance, to be attached to each other by a process of the nature of cohesive attraction.

Mr. Nicholson, in his Journal, relates the following experiments, which he made with one of Mr. Bramah's small presses, which he makes for the purpose of copying letters, or writings, in the manner of Mr. Watt (see COPYING); it had the same parts which we have described, but the frame made of wood. When employed to press papers, the force applied to the lever of the injecting pump was so slight, that the instrument required no fastening to the table on which it stood; but the effect of the upper bar, B, which was of wood, three inches and a half thick, was such, as bended it out of a straight line upwards of a quarter of an inch, and it appeared that it might have easily been broken by continuing the pressure. With a screw-press, the screw of which was iron, and nearly of the dimensions above mentioned, excepting that the lever was twelve inches long instead of four inches, and the action on the lever upwards of two hundred weight, applied with a jerk, the effect was nearly the same: he estimated the advantage to be very much in favour of the hydrostatic press.

In another press of this kind, the diameter of the great piston was four inches, and of the smaller three-eighths of an inch, and the advantage given by the lever or handle was twelve to one. Above the piston, D, of the great cylinder, was applied a long lever, at one end of which was an axis, and at the other end a large scale to hold weights; it contained twenty hundred weight. The distance between the axis of motion of this lever, and the part where it acted on the piston, was six inches; and the distance from the same axis to the extremity where the scale was hung, was one

hundred and twenty-six inches. Every hundred weight in the scale consequently pressed upon the piston with a force equal to twenty-one hundred weight, whence the whole pressure was twenty-one tons. It was easy to work the lever briskly with one hand, and each stroke raised the scale nearly one-third of an inch. Forty-seven pounds, hung at the end of the lever, carried it down with a moderate swiftness of working; but a weight of only forty-three pounds remained in equilibrio, and did not descend. Now as the true weight in theory was thirty-two pounds, as deduced from the dimension of the parts in the manner already done, with regard to the small press it follows, that less than one-third of the actual power was employed to give velocity, and overcome all friction.

It may be remarked, that the principal frictions in these presses must be at the circumference of the pistons, and that these do not increase in the simple, but in less than the sub-duplicate ratio of the power. For if the diameter of the great cylinder were double, every thing else remaining unchanged, the surface of its piston, and consequently the power, would be quadrupled, but the friction would be only doubled, and that merely at the leathering of the greater piston D.

As the pressure, in the experiment last mentioned, amounted to forty-seven thousand and forty pounds upon the great piston, of four inches diameter, and sixteen circular inches surface, it amounted to two thousand nine hundred and forty upon each round inch; but the medium pressure of the atmosphere on a round inch is nearly twelve pounds, consequently the action was equal to two hundred and forty-five atmospheres, and as each of these corresponds with a column of thirty-four feet of fresh water, at a medium the water in the cylinder was pressed in the same manner, as if the whole column had been eight thousand three hundred and thirty feet, or one mile and two-thirds perpendicular height.

Large presses of this construction are generally made with two pumps, of one inch and a quarter bore, and a cylinder of seven inches. These have been used in pressing hay and cotton for package, and are very effective in producing a greater condensation on the material, with a much less application of moving power, and consumption of time.

PRESSES used for expressing of liquors, are of various kinds; some, in most respects, the same with the common presses, excepting that the under plank is perforated with a great number of holes, to let the juice expressed run through into a tub, or receiver, underneath.

Others have only one screw, or arbor, which passes through the middle of the moveable plank, which is made to descend into a kind of square box, full of holes on all sides; through which the juices flow, in proportion as the arbor is turned; by means of a little lever applied thereto.

Press used by joiners to keep close the pieces they have glued, especially pannels, &c. of wainscot, is very simple, consisting of four members; viz. two screws, and two pieces of wood, four or five inches square, and two or three feet long; of which the holes at the two ends serve for nuts to two screws.

Press used by inlayers resembles the joiners' press, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a tressel, being sustained by two legs, or pillars, jointed into it at each end.

This press serves them for sawing and cleaving the pieces of wood required in marquetry, or inlaid work.

PRESS, Founders', is a strong, square frame, consisting of four pieces of wood, firmly joined together with tenons, &c.

This press is of various sizes, according to the sizes of the moulds; two of them are required to each mould, at the two extremities of which they are placed; so as that, by driving wooden wedges between the mould and the sides of the presses, the two parts of the mould, in which the metal is to be run, may be pressed close together.

PRESS, Printing. See *PRINTING Press*.

PRESS, Messenger of the. See *MESSENGER*.

PRESS, Auditors of the. See *AUDITORS*.

PRESS, Rolling, is a machine for the taking off prints from copper-plates.

It is much less complex than that of the letter-printers.

See its description and use under the article *Rolling-press* *PRINTING*.

PRESS, in Coining, is one of the machines used in striking of money; differing from the balance, in that it has only one iron bar to give it motion, and presses the moulds, or coins; is not charged with lead at its extreme, nor drawn by cordage. See *COINAGE*.

PRESS, Binders cutting, is a machine used equally by book-binders, stationers, and pasteboard-makers; consisting of two large pieces of wood, in form of cheeks, connected by two strong wooden screws; which being turned by an iron bar, draw together, or set asunder, the cheeks, as much as is necessary, for the putting in the books, or paper, to be cut.

The cheeks are placed lengthways on a wooden stand, in form of a chest, into which the cuttings fall. Aside of the cheeks are two pieces of wood, of the same length with the screws, serving to direct the cheeks, and prevent their opening unequally.

Upon the cheeks the plough moves, to which the cutting-knife is fastened by a screw; which has its key to dismount it, on occasion to be sharpened.

The plough consists of several parts; among the rest, a wooden screw, or worm, which catching within the nuts of the two feet, that sustain it on the cheeks, brings the knife to the book, or paper, which is fastened in the press between two boards. This screw, which is pretty long, has two directors, which resemble those of the screws of the presses. To make the plough slide square and even on the cheeks, so that the knife may make an equal paring, that foot of the plough where the knife is not fixed, slides in a kind of groove, fastened along one of the cheeks. Lastly, the knife is a piece of steel, six or seven inches long, flat, thin, and sharp, terminating at one end in a point, like that of a sword, and at the other in a square form, which serves to fasten it to the plough. See *BOOK-BINDING*.

As the long knives used by us in the cutting of books or papers are apt to jump in the cutting thick books, the Dutch are said to use circular knives with an edge all round; which not only cut more steadily, but last longer without grinding.

PRESS, in the Woollen Manufactory, is a large wooden machine, serving to press cloths, serges, rateens, &c. by which to render them smooth and even, and to give them a gloss.

This machine consists of several members; the principal of which are the cheeks, the nut, and the worm or screw, accompanied with its bar; which serves to turn it round, and make it descend perpendicularly on the middle of a thick wooden plank, under which the stuffs to be pressed are placed. The calender is also a kind of press, serving to press or calender linens, silks, &c.

PRESS, Liberty of the, in Law, consists, says judge Blackstone, in laying no previous restraints upon publications, and not in freedom from censure for criminal matter, when published; and this is essential to the nature of a free state. Every free man has an undoubted right to lay what sentiments he pleases before the public; to forbid this is to destroy the freedom of the press; but if he publishes what is improper, mischievous, or illegal, he must take the consequence of his own temerity. To subject the press to the restrictive power of a licenser, as was formerly done, both before and since the revolution, is to subject all freedom of sentiment to the prejudices of one man, and make him the arbitrary and infallible judge of all controverted points in learning, religion, and government. But to punish (as the law does at present) any dangerous or offensive writings, which, when published, shall on a fair and impartial trial be adjudged of a pernicious tendency, is necessary for the preservation of peace and good order, of government and religion, the only solid foundations of civil liberty.

The art of printing, says the same excellent writer, soon after its introduction, was looked upon (as well in England as in other countries) as merely a matter of state, and subject to the coercion of the crown. It was, therefore, regulated with us by the king's proclamations, prohibitions, charters of privilege and of licence, and, finally, by the decrees of the court of star-chamber, which limited the number of printers, and of presses, which each should employ, and prohibit new publications, unless previously approved by proper licensers. On the demolition of this odious jurisdiction in 1641, the long parliament of Charles I. after their rupture with that prince, assumed the same power as the star-chamber exercised with respect to the licensing of books; and in 1643, 1647, 1649, and 1652, issued their ordinances for that purpose, founded principally on the star-chamber decree of 1637. In 1662 was passed the statute 13 & 14 Car. II. c. 33. which (with some few alterations) was copied from the parliamentary ordinances. This act expired in 1679, but was revived by stat. 1 Jac. II. c. 17. and continued till 1692. It was then continued for two years longer by stat. 4 W. & M. c. 24; but though frequent attempts were made by the government to revive it in the subsequent part of that reign, yet the parliament resisted it so strongly, that it finally expired, and the press became properly free in 1694, and has so continued, under certain limitations, ever since.

How far these limitations and restrictions are vindicable on the learned judge's principles and declarations, (*ubi infra*), we shall not undertake to determine. It will be sufficient for us to observe, that those are inexcusable, who by abusing the liberty of the press and subjecting themselves to the just animadversion of the law, contribute to restrain it, no less than others, who by the severity of punishment inflicted on trivial violations of it occasion or justify measures for abridging this glorious privilege of Britons and palladium of the British constitution and liberties.

The learned judge says, that by the liberty of the press, as it existed in his time, "the will of individuals is still left free; the abuse only of that free will is the object of legal punishment." Neither is any restraint hereby laid upon freedom of thought or inquiry; liberty of private sentiment is still left; the disseminating, or making public, of bad sentiments, destructive of the ends of society, is the crime which society corrects. A man (says a fine writer on this subject) may be allowed to keep poisons in his closet, but not publicly to vend them as cordials. And to this we may add, that the only plausible argument heretofore used for the restraining of the just freedom of the press, "that it

was necessary to prevent the daily abuse of it," will entirely lose its force, when it is shewn (by a reasonable exertion of the laws) that the press cannot be abused to any bad purpose, without incurring a suitable punishment; whereas it can never be used to any good one, when under the controul of an inspector. So true will it be found, that to censure the licentiousness, is to maintain the liberty, of the press. Blackst. Comm. book iv.

PRESS, in the *Manege*. A horse is said to resist, or press upon the hand, when either through the stiffness of his neck, or from an ardour to run too much a-head, he stretches his head against the horseman's hand, refuses the aid of the hand, and withstands the effects of the bridle.

If your horse is too fiery, and presses upon the hand, endeavour to pacify him by making him go more softly, and pulling him backwards; and if it proceeds from a stiffness of the shoulders and neck, you must supply him with a cavesson, made after the duke of Newcastle's way. See **HEAVY**.

PRESS is also used for pushing a horse forwards by assisting him with the calves of your legs, or even spurring him, in order to make him go on.

PRESS, or *Pressing*, in *Sea-Language*. See **MANNING the Fleet**.

PRESSAS, in *Geography*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Agen. The place contains 1413, and the canton 9051 inhabitants, on a territory of 137½ kilometres, in 14 communes.

PRESSAT, a town of Bavaria; 19 miles N. of Amberg.

PRESSELUNDS, a town of Norway; 68 miles N. of Christiania.

PRESSIGNY, a town of France, in the department of the Upper Marne; 15 miles S.E. of Langres.

PRESSIGNY le Grand, a town of France, in the department of the Indre and Loire, and chief place of a canton, in the district of Loches. The place contains 953, and the canton 9000 inhabitants, on a territory of 355 kilometres, in 13 communes.

PRESSING, in the *Manufactures*, the action of violently squeezing a cloth, stuff, linen, &c. in a press, to render it even, smooth, polished, and glossy.

This, in the silken and linen manufactures, they properly call *calendering*.

There are two manners of pressing; the one *hot*, the other *cold*.

PRESSING Cold, Method of. After the stuff has had all its preparations, *i. e.* has been scoured, fulled, and shorn, (see **FULLING** and **SHEERING**,) it is folded square, in equal plaits; and a skin of vellum, or fine smooth pasteboard, is put between each plait. Over the whole is laid a square wooden plank; and in this condition it is put in the press, which is driven tight down by means of the screw turned full upon it, by the hands, assisted with levers.

After it has lain a sufficient time under the press, they take it out, remove the pasteboards or vellums, and lay it up to keep. It may be observed, that some do not use a press with a screw in pressing cold, but content themselves with laying the stuff on a firm table, after plaiting and pasteboarding it as before; covering the whole with a wooden plank, and loading this with a weight, greater or less, as is judged necessary.

PRESSING Hot, Method of. The stuff having received all its preparations, as before, it is sprinkled a little with water, sometimes with gum-water, spurted over it with the mouth; then plaited equally, and between each two plaits are put

leaves of pasteboard; and between every sixth and seventh plait, as well as over the whole, an iron or brass plate, well heated, in a kind of furnace prepared for the purpose.

This done, it is laid upon the press; and a screw is brought forcibly down upon it, by means of a long iron bar.

Under this press are laid five or six pieces, one over another, at the same time, all furnished with their pasteboard and iron plates. When the plates are well cold, they take the stuffs from under the press, remove the pasteboards and plates, and stitch it a little together, to keep it in the plaits.

This manner of pressing woollen stuffs is very pernicious, and was only invented by the manufacturers to cover the defects of the stuffs, and excuse their not giving them all the shearings, dyes, and preparations, that are necessary to render them perfect: accordingly they have been frequently prohibited.

PRESSING to Death. See **PAIN Fort & Dure**.

PRESSION, or **PRESSURE**, in the *Cartesian Philosophy*, an impulsive kind of motion, or rather an endeavour to move, impressed on a fluid medium, and propagated through it.

In such a pression the Cartesians suppose the action of light to consist. (See **LIGHT**.) And, in the various modifications of this pression, by the surfaces of bodies, on which that medium is thus pressed, they suppose the various colours to consist, &c. But sir Isaac Newton has taught us better; for if light, *e. gr.* consisted only in a pression, propagated without actual motion, it could not agitate and warm such bodies as reflect and refract it, as we actually find it does; and if it consisted in an instantaneous motion, or one propagated to all distances in an instant, as such pression supposes, there would be required an infinite force to produce that motion every moment, in every lucid particle.

And if light consisted either in pression, or in motion propagated in a fluid medium, whether instantaneously, or in time, it must follow, that it would infect itself *ad umbram*; for pression, or motion, in a fluid medium, cannot be propagated in right lines, beyond any obstacle which shall hinder any part of the motion; but will infect and diffuse itself, every way, into those parts of the quiescent medium which lie beyond the said obstacle.

Thus the force of gravity tends downward; but the pressure which arises from that force of gravity, tends every way with an equable force; and, with equal ease and force, is propagated in crooked lines as in straight. Waves on the surface of water, while they slide by the sides of any large obstacle, do infect, dilate, and diffuse themselves, by degrees, into the quiescent water lying beyond the obstacle. The waves, pulses, or vibrations of our air, in which sounds consist, do manifestly infect themselves, though not so much as the waves of water; for the sound of a bell, or of a cannon, can be heard over a hill, which intercepts the sonorous object from our sight; and sounds will be propagated as easily through crooked tubes, as through straight.

But light is never observed to go in curve lines, nor to infect itself *ad umbram*; for the fixed stars do immediately disappear on the interposition of any of the planets; as well as some parts of the sun's body, by the interposition of the Moon, Venus, or Mercury.

PRESSURE of the Air. See **AIR**.

Most of the effects anciently ascribed to the *fuga vacui*, are now accounted for from the weight and pressure of the air.

The pressure of the air on the surface of the earth is balanced

anced by a column of water of the same base, and about thirty-five feet high; or of one of mercury, of about twenty-nine inches.

The pressure of the air on every square inch on the surface of the earth, is computed to be about fifteen pounds avoirdupois. See *ATMOSPHERE*.

PRESSURE, Centre of. See *CENTER of Pressure*.

PRESSURE of Fluids. See *FLUID*.

PRESSURE Engine is an hydraulic machine, acting by the power of a descending column of water upon the piston of a cylinder, to give motion to pumps, for raising water from a different level. In the mountainous districts which so frequently contain rich mineral treasures, falls of water may be often obtained at a greater elevation than it is practicable to construct water-wheels of sufficient size to occupy the whole descent; and often the stream is too small to supply a wheel. In these situations the pressure engine is well adapted to produce the greatest effect from the fall, in working pumps, or other machines for draining the mines of water. The same principle can readily be extended to the raising of water for supplying towns, gentlemen's houses, &c.; and universally for raising water from any depth wherever a fall of water can be procured, particularly in those cases where the fall is great, that is, where it exceeds 30 or 40 feet. It will not only exceed all other known machines in effect, but in simplicity, and that whether the quantity of water that is to be applied is great or small.

Machines of this kind, invented by Mr. Denizart, are described in the *Machines Approuvées par l'Académie* for 1731, vol. v. and by Mr. Genflanes in 1741, vol. vii.; but the earliest which was put in execution in this country was by Mr. William Westgarth, who invented the proper expedients to obviate those difficulties which had before attended the practical execution of machines upon this principle in France; he erected a large one at a lead mine of Sir Walter Blacket's, at Coal Cleugh, in Northumberland, in the year 1765. Mr. Westgarth's machine consisted of a cylinder, provided with a piston suspended by a chain from a beam or working lever, from the opposite end of which the rod of the pump, which was to raise the water, was suspended; the working cylinder was made the full height of the column of water which was employed to work the engine, and the working beam was, of course, placed above the top of it, whilst the chain and rod reached down into it; so that the piston itself acted in a chamber or barrel, nearly at the bottom of it; a trough, or cistern, at the top of the cylinder, was kept constantly supplied by the stream of water, and thus the whole height of the cylinder being filled with water, the pressure of its column always bore upon the piston. From the lower part of the cylinder was a passage to permit the water to escape from it, and likewise another passage by a pipe, communicating from the lower part of the cylinder, beneath the piston, to the upper part of the same above the piston. Both these passages were governed by a sliding valve of very ingenious structure, which opened and shut them alternately, but would not allow both to be open at one time. The sliding valve was actuated by an apparatus of levers, very similar to those used in the old steam-engines for opening the cocks; and the pump rods were so loaded as always to have a preponderance to draw the piston up when the pressure of the water upon it was removed or balanced. Suppose the piston at the top of its motion, by opening the passage from the bottom of the cylinder the water escapes from it, and relieves the lower side of the piston from the pressure of the water, whilst the whole column continues to press upon the upper side: in this situation the piston descends, drawing up a column of water in the pumps

at the opposite end of the beam or lever, but on arriving at the bottom of the cylinder, the mechanism alters the sliding valve, and it closes the passage at which the water escapes from the cylinder, and at the same time opens the other in the pipe, which admitting the water from the upper into the lower part of the cylinder, it will press equally below the piston as above it, consequently the forces are balanced, and the counter-weight of the pump rods, at the opposite end of the beam, will draw up the piston to the top of its chamber, when the position of the sliding valve is again altered, and it closes the pipe, at the same time opening the passage for the water to escape; this makes another stroke, and thus the engine continues to work as long as the supply of water is kept up. The minutiae of the machine are described in the *Transactions of the Society of Arts*, vol. i. but the ingenious Mr. Smeaton soon improved it very materially, by enclosing the top of the cylinder with a lid, through which the piston rod passes in a collar of leather, and the cylinder is then required to be no higher than convenient for the motion of the piston within it, the water being introduced to it by a pipe. The construction of Mr. Westgarth's sliding valve he preserved with very little alteration. In *Plate Pressure*, we have given drawings of a small engine which Mr. Smeaton erected in Yorkshire, at the seat of lord Irwin, in 1770, to raise a supply of water for the service of the house. *Figs. 1 and 2* are elevations of the whole engine, and the other figures are enlarged sections of the sliding valve, which regulates the admission of the water into the working cylinder at proper intervals, to cause the motion.

The pipe, A, which supplies the engine with water is 1.7 of an inch bore; its perpendicular descent from its mouth or entry at the spring of supply is 54 feet; and its length 400 feet. The water is conveyed from the engine by a pipe, I, which has a fall or descent of twelve feet from the engine to the surface of the water in the pit or well into which it delivers; and it has a stop-cock, which regulates the discharge of the water. This descending column of 66 feet of water is employed in working a pump, D, which throws back part of the water to a reservoir by a pipe, O, in ascent about 900 feet in length, and 1.5 inch bore. The delivery of this pipe at the top of the reservoir is 80 feet above the engine, consequently 26 feet above the level of the head or spring of supply. The pipe, A, conducts the water to the pump, D, by one branch, and to the top of the cylinder, C, which works the engine, by the other. The cylinder, C, is of brass, truly bored, and furnished with a solid piston, whose rod, b, passes through a close stuffing-box in the cylinder lid, where a leather is packed round it so closely, that no water can leak by it; the upper end of the piston rod is keyed into a small box, which connects it with an iron rod, sliding through a guide, c, to make it move steadily. K is the working-beam, moving round a centre at L; it has an arch head at the outer end, which is a segment of a circle, struck from the centre L; the arch receives a chain, by which the piston-rod, b, is suspended, and therefore has a vertical motion. E is the pump-rod, jointed to the beam, and moving up and down with it; the forcer of the pump, D, is fixed to it at the lower end. H is a pipe, which forms a communication between the top and bottom of the cylinder; it leads down into a chest, N, upon which the cylinder is placed, and to which it is open at bottom; the chest is composed of plates screwed together, as shewn by the sections, *figs. 3, 4, and 5*, which also explain the construction of the sliding valve contained within the chest. In these figures, s is a short cylindrical pipe, fixed across within this chest, and communicating with the

pipe, H, at top, and the pipe I (which conveys the water away from the engine) at bottom. This short pipe has a water-tight division, *v*, (*fig. 4.*) in the middle of it, so that there is no direct passage through it from H to I; but there are four square holes made in the pipe, at equal distances round it, above and also below the division, as shewn at *figs. 4* and *5*. A cylinder or tube of brass, *t t*, is fitted upon the cylindric pipe, and slides up and down it, being packed with leather round the edges of the middle partition, as shewn in *fig. 4*, that no water may escape between the two cylinders. The sliding cylinder, *t*, is just half the length of the other, and when it is pushed down, as in the figures, it covers and stops the four holes in the pipe *s*, which are below the division *v*, and opens the four holes above the division, allowing a passage from the pipe H to the bottom of the cylinder C, *fig. 1*. On the contrary, when the slider is pushed up, the upper holes are closed, and the lower ones opened, making a passage from the cylinder bottom into I. The sliding valve *s*, besides the leather packing which surrounds the partition *v*, has leather placed at top and bottom of the fixed cylinder *s*, at *r, r*, and the ends of the slider are pressed upon these leathers, to make a tight joint when up or down, but the cylinder fits as tight as it can be made, independent of the leathers. The sliding valve has a pin projecting from each side of it, which pins are included between clefts made at the end of a forked lever *w x*, moveable on an axis *y*, which passes through the side of the chest in a collar of leather *z*, *fig. 5*, and has a long lever *o*, *figs. 1* and *2*, fastened upon it. By moving the upper end of this lever towards the engine, the sliding valve will be raised up; and by moving it in a contrary direction, the valve will be pushed down: *g* is a small iron rod, jointed to the upper end of the long lever by one of its ends, and the other is suspended by hooks from a spindle turning upon pivots, supported by the framing; this spindle has several levers upon it, similar to the working gear of a steam-engine, as follows: *b b e* is a three-armed lever; the arm, *e*, has a weight at the end, and is called the tumbling bob; *b* and *b* are two other arms, made in the same piece with *e*; these two latter arms strike against a pin, fixed across in the end of the rod *g*, which is forked, to admit the pin and the arms *b, b*, to act within the fork; *k* are two crooked levers, by which the spindle is moved as handles; these levers are struck by pins, *i*, fixed in a wooden rod *d d*, which is jointed to the working-beam K, and moves up and down with it: *e*, (*fig. 2.*) is a piece of wood fixed to the upright beams of the frame, having pins projecting from it, which catch the tumbling bob *e*, and prevent it moving too far; Q is a stop-cock in the main pipe, which regulates the quantity of water coming to the engine, and consequently the velocity with which the engine will work.

To describe the operation of the engine; suppose every thing to be in the position of the figures, and the pipes, cylinder, and pump, full of water, the sliding valve is down in the position of *fig. 4*, and therefore forms a communication from the top to the bottom of the cylinder: in this state the pressure of the descending column of fifty-four feet of water presses equally upon both sides of the piston of the cylinder, and therefore has no operation either way, the communication with the pipe I being stopped, so that the water cannot escape through it; but the pressure operates upon the lower surface of the forcer D of the pump, rising freely through the lower valve of the pump; this pressure, being unbalanced, raises up the working beam, and with it the piston of the cylinder and the rod *d*. This, as before mentioned, has pins, *i*, in it, one of which is seen, in *fig. 1*, to be just meeting the arm or handle *k*, which it raises, lifting

the tumbling bob *e*, and turning the axis with all its levers. When the engine arrives at the top of the stroke, the tumbling bob passes the vertical point, and falls over on the other side of the centre; the arm *b* now strikes the cross pin in the end of the rod *g*, and by drawing it moves the lever *o*, and lifts up the sliding valve; this closes the communication between the top and bottom of the cylinder, and opens a passage to the pipe I, permitting the water to pass through the pipe into the well, and thus get away from the engine. This removes the pressure of fifty-four feet from beneath the piston, though it still remains acting at the top of the piston, and has added to it the twelve feet from the engine to the bottom of the well, in consequence of this column being suspended in the pipe I; this unbalanced pressure causes the piston to descend, bringing down the end of the beam K, and pump rod E with it: the valve in the bottom of the pump now shuts, and the water in the pump, being pressed by the forcer, opens the other valve at M, and goes up the pipe, *o*, to the reservoir, lifting a column of water of eighty feet. When the engine gets to the middle of its stroke, a pin in the other side of the wooden rod *d*, and therefore not seen, takes the lever, *k*, and forces it down, raising the tumbling bob, *e*, at the same time. By the time the piston arrives at the bottom of the cylinder, the tumbling bob is brought past the vertical position, and suddenly oversets, by its own weight, into the position of *fig. 1*. The lever, *b*, now runs against the pin, across the end of the rod *g*, and shoves it from the engine, moving the long lever, *o*, of the sliding valve, and the short lever, *w x*, (*fig. 3.*) down, just in the position of the drawings. This closes the four lower holes in the fixed cylinder, and prevents the water going down the pipe I, but at the same instant opens the four upper holes, forming a communication between the top and bottom of the cylinder. The pressure of sixty-six feet, which caused the piston to descend, is now removed, or rather balanced, by causing it to act equal beneath the piston; and the column of water of fifty-four feet, coming down the pipe A, and through the branch, forces open the lower valve of the pump, (the valve at M closing and supporting the column of eighty feet,) presses the under side of the pump forcer, and raises it up, as before described, moving the beam and piston with it; there now being an equal pressure, both above and below the piston, it will be moved up easily. When the piston arrives at the middle of its stroke, the preceding operations are repeated; thus the pin in the rod, *d*, takes the lever *k*, and raises it till it arrives at the top of its stroke, when it again passes the vertical position, and instantly falls over into the position first described; the lever *b*, taking the end of the rod *g*, and pushing it towards the engine, raises the sliding valve, opens the passage to the pipe I, and the whole column of sixty-six feet now presses upon the piston, and forces it down as before described, overcoming a column of eighty feet upon the pump. Though the diameter of the pump is larger than that of the cylinder, this happens from the chain of the piston acting upon a much longer lever than the pump. P and N are two air-vessels upon the pipes A and *o*, to equalize the action of the pump, and to prevent the shock which would otherwise take place when the sliding valve was suddenly shut, and the motion of the descending water thus checked.

A very complete pressure engine was erected by Mr. Trevathick at the Druid copper-mine, in Illogan, near Truro, in Cornwall; it acted with a double power, that is, the pressure was first applied to one side of the piston to force it up, and then on the other to force it down, in the same manner as a double acting steam-engine. It acted by two sliding valves instead of one, but they were so made that one

opened rather before the other shut, and this, though it walted a small quantity of water, by permitting it to escape, prevented the concussion of stopping the column of water, which indeed is always in motion.

PREST, a duty in money, paid by the sheriff upon his accounts in the exchequer, for money left, or remaining, in his hands.

The word is French, *prest*; where it signifies *ready*.

PREST-Money is a sum of money which binds those who receive to be ready at command, at all times appointed; chiefly understood in the listing of soldiers.

PREST-Sail, in *Sea Language*, is when a ship carries all the sail she can possibly crowd.

This is sometimes done in giving chase, &c. but it is a dangerous experiment, lest the ship overfet, or bring her masts by the board; in which latter case she becomes an easy prey.

PRESTANT, the name of a metal stop in French organs, equal to the *principal* in our's: being an octave above the open diapason, and an octave below the fifteenth.

PRESTATION-MONEY, a sum of money paid yearly, by archdeacons, and other dignitaries, to their bishop, *pro exteriori jurisdictione*.

PRESTATION, *Præstatio*, was also anciently used for other payments; "Et quieti sint de præstatione muragii." Chart. Hen. VII. Sometimes also for pourveyance.

PRESTEAN, in *Geography*, a town of the Morea, in the gulf of Coron; 11 miles S.S.E. of Scardamula.

PRESTEIGNE, or LLAN-ANDRAS, a borough and market town in the cwmwd of Dyffryn Teyfecliad, Cantref-y-Clawdd, (now called the hundred of Radnor,) in the county of Radnor, South Wales. It is situated near the south bank of the river Lug, on the confines of the county with Herefordshire, and in the centre of a fertile and well cultivated valley. This town is of considerable antiquity, and is a borough by prescription, but has now lost the privilege, which it formerly enjoyed, of voting as a contributory borough, in the election of a representative to parliament. It still, however, exercises other important rights, and is governed by a bailiff, nominated by the steward of the cantref of Maelienydd, an officer in the appointment of the crown. Richard Martine, the pope's legate in the reign of Richard III., was an extraordinary benefactor to Presteigne, having obtained for the inhabitants many privileges, and among others those of holding a weekly market on Saturday, and fairs three times a year, in May, June, and December, which are continued to this day. The church here is very ancient, and over the great chancel window are sculptured the initials P. L. M. and the date 1244; but the meaning of the letters is unknown. In this church are several old monuments, inscribed with the names of Owen, Price, and Davies; and the walls are adorned with various texts from the scriptures, and with figures of Moses and Aaron, Time and Death. Here is a free-school, founded, and liberally endowed, by John Beddoes, esq. in the reign of queen Elizabeth, for the benefit of the inhabitants of the township. The great and quarter sessions are held in this town, and the county courts alternately here and at Radnor. Presteigne is now considered the principal town in the county; and seems to be improving both in respectability and population. According to the parliamentary returns of 1811, it contained 239 houses and 1114 inhabitants.

On a little eminence adjoining the town, called the Warden Walks, formerly stood the castle of Presteigne, of which not a trace remains, nor are any notices of its history recorded. Its site is now occupied by a pavilion, and by a bowling green, presented to the inhabitants by lord Ox-

ford, the present steward of the cantref of Maelienydd. A place in this vicinity, called the "King's Turning," still commemorates, (as does the parish register,) the residence of king Charles here for two nights, in his flight to Chester from the pursuit of Oliver Cromwell.

On the summit of a lofty hill, about four miles to the S.E. of the town, is Weobly encampment, which is generally attributed to the Romans; but as that people seldom fixed their camps on the summits of mountains, we rather incline to attribute it to the Britons, after they were driven into Wales, by the Saxons. It is of an oval form, with one vallum on the N. side, where the ground is precipitous, five on the N.E. side, and four on the N.W. and S. sides. There are several openings into the area; but there seems to have been only one original entrance, and that from the S. Near it is a large reservoir, fifteen feet deep, which is constantly supplied with water. At the foot of the hill is Kinsham Court, the seat of the countess dowager of Oxford. The Cambrian Traveller's Guide, 8vo. 1813. Carlisle's Topographical Dictionary of Wales.

PRESTENO, a town of Italy, in the department of the Adda and Oglio; 4 miles S. of Breno.

PRESTER, a meteor, consisting of an exhalation thrown from the clouds downwards with such violence, as that by the collision it is set on fire.

The word is Greek, *πρηστηρ*, the name of a kind of serpent; called also *dipsas*, to which this meteor is supposed to bear a resemblance.

The prester differs from the thunderbolt in the manner of its inflammation; and in its burning and breaking every thing it touches with greater violence. See *Water-SPOUT*.

PRESTER, a word used by some to express the external part of the neck, which is usually inflated in anger.

PRESTER John, or Jean, an appellation given to the emperor of the Abyssinians; because, anciently, the princes of this country were really priests; and the word *jean*, in their language, signifies *king*.

He was first made known in Europe under this title by the French. His empire was, anciently, of vast extent; but afterwards it was confined to six kingdoms, each about the size of Portugal.

The name Prester John is altogether unknown in Ethiopia; and took its rise hence, that the people of a province where this prince usually resides, when they request any thing, say *Jean-coi*, i. e. *my king*. His proper title is, the *Grand Negus*.

There is also a Prester John of Asia, mentioned by M. Polo the Venetian. His jurisdiction is in the country of Cangingu, between China, Sifan, and Thibet; a kingdom mightily valued by the Chinese for its policy, and the number of its fortified cities; though they have usually the utmost contempt for foreign countries.

Some say this latter is so called from a Nestorian priest, or presbyter, mentioned by Albericus, towards the year 1145, to have mounted the throne; who having been a presbyter before his elevation to the royal dignity, was called Presbyter John, or Prester John, even when he was seated on the throne; but his kingly name was Ungehan. This presbyter availing himself of the death of Coireinchan, otherwise called Kenchan, the monarch of Asiatic Tartary, which borders upon Cathay, invaded the kingdom with such vigour and success, that he was acknowledged as its monarch. Others say, that he takes the name from a cross which he bears in his hand as a symbol of his religion.

The history of Prester John has been involved in considerable obscurity and confusion. Some have apprehended

that there were two persons in the East under this appellation, agreeably to the preceding account; whilst others consider the Abyssinian Prester John as a fictitious character. The fact, as Mr. Mosheim has stated it, seems to be briefly this. In the fifteenth century, John II. king of Portugal, employed Pedro Covilliano in a laborious enquiry into the real situation of the kingdom of Prester John. The curious voyager undertook this task; and for information in the matter, travelled with a few companions into Abyssinia; and observing in the emperor of the Abyssinians or Ethiopians many circumstances that resembled the accounts which at that time prevailed in Europe concerning Prester John, he persuaded himself that he had fulfilled his commission, and found out the residence of that extraordinary monarch, who was the object of his researches. His opinion easily gained credit in Europe, which had not yet emerged out of its ignorance and barbarism. But a new light was cast upon this matter in the 17th century, by the publication of several pieces, which the industry of the curious drew forth from their obscurity, and by which a great number of learned men were engaged to abandon the Portuguese opinion, and were convinced that Prester John reigned in Asia, though they still continued to dispute about the situation of his kingdom, and other particular circumstances. There are, however, some men of the most eminent learning in our times, who maintain, that John was emperor of the Abyssinians, and thus prefer the Portuguese opinion, though (says Mosheim) destitute of authentic proofs and testimonies, to the other, though supported by the strongest evidence, and the most unquestionable authorities. Mosh. Eccl. Hist. vol. ii. 8vo. Eng. edit.

We shall only add, that the death of Prester John, and the total defeat of his successor by Genghizkan, or Gengiskhan, emperor of the Tartars, gave an unhappy turn to the affairs of the Christians in the northern parts of Asia, towards the close of the 12th century. From this period the Christian cause lost much of its authority and credit in the provinces that had been ruled by Prester John and his successor David, and continued to decline, till, at length, it sunk entirely under the weight of oppression; and was succeeded in some places by the errors of Mahomet, and in others by the superstitious of paganism. In this general account, however, we may except the kingdom of Tangut, the chief residence of Prester John, in which his posterity, who persevered in the profession of Christianity, maintained, for a long time, a certain sort of tributary dominion, which exhibited, indeed, but a faint shadow of their former grandeur. See NESTORIANS.

The fame of *Prester*, or *Presbyter* John, (says Mr. Gibbon,) a khan, whose power was vainly magnified by the Nestorian missionaries, and who is said at this time to have received the rites of baptism, and even of ordination, has long amused the credulity of Europe. In its long progress to Mosul, Jerusalem, Rome, &c. the story of Prester John evaporated in a monstrous fable, of which some features have been borrowed from the Lama of Thibet, and were ignorantly transferred by the Portuguese to the emperor of Abyssinia. Yet it is probable that in the 11th and 12th centuries Nestorian Christianity was professed in the hord of the Keraites. The royal convert, as the story says, was indulged in the use of a portable altar; but he dispatched an ambassador to the patriarch, to inquire how, in the season of Lent, he should abstain from animal food, and how he might celebrate the Eucharist in a desert that produced neither corn nor wine. In their progress by sea and land, the Nestorians entered China by the port of Canton, and the northern residence of Sigan. Unlike the senators of

Rome, who assumed with a simile the characters of priests and augurs, the Mandarins, who affect in public the reason of philosophers, are devoted in private to every mode of popular superstition. They cherished and they confounded the gods of Palestine and of India; but the propagation of Christianity awakened the jealousy of the state, and after a short vicissitude of favour and persecution, the foreign sect expired in ignorance and oblivion. Under the reign of the caliphs, the Nestorian church was diffused from China to Jerusalem and Cyprus; and their numbers, with those of the Jacobites, were computed to surpass the Greek and Latin communions. Twenty-five metropolitans or archbishops composed their hierarchy, but several of these were dispensed, by the distance and danger of the war, from the duty of personal attendance, on the easy condition that every six years they should testify their faith and obedience to the *Catholic* or patriarch of Babylon, a vague appellation, which has been successively applied to the royal seats of Seleucia, Ctesiphon, and Bagdad. These remote branches are long since withered, and the old patriarchal trunk is now divided by the *Elijahs* of Mosul, the representatives, almost in lineal descent, of the genuine and primitive succession, the *Josephs* of Amida, who are reconciled to the church of Rome, and the *Simeons* of Van or Ormia, whose revolt, at the head of 40,000 families, was promoted in the 16th century by the Sophists of Persia. The number of 300,000 is allowed for the whole body of the Nestorians, who, under the name of Chaldæans or Assyrians, are confounded with the most learned, or the most powerful nation of eastern antiquity. Gibbon's Hist. vol. viii.

PRESTESSE, in the *Manege*, is used to denote the readiness and diligence of a horse in working a manège.

PRESTET, JOHN, in *Biography*, a French priest and able mathematician, was born, in the year 1648, at Chalons-sur-Saône, where his father filled the humble post of tipstaff to the bailiwick. Being sent when young to Paris, in search of employment, he was taken into the service of the celebrated father Malebranche, who took upon himself the task of teaching him the mathematics. The pupil did credit to the master's expectations, and in 1675 he became himself an author, and published the first edition of his "Elements of the Mathematics," in one volume 4to. This was the first work of the kind which had appeared in France, and was particularly recommended by the number of curious problems which it contained, for exercising the ingenuity of young mathematicians. In the same year the author was admitted a member of the congregation of the Oratory, and he afterwards filled the mathematical chair in different seminaries belonging to the society, with great success and reputation. In 1689 he published at Paris the second edition of his "Elements," improved and enlarged. He died in 1690. Moreri.

PRESTEWITZ, in *Geography*, a town of Saxony; 3 miles N.E. of Liebenwerda.

PRESTIMA, a town of Portugal, in the province of Beira; 11 miles N. of Coimbra.

PRESTIMONY, PRÆSTIMONIA, in the *Canon Law*, a term about which authors are much divided. It is derived a *præstatione quotidiana*; and is, by some, defined a kind of benefice, served by a single priest: in which sense, prestimony is the same with a presbyterian chapel.

Others will have prestimony to be the incumbency of a chapel, without any title, or collation; such as are most of those in castles, where prayers or masses are said; and which are mere oratories unendowed. Whence, also, the term is applied, in the Romish church, to certain perpetual offices, bestowed

bestowed on canons, religious, or others, for the saying of masses, by way of augmentation of their livings.

Others, again, will have prestimony to be a lease, or concession of any ecclesiastical fund, or revenue, belonging to a monastery, to be enjoyed during life.

Du Moulin makes prestimony a profane benefice, which, however, has a perpetual title, and an ecclesiastical office, with certain revenues attached to it; which the incumbent is allowed to sell, and which may be possessed without tonsure: such as the lay-churchwardens of Nôtre Dame. He adds, that, in propriety, the canonries of chapels are benefices of this nature.

Upon the whole, the most probable opinion seems to be this, that prestimony is a fund or revenue appropriated by the founder for the subsistence of a priest, without being erected into any title or benefice, chapel, prebend, or priory; and which is not subject, either to the pope, or to the ordinary; but of which the patron, and those who have a right from him, are the collators, and nominate and confer, *pleno jure*.

PRESTISSIMO, in the *Italian Music*, intimates to perform extremely quick, hastily, and with fury.

PRESTO, Ital. quick. This term written at the beginning of a movement in music, implies the most rapid and animated measure of all the five different degrees of quickness; and this rapidity admits of increase by *più presto*, and *prestissimo*.

PRESTON, in *Geography*, a borough, market-town, and parish, in the hundred of Amounderness, and county-palatine of Lancaster, England. The town is placed upon an eminence ascending from the river Ribble, at the distance of 22 miles S. by E. from Lancaster, and 216 N.W. by N. from London. It is of great antiquity, having risen, according to Camden, out of the ruins of Ribchester, or Coccium, a Roman station, which was situated some miles higher up the river; but this opinion is only conjectural. It is probable, however, that it was a town of some importance previous to the Norman conquest; and it is said to have derived its name from the number of religious houses it contained during the period of the Saxon dynasty. From Domesday-book the lordship of this place appears to have been held by earl Tofti, brother to king Harold, who lost his crown and life at the celebrated battle of Hattings.

Preston was first incorporated, by charter, in the reign of Henry II.; and that charter has since been confirmed and extended by several of his successors. Under that last granted, the corporation now consists of a mayor, a recorder, eight aldermen, four under aldermen, seventeen common-councilmen, and a town clerk; and it has the peculiar privilege of holding a guild every twenty years, which is resorted to as a kind of jubilee by the people of fashion and leisure from all the country round. It is held in August, and lasts a month. On the day it begins, the members of the corporation walk in procession, followed by the trading companies, under their respective banners, and decorated with the insignia of their professions. Plays, concerts, and other public amusements enliven this period of festivity and joy. The last jubilee took place in 1802, being the third which has occurred since the commencement of the reign of his present majesty. This curious custom originated in Saxon times, and is strictly enjoined in all the charters to the corporation, on pain of forfeiting the elective franchise, and their rights as burgesses. Every person, on this occasion, must renew his freedom within twenty-eight days after proclamation is made, or be liable to lose the same for ever.

This town returns two representatives to the national councils. It first enjoyed that privilege in the reign of Ed-

ward I.; but after the first year of his successor, it ceased sending until the reign of Edward VI., since whose reign its returns have been regular. Party contests have, perhaps, been as violent here as in any borough in England; indeed, on the occasion of several elections Preston has almost suffered the fate of a town stormed by an enemy. A question has been at issue for nearly a century and a half, whether the right of election vested generally in the inhabitants, pot-wallahs, or was confined to "the in-burgesses of the last guild, and those admitted since by copy of court-roll?" This point has been four times discussed in the house of commons, and each time the decision has been in favour of the inhabitants at large. The chief influence in the borough is that of the earl of Derby, who commonly returns one member, and the dissenting interest the other. The mayor and two bailiffs are the returning officers, and the voters are estimated at 600 in number.

Preston, though free, comparatively, from the bustle of trade and manufacture, is nevertheless opulent and well inhabited; and takes the lead of all the towns in Lancashire, in point of gentility and fashionable resort. It has moreover the advantage of being the seat of several law courts, *viz.* the borough court; a court of chancery for the duchy of Lancaster; a county court, which sits on Tuesday weekly; a court called the county arrest; and a fifth for the wapentake; besides the court of quarter sessions, which is held here by adjournment from Lancaster on the Thursday of the week after Epiphany. Hence, as may be supposed, a large proportion of the inhabitants of Preston are engaged in, or connected with, the profession of the law. Markets are held here on Wednesday, Friday, and Saturday, every week, and are extremely well regulated to prevent forestalling and regrating. Here are likewise three annual fairs, in March, September, and January. Coals are supplied plentifully by means of the Douglafs and Lancaster canals, the former of which communicates with the river Ribble, and the latter passes close to the town. By these canals communications are opened with all the principal rivers in the kingdom.

From its lofty situation, and its proximity to the Irish sea, Preston enjoys a salubrious and healthful climate. It is a handsome, well-built town, with broad, regular streets, and many good houses; and is rendered gay by assemblies and other places of amusement, suitable to the genteel style of the inhabitants. The earl of Derby has a large modern mansion in it. The principal public buildings are, the parish church, the town-hall, the assembly rooms, the new prison, and the bridge. The church is a very spacious structure, the living of which was formerly appropriated to the college of Leicester, but is now in the patronage of the Hoghton family. There are also several chapels of ease, and meeting-houses for different sects of dissenters, but Sectarians are comparatively few in number. The town-hall is a very substantial and commodious building, and contains a fine portrait of George II., presented to the corporation by sir Edward Stanley. The assembly rooms, which are well adapted to their object, were erected at the expence of the earl of Derby. The new prison, or penitentiary house, is situated near the entrance to the town from Chorley, by Walton. It was built at the charge of the hundreds of Lonsdale, Amounderness, Blackburn, and West-Derby, on the Howardian plan, and is exclusively appropriated to prisoners from those hundreds. Its object is salutary confinement and reformation only; each prisoner has a daily allowance of one pound and a half of bread, with a proportionate quantity of butter, and a few potatoes; and they are permitted to exchange what they do not eat for tea and sugar; but

but all strong liquors are strictly prohibited. The new bridge was built over the Ribble in 1781, in the place of a former one carried away by a flood.

From its relative position Preston has been an important post in the civil commotions of the kingdom, and the scene of various military actions. In the time of the parliamentary resistance to Charles I., the royal army, under the duke of Hamilton and sir Marmaduke Langdale, was defeated here with great slaughter by an inferior force commanded by generals Cromwell and Lambert. Here also the rebel general Forster was routed by the king's troops in 1715; when many persons in Preston suffered for taking up arms in the cause of the Pretender. In 1745 prince Charles took possession of this town; and is said to have viewed the country around from the Enim walk with extraordinary emotions.

The borough of Preston, according to the parliamentary returns of 1811, contains 3624 houses and 17,065 inhabitants. The religious houses recorded to have been founded here since the conquest, are, an hospital, established soon after that event, and a house of Grey friars, erected and endowed by Edmund, earl of Lancaster, son to Henry III.; but of neither of them do any vestiges remain. About a mile from the town, at Penwortham, was likewise a priory of Benedictine monks, subject to the abbey of Evesham, in Worcestershire. It was founded about the year 1068 by Warine Ruffel; and at the dissolution was granted by king Henry VIII. to John Fleetwood.

From Preston a Roman causeway, or military road, still distinctly visible in places, conducts to Ribchester, once a military station of that people. Its original designation has been a matter of much contention among antiquaries. Camden supposes it to have been the Coccium of Antoninus, and the Rigodunum of Ptolemy. Horsley was of the same opinion as to Coccium, but inclined to fix Rigodunum at Warrington. Mr. Whitaker, the historian of Manchester, contended that it was Rerigonium of Richard of Cirencester; but Dr. Whitaker, who last investigated the subject, appears to have clearly identified it with Coccium. This antiquary assigns its original establishment to Agricola, and says it was placed with the peculiar judgment which distinguishes the encampments and works of that celebrated commander. From the boldness and extent of its ramparts, and also from the number of altars, inscribed stones, earthen vessels, plates of copper, coins, and other relics found here, Ribchester is presumed to have been a station of more than ordinary magnitude and importance. That the Ribble was anciently navigable as high as this place, is proved by the fact of many anchors having been dug up in the vicinity, as well as the hull of a ship, larger than could now be floated above Preston. Contiguous to Ribchester is the parochial chapel of Stede, which originally belonged to a guild or hospital. See Beauties of England and Wales, vol. ix. by John Britton, F.S.A. A Description of the Country from 30 to 40 Miles round Manchester, by John Aikin, M.D., 1795. History, &c. of Whalley, by the Rev. Dr. Whitaker.

PRESTON, a town of America, in New London county, Connecticut, six or eight miles E. of Norwich, from which it is divided by Shetucket river; incorporated in 1687, and containing two congregational churches, a society of Separatists, and 3284 inhabitants.—Also, a village of Kentucky, on the bank of the Ohio, just below the salt-works.

PRESTON'S Creek, or Wood Creek, a river of Kentucky, which runs into the Ohio, N. lat. 37° 54'. W. long. 86° 46'.

PRESTONIA, in Botany, received that appellation from Mr. R. Brown, in memory of Dr. Charles Preston,

resident in Scotland in the time of Ray, and a correspondent much esteemed by that great naturalist, in whose *Methodus emendata* many of his observations are preserved. Brown Apoc. 58. Class and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Brown.

Eff. Ch. Corolla falver-shaped; its mouth crowned with an annular undivided tube, and five internal scales, alternate with the segments of the limb. Anthers half-prominent, arrow-shaped, cohering with the middle of the stigma, their hind-lobes empty. Germens two. Style one, thread-shaped, dilated at the top. Stigma turbinate, with a small taper point. Nectary a cup of one leaf below the germen. Follicles

1. *P. tomentosa*. Downy Prestonia. Gathered by sir Joseph Banks, in hedges near Rio de Janeiro in the Brazils. A twining downy shrub. Leaves opposite, downy. Corymbs dense, between the footstalks. Calyx leafy, its segments furnished with a small scale, internally, at their base.

PRESTON-PANS, in Geography, a burgh of barony, market, and sea-port town, in the county of Haddington, or East Lothian, Scotland, is situated on the southern bank of the Frith of Forth, at the distance of eight miles E. from Edinburgh. This place derived its name from the small village of Preston adjoining, and from the salt-works or pans established here by the monks of Newbottle as early as the year 1189. For several centuries it was called *Salt-Preston*; but in 1617, when the charter for erecting it into a burgh of barony was granted, it had obtained its present appellation. Previous to the union a very considerable foreign trade was carried on here, especially in Dutch and French goods; and even so late as 1719, forty-one foreign cargoes were delivered at this port within twelve months, nineteen of them from vessels belonging to the town. The harbour chiefly used at that period was Port-seaton, about a mile to the east, in the parish of Tranent; that belonging to the town at present is Morison's Haven, which is situated at its western extremity. It was formerly called New Haven, and sometimes Acheson's Haven, from an ancient family of that name, progenitors of the earl of Gosport, in Ireland. This harbour draws twelve feet of water, and is considered one of the safest on the Frith of Forth. A custom-house is established here, the jurisdiction of which extends from the Figgat-Burn, in Mid Lothian, on the west, to the mouth of the East Lothian Tyne, on the east. Within the collection are thirty-one salt-pans: viz. eleven at Cockenzie, four at Preston-Pans, two at Cuttle, four at West-Pans, four at Pinkie-Pans, and six at Duddington-Pans. The chief imports to this town are the ingredients for the manufactures carried on in it, and in the vicinity; the exports are fish, particularly oysters, stone-ware, bricks, tiles, oil of vitriol, spirit of salt, and Glauber salts. About twelve thousand bushels of salt are made here annually. The stone-ware is manufactured partly from the fine clays in the neighbourhood, and partly from clays brought from Devonshire. The white and red lead used in the glazing process is imported from London, Hull, and Newcastle. This branch of business was established here about a century and a half ago; and was probably first derived from the Dutch. How long the smaller manufactories have existed is not recorded. Here is a market twice a-week, on Wednesday and Saturday, chiefly for butcher's meat and other provisions. In 1754, there were in this town no fewer than sixteen brewers, but they are now reduced to a third of that number; two or three of those remaining, however, brew upon a very extensive scale. According to the parliamentary returns of 1811, the parish contains 299 houses, and 1995 inhabitants.

A very singular commercial institution is connected with this town. On the second Tuesday of July, annually, the travelling chapmen, or pedlars, that is, the itinerant sellers of wares, &c. of the three Lothians, meet here and elect some of their number for the purpose of holding courts to enforce the observance of bye-laws, to which they bind themselves to give obedience at their admission into the society. They elect on this occasion a provost, or preses, a deputy-provost, a clerk, a treasurer, six bailies, and several counsellors. There is one bailie for Preston-Pans and Cockenzie; one for Haddington and North-Berwick; one for Dunbar and Oldhamstocks; one for Musselburgh and Dalkeith; one for Queensferry and Borrowstowness, and one for Linlithgow and Bathgate. After the election they march in a body, preceded by music, to the cross at Preston, where they drink a few bottles of wine, and then return. In the towns where their booths are erected at fairs, the bailie for that town gets a pledge from each chapman, who is bound to attend a meeting of the whole number at an appointed hour in the evening, or the next morning. Here the behaviour of each during the fair is enquired into. If any of the bye-laws have been transgressed, a fine is exacted and paid. If the offence has been gross, they are expelled. The fines are deposited in the hands of the treasurer, and are applied to relieve the widows or families of those members of the society who need supply, and sometimes of such of their number as have been unsuccessful in business. They cannot proceed to an election unless some married member be present; but the preses is usually chosen from among the unmarried men, it being supposed that bachelors will more readily attend the fairs. When a new member is admitted, he pays a sum to the common fund. No information has been obtained, that can be depended upon, as to the origin of this society, or the circumstances that led to the holding of their annual meetings at Preston, which was the case before its fairs were transferred to Preston-Pans. This village and parish is situated to the south of that town, comprehending Northfield and Schaw's-hospital. It is of greater antiquity than Preston-Pans, which indeed was formerly comprehended within the parish of Preston, though now a distinct parish in itself. Schaw's-hospital was originally a family residence, but was converted to its present purpose by the will of the late James Schaw, esq., who died in 1784, and now affords maintenance and education to twenty-four boys. The funds appropriated to the support of this establishment consist of the barony and a great part of the lands of Preston. Here are the ruins of a tower, which formerly constituted part of the family mansion of the Hamiltons of Preston; and here is likewise a market cross, but so much has Preston decayed, that this relic of its former importance is now situated in a field. It is the property of the pedlars, they having acquired a right to it in the year 1636.

In the open grounds above the village of Preston, was fought, on the 22d of September, A.D. 1745, the "battle of Preston-Pans," in which prince Charles Stewart, commonly called "the Young Chevalier," at the head of his Highland army, completely routed the English forces under the command of general sir John Cope; all the infantry, except about 170, being either killed or taken prisoners. In this action the brave colonel Gardner, disdaining inglorious flight, fell on the field of battle, as did likewise captain Brymer, of Lee's regiment, who was the only officer present who had ever seen Highlanders engaged with regular troops, and expressed strong apprehensions of the result on the day previous to the battle.

Preston, with Preston-Grange, which is situated within

the parish of Preston-Pans, was erected into a burgh of barony in the year 1617; and is now distinguished by the name of the West Barony. The adjunct grange to the latter place was derived from the grange which the monks of Newbattle settled here. The earl of Hyndford is principal proprietor of the grange lands, and has a seat in the vicinity.

About a mile from Preston-Pans is the village of Tranent, which contains about 1500 inhabitants, and is chiefly remarkable on account of its church, which has the appearance of being "a practical or architectural pun" upon the mysterious doctrine of the Trinity, to the honour of which it is dedicated. It is a building of very high antiquity, but nothing is known of its foundation or history. On the outside it appears to consist of three separate oblong houses, placed parallel to each other; but when entered it is found to constitute only one building. The central portion is somewhat longer at each end than the others, with which it communicates by means of openings in its side-walls, formed by lofty circular arches. The roofs of all the divisions are vaulted and covered with stone, and in the centre of the entire building rises a low, square tower. The windows of this edifice are few and small, and are scarcely adequate to afford a dismal light to the interior. Beauties of Scotland, vol. i. by Robert Forsyth, 1801. Carlisle's Topographical Dictionary of Scotland, 4to. 1813.

PRESTONVILLE, a town of America, in Floyer county, Kentucky, containing 32 inhabitants; its county contains 3453.

PRESTWICK, a town of Scotland, in the county of Ayr, which is a burgh of barony, and has a market weekly; three miles N.E. of Ayr.

PRESUMPTION, PRÆSUMPTIO, in *Law*, a suspicion, or conjecture, founded on a verisimilitude.

Presumption is of three sorts. 1. *Violent*, which many times is allowed a full proof; as if one be killed in a house, and a man is seen to come out of the house with a bloody sword, and no other person was at that time in the house; this, though but a presumption, is a proof. 2. *Probable*, arising from such circumstances as usually attend the fact, which has its due weight. 3. *Light*, or *temerarious*, which is of no prevalency at all.

In cases of a charter, or feoffment, if all the witnesses to the deed be dead, the violent presumption, that stands for a proof, gives continual and quiet possession. "Stabit præsumptio, donec probetur in contrarium." Coke on Litt. See CIRCUMSTANTIAL Evidence, and EVIDENCE.

PRESUMPTION was also anciently used for intrusion.

PRESUMPTION, *Præsumptio*, in *Rhetoric*, the same with prolepsis.

PRESUMPTIVE HEIR. See HEIR.

PRESUMPTIVE Evidence of Felony. See EVIDENCE.

PRESURA, in *Surgery*, inflammation of the ends of the fingers from cold; the phlogosis erythema of Cullen.

PRETENCE, in *Heraldry*. See INESCUTCHEON, and ESCUTCHEON of Pretence.

PRETENSED, or PRETENDED *Right*, in *Law*, is where one is in possession of lands and tenements, which another, who is out, claims and sues for. Here the pretended right is in him who so claims, or sues. As to the offence of selling such title, see CHAMPARTY.

PRETER, or PRETERIT, *præteritus*, *paß*, in *Grammar*, an inflexion of verbs, expressing the tense, or time passed.

Preter, or preterit, is a general name, that comprehends all the inflexions corresponding to the several tenses, or several circumstances and relations of the time past; all which, the Latins, &c. distinguish by particular inflexions,

or terminations, of the verb; which make the proper notion of tenses. See TENSE.

The modern languages, particularly the English, in lieu of different terminations of the verbs themselves, have usually recourse to those of their auxiliaries, and participles.

The preter, or past time, is subdivided, by grammarians, into "preterimperfect;" as *e. gr.* *I had, I thought*; in the Latin, *habebam, cogitabam*; in the French, *j'avois, je pensois*: the "preterperfect," as, *I have had, I have thought*; *habui, cogitavi*; *j'ai eu, j'ai pensé*; and "preterpluperfect," as, *I had thought, I had had*; *habueram, cogitaveram*; *j'eus eu, j'eus pensé*. The English have properly but two cases, or kinds, of the preter tense; *viz.* the preter time of the imperfect action; as, *I was at supper then*, but had not yet done it; and the preter time of the perfect action; as, *I had then supped*, and it was then done. The preter tense is ofteneft formed of the present tense, by adding *ed*; as *I burned*.

The French have a particular case of the preterperfect; which F. Buffier calls the preterite simple, in opposition to the former, called the preterit-composite; others call it the preterit-indefinite, because expressing a thing done indeterminate; as *j'écrivis hier*. This answers to the aoristus of the Greeks; and, in the distinction of this from the common preterit, does one of the greatest niceties in the practice of the French language consist.

In the passive voice, the Latins, French, &c. have recourse to participles and auxiliaries, like the English, to form their preter tenses; as, *I was loved, amatus eram, j'étois aimé, &c.*

PRETERIT, PRÆTERITUS, in the *Roman Jurisprudence*. *Infans præteritus*, is a child of whom the father has forgot to make mention in his testament; which renders it entirely null.

Exheredation of his son is allowed in a father, but never preterition.

PRETERITION, or PRETERMISSION, in *Rhetoric*, a figure whereby, in pretending to pass over a thing untouched, we make a summary mention of it.

I will not say he is valiant, he is learned, he is just, &c.

The most artful praises are those given by way of preterition. See RETICENCY.

PRETERNATURAL RAINS. See RAIN.

PRETEXT, or PRETENCE, a colour, motive, or cause, either real, or apparent.

PRETEXTA, or PRÆTEXTA, among the Romans, was a long white gown, or toga, having a band, or border, of purple, at the bottom.

It was worn by children of quality till the age of puberty, *i. e.* by boys till seventeen, at which time they laid it aside, and resumed the virile gown. Girls wore it till marriage.

It took its name prætexta, according to Godwyn, "quod ei purpura prætexta erat," because guarded about with purple silk.

The pretexta, at first, was a robe of state, or ceremony, worn only by the chief magistrates, and the priests, nor was it lawful for such who wore this gown to be arraigned, or sentence to pass against them, till it was pulled off. In continuance of time, it was permitted to noblemen's children; and at length, even to all Roman children in general. See TOGA.

PRETI, GIROLAMO, in *Biography*, an Italian poet of the 17th century, was the son of Alexander Preti, a Tuscan, and knight of St. Stephen. He was brought up as a page in the court of Alfonso II., duke of Ferrara, and afterwards lived with prince Doria at Genoa. He had been

intended for the legal profession, but it did not accord with his feelings, and he applied himself entirely to the composition of Italian verse. His works were read, admired, and translated into various languages; but they were suited to the taste of that particular period only, and have long since fallen into neglect. Preti became a favourite at the court of Rome, and was appointed by cardinal Fr. Barberini, his secretary, in a legation to Spain. He died on the journey to Barcelona, in the year 1626, being in the flower of his age. Moreri.

PRETIUM SEPULCHRI, in old *Law Books*, &c. those goods accruing to the church in which a corpse is buried.

In the Irish Canons, lib. xix. cap. 6. it is ordered, that along with every body that is buried, there go his cow, horse, apparel, and the furniture of his bed; none of which may be disposed of otherwise than for the payment of debts, &c. as being familiars and domestics of the deceased.

PRETOR, PRÆTOR, an eminent magistrate, or minister of justice, in ancient Rome; accordingly we often find a balance on the medals of the pretors.

The title of pretor is derived a *præundo*, or, *præesse*, denoting the superiority of his jurisdiction.

In the first ages of the commonwealth, all the great magistrates were stiled pretors; afterwards, the title was bestowed on all the principal officers of the army; at last, pretor became restrained to a particular magistrate.

About the year of Rome 386, the people soliciting to have one of the consuls always chosen from among themselves, the senators granted it, on condition, that a new magistracy should be erected, to be filled wholly from among the patricians; such was the origin of the *preture, pretura*; which, Livy observes, was first discharged by Spurius Furius Camillus, in the year of Rome 387; and whose office was to look to the administration of justice and equity between man and man; much in quality of a lord chief justice, or lord chancellor, or rather both in one.

But business increasing, in proportion as the empire was enlarged, a second pretor was created, A. U. C. 510, to take cognizance of the affairs of foreigners residing at Rome; upon which the former was distinguished by the title of *pretor urbanus*, or *major*; and the latter, by that of *pretor præregrinus*, or *minor*.

In the year 526 of Rome, when Sicily and Sardinia were reduced into Roman provinces, two more pretors were created to assist the consuls in the government of the provinces; and as many more upon the entire conquest of Spain, A. U. C. 556. Sylla, in the year of the city 672, increased the number to eight; Julius Cæsar, in the year 707, augmented them first to ten, and then to sixteen; under the reign of Augustus there were first ten pretors, and afterwards sixteen; two of whom were called *pratores cereales*, as being charged with the providing of corn and grain; to which number Claudius added two others, *viz. pratores fidei commissarii*. In the Code, lib. i. tit. 39. we find a law of the emperors Valentinian and Marcian, which reduces the pretors to three.

In the time of Justinian, the office of pretor was entirely abolished.

The office of the pretor, or prætor urbanus, was to render justice in the city; he had a power to interpret the laws, to supply and reform them; and even to make new ones, when the public good required. See CIVIL law.

In the Institutes, the edicts of the pretors are called *jus honorarium*; whence it should seem they had only the force of laws out of respect to that eminent magistrate; the business of the pretor being rather to look to the observation of the old laws than to make new ones. See EDICT.

Some are of opinion, he had not the *jus gladii*, the power of the sword; the cognizance of criminal matters being the special province of the prefect of Rome. See PREFECT.

But others are of another sentiment. In the general, it is very difficult to fix precisely how far his power extended.

When he walked, he was preceded by six lictors; and was clothed with the robe called *pretexa*; he sat in a curule chair; his tribunal was elevated in form of a semicircle; and he bore a spear and sword.

His authority, like that of the other magistrates, was very much weakened and reduced under the emperors. In the Digest and Code is a title *de officio pretoris*.

PRETOR was also a title among the Romans, given the governor of a province, who had served the office of praetor. Whence provinces governed by pretors, or restrained to those who had discharged that office, were called *pretorian provinces*.

PRETORIAN GUARDS, or *Bands*, *praetoria cohortes*, were the soldiers of the emperor's guard; so called, as some imagine, from their place or station in the palace or court called praetorium.

They were originally nine or ten thousand men (for Tacitus and Dion are not agreed upon the subject), divided into as many cohorts. Vitellius increased them to sixteen thousand, and as far as we can learn from inscriptions, they never afterwards sunk much below that number.

Their institution is owing, as some say, to Scipio Africanus, who first established a company of the bravest men in his army, selected for the purpose, to be his guard, and never to stir from his side in battle.

But by others, their institution is derived from Augustus. That crafty tyrant, says Mr. Gibbon, (Hist. vol. i.), sensible that laws might colour, but that arms alone could maintain, his usurped dominion, had gradually formed this powerful body of guards in constant readiness to protect his person, to awe the senate, and either to prevent or to crush the first motions of rebellion. He distinguished these favoured troops by a double pay, and superior privileges; but as their formidable aspect would at once have alarmed and irritated the Roman people, three cohorts only were stationed in the capital, whilst the remainder was dispersed in the adjacent towns of Italy. But after fifty years of peace and servitude, Tiberius ventured on a decisive measure, which for ever rivetted the fetters of his country. Under the fair pretences of relieving Italy from the heavy burden of military quarters, and of introducing a stricter discipline among the guards, he assembled them at Rome, in a permanent camp, which was fortified with skilful care, and placed on a commanding situation, close to the walls of the city, on the round summit of the Quirinal and Viminal hills. In the civil war between Vitellius and Vespasian, the pretorian camp was attacked and defended with all the machines used in the siege of the best fortified cities.

Such formidable servants are always necessary, but often fatal, to the throne of despotism. By thus introducing the pretorian guards, as it were, into the palace and the senate, the emperors taught them to perceive their own strength, and the weakness of the civil government; to view the vices of their masters with familiar contempt, and to lay aside that reverential awe, which distance only, and mystery, can preserve, towards an imaginary power. In the luxurious idleness of an opulent city, their pride was nourished by the sense of their irresistible weight; nor was it possible to conceal from them, that the person of the sovereign, the authority of the senate, the public treasure, and the seat of empire, were in their hands. To divert the pretorian bands from these dangerous reflections, the firmest and best esta-

lished princes were obliged to mix blandishments with commands, rewards with punishments, to flatter their pride, indulge their pleasures, connive at their irregularities, and to purchase their precarious faith by a liberal donative, which, since the elevation of Claudius, was exacted as a legal claim, on the accession of every new emperor. The power which they asserted by arms, their advocates attempted to justify by arguments; and maintained that, according to the purest principles of the constitution, their consent was essentially necessary in the appointment of an emperor. The pretorians, having violated the sanctity of the throne, by the atrocious murder of Pertinax, dishonoured the majesty of it by their subsequent conduct. Sulpicianus, the emperor's father-in-law, and governor of the city, treated with them for the imperial dignity; but some of the more prudent of the pretorians, apprehending that by a private contract they should not obtain a just price for so valuable a commodity, ran out upon the ramparts, and loudly proclaimed, that the Roman world was to be disposed of to the best bidder by public auction. This infamous offer at length reached the ears of Didius Julianus, a wealthy senator, March 28th, A.D. 193; and he determined to outbid Sulpicianus, who was in actual treaty for the crown. The latter had actually offered a donation of 5000 drachmas (above 160*l.*) to each soldier; when Julian, eager for the prize, advanced at once the sum of 6250 drachmas, or upwards of 200*l.* sterling. The bargain was immediately concluded, and he was declared emperor. But the day of his elevation to the throne was followed by a sleepless night, during which he probably revolved in his mind his rash folly, the fate of his virtuous predecessor, and the doubtful as well as dangerous tenure of an empire, which had been purchased by money, and not acquired by merit. He soon found himself on the throne of the world without a friend, and without an adherent. The guards themselves were ashamed of the prince whom their avarice had induced them to accept; nor was there a citizen who did not consider his elevation with horror, as the last insult on the Roman name. When the Pannonian legions, by which Septimius Severus, their commander, had been saluted with the names of Augustus, Pertinax, and Emperor, April 13th, A.D. 193, were advancing towards Rome, Julian found himself reduced to a state of the utmost distress; and in order to protract his ruin, implored the venal faith of the pretorians, who, ashamed of utterly abandoning him, and yet trembling at the name of the Pannonian legions, put on arms with reluctance. At length, however, he was deserted even by the pretorians; and condemned and executed by order of the senate, June 2, A.D. 193. Before the new emperor entered Rome, he issued his commands to the pretorian guards, directing them to wait his arrival on a large plain near the city, without arms, but in the habits of ceremony, in which they were accustomed to attend their sovereign. The haughty troops obeyed his mandate with a contrition, which was the effect of their just terrors. A chosen part of the Illyrian army encompassed them with levelled spears. Severus mounted the tribunal, and having sternly reproached them with perfidy and cowardice, dismissed them with ignominy from the trust which they had betrayed, despoiled them of their splendid ornaments, and banished them, on pain of death, to the distance of 100 miles from the capital. During the transaction, another detachment had been sent to seize their arms, occupy their camp, and prevent the hasty consequences of their despair. The pretorians, who had murdered their sovereign, and sold the empire, thus received the just punishment of their treason.

The next object to which Severus directed his attention

was an institution of guards, formed on a new model, and increased to four times the ancient number. The emperor flattered himself that these newly chosen pretorians would be regarded by the legions as the representatives of the whole military body, and that the present aid of 50,000 men, so well selected and armed, would for ever crush the hopes of rebellion, and secure the empire to himself and his posterity. The command of these troops was entrusted with an officer, denominated the pretorian prefect. See PREFECT, *Pretorian*.

By the prudent measures of Diocletian, the number of the pretorians was insensibly reduced, their privileges were abolished, and their place was supplied by two faithful legions of Illyricum, who, under the new titles of Jovians and Herculians, were appointed to perform the service of the imperial guards. The pretorians, having taken a decided and active part with Maxentius against Constantine, knew that their offences were beyond the reach of mercy; and, therefore, in the battle between these two leaders, fought near Rome, October 28th, A.D. 312, they were animated by revenge and despair. Notwithstanding their repeated efforts, these brave veterans were unable to recover the victory: they obtained, however, an honourable death; and it was observed, that their bodies covered the same ground which had been occupied by their ranks. The pretorian guards, whose numbers and privileges had been restored, and even augmented, by Maxentius, were for ever suppressed by Constantine. Their fortified camp was destroyed, and the few who had escaped the fury of the sword were dispersed among the legions, and banished to the frontiers of the empire, where they might be serviceable, without again becoming dangerous. Gibbon's Hist. vols. i. and ii.

PRETORIUM, PRÆTORIUM, among the Romans, the place, hall, or court, wherein the pretor of a province lived, and wherein that magistrate sat to administer justice to the people.

There were of these pretoriums in all the cities of the Roman empire. The scripture mentions that of Jerusalem under the name of *judgment-hall*; and there are still some remains of one at Nîmes, in Languedoc.

PRETORIUM was also the tent or pavilion of the general of the Roman army; wherein councils of war, &c. were held.

From the time of Augustus, the emperor's tent in the camp was distinguished by the title of *prætorium Augustale*.

PRETORIUM was also a place in Rome where the pretorian guards were lodged.

Some will have the pretorium to be properly the tribunal of the præfectus prætorii, or an auditory destined for the rendering of justice in the emperor's palace. See PREFECT and PRETORIAN *Guards*.

This they argue from St. Paul's Epistle to the Philipians; and from this place called prætorium, they will have the guards to have been denominated prætoriani, because assembled here for the emperor's safety.

Others will not allow the pretorium to be any tribunal, or seat of justice, but merely the imperial guard-house.

Perizonius has an express dissertation to prove, that the pretorium was no court of justice in St. Paul's time; but the camp or place where the pretorian guards were quartered.

He adds, that the name pretorium was not given to places where justice was administered till a long time after; when the office of the præfectus prætorii was converted into a civil function.

PRETSCH, in *Geography*, a town of Saxony, on the

Elbe; 50 miles N.W. of Dresden. N. lat. 57° 42'. E. long. 12° 48'.

PRETTIGAU, a valley of the Helvetian republic, in the Grisons, east of Mayenfeld.

PRETTIN, a town of Saxony, on the Elbe; 20 miles S.S.W. of Wittenberg. N. lat. 51° 37'. E. long. 13°.

PRETZ, a town of Germany, in the county of Pludentz, near the river Alfens; 3 miles E.N.E. of Pludentz.

PRETZCHENDORF, a town of Saxony, in the circle of Erzgebirg; 7 miles E. of Freyberg.

PRETZLAU, a town of Prussia, in Pomerelia; 15 miles E. of Dantzic.

PREVARICATION, PRÆVARICATIO, in the *Civil Law*, is when the informer colludes with the defendant, and so makes only a feigned prosecution.

Sylvius, in his comments on Cicero, *pro Cluentio*, gives us the difference between the three terms, *calumniari*, *prævaricari*, and *tergiversari*. He, who in his accusation forges faults which were never committed, is said *calumniari*: he who undertakes one's suit, and either will not add reasons in behalf of his client, or not answer the objection of his adversary when he is able, is said *prævaricari*: and he, who desists from his accusation, and lets the suit drop, *tergiversari*.

PREVARICATION, in our *Law*, is when a man, falsely and deceitfully seems to undertake a thing, with intention that he may destroy it; *e. gr.* where a lawyer pleads booty, or acts by collusion, &c.

PREVARICATION is also used for a secret abuse committed in the exercise of a public office, or of a commission given by a private person.

PREVARICATOR, PRÆVARICATOR, in the *University of Cambridge*, is a master of arts, chosen at a commencement, to make an ingenious satirical speech, reflecting on the misdemeanors of the principal members. See TERRÆ *Filius*.

PREVENTER, an additional security to some parts of a ship and her rigging, as the

Preventer-bolts, the bolts driven through the lower end of the preventer-plates, to assist the chain-bolts in heavy strains.

Preventer-plates, stout plates or links of iron, connected to the main and fore chains by large bolts driven through their upper and lower ends.

Preventer-braces, *preventer-shrouds*, *preventer-stays*, are additional ropes to succour the masts and yards in a gale of wind, when those they have affinity to are not supposed sufficient to bear the whole strain. See TACKLE.

Preventer-brace pendants are intended as substitutes for the brace-pendants, should they be shot away in action. See PENDANT.

PREVENTION, PRÆVENTIO, in the *Canon*, &c. *Law*, the right which a superior person or officer has to lay hold of, claim, or transact, an affair, prior to an inferior one, to whom otherwise it more immediately belongs.

The word is chiefly used in speaking of the pope's preventing the ordinary collators; and of the royal judges preventing subaltern ones.

The Roman canonists maintain, that the pope, who is the source of all jurisdiction, has not transmitted it privately to the ordinary collators; but that he may still not only collate concurrently with them, but he also may prevent them by using his original power as head of the church.

These preventions are grown odious in several countries, where they do not now obtain without many modifications

and restrictions; and the civil power in France always judges in favour of the ordinary collators.

The pope has no prevention to the prejudice of lay-patrons; but by the concordat he has reserved to himself the right of conferring elective benefices by prevention, and even cathedral and collegiate dignities.

If the provisions of the pope, and collations of the ordinary, bear date on the same day, the ultramontane canonists give the preference to the pope; the French to the ordinary.

The cardinals have a particular indulgence not to be prevented by the pope within six months. See EXPECTATIVE *Graces*, and PROVISIONS *by Prevention*.

PREVENTION, *Homicide for*. See HOMICIDE.

PREVENTIVE JUSTICE, in the *English Laws*, consists in obliging those persons, who are suspected on probable ground of future misbehaviour, to stipulate with and to give full assurance to the public, that such offence as is apprehended shall not happen, by finding pledges or securities for keeping the peace, or for their good behaviour. Such means of preventing the commission of crimes and misdemeanors reflect honour on the system of English jurisprudence; since *preventive* justice is, on every principle of reason, of humanity, and of sound policy, preferable in all respects to *punishing* justice. See GOOD *Abearing*, RECOGNIZANCE, and SURETY.

PREVESA, in *Geography*, a town of Albania, on the coast of the Mediterranean, at the entrance into the gulf of Arta, situated on the site of Nicopolis, built by Augustus after the battle of Actium; 20 miles S.W. of Arta. N. lat. 39° 22'. E. long. 20° 46'.

PREUILLY, a town of France, in the department of the Indre and Loire, and chief place of a canton, in the district of Loches, near which are some iron mines; 11 miles N.E. of Poitiers. The place contains 1680, and the canton 9402 inhabitants, on a territory of 275 kilometres, in 9 communes. N. lat. 46° 51'. E. long. 0° 30'.

PREVOT D'EXILES, ANTONY-FRANCIS, in *Biography*, a French writer, born in 1697; was educated among the Jesuits, and took the habit of the society, which he soon quitted to bear arms in quality of a volunteer. Being disappointed in his expectations, he retired in 1729 into Holland. Without means of subsistence he sought a resource in his pen, and published his "Memoires d'un Homme de Qualité qui s'est retiré du Monde," a romance, by which he acquired both money and reputation. It was written in a pure and elegant style, and with an elevated strain of morals. In 1733 he came to London, but meeting with little or no encouragement he returned to France, and assumed the costume of an abbé. He was now taken under the protection of the prince of Conti, who gave him the titles of his secretary and chaplain. He gave proofs of his industry by the publication of a number of works, and in 1745 he was selected by the chancellor d'Aguesseau to compose a "General History of Voyages." This work, though it occupied much of his time, did not prevent him from engaging in a variety of literary labours, which were for the most part successful. In November 1763, on his return from Chantilly, where he had been for his health, he was seized with an apoplectic fit, and being found apparently lifeless in the forest, the officers of justice hastily assembled, and directed his body to be opened to ascertain the cause of his death. It is said, that on the first stroke of the surgeon's knife he uttered a cry, and opened his eyes, but it was too late, a mortal wound had been inflicted, and he died in a short time. The abbé Prevot was a ready writer: of his original compositions; the most distinguished are his romances or novels. He

wrote several works, in which history is blended with fiction, as the "Histories of William the Conqueror, and of Margaret of Anjou." He conducted a periodical work entitled "Le Pour et Contrè," of which 20 vols. 12mo. were published. His great work was "L'Histoire generale des Voyages," 16 vols. 4to. He translated De Thou's History, Cicero's Familiar Epistles, and a number of English works, among which were the Clarissa and Sir Charles Grandison of Richardson: the manner of this writer may be traced in his own novels. Gen. Biog.

PREUSCHMARK, in *Geography*, a town of Prussia, in the province of Oberland, defended by a castle; 70 miles S.W. of Königsberg. N. lat. 53° 48'. E. long. 19° 22'. —Also, a town of Prussia, in Ermeland; 6 miles S.E. of Elbing.

PREUSCHWITZ, a town of Germany, in the principality of Culmbach; 5 miles W. of Bayreuth.

PREXIT, a small island, near the N. coast of Jamaica. N. lat. 18° 27'. W. long. 76° 40'.

PREYE, or PRYE, a sea-port town of Africa, in the kingdom of Kantor.

PREZ-en-Pail, a town of France, in the department of Mayenne, and chief place of a canton, in the district of Mayenne; 8 miles N.N.E. of Vilaine. The place contains 2835, and the canton 11,371 inhabitants, on a territory of 152½ kilometres, in 7 communes.

PREZEMISLAU, a town of Bohemia, in the circle of Czaflau; 8 miles E. of Teutsch Brod.

PREZERBE, a town of Brandenburg, in the New Mark, on the Havel; 5 miles N. of Brandenburg.

PRIA, a town of Spain, in the province of Asturia, near the sea-coast; 40 miles E.N.E. of Oviedo.

PRIAM, in *Biography*, the unfortunate king of Troy, at the time of its destruction, was the son of Laomedon, and when Troy was taken and his father slain by Hercules, he was carried away captive into Greece with his sister Hesiene. He succeeded to the throne of Laomedon, and to prevent a renewal of the disaster which had befallen his capital, he surrounded it with strong walls. The discovery of a gold mine on his territories enabled him to undertake many public works, and to decorate Troy with stately edifices, so as to render it the most splendid city in that part of the world. He raised and maintained a considerable army, which enabled him to extend his dominion, till at length he was regarded as the most powerful prince of Lesser Asia. His first wife was Arisba, by whom he had only one son; but his second wife was Hecuba, who made him father of a numerous family. He lived in great prosperity till the perfidy of his son Paris, in carrying off Helen, the wife of the Spartan king Menelaus, by whom he had been hospitably entertained, brought upon him that invasion from the confederated kings of Greece, which is so celebrated under the name of the Trojan war. After a struggle of ten years, in which he saw his territories laid waste, and his bravest sons slain, the capital taken, he was himself slain at his own domestic altar by the savage Pyrrhus, the son of Achilles. The death of Priam and the fall of Troy are dated in the year 1184 B. C. Univer. Hist.

PRIAMAN, in *Geography*, a sea-port town and district of Acheen in the island of Sumatra, on the W. coast, where the English and the Dutch had formerly settlements, and where the principal quantity of pepper was procured. The town is situated on a river too shallow for pinnaces, except at high water. Here is no fort, but a square, palisadoed with four bastions and a ditch. The air is healthy, and gold is found in the river. S. lat. 0° 40'. E. long. 99° 38'.

PRIAPE *de Mer*, in *Natural History*, a name given by

the French to a peculiar species of canalis, or tubulus marinus, called also, by some authors of that nation, the *arrofoir*.

It is an oblong and thick shell of this kind, with a large head, which is pierced through with a great number of holes, so as at once to resemble, in some sort, the glans of the penis, and the head of a common gardener's watering pot. This species is found at Amboyna.

PRIAPEIA, in *Poetry*, a name given to certain obscene epigrams, and other pieces, composed on the god Priapus; of which we have many instances in the Greek Catalecta. See **PRIAPUS**.

PRIAPISCUS, in *Surgery*, a bougie, or tent.

PRIAPISM, Πριαιπισμῶς, a continual and painful erection or tension of the virile member.

The term is derived from Priapus, a heathen god, whom the poets and painters represent in a state of erection.

As satyrs are usually painted after the same manner, the disease is also called *satyriasis*, or *satyriasmus*.

Some, however, distinguish between the satyriasis and priapismus, in that the latter is without any effusion, or desire of coition; but the former attended with both.

The immediate cause of a priapism is the heat, pungency, or acrimony of the semen, accompanied with a convulsion of the muscles of the part, which, compressing the veins and cavernous bodies, prevent the return of the blood.

The more remote causes are too hot, sharp, stimulating foods; cantharides are also found to produce the same effect, but with much more violence. There are instances of people, especially old men, who, making use of cantharides to enable them to satisfy their passions the better, have been seized with a priapism, which has been followed with universal convulsions, and even death.

With regard to the priapism, chordee, and other distortions of the penis, in the venereal disease, their treatment is the same with that of the gonorrhoea. When they prove very troublesome, the patient may take a few drops of laudanum at night, especially after the operation of a purgative through the day.

PRIAPOLITHUS, a name given by some authors to a stone found about Castro in Italy, which very aptly resembles the figure of the human penis.

PRIAPUS, Πριαιπος, a term sometimes applied to the genital parts of men; viz. the penis and testes.

The name took its rise from Priapus, a fabulous deity, particularly adored at Lampfacus, the place of his birth; who, for the extraordinary size of his parts, was exceedingly revered by the women; insomuch that the scripture seems to tell us, king Aza dethroned his mother Maachah, because she had consecrated a grove to Priapus, and presided at his sacrifices.

The Roman poets in general seem to have looked on Priapus as a ridiculous god, and are all ready enough either to despise or abuse him. Hor. lib. i. sat. 8. v. 3.

Priapus, among the Romans, was the god of the gardens and orchards, in which they placed his statues. Priapus is supposed by Banier to have been the same with Belphegor, that idol of iniquity mentioned by St. Jerom, and his worship is said to have been brought to Lampfacus, whence it passed into Greece and Italy. The mythology of the Greeks and Romans, with regard to this god, is as follows: although authors are not unanimous with regard to his parentage, yet it is most generally allowed, that he was the son of Bacchus and Venus. Juno, it is said, being jealous of that goddess, contrived by her enchantments that he should be brought into the world quite monstrous and deformed. On this account Venus removed him out of her

fight, and sent him to be educated at Lampfacus. Having afterwards become the dread of husbands, he was banished from that town; but the inhabitants, afflicted with a secret distemper, recalled him, and from that time he was made the object of public veneration, a temple was built for him, and sacrifices were instituted to his honour. Under this fiction is wrapped up the history of the propagation of the worship of this god from Egypt to Lampfacus, agreeably to an observation sanctioned by the authority of Herodotus, that the birth of a god in any country means only the introduction of his worship in that same country. Accordingly Priapus was reported to be the son of that Bacchus, or Dionysius, who made the conquest of India, and who was the same with Osiris; and Venus his mother was the same with Isis. This Egyptian queen, as it has been said, had introduced, after the death of her husband, the infamous ceremony of the "Phallus." This is supposed by Banier to be the whole mystery of Priapus, who was represented in so obscene a manner. We shall throw a veil over the obscenities that accompanied the worship of this god, to whom they sacrificed an ass. The principal feast of Priapus was celebrated by women, the chief of whom was a priestess, who anointed the statue of the god, while others presented to him baskets full of fruits and vases full of wine, as to the god of the gardens and of the country. Others of them appeared in the attitudes of dancers, playing upon an instrument not unlike a hoop; another held a flute, and another again a sistrum, whence it has been inferred that this was an Egyptian ceremony; others were employed in sacrificing the ass which was offered to him. Other figures, which Banier decyphers, occur in the print of a bas-relief representing that feast, given by Broisart.

PRIBODA, in *Geography*, a town of Sweden, in the province of Smoland; 76 miles S.S.W. of Carlscrona.

PRIBORN, a town of Silesia, in the principality of Brieg; 18 miles S.W. of Brieg.

PRICE, JOHN, in *Biography*, a famous English performer on the common flute, in the service of Lewis XIII. of France, celebrated by Merfennus, lib. 2. de Instrum. Harmonic. Prop. 2.

PRICE, RICHARD, a celebrated writer of the 18th century, the son of a dissenting minister at Bridge-end, in Glamorganshire, was born at Ty-yn-ton, the 22d of February 1723. He received his grammar-learning at Neath, whence he removed, in 1735, to Pentwyn, in Carmarthenshire, where he was placed under the care of the Rev. Samuel Jones. Being designed for the ministerial profession, he was, after continuing under Mr. Jones's instructions about four years, sent to the academy of the Rev. Vavasor Griffith, at Talgarth, in Brecknockshire. Our author's father was, in his religious sentiments, a rigid Calvinist; but he himself, while very young, had been inspired by his tutor, Mr. Jones, with a desire to think for himself; and began at an early period to start doubts on the subject of predestination, and other points of the Calvinistic creed, by which he sometimes incurred the anger of his father, who could not endure to hear any thing advanced against, or that might seem to shake his favourite system. Being one day caught in the act of reading a volume of Dr. Clarke's sermons, his father snatched away the book, and threw it in the fire. Such a line of conduct was not calculated to repress the young man's curiosity. But the zeal of the parent went much beyond this, and is supposed to have influenced him in bequeathing a small part of his property only to Richard, on account of his deviations from the line of *orthodoxy*, falsely so called; while he left a considerable fortune to his elder brother by a former marriage. By the death of his father

father and mother in the years 1739 and 1740, Richard was left, in a considerable degree, dependent on his uncle, the Rev. Samuel Price of London, who was co-pastor with Dr. Watts; and he was accordingly removed from Talgarth to London, and entered a student in the academy, of which Mr. Eames was the principal tutor. Here he cultivated with great diligence and success the different branches of academical learning, particularly the mathematical sciences and moral philosophy, in which he hereafter acquired an unfading reputation. For the direction of young students, who may be ambitious of following the steps of this great and good man, and whose labours have proved so beneficial to the country and the world, we will add that the books which he read were select rather than numerous; but he studied them with the closest attention; and the more strongly to impress the matter on his mind, he early commenced an excellent practice, which he continued for many years, *viz.* of drawing up analyses of them in his commonplace book. After residing at Mr. Eames's academy four years, he became domestic chaplain to Mr. Streatfield of Stoke-Newington; which situation, while it gave him ample leisure for study, afforded him opportunities of assisting with his services the ministers and congregations in and about London. In 1757 he married, and in the following year he settled at Newington-Green, and became pastor of the congregation there. In this same year Mr. Price made his first appearance as an author, in a work entitled "A Review of the principal Questions and Difficulties in Morals, particularly those relating to the original of our Ideas of Virtue, its Nature, Foundation, Reference to the Deity, Obligation, Subject, Matter, and Sanctions," 8vo. The scheme of morals which he adopts depends chiefly upon the hypothesis, that the power which perceives and determines concerning actions is the understanding, and not the moral sense, as maintained by Dr. Hutcheson. For this he contends, in order to establish the important inference, that *morality* is immutable and eternal, not the arbitrary production of any power human or divine, but equally everlasting and necessary with truth and reason. Having laid the foundation of his system, he applies it to the explication and proof of some of the principal doctrines and facts of natural religion, particularly the moral attributes of God, his moral government, and a future state of rewards and punishments. This work, which was written with great ability, advanced the author at once to a very respectable rank among moral and metaphysical writers; and it was acknowledged, by all capable of appreciating its value, to be the most able defence of those principles in the English language. A new edition, being the third, of the volume, with considerable improvements, was published in 1787. In the preface Dr. Price says, it was published "thirty years ago, and was then the author's first production, and contained the result of some of his earliest thoughts. A careful revival has now made it the result of his latest and maturest thoughts." To this edition is added a Dissertation on the Being and Attributes of the Deity. To return to the author:—in the year 1763, he was chosen afternoon preacher to the congregation in Poor Jewry street, London, which had enjoyed the ministerial services of a Benson and a Lardner. About the same time he was elected a fellow of the Royal Society of London, to whose Transactions he had been a frequent and valuable contributor. In 1767 he published Four Dissertations: 1. On Providence. 2. On Prayer. 3. On the Reasons for expecting that virtuous Men will meet after Death in a State of Happiness. 4. On the Importance of Christianity, the Nature of historical Evidence, and Miracles. These dissertations, in which it has been justly said

"philosophy and piety form a happy union," have gone through several editions.

In the year 1769, the university of Aberdeen, out of pure respect to Mr. Price's extraordinary merits, presented him with the diploma of doctor of divinity. In the following year he was chosen pastor of the congregation at the Gravel-pit meeting, Hackney, where he became distinguished as a most impressive and interesting preacher. His next work, which appeared in 1771, was entitled "Observations on reverfionary Payments; on Schemes for providing Annuities for Widows, and for Persons in old Age; on the Method of calculating the Values of Assurances on Lives; and on the National Debt," &c. The advice and instruction contained in this book were peculiarly seasonable, as various societies, professedly for the benefit of aged persons and widows, were at that time continually rising up, which, as they were founded on false principles, threatened to be productive of the most alarming evils. By the publication of this work of Dr. Price, many of the societies were induced to reform their plans; others were deserted by the public; and some, which were heedless of admonition, speedily came to ruin. After three editions of it had been sold, the author prepared a fourth, which he published in 1783, in 2 vols. 8vo. To the subsequent editions, of which there have been several, a very able general introduction has been prefixed by the author's nephew, William Morgan, esq., the distinguished actuary of the "Society for Equitable Assurances on Lives and Survivorships," who has likewise improved the body of the work by notes, tables, &c. the result of many years' experience. One chapter in this work contains interesting observations on public credit, and the national debt; points out the erroneous policy of that misapplication of the sinking fund, which, with the consent of parliament, ministers had practised from the time of sir Robert Walpole, and demonstrates the efficacy of such a fund, when inviolably applied, in extinguishing the public debts, and essentially contributing to promote national security and welfare. These important topics were further discussed in a work, entitled "An Appeal to the Public on the Subject of the National Debt," which was published in 1772. During the civil war, which terminated in the independence of the American colonies, Dr. Price united with those true friends to the country, who protested against the injustice and madness of those proceedings, the issue of which justified their predictions. It was at this period he published his, "Observations on the Nature of Civil Liberty, the Principles of Government, and the Justice and Policy of the War with America." In these Observations, his notions of government correspond with the principles taught by Locke, and all the writers on civil liberty, who have been most admired in this country; and he demonstrated the measures pursued by administration against America to be inconsistent with justice, the principles of the constitution, and the honour of the kingdom. For this work the common council of London, as a testimony of their approbation of the principles inculcated in it, presented the author with the freedom of the city in a gold box. In 1778 he published "Additional Observations on the Nature and Value of Civil Liberty, and the War with America," &c. Dr. Price also published, at the same time, a general introduction to both pieces, and a supplement. The next publication in which Dr. Price was concerned, was "A free Discussion of the Doctrines of Materialism and Philosophical Necessity," in a correspondence between Dr. Price and Priestley. In 1779 our author addressed some important observations to the "Society for Equitable Assurances," in an introduction to a work by his nephew,

nephew, Mr. Morgan, on "The Doctrine of Annuities," &c. To the exertions of this excellent man, and the indefatigable zeal of his nephew, the prosperity of that society, on which the happiness and even existence of thousands are continually depending, is almost entirely owing.

When the earl of Shelburne was prime minister, he sought the assistance of Dr. Price in forming a scheme for paying off the national debt, and moved an introductory resolution on that subject in the house of lords; but upon his being driven from office, the scheme was abandoned. It was, however, communicated to the public by Dr. Price in a treatise, entitled "The State of the public Debts and Finances, at signing the preliminary Articles of Peace in January 1783; with a Plan for raising Money by public Loans, and for redeeming the public Debts." After this, when Mr. Pitt determined to introduce a bill into parliament for liquidating the national debt, he applied to Dr. Price for his advice on the subject, and received from him three separate plans; one of which, said to be the least efficient in its operation, was adopted by the minister, though without the slightest acknowledgment of his obligations, and now forms the foundation of that act for reducing the public debt, which was established in 1786, and has contributed more than any other, or all other measures, to raise the credit of his administration. See PITT.

In the year 1784 Dr. Price published "Observations on the Importance of the American Revolution, and the Means of making it useful to the World;" which observations breathed an ardent spirit of virtue and benevolence, and afford salutary advice on various important points highly interesting to the new government. To these observations are added a letter from M. Turgot, containing remarks which merit the attention of all free governments; and the last will of M. Fortune Ricard, which exhibits an amusing, and rather humorous application of Dr. Price's account of the powers of compound interest, and the uses to which it may be applied for the benefit of mankind. In 1786 he published a volume of sermons, partly on practical, and partly on doctrinal subjects: in the latter he states, and defends with animation and zeal, the Arian hypothesis, to which he himself was attached, against Trinitarians on the one hand, and modern Unitarians on the other. The practical sermons, on the security and happiness of a virtuous course, on the goodness of God, and on the resurrection of Lazarus, are replete with the soundest reasoning, and the most glowing eloquence.

The other publications of this excellent divine, which chiefly attracted notice, were two sermons preached before his congregation at Hackney, on the fast days in 1779 and 1781:—A sermon on "The Evidence of a future Period of Improvement in the State of Mankind, with the Means and Duty of promoting it, delivered to the Supporters of the new Academical Institution among Protestant Dissenters," in the year 1787; and his "Discourse on the Love of our Country," preached the 4th of November, 1789, before the society for commemorating the revolution of 1688 in Great Britain. In this last discourse Dr. Price displayed his well-known zeal for the great principles of civil and religious liberty, and towards the conclusion of it, he adverted with triumph to the revolution in France, which in its origin augured well for the happiness of the world; and it was hoped by unnumbered thousands at that time, as well as by the benevolent and kind hearted doctor Richard Price, that it was a prelude to a general amendment in human affairs, and that hereafter, and at no great distance of time, "the dominion of arbitrary kings would be changed for the dominion of laws, and that

the dominion of priests would shortly give way to the dominion of reason and conscience." Such a prospect he thought could not but be peculiarly gratifying to Englishmen who understood and valued their own rights and privileges. There were, however, others who lamented over the downfall of tyranny in France, and who were at this period advocates for the divine rights of kings, notwithstanding their present principles belied all the former acts and exertions of their past lives. These, because they could not produce reason and argument in justification of their notions, descended to the vilest calumnies, and made up in violence what they were deficient in truth. At the head of these stood the late Edmund Burke, who in his speeches in parliament, and in his work entitled "Reflections on the Revolution in France, &c." endeavoured to expose Dr. Price to public odium, by illiberally, and contrary to his better knowledge, describing him, who was one of the most benevolent of all men, as exulting in the horrid outrages committed by the infuriated French populace, and by loading him with such epithets of contempt, as his exuberant imagination, unrestrained by any regard to truth or decency, could supply. The invectives and abuse of the senator, shortly afterwards admitted on the list of pensioners, Dr. Price thought it beneath him to notice; but in a preface to a new edition of his discourse, he vindicated his principles and conduct perfectly to the satisfaction of the unprejudiced part of the public. He was hastily drawing to his end. He had in the year 1786 lost his lady, and in February 1791 he was seized with a fever, the effects of a severe cold, which he took while attending the funeral of a friend; from the effects of this he was gradually recovering, when he was attacked with a severe and very painful disorder, by which he had been many years threatened. This he bore with fortitude and resignation, though occasionally his spirits and strength were entirely exhausted by the agonies which he endured. He died on the nineteenth of March 1791, in the sixty-eighth year of his age, beloved by all who had the honour of his acquaintance, and respected by the wise and the virtuous capable of appreciating his labours, and the value of the services which he performed for his country and the world.

Of Dr. Price's distinguished abilities as a mathematician, moralist, and lover of his country, we have given ample proof. In his profession as a dissenting minister he was ardent and zealous, anxious to promote the best interests of those who attended his services. In the pulpit his manner was natural, and very earnest; and in his devotional exercises, there was a degree of fervour, which indicated the strongest sensibility as well as sincerity in himself, and which communicated its warmth to those who joined with him. He was for many years one of the trustees to the estates of the late Dr. Daniel Williams, which is the most important concern belonging to the London Dissenters. During the applications of the dissenting ministers to parliament, from 1772 to 1779, for relief from subscription to the articles of the church of England, required by the act of Toleration, he was chosen one of the committee appointed to concert and pursue the necessary measures for obtaining that object; but when he found that it could not be obtained without a declaration of faith in the holy scriptures, which he contended the civil magistrate had no right to demand, he divided with a small minority of his brethren against the rest of the committee, refusing an enlargement of religious liberty on terms which, according to their views of things, and according to the true principles of dissent, implied submission to the authority of the civil magistrate in matters of conscience, to whom, in matters of

this kind, they owed no obedience whatever. In 1783 the degree of LL.D. was conferred upon him by Yale college, in Connecticut, and he was afterwards elected a fellow of the American Philosophical Societies at Philadelphia and Boston. In the year 1786, when a new academical institution among the Dissenters was established at Hackney, Dr. Price was appointed tutor in the higher branches of the mathematics; to three of the pupils he gave some lectures, but he soon resigned the office into the hands of his nephew the Rev. George Cadogan Morgan, of whom we may, having omitted it in its proper place, say a few words.

This gentleman, whose father was a respectable surgeon at Bridge-end, Glamorganshire, and mother the sister of Dr. Price, was born in 1754. He was intended for the church, but being dissatisfied with the articles, he entered himself as a pupil in the dissenting academy, then under the direction of Drs. Savage, Kippis, and Rees. In 1776 he settled as a minister with a congregation at Norwich. Here he resided till 1785, when he removed to Yarmouth, which he left in the following year, in order to join his uncle at Hackney. Here he became afternoon preacher at the Gravel-pit meeting, and lecturer at the New College. These offices he resigned about the year 1792, and employed his great talents in educating a select number of young people in his own house. He died at Southgate on the 17th of November 1798, at the early age of forty-four, sincerely regretted by all who knew him. He had, about four years before his decease, given the world a work in two volumes, entitled "Lectures on Electricity," which has long since been out of print. He is known also by a valuable and important paper, communicated in the year 1785 to the Royal Society, containing "Observations and Experiments on the Light of Bodies in a state of Combustion." This paper was published in the 75th volume of the Philosophical Transactions. He was an advocate for the principles of Stahl, in opposition to the system of Lavoisier and the French chemists. (See PHLOGISTON.) He was a man of incessant application, rose very early, and often studied to a late hour. In the pursuit of science he was ardent and enthusiastic. The ardour which glowed in his own breast, he had the happy art of infusing into the minds of others. He was a warm and steady friend, and ever ready to afford assistance to those who stood in need of his aid and friendly countenance, as numbers now living can testify, among whom the writer of this article rejoices in the opportunity of ranking himself.

But to return to Dr. Price: besides the articles already mentioned, he published some single sermons, and contributed various papers to the Philosophical Transactions, which may be found inserted in different volumes from 1763 to 1786. Among his numerous correspondents, were the marquis of Lansdowne, the earls Chatham and Stanhope, the bishops of Carlisle, St. Asaph, and Llandaff, Mr. Harris, the author of Philosophical Arrangements, &c., Mr. Howard, Dr. Franklin, the duke de Rochefoucault, the celebrated Turgot, and several of the most distinguished members of the first national assembly. We shall close this article with the character of its subject, as it is partly given by one of his biographers. Though strictly attentive to the obligations of domestic life, he did not suffer his private affections to encroach upon his social duties. His talents and labours were ever ready at the call of friendship; nay, so much did his nature abound with the milk of human kindness, that he could not resist, without extreme reluctance, even troublesome and unseasonable solicitations. His hours of study and retirement were frequently broken in upon for assistance and advice, especially in matters relating to an-

nities and life assurances; and in this way he sacrificed much of his personal convenience to individuals of whom he knew but little, and from whom he would accept of no pecuniary recompence. A fifth part of his annual income was regularly devoted to charitable purposes; and he was laudably anxious to distribute it in such a way, as might produce the greatest good. Simplicity and humility were among the strongly marked features of his character. No man was ever apparently less sensible of his own excellencies, nor less elated by his own celebrity; and in no man was the dignity of artless manners and unaffected modesty more happily displayed. His face was the true index of his mind. It beamed with philanthropy, and when lighted up in conversation with his friends, assumed an aspect peculiarly pleasing.

PRICE, in *Political Economy*, is the exchangeable value of a commodity for which it may be procured at pleasure. As the value of the acknowledged general medium of exchange is universally known, it is most peculiarly adapted to mark the price of commodities in general. Hence price may be defined a certain proportion of the general medium of exchange, deemed equal to the value of the thing or things to be obtained for it in exchange: in other words, price is the equivalent of a commodity expressed by the general medium of exchange. The bare amount of the pieces of money, or of other things to be given for a commodity, constitutes its *nominal* price; the influence of the three producing powers, *labour*, *land*, and *capital*, in the production of the commodity, expressed by the value in money which must be given to obtain it, constitutes its *real* price. Advances necessary to obtain a commodity are called *costs*. The aggregate of the costs, which the production or original acquisition of a commodity required, may be denominated its *cost* price: and the price at which a commodity may be purchased at pleasure constitutes its *market* price. The cost price depends on the price of the causes necessary to produce a commodity, or to make its primary acquisition. These causes are either *necessary*, that is, such as lie in the nature of the commodity itself, and without which it could not have been produced or acquired: or they are *voluntary*, that is, such causes might have been dispensed with: or they are *accidental*, that is, they have their foundation in certain adventitious circumstances. When the price of a commodity is only the equivalent to the necessary causes of its existence, it is called its *natural* price; when it is a compensation for the voluntary causes of its existence, it is an *artificial* price; and when it is a compensation for adventitious causes, an *accidental* price.

The necessary efficient causes, through one or the other of which, singly or combined, any commodity is originally sent to market, and without either one or the other of which no commodity can be produced or acquired, are, 1. *Land* or *soil*, which is the basis of our existence, and of all our operations; and furnishes us with all kinds of useful raw materials. 2. *Labour*, which is indispensable to obtain food, and to provide us with convenient dwellings. And 3. *Capital*, or a stock previously accumulated to afford advances, pay wages, and procure implements, tools, engines, &c. without which many labours could not be performed.

As land, labour, and capital, have a share in the producing of almost all commodities, every commodity produced, or its value, must be divided among those who produced it, in proportion to the share they had in its production. One part is assigned to the land-holder, another to the labourer, and a third to the capitalist. If a single individual should be land-owner, labourer, and capitalist, the whole commodity, or the whole of its value, would of course belong to him alone.

The

PRICE.

The land-owner may lend his land to the capitalist or to the labourer: the capitalist may lend his capital or stock to the labourer or the land-owner: and the labourer may lend his industry to one or both of them. And as neither is willing to lend the source from which he may obtain useful things for nothing, the individual to whom it is lent must give in return part of the commodity which the use of the loan helps him to gain, either in kind, or its value in any other acceptable commodity. What the labourer receives for the loan of his industry, is called the *wages of labour*; whatever is received for the use of a capital is called *profit of stock*; and what is received for the mere permission to use a portion of land or soil, is called *rent*. The proper employment of capital requires diligence, ability, and a certain degree of resolution, as the want of such qualities frequently induces owners of capital to entrust it to the use of others. In this case the owner of the stock is particularly called a *capitalist*, and the individual who employs the stock has been sometimes denominated an *undertaker*. The *PROFIT of Stock*, (which see,) must in such instances be divided, in certain proportions, between the capitalist and undertaker. As individual interest is universal in the human race, and no man either labours, or lends a portion of his soil or of his stock for nothing, no commodities would be produced, if the necessary causes of their production were not compensated, that is, if those who contribute to their production did not receive some compensation. Consequently, the first or cost price of all useful commodities must afford an equivalent for the wages of the labourer, the profit of the stock, and the rent of the soil employed in the production. Wages of labour, profit of stock, and rent, are the elements into which the original value of all commodities may ultimately be resolved: they are the elements of the cost price of every useful thing. Every cost price does not comprize all three elements together, because it is not every thing that requires the co-operation of the three efficient causes towards its production, but the prime or cost price of no commodity can be composed of any other elements, and when a commodity ceases to obtain its cost price, it ceases to be produced, and whether the price of the elements or causes of the commodity be natural or artificial, it must always be fully replaced if the commodity is to be farther produced or brought to market. The price of every thing, in fact, is regulated by the price of the elements of which it is composed. This price is, however, fluctuating, the causes of which we shall soon point out; but previously to this it will be necessary to inquire into the circumstances which regulate the market price, and to shew in what it deviates from the cost price.

The chief inducement to produce any commodity, or to accumulate a stock, is the probability that there will be a demand for them, and of course will meet with purchasers. But to become purchasers, people must not only wish for the commodity, but must have wealth sufficient, or a surplus of commodities to give in exchange. The desire to be possessed of a thing, combined with the means of acquiring it, is called the *demand*. The demand for a commodity, or the anticipation of a demand for a commodity, is the primary cause why it is produced, or a stock of it provided; those who wish for it must offer to give, at least, the whole cost price for the commodity. As soon as this is the case, many individuals are ready to satisfy that demand, and the owners of the article in demand look out for purchasers: this looking out for buyers is called the *offer for sale*. If the offer for sale and the demand were always equal, commodities would always bring their prime or cost price. But as this equality is frequently destroyed, it often happens that

either more or less than the cost price is paid for a commodity.

A place especially devoted to the business of buying and selling, is called a *market*, and the price at which goods are bought and sold there, is called the *market price*. They are, however, only those commodities that are in general request, that are brought to market, and have a market price. The sellers who bring their goods to market rarely know beforehand how great the demand for them will be. Hence many more commodities of a certain kind may be offered for sale than are sought for, or more commodities may be sought for than are in the market. "Yet," as is observed by Mr. Boileau, in his excellent 'Introduction to the Study of Political Economy,' "as the exertion to preserve and to increase wealth is pretty universal, buyers and sellers are equally anxious to profit by the circumstances most favourable to their views. The vender endeavours to dispose of his goods at the highest possible price, the purchaser to obtain them at the lowest possible price. A sort of struggle invariably takes place between the buyers and sellers before they agree. The latter study to raise the price, and wish to get as much as possible for their commodities; the former endeavour to lower it, and strive to give as little as possible for the commodities they are desirous of acquiring. By means of this struggle, a price is at length fixed, at which the venders are glad to sell, and which the purchasers are willing to give: this is the market price. The agreeing about the price is influenced by the need in which the parties stand to buy or to sell. It is want that impels alike the venders to sell and the buyers to purchase. He whose want is most pressing, or whose desire is the strongest, is obliged to yield." The market price exceeds or falls below the cost price, according to the supply of goods; but the commodity must always bring the cost price, if it be farther produced, and on this account the cost price always regulates the market price.

When one purchaser is anxious to buy before another, and one vender endeavours to be before-hand with another in disposing of his goods, there is what is called a *competition*. When it takes place among the buyers, it is a *competition of demand*; when among the sellers, the *competition of the offers of sale*. The one tends to raise, the other to depress the price; in the one case the buyers are slow in their purchases; in the other, the sellers endeavour to keep their goods out of the market, in the hope of obtaining still higher prices. It is not the whole stock of a commodity, but only that part which is actually offered for sale, that influences the price. When the whole stock is in the hands of one or a few individuals, he or they may easily suit the actual *offer for sale* to the *demand*, and may exact very high prices. But when the number of sellers is great, a combination to keep back goods is proportionably difficult; there becomes a competition of offers for sale, which instantly lowers the price. So, on the other hand, the want of competition among purchasers tends to *lower*, and an increased demand to *raise* the price.

Besides the competition of demand, and offers of sale, the price of goods is likewise influenced by the quantity and quality of the commodities, even when they are locked up in one or a few hands. Every stock of commodities is provided in the hope that there will be buyers willing to pay the usual cost price. This expectation may be disappointed either by the sudden starting up of competitors, or some unforeseen adventitious circumstances may cause the number of buyers to be materially different from that which had been reckoned upon, and as the stock in hand cannot immediately be increased or diminished agreeably to such casualties, the actual

actual abundance or scarcity of goods relatively to the demand, must always have a great influence on the fluctuation of the price of commodities. The increase of some of them depends, moreover, on chance, or such causes over which man has no sort of controul: while the increase of others rests in a great degree on the will of man. If chance be more favourable to one seller or one grower of a commodity than to another, the less favoured one is obliged to sell at the same price with the fortunate one, and probably under prime cost. The market price of such articles may more frequently, and for a longer time, deviate from the cost price, than the market price of such, of which the quantity is determined by man's free will. The quality of some goods, or their perishable nature, enforces also a quicker sale than that of others. Yet the cost price is the constant regulator of the production of goods; it is the price of the causes of the origin of commodities.

The state may influence the price of commodities in a two-fold way, either by increasing the charges or cost of their production, or by positive enactments which limit their sale and purchase. The former is chiefly effected by taxes, the latter by legal regulations. The amount of the duty laid on a certain article, or the sum by which the tax increases the wages of labour, the profit of stock, and even the rent, which are the efficient causes of that produce, is the proportion in which the cost price is raised by the tax; its market price must of course rise in the same proportion if there be no alteration in any of the other circumstances which influence the price of goods.

Prices are, in general, *raised*, 1. By exclusive rights granted to one or a few individuals, as is the case with monopolies, chartered companies, corporations, &c. 2. By laying heavy duties on the importation of foreign goods, or prohibiting them altogether. 3. By limiting the use of the soil. And 4. By favouring the exportation of certain commodities by means of bounties.

Prices are kept *low*, 1. By an unrestrained freedom of trade and commerce. 2. By regulations favouring the labours of a particular class, which invite others to the same labour, and lower the price of the produce. 3. By regulations which exclude a number of buyers from the purchase of a certain produce. But these lower the price of that produce only as long as the number of purchasers is not increased in another quarter, or as long as the produce is not reduced in proportion to the small number of buyers. Prohibiting the exportation of corn seldom causes much reduction in the price, for the fear of a scarcity increases the number of purchasers, and diminishes that of the sellers.

Regulations which fix the price of a commodity are called the *assize*. When they fix the price below the natural cost price, the commodity is no longer produced, or seeks for a market abroad. When they fix it at the natural cost price, they are unnecessary, unless the competition of sellers be restrained. Smith's *Wealth of Nations*. Boileau's *Political Economy*.

PRICE, *Current*, in *Commerce*, a weekly account of the current value of most commodities.

PRICK MADAM, in *Botany*, the name of a species of house-leek.

PRICK or *Queen Post*, in *Building*. See *POST*.

PRICK, or *Pinch*, in the *Manege*, is to give a horse a gentle touch of the spur, without clapping them hard to him.

To *prick* or *pinch*, is an aid; but to *appuyer*, or bear hard with a spur, is correction. See *PINCHING*.

PRICK *Timber*, or *Wood*, in *Botany*. See *SPINDLE Tree*.

PRICKER, in *Rural Economy*, a term applied to a brad

awl. It also signifies a sort of hook to clean horses feet with.

PRICKET, a term applied to a spitter, or young male deer of two years old, that begins to put forth the head. See *SPITTER*.

PRICKING of a horse's foot, in the *Manege*, is the hurt received by a nail driven too far in the foot, so as to reach the quick, or press the vein in the horse's foot, when he is shod.

PRICKING the chart, is the art of tracing a ship's course upon a marine chart, by the help of a scale and compasses, so as to discover its present situation.

PRICKING the sails, is the art of stitching two cloths of a sail together, along the space comprehended between the two edges, or selvages, that overlay each other. Or, it is the sewing a middle-seam between the two seams which are employed to unite every cloth of a sail to the next adjoining. See *SAIL-making*.

PRICKLE, in *Botany* and *Vegetable Physiology*, *aculeus*, a thorn originating from the bark of plants, and not connected in any manner with their wood. Such are found in *Rosa*, *Rubus*, &c. They are more permanent than *spinae*, being not liable to disappear by culture. See *SPINA* and *THORN*.

PRICKLE *Back*, in *Ichthyology*, a small fish, so called from the prickles on its sides and back. Vast numbers of these little fish are to be found in almost all fresh waters, wherever it is possible for fish to live, as Mr. Arderon informs us, *Phil. Trans.* N^o 428. sect. 15. who gives us some account of these creatures. They are very destructive to the spawn of all sorts of fish; and they themselves are tormented to death by a kind of louse of an oval figure, with eight legs and a very transparent body. This louse has little fins always in motion, whether it be swimming about or fixed on the fish. See *STICKLE-back*.

PRICKLY PEAR, in *Botany*. See *CACTUS*.

PRICKLY *Parfnep*. See *ECHINOPHORA*.

PRICKLY *Pear*, in *Geography*, a small island near the N. coast of Antigua. N. lat. 17° 8'. W. long. 61° 30'.

PRIDE, in *Mental Philosophy*, is, as Dr. Cogan has defined it, that exalted idea of our state, qualifications, or attainments, which exceeds the boundaries of justice, and induces us to look down upon supposed inferiors with some degree of unmerited contempt. (See *MENTAL PHILOSOPHY*.) When this elevated idea of ourselves becomes a motive to avoid and despise any thing mean and unworthy, its impropriety is overlooked; and as it leads to worthy conduct, it is honoured with the appellation of *laudable* pride. When it proceeds from the excess of attachment and affection to our country, founded on exaggerated ideas of its superiority; or to our relatives and friends on account of their real or imagined merit; or to our parents, in consequence of their rank or celebrity; or to children, by reason of their accomplishments or any honour conferred upon them; this kind of pride, proceeding from excess of affection, where the affection is natural, is called *pardonable* pride. When pride is manifested by an ostentatious display of wealth, station, or accomplishments, it is deemed a *vain* pride. When it is indulged to such an excess, that it looks down with disdain upon others, little inferior, or perhaps equal, or even superior in real merit; it is branded with the title of *insufferable* pride.

Mr. Hume has given a different definition of pride from that which we have above stated. Pride, as he says, is "a certain satisfaction in ourselves on account of some accomplishment, or possession, we enjoy," "The object of pride is *self*, the cause, some *excellence*," He adds, "our merit

raises pride, and it is essential to pride to turn our view on ourselves with complacency and satisfaction." But as he has made no distinction between real and supposed merit, he necessarily directs our thoughts to absolute merit; and according to his representation, there can be no place for a vicious pride, or an ill-founded confidence in our own superiority. See Cogan's Philosophical Treatise on the Passions. Notes.

PRIDE of the *Isis*, a name given by Dr. Plot to the common lampern, from its being found very plentifully and very delicate in that river. See PETROMYZON *Branchialis*.

PRIDE Gavel, a custom in the manor of Rodely in the county of Gloucester; by which, to this day, a rent is paid to the lord, by certain tenants, in duty and acknowledgment to him for their liberty and privilege of fishing for lampreys or lamprids in the river Severn.

PRIDEAUX, JOHN, in *Biography*, a learned English prelate, was born at Slowford, in Devonshire, in 1578. His parents were in very humble circumstances, and he himself was candidate, while only a youth, for the situation of parish clerk at the neighbouring church of Ugborow. He was extremely mortified at his want of success. To console him under the disappointment, a charitable gentlewoman maintained him at school till he acquired some proficiency in the Latin language. After this he was sent to the university of Oxford, where, at first, he earned his support by servile offices in the kitchen of Exeter-college, and spent his leisure hours in the diligent prosecution of his studies. The eagerness with which he pursued knowledge attracted the notice of the tutors and rector, and in 1596 he was admitted a member of the college. In 1596 he took the degree of B. A., and in 1602 he was chosen probationer-fellow of his college. In the following year he proceeded to M. A., and was shortly afterwards admitted to holy orders. In 1612 he took his doctor's degree, and having acquired a high reputation for deep and extensive learning, he was, in the same year, elected rector of his college. From this time, owing to his attention and zeal to its interests, the college flourished more than any other foundation in the university. In 1615 Dr. Prideaux was appointed Regius professor of divinity in the university of Oxford; and, in connection with that appointment, became canon of Christ-church and rector of Ewelme in Oxfordshire. He afterwards discharged the duties of vice-chancellor of the university during several years. In 1641 he was nominated by king Charles I. to the bishopric of Worcester, but owing to the state of the times he never derived much emolument from the see, and his great zeal in the king's cause exposed him to the resentment of the parliament party, and he was reduced to the greatest poverty, so that he was obliged to sell almost every thing of which he was possessed, to obtain the common necessaries of life. He died in 1650, leaving to his children no legacy but "Pious poverty; God's blessing, and a Father's prayers, and example of strict integrity and honour." His learning was extensive, and his memory prodigious. He was modest, kind, and unassuming; he was never anxious to conceal his low origin. "Could I," he was often heard to say, "have been clerk of Ugborow, I had never been bishop of Worcester." He was author of a great number of works, of many of which the titles are given in the General Biography, to which we refer the reader; also to Wood's Athen. Oxon. and Walker's Sufferings of the Clergy.

PRIDEAUX, HUMPHREY, distinguished for his great learning and talents, was the third son of Edmund Prideaux, esq. of Padstow in Cornwall, in the year 1648. Being designed by his parents for the church, he was initiated in grammar learning at the schools of Liskeard and Bodmin,

and then sent to Westminster school, under the direction of the celebrated Dr. Busby. Here he was elected king's scholar, and after three years was sent on the foundation to Christ-church-college in the university of Oxford, where he was admitted a student in 1668. In 1672 he was employed by Dr. Fell, dean of Christ-church, in publishing an edition of Lucius Florus, with notes. When this was finished, a wish was expressed that he would prepare for publication, from a MS. in the Bodleian library, the work of "Johannes Antiochenus Malela," a Greek historian, which he declined, judging it unworthy the labour. In 1676 he published his "Marmora Oxoniensia ex Arundellianis, Seldenianis, aliisque constat, cum perpetuo Commentario," by which he acquired a high reputation in the university, and also among the learned in many parts of the world. The work was eagerly sought for, and it soon became very scarce. It was drawn up in too much haste, and the typographical errors were numerous. A more correct edition was published under the care of Michael Mattare in 1732. In 1679 Mr. Prideaux was presented, by the lord chancellor Finch, with the rectory of St. Clement's, Oxford, and in the same year he published two treatises of Maimonides in Hebrew, with a Latin version, and notes, under the title of "De Jure Pauperis et Peregrini apud Judæos." During the short session of parliament at Oxford in 1680, Mr. Prideaux had the honour of attending upon the lord chancellor in the capacity of chaplain, and in the following year his lordship presented him to a prebend in the cathedral church of Norwich. In 1682 he was presented to the rectory of Bladen cum capella de Woodstock, in Oxfordshire; this was the more acceptable, as it might be held with his studentship, and the office to which he had been appointed of library-keeper in Christ-church college. In 1686 he proceeded doctor of divinity. The popish emissaries being very active, at this period, in propagating their principles, Dr. Prideaux exerted himself in opposing them, as well through the medium of the press as in the pulpit. He had now settled upon his prebend of Norwich, and observing that the clergy of that city were much intimidated by the severe measures which the king (James II.) took in serving the interests of his religion, especially in the suspension of the bishop of London, and Dr. Sharp, dean of Norwich, by his arbitrary ecclesiastical commission, and that they wholly abstained from any reference to the Popish controversy, at a time when there was most need for them to exert themselves in defence of Protestantism, he determined, by his own example, to encourage them to speak out in support of the principles which they professed, and boldly preached, in the cathedral, against the mass, declaring that, at all hazard, he was not ashamed of, nor afraid to preach, the gospel of Christ. He also distinguished himself by opposing, with all his powers, the declaration of indulgence, and by his influence, it was not read in more than four or five churches throughout the diocese of Norwich, which contains about 1200 parishes. After the Revolution he was collated to the archdeaconry of Suffolk. When the convocation met in 1689, Dr. Prideaux took an active part with the minority, who were expressing their indulgence towards dissenters, by such alterations in the canons, liturgy, and rituals of the church, as might contribute to promote the comprehension of them within the establishment. In the year 1691, upon the death of the learned Dr. Pococke, the place of Hebrew professor at Oxford was offered to Dr. Prideaux, which he declined. About the year 1696 he was presented to the small vicarage of Trowse near Norwich, which was worth only about 40*l.* per ann. but he readily accepted it for the sake of having an opportunity of exercising his ministerial functions. These

he regularly discharged till his ill state of health prevented him from going into the pulpit, when he resigned the living. In 1697 he published his life of Mahomet, which met with so favourable a reception, that the author sold three editions of it in the same year. In 1702 he was promoted to the deanery of Norwich, and immediately applied himself to the reformation of such disorders and abuses as prevailed in the cathedral. In 1710 he underwent a severe surgical operation, from the effects of which he did not speedily recover. After obtaining such a share of health as to be able to resume his studies, he applied himself to the composition of his most celebrated work, entitled "The Old and New Testament connected in the History of the Jews and neighbouring Nations," and in 1715 he published the first part of it in a folio volume, which was followed by a second in 1718. This work was so well received by the public that it went through eight editions at London, and two or three at Dublin, before the end of the year 1720, and it has been repeatedly printed, as well as translated into the French and Italian languages. Dr. Prideaux died on the 1st of November 1724, in the 77th year of his age. He had naturally a strong constitution, which enabled him to pursue his studies with the utmost assiduity till he was unfortunately afflicted with the stone. His abilities were solid rather than lively, his judgment excellent, and his learning very extensive. As a writer he is distinguished by perspicuity and precision. In his manner of living he was regular and temperate, being seldom out of his bed after ten o'clock, and generally at his studies before five in the morning. He spoke his mind with freedom and boldness, and was not easily diverted from pursuing what he believed to be right. *Biog. Brit. Gen. Biog.*

PRIESDORF, in *Geography*, a town of Germany, in the duchy of Anhalt Cothen; two miles S. of Cothen.

PRIESEN, a town of Bohemia, in the circle of Leitmeritz; eight miles N. of Leitmeritz.

PRIEST, **SACERDOS**, a person set apart for the performance of sacrifice, and other offices and ceremonies of religion.

Thus the false gods and goddesses of the heathens had their priests; priests of Mars, of Bacchus, of Hercules, of Isis; and some of them their priestesses. See **PONTIFEX**, &c.

The Greeks, and also the Romans, had three sorts of priests; *viz.* those of Cybele, called *Galli* (which see); those of Mithras (see *Feast of MITHRA*); and those of the Orgies, or mysteries of Bacchus (see **ORGIA** and **BACCHUS**.)

When Romulus divided Rome into 30 curiæ, he instituted two priests for each, which made the whole number 60. The priests of Romulus's institution were to be at least 50 years of age, men of distinguished morals and birth, capable of maintaining themselves with honour, and free from all bodily blemishes; and as in the ministry of these priests, there were some things which could only be performed by women, the wives and daughters of the priests were employed

in such services. At first the priesthood was engrossed by the Patricians, but afterwards the people, disliking that preference, prevailed to have the priesthood divided between the senate and themselves; and under the tribuneship of Cn. Domitius, they gained the privilege of choosing the priests, which had been reserved for the college of Patricians; but in process of time a new regulation was adopted, so that the college became the electors, and the people confirmed that election. After some subsequent alterations, the emperors arrogated the right of choosing the priests, and became themselves the high-priests, which state of things commenced with Julius Cæsar. When the election of the college was confirmed by the people, they proceeded to the inauguration, which was performed with peculiar ceremonies, and concluded with an entertainment given by the new priests. From that moment they assumed the gown, called the "toga prætexta," and the ornament for the head, named "apex," "galerus," and "albo-galerus."

The priests in Rome enjoyed several privileges, and they might assist in the senate; but they were afterwards deprived of this privilege. They were exempt from burdensome offices in the state, and were disused from going to war. They had commonly a torch and a branch of laurel carried before them, and they were allowed to ride up to the Capitol in a chariot, called "Carpentum." Some were priests for life; others were deprived of it; but the augurs could not be deposed. Every order of priests had its peculiar college, and revenues for the sacrifices. In the order of the Roman Hierarchy, the pontiffs were the first. (See **PONTIFEX**.) Next to the Pontifex maximus were the Flamines; (see **FLAMEN**.) At Rome, as well as in Greece, there were sacerdotal families; those in that city were the "Potitii" and "Pindari" for the worship of Hercules, and that priesthood continued there a long time. The king-priest, or Rex Sacrificulus, was instituted after the expulsion of the kings of Rome, to perpetuate their memory, as Dionysius of Halicarnassus says, on account of the great services which some of their kings had done to Rome. To all these ministers we may add the "epulones." (See **EPULO**.) The Romans had also other orders of priests and priestesses, such as those that were instituted for keeping the "Sibylline" books, vestals, sibyls, falii, &c. which may be found under their proper titles.

The Jews had three orders, *viz.* priests, levites, and nephthimins, who served in the temple; over whom the high-priest was chief.

The title כֹּהֵנִים, *cohenim*, or priests, is applied in scripture to the officers of state as well as to the ministers of the sanctuary; though more commonly to the latter, who offered sacrifices, and in other ways officiated in the public worship. The true reason of the different application of the word seems to be, that in the primary sense it imports those that minister to a king; and, therefore, as God had taken upon himself the character of the king of Israel, he had his *cohenim* as well as earthly monarchs, or such as attended on his special presence in the sanctuary, and ministered in the sacred service.

The priestly office of Christ, says Dr. Doddridge in his "Lectures," has generally been explained, as executed in his offering himself as a sacrifice to God for us, and interceding with God upon that sacrifice; but Mr. Pierce (on Heb. v. 5, 6. viii. 4. note z), and most of the Socinians, suppose it only to consist in the latter; and Mr. Pierce argues from Heb. viii. 4. that the execution of it begun upon Christ's entering into heaven; but, it is alleged, that the text in question only proves that Christ, being of the tribe of Judah, could not, according to the Mosaic law, be

a priest to minister in the Jewish temple, which none can reasonably maintain that he was: compare Heb. vii. 4. Nevertheless, as the apostle assures us that he is a priest of a higher order, many divines have maintained, that all which he has done and suffered to make atonement for the sins of men, may, according to the most common acceptation of the word, be called a series of sacerdotal actions; as it is certain there were many acts of atonement performed by Mosaic priests, besides that which passed on the great days of atonement, and sacrifices were sometimes offered with acceptance by those who were not regularly priests. See Judges, vi. 25, 26. xiii. 16. 1 Kings, xviii. 33. 38.

When the Jewish constitution was settled, the public sacerdotal office was allotted to Aaron and his sons, and entailed on their posterity: and it was made a capital crime for any besides them to officiate, as priests, in the more solemn acts of offering sacrifices, burning incense, and blessing the people. The Jewish priests were consecrated to their office by washing, unction, enrobing them with the sacerdotal vestments, and offering certain sacrifices prescribed in the book of Exodus, chap. xxix.

The inferior priests were divided, in the time of David, into twenty-four companies, who were to serve in rotation, each company by itself for a week. The order in which the several courses were to serve was determined by lot; and each course was in all succeeding ages called by the name of its chief at the time of its first division.

The Mahometans have their priests called *scheik* and *mufti*; and the Indians and Chinese their *bramins* and *bonzes*. See MUFTI, and BRACHMAN.

PRIEST, *Presbyter*, in the *Christian Church*, is a person invested with holy orders; in virtue of which he has a power to preach, pray, administer the sacraments, &c.; and, in the Romish church also, to bless, absolve, &c.

By the canons, can. 34, a man must be twenty-four years of age before he be admitted to the priesthood; anciently thirty years were required.

And by 13 Eliz. cap. 12. and 44 Geo. III. c. 43. none shall be made minister, *i. e.* priest, being under the age of four and twenty years; and in this case there is no dispensation, as there is in that of a deacon: and unless he first bring to the bishop of the diocese a testimonial both of his honest life, and of his professing the doctrine expressed in the thirty-nine articles: nor unless he be able to answer, and render to the ordinary an account of his faith in Latin, according to the said articles, or have special gift or ability to be a preacher. And by the canon just cited, it is required, that he shall have taken some degree of school in either of the two universities, or, at least, be able to give an account of his faith in Latin, according to the thirty-nine articles; and also that he exhibit letters testimonial of his good life and conversation, under the seal of some college of Cambridge or Oxford, where before he remained, or of three or four grave ministers, together with the subscription and testimony of other credible persons, who have known his life and behaviour for the space of three years next before. Nor shall any bishop admit any person into sacred orders, which is not of his own diocese, except he be either of one of the universities of this realm, or except he shall bring letters dismissory from the bishop of whose diocese he is. By can. 33. none shall be admitted either deacon or priest, unless he is provided of some certain place where he may exercise his functions, and exhibit to the bishop, of whom he desireth imposition of hands, a presentation of himself to some ecclesiastical preferment then void in the diocese, &c. &c.

For other requisites, see DEACON. For the form of ordination, see ORDINATION.

The bishop, previous to ordination, shall minister to every candidate for orders, the oaths of allegiance and supremacy. (1 W. c. 8.) Then the bishop, with the priests present, shall lay their hands severally upon the head of every one that receiveth the order of priesthood, the receivers humbly kneeling upon their knees, and the bishop saying "receive the holy ghost for the office and work of a priest in the church of God, now committed unto thee by the imposition of our hands; whose sins thou dost forgive, they are forgiven; and whose sins thou dost retain, they are retained. And be thou a faithful dispenser of the word of God, and of his holy sacraments: in the name of the father, of the son, and of the holy ghost." Then the bishop shall deliver to every one of them kneeling, the bible in his hand, saying, "Take thou authority to preach the word of God, and to minister the holy sacraments in the congregation, where thou shalt be lawfully appointed thereunto." Nevertheless by can. 36: he may not preach without a licence either of the archbishop, or of the bishop of the diocese where he is placed, under their hands and seals, or of one of the two universities under their seals likewise. But a licence of the bishop of any diocese is sufficient, although it be only to preach within his diocese; the statute not requiring any licence by the bishop of the diocese where the church is. Watf. c. 14.

The holy scripture makes no distinction between the title of priest, presbyter, and that of bishop, *episcopus*; and does not give any superiority to the one over the other. Blondel, therefore, and Salmalius maintain, with good reason, that in the primitive church the priests governed with perfect equality, and without any other pre-eminence beside that of age.

Yet some of the primitive writers speak of nothing but episcopacy; and frequently in such terms, as if they esteemed it of apostolical institution. See BISHOP, ORDINATION, and PRESBYTER.

As, in the ancient church, the deacons had the management and administration of the revenues of the church, their authority grew apace; and, in a little time, they were got above the priests. St. Jerom used his utmost endeavours to prove, that deacons were originally inferior to priests; and the council of Nice decided the question in favour of the latter. See DEACON.

Indeed, an order of deacons having been instituted without any other function than to assist the priest at the altar; these have made no difficulty of owning the superiority of the priests.

Add to this, that the order of a deacon being now become necessary to arrive at that of a priest, there is no room to dispute the precedency; but the deacons, who had retained their function, had the disposal of the revenues, and paid the priests their pensions, still maintained the superiority. Upon which the sixth council in Trullo pronounced once more on the dispute, and gave the pre-eminence to the priests.

In the general acceptation of the word, priests are any ministers of a church; but in our law this word is particularly used for ministers of the church of Rome. For the laws against popish priests, see PAPISTS.

PRIESTHOLM, in *Geography*, a small island in the Irish sea, near the N.E. coast of the island of Anglesey. It was formerly the residence of a priory of black monks; 5 miles N.E. of Beaumaris.

PRIESTLEY, JOSEPH, in *Biography*, a very eminent philosopher and divine, was born in March 1733, at Field-Head, near Leeds. His father was engaged in the clothing manufacture, and was a dissenter of the Calvinistic persuasion. Joseph was, in his youth, adopted by an aunt, who sent him for education to several schools in the neighbourhood, where he acquired a respectable degree of knowledge of the learned languages, including Hebrew. He was intended for the ministry among the dissenters; and in 1752 he went to the academy at Daventry, kept by Dr. Ashworth, having by ill health been prevented from pursuing his academical course at an earlier period. Here he spent three years, during which his acute and vigorous mind was expanding in free inquiry and diversified pursuit. He had already abandoned the doctrines in which he had been educated, and had become an Arian. At Daventry he became acquainted with the writings of Hartley, which exerted a powerful and lasting influence over the whole train of his thinking. On quitting the academy, he settled at Needham market, in Suffolk, as a minister, and, after a residence of three years, he undertook the charge of a congregation at Nantwich, in Cheshire, to which he joined the business of a school. In the business of education he was indefatigable; and he added to the common objects of instruction, experiments in natural philosophy, which were the means of fostering in himself a taste for pursuits of this kind. His first publication was an English grammar, on a new plan. This was printed in 1761, and in the same year he was invited by the trustees of the academy at Warrington to occupy the post of tutor in the languages. At Warrington Dr. Priestley began to distinguish himself as a writer in various branches of literature. Several of these had relation to his department in the academy, which, besides philology, included lectures on history and general policy. A visit to London having introduced him to the acquaintance of Dr. Franklin, Dr. Watson, Dr. Price, and Mr. Canton, he was encouraged by them to pursue a plan which he had already formed, of writing a history of electricity, which appeared in the year 1767. This publication made his name extensively known among those who might have remained strangers to it, as connected with his other pursuits. It went through several editions, and was translated into foreign languages, and procured for him an admission into the Royal Society. He had previously received the title of doctor of laws from the university of Edinburgh. He quitted Warrington in 1767, and settled at Leeds as minister to a large congregation of dissenters, and he instantly resumed, with his characteristic ardour, his theological studies. He about this time became an Unitarian in the strict sense of the word, that is, a believer in the simple humanity of Christ, a circumstance which he has attributed to a perusal of Dr. Lardner's "Letter on the Logos." A number of publications on different topics connected with religion, announced the zeal with which he was inspired. He likewise began to enter into a controversy respecting the right and ground of dissent in general, and to take his station as one of the most decided opposers of the authority of the established religion. It was during his residence at Leeds that his attention was first excited, in consequence of his vicinity to a public brewery, to the properties of fixed air, which he had an opportunity of

obtaining on a large scale. One experiment led to another, till the fruits of his amusements were the discoveries on which his philosophical reputation was principally founded. Though he greatly enlarged the boundaries of science, he was never vain of his discoveries. In speaking of himself, he says, "Few persons, I believe, have met with so much unexpected good success as myself in the course of my philosophical pursuits. My narrative will shew that the first hints, at least, of almost every thing that I have discovered of much importance, have occurred to me in this way. In looking for one thing, I have generally found another, and sometimes a thing of much more value than that which I was in quest of. But none of these unexpected discoveries appear to me to have been so extraordinary, as that I am about to relate, viz. the spontaneous emission of dephlogisticated air from water containing green vegetating matter, and it may serve to admonish all persons who are engaged in similar pursuits, not to overlook any circumstance relating to an experiment, but to keep their eyes open to every new appearance, and to give due attention to it, however inconsiderable it may seem."

The first of Dr. Priestley's publications on pneumatic chemistry was in 1772, announcing a method of impregnating water with fixed air; and on the preparation and medicinal uses of artificial mineral waters. He had, however, commenced his experiments on this subject as early as 1768. In the year 1771 he had procured good air from saltpetre; he had discovered the uses of agitation and of vegetation as means employed by nature in purifying the atmosphere destined to the support of animal life; and that air vitiated by animal respiration is a pabulum to vegetable life. Dr. Priestley had also procured factitious air in a much greater variety of ways than had been known before, and he had been in the habit of using mercury instead of water for the purpose of many of his experiments. In his paper read to the Royal Society in 1772, which obtained the Copley medal, he gave an account of these discoveries; and at the same time announced the discovery of nitrous air, and its application as a test of the purity or fitness for respiration of airs generally. It was on this occasion that sir John Pringle addressed him in the eloquent language of an admiring friend. "I present you, sir, with this medal, the palm and laurel of this community; as a faithful and unfading testimonial of their regard, and of the just sense they have of your merit, and of the persevering industry with which you have promoted the views, and thereby the honour of this Society. And in their behalf I must earnestly request you to continue your liberal and valuable inquiries, whether by farther prosecuting this subject, probably not yet exhausted, or by investigating the nature of some other of the subtle fluids of the universe. These, sir, are indeed large demands; but the Royal Society have hitherto been fortunate in their pneumatic researches. And were it otherwise, they have much to hope from men of your talents and application, and whose past labours have been crowned with so much success."

Dr. Priestley, at this period, shewed the use of the burning lens in pneumatic experiments; he related the discovery and properties of muriatic acid air; added much to what was known of the airs generated by putrefactive processes, and by vegetable fermentation; and he determined many facts relating to the diminution and deterioration of air, by the combustion of charcoal, and the calcination of metal. In 1774 he made a full discovery of dephlogisticated air, which he procured from the oxyds of silver and lead. This hitherto secret source of animal life and animal heat,

of which Mayow had a faint glimpse, was unquestionably first exhibited by Dr. Priestley, though it was discovered about the same time by Mr. Scheele of Sweden. In 1776, his observations on respiration were read before the Royal Society, in which he discovered that the common air inspired was diminished in quantity, and deteriorated in quality, by the action of the blood on it through the blood-vessels of the lungs; and that the florid red colour of arterial blood was communicated by the contact of air through the containing vessels. In 1778 Dr. Priestley pursued his experiments on the properties of vegetables growing in the light to correct impure air, and the use of vegetation in this part of the economy of nature; and it seems certain that Dr. Priestley made his discoveries on the subject previously to those of Dr. Ingenhousz, then engaged in similar researches. From this period Dr. Priestley seems to have attended to his pneumatic experiments as an occupation, devoting to them a regular portion of his time. To this attention, among a prodigious variety of facts tending to shew the various substances from which gases may be procured, the methods of producing them, their influence on each other, and their probable composition, we owe the discovery of vitriolic acid air, of alkaline air, and of dephlogisticated nitrous air; or, as it has since been denominated, the gaseous oxyd of azote, the subject of so many curious and interesting experiments by sir Humphry Davy. To these may be added the production of various kinds of inflammable air, by numerous processes that had escaped the observation of Mr. Cavendish. To Dr. Priestley we are indebted for that fine experiment of reviving metallic calces in inflammable air; and he first ascertained the necessity for water to be present in the formation of the gases, and the endless production of gases from water itself. His experiments on this subject, *viz.* the generation of air from water, opened a new field for reflection, and deserve particular notice. It had been already remarked that water was necessary to the generation of every species of gas; but the unceasing product of air from water had been observed by no one before.

“To enumerate,” says Mr. Kirwan, “Dr. Priestley’s discoveries, would in fact be to enter into a detail of most of those that have been made within the last fifteen years. How many invisible fluids, whose existence evaded the sagacity of foregoing ages, has he made known to us? The very air we breathe he has taught us to analyse, to examine, to improve: a substance so little known, that even the precise effect of respiration was an enigma, until he explained it. He first made known to us the proper food of vegetables, and in what the difference between these and animal substances consisted. To him pharmacy is indebted for the method of making artificial mineral waters, as well as for a shorter method of preparing other medicines; metallurgy for more powerful and cheap solvents; and chemistry for such a variety of discoveries as it would be tedious to recite,—discoveries which have new-modelled that science, and drawn to it, and to this country, the attention of all Europe. It is certain that, since the year 1773, the eyes and regards of all the learned bodies in Europe have been directed to this country by his means. In every philosophical treatise his name is to be found, and in almost every page. They all own that most of their discoveries are due either to the repetition of his discoveries, or to the hints scattered through his works.”

To return to the more general account of Dr. Priestley’s labours:—the success of his “History of Electricity” induced him to adopt the design of treating on other sciences, in the same historical manner; and at Leeds he occupied

himself in preparing “The History and present State of Discoveries relating to Vision, Light, and Colours.” The expences necessary in composing such a work obliged him to issue proposals for publishing it by subscription; and it appeared in 1772, in one very large volume, 4to. This work is at once highly instructive and entertaining; but its sale by no means corresponded with the expectations formed from the number of names given in as subscribers: it has been said, not one-third part of the number paid for, or demanded the book when it was published.

After a happy residence at Leeds for six years, Dr. Priestley quitted it for one as different as could easily be imagined. The earl of Shelburne, afterwards marquis of Lansdowne, invited Dr. Priestley to reside with him in the nominal capacity of librarian, but really as his literary companion, upon terms which a regard to the future provision of an increasing family would not permit him to decline. He accordingly fixed his family in a house at Calne, in Wiltshire, near his lordship’s seat; and during seven years attended upon the noble earl, in his winter’s residences at London, and occasionally in his excursions, one of which, in 1774, was a tour to the continent. This situation had doubtless its use, by affording Dr. Priestley advantages in improving his knowledge of the world, and in pursuing his scientific researches, which he could not have enjoyed as a dissenting minister. The manners and society of a nobleman’s house were not, however, perfectly congenial to one whose tastes were simple, and whose address was plain and unceremonious. But he was perfectly free from restraint with respect to his pursuits; and this was the period of some of those exertions to which we have referred above, which raised his reputation as a philosopher to the highest point. It was his constant practice to employ himself in various pursuits at the same time, whereby he avoided the languor consequent upon protracted attention to a single object, and came to each in turn as fresh as if he had spent an interval of entire relaxation. This effect he pleaded as his apology, to those who apprehended that the great diversity of his studies would prevent him from exerting all the force of his mind upon any one of them; and it is certain, he proceeded to such a length, in every pursuit that interested him, as fully to justify in his own case the rule which he followed.

It was during a course of original experiments, which fully exercised his faculties of invention and observation, that he was employing his reasoning powers in those deep metaphysical inquiries, by which he acquired great distinction as a philosopher of another class. In the year 1775 he published his “Examination of the Doctrine of Common Sense, as held by Drs. Reid, Beattie, and Oswald.” After this he became the illustrator of the Hartleian theory of the human mind. He had, previously to this, declared himself a believer in the doctrine of philosophical necessity; and in a dissertation prefixed to his edition of Hartley, he expressed some doubts of the immateriality of the sentient principle in man. Notwithstanding the obloquy thus brought upon him, as a favourer of infidelity, or, according to some bigots, of atheism itself, he was not deterred from pursuing the subject: for it was the governing principle of his life to follow truth whithersoever it might lead him, and regardless of consequences. Upon closer inquiry, he became an entire convert to the material doctrine, or that of the homogeneity of man’s nature; and in 1777 he published “Disquisitions on Matter and Spirit;” in which he gave a history of the doctrines concerning the soul, and openly supported the system which, upon due investigation, he had adopted. It was followed by “A Defence of Unitarianism,

tarianism, or the simple Humanity of Christ, in opposition to his Pre-existence; and of the Doctrine of Necessity." Dr. Aikin, in the General Biography, thinks it probable that the odium which these works brought upon their author was the cause of a coolness in the behaviour of his noble patron, which about this time he began to remark, and which terminated in a separation, after a connection of seven years, without any alleged complaint. The parties themselves, no doubt, well knew the cause of this separation; but it seems to have been a settled point between them, that there should be no public complainings, and that the separation should *apparently* be on amicable terms. That the separation was not really what it appeared to be is evident, as the doctor informs us, that when he came to London, he proposed to call on the noble lord; but the latter declined receiving his visits. Dr. Priestley tells us, that during his connection with his lordship, he never once aided him in his political views, nor ever wrote a single political paragraph. We can easily believe, that after a few years, the parade of having under his roof a literary companion would lose its effect, and the desire of change would induce lord Shelburne to break a connection, which proved of no real use to him. By the articles of agreement, Dr. Priestley retained an annuity for life of 150*l.*, which was honourably paid to the last; and it has been said, that when the bond securing to him this annuity was burnt at the riots of Birmingham, his lordship in the handsomest manner presented him with another.

Dr. Priestley now removed to Birmingham, a situation which he probably preferred to almost any other, on account of the advantage it afforded of able workmen in every branch requisite in his experimental inquiries, and of some men distinguished for their chemical and mechanical knowledge. Several noble-hearted friends to science, aware that the defalcation of his income would render the expences of his pursuits too burthenfome for him to support, joined in raising an annual subscription for defraying them. This assistance he without hesitation accepted, considering it as more truly honourable to himself than a pension from the crown, which might have been obtained for him, if he had wished it, during the short administration of the marquis of Rockingham, and the early part of that of Mr. Pitt.

He had not been long settled at Birmingham, before a vacancy happened in the principal dissenting congregation, and he was unanimously chosen to supply it. Without in the least interrupting his philosophical and literary pursuits, he entered with great zeal into the duties of his office, especially into that important branch of it which consists in catechising and instructing the younger members of the society. Theology again occupied a principal share of his attention, and he published his "History of the Corruptions of Christians," and "History of early Opinions concerning Jesus Christ." These proved to be, what might be expected, a fertile source of controversy, into which he entered without the smallest reluctance, and without those uneasy feelings of irritation which so commonly accompany this kind of warfare. The renewed applications of the dissenters, for relief from the penalties and disabilities of the Corporation and Test Acts, afforded another topic of discussion, in which Dr. Priestley took an active part; and convinced that all ecclesiastical establishments were hostile to the rights of private judgment, and the propagation of truth, he did not scruple to represent them all as anti-christian, and predict their downfall. Hence he was represented as the most dangerous and inveterate enemy of the established religion, in its connection with the state. Some of the clergy of Birmingham having warmly opposed the dissenters'

claims, Dr. Priestley published a series of "Familiar Letters to the Inhabitants of Birmingham," which, on account of their ironical manner, as well as the matter, gave great offence. In this state of irritation, another cause of animosity was added by the different feelings concerning that great event, the *French Revolution*; which see. The anniversary of the capture of the Bastille, July 14th, had been kept as a festival by the friends of the cause; and its celebration was prepared at Birmingham in 1791. Dr. Priestley declined joining the party; but in the popular tumult which ensued, he was particularly the object of party fury. His house, with his fine library, manuscripts, and apparatus, were made a prey to the flames. He was obliged to fly for his life. The interesting narrative which he has given of the circumstances of his escape, shews that it was extremely difficult for him to reach a place of safety, while, without the slightest charge against him, he was hunted like a proclaimed criminal. There is no doubt that this scene of outrage, attended with the conflagration of many other houses, and places of worship, was rather favoured than controlled by some, whose duty ought to have led them to active interference for the preservation of the public peace. Nor is it at all surprising that the rage of party was especially directed against one, who had so distinguished himself as a champion on the opposite side, and who had made his attacks without any regard to the dictates of caution or worldly policy. The legal compensation for which, by the advice of his friends, he sued, was far short of the amount of his losses. He was not, however, without his friends, whose zeal for his welfare was not the least damped by the bitterness and malignity of his enemies. They looked upon him with a respect and affection proportioned to his sufferings, and exerted themselves to support and console him under this trying calamity. He now settled at Hackney, and in a very short time he was chosen to succeed his deceased friend, Dr. Price, as minister to a congregation at Hackney; and he joined to it a connection, of a very restricted nature, with the New College, lately established in that village. Resuming his usual occupations of every kind, he passed sometime in comfort and tranquillity; but he soon found public prejudice following him in every path, and himself and his family molested by the rude assaults of malignity, which induced him finally to quit a country so hostile to his person and principles. He accordingly, in the month of April 1794, embarked for America, and took up his residence at the town of Northumberland, in Pennsylvania. It was a considerable labour, in this remote situation, to get a well-furnished library and chemical laboratory; but he at length surmounted all obstacles, and effected his purpose. He was offered a chemical professorship in Philadelphia, which he declined, not meaning to engage in any public duty, in order that he might be enabled to devote his whole time to his accustomed pursuits, in which he soon shewed his philosophical friends that he was not idle. Political animosity, in some measure, pursued him to the western world; and during the administration of Mr. Adams, he was regarded by the American government with suspicion and dislike. That of Mr. Jefferson, however, was very friendly to him, and he outlived all disquiet on this head. The death of his youngest son, a very promising young man, and of his excellent wife, together with other domestic calamities, were severe trials of his fortitude. A severe illness, which he suffered in Philadelphia, laid the foundation of a debility of his digestive organs, which gradually brought on a state of bodily weakness, while his mind continued in full possession of all its faculties. In January 1804, it became manifest to himself, and to his friends, that he had not long to live; and

and this warning operated upon him to lose no time in finishing the literary tasks in which he was engaged, and particularly in putting into a state fit for the press some works in which he was greatly interested. He had prepared a continuation of his Church History, and Notes on all the Books in the Bible; and had learned with great satisfaction, that his friends in England had raised a subscription, to enable him to print them without any risk to himself. Like a man, then, setting his affairs in order, previously to a long journey, he continued, to the last hour of his life, with the utmost calmness and self-collection, giving directions relative to his posthumous publications, intermixed with discourses expressive of the fullest confidence in those cheering and animating views of a future existence, that the Christian religion opened to its disciples; and on Feb. 6, 1804, in the 71st year of his age, he expired so quietly, that they who sat beside him did not perceive the last moment of his existence. As if aware the solemn moment was at hand, and unwilling to shock his children, who were sitting by his bed-side, by his departure, he had taken the precaution of putting his hand before his face.

“Dr. Priestley was a man of perfect simplicity of character, laying open his whole mind and purposes on all occasions, and always pursuing avowed ends by direct means, and by those only. In integrity and true disinterestedness, and in the performance of every social duty, no one could surpass him. His temper was easy and cheerful, his affections were kind, his dispositions friendly. Such was the gentleness and sweetness of his manner in social intercourse, that some who had entertained the strongest prejudices against him on account of his opinions, were converted into friends on personal acquaintance. Of the warm and lasting attachment of his more intimate friends, a most honourable proof was given, which he did not live to be made acquainted with. It being understood in England that he was likely to suffer a loss of 200*l.* in his annual income, about forty persons joined in making up a sum of 450*l.* which it was intended to be continued annually during life. No man who engaged so much in controversy, and suffered so much from malignity, was ever more void of ill-will towards his opponents. If he were an eager controversialist, it was because he was much in earnest on all subjects in which he engaged, and not because he had any personalities to gratify. If now and then he betrayed a little contempt for adversaries, whom he thought equally arrogant and incapable, he never used the language of animosity. Indeed his *Necessarian* principles coincided with his temper in producing a kind of apathy to the rancour and abuse of antagonists. In his intellectual frame were combined quickness, activity, acuteness, and that inventive faculty which is the characteristic of genius. These qualities were less suited to the laborious investigations of what is termed erudition, than the argumentative deductions of metaphysics, and the experimental researches of natural philosophy. Assiduous study had, however, given him a familiarity with the learned languages sufficient, in general, to render the sense of authors clear to him, and he aimed at nothing more. In his own language he was contented with facility and perspicuity of expression, in which he remarkably excelled.”

The writings of Dr. Priestley, amounting probably to seventy volumes 8vo., are too numerous to attempt any thing like an analysis of them. They have been classed in those that relate to general philosophy, pneumatic chemistry, metaphysics, civil liberty, religious liberty, ecclesiastical history, evidences of the Christian revelation, defences of unitarianism, miscellaneous theology, miscellaneous literature. Of what Dr. Priestley did in chemistry we have given a

sketch. We may, however, add in this place, that he remained to the end of his life attached to the phlogistic theory which he had imbibed, and which the French chemists thought they had completely demolished. It is more than possible that a new change in the opinions of chemists may take place on this important subject. (See PHLOGISTON.) Some of Dr. Priestley's writings of this class were attacks upon the antiphlogistic theory, of which he lived to be the sole eminent opposer.

On the science of metaphysics he was the strenuous advocate of Dr. Hartley's theory of association, upon which he founded the systems of materialism and necessity as legitimate inferences. No writer has treated these abstruse subjects with more acuteness and perspicuity, and so long as they are topics of discussion, his writings will probably be considered as the ablest elucidations and defences of the theories proposed in them. In theology, Dr. Priestley was a great leader of those who regard Jesus Christ as the son of Joseph and Mary, divinely commissioned to reveal to the world a future state of existence. He of course did not admit into his creed a miraculous conception; nor an atonement made by Christ to render the Almighty merciful to the errors of men. He founded all his expectations of a future life upon revelation alone, and he believed that punishment beyond the grave was intended to render the subject of it meet for endless happiness, to which all rational beings would finally be brought. One of his most important theological works is entitled “*Institutes of natural and revealed Religion.*” His “*Letters to a philosophical Unbeliever*” deserve also attention. Among his pieces on practical religion may be named, as of very singular excellence, “*Two Sermons on Habitual Devotion, and on the Duty of not living to ourselves:*” these have very frequently been reprinted, and many thousands of them circulated in a cheap form. *Memoirs of Dr. Joseph Priestley in two vols. 8vo. Gen. Biog.*

PRIETCHE, in *Geography*, a town of Brandenburg, in the Middle Mark; four miles S.E. of Brandenburg.

PRILIPO, a range of mountains of European Turkey, in Macedonia, about 12 miles W. of the river Vardar.—Also, a town of Macedonia; 20 miles N.N.W. of Stobi.

PRILUKI, a town of Russia, in the government of Ekaterinoslav; 52 miles S.W. of Elisabet.—Also, a town of Russia, in the government of Tchernigov; 100 miles S.E. of Tchernigov. N. lat. 51° 3'. E. long. 32° 44'.

PRILUTSKOI, a town of Russia, in the government of Archangel, on the Dwina; 28 miles E. of Schenkursk.—Also, a town of Russia, in the province of Usting, on the Dwina; 20 miles N. of Usting.

PRIM, a river of Arabia, which runs into the sea; 18 miles S.W. of Ras Vive.

PRIMA INTENSIONE, a technical expression in *Music*, as well as *Painting*. No language but the Italian seems to furnish an equivalent to this expression. Rousseau has endeavoured, with his usual good taste and ingenuity, to explain it. We shall, therefore, only translate.

An air or movement *di prima intensione*, or of first conception, is that which is formed entire in all its parts at one and the same instant, as Pallas proceeded from the brain of Jupiter.

These pieces of one conception, are those rare effusions of genius in which all the ideas are so combined that they seem to be but one, and appear as if they could not be conceived separately. They resemble those long but eloquent periods of Cicero, of which the sense is suspended to the last word, and which consequently could have formed but one thought in the mind of the author. There are in all the

arts similar beauties produced by similar efforts of genius, and of which all the details intimately connected with each other could not be produced successively; but are necessarily presented to the mind all at once; since the first without the last would have no effect. Such was, for instance, the stocking loom, that prodigious machine, which may be regarded, says the philosopher who described it in the Encyclopédie, as one sole and only act of reason, of which the fabrication of the work is the conclusion.

These kinds of operations in the human mind, so difficult to explain, even by analysis, are prodigies of reason, and never conceived but by men of such genius as are able to produce them. Their effect is always proportioned to the effort which they have cost the brain. And in music, it is only the pieces of *one conception*, that give extacy, rapture, lift the souls of the audience into Elysium, and make them forget themselves, and all that is around them. They are felt and divined at the instant; connoisseurs are never mistaken.

After one of these sublime productions, let one of those pieces of shreds and patches be performed, of which all the phrases have been composed one after the other, or which have only one phrase repeated through all the keys, and of which the accompaniment is only a crowd of unmeaning notes added by reflection after the original idea is forgotten; but in whatever style this last piece is composed, if the remembrance of the other leaves you any inclination to listen, it will be only to render you chill, tired, and impatient. After an air *di prima intensione*, all other music is without effect.

PRIMA Naturalia, in *Physics*, atoms, or the first particles of which natural bodies are primarily composed; called also MINIMA Naturalia, which see; see also PARTICLE, and ATOM.

PRIMA Tria, in *Chemistry*. See TRIA.

PRIMÆ, or *Primariæ Preces*, in *Law*. See PRECES.

PRIMÆ Viæ, a term employed chiefly in medicine, to denote the stomach and intestines, or passages of the food.

PRIMAGE, a duty at the water-side, appointed by a statute of Henry VIII. to be paid to the master and mariners of the ship, by the merchants whose goods are loaded or unloaded.

It is paid to the master for the use of his cables and ropes, in moving the goods; and to the mariners for their service and assistance.

This is different in different places; in some 12*d.* per ton; in others, a penny per pound; in others, sixpence per bale or pack. See DUTY, and CUSTOM.

PRIMARY PLANET, a planet which revolves round the sun as a centre.

PRIMARY Affections, collateral points, dials, motion, place, and qualities. See the substantives.

PRIMATE, PRIMAS, an archbishop, invested with a jurisdiction over several archbishops, or bishops.

The term primate is Latin, and signifies the first, or president of a society: the Greek word corresponding to it is ἐξάρχης, *exarch*.

Father Sirmond derives the origin of primates hence: that the large provinces have been divided and subdivided by the emperors; the first divisions were called firsts; others seconds; others thirds, &c. and the title primate given to the metropolitan, *i. e.* to the bishop of the city which was the capital of the province before the division was made. As metropolitan was a title given to the bishop of the chief city of a province, primate, or primas, was the first of the province; for such was the original signification of that

word in an ecclesiastical sense: but in process of time, the title of primate was restrained to the bishops of some great cities: and a patriarch was the chief bishop over several kingdoms or provinces, as an archbishop is of several dioceses.

Those who are advocates for a strict ecclesiastic hierarchy, maintain a primate to be a dignity who has several metropolitans under him; as a patriarch has several primates. Yet it is pretty evident from history, that primates were, at first, confounded with patriarchs: thus Socrates, enumerating ten patriarchs, does not make any distinction between them and primates.

In Africa, after the distinction was made, the primates were not at all subject to the patriarch: thus the bishop of Carthage, who was primate, paid no obedience to the bishop of Alexandria, who was patriarch.

Nor, to be a primate, was it necessary to have metropolitans for suffragans; each province of Africa, except those which composed the diocese of Alexandria, had its primate; this quality being given to age.

In France, the subdivision of provinces gave occasion to the erection of primates: thus Aquitaine, *e. gr.* being divided into two provinces, the archbishop of Bourges became primate of the Aquitaines, because Bourges was the capital of the first.

Thus, also, the division of England into two provinces, Canterbury and York, in 1152, gave occasion to the introduction of primacies among us; Canterbury, which was the metropolis before, or the royal city of the kings of Kent, and given to king Ethelbert, on his conversion to Christianity, by Austin, its first archbishop, about the year of our Lord 598; thence giving the title of *primate of all England* to its prelate, though the archbishop of York still claims that of *primate of England*. And, accordingly, the first has some jurisdiction over all England, relating to administrations, &c. which the latter has only within his own province. See ARCHBISHOP, BISHOP, and DIOCESE.

PRIMATES, in *Natural History*, the first order of the class Mammalia, according to the Linnæan system. The animals of this order are furnished with cutting *fore-teeth*; the upper four are parallel, except in some species of bats, which have two or none (see VESPERTILIO *nigrita*, *lepturus*, &c.); tusks solitary, that is, one on each side, in each jaw; teats two, pectoral; feet, two of which are hands; nails usually flattened, oval; food, fruits, except a few who use animal food. There are four genera, *viz.*

Homo,
Lemur,
Simia, and
Vespertilio.

PRIMATICCIO, FRANCESCO, in *Biography*, was born at Bologna, in 1490, of a noble family. It was intended that he should be bred up to commerce, but having too elevated a mind to adopt that occupation, and prompted by natural genius, he devoted himself to the arts of design, and began to learn design and colouring from Innocenzio da Imola, and Bagnacavallo; and in a short time was enabled, by his incessant industry, to give manifest proofs of extraordinary talents. He then quitted his native city, and went to Mantua, where he became a disciple of Julio Romano, who at that time was engaged in ornamenting the apartments of the palace del Te, assisted by a number of young artists who had received their instruction in his school. Primiticcio continued under Julio for six years, and became a great machinist, an artist in fresco, stucco, and every branch of classic or magnificent ornament.

He effectually established himself in the favour of his master,

master, and of the duke of Mantua; and was recommended in the strongest terms by that prince to Francis I., who immediately took him into his service, and appointed him to execute a great number of his designs in fresco and in oil. Not less fortunate and successful with the king than he had been with the duke, his works were improved and admired; and he adorned Fontainebleau, and most of the royal palaces in France, with his compositions.

At the time that Primaticcio was engaged by Francis, Rosso, a Florentine painter, was also retained and employed. Between these two artists a violent rivalry and jealousy subsisted; but the king, to quiet their dissensions, sent the former to Rome to purchase antiques. He executed his commission very happily; and in a short time collected a hundred and twenty-five statues, busts, and mutilated figures: and procured moulds of the most celebrated statues which were not to be purchased, such as the Laocoon, the Tiber and Nile, the Ariadne, Commodus, and others, which were cast in brass.

He was recalled from Rome to finish a large gallery, left incomplete by Rosso at his death; and the king, to express his esteem for Primaticcio, and his public approbation of his merit, conferred on him the abbey of St. Martin, at Troyes, with the annual income of 800 crowns; which he enjoyed as long as he lived.

The frescoes of Primaticcio, in the palace del Te, cannot with certainty be ascertained. His oil pictures are of the utmost rarity in Italy, and even at Bologna. In the great gallery Zambeccari, there is a concert by him with three female figures, a most enchanting performance. The eye is equally charmed by the forms, the attitudes, the tone of colour, the breadth, taste and ease of the draperies, and the original air of the whole. Nicolo Abbati, the partner of his works, though not his scholar, was left by him to terminate what was left unfinished of his plans in France. Primaticcio lived to the advanced age of eighty, and died in 1570. Fufeli's Pilkington.

PRIMAVERA, GIO. LEONARDO, a Neapolitan poet and musician, surnamed *dell' Arpa*, who published at Naples, in 1570, three books of songs, *alla Napoletana*.

PRIMBKENAU, in *Geography*, a town of Silesia, in the principality of Glogau, containing two churches, with an iron forge, and manufacture of paper; 10 miles E. of Sprottau. N. lat. $51^{\circ} 28'$. E. long. $15^{\circ} 46'$.

PRIME, PRIMUS, the first in order, degree, or dignity, among several things of the same or like kind.

Thus we say, prime minister, prime mover, prime cost, &c. See MINISTER, MOBILE, &c.

PRIME, or *Prime minute*, in *Geometry*, denotes the sixtieth part of a degree.

PRIME is sometimes also used for a tenth part of an unit. See DECIMAL.

In weights, it is used for the twenty-fourth part of a grain.

PRIME Figure, in *Geometry*, is that which cannot be divided into any other figures more simple than itself.

Such is a triangle among planes; and the pyramids in solids. For all planes are made of the first, and all bodies or solids are compounded of the second.

PRIME Number, in *Arithmetic*, is one which has no divisors, or which cannot be divided into any number of equal integral parts greater than unity: such are the numbers 2, 3, 5, 7, 11, 13, &c.

These numbers have formed a subject of investigation and inquiry, from the earliest traces of arithmetic to the present time; either with a view of finding them, or selecting them

from the common series of numbers, or for investigating certain properties which are peculiar to them.

Eratosthenes is the first author amongst the ancients who attempted the former problem, which led him to the invention of what he called his *κοκκινον*, or *sieve*; by which he excluded from the general series those that were composite, and consequently the remaining numbers were prime.

The principle of this method consisted, first, in writing down every odd number from 1 to any extent proposed, and then pointing off every 3d, 5th, 7th, &c. numbers, each of which would necessarily be composite, and those which remained without points prime numbers. Let there be written, for example, the following series:

1	3	5	7	9	11	13	15	17	19
·21	23	·25	·27	29	·31	·33	·35	·37	·39
41	·43	·45	47	·49	·51	53	·55	·57	59
61	·63	·65	67	·69	71	73	·75	·77	79
81	83	·85	·87	89	·91	·93	·95	97	·99

We begin with the first prime number 3, and over every third number from 3 a point is placed; each of these numbers being divisible by 3, as 9, 15, 21, &c.

Then from 5, a point is placed over every fifth number; these being divisible by 5, as 15, 25, 35, &c. Again, from 7, every seventh number is pointed in the same manner, such as 21, 35, 49, &c. And having done this, all that remain without points in the above series are primes; for there is no prime number between 7 and $\sqrt{100}$: and it is useless trying any prime number greater than the square root of the number proposed, which we have supposed here to be 100. Adding, therefore, to the above the prime number 2, which is the only *even* prime number, and we shall have,

2,	3,	5,	7,	11,	13,	17,	19,	23,
29,	31,	37,	41,	43,	47,	53,	59,	61,
67,	71,	73,	79,	83,	89,	97,		

which are the only prime numbers under 100.

Such was the method pursued by Eratosthenes, and the same, aided probably by some mechanical contrivance, has been adopted by modern authors. Of these, Vega has published a table of prime numbers to 400,000; and a work lately published in Holland, not only contains the prime numbers up to 1,000,000, but also the factors of all composite numbers to the same extent; a performance which, it must be allowed, displays the industry of its author to much more advantage than either his genius or judgment.

It is obvious from what is stated above, that this method cannot be employed for ascertaining whether any proposed number be a prime, without going through the whole process up to the same extent; the *desideratum*, therefore, of modern mathematicians has been to discover some rule, whereby any proposed number may be determined to be a prime or composite number; in which, however, they have not succeeded. Others, again, have endeavoured to find some formula, as $x + x + 41$, $x^2 + x + 17$, $2x^2 + 29$, &c. which shall contain prime numbers only, whatever value may be given to x ; but neither in this have they been more successful. It is in fact demonstrable, that no such formula can be found; though some formulæ of this kind are remarkable for the number of primes included in them. Thus the first of those given above, by making successively $x = 0, 1, 2, 3, \&c.$ will give a series, the first *forty* terms of which are prime numbers; the second, in the same way, gives *seventeen* of its first terms prime; and the latter,

twenty-nine. These cases shew the great danger of inductive conclusions in mathematical investigations; for it will seldom happen that we have greater reason to draw a general conclusion, on those principles, than in the series above mentioned.

It was doubtless by not being sufficiently guarded on this point, that led Fermat, the father of the present theory of numbers, to assert that $2^x + 1$ would always be a prime number, while x was taken any term in the series, 1, 2, 2^2 , 2^3 , &c.; but Euler found that it failed in the case $x = 32$, which gives $2^{32} + 1 = 641 \times 6700417$.

It may not be amiss to observe, with respect to what is stated above, *viz.* that no rule has yet been found for ascertaining whether a given number be prime or not; that this is only meant with reference to a ready method: for, in fact, if we divide a number successively by all prime numbers less than the square root of itself, and no one of them will divide it without a remainder, that number is a prime, which, though long and tedious, may be called a rule for that purpose: there are also other rules depending upon the quadratic forms of prime numbers, but they are all extremely laborious for large numbers. Waring, in his "Meditationes Algebraicæ," gives also a rule for this purpose, which he informs us is due to sir John Wilson, and which, considered *in abstracto*, is certainly as complete as can be desired. This is as follows:

If n be a prime number, then the continued product (1. 2. 3. 4. 5. &c. $n - 1$) + 1, will be divisible by n .

And as this property belongs exclusively to prime numbers, nothing can be more complete; but unfortunately the great magnitude of the product renders it totally useless as a practical rule.

The curiosity of the public has been lately much excited by the little American boy, Zerah Colburn, (already mentioned under our article MNEMONICA,) who, without any previous instruction, performs many remarkable feats in arithmetical computations, no one of which is more singular, than the ready manner in which he discovers the factors of composite numbers, and ascertains those which have no factors or primes. The writer of this article has examined him very closely on these points, in order, if possible, to discover the process which he employs for this purpose, from the whole of which it appears, that he depends very much upon the terminating figures of the number proposed. As soon as a number is mentioned, he will tell you, that as it finishes with such and such figures, its divisor, if it has one, must finish with certain other figures, and he immediately attempts the division of it by prime numbers terminating in those digits; or, which is perhaps more probable, he endeavours to find a number which, multiplied by the former, will produce the number proposed, and if he do not readily succeed, he declares it to be a prime, and is frequently correct.

Not to mention a great many smaller numbers which were proposed to him, and which he answered with great facility, it will be more to the purpose to state a few particulars relative to the number 4294967297, which was proposed to him at a dinner, where he and his father were present. This is the number mentioned above, which Fermat had stated to be a prime, but which Euler had found to be composite, consisting of the factors 641×6700417 . It was not of course expected that he could readily detect the factors in a number of such magnitude; but his attempts threw considerable light upon the process which he employed. He found, by the terminating digits of the number proposed, that its factors must be terminated with certain other digits, and thus formed a sort of table, which his father noted down

by his directions, and then again all such prime numbers as had those terminations, and by this means reduced the number of trials very considerably, and amongst the number of his divisors was found the real factor 641. In numbers of moderate extent, *viz.* such as consisted of four or five figures, this method of exclusions, which he employs, reduces the number of trials to a very few; and the rapidity with which he finds his supposed divisors, and applies them to the number proposed, is certainly one of the most extraordinary cases in the whole history of arithmetic. He undoubtedly possesses a remarkably retentive memory, but he owes still more to a very ready perception of the qualities and properties of numbers. And it is much to be regretted, that such rare talents are not duly cultivated, by placing him under the tuition of a master who is able to expand his infant ideas, and to direct his attention to subjects of greater interest than those in which he is now constantly engaged, in order to satisfy the curiosity of spectators, and the pecuniary views of his father.

We have been led into a longer digression than was at first intended respecting this remarkable boy: we shall now conclude this article by enumerating a few of the most remarkable properties of prime numbers, with a table of them as far as 216,000, which is double the extent to which they are carried in any other English work, and which it is presumed may be found useful in a great variety of cases connected with arithmetical and numeral problems.

1. Prime numbers are divided into different classes, according to the forms under which they are contained, each form having certain properties peculiar to it: and these are either linear or quadratic, according as the forms by which they are expressed are simple quantities or squares. Thus, the forms $4n + 1$, $4n - 1$, $6n + 1$, &c. are linear forms; but when we say prime numbers of the forms $x^2 + y^2$, $x^2 + 2y^2$, &c., these are called quadratic forms.

2. Every prime number is of one of the forms $4n + 1$, or $4n - 1$; that is, a prime number, when divided by 4, will either leave a remainder + 1, or - 1, which is one of the principal divisions or classifications of prime numbers; but these two forms, according as n is even or odd, are farther subdivided into the following; *viz.* $8n + 1$, $8n + 3$, $8n + 5$, $8n + 7$; and though a similar classification may be made to any modulus, yet those authors who have treated on this subject, seldom trace the properties of prime numbers to any other forms than those above given, and of these the most remarkable are as follow.

3. Every prime number of the form $4n + 1$, is at the same time of the form $x^2 + y^2$; or, which is the same, every prime number of the form $4n + 1$, is the sum of two integral squares, but it can be divided into two such squares only one way; thus $17 = 4^2 + 1^2$, $29 = 5^2 + 2^2$, $37 = 6^2 + 1^2$, &c.

As the form $4n + 1$ includes the two forms $8n + 1$, $8n + 5$; therefore every prime number contained in these two forms is the sum of two integral squares.

4. Every prime number $8n + 1$, is of the three forms $y^2 + z^2$, $y^2 + 2z^2$, and $y^2 - 2z^2$.

$$\text{Thus } 41 = 5^2 + 4^2 = 3^2 + 2 \cdot 4^2 = 7^2 - 2 \cdot 2^2$$

$$\text{And } 73 = 8^2 + 3^2 = 1^2 + 2 \cdot 6^2 = 9^2 - 2 \cdot 2^2$$

and the same for all other prime numbers of this form.

5. Every prime number of the form $8n + 3$, is of the form $y^2 + 2z^2$; that is, every prime number which, when divided by 8, leaves a remainder 3, is the sum of a square and double a square.

For example, 11, 19, 43, &c. are prime numbers of the

PRIME NUMBERS.

form $8n + 3$; and $11 = 3^2 + 2 \cdot 1^2$, $19 = 1^2 + 2 \cdot 3^2$, $43 = 5^2 + 2 \cdot 3^2$, &c.

6. Every prime number $8n + 7$, is of the form $y^2 - 2z^2$; or every prime number which, when divided by 8, leaves a remainder 7, is equal to the difference between a square and double a square.

Thus, $31 = 7^2 - 2 \cdot 3^2$, $47 = 7^2 - 2 \cdot 1^2$, &c. and the same for all other prime numbers of this form.

7. From these four properties we may readily draw the following theorems.

All prime numbers of the forms $8n + 1$, and $8n + 5$, are, exclusively of all others, contained in the formula $y^2 + 2z^2$.

All prime numbers of the forms $8n + 1$, and $8n + 7$, are, exclusively of all others, contained in the formula $y^2 - 2z^2$.

All prime numbers of the form $8n + 1$ are, at the same time, of the three forms $y^2 + z^2$, $y^2 + 2z^2$, $y^2 - 2z^2$.

The general demonstration of these very remarkable properties of prime numbers was first given by La Grange, in the Memoirs of Berlin for 1776.

It may not be amiss to observe here, that, when it is said that every prime number is of a certain form or forms, it must not be understood that, also conversely, every number contained in those forms is a prime number; for the converse does not obtain, as will be evident from a moment's inspection of any of the forms above given, nor indeed can any form be found that has this property, as we have already observed in the preceding part of this article.

8. The number of prime numbers is infinite; but the number of them, under any given number N , is very nearly expressed by the formula

$$N$$

$$\frac{\text{hyp. log. } N}{1.08366}$$

as may be verified by means of the following tablet, which contains the number of the primes, under and between certain periods, from 1 to 400,000. But for the demonstra-

tion of it we must refer the reader to part iii. of Le Gendre's "Essai sur la Theorie des Nombres."

Under	10000	Number of primes	1230
	20000	-	2263

PRIME Vertical. See VERTICAL.

PRIME Verticals, in *Dialling*, or *Prime vertical dials*, are those projected on the plane of the prime vertical circle, or on planes parallel to it.

These are what we likewise call direct, erect, north, or south dials. But since every plane hath that pole raised or depressed upon it, which lies open to it, therefore this plane (if a direct south) hath the south pole elevated; and, consequently, the style, whose height must be the complement of the latitude of the place, will point downwards. Wherefore, to find the hour's distance from the meridian upon this plane, the proportion is as the radius is to the sine of the style's height, or co-latitude, so is the tangent of the hour, or angle at the pole, to the tangent of the several hours distant from the meridian.

By this canon, the hours requisite for the plane, as also the half-hours, quarters, &c. being calculated and set in a table; the dial is described after the same manner as the horizontal dial. North direct erect dials are but the reverse side of the south, because lying in the same azimuth with it; therefore it is no more but turning the south dial upside down, and leaving out the superfluous hours between 5 and 7, and 4 and 8, and the north dial is made. Only note, that the style must point upwards to the north pole. See DIAL.

PRIME of the Moon, is the new moon at her first appearance, for about three days after her change. See GOLDEN NUMBER.

PRIME is also used, in the Romish church, for the first of the canonical hours, succeeding to lauds.

PRIME, in *Fencing*, is the first and chief of the guards; which is that the body is in, immediately after drawing the sword; being fittest to menace and terrify the enemy, by reason the point of the sword is held higher up to the eye than in any of the other guards.

PRIME, or *Priming of a Gun*. See PRIMING.

PRIMEIRA, in *Geography*, a river of Africa, which branches off from the Formosa, and runs into the Atlantic, 15 miles W. of the main stream.

PRIMEL POINT, a cape of France, in the English channel; 8 miles E.N.E. of St. Pol de Leon. N. lat. 48° 43'. W. long. 4°.

PRIMER FINE, in *Law*. See PRÆFINE.

PRIMER Seisin, *Prima seisina*, or the *first seisin*; a branch of the king's prerogative, by which he had the first possession of all lands and tenements held of him in chief, of which his tenant died seised in fee; and consequently the rents and profits of them, till livery was sued, which suit being commonly within a year and day next after the death of the tenant, therefore the king used to take at an average the first fruits, that is to say, one year's profit of the land. And this afterwards gave a handle to the popes, who claimed to be feudal lords of the church, to claim in like manner from every clergyman in England the first year's profits of his benefice, by way of primitiæ, or first fruits.

These payments were only due, if the heir was of full age; but if he was under the age of twenty-one, being a male, or fourteen, being a female, the lord was entitled to the wardship of the heir, and was called the *guardian in chivalry*.

But all charges arising by primer seisin, are annulled by stat. 12 Car. II.

PRIMICERIUS, in *Antiquity*, the first or chief person in any office or dignity.

In this sense the word occurs frequently in the code, and even in our old English laws: though it is there also occasionally used for a nobleman; as *primicerius totius Angliae*.

The Romans had great variety of primicerii, both in the church and the emperor's court; a *primicerius of the empress*, *primicerius Augustalis*, *primicerius of the bardariotæ*, *primicerii of the legions*, *of the court*, *of the chamber*, *of the palace*, &c.

The *ecclesiastical primicerius*, Du-Cange observes, was the same with the *chantor* among us.

In the church of Metz, the primicerius is the first dignitary of the diocese, and presides at assemblies of the clergy, in prejudice of the bishop.

At Venice the dean of the church of St. Mark is called *primocirio*, or *primicerius*: he is independent of the patriarch of Venice, and enjoys episcopal privileges.

PRIMIERO, in *Geography*, a small island in the gulf of Venice, near the coast of Friuli. N. lat. 45° 45'. E. long. 13° 30'.

PRIMING, or *PRIME of a Gun*, is the gunpowder put into the pan of small arms, and into the vent of cannon, near the opening of the touch-hole, in order to fire the piece. The priming is the last thing done in charging. See CHARGE.

For pieces of ordnance, they have a pointed iron rod to pierce the cartridge through the touch-hole, called the *primer*, or *priming-iron*: and it serves to discover whether the powder contained in it is thoroughly dry, and fit for immediate service.

PRIMING, among *Painters*, signifies the laying on of the first colour.

PRIMING, in *Japan Work*. See JAPANING.

PRIMIPILARII, or **PRIMOPILARII**, or *Primipilares*, in *Antiquity*, were properly such as had formerly borne the office of primipilus, or first centurion of a legion, to whom was entrusted the care of the banner.

Some will also have primipilarii to have been a denomination given to the soldiers of the first cohort of a legion.

The primipilarii had considerable advantages; one of the chief was, that most of the soldiers who died in the campaign, left them their heirs.

PRIMIPILUS, or **PRIMOPILUS**, or *Primipili centurio*, the centurion of the first cohort of a legion, who had charge of the Roman eagle.

PRIMITIÆ, the first fruits gathered of the earth; of which the ancients made presents to the gods.

In Leviticus, the primitiæ of all fruits are enjoined to be offered to God.

In our law, the primitiæ are one year's profits, after avoidance, of every spiritual living, as rated in the king's books. See *PRIMER Seisin*, and *FIRST fruits*.

PRIMITIVE, in *Grammar*, a root; or a word in a language, which is neither derived from any other language, nor compounded from any other words of the same. See *ROOT*, *WORD*, &c.

Thus *God* is a primitive; *Godly*, a derivative; *God-like*, a compound.

PRIMITIVE, in *Arithmetic*. See PRIME and NUMBER.

PRIMO, in the *Italian Music*, is often abridged thus, P° or I°, and added to other words, as, *primo canto*, the first treble; *alto primo*, the first counter-tenor; *tenore primo*, the first tenor; *basso primo*, the first bass; *fagotto primo*, the first bassoon; *choro primo*, the first chorus, &c.

PRIMO beneficio ecclesiastico habendo, in *Law*, a writ directed from the king to the lord chancellor, appointing him to bestow the benefice that shall first fall in the king's gift, above or under such a value, upon this or that clerk. See *BENEFICE*.

Propositio de Primo adjacentē. See PROPOSITION.

PRIMOICHE, NIZ, in *Geography*, a town of Russia, in the

the government of Saratov, on the Motcha; 104 miles E. of Chvalinsk.

PRIMOCHÉ, *Sred*, a town of Russia, in the government of Saratov, on the Motcha; 108 miles E. of Chvalinsk.

PRIMOCHÉ, *Var*, a town of Russia, in the government of Saratov; 116 miles E. of Chvalinsk.

PRIMOGENITURE, PRIMOGENITURA, the right of first-born, or eldest son or child.

The right of primogeniture seems to be an unjust prerogative, and contrary to natural right: for since it is birth alone that gives children a title to the paternal succession, the chance of primogeniture should not throw an inequality among them.

The "inherent prerogative of primogeniture," as Mr. Gibbon denominates it, was unknown among the Romans: the two sexes were placed upon a just level; all the sons and daughters were entitled to an equal portion of the paternal estate; and if any of the sons had been intercepted by a premature death, his person was represented, and his share was divided by his surviving children. On the failure of the direct line, the right of succession must diverge to the collateral branches.

Accordingly, the right of primogeniture, which calls the elder born to the crown, preferably to the others, was not introduced into France till very late: it was unknown to the first race of kings; and even to the second.

The four sons of Clovis shared the kingdom equally among themselves; and Louis le Debonnaire did the same: it was not till the race of Hugh Capet, that the prerogative of succession to the crown was appropriated to the first-born.

By the ancient custom of gavel-kind, still preserved in some parts of our island, primogeniture is of no account; the paternal estate being equally shared by all the sons. See DESCENT, and *Right of Crown*.

PRIMOPILUS. See PRIMIPILUS.

PRIMORES, in *Ornithology*, denote the quill-feathers which spring from the first bones of the wings, and are ten in number.

PRIMORIE, in *Geography*, a province of Dalmatia, on the coast of the Adriatic, between the Cetina and the Narenta. This was called by the ancients "Dalmatia," and by the later Greeks "Parathalassia."

PRIMROSE, JAMES, in *Biography*, an ingenious physician, was born of Scottish parents at St. Jean d'Angely, in the province of Guienne, in France, where his father was minister. He received the degree of master of arts at Bourdeaux, and then went to Paris, where he was enabled to pursue his medical studies by the liberal patronage of James I. king of England. He afterwards completed his education at Montpellier, where he was admitted to the doctorate in the year 1617; and then repaired to England, with a view to practise his profession. In 1629 he was admitted ad eundem at Oxford, and forthwith settled at Hull, where he acquired extensive reputation and practice. He was author of many works, some of which, however, remain the monuments of his illiberality and prejudice, being written in a captious style, in opposition to the discovery of the circulation, recently promulgated by the immortal Harvey, with all the demonstrative proofs that can even now be adduced, if we except that of the microscope. The following are the titles of his works: "Exercitationes et Animadversiones in Librum de Motu cordis et Circulatione sanguinis, adversus Gul. Harveum;" Lond. 1630. "Animadversiones de Joannis Waldi Disputatione quam pro circulatione sanguinis proposuit;" Amst. 1639. "De vulgi Erroribus in Medicina;" ibid. 1639. This work passed

through many editions, and was translated into French and English. "Animadversiones in Theses quas pro circulatione sanguinis in Academia Ultrajectensi Henricus le Roy proposuit;" Lug. Bat. 1640. "Enchyridion Medicum Practicum;" Amst. 1650. "Ars Pharmaceutica;" ibid. 1651. "De Morbis Mulierum et Symptomatis Libri V.;" Rot. 1655. "Destructio Fundamentorum Medicina Vobisci Fortunati Plempii;" ibid. 1657. "De Febribus Liber IV.;" ibid. 1658. "De Morbis Puerorum Partes duæ;" Rot. 1659. Eloy Dict. Hist. de la Med.

PRIMROSE, in *Botany*, &c. See PRIMULA.

PRIMROSE, *Evening or Night*. See CENOTHERA.

PRIMROSE, *Peerless*. See NARCISSUS.

PRIMULA, in *Botany*, a name given to the Primrose, as the first offering of spring, (from *primus*,) and retained by Linnæus for the genus to which that favourite flower belongs; though, as he remarks in some parts of his writings, there are plants, in various countries, more strictly entitled to such an appellation.—Linn. Gen. 80. Schreb. 106. Willd. Sp. Pl. v. 1. 800. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 222. Ait. Hort. Kew. v. 1. 307. Pursh 137. Juss. 96. Lamarck Illustr. t. 98. Gært. t. 50.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Precia*, Linn. *Lyfimachia*, Juss. *Primulaceæ*, Ventenat, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, with five angles, and five acute upright teeth, permanent. *Cor.* of one petal; tube cylindrical, about the length of the calyx, terminating in a small hemispherical neck; limb spreading, cut half way down into five inversely heart-shaped, emarginate, obtuse segments; throat pervious. *Stam.* Filaments five, very short, in the neck of the corolla; anthers pointed, erect, converging, within the mouth. *Pist.* Germen superior, globose; style thread-shaped, the length of the calyx; stigma globose. *Peric.* Capsule roundish, full as long as the perianth which clothes it, of one cell, opening with ten teeth at the summit. *Seeds* numerous, roundish, on an ovate-oblong unconnected receptacle.

Ess. Ch. Capsule of one cell, with ten teeth. Tube of the corolla cylindrical; throat pervious. Stigma globose.

Linnæus reckoned up seven or eight species of *Primula*; Willdenow 18. They are all hardy, perennial, herbaceous plants, natives of cool, generally mountainous, countries, and blossoming in the spring. Their leaves are simple and radical. Flower-stalks radical; for the most part umbellate. Flowers red, purple, or yellow, varying in some species from one hue to the other, and frequently sweet-scented. Four species, or more properly three, are natives of Britain; and of these, with a few of the most remarkable foreign ones, we shall give characters and synonyms.

P. vulgaris. Common Primrose. Hudl. 83. Fl. Brit. n. 1. Engl. Bot. t. 4. Ait. n. 1. (*P. acaulis*; Curt. Lond. fasc. 6. t. 16. *P. veris* γ ; Linn. Sp. Pl. 205. *P. elatior* β ; Willd. n. 3. *P. veris minor*; Ger. Em. 781.)—Leaves toothed, wrinkled. Stalks single-flowered. Limb of the corolla flat.—Native of groves, thickets and banks, on a fertile soil, throughout Europe, blossoming with us in profusion in April and May. The root is oblong, toothed, rather fleshy. Leaves obovate-oblong, light green, rugged, somewhat pubescent, four or five inches in length, but much enlarged after the flowers are past. Flower-stalks numerous, about equal to the leaves, simple, though more or less distinctly united by a common base, and occasionally elevated all together on one general stalk, so as to compose an umbel, accompanied by lanceolate bractæas, termed by Linnæus an *involutum*. Flowers of a delicate sulphur-colour, with an orange eye, faintly but agreeably scented. A rose-coloured variety is found in the Levant, and sometimes occurs in England.

PRIMULA.

England. We have seen it originate, with either a simple or compound inflorescence, as above described, from seeds of the common Primrose, and hence perhaps came the Polyanthus, so industriously cultivated. The gardeners keep a double lilac-coloured variety, Curt. Mag. t. 229, which is easily increased, and a less hardy one of a dark brown; but the double sulphur-coloured Primrose is peculiarly elegant. This last blooms regularly two or three weeks later than the rest.

P. elatior. Oxlip, or Great Cowslip. With. 234. Fl. Brit. n. 2. Engl. Bot. t. 513. Ait. n. 2. (*P. elatior* α ; Willd. n. 3. *P. veris* β ; Linn. Sp. Pl. 204.)—Leaves toothed, wrinkled. Stalk many-flowered. Limb of the corolla flat.—Found in groves, pastures and thickets, in England and elsewhere, but not frequently. It seems to be a variety of the former, with a greatly elevated common *flower-stalk*, and much shorter partial ones. The *flowers* however are smaller, and more drooping. The *leaves* are occasionally contracted in the middle, but less regularly or distinctly than those of the following. We are most inclined to think this true *P. elatior* a mule between the Primrose and Cowslip, distinct from the casually umbellate varieties of the former that are described above.

P. veris. Common Cowslip, or Paigle. Linn. Sp. Pl. 204. Willd. n. 2. Ait. n. 3. Fl. Brit. n. 3. Engl. Bot. t. 5. Bulliard t. 171. (*P. officinalis*; Curt. Lond. fasc. 6. t. 15. *P. veris* major; Ger. Em. 780.)—Leaves toothed, wrinkled, contracted in the middle. Stalk many-flowered. Limb of the corolla concave. Plentiful in meadows and pastures of England and other parts of Europe, but only on a strong soil of clay or marle, flowering in April or May. This is unquestionably a most distinct species, though Linnæus considered it as a variety of the Primrose. The blossoms communicate their aromatic fragrance, and narcotic quality, to made wines, which thence have a resemblance to the muscadel wines of the south of France.

P. farinosa. Bird's-eye Primrose. Linn. Sp. Pl. 205. Willd. n. 4. Ait. n. 4. Fl. Brit. n. 4. Engl. Bot. t. 6. Curt. Lond. fasc. 6. t. 14. Fl. Dan. t. 125. (*P. veris*, flore rubro; Ger. Em. 783.)—Leaves crenate, smooth; powdery underneath. Limb of the corolla flat. Found in boggy mountainous meadows in Westmoreland and the north-west part of Yorkshire, as well as in other sub-alpine countries of Europe, flowering in June or July. This pretty species is about half the size of the Cowslip. The *leaves* are of a deep shining green, and smooth, above; white and powdery, like the *flower-stalks* and *calyx*, underneath. *Corolla* of a beautiful rose-colour.

P. longiflora. Long-flowered Primula. Jacq. Austr. append. t. 46. Willd. n. 8.—Leaves serrated, smooth; powdery beneath. Umbel drooping. Tube of the corolla greatly elongated. Native of the alps of Switzerland, Italy, Carinthia, &c. Wulfen in Jacquin's work well asserts this to be a distinct species from the last, from which it differs in the length, and paler purplish hue, of the *corolla*, as well as in having larger, less powdery, *leaves*. We have fine specimens from the late Mr. Davall's herbarium.

P. marginata. Silver-edged Primula. Curt. Mag. t. 191. Willd. n. 10. Ait. n. 9.—Leaves obovate, with tooth-like powdery serratures. Stalk many-flowered. Bractæas shorter than the partial stalks. Said to be a native of the Swiss alps, from whence Messrs. Lee and Kennedy obtained, in 1777, this very pretty plant, now common in gardens, where it blooms in March and April. It is best kept in pots, with little moisture; and will not bear forcing. The *leaves* have a musky scent, and are strikingly bordered

with cream-coloured powder. The *corolla* is of an uniform deep lilac.

P. Auricula. Garden Auricula, or Bear's-ear. Linn. Sp. Pl. 205. Willd. n. 11. Ait. n. 10. (*Auricula urfi*, flore luteo; Ger. Em. 784.)—Leaves obovate, slightly serrated, smooth, more or less powdery. Stalk many-flowered, about the length of the foliage.—Native of the alps of Switzerland, Germany, Carniola, &c. We have gathered it on Mount Cenis. This, the origin of all the fine powdered garden auriculas, has, in a wild state, much less powdery *leaves*, whose edges are partially, but often coarsely, serrated; their form broadly and obtusely obovate, of a lax, leathery, twisted habit. The *flowers* are small and yellow, occasionally purple, or red, as usually seen in ordinary gardens. Their scent is grateful and peculiar.

P. cortusifoides. Cortusa-leaved Primula. Linn. Sp. Pl. 206. Willd. n. 5. Ait. n. 5. Curt. Mag. t. 399. Andr. Repof. t. 7. Jacq. Hort. Schoenbr. v. 3. 5. t. 259. (*P. n.* 33; Gmel. Sib. v. 4. 85. t. 45.)—Leaves wrinkled, lobed. Stalk many-flowered. Native of Siberia. Frequent in our more curious gardens, where it flowers in May and June. The *leaves* are of a fine green, without any mealiness, variously lobed and toothed. *Flowers* purple, very handsome. This species does indeed, as Linnæus observed, approach in habit to *Cortusa*, but his name is barbarously compounded.

PRIMULA, in *Gardening*, contains plants of the low, fibrous-rooted, herbaceous, flowery, perennial kind, of which the species cultivated are, the common primrose (*P. vulgaris*); the great cowslip or oxlip (*P. elatior*); the common cowslip or paigle (*P. officinalis*); the bird's-eye primrose (*P. farinosa*); the long-leaved bird's-eye primrose (*P. longifolia*); the cortusa-leaved primrose (*P. cortusifoides*); the silver-edged primrose (*P. marginata*); and the auricula, or bear's-ear (*P. auricula*).

The varieties of the first sort are numerous, being partly wild and partly produced by cultivation. The principal of which are; the common yellow-flowered; the white; the paper white; the red; the double yellow; the double white; the double red; the double pink; the double crimson primrose. It is a native of most parts of Europe, flowering in March and April with the wood anemone.

It is observed that a fine flower of this sort should possess a graceful elegance of form, a richness of colouring, and a perfect symmetry of parts. The properties are mostly similar to those which distinguish the auricula, in what relates to the stem or scape, the peduncles or flower-stalks, and the formation of the umbel, bunch or thyrse, vulgarly termed the *truss*; the tube of the corolla above the calyx should be short, well filled at the mouth with the anthers, and fluted termination rather above the eye; the eye should be round, of a bright clear yellow, and distinct from the ground-colour; the ground-colour is most admired when shaded with a light and dark rich crimson, resembling velvet, with one mark or stripe in the centre of each division of the border, bold and distinct from the edging down to the eye, where it should terminate in a fine point; the petals, technically termed the pips, should be large, quite flat, and perfectly circular, excepting the small indentures between each division, which separate it into five (sometimes six) heart-like segments; and the edging should resemble a bright gold lace, bold, clear and distinct, and so nearly of the same colour as the eye and stripes, as scarcely to be distinguished from it.

The second sort varies much in the colour of the flowers, but the chief are purple-flowered, red-flowered, gold-coloured, orange-coloured, with various shades of each.

The

The varieties in the third sort are the common single yellow cowslip; double yellow cowslip; scarlet cowslip; and hose, and hose cowslip.

The fourth sort varies in the size of the plant, having been found wild a foot and half in height; and in the cultivated plant, a tendency to become viviparous has been observed by Curtis, or to produce one or more tufts of leaves among the flowers of the umbel. In its wild state it seeds readily, and frequently when cultivated; the flowers also vary with different shades of purple, and have been found entirely white.

The eighth sort varies much in the leaves and flowers; as the oblong-leaved, roundish-leaved, broad-leaved, narrow-leaved, green-leaved, white or meal-leaved; the purple-flowered, of various shades and variegations; yellow-flowered, of different shades; double purple-flowered, double yellow-flowered, variegated purples, &c.

With regard to the properties of a fine auricula, they are these, according to Martyn; the stem should be strong, upright, and of such a height as that the umbel of flowers may be above the foliage of the plant; the peduncles or foot-stalks of the flowers should also be strong, and of a length proportional to the size and quantity of the flowers; which should not be less than seven in number, that the umbel may be regular and close; the tube, eye, and border should be well proportioned, which they will be, if the diameter of the first be one part, of the eye three, and the whole border six parts or thereabouts; the circumference of the border should be round, or nearly so, or at least not what is called starry; the anthers ought to be large, bold, and fill the tube well; and the tube should terminate rather above the eye, which should be very white, smooth, and round, without cracks, and distinct from the ground-colour; the ground-colour should be bold and rich, and regular, whether it be in one uniform circle, or in bright patches; it should be distinct at the eye, and only broken at the outer part into the edging; a fine black, purple, or bright coffee-colour, contrast best with the white eye; a rich blue, or bright pink, is pleasing; but a glowing scarlet or deep crimson would be most desirable, if well edged with a bright green; this, however, can seldom be expected; the green edge is the principal cause of the variegated appearance in this flower; and it should be in proportion to the ground-colour, that is, about one-half of each; the darker grounds are generally covered with a white powder, which seems necessary, as well as the white eye, to guard the flower from the scorching heat of the sun's rays.

It is observed that all flowers that want any of the above properties are turned out into the borders of the garden, or rejected wholly by every good florist, for as there are varieties every year from seeds, the bad ones must make room for their betters; but in some the passion for new flowers so much prevails, that supposing the old flower to be greatly preferable to a new one, the latter must take place, because it is of their own raising.

Method of Culture.—These beautiful plants are raised without much difficulty, by proper care and attention in their management, with respect to the parting of the roots, and the planting them out in their due season; they succeed best in a strong soil, and some of them, as the primrose kind, in a shady situation.

Culture in the Polyanthus Kinds.—These are all capable of being increased by seed, and the parting of the roots, the former being the only method for obtaining new varieties, or a large supply of plants. The seed should be collected from such flowers as have large upright stems, and which produce many flowers upon the stalk, being large, beautifully striped,

open, flat, and not pin-eyed, as from such seed a great variety of good sorts may be expected; care should however be taken that no bad or common flowers stand near them, as they will be apt to debase them, by the admixture of their farina.

The seeds should be sown in boxes or large pots filled with light rich mould. The proper season for this business is in the autumn, or the early spring; but the former is the better, as by sowing then the plants come up well the same year, and are strong and fit to plant out the following spring, and are fine plants for flowering the second spring. In the first season the sowing should be performed as soon as possible after the seed becomes well ripened; though some advise December as a good time, or the spring season, it may be done in February, March, or the following month. The seed should be sown over the surface tolerably thick, being covered in very lightly, and the boxes or pots placed where they may have a little of the morning sun, but not by any means the mid-day heats. The plants may be much forwarded by the pots or boxes being plunged in a mild hot-bed; in the spring, when dry, they should be frequently refreshed with water, in very moderate proportions at a time, removing the plants more into the shade as the heat advances, as it soon destroys them. The autumn-sown plants should have a warm situation during the winter, or be protected from frosts or severe weather by glasses or other means.

In the spring, or early summer, the plants of the different sowings will be sufficiently strong to plant out, for which a bed or shady border should be prepared, and made rich by neat's dung, on which the plants should be set out about four or five inches distant in every direction, care being taken to water them occasionally till well-rooted, after which they only require to be kept free from weeds; and when they flower in the following spring the best flowers should be marked, and the rest be removed into the borders or other places for affording variety; and the valuable plants may be removed, when they have finished flowering, into the borders or beds where they are designed to flower and remain, in the same manner as above, watering them slightly till well rooted again. The roots afterwards require to be parted and removed annually, and the earth of the borders renewed, to prevent their degenerating.

It is necessary, in order to keep up a proper stock of plants, to raise new seedling plants every two or three years, as the old plants mostly decline in beauty after the third year.

In the latter method, the roots should be parted in the beginning of the autumn, as soon as the flowering is over, and it may likewise be done early in the spring; but the former is the best time, as the plants get stronger and flower better in the spring. In performing the work the plants should be taken up out of the ground, and each bunch divided into several slips, not too small, unless where a great increase is wanted, being careful to preserve some root to each slip; they are then to be planted in a fresh dug border, enriched with dung as above, setting them five or six inches asunder, giving them water directly, and repeating it occasionally, till they have taken good root. The approved sorts may, in this way, be easily preserved.

These plants are observed by the editor of Miller's dictionary to be very liable to the depredations of snails and slugs, in the spring of the year; the plants and pots therefore should be carefully examined on all sides early in the morning. But their worst enemy is a small red spider or acarus, which, in summer, forms its web on the under-side of the leaves. These little insects, scarcely visible without a magnifying-glass, cause the leaves to become yellow and spotted,

spotted, and eventually destroy the plant; they multiply with such rapidity as to take possession of a whole collection in a very short time. Such plants as appear infected should therefore be immediately selected from the rest, taken up, and soaked for two or three hours in a strong infusion of tobacco water, and then re-planted in a fresh soil or compost, and removed to a situation at a distance from the former. But if the whole bed or border be overrun with this insect, it is best to take up all the plants, and, having soaked them, to plant them elsewhere. The bed or border should then be trenched up, and remain fallow to the next season, or be planted with another crop not liable to this calamity.

In their after-management, they are said to blow at the same time, and require nearly the same treatment as auriculas, both with respect to soil and situation; they are, however, more impatient of heat and drought, and more partial to shade and moisture. They may be set in the same sized pots, and in the same compost as the auricula, only with the addition of more loam; or they may be planted on cool shady beds or borders, being very hardy, and seldom perishing in the coldest and wettest seasons, because their parent is a native of this country; but during the heats of summer they are frequently destroyed, unless proper precautions are taken. This dislike to heat seems to indicate, it is added, that the polyanthus is rather the offspring of the primrose, which requires shade, than of the cowslip, which grows in open pastures; though Mr. Miller seems to regard it as a variety of the latter.

The roots of the wild plants, when they can be procured, may be taken up, divided, and planted out in the autumn, when they will flower in the following spring.

The fourth sort readily seeds in its wild state, and also frequently when cultivated; but is scarcely worth the pains to raise it from seed, since a strong root may be divided so as to form many plants; the best time for doing this is in the spring, soon after the leaves are expanded. Each off-set should be placed in a separate pot, filled with two parts of stiffish loam, and one part of light sandy bog-earth, watering and setting them in the shade, under a north wall or paling, but not under trees, keeping them there during the summer in pans of water, but in the autumn, as the wet season comes on, taking them out of the pans, and either laying the pots on their sides, or placing them during winter under a common cucumber frame, to keep them from immoderate wet, which this plant cannot bear, although it be a native of boggy meadows. In the following, if not the same year, these plants will blow strong; and they should be thus treated every year, as they require to have their roots frequently parted.

The fifth sort is increased by parting the roots, either in September, or at the beginning of March. It is hardy, of ready growth, and will succeed either in the pot or border, by guarding it from the sun in summer and from severe frost and too much wet in winter.

The sixth species, which is yet a rare plant, must be treated with care, as the fifth sort, and may be raised from seeds, or increased by parting the roots; but it is apt to be lost if not well attended to.

The seventh sort is delicate, and should be placed in a pot of stiffish loam, mixed with one-third rotten leaves, bog-earth, or dung, and plunged in a north border, taking care that it does not suffer for want of water in dry seasons; as when thus treated it increases by its roots nearly as readily as the auricula.

Culture in the Auricula Kinds.—These plants may all be

increased by feeds in order to procure new varieties, and by slipping the roots to increase the approved kinds.

In order to obtain good flowers from seeds, choice should be made of the best flowers, which should be exposed to the open air, that they may have the benefit of showers, without which they seldom produce good seeds: the time of their ripening is in June, which is easily known, by their seed-vessels turning to a brown colour, and opening, being then careful lest the seeds be scattered out of the vessel, as they will not be all fit to gather at the same time.

The proper soil for this sort of seed is good, fresh, light, sandy mould, mixed with very rotten neat's-dung, or very rotten dung from the bottom of an old hot-bed; with which the pots, boxes, or baskets in which the seeds are to be sown should be filled; and having levelled the surface very smooth, the seeds should be sown, sifting over them a little rotten willow mould; then covering them with a net or wire, to prevent cats or birds from scratching out, or burying the seeds so as to destroy them. Some persons never cover the seeds, but leave them on the surface for the rain to wash them into the ground, which is often the best method. The boxes, &c. should then be placed so as to receive half the day's sun during the winter season; but in the beginning of March be removed, where they may have only the morning sun till ten o'clock; for the young plants now soon begin to appear, which, if exposed to one whole day's sun only, are all destroyed. The proper season for sowing the seed is in the latter end of summer, or beginning of autumn, as about September, but they may be sown in the spring. During the summer season, the plants in dry weather should be often refreshed with water, never giving them too great a quantity at once. In the July following, the plants will be large enough to remove, at which time a bed must be prepared, or boxes filled with the above-mentioned soil, in which they may be planted about three inches apart, and shaded when in beds, every day, till they are thoroughly rooted, as also in very hot dry weather; but if they are in baskets or boxes, they may be removed to a shady situation.

When planted in beds, there should be some rotten neat's-dung laid about ten inches under the surface, and beaten down close and smooth: this will prevent the worms from drawing the young plants out of the earth, which they generally do where this is not practised. This dung should be laid about half a foot thick, which will entirely prevent the worms getting through it until the plants are well established in the beds; and the roots strike down into the dung by the spring, which makes their flowers stronger than usual: these beds should be exposed to the east, and screened from the north sun as much as is necessary.

In the spring following many of these flowers will shew; when such of them as have good properties should be selected, which should be removed, each of them into a pot of the same prepared earth, and preserved until the next season, at which time a judgment of the goodness of the flower may be formed; but those that produce plain-coloured or small flowers should be taken out, and planted in borders in the out parts of the garden, to make a show, or gather for nosegays, &c.; the others, which do not produce their flowers the same year, may be taken up and set out in a fresh bed, to remain till their properties are known.

In the second method, the offsets or slips may be taken from the old roots in the spring or autumn, and be planted into small pots filled with the same sort of earth as was directed for the seedlings, and during the summer season be

set in a shady place, and must be often gently refreshed with water, and in the autumn and winter be sheltered from violent rains. In the spring following these plants produce flowers, though but weak; therefore, soon after they are past flowering, they should be put into larger pots, and the second year they will blow in perfection.

In order to obtain a fine bloom of these flowers, the plants should be preserved from too much wet in winter, which often rots and spoils them, letting them have as much free open air as possible; but they should not be too much exposed to the sun, which is apt to forward their budding for flower too soon; and the frosty mornings, which often happen in March, thereby destroy their buds, if they are not protected; to prevent which, those who are curious in these flowers place their pots in autumn under a common hot-bed frame, where, in good weather, the plants may enjoy the full air, by drawing off the glasses; and in great rains, snow, or frost, be screened by covering them.

About the beginning of February, when the weather is mild, the upper part of the earth in the auricula pots should be taken off as low as can be, without disturbing their roots, filling up the pots with fresh rich earth, which greatly strengthens them for bloom. As those plants which have strong single heads always produce the largest clusters of flowers, the curious florist should pull off the offsets as soon as it can be done with safety to their growing, to encourage the mother plants to flower the stronger; they should also pinch off the flowers in autumn, where they are produced, and not suffer them to open, that the plants may not be weakened by it. The pots should be covered with mats in frosty weather, during the time of their budding for flower, lest the sharp mornings blight them, and prevent their blowing. When the flower stems begin to advance, and the blossom buds grow turgid, they must be protected from hasty rains, which would wash off their white mealy farina, and greatly deface the beauty of their flowers, keeping them as much uncovered as possible, otherwise their stems will be drawn up too weak to support their flowers, (which is often the case when their pots are placed near walls,) giving them gentle waterings to strengthen them, but none of the water should be let fall into the centre of the plant, or among the leaves.

When the flowers begin to open, their pots should be removed upon a stage (built with rows of shelves, one above another, and covered on the top, to preserve them from the wet: this should be open to the morning sun, but sheltered from the heat of the sun in the middle of the day): in this position they will appear to much greater advantage, than when they stand upon the ground; for their flowers being low, their beauty is hid; whereas, when they are advanced upon shelves, they are fully seen. In this situation they may remain until the beauty of their flowers is past, when they must be set abroad to receive the rains, and have open free air, in order to obtain seeds, which will fail if they are kept too long under shelter. When the seed is ripe, it should be gathered when it is perfectly dry, and exposed to the sun in a window upon papers to prevent its growing mouldy, letting it remain in the pods till the season for sowing.

It is observed by the editor of Miller's Dictionary, that those who are very nice in raising auriculas, direct the compost to be made of one-half rotten cow-dung two years old; one-sixth fresh found earth of an open texture; one-eighth earth of rotten leaves; one-twelfth coarse sea or river sand; one twenty-fourth soft decayed willow wood; one twenty-fourth peaty or moory earth; one twenty-fourth ashes of burnt vegetables; to be spread upon the surface of the

other ingredients. This compost is to be exposed to the sun and air, turned over once or twice, and passed as often through a coarse screen or sieve; then laid in a regular heap from fifteen to eighteen inches thick, and in this state remain a year, turning it over two or three times, and keeping it free from weeds. And it is added, that the pots for the auriculas should be hard baked: the inner diameter of the top to be six inches and a half, of the bottom four inches, and they should be about seven inches deep, for common-sized blooming plants: but smaller plants and offsets should have smaller shallower pots, and very large plants should have larger pots in proportion; the bottom should have a small degree of concavity, and the hole should be half an inch in diameter: the rims should project about half an inch, in order to take up and remove them with greater ease and safety. The pots should be buried in wet earth, or immersed in water three or four days, or a week before they are wanted, to take off their absorbent property.

In the after-management of the plants, they should be potted annually soon after bloom; curtailing their fibres, if grown very long, and cutting off the lower part of the main root if too long or decayed. The offsets at this season strike freely, and become well established before winter. The plants should be carefully examined, and where any unsoundness appears, be cut out entirely with a sharp penknife, exposing the wounded part to the sun, and when it is quite dry, applying a cement of bees'-wax and pitch in equal quantities, softened in the sun or before a fire. If the lower leaves be yellow or dried up, they should be stripped off in a direction downwards. Having put the hollow shell of an oyster over the hole of the pot, three parts of it should be filled with compost, highest in the middle, placing the plant there, with its fibres regularly distributed all round; then filling the pot with the compost, adding a little clean coarse sand close round the stem on the surface, and striking the bottom of the pot against the ground or table to settle the earth. The true depth of planting is within half an inch of the lowest leaves, as the most valuable fibres proceed from that part; and the offsets will be thereby encouraged to strike root sooner. When these have formed one or more fibres of an inch or two in length, they may, by means of a piece of hard wood, or by the fingers, be separated with safety, and planted round the sides of a small pot, filled with the same compost, till they are sufficiently grown to occupy each a separate pot: if a small hand-glass be placed over each pot it will cause the fibres to grow more rapidly; but if it be long continued, it will draw up and weaken the plants. And in the beginning of May, as soon as the operation of potting is finished, the plants should be placed in an airy shaded situation, but not under the drip of trees. Here they may remain till September or October, when they should be removed into shelter.

The plants should, in the first favourable weather in February, be divested of their decayed leaves; and by the middle of that month earthing them up; that is, taking away the superficial mould of the pots about an inch deep, and putting in fresh compost, with the addition of a little loam, to give it more tenacity. This contributes greatly to the strength of the plants, and the vigour of their bloom; at the same time it affords a favourable opportunity to separate such offsets as appear to have sufficient fibre to be taken off at this early season. The pots with these offsets should be placed in a frame, in a sheltered situation, till their roots are established. Though frost, unless it be very rigorous, will not destroy the plants, it will injure them

and perhaps spoil the bloom, especially early in the spring; they should therefore be covered with mats in a severe season. When any plant has more than one or two principal stems, it is advisable to pinch off the smallest and weakest, in order to render the blossoms of that which remains larger and more vigorous. And when the flowers (pips) become more turgid and begin to expand, the plants should be selected from the rest, removing them to a calm shady corner, suspending small hand-glasses over them.

In this culture the stages for the pots to stand on whilst in bloom should have a northern aspect, and should consist of four or five rows of shelves, rising one above another, the roof being covered with frames of glass; the tallest blowing plants being placed behind, and the shortest in front. The plants must be regularly watered two or three times every week during the blooming season.

All these plants are highly ornamental; the former in beds and borders, and the latter sorts among curious potted flowering plants.

PRIMUM ENS. See ENS.

PRIMUM Mobile. See MOBILE.

PRIMUS *Brachii Moventium*, in *Anatomy*, a name given by Vesalius, and some others who have copied from him, to a muscle generally known under the name of the pectoralis.

PRIMUS *Communium Laryngis*, a name given by Casserius and some others to the muscle more generally known by the name of sterno-thyroidæus, or sterno-thyroides.

PRIMUS *Hyoidis Ossis Musculus*, a name given by Fallopius and some others to the muscle of the os hyoides, called by Albinus sterno-hyoidæus.

PRIMUS *Oculum Movens*, a name given by Vesalius to one of the four muscoli recti of the eye, called by Albinus and others the adductor. It is called by Fabricius the rectus inferior, and by some the bibitorius.

PRIMUS *Propriorum Auriculæ Musculus*, a name given by Casserius to one of the muscles of the head, called by Albinus the auriculam attollens, and by Cowper and Winslow superior auriculæ.

PRIMUS *Peronæus*. See PERONÆUS.

PRIMUS *Scalenus*. See SCALENUS.

PRINCE, PRINCEPS, in *Politics*, a person invested with the supreme command of a state or country, independent of any superior.

PRINCE is also used for a person who is sovereign in his own territory; yet holds of some other, as his superior or lord, and pays homage or tribute to him.

Thus all the princes of Germany are feudatories of the emperor: they are as absolute in their respective principalities as the emperor himself; yet are all bound in certain services to him.

PRINCE, in *Ancient Records*, frequently signifies no more than lord. Du-Cange gives a great number of instances of this usage.

In effect, the word *princeps* in Latin, whence *prince* in English, originally signifies only the *chief*, or *first*: it is compounded of the Latin *primus*, and *caput*; and is properly a word of dignity and office, not of property and sovereignty.

Thus in the charter of king Offa, after the bishops had subscribed their names, we read *Brordanus patritius*, *Binnanus princeps*; and afterwards the dukes subscribed their names.

And in the charter of king Edgar, in *Mon. Angl.* tom. iii. p. 301. "Ego Edgarus rex rogatus ab episcopo meo Deorwolfe, & principe meo Aldredo, &c." And in

Mat. Paris, p. 155. "Ego Halden princeps regis pro vieribus assensum præleo, & ego Turketillus dux concedo."

PRINCE of the Senate. There was one member of the Roman senate distinguished always from the rest by the title of "prince of the senate." This title was given of course to that person whose name was called over the first in the roll of the senate, whenever it was renewed by the censors. He was always one of consular and censorian dignity.

After the institution of the censors, it became a custom to confer this title of "prince of the senate" on the oldest senator then living of censorian dignity. Yet there were no peculiar rights annexed to this title, nor any other advantage, except an accession of authority, from a notion which it would naturally imprint of a superior merit in those who bore it. See SENATE.

PRINCE of the Waters, an officer of state in Persia. The number of wells and subterraneous pits, which were objects of peculiar attention in the reign of Nushirvan, or Chosroes, so that fresh water was skilfully dispersed over the arid territory of this country, is much diminished in later times, and of course the fertility of the soil. Four hundred wells, as we learn from Chardin and Tavernier, have been recently lost near Tauris, and 42,000 were once reckoned in the province of Khorafan.

PRINCE of the Youth. Among the ancient Romans, it was the custom for the emperor in his life-time to nominate him whom he would have to succeed in the empire, under the title of *princeps juventutis*, & *Cæsar*.

In the ludus Trojanus, the youth who was chosen captain, was also called *princeps juventutis*.

PRINCE is also a title given to the issue of princes, or those of the royal family.

In which sense they are called, particularly in France, *princes of the blood*; as partaking of the blood to which the sovereignty is appropriated: and not by any hereditary right, but as a patrimony substituted to all the royal race.

In England, the king's children are called *sons and daughters of England*: the eldest son is created *prince of Wales*. The cadets, or younger, are created dukes or earls, with what title the king pleases. They have no appendages, as in the former constitution of France; but only what the good pleasure of the king and parliament bestow on them.

The sons are all by birth counsellors of state: and the daughters are all styled *princesses*; to violate the eldest of which, unmarried, is at this day high treason. See MARRIAGE and PREMUNIRE.

To all the king's children belongs the title of *royal highness*: all subjects are to kneel, when admitted to kiss their hand; and at table, out of the king's presence, they are served on the knee. The youngest sons and daughters of the king who are not in the line of succession, have precedence before all peers and public officers, as well ecclesiastical as temporal. 31 Hen. VIII. cap. 10.

The first prince of the blood in France was, under the old government, called absolutely *monsieur le prince*. The quality of prince of the blood gave a rank and precedence, but it did not include any jurisdiction; they were princes by order, not by office.

Wicquefort observes, that it was not more than fifty years from his time that the princes of the blood of France gave place to all ambassadors, even those of republics; and it was at the king's request, that they were since allowed the precedence.

The moment a pope is elected, all his relations become princes.

PRINCE of *Wales*, the eldest son of England.

He is born duke of Cornwall; and immediately intitled to all the rights, revenues, &c. belonging thereto; as being deemed in law at full age on his birth-day.

He is afterwards created prince of Wales, and earl of Chester; the investiture of which is performed by imposition of a cap of state, and a coronet, a verge of gold, and a ring. He holds the principality by patent granted him and his heirs, by the kings of England.

The title and principality were first given by king Edw. I. to his eldest son: till that time the eldest son of England was called *lord prince*. While Normandy remained to the king of England, the eldest son was always styled duke of Normandy: since the union, his title is *Magna Britannie princeps*.

He is reputed in law the same person with the king: to imagine his death, or to violate his wife, and also the princess royal, or eldest daughter of the king, is high treason by stat. 25 Edw. III., as much as to conspire the death of the king, or violate the chastity of the queen. The reason of which is, that the prince of Wales is next in succession to the crown, and to violate his wife might taint the blood royal with bastardy; and the eldest daughter of the king is also alone inheritable to the crown, on failure of male issue, and therefore more respected by the laws than any of her younger sisters; insomuch that upon this, united with other (feodal) principles, while our military tenures were in force, the king might levy an aid for marrying his eldest daughter, and her only.

His revenues, as duke of Cornwall, have been computed at 14,000*l. per annum*. The revenues of the principality were estimated, three hundred and fifty years ago, at 4680*l. per annum*.

PRINCE of *Pleasantry*, *prince de plaisir*, in the *Customs of Flanders*. See SPORTS.

PRINCE of the *Horse-comb*. See SPORTS.

PRINCE'S *Feather*, in *Gardening*, the common name of a beautiful flower plant. See AMARANTHUS.

PRINCE'S *Wood*. See CORDIA and HAMELIA.

PRINCE'S *Bay*, in *Geography*, a bay on the S. coast of Staten island, New York.—Also, a bay called “Barawally,” on the W. of the island of St. Vincent; two miles S. of Cumberland bay.

PRINCE'S *Island*, an island in the Atlantic, near the coast of Africa, 90 miles in circumference, deriving its name from the assignment of its revenues to the prince of Portugal; discovered in the year 1471. The land is high and fertile, producing chiefly rice, tobacco, millet, oranges, lemons, bananas, cocoa, sugar-canes, manioc, and grapes; and the air is salubrious. The town, which lies on the N. coast, contains about 200 houses, and has a good harbour. N. lat. 2° 50'. E. long. 7° 10'.—Also, an island in the East Indian sea, visited by European ships for wood and water. It is subject to the king of Bantam. The Malays call it “Pulo Selan,” but by the inhabitants it is denominated “Pulo Paneitan.” It lies at the W. entrance of the straits of Sunda. Captain Cook, who visited it in 1771, gives the following account of it. It is woody and very small, part only has been cleared: there is no remarkable hill upon it, yet the English call the small eminence which is just over the landing-place, “The Pike.” It was formerly much frequented by the Indian ships of many nations, but especially those of England, which of late have forsaken it, as it is said, because the water is bad, and touch either at North island, a small island that lies on the coast of Sumatra, without the east entrance of the strait, or at New Bay, which lies only a few leagues from Prince's island; at neither of which places any considerable quantity of

other refreshments can be procured. Prince's island is, upon the whole, certainly more eligible than either of them; and though the water is brackish, if it be filled at the lower part of the brook, yet higher up it may be found excellent. The first and second, and perhaps the third ship that comes in the season, may be tolerably supplied with turtle; but those coming afterwards must be content with small ones. Cocoa-nuts were bought at the rate of 100 for a dollar, if they were picked, and if taken promiscuously, 150. Plantains he found in great plenty, also some pine apples, water melons, jaccas, and pumpkins, besides rice, the greater part of which was of the mountain kind, that grows in dry land. The inhabitants are Javanese, whose rajah is subject to the sultan of Bantam. Their customs are very similar to those of the Indians about Batavia; but they seem to be more jealous of their women. They profess the Mahometan religion. The houses of their town are built upon piles or pillars, four or five feet above the ground; upon these is laid a floor of bamboo-canes, which are placed at some distance from each other, so as to leave a free passage for the air from below; the walls also are of bamboo, which are interwoven hurdlewise, with small sticks that are fastened perpendicularly to the beams, which form the frame of the building. The disposition of the people, as far as they could discover it, is good. They dealt honestly, except that, like all other Indians, and the itinerant retailers of fish in London, they asked sometimes twice, and sometimes thrice as much for their commodities as they would take. They all speak the Malay language, though they have a language of their own, different both from the Malay and the Javanese. Their own language they call Catta Gunung, the language of the mountains; and they say that it is spoken upon the mountains of Java, whence their tribe originally migrated. E. long. 104°. S. lat. 6° 41'.

PRINCE'S *Islands*. See PAPAS *Adass*, and PRINKIPOS.

PRINCE *Charles's Island*, a small island in the North sea, near the W. coast of Spitzbergen.

PRINCE *Edward's Island*. See St. JOHN.

PRINCE *Edward's Islands*, two islands in the Indian sea, discovered in the year 1772, by captains Marion du Fresne and Crozet, French navigators, on their passage from the Cape of Good Hope to the Philippine islands. Captain Cook sailed between them in 1776, and gave them their present name, in honour of prince Edward, our sovereign's fourth son. Their distance from one another is about 15 miles. Captain Cook's account is as follows: we passed through this channel at equal distance from both islands; and could not discover, by the assistance of our best glasses, either tree or shrub on either of them; they seemed to have a rocky and bold shore; and excepting the south-east part, where the land is rather low and flat, a surface composed of barren mountains, which rise to a considerable height, and whose summits and sides were covered with snow, which in many places seemed to be of a considerable depth; the south-east parts had a much greater quantity on them than the rest; owing, probably, to the sun acting for a less space of time on these, than on the north and north-west parts. The ground, where it was not hid by the snow, from the various shades it exhibited, may be supposed to be covered with moss or coarse grass. On the north side of each of the islands is a detached rock: that near the south island is shaped like a tower, and seemed to be at some distance from the shore. As we passed along, a quantity of sea-weed was seen, and the colour of the water indicated soundings; but there was no appearance of an inlet, unless near the rock just mentioned; and that, from its smallness, did not promise a good anchoring-place. That which lies most to the south, and is also the largest,

we judged to be about 45 miles in circuit ; and to be in S. lat. $46^{\circ} 53'$. E. long. $37^{\circ} 46'$. The most northerly one is about 27 miles in circuit, and lies in S. lat. $46^{\circ} 40'$. E. long. $38^{\circ} 8'$.

PRINCE Edward, a county of Virginia, between the Blue Ridge and the tide waters, containing 12,409 inhabitants. Hampden Sydney college is in this county, the building of which is large enough to accommodate 60 students. The principal rivers are the Buffaloe, Biscay, and Bush. On the N. side, towards the middle, bordering on the Appamatox, the soil is of a good quality ; the W. and S. parts are less fertile. This county contains three Episcopal, three Presbyterian, three Baptist, and one Methodist churches. The court-house is 50 miles from Lynchbury, and 358 from Philadelphia.

PRINCE Edward, a county of Canada, bounded S. by lake Ontario, W. by the carrying place or the isthmus of the Presque Isle de Quinté, N. by the bay of Quinté, and E. from Point Pleasant to Point Traverse, by its several shores and bays. This county comprehends all the islands in lake Ontario, and the adjacent bay of Quinté.

PRINCE Edward's Isles. See WASHINGTON'S *Isles*.

PRINCE Ernest's Sound, an inlet which branches off from the Duke of Clarence's strait, and separates the S.E. coast of the Duke of York's island from the continent of America. The S.W. entrance is between Point Onslow and Point Le Mesurier.

PRINCE Frederick, the chief town of Calvert county, Maryland ; 3 miles S. of Huntingtown.

PRINCE Frederick's Sound, an inlet on the North Pacific ocean, on the west coast of North America ; so named by captain Vancouver, in honour of his royal highness Frederick, duke of York. It extends eastward from Chatham strait to the continent. About 42 miles to the north are Admiralty island, Stephens's passage, and a part of the continent ; and on the south are some large islands. N. lat. $56^{\circ} 52'$ to $57^{\circ} 12'$. E. long. $225^{\circ} 42'$ to $227^{\circ} 20'$.

PRINCE George, a county of Virginia, bounded north by James river, which washes about 35 miles of it, in medial breadth 16 miles, containing 8050 inhabitants, five episcopal churches, one meeting for Friends, and several meetings for Methodists, and some for Baptists. This is a fertile county, and abounds with wheat, corn, flax, cotton, and tobacco. Its timber consists of various kinds of oak, of good quality, and fit for ship-building. It has also abundance of wild grapes, flowering shrubs, sarsaparilla, snake-root, and ginseng. Its peaches are finely flavoured ; the almond and fig trees grow in the open air. Large quantities of pork and bacon are cured here, and form the principal food of the inhabitants. Its veal is good, but mutton indifferent ; its poultry is good and abundant. The winters are short, and generally pleasant ; and the country cannot be considered unhealthy.

PRINCE George, a county also of Maryland, on the west shore of Chesapeake bay, between Patowmac and Patuxet rivers. The eastern corner of the territory of Columbia borders on the west part of this county. It contains 20,589 inhabitants.

PRINCE Rupert's Bay, a bay on the north-west coast of the island of Dominica, which is deep, capacious, and sandy, and affords excellent shelter from the winds. On this bay is situated the town of Portsmouth, north of which is a cape called "Prince Rupert's Head." N. lat. $15^{\circ} 42'$. W. long. $61^{\circ} 31'$.

PRINCE Town. See PRINCETON.

PRINCE of Wales's Archipelago, a large island in the North Pacific ocean, with a number of small ones in the bays on

its coast, so called by captain Vancouver ; extending about 110 miles in length from north-west to south-east, and from 30 to 40 in breadth. N. lat. $54^{\circ} 42'$ to $56^{\circ} 21'$. E. long. $226^{\circ} 20'$ to $228^{\circ} 26'$.

PRINCE of Wales's Island, an island in the South Pacific ocean, observed by captain Byron in 1765, and judged to be about 60 miles long, narrow, and low, and abounding with inhabitants. S. lat. 15° . W. long. $151^{\circ} 53'$.

PRINCE of Wales's Foreland, a cape on the east coast of Kerguelen's land. S. lat. $49^{\circ} 39'$. E. long. $72^{\circ} 22'$.—Also, the most southerly point of New Caledonia, in the South Pacific ocean. S. lat. $22^{\circ} 29'$. E. long. $166^{\circ} 57'$.

PRINCE of Wales's Fort, a fort and factory, on Churchill river, belonging to the Hudson Bay Company. N. lat. $58^{\circ} 47'$. W. long. $94^{\circ} 7'$. The mean heat here is $18^{\circ} 7'$; the least -18° , and greatest 85° .

PRINCE of Wales's Islands, a cluster of islands, supposed to extend from New Holland to New Guinea, differing in elevation and compass, many of which are well covered with herbage and wood. Captain Cook saw on most of them smoke, and thence inferred that they were inhabited. Between these are probably good sailing passages.

PRINCE of Wales's Lake, a lake of North America. N. lat. $50^{\circ} 55'$. W. long. 94° .

PRINCE William, a county of Virginia, bounded west by Farquier, and east by Patowmac river, which separates it from Maryland ; containing 11,311 inhabitants.

PRINCE William Henry's Island, an island in the South Pacific ocean, discovered by captain Wallis, on the 13th of June 1767. S. lat. 19° . W. long. $141^{\circ} 6'$.—Also, an island in the Pacific ocean, discovered, in 1790, by lieutenant Ball, commander of the Supply. It is elevated, and about 70 miles in circumference ; well wooded, interspersed with cultivated tracts of ground, on which was perceived something that had the appearance of Indian corn, or sugar-cane. It is surrounded by a sandy beach, on which were seen several canoes, and also several of the natives. Several houses were perceived among the trees, and appeared to be large and well constructed. The appearance of the island is luxuriant and picturesque, and it is thought to be very fertile and well peopled. The natives were wholly naked, and seemed to be the same sort of people that had been seen at Tench's island. S. lat. $1^{\circ} 32'$. E. long. $149^{\circ} 30'$.

PRINCE William's Islands, a cluster of islands in the Pacific ocean, discovered by Tasman in 1643. S. lat. $17^{\circ} 19'$. E. long. 179° .

PRINCE William's Sound, an inlet of the North Pacific ocean, occupying at least $1\frac{1}{2}^{\circ}$ of latitude, and 2° of longitude, exclusive of its arms and branches, which are not ascertained. Captain Cook, who discovered it in 1778, gives the following account of it. The natives, who came to make them several visits while they were in the sound, were generally not above the common height, though many of them were under it. They were square or strong chested ; and the most disproportioned part of their body seemed to be their heads, which were very large, with thick short necks, and large, broad, or spreading faces, which, upon the whole, were flat. Their eyes, though not small, scarcely bore a proportionate size to their faces ; and their noses had full round points, hooked and turned up at the tip. Their teeth were broad, white, equal in size, and evenly set. Their hair was black, thick, straight, and strong ; and their beards, in general, thin or wanting ; but the hairs about the lips of those who had them were stiff or bristly, and frequently of a brown colour ; and several of the elderly men had even large and thick, but straight beards. Their com-

mon drefs (for men, women, and children, are clothed alike) is a kind of clofe frock, or rather robe, reaching generally to the ankles, though fometimes only to the knees. At the upper part is a hole, juft fufficient to admit the head, with sleeves that reach to the wrift. Thefe frocks are made of the skins of different animals; the moft common of which are the fea-otter, grey fox, racoon, and pine martin; with many of feal skins, and, in general, they are worn with the hairy fide outward. Some alfo have thefe frocks made of the skin of fowls, with only the down remaining on them, which they glue on other fubftances; and we faw one or two woollen garments, like thofe of Nootka. In general, they do not cover their legs or feet; but a few have a kind of fkin ftockings, which reach half way up to the thigh; and fcarcely any of them are without mittens for their hands, made of the skins of bears' paws. Thofe who wear any thing on their heads, refembled in this refpect our friends at Nootka, having high truncated conic caps, made of ftraw, and fometimes of wood, refembling a feal's head, and well painted. The men commonly wear the hair cropt round the neck and forehead; but the women allow it to grow long, and moft of them tie a fmall lock of it on the crown; or a few club it behind, after our manner. Both fexes have the ears perforated with feveral holes, about the outer and lower part of the edge, in which they hang little bunches of beads, made of the fame tubulous fhelly fubftance ufed for this purpofe by thofe of Nootka. The feptum of the nofe is alfo perforated; through which they frequently thruft the quill-feathers of fmall birds, or little bending ornaments, made of the above fhelly fubftance, ftung on a ftiff ft ring, or cord, three or four inches long, which gives them a truly grotesque appearance. But the moft uncommon and unfightly ornamental fafhion, adopted by fome of both fexes, is their having their under lip fplit, or cut quite through, in the direktion of the mouth, a little below the fwell part. This incifion, which is made even in the fucking children, is often above two inches long; and either by its natural retraction, when the wound is frefh, or by the repetition of fome artificial management, affumes the true fhape of lips, and becomes fo large, as to admit the tongue through. The food which we faw them eat was dried fifh, and the flefh of fome animal, either broiled or roasted. Some of the latter that was brought feemed to be bear's flefh, but with a fifhy tafte. As to the animals of this part of the continent, the fame muft be underftood as of thofe at Nootka; that is, the knowledge we have of them is entirely taken from the skins which the natives brought to fell. Thefe were chiefly of feals, a few foxes, the whitifh cat or lynx, common and pine martins, fmall ermines, bears, racoons, and fea-otters; of thefe the moft common are the martin, racoon, and fea-otter, which compofed the ordinary drefs of the natives. Of the birds mentioned at Nootka, we found here only the white-headed eagle, the fhag, the alcyon, or great king-fifher, which had very fine bright colours; and the humming-bird, which came frequently and flew about the fhip, while at anchor, though it can fcarcely live here in the winter, which muft be very fevere. The water-fowls were geefe, a fmall fort of duck, and fome black fea-pyes, with red bills, which were found at Van Diemen's land and New Zealand. The metals we faw were copper and iron, both in plenty. Few vegetables of any kind were feen; and the trees which chiefly grew here were the Canadian and fpruce pine, and fome of them tolerably large. Captain Vancouver vifited this found in 1794, and fays, after a minute examination we were empowered to make of Prince William's found, we were not only made acquainted with its utmoft limits in every direc-

tion, but proved it to be a branch of the ocean that requires the greateft circumfpection to navigate; and although it diverges into many extenfive arms, yet none of them can be confidered as commodious harbours, on account of the rocks and fhoals that obftrudt the approach to them, or of the very great depth of water at or about their entrances; of the former innumerable have been difcovered, and there is great reafon to fuppofe that many others may have exiftence, of which we gained no knowledge. By what may be collected from our inquiries, Snug-corner cove, and the paffage to it from the ocean, feem to be the leaft liable to thefe objections of all places of fhelter which the found affords. N. lat. 20° to 61°. W. long. 147°.

PRINCES, *College of*. See COLLEGE.

PRINCESS ANNE, in *Geography*, a maritime county of Virginia, bounded W. by Norfolk county, S. by North Carolina, and N. by Chafapeak bay, 30 miles long, 29 broad, containing 9498 inhabitants.—Alfo, a poft-town of Maryland, on the eaft fhore of Chafapeak bay, in Somerfet county, on the eaft fide of Monokin river; 178 miles S. by W. from Philadelphia. N. lat. 38° 10'. W. long. 75° 48'.

PRINCESS *Royal's Harbour*, a harbour on the fouth-weft coaft of New Holland, and the weftern part of King George Third's found. The paffage into it is about a quarter of a mile wide; the depth near the northern fhore is 5 or 6 fathoms, but on the fouthern not more than 2½ and 3 fathoms, on account of banks of coral-rock that are very vifible, but not dangerous, as they are not liable to any violent agitation of the fea. Within the points of entrance the depth is regularly from 4 to 7 fathoms, and the bottom is clear good holding ground. This depth, occupying only part of the harbour, affords fufficient fpace for feveral vefels to ride in fafety. S. lat. 35° 8'. E. long. 118° 9'.

PRINCESSE, in *Ichthyology*. See CHÆTODON *Vagabundus*.

PRINCETON, in *Geography*, a township of Worcefter county, Maffachufetts, 15 miles N. by W. of Worcefter, and 52 W. by N. of Boston. This township contains 19,000 acres of high and hilly, but ftong and rich land, adapted to grafs and grain. Its principal productions are excellent beef, butter, and cheefe. Here is a handsome congregational church, feated on a high hill, and commanding a moft extenfive and rich profpect of the furrounding country. Wackufett mountain, the moft noted in the ftate, is in the north part of this township. The town has a valuable library, was incorporated in 1759, and contains 1062 inhabitants.

PRINCETON, a poft-town of New Jerfey, fituated partly in Middlefex and partly in Somerfet counties. Here are Naffau-Hall college (fee COLLEGE), about 80 dwelling houfes, and a brick Prefbyterian church. It is diftant 12 miles N.E. from Trenton, and 42 N.E. from Philadelphia. N. lat. 40° 22' 12". W. long. 74° 34' 45".—Alfo, a fmall poft-town of North Carolina; 35 miles from Halifax.

PRINCIPAL, PRINCIPALIS, the chief, moft confiderable, or neceffary part of a thing.

Thus we fay, the mayor is the principal magiftrate of a city or town; a council of war confifts of the principal officers. In the peroration, the principal points infifted on are to be briefly fummed up. The principal of a college or hall is the mafter of it.

PRINCIPAL, in *Commerce*, is the capital of a fum due or lent; in which fenfe the word is ufed in oppofition to intereft.

PRINCIPAL is alfo ufed for the firft fund or fum put by partners

else. There is, however, a difference of opinion concerning these first principles; some admitting them to be self-evident, others proving them by arguments, and others again totally denying them. Before the time of Descartes, it was assumed as a first principle, that the sun and moon, and earth and sea, have a real existence, whether we think of them or not. Descartes thought that their existence should be proved by argument; in which opinion he has been followed by Malebranche, Arnauld, and Locke. They have endeavoured to prove by reasoning the existence of external objects of sense; and Berkeley and Hume, conceiving their arguments to be feeble and unsatisfactory, have been led to deny their existence altogether. The ancient philosophers granted, that all knowledge must be grounded on first principles; and the Peripatetic philosophy admitted a great number of them, erring perhaps in excess rather than in defect. Descartes was satisfied with one principle, expressed in one word, "cogito," I think. Mr. Locke seems to have thought them of very little use.

In order to obtain some mark or criterion by which first principles, that are really such, may be distinguished from others that assume this character without a just title, Dr. Reid makes the following observations. 1. "I hold it to be certain," he says, "and even demonstrable, that all knowledge got by reasoning must be built upon first principles. 2. Some first principles yield conclusions that are certain, others such as are probable in various degrees, from the highest probability to the lowest. 3. It would contribute greatly to the stability of human knowledge, and consequently to the improvement of it, if the first principles upon which the various parts of it are grounded, were pointed out and ascertained. 4. Nature hath not left us destitute of means by which the candid and honest part of mankind may be brought to unanimity, where they happen to differ about first principles.

First principles may relate either to the class of *contingent*, or to that of *necessary* truths. Those of the first class comprehend, according to Dr. Reid's enumeration, such as follow. 1. The existence of every thing of which he is conscious. Mr. Hume, it is said, after annihilating body and mind, time and space, action and causation, and even his own mind, acknowledges the reality of the thoughts, sensations, and passions of which he is conscious. (See CONSCIOUSNESS.) 2. Another first principle is, that the thoughts of which, says Dr. Reid, I am conscious, are the thoughts of a being, which I call *myself*, *my mind*, *my person*. (See IDENTITY.) 3. Those things did really happen which are distinctly remembered. (See MEMORY.) 4. Another first principle is our own personal identity and continued existence, as far back as we remember any thing distinctly. 5. Those things do really exist which we distinctly perceive by our senses, and are what we perceive them to be. 6. That we have some degree of power over our own actions, and the determinations of our will. This is implied in every act of volition, in all deliberation, in every purpose or resolution formed in consequence of deliberation, and in every promise or contract in which a man plights his faith. 7. That the natural faculties, by which we distinguish truth from error, are not fallacious. 8. There is life and intelligence in our fellow-men with whom we converse. 9. Certain features of the countenance, sounds of the voice, and gestures of the body, indicate certain thoughts and dispositions of the mind. 10. A certain regard is due to human testimony in matters of fact, and even to human authority in matters of opinion. 11. There are many events depending upon the will of man, in which there is a self-evident probability, greater or less, according to circumstances.

12. In the phenomena of nature, what is to be will probably be like to what has been in similar circumstances.

The first principles of *necessary* truths are divided by Dr. Reid into different classes, according to the sciences to which they belong; and he mentions some, in each class, by way of specimen. 1. Some of these may be called grammatical, such as, that every complete sentence must have a verb. 2. Some are logical, such as, that every proposition is either true or false, that reasoning in a circle proves nothing, &c. 3. Some are mathematical. (See AXIOMS.) 4. In matters of taste, there are also axioms, or common principles. (See TASTE.) 5. There are also first principles in morals; such are the following, *viz.* that no man ought to be blamed for what it was not in his power to hinder, that we should do to others what we should expect them to do to us in the same circumstances, &c. (See MORAL PHILOSOPHY and MORAL SENSE.) 6. Some first principles are metaphysical; such are the following, *viz.* that the qualities which we perceive by our senses must have a subject, which we call body; and that the thoughts of which we are conscious must have a subject, which we call mind: that whatever begins to exist must have a cause which produced it (see CAUSE); and that design and intelligence in the cause may be inferred, with certainty, from marks or signs of it in the effect. All these three principles are denied by Mr. Hume; others think that they admit of proof by reasoning, or from experience; but all must allow their truth and importance. On the last of the three principles above mentioned, we shall refer to the articles *Final Cause* and *GOD*; and, moreover, cite an appropriate passage from archbishop Tillotson's sermons, vol. i. serm. i. "For I appeal to any man of reason," says the excellent preacher, "whether any thing can be more unreasonable, than obstinately to impute an effect to chance, which carries in the very face of it all the arguments and characters of a wise design and contrivance? Was ever any considerable work, in which there was required a great variety of parts, and a regular and orderly disposition of those parts, done by chance? Will chance fit means to ends, and that in ten thousand instances, and not fail in any one? How often might a man, after he had jumbled a set of letters in a bag, fling them out upon the ground, before they would fall into an exact poem; yea, or so much as make a good discourse in prose? And may not a little book be as easily made by chance, as this great volume of the world? How long might a man be in sprinkling colours upon canvas with a careless hand, before they would happen to make the exact picture of a man? And is a man easier made by chance than his picture? How long might twenty thousand blind men, which should be sent out from the several remote parts of England, wander up and down before they would all meet upon Salisbury-plain, and fall into rank and file in the exact order of an army? And yet this is much more easy to be imagined, than how the innumerable blind parts of matter should rendezvous themselves into a world. A man that sees Henry the Seventh's chapel at Westminster might with as good reason maintain, (yea, with much better, considering the vast difference betwixt that little structure and the huge fabric of the world,) that it was never contrived or built by any man, but that the stones did by chance grow into those curious figures into which they seem to have been cut and graven; and that upon a time, (as tales usually begin,) the materials of that building, the stone, mortar, timber, iron, lead, and glass, happily met together, and very fortunately ranged themselves into that delicate order in which we see them now so close compacted, that it must be a very great chance that parts them again. What would the world think of a man that

that should advance such an opinion as this, and write a book for it? If they would do him right, they ought to look upon him as mad: but yet with a little more reason than any man can have to say that the world was made by chance; or that the first men grew up out of the earth as plants do now. For can any thing be more ridiculous and against all reason, than to ascribe the production of men to the first fruitfulness of the earth, without so much as one instance and experiment in any age or history to countenance so monstrous a supposition? The thing is at first sight so gross and palpable, that no discourse about it can make it more apparent. And yet these shameful beggars of principles, who give this precarious account of the original of things, assume to themselves to be the men of reason, the great wits of the world, the only cautious and wary persons that hate to be imposed upon, that must have convincing evidence for every thing, and can admit of nothing without a clear demonstration for it."

Dr. Reid is of opinion, that the principle, so admirably illustrated in the passage now cited, *viz.* that from certain signs or indications in the effect we may infer, that there must have been intelligence, wisdom, or other intellectual or moral qualities in the cause, is gained neither by reasoning nor by experience; and, therefore, if it be a true principle, it must be a first principle. There is, he says, in the human understanding a light, by which we see immediately the evidence of it, when there is occasion to apply it. Whether it be in his sense, the true and first principle or not, it is unquestionable, that the clear signatures of wisdom, power, and goodness, in the constitution and government of the world, afford an argument for the being and providence of the Deity, that in all ages has made the strongest impression upon candid and thinking minds; an argument which has this peculiar advantage, that it acquires strength as human knowledge advances, and is more convincing at present than it was some centuries ago. On this account, those who, in all ages, have been unfriendly to the principles of religion, have made attempts to weaken the force of the argument, which is founded on the principle above stated. This argument has been denominated the argument from final causes; and when reduced to a syllogism, it comprehends these two premises: *first*, that design and intelligence in the cause may, with certainty, be inferred from marks or signs of it in the effect. This may be considered as the *major* proposition of the argument. The *second*, which may be called the *minor* proposition, is, that there are in fact the clearest marks of design and wisdom in the works of nature; and the conclusion is, that the works of nature are the effects of a wise and intelligent Cause. A person must either assent to the conclusion, or deny one or other of the premises. Those, among the ancients, who denied a God or a Providence, seem to have allowed the *major* proposition, and to have denied the *minor*. An instance to this purpose occurs in the reasoning of Cotta the academic, in the third book of Cicero, of the nature of the Gods. In later times, those, who are dissatisfied with this argument from final causes, have quitted the strong hold of the ancient atheists, which had become untenable, and have chosen rather to make a defence against the *major* proposition. Descartes, although he was no atheist, seems to have led the way. Having invented some new arguments for the being of God, he was perhaps induced to disparage those that had been used before, that he might secure greater credit to his own; or, perhaps, he was offended with the Peripatetics, because they often mixed final causes with physical, in order to account for the phenomena of nature. He therefore maintained, that physical causes only should be assigned for phe-

nomena; that the philosopher has nothing to do with final causes; and that it is presumption in us to pretend to determine for what end any work of nature is formed. After the example of Descartes, some of his followers have manifested a contempt of all reasoning from final causes. Among these we may reckon Maupertuis and Buffon. But the most direct attack has been made upon this principle by Mr. Hume, who puts an argument in the mouth of an Epicurean, on which he seems to lay great stress. The argument is, that the universe is a singular effect, and therefore we can draw no conclusion from it, whether it may have been made by wisdom or not. Mr. Hume's reasoning is founded on the supposition, that our inferring design from the strongest marks of it is entirely owing to our past experience of having always found these two things conjoined. Dr. Reid has laboured to prove, that this is not the case; and he alleges, that, according to this reasoning, we can have no evidence of mind or design in any of our fellow men; and, moreover, that the man who maintains, that there is no force in the argument from final causes, must, if he will be consistent, see no evidence of the existence of any intelligent being but himself.

Aristotle, in his second book upon demonstration, has treated very fully concerning first principles, and clearly shewn, that all demonstration must be built upon truths which are evident of themselves, but cannot be demonstrated. Whilst the philosophy of Aristotle prevailed, it was held as a fixed point, that all proof must be drawn from principles already known and granted. The Peripatetic philosophers, however, adopted, as first principles, many vulgar prejudices and rash judgments. Among the ancients no opposition was made to first principles. But when the authority of the Peripatetic system terminated, and the revolution by Descartes took place, this great reformer of philosophy, cautious to avoid the snare in which Aristotle was taken, of admitting things as first principles too rashly, resolved to doubt of every thing, and to withhold his assent, unless it was forced by the clearest evidence. At length, however, he emerged from universal scepticism by the short enthymeme, "cogito ergo sum." This enthymeme consists of an antecedent proposition, *I think*, and a conclusion drawn from it, *therefore I exist*. For the truth of the antecedent proposition, Descartes trusted to the testimony of consciousness. Being conscious that he thought, he needed no other argument. Hence it appears, that we find it impossible to doubt of things of which we are conscious: the constitution of our nature forces this belief upon us irresistibly; and, therefore, Descartes is justified in assuming, as a first principle, the existence of thought, of which he was conscious. From the existence of his thought he infers his own existence; and thus he assumes another first principle, not a contingent but a necessary one, *viz.* that where thought is, there must be a thinking being or mind. Hence he proceeds to prove the existence of a supreme and infinitely perfect Being; and from the perfection of the Deity, he infers that his senses, his memory, and the other faculties which God had given him, were not fallacious. From this principle he deduced the existence of a material world, and of what we perceive by our senses. Father Malebranche agreed with Descartes, that the existence of a material world requires proof; but being dissatisfied with Descartes's argument from the perfection of the Deity, he thought that the only solid proof of it is derived from divine revelation. Mr. Norris, a great admirer of Descartes and of Malebranche, seems to have thought all the arguments offered by them and by Arnauld to be weak, and confesses that we have at best only probable evidence of the

the existence of the material world. Mr. Locke acknowledges, that the evidence we have of this point is neither intuitive nor demonstrative. At last bishop Berkeley and Collier undertook to prove, that there neither is nor can be a material world. Mr. Hume has adopted Berkeley's arguments against the existence of matter, and thinks them unanswerable. From the single principle of the existence of our own thoughts, very little, if any thing, as Dr. Reid conceives, can be deduced by just reasoning, especially if we suppose that all our other faculties may be fallacious. Accordingly we find that Mr. Hume was not the first that was led into scepticism by the want of first principles: for soon after Descartes, there arose in France a sect called *Egoists*; which see. Mr. Locke's sentiments on the subject of first principles and maxims are well known. He allows that part of our knowledge is intuitive (see KNOWLEDGE); and that this kind of knowledge is necessary to connect all the steps of a demonstration. He also maintains, that axioms, or intuitive truths, are not innate; and he observes, that self-evidence is not peculiar to those propositions, which pass under the name of axioms, and have the dignity of axioms ascribed to them; and that the particular propositions contained under a general axiom are no less self-evident than the general axiom; and that they are sooner known and understood. Nevertheless, this excellent writer is of opinion, that concerning the real existence of all other beings, besides ourselves and a first Cause, there are no maxims. Dr. Reid, on the other hand, contends, that there are maxims or first principles with regard to other existences. Mr. Locke further maintains, that no science is, or hath been, built upon maxims: whereas it cannot be disputed, that every demonstration in geometry is grounded either upon propositions formerly demonstrated, or upon self-evident principles. He also observes, that maxims are not of use to help men forward in the advancement of the sciences, or new discoveries of yet unknown truths: to which it may be replied, that Newton, as well as all other mathematicians, ground their demonstrations of mathematical propositions upon the axioms laid down by Euclid, or upon propositions which have been before demonstrated by help of those axioms. Our great astronomer, by laying down the first principles upon which he reasons, in those parts of natural philosophy which he cultivated, has given a stability to that science which it never had before, and which it will retain to the end of the world. On the subject of first principles, another writer, viz. Père Buffier, a French Jesuit, has written a treatise, entitled "Traité des premiers Veritez, et de la Source de nos Jugemens," and published in 8vo., in 1724; and afterwards in folio, as a part of his "Cours des Sciences," Paris, 1732. This ingenious writer defines first principles to be propositions so clear, that they can neither be proved nor combated by those that are more clear. The first source of first principles, which he mentions, is that intimate conviction which every man has of his own existence, and of what passes in his own mind. A second source of first principles he makes to be common sense; for an account of which, see COMMON SENSE. Father Buffier, says Dr. Reid, has the honour of being the first, as far as he knows, after Aristotle, who has given the world a just treatise upon first principles. Some late writers, particularly Dr. Oswald, Dr. Beattie, and Dr. Campbell, have been led into a way of thinking somewhat similar to that of Buffier; the two former, as Dr. Reid presumes, without any intercourse with one another, or any knowledge of what Buffier had written on the subject. See the article to which we have above referred; and Reid's Essays on the Intellectual Powers of Man, *ess. vi. chap. 7.*

Leibnitz maintained, that the principles of contradiction, and of a sufficient reason, were the foundations of all science; that the first was sufficient for the demonstration of all necessary, and the other of all contingent truths. But though it be true, that the principle of contradiction, that is, the *reductio ad absurdum*, often occurs expressly, and is oftener implied in geometry, yet by what has been said it appears, that this principle alone is not sufficient to demonstrate all the other universally received principles of that science. Far less is it true, that we are enabled by the principle of a sufficient reason, which amounts to the exclusion of pure chance out of the universe, to demonstrate all physics and morals; but additional principles, derived from experience, must be assumed.

PRINCIPLES of *Action* denote, according to the definition of Dr. Reid, every thing that incites us to act: and he distinguishes the actions of man into three general classes, viz. voluntary, involuntary, and mixed. See ACTION, in *Ethics*.

The investigation of these principles is attended with considerable difficulty, from various causes: *first*, on account of the great number of active principles that influence the actions of men; and, *secondly*, because the same action, and even the same course and train of action, may proceed from very different principles. Some admit no principle but self-love; others resolve all into the pleasures of sense, variously modified by the association of ideas; others admit disinterested benevolence with self-love; others reduce all to reason and passion; others to passion alone; nor is there less variety about the number and distribution of the passions. (See PASSION.) There are some principles of action, which require no attention, no deliberation, no will. These, for distinction's sake, Dr. Reid calls *mechanical*: another class he denominates *animal*, as they are common to man with other animals; and a third class he calls *rational*, being proper to man as a rational creature. The *mechanical* principles of action he reduces to two species, *instincts* and *habits*; see these articles. The *animal* principles of action are such as operate upon the will and intention, but do not suppose any exercise of judgment or reason; and are, most of them, to be found in some certain animals as well as in man. The first of these Dr. Reid calls *appetites*. (See APPETITE.) Another class comprehends those which he denominates *desires*; and he distinguishes them from appetites by this circumstance, that there is not an uneasy sensation proper to each, and always accompanying it; and that they are not periodical, but constant, not being sated with their objects for a time, as appetites are. The desires which he has chiefly in view are, the desire of power, the desire of esteem, and the desire of knowledge. (See DESIRE.) These principles, it is observed, have things, not persons, for their objects, and cannot, therefore, with propriety, be called either "selfish" or "social." But, besides these, there are various principles of action in man, which have persons for their immediate object, and imply, in their very nature, our being well or ill affected to some person, or, at least, to some animated being. Such principles Dr. Reid denominates *affections*, whether they dispose us to do good or hurt to others. (See AFFECTIONS of *Mind*, PASSION, and DISPOSITION.) Opinion also (see OPINION) has a considerable influence upon the animal principles of action, whilst it is an essential ingredient in those that are rational.

The *rational* principles of action in man have this name appropriated to them, because they can have no existence in beings not endowed with reason, and, in all their exertions, require, not only intention and will, but judgment and reason. The ends of human actions, considered in this connection, are two, viz. what is good for us upon the

the whole, and what appears to be our duty. The conception of what is good or ill for us upon the whole, is the offspring of reason, and can only exist in beings endued with reason: and if this conception give rise to any principle of action in man which he had not before, that principle may very properly be called a rational principle of action. As soon as we have a conception of what is good or ill for us upon the whole, we are led, by our constitution, to seek the good and avoid the ill; and this becomes not only a principle of action, but a leading or governing principle, to which all our animal principles ought to be subordinate. Accordingly, Dr. Price suggests, and Dr. Reid concurs with him in opinion, that, in intelligent beings, the desire of what is good, and aversion from what is ill, are necessarily connected with the intelligent nature; and that it is a contradiction to suppose such a being to have the notion of good without the desire of it, or the notion of ill without aversion from it. This rational principle of a regard to our good upon the whole, gives us the conception (we should rather say a stronger feeling) of a *right* and a *wrong* in human conduct; at least of a *wise* and a *foolish*. Thus it produces a kind of self-approbation, when the passions and appetites are kept in their due subjection to it, and a kind of remorse and compunction, when it yields to them. In these respects this principle is so similar to the moral principle, or conscience, and so interwoven with it, that both are commonly comprehended under the name of "reason;" and hence many of the ancient philosophers, and some among the moderns, have been led to resolve conscience, or a sense of duty, entirely into a regard to what is good for us upon the whole. The principle of a regard to our good upon the whole, does, agreeably to the opinion of the wisest men in all ages, in a man duly enlightened, lead to the practice of every virtue. Some philosophers have supposed that this principle is the only regulating principle of the human conduct; but in this view of its importance and use, it is essentially defective for the following reasons. The greater part of mankind can never attain to such extensive views of human life, and so correct a judgment of good or ill, as the right application of this principle requires. Besides, though a steady pursuit of our real good may, in an enlightened mind, produce a kind of virtue which is entitled to some degree of approbation, yet it can never produce the noblest kind of virtue, which claims our highest love and esteem. Disinterested goodness and rectitude constitute the glory of the Deity, without which he might be an object of fear or hope, but not of true devotion: and it is the image of this divine attribute in the human character, that is the glory of man. But to serve God, and be useful to mankind, without any concern about our own good and happiness, is, possibly, beyond the pitch of human nature; and yet to serve God, and be useful to man, merely to obtain good to ourselves, or to avoid ill, is servility, and not that liberal service which true devotion and real virtue require. Moreover, although one might be apt to think, that he has the best chance for happiness who has no other end of his deliberate actions but his own good; yet a little consideration may satisfy us of the contrary.

Upon the whole, we may observe, that although a regard to our good upon the whole be a rational principle in man, yet if it be supposed the only regulating principle of our conduct, it would be a more uncertain rule, it would give far less perfection to the human character, and far less happiness than when joined with another rational principle, *viz.* a regard to duty.

This leads us to observe, that the subject of law must have the conception of a general rule of conduct, which, without some degree of reason, he cannot have. He must like-

wife have a sufficient inducement to obey the law, even when his strongest animal desires draw him the contrary way. This inducement may be a sense of interest, or a sense of duty, or both concurring. These principles, being those alone which can reasonably induce a man to regulate all his actions according to a certain general rule or law, may be justly called the *rational* principles of action, since they can only exist in a being endued with reason, and since it is by them only, that man is capable either of political or of moral government. It is a consideration of great moment in our investigation of the rational principles of conduct now stated, how we learn to judge and determine, that this cause of action is right, and that another of an opposite kind is wrong. The abstract notion of moral good and evil would be of no use to direct our practice, if we had not the power of applying it to particular actions, and determining what is morally good, and what is morally evil. Some philosophers ascribe this to an original power or faculty in man, which they call "moral sense," the "moral faculty," or "conscience." (See *Moral SENSE* and *CONSCIENCE*.) Others think that our moral sentiments may be accounted for without supposing any original sense or faculty appropriated to that purpose, and in order to account for them, they adopt very different systems. Reid's *Essays on the Active Power of Man*, *Ess.* iii. See *APPROBATION*, *OBLIGATION*, *VIRTUE*, and *Moral PHILOSOPHY*.

PRINCIPLES, Innate. See *INNATE*.

PRINCIPLE, in *Physics*, or *Principle of a natural body*, is something that contributes to the essence of a body; or, of which a natural body is primarily constituted.

Aristotle defines principles to be those things which are not made and constituted of themselves, nor of other things, but all things of them: *quæ non fiunt ex se invicem, nec ex aliis, sed ex iis omnia*.

To give an idea of natural principles, consider a body in several states: a coal, *e. gr.* that was just now a piece of wood: it is evident there is something in the coal, which before existed in the wood; this, whatever it is, is a principle, and is what we call matter.

Again, there must be something joined with this matter, to make it wood rather than fire, or fire rather than wood: this is another principle, and is what we denominate form.

Matter and form, then, are universal principles of natural bodies; by the union of these they are produced or generated. The Peripatetics add a third principle; *viz. privation*; for though, say they, a thing is not made from nothing, yet it must be made from its not being that thing before. This Aristotle calls *privation*, and admits it as a third principle; or a principle of corruption. But the moderns reject it: for if privation be a principle, it is at least so in a very different sense from matter and form.

Some late philosophers admit no principles but *acid* and *alkali*. Aristotle distinguishes two sorts of natural principles, as they concur in the generation, or in the composition of bodies.

PRINCIPLES of Generation, or of a body *in fieri*, are those without which a natural generation can neither be, nor be conceived. Such are the three principles above mentioned, *matter*, *form*, and *privation*.

As to matter, or the first matter, as it is called, it is neither substance nor accident; it has no quality or property; it is nothing actually, but every thing potentially. It has so strong an appetite for form, that it is no sooner divested of one form, than it is clothed with another, and is equally susceptible of all forms successively. Form, or as it is also called, act or perfection, does not consist in the figure, size, arrangement, or motion of the parts of matter: these, in-

deed, are accidental forms, by which artificial things are formed; but every production of nature has a substantial form, which, joined to matter, makes it to be what it is. The substantial form is a kind of informing soul, which gives the thing its specific nature, and all its qualities, powers, and activity. See MATTER and FORM.

PRINCIPLES of Composition, or of a body *in facto esse*, already made, or those of which natural bodies really consist. Such, according to him, are *matter* and *form*; to which some add a third, *viz.* union to connect the two others together. But this is only necessary upon supposition of substantial forms.

Principles are usually confounded with elements; yet there is a real difference: elements are properly the first and simplest beings, arising from the first determination or assemblage of principles. They are the simplest things in which matter and form are combined. Elements and principles, therefore, differ in this, that a principle, as matter, is only a begun, not a complete nature; but an element is perfect and complete.

Some ancient philosophers distinguished between principles, *αρχαι*, and elements *στοιχεια*.

Principles, according to them, were neither composed nor produced; but the elements were complex or compounded beings. Plutarch, ap. Eller. in Mem. de l'Acad. Berlin, 1746.

It would be endless to enumerate all the opinions of philosophers concerning the elements of bodies. A late author has given us a summary of many of these opinions; and, lastly, adds his own, that fire and water are the only things which properly deserve the name of elements, or principles of natural bodies; fire being the active, and water the passive principle. According to him, water is convertible into air, and into earth, by means of fire. Hence the four, vulgarly called, elements, may be reduced to two. He endeavours to establish his doctrine on the experiments of Boyle, Hales, and Muschenbroeck. See ELEMENTS.

To this head may likewise be referred what we call *mechanical principles of bodies*, which serve to account for the mechanism or artificial structure of things, and all the varieties and differences of bodies from motion, figure, and other common affections.

These principles are differently maintained by three or four different sects of philosophers; *viz.* the ancient Epicureans, or Corpuscularians, to whom may be added the modern Gassendists, the Cartesians, and the Newtonians.

PRINCIPLES, in *Chemistry*, are the first and simplest parts of which natural bodies are compounded, and into which they are again resolvable by fire, &c.

These are more properly, as well as more commonly, called *elements*.

In each school of philosophy among the ancients, very different opinions prevailed concerning these principles; some of them admitting only one, and others more. Some contending for earth, and others for fire. Nor were the notions of the chemists of the middle ages, or about the time of Paracelsus, more clear and satisfactory. They admitted five principles of bodies, which they call mercury or spirit, phlegm or water, sulphur or oil, salt, and earth. But it has been found by later experiments, that some of these principles are more simple than others; and, therefore, Beccher attempted to reduce their number, and established only two general principles of all bodies, *viz.* water and earth; extending the term to that which is vitrifiable, and which he conceived to be the principle of the fixity, solidity, and hardness of bodies; to that which is inflammable, and

to which he ascribed the inflammability of all inflammable bodies; and to that which he called *mercurial earth*.

This theory has been farther illustrated and extended by Stahl, who shewed, that water and vitrifiable earth enter as elements into the composition of many bodies; but the other two principles of Beccher, *viz.* the mercurial earth and the inflammable earth, have not yet been exposed to our senses single and pure: though some have supposed that the existence of the latter is sufficiently ascertained (see PHLOGISTON), but that of the latter is not satisfactorily demonstrated.

That earth, water, and fire, enter into the composition of bodies as principles, has been considered as demonstrated by Beccher and Stahl: and the experiments of Boyle, Hales, Priestley, &c. sufficiently prove that air enters into the composition of many bodies as a principle. So that the chemists generally admit the four principles of Aristotle, *viz.* fire, air, water, and earth. In whatever manner bodies are decomposed, we always obtain these substances; and they are the utmost limits of chemical analysis. These are, therefore, called *primary principles*, or *elements*.

Secondary principles are those which result immediately from the union of primary principles.

Principles of the third order are those which are composed of secondary principles, &c. Thus, nitre is a compound of the acid called nitrous, and of the fixed vegetable alkali, combined and saturated together: by a first analysis of nitre, we obtain this acid and this alkali, which are, therefore, the proximate principles of nitre. But neither of these are simple substances. By a farther analysis of each of these, they may be decomposed into water, earth, and fire, or the inflammable principle: and these may be considered as primary principles; but the acid and alkali are secondary principles. The water, earth, and fire are the remote principles of the nitre. Dict. Chem. Eng. edit. art. *Principles*. See also Geoffroy's Tracts, p. 5, &c.

PRINCIPLE, *Inflammable*. See PHLOGISTON.

PRINCIPLE, *Original, principium originale*, a name given by Tachenius, and some other authors, to salt, without considering it as acid, alkali, or of any other particular kind; or any mode of existence. But many others allow this name only to water, or at least that water is, in almost all natural bodies, the most copious, the most active, and the most influencing part; yet even this is found to agree much better with some bodies than with others.

PRINCIPLES, among *Hermetic Philosophers*. According to these gentlemen, the two *universal* principles of sensible nature, are subtle and solid; which, being joined in a greater or less degree, generate all that beautiful variety of beings in the universe.

The three *natural* principles are salt, sulphur, and mercury. These principles generate the four elements; and are, as it were, secondary elements, inasmuch as they are contained in all mixed bodies. Sulphur is the first, and stands in the place of male; mercury the second, standing in the place of female; and salt the third, which copulates the others together. Dict. Hermet.

PRINCIPLE is also applied to the foundations of arts and sciences. In this sense we say, principles are not to be proved; they must be common notions.

There is no disputing against a man that denies principles: the worst reasoning is that which includes a *petitio principii*; *i. e.* which supposes a principle that ought to be proved.

PRINCIPLE is also applied by extension to the first rules or maxims of an art.

In this sense we say a man is ignorant of the principles of

of geometry ; meaning he has not learnt Euclid's Elements. The principles of most arts and sciences are found in this Dictionary under their respective heads.

PRING, in *Geography*, a town on the W. coast of Sumatra. S. lat. $4^{\circ} 12'$. E. long. $102^{\circ} 28'$.

PRINGLE, Sir JOHN, in *Biography*, a distinguished physician, was born at Stichel-house, in the county of Roxburgh, in April 1707. He was the youngest son of sir John Pringle, bart. of Stichel, and of Magdalen Elliot, sister of sir Gilbert Elliot, two families of ancient and honourable repute in the south of Scotland, and distinguished for their public and private virtues. He received his grammatical education at home, under a private tutor, and afterwards went to St. Andrew's, where a near relative of his father's, Mr. Francis Pringle, was professor of Greek. Having determined to make medicine his profession, he went to Edinburgh, in October 1727, which, however, he quitted, after a residence of one year, with the view of profiting from the instructions of the celebrated Boerhaave, who was then advanced in years. While he studied at Leyden, he contracted an intimate friendship with Van Swieten, who subsequently obtained the highest reputation at Vienna and throughout Europe. He graduated at that university in July 1730, publishing an inaugural dissertation, "de Marcore Senili," and then repaired to Edinburgh, where he settled as a physician, and gained the esteem of the magistrates and professors by his abilities and good conduct. His knowledge of ethics obtained for him, in March 1734, the appointment of joint professor of moral philosophy with Mr. Scott, and sole professor after the death of the latter ; and he continued in the discharge of the duties of this office, and in the practice of physic in Edinburgh, until 1742, when he was appointed physician to the earl of Stair, who then commanded the British army ; and in August, in the same year, he was nominated physician to the military hospital in Flanders. He did not, however, resign his professorship on this occasion, as the university permitted him to appoint a substitute in his absence as long as he requested it.

From this time Dr. Pringle's career began to open in a new and successful walk ; his reputation as an army-physician not only obtained for him a high professional rank, but also the patronage of the great. On the retirement of his noble friend, the earl of Stair, after the battle of Dettingen, he offered to resign with him, but was not permitted. He attended the army in Flanders through the campaign of 1744, and so strongly recommended himself to the duke of Cumberland, by the able and assiduous discharge of his duties, that in the spring following, he received a commission from his royal highness, appointing him physician-general to his majesty's forces in the Low Countries ; and on the next day a second, constituting him physician to the royal hospitals in the same countries. In consequence of these promotions, he immediately resigned his professorship. In 1745 he was with the army in Flanders, but was recalled to attend the forces about to be sent against the rebels in Scotland. In the beginning of 1746 he accompanied the duke of Cumberland in this expedition, and remained with the forces after the battle of Culloden, till their return to England in August. In 1747 and 1748, he again attended the army abroad, and in the autumn of the latter year, on the conclusion of the treaty of Aix-la-Chapelle, he embarked with the forces for England. In 1749 he was appointed physician to his royal highness the duke of Cumberland, and took up his residence in London, where the high reputation and distinguished connections

which he had acquired, afforded every reasonable expectation of success as a physician. He attended the camps in England, however, during three seasons, in the war which commenced in 1755, and finally quitted the service of the army in 1758.

Dr. Pringle had been elected a fellow of the Royal Society in 1745, and on settling in London, he became a very active contributor to its Transactions. His first publication was a letter to Dr. Mead, entitled "Observations on the Gaol or Hospital Fever," 1750, which appears to have been brought forward in consequence of the alarm excited by the fever which appeared at the Old Bailey. This little work passed through two editions, and was afterwards inserted in his great work on the diseases of the army, of which it constitutes the seventh chapter of the third part. In the same year he began to communicate to the Royal Society his "Experiments on Septic and Antiseptic Substances," in a series of papers, which were afterwards subjoined, by way of appendix, to the work just mentioned, and which procured him the Copleian medal. For several successive years, he added many papers to the Transactions, especially an account of the contagious fever at Newgate, a case of fragility of the bone, an account of several earthquakes, and of a fiery meteor, &c.

In the year 1752, the first edition of his "Observations on the Diseases of the Army" was given to the public, and it was reprinted in the following year. The third edition was considerably improved by the further experience, which his attendance on the English camps for three years enabled him to obtain ; and many subsequent editions have been called for, as well as translations into the French, German, and Italian languages. This work, indeed, the result of acute and diligent observation and extensive experience, was calculated to become a standard of reference, not only to the medical officers, but to the leaders of armies, to whom the preservation of the health of their troops is of the utmost importance ; it necessarily procured extensive fame for its author, whom it placed high among the benefactors to medical science, and to mankind ; and it remains at present a classical work. It contributed materially, indeed, to the introduction of those principles, by which the salubrity of crowded population has been subsequently augmented, and the sources of many malignant diseases have been nearly destroyed, under the farther directions of a Howard, a Lind, and a Haygarth, and which were so signally illustrated by the example of captain Cook. In a word, its utility was equal to its reputation.

It was not until he had quitted the army in 1758, that Dr. Pringle was admitted a licentiate of the College of Physicians, probably from the uncertainty of his residence. Soon afterwards, however, his medical character, as well as his reputation as a philosopher, attained a high pitch, and both honours and emoluments flowed in upon him. After the accession of George III., he was appointed physician to the queen's household in 1761, and physician extraordinary to her majesty in 1763 ; and in the same year he was elected a fellow of the College of Physicians. In 1764, on the death of Dr. Wollaston, he was made physician in ordinary to the queen, and two years afterwards was raised to the dignity of a baronet. In 1768 he was nominated physician to her royal highness the princess dowager of Wales ; and in 1774 he received the appointment of physician extraordinary to the king.

Among the numerous literary honours which sir John Pringle received from the various academies of science in Europe, the highest was conferred upon him in the year

1770, when, on the decease of James West, esquire, he was elected president of the Royal Society. Though now in the sixty-sixth year of his age, he spared no exertion to fulfil the duties of his new office, and endeavoured to cherish, by all the means in his power, the scientific ardour which was then rising in Europe, and especially in this country. It had been customary, since the time of Mr. Martin Folkes, for the president to make a speech on the annual delivery of sir Godfrey Copley's medal, which was usually short, and inserted in the minute-book. But the first speech which sir John Pringle delivered, after being called to the chair, being more elaborate and extended, the publication of it was requested; and for the five subsequent years he continued the practice of giving a learned discourse on these occasions, entering at large into the previous history of that part of science, to which the paper (which was complimented by the award of the medal) related. In these six discourses, which treated of the subjects of fictitious gases, of the torpedo, of the attraction of mountains, of captain Cook's mode of preserving the health of his crew, of the structure and composition of the specula of telescopes, and of the explosive powers of gunpowder, sir John displayed an extent and variety of knowledge highly creditable to his reputation; for they abound not only with proofs of his information on the subjects of medicine, natural history, and philosophy, but with a fund of ancient and modern learning. Had he continued to preside in the chair of the Royal Society, he would no doubt have found other occasions of displaying his acquaintance with the history of science. But finding his health declining with his years, he resigned his office in 1778, in opposition to the solicitations of many distinguished members of the society, and was succeeded by the present distinguished president, sir Joseph, then Mr. Banks. Still, however, he maintained his zeal for science and his country; for few learned foreigners visited this country without paying him their respects.

Finding his health declining, sir John Pringle took a journey to Scotland in 1780, and spent the summer there, principally in Edinburgh. Here he met with so kind a reception, that he purchased a house, with the intention of returning in the following spring; and having disposed of the greater part of his library, and of his house in Pall-Mall, on his return to London, he put this intention in execution in April 1781. But he was disappointed in his expectations of health and satisfaction from this change. Edinburgh was not now to him what it had been in early life: it was too late to form new habits of friendship; and the few old friends who remained, were not able to meet with the same ardour as formerly. The air, also, he found too sharp for his weakened frame. He determined, therefore, once more to return to London, where he arrived in the beginning of September. Before he quitted Edinburgh, he presented to the college of physicians of that city ten volumes, folio, in manuscript, of "Medical and Physical Observations," with the restriction that they should not be published, and never lent out of the library on any pretence whatever.

On his arrival in London, sir John found his spirits somewhat revived by the society of his friends. His Sunday evening conversations were again honoured with the attendance of many respectable men; and he enjoyed the pleasure of spending a couple of hours, on the other nights of the week, with his friends, at a society, which had been long established, and had met for some time past at Mr. Watson's, a grocer in the Strand. His constant attendance

upon this society constituted, to the last, his principal amusement. During this winter, however, his strength declined rapidly; and on Monday evening, January 14, 1782, he was seized with a fit, while with the society at Watson's, which terminated his life on the Friday following, at the age of 75. The account of his death was every where received in a manner which evinced the high sense that was entertained of his merit.

Sir John Pringle left no family. He married, in 1752, the daughter of Dr. Oliver, an eminent physician at Bath, who died a short time afterwards. He had acquired by his long practice a handsome fortune, which he disposed of with great prudence and propriety. His mind was characterised by a great love of science, founded on the basis of fact and experiment, and by an aversion to hypothetical speculation. He had not much taste for poetry, and had little relish even for our immortal Shakspeare; but to the sister art, music, he had a strong attachment, and was even a performer on the violoncello, at a weekly concert, given by a society of gentlemen at Edinburgh. He paid great attention to the French language, and studied his own with great assiduity. He took uncommon pains, indeed, to perfect the style of his own compositions; and it cannot be denied that he excels in perspicuity, correctness, and propriety of expression. His leading principle of action through life was a rigid integrity, according to the unanimous testimony of all his acquaintance; and he was equally distinguished for his sobriety, having never, as he informed Mr. Boswell, been intoxicated in his life. He was ardent and steady in his friendships, and was active in his civilities and good offices to all strangers and foreigners, who came to him well recommended; but he had at times a dryness and reserve in his behaviour, which had the appearance of coldness, especially when he was not perfectly pleased with the persons who were introduced to him. He was, in fact, above assuming the professions, without the reality of respect. His sense of integrity and dignity would not permit him to adopt that false and superficial politeness, which treats all men alike, however different in point of real estimation and merit. His connections and acquaintance were exceedingly numerous, including men of all professions, as well as many persons of rank and consequence; and he corresponded with many eminent philosophers and physicians, whom he had never seen. He was interred in St. James's church, and a monument was erected to his memory, by his nephew and heir, sir James Pringle, in Westminster Abbey. See Dr. Kippis's *Life of Pringle*, prefixed to the six Discourses.

PRINKIPOS, in *Geography*, the most considerable and the most fertile of those denominated "Prince's" islands, in the sea of Marmora. It appears, says Olivier, to be entirely volcanic, and formed of quartz, granites, &c. &c. altered or decomposed. The land is elevated, uneven, and hilly. It is dry and arid on the hills, red and tolerably fertile in the bottoms, and especially to the south of the town. The natural productions are the Aleppo pine, the oxycedrus or brown-berried juniper, the broad-leaved phillyrea, the arbutus, the prickly pimpinella, the pale-flowered French lavender, the broom, the acute-leaved asparagus, the Cretan cistus or rock-rose, the turpentine tree, a species of favory, the mallow-leaved bindweed, &c. &c. The wild olive-tree is found in abundance on all the hills. The culture of Prinkipos consists in a few fields sown with wheat, barley, chick-peas, kidney-beans, broad beans, &c. The vine is not abundant; it yields two or three sorts of very good grapes, from which wine is seldom made. The inhabitants prefer carrying the grapes to the markets of Constantinople, and there

there selling them. Near the town are several gardens, in which are cultivated, with no great skill, a few kitchen-garden plants and fruit-trees, among which is distinguished a species of fig-tree, with fruit greenish without and red within, and of an excellent quality.

This island has several times served as a prison or place of exile to the Greek princes. Irene, an Athenian woman, who had been raised to the throne from an obscure station by the charms of her mind and the graces of her person, and who, setting no bounds to her ambition, stained herself by various crimes after the death of Leon Porphyrogenitus, her husband, was dethroned by Nicephorus, one of her confidants, and banished to a monastery of this island, which she herself had caused to be erected. In this island, quails that are fat, and well tasted, are abundant; besides some other birds of passage, such as turtles, rollers, loriots, thrushes, &c. and in particular falcons and sparrow-hawks. Hares are scarce in this island, and it has no rabbits. Oysters, muscles, and several fishes, such as mackarel, bonito, turbot, and the bearded mullet, are plentiful. There are two monasteries in Prinkipos, situated on the most elevated and solitary places of the island. N. lat. $40^{\circ} 51'$. E. long. $28^{\circ} 56'$.

PRINOS, in *Botany*, an ancient generic name used by Theophrastus and Dioscorides; probably derived from $\pi\rho\iota\nu\alpha$, *to saw*, and applied by Linnæus to this genus on account of the strong serratures of the leaves in some of the species.—Linn. Gen. 174. Schreb. 231. Willd. Sp. Pl. v. 2. 225. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 312. Pursh. 213. Michaux Boreal-Amer. v. 2. 236. Juss. 379. Lamarck Illustr. t. 255. Class and order, *Hexandria Monogynia*. Nat. Ord. *Dumosa*, Linn. *Rhamni*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, six-cleft half way down, flat, very small, permanent. *Cor.* of one petal, wheel-shaped; tube none; limb flat, deeply cloven into six ovate segments. *Stam.* Filaments six, awl-shaped, erect, shorter than the corolla; anthers oblong, obtuse. *Pist.* Germen superior, ovate, terminating in a style shorter than the stamens; stigma obtuse. *Peric.* a roundish berry, six-celled, much larger than the calyx. *Seeds* solitary, bony, obtuse, convex on one side, angular on the other.

Obs. The chief difference between this and *Ilex* consists in its being hexandrous; but the parts of fructification, according to Jussieu, agree occasionally with that genus in number. *Prinos* is sometimes dioecious.

Eff. Ch. Calyx inferior, six-cleft. Corolla of one petal, wheel-shaped, from three to seven-cleft. Berry of six seeds.

1. *P. verticillatus*. Deciduous Winter-berry, or Service-Bush. Linn. Sp. Pl. 471. Smith Insects of Georgia, t. 86. (*P. Gronovii*; Michaux Boreal-Amer. v. 2. 236. *Aquifolium foliis deciduis*; Duham. Arb. v. 1. 62. t. 23.)—Leaves obovate-lanceolate, pointed, doubly serrated, with downy veins underneath.—Found in moist woods, or on the banks of ditches all the way from Canada to Virginia. It flowers in June and July. *Stem* shrubby, eight or ten feet high, branched all the way up. *Leaves* alternate, on short stalks, about three inches long, and one broad, acutely pointed, paler beneath. *Flowers* solitary, or two or three together at the base of the leaf-stalks, small, white. *Berries* red or crimson, at length purple, larger than those of the Holly.

Mr. Abbot mentions that the fruit of this shrub is said to have been useful in curing the diarrhœa. Duroi says that *P. verticillatus* has sometimes a seven and even eight-cleft corolla, with a like number of stamens.

2. *P. montanus*. Mountain Winter-berry. Willd. n. 2.

Swartz. Prodr. 58. Ind. Occ. v. 1. 622.—Leaves ovate, serrated, shining on both sides.—Native of Jamaica, in thickets on the loftiest mountains, flowering in August, and bearing fruit in December. The *trunk* of this tree is upwards of twenty feet high, with a smooth, brown bark. *Branches* much divided, nearly upright, round, smooth. *Leaves* alternate, on short stalks, pointed at both ends, when dry of a dark, livid colour. *Flowers* two or three together, on separate stalks, small, white. *Berries* blackish.

3. *P. dioicus*. Dioecious Winter-berry. Willd. n. 3. Vahl. Eclog. v. 2. 25. t. 14.—Leaves oblong-ovate, somewhat serrated, smooth, coriaceous. Flower-stalks axillary, generally single-flowered. Flowers dioecious, tetrandrous.—Found by Mr. Ryan, in the island of Montserrat. *Stem* branched. *Branches* half an inch thick, with a grey, dotted bark, the younger ones alternate, dusky purple. *Leaves* alternate, slightly serrated, entire at the base, smooth on both sides, paler and slightly dotted beneath. *Flowers* generally three together in the males, always solitary in the females.

4. *P. nitidus*. Shining Winter-berry. Willd. n. 4. Vahl. Eclog. v. 2. 26.—Leaves oblong-ovate, serrated, shining, membranaceous. Flower-stalks axillary, each with a single, tetrandrous flower.—Native of Montserrat; found there by Mr. Ryan. *Branches* angular, smooth, compressed, dusky purple. *Leaves* alternate, on short stalks, very shining, commonly contracted towards the base. *Flowers* solitary, rather large. *Berry* ovate, or roundish, the size of black pepper.

5. *P. glaber*. Smooth or Evergreen Winter-berry, or Gall-berry. Linn. Sp. Pl. 471. Sm. Insects of Georgia, t. 35.—Leaves lanceolate, rather obtuse, smooth, serrated at the top.—Native of Canada in sandy shady woods, introduced at Kew in 1759, where it flowers in July and August. The *stems* of this plant are much branched. *Branches* alternate, smooth, brown, the younger ones green. *Leaves* alternate, stalked, lightish green, with a yellow rib, pale and downy beneath, evergreen, resembling those of Sweet Gall. *Flowers* small, on axillary stalks, generally three together. *Berries* round, purplish or black, solitary, on long stalks, called in Jersey Ink-berries. Obs. The synonyms from Miller and Catesby, quoted by Linnæus for this species, belong to *Ilex vomitoria*.

6. *P. sideroxyloides*. Round-leaved Winter-berry. Willd. n. 7. Swartz. Prodr. 58. Ind. Occ. v. 1. 624.—Leaves roundish, quite entire.—Native of the Caribbee Islands, St. Christopher's and Montserrat. The *wood* of this tree is durable. *Branches* divided, round, ash-coloured. *Leaves* alternate, stalked, smooth on both sides, paler beneath, coriaceous. *Flowers* on single, axillary stalks, small, whitish. *Berry* roundish, crowned with the stigma pressed close.

Mr. Pursh, in his North American Flora, tells us it is plain from specimens in the herbarium of A. B. Lambert, esq. V.P.L.S., that *Prinos lucidus*, Willd. n. 6. Ait. Hort. Kew. n. 3, is *Ilex canadensis* of Michaux Boreal-Amer. v. 2. 229. t. 49.

7. *P. ambiguus*. Doubtful Winter-berry. Michaux Boreal-Amer. v. 2. 236. Pursh v. 1. 220. (*Cassine caroliniana*; Walt. Carolin. 242.)—Leaves oval, pointed at both ends, serrated, deciduous.—Found in sandy wet woods, on the borders of swamps from New Jersey to Carolina, flowering in July and August. This is a dioecious species, whose male flowers are crowded together in clusters at the bottom of the smaller branches; female ones solitary: they

they are pentandrous and white. *Berries* larger than in *P. verticillatus*.

The three following new species are adopted from Pursh's *Flora*, v. 1. 220, 221.

“*P. laevigatus*. Leaves deciduous, lanceolate, closely serrated, pointed at each end; smooth and shining above; slightly downy at the nerves beneath. Flowers six-cleft; males scattered; females axillary, solitary, nearly sessile.—On the Alleghany mountains: from New York to Virginia; flowering in July. *Berries* large, dark red.

“*P. lanceolatus*. Leaves deciduous, lanceolate, very delicately and remotely serrated, acute at each end, smooth on both sides. Male flowers aggregate, triandrous; females scattered, two together, stalked, six-cleft. In the lower tracts of Carolina and Georgia, flowering in June. *Berries* small, scarlet.

“*P. coriaceus*. Leaves evergreen, wedge-shaped, lanceolate, coriaceous, smooth, shining, entire. Corymbs axillary, very short, sessile, many-flowered. Flowers six-cleft.—In sandy woods, near the banks of rivers in Georgia, flowering in June and July. A handsome tall shrub, of the appearance of *Ilex Dahoon*.

Mr. Pursh mentions two varieties of this species, the first of which with “Leaves obovato-lanceolate, pointed,” he calls *latifolia*; the second with “Leaves lanceolate, acute,” he calls *angustifolia*.

PRINOS, in *Gardening*, contains plants of the deciduous and evergreen kind, of which the species cultivated are, the deciduous winter berry (*P. verticillata*); and the evergreen winter berry (*P. glabra*).

Method of Culture.—In these plants it is effected by seeds, sown soon after they are ripe, or early in the spring, upon a bed of light earth, covering them half an inch with the same sort of earth; but the seeds which are put into the ground in the autumn will many of them come up the following spring, while those which are kept longer out of the ground, often remain a whole year before the plants appear, as in holly, hawthorn, and some others. The seeds may be forwarded in their growth by means of a hot-bed. When the plants have sufficient strength they should be planted out, some in nursery-rows and others in pots. They delight in a moist soil and shady situation. In hot land they make little progress, and rarely produce fruit.

They are ornamental, and afford variety in the pleasure-grounds, and among potted plants.

PRINTER, TYPOGRAPHUS, a person who composes, and takes impressions, from moveable characters, ranged in order, or from plates engraven, by means of ink and a press.

Laurentius, called Coster, Geinsfleisch, Faust, Guttenberg, Schoeffer, Mentel, and Eggelstein, were the first printers. The first that practised it in England was Fred. Corfellis, brought over from Haerlem, under king Hen. VI.; in France, Uldric Gering, Martin Crantz, and Michael Friburgher; at Augsburg, John Bemler; at Rome, Conrad Sweynheim, and Arnold Pannartz, Germans; at Venice, the two brothers John and Vindelin of Spire, Nicholas Jenfon, and John de Cologn; at Florence, Bernard Cennini; at Naples, Sixtus Rufinger.

The great printers were Aldus of Venice, and his son, Paulus Manutius; the two Badii; William and Frederic Morel; Oporin; Frobenius; Rob. Hen. and Charles Stephens; Gryphius, Turnebus, Torres, Commelin, Plantin, Raphelengius, Vascosan, Beau, Crispin, and the two Elzevirs.

The learned printers were the Manutii, Amerbach, and Froben, of Basil, the Stephenses, the Badii, Turnebus, Wechel, Morel, Junta, &c.

Plantin had the title of *arch-printer*, *architypographus*, given him by the king of Spain, in consideration of his printing the Polyglot of Antwerp.

The names, characters, and eulogies of all the famous printers are found in part ii. of the first tome of the “*Jugemens de Scavans*.”

The printers, since the establishment of that art, are esteemed a part of the company of stationers and booksellers; before that establishment, the company consisted only of booksellers, binders, writers, illuminers, and parchment-makers. The parchment-makers prepared the skins, and made the parchment or vellum; which were then almost the only matters on which books were written. The writers, or copyists, wrote and transcribed books after copies given them by the booksellers. The binders were charged with the binding of those days, which was very coarse, only consisting of two slight boards covered with some paltry leather. The illuminers painted in miniature, and gilt initial letters, head-pieces, tail-pieces, and other compartments. Lastly, the stationers, or booksellers, set the writers to work, and sold their copies in shops, and other places, on the days allowed them by the statutes to expose the same.

PRINTING, TYPOGRAPHIA, the art of taking impressions with ink, from characters and figures, moveable or immovable, upon paper, vellum, or the like matter.

There are two kinds of printing; the one for books, the other from copper-plates, for pictures. The first called *common press printing*, the second *rolling press printing*.

The prime difference between the two consists in this, that the characters of the former are cast in relief, and those of the latter are engraven in creux.

The art of printing is a modern invention: it is, indeed, of a very ancient standing among the Chinese; but then their printing is very different from our's. It must be owned, the European printing, in its original, was much the same with the Chinese; yet, as there was at that time no commerce or correspondence between Europe and China, the passage into the East by the Cape of Good Hope being as yet undiscovered by the Portuguese, there is no room to charge the Europeans with borrowing their art from the Chinese: but each must be owned to have fallen on the same thing, though at very different times. Father Couplet assures us, that printing has been in use in China from the year 930. Father le Compte speaks more largely; saying, that it has been there from almost all ages: he adds, that there is this difference between their's and our's, that whereas we have but a very small number of letters in our alphabets, and by the various arrangement of these, are able to form infinite volumes; we have the advantage, by making our characters moveable, to print the largest works with an inconsiderable quantity of letter; those that served for the first sheets, serving over again for the succeeding ones: the Chinese, on the contrary, by reason of the prodigious number of their letters, are precluded this resource; and find it more easy and less expensive to cut all their letters on wooden blocks; and thus to make as many blocks as there are pages in a book; and these of no farther use but for that single work. Their method of printing see hereafter.

PRINTING, *Origin of*.—Who the first inventors of the *European* printing were, in what city, and what year, it was at first set on foot, is a famous problem long disputed among the learned. In effect, as the Grecian cities contended for the birth of Homer, so do the German cities for that of printing.

Mentz, Haerlem, and Strasburgh, are the warmest on this point of honour: Italy also would have entered the lists;

lifts; but the suffrages being at first divided between the first three pretenders, they are left in possession of the question, which, in reality, is not yet justly decided; though it must be owned, Mentz has always had the majority of voices.

We shall not here enter into a nice disquisition of the merits of the cause, but only propose the pretensions of each. John Mentel of Strasburgh, John Guttenberg and John Faust of Mentz, and L. John Colter of Haerlem, are the persons to whom this honour is severally ascribed by their respective countrymen; and they have all their advocates among the learned. Mentel, a physician of Paris, enters the lists in behalf of his namesake of Strasburgh; and contends that it was he who first invented printing in the year 1440, and that, in consideration of it, the emperor Frederic III. gave him a coat of arms corresponding to it, in the year 1466. He adds, that Guttenberg, whom he had taken in as a partner, or associate, carried it to Mentz, where he took in Faust a partner. John Gensfleisch, a native of Mentz, who was his servant, communicated the art to J. Guttenberg, whom Mentel had employed in making some of his tools; and becoming thus possessed of the art, they removed and settled at Mentz, where it was perfected by the assistance of John Faust. But this account depends on a Strasburgh chronicle of very doubtful authority, and is contradicted by the chronicle of Cologne, Trithemius, and Wimpeling. The last-mentioned writer expressly says, that the art of printing was invented, incompletely, at Strasburgh, by Guttenberg, and perfected at Mentz. Here Mentel acquired it from Guttenberg and Faust, and returning to Strasburgh about the year 1455, practised it in connection with Eggelstein.

The Haerlemers, with Boxhornius, Scriverius, &c. refer the first invention to Laurens Janz Colter, or Laurence John Colter, (called Colter on account of the public office distinguished by this appellation, which he sustained at Haerlem, and which was hereditary in his family,) of Haerlem, in the year 1430, adding, that his associate Guttenberg stole away his tools while he was at church, and carried them to Mentz, where he set up for the first inventor; though others attribute this theft, &c. to his partner Faust. And others, again, with greater probability, ascribe it to John Gensfleisch senior, one of his servants, in the year 1441: and with these types, &c. of Laurence, two small works were printed at Mentz in 1442. The principal evidence in favour of Haerlem, is Cornelius, who had been a servant of Laurence, and afterwards a book-binder in that city, on whose authority Adrian Junius, M. D. founds his account, which appears to have been drawn up between the years 1562 and 1575, and published at Leyden in 1588. The learned Meerman, in his "Origines Typographicæ," 1765, has amply vindicated and confirmed the account which Junius gives of the fact; though he disputes and sufficiently invalidates what this writer says, as to the types which were used by Colter, at Haerlem. These, he shews, were neither cut nor fusible metal types, but separate wooden types.

Munster, Polydore Virgil, Pasquier, &c. will have Guttenberg, or Guttemburg, to have really been the inventor of printing: and add, that he took in Faust and Schoeffer for associates.

Naude, in his "Mascurat," espouses the cause of Faust, or Faustus; and will have him to be the first printer in Europe, and that he took in Guttenberg for a partner. His reason for putting Faust in possession of this privilege is, that the first books that were printed appear to have

been all of his impression. To this purpose it is alleged, that it is more than probable, if Guttenberg or Colter had had a greater or an equal share in the invention, they would not have allowed him to attribute the whole to himself and his son-in-law Schoeffer, as he has done, without ever offering to do the like, or in the least contradicting him, and asserting their own right.

The true state of the case seems to be this, that metal types were first invented at Mentz; of these there were two sorts, viz. those that were cut, and those that were cast in matrices. The invention of the former has been ascribed by some writers to Faust, but without sufficient authority; the real inventor being John Gensfleisch senior, who had brought the art of printing with wooden types from Haerlem to Mentz, with whom John Gensfleisch junior, called Guttenberg, might probably have concurred. The era of this invention must be about the year 1442 or 1443; for John Gensfleisch senior came to Mentz in 1441, and the Latin bible, with metal types, was printed in 1450, which could not require less than seven or eight years.

The latter were invented by Peter Schoeffer, the servant and son-in-law of Faust, who settled at Mentz in the year 1449 or 1450, and having acquired under the two Gensfleischs the art of cutting types, remedied the inconvenience of this method by contriving to cast them, which must have been practised before the year 1459. The partnership that subsisted between Gensfleisch and Faust, and the relation between Schoeffer and Faust, have probably given occasion for ascribing to him the merit of the invention of printing with metal types, in which, from the connections of this kind, he probably might have had some concern.

The editions above referred to in Naude's account are,
 1. The "Codex Psalmodum," printed in 1457, which is the most ancient book known to be printed with a date or inscription, and is lodged in the emperor's library at Vienna.
 2. The "Rationale Divinorum Officiorum" of William Durand, printed at Mentz in 1459, in folio. This "Rationale" is in the earl of Pembroke's library. Malinkrot has erroneously supposed this to be the first printed book.
 3. The "Catholicon Januensis," dated in 1460, and now in the king's library. Faust's name, indeed, is not to this; but it is perfectly like the following ones where it is. It is said that the first printers did not subjoin their names and inscriptions at the end of their books till the year 1457: and this they continued to do till Faust either died or left off business.
 4. The Latin Bible of 1462, being the second edition of it, now in the French king's library.
 5. "Tully's Offices," in quarto (the rest being all folios), in the year 1465, and 1466, for there are copies in the Bodleian, and the library of Corpus Christi college, Oxon, of both these dates. Some eminent writers have asserted that this is the first printed book.
 6. Other bibles of 1471.
 7. "St. Augustine Civitate Dei," 1473.
 8. "Mercurius Trismegistus de Potestate & Sapientia Dei," in 1503.
 9. "Titus Livius," in 1518, &c.

Add to this, that at the end of Livy is a privilege granted by the emperor Maximilian to Schoeffer, grandson of Faust, for the sole power of printing that author for ten years; and for six years, to all the other books he should print thereafter; in consideration of Faust's having invented the art of printing. This privilege is dated 1518, and signed Jac. Spiegel.

Erasmus, however, in the epistle after that privilege, does not positively aver the fact; he only observes, that the first, or the chief inventor of that art, is held to be J.

Fault. In the advertifement to the faid book, Nic. Carbachius fpeaks to the fame effect as to the privilege, and Erafmus.

As to Guttenberg, Mentel, and Caftor, Naude obferves, the perfon is not yet born that can fay he has ever feen books printed by any of them, before or as early as thofe of Fault. All that is urged on their behalf, is only founded on reports, conjectures, probabilities, forged authorities, and the jealousies of cities againft one another.

Yet Salmuth, in his additions to Pancirollus, cites a public act, by which it appears that Fault, after having invented printing, and fufained it a long time on his own footing; at length took in Guttenburg as partner, to contribute to the expence; which was very great, by reafon the firft books were moft of them printed on vellum, or at leaft on parchment, and after the Chinefe way.

But the caufe is not thus decided: the advocates for Cofter urge divers things, which feem to put him in the place here affigned to Fault. Mr. Ellis, in the Philofophical Tranfactions, fathers books on him prior to any of thofe above referred to Fault, and even fome as early as 1430 and 1432. It is certain, the Haerlemers fhew printed books of that date, which agreeing fo well with the account given by Theod. Scriverius, and others, leaves Mr. Ellis little room to doubt, whether the honour of the invention be his or the other's due. All that belongs to Fault, according to this writer, is the honour of eftablifhing the art in greater luftre and perfection at another place many years after.

But the difficulty lies, either in fhewing why the practice fhould be at a ftand from 1432, to the reviving of it at Mentz by Fault and Schoeffer in 1465, or elfe in giving fome account of the condition and progrefs of this invention during that interval.

Now, Boxhornius, Scriverius, and other authors, exprefly affirm, that fo large a work as the "De Spiegel, Speculum Salutis" of Cofter, fhewn at Haerlem for the firft printed book, could never be his firft effay: he muft have had the art in its rougher rudiments before, and have made many trials on lefs works: no doubt his firft attempts were on loofe fheets, which we may fuppofe were eafily loft. In effect, it muft be allowed no inconfiderable argument in Cofter's behalf, that the rudeft and moft artlefs performances feem to be his. Mr. Ellis mentions fome things of this kind without date, which he had feen in the king's library at St. James's, in that of Bennet college and the Bodleian at Oxford, with all the marks of the utmoft fimplicity, and which might fairly bid for firft effays. There is fomething fo awkward and coarfe in them, that any body almoft might have done them; mere nature being fufficient, without any art or experience at all. The ink was only common writing ink, unartfully fpread upon wooden blocks, very clumsily cut, &c.

By this time we have traced up the art to fuch a ftate, that it may, perhaps, fcarcely feem worth the contefting who it was invented it; and no doubt printing, as it now ftands, owes more to the genius and addrefs of fome of the later improvers than it did to its firft author.

The fame confideration may make us more eafy under our prefent ignorance of the inventors of moft other arts; many of which had fuch fimple unmeaning originals, that it might perhaps be no mighty credit to be eftemed the authors of inventions not lefs artful and ingenious.

We fhall conclude this account of the origin of printing with an abridgment of the history of it, given by the late Mr. Bowyer. This writer obferves, that the honour of having given rife to this art has been claimed by the cities

of Haerlem, Mentz, and Strafburgh. To each of thefe cities it may be afcribed in a qualified fenfe, as they made improvements upon one another. But the real inventor of printing was Laurentius, of Haerlem; who proceeded, however, no farther than to feparate wooden types. His firft effay was about the year 1430; and he died about 1440, after having printed the "Horarium," the "Speculum Belgicum," and two different editions of Donatus. Some of Laurentius's types were ftolen from him by one of his fervants, John Gensfleisch, feniour, who became the firft printer in Mentz, and publifhed, in 1442, "Alexandri Galii Doctrinale," and "Petri-Hifpani Tractatus." Thefe works were executed with wooden types, cut after the model of thofe which he had ftolen. In 1443, Gensfleisch feniour entered into partnership with Fault (who fupplied money), Meidenbachius, and others; and in 1444 they were joined by John Gensfleisch junior, who was diftinguifhed by the name of Guttenberg. Guttenberg, by the affiftance of his brother, Gensfleisch the elder, firft invented cut metal types, with which was printed the earlieft edition of the bible. This edition appeared in 1450, and the completing of it took up feven or eight years. Guttenberg ufed none but either wooden or cut metal types. The carrying of the art to perfection was owing to Peter Schoeffer, the fervant and fon-in-law of Fault, who invented the mode of cafting the types in matrices; and who was probably the firft engraver on copper-plates. The firft book printed with the improved types was "Durandi Rationale," in 1459. More copies of the earlieft books were printed on vellum than paper. This method, however, was foon changed; and paper was introduced for the greateft part of the impreffions, a few only being printed on vellum, for curiofities, and for the purpofe of being illuminated.

With regard to the claim of Strafburgh, it appears that Guttenberg had endeavoured to introduce printing into that city before he joined his brother at Mentz; but without fuccefs. The firft actual printers at Strafburgh were Mentelius and Egleftenius; and there is no certain proof of a fingle book having been printed there till after 1462. The difperfon of the Mentz printers, in that year, occafioned the art to fpread rapidly through Europe; and in 1490 it reached even to Conftantinople. Thofe who wifh to fee this fubject farther difcuffed, and to find the authorities on which this abftract of the rife of printing is founded, may confult Meerman's "Origines Typographicæ," quarto, 1765, and Bowyer's "Origin of Printing," edit. 2.

PRINTING, *Progreff of.* The firft printers, then, whoever they were, made their firft effays on wooden blocks, or forms, after the Chinefe manner.

It is not improbable, fays Mr. Bagford, they might take the hint from ancient medals and feals. To this purpofe, it is obferved, that the arts and fciences, efpecially ftatuary and fculpture, were arrived at fo great perfection among the Romans, at the time when that empire was in its greateft glory, that it is much to be wondered at that the art of printing was not found out among them; an art fo nearly allied to that of the cutting of feals and the dies of medals.

The making of thefe dies, and the ftamping of their coins with them, was, in reality, no other than printing on metal; and their impreffing their feals, cut in cornelians, agates, &c. on wax, was another fpecies of printing on this fubftance. And finally, a third fort of printing among them, was the impreffing the name of the workmen on their pieces of fine earthen-ware.

Montfaucon, in his Antiquities, gives the figures and defcriptions

scriptions of several very large figilla of the Romans, in which the names were all cut in hollow, in capital letters; and he imagines, that the use of these was to mark large earthen vessels with, while the clay was soft, and particularly those large vessels in which the Romans kept their wines. It does not seem that this diligent enquirer into antiquity ever met with any of these figilla with the letters or characters in relief, or standing out in the manner of our modern types for printing, since he mentions none such; yet the remains of the Roman antiquities in terra cotta, or earthen-ware, shew that they had some such, though they were less common than the others; these vessels sometimes being marked with letters going in, though in general they have them all standing out, as must be the case when the impression was given from a figillum cut in creux.

There is now, in the collection of the duke of Richmond, a figillum of the other more rare kind, which brings the discovery very near to that of printing: on this all the letters are raised, as is also the verge or rim of the seal in the manner of our types used this day in printing. The stamp is made of true ancient brass, and has on it the common green coat of ærugo, which distinguishes the true antique medals. The plate is nearly two inches long, and nearly an inch in breadth, and has on the back part a ring for the convenience of holding it for making the impression. The letters stand in two rows; they are the common Roman capitals, very well made, and their faces all stand exactly on the level with one another, and with the surface of the verge of the seal. This seal was exactly of the nature of our method of printing so many letters at once. It contains the name of one Caius Julius Cæcilius Hermias, some private man, as we have no account of any person of this name upon record. It served him probably to set his name to any thing, to save him the trouble of writing; and the name being that of some private man seems also to prove, that these figilla were very common among that people. It was evidently made to be used on parchment, or some other such thin substance; and the manner of using it must have been by first dipping into ink, or some other coloured matter, not plunging it so far as to touch the ground, so that the letters only became marked, and gave their figures on the paper. The ground of this seal is very rough and uneven, and thence also it is plain, that the use of it was not to press down any soft substance, such as clay, or the like; because the imperfection of the ground would, in that case, have been seen; whereas in the use it was really intended for, the ground never gave any impression, and therefore there was no reason for bestowing any pains on the working it even.

The first use of printing among the later ages, was by wooden blocks in this very manner; and it was not till long after this invention, that we learned the way of using separate types for the letters; and these were then called *typi mobiles*, in opposition to the blocks, where the whole page was contained together, which was called *typi fixi*. This signet of the duke of Richmond's, which was found near Rome, is truly and properly one of those *typi fixi*, and prints off its impression on paper with our modern printer's ink, as well as any set of letters cut in this manner can be expected to perform. This seems, therefore, the most ancient sample of printing that we know of; for, by the appearance of the metal, it seems to be of the Higher Empire.

It is plain, by this stamp, that the very essence of printing was known to the Romans; for they had nothing to do, but to have made a stamp, with lines three or four times as long, and containing twenty lines instead of two, to have formed a frame of types that would have printed a whole

page as Coster's wooden blocks, used in printing the book called "Speculum Salutis," which, as some say, is the first book printed in the year 1440, and consisting of pictures of stories out of the bible, with some of the verses underneath each page; being printed from a block of wood, like a wooden cut. This was the first essay of fixed types, from which the moveable, or common separate types were soon deduced; and it seems strange that the Romans, who were as sagacious a people as any in the world, should not as easily have fallen upon the use of separate types, in which the whole art of modern printing consists, from such signets as these, as the later ages from Coster's wooden blocks, which were plainly no other than larger works of the same kind.

Cicero, in his book "De Natura Deorum," has a passage from which Toland supposes that the moderns took the hint of printing. That author orders the types to be made of metal, and calls them *formæ literarum*, the very words used by the first printers to express them. It is plain from Virgil, that brands, with letters of the owner's name, were in use in his time for the marking of cattle. And we have an account of the same artifice that is now used for the painting of cards being used by the emperor Justin, who could not write. There was a smooth board, with holes cut through it, in form of the letters of his name; and when he had occasion to sign any thing, this was laid on the paper, and he marked the letters with a pen or stylus dipped in red ink and directed through the holes. *Philos. Transf. N^o 479, p. 393.*

But others rather imagine the art of printing to have come from the method of making playing cards, which, it is certain, bear a nearer resemblance to the primitive process of printing than seals; as appears from the first specimens of that art above mentioned.

The book at Haerlem, the vocabulary called "Catholicon," and the pieces in the Bodleian and Bennet college, are all performed in this way; and the impression appears to have been given on one side of the leaves; after which the two blank sides were pasted together.

But they soon found the inconveniencies of this method, and therefore bethought themselves of an improvement; which was by making single moveable letters, distinct from one another.

These being first done in wood, gave room for a second improvement; which was the making of them, at length, of metal; and in order to that, cutting moulds, matrices, &c. for casting them.

From this ingenious contrivance we ought to date the origin of the present art of printing, as practised throughout Europe; contradistinguished from the methods of the Chinese abroad, and the card-makers at home, which were the same art, only practised in a different place, or with a different view.

And of this, Schoeffer, or Scheffer, first servant, and afterwards partner, and son-in-law of Faust, at Mentz, above mentioned, is pretty generally allowed the inventor; so that he was properly the first printer with fusile types.

But the art being yet in its infancy, there were some imperfections in the books they printed; among the rest was the want of capital letters: hence they left the places of the initial letters blank, and gave them to the illuminers to paint in gold, or azure, though others say, this was done designedly, to enable them to pass off their books for manuscripts.

Some authors tell us, that Faust carrying a parcel of his bibles to Paris, and offering them to sale as MSS., the French, upon considering the number of books, and their exact conformity with one another, even to a point, and that

the best book-writers could not be near so exact, concluded there was witchcraft in the case; and, by either actually indicting him as a conjuror, or threatening to do so, extorted the secret. And thence the origin of the popular story of Dr. Faustus.

From Mentz, about the year 1462, when it was taken, plundered, and deprived of all its former rights and franchises, the art of printing soon spread itself throughout a good part of Europe; Haerlem and Strasburgh had it very early; which, as authors represent it, occasioned their pretending to the honour of the invention.

From Haerlem it passed to Rome in 1466, where the Roman type was introduced in 1467, which was soon after brought to great perfection; and into England in the reign of Henry VI. by means of Thomas Bouchier, archbishop of Canterbury, who sent R. Tournour, master of the robes, and W. Caxton, merchant, to Haerlem, to learn the art. These privately prevailing with Corfellis, an under-workman, to come over, a press was set up at Oxford.

This account depends on the authority of an old manuscript chronicle, said to be preserved in the archbishop's palace, and cited by Atkins, in his "Original and Growth of Printing in England," published at London in 1664. This chronicle informs us, that the execution of the business intrusted with Tournour and Caxton, cost fifteen hundred marks; and that printing was set up at Oxford before there was any printing press or printer in France, Spain, Italy, or Germany, except the city of Mentz, which claims seniority as to printing even of Haerlem itself, calling herself *Urbem Moguntinam artis typographicæ inventricem primam*; though it is known to be otherwise, that city (as the chronicle adds) gaining that art by the brother of one of the workmen at Haerlem, who had learned it at home of his brother, and afterwards set up for himself at Mentz. This press at Oxford was at least ten years before there was any printing in Europe (except at Haerlem and Mentz), where also it was but new-born. This press at Oxford was afterwards found inconvenient to be the sole printing place in England, as being too far from London and the sea; upon which the king set up a press at St. Alban's, and another at the abbey of Westminster. But the authority of this chronicle has been warmly disputed by Mr. Palmer in his "History of Printing," 1733, book iii.; Dr. Ducarel, in his letter to Meerman, Dr. Middleton, Ames, and others, who maintain that there was no printing in this kingdom till the introduction of it by Caxton, who had acquired it in his travels abroad, about the year 1474, or as some say, 1470 or 1471.

But Mr. Bowyer, in his notes to the Abridgment of Dr. Middleton's "Dissertation on the Origin of Printing in England," hath offered several reasons to shew, that the account given in Atkins's record is not so incredible or improbable as some persons have imagined.

Mr. Meerman, in his learned work already cited, is a strenuous advocate for the authenticity of this record: and he apprehends that the period to which this history relates, must have been between the years 1454 and 1459; because Bouchier was made archbishop of Canterbury in 1454, and Edward IV. succeeded Henry VI. in 1460. This accurate writer has produced a variety of evidence in support of the claims of Corfellis, for which we must refer to his elaborate work, and particularly to his letter in reply to Ducarel, tom. ii. p. 19, &c., and to Mr. Bowyer, *ubi supra*; which evidence derives much confirmation from a book with a date of its impression from Oxford, anno 1468, copies of which are in several public libraries, particularly at Cambridge, Oxford, lord Pembroke's library, &c. This is a small volume of forty-one leaves in quarto, with this title; "Expo-

sitio Sancti Jeronimi in Symbolum Apostolorum ad Papam Laurentium," and at the end are the following words, "Explicit Expositio, &c. impressa Oxoniæ & finita, Anno Domini MCCCCLXVIII. XVII die Decembris."

If the authority of this book be admitted, it is a clear proof and monument of the exercise of printing in Oxford several years before Caxton began to deal in it. Dr. Middleton, indeed, endeavours to shew that the date is a false one; and, not to mention the rest of his arguments, confirms his opinion from this circumstance, that we have no other fruit or production from the press at Oxford for eleven years next following. But this objection is invalidated by two considerations; first, that Corfellis's books may have been lost, a thing by no means uncommon in those days of ignorance; and, secondly, that the civil wars broke out in 1469, which might probably oblige our Oxford printer to shut up his press.

Mr. Bowyer produces a passage from the second part of Shakspeare's Henry VI., as a farther evidence of a more early introduction of printing into England than hath generally been supposed. See also Meerman *ubi supra*, monitum novissimum, prefixed to tom. ii.

The result of the whole is, that this fact doth not at all derogate from the honour of Caxton, who was the first person in England that practised the art of printing with fusile types, and consequently the first who brought it to perfection: whereas Corfellis printed with separate cut types in wood, being the only method which he had learnt at Haerlem.

In 1467, printing was set up in the city of Tours; at Reuthlingen and Venice in 1469; and probably in the same or next year at Paris, where Gering, Crantz, and Friburger, all Germans, invited thither by two doctors of the Sorbonne, set up a press in that learned house.

Hitherto there had been nothing printed but in Latin, and the vulgar tongues; and this first in Roman characters, then in the Gothic, and at last in Italic. But in 1480, or, as some say, in 1476, the Italians cast a set of Greek types; and it was at Venice, or, as some say, at Milan or Florence, that the first editions in that language appeared.

Here we may observe, that the first Greek printing was a few sentences of Tully's Offices at Mentz, in 1465, which were very incorrect. In the same year, some Greek quotations in an edition of Lactantius's Institutes, were neatly printed, in a monastery, in the kingdom of Naples. The first whole Greek book was the Grammar of Constantine Lascaris, at Milan, in 1476. See Bowyer, *ubi supra*, Appendix, N^o 1; or the excellent edition of the Biographia Britannica, by Dr. Kippis, art. *Atkins*, note (A).

The Italians, too, have the honour of the first Hebrew editions, which were printed about the same time with the Greek, at Soncino, a little city in the duchy of Milan; under the direction of two Jewish rabbins, Joshua and Moses, whose works are dated in the year of the world 5244, answering to the year 1484 of the Christian era.

Towards the end of the sixteenth century, there appeared various editions of books in Syriac, Arabic, Persian, Armenian, Coptic, or Egyptian characters; some to gratify the curiosity of the learned, and others for the liturgic uses of the Christians in the Levant: these were printed chiefly at Paris; whither punches and matrices were sent from Constantinople by M. Savary, then ambassador at the Porte.

Out of Europe, the art of printing has been carried into the three other quarters of the world: for Asia, we see impressions of books at Goa, and in the Philippines; at Lima,

This Character was cut by WYNKYN DE WORDE, in exact imitation of that ancient and valuable Manuscript of the New Testament in the British Museum, which was, (as the late Dr. Woide communicated to Dr. Fry), presented, in 1628, to K. Charles I. by Cyrillus Lucaris, Patriarch of Alexandria, but afterwards of Constantinople; and which is supposed to have been written upwards of fourteen hundred years.—See Paterson's Catalogue and Specimens of James's Foundry, sold 1752, p. [10].

PRINTING.

Lima, Boston, Philadelphia, Mexico, &c. for America; and at Morocco for Africa.

The Turks, indeed, are said rigorously to prohibit printing throughout their empire, as imagining that the too free communication with books might occasion some change in religion or government, but this is to be understood with some limitation: and it is certain that the Jews have several editions of their books printed at Constantinople, Theffalonica, &c.

PRINTING, *Method of.* For the printing letters see the annexed specimen.

For the method of forming and casting them, see *Letter Foundery*.

And for the art of engraving the puncheons, matrices, &c. in order thereto, under the articles ENGRAVING, PUNCHEON, MATRICE, &c.

The workmen employed in the art of printing are of two kinds; *compositors*, who range and dispose the letters into words, lines, passages, &c. according to the copy delivered them by the author; and *pressmen*, who apply ink upon the same, and take off the impression. See COMPOSITION, &c.

Office of the Compositor.—The types, being cast, &c. are distributed, each kind by itself, among the divisions of two long wooden frames, an upper and under one, called *cases*; each of which is divided into little cells, or boxes, of different sizes.

The boxes of the upper cases are in number ninety-eight; and in these are disposed the capitals, small capitals, accented letters, &c. In the cells of the lower case, which are fifty-four, are disposed the common running letters, with the points, commas, spaces, quadrats, &c.

Each case is placed a little aslope, like a reading-desk, that the operator may reach the upper boxes the better, and be in less danger of mixing the letters by stretching his arm over them.

The compositor's post is against the middle of the case, and he works standing, holding an instrument, usually made of iron, called the *composing-stick*, in one hand; with the other he takes the types as he requires them, out of the boxes; ranges them on a slip of brass, called a *rule*, in his composing-stick; and, putting a space, to make a blank between each two words, forms one line after another, till the stick being full, he empties it out upon another instrument, called the *galley*; several of which ranged and wedged tight in an iron frame, called a *chase*, are ready for the press.

This short view of composing may need to be farther illustrated and enlarged upon. The composing-stick, then, (represented *Plate IV. Printing, fig. 5.*) consists of a plate, or slip of iron, brass, wood, &c. more or less broad, and contrived so as to be made more or less long, according to the width of the page, and the number of lines to be composed in it.

From the right side of this plate arises a ledge *aa*, about half an inch high, running the whole length of the plate, and serving to sustain the letters, the sides of which are to rest against it; from the same plate likewise arise three other lesser pieces, *b* and *c, c*, two of which, *c, c*, are contrived to slide along it, so that the two pieces may be either approached or withdrawn at pleasure, to adjust the length of the line to the measure intended. Add, that where marginal notes, references, &c. are required in a work, the two sliding-pieces, *c, c*, are opened in the composing-stick to a proper distance from each other.

Before the workman proceeds to compose, a rule, or thin slip of brass plate, cut to the length of the line, and of the same height as the letter, is placed in the composing-

stick against the ledge of it, for the letter to bear immediately against.

Things thus prepared, the compositor having the copy lying before him, and the stick in his left hand, with the right he picks up the letters, spaces, &c. and places them against the rule; while with the thumb of the left he presses them close to the upper screw, or cheek: and thus keeps them tight and steady; while the other hand is constantly employed in setting in more letters; the whole being performed with a degree of expedition and address not easy to be imagined.

A line being thus composed, if it end with a word or syllable, and fill the measure, there needs no farther care; otherwise more spaces are to be put between the several words to justify the lines, *i. e.* to make the measure quite full, so that every line may end even; and thus he proceeds to another line.

The spaces here used are a sort of blanks, of the like dimensions as the letters, but less high; and whose faces, therefore, when set, do not appear, nor give any impression. They are of several kinds, according to the dimensions of the whites or intervals to be made by them, *viz.* quadrats, to fill up a break at the end of a paragraph, or the like; m quadrats, which are square, and of the thickness of an m, serving to make the distance after a period, or between sentence and sentence; n quadrats, of the thickness of an n, to be placed after colons, semicolons, and commas; and thick or thin spaces, to be used between the words in justifying, as above.

For marginal notes, in the spaces reserved for them between the two sliding pieces of the composing-stick, are put little quadrated pieces of metal, called *gustations*; which are justified by other smaller pieces; a slip of scaleboard being placed from the top of the page to the bottom, to keep the note and text at due distance.

The first line being thus completely justified, the compositor advances to the next; in order to which, he moves the brass rule from behind the former, and places it before it, and thus composes another line against it, after the same manner as the former: and thus he goes on till his stick be full, which he empties into the galley, after the manner following:

Taking the rule from behind the last line, he places it before it; and with his two middle fingers squeezes the lines in the stick close; his two fore-fingers at the same time being applied on the outside of the rule: thus he lifts them out of the stick, and clapping his two thumbs behind the first line, lifts them into the galley; taking care to disengage his two thumbs without breaking the lines.

The compositor having thus set the proper number of lines in the stick, *viz.* four, five, six, or more, and emptied them out into the galley, he again fills and empties, as before, till a complete page be formed; remembering at the bottom of every page to set a line of quadrats, and at the end of it the first word of the page ensuing, for a catch-word; and if it be the first page of the sheet, one of the letters for a signature.

The galley is a flat wooden tray or dish, in form of a long square; of a length and breadth proportionable to that of the page; it consists of two parts, the upper, called the *slice*, by which the pages of large volumes, when composed, are slid upon the stone; the other, called the *coffin*, which is the body of the galley, is ledged on three sides to contain the slice; the inner ledge not to exceed half an inch in height, that the composed page rising above it by one half the height of the letter, may be tied up, or bound down, and removed without danger. When at work, the

the compositor places this galley at the top of the case, and it is prevented by a wooden pin from sliding down the boxes.

The page, then, being composed, and ranged in the galley, he ties it up in it with a cord or packthread, and sets it by, and proceeds to the next, till the number of pages of the sheet be completed; which done, he carries them to the imposing or correcting stone, there to range them in order in a chafe; which they call *imposing*.

The chafe is a rectangular iron frame of different dimensions, according to the size of the paper to be printed on, having two cross pieces of the same metal, called a *long* and *short cross*, mortised at each end into the frame, so as to be taken out occasionally.

By the different situations of these crosses, the chafe is fitted for different volumes, for quartos and octavos; one traverses the middle lengthwise, the other broadwise, so as to intersect in the centre, which is the most customary situation; for twelves and twenty-fours, the short cross is shifted nearer to one end of the chafe. For folios, the long cross is left entirely out, and the short one placed in the middle; and for broad-sides, or sheets printed on one side only, both crosses are set aside.

To dress the chafe, or range and fix the pages in it, they make use of a set of furniture, consisting of reglets, or slips of wood of different dimensions, and about half an inch high, that they may be lower than the letters; some of these are placed at the top of the pages, called *head-sticks*; others between them to form the inner margin, called *gutter-sticks*; others at the sides, called *side-sticks*; and others at the bottom, called *foot-sticks*.

The pages then being placed in order on the stone, the chafe is put over them, and the reglets applied between the letter and the chafe, in the position above-mentioned; the whole is locked up by means of small pieces of wood, cut in the wedge-form, called *quoins*, which are driven with a mallet and shooting-stick to a sufficient tightness. Before the form be quite locked up, they press down the same, by passing a smooth piece of wood, called the *plainer*, over the letters, to make their surfaces stand flat and even; and, when locked up, they shake it, to see that nothing stir.

In this condition, the work is called a *form*, containing more or fewer pages, according to the volume.

As there are two forms required to every sheet, when both sides are to be printed, it is necessary they be exactly of the same length and breadth; *i. e.* the corresponding reglets, head-sticks, &c. are to be equal in both forms, that the pages may fall exactly on the back one of another; which is called *register*.

Here, then, properly ends the compositor's office; the form, thus finished, being to be committed to the pressman.

Indeed, as it is impossible but there must be mistakes in the work, either through the oversight of the compositor, or by the casual transposition of the letters in the cases; after drawing off a proof, it is delivered to the corrector; who reading it over, and rectifying it by the copy, it is remanded to the former operator, to be corrected accordingly. For the characters used in correcting a sheet for the compositor, see CORRECTION.

The compositor, then, unlocking the form upon the correcting-stone, by knocking out or loosening the quoins, and spreading his corrected proof so as that the lines of it range with the respective ones of the metal, by running his eye along both, he easily spies where corrections are to be made; according to which, he proceeds to pick out the

faulty letters, points, &c. with a sharp-pointed steel bodkin, and puts others in their places.

Where the alterations are considerable, and particularly where insertions or omissions are to be made, there usually arises a necessity of over-running; in order to which, they must decompose, or return the lines back from the chafe into the galley, and from the galley again into the composing-stick, to be new-modelled and rectified accordingly.

If, *e. gr.* one or more words, to be inserted in a line, cannot be gotten in by changing the spaces of the line for lesser ones, part of the line must be put back into the close of the preceding one, or forward into the beginning of the subsequent one, or both, till room is obtained. If the insertion be large, several lines will need to be over-run, either backward or forward, till a break is arrived at; when if it be not gotten in, a line is to be driven out; and, to get in that line, the next pages, either backward or forward, must sometimes be over-run before it can come in.

When an omission is to be made, the contrary course must be taken. If it be but little, the compositor takes it out, and drives out the remaining matter, either by enlarging his spaces, or bestowing the beginning of the following, or the close of the preceding line therein. If it be considerable, he may be obliged to over-run several pages before it can be driven out.

As to the faults which escape the corrector and compositor, they are usually noted in what we call the *errata*. The ancient editions had no errata; but in lieu of it, they corrected the faults in each printed copy with a pen, which was easy enough in those days, though impracticable now. In effect, we have anciently had printers, who did not need an errata of above five articles in a volume of five hundred sheets; and the distinguishing excellence of printing is correctness; and in this respect many of our modern printers deserve much commendation.

Besides the several kinds of letters and characters above-mentioned, used in printing, they have likewise rules for black lines, borders, and head and tail-pieces, accommodated to the several kinds of letters.

The rules for black lines are of brass, and are made exactly of the height of the letter; otherwise they will hinder the neighbouring letters from printing, or will themselves be hindered by them. These the compositor occasionally cuts into proper lengths, as his work requires.

The *borders*, or *flowers*, are a kind of ornaments, in form of long bars, serving for the division of books, chapters, &c. Their depth is proportioned to the letter; and their length adjusted to the page; for being composed of several moveable pieces, it is easy to lengthen or shorten them.

The *head* and *tail-pieces*, cut either in wood, pewter, brass, copper, or silver, are compartments used at the beginnings and endings of books.

The initial letters are sometimes cut in wood, and figured; sometimes cast like the other characters.

For the conveniency of the binding, the printers had early recourse to signatures, *i. e.* letters of the alphabet placed at the bottom of the first page of each sheet, which shew the order they are to be bound in, as well as whether the quires are complete; which method is still continued.

The *catch-words* serve nearly the same purpose: these are the first words of each page, which are inserted at the bottom of the preceding pages. The number of the pages are equally serviceable to the reader and the binder, to guide to references, and to warrant the book duly bound and collated; some printers formerly put them at the bot-

toms of the pages; but custom has now carried it for the tops.

In the infancy of printing, they had likewise a *registrum chartarum* for the convenience of the binders: to draw this, at the end of each volume, they collected the signatures, and the first words of the first four sheets of each alphabet. To abridge it, they afterwards contented themselves to express the signatures, and how often each letter was repeated; but the *registrum* has been now long disused.

Pressman's office, or PRINTING, properly so called. To work off the form thus prepared and corrected by the compositor, there are three things required, paper, ink, and a press.

To fit the paper for use, it is to be first wetted or moistened, by dipping several sheets together in water: these are afterwards laid in a heap over each other; and to make them take the water equally, they are all pressed close down with a weight at top. As to the degree of wetting, it must be according to the quality of the paper, and the size of the letter; small letters, and stiff paper, requiring most wetting.

PRINTING Ink is of two kinds, black and red; the last occasionally used in title-pages, calendars, &c. the first for the body of books. The composition of each, though now reckoned no part of the printer's business, but usually furnished them by other hands, is as follows:

For black ink.—A hundred pounds of nut or linseed oil, being reduced, by boiling, to the consistence of a syrup, are cleansed and purified by throwing into them two pounds of coarse bread, and about a dozen onions. Nut-oil is supposed to be the best, and is accordingly preferred for the black ink, though the darker colour which it acquires from the fire makes it less fit for the red. This oil is boiled in an iron pot, capable of holding at least half as much more, because it swells very much; when it boils it is kept stirring with an iron ladle; and if it does not itself take flame, it is kindled with a piece of lighted paper, or burning wood, in order to increase its consistence and tenacity, and to diminish its greasiness. The oil is suffered to burn for half an hour or more; and the flame being then extinguished by covering the vessel close, the boiling is afterwards continued, with a gentle heat, till the oil appears of a proper consistence; in which state it is called varnish; of which there should be two kinds, one more and another less boiled; or a thicker and thinner, to be used for different purposes, and in different weathers. The oil is said to lose in being boiled into thick varnish from a tenth to an eighth part of its weight; but different oils, and perhaps the same oil in different states, differ in this respect. The design of adding the bread and onions is more effectually to destroy the greasiness; but Dr. Lewis doubts, whether additions of this kind are of much use. They then boil thirty or thirty-five pounds of turpentine apart, till such time as they find, upon its cooling on paper, that it breaks clean, like glass, without pulverizing; for if it pulverize easily, it is a sign it is burnt. The oil and turpentine being thus prepared, the first is gently poured, half cold, into the latter; and the two stirred together with a stick till they be well mixed: after which the boiling is repeated and the composition is set by, to be used occasionally. The turpentine is used in order to give a greater body to the varnish, and to increase its drying quality; and with some artists, litharge has in this intention been a secret. M. le Breton, in the *Encyclopédie*, observes, that when very old oil is used, neither turpentine nor litharge are needful; but that when the oil is new, some turpentine ought to be

employed, because without it, the smearing of the paper, by the spreading or coming off of the ink, cannot be avoided; and he adds, that it is much more eligible to use old oil than to have recourse to this correction of the new: both turpentine and litharge, particularly the last, making the mixture adhere so firmly to the types, that it is scarcely to be got entirely off by the ley, whence the eye of the letter is soon clogged up.

Now to proceed to make ink, they take a quantity of this mixture, and add to it a certain quantity of lamp-black, working it up with a kind of wooden mallet, or brayer, till the whole be incorporated, and reduced into a kind of pulp; which is the ink for use.

Where, note, that its thickness or strength is always to be proportioned to that of the paper, and the warmth of the weather; strong paper, and hot weather, requiring strong ink: and that the strength or weakness of the ink depends on the greater or the less degree of coction of the varnish. According to M. le Breton, two ounces and a half of the lamp-black are sufficient for sixteen ounces of the varnish. Lewis's *Commerce of Arts*, p. 371.

For red ink, they use the same materials as for black, excepting only, that instead of lamp-black, they add a proper quantity of vermilion. Some hold, that by mixing and incorporating the bigness of a nut of fish-glue, or brandy, or the white of an egg, with the ink, the vermilion acquires a greater lustre.

The PRINTING Press is a well contrived machine, and at a very early period of the art was brought to a degree of perfection, which has not admitted of any very material improvements till the present age. Who first invented it we are not informed, but from Mr. Moxon we learn, that it was very greatly improved by William Jansen Blaew, who established a printing-house at Amsterdam, where he printed many books and maps, which he made from the observations of the famous Tycho Brahe, who had for many years employed him as an assistant, and to make his instruments.

Fig. 1. Plate IV. Printing, is a representation of the printing press in perspective. It has two principal parts, each of which is composed of several others: the first is the body of the press, which is a frame containing the screw, and platen, or surface which produces the pressure upon the paper; and the other is the carriage, on which the *form* of types is laid, and has the means of being drawn out of the body of the press, to remove the paper when printed, and to substitute another sheet. For the convenience of changing the paper, the carriage is provided with frames, called the tympan and frisket, which fold upon each other and enclose the sheet between them, and are then again folded down upon the types.

The body of the press consists of two strong posts, *b, b*, placed perpendicular, called the cheeks, which are joined together by four horizontal cross pieces; the upper of these, *a*, is called the cap, and has no office but to retain the two cheeks at their required distances asunder: the next cross piece, *b*, is called the head; it is fitted by tenons at the ends into mortises between the cheeks, and these mortises are filled up with pieces of pasteboard or soft wood, in such a manner as to admit of a small motion or yielding. The head is sustained by two long screw-bolts, which suspend it from the cap: in the head is fixed a brass nut, containing a female screw or worm, which is fastened in the wood by two short bolts to keep it up: the worm is adapted to receive the screw by which the pressure is produced. The third cross piece, *c, c*, called the shelves, or till, is to guide and keep steady a part, *i*, called the hose, in which the spindle of the screw (to be spoken of hereafter) is inclosed. The fourth cross plank, *f, f*, called the winter, is fitted between the cheeks to bear the carriage;

it sustains the effort of the prefs beneath, as the head does above, each giving way a little, the one upwards the other downwards, to make the pull the easier. The spindle, *g g*, is an upright piece of iron, pointed at the lower end with steel, having a male screw formed on its upper end, which enters about four inches into the female screw or worm fixed in the head: through the eye of this spindle is fixed the bar or handle, *b*, by which the pressman works the prefs. The platen *k*, or surface which acts upon the paper to produce the impression, is suspended from the point of the spindle by means of a square block or frame of wood, *i*, called the hofe, which is guided by passing through the shelves *e e*: the lower part of the spindle passes through the hofe, and its point rests upon the platen *k*, being received into the plug fixed in a brass pan supplied with oil, which pan is fixed to an iron plate let into the top of the platen *k*. The pressman then, by pulling the bar *b*, fixed in the eye of the spindle *g*, by an iron key turns the spindle, and by means of its screw presses down the platen upon the *form* of types, which is covered with the paper, tympan, and its blankets, all these parts being brought under the platen by the carriage, when the impression is to be given. That the platen may be suspended from the spindle, and rise up again with it, the hofe, *i*, is attached to the spindle by the *garter*; this is a fillet of iron screwed to the hofe, and entering into a nick or groove formed round the upper part of the spindle; it prevents the hofe falling down on the spindle. At each corner of the lower part of the hofe there is an iron hook fastened, and from these to similar hooks, fastened at each corner of the platen *k*, cords or packthread are looped to suspend the platen, and they are exactly adjusted, to hang the platen truly level.

The carriage *ll*, which is the other principal part of the prefs, is adapted to run into the space between the cheeks under the platen. It is supported upon the ribs *n*, which are part of a horizontal wooden frame, having its fore-part supported by a wooden prop *m*, called the fore-stay, while the other end rests on the winter. On the rails of this frame two long iron bars or ribs are nailed, and under the plank of the carriage are nailed short pieces of iron or steel, called cramp irons, which slide upon the ribs, when the carriage is run in or out, by the following means. Beneath the carriage is placed a small spindle called the spit, with a double wheel formed in the middle of it, round which leather girts are passed and fastened, the opposite ends being nailed to each end of the plank, *l*, of the carriage. On the extreme end of the spit is fixed the handle or rounce *p*, by which the pressman turns the spit, and this, by means of the wheel and straps, runs the carriage in or out at pleasure. The carriage itself consists of a strong wooden plank *l*, upon which a square frame of wood is fixed, to form the coffin or cell, in which a marble or polished stone is inclosed, for the form of the types to be laid upon. To this coffin are fastened leather stay-girts, one to each side, which being at the opposite ends fastened to the cheeks of the prefs, prevent the carriage running too far out, when drawn from under the platen. On the fore-part of the plank is a gallows *rr*, which serves to sustain the tympan, when turned up from off the form, on their hinges. The tympan, *s, s*, are square frames covered with parchment. The frames are made of three slips of very thin wood, and at the top a slip of iron, still thinner, called a head-band. The two tympan are fitted together by the frame of one, being small enough to lie within the other: the outward tympan is fastened with iron hinges to the coffin. Between the two parchments of the tympan two or three thicknesses of blankets are placed, which serve to make the impression of the platen upon the surface of

the letters more equal, as also to prevent the letters from being broken by the force of the prefs. The use of the inner tympan is to confine these blankets. The frisket, *t*, is a square frame of iron, made very thin, also covered with paper or parchment, and fastened to the head-band of the outer tympan by hinges: it folds down upon the tympan, to enclose the sheet of paper between them, the parchment or paper with which the frisket is covered being cut out in the necessary places, that the sheet, when placed between the tympan and frisket, and both together folded down on the form, may receive the ink from the types in the pages; but the frisket sheet keeps the margins clean. The tympan and frisket, when folded down, lie flat upon the form, and the carriage with them is run into the prefs; but when the sheet is to be taken out, the tympan is lifted up upon its hinges, and rests, as represented, in an inclined position against the gallows *r*, before mentioned, at the back part of the carriage; then the frisket, *t*, is lifted up on its hinges, and sustained by a slip of wood, *w*, hanging from the ceiling, whilst it continues open, to take out the printed sheets and put in others.

To regulate the margin, and make the lines and pages answer each other when printed on the opposite side of the sheet, two iron points are fixed to the middle of the wooden sides of the frame of the tympan, which make two holes in the sheet. These holes are placed on the same pins, when the sheet is returned for making an impression on the other side, which is called the *reiteration*, and the pins are adjustable, that they may make the impressions of the opposite sides exactly correspond.

The ink is applied upon the form by balls, which are a kind of wooden cups with handles, the cavities of which are filled with wool, or hair, covered with sheep's skin nailed to the wood. One of these the pressman takes in each hand, and applying them on the ink-block, to charge them with ink, he works them one against the other, to mix and distribute the ink equally; and, at last, smears over the form, by beating or dabbing them several times over the whole face of it; this leaves the form in a condition to be passed under the prefs, with the moistened paper laid on it.

To prepare the prefs for working, the parchment of the outer tympan, against which the sheet is to be laid, is wetted till it is very soft, in order to render the impression more equable; the blankets are then put in, and secured from slipping by the inner tympan. Then, while one pressman is beating the letter with the balls, covered with ink, taken from the ink-block, the other person places a sheet of paper on the tympan, turns down the frisket upon it, to inclose it, keep the margins clean, and prevent it slipping; then folding the tympan down upon the form, and turning the rounce, *p*, with his left hand, he brings the form, with the stone and carriage, (which altogether weighs about 300 lbs. weight,) under the platen; pulls the bar with the right hand, by which means the platen presses the blankets and paper close upon the letter, whereby half the form is printed; then releasing the bar, he advances the form still forward into the prefs, by turning the rounce, and gives a second pull: now letting go the bar, he turns back the form, lifts up the tympan, and opens the frisket, takes out the printed sheet, and lays on a fresh one; and this is repeated, until he has taken off the impression for the full number of sheets the edition is to consist of. One side of the sheet being thus printed, the form for the other is laid upon the prefs, and worked off in the same manner; the sheet being so disposed, that the iron points shall pass through the holes already made in the sheet.

Sometimes it is required to cut the frisket afresh, where

the second side is to be more or less full of printing than the first, as is frequently the case at the beginning and ending of books, half pages at the ends of chapters, &c.

The number of sheets of the edition being complete, the form is to be separated: to restore the letters into the compositors' cases, they first wash it in a strong ley, to take out the remains of the ink, scouring it with a brush, and then with fair water. This done, it is carried to a wooden frame to be unlocked, and the furniture, *i. e.* the sticks and quoins, taken off, to disengage it from the chase. Then the compositor, taking out several lines at once upon a little brass ruler, replaces each letter in its proper box, to be again used in the remainder of the impression; which last operation they call *distribution*.

The operations of the printing press, when conducted by an expert pressman, are performed with a surprising rapidity; but the labour is very great. Two men take it by turns to *pull*, that is, work the press, and *beat*, or ink the types. Whilst one workman is employed in pulling the sheet, his comrade is distributing the ink on his balls, by first applying them to the ink-block, which is a small shelf fixed up against one of the cheeks of the press, and has ink spread out upon it by the slice and *brayer*, which is a wooden muller to mix and grind the ink; then applying the balls together, and turning them round in his hands, whilst the surfaces are rolled or dabbed against each other, the ink becomes equally distributed over them. By this time the pressman having made the pull, and opened the tympan, the other instantly begins the beating, whilst the pressman gets the sheet changed. In beating, he holds a ball in each hand, and applies them upon the types, with the handles in an inclined position; and then he mounts the handles perpendicular, by which means the leather is rolled over the surface of the types, and they are effectually inked; but if they were moved in any other way, the hollows would scrape off the ink, and clog up the letters. Having thus inked a space of as much extent as the two balls will conveniently cover, they are lightly lifted off the letters, and removed to another part, which is inked in the same manner, till the whole sheet is gone over.

The pressman, during the beating, has removed the printed sheet, and laid another evenly upon the tympan, which is done with great address; then folding down the frisket upon it, and shutting both together down upon the form, he runs in the carriage as before-mentioned, to take the first pull; for the platen being only half the size of the sheet, it is printed at twice, and the first time the carriage is run into the press, the pressman knows by a chalk mark previously made on the carriage when the first half of the sheet is under the platen; he now makes his pull, and letting the handle go back, runs the carriage in again, till the other half of the sheet comes under the platen, and then makes a second pull. In this operation he leans his body back, and places his foot against a foot-board beneath the press, to gain a greater purchase. Presses are, in general, adapted for the screw to make a sufficient pressure by a quarter turn of it, but this the pressman can vary to his own inclination, by packing up the head, *b*, of the press with pieces of pasteboard in the mortises, till it yields as much as he requires for a *long pull*; or if he puts blocks of wood to fill up the mortises, it will make a *short pull*, which has much the advantage of the other, in respect to the total exertion it requires; but then the handle being suddenly checked on coming to the pressure, it gives a shock to the whole body, which few men can bear. Strong men will work best with a solid press.

The severe labour of printing, by the ordinary press,

has, for a long time past, rendered it very desirable to obtain an accession of power. Many attempts have been made to produce a press which would print the whole surface of a sheet at a single pull: the first which has come to our knowledge was brought from France many years ago, and was called the *Apollo press*. It was a wooden press of the ordinary construction, except that the platen was composed of an iron plate instead of a wooden plank, and made sufficiently large to print the whole sheet at once: the under surface of it was covered with brass, and made truly flat. The screw, or spindle, instead of being turned by the bar or handle, in the usual manner, was united, by connecting rods, with a long lever, placed at the side of the press, and the man worked it by applying both hands to the lever, to bring it down nearly by the same action as working the lever of a pump; this action, requiring a motion of the whole body, was found intolerably fatiguing, and in consequence they were soon disused, even for printing newspapers, where expedition is a superior consideration to every other.

Among the contrivances we have met with for improved printing presses, the first which has been successful in a long course of practice, was invented many years ago by Mr. Roworth, a printer in London. Instead of the screw he uses a plain vertical spindle, furnished with a bar, hose, &c. just as usual; but the upper part, where the worm is usually cut, is a plain cylindrical spindle, and fits into a socket fitted into the head of the press. Upon the upper end of the spindle, just beneath the head, a short cross arm is fixed, which acts against a circular inclined plane fixed under the head of the press; therefore, by turning the spindle, the cross arm acts against the under side of the circular inclined plane, and causes the spindle to descend in the same manner as the screw, but with this advantage, that the inclined plane is formed with a rapid descent at the time the action first begins; but when the platen has come down to the tympan, and the pressure begun, the plane has a very slight inclination, and therefore a great power to produce the impression; and this power increases as the resistance increases. Still, from the manner in which the platen is first brought down, there is not, on the whole, that corresponding loss of time which takes place in the usual mechanical combinations for producing a great power. A great advantage is also derived in the working of this press, from making the inclined plane and cross arm of hardened steel.

The Stanhope press, which is now becoming general, has this property in a higher degree, and is therefore capable of printing a double surface to the common press, with a very small portion of the power which that required.

A Stanhope press is delineated in *Plate I. Printing*, *figs. 1* and *2* being elevations, and *fig. 3* a plan. *AA* is a massive frame of cast iron, formed in one piece: this is the body of the press, in the upper part of which a nut is fixed for the reception of the screw *b*, and its point operates upon the upper end of a slider *d*, which is fitted into a dovetail groove formed between two vertical bars, *e, e*, of the frame. The slider has the platen, *DD*, firmly attached to the lower end of it; and being accurately fitted between the guides *e, e*, the platen must rise and fall parallel to itself when the screw, *b*, is turned. The weight of the platen and slider are counterbalanced by a heavy weight, *E*, behind the press, which is suspended from a lever *F*, and this acts upon the slider to lift it up, and keep it always bearing against the point of the screw. At *G* are two projecting pieces, cast all in one with the main frame, to support the carriage when the pull is made; to these the rails, *H*, are screwed, and placed truly horizontal for the carriage, *I*, to run upon them, when it is carried under the press to receive

ceive the impression, or drawn out to remove the printed sheet. The carriage is moved by the rounce or handle K, with a spit and leather girts, very similar to the wooden prefs. Upon the spit, or axle of the handle K, a wheel, L, is fixed, and round this leather belts are passed, one extending to the back of the carriage to draw it in, and two others, which pass round the wheel in an opposite direction, to draw it out. By this means, when the handle is turned one way it draws out the carriage, and by reversing the motion it is carried in. There is likewise a check strap, f, from the wheel down to the wooden base, M, of the frame, and this limits the motion of the wheel, and consequently the excursion of the carriage. The principal improvement of earl Stanhope's prefs consists in the manner of giving motion to the screw, b, of it, which is not done simply by a bar or lever attached to the screw, but by a second lever; *e. gr.* the screw, b, has a short lever, g, fixed upon the upper end of it, and this communicates by an iron bar, or link, h, to another lever, i, of rather shorter radius, which is fixed upon the upper end of a second spindle, l, and to this the bar or handle, k, is fixed. Now when the workman pulls this handle, he turns round the spindle l, and by the connection of the rod, h, the screw, b, turns with it, and causes the platen to descend and produce the pressure. But it is not simply this alone, for the power of the lever, k, is transmitted to the screw in a ratio proportioned to the effect required at the different parts of the pull; thus at first, when the pressman takes the bar, k, it lies in a direction parallel to the frame, or across the prefs, and the short lever, i, (being nearly perpendicular thereto,) is also nearly at right angles to the connecting rod b; but the lever, g, of the screw makes a considerable angle with the rod, which therefore acts upon a shorter radius to turn the screw; because the real power exerted by any action upon a lever, is not to be considered as acting with the full length of the lever between its centres, but with the distance in a perpendicular drawn from the line in which the action is applied to the centre of the lever. Therefore, when the pressman first takes the handle, k, the lever, i, acts with its full length upon a shorter length of leverage, g, on the screw, which will consequently be turned more rapidly than if the bar itself was attached to it; but on continuing the pull, the situation of the levers change, that of the screw, g, continually increasing in its acting length, because it comes nearer to a perpendicular with the connecting rod, and at the same time the lever, i, diminishes its acting length, because, by the obliquity of the lever, the rod, h, approaches the centre, and the perpendicular distance diminishes; the bar or handle also comes to a more favourable position for the man to pull, because he draws nearly at right angles to its length. All these causes combined have the best effect in producing an immense pressure, without loss of time; because, in the first instance, the lever acts with an increased motion upon the screw, and brings the platen down very quickly upon the paper, but by that time the levers have assumed such a position as to exert a more powerful action upon each other, and this action continues to increase as the bar is drawn forwards, until the lever, i, and the connecting rod are brought nearly into a straight line, and then the power is immensely great, and capable of producing any requisite pressure which the parts of the prefs will sustain without yielding. The handle is sometimes made to come to rest against a stop, which prevents it moving further, and therefore regulates the degree of pressure given upon the work: but to give the means of increasing or diminishing this pressure for different kinds of work, the stop is made moveable to a small extent.

A better plan is adopted by some makers of the Stanhope prefs, *viz.* to have a screw adjustment at the end of the connecting rod b, by which it can be shortened; it is done by fitting the centre pin which unites it to the lever, g, in a bearing piece, which slides in a groove formed in the rod, and is regulated by the screw. This shortening of the connecting rod produces a greater or less descent of the platen, when the handle is brought to the stop.

The carriage of the prefs in *Plate I.* is represented with wheels, m, m, beneath, to take off the friction of moving upon the ribs, H. These wheels are shewn at *fig. 4*, which is a section of the screw and the platen, with the carriage beneath it; and *fig. 5* is a plan answering to it. *Fig. 6* is a figure of the carriage, inverted, to shew the wheels; their axles, n, are fitted to springs, p, and these are adjustable by means of screws, r, so that the carriage will be borne up to any required height. This is so regulated, that when the carriage is run into the prefs, its lower surface shall bear lightly upon the solid cheeks, G, which are part of the body of the prefs, and these support it when the pressure is applied, the same as the winter of the old prefs: but the wheels by their springs act to bear up great part of the weight of the carriage with the types upon it, and diminish the friction, yet do not destroy the contact of the carriage upon the ribs, because this would not give the carriage that solidity of bearing which is requisite for resisting the pull. This is only at the time when the carriage is run into the prefs, because as it runs out, the ribs on which the wheels run rise higher, and therefore the wheels support the whole weight. The manner in which the wheels run in rebates or recesses in the edges of the ribs, is shewn at *fig. 2*. The carriage is made of cast iron, in the form of a box, with several cross partitions, which are all cast in one piece, and though made of thin metal, are exceedingly strong: the upper surface is made truly flat, by turning it in a lathe. The same of the platen, which is likewise a shallow box: the slider, d, has a plate formed on the lower end of it, which is fixed by four screws upon the top of the platen, and thus they are united. At the four angles of the carriage, pieces of iron, r, (*fig. 5*.) are screwed on, to form bearings for the quoins or wedges which are driven in to fasten the form of types upon it in the true position for printing. The tympan, P, (*fig. 1*.) is attached to the carriage by hinges, with an iron bracket or stop to catch it when it is thrown back: the frisket, R, is joined to the tympan, and when opened out, rests against a frame suspended from the ceiling. The register points are the same as before described in the wooden prefs, and all the operations of working are exactly the same. The iron frame, A, of the press is screwed down upon the wooden base, M, by bolts, which pass through feet, s, projecting from the lower part of the iron frame. Another wooden beam is fixed into the former at right angles, so as to form a cross, which lies upon the floor. The ribs, H, for the carriage to run upon are supported from the wooden base by an iron bracket, T.

The advantages of the iron presses in working are very considerable, both in saving labour and time. The first arises from the beautiful contrivance of the levers, the power of the prefs being almost incalculable at the moment of producing the impression; and this is not attended with a correspondent loss of time, as is the case in all other mechanical powers, because the power is only exerted at the moment of pressure, being before that adapted to bring down the platen as quickly as possible. This great power of the prefs admits of a saving of time, by printing the whole sheet of paper at one pull, the platen being made sufficiently large for that purpose; whereas, in the old prefs, the platen is only half

the size of the sheet. In the Stanhope presses, the whole surface is printed at once, with far less power upon the handle than the old presses, when printing but half the surface. This arises not only from the levers, but from the iron framing of the presses, which will not admit of any yielding, as the wood always does, and indeed is intended to do, the head being often packed up with elastic substances, such as pasteboard, or even cork. In this case much power is lost, for in an elastic press the pressure is gained by screwing or straining the parts up to a certain degree of tension, and the effort to return produces the pressure: now in this case, the handle will make a considerable effort to return, which, though it is in reality giving back to the workman a portion of the power he exerted on the press, is only an additional labour, as it obliges him to bear the strain a longer time than he otherwise would. The iron has very little elasticity, and those who use them find it advantageous to diminish the thickness of the blankets in the tympan to one very thin piece of fine cloth; the lever has then very little tendency to return, and the pull is easy in the extreme, requiring very little more force to move it at the latter, than at the first part: indeed it is so different from the other presses, that when an experienced pressman first tries it, he cannot feel any of that re-action which he has been accustomed to, and will not believe, till he sees the sheet, that he has produced any impression at all; and for many days after he begins to work at an iron press, he by habit throws back all the weight of his body in such a manner, as to bring the handle up to its stop with a concussion that shakes his arm very much; and in consequence most pressmen, after a few hours' work, feel inclined to give up the iron press; but when they have once got into a new habit of standing more upright, and applying only as much force as it requires, the labour of the pull becomes less than that of running the carriage in and out; and men who are accustomed to the iron presses only, would be scarcely able to go through the work of the old presses.

The Stanhope presses have come very much into use, and many people are engaged in making them. The first of these are Messrs. Walker, of Oxford-street, who have the advantage of being assisted by the inventor, earl Stanhope; they have a very good machine for turning the surfaces of the platen and carriage, so as to produce very accurate planes; which is a great advantage, as it permits a much thinner blanket than could otherwise be used.

Mr. De Heine has a patent for a Stanhope press, which answers extremely well: the only material alteration is, that he has substituted a spiral, or curved inclined plane, in place of the screw, which is fixed to the head of the press; and a cross arm properly formed, and fixed on the upper end of the spindle, which stands in place of the screw, acts against the fixed inclined plane. The action is very nearly the same as the screw, except that the surfaces admit of being made of hardened steel, and thus diminish the friction very much. The inventor of this for the common press was, as we have before mentioned, Mr. Roworth, but Mr. De Heine has combined it with the levers and iron frame of the Stanhope press. This Cyclopædia is printed by Stanhope presses.

Mr. Peter Kier, of Camden Town, has made several Stanhope presses of a very good construction, the strength of all the parts being very well proportioned, so that his presses are not more liable to break at one part than another. The slider, *d*, he has made in a very convenient manner, by boring out a cylindrical hole down the centre of the press with a boring machine, and into this a cylinder is accurately fitted, the platen being fixed on the lower end of it. To prevent

it from turning round, a flat side is made to the cylinder, and a bar of iron is screwed across the two cheeks *e, e*, between which the hole is bored, and bears against the flat side of the cylinder. Another improvement is in the spindle *l*, to which the handle is affixed: this has a screw cut upon the lower end of it, which is fitted into a nut, and thus, when it is turned round, the spindle rises and falls a quantity equal to the descent of the screw, *b*, in the same period. By this means, the connecting rod, *b*, always draws in an horizontal direction, whereas, in the other presses, one end remains at the same level, whilst the other descends, in consequence of which the joints wear irregularly. On the whole, Mr. Kier's improvements, though they do not constitute a feature of the invention, contribute much to the accurate performance and durability of the machine.

The form he has adopted for the frame, *A A*, is very judicious; that in our plate is unnecessarily strong, having been made at an early period of the invention, when, from being unacquainted with the full power of the levers, many of the presses were broken by the strain, and some makers then determined to put in such a mass of metal, as to resist the utmost efforts of a man at the handle; but being now better understood, they are made much lighter than in the one in our plate, and sufficiently strong.

Several Stanhope presses, that is, presses having levers to work the screw, have been made in wood by Mr. Brooke, or altered from the old wooden presses; but though this is an improvement upon them, it is greatly inferior to the iron frame, which, for the reasons we have given, has a share in the saving of power.

Mr. Medhurst, of Denmark-street, Soho, has produced a printing press of great merit, from its simplicity, and it has the same advantage, in point of power, as lord Stanhope gains by the compound levers. It is a common press in all its parts, but the platen is made the full size of the sheet, and instead of a screw, a plain spindle is employed: on the lower part of it, just above the bar, a circular plate is fixed, and affords steps for the points of two iron rods, which extend up to the head, and are there supported by their points entering sockets. When the platen is up, these rods stand in an inclined position, although both the ends of them are at the same distance from the centre of the spindle; but when the spindle is turned by the bar, the circular plate, in which the lower points of the iron rods rest, turns round in a circle, and the upper ends remaining stationary, they of course come towards a vertical position, in which motion the spindle and platen are forced to descend, in the same manner as though a screw was employed; but this motion has every advantage of the Stanhope levers, or Mr. Roworth's press, without the friction of either, for the power increases as the resistance increases, and when the rods come nearly parallel to the spindle, or into a vertical position, the power is immensely great. We think a press of this kind, if made of iron, and with the other advantages of lord Stanhope's, would be much simpler, and rather better, because the friction and wear are inconsiderable, if the points of the rods and their sockets are hardened.

We have been shewn a model of a new kind of press invented by Mr. Ruthven of Edinburgh; it differs from others in the following circumstances. The form of types, instead of being situated on a running carriage, is placed upon a stationary platform or tablet, which is provided with the usual apparatus of tympan and frisket, with points, &c. to receive the sheet of paper, and convey it to its proper situation on the face of the types, after they have been inked. The machinery by which the power for the pressure is produced, is situated immediately beneath this tablet, and the

platen or surface which is opposed to the face of the types to press the sheet of paper against them, can be brought over the types, and connected at two opposite sides or ends with the machinery beneath the table. By this machinery it is so forcibly pressed or drawn down upon the paper which lays over the types, as to give the impression, which being thus made, the platen can be disengaged from the machinery, and removed from off the types by a motion of the foot, to take out the paper and introduce a fresh sheet.

The machinery for producing the pressure is a combination of levers, actuated by a crank, or short lever, turned by a winch or handle, to which the pressman applies his left hand, just as he does in the present to the rounce or handle of the spit, the handle being placed in the same situation for that purpose. The levers beneath the table are well contrived to have the best effect in saving time, and producing an immense pressure; for when the pressman first takes the handle, it acts with but little advantage as to power upon the levers, and therefore brings the platen down very quickly upon the tympan. The levers have then assumed positions, in which they exert a more powerful action upon each other; and this action continues to increase until one of the levers and its connecting rod come nearly into a line, when the power is immensely great, and capable of producing any requisite pressure. For fastening the types upon the table, or what the printers call the making register, instead of quoins or wedges being introduced at the angles in the usual manner, screws are fitted through pieces which are fixed to the sides of the table; and between the points of these screws the form of types is held steady upon the table, and may be adjusted.

We have not had an opportunity of trying a large press of this kind, but think it promises so much in saving of power and time, as to deserve a trial by printers. It avoids the moving of the heavy carriages with the form; for the platen need be but a small portion of the weight of the loaded carriage; and further, it is adapted to be moved from off the types sideways, and therefore has a less distance to move than the carriage in the ordinary press. The machinery is well contrived in all its parts, both for performance and stability, and is adapted to be made of iron, that it may have no yielding parts. It is far cheaper than the Stanhope press.

A *PRINTING-HOUSE* is a place destined for printing, and fitted up for that purpose with presses, cases, and other furniture.

The most considerable printing-houses in the world are those of the Louvre and Vatican. The first, begun under Francis I., was carried to its utmost perfection under Lewis XIII., by the care of cardinal Richelieu; and removed into the galleries of the Louvre by Lewis XIV.

The Vatican printing-house, called also the *Apostolical* printing-house, because the pope's bulls, decrees, &c. are printed in it, was begun by Pius IV., and furnished with great magnificence by Sixtus V. See *VATICAN*.

Out of both these printing-houses have come forth very beautiful and splendid editions of the ancient authors. The Vatican was the first that printed books in the Arabic language.

PRINTING, Stereotype, is a method of producing plates from moveable types, by forming a mould with them in plaster of Paris, or any other fit substance, and in this mould casting a metallic plate, which will have the same surface as the types had, and will print the same. Therefore, in this method the moveable types are not used to print from, (except for proofs to correct the errors of composition,) but are employed as a model or pattern to cast the

stereotype plates by which the impression is to be printed. For the history and further particulars of this invention, see *STEREOTYPE*.

PRINTING Machine.—The immense number of books and newspapers which are printed in this country, has rendered it desirable to have machines for printing, which would throw off copies more rapidly, and without requiring such excessive labour as the printing press does. For daily newspapers in London expedition is the grand object, as the whole impression (often as many as 6 or 8000 copies) must be printed between the hours of midnight, and eight or nine o'clock in the morning; and often, when there are important debates in parliament, they are not able to begin printing so soon as midnight.

The first attempts at printing machines were only to employ machinery for actuating a common press, and by the force of horses, or steam-engine, to perform the part of the pressman. We have seen a model of such a machine, which printed very well, and with great rapidity, but was so complicated, that on a large scale it could not have been urged into motion so quickly as the pressman can work; and in effect, when put to trial, it was found to employ one horse instead of one man to work the press. In 1790, Mr. Nicholson took out a patent for a machine to print by cylindrical rollers, the types being so formed with stems smaller at one end than at the other, that, when composed, they would form a cylindrical surface instead of a plane. Between a roller covered with these types, and another plain roller, the paper was to be passed, and thus receive an impression: the ink was distributed by machinery. Mr. Nicholson's machine answered very well for printing patterns upon calico, paper-hangings, or any other papers, where the surface of a solid roller could be engraved to print from; but the moveable types were not found practicable, and therefore the machine was inapplicable to book-printing.

A patent has recently been obtained by Messrs. Bacon and Donkin, for a machine which they publicly exhibited before the university of Cambridge, and they are now making one for printing bibles and prayer-books at the university. We have examined their machine at work, and found it to display so much mechanical ingenuity, and to produce such beautiful specimens of printing, with a rapidity unequalled by any other means, that we have made a drawing of it. (See *Plate III. Printing*.) The invention consists in adapting the types to be fixed upon, and form the surface of, a prismatic roller, such as a square, pentagon, hexagon, octagon, or other figure, and mounting this in a frame, with the means of turning it round upon its centres; a second roller is applied in such a manner, that its surface will keep in contact with the surface of the types which are inked, and the machine being put in motion, the paper which is to be printed is passed through and receives the impression. The types are inked by a cylinder, which is applied to revolve with its surface in contact with them. By this invention, the advantages of types between rollers are obtained, although the types are imposed upon plain surfaces.

Plate III. of Printing, contains a perspective view of a machine, the prism, A, of which is square in its section, and has the ordinary types or letter press applied upon its four sides, and firmly attached to it. The pivots at the end of the axis of this prism are supported in the frame B B, and it is caused to revolve, by a connection of wheelwork, D E and F G, from the winch and fly-wheel at H. The types upon its surface are caused to print upon the paper by means of a second roller, I i, called the platen, placed immediately beneath the former, and its surface being formed

PRINTING.

to a particular curvature, produced by four segments of cylinders, its circumference, when it turns round, will always apply to the surface of the types, and thus a sheet of paper being introduced between them will receive the impression. The ink is applied to the types by means of a cylinder, *K K*, placed above the prism. It is composed of a soft elastic substance; and that its surface may always apply to the types, its spindle is fitted in pieces *L, L*, which moving upon an axis, *n*, permit the cylinder to rise and fall, to accommodate itself to the motion of the types. The ink cylinder receives its ink from a second cylinder, *M M*, which is called the distributing roller, also composed of a soft substance, and is supplied with ink by a third ink roller *N N*, which is made of metal, and extremely true. The ink is lodged in quantity against this roller upon a steel plate, *O O*, the edge of which, being placed at a very small distance from the circumference, permits the roller, as it revolves, to carry down a very thin film of ink upon its surface, and this being taken off by the distributing roller, is applied to the surface of the inking cylinder, which, as before-mentioned, inks the types.

The sheet of paper is introduced, as shewn in the figure, by placing it upon a blanket, which is extended upon a feeding-board *P P*, and drawn into the machine at a proper time, by having a small ruler, *z*, fixed to it. The ends of this are taken forward by two studs, *b*, attached to endless chains, which are extended from the wheels, *e, e*, at the end of the platen, to other wheels, *d, d*, which are supported in the frame of the feeding-board. The wheels, *e, e*, having teeth entering the links of the chains, cause them to traverse when the machine is turned round, and at the proper time the pins, *b*, draw the ruler, *z*, and blanket forward, and introduce the paper into the machine, and by passing between the prism and platen, it is printed as before-mentioned. This is the general action of the machine, and we shall proceed to detail the structure of the several parts. The type is composed, and made up into pages, in the usual manner; the pages are then placed in frames or galleys, *a, a*, and fastened by the screws at the ends, the shape and size of the galleys being adapted to the size of the page it is intended to print. These galleys are attached to the four sides of the central axis of the prism by the screw-clamps *1*, the edges of the galleys being mitred together. By relieving the clamps the galleys can quickly be removed, and others put in their places. The platen, *I i*, is composed of four segments of cylinders, *i i*, which are attached to the different sides of the central axis, *I*, by means of screws, and these segments being proportioned to the prism, will be the true figure for the platen to produce the required motion, so that the surface, when it revolves, will, in all positions, preserve an accurate contact with the surface of the types. The two wheels, *D, E*, which cause the prism and platen to accompany each other, are formed to correspond with the two. Thus the upper wheel, *D*, is a square, with its angles rounded off, and the pitch or geometrical outline is exactly of the same size as the square formed by the surfaces of the types. The lower wheel, *E*, is of the same shape as the platen, and its pitch line the exact size of the surface thereof. These wheels being cut into teeth, as the figure shews, will turn each other round, and make their surfaces at the point of contact exactly correspond in their motions, so as to have no sliding or slipping upon each other. To regulate the pressure upon the paper, the bearings in which the pivots of the platen are supported, can be elevated by screws, *3*, and its surface will press with more force upon the types; but that this may not derange the action of the wheels, *D* and *E*, universal joints are applied in their

axles at *R*. The inking cylinder, *K*, is caused to preserve its proper distance from the centre of the prism by wheels, *S*, fixed upon its axis, and resting upon shapes, *T*, fixed upon the axis of the prism. Each of the shapes, like the wheel *D*, has four flat sides, corresponding in size with the surfaces of the types; the angles are rounded to segments of a circle from the centre: the wheels, *S*, are of the same size as the inking cylinder, therefore, as they rest upon the shapes, *T*, they prevent the ink cylinder pressing upon the types with any more than a sufficient force to communicate the ink without blotting: The inking cylinder is turned round by a cog-wheel, *V*, upon the extremity of the axis of the prism, which is of the same shape as the wheel, *D*, and engages another wheel, *W*, upon the end of the spindle of the inking cylinder: the latter wheel likewise gives motion to the distributing roller by a pinion, *f*, and this again turns the ink roller by a third pinion, *g*, fixed upon the end of its axis, *n*, which is supported upon bearings, *B, B*, in the frame. The pieces, *L, L*, which support the pivots of the distributing roller and inking cylinder, are fitted upon the axis, *n*, of the inking cylinder, so as to rise and fall upon its centre, and the distances of the rollers being thus kept invariably the same, their circumferences are kept accurately in contact, to communicate the ink to each other. The steel plate, *O*, which, as before-mentioned, regulates the quantity of ink that the roller, *N*, shall take round with it, is supported by a piece extended across the fixed frame, *B B*. There are pieces of metal fixed upon this plate by thumb nuts, which prevent the ink flowing off at the ends, and they enter into grooves formed round the ink roller, *N*, near its ends. The machine is put in motion by the handle with the fly-wheel *H*, and this has a small wheel, *G*, turning a large one, *F*, upon the end of the axis *l*.

The frame supporting the feeding-board, *P*, consists of two rails, *X*, fitted upon the axis of the platen, and supported at the opposite ends by a brace from the framing; they sustain the pivots of the wheels, *d, d*, for the chains; *x* are two rulers fixed at each side of the feeding-board, and forming a lodgment for the ends of the ruler *z*, which is attached to the blanket, and it slides upon these when it is advanced by the chains. The spaces on the platen between the segments, *i, i*, are all filled up by pieces of wood, except one, and in this space the ruler is received when it passes through the machine. In the interval when the spaces between the types are passing over the sheet, and therefore leave the margin between the pages of printing, the paper is not held between the rollers; but to prevent it from slipping during this interval, the blanket and paper are pressed down upon the pieces of wood which fill up in the platen between the segments, *i, i*, by the weight of small rollers or wires, *4*, supported by cocks, *5*, projecting from the axis of the prism, and being fitted into the slits at the end of these cocks. The wires are at liberty to rise and fall by their own weight; thus, when they are at the upper part of the revolution, they fall into the spaces at the angle of the prism, between the pages of the types, and thus escape the ink cylinder; but when they are at the lower part of their revolution, they fall upon the paper, and press it with sufficient force upon the pieces of wood in the platen to carry the paper forward at the interval when the types do not act upon it, and of course while the space between the pages of the printing is passing through.

The operation of printing being very delicate, and requiring great accuracy, the machine is provided with many adjustments to make it act correctly, which are as follow: The segments, *i, i*, upon the platen roller are attached to the central axis, *I*, by three screws at each end; the two
middle

PRINTING.

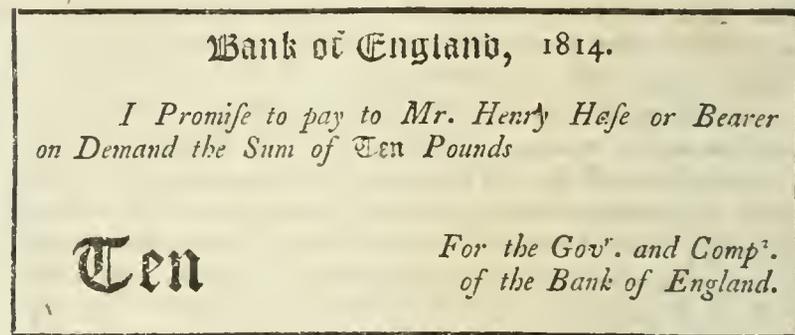

middle ones of these (represented with square heads) draw the segments down upon the central axis, whilst the others (which are turned by a screw driver) bear them off; therefore, by means of these screws, the segments can be accurately adjusted, till they are found by experiment to apply correctly to the types, and make an equal impression on all parts of the sheet. To render the whole impression greater or less, the screws, 3, beneath the bearings of the platen roller are turned as before-mentioned. The degree of pressure with which the ink roller bears upon the types, is regulated by increasing or diminishing the size of the shapes, T, which support its weight. And to render these capable of adjustment, each is composed of four pieces, marked 6, attached by screws, 7, to a central piece, or wheel, which is fixed upon the axis; and as the edges of these pieces form the outline of the shape, they admit of being adjusted by other screws to a greater or less distance from the centre, and of course may be made to bear up the ink cylinder, till the pressure on the types is equal throughout the whole surface, and sufficient to supply the ink properly. The ink cylinder is adjustable as to its pressure against the distributing roller, and for this purpose the bearings, k, which support the cylinder, are fitted upon the pieces, L, to slide, being capable of regulation by means of screws. In a similar manner the distributing roller can be adjusted to a proper distance from the inking cylinder. The plate, o, can be adjusted for the distance from the ink roller, N, by screws, p, fastened by thumb nuts: this regulates the degree of colour the impression will have, by permitting the roller, N, to take more or less ink: behind the inking cylinder, K, a rubber, or scraper, is placed, to press very lightly against the cylinder, and to prevent the ink accumulating, in rings, round the cylinder; it is fitted upon centres, and held up by a lever, which is suspended by a catch, y, at the end of the piece L. This catch is withdrawn when the machine is not at work, and then the scraper falling down upon its centre, does not touch the cylinder. It is necessary that the wheels D and E should be placed upon their axes, in such a position that their curvature will correspond with the curvature of the prism and platen. For this purpose the universal joint, R, is fitted upon the axis, l, of the wheel, with a round part, that it may turn on it. A piece of metal, r, is fixed fast upon the spindle, l, and has a hole in it for the reception of a tooth, s, which is screwed fast upon the universal joint; then two screws being tapped through the sides of the piece, r, press upon the end of s, and by forcing it either way, will adjust the wheel with respect to the platen, till they exactly correspond: another similar adjustment may be applied to the upper axis.

The manner of forming the inking and distributing rollers with an elastic substance, is worthy of particular notice. Leather stuffed in the manner of a cushion was first used, but did not succeed, because it became indented with the types; but after many trials, a composition of glue, mixed with treacle, was found to answer perfectly. The roller is made of a copper tube, covered with canvas, and placed in a mould, which is a cylindrical metal tube, accurately bored, and oiled within: the melted composition is then poured into the space of the mould, and when cold, the whole is drawn out of it, with the glue adhering to the copper tube, and forming an accurate cylinder without any farther trouble. The composition will not harden materially by the exposure to air, nor does it dissolve by the oil contained in the ink. This machine is well adapted to print from stereotype plates, which the universities have adopted for their bibles and prayer-books.

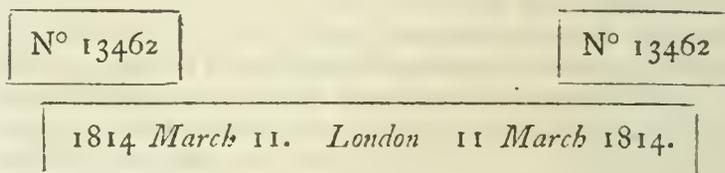

We understand that a printing machine will very soon be

produced by Mr. Bensley, which is the invention of a foreigner, who has taken several patents for it, but we have not yet had an opportunity of seeing one.

Printing Machine for numbering Bank Notes.—This machine is ingenious and curious, from the circumstance, that after every impression which is produced by it, the types are changed by mechanism, so as to produce a different impression the next time. The Bank of England have, within these few years past, adopted this method of filling up the blank spaces which are left in their notes after they have been printed from a copper plate by the rolling-press. These blanks, which are for the number and date of the note, were formerly filled up in writing; for each note being different in these particulars did not admit of being printed, until the present machine was invented by Mr. Joseph Brahmah. The note which is engraved on the copper plate, and printed, is as follows.

Upon these notes the machine is required to print the number twice repeated, which is first to be printed, in large characters, upon the word *I Promise*, in the first line, and again upon the words *or Bearer*, at the end of the same; as, for instance,

London and the date are printed in the blank line which is left after the words, *sum of Ten Pounds*.

The copper plates on which the above is engraven are double, that is, each prints two notes upon one long piece of paper, which being put into the machine, has the blanks printed in the easiest manner imaginable. In the operation of taking out the paper to put in another note, the machine changes the types to the succeeding number: for instance, if one of the notes is printed N° 10 N° 10, and the other upon the same paper, N° 100 N° 100, when the paper is taken out, the types change, without any attention of the operator, to N° 11 N° 11, and N° 101 N° 101, and when these are printed, they change again to the succeeding numbers. The types for the date are cast in stereotype, and are of course changed every day, each machine being furnished with one for every day in the year.

The advantages of this method have been found considerable, in avoiding mistakes of numbering notes erroneously, to which they were before very liable, and in the dispatch of business, its advantages are very great. To fill up 400 notes, with the number and date twice repeated, was considered a sufficient day's labour for each clerk; but by the machines, one man can print 1300 double notes, which are equal to 2600 single ones, or perform more than six times the business which could formerly be done in the same time. The Bank

PRINTING.

Bank of England have more than forty of these machines, one of which we have obtained drawings from ; but to diminish it to the size of a plate, our draughtsman has represented it as if cut in half, or made as a single machine, to print only one note at a time ; those in use at the Bank are therefore to be considered as double the length, and containing a repetition of the types and the machinery for moving them. In *Plate II. Printing, fig. 1.* is a section, and *fig. 2.* a plan, and the same letters refer to both. The whole is framed upon a thick board of mahogany, which is fastened down upon a table : the frame, which is of iron, is screwed to the board at *L*, and forms a square box, in which the mechanism is contained. *KK* is a brass lid, or cover, to the box, through holes in which the types, for printing the numbers, are placed, and their surfaces project a little above the surface of the cover, *K*, so as to produce an impression when the note is pressed down upon them by the power of the hand applied to the lever *D*. This lever moves upon an axis *A*, (*fig. 1.*) which extends across the box, having pivots fitted into sockets, *B*, (*fig. 2.*) projecting up from the frame, as is evident in the figure. From this axis a piece of metal, *C*, extends, and has screws, *l* and *m m*, in it, by which the tablet, or platen, *E*, is attached to it ; and these screws admit of adjusting the tablet, *E*, with respect to the axis, that its under surface may fall perfectly flat upon the types, and print with equal pressure upon all parts of the note. For this purpose four of the screws, *m*, pass through holes in the piece *C*, and screw into the tablet, so as to draw the two together ; whilst the other two screws, *l, l*, screw into the piece *C*, and their points bear upon the upper surface of the tablet, *E* ; it is therefore by the latter that the pressure is transmitted, the others being only for adjustment : the lever *DD* is fastened upon *C* by three screws, marked *n, o, o*. The note is placed upon the under surface of the tablet, *E*, when it is to be printed, its situation being determined by two fine pins fixed in the tablet, which are made to penetrate the paper at two small dots printed upon it by the copper-plate which printed the words of the note, as before-mentioned ; and it is confined in its position against the tablet by the frisket, which is a piece of vellum, *H*, stretched in a brass frame, and is connected by hinges, *a, a*, to the tablet *E* ; it thus folds down, enclosing the note between the tablet and frisket as it were in a book. The vellum of the frisket has openings cut through it at the places where the machine is to print upon the note. As it is necessary that the paper should be pressed upon the types by a yielding substance, the tablet, *E*, has two folds of cloth placed against its surface, and these are secured by a piece of parchment, stretched over a brass frame, which is attached to the tablet by four screws. The note therefore is placed against this parchment when it is to be printed ; and not against the brass of the tablet. Each circle, as shewn in *fig. 6*, has its circumference divided into 11 cogs, and in every cog a space is cut to receive one of the types which are arranged round the cogs, in a series of 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, and a blank ; and as the circles are placed close together, and turn round independent of each other, any combination of figures may be made by them which is less than $N^{\circ} 99,999$, beyond which number the bank-notes have not extended. Each of the circles has a tendency given it to assume the position in which the types are proper for printing ; that is, with their upper surface parallel to the brass plate *K*, by means of a small pin fitted into a hole in the axis *F*, and having a constant pressure outwards by a small spiral spring placed in the hole beneath it. This pin comes to rest in an angular notch made within the

circle, opposite each type, as shewn by the dark shaded parts in *fig. 6*, and each circle is provided with one of these pins. The end of the pin is formed spherical, and well polished, so that when the circle is turned round, it is forced into its hole in the axis *F* ; but when another notch in the circle presents itself, the pin presses out into it, and retains the circle with a moderate force in its proper position, but will not allow it to rest, except when the pin is in the notch. The word London and the dates are cast in stereotype, and are fastened down upon the surface of the cover, *K*, of the box, just beneath the letter *E*, in *fig. 1*. The dates are changed every day ; the catch, by which they are fastened on the plate, being very readily withdrawn ; but when thrown up, holds them sufficiently fast. The types for printing the numbers are moveable, and herein the invention consists ; they are fixed in the circumferences of wheels, or circles, *d, d*, (shewn also at *e, e*, in *fig. 3*, where the types are plainly pointed out by the numerals upon them) ; these circles are ten in number, and are divided into two clusters, one at each end of the spindle, or axis, *F*, upon which they all revolve freely. This axis, when in the machine, as at *F*, (*fig. 1.*) extends across the frame from side to side, and the types fixed in the circles project above the surface of the cover, *K*, passing up through holes made in the same, as is evident from the figure. By this means the types always arrange themselves into a straight line, and also with their surfaces parallel to the surface *KK*, without which they would not print equally upon the paper. From this description, our readers will perceive that the machine has the power of printing any numbers, or series of numbers, containing less than five figures, by turning the circles round one tooth every time after an impression has been taken, so as to bring a succeeding type into action. But the machine is rendered very complete, by the addition of the following mechanism, to give motion to the circles. A catch or click, *b*, is fixed upon the axis, *A*, of the platen, and acts in the teeth of a wheel, *H*, fixed upon an axis, *G*, (see also *fig. 4.*) which is extended across the machine, and the teeth of other similar wheels, *H* and *K*, (*fig. 4.*) enter into the spaces between the types in the circles *d, d*, as seen in *fig. 1*, and thus, when the axis, *G*, is turned round, it communicates a corresponding motion to some of the circles. The click, *b*, is fixed on the axis, *A*, in such a position, that it does not operate upon the teeth of *H*, except when the handle, *D*, is lifted up, or rather thrown back, as far as it will go, which is regulated by pieces screwed upon the axis coming in contact with the stops fixed upon the plate *K* ; and in doing this, the catch, *b*, moves the wheel, *H*, round one tooth, and consequently the wheel *d*, so as to bring up another type.

The operator, in using the machine, first inks the types with a small printer's ball, opens the frisket sheet, *H*, upon its hinges, *a*, and places the note against the tablet, the proper place being determined by the dots and pins before-mentioned. He now shuts up the frisket, and encloses the note between it and the tablet, the frisket sheet having holes cut through it at the places where the note is to be printed. The handle, *D*, is now brought down to give the impression ; but in this, it should be observed, that though the catch, *b*, again meets the tooth of the wheel *H*, it has no effect upon it, being fitted upon a joint, so as to give way in this direction, and it passes by without moving the wheel. The pressure for printing is given in an instant, and the handle, *D*, being then lifted up to remove the note, and place a fresh paper upon the tablet, the catch, *b*, moves the wheel, *H*, one tooth ; and as these engage the teeth of the

PRINTING.

the circles, *d*, they are turned likewise to change the types ready for printing the succeeding numbers.

We have now to explain the order in which the change of the numbers is conducted. The wheels, H and K, (*fig. 4.*) are only intended to operate upon one of the five circles at the same time; but by sliding the axis, G, endways in its bearings, they can be made to act upon any one of the five which is required; and in all cases the distance between the two wheels, H and K, is such, that they will operate upon the same circle of the assemblage, at either end at the same time. The axis, G, can be retained in any required position by a semi-circular clip, which enters into grooves, *e*, (*fig. 4.*) formed round the axis, and there are five of these, corresponding with the different positions of the axis proper for the wheels to act with the several circles. The shifting of the axis is performed by the knobs at the ends of the spindle, G, which come through the sides of the box, the semi-circular clip which retains it being first lifted up, by turning a knob, *k*, which operates upon it. When the printing first begins, the circles, *d*, are turned round by means of a wooden skewer, so that all the blank types are brought up at the same time. The axis, G, is next set, so that its wheels, H and K, are engaged with the right-hand circle of each of the assemblages of five at each end. In this situation, if the handle, D, is moved down, in raising it up again, the catch, *b*, moves the wheels round, and brings up N^o 1 N^o 1 of the types, and a note being printed with this, in lifting up the handle N^o 2 is brought up. Another note is now printed, then N^o 3, and so on, till N^o 9 is printed, and 0 brought up; after which, the handle is brought down twice without printing any note. This brings up the blank space and N^o 1. The axis is now shifted by its knob Q, (*fig. 1.*) to act upon the second circle from the right-hand, and one motion of the handle being made, brings up 0 of the second circle, making 01 °N, which, when printed, (types being always in reverse,) will be N^o 10. The first circle to the right-hand, which before was units, is now become tens, and the second units, which therefore shifts, at every impression, to 11, 12, &c. up to 19; and after printing this the 0 comes up, making 10. The first right-hand circle is then pushed forwards by the printer by a small wooden skewer, and 2 brought up, making 20. In this manner it proceeds, changing the first circle by hand at every ten, the machine altering itself at every unit, till 99 are printed. When 100 is to be printed, the axis, G, is shifted to the third circle, which becomes units, the second, tens, and the first, hundreds. The printing then proceeds as before, the units being advanced by the machine, but the tens and hundreds, as often as they require it, are advanced by hand. At 1000 the axis is shifted to the fourth circle, and the denomination of each is changed by this becoming the unit: three circles must now be moved by hand, as often as they require it. On arriving at 10,000, the fifth circle must be made unit, by shifting the axis to it, and the four first are moved, when necessary, by hand, and in this manner the machine will print up to 99,999, which is 100,000, wanting 1.

PRINTING, *Chinese*. There are three opinions as to the antiquity of the Chinese printing: one fixing it three hundred years before Christ; another nine hundred years after him; and a third carrying it still farther back, and making it coeval with that mighty empire; though, it must be allowed, the last is much the least probable of the three.

The manner of printing we have already hinted to be very different from that which now obtains among the Europeans. It is true, it has some advantage over our's in correctness, and the beauty of the character; but, in other respects, it

comes far short, the single advantage of moveable characters making more than amends for all that is urged against us by some zealous advocates for this oriental printing.

Books are printed in China from wooden planks, or blocks, cut like those used in printing of calico, paper, cards, &c. among us.

These blocks are made of a smooth, firm, close wood, and of the size of the leaf required. On the face-side they glue a paper, upon which some able penman draws out the several letters and characters with a Chinese pen, which is a kind of pencil. This is the principal part of the work, and that on which the success of the rest depends.

When finished, the block is put into the hands of a sculptor, or cutter in wood; who, following the several strokes of the writer with his gravers, and other sharp little instruments, makes them all appear in relief on the wood. When the carving or cutting is finished, they moisten what remains of the paper, and rub it gently off.

The ink they use in printing is the same with the common Chinese ink, with which they also write, and is made of lamp-black, mixed up with other ingredients.

Their press resembles our rolling-press much more than the letter-press.

As to their paper it is inferior to our's: it is made of the inner bark or rind of a kind of rushes, beat up with water into a pulp or paste, and formed in moulds, much like our's. See PAPER.

The advantages of the Chinese printing consist in this, that they are not obliged to take off the whole edition at once, but print their books as they need them; that the blocks are easily retouched, and made to serve afresh, and that there needs no corrector of the press.

Its disadvantages are, that a large room will scarcely hold all the blocks of a moderate volume; that the colour of the ink easily fades; and that the paper is apt to tear, and is subject to worms: whence it is, that so few ancient books are seen in China.

PRINTING, *Rolling-Press*, is employed in taking off prints or impressions from copper-plates engraven or etched.

It differs, as we have before observed, from letter-printing, in that the marks and characters, whose impressions are to be taken, in the former case are indented, or cut inwards; and in the latter are in relief, or stand out.

This art is said to be as ancient as the year 1460, and to owe its origin to Finiguerra, a Florentine goldsmith; who, casting a piece of engraven plate in melted brimstone, found the exact print of the engraving left in the cold brimstone, marked with black licked out of the strokes by the liquid sulphur.

Upon this, he attempted to do the same on silver plates with wet paper, by rolling it smoothly with a roller; and this succeeded.

This novelty tempted Baccio Baldini, a goldsmith of the same city, to attempt the same; which he did with success, engraving several plates of Sandro-Boticello's design, and printing them off in this new way; in which he was followed by Andrew Mantegna, then at Rome.

This knowledge getting into Flanders, Martin of Antwerp, a famous painter, graved abundance of plates of his own invention, and sent several prints into Italy, marked thus, M. C. After him, Albert Durer appeared, and gave the world a vast number of prints both in wood and copper. About this time, one Hugo de Carpi, an Italian painter, found out a way, by means of several pieces of wood, to make prints resemble designs of chiaro-scuro (see CUTTING in Wood); a method revived in our country, some years ago, with much success by Kirkall, and since at Venice by

Jackson, though very imperfectly; and some years after, the invention of etching was discovered, which was soon after made use of by Parmeggiano.

Mr. Walpole observes, that it was not till Raphael had formed Marc Antonio, that engraving placed itself with dignity by the side of painting. See ENGRAVING and ETCHING.

When the art reached England does not certainly appear. Mr. Chambers, on the authority of Mr. Bagford, (see Phil. Trans. N^o 310. p. 2397, or Abr. vol. v. part ii. p. 20.) erroneously said, that it was first brought from Antwerp by Speed, in the reign of James I.; whereas we had it in some degree almost as soon as printing; the printers themselves using small plates for their devices and rebuses. Caxton's Golden Legend, printed in 1413, has in the beginning a group of saints, and many other cuts disposed through the body of the work. The second edition of his Game of Chesse, and Le Morte de Arthur, had also cuts. Wynkyn de Worde, Caxton's successor, prefixed to his title of the Statutes, in the seventh year of Henry VII. or 1491, a plate with the king's arms, crests, &c. a copy of which is given in the Life of Wynkyn, by Mr. Ames, in his Typographical Antiquities, p. 79. The same printer exhibited several books adorned with cuts, some of which are particularly described by his biographer, p. 87, 88, 89, &c.

The subsequent printers continued to ornament their books with wooden cuts. One considerable work, published by John Rastell, called the Pastyme of the People, and Rastell's Chronicle, was distinguished by prints of such uncommon merit for that age, as to have been ascribed to Holbein. Grafton's Chronicle, printed in 1569, contained many heads, as of William the Conqueror, Henry VIII., queen Elizabeth, &c. and many more are recorded by Ames. But though portraits were used in books, Mr. Walpole observes, that he can find no trace of single prints being wrought off in that age. Those which composed part of the collection of Henry VIII. were probably the productions of foreign artists. The first book that appeared with cuts from copper-plates, or at least the first that Mr. Ames had observed, was the Birth of Mankind, otherwise called the Woman's Book, dedicated to queen Catharine, and published by Thomas Raynalde in 1540, with many small copper cuts, without any name. See Ames, ubi supra, p. 35. 46. 60, and 219. Walpole's Catalogue of Engravers, &c. 4to.

The fabric of the rolling-press, and the composition of the ink used in it, with the manner of applying both in the taking off prints, are as follow:

Structure of the Rolling-Press.—This machine, like the common press, may be divided into two parts: the *body* and *carriage*, analogous to those in the other.

The body consists of two cheeks of different dimensions, ordinarily about four feet and a half high, a foot thick, and two and a half apart, joined at top and bottom by cross pieces. The cheeks are placed perpendicularly on a wooden stand or foot, horizontally placed, and sustaining the whole press.

From the foot likewise rise four other perpendicular pieces, joined by other cross or horizontal ones; which may be considered as the carriage of the press, as serving to sustain a smooth, even plank, which is about four feet and a half long, two feet and a half broad, and an inch and a half thick; upon which the engraven plate is to be placed.

Into the cheeks go two wooden cylinders or rollers, about six inches in diameter, borne up at each end by the cheeks, whose ends, which are lessened to about two inches

diameter, and called *trunnions*, turn in the cheeks between two pieces of wood, in form of half-moons, lined with polished iron, to facilitate the motion.

The space in the half moons, left vacant by the trunnion, is filled with paper, pasteboard, &c., that they may be raised and lowered at discretion; so as only to leave the space between them necessary for the carriage of the plank charged with the plate, paper, and blankets.

Lastly, to one of the trunnions of the upper roller is fastened a cross, consisting of two levers, or pieces of wood, traversing each other. The arms of this cross serve in lieu of the handle of the common press; giving a motion to the upper roller, and that to the under one; by which means the plank is protruded, or passed between them.

Preparation of the Ink.—The ink used in rolling-press printing, is a composition of black and oil mixed and boiled together in a due proportion.

The black is a factitious matter, made, as some suppose, of the oil of vine twigs, or, according to others, of the kernels of fruits, such as peaches and apricots, well burnt, with wine lees.

This black is usually brought hither ready prepared from Frankfort on the Maine; whence our printers call it Frankfort black.

This is softer and more free from grittiness than the ivory or other charcoal blacks, as they are usually prepared among us.

The oil with which they dilute this black is nut-oil; which is set on fire, boiled up differently, according to the different works it is to be used in; but never so far as to communicate to the oil the adhesive gluey quality of the printer's varnish.

They usually make three kinds, thin, thick, and strong, only differing in the degree of coction; the strong is that used in the finest works, &c.

To make the ink, they pulverize the black very carefully, and pass it through a fine sieve; then mix it up on a marble with the proper oil, by means of a mullet, after the same manner as the painters do their colours.

PRINTING from Copper-plates, Method of.—The ink being prepared, they take a little quantity of it on a rubber, made of linen rags, strongly bound about each other; and with it smear the whole face of the plate, as it lies on a grate, over a charcoal-fire.

The plate sufficiently inked, they first wipe it coarsely over with a foul rag, then with the palm of the left hand, then with that of the right; and to dry the hand, and forward the wiping, rub it from time to time on whiting. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, consists a great part of the address of the workman. The French printers use no whiting, as being detrimental to the colour of the ink; nor do they lay the plate on the grate to warm, till after inking and wiping it.

The plate, thus prepared, is laid on a thick paper, fitted upon the plank of the press; over the plate is laid the paper, first moistened, to receive the impression; and over the paper two or three folds of blanketing, or other stuff.

Thus disposed, the arms of the cross are pulled, and, by this means, the plate, with its furniture, passed through between the rollers; which, pinching very strongly, yet equably, presses the moistened paper into the strokes of the engraving, whence it licks out the ink.

Some works require being passed twice through the press, others only once, according as the graving is more or less deep, or the greater or less degree of blackness the print is desired to have.

It must be observed, that the stronger and thicker the ink is, the stronger must the rollers pinch the plate; this tempts many of the workmen to use a thinner oil, in order to save labour; which proves very prejudicial to the impression.

The wetting of the paper ought to be done two or three days before printing it, to render it more supple and mellow: as the prints are drawn off, they are hung up to dry on lines, &c.

Lastly, after the number of prints desired have been wrought off from the plate, they rub it over with oil of olives, to prevent its rusting, and set it by against a new impression. If the strokes of the graving be perceived full of ink hardened therein in the course of the printing, they boil it well in ley before the oil be applied.

PRINTING *with wooden prints.* See CUTTING *in Wood.*

PRINTING *in chiaro-scuro*, is a method of producing a strong effect of relief, attended with a just and natural gradation of the lights and shades, grounded with brown, with white and black, by printing on paper. We have already observed, that the art of doing this in wood was discovered in Italy, by Hugo de Carpi. M. le Bosse directs it to be performed in the following manner. Having provided two copper-plates of equal size, and exactly fitted to each other, on one of them let the proposed design be engraved, and let the prints be taken off from it with printing ink on sheets of grey paper. The other plate must then be varnished, and the varnished side being laid upon the sheet printed by the first plate, they must be passed under the roller; when the print will have made a counter-proof on the varnish of the plate; after which the lights must be graved on the plate, and corroded very deeply by aquafortis. The same thing may otherwise be done with the graver, and with greater ease by those who can use it well. In order to properly prepare the oil, the best method is to use very white nut-oil drawn without fire, and to put it into two leaden vessels, and set it in the sun till it becomes thick in the proportion of the weak oil. Flake white must then be taken, which must be ground, and washed over, till it be extremely fine; and then being dry, it must be ground with the weak oil, and the thick oil added to it. Then having taken an impression with black printing ink, or any other colour, from the first plate, that is entirely engraved, on coarse grey paper, it must be left to dry for ten or twelve days; when these prints having been wet, another impression must be made upon them by the plate, on which the lights are engraved, charged with the white flake and oil in the usual manner of printing; taking care that the correspondent parts of the plate, and the impression already made, may be adapted exactly. By this means the printing in chiaro-scuro is perfectly performed. See CLAIR *Obscure.*

PRINTING *with a variety of colours to imitate painting.* See MEZZOTINTO.

PRINTS, PROPERTV OF. See LITERARY *Property*, and ENGRAVER.

PRINTZ, WOLFFGAN GASPAR, in *Biography*, a practical, theoretical, and historical musician of Germany, whose writings and memory are much respected by his countrymen. He was born in 1641, at Waldthuen, a small city in the Upper Palatinate, on the frontiers of Bohemia, where his father was a principal magistrate, and a receiver of the public revenues; but on account of his religion he quitted that station, and removed to Vavenstraces, a small town in the territory of Furstenberg. The young Printz, having discovered an inclination for music, was committed to the care of several able masters successively, of whom he learned

to play on several different instruments, and studied composition till 1659; after which he went to the university of Altdorf, where he continued till the year 1661, when he seems to have made good use of his time, as his reading and classical knowledge appear considerable.

He had several small appointments in different parts of Germany, as canter, and music director; but none very considerable. However, while he filled these offices, he produced 21 different works upon music; but the most important, and that which now is only sought, is his *History of Vocal and Instrumental Music; historisch Beschreibung der edelen Sing- und Kling-kunst*, Dresden, in 4to. 1690.

The book is now become so scarce, that we have never been able by our own diligence, or that of our friends, to procure a copy of it; and all we know of its contents has been derived from Walther, and Marburg's extracts and account of it in his *Musical Essays*, vol. i. p. 104; by which, however, it appears, that his plan and arrangement were good, and the authors he had consulted the best on the subject. The work seems never to have been finished, as it consisted but of two hundred and twenty-three pages, and M. Marburg's extracts advance no farther in the narrative than Tuifco and Bardus, kings of the ancient Germans and Gauls, who founded the orders of druids and bards.

Printz was not only an historian, musical composer, and critic, but a satirist. His work entitled, *Der Satyrische Componist; the Satirical Composer*, which we have seen, and of which there are five parts, seems to have been produced "in Rabelais easy chair." This work is written with considerable wit and humour. The jests indeed are not of the most delicate and refined sort, though extremely queer and risible.

PRINTZENDORF, in *Geography*, a town of Austria; three miles N.N.W. of Zisterdorff.

PRINTZERDORFF, a town of Austria; four miles W. of St. Polten.

PRIOLA, a town of Italy, in Friuli; 12 miles N.W. of Gemona.

PRIOLO, or PRIOLI, BENJAMIN, in *Biography*, a writer of French history, was born at St. Jean d'Angely, in 1602, of a family descended from Prioli, or Priuli, of Venice. He was educated in the reformed religion, and displayed from a very early period a great avidity for learning. He lost both his parents at the age of 15, and having pursued his introductory studies in his own country, he went to Leyden, where he perfected himself in classical literature under Heinius and Vossius. The desire of consulting Grotius induced him to visit Paris, after which he studied philosophy at Padua, under Cremonini and Liceto. He then attached himself to the duke of Rohan, who was at that time in the service of Venice, and became the intimate confidant of that nobleman, who sent him twice into Spain as his negotiator. He afterwards fought in several actions under his banners. At the death of the duke he retired to Geneva, and married a lady of noble family. He was called from his retreat by the duke de Longueville, when appointed plenipotentiary for the peace of Munster. Here he resided a year, then returned to France, and was converted to the Catholic faith. In the ensuing troubles in France, he took part with the prince of Condé against the court, and was in consequence obliged to retire into Flanders, his property being confiscated, and his family exiled. When he was restored to favour he returned to Paris, and employed himself in composing the history which has preserved his name. This is entitled "Benjamini Prioli ab Excessu Ludovici XIII. de Rebus Gallicis Historicis, Lib. xii." It was first printed at Paris in 1665, but the best edition is that of Leipsic, in 1686. A dedication

dedication is prefixed, addressed to the doge and senate of Venice, as a token of gratitude for their recognizing him as a noble Venetian, and creating him chevalier of St. Mark. The style of this history is copied from that of Tacitus, and it abounds in characters and portraits, often touched in a satirical manner, but the narrative is said to be a free and faithful relation of the war of the Fronde, and the administration of cardinal Mazarin. Prioli died in 1667. Various works were announced at the close of his history as about to be published, but they never made their appearance. Moreri. Bayle.

PRIONUS, in *Entomology*. See CERAMBYX.

PRIOR, MATTHEW, in *Biography*, a distinguished English poet, was born in 1664, according to one account, in London, where his father was a citizen and joiner, but according to another, at Wimborne, in Dorsetshire. His father dying while he was young, he was brought up by an uncle, a vintner, who sent him to Westminster school, then under the direction of the famous Busby. His uncle took him from school before he had passed a regular course, with an intention of bringing him up to his own business; but he had already imbibed a taste for classical literature, and was unfitted for trade. The earl of Dorset, at that time a patron of letters, who frequented his uncle's tavern, found him reading Horace, and on conversing with him, was so much pleased with the modesty and talents which he displayed, that he determined to give him an university education. He was admitted of St. John's college, Cambridge, in 1682, and was elected to a fellowship in 1686. Here he contracted an intimacy with Charles Montague, afterwards earl of Halifax, in partnership with whom he composed the "Country Mouse and City Mouse," which was a parody of Dryden's poem of the "Hind and Panther," and consequently was a declaration of their attachment to the principles which soon after effected the revolution. His next poetic piece was an "Ode on the Deity," written in 1688, as a college exercise. In the following year he went to London, and was introduced at court by the earl of Dorset, who recommended him so effectually, that in 1690 he was appointed secretary to the English plenipotentiaries who attended at the congress at the Hague. He was now completely in the service of the court, and the efforts of his muse were for some years chiefly directed to public or courtly topics. In 1697 Prior was nominated secretary to the commissioners for the treaty of Ryswick, and after his return from that employment, was made secretary to the lord lieutenant of Ireland. He went to France in the following year as secretary to the ambassador, the earl of Portland, and remained in that employment under the earl of Jersey. After this he was appointed under-secretary of state; and was sent to Paris to assist the ambassador in negotiating the partition treaty. In 1700 he succeeded the great Locke as a commissioner at the board of trade, and he sat in the parliament as representative of East-Grinstead. The Tories were now become the prevalent party, and Prior forsook his friends the Whigs, by whom he had been brought into life, and promoted; and joined their opponents, to whom he ever after adhered. He even voted for the impeachment of those lords who were charged with advising that partition treaty, in which he had been officially engaged. Like most converts, he embraced his new party with great zeal, and thenceforward almost all his social connections were confined within its limits. Prior now celebrated the victories of Blenheim and Ramilies, and about the same time he published a volume of poems, of which the concluding piece was his admired "Henry and Emma." In the year 1711 he was sent to Paris in a diplomatic character, with pro-

posals for peace. The congress of Utrecht followed, and in August 1712 he was with lord Bolingbroke at Paris, who was sent there to adjust some difficulties that had occurred. Prior remained in France with the authority and appointment of an ambassador, though without the title, for the duke of Shrewsbury, who went in that capacity, refused to be joined in the same commission with a man so meanly born. Talents, however, are not always allied to high birth, and Prior possessed the confidence of the French court, and was entrusted by Lewis with a special letter to queen Anne, in favour of the elector of Bavaria. After the departure of the duke, in 1713, he publicly assumed the character of ambassador, which he retained till he was superseded by the earl of Stair, on the accession of George I. It was some time before he received remittances from the treasury, enabling him to return; and soon after his arrival in 1715, the Whigs being now in power, he was committed to the custody of a messenger. He was examined closely with respect to his share in negotiating the peace of Utrecht, and Mr. Walpole moved an impeachment of him on a charge of high treason, for holding clandestine conferences with the French plenipotentiary; and when an act of Grace was passed, he was excepted, and treated with a considerable degree of rigour. At length, however, he was discharged without being brought to trial. Hitherto Prior had been chiefly considered as a politician; and though some persons have expressed contempt of his political talents, yet that they were regarded in a respectable light by the heads of both parties is evident from the situations which he held, and there can be no doubt that he possessed the faculty of rendering himself acceptable to the courts to which he was sent. Prior was now reduced to a private station without any provision for his declining years, except his fellowship at the college, which he prudently retained during his highest employments, as what would furnish him with necessaries should every thing else fail. He now completed his longest poetical piece, entitled "Solomon," which, with some other pieces, supplied matter for a folio volume, published by subscription at two guineas. By the efforts of his friends a considerable sum of money was thus raised. He continued occasionally to amuse himself with writing verses; but had reserved for the serious employment of his advanced years, the composition of a history of his own times. The design was, however, cut short by a lingering illness, which put an end to his life in September 1721, in the 58th year of his age. He was interred in Westminster Abbey, under a monument, for the erection of which he left, by will, 500*l*. On the monument is a long Latin epitaph drawn up by Dr. Freind, the master of Westminster school.

"Prior," says one of his biographers, "appears to have been one of those characters whom wit, ease, and companionable qualities, render general favourites, without any exact estimate of moral desert. His dereliction of his first political friends might be atoned for by his steadfast attachment to the second, especially to the earl of Orford, whom he sheltered, on his examination, with a constancy that was probably the cause of the severity with which he himself was treated. His modes of life appear to have been irregular, and notwithstanding his introduction to the highest and most cultivated society, he is said to have retained a taste for low company and gross enjoyments." As a poet his reputation has a good deal declined with the lapse of years, yet in one point, the faculty of telling a story with ease and vivacity, he has, perhaps, scarcely been equalled. His songs and amatory pieces are generally elegant and classical. The most popular of his serious compositions is "Henry and Emma,"

or the Nut-brown Maid. A complete edition of his poems was given in 1733, in three vols. 8vo. Biog. Brit. Johnson's Lives of the Poets.

PRIOR, *before*, something that is nearer the beginning, than another with which it is compared.

PRIOR is particularly used for a superior of a convent of monks, or the second person after the abbot.

Priors are either *claustral* or *conventual*.

PRIORS, *Conventual*, are the same as abbots, all the difference between them being in name; both having the same rights, and both alike being governors of monasteries.

These are of two kinds; *viz.* *regular conventual* priors, who govern religious living in the community; and *secular* or *commendatory conventual* priors.

Conventual priors are obliged to take up the priesthood within a year, or at most two, from the dates of their provision: in default of which, their benefices are declared vacant.

Priors must be twenty-five years old before they can govern the convent; and twenty, if the convent be governed by another. See CONVENTUAL.

Some of these abbots and priors were so considerable, that they were called to parliament, and had seats and votes in the house of lords.

Mr. Fuller says, that in the 49 Hen. III. 64 abbots and 36 priors were called to parliament. But this number being too great, king Edward I. reduced it to 25 abbots and two priors, to whom were afterwards added two abbots; so that there were 29 in all, and no more, that stately and constantly enjoyed this privilege, among whom was the prior of St. John's of Jerusalem, who was stiled the first baron of England, but it was with respect to the lay barons only, for he was the last of the spiritual ones.

PRIOR, *Claustral*, is he who governs the religious of an abbey, or priory, *in commendam*; so called, because he has superiority in the cloister or monastery.

His jurisdiction is wholly from the abbot, and ends with the abbot's death, unless he has been elected by the whole convent.

PRIOR, *Grand*, is the superior of a large abbey, where several superiors are required; as in the abbeys of Cluney and Feschamp.

In the monastery of St. Deny's, there were anciently five priors; the first of whom was called the *grand-prior*. In most monasteries, there is also a *sub-prior*. There are also grand-priors in the military orders; as in that of Malta, or St. John of Jerusalem, &c.

PRIORS *Aliens* were certain religious, born in France and Normandy, superiors of religious houses erected for their country-folks here in England.

These Henry V. deeming no good members for this land suppressed; and their livings were afterwards given by Henry VI. to other monasteries and houses of learning; but chiefly, as Stow observes, to the erecting of those two famous colleges, called the *King's colleges of Cambridge and Eton*.

PRIOR, *Arch*. See ARCH-prior.

PRIOR *Medii*,
PRIOR *Indicis*,
PRIOR *Annularis*,
PRIOR *Auricularis*, } Four of the interossei muscles of the hand. The first belongs to the external, and the three last to the internal interossei. See INTEROSSEI.

PRIORAU, in *Geography*, a town of Saxony; five miles N. of Bitterfeld.

PRIORITES, in *Botany*, a name given by the ancient Greeks to a plant which they recommended in medicine; but they do not clearly explain what it was. It is the same with the *cestrum* and *psuchrotrophon* of the same writers;

and they say it was called *betonica*, *ferratula*, or *rosmarinus*, by the Romans.

It is evident, from a strict enquiry into their accounts, that the *ferratula* was the plant they meant; for Pliny says, that the *betonica* was only a Gaulish name for this plant, and the place of growth, which is described to be wet shady places, evidently excludes what we call *rosemary* from any title to the name.

Apuleius has greatly perplexed the cause, by saying that the *priorites*, or *betony*, has leaves like the docks; but he does not distinguish between the *betonica* and *britannica*, which last plant is the *hydrolapathum*, or great water-dock, and has leaves like the other docks; and it is plain, that both Apuleius and Pliny borrow the account of the dock-like leaves from this passage, and attribute them to a plant the original author never meant them for.

PRIORITY, PRIORITAS, the relation of something, considered as it is *before*, or *prior* to, another; *i. e.* as it is nearer to the beginning, or the first.

The principal modes of priority are five; *viz.* in respect of *time*; as when we say, that the Grecian empire was prior to the Roman; *nature*, as when we say, one is prior to two; *order*, *dignity*, and *causality*; which are all summed up in the technical distich:

“Tempore, natura, prius ordine, die et honore;
Effecto causam dicimus esse prius.”

PRIORITY, in *Law*, denotes an antiquity of tenure, in comparison of another less ancient.

PRIORITY, *To hold by*, is to hold of one lord more anciently than of another; in respect of which the tenant is said to *hold in posterity*. The lord of the priority shall have the custody of the body.

PRIORITY of *Debts*, in *Law*. See DEBT.

PRIORY denotes a society of religious, the superior of which was denominated a prior, or prioress; and of these there were two sorts; as where the prior was chief governor, as fully as any abbot in his abbey, and was chosen by the convent; such were the cathedral priors, and most of the Austin order, and where the priory was a cell, subordinate to some great abbey; and the prior was placed and displaced at the will of the abbot. There were also priories alien. See ALIEN Priories, and PRIORS *Aliens*.

PRISAGE, PRISAGIUM, that share which belongs to the king, or admiral, out of such merchandises as are taken at sea as lawful prize. See PRISE.

PRISAGE of *Wines*, a custom in certain ports, by which the king challenges out of every vessel laden with wine, containing twenty tons, or upwards, two tons of wine; the one before, the other behind the mast; which, by charter of Edward I., was exchanged into a duty of 2*l.* for every ton imported by merchant strangers.

The custom varies a little in various places: at Boston, *e. gr.* every bark, laden with ten tons of wine, pays prisage.

The term is now grown into disuse; and in lieu of prisage, the custom, says Cowel, is popularly called *butlerage*; because it is the king's chief butler that receives it.

PRISCA, in *Geography*, a town of European Turkey, in Albania; 12 miles N. of Albasano.

PRISCIANUS, in *Biography*, an eminent grammarian, was a native of Cæsarea, and went to Constantinople, where he taught grammar and rhetoric with much success about the year 525. He composed various works, of which his treatise “*De Arte Grammatica*” was first published by Aldus Manutius, at Venice, in 1476, from a MS. found in France. It has been reprinted frequently, but the best edition

tion is said to be that of Patfchius, 1605, among the Grammatici Latini. A translation of Dionysius' Periegesis into Latin verse is attributed to Priscian, and has been printed with the Oxford edition of that author. The grammatical fame of this author may be justly inferred from the proverbial phrase of "breaking Priscian's head," applied to a violation of grammar.

PRISCILLIANISTS, PRISCILLIANISTÆ, in *Ecclesiastical History*, ancient heretics, who arose in Spain, or rather were derived thither from Egypt, towards the end of the fourth century.

The origin of this heresy is not well known; but it appears to have been brought into Spain by one Marcus of Memphis, who had for his disciple the rhetor Helpidius, under whom Priscillian was educated.

What their particular tenets were, it is not easy to discover; but they are charged by their adversaries with indulging all kinds of secret filthiness, and nocturnal mixtures, under a religious notion. Among their dogmata, this is said to have been one: "Jura, perjura, secretum prodere noli."

It appears, however, from authentic records, that the difference between their doctrine, and that of the Manicheans, was not very considerable; for they denied the reality of Christ's birth and incarnation; maintained, that the visible universe was not the production of the Supreme Deity, but of some demon or malignant principle; adopted the doctrine of æons, or emanations from the divine nature; considered human bodies as prisons, formed by the author of all evil to enslave celestial minds; condemned marriage, and disbelieved the resurrection of the body. Their rule of life and manners was rigid and severe; and the accounts which many have given of their lasciviousness and intemperance deserve not the least credit, as they are totally destitute of evidence and authority. That the Priscillianists were guilty of dissimulation upon some occasions, and deceived their adversaries by cunning stratagems, is true; but that they held it as a maxim, that lying and perjury were lawful, is a most notorious falsehood, without even the least shadow of probability, however commonly this odious doctrine has been laid to their charge.

Priscillian, their leader, was a man of great birth, fortune, parts, and learning: he was condemned, with some bishops his adherents, in a council at Saragossa, in the year 380, and in another at Bourdeaux in 384; but he appealed to the emperor Maximus, and had a hearing at Treves; where being convicted of broaching novelties, he was condemned to death, with several of his followers. His doctrine, however, survived him, and was propagated through the greatest part of Spain and Gaul. Mosheim's *Eccl. Hist.* vol. i. 8vo. edit.

PRISE, or PRIZE, in *Navigation*, a vessel taken at sea from the enemies of the state, or from pirates, by a man of war, or a merchant-vessel having commission from the admiral.

Vessels are looked on as a lawful prize, if they fight under any other standard than that of the state from which they have their commission: if they have no charter-party, invoice, or bill of lading, aboard them; if they be laden with effects belonging to the king's enemies, or with contraband goods.

Those of the king's subjects, recovered from the enemy, after having remained twenty-four hours in their hands, are also deemed lawful prize.

Vessels, that refuse to strike their sails, after having been summoned thereto by the king's ships, may be constrained

to do it; and, if they make resistance, and fight, they are lawful prize.

The officers and seamen of the king's ships, and of other British ships having letters of marque, are intitled to the sole interest, and property of all ships and goods by them taken, and adjudged lawful prizes by the court of admiralty.

The prize is to be divided among the officers and seamen of the king's ships, as he shall appoint by proclamation. Among privateers, the division is according to the agreement between the owners.

The court of admiralty is to finish the examination of the persons to be examined to prove the lawfulness of the prize, in five days after request for that purpose made. The monition is to be executed in three days. And in case no claim of the capture be duly entered, giving twenty days notice after the execution of the monition; or if there be a claim, and the claimant does not give sufficient security to pay double costs to the captors, if the prize be adjudged lawful, then the court is to proceed to sentence in ten days.

In case of doubt, or of witnesses being remote, the court may release the prize, on the claimant's giving good security to the captors for the payment of the full appraised value, in case the prize be adjudged lawful.

Judges and officers, on failure of their duty, in respect to the condemnation of prizes, forfeit 500*l.* with full costs of suit; one moiety to the king, and the other to the informer.

The judges and officers of the court of admiralty in the king's plantations or dominions abroad, shall not receive above 10*l.* in case the prize be under a hundred tons burthen; nor above 15*l.* if it be of greater burthen.

Commissioners of appeals in causes of prizes are to be appointed under the great seal; and appeals may be made to them within fourteen days after sentence.

Agents for prizes are to be chosen by the captors.

The treasurer of the navy is to pay to the officers and seamen on board ships of war, or privateers, in any action where any ship of war, or privateer, shall have been taken from the enemy or destroyed, 5*l.* for every man on board such prize or ship destroyed, at the beginning of the engagement.

The captures of flota ships, or galleons, or register ships bound from Buenos Ayres, or Honduras, can be tried only in the high court of admiralty.

The statute enacts several penalties and forfeitures for taking prizes by collusion. Privateers forfeit the prize, half to the king, and half to the informer; and the commander of a man of war forfeits 1000*l.* to be divided between the king and the informer.

Also, if any ships belonging to the English be taken by the enemy, and afterwards retaken by any of our men of war, or privateers, they are to be restored to the owners, on paying an eighth part of the value, in lieu of salvage, after having been in the enemy's possession twenty-four hours; and if above that time, paying a farther moiety, &c. 13 Geo. II. cap. 4. 30 Geo. II. cap. 18.

The regulations with regard to prizes in the royal navy, are as follow: 1. When any ship or vessel is taken from the enemy, the hatches are to be immediately spiked up, and her lading and furniture secured from embezzlement, till sentence is passed upon her in some court of admiralty, empowered to take cognizance of causes of that nature. 2. The captain is to cause the officers of the prize to be examined; three or more of the company, who can give best evidence, to be brought to the said court of admiralty, together with the charter-parties, bills of lading, and other ship's

ship's papers, found on board. The 3d and 4th articles relate to finding any of the king's subjects in the prizes. 5. When a privateer is taken, great care is to be had to secure all the ship's papers, especially the commission; but if there be no legal commission found on board, then all the prisoners are to be carried before some magistrate, in order to their being examined and condemned as pirates. See articles 7, 8, and 9, for the government of the navy.

The captor acquires an insurable interest in a prize regularly taken in war. From the moment that the victor hoists his flag on board a conquered ship, he has acquired a qualified property in her which he may insure. For though the king is, in contemplation of law, the captor, and the property of every prize immediately vests in him; yet the practice of bestowing all prizes taken from the enemy upon the officers and men, who are the persons immediately concerned in the capture, is so constant and uniform, that the law will consider the expectation, founded upon this practice, as equivalent to a vested interest. It is also held, that a consignee, trustee, or an agent for prizes, may insure.

PRIZE, in our *Statutes*, is used for things taken of the subjects by the king's purveyors.

Spelman describes prizes to be corn and other provisions taken from the country-people, at lower rates than ordinary, for the maintenance of the king's household, garrisons, &c.

Roger de Monte Alto, who married the sister of Hugo de Albeney, claimed the following privileges; *viz.* his castle of Resigne *cum* prisus 40 *dierum*, with prizes of forty days: which phrase the same author understands of the liberty of taking provisions for the support of the garrison of his castle, upon paying for them within forty days. See stat. 12 Car. II. cap. 34.

PRISM, PRISMA, thus called from *πρισμα*, something *sawn*, or *cut off*, in *Geometry*, an oblong or solid body, contained under more than four planes, and whose bases are equal, parallel, and alike situated.

The prism is generated by the motion of a rectilinear figure, as ACB (*Plate XI. Geometry, fig. 12.*), descending always parallel to itself, along the right line AE.

If the describer be a triangle, the body is said to be a *triangular prism*; if square, a *quadrangular one*, &c.

From the genesis of the prism, it is evident it has two equal and opposite bases; that it is terminated by as many parallelograms as the base consists of sides; and that all the sections of a prism parallel to its base are equal.

Every triangular prism may be divided into three equal pyramids.

PRISM, *to measure the surface and solidity of a.* Find the area of the base, *e. gr.* ABC (*see TRIANGLE*), and multiply it by 2; find the areas of the planes or parallelograms, that include or circumscribe it; and add their sum to the former product. The sum is the whole surface of the prism.

Multiply then the base ABC by the altitude CD; the product is the solidity of the cube ABCDEF. (*See CENTROBARYC.*) Or, for a right prism, multiply the perimeter of the end by the height, and the product will be the sum of the sides, or upright surface. If the ends of the prisms be regular plane figures, multiply the perimeter of the end by the sum of the height of the prism and the radius of the circle inscribed in the end, and the product will be the whole surface.

It is evident, in general, that if the area of each side and end be calculated separately, the sum of those areas will be the whole surface of any prism, whether right or oblique; or, indeed, of any other body whatever.

All prisms are in a ratio compounded of their bases and altitudes; if, then, their bases be equal, they are to each other as their heights; and *vice versa*. Similar prisms, &c. are in a triplicate ratio of their homologous sides, as also of their altitudes.

PRISM, in *Dioptrics*, is a glass in form of a triangular prism, much used in experiments about the nature of light and colours.

The phenomena and use of the prism arise from its separating the rays of light in their passage through it.

The more general of these phenomena are enumerated and illustrated under the articles COLOUR and REFRACTION: for, to enumerate all would be endless; and even these are sufficient to demonstrate, that colours do not either consist in the contortion of the globules of light, as Descartes imagined; nor in the obliquity of the pulses of the ethereal matter, as Hooke fancied; nor in the constipation of light, and its greater or less concitation, as Dr. Barrow conjectured; but that they are original and unchangeable properties of light itself. See LIGHT.

PRISMATIC ANTENNÆ, in *Natural History*, a term used to express the horns or antennæ of a peculiar genus of butterflies. See FEELERS.

PRISMOID, PRISMOIDES, in *Geometry*, a solid figure, having for its two ends any dissimilar parallel plane figures of the same number of sides, and all the upright sides of the solid trapezoids. If the ends of the prismoid be bounded by dissimilar curves, it is sometimes called a cylindroid.

To find the solidity of a prismoid, the general rule is: To the sum of the areas of the two ends, add four times the area of a section parallel to, and equally distant from both ends: multiply the last sum by the height, and one-sixth of the product will be the solidity. Or, if the bases be dissimilar rectangles, take two corresponding dimensions, and multiply each by the sum of double the other dimension of the same end, and the dimension of the other end corresponding to this last dimension: then multiply the sum of the products by the height, and one-sixth of the last product will be the solidity. Note, corresponding dimensions are those, which are connected by a side of the solid.

E. G. How many solid feet of timber are in a tree, whose ends are rectangles, the length and breadth of the one being 14 and 12 inches; and their corresponding sides of the other 6 and 4 inches; and the perpendicular length $30\frac{1}{2}$ feet?

By the first general rule,

$$\left. \begin{array}{l} \frac{14 + 6}{2} = \frac{20}{2} = 10 \\ \frac{12 + 4}{2} = \frac{16}{2} = 8 \end{array} \right\} \text{the dimensions in the middle.}$$

$$\begin{array}{l} 10 \times 8 \times 4 = 320 = \text{four times the middle area.} \\ 14 \times 12 = 168 = \text{area of the greater end.} \\ 6 \times 4 = 24 = \text{area of the less end.} \end{array}$$

This sum is 512 square inches = $\frac{32}{9}$ square feet.

Then $\frac{32}{9} \times \frac{30\frac{1}{2}}{6} = \frac{16 \times 30\frac{1}{2}}{9 \times 3} = \frac{162\frac{1}{2}}{9} = 18\frac{2}{7}$ feet, the solidity.

By the second or particular rule,

Let L, l, be one dimension of each corresponding to each other, and B, b, the other corresponding dimensions, and h the height; then, L being = 14, B = 12, l = 6, b = 4 inches, and h = $30\frac{1}{2}$ feet, we shall have $(2L + l)$

$$B + (2l + L)b \times \frac{1}{2}b = \frac{34 \times 12 + 26 \times 4}{6 + 144} \times 30\frac{1}{2} = 18\frac{2}{7} \text{ feet, as before. Hutton's Mens. p. 193.}$$

PRISON. See **GAOL, PUNISHMENT, and TRANSPORTATION.**

PRISON Breaking, by the offender himself, when committed for any cause, was felony at the common law (1 Hal. P. C. 607.); or even conspiring to break it: (Braët. l. 3. c. 9.) But this severity is mitigated by the statute *de frangentibus prisonam*, (1 Edw. II.) which enacts that no person shall have judgment of life or member for breaking prison, unless committed for some capital offence. So that to break prison when lawfully committed for any treason or felony, remains still felony as at the common law; and to break prison, when lawfully confined upon any other inferior charge, is still punishable as a high misdemeanor by fine and imprisonment. For the statute which ordains, that such offence shall be no longer capital, never meant to exempt it entirely from every degree of punishment. Blackst. Com. vol. iv. See **ESCAPE.**

Breaking of prison, by the law of Scotland, is a punishable offence; but there are no particular laws against it in that country, so they are guided by the Roman law in such cases. But though this law seems to make the punishment of this crime capital, yet this is thought too great severity in Scotland, where an arbitrary punishment, greater or less, according to the circumstances of the escape, and the violence with which it was accomplished, is thought sufficient and adequate.

PRISONER, in *Law*, one that is restrained of his liberty upon any action civil or criminal, or upon commandment.

A man, again, may be prisoner, either upon matter of fact, or of record.

PRISONER, upon matter of record, is he, who being present in court, is, by the court, committed to prison.

PRISONER, upon matter of fact, is he who is committed upon an arrest, be it by the sheriff, constable, or other.

PRISONERS of War. See **CAPITULATION.**

The right of making prisoners of war is founded on the principles of security and self-defence; either that they may not take up arms against their victors, or that their own party may be weakened, or that by getting into the power of the conqueror, some person or child for whom the vanquished sovereign has an affection, this sovereign may be induced to assent to equitable or advantageous conditions of peace, in order to obtain the deliverance of these valuable pledges. But as soon as your enemy has laid down his arms and surrendered his person in a battle or siege, you have no further right over his life, unless he should give you such a right by some new crime, or had before committed against you a crime deserving death. It was therefore a dreadful error of antiquity, indeed a most unjust and savage claim, to assume a right of putting a prisoner to death, and even by the hand of the executioner. It is now, however, a long time since our just and humane principles have taken place. Accordingly in a battle, quarter is to be given to those who lay down their arms, and at a siege, a garrison offering to capitulate are never to be refused their lives. The humanity with which most nations in Europe carry on wars at present cannot be too much commended: if sometimes in the heat of action the soldier refuses to give quarter, it is always contrary to the inclination of the officers, who eagerly interpose for saving the lives of such enemies as have laid down their arms. See **QUARTER** and **REPRISALS.**

As to the treatment of prisoners of war, they may be secured, and for this purpose shut up; and if there is cause to fear their rising or running away, they may be even fettered. But they are not to be treated harshly, unless personally guilty towards him who has them in his power. Among European nations, prisoners of war are seldom ill-treated. And what is more, by a custom which equally displays the humanity of the Europeans, an officer, taken prisoner of war, is released on his parole, and enjoys the comfort of passing the time of his imprisonment in his country, with his family; and the party releasing him thinks itself as secure of him as if it had detained him in the closest prison. On the other hand, it was formerly a question, whether, if the number of prisoners was so great as not to be kept or fed with safety, it was right to put them to death? or, whether in such circumstances they should be sent back to the enemy at the hazard of their strengthening him, so as on another occasion to gain the advantage? At present the case is plain. These prisoners are sent back on their parole, not to carry arms for a certain time, or to the end of the war. An enemy may require from prisoners, in consideration of their release, that they shall not carry arms against him till the end of the war, having a right to keep them prisoners during that time. But he cannot require that they shall for ever renounce the liberty of fighting for their country, as at the end of the war their imprisonment ceases: and they, on their side, cannot take upon themselves an engagement absolutely contrary to their quality as citizens or subjects. If, indeed, their country forsakes them, they are free, and equally entitled to a renunciation on either side.

Another question has been started in reference to this subject. Are prisoners of war to be made slaves? This may be answered in the affirmative, in cases which give a right to kill them, when they have rendered themselves personally guilty of some crime deserving death. The ancients used to sell their prisoners of war for slaves, because they thought that they had a right of putting them to death. But in every circumstance, in which a prisoner's life cannot innocently be taken away, we have no right to make him a slave. "What is life," says Vattel, "without freedom? If any one counts life a favour, when the grant of it is attended with chains, let him enjoy it, let him accept the kindness, submit to his conditions, and fulfil his duties! But they are not what I shall teach him; he may find enough said of them in other authors: I shall dwell no longer on the subject, and indeed this disgrace of mankind is happily extinct in Europe."

Prisoners of war are detained, that they may not return again to the enemy, as also for obtaining from their sovereign a just satisfaction, as the price of their liberty; nor is there any obligation to release those who are detained with the latter view, till after satisfaction is obtained. As to the former, whoever makes a just war has a right, if he thinks proper, to detain his prisoners till the end of the war. And then, on releasing them, he may justly require a ransom, either as a compensation at a peace, or, if the war continues, for diminishing his enemy's finances, at the same time that he strengthens him with the return of soldiers. The European nations, who are ever to be commended for their care in alleviating the evils of war, have, with regard to prisoners, introduced humane and salutary customs. They are exchanged or ransomed even during the war, and this is generally stipulated in a previous cartel. However, if a nation finds a considerable advantage in leaving its soldiers prisoners with the enemy during the war, rather than exchange them, it may certainly, unless bound by cartel, act as is most agreeable

able to its interest. This would be the case of a state abounding in men, and at war with a nation more formidable by the courage than the number of its soldiers. It would have been of little advantage to the czar, Peter the Great, to restore the Swedes, his prisoners, for an equal number of Russians. But the state is obliged, as soon as it can be done without danger, and has the means in its hands, to deliver, at its own expence, such of its citizens and soldiers as are prisoners of war. They are fallen under this misfortune only by acting for its service, and in support of its cause. The same reason dictates that it shall provide for their support during imprisonment. Formerly prisoners of war were obliged to redeem themselves, but then the ransom paid belonged to the officer or soldiers who took them: the modern use is more agreeable to reason and justice. If prisoners cannot be delivered during the course of the war, at least their liberty must, if possible, make an article in the treaty of peace. This is a care which the state owes to those who have exposed themselves for it. However, it must be allowed, that every nation may by a law, after the example of the Romans, and for inspiring their soldiers to make the most vigorous resistance, prohibit prisoners of war from being ever ransomed: when this is agreed on by the whole society, nobody can complain; but such a law is very harsh, and could scarcely suit any but those ambitious heroes who were determined on sacrificing every thing for making themselves masters of the world. Vattel's Law of Nations, b. iii. c. 8.

PRISRENDI, in *Geography*, a town of European Turkey, in Servia, the see of a Greek bishop; 43 miles N. of Alessio. N. lat. $42^{\circ} 52'$. E. long. $20^{\circ} 4'$.

PRIST—*Unques* PRIST. See UNCORE.

PRISTINA, in *Geography*, a town of Servia, the see of a Greek bishop; 100 miles E. of Ragusa. N. lat. $43^{\circ} 10'$. E. long. $20^{\circ} 34'$.

PRISTIS, *Saw-fish*, in *Ichthyology*, a genus of fishes in the Linnæan system of the order chondropterigious; but others rank it with the cartilaginous order; and Dr. Shaw thinks it may, with propriety, be considered as a species of the SQUALUS, or shark, which see, of which he makes three varieties. But as we follow the Linnæan system, we shall set down its generic character: snout long, flat, spinous down the edges; four or five spiracles which are lateral; the body is oblong, roundish, covered with a rough coriaceous skin; mouth beneath; nostrils before the mouth, half covered with a membranaceous flap; there are two oval orifices behind the eyes; the ventral fins are approximate; it has no anal fin.

The saw-fish inhabits the Mediterranean, and was known to the ancient Greeks and Romans by the name of pristis.

Species.

ANTIQUORUM. The specific character of this fish is, that its snout is armed with from eighteen to twenty-four strong spines on each side. It inhabits the ocean, is fifteen feet long; the body above is blackish, and beneath whitish. The head is flat on the fore-part; the snout is five feet long; teeth granulate; the eyes large, the iris golden; it has five spiracles. The first dorsal fin is opposite the ventral, the second stands midway between the first and the tail; the pectoral fin is broad and long; the caudal short.

PECTINATUS. The snout of this species has from twenty-five to thirty-four narrow spines on each side. It is an inhabitant of the ocean; resembles the last, but the snout is slenderer and narrower at the base; the spines are longer and slenderer. This and the former species are fully described in the second volume of the Linnæan Transactions.

CUSPIDATUS. The snout has twenty-eight broad, cus-

pidate spines on each side. A specimen of the snout was a few years since preserved in the Leverian Museum. The spines were sharp at the point, like a surgeon's lancet.

MICRODON. The spines on the snout are small, hardly perforating the skin. The habitation of this and of the cuspidatus is unknown, but a complete specimen of the fish was in the Leverian Museum. Its whole length was twenty-eight inches long; the snout ten inches; the dorsal fins much hollowed out at the back part.

CIRRATUS. Snout cirrate in the middle; spines long, with intermediate shorter ones. Found on the coast of New Holland, about forty inches long; the body is of a pale brown. See Linn. Transf. vol. ii., where it is described and figured.

PRIT, in *Law*, a word used in pleading, when, after the prisoner hath pleaded not guilty, *non culpabilis*, the clerk of the assize, or clerk of the arraigns, on behalf of the crown replies, that the prisoner is guilty, and that he is ready to prove him so. This is done by two monosyllables, "*culprit*," which signify, first, that the prisoner is guilty, "*cul.*" or "*culpabilis*," and then that the king is ready to prove him so; *prit*, *præsto sum*, or *paratus verificare*. This is a replication on behalf of the king *viva voce* at the bar: and this was formerly the course in all pleadings, as well in civil as in criminal causes. This was done in the concise manner; for when the pleader intended to demur, he expressed his demurrer in a single word, "*judgment*," signifying that he demanded judgment whether the writ, declaration, plea, &c. either in form or matter, were sufficiently good in law: and if he meant to rest on the truth of the facts pleaded, he expressed that also in a single syllable, "*prit*;" signifying that he was ready to prove his assertions. By this replication, the king and the prisoner are at issue in point of fact. The usual conclusion of all affirmative pleadings, as this of "*cul.*" or guilty is, was by an averment in these words, "and this he is ready to verify; *et hoc paratus est verificare*"; which same thing is here expressed by the single word "*prit*." See CUL-PRIT.

PRIT'HU, and PRIT'HVI, in *Hindoo Mythology*, are names and forms of Vishnu and Lakshmi. They are found to be personifications of the earth, and a great deal of fable, with some traces of historical tradition, are mixed together in the relations connected with this subject. The immediate ancestor of Prit'hu, whose name was Vena, was an impious and tyrannical prince, and, in consequence of Brahmanical denunciation, died without issue. To remedy this, his arm was opened and churned with a stick, till it produced a son, who proved to be a form of Vishnu, and was named Prit'hu. He married a form of the goddess Lakshmi, who was named Prit'hvi, being indeed the earth. She became obstinate, and refusing her wonted supplies to mankind, Prit'hu was forced to beat and wound her, when she, assuming the form of a cow, ascended to Meru to complain to the gods; who, on hearing that she refused the necessaries of life to mankind, and to her husband, rejected her complaint, and she was forced to submit to the treatment complained of. By this it is supposed is meant, that Prit'hu, who is found to correspond with Noah, an agriculturalist, cut down forests, used the plough, &c. by such means maiming and disfiguring the earth, which he and his descendants were authorized to do.

Prit'hvi, as a personification of the earth, also represents *patience*: the Hindoos refer to the earth, or Prit'hvi, proverbially, as an example of patience; permitting her bowels to be ripped open, her surface lacerated, and suffering every indignity, without resentment or murmuring, and even returning all good for all such evil usage. Prit'hvi-pati, lord of the earth, is a title conferred on terrestrial, or real, as well

well as on mythological sovereigns. Prit'hvi is sometimes spoken of as a cow, milked by Swayambhuva, or Adam, grand ancestor of Prit'hu. She is sometimes called the daughter, as well as the wife of Prit'hu, under the name of Ila, another personification of the earth, of very equivocal history. See ILLA.

In Menu's Institutes, c. ix. v. 311, it is said, that "as Prit'hvi supports all creatures equally, so a king, sustaining all subjects, resembles in his office the goddess of earth." In this character she shares the daily Brahmanical oblations offered to the gods. On an examination of the character and history of Prit'hvi, she is found to correspond with the Tellus, Terra, Vesta, &c. of Grecian mythology. The consort of Siva, as noticed under the article PARVATI, sometimes appears in the character of goddess of the earth, and is then called Bhudevi: but Prit'hvi is always considered a form of Lakshmi.

PRITZ, JOHN-GEORGE, in *Biography*, a learned German Lutheran divine, was a native of Leipzig, where he was born in the year 1662. He pursued his studies in the university of that city, where he took his degree of M.A. in 1685; and two years afterwards he enlisted in the number of contributors to the "Acta Eruditorum" of Leipzig. In 1690 the senate nominated him preacher at St. Nicholas' church; in 1693 he took the degree of bachelor of divinity; and in 1698 he was created doctor in that faculty, and accepted of an invitation to become professor of divinity, and of metaphysics, as well as minister, at Zerbst, in Saxony. In the year 1705 he visited Holland and England, and after his return to Germany, in 1707, was chosen professor of divinity, ecclesiastical counsellor, and minister at Greifswalde, in Pomerania. Here he continued till the year 1711, when he removed to Frankfort on the Maine, where he held the appointment of principal minister, till his death in 1732, when he was about 70 years of age. He published "Patris Macarii Ægyptii Homiliæ, Græcè et Latine, interprete Zacharia Palthenio;" "Macarii Ægyptii Opera, Græcè et Latine," consisting of the rest of the works attributed to Macarius the elder. "Introductio in Lectionem Novi Testamenti," which is highly esteemed, and has been repeatedly printed: an edition of the New Testament in the original Greek, with various readings, geographical charts, &c.; and a great number of philosophical and theological dissertations, controversial pieces, &c. Moreri.

PRITZERBE, in *Geography*, a town of the Middle Mark of Brandenburg, on the Havel; 7 miles N.N.W. of Brandenburg.

PRITZLER'S HARBOUR, a bay on the N. side of Hudson's straits. N. lat. 62°. W. long. 67° 10'.

PRITZWALK, a town of Brandenburg, in the Mark of Pregnitz; 44 miles N. of Brandenburg. N. lat. 53° 11'. E. long. 12° 16'.

PRIVAS, a city of France, and principal place of a district, in the department of the Ardèche, seated on a small river, about six miles from the Rhone; 18 miles S.W. of Valence. The town contains 2923, and the canton 11,743 inhabitants, on a territory of 200 kilometres, in 15 communes. N. lat. 44° 44'. E. long. 4° 40'.

PRIVATE *Average, Charters, Nuisance, Spirit, Statute, and Wrong.* See the substantives.

PRIVATE *Act.* See STATUTE.

PRIVATE *Stealing* from a man's person. See LARCENY.

PRIVATEERS, are vessels of war, armed and equipped by particular merchants, &c. and furnished with a military commander by the admiralty, or the officers who superintend the marine department of a country, to cruise against the

enemy, and take, sink, or burn their shipping, or otherwise annoy them as opportunity offers.

These vessels are generally governed on the same plan with his majesty's ships, though often guilty of shameful depredations.

Persons concerned in privateers administer at their own costs a part of a war, by providing ships of force, and all other military stores, and they have, instead of pay, leave to keep what they can take from the enemy, allowing the admiral his share, &c.

Privateers may not attempt any thing against the laws of nations, as to assault an enemy in a port or haven under the protection of any prince or republic, whether he be friend, ally, or neuter, for the peace of such places must be inviolably kept; and therefore, by a treaty made by king William and the states of Holland, before a commission shall be granted to any privateer, the commander is to give security if the ship be not above one hundred and fifty tons, in 1500l.; and if the ship exceeds that burthen, in 3000l.; that they will make satisfaction for all damages which they shall commit in their courses at sea, contrary to the treaties with that state; upon pain of forfeiting their commissions, and the ship is made liable. Lex Mercat. or Merch. Compan. 177.

By statute, ships taken by private men of war, were to be divided into five parts, four parts of which to go to the persons interested in the privateer, and the fifth to his majesty; and as a farther encouragement, privateers, &c. destroying any French man of war, or privateer, shall receive for every piece of ordnance in a ship so taken, 10l. reward, &c. 4 & 5 Will. & M.

But by a later statute, the commissioners of the admiralty may grant commissions to commanders of privateers, for taking ships, &c. which being adjudged prize, and the tenth part paid to the admiral, &c. wholly belong to the owners and captors. (See PRIZE.) By 19 Geo. II. c. 37. § 2. it is provided, that insurances on private ships of war, fitted out by any of his majesty's subjects, solely to cruise against his enemies, may be made by or for the owners thereof, interest or no interest, free of average, and without benefit of salvage to the insurer. By 33 Geo. III. c. 66. § 42. ships and goods belonging to any of his majesty's subjects that are re-captured by privateers, shall pay one-sixth part of their true value to the owners, officers, and seamen, of such privateers, for salvage, without any deduction. See SALVAGE.

PRIVATION, PRIVATIO, the absence, want, or defect of something needed or necessary.

In logic, privation, as applied to modes of being, and opposed to negation, denotes the absence of what naturally belongs to the thing we are speaking of, or which ought to be present with it. It was called in the schools *absentia habitus debiti*.

In the canon law, privation is used for an interdiction, or suspension.

Mystic divines use the phrase *privation of God*, for those drynesses which the soul experiences, to whom God does not make himself felt.

The church of Rome teaches, that children, dying without baptism, go into a limbus, where they undergo a privation of the sight of God.

PRIVATION, in *Physics*, is a negative principle, which, with matter and form, the Peripatetics suppose conspires to constitute natural bodies. See PRINCIPLE.

PRIVATIVE, in *Grammar*, a particle, which, prefixed to a word, changes it into a contrary sense.

Thus, among the Greeks, the α is used as a privative; as

in *αθεος*, *atheists*, *acephalus*, &c. The Latins have their privative in: as *in corrigibilis*, *indeclinabilis*, &c. The English, French, &c. on occasion, borrow both the Latin and Greek privatives.

PRIVATIVE *Modes*. See *MODE*.

PRIVATIVE *Quantity*, in *Algebra*, denotes a quantity less than nothing; called also a *negative quantity*; in opposition to affirmative or positive quantities.

Privative quantities are denoted by the character of subtraction — prefixed to them.

PRIVET, in *Botany*. See *LIGUSTRUM*.

PRIVET, *Mock*. See *PHILLYREA*.

PRIVET-*Fly*, in *Entomology*, the name of a species of fly very common on the shrub from whence it has its name. It is called the *erinopterus*, and is remarkable for having its wings deeply divided into segments, so that they seem composed of feathers like bird's wings. The creature, as it fits, looks like a small feather.

PRIVIES to a *Fine*, in *Law*. See *FINE*.

PRIVILEGE, PRIVILEGIUM, formed from the Latin *privata lex*, in the general, any kind of right, prerogative, or advantage, attached to a certain person, condition, or employment, exclusive of others.

PRIVILEGE, in *Law*, is a particular right granted to a single person, place, community, or the like, by which they are exempted from the rigour of the common laws.

Privilege is either *personal* or *real*.

PRIVILEGE, *Personal*, is that which is granted to any person, either against or beyond the course of the common law.

Such, *e. gr.* is that of a member of parliament; who may not be arrested during the sitting of parliament, nor for a certain time before and after. See *ARREST*, and *PARLIAMENT*.

PRIVILEGE, *Real*, is a franchise granted to a place.

Such is that granted to our universities, by which none who are members of it may be called to Westminster-hall upon any contract made within their own precincts. So also a person belonging to the court of chancery cannot be sued in any other court, certain cases excepted; and if he be, he may remove it by *writ of privilege*. It is an ancient privilege for men to be exempted from arrests within the verge of the court, *i. e.* in or near the palace where the king is resident; because, in such cases, quarrels frequently happen; and the peace ought to be strictly kept there.

In the laws of Henry I. it is expressed, that peace ought to be maintained religiously and reverently within four miles of the king's doors towards the four quarters; and forty-nine acres, nine feet, nine palms, and nine barley-corns, around.

PRIVILEGE, in *Commerce*, is a permission from a prince or magistrate, to make and sell a certain merchandize, or to engage in a certain commerce, either exclusively of others, or currently with them.

The first is called an *exclusive* privilege; the latter, simply, a *privilege*.

Exclusive privileges are to be granted rarely, by reason of the hindrance they are of to trade; yet they are sometimes very just and reasonable, by way of reward for the invention of useful machines, manufactures, &c.

Exclusive privileges for *foreign commerce* are usually granted on the following conditions; that the commodities be brought from remote parts, where there is no going without running great risks; that the privilege be only for a limited time; that the persons privileged be not allowed to monopolize, *i. e.* to raise and lower their commodities at pleasure; but that the sale and price be always proportionable to the

expence, interests, &c. and that the privileged assist the state, on occasion, with part of their gains.

PRIVILEGE for the *impression of books* is properly exclusive; being a permission which an author, or bookseller, obtains under a prince's seal, to have alone the impression of a book, with a prohibition of all others to print, sell, or distribute the same, within a certain term of years, usually fourteen, under the clauses and penalties expressed in it. These privileges were unknown till the beginning of the sixteenth century, when they were introduced in France. The oldest is said to bear date in the year 1507, and to have been occasioned by some printers counterfeiting the works of others as soon as they appeared.

But people were yet at liberty to take or let them alone at pleasure, till the interests of religion, and the state, occasioned the restraining of this liberty.

In 1563, Charles IX. published a celebrated ordonnance, forbidding any person, on pain of confiscation of body and goods, to print any letter, speech, &c. without permission.

The like has been since done in England; though, at present, privileges are not only not required, but by the late act, for securing the properties of books, seem needless. See *LITERARY Property*.

PRIVILEGE, *Attachment of*. See *ATTACHMENT*.

PRIVILEGE, *Bill of*. See *ARREST*.

PRIVILEGES of the *Clergy*. See *CLERGY*.

PRIVILEGES of the *King*. See *KING* and *PREROGATIVE*.

PRIVILEGES of *Parliament*. See *PARLIAMENT*.

PRIVILEGE of the *Tabouret*. See *TABOURET*.

PRIVILEGE, *Writ of*, in *Law*, an ancient writ, by which courts of justice took cognizance of privileges of parliament, in the nature of a *superfedeas* to deliver the party out of custody when arrested in a civil suit. (Dyer, 59. 4 Pryn. Brev. Parl. 757.) For when a letter was written by the speaker to the judges, to stay proceedings against a privileged person, they rejected it as contrary to their oaths of office. (Latch. 48. Noy. 83.) But since the statute 12 W. III. c. 3. which enacts, that no privileged person shall be subject to arrest or imprisonment, it hath been held that such arrest is irregular *ab initio*, and that the party may be discharged upon motion. (Stra. 989.) It is to be observed, that there is no precedent of any such writ of privilege, but only in civil suits; and that the statute of 1 Jac. I. c. 13. and that of king William (which remedy some inconveniences arising from privilege of parliament) speak only of civil actions. And therefore the claim of privilege hath been usually guarded with an exception as to the case of indictable crimes (Com. Journ. 17 Aug. 1641); or, as it hath been frequently expressed, of treason, felony, and breach (or surety) of the peace. (4 Inst. 25. Com. Journ. 20 May 1675). By which it seems to have been understood that no privilege was allowable to the members, their families, or servants, in any *crime* whatsoever; for all crimes are treated by the law as being *contra pacem domini regis*. And instances have not been wanting, in which privileged persons have been convicted of misdemeanors, and committed, or prosecuted to outlawry, even in the middle of a session (Mich. 16 Edw. IV. in Scacch. — Lord Raym. 1461); which proceeding has afterwards received the sanction and approbation of parliament. (Com. Journ. 16 May 1726). To which may be added, that, a few years ago, the case of writing and publishing seditious libels was resolved by both houses (Com. Journ. 24 Nov. Lords' Journ. 29 Nov. 1763) not to be entitled to privilege; and that the reasons upon which that case proceeded, (Lords' Protest.

Protest. 29 Nov. 1763) extended equally to every indictable offence. So that the chief, if not the only, privilege of parliament, in such cases, seems to be the right of receiving immediate information of the imprisonment or detention of any member, with the reason for which he is detained; a practice that is daily used upon the slightest military accusations, preparatory to a trial by a court martial (Com. Journ. 20 April 1762); and which is recognized by the several temporary statutes for suspending the *habeas corpus* act, particularly 17 Geo. II. c. 6; by which it is provided, that no member of either house shall be detained, till the matter of which he stands suspected be first communicated to the house of which he is a member, and the consent of the said house obtained for his commitment or detaining. But yet the usage has uniformly been, ever since the revolution, that the communication has been subsequent to the arrest. Blackst. Com. b. i.

PRIVILEGED DEBT. See DEBT.

PRIVILEGED Places. See PROCESS.

PRIVILEGIA, or private laws, a denomination given by the Romans to laws *ex post facto*; that is, to laws which were enacted after an action (indifferent in itself) is committed, and the legislator then, for the first time, declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Of these laws Cicero (*de Leg. 3. 19.*) and in his oration (*pro dom. 17.*) thus speaks: "*Vetant leges sacratas, vetant duodecim tabulas, leges privatis hominibus irrogari; id enim est privilegium. Nemo unquam tulit, nihil est crudelius, nihil perniciosius, nihil quod minus hæc civitas ferre possit.*"

PRIVILEGIUM CLERICALE. See CLERGY.

PRIVILEGIUM, *property propter*, denotes that qualified property which a man has in animals "*feræ naturæ*;" so that he may have the privilege of hunting, taking, and killing them, in exclusion of other persons. Here he has a transient property in these animals, usually called *game* (which see), so long as they continue within his liberty; and may restrain any stranger from taking them therein, but the instant they depart into another liberty, this qualified property ceases.

PRIVITY, an intimate freedom, or private familiarity between two persons.

The lawyers say, if there be lord and tenant, and the tenant hold of the lord by certain services; there is a privity between them in respect of the tenure.

PRIVOLNOE, in *Geography*, a town of Russia, in the government of Saratov, on the Volga; 48 miles S. of Saratov.

PRIUS. *Nisi Prius*, in *Law*. See NISI.

PRIVY, a person who is partaker, or has an interest in any action or thing.

In this sense they say, *privies in blood*: every heir in tail is privy to recover the land intailed.

In old law-books, merchants privy are opposed to merchants strangers.

Coke mentions four kinds of privies. *Privies in blood*, as the heir to his father; *privies in representation*, as executors and administrators to the deceased; *privies in estate*, as he in reversion, and he in remainder; donor and donee; lessor and lessee; lastly, *privy in tenure*, as the lord by escheat; *i. e.* when land escheats to the lord for want of heirs.

PRIVY Council, called, by way of eminence, *the council*, a council of state, held by the king with his counsellors, to concert matters for the public service, and for the honour and safety of the realm.

This, according to sir Edward Coke's description of it, (4 Inst. 53.) is a noble, honourable, and reverend assembly

of the king and such as he wills to be of his privy council, in the king's court or palace.

The king's will is the sole constituent of a privy-counsellor; and this also regulates their number, which in ancient time was about twelve. Afterwards it increased to so large a number, that it was found inconvenient for secrecy and dispatch: and therefore king Charles II., in 1679, limited it to thirty; of whom fifteen were to be the principal officers of state, and those to be counsellors, *virtute officii*; and the other fifteen were composed of ten lords and five commoners of the king's choosing. But since that time the number has been much augmented, and now continues indefinite. At the same time also, the ancient office of lord president of the council was revived in the person of Anthony, earl of Shaftesbury; an officer, who by the statute of 31 Hen. VIII. c. 10. has precedence next after the lord chancellor and lord treasurer.

Privy-counsellors are made by the king's nomination, without either patent or grant; and, on taking the necessary oaths, they become immediately privy-counsellors during the life of the king that chooses them, but subject to removal at his discretion.

As to the qualifications of members to sit at this board, any natural born subject of England is capable of being a member of the privy council; taking the proper oaths for security of the government, and the test for security of the church. By the act of settlement, 12 & 13 W. III. cap. 2. it is enacted, that no person born out of the dominions of the crown of England, unless born of English parents, even though naturalized by parliament, shall be capable of being of the privy council.

The duty of a privy-counsellor appears from the oath of office (4 Inst. 54), which consists of seven articles. 1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honour and good of the public, without partiality, through affection, love, meed, doubt or dread. 3. To keep the king's counsel secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And, lastly, in general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

The privy council is, or ought to be, the *primum mobile* of the state, and that which gives the motion and direction to all the inferior parts. It is likewise a court of justice of great antiquity; the primitive and ordinary way of government in England being by the king and privy council.

It has been frequently used by all our kings for determining controversies of great importance: the ordinary judges have sometimes declined giving judgment till they had consulted the king and privy council; and the parliament have frequently referred matters of high moment to the same, as being by long experience better able to judge of, and, by their secrecy and expedition, to transact some state affairs, than the lords and commons.

At present, the privy council takes cognizance of few or no matters, except such as may not be well determined by the known laws, and ordinary courts; such as matters of complaint and sudden emergencies: their constant business being to consult for the public good in affairs of state. This power of the privy council is to enquire into all offences against the government, and to commit the offenders to safe custody, in order to take their trial in some of the courts of law. But their jurisdiction herein is only to enquire, and not to punish; and the persons committed by them

are entitled to their *habeas corpus* by statute 16 Car. I. cap. 10. as much as if committed by an ordinary justice of the peace.

In plantation or admiralty causes, which arise out of the jurisdiction of this kingdom, and in matters of lunacy and idiocy, the privy council has cognizance, even in questions of extensive property, being the court of appeal in such causes; or, rather, the appeal lies to the king's majesty himself in council.

From all the dominions of the crown, excepting Great Britain and Ireland, an appellate jurisdiction (in the last resort) is vested in this tribunal; which usually exercises its judicial authority in a committee of the whole privy council, who hear the allegations and proofs, and make their report to his majesty in council, by whom the judgment is finally given.

The privileges of privy counsellors, as such, (abstracted from their honorary precedence,) consist principally in the security which the law has given them against attempts and conspiracies to destroy their lives.

Anciently, to strike in the house of a privy-counsellor, or elsewhere in his presence, was grievously punished: by 3 Hen. VII. cap. 14. if any of the king's servants, of his household, conspire or imagine to take away the life of a privy-counsellor, it is felony, though nothing shall be done upon it; and by 9 Ann. cap. 16. it is enacted, that any persons who, shall unlawfully attempt to kill, or shall unlawfully assault, and strike or wound any privy-counsellor in the execution of his office, shall be felons, and suffer death as such.

With advice of this council, the king issues proclamations that bind the subject, provided they be not contrary to law.

In debates, the lowest delivers his opinion first, the king last, and thereby determines the matter.

A council is never held without the presence of a secretary of state.

The dissolution of the privy council depends upon the king's pleasure; and he may, whenever he thinks proper, discharge any particular member, or the whole of it, and appoint another. By the common law also it was dissolved *ipso facto* by the king's demise, as deriving all its authority from him. But now, to prevent the inconveniencies of having no council in being at the accession of a new prince, it is enacted, by 6 Ann. cap. 7, that the privy council shall continue for six months after the demise of the crown, unless sooner determined by the successor. Blackst. Com. book i.

The officers of the privy council are four clerks of the council in ordinary, three clerks extraordinary, a keeper of the records, and two keepers of the council-chamber.

Lord President of the Privy Council. See PRESIDENT.

Privy Purse, or the king's private expences. See KING and REVENUE.

Privy Seal, a seal which the king uses, previously to such grants, &c. as are afterwards to pass the great seal.

Yet the privy seal is sometimes used in matters of less consequence, which do not require the great seal.

Lord Privy Seal. See KEEPER of the Privy Seal, and LORD Privy Seal.

Clerks of the Privy Seal. See CLERK.

Privy Chamber. See CHAMBER.

Privy Signet. See SIGNET.

Privy Tithes. See TITHES.

Privy Verdict. See VERDICT.

PRIZE. See PRISE.

PRIZE-Cattle, in *Rural Economy*, such cattle or other ani-

mals as have obtained premiums at some of the cattle shows, either from their superiority of form, fatness, or other circumstances.

PRIZING, in *Sea Language*, denotes the application of a lever to move any weighty body, as a cask, anchor, cannon, &c.

PRIZZI, in *Geography*, a town of Sicily, in the valley of Mazara; 10 miles S. of Palermo. N. lat. 37° 46'. E. long. 13° 35'.

PRO, a preposition, signifying *for*, or in respect of a thing, as *pro consilio*, &c. And in law, *pro* in the grant of an annuity, *pro consilio*, shewing the cause of the grant, amounts to a condition. But in a feoffment, or lease for life, &c. it is the consideration, and doth not amount to a condition; and the reason of the difference is, because the state of the land by the feoffment is executed, and the grant of the annuity is executory.

PRO-Confesso. See PRO-CONFESSO.

PRO-Indiviso. See PRO-INDIVISO.

PROA, FLYING, in *Navigation*, a name given to a vessel used in the South Seas, on account of the swiftness with which it sails, being, with a brisk trade-wind, nearly twenty miles an hour. As to the construction of the proa, her head and stern are exactly alike, but her two sides are very different: the side intended to be always the lee-side being flat; and the windward-side made rounding, in the manner of other vessels, and, to prevent her oversetting, which, from her small breadth, and the straight run of her leeward-side, would, without this precaution, infallibly happen, there is a frame laid out to her from windward, to the end of which is fastened a log, fashioned into the shape of a small boat, and made hollow. The weight of the frame is intended to balance the proa, and the small boat is, by its buoyancy (as it was always in the water), to prevent her oversetting to windward; and this frame is usually called an out-rigger. The body of the proa is made of two pieces joined endways, and sowed together with bark, for there is no iron used about her; she is about two inches thick at the bottom, which, at the gun-wale, is reduced to less than one. The sail is made of matting, and the mast, yard, boom, and out-riggers, are all made of bamboo. See the description and drawing of a proa in Anson's Voyage, quarto, p. 341.

The proa generally carries six or seven Indians; two of whom are placed in the head and stern, who steer the vessel alternately with a paddle, according to the tack she goes on; the person in the stern being the steersman: the other Indians are employed either in bailing out the water, which she accidentally ships, or in setting and trimming the sail.

PROAO, in *Mythology*, a divinity of the ancient Germans, who held in one hand a pike, wrapped about with a kind of flag, and in the other a scutcheon not unlike to ours. According to Samuel Groffer, in his History of Lusatia, this god presided over courts of justice, and also the public market, that every thing might be sold there with equity.

PROASM, in *Ancient Poetry*, the same as *Epode*; which see.

PROBABILISTS, a sect, or division, among the Romanists, who adhere to the doctrine of probable opinions; holding, that a man is not always obliged to take the more probable side, but may take the less probable, if it be but barely probable.

The Jesuits and Moralists are strenuous Probabilists. See JESUIT, &c.

Those who oppose this doctrine, and assert that we are obliged, on pain of sinning, always to take the more probable

hable side, are called Probabilists; to which class belong the Jansenists, and particularly the Portroyalists.

PROBABILITY of an Event, in the Doctrine of Chances, is greater or less according to the number of chances by which it may happen, compared with the whole number of chances by which it may either happen or fail. Wherefore, if we constitute a fraction, of which the numerator be the number of chances whereby an event may happen, and the denominator the number of all the chances by which it may either happen or fail, that fraction will be a proper designation of the probability of happening. Thus, if an event has three chances to happen, and two to fail, the fraction $\frac{3}{5}$ will fitly represent the probability of its happening, and may be taken to be the measure of it. The same thing may be said of the probability of failing, which will likewise be measured by a fraction, whose numerator is the number of chances by which it may fail, and the denominator the whole number of chances both for its happening and failing; thus the probability of the failing of that event which has two chances to fail and three to happen, will be measured by the fraction $\frac{2}{5}$. If the fractions which represent the probabilities of happening and failing be added together, their sum will always be equal to unity, since the sum of their numerators will be equal to their common denominator: and since it is a certainty that an event will either happen or fail, it follows, that certainty, which may be conceived under the notion of an infinitely great degree of probability, is fitly represented by unity. De Moivre's Doct. of Chances, p. 1, &c. See CHANCES, EXPECTATION, and GAMING.

PROBABILITY of Life. See EXPECTATION of Life, and LIFE Annuities.

PROBABILITY, in Reasoning, *verisimilitude*; or an appearance of truth.

To define it philosophically, probability is the appearance of the agreement or disagreement of two things by the intervention of proofs, whose connection is not constant and immutable, or is not perceived to be so; but is, or appears, for the most part, to be so; so as to suffice to induce the mind to judge the proposition to be true or false, rather than the contrary.

That proposition, then, is probable, for which there are arguments and proofs to make it pass, or be received for true.

The entertainment the mind gives to this sort of propositions, is called *belief*, *assent*, or *opinion*.

Probability, then, being to supply the defect of our knowledge, is always conversant about propositions of which we have no certainty, but only some inducements to receive them for true: and this probability relates either to matter of fact, which falling under observation, are capable of human testimony, or to things which, being beyond the discovery of our senses, are not capable of any such testimony; called matters of speculation.

According to Aristotle, a proposition is probable, if it seem true to all or most people, and those the wiser and more reputable sort: but by *seem* he means, what, after a close inquiry, shall seem to be true.

Of probability there are various degrees, from the confines of certainty and demonstration, down through improbability and unlikeliness, to the confines of impossibility; and also degrees of assent from certain knowledge, and what is next to it, full assurance and confidence, quite down to conjecture, doubt, distrust, and disbelief.

The grounds of probability are, in short, these two following: *viz.* the conformity of any thing with our own particular knowledge, experience, or observation, called

internal probability; and the testimony of others, vouching their observation, or experience, called *external* probability.

It was a doctrine of the New Academy (see ACADEMY), that the senses, the understanding, and the imagination, which frequently deceive us, cannot be infallible judges of truth; but that from the impressions which we perceive to be produced on the mind, by means of the senses, we infer appearances of truth, or probabilities. Accordingly Carneades, an eminent orator and philosopher of that academy, maintained that though these impressions, which he called phantasies or images, do not always correspond to the nature of things, and there is no infallible method of determining when they are true or false, and consequently that they afford no certain criterion of truth, nevertheless, probable appearances are a sufficient guide, with respect to the conduct of life and the pursuit of happiness, because it is unreasonable not to allow some degree of credit to those witnesses who commonly give a true report. He divided probabilities into three classes; simple, uncontradicted, and confirmed by accurate examination. The lowest degree of probability takes place, where the mind, in the casual occurrence of any single image, perceives in it nothing contrary to truth and nature: the second degree of probability arises, when, contemplating any object in connection with all the circumstances associated with it, we discover no appearance of inconsistency, or incongruity, to lead us to suspect that our senses have given a false report; as when we conclude, from comparing the image of an individual man with our remembrance of that man, that he is the person we supposed him to be: and the highest degree of probability is produced, when, after an accurate examination of every circumstance which might be supposed to create uncertainty, we are able to discover no fallacy in the report of our senses. The judgments arising from this operation of the mind, are, according to the doctrine of the New Academy, not science, but opinion, which is all the knowledge that the human mind is capable of attaining.

In the doctrine of probability, one important observation may be made, *viz.* that if one premise only of an argument be probable, the conclusion is necessarily probable; but if two or more premises be probable, the conclusion will not be necessarily probable. Thus, for instance, supposing the probability of each premise expressed by $\frac{7}{10}$, the probability of the conclusion will be but $\frac{49}{100}$, which shews it to be improbable. For we may call any thing improbable, if the measure of the chance for its happening is less than $\frac{1}{2}$. If there had been three premises, and the probability of each equal to $\frac{7}{10}$, the probability of the conclusion would be $\frac{343}{1000}$, which is considerably improbable. Again, supposing the probability of the truth of each premise to be 2 to 1, or expressed by $\frac{2}{3}$, the probability of the conclusion in the case of the two premises would be $\frac{4}{9}$. Where three premises are assumed to infer a conclusion, this would be $\frac{8}{27}$; and in case of four premises, the probability of the conclusion would be but $\frac{16}{81}$, which is less than $\frac{1}{5}$, so that one might with advantage lay 4 to 1 against the truth of a conclusion founded on four probable premises, for the truth of which, separately taken, 2 to 1 might be laid. It is to be observed in all these cases, that the premises are supposed independent, that is, not necessarily connected with each other. Hence it is easy to account how it happens, that the most plausible political and physical reasonings lead so often to conclusions false in fact.

M. de Moivre has solved two problems, tending to establish the degree of assent that ought to be given to experience.

rience. He determines from his solutions, that if, after taking a great number of experiments, it should have been observed, that the happenings or failings of an event have been very near in a ratio of equality, it may safely be concluded, that the probability of its happening or failing at any one time assigned, are very near equal.

And if, after taking a great number of experiments, it should be perceived, that the happenings and failings have been nearly in a certain proportion, such as 2 to 1, it may safely be concluded, that the probabilities of happening or failing, at any one time assigned, will be very nearly in that proportion; and that the greater the number of experiments has been, so much the nearer the truth will the conjectures be that are derived from them.

Chance very little disturbs the events which, in the natural institution, were designed to happen or fail according to some determined law. For if, in order to help our conception, we imagine a round piece of metal, with two polished opposite faces, differing in nothing but their colour, of which one may be supposed to be white, and the other black, it is plain that this piece may with equal facility exhibit a white or black face; and we may even suppose that it was framed with that particular view of shewing sometimes the one face, sometimes the other; and that consequently, if it be tossed up, chance will decide the appearance. But although chance may produce an inequality of appearance, and that a greater inequality, according to the length of time in which it may exert itself, still the appearance, either one way or the other, will perpetually tend to the proportion of equality. This is, in like manner, applicable to a ratio of inequality; and thus in all cases it will be found, that although chance produces irregularities, still the odds will be infinitely great, that in process of time those irregularities will bear no proportion to the recurrency of that order which naturally results from original design. See De Moivre's Doctrine of Chances, p. 231, 243. See *Moral CERTITUDE*, and *Doctrine of CHANCES*.

PROBABILITY, in *Poetry*, denotes the appearance of truth in the fable or action of a poem.

There are four kinds of actions: for a thing may be either only true or only probable; or true and probable at the same time; or neither the one, nor the other.

These four kinds of actions are shared between four arts: history takes the first, still keeping to truth, without regard to probability.

Epic and dramatic poetry have the second, and still prefer probability, though false, to an improbability, though true. Thus the death of Dido, who killed herself on her being deserted by Æneas, though false in itself, is a fitter subject for a poem, than the action of Sampson, or the Maid of Orleans.

Moral philosophy takes the third; and the fabulists, as Æsop, &c. the fourth.

Boslu adds, that the epopœia, in its nature and essence, uses truth and probability like morality; yet, in its certainty and expressions, takes a liberty like that of Æsop; instances of which we have in the Æneid.

Poetical probability may be so either in respect of the rules of theology, or morality, nature, reason, experience, or opinion.

As to *theology*, there is scarcely any thing but is probable, in this respect; because nothing is impossible to God. This is an expedient the poets have frequent recourse to, in order to bring things feigned contrary to the order of nature, within the bounds of probability. See this considered under the article MACHINE.

As to *morality*, we have observed, it requires both truth

and verisimilitude: an ancient poet was condemned on the theatre for a slip in it: viz. for making a person, whom he represented as an honest man, say, that "though his tongue swore, his mind did not."

Seneca accuses Virgil of an offence against *natural* probability in saying, that the winds were pent up in caves; for, says that philosopher, wind being only air in motion, to suppose it at rest, is to destroy its nature. To which Vossius answers, that the poet only speaks of the natural origin of winds; which are produced in mountains by vapours, &c. pent there; just as we should say, the winds are inclosed in an *æolipile*.

Virgil, likewise, committed an offence against natural probability, by making Æneas find deer in Africa; because that country produces none.

Indeed these faults are excusable, because, as Aristotle finely observes, they are not faults in the poet's art, but they arise from his ignorance of something taught in the other arts.

However, care must be taken they be not too gross: there being some probabilities of this kind, with which Æsop himself could not dispense; he would never be forgiven, were he to represent a lion fearful, a hare daring, a fox stupid, &c.

Probability, in respect of *reason*, is frequently broken in upon by those who affect nothing but the *merveilleux*. Here Statius is a notorious offender: Tydeus, being surprised in an ambuscade by fifty bravoës, who had vowed his death, kills forty-nine of them, and pardons the last. But the principal and most important kind of probability is that in respect of *common opinion*. A thing is probable, when it looks like truth: but sometimes it shall appear true to the people, and false to the learned; and *vice versa*. When, then, the learned and the people are divided, to which side must the poet adhere? Suppose, for instance, the adventure of Penelope, the history of Medea, Helena, or the like: what Virgil and Homer have written of them shall appear probable to the populace, yet the learned read the contrary in history; some authors having written, that Dido was chaste, and Medea innocent; that Penelope was divorced and banished, by Ulysses, for abusing his absence; and that Helena never saw Troy.

This point is soon decided: Homer and Virgil make no scruple of deviating from history to improve their fables; and Horace does not send the poets to the truths of history; but either to fables already invented, or to common fame. All which is confirmed by Aristotle.

To these kinds of probability may be added another, which we call *accidental* probability: it consists not in the using of several incidents, each probable apart; but in disposing them so as to hang probably together.

A man, *e. gr.* may probably die of an apoplexy; but that this should happen just in the moment when the poet wanted it for an unravelling, is highly improbable.

It is an offence against this kind of probability, to produce an incident all at once, and without any preparation which yet needed one. Virgil is wonderfully exact in this point: Juno prepares the tempest raised in the first book; Venus in the same book prepares the amours of the fourth. The death of Dido, in the end of the fourth, is prepared on the first day of marriage; Helenus, in the third, disposes the whole matter of the sixth; and in the sixth, the Sibyl predicts all the wars that follow.

PROBABLE OPINION, a term a long time controverted among the Romish casuists; usually defined, an opinion founded on a grave motive, or an apparently good foundation,

tion, and which has authority enough on its side to persuade a wise disinterested person to assent to it.

Others define a probable opinion to be that, which, being compared with the contrary opinion, becomes problematical, by a perfect equality of the reasons on each side; so that there is nothing in reason or nature to determine on this side, rather than that.

But the Jesuits go still farther, and maintain, that to render an opinion probable, it suffices that it be either built on a reason of some consequence, or on the authority of some one grave doctor. With these qualifications it is allowable to follow it, even though it be less probable and less certain than the contrary opinion; thus it is said, that an opinion or precept may be followed with a good conscience, when it is inculcated by four, three, or two, nay even by one, doctor of any considerable reputation, even though it be contrary to the judgment of him that follows it, and even of him that recommends it. Here it is that the venom of probability lies; as this doctrine rendered the Jesuits capable of accommodating themselves to all the different passions of men, and to persons of all tempers and characters, from the most austere to the most licentious.

This doctrine is attacked, with infinite address, by M. Pascal in the Provincial Letters; on which account they were burnt publicly at Paris. The doctrine of the Jesuits was also attacked by Perrault in his "La Morale des Jesuites, &c." published at Mons, in 3 vols. 8vo. in 1702; which shared the same fate with the Provincials of Pascal. The attack is farther pursued in Arnauld's "La Morale Pratique des Jesuites," 8 vols. 8vo. of which a second edition was published at Amsterdam in 1742.

One of the twenty-four patriarchs of the Jesuits, Castro Palaio, asserts, that a judge, in a question of right, may give sentence, according to a probable opinion, against a more probable one; and this contrary to the judgment and persuasion of his own mind; "imo contra propriam opinionem." Escobar, tr. 6. ex. 6. n. 45.

So Vasquez maintains, that it is lawful to follow the less probable and less secure opinion, discarding the more probable and more secure one.

Lessius and Escobar, treating of the question, Whether a man may kill another for giving him a box on the ear? decide it to be a probable opinion, and speculatively true; though there may be some inconveniences in the practice, for which it would be as well to let it alone. "In praxi tutam et probabilem judicarunt—sed non facile admittendam." Let. Provinciales, p. 307, 308.

PROBABLE *Presumption*, in *Law*. See PRESUMPTION.

PROBANDA, PROPRIETATE. See PROPRIETATE.

PROBANG, in *Surgery*, signifies a long smooth piece of whalebone, to one end of which is fixed a bit of sponge. It is used for pushing extraneous substances down the œsophagus.

PROBATE of a *Will or Testament*, in *Law*, is the exhibiting and proving a will and testament before the ecclesiastical judges delegated by the bishop, who is ordinary of the place where the party dies.

The granting of probates of wills regularly belongs to the ecclesiastical courts; but some courts baron have this right by prescription, as the manor of Mansfield, and those of Cowle and Caversham in Oxfordshire.

When the will is proved, the original must be deposited in the registry of the ordinary; and a copy of it in parchment is made out under the seal of the ordinary, and delivered to the executor or administrator, together with a certificate of its having been proved before him; all which together is usually styled the *probate*. The person before

whom the testament is to be proved is, generally, the bishop of the diocese where the testator dwelled, or his officer.

If all the goods of the deceased be in the same diocese, then the bishop of the diocese, or the archdeacon, according as their composition leads, has the probate of the testament. If the goods lie dispersed in several dioceses, so that there be any sum or note, *bona notabilia*, as five pounds, in two distinct dioceses or jurisdictions, then the will must be proved, or administration taken out, before the metropolitan of the province, by way of special prerogative; whence the court where the validity of such wills is tried, and the office where they are registered, are called the prerogative court, and the prerogative office, of the provinces of Canterbury and York. The power of granting probates and administrations of the goods of persons dying, for wages or work done in the king's docks and yards, shall be in the ordinary of the diocese where the person dieth, or in him to whom power is given by such ordinary, exclusive of the prerogative court, &c. 4 Ann. cap. 16.

This probate may be made two ways; either in *common form*, or *per testes*. The proof in *common form* is only by the oath of the executor, or party exhibiting the will, who swears upon his belief, before the ordinary or his surrogate, that the will exhibited by him, is the last will and testament of the deceased.

This is the practice, it is said, through the province of Canterbury; but within the province of York, it hath been usual (though now discontinued in some of the dioceses) also to swear one witness to the will.

The proof *per testes*, by *witnesses*, or in *form of law*, is when, over and besides his own oath, he also produces witnesses, or makes other proof to confirm, that it is the last will of the deceased; and this in the presence of such as may pretend some interest in the goods of the deceased; or at least in their absence, after they have been lawfully summoned to see such a will proved, if they think fit.

The latter course is commonly taken when there is fear of some strife, or dispute about the deceased's goods: for some hold, that a will proved in common form only, may be called in question any time within thirty years after.

It is not necessary, to the proof of a written will, that the witnesses hear it read, so as that they can depose that the testator declared before them, that the self-same writing now produced is or was his last will and testament.

Where a will disposes of lands and tenements of freehold, it is now frequently proved by witnesses in chancery. It is said (1 P. Will. 741.) that in proving a devise of lands, the proper way is, that the witness should not only prove the executing of the will by the testator, and his own subscribing in his presence, but likewise that the rest of the witnesses subscribed their names in the testator's presence; and so one witness proves the full execution of the will.

Besides those forms of proving testaments already recited, which are referred to that kind of probation which is called the "publication of the testament," there is yet another form, which is called the "opening of the testament," which respects written or closed testaments, in the making of which the civil law did require that the witnesses should put to them their seals; and after the death of the testator, at the opening of the written or closed testament, the same law did also require that the same witnesses should be called by the magistrates to acknowledge their seals, or to deny the sealing. But as we do not observe that solemnity of the civil law in the sealing of the testaments by the witnesses, no more do we observe that solemnity which the civil law requireth in opening of testaments sealed; unless this may seem to have some resemblance with this third form about the

the opening of the testament, which is enacted by the statute of the 21 Hen. VIII. c. 5, which saith, that "the bishop, ordinary, or other person having authority to take probate of testaments, shall, upon the delivery of the seal and sign of the testator, cause the same seal to be defaced, and thereupon incontinent re-deliver the same seal unto the executor or executors, without claim or challenge thereunto to be made."

Dr. Swinburne says, if a testament be made in writing, and afterwards be lost by some casualty; yet if there be two witnesses (*i. e.* in the case of goods and chattels), which did see and read the testament written, and do remember the contents thereof, those two witnesses so deposing of the tenor of the will are sufficient for the proof thereof in form of law: so that they be otherwise, as well in respect of their skill as of their integrity, greater than all exception, and specially some other likelihoods concurring therewithal to make their testimony more credible.

By a constitution of archbishop Stratford; "after the testament shall be proved, according to custom, before the ordinary; the execution or administration of any goods shall not be committed, but to such as shall faithfully promise to render a just account of their administration, when they shall thereunto be duly required by the ordinary." (Lind. 177.) In the same constitution it is added, that those to whom the execution or administration is committed, shall give sufficient security to render a just account of their administration, when duly required by the ordinary.

All previous circumstances being settled, the bishop's officers are to keep the will original, and certify the copy thereof in parchment under the bishop's seal of office; which parchment, so sealed, is called the will proved.

The devise of a personal estate is not considered of any effect until probate is made of the will by the executor; neither can any executor or other person give a will in evidence concerning a personal chattel without producing the probate: and a probate obtained in the ecclesiastical court cannot be set aside in any other court either of law or equity. But the probate of a will, or a copy of the will out of the register of the spiritual court, is not to be allowed as evidence in the case of lands.

Regularly, that is, by the civil law, testaments ought to be insinuated in the official or commissary of the bishop of the diocese within four months next after the testator's death; but an executor is a complete executor before probate, to all purposes but bringing of actions. By 21 Hen. VIII. c. 5. the ordinary, or other person having authority for probate of testaments, may convene before them persons named executors of any testament, to the intent of proving or refusing the testament, as they might do heretofore. (See also 1 Ed. VI. c. 2.) And the ordinary may sequester the goods of the deceased, until the executors have proved the testament; so may the metropolitan, if the goods be in divers dioceses. (Swinb. *a.* 477, 478.) And if the executors do not appear upon the process, the ordinary may excommunicate them; but they may pray time to advise: and the ordinary may grant in the mean time letters "ad colligendum bona defuncti." On the other hand (inasmuch as the executor, though he may be sued, and pay debts, and release an action, yet cannot have an action, before probate), the ordinary is bound to prove the will; and on his refusal, a writ will go to the temporal court, to compel him to proceed to probate, where the will is not controverted: but if the validity of the will is contested, it is a sufficient answer by the ordinary to a writ of mandamus, to return, that a suit is depending before him concerning the same, and not yet determined.

By 21 Hen. VIII. cap. 5. it is enacted, that on probate of wills, &c. 6*d.* and no more shall be taken by the register, where the goods of the deceased do not exceed 5*l.* value; and when the goods are above the value of 5*l.* and under 40*l.*, the fee to the bishop or ordinary shall be 2*s.* 6*d.*, and to the register 1*s.* And if the goods exceed 40*l.* value, in to the bishop or ordinary 2*s.* 6*d.*, and to the register 2*s.* 6*d.*; which, however, he may refuse, and take 1*d.* for every ten lines of the will, &c. And if the officer takes more than his due fees, he shall forfeit 10*l.*, to be divided between the king and the party grieved. See also 31 Geo. II. cap. 10. which relates to seamen and marines.

By 48 Geo. III. c. 149. the following stamp duties are imposed on probates and letters of administration:

Above the value of 20 <i>l.</i> and under the value of 100 <i>l.</i>		the value		£	s.	d.
Of the value of	100 <i>l.</i> and under	200 <i>l.</i>		0	10	0

See EXECUTOR and WILL.

PROBATICA PISCINA. See PISCINA.

PROBATION, in a *Monastic Sense*, a time of trial; or the year of noviciate, which a religious must pass in a convent to prove his virtue and vocation, and whether he can bear the severities of the rule.

The year of probation commences from the day of novices taking the habit.

PROBATION, in the *Universities*, denotes the examination and trial of a student who is about to take his degrees. See DEGREE.

PROBATIONER, in the *Presbyter Discipline*, a person licensed by a presbytery to preach; which is usually done a year before he be ordained.

A student

A student in divinity is not admitted probationer till after several trials; the first, private, before a presbytery; the second, public, before a congregation, the presbytery being present.

The private trials are a homily and exegesis, *i. e.* a theological subject is given to the presbytery in theses, and the candidate answers any objections started against it.

The public trials are a popular sermon, and an exercise and addition, *i. e.* a text is handled, half an hour logically and critically, and half an hour more practically. If he acquit himself to the satisfaction of the presbytery, he signs the confession of faith, and owns the Presbyterian government, &c.; upon which he receives a licence to preach.

PROBATOR, in *Law*, an accuser or approver; one who undertakes to prove a crime charged upon another: properly, an accomplice in the crime, who impeaches others.

PROBATUM EST, *q. d.* it is proved; a term frequently subjoined to a receipt for the cure of some disease.

PROBE, a surgeon's instrument with which to sound and examine the circumstances of wounds, ulcers, and other cavities.

PROBE, *Anel's*. See FISTULA *Lachrymalis*.

PROBENCIO, in *Geography*, a town of Spain, in New Castile; 25 miles S.W. of Alarcon.

PROBERSDORFF, or PROTTESDORFF, a town of Austria, on the river Leyta; 12 miles W.S.W. of Brugg.

PROBLEM, *Προβλημα*, in *Logic*, a doubtful question; or a proposition that neither appears absolutely true, nor false; but which is probable on both sides, and may be asserted either in the negative or affirmative, with equal evidence.

Thus, that the moon and planets are inhabited by animals in some respect like us, is a problem: that the fixed stars are also suns, and each the centre of a separate system of planets and comets, is a problem.

PROBLEM is also a proposition expressing some natural effect, proposed in order to a discovery of its apparent cause. Such are the problems of Aristotle.

A logical or dialectical problem, say the schoolmen, consists of two parts; a subject, or subject matter, about which the doubt is raised: and a predicate or attribute, which is the thing doubted whether it be true of the subject or not.

There are four topical predicates; *viz.* *genus*, *definitio*, *proprium*, and *accidens*: whence arise four different kinds of dialectical problems. The first, when the thing attributed to the subject is in the relation of a genus; as, whether fire be an element or not? The second, when the thing attributed as the effect of a definition; as, when it is asked, whether or no rhetoric be the art of speaking? The third, when the attribute imports a propriety; as, whether it belong to justice to give every one their due? The last is when the thing attributed is adventitious: as, whether justice is to be desired?

Problems, again, may be divided into those relating to things to be done, or avoided, called *ethical*; those relating to the knowledge of nature, called *physical*; and those relating to spirits, called *metaphysical* problems, &c.

PROBLEM, in *Geometry*, denotes a proposition in which some operation, or construction, is required; as to divide a line, to make an angle, to draw a circle through three points not in a right line, &c.

Messieurs of the Port Royal define a *geometrical* problem, a proposition given to be demonstrated, in which something is required to be done; and what is done, to be proved to be the thing required.

A problem, according to Wolfius, consists of three parts. The proposition, which expresses what is to be done. The resolution, or solution, wherein the several steps, by which the thing required is to be effected, are orderly rehearsed. The demonstration, in which is shewn, that by doing the several things prescribed in the resolution, the thing required is obtained.

Accordingly the general tenor of all problems is this; the things prescribed in the resolution being done, the thing required is done. See *GEOMETRICAL Solution of a Problem*.

PROBLEM, in *Algebra*, is a question or proposition which requires some unknown truth to be investigated or discovered; and the truth of the discovery demonstrated.

In this sense it is a problem, *to find a theorem*. Algebra is defined to be the art of resolving all problems that are resolvable.

PROBLEM, *Kepler's*, in *Astronomy*, is the determining of a planet's place from the time; thus called from the astronomer Kepler, who first proposed it.

The problem, stated in form, stands thus: to find the position of a right line, which, passing through one of the foci of an ellipsis, shall cut off an area described by its motion, which shall be in any given proportion to the whole area of the ellipsis.

The proposer knew no way of solving the problem directly and geometrically; and therefore had recourse to an indirect method; for which he was taxed with an *αγεωμετρικια*, or want of geometry; and his astronomy charged with not being geometrical. But the problem has since been solved directly and geometrically several ways, by several authors; particularly Sir Isaac Newton, Dr. Keil, &c.

As to the solution of this problem, the late excellent mathematician Mr. Machin observes, that many attempts have been made, at different times, but never yet with tolerable success, towards the solution of the problem proposed by Kepler: to divide the area of a semicircle into given parts, by a line from a given point of the diameter, in order to find an universal rule for the motion of a body in an elliptic orbit. For among the several methods offered, some are only true in speculation, but are really of no service. Others are not different from his own, which he judged improper. And as to the rest, they are all some way or other so limited and confined to particular conditions and circumstances, as still to leave the problem in general untouched. To be more particular, it is evident, that all constructions by mechanical curves are seeming solutions only, but in reality unapplicable; that the roots of infinite serieses are, upon account of their known limitations in all respects, so far from affording an appearance of being sufficient rules, that they cannot well be supposed as offered for any thing more than exercises of a method in calculation. And then, as to the universal method, which proceeds by a continued correction of the errors of a false position, it is, when duly considered, no method of solution at all in itself; because, unless there be some antecedent rule or hypothesis to begin the operation (as suppose that of a uniform motion about the upper focus, for the orbit of a planet; or that of a motion in a parabola for the perihelion part of the orbit of a comet; or some other such), it would be impossible to proceed one step in it. But as no general rule has ever yet been laid down to assist this method, so as to make it always operate, it is the same in effect as if there were no method at all. And accordingly in experience it is found, that there is no rule now subsisting but what is absolutely useless in the elliptic orbits of comets; for in such cases there is no other way to proceed but that which was used by Kepler:

to compute a table for some part of the orbit, and therein examine if the time to which the place is required, will fall out any where in that part. So that, upon the whole, it appears evident, that this problem, contrary to the received opinion, has never yet been advanced one step towards its true solution. Vide Machin, in Phil. Trans. Martyn's Abridg. vol. viii. p. 73.

Mr. Machin afterwards proceeds to give his own solution of this problem, which is particularly necessary in orbits of a great excentricity; and he illustrates his method by examples, for the orbits of Mercury, of Venus, of the comet of the year 1682, and of the great comet of the year 1680, all which shew the universality of that method. See ANOMALY, and EQUATION of the Centre.

PROBLEM, *determinate, diophantine, indeterminate, limited, linear, local, plain, solid, surfsolid, and unlimited.* See the adjectives.

PROBLEM, *Deliacal*, in *Geometry*, is the doubling of a cube. This problem coincides with that for finding two mean proportionals between two given lines; whence that also is called the *deliac* problem. See DUPLICATION.

PROBLEMATICAL RESOLUTION, in *Algebra*, a method of solving difficult questions by certain rules, called *canons*.

PROBOLIUM, among the Romans, a kind of spear, which hunters used in hunting boars.

PROBOSCIDEA, in *Botany*, so called from the very long beak of the fruit. See MARTYNIA.

PROBOSCIPLECTANUS, in *Natural History*, a name given by some authors to a peculiar and very elegant species of penicillus marinus, which has somewhat of a funnel-like shape, and has its mouth surrounded by a number of thin hair-like filaments. See PENICILLI *Marini*.

The first who has described this particular species is the accurate Fabius Columna, from whom Klein has engraven a figure of it.

PROBOSCIS, *προσοσκις*, the trunk or snout of an elephant, and of some other animals.

The proboscis is a member issuing out of the middle of the forehead, serving instead of a hand; and having a little appendix fastened to the hand of it, in form of a finger. By the proboscis the she-elephant, it is said, sucks herself; and by the same conveys the milk to her young. All quadrupeds have the length of their neck equal to that of their feet, the elephant alone excepted; in which the shortness of the neck is compensated by the length of the proboscis. See ELEPHANT.

Theameleon has also a kind of trunk or proboscis, which is its tongue; and which it darts nimbly out of its throat as if it spat it; and draws it in again instantaneously. It serves, like the elephant's trunk, to lay hold on, and take in its food. See CAMELEON.

The microscope shews us a little trunk or proboscis in flies and gnats, by means of which they suck the blood of animals, or liquors, for their food.

PROBOSCIS of *Flies*. See TRUNK, ENTOMOLOGY, FLY, and INSECT.

PROBSTORFF, in *Geography*, a town of Austria; three miles S.E. of Entzerdorff.

PROBSTZELLE, a town of Saxony, in the principality of Altenburg; six miles S. of Saalfeld.

PROBULEUMA, *Προβουλεμα*, among the Athenians, a decree or vote of the areopagus, or senate of Athens.

It was so called because agreed upon by the senate, with a design to have it afterwards propounded to an assembly of the people, that it might receive from them a farther ratification, without which it could not be passed into a law, nor

have any force or obligatory power after the end of that year, when the senators and other magistrates laid down their commissions. Potter, *Archæol. Græc. lib. i. cap. 18. tom. i. p. 100.*

PROBUS, M. AURELIUS, in *Biography*, a Roman emperor, was born about the year 232, at Sirmium, in Pannonia. He entered young into the Roman army, and distinguished himself so much by his valour and integrity, that the emperor Valerian raised him to the post of tribune before the legal age for that advancement. In a battle with the Sarmatians and Quadians he obtained a civic crown, by rescuing from the hands of the enemy a young man of rank related to the emperor. In every station he shewed himself superior to the trust committed to him. After having subdued the Marmarides in Africa, and quelled a rebellion at Carthage, he was employed to recover Egypt from the Palmyrenians, who, under the famous Zenobia, had conquered that country. This important business he effected, and so well established was his reputation at that period, that when, after the death of Aurelian, Tacitus was nominated to the empire by the senate, in his speech to decline that charge he proposed Probus in his stead. On the murder of Tacitus in 276, his half-brother Florianus, at the head of an army near the Bosphorus, assumed the purple as by right of inheritance; but at the same time the army of the East conferred the imperial dignity upon their commander Probus. A civil war succeeded, which in two months was terminated by the death of Florianus, and Probus was recognised by the troops of his rival. He then wrote a very modest letter to the senate, to whom he submitted his pretensions; and his deference was rewarded by an unanimous vote, conferring upon him the usual titles and prerogatives. In return, he issued a declaration, confirming the privileges of the senate, to whom he committed the whole administration, contenting himself almost solely with the military command. One of the first exertions of his authority was the punishment of the conspirators against Aurelian and Tacitus. He then marched into Gaul, which he cleared, after several victories, of those numerous tribes of barbarians which had ravaged and occupied a great many towns and districts of that country. He followed the vanquished across the Rhine, laid waste a large tract of country, and compelled nine of their petty kings to throw themselves at his feet, and supplicate for peace. To protect from invasion the Gallic colony settled in Suabia, he erected a stone wall, with towers at proper intervals, which extended from the Danube near Ratisbon, to Wimpfen on the Neckar, and finally terminated on the Rhine, after a winding course of nearly 200 miles. He undertook to reduce the Isaurians, a fierce band of robbers in Asia Minor, and made himself master of their principal town. After this he proceeded to the frontiers of Persia. The king of that country, alarmed at his approach, sent an embassy to him, which found him encamped on the mountains of Armenia. He was dining on pork and peas when the deputies arrived, whom he astonished by the plainness of his dress, and the simplicity of his manners, while he made them tremble by the sternness with which he delivered a menacing message to their master. The differences between the two empires were for the present accommodated, but Probus did not renounce his purpose of making war upon the Persians, though he was, for the present, recalled to his European territories, by the necessity of taking measures to prevent revolts among the barbarians whom he had vanquished. His policy with respect to this, was to transport great bodies of the conquered nations to a distance from their own homes, and settle them upon unoccupied lands in remote provinces of the empire. Thus a number of

of Vandals were conveyed to the central parts of Britain, in which situation they continued a distinct tribe: by means such as these he kept the frontiers in a state of tranquillity. The people of Alexandria having proclaimed Saturnius, a commander in the East, emperor, he thought it prudent to withdraw into Palestine without accepting the honour. But reflecting on the improbability of remaining as a private man in a state of safety, he suffered the soldiers to confirm the tumultuary election, and prepared for his defence. Probus had a high respect for him, and offered him a free pardon; but he had, in his own estimation, gone too far, and he was slain: the same fate occurred to Proculus and Bonofus, two military commanders that had excited rebellions in Gaul. The return of peace in 281, was celebrated by the emperor with a triumph over the distant nations of the Germans, &c., in which he presented to the people of Rome the usual spectacles of gladiators, the chase of wild beasts, and other amusements, with great magnificence. A more useful benefit was bestowed on his subjects, in taking off Domitian's interdiction against planting vines, in favour of the Gauls, the Spaniards, and the Pannonians; so that the fine wines of Burgundy, Champagne, and Tokay, may be said to owe their origin to Probus. He employed the soldiery in planting and other useful labours, over whom he constantly exercised a constant and strict, but by no means severe, discipline. It was, however, his wise policy of keeping them regularly employed in peace as well as in war, that was at last the cause of his untimely end. He had determined to improve the land about Sirmium, of which he was a native; "but," says the historian, "in the prosecution of a favourite scheme, the best of men, satiated with the rectitude of their own intentions, are subject to forget the bounds of moderation; nor did Probus himself sufficiently consult the patience and disposition of his fierce legionaries. The dangers of the military profession seem only to be compensated by a life of pleasure and idleness; but if the duties of the soldier are incessantly aggravated by the labours of the peasant, he will at last sink under the intolerable burden, or shake it off with indignation." The imprudence of Probus is said to have inflamed the discontent of the troops. More attentive to the interests of mankind than to those of the army, he expressed the vain hope, that by the establishment of universal peace, he should soon abolish the necessity of a standing and mercenary army. The unguarded expression proved fatal to him. In one of the hottest days of summer, as he severely urged the unwholesome labour of draining the marshes of Sirmium, the soldiers, impatient of fatigue, on a sudden threw down their arms, and broke out into a furious mutiny. The emperor, conscious of his danger, took refuge in a lofty tower constructed for the purpose of surveying the progress of the work. The tower was instantly forced, and a thousand swords were plunged at once into the bosom of the unfortunate Probus. The rage of the troops subsided as soon as it had been gratified. They then lamented their fatal rashness, forgot the severity of the emperor whom they had massacred, and hastened to perpetuate, by an honourable monument, the memory of his virtue and victories. Gibbon. Univer. Hist.

PROBUS, M. VALERIUS, a Latin grammarian, lived in the second century, under the emperor Adrian. He wrote several treatises, of which one, cited by Servius, was entitled "De Temporum Connexione." Some fragments of his writings have been published among the "Grammatici Latini Veteres." Moreri.

PROBY'S ISLAND, in *Geography*, a small island in the Pacific ocean, so called by Capt. Edwards in 1791; denomi-

nated by the natives "Onoo-afou." S. lat. 15° 53'. W. long. 175° 51'.

PROCACCINI, GIULIO-CESARE, in *Biography*, was the son of Ercole Procaccini of Bologna, a painter of considerable note, and an imitator of Corregio. He was born in 1548, and was at first educated as a sculptor, but abandoned the chisel for the pencil; the instrument of an art less laborious and more ingenious. In Bologna he frequented the academy of the Caracci, and it is said, that in reply to some sarcasms of Annibal, he struck and wounded him. The principal object of his studies were the works of Corregio, and in the opinion of many, none ever approached nearer the grandeur of that style. In easel pictures, and works of confined composition, he has not seldom been mistaken for Corregio, though his grace be often meretricious, and his colour less vigorous. Thus, a Madonna of his at St. Luigi de Francesi, has been engraved as the work of Allegri; and some still better imitations may be seen in the palace of St. Vitali at Parma, in that of Carega at Genoa, and elsewhere.

Of his various altar-pieces, the most Corregiesque is perhaps that of St. Afra in Brescia: it represents Maria with the infant, amid an ogling and smiling group of angels and saints; where dignity seems as much sacrificed to grace, as in the mutual smile of the Virgin and the angel in his Nunziata, at St. Antonio of Milan; grimaces both, unworthy of the moment and of the mystery.

He is sometimes equally blameable for extravagance of attitude, as in the executioner of St. Nazario; a picture else composed of charms and beauties. But notwithstanding the number and copiousness of his works, his design is correct, his forms and draperies select, his invention varied, and the whole together has a certain grandeur and breadth which he either acquired from the Caracci, or like them derived from Corregio. He died in 1626, at the age of 78.

Procaccini had two brothers, both painters; but not of equal merit with himself. Camillo, who practised in history painting, and Carlo Antonio, who adopted landscape. The latter left a son, Ercole, called the Young, who painted flower-pieces with considerable skill, and died in 1676, aged 80. Fufeli.

PROCATARCTIC CAUSE, in *Medicine*, from προαρχω, *I precede*, or *pre-exist*, is the pre-existent or *pre-disponent* cause of a disease, which renders the body liable to be excited to disorder by certain subsequent and immediate causes. Thus, a hot climate or season induces a disposition to be affected with bilious diseases, when intemperance or sudden chill may influence the body, the heat being the *procatarctic*, and the intemperance or chill the *exciting* cause of the bilious affections. See CAUSE, in *Medicine*.

PROCEDENDO, in *Law*, a writ whereby a plea or cause, formerly called from an inferior court to the chancery, king's bench, or common pleas, by writ of privilege, habeas corpus, or certiorari, is released, and returned to the other court to be *proceeded* in; upon its appearing that the defendant has no cause of privilege, or that the matter comprised in the party's allegation is not well proved.

Non PROCEDENDO ad assisam rege inconsulto. See NON.

PROCEDURE, PROCEEDINGS, the course of the several acts, expeditions, and instructions of a process or lawsuit.

Procedure is either *civil* or *criminal*. *Civil* procedure is that where the estate alone is concerned: *criminal*, or *extraordinary* procedure, is that where the person is prosecuted.

Proceedings are also *summary* and *regular*.

PROCEED, among *Merchants*, that which arises from a thing. In which sense they say, the *net* proceed.

PROCELEUSMATICUS, προκελευσματικός; in the *Ancient Poetry*, a foot consisting of four short syllables: as *arietat*.

PROCELLARIA, the *Petrel*, in *Ornithology*, a genus of birds of the order Anseres: the generic character is, bill toothless, a little compressed, hooked at the point; mandibles equal; nostrils cylindrical, tubular, truncate, lying on the base of the bill; feet palmate; the back toe pointing downwards, sessile, sharp, a mere spur.

The birds of this genus, of which there are twenty-four species, live chiefly at sea, and, except at the breeding-time, are seldom seen near land; they have the faculty of spouting from their bills, to a considerable distance, a quantity of pure oil; they feed on the fat and muscle of dead whales, and other large fish. At sea they are capable of enduring the greatest storms, and on shore they possess the faculty of walking.

Species.

OBSCURA. Black, beneath white; membrane connecting the toes is tawny. It is a native of North America, and is about thirteen inches long. Its bill is black, horny at the sides; the nostrils are distinct; the sides of the neck are varied with brown and white; legs black without, pale within.

PACIFICA; Pacific Petrel. Black; dusky beneath; legs spotted with black; bill plumbeous and much hooked; the nostrils are elevated, oval, distinct, obliquely placed; legs pale. It is full twenty-two inches long. It inhabits, in vast flocks, the islands of the Pacific ocean. These flocks disappear at once, dipping under water altogether, and then rising as suddenly.

CÆRULEA; Blue Petrel. Whitish-blue, beneath white; bill and legs blue. It inhabits the southern ocean, and is twelve inches long. The bill is black at the tip, and the legs are blueish; the outer quill-feathers entirely, the next within, the rest tipped with white; the area beneath the eyes and band on the breast dusky.

VITTATA; Broad-billed Petrel. Blueish-ash, beneath white, legs black. This species inhabits the antarctic seas; it lays in holes or rocks; it flies by night in numerous flocks, and is about twelve inches long.

URINATRIX; Diving Petrel. Blackish-brown; white beneath; the bill and chin black; legs blue-green, without the spur behind. It is eight inches and a half long. Inhabits New Zealand in flocks of large numbers; it dives remarkably well, often rising at a considerable distance with surprising agility. The birds of this species croak like frogs, and sometimes make a noise like the cackling of a hen.

PELAGICA; Stormy Petrel; called also the storm-finch, or mother Cary's chicken. The specific character is black, with a white rump. It is only about the size of a swallow, and in its general appearance and flight not unlike that bird. The stormy petrel is rarely seen on our shores, except in some of the northern islands where it breeds in the holes of rocks, or under loose stones, in the months of June and July. At all other seasons it keeps far out at sea. Multitudes of them are seen all over the vast Atlantic ocean, especially before stormy weather. They often skim with incredible velocity along the hollows of the waves, and sometimes on the summits, braving the utmost fury of the tempest. As they appear to run on the surface of the sea, they have their name from an allusion to the apostle Peter's walking on the water. The inhabitants of the Feroe islands draw a wick through the body of this bird, which is by the pro-

cess so covered with grease, as to burn, when lighted, like a candle, and serving the purpose of one. There is a variety with the body black; head and sides blueish; scrag green; wing-coverts and rump spotted with green. Both sorts are excellent divers; they feed on small fishes, are mute during the day, and clamorous in the night. If the birds of this species are seen hovering round the sterns of vessels, it is thought to be a presage of bad weather.

FREGATA; Frigate Petrel. Black, beneath white; legs black. It inhabits the southern seas, and is eight inches and a half long.

FURCATA; Fork-tailed Petrel. Silver-grey; rump white; tail forked; legs black. It inhabits the seas between Asia and America. The bill is black, the upper mandible is much hooked; inner flexure of the wings black; the outer tail-feathers white on the outside.

FULIGINOSA; Sooty Petrel. Mixed black and brown; head grey and sooty; tail forked; wings, bill, and legs black. It inhabits Otaheite, and is eleven inches long; the irids are pale ash.

MARINA; Marine Petrel. Back and wing-coverts brown; crown and neck blueish-ash; rump blueish; cheeks and body beneath white. It inhabits the southern ocean; is eight inches and a half long. Under the eyes, on each side, is a cinereous streak; the legs are black.

DESOLATA; Brown-banded Petrel. Greenish-ash, beneath white; wings and rounded tail dusky, the latter tipped with brown. It is found on and about the island of Desolation, and is eleven inches long. The bill of this species is black, tipped with yellowish; temples and area of the eyes are white; the legs are brown, the membrane connecting the toes is yellow.

NIVEA; Snowy Petrel. Snowy, as its name imports; shafts of the feathers and bill black; legs dusky blue. Inhabits the colder parts of the South sea, and is twelve inches long. Bill and legs blackish-blue; the membrane is pale.

MELANOPUS; Black-toed Petrel. Black, beneath hoary; legs pale; frontlet and chin grey, with minute blackish spots; the bill and part of the toes are black. It inhabits North America, and is thirteen inches long.

* **GLACIALIS**; Fulmar Petrel. Whitish; back hoary; bill and legs yellowish; a variety is white; middle of the back hoary; wings blackish. This species inhabits the southern and northern seas; breeds in Greenland, Spitzbergen, and St. Kilda, and is seventeen inches long: it is a stupid and fearless bird; feeds on fishes, dead whales, and any filthy matter; the flesh is rancid, but eaten by the inhabitants of St. Kilda, &c. The oil is very highly esteemed, and the young bird, if taken by surprise, yields a pint of it, otherwise it spouts it out in self-defence.

CINEREA; Cinereous Petrel. This is cinereous; beneath white; tail black; bill yellowish; legs blueish. It inhabits the antarctic circle, and is 20 $\frac{1}{4}$ inches long.

GIGANTEA; Giant Petrel. Brownish, spotted with white; it is white beneath; the shoulders, wings, and tail are brown; the bill and legs are yellow. It has a naked, wrinkled, yellow membrane at the angles of the mouth. It is bigger than a goose, being in length full forty inches, and the expansion of the wings is seven feet. It is a very common bird in the high southern latitudes, and sometimes seen, though much more rarely, in the northern seas. It is often seen sailing, with the wings expanded, close to the surface of the water, but without appearing to move them. At Christmas harbour, and Kerguelen's lands, they have been seen so tame, as to be caught without difficulty. Though their

their chief food is fish, they also feed on the carcases of seals and birds.

BRASILIANA. Blackish; lower part of the neck yellow. It inhabits Brazil, is the size of a goose, frequents the mouths of rivers, and makes its nest on the shore.

ÆQUINOCTIALIS; Black Petrel. Brown, without spots; bill yellow; legs brown. A variety has legs reddish-black. The *first* inhabits the Cape of Good Hope and New Zealand; the *second* Kamtschatka: the former is about twenty-three inches long; the latter thirty-five or thirty-six.

GRISEA; Grey Petrel. Sooty; lower wing-coverts white; bill brown; legs blueish on the fore-part. It is a native of the southern hemisphere, and is fourteen or fifteen inches long.

GELIDA; Glacial Petrel. Blueish-ash; back blackish; chin, throat, and breast white; bill yellow; legs blue. It inhabits the icy seas, and is nineteen inches long.

ALBA; White-breasted Petrel. Black-brown; breast, belly, and vent white. A variety is footy, beneath cinereous; face varied with white and brown; legs yellowish; toes and membranes half black. It inhabits the Pacific ocean, and is about sixteen inches long.

ANTARCTICA; Antarctic Petrel. Brown, beneath blueish-white; tail white tipped with black; the legs are of a lead colour. It is a native of the antarctic circle.

CAPENSIS; Pintado. Variegated with white and brown, and sometimes with yellowish and brown; bill and legs black; temples white and black. This is the pintado-bird of Dampier; the white and black spotted petrel of Edwards; and the Cape pigeon of our sailors. It is seldom seen to the north of thirty degrees, and is most frequent about the Cape of Good Hope, and the neighbouring regions. It flies in numerous flocks, which almost sweep the surface of the water. They have been traced to New Zealand, the Falkland islands, and other regions in the southern hemisphere. The sailors often catch them with some tarred string, or a bit of lard on a fishing-rod. Seven hundred have been caught in a night. They feed on fish, but seem to delight on the dead carcases of whales.

* **PUFFINUS;** Shearwater Petrel. Black above; white beneath; legs rufous; bill yellow, tipped with black; hind-head whitish-ash; spurious wings spotted with black; first quill and tail-feathers brown without, and white within. It is about the size of a large pigeon. It inhabits the southern and arctic seas. Breeds in the Isle of Man and in the Orkneys, in the former of which it is called *manks puffin*, and in the latter *lyre*. It takes possession of a rabbit burrow, or other hole, and lays one white egg, blunt at each end, which is hatched in August. The flesh is eatable, but rank. Numbers are killed and barrelled with salt; and in this state they are eaten as we eat salt fish. There is a variety which is cinereous above, white beneath; the tail is of a clear white. It inhabits the southern and arctic seas, and is fifteen or sixteen inches long.

PROCERS, in *Glass Making*, iron instruments, hooked at the extremity, used to settle the pots in their places, whether set too near or too far off.

PROCESS, PROCESSUS, in *Law*, is used for all the proceedings in any cause or action, real or personal, civil or criminal, from the original writ to the end. See **PROCEDURE**.

PROCESS denotes, in a more restrained sense, the means that are made use of, after suing out the original, for compelling the defendant to appear in court: this being the beginning, or principal part, and that by which the rest of the business is directed.

This is sometimes called *original process*, being founded

upon the original writ; and also to distinguish it from *mesne* or intermediate process, which issues, pending the suit, upon some collateral interlocutory matter; as to summon juries, witnesses, and the like. *Mesne* process is also sometimes put in contradistinction to *final* process, or *process of execution*; and then it signifies all such process as intervenes between the beginning and end of a suit. The preliminary step in *civil* process is that of giving notice to the party to obey the original writ, issued for compelling his appearance in court. This notice is given upon all real "præcipes," and also upon all personal writs for injuries not against the peace by *summons*: which see. If the defendant disobeys this verbal admonition, the next process is by writ of *attachment*, or *pone*: which see. If, after attachment, the defendant neglects to appear, he not only forfeits the security he has given, but is moreover to be further compelled by writ of *distingas*, or *distress, infinite*: which see. Here by the common, as well as the civil, law, the process ended in case of injuries without force: the defendant, if he had any substance, being gradually stripped of it all by repeated distresses, till he rendered obedience to the king's writ: and if he had no substance, the law held him incapable of making satisfaction, and therefore looked upon all further process as nugatory. For the process, in cases of injury accompanied with force, see **CAPIAS**.

Such is the first process in the court of common pleas. In the king's bench they *may* also (and frequently *do*) proceed in certain causes, particularly in actions of ejection and trespass, by *original writ*, with *attachment* and *capias* thereon: returnable, not at Westminster, where the common pleas are now fixed, in consequence of Magna Carta, but *ubicunque fuerimus in Anglia*, wherever the king shall be in England; the king's bench being removable into any part of England, at the pleasure and discretion of the crown. But the more usual method of proceeding therein is without any original, but by a peculiar species of process, entitled a *BILL of Middlesex*; which see.

In the exchequer, the first process is by writ of *quo minus*, which see. The three courts set out differently, as we have briefly stated, in the commencement of a suit, in order to entitle the two courts of king's bench and exchequer to hold pleas in causes between subject and subject, which by the original constitution of Westminster-hall they were not empowered to do. Afterwards, when the cause is once drawn into the respective courts, the method of pursuing it is partly much the same in all of them. If the sheriff has found the defendants upon any of the former writs, the *capias, latitat*, &c. he was anciently obliged to take him into custody, in order to produce him in court upon the return, however minute the cause of action might be. For, not having obeyed the original summons, he had shewn a contempt of the court, and was no longer to be trusted at large. But when the summons fell into disuse, and the *capias* became in fact the first process, it was thought hard to imprison a man for a contempt which was only supposed: and therefore in common cases by the gradual indulgence of the courts (at length authorized by statute 12 Geo. I. c. 29, amended by 5 Geo. II. c. 27, made perpetual by 19 Geo. III. c. 70, and extended to all inferior courts by 19 Geo. III. c. 70.) the sheriff, or proper officer, can now only personally serve the defendant with the copy of the writ or process, and with notice, in writing, to appear, by his attorney in court, to defend this action; which, in effect, reduces it to a mere summons. The next part of the process is *bail*; which see. (See also **AC ETIAM**.) Besides the *ac etiam*, added to the writ of *capias*, the man sworn to by the plaintiff is marked upon the

the back of the writ: and the sheriff, or his officer the bailiff, is then obliged actually to arrest or take into custody the body of the defendant; and having so done, to return the writ with a *cepi corpus* endorsed thereon. (See ARREST.) When the defendant is regularly arrested, he must either go to prison, for safe custody: or put in to the sheriff *Special BAIL*; which see. Upon the return of the writ, or within four days after, the defendant must *appear* according to the exigency of the writ. (See BAIL.) When the defendant appears in court, in consequence of *process*, either in person as a prisoner, or out upon bail, the next stage is that of the *pleadings*; which see.

For an account of *process* in criminal cases, see INDICTMENT and CAPIAS. See also CERTIORARI.

By 48 Geo. III. c. 58. § 1. it is enacted that whenever any person is charged with any offence for which he may be prosecuted by indictment or information in the king's bench, not being treason or felony, and the same shall be made to appear to any judge of the same court by affidavit, or by certificate of an indictment or information being filed against such person in the said court for such offence, such judge may issue his warrant under his hand and seal, and thereby cause such person to be apprehended and brought before him or some other judge of the same court, or before some one justice of the peace, in order to his being bound with two sufficient sureties in such sum as the said warrant shall express, with condition to appear in the said court at the time mentioned in the said warrant, and to answer all and singular indictments or informations for any such offence; and if he shall neglect or refuse to become so bound, such judge or justice may respectively commit him to the common gaol of the county, city, or place where the offence shall have been committed, or where he shall have been apprehended, there to remain until he shall become bound as aforesaid, or be discharged by order of the said court in term time, or of one of the judges of the said court in vacation; and the recognizance to be thereupon taken shall be returned and filed in the said court, and shall continue in force until such person shall have been acquitted of such offence, or in case of conviction shall have received judgment for the same, unless sooner ordered by the said court to be discharged; and that where any person, either by virtue of such warrant of commitment, or by virtue of any writ of *capias ad respondendum* issued out of the same court, is now or hereafter shall be committed or detained in any gaol for want of bail, it shall be lawful for the prosecutor to cause a copy thereof to be delivered to such person, or to the gaoler, keeper, or turnkey of the gaol, wherein he is or shall be so detained, with a notice endorsed, that unless such person shall, within eight days from the time of such delivery of a copy of the indictment or information as aforesaid, cause an appearance, and also a plea or demurrer to be entered in the said court to such indictment or information, an appearance and the plea of not guilty will be entered thereto in the name of such person; and in case he shall thereupon for the said space of eight days after such delivery of a copy of the indictment or information as aforesaid neglect to cause an appearance, and also a plea or demurrer to be entered in the said court to such indictment or information, it shall be lawful for the prosecutor, upon affidavit made and filed in the said court, of the delivery of a copy of such indictment or information, with such notice so endorsed to such person, or to such gaoler, keeper, or turnkey as the case may be, which affidavit may be made before any judge or commissioner of the said court authorized to take affidavits in the said court, to cause an appearance and the plea of not guilty to be entered in the said court to such

indictment or information for such person, and such proceedings shall be had thereupon as if the defendant in such indictment or information had appeared and pleaded not guilty according to the usual course of the said court; and if upon the trial thereof the defendant so committed and detained shall be acquitted of all the offences charged there upon him, the judge before whom such trial shall be had, although he may not be one of the judges of the king's bench, may order the defendant to be forthwith discharged out of custody as to his commitment as aforesaid, and such defendant shall be thereupon discharged.

Concerning the execution of the *process*, it is laid down as a general rule, that wherever the king is a party to the suit (as he certainly is to all informations and indictments), the *process* ought to be executed by the sheriff himself, and not by the bailiff of any franchise. (2 Hawk. c. 27.) And if the party be in a house, if the doors be shut, and the sheriff (having given notice of his *process*) demand admittance, and the doors be not opened, he may break open the doors, and enter to take the offender. (2 H. H. 202.) But no person, on the Lord's day, shall serve, or cause to be served, any writ, *process*, &c. except in cases of treason, felony, and breach of the peace, 29 Geo. II. c. 7.

The difference between *process* and *precept*, or *warrant* of the justices, is this; that the precept or warrant is only to attach or convene the party, before any indictment or conviction, and may be made either in the name of the king or the justice: but *process* is always in the king's name, and, usually, after an indictment.

Obstructing the execution of lawful *process* is a high offence; particularly when it is an obstruction of an arrest upon criminal *process*. And it hath been held, that the party opposing such arrest, becomes thereby *particeps criminis*, i. e. an accessory in felony, and a principal in high treason. 1 Hawk. P. C. 12. Blackst. Com. vol. iv.

PROCESS by Attachment. See ATTACHMENT.

PROCESS by Attainder. See ATTAINDER.

PROCESS, Discontinuance of. See DISCONTINUANCE of *Process*.

PROCESS of Outlawry. See OUTLAWRY.

PROCESS, in Anatomy. See PROCESSUS.

PROCESS, in Chemistry, the whole course of an operation, or experiment.

PROCESSION, PROCESSION, in Theology, a term used for the manner in which the Holy Spirit is conceived, by some divines, to issue from the Father and the Son, in the mystery of the Trinity.

The Greeks and Latins are not agreed about the procession of the Holy Spirit.

PROCESSION also denotes a ceremony in the Romish church, consisting in a formal march of the clergy in their robes, and the people after them, putting up prayers, singing hymns, &c. and in this manner making a visit to some church or other holy place.

There are general processions of all the people in jubilees, and the same often in public calamities. The processions of the holy sacrament are very solemn. They have also processions, frequently around the church, at the salutations, &c. in the mass. Anciently, among us, there were, in each parish, customary processions of the parish-priest, the patron of the church, with the chief flag, or holy banner, attended by the other parishioners, each Ascension week; to take a circuit round the limits of the parish, and pray for a blessing on the fruits of the earth. Of which custom there still remains a shadow in that annual perambulation, still called *processioning*; though the order and devotion of the ancient processions be almost lost.

PROCESSUM CONTINUANDO, in *Law*, a writ for the continuance of a process, after the death of the chief justice, or other justices in the commission of oyer and terminer. Reg. Orig. 128.

Recordo & Processu mittendis. See RECORDO.

PROCESSUS, PROCESS, in *Anatomy*, a term applied to many parts of the body, but more particularly in the bones, and usually denoting a prominence. They are too numerous to admit of our enumerating them here.

PROCESTRIA, among the Romans, buildings adjoining to camps, especially winter quarters, or standing camps, where sutlers, strangers, traders, and others that followed the army resided; for they were not permitted to mix with the soldiers, unless when the enemy was near.

PROCHARISTERIA, Προχαριστήρια, in *Antiquity*, a solemn sacrifice which the Athenian magistrates yearly offered to Minerva, when the spring first began to appear.

PROCHELLA, formed of πρῶς and χεῖλος, *lip*, a word used by some authors to express the extremities of the lips.

PROCHEIN AMY, *Proximus amicus*, in *Law*, the nearest friend, or person next akin, to a child in nonage; and who, in that respect, is allowed in law to deal and negotiate for him, to manage his affairs, to see him redressed of any wrong, and to be his guardian, if he hold land in socage.

By prochein amy is commonly understood the guardian in socage: though, in propriety, it is he who appears in court for an infant who sues any action, and aids the infant in pursuit thereof. For, to sue, an infant is not allowed to make an attorney; but the court will admit his prochein amy, next friend, as plaintiff; or his guardian as defendant.

PROCHYMA, a word used by the ancients to express that kind of must which flows spontaneously from the grapes without their being pressed.

PROCICADA, in *Natural History*, a name given by some to the insect which the French call *proci-gale*. It resembles the cicada in most respects, but it has not the power of making the noise that insect does.

PROCIDA, JOHN DI, in *Biography*, a native of Salerno, and lord of the isle of Procida, on the coast of Naples, was a physician by profession, and became a counsellor to Frederic II. and Manfred, kings of Sicily. By Charles of Anjou he was deprived of his estate and employment under pretence of treason, and his wife having been debauched by one of the French who accompanied Charles, he nourished a rooted hatred to that nation, and resolved upon revenge. He visited Sicily disguised in a Franciscan habit, where he concerted a plan for a revolution with the principal malcontents. Hence he went to Constantinople, where he held a consultation with the emperor Palæologus, and obtained from him a supply of money. He next proceeded to Rome, where he readily persuaded pope Nicholas III., who was an enemy of Charles, to concur in the enterprise. When the conspiracy was brought to maturity he repaired to Palermo, where, on East Monday 1282, the massacre began, which ended only in the complete extirpation of the French from the island of Sicily. The circumstances of this dreadful tragedy are thus related by contemporary authors. The chief conspirators had, on that day, assembled at Palermo, where, in the afternoon, they joined with the French in a procession to the church at some distance. A bride with her retinue happening to pass by, a Frenchman went up and began to take indecent liberties with her. He was stabbed on the spot by an enraged Sicilian, which became the signal for the general massacre, that extended to all the French in Palermo, and

thence spread over the whole island. Other accounts say that the massacre began on the ringing of the bell for vespers, and hence it has obtained the name of the *Sicilian vespers*. It is agreed by all, who have touched on the subject, that it was conducted with the most sanguinary ferocity, neither sex nor age being spared, nor even the progeny of Sicilian mothers by French fathers. One man alone, viz. William de Porcelets, a Provençal gentleman, and governor of a town, was dismissed unhurt, in consequence of the high respect inspired by his many virtues. After this Charles made an unsuccessful attempt to recover Sicily, which was possessed by Peter of Arragon, and after his death by his son James. John of Procida continued in the service of these kings, and was sent by the latter to Rome in 1289, to reconcile Sicily to the holy see, but without effect; he resumed his negotiations in 1295, under Boniface VIII.; and, in short, he accompanied the dowager queen Constantia to Rome, where he ended his days. Moreri.

PROCIDA, or *Procita*, in *Geography*, an island in the Mediterranean or Tuscan sea, near the coast of Naples; about five or six miles in circumference. In the thirteenth century it belonged to John of Procida, who was guilty of the notorious massacre of the French in Sicily. The shore is in general high and rocky: its small sea-port, of the same name, is populous and commercial: some of the streets, as well as the roads, are paved with lava. Pheasants abound, and to prevent their destruction the inhabitants are forbidden by law to keep cats; so that the island is overrun with rats and mice, which are dangerous to infants in the cradle; and dogs also are prohibited. N. lat. 40° 50'. E. long. 13° 48'.

PROCIDENTIA, and *Prolapsus Uteri*, a troublesome descent or bearing down of the womb, which, if not restrained, and kept up by art, would in time appear outwardly. See BEARING *down of the Womb*.

PROCIDENTIA *Ani*, in *Surgery*. See PROLAPSUS *Ani*.

PROCIDENTIA *Iridis*. See IRIS, *Prolapsus of*.

PROCIDENTIA *Oculi*. See EXOPHTHALMIA.

PROCIDENTIA *Uteri*. See PROLAPSUS *Uteri*.

PROCIDENTIA *Vaginae*. See VAGINA.

PROCIGALE, in *Natural History*, a name given by Reaumur, and from him by all the French naturalists, to a species of four-winged fly, greatly resembling the cigale, or cicada, but wanting its powers of making a noise.

This creature has a trunk of the same form with that of the cicada, very long, and laid closely upon the belly, and contained in a case or sheath of the same structure with that of this insect. The female has also the same instrument at its tail, prepared for boring holes in wood, and called in that creature the *piercer*, and it uses it to the same purpose, depositing its eggs by means of it in the branches of trees.

There is also another very small insect mentioned by Reaumur, as reducible to this class, if properly of the fly kind; but its smallness makes the structure of its wings scarcely distinguishable with any degree of accuracy; and it is hard to determine whether it has four wings, or two wings and two cases of wings. This little fly is extremely common on rose-trees; its wings are yellowish, and its body white; and it can hop as well as fly. It is hardly possible to find a rose-tree in the summer months that is not loaded with these insects, and they are principally found about the extremities of young branches. Reaumur's Hist. Inf. vol. ix.

PROCINDYNEUONTES, Προκινδυνεωντες, among the Romans, a designation given to the velites, because they were most exposed to danger. The term answers to what we call the forlorn-hope.

PROCKIA,

PROCKIA, in *Botany*, received its name from the celebrated Browne, who communicated the genus to Linnæus, by letter, from America.—Linn. Gen. 271. Schreb. 363. Willd. Sp. Pl. v. 2. 1213. Mart. Mill. Dict. v. 3. Juss. 340. Lamarck Dict. v. 5. 625. Illustr. t. 465. (*Lightfootia*; Swartz Ind. Occ. v. 2. 947.)—Class and order, *Polyandria Monogynia*. Nat. Ord. *Tiliaceæ*? Linn. *Rosaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of three leaves (occasionally with two very small leaflets at the base). *Cor.* none. *Stam.* Filaments numerous, capillary, the length of the calyx; anthers roundish. *Pist.* Germen superior, roundish, slightly five-sided; style thread-shaped, the length of the stamens; stigma bluntish. *Peric.* Berry with five angles. *Seeds* numerous.

Obf. From a variation in shape of the style and stigma in some species of *Prockia*, Vahl and Swartz were induced to establish a new genus, which they call *Lightfootia*; but we are inclined to think with Willdenow and Lamarck, that this is not a sufficient difference to authorize such a step. Jussieu considers *Prockia* nearly allied to *Laetia*.

Ess. Ch. Calyx of three leaves, besides two leaflets at the base. Corolla none. Berry with five angles, and many seeds.

1. *P. Crucis*. Linn. Sp. Pl. 745. Vahl. Symb. v. 3. 69. t. 64.—Leaves heart-shaped, ovate, toothed. Flower-stalks terminal, somewhat racemose.—Native of Santa Cruz. The *branches* of this shrub are round, smooth, and purplish. *Leaves* alternate, stalked, smooth, three-ribbed. *Stipulas* sickle-shaped, tapering, toothed, deciduous. *Flowers* about four or five in a cluster, at the ends of the branches. *Berry* the size of a pea, terminated by the permanent *style*.

2. *P. deltoides*. Lamarck Dict. v. 5. 626. Illustr. t. 465. f. 3.—Leaves roundish or deltoid, notched. Flowers lateral, mostly solitary.—Native of the Isle of France, where it was gathered by Commerçon.—*Branches* slender, waved at their tops. *Leaves* alternate, stalked, smooth; the lower ones deltoid, a little pointed; the upper smaller, entire at their base. *Flowers* lateral, solitary, occasionally two or three together. *Fruit* oval.

3. *P. theaformis*. Willd. n. 3.—Leaves lanceolate-elliptical, serrated, bluntish. Flower-stalks axillary, mostly solitary, single-flowered.—Native of the Isle of Bourbon. *Branches* alternate, furrowed, greyish. *Leaves* alternate, stalked, leathery, smooth on both sides. *Flowers* lateral, solitary, on long, smooth stalks. *Fruit* nearly globular, surmounted by a sessile lobed *style*, and therefore, like the following, referred by Vahl to *Lightfootia*.

4. *P. integrifolia*. Willd. n. 4.—Leaves somewhat coriaceous, oblong or obovate, emarginate, nearly entire. Flower-stalks generally crowded together, single-flowered.—Native of the Mauritius.—*Branches* cylindrical, smooth, ash-coloured. *Leaves* alternate, stalked, pale green. *Flowers* axillary, sometimes many together at the axils of the upper leaves. *Fruit* oval, about the thickness of a very small hazel-nut.

5. *P. ovata*. Lamarck Dict. v. 5. 626. Illustr. t. 465. f. 2.—Leaves obtusely ovate, serrated. Flowers solitary, in a sort of umbel.—Native of the same country. This new species of Lamarck's is distinguished by its obtusely oval, long *leaves*, notched with sickle-shaped teeth at their edges, marked with lateral, parallel nerves, and stalked. *Flowers* forming an umbel. *Fruit* oval, small.

6. *P. ferrata*. Willd. n. 2. (*Lightfootia ferrata*; Swartz Ind. Occ. v. 2. 948.)—Leaves oblong-ovate, serrated, pointed. Flower-stalks lateral, aggregate, single-flowered.

Native of Montferrat and the Mauritius. The *branches* of this shrub are round, warty and ash-coloured. *Leaves* alternate, stalked, smooth on both sides. *Flowers* of a pale colour, small. *Fruit* resembling a black currant. This species is occasionally dioecious.

7. *P. laciniata*. Lamarck Dict. v. 5. 627.—Leaves very smooth, oblong-lanceolate, lacinated, very narrow.—Native of the Isle of Bourbon, from whence it was sent to M. Lamarck under the name of *P. trithales*, who tells us the *flowers* of this species are unknown, so that it cannot with certainty be referred to the present genus.

8. *P. lobata*. Lamarck. Dict. v. 5. 627. (Litsea; Illustr. t. 834.)—Leaves ovate, pointed, serrated. Flowers axillary, racemose, very small.—Place of growth unknown. *Branches* smooth, alternate, dotted. *Leaves* alternate, stalked, smooth, toothed, pointed, veined. *Flowers* in short bunches, very small. *Fruit* globular.

PROCLAMATION, **PROCLAMATIO**, an instrument dispatched by the king, with the advice of his privy-council, whereby the people are advertised of something which his majesty thinks fit for them to know; and by which they are sometimes required to do, or not to do, certain things.

The word is of Latin origin, formed from *proclamare* *pa-lam* & *valde clamare*.

Proclamations have the force of laws; but then they are supposed to be consistent with the laws already in being; otherwise they are superseded.

Thus, the established law is, that the king may prohibit any of his subjects from leaving the realm; a proclamation, therefore, forbidding this in general for three weeks, by laying an embargo upon all shipping in the time of war, will be equally binding as an act of parliament, because founded upon a prior law. But a proclamation to lay an embargo in time of peace upon all vessels laden with wheat (though in time of a public scarcity), being contrary to law, and particularly to statute 22 Car. II. cap. 13, the advisers of such proclamation, and all persons acting under it, found it necessary to be indemnified by a special act of parliament, 7 Geo. III. cap. 7.

By the statute 31 Hen. VIII. cap. 8. it was enacted, that the king's proclamations should have the force of acts of parliament, a statute, says Judge Blackstone, which was circulated to introduce the most despotic tyranny, and which must have proved fatal to the liberties of this kingdom, had it not been happily repealed in the minority of his successor. Stat. 1 Edw. VI. cap. 12. Comm. book i.

PROCLAMATION is also used for a solemn denunciation, or declaration of war or peace.

War is an evil, and besides its being undertaken on just grounds, those who are concerned should take every method in their power for preventing it. Accordingly they should endeavour, by declaring their intentions to have recourse to the last remedy against injustice, by the use of open force, to impress the minds of their adversaries, and to excite fear, in order to induce them to adopt equitable and pacific measures. Such is one end of declaring or proclaiming war, after other means of securing uninterrupted conciliation have been ineffectual. This was the mode of proceeding adopted by the Romans, according to the regulations of their "Fecial" law. They first sent the chief of the "Feciales," or heralds, called "Pater patratus," to demand satisfaction of the people who had offended them; and if, within the space of 33 days, a satisfactory answer was not returned, the herald called the gods to be witnesses of the wrong, and came away saying, that the Romans would consider what they had to do. The king, and afterwards the consul, used

used to ask the senate's opinion, and war being resolved on, the herald was sent back to the frontier, where he declared it.

A declaration of war being necessary as a farther trial for terminating the difference without the effusion of blood, by making use of the principle of fear for bringing an enemy to more equitable sentiments; it is, at the same time that it declares the resolution taken of making war, to set forth the cause of that resolution. This is, at present, the constant practice among the powers of Europe. After a fruitless application for justice, a nation may proceed to a declaration of war, which is then *pure* and *simple*. But if it be thought proper to avoid making it two several times, the demand of satisfaction, which the Romans called "*rerum repetitio*," may be accompanied by a *conditional* declaration of war, notifying, that if justice be not done without delay, an immediate war will be the consequence. And then there is no need of a *pure* and *simple* declaration of war, the *conditional* being sufficient, if the enemy delay to give satisfaction. If the enemy, on either declaration, offer equitable conditions of peace, the war ought to be suspended, for when justice is done, all right of employing force is superseded, the use being permitted only for the necessary support of right. To these offers, however, are to be added securities; for we are under no obligation to suffer ourselves to be amused by empty proposals. The word of a sovereign is a sufficient security, whilst he has not disgraced his credit by any act of perfidy; and we should be contented with it. As to the conditions in themselves, besides the essential subject, a reimbursement of the expences may likewise be demanded in regard to the preparations.

The declaration of war must be known to the state against which it is made. This is all which the law of nations requires; yet custom having introduced some formalities, those nations which, by adopting the custom, have given a tacit consent to the formalities, are under an obligation of observing them, till they have publicly renounced them. Formerly the powers of Europe used to send heralds or ambassadors to declare war; at present this is only done in the capital, the principal towns, or on the frontiers; manifestoes are issued, and the communication, so easy and expeditious since the establishment of posts, soon spreads the intelligence.

Besides the foregoing reasons, it is necessary for a nation to publish the declaration of war for the instruction and direction of its own subjects, in order to fix the date of the rights belonging to them from the moment of this declaration, and relatively to certain effects which the voluntary law of nations attributes to a war in form. Without such a public declaration of war, it would be difficult to settle, in a treaty of peace, those acts which are to be accounted the effects of the war, and those which each nation may consider as wrongs, for obtaining reparation. He who is attacked, and makes only a defensive war, need not declare it; the state of war being sufficiently determined by the declaration of the enemy, or his open hostilities. An act of aggression may, in some cases, be considered as a declaration of war. However, either from dignity, or for the direction of his subjects, a sovereign, though attacked at present, seldom fails of declaring war in his turn. If a nation against which a war has been resolved on, will not admit any minister or herald to declare it, whatever the custom otherwise be, it is sufficient for the other nation to declare it within its own territories, and on the frontier, and if the declaration does not come to its knowledge before hostilities are commenced, the former can only blame itself. But no person being exempted from his duty, only because another has been wanting in *his*, we are not to omit declaring war against a nation be-

fore hostilities are commenced, because this nation had, on another occasion, attacked us without any declaration. That nation, in so doing, has violated the law of nature; and its fault is no warrant for us to be guilty of the like.

The law of nations does not impose the obligation of declaring war, for giving the enemy time to prepare itself for an unjust defence. The declaration need not be made till the army has reached the frontiers; it is even lawful to delay it till we have entered the enemy's territories, and occupied an advantageous station; yet it must always precede the commission of any hostility. Thus we provide for our own safety, and equally secure the end of the declaration of war, which is, that an unjust adversary may still seriously consider his measures, and avoid the horrors of war, by doing justice. A sovereign who has entered a country, and declared war, may proceed to military operations; but, at the same time, the only legitimate causes of war (see WAR) should not be forgotten. The sovereign that declares war can detain neither those subjects of the enemy that are within his dominions at the time of the declaration, nor any of their effects; because they came into his country on the public faith. He should therefore allow them a reasonable time for withdrawing their persons and their property.

A sovereign should make the declaration of war public, not only to his own subjects, but also to neutral powers. This is necessary to vindicate his conduct in their estimation of it, as well as to obviate all difficulty, with regard to those commodities which neutral nations are carrying to the enemy, and which, in time of war, are called contraband. Declarations of war should either themselves express, or be accompanied with manifestoes that announce the reasons that induce and justify recurrence to arms, and also those general orders that relate to the conduct of the subjects of the state during the progress of the war. In a civilized age it may, perhaps, be thought unnecessary to observe, that in all publications of an authoritative kind, and that issue from the press under the sanction of government, all opprobrious words are to be avoided, together with every expression that indicates hatred, animosity, and rage, because they only degrade those who use them, and excite similar sentiments in the minds of the enemies.

Grotius says, that, according to the law of nations, two things are required to make a war solemn, or in due form, 1. That on both sides it should be by authority of the sovereign; 2. That it should be accompanied with certain formalities. These formalities consist in the demand of a just satisfaction, (*rerum repetitio*), and in the declaration of war, at least on the part of him who attacks, defensive war requiring no declaration, nor even, on urgent occasions, so much as an express order from the sovereign. Vattel's Law of Nations, b. iv.

PROCLAMATION also denotes the act of notifying to the people the accession of a prince to the crown.

The proclamation does not invest the prince with the regal authority; it supposes him already invested with it, and only gives notice of it to the people.

PROCLAMATION of *Estrays*. See ESTRAY.

PROCLAMATION of *Exigents*. See EXIGENT.

PROCLAMATION on *Attachment*. See ATTACHMENT, and COMMISSION of *Rebellion*.

PROCLAMATION of a *Fine*, is a notice openly and solemnly given of it in the court of common-pleas, where it passed, and at all the assizes in the country, held within one year after the engrossing it. See FINE.

These proclamations, at the assizes, are made on transcripts of the fine, sent by justices of the common-pleas to the justices of the assize, and of the peace.

PROCLAMATION, *in case of riot*. See RIOT.

PROCLAMATION, in a *Monastic Sense*, is the accusation of a friar or brother, by another brother, in open chapter, and in presence of the superior and community, for some external crime he has seen him commit.

PROCLAMATION, *Writ of*. See EXIGENT.

PROCLUS, in *Biography*, an eminent mathematician and philosopher of the Eclectic school, was born at Constantinople in the year 410 of the Christian era. He was instructed in grammar learning at Xanthus in Lycia, and from thence he was sent to Alexandria, where he studied eloquence and polite literature, with a view to qualify himself for the profession of the law. He, however, soon abandoned this, for the pursuit of the sciences properly so called. He learnt philosophy under Olympiodorus, and mathematics under Hero, and was distinguished by quickness of conception, and great strength of memory. He acquired a high reputation among his fellow students, by being able, at all times, to give them an accurate summary of the arguments of their master. After spending several years in the Alexandrian schools, Proclus went to Athens, where he first became acquainted with Syrian, to whom he attached himself. By him he was introduced to Plutarch, the son of Nestorius, an eminent teacher of the Eclectic philosophy, by whom he was conducted into the more recondite mysteries of the doctrine. Among other means of improvement he derived great benefit from the practice recommended by Plutarch, of drawing up, from his own recollection, compendious abridgments of the lectures which he had heard from his preceptor. Of his laborious application he afforded evidence at the age of twenty-eight, by having then written, besides several other pieces, his "Commentaries on the Timæus of Plato," abounding with much learning of the times. He was instructed by Plutarch's daughter in the arts of divination, who inherited from her father many secrets of this kind. By these helps, and the diligent perusal of the writings of Plotinus, Porphyry, Jamblicus, &c., he became a complete master, not only of divine science, but of Theurgic powers. He hence became accomplished as a preceptor in the Alexandrian philosophy, and Syrian associated him with himself in the Platonic chair at Athens. It is said that he excelled all his predecessors in this department, and improved the Eclectic system by many new discoveries, and was the author of many opinions which had never before entered the mind of man, both on the subject of physics, and in the sublime science of ideas. His piety is highly extolled; he practised rigorous fastings, and spent whole nights and days in repeating prayers and hymns, that he might thereby prepare himself for immediate intercourse with the gods. He died when he was about the age of 83 years. In his writings, Dr. Enfield says he appears at once a man of learning and a fanatic. They contain a rude and undigested mass of materials, collected with bold variations from the Chaldaic, Orphic, Hermetic, Pythagoric, Platonic, and Aristotelian doctrines, and adorned with fictions and allegories, which, while they involve the subjects upon which the writer treats in thick darkness, discover great luxuriance of imagination. Among the works which Proclus left behind him are, books "De Providentia et Fato;" "De decem Dubitationibus circa Providentiam;" and "Malorum Subsistentia;" Latin versions of which, from the Greek, were given by William de Morbeka, chaplain to the archbishop of Corinth. Godfrey Olearius, and Hugo Grotius, published Latin versions of his Hymns to the Sun, to the Muses, and to Venus. His work "De Sphæra, sive Circulis Cœlestibus Libellus," was copied in part from the Ifagoge of Geminus, an astronomer

of some distinction in the time of Cicero, and frequently published, but in its best form by Bainbridge, Savilian professor of astronomy at Oxford, in 1620. Many other pieces are enumerated in Enfield, some as published, some as still existing in MS., and others no longer extant.

PROCONDYLUS, *περοκονδυλος*, an appellation given to the first point of each finger. See EXTREMITIES.

PRO-CONFESSO, in *Law*. When, upon a bill exhibited in chancery, the defendant appears, and is in contempt for not answering, and in custody; upon an habeas corpus (which is granted by order) to bring him to the bar, the court assigns him a day to answer; which being expired, and no answer put in, a second habeas corpus is granted, and a farther day assigned; by which day, if he answer not, the bill upon the plaintiff's motion shall be taken pro-confesso, or as allowed, unless cause be shewn by a day, which the court usually gives. For want of such cause shewed, upon motion, the substance of the plaintiff's bill should be decreed, *as if it had been confessed* by the defendant's answer; or, after a fourth insufficient answer made to the bill, the matter of fact not sufficiently answered unto, shall be taken pro-confesso.

By stat. 5 Geo. II. c. 25. it is enacted, that in order to prevent a defendant's eluding justice, by absconding to avoid a subpoena, where the defendant cannot be found to be served with process of subpoena, and absconds (as is believed) to avoid being served with it, a day shall be appointed him to appear to the bill of the plaintiff; which is to be inserted in the London Gazette, read in the parish church where the defendant last lived, and fixed up at the Royal Exchange; and if the defendant does not appear upon that day, the bill shall be taken pro-confesso.

PROCONNESIUM MARMOR, a name given by the ancients to a species of marble, called also neuris and elaphonefus, and by some Cyzicum, from the works of a famous statuary of that name, many of which were made of it. It was of a blueish white, lightly variegated with black; this colour usually running in small veins, and not unaptly resembling, in many instances, the course of the veins of a human body in the naked statues. It was also used in the sumptuous buildings of the Romans. See MARBLE.

PROCONSUL, a Roman magistrate, sent to govern a province, with a consular authority.

The proconsuls were appointed out of the body of the senate; and ordinarily, as the year of any one's consulship expired, he was sent proconsul into some province.

The proconsuls had the same honours, &c. with the consuls themselves; except that they had only six lictors and fasces before them.

The proconsuls did not ordinarily hear and determine processes in person, but had that office performed by their assessors, or other judges, constituted or delegated by them.

As the proconsuls had the direction of justice, of war, and of the revenues, they had their several lieutenants in each capacity: these were called *legati*, and were ordinarily nominated by the senate.

The proconsular function only held a year. The charges of their journey, backwards and forwards, were borne by the public, and were called *viaticum*.

After the partition of the provinces between Augustus and the people, those who presided over the provinces of the people were called especially proconsuls. See PRE-FECT.

Livy, lib. viii. and lib. xxvi. mentions two other sorts of proconsuls; *viz.* such as being consuls had their office prolonged beyond the time settled by law; and such as

were invested with this honour, either for the government of the provinces, or the command in war, who before were only in a private station. We also read of such as the senate created proconsuls without a province, merely for the command of the army, and the care of the military discipline; and such as entered on their proconsular office before they were admitted to the consulship, though designed for this honour.

PROCONSUL, in our *Ancient Law Books*, is sometimes used for a justice in eyre, or justice errant.

PROCOPIUS, in *Biography*, one of the later Greek historians, was a native of Cæsarea in Palestine, where he obtained a high reputation as professor of rhetoric, and whence at length he repaired to Constantinople. In the reign of Justinian he engaged the confidence of the great general Belisarius, who made him his secretary, and took him in his company to the campaigns in Asia, Africa, and Italy. The emperor honoured him with the title of *Illustis*, and raised him to the office of prefect of Constantinople. What his religion was is not certainly known, but Gibbon supposes him to have been an occasional conformist to Christianity, with a secret attachment to paganism and philosophy. He died about the year 560.

Procopius was the author of a "History," in eight books, of the public events of his own time, divided into the Persian war, comprised in two books; the Vandalic, in two books; the Gothic, in three: there is an eighth book, which is supplemental and miscellaneous, and comes down to the year 553. It is an elaborate and exact performance: the facts are collected from personal observation or enquiry, and are related with freedom, and interspersed with useful reflections. The characters of the different barbarous tribes which pressed upon the declining empire, are strongly painted. To these he afterwards added a ninth book, which he entitled "Anecdota," or Secret History; and in this Justinian and his empress, Theodora, are drawn with the most odious features; and of the latter, in particular, stories are told, which are a scandal to her sex, as well as to her high station. The books of Procopius on the Gothic war were published by Leonardo Aretino, in Latin, as his own, in 1470. His works were mutilated by the first Latin translators, and the Greek was not printed till 1607. A Paris edition was published by the Jesuit Claude Maltrel in 1663, in two vols. fol. Gr. et Lat. with the omission of most of the anecdotes. These were afterwards published by Monnoye in the first volume of the *Ménagiana*. Moreri. Gibbon.

PROCOPIUS-RASA, or *the Shaven*, a famous leader of the Hussites in Bohemia, was, in early life, sent to study, and afterwards travelled in France, Italy, Spain, and the Holy Land. On his return he was obliged, against his will, to receive the tonsure, and it is said to be ordained priest; but when the war of religion in Bohemia broke out, he joined the Hussites under their great leader Ziska, and displayed so much courage and ability, that he obtained the confidence of that leader and of the party. After the death of Ziska in 1424, Procopius succeeded to the command of the Hussites, who were making war upon the Catholics with all the ardour of enthusiasm, exasperated to savage ferocity by the persecution they had undergone. He obtained very great successes, and spread terror throughout a large part of Germany. The emperor Sigismund sent deputies in 1428 to treat with him, and Procopius professed himself willing to make peace, and even to procure Sigismund's election to the throne of Bohemia, provided the religious grievances of his party should be redressed,

and the privileges of the country confirmed. An evasive answer being returned, arms were again resumed, and the Hussites laid waste Misnia with fire and sword, and extended their ravages to the surrounding countries. When the council of Basil was convoked in 1431, Procopius issued a circular letter in Latin, addressed to all the sovereigns and states, setting forth the complaints of his party, and proposing a disputation between the Catholic and Hussite doctors on scripture grounds. In reply to which a crusade was published against the Hussites, and an imperial army marched into Bohemia, which retaliated all the barbarities of that party, but being alarmed at the approach of the sectarian forces, fled with precipitation, leaving all their baggage and rich furniture as spoils to the enemy. In 1433, Procopius and some of the other leaders held several disputations without effect with the Catholics, and on their return hostilities were renewed. Procopius laid siege to Pilsen in Bohemia, but was obliged to raise it with great loss in 1434. He soon afterwards received a mortal wound, and died, leaving a name in his party for the greatness of his exploits, and the ferociousness of his manners. Some of his letters have been published in the last volume of the collection of ancient documents by Martenne and Durand. Univer. Hist. Moreri.

PROCOPIUS of Gaza, celebrated as a scripture commentator, flourished under the reign of the emperor Justin I. He presided with great reputation over a rhetorical school in Gaza of Palestine, whence he derived his surname. There is still extant an eloquent funeral oration in praise of his talents and virtues, pronounced by Choricus, his disciple and successor, when the infirmities of age obliged him to resign the rhetorical chair. This oration was published with a Latin version, by John Christian Wolf, and is inserted in the eighth volume of Fabricius's "Bibliotheca Græca." Procopius applied himself to the study of the orthodox fathers and commentators of the holy scriptures, and he himself compiled commentaries on various books of the bible, which are now frequently referred to, and which are executed with considerable judgment, as well as in a polished style, and have been useful to succeeding writers. Those given to the world consist of "Commentaria, seu, Εξηγητικαὶ σχολαὶ in Octateuchum," published at Zurich in 1555: "Scholia in Quatuor Libros Regum et duos Chronicorum," translated into Latin from the Greek by Lewis Lavater, and published in Greek and Latin at Leyden: and "Variorum in Esaiam Prophetam Commentariorum Epitome," 1580. It is not known whether he was the author of "Letters" written in an elegant style, in the collection of Greek Letters printed by Aldus, and ascribed to Procopius the sophist, or whether they were written by Procopius the historian. Moreri.

PROCREATION, PROCREATIO, the action of begetting and bringing forth children. See GENERATION.

PROCRIS, in *Botany*. See ELATOSTEMA.

PROCTALGIA, PROCTITIS, in *Medicine*, from *πρωκτος*, anus, and *αλγη*, pain, a term employed by Sauvages to denote the varieties of disease affecting the anus, of which he enumerates several species, including inflammation, cancer, fistula, intertrigo, rhagades, hæmorrhoids, prolapsus, &c. Nosol. Method. class vii. gen. 32. The various kinds of inflammation and abscesses affecting this part of the body, are treated of in the article FISTULA.

PROCTOR, PROCURATOR, a person commissioned to act as proxy, or delegate, in behalf of another. See PROCURATOR.

PROCTOR, *Procurator*, in the *Civil Law*, is an officer appointed

pointed to appear in court, and manage the causes of parties who will make use of his procuration.

Anciently every body was obliged to appear in person; and when the affair happened to be drawn out to a great length, they were allowed to create a proctor, or proxy, in their cause. See ATTORNEY.

But this was a favour only granted for a certain time, till towards the middle of the sixteenth century, when it was decreed, that all procuration should hold till revoked.

PROCTORS in the Commons, are persons skilled in the civil and ecclesiastical laws, who exhibit their proxies, and make themselves parties for their clients, to draw up acts and pleadings, produce witnesses, prepare causes for sentences, and attend the advocates with the proceedings. They are about fifty in number; are admitted by the archbishop's fiat; and wear black robes, and hoods lined with white furs.

By 3 Jac. c. 5. no recusant convict shall practise in the civil law as proctor; but this was repealed by 31 Geo. III. c. 32. which introduces a new oath to be taken by Roman Catholics practising the law: and by 5 Geo. II. c. 18. no proctor in any court shall be a justice of the peace, during such time as he shall continue in the business and practice of a proctor. Moreover, by 48 Geo. III. c. 149. every admission of any person to the office of proctor in any of the courts shall be upon a 20*l.* stamp. And every practising solicitor, attorney, notary, proctor, agent, or procurator, must take out a certificate annually; upon which there shall be charged, if he reside in the city of London or Westminster, or within the limits of the two-penny post, in England, or within the city or shire of Edinburgh, and shall have been admitted to his office three years, 10*l.*; if not so long, 5*l.* If he shall reside elsewhere, and have been admitted three years, 6*l.*; if not so long, 3*l.*

PROCTORS of the Clergy, are deputies, or representatives, chosen by the clergy of each diocese, two for each; and by the cathedral and collegiate churches, one for each, to sit in the lower house of convocation.

PROCTORS in the University, are two officers chosen from among the students, to see good orders and exercises daily performed there.

PROCTOR'S Creek, in Geography, a river of Virginia, which runs into James river, N. lat. 37° 24'. W. long. 77° 36'.

PROCTOR'S Point, a cape on the S. coast of the island of Antigua, E. of Falmouth harbour. N. lat. 17° 8'. W. long. 61° 29'.

PROCUBITORES, among the Romans, an appellation given to the velites, because, when the enemy was near, they always formed the outguard.

PROCULIANS and SABINIANS, in Antiquity, two famous sects which divided the Roman jurisprudence, forming two schools, and deriving their respective appellations from Proculus and Sabinus, their most celebrated teachers. The two sages of the law, Alcius Capito and Antistius Labeo, belonged to these schools, which thus maintained their inveterate conflict from the age of Augustus to that of Adrian.

PROCULS, in Geography, a town of Prussia; 10 miles S.S.E. of Memel.

PROCUMBENT LEAVES, in Botany, such leaves of plants as lie flat, or trailing on the ground.

PROCUPIA, in Geography, a town of European Turkey, in Servia, formerly the capital of Dardania; the see of two archbishops, one Rascian, the other Latin; 16 miles W. of Nissa. N. lat. 43° 30'. E. long. 21° 30'.

PROCURATION, or PROCURACY, an act or instru-

ment by which a person is empowered to treat, transact, receive, &c. in another's name, as if he himself were actually present.

When a man treats in behalf of another, the first thing is to examine his procuration or procuracy.

Procuration is now little used in this sense, except in the case of a person who collects the fruits of a benefice for another.

PROCURATION, in the Canon Law, is used for the repast, or entertainment, anciently given to church officers, or ordinaries, who came to visit in churches or monasteries, whether they were bishops, archdeacons, or visitors. Procuration was due to the pope's legate, and even to popes themselves, when they came into France; and the charge was comprised in the bulls then granted.

Complaints were frequently made to the pope of the excessive charges of the procurations of bishops and archdeacons; upon which they were prohibited by several councils and bulls.

That of Clement IV., mentioned in the Monasticon, is very express; in which that pope tells us, complaint had been made, that the archdeacon of Richmond, visiting the diocese, travelled with one hundred and three horses, twenty-one dogs, and three hawks; and did so grievously oppress a religious house with that vast equipage, that he caused the monks to spend in an hour as much as would have maintained them a long time.

PROCURATION is now used for a sum of money paid yearly by parish-priests to the bishop or archdeacon, in lieu of this entertainment, towards defraying the charge of their visitation.

These procurations were anciently so extravagant and oppressive, that several constitutions were framed by Langton and others to restrain them. The last constitution of this kind by Stratford, by putting it in the choice of the incumbent, whether he would entertain the visitor in provisions, or compound for it by a certain sum of money, was the cause of the custom generally prevailing afterwards, and which now universally obtains, of a fixed payment in money, instead of a procuration in meat, drink, provender, and other accommodation.

Procuration is due to the person visiting, of common right; and though originally due by reason of visitation only, yet the same may be due without actual visitation. The constitutions to which we have above referred, limit the payment, in provisions or money, to actual visitation, and warrant the denial of them when no visitation is held. Upon this a doubt has been raised, whether those archdeacons who are not permitted to visit, but are inhibited from doing it in the bishop's triennial visitation, have a right to require procurations for that year. Those who maintain the negative, found their opinion upon the express letter both of the ancient canon law, and of our own provincial constitutions. But others, who undertake to defend the rights of the archdeacons, allege, that though it might be reasonable that they lose their procurations, in case they neglect their office of visiting (which, by the way, was all that the ancient constitutions meant), yet that reason doth not hold, when they are restrained and inhibited from it; and that procurations are rated in the valuation of king Henry VIII., as part of the revenues of every archdeacon, who therefore pays a certain annual tenth for them; and the law could never intend the payment of the tenth part every year, if there had been any year in which he was not to receive the nine parts. These two arguments (says Dr. Gibson) are so strong in favour of the archidiaconal right,

right, the first in reason, and the second in law as well as reason, that it is needless to say more on that head.

Procurations are sueable only in the spiritual court, and are merely an ecclesiastical duty. (L. Raym. 450.) And they may be levied by sequestration, or other ecclesiastical process. (Gibf. 1546.) By the law of the spiritual court, forty years make a custom or prescription. (1 Peere W. 657. Str. 421.) If there be a parsonage and vicarage endowment, only one is to pay procurations, but custom, or the endowment if extant, directs which of them is chargeable. A chapel of ease shall be included in the procuration of the mother church. (Lind. 223. Deg. p. 2. c. 15.) Churches newly erected shall be rated to procurations, according to the proportion paid by the neighbouring churches. (Gibf. 976.) Donatives and free chapels pay no procurations to any ecclesiastical ordinary, because they are not visitable by any. Deg. p. 2. 15.

PROCURATION, in *Commerce, &c.* When exchange is made in the name and for the account of a third person, by virtue of full power, and authority given by him, commonly termed "procuration," such bills (of exchange) may be drawn, subscribed, indorsed, accepted, and negotiated, not in the name or for the account of the manager or transactor of any or all of these branches of remittances, but in the name and for the account of the person who authorised them. See *POWER of Attorney*, and *BILLS of Exchange*.

PROCURATOR, PROCTOR, or *Proxy*, a person who has a charge, or office committed to him, to act in behalf of another.

Thus the proxies of the lords in parliament, in our law-books, are called procurators.

The word is also used for a vicar, or lieutenant. Thus, in Petrus Blesensis, we read of a *procurator regni*.

Those who manage causes in Doctors' Commons, are also called procurators or proctors.

The bishops are sometimes called *procuratores ecclesiarum*, and the representatives sent by the clergy to convocation, *procuratores cleri*.

In our statutes, a person who gathers the fruits of a benefice for another, is particularly called a procurator, and the instrument empowering him to receive the same, is termed a procuracy.

PROCURATOR is also a kind of magistrate, in several cities of Italy, who takes care of the public interests. There are procurators of St. Mark at Venice, at Genoa, &c.

Originally there was but one procurator of St. Mark at Venice: in 1442 the number was augmented to nine, when the senate made a decree, appointing, that, for the future, none should be admitted to the dignity, but after the death of some of the nine. But, in the necessities of the republic, the number was afterwards enlarged to forty; though of these there are only nine that bear the title of procurators, and whose place is regularly filled. They are administrators of the church of St. Mark, and of the revenues attached to it, the patrons of orphans, and the executors of testaments.

This office receives more lustre from the merit of those who discharge it, than from its authority. They are clothed in black, or violet, with ducal sleeves.

PROCURATOR *Monasterii*, anciently was the advocate of a religious house, who was to solicit the interest, and plead the causes, of the society. See *ADVOCATE* and *ADVOWEE*.

PROCURATORES *Ecclesie Parochialis*, are the churchwardens, whose office is to act as proxies and representatives of the church.

PROCURATORES, in the *Roman Law*, were such lawyers as assisted the plaintiff in proving, or the defendant in clear-

ing himself from the matter of fact. These, as well as the patron (see *PATRON* and *ADVOCATE*), were selected out of the ablest lawyers, and had their names entered in the matriculation book of the forum.

This was one condition requisite to give them the liberty of pleading; the other was the being retained by one party, or receiving a fee, which they termed *mandatum*.

PROCURATORES *Cesaris*, among the Romans, were officers, often mentioned by Tacitus and Suetonius, who were sent by the emperors into every province, to receive and regulate the public revenue, and to dispose of it at the emperor's command. The procurator of Judæa was invested with all the authority proper to the *Proconsul*, which see; and, as the learned bishop Pearson observes on the Creed, art. 4, even with the power of life and death.

PROCYON, in *Astronomy*, a fixed star of the second magnitude, in Canis minor.

PROD, in *Rural Economy*, a term signifying a short spike. It also signifies a goad for driving oxen, and likewise a sharpened piece of stick for keeping thatch upon stacks, buildings, &c.

PRODANO, in *Geography*, an island in the Mediterranean, near the coast of Morea, anciently called "Sphacteria;" 36 miles S.S.E. of Zante. N. lat. 37° 15'. E. long. 21° 24'.

PRODEGAS, a town of South America, in the province of Quito; 38 miles N.N.E. of Guayaquil.

PRODES HOMMES, *q. d.* wise or discrete men, in our *Ancient Customs*, a title given to the barons, and other military tenants, who were called to the king's council, and were to give advice according to the best of their prudence and knowledge.

PRODICTATOR, among the Romans, a magistrate who had the power, and did the office of a dictator.

The Romans sometimes created a prodicator, in cases where they could not have a dictator. Fabius Maximus was prodicator.

PRODIGALITY is a term, the meaning and application of which are well known. We shall, therefore, under this head, only take occasion to observe, that, by the Roman law, if a man by notorious prodigality was in danger of wasting his estate, he was looked upon as *non compos*, and committed to the care of curators, or tutors, by the prætor. And by the laws of Solon, such prodigals were branded with perpetual infamy.

PRODIGY, in *Mythological and Fabulous History*, an event which really or apparently deviated from the ordinary course of nature, and which credulity and superstition interpreted as an omen or presage of good or ill fortune. (See *PRESAGE*.) The history of paganism abounds with occurrences of this kind, and with an ample account of ceremonies which they were the occasion of introducing. An accidental, and sometimes a merely imaginary coincidence between the event, deemed a prodigy, and the circumstances that followed it, led the credulous to connect them together, and to consider the former as the cause, or at least as the presage of the other. The historians of antiquity, such as Livy, Dionysius Halicarnassensis, Pliny, Valerius Maximus, &c. &c. have recorded various occurrences of this nature, and the political uses to which they were applied by the crafty and designing. The prodigies treated of by the ancients, are reduced by Bannier into two classes. In the first, he comprehends those reputed miracles of paganism, which have been considered as inexplicable, without having recourse to a supernatural cause. Such have been reckoned the story of the Dii Penates, or household gods, related by Dionysius of Halicarnassus (lib. i.); that of Jupiter Terminalis,

minalis, which it was impossible to force from its place at the time of building the Capitol; the adventure of Accius Nævius, who cut, as it is said, a flint stone with a razor, to convince the incredulity of a king of Rome, who slighted the augurs and the Tuscan divination; that of the vestal virgin Æmilia, who drew water in a sieve; that of another vestal, who with her girdle drew to shore a ship which had been stranded; and, to mention no more of a similar kind, for they are numerous, and all equally incredible, that of the shield which fell from heaven, under the reign of Numa Pompilius. The prodigies of the second class were purely natural events, but being less frequent, and seeming to be deviations from the ordinary course of nature, they were ascribed to a superior cause by the credulous and superstitious. Such were various meteors, the appearances of fire and light in the night, monstrous births of men or of animals, showers of blood, of stones, or of ashes, and many other things, which were natural, but the causes of which were not investigated or not understood. All these prodigies have diminished in number, as a spirit of inquiry and knowledge have prevailed, and those which have not been explained have had secret causes, which the most sagacious and diligent inquirers have not been able to explore. To the number of such incredible prodigies, some writers have referred Constantine's luminous trophy of the cross, which he observed above the meridian sun, and inscribed with the following words, BY THIS, CONQUER, and which the emperor either thought he saw, under the delusion of his fancy and senses, or said he saw, to answer his own political purposes. The latter alternative is adopted by Mr. Gibbon. *Hist. of Rome*, vol. iii. See CROSS.

PRODROMUS, *προδρομος*, literally denotes a fore-runner, an harbinger. Hence,

PRODROMUS *Morbis*, among *Physicians*, is used for a lesser disease, which precedes, or foreruns, a greater.

Thus, a straightness of the breast is a prodromus of a consumption, &c. A vertigo is sometimes a prodromus of an apoplexy.

PRODUCE, NET. See NET *Produce*.

PRODUCING, in *Geometry*, denotes the continuing a right line, or drawing it out farther, till it have any assigned length.

PRODUCT, in *Arithmetic* and *Geometry*, the factum of two numbers, or the quantity arising from, or produced by, the multiplication of two or more numbers, lines, &c. into one another.

Thus, if 6 be multiplied by 8, the product is 48.

In lines it is always (and sometimes in numbers) called the rectangle, between the two lines multiplied by one another.

PRODUCTION. See GENERATION, and PROPAGATION.

PRODUCTION, in *Anatomy*, a continuation or process.

PROZELDEN, or PROCELDEN, in *Geography*, a town of Germany, in Hesse-Darmstadt; seven miles E. of Miltenberg.

PROEDRI, *προεδροι*, among the Athenians, magistrates whose business it was to propose to the people the things they were to deliberate upon and determine at every assembly, after which their offices expired.

They were so called from the privilege they enjoyed, of always having the first seats at assemblies. See EPISTATES.

PROEM, PROEMIUM, a term anciently used for preface.

PROEMPTOSIS, in *Astronomy*, that which makes the new moons appear a day later, by means of the lunar equa-

tion, than they would do without that equation. See METEMPTOSIS.

PROENÇA a *Velho*, in *Geography*, a town of Portugal, in the province of Beira; 17 miles N.E. of Castel-Branco.

PROEROSIA, in *Mythology*, a festival of Ceres, instituted to her honour in Attica, and so called because it was celebrated before sowing and tilling: and the goddess herself was called by the same name.

PROFANATION, in *Religion*, the doing of something which is disrespectful to holy or sacred things.

PROFANATION of the *Lord's day*. See SUNDAY.

PROFANE, a term used in opposition to *holy*, *sacred*.

Except churches, and church-yards, all places are esteemed profane. By the canon law, a sacred chalice, or cup, becomes profane, by giving it a blow with a hammer.

PROFANE is also applied, in general, to all persons who have not the sacred character; and all things which do not belong to the service of religion.

In this sense, Xenophon, Seneca, &c. are profane authors. The heathen priests, pontiffs, &c. also pass with us for profane.

PROFANENESS denotes a disrespect paid to the name of God, and to things and persons consecrated to him. By statute 19 Geo. II. cap. 21. which repeals all former ones, every labourer, sailor, or soldier, shall forfeit 1s. for every profane oath or curse; every other person under the degree of a gentleman, 2s.; and every gentleman, or person of superior rank, 5s. to the poor of the parish; and on a second conviction, double; and for every subsequent conviction, treble the sum first forfeited, with all charges of conviction; and in default of payment shall be sent to the house of correction for ten days. Any justice of the peace may convict upon his own hearing, or the testimony of one witness; and any constable or peace officer, upon his own hearing, may secure any offender, and carry him before a justice, and there convict him. If the justice omits his duty, he forfeits 5l. and the constable 40s. And the act is to be read in all parish churches and public chapels, the Sunday after every quarter day, on pain of 5l. to be levied by warrant from any justice. By 22 Geo. II. c. 33. art. 2. all flag-officers, and all persons in or belonging to his majesty's ships or vessels of war, being guilty of profane oaths, cursings, exclamations, or other scandalous actions, in derogation of God's honour, and corruption of good manners, shall incur such punishment as a court-martial shall think fit to impose, and as the nature and degree of their offence shall deserve. Besides this punishment for taking God's name in vain in common discourse, it is enacted by stat. 3 Jac. I. cap. 21. that if in any stage-play, interlude, or show, the name of the Holy Trinity, or any of the persons therein, be jestingly or profanely used, the offender shall forfeit 10l. one moiety to the king, and the other to the informer. See BLASPHEMY and TOLERATION.

PROFECTITIOUS. See ADVENTITIOUS, and GOODS.

PROFER, formed of the French *proferer*, to produce, in *Law*, the time appointed for the accounts of sheriffs, and other officers, to be given into the exchequer; which, by stat. 51 Hen. III. is to be twice in the year.

PROFER is also used for an offer, or endeavour to proceed in an action, by a person concerned so to do.

Trinity term shall begin the Monday next after Trinity Sunday, whenever it shall happen to fall, for the keeping of the essoigns, profers, returns, and other ceremonies, heretofore in use. Stat. an. 32 Hen. VIII.

PROFER the half mark. See HALF-mark.

PROFERT in *Curia*, in *Law*, is where the plaintiff in

an action declares upon a deed, or the defendant pleads a deed, he must do it with a *profert in curia*, to the end that the other party may at his own charges have a copy of it, and until that time he is not obliged to answer it.

PROFESSED MONK, or *Nun*, one who, having made the vow, is admitted of a religious order.

In this sense the word is used in opposition to novice.

PROFESSIO VIDUITATIS. See VIDUITATIS.

PROFESSION, PROFESSIO, in a monastic sense, the entering into a religious order; or an action whereby a person offers himself to God, by a vow of observing three things: *viz.* obedience, chastity, and poverty; which he promises inviolably to maintain.

This is called *sanctæ religionis professio*, and the person, a *religious professed*.

Persons are not admitted to make profession till after a year of probation.

PROFESSOR, in the *Universities*, a person who teaches or lectures, publicly, some art or science, in a chair established for that purpose.

The professors, in foreign universities, teach the arts, and have their classes of pupils; those in our universities only read public lectures in term-time.

Of professors we have a great number, some denominated from the arts they profess, as *casuistical* professor, *Hebrew* professor, *physic* professor, *divinity* professor, &c. Others, from those who founded the professorship, or assigned a revenue for the support of the professor, as the *Savilian* professors of astronomy and geometry, the *Lucaſian* professor of mathematics, *Margaret* professor of divinity, &c.

PROFESSORS, *Regius*. See REGIUS.

PROFICISCENDUM, *Capias Conductos ad proficiscendum*. See CAPIAS.

PROFILE, in *Architecture*, the figure or draught of a building, fortification, or the like; in which are expressed the several heights, widths, and thicknesses, such as they would appear, were the building cut down perpendicularly from the roof to the foundation.

Whence the profile is also called the *section*, sometimes the *orthographical section*: and, by Vitruvius, also the *ſciagraphy*.

Profile, in this sense, amounts to the same with *elevation*; and stands opposed to a plan, or *ichnography*.

PROFILE is also used for the contour, or outline of a figure, building, member of architecture, or the like; as a base, a cornice, &c.

Hence *profiling* is sometimes used for designing, or describing the member with rule, compass, &c.

PROFILE of a *Fortification*. See FORTIFICATION.

PROFILE, in *Sculpture* and *Painting*. A head, a portrait, &c. are said to be in profile, when they are represented sideways, or in a side-view.

As, when in portrait, there is but one side of the face, one eye, one cheek, &c. shewn, and nothing of the other. On almost all medals the faces are represented in profile.

PROFIT of *Stock*, in *Political Economy*, is that which is produced by means of a capital above its value. Capitals are in general consumed or employed, with the view to gain by their employment. In the latter case, the capital is either lent to another individual, who consumes it, and restores it to the owner out of some other source, with profit; or the capitalist employs his stock in the payment of such labour as produces more than the value of his capital. The first of these two ways of employing capital, though it may be beneficial to the capitalist, produces no advantage to the country. The second is that which yields the most

regular and highest profits. A capital may be considered as a machine, by the use of which something is to be gained. The capitalist is the owner of the machine, and he who uses it for the purpose of producing something useful with it, is, as we have seen in the article PRICE, called the undertaker. The former has nothing to do but to lend it; the latter regulates its operations, and disposes of its produce. When the functions of capitalist, undertaker, and labourer, exist in the same person, the whole produce of his stock and labour belongs to that individual: in general they are different persons. In either case we must distinguish the shares of profit enjoyed by the capitalist, undertaker, and labourers in their different capacities. The labourer returns for his wages something of greater value, and it is the surplus of this value which constitutes the profit of stock. The capital is restored to the capitalist, but the surplus or profit is divided between him and the undertaker. What the former receives for the mere act of lending his capital is called interest, what the latter gets for the management or enterprize, is called the profit of the undertaker. This profit is a reward, not only for his skill and trouble in the management of the undertaking, but also for the risk connected with the same. The rewards of an undertaker must always be more considerable than those of a common labourer, for otherwise he would prefer being a labourer, whose occupation is not attended with any hazard. But independently of this, the nature of his business entitles him to a higher reward. Moreover, in those who undertake the employment of another person's capital, certain requisites are looked for. They ought to be possessed of property of some kind or other, as a security to the capitalist, or their moral qualities must inspire great confidence, and either the one or the other, or both conjoined, must be in proportion to the amount of the capitals which their enterprize requires. They must be men of talent, of judgment, and industry. Different undertakings require those qualities in different degrees, which cause a difference in their profits. Hence it is extremely difficult to ascertain the principles by which the profit of the undertaker is regulated. At any rate, the profit of stock ought to be greater than the usual rate of interest; so that the surplus above the interest ought to be sufficient to enable the undertaker to live according to his rank of life, and save something to accumulate a capital for himself.

The market price of this profit follows the general rule of all market prices. As long as skilful undertakers are scarce, their profits are great, but when a country abounds with clever men in that line, their profits are small. When the profits of the undertakers are generally high, the rate of interest is also high. In that case the class of undertakers is increasing; they strive to deprive each other of capital, by offering higher interest. Where the profits are small, the rate of interest is necessarily low. *Wealth of Nations*. *Boileau's Political Economy*.

PROFITS, *Pernor of*. See PERNOR.

PROFLUVIA, in *Medicine*, diseases accompanied with fever, and with increased excretion of some fluid, naturally not bloody: whence the order of profluvia, in Dr. Cullen's arrangement of diseases, includes only two genera; the *cattarrh*, or morbid excretion of mucus from the nostrils, throat, and bronchial passages; and *dysentery*, with a morbid excretion of mucus, with or without blood, from the bowels. See his *Nosol. Method. class 1. ord. v.*

PROFLUVIUM, any kind of flux, or copious and liquid evacuation. Thus, *profluvium veneris* signifies a diarrhœa. Dr. Cullen, after Vogel, has used the word in the plural, to denote an order of febrile diseases. See the preceding article.

PROFLUVIUM *Mensium*, a profuse discharge of the menstrual flux. See **MENSES**.

PROFUNDUS, in *Anatomy*, a name given by Albinus, Hunaud, and others, to a muscle of the wrist, generally known by the name of the perforans. These authors called, in the same manner, the perforatus of others the sublimis.

PROGAL-INSECT, an animal nearly approaching to the gall-insect class, but differing from it in some respects, and called by this name from its resemblance to those creatures; as the creatures somewhat approaching to the scarab or beetle class, but not regularly of it, are called *pro-scarabs*.

Animals of this class pass a great part of their lives in the same manner with the gall-insects, fastened to the bark of a tree, and there remain motionless: some of them also, in the manner of the gall-insects, cover their young brood with their bodies; but they are easily distinguishable as animals, in all the stages of their lives, and in that they differ from the others. The annular depressions of their bodies may in all their states be distinguished, especially with the help of a magnifying glass; whereas those of the gall-insects all disappear as they grow towards their utmost bulk.

If the gall-insects are worthy of observation, on account of the great value of one species of them, the kermes; the progal-insects are at least equally so on the same account, since the cochineal belongs to this class.

The most common and observable species of the progal-insect class, is that of the elm.

PROGNOSIS, in *Medicine*, from *πρῶ*, before, and *γινωσκω*, I know, the foretelling the event of any disease, or the approach of disease.

There is no part of the science of medicine, which it is so difficult to teach by precept as the principles of prognosis; the application of which, at least, must be learned exclusively from experience of the ordinary progress and tendency of certain combinations of symptoms. The very young practitioner, and above all the pretender to medical knowledge, are, therefore, usually very deficient in this species of skill: with this difference, that the former daily multiplies his knowledge by observation; while the latter, being devoid of principles, is incapable of improvement, unless he possess an unusual share of sagacity and attention. For the power of anticipating the course of the symptoms of disease, must be founded on a knowledge of the nature of those symptoms; that is, of the actual state of the different organs of the body which they indicate. This, however, implies also that degree of knowledge of the structure and functions of the living body, which belong to anatomy and physiology, without which it is impossible that any clear indications can be inferred from certain symptoms: the structure of the machine, and its healthy mode of action, must be understood, before we can either appreciate or comprehend the derangements of its parts. It is upon a clear estimation, then, of the extent of mischief already done in any important organ, or likely to ensue from the violence of the action going on, (which must be estimated from the symptoms,) that a sound prognosis can alone be founded: in other words, he who, from previous knowledge of the nature of the living body, and from greater opportunities, or what is still more important, from greater attention and accuracy in the discrimination of symptoms, acquaints himself most thoroughly with the actual nature of the disease, will be the best able, not only to cure the disease, but to anticipate its changes and termination.

The danger or safety indicated by certain symptoms will be exactly in the ratio of the importance of the organs dis-

eased, and of the degree of the morbid derangement which is actually produced, or the violence of the action which is going on in them, the tendency of which is to produce organic derangement. The affections of particular organs are distinguished, partly by the seat of pain, tumour, change of colour, &c. where these exist, but principally by the particular functions which are disturbed. For as physiology teaches us, that certain functions are performed by particular organs; so, where we have no opportunity, like the common mechanic, of examining the organs themselves, we must infer their derangement from the excess, defect, or unnatural performance of these functions. The three great organs, the functions of which are immediately necessary to the continuance of life, are the brain, the heart, and the lungs; for the functions of the nervous system, the circulation, and respiration, cannot be long suspended, without occasioning death; and death, in all cases, takes place from the cessation of one or other of these three functions. (See **DEATH**.) It is chiefly, therefore, from the violent disturbance of one or more of these functions, that the prognosis in acute diseases becomes unfavourable. In chronic diseases, however, where no organ immediately necessary to life may be affected, the prognosis may still be unfavourable, in consequence of the serious derangement of less vital, though important, organs, which are absolutely necessary to the constitution, and contribute to some of the purposes of life; as in organic diseases of the stomach, liver, spleen, mesentery, kidneys, bladder, uterus, &c. and even of the bones, muscles, and ligaments.

As we have detailed, under the head of each disease respectively, the symptoms which afford a favourable or unfavourable prognosis, it will not be necessary to enter at any length here into the particular prognostics, which the various circumstances of disease may give rise to. We shall, therefore, exemplify very briefly the mode in which the prognostics are deduced in violent diseases, from indications relative to the three great functions just mentioned.

In all febrile diseases, great disturbance of the functions of the brain, or common sensorium, is indicative of danger. The existence of this disturbance is denoted by aberration of the *intellectual functions*; as by delirium, whether furious and noisy, or low and muttering; by stupor, loss of memory, and incoherence of thought. It is denoted also by morbid changes in the *organs of sense*; as by extreme sensibility to light, or by partial or total blindness; by the appearance of black spots, spectra, sparks of light, &c. floating before the eyes; by acuteness of hearing, or by deafness; by perversion or loss of taste, and of feeling as to external objects; by coma, or by great watchfulness. It is indicated, moreover, by a disordered state of volition and *muscular motions*; as by spasms, subfultus of the tendons, and convulsions; by squinting of the eyes, distortions of the countenance, dilatation of the pupils; and by prostration, or a preternatural exertion, of the muscular strength. These are direct indications of the disordered state of the brain; the excess or over-acuteness of the faculties implying inflammatory excitement, the defect or abolition of them denoting pressure, oppression, or distension of the organ; the latter of which is often the consequence of the former state. These conditions of the brain can scarcely occur, without producing other indirect indications in distant organs, which are necessarily influenced through the nervous system. Whence the symptoms just enumerated are commonly accompanied by various morbid states of the circulation, as indicated by the pulse: thus in the case of high excitement, the pulse is frequent, hard, strong, and sharp; and in the oppressed state of the brain, it is often preternaturally

naturally flow, irregular, and intermitting. The respiration is also disordered, in the latter case, from the impaired influence of the brain on the muscles of the chest, and becomes slow, irregular, and stertorous. And the alimentary canal, also, suffers from the same sympathy, the stomach sometimes rejecting its contents by vomiting, whilst the bowels become exceedingly torpid. According to the greater violence and combination of such symptoms, or the mildness or absolute absence of all or many of them, the prognosis, as to the state of the brain, will necessarily be more or less favourable.

The lungs, however, are often affected primarily and idiopathically, by inflammation, tubercle, dropsy of the chest, obstructions in the trachea and air-tubes, &c.; when the prognosis will be principally collected from the disordered state of the functions of respiration. This function may be performed with various degrees of facility, or with various noises, as coughing, wheezing, rattling, piping, &c.; it may be performed more or less freely in different positions, as on the back, on one side, or only in the erect posture, when it is called orthopnœa; it may be accompanied with much discharge by expectoration, as of mucus, pus, blood, sanies, &c.; or with pain in different parts of the chest; or with lividity of the face. And from these symptoms, together with other concomitant circumstances, as the absence or presence of acute fever, or of hectic fever, the state of fulness or emaciation, the long or short duration of the disease, the age and constitution of the patient, it will be decided whether the disease be pleurisy, peripneumony, phthisis, croup, hydrothorax, asthma, &c.; and the degree of danger, or the chance of recovery, will thus be estimated.

The circulation is much more frequently affected secondarily, than idiopathically, unless the local inflammations are deemed affections of the circulation. Inflammation is dangerous, in proportion to the importance of the organ which it attacks, and to the violence and rapidity of its progress. Two of its terminations, *gangrene* and *suppuration*, are extremely dangerous, when they take place in internal organs; and the prognosis is more or less favourable, according as the tendency to these is more or less manifest. Extreme violence of pain, and a long continuance of it, with constant fever, betoken the probability that suppuration will ensue; and when the pain, after such a continuance, begins to remit, while rigors or shiverings come on, it may be concluded that suppuration is begun. A sudden cessation of all pain, without any adequate cause, affords a most unfavourable prognosis in cases of acute inflammation, especially in the bowels, and other membranous parts; for it is commonly the signal of commencing *mortification*; and though the patient expresses himself as perfectly comfortable, the sinking pulse will inform the physician that a few hours will probably terminate his life.

In chronic diseases, the prognosis is often less easily laid down, in consequence of the slow progress of the symptoms; but our principal guide, in forming it, will be an attention to the state of the functions, as leading to the seat of the disease. See DISEASE.

PROGNOSTICS of the Weather. See WEATHER.

PROGRAMMA, anciently denoted a letter sealed with the king's seal.

PROGRAMMA is also a college term, signifying a billet, or advertisement, posted up, or given into the hand, by way of invitation to an oration, or other college ceremony: containing the argument, or so much as is necessary for the understanding of it. Programmas are sent to invite people to assist at declamations, dramatic performances, &c.

PROGRESSIO HARMONICA, Progression in harmonics, is a continued proportion prolonged beyond three terms. (See PROPORTION.) The succession of equal intervals is in all progression: as the triple progression gives perfect fifths, and equal harmony. See PARTICIPATION.

PROGRESSION, PROGRESSIO, an orderly advancing, or going forward, in the same manner, course, tenor, &c.

PROGRESSION, in Mathematics, is either arithmetical, or geometrical.

PROGRESSION, Arithmetical, is a series of quantities equidistant from each other; i. e. either increasing or decreasing, by the same common interval, or difference.

Thus, 3, 6, 9, 12, 15, 18, &c. make an arithmetical progression; because increasing, or differing equally by 3: thus also 25, 20, 15, 10, and 5, are in arithmetical progression, decreasing by a common difference, 5.

In every arithmetical progression, whether increasing or decreasing, the sum of the first and last term is equal to the sum of any two intermediate terms equidistant from the extremes; as also, if the number of terms be uneven, to the double of the middle term. For instance:

$$\begin{array}{ccccccc} 3, & 6, & 9, & 12, & 15, & 18, & 21 \\ & & & 12, & 9, & 6, & 3 \\ \hline & & & 24, & 24, & 24, & 24 \end{array}$$

Hence, 1. We find the sum of any arithmetical progression, by multiplying the sum of the first and last term by half the number of terms. Thus let a represent the first term, x the last, and n the number of terms; and we

shall have $\frac{a+x}{2} \times n = s$, or the sum of all the terms.

2. Having, therefore, the first term, the difference, and the number of terms given, the sum of the progression is had by multiplying the first term by the number of terms; and to the product adding the product arising from the difference multiplied into the semi-difference of the number of terms from the square of that same number.

Let b be the common difference; and since $x = a + n - 1$ $\times b$, and $\frac{a+x}{2} \times n = s$, we shall have, merely by sub-

stitution, $\frac{2a + nb - b}{2} \times n = s$, i. e. $an + \frac{n^2 - n}{2} \times b = s$.

Thus suppose the first term 3, the number of terms 7, and the difference 3; the product of 3 and 7 = 21, being added to the product 63, of the difference 3 multiplied into the semi-difference of the number of terms 7, from the square thereof 49, which is 21, gives 84, the sum of the progression.

3. The number of terms lessened by one, being multiplied by the common difference, and the first term added to the product, the sum is the last term, i. e. $n - 1 \times b + a = x$. Thus, in the progression of 52 places, where the difference is 3, and the first term 5, 51 being multiplied by 3, produces 153; to which adding 5, the sum 158 is the last term required.

4. If the progression begin with 0, the sum of all the terms is equal to half the product of the last term multiplied by the number of terms, i. e. $\frac{x}{2} \times n$ becomes in this

case $\frac{nx}{2}$.

Whence it follows, that the sum of a progression beginning from 0, is subduple the sum of so many terms, all equal to the greatest.

PROGRESSION, *Geometrical*, is a series of quantities increasing or decreasing, in the same ratio, or proportion; or it is a series of quantities that are continually proportional; or which increase by one common multiplier, or decrease by one common divisor: which common multiplier or divisor is called the common ratio. Thus, $a, ar, ar^2,$

$ar^3, ar^4, \&c.$ or $a, \frac{a}{r}, \frac{a}{r^2}, \frac{a}{r^3}, \frac{a}{r^4}, \&c.$ and in numbers, 1, 2, 4, 8, 16, 32, 64, &c. or 729, 243, 81, 27, 9, 3, 1, make a geometrical progression.

1. In every geometrical progression, the product of the two extreme terms is equal to the product of the two intermediate terms equidistant from the extremes; as also, if the number of terms be uneven, to the square of the middle term. For example: let $a, ar, ar^2, ar^3, \&c.$ continued

to y , the last term, be such a series; then $y, \frac{y}{r}, \frac{y}{r^2}, \frac{y}{r^3},$

will be the four last terms; and $a \times y = ar \times \frac{y}{r} = ar^2$

$\times \frac{y}{r^2} = ar^3 \times \frac{y}{r^3}, \&c.$ And, in numbers,

3,	6,	12,	24,	48,	96
			12,	6,	3
288, 288, 288					

2. If the difference of the first and last term of a geometrical progression be divided by a number less by unit than the denominator of the ratio, the quotient will be the sum of all the terms except the greatest: hence, by adding the greatest, we have the sum of the whole progression.

In the preceding series, $\frac{y-a}{r-1} + y = \frac{y-a+yr-a}{r-1} = \frac{yr-a}{r-1} = s.$ For the sum of a series of geometrical

proportionals, wanting the first term, or the sum of all the consequents, is equal to the sum of all but the last term, or the sum of all the antecedents, multiplied by the common

ratio. Thus, $ar + ar^2 + ar^3, \&c. + \frac{y}{r^2} + \frac{y}{r^3} + \frac{y}{r^4}$

$+ y = r \times a + ar + ar^2, \&c. + \frac{y}{r^4} + \frac{y}{r^3} + \frac{y}{r^2} + \frac{y}{r^1}.$

Therefore $s - a = s - y \times r = sr - yr$; or, $sr - s$

$(s \times r - 1) = yr - a$; and $s = \frac{yr-a}{r-1}.$ If it be a de-

creasing series, whose sum is to be found, as of $y + \frac{y}{r} +$

$\frac{y}{r^2} + \frac{y}{r^3}, \&c. + ar^3 + ar^2 + ar + a$; and the number

of terms be supposed infinite, then a , the last term, will be equal to nothing; consequently the sum of such a series $s =$

$\frac{yr}{r-1}$; which is a finite sum, though the number of terms

be infinite.

Thus $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16}, \&c. = \frac{1 \times 2}{2 - 1} = 2.$

In a progression of five terms, beginning with 3, and the denominator being likewise 3, the greatest term will be 243. If, then, the difference of the first and last term 240 be divided by 2, a number less by 1 than the denominator, the quotient 120, added to 243, gives 363, the sum of the progression.

Hence, 3. The first or least term of a progression is to the sum of the progression, as the denominator lessened by 1, to its power likewise lessened by 1; the exponent of which power is equal to the number of terms. For, if the number of terms be n , the exponent of r in the last term will be $n - 1$. Therefore $y = ar^{n-1}$; and $yr = ar^{n-1+1} = ar^n$; and $s = \left(\frac{yr-a}{r-1}\right) \frac{ar^n-a}{r-1}$; consequently $s \times r - 1 = a \times r^{n-1}$, and $a : s :: r - 1 : r^n - 1.$

Thus, supposing the first term 1, the denominator 2, and the number of terms 8, the sum will be 255.

4. Hence, also, the difference between the last term and the sum, is to the difference between the first term and the sum, as unity to the denominator. Wherefore, if the difference between the first term and the sum be divided by the difference between the sum and the last term, the quotient is the denominator.

From art. 2. it appears, that $s - a = s - y \times r$; therefore $s - y : s - a :: 1 : r$, or $r = \frac{s-a}{s-y}.$

As a right line, or figure, may increase continually, and never amount to a given line or area; so there are progressions of fractions which may be continued at pleasure, and yet the sum of the terms be always less than a given number. If the difference between their sum and this number decrease in such a manner, that by continuing the progression it may become less than any fraction, how small soever, that can be assigned, this number is the limit of the sum of the progression, and is what is understood by the value of the progression, when it is supposed to be continued infinitely. These limits are analogous to the limits of figures, and they mutually assist each other. The areas of figures can, in many cases, be no otherwise expressed than by such progressions; and when the limits of figures are known, they may sometimes be advantageously applied for approximating to the sums of certain progressions.

Thus, for instance, let the terms of any progression be represented by the perpendiculars AF, BE, CK, HL, &c. standing at a given distance on the base AD (*Plate XIII. Analysis, fig. 5.*); and let PN be any ordinate of the curve FNE passing over the extremities of those perpendiculars. Suppose AP to be produced; then according as the area APMF has a limit to which it may approach continually, but never exceed, or may be produced till it exceed any given space; there will also be a limit of the sum of the progression, or it may be continued till it exceed any given number. For supposing the rectangles FB, EC, KH, LI, &c. completed, the area APNF will always be less than the sum of those rectangles, but greater than their sum after the first; therefore the area APNF, and the sum of those rectangles, either both have limits or both have none. The same is to be said of the sum of the ordinates AF, BE, CK, HL, &c. and of the sum of the terms of progression represented by them. If the curve FNE, for example, be the common hyperbola, b its centre, bP the asymptote, and AB equal

PROGRESSION.

equal to bA ; if AF represent unity, the series of ordinates will represent the progression $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \&c.$ which may therefore be continued till it exceed any given number, as the hyperbolic area may be produced till it exceed any given space. But if PNe be an hyperbola of any higher order, so that the ordinate PN be reciprocally as any power of the base bP , whose exponent is greater than unity, the area $APNF$, and the sum of the progression represented by the series of ordinates, will have limits. Hence there is always a limit of the sum of the fractions that have unity for their common numerator; and the squares, cubes, or any other powers of the numbers $1, 2, 3, 4, \&c.$ whose exponents exceeded unity for their successive denominators.

When the area $APNF$ has a limit, we may not only conclude that the sum of the progression, represented by the ordinates, has a limit; but when the former limit is known, we may by it approximate to the value of the latter; and *vice versa*, when the limit of the progression is given, the limit of the area may be found.

Progressions of fractions may be found at pleasure, that shall have assignable numbers equal to the limit of the sum of the terms. Thus a series or progression of any number of quantities continually decreasing being given, their successive differences form a new series of terms, the sum of which from the beginning is always equal to the excess of the first term of the first series above its last term. For instance, if $A, B, C, D, \&c.$ be the terms of the first series, it is manifest, that the sum of the difference of A and B , B and C , C and D , D and E , is the excess of A above E . If the terms of the first series decrease in such a manner, that by continuing the progression they may become less than any quantity that can be assigned, then the first term of the first series is the limit of the sum of the second series. In like manner, the difference of the alternate terms of the first series, as of A and C , B and D , C and E , $\&c.$ form a new progression of terms, the sum of any number of which is equal to the excess of the sum of A and B , the first and second term of the series, above the sum of the last and penultimate terms; and the sum of A and B is the limit of the sum of the new series. In general, if a progression is formed by taking the difference of the first term A and the term whose place in the series is expressed by any number n ; of the second term B , and that whose place is $n + 1$; of the third term C , and that whose place is $n + 2$, and so on; then will the limit of the sum of this new progression be equal to the sum of the terms $A, B, C, D, \&c.$ which precede that term whose place is expressed by n . In this manner progressions may be found at pleasure, which may be continued without end, and have given numbers for the limits of their sums.

For example, let the first series be $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \&c.$ the successive differences of the terms of which are $\frac{1}{2}, \frac{1}{6}, \frac{1}{12}, \frac{1}{20}, \&c.$ and the limit of the sum of this progression will therefore be 1 . If we multiply each term of this last series by 2 , that the first term may be unity, we shall have $1, \frac{1}{2}, \frac{1}{6}, \frac{1}{12}, \&c.$ the denominators of which are the triangular numbers, unity being the common numerator, and the limit of the sum of this progression is 2 . The successive difference of the terms of this latter series being each multiplied by $\frac{1}{2}$, that the term of the new series may be unity, give $1, \frac{1}{4}, \frac{1}{16}, \frac{1}{36}, \&c.$ which have the pyramidal numbers for their successive denominators; and the limit of the sum of this progression is $\frac{1}{2}$. In the same manner, the limit of the sum of the fractions having unity for their common numerator, and the figurate numbers of any order de-

nominated by m for their successive denominators, is found to be $\frac{m-1}{m-2}$.

The same series $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \&c.$ being again assumed, the difference of the alternate terms are $\frac{1}{3}, \frac{1}{8}, \frac{1}{15}, \frac{1}{24}, \&c.$ the limit of the sum of which progression is $\frac{1}{2}$. Dividing each term by 2 , the limit of the sum of $\frac{1}{2}, \frac{1}{6}, \frac{1}{12}, \frac{1}{20}, \&c.$ is $\frac{1}{3}$. If we take the differences of the first term, and that whose place is m , the second term, and that whose place is $m + 1$, $\&c.$ the common numerator of those differences will be $m - 1$; and their successive denominators, the product of $1 \times m, 2 \times m + 1, 3 \times m + 2$, and the limit of the sum of this progression is the sum of as many terms $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}, \&c.$ as there are units in $m - 1$. Now if each term of the new progression be divided by $m - 1$, that unity may be the common numera-

tor, the terms $\frac{1}{m}, \frac{1}{2 \times m + 2}, \frac{1}{3 \times m + 2}, \&c.$ will arise,

the limit of which is equal to the sum of the fractions $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \&c.$ (continued till their number be $m - 1$) divided by $m - 1$. In like manner, by assuming other alternate, or any equivalent terms of the series $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \&c.$ we may form new progressions, the value of which may be found. Thus, if we take the terms $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \&c.$ passing over three terms, and divide the successive differences of these terms by 96 , we shall have the series

$\frac{1}{5 \cdot 24}, \frac{1}{5 \cdot 9 \cdot 24}, \frac{1}{9 \cdot 13 \cdot 24}, \frac{1}{13 \cdot 17 \cdot 24}, \&c.$ which is equivalent

to the series C , given by Mons. de Monmort, in the Philosophical Transactions, N^o 353, p. 651, viz. $C =$

$\frac{1}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5} + \frac{14}{5 \cdot 6 \cdot 7 \cdot 8 \cdot 9} + \frac{55}{9 \cdot 10 \cdot 11 \cdot 12 \cdot 13} + \frac{140}{13 \cdot 14 \cdot 15 \cdot 16 \cdot 17}$

+ $\&c.$ the sum of which will therefore be $\frac{1}{96}$. And if we take the alternate terms of the series $\frac{1}{2}, \frac{1}{12}, \frac{1}{36}, \frac{1}{80}, \&c.$ above mentioned, and divide the successive differences of

the terms by 2 , we shall have the series $\frac{5}{2 \cdot 12}, \frac{9}{12 \cdot 30},$

$\frac{13}{30 \cdot 56}, \&c.$ which is equivalent to the series $\frac{5}{1 \cdot 2 \cdot 3 \cdot 4}, \frac{9}{3 \cdot 4 \cdot 5 \cdot 6},$

$\frac{13}{5 \cdot 6 \cdot 7 \cdot 8}, \frac{17}{7 \cdot 8 \cdot 9 \cdot 10}, \&c.$ mentioned in the said Philosophi-

cal Transactions, and marked A , the sum or limit of which, by the foregoing rule, will be $\frac{1}{4}$. So the limit of Mr. Mon-

mort's series $B = \frac{1}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5} + \frac{4}{4 \cdot 5 \cdot 6 \cdot 7 \cdot 8}, \&c.$ will be $= \frac{1}{108}$.

See Maclaurin's Fluxions, art. 356, where there is an error of the press, in p. 296, l. 11 and 15; for the series which in line 11 is said to be Mr. Monmort's series B , is the series A , p. 651, of the Philosophical Transactions, N^o 353, aforesaid; so in line 15, for A , read B .

This may suffice to shew how the sums of progressions so derived may be found. We refer, for the farther application of these principles, to the aforesaid Treatise of Fluxions, art. 357, $\&c.$ Mr. Stirling's Treatise of the Summation of Series ought also to be consulted, as he has improved the method of approximating to the value of progressions, which often arise in the solution of problems. See also Mr. de Moivre's Miscellanea Analytica, and particularly the supplement to that work. Methodus Differentialis, five Tractatus de Summatione et Interpolatione Serierum infinitarum, Lond. 1730, 4to.

PROGRESSION, Arch of a. See ARCH.

PROGYMNASMATA, προγυμνασματα, in *Antiquity*, certain preparatory exercises performed by all those who offered themselves to contend in the Olympian games.

PROHIBITED GOODS, in *Commerce*, such commodities as are not allowed to be either imported or exported. See CONTRABAND.

PROHIBITIO *de vasto directa parti*, in *Law*, is a writ judicial, directed to the tenant, prohibiting him from making waste upon the land in controversy, during the suit. It is sometimes also directed to the sheriff.

PROHIBITION, PROHIBITIO, the act of forbidding, or inhibiting any thing.

It is the prohibition of the law that makes the sin; a testator frequently bequeaths things with a prohibition to alienate.

PROHIBITION, in *Common Law*, denotes a writ issued out of the chancery, the king's bench, common pleas, or exchequer, to forbid some other court, either spiritual or secular, to proceed in a cause there depending, upon suggestion, that the cognizance thereof belongeth not to that court.

It is now usually taken for that writ which lieth for one who is impleaded in the court Christian, for a cause belonging to the temporal jurisdiction, or the cognizance of the king's courts; by which, as well the party and his counsel, as the judge himself, and the register, are forbidden to proceed any farther in that cause.

PROHIBITIONS, in *Musick*, during the seventeenth century. The church style, during that period, was much changed, not only by the imitations of dramatic music, and the introduction of instruments, but by writing in transposed keys, and supplying the deficiencies in the scales, which too strict an adherence to the species of octave, and modes of the church, had occasioned. Indeed, before this time, there was no decision of keys, either in sacred or secular music, according to our present rules of beginning and ending upon the chord, major or minor, of some determinate note of the scale. The prohibitions were so numerous in the writings of the old theorists, that if the most regular modern compositions were tried by such rules as subsisted at the beginning of the last century, they would appear extremely licentious. No part was to be extended above or below the staff, or five regular lines, on which it was written; the combination of chords was never to be broken by moving to an unrelative harmony; and the intervals of the sharp seventh, the tritonus or sharp fourth, false fifth, sharp second, and even the major sixth, were prohibited. Indeed, an excellent composition might now be produced, merely from ancient disallowances.

PROHIBITO, in the *Italian Musick*, is a term applied to such parts of a piece as are not proper, or according to just rule. Thus, *intervallo proibito* is every interval in melody that does not pass the ear easily or naturally, to give it some pleasure; such are the tritone, the sixth major, the seventh, ninth, &c. though, under certain circumstances, even these have pleasing effects, in that by their harshness they render the subsequent concords more agreeable.

PROJECTILE, or PROJECT, in *Mechanics*, a heavy body, which, being put into motion by an external force impressed upon it, is dismissed from the agent, and left to pursue its course.

Such, *e. gr.* is a stone thrown out of the hand or a sling, an arrow from a bow, a bullet from a gun, &c.

PROJECTILES, the cause of the continuation of the motion of, or what it is determines them to persist in motion, after the first cause ceases to act, has puzzled the philosophers. See MOTION and COMMUNICATION.

The Peripatetics account for it from the air, which, being violently agitated by the motion of the projecting cause, *e. gr.* the hand and sling, and forced to follow the projectile, while accelerated in it, does, upon the dismissal of the projectile, press after it, and protrude it forward, to prevent a vacuum.

The moderns account for the motion of projectiles on a much more rational and easy principle; it being, in effect, a natural consequence from one of the great laws of nature; *viz.* that all bodies, being indifferent as to motion or rest, will necessarily continue the state they are put into, except so far as they are hindered, and forced to change it by some new cause.

Thus a projectile, put in motion, must continue to move eternally in the same right line, and with the same velocity, were it to meet with no resistance from the medium, nor had any force of gravity to encounter.

The doctrine of the motion of projectiles is the foundation of all gunnery.

PROJECTILES, *Theory of*, is that branch of mechanics which relates to the motion, velocity, range, &c. of heavy bodies projected into space by any external force.

This subject may be considered under two distinct heads, *viz.* 1. With reference to bodies moving in void space, or, as is usually said, in a non-resisting medium; and 2. When the body is projected into a resisting medium, as air, water, &c.

Of the Theory of Projectiles in vacuo.—As the curve described by a projectile in void space depends upon its first initial velocity and the law of acceleration which a body would in this case observe in its fall towards the earth by the action of gravity, and as the latter was not known till the discovery of it by Galileo, it follows *à fortiori* that the real path of a projectile was also unknown before the time of this celebrated philosopher, who not only determined the true nature of the curve, shewing it to be the common parabola, but he examined also various circumstances relative to its motion. He shews how to ascertain the impetus for any range and elevation, and how the range was to be found when the impetus and elevation were given; and the elevation from the range and impetus. He demonstrated also, that the velocity of the projectile in any point of the curve, is equal to that which would be generated by a heavy body in falling, though one-fourth of the parameter to the diameter at that point; that the greatest range, the impetus being the same, is when the angle of elevation is 45° ; and that the ranges are equal for angles equally above and below 45° ; limiting his enquiries, however, in all these cases to the horizontal plane only.

Toricelli, the worthy pupil of so great a master, pursued the subject still farther, and investigated all the circumstances of a projectile, with reference to the inclined plane; and, amongst other very interesting properties he discovered, that the locus of the vertices of all the parabolas described by a body thrown from the same point with the same velocity, but with different degrees of elevation, was itself a parabola, of which the point of projection was the focus. In fact, the theory of projectiles in non-resisting mediums has received very little addition since the time of Toricelli, except so far as regards simplicity; but, in this respect, it has received great improvement in the hands of more modern mathematicians. We shall endeavour to condense all the most important propositions connected with this theory in the shortest space possible, in order that we may enter more at length on the subject when we come to consider it with reference to the resistance of the air, which is, in fact, the only useful case; for though there

PROJECTILES.

there is not perhaps any branch of mixed mathematics, which presents a more elegant and interesting theory than that of projectiles in a non-resisting medium, it unfortunately happens also that there is none, in which theory and practice are more at variance with each other, in consequence of rejecting the air's resistance, which is so great, that, in many cases, the computed range exceeds the real range obtained in practice, by more than twenty miles.

PROP. I.—If a body be projected into a non-resisting medium, either parallel, or any way inclined to the horizon, it will, by this motion, combined with that resulting from the action of gravity, describe the curve of a parabola.

Let a body be projected from A, (*Plate XXXVI. Mechanics, fig. 7.*) in the direction AD, with an uniform velocity, which would carry it over the equal spaces AB, BC, CD, &c. in equal portions of time, and BE, CF, DG, &c. the spaces through which a heavy body would descend by the force of gravity in those times; then it follows, from the principles of the composition of motion, that the body would be found at the end of these portions of time in the points E, F, G; or that its path will be the curve A E F G H passing through those points, and which is to be demonstrated to be a parabola.

Let t , T, represent the times the body would take in passing over any two of those spaces AB, AD; then since the motion in this direction is uniform, we have

$$\begin{array}{l} \text{therefore} \quad AB : AD :: t : T \\ \text{but} \quad \quad \quad AB^2 : AD^2 :: t^2 : T^2 \\ \quad \quad \quad BE : DG^2 :: t^2 : T^2 \end{array}$$

by the laws of falling bodies; therefore

$$AB^2 : AD^2 :: BE : DG$$

which is a known property of the parabola.

Cor. 1.—The velocity in the direction AD being uniform, the horizontal velocity is also uniform; and it is to the former as the cosine of the angle HAD of elevation to radius.

Cor. 2.—The velocity in the direction of gravity at any point F, is to the first projectile velocity, as 2 CF to AC. For this velocity would carry the body over 2 CF in the same time by the law of falling bodies, but in the same time the projectile velocity would carry the body over the space AC; therefore the former velocity is to the latter as 2 CF : AC.

Cor. 3.—Let PA be the height due to the first projectile velocity, or that space through which a heavy body must fall to acquire a velocity equal to that of projection, and DG be an ordinate equal to PA; then the velocity in the direction of gravity at G, will be equal to the projectile velocity at A; but it has been shewn that these velocities are to each other as 2 DG to AD, therefore, being equal at this point, we have 2 DG or 2 PA = AD, whence $AD^2 = 2 DG \times 2 PA$, or $DG^2 = 4 PA \times DG$, consequently $PA = \frac{1}{4}$ of the parameter of the diameter at A; and, therefore,

$$\begin{array}{l} AB^2 = 4 AP \times BE \\ AC^2 = 4 AP \times CF \\ AI^2 = 4 AP \times IH \\ \&c. = \quad \&c. \quad \&c. \end{array}$$

Cor. 4.—Hence again it follows, that the velocity of a projectile in the direction of the curve, or of its tangent, at any point, is equal to that which would be generated by gravity in a heavy body falling through $\frac{1}{4}$ of the parameter at that point. Whence, and from the known property of the direction of a parabola, it appears, that if from the

direction of the parabola the several lines HE, HE, &c. be drawn perpendicular to H, H, &c. (*fig. 8.*) then the velocity of the projectile in the direction of the curve, at any point E, is always equal to the velocity acquired by a body falling through HE.

Cor. 5.—It follows also from this property, that the motion of the projectile in the direction of the curve, is the least at the vertex of the parabola, at which point also the projectile is at its greatest height above the point of projection.

From these properties we may readily draw the geometrical construction for the determination of the range, elevation, or impetus, any two of them being given.

PROP. II.—Having given the velocity, or the height due to the velocity, and the angle of elevation, to find the range upon any given plane passing through the point of projection; whether parallel or oblique to the horizon.

Let PA (*fig. 9.*) be the height due to the velocity, or that through which a body must fall to acquire a velocity equal to that of projection, the direction of which let be AI; and AH the given plane.

From P draw PQ, making the angle APQ = the angle QAR; take AI = 4 AQ, and draw HI parallel to PA, so shall AH be the range required.

For the triangles APQ, AIH, are similar, and therefore AP : AQ (= $\frac{1}{4}$ AI) :: AI : IH, whence $\frac{1}{4} AI^2 = PA \cdot IH$, or $AI^2 = 4 PA \times IH$; therefore H is a point in the parabola by cor. 3. above.

Cor.—Draw QV parallel to AH, and V will be the vertex of the parabola, which will give the greatest height, Vn, of the projectile above the plane by cor. 4; and which, since Vn = QR, it is equal to $\frac{1}{4}$ of IH.

PROP. III.—Given the range and impetus, to find the angle of elevation.

On PA, the height due to the impetus, describe a segment to contain an angle equal to ARQ, or a AP, and take AR = $\frac{1}{4}$ AH, and draw QR parallel to AP, cutting the circle in QQ', so shall AQ, or AQ', be the direction required.

For since the angle AQP = ARQ, and PAQ = AQR, because of the parallels AP, QR, it follows that the angle APQ = QAR; and since AR = $\frac{1}{4}$ AH, AQ = $\frac{1}{4}$ AI; therefore AQ is the direction required, as is obvious from the preceding proposition.

Cor. 1.—Hence it follows, that there are always two angles of elevation which give the same range, except when the two points QQ' coincide, or when the angle PAH is bisected, in which case the range is the greatest possible, as is obvious.

Cor. 2.—Hence the greatest range for the horizontal plane, is when the angle of elevation is 45°.

Cor. 3.—Hence also, when it is required to determine the greatest range with a given impetus, we must bisect the angle PAH, which will be the angle of direction, from which the range will be found as in prop. 2.

PROP. IV.—Having given the range and elevation, to find the height due to the velocity,

Draw PA perpendicular to the horizontal line AB; take AR = $\frac{1}{4}$ AH; also draw QR parallel to PA, and from Q draw QP, making the angle AQP = AQR, and the point P, where this line cuts PA, will give the height due to the projectile velocity; as is obvious from the demonstrations given above.

The above propositions include all the most important cases relating to projectiles, when the plane passes through the point of projection; we shall therefore only add another for

for the case in which the plane does not pass through that point.

PROP. V.—Given the direction and velocity, to find the point where the projectile meets a plane given in position.

Let AP (*fig. 10.*) be the height due to the velocity, AI the direction, and BC the plane. Produce BC to meet PD in D , DP being perpendicular to PA , which produce to cut the plane BC in B . Make the angle $RAF = RAP$, and $AF = AP$, and join DF , and from the centre B , with the distance BP , describe a circle cutting DF in N ; join BN , parallel to which draw FC , which will cut the plane in the point C required.

For draw EC perpendicular to PD , then since $AP = AF$, by construction, F is the focus of the parabola; also

$$DB : DC :: BN : CF, \text{ and} \\ DB : DC :: BP : CE$$

But $BN = BP$, therefore $CF = CE$, and consequently the point P is in the parabola.

And it is obvious, that the same construction applies to the preceding propositions, the only difference being, that the points A and B in those cases coincide.

Cor.—When the point is given on the plane, and the elevation or impetus is required, it is obvious that the construction is then the same as in prop. 2, or prop. 3, whether the plane pass through the point of projection or not.

From the preceding constructions it will be easy to compute the several cases trigonometrically.

Let $AP = m$, then $v = 2\sqrt{gm}$, the time of flight $= t$, $16\frac{1}{2} = g$, the greatest height $vn = h$. Make also, for the sake of abridging the expressions, the angles BAI , BAH , and HAI , respectively equal to a , b , c .

Then $AI = tv$; and as $\sin. AHI (= \text{cof. } b) : \sin. c$
 $:: AI (= tv) : \frac{\sin. c}{\text{cof. } b} \cdot tv = IH = gt^2$, by the laws of

falling bodies $= 4h$, by cor. 5, prop. 1; hence $\frac{\sin. c}{\text{cof. } b}$

$tv = gt^2 = 4h$; whence we draw $v = \frac{\text{cof. } b}{\sin. c} gt$, and $t = \frac{\sin. c}{\text{cof. } b} \cdot \frac{v}{g}$.

Again, as $\sin. AHI (= \text{cof. } b) : \sin. HIA (= \text{cof. } a)$
 $:: AI : AH$, whence $AH = \frac{\text{cof. } a}{\text{cof. } b} \cdot AI = \frac{\text{cof. } a}{\text{cof. } b} tv$.

Now, substituting in this last expression the values of t and v , as found above, we have, for the range r , the following values; *viz.* $r = \frac{\text{cof. } a}{\text{cof. } b} tv = \frac{\text{cof. } a}{\sin. c} gt^2 = \frac{\text{cof. } a \cdot \sin. c \cdot v^2}{\text{cof.}^2 b \cdot g} = \frac{\text{cof. } a \cdot \sin. c}{\text{cof.}^2 b} \cdot 4m = \frac{\text{cof. } a}{\sin. c} 4h$.

From which, it is obvious, we may readily find t , v , m , or h , when the range r is given; as we may also the angle of elevation and the inclination of the plane, when these are to be determined.

When the plane is horizontal these expressions become more simple, for in that case $\text{cof. } b = 1$, and angle $a =$ angle c , whence the above become $r = \text{cof. } a tv = \frac{\text{cof. } a}{\sin. a}$

$gt^2 = \text{cof. } a \cdot \sin. a \cdot \frac{v^2}{g} = \text{cof. } a \cdot \sin. a \cdot 4m = \frac{\text{cof. } a}{\sin. a} 4h$.

And these, again, by substituting $\sin. a \text{ cof. } a = \frac{1}{2} \sin. 2a$, and $\frac{\sin. a}{\text{cof. } a} = \tan. a$, are rendered still more simple, particu-

larly those which relate to the angle of elevation. We have

$$\text{thus } r = \frac{gt^2}{\tan. a} = \sin. 2a \frac{v^2}{2g} = \sin. 2a \cdot 2m$$

$$\sin. a = \frac{gt}{v} = \frac{2}{v} \sqrt{gb} = \frac{tv}{4b}$$

Cor. 1.—From the last value of r it is obvious, that in the horizontal plane the range varies, the impetus being the same, as the sine of the double angle of elevation, and, therefore, that it is the greatest when that angle is 45° , or when the angle subtended by the impetus and plane is bisected; and the same is also true in the latter sense for the oblique plane.

Cor. 2.—And in both cases, all angles equally above and below that which gives the maximum range, will give equal ranges, as may be readily deduced from the preceding formulas.

Cor. 3.—All other things being the same, the range varies as v^2 , or as the square of the velocity, as does also the greatest height of the projectile above the plane.

Cor. 4.—The time of flight varies as the velocity, or as the impetus.

For more on this subject, see Robins's Gunnery, Hutton's Tracts, and Burrow's Theory of Gunnery, contained in his Restitution of the Inclinations of Apollonius.

Theory of Projectiles in Resistling Mediums.—We have already observed, that the doctrine of projectiles in a non-resistling medium, is only to be considered as an elegant theory, which is, in fact, almost entirely useless in practice, in consequence of its not taking any account of the resistance of the air; it being only with very small velocities, that there is any tolerable agreement between experiments and the computed ranges. But when the velocity is at all considerable, the resistance becomes very great, and such as to render the parabolic theory of no practical use whatever. The inaccuracy of those authors who have treated the subject upon the supposition of the resistance of the air being inconsiderable, will easily appear from what is established by Robins in his New Principles of Gunnery, where he has shewn that this resistance to a cannon ball amounts to more than twenty times the weight of the ball. What errors may not be expected from an hypothesis which neglects this force as inconsiderable? In effect, it will not be difficult to shew, that the track described by the flight of shot or shells, is neither a parabola nor nearly a parabola. For by that author's experiments it appears, that a musket-ball of three-fourths of an inch diameter, fired with half its weight of powder from a piece forty-five inches long, moves with a velocity of nearly 1700 feet in a second. Now, by the common parabolic theory, if this ball flew in the curve of a parabola, its horizontal range at 45° would be found to be about seventeen miles. But from practical writers, as Diego Ufano, and Merfennus, it appears, that this range is short of half a mile; so that a musket-shot at 45° elevation, with a reasonable charge of powder, flies not the $\frac{1}{34}$ th part of the distance it ought to do, if it moved in a parabola.

Nor is this great diminution of the horizontal range to be wondered at, when it is considered that the resistance of the air to this bullet, when it first issues from the piece, amounts to one hundred and twenty times its gravity

Again, if the flight of the heaviest shot, in common use for land service, as of iron bullets of 24 lb. weight, be examined, it will appear, that such a shot, with a full charge of powder, has a velocity of 1650 feet in 1". And the horizontal range at 45° of this shot, would, according to the parabolic hypothesis, be about sixteen miles; but by the experiments of St. Remy it appears, that the range is really short

PROJECTILES.

short of three miles; which is not one-fifth of the distance it ought to fly, if it described the curve of a parabola.

And this deviation from the parabola happens not only in these great velocities, but in such as are much less; thus in velocities of about 400 feet in 1", by several experiments it appears, that the range of a leaden bullet of three-fourths of an inch in diameter, fired at different elevations with this velocity, did not at all answer the common theory. So that it sufficiently appears that any theory, which depends upon the supposition of the inconsiderableness of the air's resistance to projectiles, is useless.

Indeed, the inaccuracy of this hypothesis almost appears at sight, even in projectiles slow enough to have their motion traced by the eye; few there are who do not descend through a curve manifestly shorter and more inclined to the horizon than that in which they ascended, and the highest point of their flight, or the vertex of the curve, is much nearer to the place where they fall on the ground, than to that whence they were at first discharged. These things cannot be a moment doubted of by any one, who in a proper situation views the flight of stones, arrows, or shells, thrown with any considerable velocity.

What is here advanced may be confirmed from the constant observation of all who are conversant in the practice of throwing shells, *viz.* that the ranges at elevations below 45° , constantly exceed the ranges at elevations above 45° , which are respectively at an equal distance from 45° . But it is known that in the parabolic hypothesis these ought to be equal; which is a farther proof of the fallacy of this hypothesis.

There is also a singular phenomenon in the motion of bodies projected with considerable force, which shews the great complication and difficulty of this subject; which is that bullets in their flights are not only depressed beneath their original direction by the action of gravity, but are also frequently driven to the right or left of that direction by the action of some other force.

If it was true, that bullets varied their direction by the action of gravity only, then it ought to happen that the errors in their flight to the right or left of the mark they were aimed at, should increase in the proportion of the distance of the mark from the piece only. But this is contrary to all experience; the same piece which will carry its bullet within an inch of the intended mark, at ten yards distance, cannot be relied on to ten inches in one hundred yards, much less to thirty inches in three hundred yards.

Now this inequality can only arise from the track of the bullet being incurvated sideways, as well as downwards: for, by this means, the distance between the incurvated line, and the line of direction, will increase in a much greater ratio than that of the distance; these lines being coincident at the mouth of the piece, and afterwards separating in the manner of a curve from its tangent, if the mouth of the piece be considered as the point of contact.

This is put beyond dispute from the experiments made by Mr. Robins; who informs us, that having taken a barrel carrying a ball of three-fourths of an inch diameter, and fixing it on a heavy carriage, he satisfied himself of the steadiness and truth of its direction, by firing at a board $1\frac{1}{2}$ foot square, at the distance of one hundred and eighty feet, and missed it but once in sixteen successive shot. Now the same barrel being fixed on the same carriage, and fired with a smaller quantity of powder, so that the shock on the discharge would be much less, and consequently the direction less changed, he found that at seven hundred and sixty yards distance the ball flew sometimes one hundred yards to the

right of the line it was pointed on, and at other times one hundred yards to the left. He found, too, that its direction in the perpendicular line was not less uncertain, it falling one time above two hundred yards short of what it did at another; although by the nicest examination of the piece after the discharge, it appeared not to have the least started from the position it was placed in.

If it be asked what can be the cause of a motion so different from what has been hitherto supposed? It may be answered, that the deflection in question must be owing to some power acting obliquely to the progressive motion of the body, which power can be no other than the resistance of the air. And this resistance may perhaps act obliquely to the progressive motion of the body, from inequalities in the resisted surface; but its general cause is doubtless a whirling motion acquired by the bullet about its axis; for by this motion of rotation, combined with the progressive motion, each part of the bullet's surface will strike the air in a direction very different from what it would do if there was no such whirl; and the obliquity of the action of the air arising from this cause will be greater, according as the rotatory motion of the bullet is greater in proportion to its progressive motion. Principles of Gunnery in Tracts, vol. i. p. 149, &c.

Euler, on the contrary, attributes this deflection of a bullet to its figure, and scarcely at all to its rotation: for, if the bullet was perfectly round, though its centre of gravity did not coincide with its centre of magnitude, the deflection from the axis of the cylinder, or line of direction sideways, would be very inconsiderable. If such a ball goes to the right or left of an object, it is certain that the object does not lie in the same vertical plane with the axis of the piece. But if it be not round, it will generally go to the right or left of its direction, and so much the more, as it goes farther from the piece. He infers from his reasoning on this subject, that cannon-shot, which are made of iron, and rounder and less susceptible of a change of figure in passing along the cylinder than those of lead, are more certain than musket-shot.

There is another circumstance, however, which appears to us to account for the irregular motion of shot, which is the windage; for the ball not exactly fitting the bore of the cannon, and the explosion of the powder not taking place exactly in the axis of the gun, it must necessarily happen, that in the motion of the ball along the barrel, it strikes sometimes one side and sometimes another of the bore, and that it will, therefore, be elevated or depressed, or be thrown to the right or left of the object, according to the point at which it was last in contact with the mouth of the cannon. That this is the true cause of the irregular motion we are speaking of, is made pretty obvious from an experiment reported by M. Guyton, in vol. viii. of the Memoirs of the National Institute. In this experiment the bore of the cannon was slightly conical, the greater part being at the breech, where the cannon was charged with a leaden bullet, as in a rifle gun, and which consequently must undergo a slight change in its form in passing through the bore of the piece, so that there was no windage, and the consequence was the most complete regularity in the flight of the shot, the deviation being scarcely perceptible in the longest ranges.

Another experiment is reported in the same Memoir, which it is important to detail, because it contradicts a sort of hypothesis which has been almost universally admitted, and in some measure justified by experiment; namely, that the less the windage, the greater the range, all things else being the same; but it appears from the experiments above alluded to, that the medium range of a number of experiments, in which the

the windage was reduced to half a millimeter, was only about half the range with a windage of a millimeter; but that the ranges again decreased by diminishing farther the size of the shot; so that the millimeter, answering to about $\frac{1}{32}$ th of an English inch, seems to be the best suited for giving the greatest range. This experiment appears to be at variance with the one mentioned above by the same author, and also with some other of his experiments made with balls of new construction, which M. Guyton calls "bullet a bague de plomb," which are constructed so as to prevent any windage, by a collar of lead fixed about the middle of the ball; with these, though their weight was nearly double that of a common shot, the range was in some cases greater, and in very few less, than with the common ball, the charge and every thing else being exactly the same. The former anomaly, therefore, both M. Guyton and M. Prony endeavour to account for, by the protrusion of the vertical diameter of the shot, and the consequent friction between the ball and the bore of the cannon, both of which appear to have been brass in these experiments; and which friction they suppose to be so much greater than that between lead and brass, as to be sufficient to account for the great defect in the ranges in the former case: we are doubtful, however, how far this may be considered as a satisfactory explanation.

The most complete set of experiments made with a view of obtaining a rational theory of projectiles in air, are those of Dr. Hutton, which were carried on at Woolwich during the years 1775, 1783, 1784, 1785, 1787, 1788, 1789, and 1791, the objects of which were very various, and some of the results highly important. The latter are thus enumerated by the author in the second vol. of his "Tracts," lately published.

"1. It is made evident by these experiments, that powder fires almost *instantaneously*, seeing that nearly the whole of the charge fires, though the time be much diminished.

"2. The velocities communicated to the shot of the same weight, with different quantities of powder, are nearly in the subduplicate ratio of those quantities. A very small variation, in defect, taking place when the quantities of powder become great.

"3. And when shot of different weights are fired with the same quantities of powder, the velocities communicated to them, are nearly in the reciprocal subduplicate ratio of their weights.

"4. So that, universally, shots which are of different weights, and impelled by the firing of different quantities of powder, acquire velocities which are directly as the square roots of the quantity of powder, and inversely as the square roots of the weight of the shot nearly.

"5. It would, therefore, be a great improvement in artillery, to make use of shot of a long form, or of heavier matter; for thus the momentum of the shot, when fired with the same weight of powder, would be increased in the ratio of the square root of the weight of the shot.

"6. It would also be an improvement to diminish the windage; for by so doing, one-third or more of the quantity of powder might be saved."

This, however, must be understood only to be true within certain limits. See the experiments of M. Guyton, above referred to.

"7. When the improvements mentioned in the two last cases are considered as both taking place, it is evident that about half the quantity of powder might be saved, which is a very considerable object. But important as this saving may be, it seems still to be exceeded by that of the guns: for thus a small gun may be made to have the effect of one, of two, or three times its size, in the present way, by dis-

charging a long shot of two or three times the weight of its natural ball, or round shot: and thus a small ship might discharge shot as heavy as those of the greatest now made use of."

The objects of the latter courses of experiments are thus detailed; *viz.* to ascertain,

"1. The velocities with which balls are projected by equal charges of powder, from pieces of the same weight and calibre, but of different lengths.

"2. The greatest velocities due to the different charges of powder, the weight and length of the gun being the same.

"3. The greatest velocity due to the different lengths of guns; to be obtained by increasing the charge as far as the resistance of the piece is capable of sustaining.

"4. The effect of varying the weight of the piece; every thing else being the same.

"5. The penetration of balls into blocks of wood.

"6. The ranges and times of flight of balls, with the velocities, by striking the pendulum at various distances, to compare them with initial velocities, for determining the resistance of the medium.

"7. The effects of wads; of ramming, of windage, &c. &c."

We cannot of course enter in this place into any detail relative to the manner of performing these experiments, nor even of the results of them; indeed, they are not all necessarily connected with our subject, but rather belong to the general article GUNNERY; but as they have been published since that article in the present work was written, we have thought it right to give a slight abstract of the experiments in this place, but for farther particulars on some of the subjects, we must refer the reader to the work itself; others will be found illustrated at some length under the articles PENETRATION, RESISTANCE, WHIRLING Machine, Initial VELOCITY, &c. &c.

We shall here merely adopt the author's expression for the resistance of the air, as deduced from these experiments, and thence determine the ranges, times of flight, &c. of projectiles according to that hypothesis.

Theorem.—The resistance of the air to a ball projected into it with any considerable velocity, is expressed by the formula $r = (.000007565 v^2 - .00175 v) d^2$. But for the smaller velocities, $r = .0000044 d^2 v^2$ will be a sufficiently near approximation, where r represents the resistance in avoirdupois pounds, d the diameter of the ball in inches, v the velocity in English feet. See Hutton's Tracts, vol. iii. p. 232; see also our article RESISTANCE.

PROB. 1.—To determine the height to which a ball, projected perpendicularly upwards, will ascend, being resisted by the atmosphere.

Putting x to denote any variable and increasing height ascended by the ball; v its variable and decreasing velocity there; d the diameter of the ball, its weight being w ; $m = .000007565$, and $n = .00175$, the coefficients of the two terms in the above theorem. Then $(m v^2 - n v) d^2$ will be the resistance of the air against the ball in avoirdupois pounds, to which, if the weight of the ball be added, then $(m v^2 - n v) d^2 + w$ will be the whole resistance to the ball's motion, and consequently $\frac{(m v^2 - n v) d^2 + w}{w}$

$= \frac{(m v^2 - n v)}{w} d^2 + 1 = f$, the retarding force. (See ACCELERATION and RETARDATION.) Hence the general formula $v \dot{v} = 2 g f x$ (given under the former of these articles)

PROJECTILES.

articles) becomes $-v \dot{v} = 2 g x \times \frac{(m v^2 - n v) d^2 + w}{w}$ making v negative, because the velocity is decreasing, where $g = 16\frac{1}{2}$ feet, or 16 feet, the descent of a body in one second by gravity.

Hence $\dot{x} = -\frac{w}{2g} \times \frac{v \dot{v}}{(m v^2 - n v) d^2 + w} = \frac{-w}{2 g m d^2} \times \frac{v \dot{v}}{v^2 - \frac{n}{m} v + \frac{w}{m d^2}}$. The fluent of which being taken, and corrected for the instant of the first velocity V , when $x = 0$, gives $x = \frac{w}{2 g m d^2} \times \left\{ \frac{1}{2} \log. (V^2 - \frac{n}{m} V + \frac{w}{m d^2}) - \frac{1}{2} \log. \frac{w}{m d^2} + \frac{p}{q^2} (\text{arc. tan. } (V - p) - \text{arc. tan. } - p \text{ to rad. } q) \right\}$ where $p = \frac{n}{2m}$, and $p^2 + q^2 = \frac{w}{m d^2}$.

But as part of this fluent, denoted by $\frac{p}{q^2} \times$ the difference of the two arcs to $\text{tan. } (V - p)$ and $-p$, is always very small in comparison with the other preceding terms, it may be omitted without any material error in practical cases; in which case we have

$$x = \frac{w}{4 g m d^2} \times \text{hyp. log. } \frac{V^2 - \frac{n}{m} V + \frac{w}{m d^2}}{\frac{w}{m d^2}}$$

for the greatest height to which the ball will ascend in air; supposing its density uniformly the same as at the earth's surface. Now for the numerical value of the general coefficient $\frac{w}{4 g m d^2}$, and the term $\frac{w}{m d^2}$; because the mass of the ball to the diameter d is $.5236 d^3$, if its specific gravity be s , its weight will be $.5236 s d^3 = w$; therefore $\frac{w}{d^2} = .5236 s d$, and $\frac{w}{m d^2} = 69259 s d$; this divided by $4g$ or 64 ,

gives $\frac{w}{4 g m d^2} = 1082 s d$ for the value of the general coefficient, to any diameter d , and specific gravity s . And if we farther suppose the ball to be cast iron, the specific gravity of which, or the weight of a cubic inch, is $.26855 \text{ lb.}$, it becomes $290.6 d$ for that coefficient; also $69259 s d = 18600 d = \frac{w}{m d^2}$, and $\frac{n}{m} = 231.5$.

Hence the preceding fluent becomes

$$x = 290.6 \times \text{hyp. log. } \frac{V^2 - 231.5 V + 18600 d}{18600 d}$$

$$x = 669 d \times \text{com. log. } \frac{V^2 - 231.5 V + 18600 d}{18600 d}$$

which is a general expression for the altitude in feet ascended by an iron bullet, whose diameter is d , and projectile velocity V .

Example 1.—Suppose a ball of cast iron, whose diameter is two inches, and, therefore, its weight $1\frac{1}{2} \text{ lb.}$, to be projected upwards with a velocity of 2000 feet *per* second, to find the greatest height to which it will ascend.

Here, substituting for d , w , and V their respective values, we have

$$x = 669 d \times \text{com. log. } \frac{V^2 - 231.5 V + 18600 d}{18600 d} = 2653 \text{ feet.}$$

Ex. 2.—Again, let the ball weigh 24 lb., and, therefore, its diameter 5.6, and velocity 2000 feet *per* second, as before; then

$$x = 669 d \times \text{com. log. } \frac{V^2 - 231.5 V + 18600 d}{18600 d} = 5782 \text{ feet, the height required.}$$

In the first of these examples, where the height is found to be only about $\frac{1}{2}$ mile, the ball would ascend to nearly 12 miles in a non-resisting medium; and hence we may see the immense effect of atmospheric resistance to the motion of projectiles.

PROB. II.—To determine the time in which a ball will have acquired its greatest height, using the same formula of resistance as in the last case.

Here the general value of t , determined on principles similar to those above employed, gives

$$t = \frac{w}{2 g m q d^2} \times \left(\text{arc. tan. } \frac{V - p}{q} - \text{arc. tan. } \frac{v - p}{q} \right), \text{ or}$$

$$t = \frac{w}{2 g m q d^2} \times \text{arc. tan. } \frac{V - p}{q}, \text{ rejecting the latter arc as inconsiderable; } p \text{ and } q \text{ representing the same as before.}$$

Ex. 1.—Let it be proposed to find the time in which an iron ball, two inches in diameter, will acquire its greatest height, when projected with a velocity of 2000 feet *per* second.

Here $\frac{n}{2m} = 115\frac{1}{2} = p$, and $\frac{w}{m d^2} = p^2 + q^2$, gives $q = \sqrt{37153 - p^2} = 154\frac{1}{2}$; whence $t = \frac{w}{2 g m q d^2} \times \left(\text{arc. tan. } \frac{V - p}{q} \right) = 11.81 \text{ seconds.}$

If we take the second example above to find the time, we shall have $p = 115\frac{1}{2}$ as before, and $q = 299.4$; therefore $t = \frac{w}{2 g m q d^2} \times \text{arc. tan. } \frac{V - p}{q} = 16.89 \text{ seconds.}$

Dr. Hutton, after the investigation of these two problems, and some others of a similar nature, proceeds to the investigation of his principal problem, *viz.* to determine the circumstances of ranges at different degrees of elevation; which we shall transcribe in the author's own words.

“Rules for the general solution of this problem would be best derived from experiments; and these should be made at all elevations, and with all charges, and with various sizes of balls, observing both the ranges and times of flight in every experiment. Such experiments would give us the relations existing, in all cases, amongst these four terms, *viz.* the ranges, the times of flight, the velocity or charges, and the size of the balls. Numerous and various as are our experiments, as before related, and fruitful as they are in useful consequences, we have obtained but a small portion of those alluded to; nor do I know of any proper set of such experiments any where to be found. Such must, therefore, still remain a valuable desideratum; the few that we have been able to make, afford us but very few and imperfect rules, being chiefly as follows. 1. That the ranges with the one-pound balls, at an elevation of 15° , are nearly proportional to the times of flight. 2. That the ranges with the three-pound balls, at 45° of elevation, are nearly as the times of flight, and also as the projectile velocities. Besides these inferences, it does not appear that the experiments are extensive enough to afford any more useful conclusion.

“By trials, however, amongst many of the numbers in

art. 24, it appears, that in most of them at an elevation between 45° and 30° , the time of flight is nearly equal to $\frac{1}{4}$ of the square root of the range in feet, in which respect it nearly agrees with the similar rule for the time of flight in the parabolic theory, at the angle of 45° for the greatest range, which time, it is well known, is equal to $\frac{1}{4}$ of the square root of the said range in feet. Whence it is probable, that with the help of a few other ranges at several elevations, some general relations might be evinced between the ranges, and the times of flight, with the tangents of the elevation.

“But such experiments and enquiries as these, unfortunately it is no longer in my power either to procure, or by any means to promote; and we can, therefore, only endeavour to render, without them, what service we can to the state, and to philosophy, by such means as are in our power.

“There are some few theoretical principles which it may be useful to notice here, as first mentioned by professor Robinson. Thus balls of equal density, discharged at the same elevation, with velocities which are proportional to the square roots of their diameters, will describe similar curves; because then the resistances will be in proportion as the momentum or quantity of motion. For the resistance r , is $d^2 v^2$ nearly; d being the diameter, and v the velocity. But v being as \sqrt{d} , v^2 will be as d ; consequently $d^2 v^2$ will be as d^3 ; that is, r is as d^3 . But the momentum is as the magnitude or mass, which is as d^3 also, the cube of the diameter. Therefore the resistance is proportional to the momentum, when the velocity is as \sqrt{d} , or the square root of the diameter of the ball. In this case, then, the horizontal velocity at the vertex of the curve will be proportional to the terminal velocity; also the ranges, and heights, and all other similar lines in the curve, will be proportional to d , the diameter of the ball. And this principle may be of considerable use; for thus, by means of a proper series of experiments on one ball, projected with different velocities and elevations, tables may be constructed, by which may be ascertained the motions in all similar cases.”

The following table, deduced partly from theory, and partly from experiment, may be found of use by analogy in many cases.

TABLE of the Motions of a 24lb. Shot, projected at 45° Elevation.

Velocity per Second.	Range in Vacuo.	Range in the Air.	Range corrected.	Height the Ball rises to.
Feet.	Yards.	Yards.	Yards.	Yards.
200	415	320	330	100
400	1658	1000	1019	300
600	3731	1391	1419	400
800	6632	1687	1719	464
1000	10362	1840	1878	515
1200	14922	1934	1978	561
1400	20310	2078	2129	606
1600	26528	2206	2264	650
1800	33574	2326	2391	694
2000	41450	2438	2510	738
2200	50155	2542	2622	778
2400	59688	2640	2726	816
2600	70050	2734	2823	852
2800	81241	2827	2916	887
3000	93262	2915	3002	922
3200	106111	2995	3086	996
1	2	3	4	5

This table contains, in the first column, the velocity, in feet, of a 24lb. shot, projected at an angle of 45° ; the second column shews the distance, in yards, to which the ball would go, in vacuo, on an horizontal plane; the third column contains the distance to which it will range through the air, considered all of the same density as at the earth's surface; the fourth shews the same ranges corrected for the diminution of the air's density as the ball ascends, and is, therefore, called the corrected range; and the fifth column shews the height to which the ball rises in the air, or the height of the vertex of the curve above the plane.

By this table it appears, what an immense difference there is between the motions through the air and in void, especially with the large velocities. It is seen that the ranges through the air, instead of increasing in the duplicate ratio of the initial velocities, as in non-resisting space, really increase slower than those velocities, in all the actual cases of military service; and in the most useful cases, viz. from 800 to 1600 feet, they increase nearly as the square roots of the velocities. A set of similar tables, made with the same shot at other elevations, would nearly complete what might be done by theory, as well as useful and necessary for practice.

To use the foregoing Table.—Suppose it were required to find the dimensions of the path described by a 12lb. shot, discharged with 1600 feet velocity, at an elevation of 45° degrees. Here, recollecting that the curves are similar, and their corresponding lines proportional to the diameters of the shot, when these are discharged with velocities that are to one another as the square roots of the same diameters; we must, therefore, first find what velocity of the 24-pound shot, or tabular ball, corresponds to the 1600 feet velocity of the 12-pounder, in this manner. The diameters of the two balls being 4.403 and 5.546, it will be as $\sqrt{4.403} : \sqrt{5.546} :: 1600 : 1796$, the corresponding velocity of the 24-pounder; which being sought in the table, the range and height answering to it are there found to be 2386 and 692; therefore, as $5.546 : 4.403 :: 2386 : 1894$ yards the range, and $5.546 : 4.403 :: 692 : 549$ yards the altitude. That is, the range is about $1\frac{1}{2}$ of a mile; and the height about $\frac{1}{2}$ of a mile.

Again, to find the range and greatest altitude of a 9lb. ball, projected with 1500 feet velocity. The diameter of the 9-pound ball being 4 inches, we have $\sqrt{4} : \sqrt{5.546} :: 1500 : 1766$, to which, in the table, correspond 2343, and 680, for the tabular range and altitude. Then

$$5.546 : 4 :: 2343 : 1690 \text{ the range} = 1 \text{ mile nearly.}$$

$$5.546 : 4 :: 680 : 491 \text{ the height} = \frac{1}{2} \text{ mile nearly.}$$

The same table may also serve for computing the ranges of mortar shells. For this purpose, we have only to find what must be the initial velocity of the 24-pound shot, corresponding to the proposed velocity of the shell. This must be deduced from the diameter and weight of the shell, by making the velocity of the 24-pounder such, that the ratio of its weight to the resistance may be the same as in the shell.

Thus, to find the range of the 13-inch shell, projected with the velocity of 2000 feet per second, at 45° elevation. Here the diameter being 12.8, we have $\sqrt{12.8} : \sqrt{5.546} :: 2000 : 1317$, and as $178 : 149.4 :: 1317 : 1105$, the correspondent velocity of the 24-pounder; to which, in the table, answers the range 1930; then as $5.546 : 12.8 :: 1930 : 4455$ yards, or about $2\frac{1}{2}$ miles the range. Hutton's Tracts, vol. iii.

PROJECTING TABLE. See TABLE.

PROJECTION, in *Mechanics*, the action of giving a projectile its motion. See PROJECTILE.

If the direction of the force by which the projectile is put in motion, be perpendicular to the horizon, the projection

PROJECTION.

is said to be perpendicular; if parallel to the apparent horizon, it is said to be an horizontal projection; if it make an oblique angle with the horizon, the projection is oblique. The angle IAB (*Plate XXXVI. Mechan. fig. 9.*) which the line of direction AI makes with the horizontal line AB , is called the *angle of elevation of the projectile*.

PROJECTION, the art of forming the representation of a body upon a plane, by drawing straight lines through a given point or parallel from the contour, and from the intermediate lines of the body, if any, so as to cut the plane; then colouring the respective compartments, or each compartment, according to the degree of light, shade, and hue of the surfaces, or of each surface.

If the projection is made by drawing straight lines from a point, it is called a perspective representation; but if formed by parallel lines, it is called an orthography, or the orthographical representation, which is the subject of the present article, the former having been already given under the article **PERSPECTIVE**.

Definitions.

1. The plane on which the object is represented, is called the plane of projection.

In orthographical projection, the rays by which the projection is formed, are here understood to be perpendicular to the plane of projection.

2. If the projection is made on a plane parallel to the horizon, or on a plane representing the horizon, it is called the plan of the object.

3. If the projection is made on a plane perpendicular to the horizon, or on a plane representing a vertical plane, it is called the elevation of the object.

4. The plane of position of an inclined line and a plane, is another plane passing along the line perpendicular to the plane.

5. The inclination of a line to a plane, is the angle on the plane of position comprehended between the line and the plane.

6. The plane on which any object is given, is called the primary plane.

7. A point on a plane is said to be given when its situation is known in respect of some given line, with regard to some fixed point in that plane.

8. The position of a line to a plane is said to be given when the seat of the line is given upon the plane, and when the angle which the line makes with its seat is known.

9. In the representation of figures, in planes inclined to the plane of projection, the situation of the figure, in respect to the intersection of its plane with the plane of projection, is supposed to be known. The intersection is, therefore, given on the plane of projection, and the space on the one side is to be considered as the original plane, while that on the other is the plane of projection.

Axiom.—If any point, line, or plane, coincide with the plane of projection, that point, line, or plane, so coincident, is both the original and the projection, of that point, line or plane.

PROPOSITIONS.

I. The projection of a point is in a straight line drawn from the original point perpendicular to the intersection.

For, suppose a plane to pass through the original point perpendicular to the primary plane and to the plane of projection, the intersection of this plane with each of these planes will be perpendicular to the intersection of the primary plane and the plane of projection; but lines which are perpendicular to the same straight line, drawn from the same

point, are in the same straight line, and, therefore, the projection of a point is in a straight line drawn from the original point perpendicular to the plane of projection.

II. The orthography, or projection of a straight line, is also a straight line.

For, let a plane pass through the original straight line perpendicular to the plane of projection, to intersect it; now the intersection of one plane with another is a straight line; therefore the orthographic representation is also a straight line.

III. All original parallel straight lines are represented by parallel straight lines.

IV. The orthographical representation of a line parallel to the plane of projection, is a line equal and parallel to its original.

V. The orthographical representation of a line parallel to the intersection, is a line equal and parallel to the original.

VI. The orthographical representation of a plane figure parallel to the plane of projection, is a figure equal and similar to the original.

VII. All planes perpendicular to the plane of projection, are represented as straight lines.

VIII. All straight lines in the primary plane perpendicular to the intersection, have their representations also perpendicular to the intersection.

IX. Every straight line in a plane perpendicular to the plane of projection, is represented by the intersection, or a part of the intersection, of that plane.

PROBLEM I. *Plate I. fig. 1.*

Given a point on a plane inclined to the plane of projection, to find the orthography of the point.

Let AB (*fig. 1.*) be the intersection, and let g' be the original point. Draw gg' perpendicular to AB , and through any other point D in AB , draw CE parallel to gg' ; make the angle CDF equal to the inclination of the planes; draw $g'C$ parallel to BD , and draw Ce perpendicular to DF , cutting DF in e ; make De equal to De ; draw Eg parallel to AB , then g is the representation of the point g' . For the representation of g' is in the line $g'g$; but it is also in the line Eg : it will therefore be found in the intersection, g , of the lines Eg and $g'g$.

PROB. II. *Fig. 2.*

To find the orthography of a line on an inclined plane, the line being placed obliquely to the intersection.

Method 1. *Fig. 2.*

Let AB be the intersection (*fig. 2.*), and $k'b'$ the line. Find k and b the representations of the points k' and b' , by problem I.; join kb , and kb is the orthographic representation of the line required.

For since b is the representation of the point b' , and k the representation of the point k' , the extremities of the given line, the straight line bk , joining these two points, is the orthography of the line $b'k'$ by prop. I.

Method 2. *Figs. 3 and 4.*

The intersection AB , the line EC , and the angle CDF , are here supposed to be the same as in *fig. 1.*

Let $g'b'$ be the original line; produce $g'b'$, (*fig. 3.*) to meet EC in C , and AB at i . Draw Ck perpendicular to DF , cutting DF in k : make DE equal to DK , and join Ei ; then Ei is the orthography of the line Ci . Draw $g'g$ parallel to CE , cutting Ei at g ; $b'b$ parallel to $g'g$, cutting Ei at b ; then bg is the representation of $b'g'$.

PROJECTION.

Method 3. Fig. 4.

Let $g'b'$ be inclined the contrary way; find the orthography, g , of the point g' , as in problem I., and join gi : draw $b'b$ perpendicular to AB , cutting Ei at g ; then the intercepted part, gb , is the orthography of $g'b'$, as required.

PROB. III. Fig. 5.

To find the orthography of a line perpendicular to the primitive.

Find g , the orthography of g' , by problem I.; draw $g'C$ parallel to AB , cutting CE at C ; make CK equal to the height of the line; draw KO perpendicular to FD , cutting DF at O ; make DE equal to DO ; draw Eh parallel to AB , and gb perpendicular to AB ; then gb is the representation of the line required.

PROB. IV. Fig. 6.

To find the orthography of a line inclined to the primitive, given the seat of the line and its inclination to the primitive.

Let $g'b'$ be the seat of the line; draw $g'p'$ perpendicular to $g'b'$; and make the angle $g'b'p'$ equal to the inclination of the line with its seat: find g the orthography of g' , and b the orthography of b' , by problem I.: also find gp the orthography of the perpendicular $g'p'$, and join pb ; then pb is the representation of the inclined line as required.

PROB. V. Fig. 7.

A parallelogram being given in the primitive, to find the representation of the parallelogram.

Let $g'b'i'k'$ be the original parallelogram.

Find g the representation of g' , by problem I.; produce $g'b'$ to meet the intersection AB in l ; also produce $g'i'$ to meet the said intersection in o ; join gl and go ; produce $b'i'$ to meet AB in m , also produce $k'i'$ to meet it in n ; draw mb parallel to lg , cutting og at b ; also draw nk parallel to og , cutting lg in k , and mb at i , then $gbik$ is the orthographical representation of $g'b'i'k'$.

In the same manner, the orthography of any plane figure in the primitive may be found, by producing the sides of the original figure.

PROB. VI. Fig. 8.

To find the orthography of a circle, draw the diameters $i'l$ and $b'k'$ of the circle, the one parallel and the other perpendicular to AB , the intersecting line; find il and bk the orthography of these diameters; and il and bk will be the two axes of the ellipsis, which is the orthographic representation of the circle.

PROB. VII. Fig. 9.

To find the orthography of a rectangular prism.

Find the representation $gbik$ of the base by problem V.; then find gl the representation of a line perpendicular to the primitive, by problem III.; draw km, io, hu , parallel to gl ; through l draw lm parallel to gk , cutting km at m ; and ln parallel to gb , cutting hn at n : lastly, draw mo parallel to ln , and no parallel to lm ; and $ikmlnubi$ will be the orthography of the solid.

PROB. VIII. Fig. 10.

To find the orthography of a right pyramid.

Find $gbik$ the representation of the base $GHIK$, by problem V.; find o the representation of O , the seat of the apex, by problem I.: lastly, find gm the representation of

the axis, by problem III., and join mk, mi, mb ; then $kimbk$ is the representation of the pyramid.

If the primitive and the plane of projection are at a right angle, the base of the object will be projected into a straight line, and all lines that are perpendicular will have their representations also perpendicular, and in height equal to that of the original solid.

Fig. 11. is the representation of a rectangular prism, fig. 12. that of a pyramid, fig. 13. the representation of a cylinder, and fig. 14. the representation of a cone, where the primitive and the plane of projection are at a right angle to each other.

Upon this simple principle the method of drawing plans and elevations depends.

PROB. IX. Plate II. fig. 1.

To find the orthography of any polygonal figure, the intersecting line, II , being given.

Let the polygon be a regular hexagon, $ABCDEF$; produce the side AF to meet the intersecting line in i' ; also produce AB to meet II in i'' ; find the point a , the orthography of A , by problem I.; draw the diagonals AC, AD, AE , to meet II in i^3, i^4, i^5 ; join ai' and ai'' ; draw Bb perpendicular to II , cutting ai'' at b , then b will be the representation of B ; also draw Ff perpendicular to II , cutting ai' at f , and f is the representation of F ; therefore, ab and af are the representations of AB and AF ; join ai^3, ai^4, ai^5 ; draw bc parallel to ai^4 , cutting ai^5 at c , and fe also parallel to ai^4 , cutting ai^3 at e ; draw ed parallel to ab , cutting ai^4 at d , and cd parallel to af ; then $abcdeaf$ is the orthography of $ABCDEF$.

For, in the primitive figure, BC and FE are parallel to AD , and the opposite sides are parallel; therefore, in the representative figure, bc and fe are parallel to ad or ai^4 , and the remaining sides are parallel to their opposite sides.

PROB. X. Fig. 2.

Given the projection of an angle of a pentagon, and the projected length of one of the sides containing the angle, to find the orthography of the whole figure, the intersecting line being given.

Let II be the intersecting line, cab the projected angle, and ab the projected side; produce ab to meet II at i^2 , and ae to meet II at i' ; on $i'i^2$ describe the segment $i'Ai^2$ of a circle, to contain the angle of the two sides of a pentagon; that is, 108 degrees; draw aA perpendicular to II , cutting the arc $i'Ai^2$ at A ; join Ai', Ai^2 ; draw bB parallel to aA , cutting Ai^2 at B ; then upon AB describe a pentagon, which will be the primitive figure; find the representations of the remaining parts as in the preceding problem, and $abcdea$ will be the orthography required.

PROB. XI. Fig. 3.

Given the intersection and the inclination of a plane, and the projection of the intersection of that plane with another plane, and the inclination of the planes, to find the intersection of the second plane on the plane of projection.

Let AB be the intersection of the first plane on the plane of projection; and let AE be the projection of the intersection of the inclined planes. In AB take any point G , and draw GE perpendicular to AB , cutting AE at E ; produce AE to K ; make the angle EGF equal to the inclination of the primitive to the plane of projection; through E draw EH perpendicular to AE ; make EH equal to EF , and join HA ; draw EI perpendicular to AH , cutting AH at I ; make EK equal to EI , and join

PROJECTION.

join BK ; make the angle BKD equal to the angle which the two planes make with each other; join DA , and DA will be the intersection of the second plane with the plane of projection.

PROB. XII. *Fig. 4.*

Given the intersection and inclination of a plane to the plane of projection, and the intersection of that plane with another inclined plane, and the angle which the inclined planes make with each other, to find the intersection of the second inclined plane with the plane of projection.

Let AB be the intersection of the first inclined plane with the plane of projection; and let AE be the intersection of the two inclined planes; draw EF perpendicular to AB , cutting AB at K ; make the angle FKG equal to the angle of the planes; make KG equal to KE , and draw GF parallel to AB ; draw DC perpendicular to AF ; make FD equal to FG , and join DA ; draw FI perpendicular to DA , cutting DA at I ; produce AF to H , and make FH equal to FI ; join BH , and make the angle BHC equal to the angle of the planes; then join CA , and CA is the intersection which was to be found.

PROB. XIII. *Figs. 5, 6, 7, 8, 9.*

To find the inclination of two adjoining planes of the regular solids.

Draw the base ABC , $ABCD$, or $ABCDE$, of the pyramid which forms one of the solid angles: draw the triangle BGC , the development of one of the sides of the pyramid; draw GF perpendicular to BC ; bisect the angle ABC ; and let the bisecting line meet GF in F , their point of concurrence; draw FH perpendicular to BF ; from B , with the radius BG , describe an arc, cutting FH at H ; draw FI perpendicular to BH , cutting BH at I ; in FB make FL equal to FI ; let FH and BC meet in M ; also let FH and BA meet in K ; join ML and KL ; then KL will be the angle of the planes as required.

As the sides of the tetrahedron are equilateral triangles, and as three of the triangles form each solid angle, both the base of the pyramid ABC , and the developed side BGC , will be equilateral triangles in *fig. 5*.

In the construction for *fig. 6*, as the sides of the hexahedron are squares, and as each solid angle is formed by three of the right angles, the base of the pyramid will be an equilateral triangle, and the vertical angle of the developed side will be a right angle.

In the construction for the octahedron (*fig. 7.*), as each side is an equilateral triangle, and as four of the angles of the triangle form the sides of the solid angle, the base of the pyramid will be a square, and the developed side will be an equilateral triangle.

In the construction for the dodecahedron, as each solid angle is formed by three planes, and as each of the planes is a pentagon, the base of the pyramid will be an equilateral triangle, and the vertical angle of the developed side will be equal to the angle formed by the two sides of a pentagon.

In the construction for the icosaedron (*fig. 9.*), as each solid angle is composed of five sides, and as all the sides of the solid are equilateral triangles, the base of the pyramid is a pentagon, and the developed side an equilateral triangle.

In the construction for the dodecahedron, the angle of the pentagon was found by dividing a circle into five equal parts, and joining the chords of two adjoining parts, as AB , BC , *fig. 8.* $N^{\circ} 1.$) Then, to obtain the vertical angle, draw AC as a base; bisect the angle ABC , which will also bisect the straight line AC in E ; make EF equal to the half of BC , $N^{\circ} 2.$ and draw FG parallel to BC , cut-

ting BD at G ; make EG , $N^{\circ} 2.$ equal to EG , $N^{\circ} 1.$; and in $N^{\circ} 2$ join GB and GC , which will give the vertical angle BGC .

PROB. XIV. *Fig. 13.*

To project the dodecahedron.

Find $abcde$ the orthography of one of the planes, by problem IX.; find the angle which two contiguous planes of the solid make with each other, by problem XIII.; find the intersection of each of the planes adjoining to the plane whose projection is found, by problem XII., and thus three of the arrises of the solid will be projected; then to project the planes adjoining the extremities of the arrises or edges ab , ac , aq , suppose that contiguous with ac , produce ed to meet the intersecting line $I'I'$ in i^5 , and produce ef to meet $I^3 I^3$ in i^6 ; join i^5, i^6 ; then having the projection of the angle def , and the projected lengths ed or ef of one of the sides, and the intersecting line $i^5 i^6$ of the plane of that side, find the orthography $defgb$ of the whole figure, by problem X. In like manner, find the orthography of the figures $mno pq$, $clkib$, and the representation of the solid will be completed.

This new method of projection is not only more perspicuous, and requires fewer lines in the construction than that used by Brook Taylor, &c., but is also of universal application in every position, without the principle of dividing a line into extreme and mean ratio.

Not only architectural designs, but machinery drawing, depend upon orthographical representation; it enables the architect, engineer, or mechanic, to construct the object intended to be executed. As drawings of every kind are greatly facilitated by a knowledge of the formation of bodies, so in drawing machines it is necessary to know the methods of representing any system of lines upon cylindrical and conic surfaces, as this knowledge will determine whether the lines represented are parallel to each other, or tend to a point.

In drawing of machinery, as in other kinds of orthographical representations, the object is represented upon two planes, one parallel, and the other perpendicular to the horizon.

As the faces of the different parts of a machine are generally in vertical planes parallel to each other, the elevation is also made on a vertical plane parallel to the faces of the work, or to the greatest number of faces, in order to facilitate the execution, as this position not only gives the altitude of the parts, but is also convenient in ascertaining the magnitude of lines in every direction in these planes, and the angles which the lines form with each other; for if the faces of the work stand at oblique angles with the projecting plane, there can be only one direction, namely, that of measuring in a vertical line, in which the true dimensions can be ascertained; every other will be fore-shortened, and the angles formed by the lines of representation will also vary from the original angles of the object.

As the axes of wheels are sometimes obliquely situated, it becomes necessary to represent them in various positions. The several kinds of representations are sections through the principal parts; as through the axis of a wheel, plans or horizontal projections, and elevations.

Though a plan and elevation are sufficient to construct any machine with proper attention, yet from the greater facility of comprehending the nature of the design, and applying the measures to practice, two elevations are sometimes given, particularly in a complex machine. One of these elevations expresses the parts in the longest horizontal dimension of the work, and the other represents the parts comprehended

PROJECTION.

comprehended in the breadth or horizontal extension of the work.

In the representation of a machine, the wheelwork is the most difficult of any part, except when the whole of the surfaces of the wheel are planes, with two or more faces parallel to the projecting plane, and all the other surfaces perpendicular to the said plane, as in this case the boundaries of the parallel planes are represented by figures similar to the original faces, and the whole of the other surfaces are projected into straight lines or circles. This case is so very simple, as not to require any directions; but if the wheel or its faces have an oblique position to the projecting plane, several considerations are necessary to effect a true representation. A ground section through the axis of the wheel, placed at the required angle, with the intersection of the plane of elevation, and an elevation of the wheel on a plane parallel to the faces, will be required. It is likewise necessary to observe, that in this oblique projection all the parallel arrises of any original object are represented by parallel lines, and all equal distances in the original object are represented by other distances equal among themselves; also all straight lines whatever in the original plane, divided into parts, are represented by a series of parts respectively in the same proportion. The proportion of any line is to its original, as radius to the cosine of the inclination of the original line and the plane of projection. The representation of an original circle is an ellipsis; and as the plane of projection is vertical, the elevation of an ellipsis will be represented with its greater axis perpendicular to the intersecting line.

Having now premised a few of the leading principles, we shall proceed to the representations of wheelwork.

Example 1. Plate III.

Fig. 1, N^o 1, is the representation of the half of a water-wheel, on a plane perpendicular to the axis of the wheel. *F G H* is the arc of a circle representing the convex side of the ring; *I K L* is the arc of a circle representing the concave side; *I, H, L, M, N, O, P,* are the ends of the float-boards, fastened to the radiating pieces at the back, and the radiating pieces are fastened to the ring by mortise and tenon.

Fig. 1, N^o 2, is an elevation of the wheel upon a plane parallel to the axis; this shews the planes of the ring as straight lines; the float-boards are represented by *I, H, L, M, N, O, P,* which shew the radiating planes of the sides, and the outer edges which adjoin, and which range in a cylindrical surface.

Fig. 1, N^o 3, is an elevation of the wheel upon a plane inclined to the axis; but the axis, in all these three positions, is supposed to be in a plane perpendicular to the plane of projection. The intersection of this plane is represented by the straight line *E E E*.

In this it will be observed that all the circles are represented by ellipses, and that all the ellipses are proportional to each other, and the dimensions in the transverse axis are equal to those in the original object which they represent. The dimensions in the conjugate axis, *viz.* in the line *E E E*, are diminished in the ratio of radius to the cosine of inclination: *viz.* in all the planes which are perpendicular to the axis of the wheel. Therefore in *fig. 1, N^o 4,* draw any two straight lines, making any convenient angle with each other: make *E F* equal to the transverse axis of the greatest ellipsis, and *E G* equal to the conjugate in *fig. 1, N^o 3*; in *E F* make *E b* equal to the length of a float-board; bisect *E b* at *k*, and make *k i* and *k l* half the thickness of the ring; then *l i* will be the whole thickness: join *G F*, and draw *b m, i n, k o, l p*, parallel to *F G*, cutting *G E* at

m, n, o, p; then *E m* is the length of the float-board in the drawings, and *p n* is the thickness of the ring in the same, to be transferred to the line *E E E*; observing that the transverse axis is perpendicular to the line *E E E*.

In *fig. 1, N^o 3,* draw the two similar and equal ellipses which form the extremities of the outer edge of the float-boards, at the distance of *E m, N^o 4,* from each other about the same axis; these will contain the edges of the float-boards. One of these ellipses may be projected entirely round; as also the other in the same plane which forms the lower edges. The latter two ellipses will contain the ends of the float-boards which radiate to the centre of the wheel.

The edges of the float-boards ranging in the exterior cylindrical surface, might be found by drawing lines parallel to the axis from *I, H, L, M, N, O, P,* &c. *N^o 1,* to the corresponding letters *I, H, L, M, N, O, P,* &c. *N^o 3*; but this method, though simple, does not give sufficient accuracy at the extremities of the transverse axis.

In order to obtain greater certainty, let *A C B, N^o 5,* be a semi-ellipsis, equal to the half of the two ellipses which contain the edges of the float-boards, arranged in the exterior cylindrical surface of *N^o 3*; *A B* being the transverse axis, and *E C* the semi-conjugate: join *A C* and *C B*; bisect *A C* by a perpendicular *g 2*, cutting *A C* at *2*; make *2 g* equal to *2 A* or *2 C*. From the centre *g*, with the distance *g 2*, describe an arc *3 2 4*, intercepting *g C* and *g A* at *3* and *4*. Between the points of intersection divide the quadrant into as many equal parts as there are intended to be float-boards in a quarter of the wheel. Suppose it were required to place the first division at the point *I* of the ellipsis *A C B*; draw *I E*, cutting *A C* at *y*, and join *y g*, cutting the arc *3 2 4* at *r*; then the part of which the arc *3 2 4* is a multiple being retained, and beginning at *r* with that part as a radius, cut off the equal arcs *r k, k l, l m, m n, n o, o p, p q*; through the points *r, k, l, m, n, o, p, q*, draw *g y, g i, g s, g t, g u, g v, g w, g x*, cutting *A C* at *y, i, s, t, u, v, w, x*; through the points *y, i, s,* &c. draw the lines *E I, E H, E L,* &c. cutting the circumference of the semi-ellipsis at *I, H, L,* &c. and the parts *Q P, P O, O N,* will be obtained with the greatest certainty, as well as the representations of the angles *I E H, H E L, L E M,* &c. about the centre. Upon this principle the edges of the boards in the planes in which the ends of the float-boards are arranged, are found. The edges of the float-boards arranged in the cylindrical surfaces are all parallel to the axis; and the parts in the plane of position in which the axis of the wheel is posited are obtained from *N^o 4*.

The whole of this process is so very easy, that a little reflection will enable the reader to comprehend the principles clearly.

Example 2. In sphero-conic wheels.

Sphero-conic wheels are those of which the teeth project from the surface of a cone, and of which the working surfaces of the teeth tend to the apex of the said cone.

Hence the ends of the teeth of two wheels which work together will be found in a spheric surface, of which the apex of the cone is the centre of the sphere.

Fig. 2, N^o 1, is the section of a sphero-conic wheel *H I F E*, and *O P M L* the section of the opposite teeth; *G H E D*, and *N O L K*, the sections through the opposite parts of the ring.

Fig. 2, N^o 2, the orthography of the wheel upon a plane parallel to the circles which form the arrises of the ring, In *N^o 1* and *N^o 2,* the point *A* represents the vertex of the conic surfaces from which the teeth project; the line *R A,*

PROJECTION.

N^o 1, represents the axis in the same straight line with the point A, N^o 2.

Fig. 2, N^o 3, is half the section of the wheel; fig. 2, N^o 4, is the orthography on a plane parallel to the axis; in N^o 3 and N^o 4, A B and A B are the axes parallel to each other; the points A, A, are in the perpendicular A A to A B.

Fig. 2, N^o 5, is a whole section of the wheel. N^o 6 is the orthography projected upon a plane oblique to the axis.

In N^o 2, N^o 4, and N^o 6, the edges of the teeth in the conic surface of contact terminate in the vertex A; and the edges in the two concentric conic surfaces, each perpendicular to that ending in the point A, terminate in the points B and C. These are all projected in the point A, fig. 2, N^o 2.

The three projections N^o 2, N^o 4, and N^o 6, have their axes in the same straight line, in order to find the representation of the teeth by drawing parallel lines to cut the representations of the corresponding circles.

In N^o 2, the representations of the original circles are also circles; in N^o 4 the representations of the original circles are straight lines; and in N^o 6, the representations of the original circles are ellipses. The section at N^o 4 determines the conjugate axis of each ellipsis, the transverse being equal to the diameters of the original circles.

PROB. XV. Plate IV. fig. 1.

Given the feat and altitude of a line on a plane, and the intersection of the plane with another plane, at a given angle, to find the sun's feat on the other plane, as also its angle of altitude.

Let A C, fig. 1, N^o 1 and 2, be the feat of the line; A B the intersection of the other plane. In A C take any point C; draw C D perpendicular to A C; draw C E perpendicular to A B, cutting A B at B. In N^o 2, draw C H perpendicular to B C; make C H equal to C D; make the angle C B G equal to M L K, N^o 3, the inclination of the planes; draw H G perpendicular to B G; make B E equal to B G, and join A E; then A E is the feat of the sun's rays on the other plane.

Draw E F perpendicular to A E; make E F equal to G H, and join A F; then E A F will be the angle of altitude of the line on the other plane.

In N^o 1, the two planes are at right angles with each other; in this case the problem may be constructed without the quadrilateral B C H G; thus, having drawn C E perpendicular to A B, cutting A B at B; make B E equal to C D, and complete the triangle A E F, as in N^o 2; then A E is the feat of the line, and E A F is the angle of altitude, as before.

This may easily be conceived, by supposing that upon the triangle A B C, N^o 2, the triangle A C D, and the quadrilateral B C H G, are raised perpendicularly, then C H and C D will coincide, and the point H will coincide with the point D; turn the triangle A B E upon A B, and the side B E, being perpendicular to A B, will describe a plane upon B E perpendicular to the plane A B C; and because B C and B E are in the same straight line, B C will be in that plane; and because the plane B C H G is supposed to be raised perpendicular to the plane A B C upon B C, the plane supposed to be described by B E will be in the same plane with B C H G, when raised perpendicularly to the plane A B C; therefore, move the plane A B E until B E coincide with B G, supposed to be raised with the plane B C H G; the plane A C D, the plane B C H G, and the plane A B E, being thus supposed to be raised, turn the plane

A E F round A E, until E F fall upon G H; then the point F will fall upon H; and the straight line A F will also be coincident with A D; for the triangle A E F will be at a right angle with the triangle A E B, therefore E F will be at right angles to the plane A B E.

PROB. XVI. Fig. 2.

Given the feat and altitude of the sun's rays on a plane and the angle which the feat of a line parallel to the plane of projection makes with the feat of the sun's rays, to determine the inclination of the plane of shade obstructed by the original line with the plane of projection.

Let A C be the feat of the sun's rays given upon the plane of representation; make C A D equal to the altitude of the sun's rays; draw C D perpendicular to A C; make C A B equal to the angle which the feat of the sun's rays makes with the feat of the original line, which occasions a plane of shade; from C draw C B perpendicular to A B, and C E perpendicular to C B; make C E equal to C D, and join B E; then C B E is the inclination of the plane required. Produce C B to F; make B F equal to B E, and join A F; then let the triangles C A D, C B E, B A F, be turned up, and A F and A D will coincide; and the triangle C B E will measure the inclination of the plane A B F to C B A.

This problem is of the utmost use in finding the shadows of parallel lines to planes in various positions, as also in finding the shadows of cylinders where the axis is parallel to the plane of projection; also in determining the points and lines of light and shade both in cylinders and cylindric rings.

PROB. XVII. Fig. 3.

Given the feat and altitude of a line; and the feat and altitude of the sun's rays, to determine the shadow of the line on that plane.

Let H E be the feat of the line; make the angle E H I equal to the altitude of the line, viz. of A B C, N^o 1; E being any point in H E; draw E I perpendicular to H E; draw E F parallel to the feat of the sun's rays; and draw E G perpendicular to E F; make E G equal to E I: make the angle E G F equal to the complement of the sun's altitude, and join H F, which will be the shadow of the line required.

This problem will be found of the greatest use in finding the shadows of objects upon inclined planes.

PROB. XVIII. Fig. 4.

Given the inclination of a line to two planes at right angles to each other, to find the feat of the line on each of the planes, and the intersection of the planes.

Let A B C, N^o 2, be the inclination or angle which the line makes with one of the planes, and D E F, N^o 3, the angle which it makes with the other plane.

From the angular point B, N^o 2, take B C of any length, and from the angular point E, N^o 3, take E F equal to B C. In N^o 2, draw C A perpendicular to A B, and in N^o 3, draw F D perpendicular to E D. In N^o 1, draw any line G K; and through G, any point in G K, draw H I perpendicular to G K; make G H equal to the sine D F of one of the angles of N^o 3, and G I equal to the sine A C of the other, N^o 2; from H, with the radius A B, N^o 2, describe an arc, cutting G K at K, and join H K and K I; then G K will be the intersection of the planes, and K H and K I will be the feats of the line on each plane.

In the following problems respecting shadows, two planes of

of projection are always supposed to be given, *viz.* the seat of the rays of light on each of the planes, and the intersection of the planes, unless it be otherwise announced.

Practical Examples of Shadows.

Ex. 1.—To find the shadow of a rectangular prism attached to a wall, one of the sides of the prism coinciding with the surface of the wall.

Let $H I K L M N$ (*fig. 5.*) be the plan, the straight line $H I M N$ that of the wall, and $I K L M$ that of the prism; and let $A B C D$ be the elevation of the prism, and $V W$ the intersection of the plane of elevation, and that of the ichnography parallel to $H N$ and $K L$ in the plan.

To find the shadow of any point B on the elevation, corresponding to L on the plan.

Draw the ichnography $L N$ of a ray of light; also from B draw $B F$, the elevation of the ray, at any given angle with the intersection $V W$; join $B L$; draw $F N$ parallel to $B L$, and the point F will be the shadow of the point B on the elevation.

In the same manner find E and G the shadows of the points A and C ; join $E F$ and $F G$, and $A B C G F E A$ is the shadow required. Or thus;

Find the shadow F of the point B as before: draw the indefinite representations $A E$ and $C G$ of the extreme rays; then because the arrises or edges of the prism are parallel to the wall, or to the surface on which the shadows are thrown, the representations of the edges of the shadows will be parallel to the representation of the arrises on the plane of elevation; therefore draw $F E$ parallel to $A B$, and $F G$ parallel to $B C$, and $A E F G C$ will be the edge of the shadow, as before.

Ex. 2.—The shadow of *fig. 6.* is found in the same manner as in the last problem; the body which throws the shadow being a prism, having its planes parallel and perpendicular to the surface on which the shadow is thrown; $A N M L C$ is therefore the outline of the shadow thrown by a prism, represented by $F G H I$ on the plan, and by $A B C D$ on the elevation. The figure here introduced represents a cantiliver projecting from a wall.

Ex. 3.—To find the shadow of a cantiliver formed as in the last example, the plane of elevation being placed obliquely to the surface on which the shadow is thrown.

Let $E F I L K$ (*fig. 7.*) be the representation of the surface on which the shadow is projected, placed obliquely to the line $V W$, the intersection of the orthographic planes; let $F G H I$ be the plan of the cantiliver, and let $A B C D$ be the elevation of the same; the points A and D on the elevation corresponding with the point H on the plan; and the points B and C corresponding with the point F on the said plan. The end of the cantiliver is represented by $D e f A$, and the root by $C g b B$; the point I on the plan being represented by g and b on the elevation, and the point F on the plan by B and C on the elevation. To find the shadow of any corresponding lines $F G$ and $B b$; draw $G L$, the parallel of the seat of the sun's rays on the plan, meeting the shadowed surface $E K$ in L ; draw $L m$ perpendicular to $V W$; from b , the corresponding point of G , draw $b m$ the elevation of the ray; join $B m$; draw $g o$ parallel to $B m$; draw $m n$ parallel to $A B$, and $n o$ parallel to $A D$; then $b m n o g$ will be the shadow required; for the representation of the two edges of the shadows are parallel to the representation of the two edges of the end of the cantiliver.

Ex. 4.—Let $A B D E$ (*fig. 8.*) be the intersection of any vertical surface on which a shadow is to be thrown; and

let $B C D$ be the plan of a triangular prism projecting from that surface; also let $G H I F$ be the elevation of the same; find $p n$ the shadow of the perpendicular line as before, and join $n G$, and $p n G$ is the shadow of the prism as required.

Ex. 5.— $G H I K L$ (*fig. 9.*) is the elevation of several rectangular prisms joined to each other in the form of a pediment; $G H I K L$ is the outline, and $l m n$ the inner line forming the tympanum.

$A B E F$ is the plan of the surface on which the shadow is to be thrown parallel to the intersecting line $V W$; $B C D E$ is the plan of the pediment, of which the line $C D$, representing the face, is parallel to $A F$.

Draw $G O$, $H P$, $I G$, and $n r$, the elevation of the rays; draw the ray $D v$ on the plan, meeting $A F$ at v ; draw $v P G$ perpendicular to the intersecting line, cutting the rays $H P$ and $I G$ of elevation at P and G ; draw $P O$ parallel to $G H$; then $G O P G I$ will be the extremity of the shadow, the same as in example 1. To find the shadows from the inner edges $l m$ and $n m$; make $n r$ equal to $G O$, or $H P$, or $I G$, as each of the points G , H , I , r , is equally distant from the surface; draw $r s$ parallel to $n l$, and $r t$ parallel to $n m$; and $s r t$ is the shadow from the under arrises of the inclined parts.

Ex. 6.—*Fig. 10.* is the shadow of several rectangular prisms crossing each other at equal angles; one of the faces of each is parallel to the plane on which the shadow is thrown, and also parallel to the plane of elevation; the opposite or parallel faces are attached to the plane on which the shadow is thrown, and, therefore, the other faces are perpendicular to the said plane. The shadows, therefore, are to be found in the same manner as in the last example, *viz.* by drawing indefinite rays from all the angular points on the elevation, and finding the length of one of them; then the rest is completed by parallel lines from the termination.

Ex. 7.—To find the shadow of a rectangular ring.

Find the point l (*fig. 11.*) the shadow of the centre k ; through l draw $O P$ perpendicular to $k l$; then with the radius of the interior circle describe the arc $W X U$, meeting the said inner circle in W and U ; also from l , with the radius of the exterior circle, describe the semicircle $O Q P$; draw $O M$ and $P N$ parallel to $l k$, and these lines will touch the circle in M and N ; then $M O Q P N$ is the exterior shadow required.

PROB. XIX.

To find the representation of the shadow on a prismatic solid, by a plane cutting the prism perpendicular to its arrises; given the elevation of the prism on a plane parallel to its arrises, and parallel to one of its sides; given also the figure of the plane which throws the shadow, with the section of the surfaces of the prism, on that plane; likewise the sun's rays both on the plane and on the elevation.

Place the figure of the plane and the elevation so, that any two of their corresponding points, or parts, may be in a line perpendicular to the intersection. Draw the representation of the rays from all the angular points on the figure of the plane to meet the sectional line of the prism; draw the corresponding representations of the rays on the elevation, and from the points where the representations from the angles of the plane meet the section, draw lines parallel to the representations of the arrises of the prism to cut the corresponding rays on the elevation; then by joining the successive points, the shadow which was required is determined.

PROJECTION.

Examples. Plate V.

Ex. 1.—Let $A B C D$ (*fig. 1.*) be the plane, and $E F, F G$, the interfections of two other planes at right angles to the plane $A B C D$, and let $K L N O$ be the elevation of the prism; the lines $O N, R M$, and $K L$, representing the arrifes corresponding to the angular points G, F, E , on the section, that is to say, the point G is in the same straight line with $O N$, the point F with $R M$, and the point E with $K L$. Also let $K L M R$ represent the plane which is parallel to the plane of elevation, and let $K P$ represent the line of interfection.

Make $K U$ equal to the breadth of the shadow at the bottom; draw the ray $D I$ on the figure of the plane; draw $D T$ perpendicular to $K P$, cutting $K P$ at T , and T will represent the point which throws the shadow on the elevation; draw $T Q$, the ray of the sun, on the elevation; $I Q$ parallel to $D T$, and $U S$ parallel to $K P$, cutting $R M$ at S ; join $S Q$; then $K U S Q V O$ will be representation of the shadow required.

The examples in this plate, as well as the five succeeding ones in the following *Plate VI.*, shew the forms of shadows on the roofs of buildings, from chimney shafts and dormer windows of various forms.

Ex. 2.—*Fig. 3.* shews the shadows of a chimney shaft upon the roof of a house, the sides of the chimney shaft being parallel and perpendicular to the front.

Ex. 3.—*Fig. 4.* shews the shadow of a chimney shaft upon a roof which has two inclinations, the sides of the chimney shaft being situated as in example 2. The principles of performing these two examples are the same as in the preceding problem, and as illustrated in example 2. under the said problem.

PROB. XX.

Given the sun's feat and inclination on the plane of the horizon, and the interfection of two planes at right angles with each other, and perpendicular to the horizon, to find the representation of the sun's rays on each of the vertical planes.

Let $A D$ and $D B$ (*fig. 2.*) be the interfection of the two vertical planes, and let $A B$ be the feat of the sun's rays on the horizon; make the angle $A B C$ equal to the angle of the sun's altitude; draw $A C$ perpendicular to $A B$, and $A E$ perpendicular to $A D$; make $A E$ equal to $A C$, and join $E D$, which will represent the ray of the sun, on the plane of which the interfection is $A D$.

Produce $A D$ to G ; make $D G$ equal to $A C$, and join $G B$; and $G B$ is the representation of the sun's ray, on the plane of which the interfection is $D B$.
