His academical knowledge and skill were here, perhaps more than in any other of his productions, called into action, and their strength put to the test. Nothing stood higher in these respects than the reputation of the great original, which is even, by Benvenuto Cellini and other excellent judges, esteemed the masterpiece of Michael Angelo: and this high reputation Schiavonetti had not merely to sustain, but in some degree to reiterate; for the Cartoon itself being destroyed (in a fit of envy, as it is said, by Bandinelli, who was entrusted with the key of the apartment where it was placed,) and the details of its superlative merits being known to us moderns, only through the media of Sangallo's copies, and the separate groups which have been engraved by Marc Antonio, Agostino of Venice, and other contemporary artists, whose works we have already enumerated under an early part of this article of the Italian school, our engraver felt it to be his duty to collate these versions and fragments of the Cartoon of Pifa with conscientious scrupulosity, and, by balancing probabilities, to restore what may be called the true classical reading. An awful task! yet which he has performed with the ability and success of a consummate scholar in art.

The reader should be apprised, that the Holkham copy, which is believed to be the work of Bastiano de Sangallo (an artist who was never held in any very high degree of estimation) was painted in his old age, from a small drawing which he had himself copied from the original Cartoon in the year 1542, during his pupilage. It was made at the request of Vasari, and, through means of Monsignor Jovio, came into the possession of Francis I. of France, who highly esteemed it; from his collection it however disappeared, and no mention is made of it by the French writers for near two centuries. It was probably discovered at Paris, purchased, and brought to England by the father of the late marquis Townshend.

Schiavonetti had not even this copy to work from, but a

copy of this copy, and has therefore, with commendable regard for his own reputation, and that of Michael Angelo, and with due respect for the public, who always ought to be rightly informed upon such occasions, followed the recommendation which was publicly laid before him in the Review of Art, vol. i. and scratched with his dry needle under the few proofs which were received as presents by his friends, "Engraved by L. Schiavonetti, after a copy painted by H. Howard, R. A. from da Sangallo's copy of his own study, after Michael Angelo's cartoon."

The same respect for truth and the public, which dictated this recommendation and this conduct, requires us to mention that Schiavonetti has corrected a general heaviness of drawing which prevails in Mr. Howard's picture, which heaviness that accomplished artist no doubt found in the Holkham copy, but which is perfectly inconsistent both with the active sentiment of the subject, and the earlier graces of Michael Angelo's composition. A foot of one of the principal figures, which is there turned inward, he has turned outward; and, beside some other minor details, has added requisite strength to the limbs of the figure who is climbing the rocky bank of the Arno. Whether our artist had seen the small fragment of Michael Angelo's original, which is said to be still in existence at Mantua, or of what part or parts that fragment may consist, the present writer is not able to say; but Schiavonetti was in possession of various old prints of its principal groups, of which we have already spoken in our accounts of Marc Antonio and his disciples, and which were executed for the most part during the lifetime of Michael Angelo, and from comparing them, and reflecting on the whole, has ventured on the above emendations of the extant copies.

As this cartoon of Pifa is esteemed to have been one of the most extraordinary works that has been produced since the revival of art, the reader will not be displeased to find here the following eloquent account of it, as delivered from the professor's chair of the Royal Academy of London, by M. Fuseli. It does not in all its details exactly tally with the print, but its general sentiment of impatient animation and patriotic ardour is precisely the same. "It represents an imaginary moment relative to the war carried on by the Florentines against Pisa; and exhibits a numerous group of warriors, roused from their bathing in the Arno, by the sudden signal of a war-horn, and rushing to arms. In imagining this transient moment from a state of relaxation to a state of energy, the ideas of motion, to use the bold figure of Dante, seem to have showered into the artist's mind. From the chief, nearly placed in the centre, who precedes, and whose war-voice accompanies the trumpet, every age of human agility, every attitude, every feature of alarm, haste, hurry, exertion, eagerness, burst into so many rays, like the sparks flying from a red-hot iron. Many have reached, some boldly step, some have leaped, on the rocky shore; here two arms emerging from the water grapple with the rock; there two hands cry for help, and their companions bend over or rush on to assist them; often imitated, but inimitable, is the ardent feature of the grim veteran, whose every sinew labours to force over the dripping limbs his clothes, whilst gnawing, he pushes his foot through the rending garment. He is contrasted by the slender elegance of a half averted youth, who sedulously eager buckles the armour to his thigh and methodizes hate; another swings the high-raised hauberk on his shoulder, whilst one who seems a leader, mindless of dress, ready for combat, and with brandished spear, overturns a trier, who is crouched to grasp a weapon; one naked, himself buckles

on the mail of his companion, and he, turned toward the enemy, seems to stamp impatiently the ground. Experience and rage, old vigour, young velocity, expanded or contracted, vie in exertions of energy; yet in this scene of tumult one motive animates the whole, eagerness to engage with subordination to command; this preserves the dignity of action, and from a straggling rabble, changes the figures to men whose legitimate contest interests our wishes."

Three plates in lines, which he advanced no further than the aquafortis state, will close our list of the works of this admired and regretted artist. The first, in the order of production, is a masterly etching of large folio size, after Trumbull, of "The Death of General Montgomery," which was finished by Mr. Clemens (a German artist). It was performed several years ago, and displayed powers which ought to have made an earlier impression than they did on the eye and taste of the public. The next is "The Procession of Chaucer's Pilgrims to Canterbury," a large folio plate of the frieze proportions, after a very capital work from the pencil of the academican Stothard.

Chastening every ambitious display of his own executive powers; and repressing every idea and every feeling that was not homogeneous with the nature, and proportioned to the demands of the occasion, Schiavonetti has here, like the hero of the *Odyssey*, expressed, "no more than just the things he ought." The spirit which animated him in the performance of this work, like that which has animated the painter, seems to have glided from the elysium of the great artists of antiquity; there is the same truth of Nature, and the same unobtrusively classic purity of style, pervading the whole;

"Enlight'ning ev'ry line in such a guise,
That they seem rather fallen from the skies
Than of a Mortal hand."

Since the lamented death of Schiavonetti, the proprietor of this plate has with some inconsiderately stated to the public, that, "in the present state of this etching, considered with reference to the peculiar circumstances of the case, perhaps no better mode could be devised of paying an impressive and lasting tribute to his memory, and one in which all his admirers could participate, than by giving it to the public as he left it, a consecrated monument of his genius;" he has before held forth a powerful additional motive to this end, a motive as powerful as taste and friendship themselves could have connected with such a purpose, by informing his readers, that "the movement of the figures and the expression in their heads and characters are as finely maintained in outline, as they could possibly have been in the most finished print," which is pretty strong language, yet he has since announced Mr. Bromley and himself as the finishers of the plate.

Now, though the present writer does not think finishing, in the engraver's art, is thus utterly thrown away, or contributes nothing in addition to an exquisite outline, to the motions, characters, and expressions of a protracted group of figures, such as the Canterbury pilgrims; or though, regarding the above as an impassioned, or hyperboic sentence from the pen of Mr. Cronck; he can make due allowance for the occasion which gave it birth, he yet thinks the impressive and lasting tribute to the memory of Schiavonetti should have been paid; the monument which his genius itself had raised should have been consecrated; and he therefore regrets those views of profit, or those hopes of reputation, or those ulterior mistakes which have prevented this consummation. Achilles and Ulysses could not both be the heroes of the same poem; and it would have been wise for

Mr. Bromley, and well for the public, for him to have begun his Canterbury pilgrims on a fresh plate of copper.

The next, and the last of our artist's performances, was an etching, of folio dimensions, of the portrait of Sir Joseph Banks, as president of the Royal Society, from a picture by T. Phillips, R.A. replete with that truth of character and mild force of execution, which usually distinguish the works of this painter. To detail the merits of this work, would be but to call forth afresh our former praises; it is as masterly a display of his talent in the portrait branch of his art, as the etching of the Canterbury pilgrims is of his merit in the historical. This plate, as we are given to understand, is now finishing by Nicholas Schiavonetti, who may naturally be presumed to be at least as well acquainted with his brother's style and professional intentions, as any engraver whatever.

Of Francesco Bartolozzi of Florence, the pupil of Wagner, but more the pupil of Italy and nature, and the principal instructor of Schiavonetti and Volpato, we shall say but little. He is still at upwards of fourscore years of age, considered as speaking for himself by his productions, though doomed to linger out the evening of his glorious day, in Portugal, far from the haunts of studious retirement, and amidst the din of arms. Till nature has closed her account with him, what bold auditor shall presume to estimate his worth?

Of him and his disciple Schiavonetti, we have already spoken as two of the brightest stars in our graphic hemisphere. The latter has fallen from his zenith: that Bartolozzi may long remain above the horizon, is our fervent wish.

But it has been emphatically said, that "stars teach as well as shine." On the continent of Europe, they teach and shine in vain, while war desolates the plains of the western peninsula; if *Ate* flings wide and wild her torch, in vain exit the charms and the lessons of art: in vain are the heavens serene, if an earthquake rages below.

ITALIC, or ITALIAN Hours, are the twenty-four hours of the natural day accounted from the sun setting of one day to the same again the next day.

This way of reckoning was used by the Jews of old, and is used by the Italians to this day.

ITALIC Character, in *Printing*. See **LETTER**.

ITALIC Sect, is the name of a party of ancient philosophers founded by Pythagoras; so called, because that philosopher taught in Italy, spreading his doctrine among the people of Tarentum, Metapontus, Heraclea, Naples, &c. See **PYTHAGORIC Sect**.

ITALY, in Geography and History. In ancient geography, this country, the most celebrated in Europe, was denominated Italia. It is bounded on the N. and N.W. by the Alps; on the E. by the mare Superum, that is, the Adriatic gulf, or gulf of Venice; on the W. by the mare Inferum, or Tuscan sea; and on the S. by the Ionian sea adjacent to Greece. In form, it has been compared to the shape of a boot, lying in an oblique direction from N.W. to S.E. From the Alps to the fretum Siculum, or Strait of Messina, it extends from 47 to 37° 45' N. lat. or about nine degrees. In breadth it is very unequal, in some places not exceeding 2°, and in others upwards of 8 long; hence its length from N. to S. is about 600 miles, and its breadth varies from 1 to 300 miles or more. It has borne at different periods very different names. One of its most ancient names was Italia, either from Italus, a king of that country, not known in history, or from a Greek word signifying an ox, an animal very common in that part of

the country. It was denominated "Hesperia," on account of its western situation in respect to Greece; "Saturnia," from Saturn; "Latium," from the Latini; "Ausonia," from the Ausones; "Ombria," from a tribe settled between Perulum and Parantum. These names were originally appropriated to particular provinces, but in process of time they were applied to the whole country, which has been denominated the garden of Europe. The ancient inhabitants called themselves aborigines, offspring of the soil; and the country was, at a very early period, peopled by colonies from Greece. The Pelasgi and Arcadians made settlements there, and the whole country was divided into as many different governments as there were towns, till the rapid increase of the Roman power changed the face of Italy, and united all the states in support of one common cause. (See *ROME*.) Under the dominion of the Gauls and Greeks, Italy, in reference to its inhabitants, was divided into "Gallia Cisalpina," "Italia Propria," and "Grecia Magna;" the first comprehended the provinces lying between the Alps, and the Rubicon; the second included the intermediate provinces; and the third those adjacent to Sicily and Greece, and inhabited chiefly by Grecian colonies. It was divided into eleven small provinces or regions by Augustus; but according to the common and most approved division, ancient Italy consisted of two parts, *viz.* "Gallia Cisalpina," and "Italia Propria;" the former, likewise called "Gallia Italica," and sometimes "Gallia," was bounded on the N. by Rætia, and on the S. by the sinus Ligusticus, or gulf of Genoa. This province, while under the Roman dominion, contained several tribes, which will be noticed in their places. Italia Propria was on all sides surrounded by the sea, except on the N. where it was bounded by an imaginary line, extending from the mouth of the Maera to that of the Rubicon. It contained, among others, the following provinces, *viz.* Etruria, Sabina, Latium, Campania, Samnium, Apulia, Messapia, Lucania, and Brutium. During the middle ages Italy underwent many revolutions, and frequently changed its masters. In the reign of Honorius the Visigoths, under the command of Alaric, penetrated into that fertile country, which they plundered from the foot of the Alps to the strait of Sicily. The reign of the Goths in Italy ended in Teia, Totila's son, who was defeated and slain by Narfes in the year 553. Italy now became a province of the Greek empire. The Lombards were a fierce nation, first discovered between the Elbe and the Oder, from thence they descended to the south and the Danube. They afterwards passed the Danube, wandered along the coast of the Adriatic, and in the year 566, aided by the Avari, a Scythian horde, they undertook the conquest of Italy. Many provinces were added to their dominions, as a large portion of the Venetian territory, Tyrol, Milanese, Piedmont, the coast of Genoa, Mantua, Parma, and Modena, the grand duchy of Tuscany, together with a considerable portion of the ecclesiastical state.

Italy, in the modern acceptation of the word, includes both main land and islands. The former, by geographers, is commonly divided into upper, middle, and lower. Upper Italy, called Lombardy, contains seven duchies, ten small principalities, and two republics. Middle Italy consists of the grand duchy of Tuscany, the ecclesiastical state, and two republics. Lower Italy includes a part of ancient Italia Propria, and the kingdom of Naples. The climate of this country differs with its different divisions. In mountainous districts the air is keen and piercing; the provinces, north and east of the Apennines, are mild and temperate; those on the S. of that chain are warm, sultry,

and liable to torrents of rain. An account of the mountains, rivers, and lakes, belonging to Italy, or dividing it from other countries, will be found in the alphabetical order of this work. (See *ALPS*, *APENNINES*, *PO*, &c.) There is a very considerable diversity in the soil as well as the climate. The northern division exhibits the grand fecundity of the Alps, contrasted with delightful vallies and plains, watered by many streams which run towards the south to augment the Po. In the central parts are marshes, stagnant waters, and fruitful districts. A great proportion of the kingdom of Naples (which see) is hilly, but many tracts, though subject to inconveniences, are uncommonly fertile. Italy has been denominated the parent of plenty, and each province has its peculiar excellence and commodity; and, taken together, they all yield the comforts and luxuries of life in great abundance. In the time of Pliny, Italy was said to contain 14,000,000 of inhabitants. This was probably an exaggerated account. The present population, though not only to be got at, cannot, with the islands of Sicily and Sardinia, be estimated at more than 13,000,000. Naples and Sicily are supposed to contain 6,000,000; the central part about 3,000,000; and the northern about 4,000,000. The manners and customs of the natives are various and discordant. The real Italians are in general well proportioned, affable, polite, profuse in their compliments, and nice in all punctos of civility; observing, it is said, a due medium between the levity of the French and the gravity of the Spaniards. They are impetuous in their temper, keen in their resentments, revengeful in their manners, and superstitious in their religion. "Attached," says Mr. Playfair, "to ancient customs, they apprehend no occasion for improvement. Conceiting themselves to be the conquerors of the world, they look on the rest of mankind with contempt. Out of a vain ostentation, they lavish their money on paintings, gardens, and statues, on costly equipages, and a numerous retinue of servants; but this profusion does not seem to interfere with the economy of their tables, which are neither splendid nor expensive. Their dinner, consisting principally of roots and vegetables, is a slight meal compared with their supper; but at all times they eat and drink sparingly. Their houses, furniture, and entertainments, are a composition of magnificence and meanings. While they delight in outward show, they bestow little attention on the comforts of life. Masquerading, gaming, conversations, music, and religious exhibitions, are their chief amusements." The dress of the Italians is not materially different from that of the inhabitants of the neighbouring countries; and it has been observed, with much justice, that Italy, instead of being visited by travellers for the sake of its inhabitants, is visited only for the sake of the places which they inhabit. There are some remains of forests among the Apennines; but the early civilization of Italy has been disadvantageous to the growth of timber. The botanical products of Italy are supposed to be equal to those of any European country, on account of the great variety of its soil, the irregularity of its surface, and the genial benignity of its climate. In the southern parts, cotton, rice, and the sugar-cane, indicate the fertility of the soil, and the warmth of the climate; and the fields and the pastures bear a striking resemblance, in their native products, to those found in the southern provinces of Spain. The Italian horse is of little reputation, and the cow, from which the noted Parmesan cheese is made, are described as of a deep red colour, long, lank, and ill made. In Tuscany the art of fattening cattle is well understood. The buffalo is, in Europe, almost peculiar to Italy. This animal in some respects resembles the hog, being fond of

wallowing in the mud; his flesh is coarse, and his hide, though light, is so firm as to have supplied armour to the military. The marmot and the ibex are reckoned among the animals of the Apennines, and the crested porcupine is esteemed peculiar to the south of Italy. The Alpine district abounds in rich mines which are neglected: here are mines of silver, lead, iron, copper, and gold; in many parts there is excellent coal, and in detached hills throughout the country, marble, lime-stone, metallic ores and minerals are found. There are but few manufactures in Italy in proportion to the fertility of the soil. Those of silk and wool are carried on to a considerable extent: but great quantities of the raw materials are exported. Besides these, wine, oil, and fruits are exported in abundance. The chief imports are hard ware, metals, cotton, woollen and silk stuffs, leather, timber, pitch, &c. The skill of the natives in statuary, painting, and architecture, has been long the subject of admiration. The established religion is the Roman Catholic, consisting chiefly in external observances, rites, and ceremonies. The pope is still looked up to as the head of the church; but his power and influence are now almost wholly destroyed. Before the late revolution, the form of government in the states of Italy was monarchical, and in the republics it was aristocratical. The sovereigns governed their dominions with unlimited authority: in the republics of Venice, Genoa, and Lucca, the nobility shared in the management of the state. In the present unsettled situation of the country it is not possible to give any tolerable estimate of the revenues: they were reckoned between four and five millions sterling towards the close of the last century. Anciently, Italy gave birth to men illustrious in almost all the departments of science then cultivated: the generals, philosophers, historians, orators, and poets of Rome can never be forgotten. In the sixth century, when numerous tribes of barbarians overran the Roman empire, scarcely a vestige of literature and the fine arts remained. From this period until the 16th century, the human mind sunk into profound ignorance, but since the revival of learning very many eminent persons have appeared in Italy that have adorned the sciences and the various branches of literature. The elegant arts of sculpture, painting, architecture, and music have likewise been cultivated with success.

We have already alluded to the early history of Italy, which, in a few lines, we brought down to the invasion, and, indeed, conquest of that country by the Lombards. The great object of ambition to this new race was the entire conquest of all Italy, and this, as in almost all other similar cases, proved the ruin of their empire by Charles the Great, or, as he is generally denominated, the illustrious Charlemagne, who was crowned sovereign of that country in the year 800. As, however, the Lombards had never possessed the whole of Italy, so the whole of it never came into the possession of Charlemagne, nor, indeed, since the time of the Goths, has the whole extent of this country been under the dominion of any single state. The undivided territory of Charlemagne in Italy was restricted to Piedmont, the Milanese, and the Mantuan territories, those of Genoa, Parma, Modena, Tuscany, Bologna, the dukedoms of Friuli, Spoleto, and Benevento, the last of which contained the greater part of the present kingdom of Naples. The feudal government which the Lombards had introduced into Italy produced several revolts, as the different dukes inclined, either to change masters, or to set up for themselves. Several of these rebellions happened during the life of Charlemagne, which, by the vigour of his mind and the decisiveness of his measures, he found means to crush; but after his

death, the sovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That monarch had divided his extensive dominions among his children; but they all died during his own reign, excepting Lewis, whom he associated with himself in the empire, and who succeeded to all his dominions after his death. Hence are dated those troubles with which Italy was so long overwhelmed, and of which, as they proceeded from the ambition of those called kings of Italy and their nobles, of the kings of France, and the emperors of Germany, it would be difficult to give our reader any satisfactory account, although we were to extend the boundaries of the present article much beyond the limits that can be allowed it. We shall attempt only an outline. At the time when Lewis, the son of Charlemagne, was declared emperor of the West, Italy was held by Bernard, the son of Pepin, brother of Louis. Though Bernard bore the title of king, he was only accounted a vassal of the emperor. He soon rebelled against his uncle, but being abandoned by his troops, and taken prisoner, he was deprived of his sight, and died in a few days; and in 823 the eldest son of the emperor was sent into Italy, of which country he was crowned king at Rome, and afterwards emperor of the West during his father's life-time. He also rebelled against his father, whom he took more than once prisoner, though in the end he was obliged to submit, and ask pardon for his offences. In the mean time the Saracens, taking advantage of the civil commotions, landed on the coasts of Italy, and committed such ravages, that even the bishops were obliged to arm themselves in defence of the country. Lothaire took but little care to put an end to these ravages, or to restore tranquillity, he even embroiled himself so far tid he had lost almost all his dominions: at length he died, leaving his son Lewis the title of emperor, as well as that of king of Italy. Lewis applied himself to the restoration of tranquillity in his dominions, and the driving out of the Saracens from those places of which they had possessed themselves in Italy. This arduous task he fully accomplished, and obliged the infidels to retire into Africa, but in 875 he died, without naming a successor. After this event, the Italian nobles, headed by the duke of Tuscany, represented to the pope, that as Lewis had left no successor, the regal dignity, which had been so long usurped by foreigners, ought now to return to the Italians. The pope, however, crowned Charles the Bald of France emperor and king of Italy, on the condition of his acknowledging the independency of Rome, and that he himself only held the empire by the good-will and gift of the pope. This produced a serious conspiracy among the discontented nobles, of which the Saracens took advantage, renewed their incursions, and even threatened the ecclesiastical territories with the utmost danger. The pope earnestly solicited the emperor's assistance, but that prince died before he could afford him any effectual aid, and being distressed by the Saracens on the one hand, and the Lombard nobles on the other, the wretched pontiff was forced to fly into France. Italy now fell into the utmost confusion and anarchy; during which, many of the nobles and states of Lombardy assumed an independency which they have ever since retained. The pope, in 877, was re-conducted to Italy by Boson, son-in-law to Louis II. of France, whom the pontiff would willingly have raised to the dignity of king of the country, but he found his interest insufficient for the purpose, and matters remained in their former situation. The nobles became reconciled to the pope, but they renounced the authority of any superior, and every one claimed to be an independent sovereign of his own territories: they even applied to the pope, and requested him to join in assert-

ing the independence of Italy, and obtained from his holiness the two following decrees, &c. That the popes, after their election, might be consecrated, without waiting for the presence of the king, or his ambassadors; and that if Charles the Great died without sons, the kingdom of Italy, with the title of emperor, should be conferred on some Italian noble. The emperor felt himself neglected and insulted, and complained bitterly of being deprived of his right, and the dissensions between the Italian nobles became more fatal than ever. Two of these noblemen, Berengarius, duke of Friuli, and Guido, and Vido, duke of Spoleto, entered into an agreement, that on the death of the emperor, the former should seize the kingdom of Italy; and the latter on the kingdom of France. Berengarius succeeded without opposition, but Guido was disappointed: upon this he returned to Italy, and turned his arms against Berengarius, whom he drove into Germany, and obtained for himself the kingdom of Italy. He now employed himself in reforming the abuses of the state, and confirming the grants formerly allowed the pope, out of gratitude for his having sanctified his usurpation, and declared him lawful king of Italy. After the death of Guido, Berengarius became king of Italy, without a rival, and held his kingdom during the space of twenty years. In 1024 he was treacherously assassinated at Verona. In 947, after the kingdom had undergone many changes, and suffered much from the incursions and cruelties of the Hungarians, Berengarius, grandson of the first king of that name, became possessed of the supreme power. He did not assume the title of king till after the death of Lotharius, which happened in 950; and in the mean time Italy was invaded by the united forces of Bavaria and Hungary. So formidable was their power, that Berengarius was obliged to purchase their departure with a large sum of money, which he raised by a very heavy personal tax laid upon every individual, without distinction of age or sex. In these efforts, Berengarius was more oppressive to his people than even the enemy had been: he, however, raised an immense sum of money, ten bushels of which he gave to the Hungarians, but kept the much larger portion for himself. After this he was attacked by Otho, king of Germany, who allowed him to retain his kingdom upon the hard condition of doing homage for it to the king of Germany. Berengarius did not readily submit to his fate; he rebelled against Otho, who, determined to support his authority by force of arms, brought an army into Italy, and was himself crowned king by the archbishop of Milan, and in the following year he received the crown from the hands of the pope. On this occasion, the holy pontiff and Otho went together to the altar of St. Peter, and bound themselves by a solemn oath; the pope to be always faithful to the emperor, and Otho to consult the welfare of the church, and to restore to it all its patrimony granted by former emperors. Otho bestowed rich presents on the church, but he likewise ordained that the election of the popes should be according to the canons; that the elected pope should not be consecrated till he had publicly promised, in the presence of the emperor's commissaries, to observe every thing formerly specified with regard to the rights of the emperors; that these commissaries should constantly reside at Rome, and make a report every year as to the manner in which justice was administered by the judges; and in case of any complaints, the commissaries should lay them before the pope; but if he neglected to attend to them, then the imperial commissaries might take what steps they pleased. Thus, however much Otho might allow the pope's supremacy in spirituals, he plainly assumed the sovereignty in temporals to himself, and thus Italy was, for upwards of 300 years, accounted a part of

the German empire. The long period we talk of course is most entirely past over in this sketch. We find, in 1215, Frederic II. acknowledged emperor, and crowned at Aix-la-Chapelle. Shortly after this he was urged by the pope to undertake an expedition into the Holy Land against the infidels, but he refused, under various pretences, obedience to the mandate of his holiness, which caused the most decided hostility between these great personages. Frederic renounced all correspondence with the pope, and set his power at defiance. The pope, convinced of his error, or at least of his not being able to support his power against that of the emperor, thought proper to soothe him by submissive apologies and gentle exhortations. They were accordingly reconciled. The pope shortly after this died; and Frederic, during the popedom of Gregory IX., undertook an expedition to the Holy Land, leaving the affairs of Italy to the management of Rudolph duke of Spoleto. The pope, hearing of his determination, prohibited his departure before he should be absolved from the censures of the church; but Frederic went in contempt of the church, and his success was very complete. The sultan ceded to him Jerusalem, and its territory as far as Joppa. Frederic had before acquired, by marriage, the title of "king of Jerusalem;" and now, by his moderation and great talents, he acquired the territory, to which were added Bethlehem, Nazareth, and all the country between Jerusalem and Ptolemais, Tyre, Sidon, and the neighbouring territories: in return for which, the emperor granted the Saracens a truce for ten years; and in 1230 he returned to Italy. The reign of this prince, after his return from the East, was one continued quarrel with the popes. He was excommunicated by Gregory IX.; and in his turn he proclaimed every where that Gregory was the "great dragon," the predicted "man of sin," the "antichrist," &c. In 1250, Frederic, after various troubles, died. From this time, the affairs of Germany fell into the utmost confusion; and Italy continued long in the same distracted state in which he left it. Conrad, the son of Frederic, assumed the imperial dignity; but after his death, there were several candidates for the high honour. No emperor, however, was properly acknowledged till 1273, when Rodolph, count of Hapsburg, was unanimously raised to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were accustomed to pay to the empire; and about the same time, several German cities erected a municipal form of government, which continued till within these few years. Lubec, Cologne, Brunswick, and Dantzick, united for their mutual defence, against the encroachments of the great lords, by a well-known association, called the Hanseatic league; and these towns were afterwards joined by eighty others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. From the time of Frederic II. we may date the ruin of the German power in Italy. The Flemings, the Pisans, the Genoese, the Lucans, &c. became independent. At the commencement of the fourteenth century, Henry VII. undertook to restore the imperial power in Italy. For this purpose a diet was held at Fracort, where empires being granted for the emperor's journey, well known in history by the name of the "Roman expedition," he set out for Italy, which was at this period divided by the factions of the Guelphs and Gibellines, who were destroying one another without humanity or remorse. Pope Clement V. had been obliged to leave Rome, which was in a state of anarchy; and owing to the divisions in that city, the holy pontiff long

took up their residence in France, so that Rome seemed equally lost to the popes and the emperors. Sicily was in possession of the house of Arragon, in consequence of the massacre called the "Sicilian vespers," which delivered that island from the tyranny of the French. Carobert, king of Hungary, disputed the kingdom of Naples with his uncle Robert. The old league of the Italian cities no longer subsisted. It had been formed with no other view than to oppose the emperors; and since they had neglected Italy, the cities were wholly employed in aggrandizing themselves at the expense of each other. In the midst of these troubles, Henry VII. appeared in Italy in 1311, and caused himself to be crowned king of Lombardy at Milan. But the Guelphs had concealed the iron crown of the Lombard kings, as if they regarded the right of reigning as attached to a circlet of metal. Henry, however, was not to be put off under such a pretence; he ordered a new crown to be made, with which the royal ceremony was performed. Henry was unable to restore the imperial power in Italy, and his reign was terminated in a few months. From this time, the authority of the emperor in that country consisted, in a great measure, in the conveniency which the Gibellines found in opposing their enemies under the sanction of his name. The power of the pope was of the same nature, and he was probably less regarded in Italy than in any other country in Christendom. There was likewise a party who called themselves Guelphs; but they affected this distinction only to keep themselves independent of the imperialists. The most desperate wars were carried on by the different cities against each other; but it would be contrary to our plan to attempt to give a detail of them; and this is the less necessary, as nothing material was effected by their valour. By degrees this martial spirit subsided; and in the year 1492, the Italians were so little capable of resisting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in six weeks; and he might easily have subdued the whole country, if it had not been for his own imprudence. Another attempt on Italy was made by Louis XII.; a third by Francis I.; and during the reigns of Louis XIII. and XIV., an obdurate war was carried on between the French and the Spaniards, in which the Italian states bore a considerable share. The war concluded in 1660, with very little advantage to the French, who had never been very successful in their Italian wars. A similar want of success attended them in the war which commenced four score years afterwards; but the farther particulars relating to these other contests belong properly to the history of the different states into which that country was divided.

At present, the whole of Italy is subject to the control of the French emperor, who led his victorious troops over the Alps, and made himself master of the Austrian dominions in Italy. The battle of Lodi decided the fate of Lombardy. Verona, Tortona, Bologna, and Urbino, quickly yielded to his arms. He even menaced imperial Rome. The pope, incapable of resisting his power, begged for peace, which was granted him on the humiliating condition, that his holiness should surrender to the conquerors a great many pictures, and statues, and a multitude of curious MSS. from the Vatican. With these the general was for the present content; he retired from Rome, perhaps, however, desirous of some new conquest to enable him to enrich his country with further spoil. A pretence was soon given him. He had scarcely reached the boundaries of France, when he learned that the terms of the treaty had been wantonly broken by the subjects of his holiness. In the following year, 1797, he entered Italy again, and in one battle, well contested, decided the fate of the ecclesiastical

state. The banners of France now waved triumphant over the patrimony of the church. The pope was obliged to submit to whatever terms the conqueror should dictate. He agreed to the cession of Avignon, part of Venice, the cities and territories of Bologna, Ferrara, and Romagna; and to prevent the future power of the Roman pontiffs, the newly ceded territories, together with Reggio and Modena, were formed into one republic called the Cisalpine, and afterwards the Italian republic; while the Milanese, and other districts of Lombardy, were formed into another called the Ligurian republic. Thus the power and importance once annexed to the see of Rome were annihilated, and the influence of France in Italy established on the surest foundations. In 1801 the Italian republic was, at the desire of Bonaparte, divided into twelve departments. We have seen, under the article FRANCE, in what manner Bonaparte, as well by a train of fortunate circumstances, as by his talents, obtained the honours of a consulship, in imitation of the office held in ancient Rome; and how he advanced from step to step, till he was proclaimed "emperor of the French," with unlimited powers. This event occurred on the 2d of December 1805, when he swore in the presence of the pope (Pius VI.), whom he had brought to Paris to be the witness of his own humiliation, "to govern solely with a view to the interest, the happiness, and glory of the French nation." He boldly asserted, in the presence of all the principal personages then assembled, that he ascended the throne by the unanimous wishes of the senate, the people, and the army, whose happiness or misery had constituted, and would for ever constitute the sources of his own pleasures and pains. "My descendants," said he, "shall long preserve this throne. In the field, they will be the first soldiers of the army, sacrificing their lives for the defence of their country. As magistrates, they will never forget that contempt of the laws, and the confusion of social order, are only the result of the imbecility and uncertainty of princes." The splendour of this show was introductory to a similar display in Italy. He had before been regarded as the chief of the Italian republic; but the name of a republic probably carried with it ideas abhorrent to his heart, and the very word grated on his ears. In the month of April 1805, he assumed at Milan the title of "king of Italy;" in this city he placed the iron crown on his own head, while senators from almost all the ancient states were assembled as witnesses of his elevation, and their own degradation. On this occasion he related all that he had done as a conqueror and a great statesman; saying, that the power of the French empire had nevertheless been surpassed by the moderation which prevailed in its political transactions. "We had conquered," said he, "Holland, three-fourths of Germany, Switzerland, all Italy; but of so many provinces, we have only kept what was necessary to preserve us at the same point of consideration and power which France has always possessed. The partition of Poland, the losses sustained by Turkey, the conquest of the Indies, and almost all our colonies, had destroyed the balance of power to our disadvantage." He next recounted all his glorious deeds, and all his generosity with regard to Germany, Holland, and Switzerland; and adds, "The union of the Italian republic to the French would have been an advantage to our agriculture; nevertheless, after the second conquest, we, at Lyons, confirmed its independence. We now do more. We proclaim the principle of the separation of the crowns of France and Italy, by fixing for that separation the moment it can be done, and without danger to our people of Italy. We have accepted, and will place upon our head, the iron crown of the ancient Lombards, in order to re-temper and consolidate

it; so that it may not be broken by the shocks by which it will be threatened, as long as the Mediterranean continues out of its habitual state. But we do not hesitate to declare, that we will transfer that crown to one of our children, natural or adopted, the moment we are freed from alarms for that independence which we have guaranteed to the other flates of the Mediterranean." Upon the return of the emperor to his own dominions, it was announced to him that the Ligurian senate was waiting for an interview upon very important business. Accordingly, on the 25th of May, an extraordinary sitting of the Ligurian senate was held, when it was decreed that Genoa, its territories, and dependencies, should be annexed to the French empire. In his speech on this occasion, the emperor, having dwelt much at large on the advantage which would accrue to the continent in general, and to Genoa in particular, from this addition to his own dominions, added, "I will realize your expectations; I will unite you to my great people. I shall thereby acquire additional means of rendering that protection more powerful, which I have always been disposed to extend to you. My people will with pleasure receive you. They know that at all times you have been friendly to their armies; and that you have assisted them with all your force, and with all your means. They find, moreover, in your territory, ports, and an increase of maritime power, which is necessary for the support of their lawful rights against the tyrants of the seas.—Doge, and gentlemen of the deputation of the senate, and people of Genoa, return to your native country: I shall be there ere long, and will confirm the union which you and my people are about to form." At this meeting of the Italian legislature, the emperor presented prince Eugene Beauharnois to them as his representative, and viceroy of Italy; saying, that he himself would take an early opportunity of visiting all the departments of his new kingdom, in order that he might become better acquainted with their various wants. Since that period, in consequence of the success attendant on the wars between France and Austria, which were terminated by the treaties of peace of Presburg and Vienna, the whole Venetian territory, which pertained to Austria, the county of Goritz or Gorizia, the county of Trieste, Carniola, with its dependencies on the gulf of Trieste, and all the territories lying on the right bank of the Save, from the point where that river leaves Carniola, along its course to where it touches the province of Bosnia, six districts of military Croatia, Fiume, the Hungarian Littoral, Austrian Iliria, together with the islands dependent upon the ceded territory, were added to the Italian dominions of the new emperor and king. On the 20th of March 1811, Bonaparte had a son born by his present empress, the daughter of the emperor of Germany. To this son he instantly gave the title of "king of Rome," and required his ministers, and the chief persons under his direction, to render due homage to the infant in his cradle: thus shewing that he meant the prince Eugene, above noticed, only as his representative till one of his own children should be fitted to sway the sceptre of the Italian kingdom. Cellarius's Anc. Geogr. Univer. Hist. Anc. and Mod. Geographies of Pinkerton, Playfair, and Smith. Holberg's Univer. Hist. And Public Papers in the several volumes of the New Ann. Register.

In the fifteenth century, when we first hear of harmony in four parts, and masses set to figurative music, it was for the use of the pope's chapel that the greatest efforts of genius in composition were excited among the candidates for favour in that art, by the double certainty of having their labours liberally rewarded, and their productions well performed. And if we find that many of the composers of the pontifical

chapel were Netherlanders, and the singers Spaniards, it does not necessarily follow that the Italians had either counterpoint, or the art of singing, from the Low Countries, or from Spain. The Roman college of singers had been established and celebrated during so many ages, that we may well imagine these foreigners went to Rome to learn music, as to teach it.

We know, in later times, that many of the greatest musicians of Europe have either had their education in Italy, or thought it as necessary to visit that country as the ancient Roman philosophers to travel into Greece, or the Grecians into Egypt. Orlando di Lasso, Handel, Haffé, Gluck, and J. C. Bach, went thither very early, and may be said to have formed their styles on the best models of that country. The first motets of Orlando that were published at Antwerp, by Tylman Sefato, 1555, were said to be made "à la nouvelle composition d'auteurs d'Italie;" as the first productions of Handel, that were published in England, were said to be composed "by an eminent Italian master;" Haffé went very young into Italy, and was a scholar of Alessandro Scarlatti; however, his clear and graceful style more resembled that of Vinci and Pergolesi, his competitors in the natural, simple, and elegant manner of writing for the voice, than that of either Scarlatti, his master, or Kaiser, his countryman, and first model. The late excellent composer, Mr. J. C. Bach, son and brother of two of the greatest musicians that ever existed, is allowed to have been a fine player on keyed instruments, before he went into Italy; but his vocal music is certainly more in the style of Italy, than of his native country.

If the great musicians of antiquity, whose names are so familiar to our ears, had not likewise been poets, time and oblivion would long since have swept them away. But these having been luckily writers themselves, took a little care of their own fame; and their brethren of after-ages gladly supported it to the honour of the *corps*.

But fine writing and practical music have become separate professions, the celebrity of the poor musician dies with the vibration of his strings; or if, in condescension, he be remembered by a poet or historian, it is usually but to blazon his infirmities, and throw contempt upon his talents. The voice of acclamation, and thunder of applause, pass away like vapours; and those hands which were most active in testifying temporary approbation, suffer the fame of those who charmed away their care and sorrows in the glowing hour of innocent delight, to remain unrecorded.

If it be true that the progress of music in every country depends on the degrees of civilization and culture of other arts and sciences among its inhabitants; and on the language which they speak, the accents of which furnish the skeleton and nerves of all vocal melody; great perfection cannot be expected in the music of Europe during the middle ages, when the Goths, Vandals, Huns, Germans, Franks, and Gauls, whose ideas were savage, and language harsh and insolent, had fixed on its most sterile provinces. All the dialects that are now spoken in Europe are a mixture of Celtic and Latin; and as the inhabitants of Italy preserved the Roman language longer than those of other countries remote from the seat of empire, more vestiges of the Latin tongue still remain in Italy than elsewhere. For though there are many terms in it that they were forced to receive from the barbarians who invaded them, yet the chief part of the language is still Latin corrupted, and sometimes softened and improved. And as literature, arts, and manufactures, were encouraged more early in Italy at the court of the Roman pontiffs, than in any other country, modern music has there been furnished with its flesh, its counterpoint, and its

includes its religious and secular drama, and with the chief part of its grace and elegance. Italy, in modern times, has been to the rest of Europe what ancient Greece was to Rome; its inhabitants have helped to civilize and polish their conquerors, and to enlighten the minds of those whose superior force and prowess had frequently enslaved them.

ITANBERA, a town of Brazil, in the government of Minas Geraes; 26 miles W. of Villa Rica.

ITANNA, or ENENNA, a kingdom of Africa, on the Slave coast, subject to Benin.

ITAPE, a town of South America, in the province of Paraguay; 170 miles S.E. of Assumption.

ITAPUA, a town of South America, in the province of Paraguay, on the Parana; 170 miles S.E. of Assumption.

ITATA, a town of South America, in the country of Chili, on a river of the same name; 32 miles N.N.E. of La Concepcion.

ITATI, a town of South America, in the province of Buenos Ayres, on the Parana; 35 miles N.E. of Corrientes.

ITCH, in *Medicine*, a contagious disease of the skin, which is characterized by an eruption of numerous small pustules, more especially about the fingers, wrists, and the bending of the joints, accompanied by the most importunate itching, without fever.

This disease seems to have been included, together with the running, or moist tetter, under the appellation of *ulcerating pсора*, (*ἄσκη ὑδαρική*) of the Greeks, and constituted one form of the *scabies* of the Latin writers. In the writings of the moderns, it is sometimes denominated *psora*, but more frequently *scabies*; the term *psora*, indeed, when used by the Greeks without any epithet, signified the scaly tetter, which is analogous to their *lepra*, (see Willan on Cutaneous Diseases, Order ii. Genus 2.) and not a pustular disease.

The eruption of scabies begins most commonly on the limbs, and especially about the wrists and fingers, in the form of minute pustules or watery pimples, which are accompanied by a sensation of violent itching, which is greatly increased by external warmth, and therefore is particularly troublesome soon after the patient gets into bed. It assumes, however, a considerable variety of forms, in different instances, and even in different stages, of the complaint, which the vulgar have noticed, and distinguished by particular appellations. What they denominate the *rank itch*, is often seen early in the progress of the disorder, or in mild cases; and consists of a numerous crop of pimply eruption, which spreads over the whole body, arms, breast, and lower extremities; but, on the trunk of the body especially, the characteristic ichorous pustule commonly appears here and there intermixed with the papule, and the final tendency of the eruption is to the pustular form. In other cases, large watery vesicles are seen diffused over the thighs, arms, hands, and region of the stomach; in which case the disease is particularly termed the *century itch*. And not infrequently the eruption over the arms, wrists, and fingers, consists of large, yellow pustules, which become confluent, and form crabs or scabs as the matter dries; this has been termed the *po-ky itch*, not from its connection with any syphilitic contagion, as some have been led to imagine from the term; but from the resemblance of the pustules to those of the distinct small-pox. Some writers have mentioned a *scorbatic itch*, and have included the pustular syphilitic eruptions under the term *itch*; but these eruptions, as well as the affections of the skin originating from the true scurvy, differ essentially from *scabies*

in their form, and in the absence of that incessant and importunate itching, which accompanies the latter. The term *scorbatic itch* has sometimes been applied to the *prurigo*, it would seem, when it was accompanied by a particularly irritable and inflamed state of the skin.

The pruriginous eruptions, indeed, which Dr. Willan has described as consisting of pimples, which do not become pustular in general, or discharge any fluid, even when the tops are rubbed off, after continuing some time, are apt to become pustular and contagious; that is, to degenerate into *scabies*, if they are long neglected, or where cleanliness is not sufficiently attended to. And there is an eruption, which is not very uncommon, partaking, in its appearance, of the character of *prurigo*, and *impigo*, conjoined, which is contagious in its double character, and exceedingly obnoxious. In work-houses, moreover, a virulent scabies is often seen, which appears to be a mixture of the poison of *porrigo* with that of *itch*, and which affects the whole body, with scabby and itching ulcerations, that are communicated by the contagion, under the same form. In short, it is extremely difficult to point a certain diagnosis of the *scabies*, from the variety of forms under which a contagious and pustular eruption appears, under different circumstances. See PRURIGO.

The itch is most frequently communicated from one person to another by contagion, that is, by actual contact; as by sleeping, shaking hands, &c. with a person affected, or by using the clothes, linen, &c. which had been previously used by such a person. But in some cases it seems to originate in individuals, who neglect or do not possess the proper means of cleanliness, and in others is the result of the conversion of the papulous diseases (the lichen and prurigo of Dr. Willan's arrangement) into a pustular disease. When the complaint is communicated by contact with the person or clothes of one already infected, it is doubtless commonly conveyed by a sort of inoculation of the ichorous or purulent matter, discharged from the pustules. Some, however, have attributed the disease itself, as well as the ready propagation of it, to the existence of certain minute insects, which breed in the furrows of the cuticle, and which are conveyed from one person to another by such intercourse as we have just mentioned. Bonomo, an Italian physician, was one of the first to describe this insect, and his account was made known in England by Dr. Mead. (See Philof. Transf. vol. xxiii.) It has been since called the *acarus scabiei*, and has been particularly described and figured by Deeger (Hist. des Insectes), and others. Linnæus considered it the same with the *acarus or mite*, which breeds in flour; but Deeger has shewn this to be a mistake. These insects, which we confess we have never been able to detect in any case of scabies, are said to be found, not in the large pustules, but in the recent watery pustules, or still more commonly in the furrows of the cuticle, near them, on the hands and fingers.

Cure.—A great variety of remedies have been employed at different times for the cure of this filthy complaint; and in general, indeed, it is not very difficult of cure, although the remedy is also filthy like the disease. Sulphur, both taken internally, in combination with some neutral or alkaline salt, and applied externally over the parts affected, in the form of an ointment, is found to be the most certain and efficacious remedy. The white hellebore, applied either in an ointment, or in a strong decoction as a lotion, has considerable influence over the disease; and some of the preparations of mercury, such as the white precipitate, the oxy-muriate, or corrosive sublimate, &c. as well as the muriate of ammonia, potash in a state of a deliquescence, &c. are also occasionally resorted to, in various combinations, with success.

success. A number of other medicines, both external and internal, are recommended by the older writers, especially the juices and decoctions of several roots and plants; but it seems altogether unnecessary to enumerate them, since recent experience has decided upon the superior efficacy of the remedies just mentioned. See Turner on Dis. of the Skin. Callien. Syll. Chir. Hodeira. p. 824. Sauvages, Nofel. Meth. Clafs. x. Gen. 28.

ITRU Animal, a creature said to be found in the pustules of the itch; it is a species of acarus.

ITCHAPOUR, in *Geography*, a town of Hindoostan, in the circar of Ellichpour; 48 miles S.S.W. of Ellichpour. N. lat. 20 28'. E. long. 77 38'.—**Aïte**, a town of Hindoostan, in the circar of Cicacoe; 30 miles S.S.W. of Ganjam.

ITCHAUR, a town of Hindoostan, in the circar of Hindia; 30 miles N. of Hindia.

ITCHE, a town of Thibet; 95 miles S.W. of Chactseou.

ITCHING RIVER, in Hampshire, is navigable for barges up to Winchester city, of which an account has been given in our article CANAL: since which, there have been attempts, and one is now making, for obtaining an act for further improving this navigation. About 1802, a bridge was built over this river at Northam. At Wood mills, on this river, ships' blocks are manufactured by machinery, but in a manner far less complete and ingenious than the block machines by Mr. Brunel, which are erected in the dock-yard at Portsmouth, of which we intend to give some account under our article BLACK MACHINERY.

ITCHORSKA, a town of Russia, in the government of Irkutsk, on the Lena; 80 miles N.E. of Kirensk.

ITEA, in *Botany*. One of the ancient Greeks is a general appellation for willows or fallows, as appears from Theophrastus and Dioscorides. The word is derived from *ἴτα* *ita*, alluding to their quick growth, or early germination.—Linnaeus applied the name to this North American genus from its willow-like aspect.—Linn. Gen. 109. Schreb. 150. Willd. Sp. Pl. v. 1. 1146. Mart. Mill. Dict. v. 2. Art. Hort. Kew. ed. 2. 37. Juff. 159. Lamarck Dict. v. 3. 314. Illustr. t. 147. (Cyrilla; Linn. Mant. 50. Syll. Veg. ed. 14. 241. Schreb. 150.) Clafs and order, *Pentandra Monogynia*. Nat. Ord. *Bicornis*, Linn. *Rhododendra*, Juss.

Gen. Ch. *Cal.* Perianth of one leaf, erect, very small, permanent, divided into five acute, coloured segments. *Cor.* Petals five, lanceolate, long, inserted into the calyx. *Stam.* Filaments five, awl-shaped, erect, the length of the corolla, inserted into the calyx; anthers roundish, incumbent. *Pist.* Germen superior, ovate; style cylindrical, permanent; as long as the stigma; stigma obtuse. *Peric.* Capsule ovate, much longer than the calyx, terminated by the style, of two cells, and two valves with inflexed edges, gaping at the top. *Seeds* numerous, very small, oblong, shining.

Eff. Ch. Petals long, inserted into the calyx. Capsule of one cell, and two valves.

Obf. L'Heretier has the honour of having first declared the *Ita* and *Cyrilla* of Linnaeus to be one and the same genus, from the conformity of the flower, and two-celled fruit of each.

1. *virginica*. Linn Sp. Pl. 289. Trew Ehret 55. t. 98.—"Leaves ovate, acute, serrated."—A native of North America, flow from June to August.—This shrub rises to the height of five or six feet. Its stem is branched all the way up. Leaves slightly serrated, reflexed, light green. Flowers white or yellowish, composed of numerous spikes three or four inches long.—Linnaeus remarks that this species is very similar in appearance to *Prunus Padus*, the Bird-cherry.

2. *Cyrilla*. Willd. n. 2. J. Hort. Strep. Kalc. 6. 157. t. 69. (Cyrilla ramiflora; Linn. Sp. Pl. 289. Jacq. Ic. Rar. 1. t. 47).—"Leaves lanceolate, entire, membranaceous."—A native of Carolina. It flowers in July and August.—Root perennal. Stem sparingly branched, round, ash-coloured. Leaves alternate, bluntish, rather unguated; their foot-stalks reddish. (Glyster) numerous, linear, from four to six inches long. Flowers clustered, white; anthers pale-violet coloured; germen whitish.

ITEA, in *Gardening*, contains plants of the hardy, deciduous, shrubby kinds, of which the most commonly cultivated are, the Virginia itea (*I. virginica*); and the entire-leaved itea (*I. cyrilla*).

Method of Culture.—The first root is capable of being increased by layers, which should be laid down in the autumn, when they will put out roots so as to be fit to take off by the following autumn, when they may be removed into the nursery, or the places where they are to grow. It does not succeed well on dry gravelly soils.

It is also capable of being raised from seed, by sowing it in the spring, as soon as procured from abroad.

The second species may be increased by layers or cutting, planted in pots of good mould in the spring; in the latter case, placing them in a mild hot-bed, till they have striken root, afterwards removing them into separate pots, placing them in airy situations in the green-house or other proper place.

Plants of the first kind are very ornamental in the borders and clumps, and those of the latter among green-house collections, or those in other protected places.

ITENG, in *Geography*, a small island in the East Indian sea. S. lat. 6° 42'. E. long. 132 15'.

ITERATION. See REITERATION.

ITERI, in *Geography*, a town of the island of Sardinia.

ITFU, a town of Egypt; 8 miles S. of Tahta.

ITHACA, a town of New York, at the southern extremity of lake Cayuga; 30 miles S. of Cayuga. N. lat. 42° 27'. W. long. 76° 33'.

ITHACA, in *Ancient Geography*, one of the Greek islands, situated in the Ionian sea, between Dulichium and Capalenia, famous for being the birth-place of Ulysses, the son of Laertes. It had the advantage of a town and a good port: it is now called "Theaki," and its port "Vahti." Its circuit is reckoned about 40 miles. Some ruins still remain, which tradition reports to have been part of the palace of Penelope.

ITHCYPHOS, in *Surgery*, curved or deformed in the back.

ITHOME, in *Ancient Geography*, a town of Messenia, north of Messene, so called from the mountain on which it was erected and well fortified, being encompassed with a stone wall. In it was a statue of Jupiter the "Saviour," and also a fountain called Arfinoe, which was supplied with water from another fountain called Clepsydra. Neptune and Venus had each of them a temple in this place; and the mother of the gods had a superb statue of Parian marble. This town contained also a temple dedicated to Messene, daughter of Triopas, whose statue was formed partly of gold and partly of the marble of Paros. It had likewise a temple, in which were deposited and preserved the victims appropriated to the sacrifices. Besides, it was adorned with all the statues of the gods which were worshipped in Greece. It had a theatre which had been a temple dedicated to Serapis and Isis. The citadel was constructed on the summit of the mountain, and at the gate by which they passed to Megalopolis was a statue of Mercury.

Jupite

Jupiter was worshipped in this place under the appellation of "Ithomatus" by the people of Messenia; and as they pretended that he had been educated in their country, they appropriated to him a peculiar worship; and while the festival, called "Ithomara" lasted, they were accustomed to carry water during the whole day from the fountain Clepsydra into his temple. Games accompanied this festival, and also trials of skill on various instruments of music. Pausan. in Messen.

ITHYNTERION, *Ἰθυντήριον*, in *Antiquity*, a staff of laurel, which prophets usually carried in their hands, otherwise called *scythron*.

ITHYSCOLIOS, in *Surgery*, an oblique curvature of the spine.

ITINERANT JUDGES, or *Justices*, such as were formerly sent with commissions into divers counties, to hear chiefly those causes called *pleas of the crown*; the same with what are otherwise called *justices in eyre*. See JUSTICE.

ITINERARIUM, in *Surgery*, a name given by Hildanus, and many other writers, to a staff used in the operation of cutting for the stone.

ITINERARY, the description a traveller gives of the course of his journey, and of the curiosities, &c. he observed therein.

The Itinerary of Antonine shews all the grand Roman roads in the empire, and all the stations of the Roman army. It was drawn up by order of the emperor Antoninus Pius; but is now very defective, having suffered much under the hands of the copyists and editors.

ITINERARY Column. See COLUMN.

ITING, in *Ornithology*. See GRACULA Calva.

ITIOBARA BAY, in *Geography*, a bay on the coast of Brazil. S. lat. 6° 20'. W. long. 37° 46'.

ITIUM PROMONTORIUM, in *Ancient Geography*, a promontory of Gaul, mentioned by Ptolemy, and supposed to be at the mouth of the Somme, in France, and extending towards the north. According to D'Anville it is Grisenef.

ITIUS PORTUS. See ICIUS Portus.

ITKARINSKOI, in *Geography*, a town of Russia, in the government of Kolivau; 156 miles E.N.E. of Kolivau. N. lat. 55° 36'. E. long. 85° 44'.

ITONA, in *Ancient Geography*, a town of Epirus.—Also, a town of Italy.—Also, a town of Asia Minor, in Lydia.—Also, the name of two places, one in Bœotia, the other in Lydia.

ITORUM URBS, a town of Italy, on the route from Ostia to Rimini, near the mountains; mentioned by Strabo.

ITRABO, in *Geography*, a town of Spain, in the province of Granada; 10 miles W.N.W. of Motril.

ITRI, a town of Naples, in the province of Lavora; 3 miles S.E. of Fondi.

ITSJA, a town of Japan, in the island of Ximo; 10 miles N. of Tsifero.

ITTENDAL, a town of Sweden, in the province of Helsingland; 15 miles N. of Hudwickfwal.

ITTERGAU, a fertile district of Upper Hesse, watered by the Itter, which runs into the Eder, two miles S.W. of Volhe.

ITTER THIAL, ITTER-EN-VAL, or *Bergstadt*, a town of Upper Hesse; 24 miles W. of Cassel.

ITTFIGIUS, THOMAS, in *Biography*, who flourished in the seventeenth and eighteenth centuries, was born at Leipzig about the year 1654. Here he pursued his studies, and was afterwards appointed assessor of the faculty of philosophy at the same place. Being admitted to the ministry, he discharged the duties of that office in different churches in

that city. In 1686, he was admitted to the degree of doctor of divinity, and in the following year he was appointed first professor extraordinary in that faculty, and then professor in ordinary. He took a considerable share in publishing the "Leipzig Acts," and besides other employments, filled the post of superintendent of the ecclesiastical district of that city. He died in 1730: and was author of "A Treatise on Burning Mountain;" "Dissertatio de Hæresiacis Ævi Apollinici, eique proximi;" "Prolegomena ad Josephi Opera," and many other works, which were highly esteemed by his contemporaries. Lardner, in his seventh vol. speaks of him as the very learned Ittigus. The same author refers to his opinion in other places. Moreri. Lardner.

ITU, in *Geography*, a town of South America, in the province of Buenos Ayres, on the Parana; 130 miles E. of Corrientes.

ITUCI, in *Ancient Geography*, a town of Hispania, in Bœotia, a little south of Cantulo, and north of Eliberis; called by Pliny "Virtus Julia."

ITUERO, in *Geography*, a town of Spain, in the province of Leon; 13 miles S.S.W. of Ciudad Rodrigo.

ITUNA, in *Ancient Geography*, an estuary of Britain, which is unquestionably the Sulway Firth, which now divides England from Scotland on the west side.

ITUREA, a province of Asia, so called from Itur, the son of Ithmael, sometimes erroneously called Jetur. It was situated on the other side of Jordan, on the N. side of the half-tribe of Manasseh, between that and the territories of Damascus; so that it made one part of Cœlefyria, and lay on the side of Judæa, as Idumæa lay on the other. The Itureans were famous for drawing the bow, but they were a fierce people. Iturea was invaded by Aritobolus, who succeeded his father Hyrcan; but being taken ill in the midst of his successes, he was under a necessity of being brought back to Jerusalem, and to leave his brother to complete the conquest of that province; an achievement which he soon accomplished, causing all the Itureans, either to be circumcised and incorporated with the Jews, or else to depart into some other country.

ITURISSA, a town of Hispania, in the country of the Vascones. Ptol. In the Itinerary of Antonine it is placed 18 miles from the Pyrenees.

ITWA, in *Geography*, a town of Bohemia, in the circle of Pilsen; 3 miles N.W. of Teusing.

ITYCA, in *Ancient Geography*, a town of Africa, in Libya, which was a colony of Tyrians.

ITYPHALLOPHORI, in *Ancient Mythology*, attendants on the orgies of Bacchus, who accompanied the Phallophori, habited like fawns, counterfeiting persons drunk, and singing, in honour of Bacchus, songs suitable to their functions. See ORIORES.

ITYS, in *Ancient Geography*, one of the rivers of Britain, which runs into the sea opposite to the isle of Skye.

ITZEHOE, in *Geography*, a town of the duchy of Holstein. This town has a very ancient origin: it is named from a fortress built in the beginning of the ninth century by order of Charles the Great, issued in 809, to repel the incursions of the Danes into Germany. This fortress was called Etscho, or Isscho. In process of time it was surrounded by a number of houses, which, about the middle of the 13th century, obtained the privileges of a town. It has since been several times destroyed; but is now a small, agreeable, and well built town, partly situated on the river Stöer, which runs into the Elbe, and has been erroneously mentioned by some travellers as a canal cut from that river. It is distant from Hamburg 47 miles, and 12 from Glückstadt. The church, which is in the market-place, is

very small, but the keeple is high, of a particularly light architecture: it stands on four small iron pillars, which, at a distance, are hardly perceivable. N. lat. 53° 57'. E. long. 9° 35'.

I V A, in *Botany*, a name apparently of barbarous origin, first applied to a species of *Teucrium* or *Ajuga*. It does not appear why Linnaeus appropriated it to the present genus. —Linn. Gen. 490. Schreb. 637. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 346. Juss. 190. Lamarck Dict. v. 3. 315. Illustr. t. 766. Gærtn. t. 164. (Tarchonanthus; Vaill. Act. 1719. f. 16, 17.)—Clas and order, *Mentha Pentandria*. Nat. Ord. *Compositae Nucamentacea*, Linn. *Corymbiferae*, Juss.

Gen. Ch. Common Calyx roundish, of about five lobovate, obtuse, nearly equal, permanent leaves, containing many florets. Cor. Compound convex, having numerous male florets in the disk, and five female ones in the circumference; that of each of the males monopetalous, funnel-shaped, five-toothed, the length of the calyx; of the females wanting. Stam. Filaments five, fetaceous, the length of the floret; anthers erect, approximated. Pist. Germen oblong, the length of the calyx; styles two, capillary, long; figmas acute. Peric. none, except the unchanged calyx. Seeds foliary, naked, as long as the calyx, thicker about the upper part, obtuse. Recept. beset with linear scales.

Ess. Ch. Male, Common calyx of three or five leaves. Florets of the disk monopetalous, five-cleft. Female, Corolla wanting. Styles two. Seeds naked, obtuse.

1. *I. annua*. Linn. Sp. Pl. 1402. Schmid. Ic. 59. t. 16. "Leaves lanceolate, ovate. Stem herbaceous."—A native of South America.—This annual rises to the height of five or six feet. Root fibrous, branching. Stem jointed, furrowed, red, hairy; pairs of opposite branches formed at each joint. Leaves opposite, on foot-stalks, ovate and pointed, veined, reddish above, and green underneath. Clusters axillary and terminal, blueish, or of the same rusty colour with the stem, interspersed with long, pointed, serrated bracts.

2. *I. frutescens*. Linn. Sp. Pl. 1402. (Elichryso affinis peruviana frutescens; Pluk. Phyt. t. 27. f. 1.)—"Leaves lanceolate. Stem shrubby."—Found in Virginia and Peru. It flowers in August.—Root perennial. Branches woody, slender, eight or ten feet long. Leaves serrated; the branches terminated by clusters of pale purple flowers.

I V A, in *Gardening*, comprises plants of the hardy, deciduous, shrubby, herbaceous, annual kinds, of which the species commonly grown are, the annual iva (*I. annua*), and the shrubby iva, or bastard Jesuit's bark-tree (*I. frutescens*.)

Method of Culture.—The plants of the first sort are raised by sowing the seeds on a moderate hot-bed in the spring, and when they are fit to remove, placing them in another hot-bed, treating them as the less tender annual sorts.

But in the second sort, the young branches should be laid down in the spring, when they will put out roots in about six months; or cuttings may be planted in a shady border in May, and when they have taken root, removed, with earth about their roots, to the places where they are to grow. The plants succeed best in a dry soil, and warm sheltered situation.

Plants of the first sort afford ornament among the less tender annuals, and those of the latter in the warm borders and clumps in shrubberies and pleasure ground.

I V A F U N E, in *Geography*, a town of Japan, in the island of Niphon; 30 miles S.S.E. of Nigata.

I V A H A H is the name of one of the canoes or boats used

by the islanders of the South sea, for short excursions to sea; it is wall-sided and flat-bottomed. See BOAT.

I V A N, I. VASSILIEVITCH, JOHN BASILOVITZ, in *Geography*, czar of Russia, was born in 1438, and succeeded to the throne in 1462. At this period Russia was divided into a number of petty principalities: some of them were subject to the czar or great duke, and all, together with him, tributary to the Tartars, who assumed a superiority over that prince. The following is given as an instance of the servitude of the great duke. It is recorded by Gieseler, the Polish historian, and quoted by Cox in his travels: "Whenever the Tartar ambassadors were sent to Moscow to collect tribute, the great duke used to meet them, and offer, as a mark of his respect, a cup of mare's milk; and if a drop chanced to fall upon the mane of the horse on which the Tartar ambassador was sitting, he would immediately lick it up. When they reached the hall of audience, the ambassadors read the khan's letter seated upon a carpet of the choicest furs, while the great duke with his nobles knelt, and listened in respectful silence." Ivan, who may be justly esteemed the founder of Russian greatness, was a man of gigantic stature, and of corresponding resolution and vigour, accompanied with the ferocity of a barbarian despot. In the course, however, of a prosperous reign of above 40 years, he gave a new aspect to the Russian affairs: he annexed to his dominions several neighbouring principal duchies, subdued Novogorod, and rescued his country from the Tartar yoke. He had no sooner delivered Russia from this dependence, than his alliance was courted by many European sovereigns, and during his reign, for the first time, the emperor of Germany, the pope, the grand signior, the kings of Poland and Denmark, and the republic of Venice, felt it their interest to send ambassadors to the Russian court. The talents of Ivan were not confined to military affairs. Russia was indebted to him for the improvement of her commerce, and for opening a more ready communication with European nations. Under his auspices, the knowledge of gunpowder, and the art of casting cannon were first brought into Russia by Aristotle of Bologna: he employed the same artill, and some other foreigners, to re-coin Russian money, which had hitherto been disfigured by Tartar inscriptions: he engaged, at a vast expence, Italian artill to enclose the citadels of Moscow and Novogorod, with walls of brick, and to erect several churches and other public structures with the same materials. For his various services he obtained the title of *Great*. It should be observed, that the manners of Ivan were refined and polished in some degree by the example of his second wife Sophia, a Grecian princess, daughter of Thomas Paleologus, a lady of consummate beauty and virtuous adsors, who, to all the softer graces of her sex, added a vigorous and manly spirit, and who, while she infused into her husband a taste for the arts of peace, animated him to those glorious enterprises which occasioned the aggrandisement of his country. He is represented as being stern and unfeeling, given to ebriety, though he punished it severely in others, and an object of dread to all who approached him. He died in 1505, in the 67th year of his age, and the 43d of his reign. On each side of his remains were deposited those of his father, Vassilievitch, and of his son, Vassil Ivanovitch, who succeeded him on his throne, and expired in 1533. Cox's Travels, vol. ii.

I V A N, I. VASSILIEVITCH, succeeded his father Ivanovitch in the year 1530. Being only three years of age, he was left under the care and superintendance of guardians, who faithfully performed the duty committed to them, and defeated the plots of the young prince's uncles, who were

desires of depriving him of his crown. At the age of 19 he sent a splendid embassy to the emperor Charles V. the chief purpose of which was to obtain from Germany proper persons to assist him in the civilization of his subjects, and in introducing arts and manufactures. More than 300 artisans, of all professions, actually arrived at Lubec in their way to Moscow, but were prevented from proceeding on their journey by the intrigues of the inhabitants of that town. Ivan II. raised the superstructure of the Russian grandeur, of which his grandfather had laid the foundation. He instituted a standing army, trained his soldiers to the use of fire-arms, and accustomed them to a more regular discipline. By means of this formidable body, he extended his dominions on all sides, conquered the kingdoms of Kasan and Astracan, and rendered the Russian name respectable to the distant powers of Europe. He gave to his subjects the first code of written laws; he introduced printing into Russia; he promoted commerce, and regulated all the duties connected with it. While involved in a war with the Poles, a domestic conspiracy, in 1566, occasioned by his tyranny, threatened to deprive him of his crown. Such was the danger, that he thought it best to make a feigned abdication. This produced the proposed effect of awakening the dormant loyalty of the people; but as soon as he had resumed the reins of government, he put to death the leaders of the conspiracy, and secured himself against any future rebellion, by the institution of a body of guards drawn from the remote provinces, and attached solely to himself. These he augmented, till at length they proved ready instruments of despotism. He entered into a friendly intercourse with queen Elizabeth of England, to whom he proposed an alliance offensive and defensive. Though the queen did not agree to his proposal in its full extent, yet a treaty was made, which was the commencement of the intercourse which has since subsisted between the two nations. In an invasion of Russia by the Poles, the city of Novogorod incurred the suspicion of having, by its principal inhabitants, held a correspondence with the king of Poland. This defection was punished in the most barbarous manner by the czar, who, in the course of a few weeks, adjudged several thousand persons to death. In 1571, after Russia had been desolated by the plague, the Crim Tartars, incited by the Poles, made an irruption into the southern provinces, and advancing towards Moscow, entirely defeated the Russian army, which made a stand within 18 leagues of the capital. Ivan, upon the news, shut himself up in a fortified cloister, with his two sons, and most valuable effects, and by this cowardly desertion, allowed the Tartars to enter Moscow, which they plundered and burnt, with a vast destruction of the inhabitants. The czar's most formidable enemy was Stephen Batori, king of Poland, who, with the king of Sweden, declared war against Russia in 1579, took Narva and Riga, and became masters of the whole of Livonia. The Russians murmured at his conduct, and some of the nobles ventured to make remonstrances against his suffering foreign enemies to ravage the country, and requested that he would permit his eldest son to appear at the head of the army. The czar, suspecting that the prince had urged the noble to this step, reprimanded him in very severe terms; and by attempting to justify himself, the father's anger was roused to such a pitch, that he gave him a violent blow with a staff tipped with iron, which laid him at his feet, and which in four days proved fatal. The savage monarch, who did not probably intend his son's death, passed from the extreme of anger to that of sorrow; he refused to take food or change his dress for several days, and endeavoured to expiate the deed by a magnificent funeral. An unsuccess-

ful attempt to chastise the Tartars, who had made a new incursion into the Russian territories, was the last act of this reign. He negotiated with them and returned to Moscow, when the approach of his own death awakened in him a desire of conferring benefits on his people. He now endeavoured to correct abuses introduced by his long wars, performed many acts of clemency, enjoyed his success in liberating prisoners, repeal taxes, and redress the injuries which his brutality had inflicted. He expired in 1584, in the 54th year of his age. He has been reckoned among the great monarchs of his country, on account of his spirited and successful attempts to free it from a foreign yoke, and to introduce arts and civilization. He left two sons, of whom Feodor or Theodore succeeded him.

JUAN, GEORGI, in *Biography*. See the article DEGREY for an account of this naval commander, eminent for his mathematical knowledge and skill in practical astronomy.

JUAN, *St.* in *Geography*, one of the Cape Verde islands. See BRAVA.—Also, the capital of California. N. lat. 26° 25'. W. long. 114 9'.—Also, a town of Mexico, in New Biscay; 75 miles S.S.W. of Paral.—Also, a town of South America, in the province of Panama, between Panama and Porto-Bello.—Also, a sea-port town of Mexico, in the province of Nicaragua; 30 miles S.E. of Leon. N. lat. 12° 10'. W. long. 87 38'.—Also, a town in East Florida; 12 miles N. of St. Mark.—Also, a small island in the North Pacific ocean, near the coast of New Albion, between the islands of St. Clemente and St. Diego.—Also, a town on the W. coast of the island of Lucon. N. lat. 17° 12'. E. long. 120° 48'.—Also, a town of South America, in the province of Mexico; 70 miles E.N.E. of Trinidad.—Also, a town of Paraguay; 270 miles S.S.E. of Assumption.—Also, a river of New Mexico, which runs into the gulf of California, N. lat. 29 10'.—Also, a river of Spanish North America, in the province of Nicaragua, which forms an outlet for the lake of Nicaragua to the gulf of Mexico. It has been proposed to make use of this river in order to open a communication between the Atlantic and Pacific ocean. It is said to be navigated by the Indians through its whole course, and was reported in the reign of Charles V. to be as considerable as the Guadalquivir at Seville. The length of the river St. Juan is by the latest English maps about 100 miles: and it is navigated by large flat-bottomed boats and canoes, laden with tallow and other effects, which they carry to Porto-Bello, at the distance of 80 leagues; but they are obliged to unload at three places, probably rapids, where canals would be required. At one of these, the castle of our lady, called by the English the fort St. Juan, is placed on a rock, and though small, strong enough to protect the entrance. It has 36 cannons and a battery; level with the water is a platform, and towards the land it is defended by a ditch and rampart, reaching to the river. The usual garrison is 100 men, besides 16 of artillery, 40 musqueteers, and 20 militia; which last manage the barks, two being placed every night up and down the river. There are 18 slaves, male and female, for the service of the garrison, which is supplied with provisions, flesh, fowls, garden stuff, maize, and other articles, from the city of Granada, at the distance of 60 leagues; and there are always provisions for six months. But the climate is unhealthy, as it rains almost perpetually, and a recruit of 50 men from the capital, Guatimala, is necessary to supply the places of those who die. This fortress is regarded as the key of New Spain and Peru; and by seizing it, and the port of Realajo, an enemy would become master of both oceans. Such is the account of Alcedo, cited by Pinkerton in the 3d volume

of *la* Geography, to which we refer for some further particulars relating to the projected passage by the lake of Nicaragua between the two fore-mentioned oceans.—*Alfo*, a town of South America, in the Audience of Quito; 17 miles N.W. of St. Joachim de Omaguas.—*Alfo*, a river of Popayan, which runs into the Pacific ocean, N. lat. 3° 32'.

JUAN BATTISTA, St., a town of South America, in the province of Chiñitos; 250 miles E.S.E. of Santa Cruz de la Sierra la Nueva.—*Alfo*, an island in the Pacific ocean, discovered by Quiros in 1606. S. lat. 26°. W. long. 149°.

JUAN de Bucarivilla, a town of the island of Cuba, on the N. coast. N. lat. 22° 2'. W. long. 77° 5'.

JUAN Capistrano, St., a Spanish settlement and mission in N. W. Albion, formed in 1776; situated in a small cove on the Pacific ocean.

JUAN de Caceres, St. See CINALOA.

JUAN d' Dios, St., a town of New Navarre; 240 miles W. of Casa Grande.

JUAN Fernandez. See FERNANDES.

JUAN de la Presenta, or de la Cordillera, a town of Chili; 120 miles N.N.E. of St. Yago. In its neighbourhood are gold mines. S. lat. 33° 25'. W. long. 68° 55'.—*Alfo*, a district of South America, lying to the east of the Andes, with a town of the same name; called also Chacapoyas.—*Alfo*, a town of Peru, and capital of a jurisdiction in the diocese of Truxillo. S. lat. 6° 12'. W. long. 77° 28'.

JUAN de Fuca, Straits of, a large bay or gulf of the North Pacific ocean, on the W. coast of North America. In 1792 captain Vancouver gave it the name of the gulf of Georgia, which see. Its entrance lies in N. lat. 48° 25'. W. long. 122° 55'.

JUAN de Gacova, St., a town of the island of Hispaniola; 80 miles N.W. of St. Domingo.

JUAN de Nova, two small islands in the Indian sea. S. lat. 10° 20'. E. long. 52° 45'.

JUAN de los Llanos, St., or *San*, a province of South America, in New Granada, which forms a considerable district, if it be extended as far as the Orinoco; but as the capital town is on the western skirts, the extension given by La Cruz seems very arbitrary, there being no Spanish settlement in that direction. This territory consists of prodigious plains, extending for 2 or 300 leagues. The town was founded in 1555, and was formerly celebrated for gold mines, which have now declined; and the inhabitants scarcely exceed 50; 50 miles E.S.E. of Santa Fé de Bogota. N. lat. 3°. W. long. 73° 26'.

JUAN del Oro, St., or *Caracaya*, a town of Peru, and capital of a jurisdiction, in the vicerojalty of Buenos Ayres, and diocese of Cusco; 150 miles S.E. of Cusco. N. lat. 14° 40'. W. long. 69° 36'.

JUAN de Pablos, St. See PASTO.

JUAN de Porto Rico, St., a town and capital of the island of Porto Rico, situated on a peninsula in the N. coast of the island, having a good harbour, defended by a citadel and castle; populous and well built, the see of a bishop and residence of the governor. The town was founded in the year 1514; but in 1594, when it was in a flourishing state, it was attacked by Sir Francis Drake, who destroyed all the ships in the harbour, but could proceed no farther. In 1597 it was taken and plundered by the earl of Cumberland. N. lat. 18° 30'. W. long. 66° 20'.

JUAN del Rey, St., a town of Mexico, in the province of Guaxaca; 25 miles N. of Guaxaca.

JUAN Rio, a town of the island of Cuba; 26 miles E.S.E. of Spiritu Santo.

JUAN d'Ulva, St., a small island in the gulf of Mexico, near the coast of Tlafcala, at the mouth of the river Vera

Cruz. On this little island is a fortalice to defend the entrance into the harbour of Vera Cruz.

IVANGOROD, a town of Russia, in the government of Petersburg, on the Plussa, near the Baltic, opposite Narva, built by Ivan Boshlovitz; surrounded by a brick wall, and defended by a number of small towers; 52 miles S.W. of Petersburg. N. lat. 59° 16'. E. long. 30° 14'.

IVANTIS, a town of Croatia, on the river Danube; 4 miles N.E. of Carladit. N. lat. 46°. E. long. 16° 45'.

JUANNA. See HINZUAN.

IVAPÉCANGA, in *Luani*, a name given by the first authors to the climbing plant, of which the farlapanta, used in medicine, is the root.

JUAR, in *Geography*, a town of Hindoostan, in the island of Delhi; 17 miles S. of occidiana.

JUBA I., in *Biography*, king of Numidia, the son of Hiempfal, a descendant of Maffilla, laid siege to the camp of Pompey against Julius Cæsar. He defeated Cæsar's officers, and after the battle of Pharfalia he united his forces to those of Scipio. They were joined by Cato, who reproached the pride of Juba, by preventing him taking place above Scipio. He was conquered in a battle at Thapsus, and was totally abandoned by his subjects. Seeing that all was lost, he killed himself, as did Petreus, who had shared his good fortune and his adversity. His kingdom became a Roman province, of which Sallust was the first governor.

JUBA II. king of Mauritania, son of the preceding, being very young at the time of his father's death, was led as a captive in Cæsar's triumph. The conqueror required him for this act of humiliation by affording him the advantages of an excellent education, in consequence of which he became one of the most learned men of his time, and attained a conspicuous place as an author, by which he attained to more glory than he could have derived from the inheritance of a kingdom. He gained the hearts of the Romans by the courteousness of his manners, and Augustus rewarded his fidelity by giving him in marriage Cleopatra, the daughter of Antony, by conferring upon him the title of king, and making him master of all the territories which his father once possessed. Juba governed his dominions with a spirit of justice and lenity which gained him the esteem of his subjects. He distinguished himself as a writer by various learned works, which related to the history and antiquities of the Arabians, Assyrians, and Romans. He wrote also the history of theatres, of painting and painters, of the nature and properties of different animals, and a particular treatise on the virtues of the herb Euphorbia. He died about the year 24 of the Christian era, leaving a son, Ptolemy, afterwards put to death by Caligula. Juba is quoted with great applause by Pliny, Strabo, Plutarch, Tacitus, and some other authors. His popularity, as a lover, was so great, that the Mauritians rewarded his benevolence by making him one of their gods. The Athenians raised him a statue, and the Æthiopians did him homage as a deity. Univer. Hist. Suet.

JUBA, in *Geography*, a town of Syria, on the right banks of the Euphrates, on a narrow slip of land, formed by the winding of the river; 90 miles W.N.W. of Bagdad. N. lat. 53° 42'. E. long. 41° 58'.

JUBBAL, an island in the Red sea, N. lat. 27° 30'. E. long. 33° 40'.

JUBBIL, a town of the Arabian Irak, on the Tigris; 50 miles S.E. of Al Modain.

JUBBRA, a town of Bengal; 45 miles W.N.W. of Rangpur. N. lat. 23° 58'. E. long. 84° 58'.

JUBE, the *Arabo*, *Roal*, *Lefty*, or gallery over the elve

found in our ancient churches, from which the lessons in the mass and other church offices used to be read. It was so called from the readers or cantors asking the benediction of the abbot, dean, or other superior, before he began, in the following form: "Jube Domine benedicere."

JUBILEE, among the Jews, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonish captivity.

The word, according to some authors, comes from the Hebrew *jobel*, which signifies *fifty*; but this must be a mistake, for the Hebrew *יובל*, *jobel*, does not signify fifty; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 2, and 30, that is 48. Others say, that *jobel* signifies a ram, and that the jubilee was thus called because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the field. Maffei chooses to derive the word from *Jabal*, the first inventor of musical instruments, which, for that reason, were called by his name; whence the word *jobel* and *jubilatio* came to signify the year of deliverance and remission, because proclaimed with the sound of one of those instruments, which at first was no more than the horn of a ram. Hottinger, which whom Dr. Patrick agrees, is of opinion, that *Jobel* is a word invented to imitate the sound of the instrument; and that it does not signify the instrument itself, but the sound which it made. Others derive *jobel* from *יובל*, *jubil*, in Hebrew *יובל*, *jubil*, which signifies to recall or return; because the year restored all Jews to their liberty, &c. The last origin of this festival is in Lev. xxv. 8, 17.

The learned are divided about the year of jubilee; some maintain that it was every forty-ninth, and others that it was every fiftieth year. The ground of the former opinion is chiefly this, that the forty-ninth year, being of course a fabbatical year, if the jubilee had been kept on the fiftieth, the land must have had two fabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the other hand it is alleged, that the scripture expressly declares for the fiftieth year, Lev. xxv. 10, 11. And besides, if the jubilee and fabbatical year had been the same, there would have been no need of a prohibition to sow, reap, &c. because this kind of labour was prohibited by the law of the fabbatical year. (Lev. xxv. 4, 5.) The authors of the Universal History, book i. chap. 7. note R, endeavour to reconcile these opinions, by observing, that as the jubilee began in the first month of the civil year, which was the seventh of the ecclesiastical, it might be said to be either the forty-ninth or fiftieth, according as one or other of these computations was followed. The political design of the law of the jubilee, was to prevent the too great oppression of the poor, as well as their being liable to perpetual slavery. By this means the rich were prevented from accumulating lands for perpetuity, and a kind of equality was preserved through all the families of Israel, and the distinction of tribes was also preserved, in respect both to their families and possessions, that they might be able, when there was occasion, to the jubilee year, to prove their right to the inheritance of their ancestors. Thus also it would be known with certainty of what tribe or family the Messiah sprung, he served also, like the Olympiads of the Greeks, and the *lustrum* of the Romans, for the readier computation of time. The jubilee has also been supposed to be typical of the gospel dispensation, described by Isaiah, lxi. ver. 1, 2. in reference to this period, as the "acceptable year of the Lord."

Some learned men have attempted to prove by a calcula-

tion, thought by others to be tolerably exact, that if the Jews had still observed the jubilees, the fifteenth year of Tiberius, when John the Baptist first began to preach, would have been a jubilee, and consequently the last; since fifty years after, the Jewish commonwealth was no longer in being. This particular is of some consequence, if it be well founded, in our controversy with the Jews, who pretend, that the son of David will come during the last jubilee. And this also exactly agrees with the design of the gospel, already stated, which was to proclaim the grand jubilee, the spiritual freedom of the children of God foretold by the prophets Isaiah and Zechariah, and figured by the jubilees of the Jews. Other places the first jubilee, after the promulgation of the law by Moses, A. M. 2609, B. C. 1395; the second A. M. 2658. B. C. 1346; the third A. M. 2707, B. C. 1297, &c. thus reckoning 49 years from jubilee to jubilee.

JUBILEE, in a more modern sense, denotes a grand church solemnity, or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all sinners; at least to as many as visit the churches of St. Peter and St. Paul at Rome.

The jubilee was first established by Boniface VIII. in 1300, in favour of those who should go *ad limina apostolorum*; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the golden year; which occasioned Clement VI. 1350, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life.

Boniface IX. granted the privilege of holding jubilees to several princes and monasteries; for instance to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to visit the tomb of Thomas a Becket. Jubilees afterwards became more frequent, and the pope granted them as often as the church, or himself, had occasion for them. There was usually one at the inauguration of a new pope.

To be entitled to the privileges of the jubilee, the bull enjoins fastings, alms, and prayers. It gives the priests a full power to absolve, in all cases, even those otherwise reserved to the pope; to make commutations of vows, &c. in which it differs from a *plenary indulgence*. During the time of jubilee, all other indulgences are suspended.

See an enumeration of the various writers, who have treated of the institution of the Roman jubilee, in the "Bibliogr. Antiq." of Jo. Albert Fabricius; and the subject fully stated by the reverend Charles Chais, formerly minister of the French church at the Hague, in his "Lettres Historiques et Dogmatiques sur les Jubilés et des Indulgences," published at the Hague in three vols. 8vo. 1751. These letters contain the most full and accurate account that has ever been given of the institution of the jubilee, and of the rise, progress, abuses, and enormities of the infamous traffic of indulgences. This account is judiciously collected from the best authors of antiquity, and from several curious records that have escaped the researches of other writers; it is also interperfed with curious and sometimes ludicrous anecdotes, that render the work amusing as well as instructive. In the first volume of these letters the learned author lays open the nature and origin of the institution of the jubilee; he proves it to have been a human invention, which owed its rise to the avarice and ambition of the popes; and its credit to the ignorance and superstition of the people; the celebration of which was absolutely unknown before the thirteenth century,

century, which is the true date of its origin. He takes notice of the various changes which it underwent with respect to the time of its celebration, the various colours with which the ambitious pontiffs covered it, in order to render it respectable and alluring in the eyes of the multitude; and exposes these illusions by many convincing arguments, the gravity of which is seasoned with an agreeable and temperate mixture of decent raillery. He proves, with indisputable evidence, that the papal jubilee is an imitation of the "secular games" that were celebrated with such pomp in pagan Rome. He points out the gross contradictions that reign in the bulls of the different popes, with respect to the nature of this institution and the time of its celebration. Nor does he pass over in silence the infamous traffic of indulgences, the wordly pomp and splendour, the crimes, debaucheries, and disorders of every kind, that were observable at the return of each jubilee year. He lays also before the reader an historical view of all the jubilees that were celebrated from the pontificate of Boniface VIII. in the year 1300 to that of Benedict XIV. in 1750, with an entertaining account of the most remarkable adventures that happened among the pilgrims who repaired to Rome on these occasions.

One of our kings, viz. Edward III. caused his birth-day to be observed in manner of a jubilee, when he became fifty years of age, in 1362, but never before or after. This he did, by releasing prisoners, pardoning all offences, except treason, making good laws, and granting many privileges to the people.

We have lately, viz. in 1800, had a jubilee, on occasion of our sovereign George III. having attained to the fiftieth year of his reign.

There are particular jubilees in certain cities, when several of their feasts fall on the same day; as Puy en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons, when the feast of St. John Baptist concurs with the feast of Corpus Christi.

In 1640, the Jesuits celebrated a solemn jubilee at Rome; that being the centenary, or hundredth year from their institution, and the same ceremony was observed in all their houses throughout the world.

JUBILEUS, or JUBILEE, is used among the Romanists, to signify a religious who has been fifty years in a monastery, or an ecclesiastic who has been in orders fifty years.

Such veteran religious are dispensed with in some places from attending matins, or a strict observance of any other of their rules.

JUBILEUS is also extended to any man a hundred years old; and to a possession or prescription for fifty years, "Si ager non invenitur in scripturis, inquiratur de senioribus, quantum temporis fuit cum slero; & si sub certo jubileo mansit sine vituperatione, maneat in aeternum."

JUBO, in *Geography*, a kingdom of Africa, on the coast of Ajan, near the East Indian sea, with a capital of the same name, subject to the Portuguese. N. lat. 0 50'. E. long. 43 20'.—Also, a river of Africa, which runs into the Indian sea, a little to the N. of the equinoctial line, E. long. 42 46'.—Also, a town of Africa, in the kingdom of Benin.

JUBONES, a river of Peru, which runs into the Pacific ocean, S. lat. 5 20'.

JUCARIL, a town of Mexico, in the province of New Biscay; 110 miles N.W. of Patral.

JUCASATZ, a town of Slavonia; 25 miles S of Eszek.

JUCATAN. See YUCATAN.

JUCCA, in *Botany*, the name of a distinct genus of plants, otherwise called *Yucca*.

JUCENDRO, in *Geography*, a town of the island of Madagascar. S. lat. 23 10'. E. long. 47 14'.

JUCKASJERVI, a town of Swedish Lapland; 145 miles N.W. of Tornea. N. lat. 67 50'. E. long. 20 46'.

JUCKATAGHERI, a town of Hindoostan, in the Carnatic; five miles E. of Muggie.

JUCKING, the notes of a cock partridge, inviting the hen to come to him. These serve the sportsmen in good stead for finding the places where they are.

JUCLEZ, in *Geography*, a town of Turkestan; 45 miles S.W. of Turkestan.

JUCURUTA, in *Ornithology*, a very beautiful species of owl, found in the Brazils, and variegated with black and yellow.

JUD, in *Mining*, is applied, in the collieries in Derbyshire, to a certain depth of coal in the face of their work, which will fall at once, after the holers have undermined the same, and the hammer-men have applied their wedges near to the roof: it is also called the web, and the rib of coal in some places, and is limited, like the face of the coal, by parallel vertical lines or long way joints; the backs of Newcastle colliers.

JUDEA AGRICOLA. See AGRICOLA.

JUDEA. See JUDEA.

JUDAH, in *Scripture Biography*, the fourth son of Jacob and Leah, was born in Melopotamia, A.M. 2249, B.C. 1755; and was always regarded as the chief of Jacob's children. The privileges of the first-born seem to have been transferred from Reuben to him, after the incest of Reuben with Bilhah his father's wife. For the blessing pronounced by Jacob on his death-bed to Judah, see Gen. xlix. 8—12. That part of it which occurs in the 10th verse, seems to imply, that the regal power should not go out of his family, and that the Messiah should derive his birth from it.

JUDAH, LEU, in *Biography*, a learned Protestant divine, son of John Judah, a German priest, was born in the year 1482. When he was about twenty years of age, he was sent to Basil to pursue his academical studies. Here he had for a fellow student, the afterwards much celebrated Zaingle, and from him, who had at a very early age been shocked at the superstitious practices of the church of Rome, he received such impressions, and was directed to such enquiries, as predisposed him to embrace the reformed religion. Having obtained his degree of M.A. he was appointed minister of a Swiss church, to the duties of which he applied himself with industry & zeal. His studies led him to renounce the distinguishing tenets of popery, and an adoption of those of the reformation. He openly preached in defence of the Protestant religion, was appointed by the magistrates and ecclesiastical assembly of Zurich pastor of the church of St. Peter in that city, and became very celebrated as an advocate, as well from the press as the pulpit, of the system to which he was a convert. At the desire of his brethren, he undertook a translation, from the Hebrew into Latin, of the whole Old Testament. The magnitude of the work, and the closeness with which he applied to it, were more than he was able to bear, and before he had completed it, he fell a sacrifice to his labours in 1542, when he was about sixty years of age. The translation was finished by other hands, and was printed at Zurich in 1543, and two years afterwards it was reprinted at Paris by Robert Stevens, accompanying the vulgar version, in adjoining columns, but without the name of the author of the new version. Judah was likewise the author of "Annotations"

tions" on divers books of the Old and New Testament, and of two catechisms. Gen. Biog.

JUDAH, Tribe of, in *Scripture Geography*, a canton of Palestine, which extended S. of Benjamin, about 27 miles, quite to the mountains of Seir, or Edom, which were the frontiers between it and Idumaea. It was bounded on the E. by the Dead sea, and on the W. by the tribes of Dan and Simeon, both which lay between it and the Mediterranean. Judah was reckoned the largest and most populous tribe of all the twelve, and the inhabitants were the stoutest and most valiant. It was, moreover, the chief and royal tribe, from which the kingdom was denominated. The land was beautifully variegated with fertile plains, hills, dales, lakes, and fountains, and it produced great plenty of corn, wine, oil, fruits, and pasture, except where it lay contiguous to Idumaea. It was properly in this territory of Judah, that the Canaanites dwelt, and here Abraham and his descendants sojourned, till they went down into Egypt. The most remarkable places of this tribe were Azekah, Bethlehem, Bethzor, Emmaus, Engedi, Hebron, Libna, Makkedah, Maon, Muffah, Tekoah, and Ziph; which see respectively.

One of the principal prerogatives of this tribe was, that it preserved the true religion, and the public exercise of the priesthood, with the legal ceremonies in the temple of Jerusalem; while the ten tribes gave themselves up to idolatry, and the worship of the golden calves. This tribe, at the Exodus, was composed of 74,600 men, capable of bearing arms.

JUDAH, Kingdom of, a denomination given to the maimed kingdom of Rehoboam, in contradistinction to that of Israel, upon the revolt of the ten tribes. The crown passed from Benjamin (from Saul and Ishobeth) into Judah, which was David's tribe, and that of the kings his successors, until the Babylonish captivity. And after the return from that captivity, although this tribe did not reign, it gave the sceptre to those who did reign, and in a certain sense reunited in itself the whole Hebrew nation, which from that time was known only as "Judæi," Jews, descendants of Judah. See JEWS and ISRAEL.

JUDAICUS LAPIS, a small, grey, soft, brittle stone, in form of an olive, having lines drawn regularly on its surface, as if they were formed by art.

This is a kind of extraneous fossil, being a spine of an echinus marinus petrified. This stone has by many been supposed to be a fossil body in its native figure, but is really the remains of a spine of an echinus, filled with a plated spar. It is very common in Syria, and is sometimes found with us. See SPAR.

These extraneous fossils are the petrified spines of echini, aculei echinorum, or teolithi of Pliny, which the chalk strata, and those of the Bath freestone in England, produce in great perfection and variety of shapes; some of them occasioned by disease in the animal, as is probable, from the observations of Mr. Sowerby. It is not very common, that the spines are found attached to the fossil echini: a specimen of this kind, imbedded in a black flint, sold for 20 guineas, we are told, at the sale by auction of the late Sir Aston Lever's museum. The fossil spines of most of the echini differ so much from the recent spines, that Linnæus doubted whether they really were such, a matter now placed beyond any doubt, by the discovery of specimens like that above mentioned.

JUDAISM, the religious doctrines and rites of the Jews, which, as well as their commonwealth, (see THEOCRACY,) are attributed by Moses wholly to God. Judaism was but a temporary dispensation, and was to give way, at

least the ceremonial part of it, at the coming of the Messiah. For a complete system of Judaism, see the books of Moses. Judaism was anciently divided into several sects; the principal whereof were the *Pharisees, Sadducees,* and *Essenes*; which see respectively.

At present there are two sects among the Jews, viz. the *Ceretics*, (which see,) who admit of no rule of religion but the law written by Moses; and the *Rabbinists*, who add to the law the traditions of the Talmud. See **RABBINISTS** and **TALMUD**.

It has been observed that Judaism, of all religions, is that which is the most rarely abjured. In the 18th of Edward I. the parliament granted the king a fifteenth for the expulsion of Judaism.

In England formerly, the Jews and all their goods belonged to the chief lord where they lived, and he had such absolute property in them, that he might sell them; for they had not liberty to remove to another lord without leave. Mat. Paris tells us, that Henry III. sold the Jews to earl Richard, his brother, for a term of years, that *quos rex excariverat, comes vicecarat*.

They were distinguished from the Christians both living and dying; for they had proper judges and courts wherein their causes were tried, and they wore a badge on their breast over their clothes in shape of a table; and they were fined, if they stirred abroad without such badges. They were never buried in the country, but always brought up to London, and interred without the walls.

JUDAN, in *Geography*, a town of Hindoostan, in Baglana; 20 miles W. of Junere.

JUDAS MACCABÆUS. See **MACCABÆUS**.

JUDAS-TREE, in *Botany*. See **CERCIS**.

JUDDA, in *Geography*, a town of Hindoostan, in the circar of Gurrah; 10 miles E. of Mahur.

JUDE, or *the Epistle of Jude*, a canonical book of the New Testament, written against the heretics; who, by their impious doctrines and disorderly lives, corrupted the faith and good morals of the Christians.

The author of this epistle, called Judas, and also Thaddeus and Lebbeus, was one of the 12 apostles; he was the son of Alphaeus, brother of James the Less, and one of those who were called our Lord's brethren. We are not informed, when or how he was called to be an apostle; but it has been conjectured, that before his vocation to the apostleship he was an husbandman, that he was married, and that he had children. The only account we have of him in particular, is that which occurs in John, xiv. 21, 22, 23. It is not unreasonable to suppose, that, after having received, in common with the other apostles, extraordinary gifts at the pentecost, he preached the gospel for some time in several parts of the land of Israel, and wrought miracles in the name of Christ. And, as his life seems to have been prolonged, it is probable that he afterwards left Judea, and went abroad preaching the gospel to Jews and Gentiles in other countries. Some have said that he preached in Arabia, Syria, Mesopotamia, and Persia; and that he suffered martyrdom in the last-mentioned country. But we have no account of his travels upon which we can rely; and it may be questioned whether he was a martyr.

In the early ages of Christianity, several rejected the Epistle of St. Jude, because the apocryphal books of Enoch, and the ascension of Moses, are quoted in it. Nevertheless it is to be found in all the ancient catalogues of the sacred writings; and Clement of Alexandria, Tertullian, and Origen, quote it as written by Jude, and reckon it among the books of sacred scripture: in the time of Eusebius it was generally received. As to the objections that have

been urged against its authority, Dr. Lardner suggests, that there is no necessity for supposing that St. Jude quoted a book called Enoch, or Enoch's prophecies; and even allowing that he did quote it, he gives it no authority; it was no canonical book of the Jews, and if such a book existed among the Jews, it was apocryphal, and yet there might be in it some right things. Instead of referring to a book, called the "Assumption or Ascension of Christ," which probably was a forgery much later than his time, it is much more credible, that St. Jude refers to the vision in Zech. iii. 1-3. It has been the opinion of several writers, and among others of Hammond and Benson, that St. Jude addressed his epistle to Jewish Christians; but Dr. Lardner infers, from the words of the inscription of the epistle v. 1, and v. 3, that it was designed for the use of all in general, who had embraced the Christian religion. The last mentioned author supposes, that this epistle was written in the year of Christ 64, 65, or 66. Lardner's Works, vol. vi. See EPISTLES.

JUDEA, in *Ancient Geography*, a province of Asia, more anciently called the *land of Canaan*, the *land of Promise*, the *Holy Land*, and *Palestina*; which see. It was called *Judæa*, from Judah, whose tribe was the most considerable of the 12, and possessed the most fertile part of the whole. It did not assume the name of Judæa, till after the return of the Jews from the Babylonish captivity, though it had been denominated, long before, the kingdom of Judah, in opposition to that of Israel. After their return, this tribe, which was the only one that made a figure, settled first at Jerusalem, and in the adjacent territories, and then spread through the whole country, so that the name of Jehudah and Jehudim extended itself to all the rest. (See JUDAH.) Judæa was also called Syria, Palestine-Syria, Coele-Syria, and Phœnicia. It was also called Idumæa, merely because the Idumæans seized on some parts of it during the Babylonish captivity. The modern name, especially among Christians and Mahometans, is *Palestine*; which see.

Before the arrival of the Hebrews, Judæa was governed by Canaanitish kings, each in his respective city. (See CANAAN.) When Joshua conquered it, he governed it as the viceroy of Jehovah, according to the form of the Jewish theocracy. The elders succeeded Joshua, about 15 years; after which the Israelites fell into a kind of anarchy for seven or eight years. They were governed by Judges for about 317 years; then by kings from Saul to the Babylonish captivity about 507 years. After the captivity, Judah continued subject to the kings of Persia, then to Alexander the Great, and his successors; sometimes to the kings of Syria, sometimes to the kings of Egypt; paying, nevertheless, great deference, in matters of private government, to the high priest, and to princes of the family of David. From the time of the Maccabees, they continued in possession of the sovereign authority, till the reign of Herod the Great, about 135 years. See Jews.

JUENBACH, in *Geography*, a town of Germany, in the principality of Coburg; 12 miles N.E. of Coburg.

JUENBURG, a town and capital of Upper Stiria, on the river March, on a plain surrounded with lofty mountains, always covered with snow. It has a castle, college, and two convents. The French took it in 1797; 32 miles W.N.W. of Gratz. N. lat. 47° 10' E. long. 14° 25'.

JUDGE, an officer appointed by the sovereign powers of any country, to distribute that justice to their subjects which they cannot administer in person.

The character of judge is part of the regal authority, wherof the king boasts himself.

The chief function of judges is for the trial of causes both civil and criminal.

The English judges are chosen out of the sergeants at law, and are constituted by letters patent. Their commissions are bounded with this limitation, "facturi quod ad justitiam pertinent secundum legem & consuetudinem Angliæ;" and at their creation they take an oath, that they will indifferently minister justice to all them that shall have any suit or plea before them; and that they will not forbear to do, though the king, by his letters, or by express word of mouth, should command the contrary; and they are answerable in body, land, and goods. 18 Ed. III. c. 1.

By the law of England all judges must derive their authority from the crown, by some commission warranted by law. The judges of the king's bench, common pleas, and the barons of the exchequer, are all (excepting the chief justice of the king's bench, who is created by writ) appointed by patent. Formerly they held their places only during the king's pleasure; but now, for the greater security of the liberty of the subject, by statute 13 Will. III. c. 2. their commissions are to be *quamdiu se bene gesserint*, and their salaries are ascertained and established; and by 1 Geo. III. c. 23. they are to continue, notwithstanding the demise of the crown; and their full salaries are absolutely secured to them during the continuance of their commissions. Though upon an address of both houses of parliament they may be lawfully removed.

Judges must exercise their authority in a legal manner, and hold their courts in their proper persons; for they cannot act by deputy, nor any way transfer their power to another, as the judges of ecclesiastical courts may. Yet when there are several judges in a court of record, the act of any one of them is effectual, provided their commissions do not require more: so likewise what is executed by a majority present, is the act of the court; but where they are equally divided in opinion, the cause is to be removed into the exchequer chamber, and for that purpose a rule is to be made, and the record certified, &c. Some things done by judges at their chambers are accounted as done by the court; and that they may be prepared to hear what is to come before them, they are to have a paper of the causes to be heard, sent to them by the attorneys the day before they are spoken to; that if, upon reading the record of any cause, any special matter that arises should appear doubtful, they may satisfy themselves by consulting books.

The judges are bound by oath to determine according to the known laws and ancient customs of the realm. Their rule herein must be the judicial decisions and resolutions upon the various causes that have occurred, and not their own arbitrary will and pleasure, or that of their prince.

Judges are free from all prosecutions for any thing done by them in court, which appears to have been an error of their judgment. But for wilful corruption, they have been complained of to the star-chamber formerly, and may now be called to an account in parliament.

It has been said, that scandalous reflections on the judges in Westminster-hall are within the statute of *scandalum mag-natum*.

Those who use threatening or reproachful words to a judge sitting in the courts, are guilty of a high misdemeanor, and have been punished with large fines, imprisonment, and corporal punishment. (Cro. Car. 503.) Assaulting a judge, sitting in the court, by drawing a weapon, without any blow struck, is punishable with the loss of the right hand, imprisonment for life, and forfeiture of goods and chattels, and of the profits of the person's lands during life (3 Inst.

140, 141.); and slaying the chancellor, treasurer, or the king's justices of either bench, justices in eyre, or justices of assize, and all other justices assigned to hear and determine, being in their places doing their offices, is a species of treason by 25 Edw. III. c. 2. However, the barons of the exchequer, as such, are not within the protection of this act. (1 Hal. P. C. 231.) Judges, who become solicitors in a cause which they are to judge, and privately and extrajudicially tamper with witnesses, or labour jurors, may be dealt with according to the same capacity to which they lawfully degrade themselves. Bribery in judges is punishable by loss of office, fine, and imprisonment; and by the common law, bribery of judges in relation to a cause depending before them, has been punished as treason. If a judge ignorantly condemns a man to death for felony, when it is not felony; for this offence he shall be fined and imprisoned, and lose his office. If a judge, who hath no jurisdiction of the cause, give judgment of death and award execution, which is executed, such judge is guilty of felony; and also the officer who executes the sentence. And if justices of the peace, on indictments of trespass, arraign a man of felony, and judge him to death, and he is executed, it is felony in them. A judge ought not to judge in his own cause, nor in pleas where he is party.

It was formerly enacted, stat. 33 Hen. VIII. c. 24. that none should be justices of assizes within the county where they were born, or do inhabit: but this is repealed by a late statute, 12 Geo. II. c. 27.

It was formerly held, that by a justice's acceptance of any new name of dignity, his commission was determined; but this was remedied by statute: Edw. VI. c. 7. But it has been doubted, whether the dignity of baronet, created since that statute, is within the equity of it.

JUDGES of Hell. See HELL and TANTARUS.

JUDGE, Itinerant. See ITINERANT.

JUDGE Martial, or Advocate General, the supreme judge in martial law as to the jurisdiction and powers of military courts. It is incumbent upon this person, as well as upon his deputies, to be well acquainted with the laws of the land, that they may admonish the court or president when their proceedings are tending to infringe the civil law. He is register of courts-martial, and should take down the evidence in the very words of the witnesses. He is neither a judge nor a juror as to the charge.

JUDGE, in Scripture, is applied to certain eminent persons chosen by God himself to govern the Jews, from the time of Joshua till the establishment of the kings. For the nature and duration of their office, and the powers with which they were invested, see JEWS.

The judges were not ordinary magistrates, but were appointed by God on extraordinary occasions, as to head the armies, to deliver the people from their enemies, &c.—Salian has observed that they not only presided in courts of justice, but were also at the head of the councils, the armies, and of every thing that concerned the government of the state; though they never assumed the title either of princes, governors, or the like.

Salian remarks seven points wherein they differed from kings. 1. They were not hereditary. 2. They had no absolute power of life and death, but only according to the laws, and dependently upon them. 3. They never undertook war at their own pleasure, but only when they were commanded by God, or called to it by the people. 4. They exacted no tribute. 5. They did not succeed each other immediately, but after the death of one there was frequently an interval of several years before a successor was appointed.

6. They did not use the ensigns of sovereignty, the sceptre or diadem. 7. They had no authority to make any laws, but were only to take care of the observance of the laws of Moses.

Godwin, in his "Moses and Aaron," compares them to the Roman dictators, who were appointed only on extraordinary emergencies, as in case of war abroad, or conspiracies at home; and whose power, while they continued in office, was great, and even absolute. Thus the Hebrew judges seem to have been appointed only in cases of national trouble and danger. This was the case particularly with respect to Othniel, Ehud, and Gideon. The power of the judges, while in office, was very great; nor does it seem to have been limited to a certain time, like that of the Roman dictators, which continued for half a year: nevertheless it is reasonable to suppose, that when they had performed the business for which they were appointed, they retired to a private life. This Godwin infers from Gideon's refusing to take upon him the perpetual government of Israel, as being inconsistent with the theocracy.

Besides these superior judges, every city in the Hebrew commonwealth had its elders, who formed a court of judicature, with a power of determining lesser matters in their respective districts. The rabbies say, there were three such elders or judges in each lesser city, and twenty-three in greater. But Josephus, whose authority has greater weight, speaks of seven judges in each, without any such distinction of greater and less. Sigonius (De Republ. Heb. l. vi. c. 6.) supposes that these elders and judges of cities were the original constitution settled in the wilderness by Moses, upon the advice given him by Jethro (Exod. xxviii. 21, 22.); and continued by divine appointment after the settlement in the land of Canaan; whereas, others imagine that the Jethronian prefectures were a peculiar constitution, suited to their condition while encamped in the wilderness, but laid aside after they came into Canaan. It is certain, however, that there was a court of judges and officers, appointed in every city, by the law of Moses. (Deut. xvi. 18.) How far, and in what respects, these judges differed from the elders of the city, it is not easy to ascertain; and whether they were the same or different persons. Perhaps the title elders may denote their seniority and dignity; and that of judges, the office they sustained. The lower courts of justice, in their several cities, were held in their gates. (Deut. xvi. 16.) See GATE. Each tribe had its respective prince, whose office related chiefly, if not altogether, to military affairs. We read also of the princes of the congregation, who presided in judiciary matters. These are called elders, and were seventy in number. (Numb. xi. 16, 17, 24, 25.) But it does not appear whether or not this consultative of seventy elders was a perpetual, or only a temporary institution. Some have supposed that it was the same that afterwards became famous under the appellation of Sanhedrim; but others conceive the institution of the seventy elders to have been only temporary, for the assistance of Moses in the government, before the settlement in the land of Canaan; and that the Sanhedrim was first set up in the time of the Maccabees. See SANHEDRIM.

JUDGE, in Mining, is applied, in the coal-pits of Nottinghamshire and Derbyshire, to a piece of board cut to a wedge-like shape, which should fit exactly into any part of the excavation made under the face or bank of the coals, by the holers, in order to loosen them. The length of the judge is regulated by the depth or width of the jud, or web of coal which will fall at once; and the overlooker is required daily to try the judge in the holing, to see that the holers

holers undermine sufficiently far back; and yet, in order to save themselves trouble, do not make the hole higher than the judge, and thereby cut away and waite the jud of coal. These proecesses of coal-digging are particularly described in Mr. Farey's Report, vol. i. p. 344.

JUDGES, or *Book of Judges*, is a canonical book of the Old Testament, containing the history of the Israelite judges, of whom we have been speaking in a preceding article.

The author is not known: it is probable the work did not come from any single hand, being rather a collection of several little histories, which at first were separate, but were afterwards collected by Ezra, or Samuel, into a single volume; and, in all likelihood, were taken from the ancient journals, annals, or memoirs, composed by the several judges.

The antiquity of this book is unquestionable, as it must have been written before the time of David; since the description (chap. i. v. 21.) was no longer true of Jerusalem, after he had taken possession of it, and had introduced a third class of inhabitants of the tribe of Judah. Eichorn acknowledges, that it doth not bear any marks of subsequent interpolation. Dr. Patrick is of opinion that the five last chapters are a distinct history, in which the author gives an account of several memorable transactions, which occurred in or about the time of the judges; whose history he would not interrupt by intermixing these matters with it, and therefore reserved them to be related by themselves, in the second part, or appendix. In these he first gives an account how idolatry crept into the tribe of Ephraim, then how it was propagated among the Danites; after which he relates a most heinous act of adultery, committed in the tribe of Benjamin; which introduces the history, first, of the almost total destruction of that tribe for their countenancing that detestable fact, and then of its restoration. Eichorn also supposes that these chapters are distinct fragments of a less certain date, but posterior to David (chap. xviii. v. 31.), under whom the house of God ceased to be in Shiloh.

JUDGMENT, or the second operation of the mind in the acquisition of knowledge (the first being perception), is a faculty of the soul, by which it perceives the relation between two, or more, ideas: or the concurrence or coincidence of two ideas, or the want of concurrence or coincidence. Two ideas, being compared together, concur, as in the instance of milk and whiteness; and they coincide, as in those of God and Creator; or they do not concur, as vice and usefulness, or they do not coincide, as man and brute.

Thus, when we judge, that the sun is greater than the moon, the understanding first compares the two ideas of the sun and the moon; and, finding the idea of the sun greater than that of the moon, the will perfectly acquiesces in that perception, nor puts the mind upon any farther enquiry.

It is not the understanding, then, that judges, as is ordinarily thought; judgments and reasonings on the part of the understanding, are but mere perceptions; it is the will alone that judges, by acquiescing in what is represented to it by the understanding.

The only difference, then, between *perception*, *judgment*, and *reasoning*, so far as the understanding is concerned in them, is this; that it perceives a thing simply, without any relation to any other thing, in a simple perception; that it perceives the relations between two or more things in judgments; and, lastly, that it perceives the relations that are between the relations of things in reasonings; so that all the

operations of the understanding are in effect no more than pure perceptions.

Thus, when we perceive, for instance, twice 2, or 4, this is no more than a simple perception; when we judge, that twice 2 are 4, or that twice 2 are not 5, the understanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5. Farther, reasoning consists in perceiving the relation, not between two or more things, for that would be a judgment, but of two or more relations of two or more things: thus, when I conclude, that 4 being less than 6, twice 2 being 4, are by consequence less than six; I perceive not only the relation of inequality between 2 and 4, and 6 (for this were only a judgment), but also the relation of inequality between the relation of twice 2 and 4, and the relation between 4 and 6; which constitutes a reasoning. The understanding, therefore, only perceives, and it is the will that judges and reasons, in assenting voluntarily to what the understanding represents.

Indeed, when the things which we consider appear clear and perfectly evident, it seems as if it were not voluntarily, that the mind consents to them; whence we are led to think, that it is not properly the will, but the understanding that judges of them. But to clear this point it must be observed, that the things which we consider, never appear entirely evident, till the understanding has examined them on all sides, and has perceived all the relations necessary to judge of them; whence it happens, that the will, not being able to will any thing without knowledge, cannot act on the understanding; that is, cannot desire it to represent any thing new in its object, as having already viewed it on all sides that have any relation to the question in hand. It is obliged then to rest in what has been already represented, and to cease to agitate and disturb it any farther; in which cessation it is that judgment consists.

This rest or judgment, then, not being free when things are in their last evidence, we are apt to imagine, that it is not the effect of the will. So long as there is any thing obscure in the subject that we consider, or that we are not fully satisfied that we have discovered every thing necessary to resolve the question, as it happens in most of those things that are difficult, and that contain various relations; we remain at liberty not to acquiesce: the will may command the understanding to pursue its enquiries farther, and to make new discoveries, whence it is, that we are more ready to allow the judgments formed on these subjects to be voluntary.

Most philosophers, however, maintain, that even the judgments which we form on obscure things are not voluntary; and will have our consenting to the truth to be an action of the understanding, which they call *assent*, to distinguish it from our consenting to goodness, which they attribute to the will, and call it *consent*.

But their error is owing to this, that in our present state we frequently see things to be evidently true, without the least reason to doubt of them; in which case the will is not at liberty either to give or refuse her assent: but it is not so in matters of goodness; there being nothing, which we do not know some reason for forbearing to love. So that we here perceive a manifest indifference, and are fully convinced, that when we love any thing, even God, for instance, we use our liberty, and do it voluntarily. But the use we make of our liberty is not so apparent, when we consent to the truth especially when it appears perfectly evident; and this leads us to think, that our consent to truth, that is, our *assent*, is not voluntary; as if an action, to be voluntary, must be indifferent; as if the blessed above did not love God voluntarily.

rarily, because they cannot be diverted from it by any other thing; nor we content freely to this evident proposition, that twice 2 are 4, because we have no appearance of reason to dissuade us from it.

Mr. Locke (b. iv. c. 14.) distinguishes between knowledge and judgment; the former being that faculty of the mind, by which it certainly perceives, and is undoubtedly satisfied of the agreement or disagreement of any ideas; the latter, or judgment, is the putting of ideas together, or the separating of them from one another in the mind, when their certain agreement or disagreement is not perceived, but presumed to be so; which is, as the word imports, taken to be so before it certainly appears; and if it so unites or separates them, as in reality things are, it is right judgment. A judgment, called by Mr. Locke a mental proposition, is that union or separation of the ideas which is the result of the act of judging; and this may exist without any connection with words; though, as men are very much used to connect ideas with words, it is very difficult to treat of judgments as distinguished from verbal propositions. (See PROPOSITION.) The sources of judgment are consciousness, sense, intuition, and testimony. See each of these articles respectively. The definition commonly given of judgment, by the more ancient writers in logic, was, that it is an act of the mind, by which one thing is affirmed or denied of another. Dr. Reid thinks this to be as good a definition as can be given, and prefers it to some others; but it is evidently liable to objections, which he has stated. Judgment is a solitary act of the mind, and the expression of it by affirmation or denial is not at all essential to it; and therefore the definition must be restricted to mental affirmation or denial, which, as he says, is only another name for judgment. Besides, affirmation or denial is very often the expression of testimony, which is a different act of the mind, and ought to be distinguished from judgment. Judgment, as Dr. Reid proceeds to observe, is an act of the mind specifically different from simple apprehension, or the bare conception of a thing; for although there can be no judgment without a conception of the things about which we judge, yet conception may be without any judgment. Judgment can be expressed by a proposition only, and a proposition is a complete sentence; but simple apprehension may be expressed by a word or words, which make no complete sentence. It is self-evident, that every judgment must be either true or false; but simple apprehension or conception can neither be true nor false. Again, one judgment may be contradictory to another; and it is impossible for a man to have two judgments at the same time, which he perceives to be contradictory. But contradictory propositions may be conceived at the same time without any difficulty. Dr. Reid observes, that there are some notions or ideas that ought to be referred to the faculty of judgment as their source; because if we had not that faculty, they would not enter into our minds; e.g. we could not have the idea of any relation without some exercise of judgment, and yet the relations of things constitute one great class of our notions or ideas. It is further remarked, that in persons come to years of understanding, judgment necessarily accompanies all sensations, perception by the senses, consciousness and memory, but not conception. The man who feels pain, judges and believes that he is really pained; a person who perceives an object believes that it exists, and is what he distinctly perceives it to be; nor is it in his power to avoid such judgment; and the same may be said of memory and consciousness. All operations of this kind are accompanied with a determination that something is true or false, and a consequent belief. If this determination be not judgment, it is an operation without a name; for it is

not simple apprehension, neither is it reasoning; it is a mental affirmation or negation; it may be expressed by a proposition affirmative or negative, and it is accompanied with the firmest belief. "These," says Dr. Reid, "are the characteristics of judgment, and I must call it judgment, till I can find another name for it." The judgments we form are either of things necessary, or of things contingent. Our assent to necessary propositions is not grounded upon any operation of sense, of memory, or consciousness, nor does it require their concurrence; it is unaccompanied by any other operation but that of conception, which must accompany all judgment; and therefore this judgment of things necessary may be called pure judgment. Our judgment of things contingent must always rest upon some other operation of the mind, such as sense or memory, or consciousness, or credit in testimony.

In common language, there are many forms of speech which shew that the senses, memory, and consciousness, are considered as judging faculties. Evidence is the ground of judgment, and when evidence is perceived, it is impossible not to judge. Dr. Reid, adverting to the notion of judgment, which, he thinks, is peculiar to Mr. Locke, and which we have already stated, expresses his opinion, that there can be no knowledge without judgment, though there may be judgment without that certainty which we commonly call knowledge. In order to avoid disputes about the meaning of words, this author wishes to be understood as giving the name of judgment to every determination of the mind concerning what is true or what is false. This, he thinks, is what logicians, from the days of Aristotle, have called judgment. "Whether it be called one faculty," he says, "as I think it always has been, or whether a philosopher chuses to split it into two, seems not very material. And if it be granted, that by our senses, our memory and consciousness, we not only have ideas or simple apprehensions, but form determinations concerning what is true and what is false; whether these determinations ought to be called *knowledge* or *judgment*, is of small moment."—"Philosophers," says the same writer, "have never been able to give any definition of judgment which does not apply to the determination of our senses, our memory, and consciousness, nor any definition of simple apprehension which can comprehend those determinations." Judgments of this kind may, in the strictest sense, be called "judgments of nature," nor do they admit of improvement by culture.

Dr. Reid further observes, that some exercise of judgment is necessary in the formation of all abstract and general conceptions, whether they be more simple or more complex; in dividing, in defining, and, in general, in forming all clear and distinct conceptions of things, which are the only fit materials of reasoning. He adds, that all our notions of relations may more properly be ascribed to judgment as their source and origin, than to any other power of the mind. The notions of unity and number are so abstract, that it is impossible they should enter into the mind until it has some degree of judgment. Judgment is also an ingredient in all matters of taste; in all moral determinations; and in many of our passions and affections. So that this operation, after we come to have any exercise of judgment, mixes with most of the operations of our minds, and, in analysing them, cannot be overlooked without confusion and error. Reid's Essays, *ess. vi. chap. 1.*

JUDGMENT, in a *Legal Sense*, is a sentence or decision pronounced by authority of a king, or other power, either by their own mouth, or by that of their judges, and officers, whom they appoint to administer justice in their stead.

Judgments are the sentence of the law, pronounced by the

the court upon the matter contained in the record; and they are of four sorts. 1st. Where the facts are confessed by the parties, and the law determined by the court; as in case of judgment upon *demurrer*. (See DEMURRER.) 2^{dy}. Where the law is admitted by the parties, and the facts disputed; as in case of judgment upon a *verdict*. (See VERDICT.) 3^{dy}. Where both the fact and the law arising thereon are admitted by the defendant; which is the case of judgments by *confession or default*. (See those articles.) 4^{thly}. Where the plaintiff is convinced that either fact, or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution; which is the case in judgments upon a *nonuit or retraxit*; which fee.

The judgment, though pronounced or awarded by the judges, is not their determination or sentence, but the determination and sentence of *the law*; and, in short, it is the remedy prescribed by law for the redress of injuries; and the suit or action is the vehicle or means of administering it. What that remedy may be, is, indeed, the result of deliberation and study to point out; and therefore the file of the judgment is, not that it is decreed or resolved by the court, for then the judgment might appear to be their own; but "it is considered," *consideratum est per curiam*, that the plaintiff do recover his damages, his debt, his possession, and the like; which implies, that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and enquiry. All these species of judgments are either *interlocutory* or *final*. For the former, see INTERLOCUTORY. *Final* judgments are such as at once put an end to the action, by declaring that the plaintiff has either entitled himself, or has not, to recover the remedy for which he sues. In which case, if the judgment be for the plaintiff, it is also considered, that the defendant be either amerced, for his wilful delay of justice is not immediately obeying the king's writ by rendering the plaintiff his due (8 Rep. 40. 61.); or be taken up, *captivatus*, till he pays a fine to the king for the public misdemeanor, which is coupled with the private injury, in all cases of force (8 Rep. 59. 11 Rep. 43. 5 Mod. 285.), of falshood in denying his own deed, (F. N. B. 121. Co. Litt. 131. 8 Rep. 60. 1 Roll. Abr. 219. Lill. Entr. 379. C. B. Hil. 4 Ann. Rot. 430.) or unjustly claiming property in replevin, or of contempt by disobeying the command of the king's writ or the express prohibition of any statute. (8 Rep. 60.) But now, in case of trespass, ejectment, assault, and false imprisonment, it is provided by the statute 5 & 6 W. & M. c. 12., that no writ of *captus* shall issue for this fine, nor any fine be paid; but the plaintiff shall pay *6s. 8d.* to the proper officer, and be allowed it against the defendant among his other costs. And therefore upon such judgments, in the common pleas, they used to enter that the fine was remitted, and now in both courts they take no notice of any fine or *captus* at all. (8 Rls. 54. Carth. 399.) But if judgment be for the defendant, then in case of fraud and deceit in the court, or malicious or vexatious suits, the plaintiff may also be fined (8 Rep. 59. 60.); but in most cases it is only considered, that he and his pledges of prosecuting be (nominally) amerced for his false claim, *pro falso clamore suo*, and that the defendant may go there without a day, *ex iudice sine die*, that is, without any further continuance or adjournment; the king's writ, commanding his attendance, being now fully satisfied, and his innocence publicly cleared. To judgments coils are a necessary appendage. See COUS. Blackitt. Com. book iii.

In every judgment there ought to be three persons, *actor, reus, and iudex*; plaintiff or prosecutor, defendant, and judge.

Judgment may be given not only upon the trial of the issue, but on a default, confession, demurrer, or an outlawry, which is a judgment in itself. After issue joined in a cause, the plaintiff may, if he thinks proper, accept of a judgment from the defendant; but on such a judgment, a writ of error may be had without putting in bail, which cannot be done on a judgment after verdict. All judgments given in course of record must be entered; in order to which the plaintiff's attorney, four days after the record is brought into court, may, if the judgment is out, enter judgment by the usual course of the court; but he cannot do this sooner, because the defendant must have time to bring in a writ of error, or to find out matter for an arrest of judgment. The defendant may oblige the plaintiff to enter his judgment, in order that he may plead it to any other action; and judgment upon a demurrer to a declaration, &c. which does not pass upon the merits of the cause, is no bar to it, though other judgments may be pleaded in bar to any action brought again for the same thing. Judgments are to continue till they are reversed; but an action of debt will lie on a good judgment, as well after a writ of error is brought, as before it. If a plaintiff does not take out an execution within a year and a day after judgment is obtained, the judgment must be revived by a *scire facias*.

JUDGMENT for Crimes, succeeds trial and conviction, in such crimes and misdemeanors as are either too high, or too low, to be included within the benefit of clergy. For when, upon a capital charge, the jury have brought in their verdict guilty, in the presence of the prisoner; he is either immediately, or at a convenient time soon after, asked by the court, if he has any thing to offer, why judgment should not be awarded against him. And in case the defendant be found guilty of a misdemeanor, (the trial of which may, and does usually, happen in his absence, after he has once appeared,) a *capias* is awarded and issued, to bring him in to receive his judgment; and, if he absconds, he may be prosecuted even to outlawry. (See ARREST of Judgment.) When all resources fail, the court must pronounce that judgment, which the law hath annexed to the crime. Judgment, in case of treason or felony, must be by an express sentence, an outlawry, or abjuration; and no judgment can be inflicted contrary to law, or that is not appointed by act of parliament. These judgments are of very different kinds, some are capital, extending to the life of the offender, and consisting generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or disgrace, are superadded; as in treasons of all kinds, the offender is sentenced to be drawn or dragged to the place of execution; in high treason affecting the king's person or government, emboweling alive, beheading, and quartering; and in murder, a public dissolution. In case of any treason committed by a female, the judgment is to be buried alive. But the humanity of the English nation has authorized, by a tacit consent, an almost general mitigation of such part of these judgments as savour of torture or cruelty; a sledge or hurdle being usually allowed to such traitors as are condemned to be drawn; and there being few instances (and those accidental or by negligence) of any person's being embowelled or burned, till previously deprived of sensation by strangling. (See EXACTOR of Criminals.) Some punishments consist in exile or banishment, by abjuration of the realm, or transportation; others in loss of liberty, by perpetual or temporary imprisonment. Some extend to confiscation, by forfeiture of lands, or revenues, or both, or of the profits of land for life; other reduce a disability of holding offices or employment, being licensers, executors, and the like. Some, though rarely, occasion a mutilation, or dismembering, by

cutting off the hand, or ears; others fix a lasting stigma on the offender, by slitting the nostrils, or branding in the hand or cheek. Some are merely pecuniary, by fated, or discretionary fines; and lastly there are others, that consist principally in their ignominy, though most of them are mixed with some degree of corporal pain; and these are inflicted chiefly for such crimes, as either arise from indigence, or render even opulence disgraceful. Such are whipping, hard labour in the house of correction or otherwise, the pillory, the stocks, and the ducking stool. Blackit. Com. book iv.

JUDGMENTS for Debts are acknowledged by a person's giving a general warrant of attorney to any attorney of the court in which it is to be acknowledged, to appear for him at the suit of the party to whom the same is to be done, and to file common bail, receive a declaration, and then to plead, *non sum informatus*, I am not informed; or to let it pass by *nihil dicit*, he says nothing; upon which judgment is entered for want of a plea. Judges that sign judgment of lands, are to set down the day of the month and year in which they do it; and they shall be good against purchasers only from such signing. Where a person has acknowledged a judgment for the security of money, and afterwards, on borrowing more money of another person, mortgages his lands, &c. without giving any notice of the judgment to the mortgagee; in such case, if the mortgagee do not within six months pay off and discharge the judgment, he shall forfeit his equity of redemption, 4 and 5 Will. and Mary. Acknowledging a judgment in the name of another person, without his privacy or consent, is made felony by 21 Jac. I. c. 26.

JUDGMENT, Action of Debt on, lies for a person who hath once obtained a judgment against another for a certain sum, and who has neglected to take out execution upon it; such person, in his fresh action, shall not be put upon the proof of the original cause of action; but, after shewing the judgment once obtained, still in full force, and yet unsatisfied, the law immediately implies, that by the original contract of society the defendant hath contracted a debt, and is bound to pay it. This method seems to have been invented when real actions were more in use than at present, and damages were permitted to be recovered thereon; in order to have the benefit of a writ of *capias* to take the defendant's body in execution for these damages, which process was allowable in an action of debt (in consequence of the statute 25 Edw. III. c. 17.), but not in actions real. Wherefore, since the disuse of these real actions, actions of debt upon judgment in personal suits have been partly much discountenanced by the courts, as being generally vexatious and oppressive, by harassing the defendant with the costs of two actions instead of one. Blackit. Com. b. iii.

JUDGMENT, Arrest of. See ARREST.

JUDGMENT, Assigning false. See ASSIGN.

JUDGMENT of God. See JUDICIUM DEI.

JUDGMENT, Execution of. See EXECUTION, &c.

JUDGMENT, Mass of. See MASS.

JUDGMENT, Property by. A judgment, in consequence of some suit or action in a court of justice, is frequently the means of vesting the right and property of chattel interests in the prevailing party. In this case we must distinguish between property, the right of which is before vested in the party, and of which only possession is recovered by suit or action; and property, to which a man before had no determinate title or certain claim, but he gains as well the right as the possession by the process and judgment of the law. Of the former sort are all debts and choses in action; as if a man gives bond for 20*l.*, or agrees to buy a horse at a fated sum, or takes up goods of a tradesman upon an im-

plied contract to pay as much as they are reasonably worth; in all these cases the right accrues to the creditor, and is completely vested in him at the time of the bond being sealed, or the contract or agreement made; and the law only gives him a remedy to recover the possession of that right, which already in justice belongs to him. But there is also a species of property, in which a man has no claim or title whatsoever, till after suit commenced and judgment obtained in a court of law; where the right and the remedy do not follow each other, as in common cases, but accrue at one and the same time; and where, before judgment had, no man can say that he has any absolute property, either in possession or in action. Of this nature are such penalties as are given by particular statutes, to be recovered on an action *popularis*; or, in other words, to be recovered by him or them who will sue for the same; in which case a suit and judgment at law are not only the means of recovering, but also of acquiring property. Another species of property, that is acquired and lost by suit and judgment at law, is that of *damages* given to a man by a jury, as a compensation and satisfaction for some injury sustained; as for a battery, for imprisonment, for slander, or for trespass. Here the plaintiff has no certain demand till after verdict; but when the jury has assessed his damages, and judgment is given thereupon, whether they amount to 20*l.* or 20*s.*, he instantly acquires, and the defendant loses at the same time a right to that specific sum. To this kind of property may also be referred all title costs and expences of suit.

JUDGMENT, Villainous. See VILLAINOUS.

JUDICATURE, the quality or profession of those who administer justice.

In which sense judicature is a kind of priesthood. In France, officers of judicature are vernal.

JUDICATURE is also used to signify the extent of the jurisdiction of the judge, and the court wherein he sits to render justice.

JUDICIUM DEI, Judgment of God, was a term anciently applied to all extraordinary trials of secret crimes; as those by arms and single combat, and the ordeals; or those by fire, or red-hot plough-shares; by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle rather than suffer truth and innocence to perish.

“Si super defendere non possit, judicio Dei, scilicet, aqua vel ferro, sieret de eo iustitia.”

These customs were a long time kept up, even among Christians; and they are still in use in some nations. See ORDEAL, WATER, COMBAT, DEEL, and CHAMPION.

Trials of this sort were usually held in churches, in presence of the bishops, priests, and secular judges; after three days fasting, confession, communion, and many adjurations and ceremonies, described at large by Du Cange.

JUDICIUM Parium denotes a trial by a man's equals, i. e. of peers by peers, and of commoners by commoners. In magna charta it is more than once insisted on as the principal bulwark of our liberties, but especially by chap. 29, that

no freeman shall be hurt in either his person or property, " nisi per legale iudicium parium fuorum vel per legem terre." And this was ever esteemed, in all countries, a privilege of the highest and most beneficial nature.

JUDITH. an apocryphal book, excluded by the Jews from the canon of the Old Testament, and so called, because Judith is the principal person to whose history the book refers. We shall first give a summary of the contents of this book, and then inquire into the time in which it was written, and state different opinions concerning the writer of it. Nebuchodonosor, king of the Assyrians, who reigned in Nineveh, having defeated Arphaxad, king of the Medes, and taken him prisoner, formed a design of extending his conquests, and for this purpose sent Holofernes with a powerful army, who became master of Mesopotamia, Syria, Lybia, and Cilicia. After these conquests, he took possession of Idumæa. Upon this the Israelites were alarmed, and taking possession of the hilly country, fortified their cities. The high priest, Joachim, or Eliakim, encouraged their exertions, and ordered them to confide in God, and to implore his succour. Holofernes expressed surprize at their vigorous preparations for resistance against his powerful army, and enquired of their neighbours, the Moabites and Ammonites, what force they could command, and what was the reason of their declining to submit to him. Achior, the chief of the Ammonites, informs him, that these people were sometimes protected, and sometimes forsaken by their God; adding, that if they had offended their God, he would deliver them into his hands; but if not, then God would defend them, and his whole army could not conquer them. Holofernes received this account with indignation, and ordered Achior to be carried to Bethulia, which he immediately besieged, intending to revenge himself of Achior, as soon as he had taken that place. Onias, the governor of Bethulia, made preparations for its defence; but the inhabitants, dreading the event of a prolonged siege, wished to surrender the place, and could scarcely be induced to continue their resistance for five days. It was in these critical circumstances, that Judith, said to be of the tribe of Reuben, daughter of Merari, and widow of Manasseh, both opulent and beautiful, resolved upon going into the camp of Holofernes, in order to destroy him. Accordingly she left the city, and was introduced to Holofernes. The conqueror was captivated by the charms of her person, entertained her with a sumptuous feast, and expecting to obtain a complete triumph over this beautiful and rich widow, indulged in drinking to excess. In the evening, Bagoas, the eunuch of Holofernes, who had introduced Judith, with her maid-servant, to the feast, shut up the chamber-doors and departed. Holofernes, overcome by the wine which he had drank, fell into a sound sleep. Judith availed herself of the opportunity, cut off the head of Holofernes with his own sabre, deposited it in her maid's bag, and taking advantage of the liberty that was allowed her to visit and leave the camp at pleasure, hastened back to Bethulia. When the head of Holofernes was displayed to view on the walls of the city, the besieging army of the Assyrians was seized with dismay, and fled in great disorder. The Israelites pursued them, killed many of them, and took possession of a very large spoil. Judith took occasion to sing a hymn to the Lord, to whom she consecrated the arms of Holofernes, and accompanied the people to Jerusalem to present their public thanksgiving for this signal deliverance. She returned afterwards to Bethulia, lived there to the advanced age of 85 years, and was buried with her husband in this city. The people lamented her death for seven days; and the day

on which this victory was obtained was reckoned by the Hebrews among their festivals.

The greatest difficulty in this narration is to fix the time, when the event, which it records, happened. Some place it before, others after the captivity; and some finding insuperable difficulties in reconciling it with the history of the Jews, Assyrians and Medes, have maintained, that it is only a parable and allegory, and not a true history. The Greek and Syriac versions seem to prove, that it occurred after the captivity of Babylon. The Vulgate may be explained as referring to the time preceding the captivity. Neither sacred nor profane history, in the time of Manasseh, or in that of Zedekiah, either before or after the captivity, say any thing of a king of Nineveh, named Nebuchodonosor, who in the 12th and 17th years of his reign conquered a king of the Medes, called Arphaxad. It would also be hard to find at this particular time an high-priest of the Jews, whose name was Joachim or Eliakim. We should likewise meet with invincible difficulties, in reconciling the Greek text and the Syriac with the Latin of St. Jerom; nor would there be perhaps less, if we were to adhere only to the Vulgate, and reject the Greek, Syriac, and old Italic versions. If the names were granted, it is not easy to determine whether we should adopt the Greek or the Latin text. As to the Syriac, it was taken from the Greek, and from the Greek only one might infer, that the story of Judith was translated and written after the captivity; but if we follow the Latin, it may be placed before the captivity. The Greek text is very ancient: some suppose it to be Theodotus's, who lived under Commodus, after A.D. 180; but it must be more ancient, because it is cited by Clemens Romanus in his epistle to the Corinthians, written above 120 years before. The Syriac likewise is very ancient, and translated from some Greek text more correct than any we have at present; but the same as to substance. The Latin Italic version, or the old Vulgate, is made likewise from the Greek, but it is very defective. St. Jerom's Vulgate was translated from a Chaldee text, which St. Jerom took to be the genuine original of Judith; but he leaves the subject in a very perplexed and unsatisfactory state. With the old Latin version before him, he omitted what was superfluous; and reserved all that was found agreeing with the Chaldee, and probably added what was wanting, so that his version is rather a reform of the old, than a translation altogether new; and some words are observed in it which are taken from the old Italic. They who maintain, that the history of Judith contained what passed before the captivity, and in Manasseh's time, believe it sufficient to demonstrate, that there is nothing in the history repugnant to this assertion. The opinion, which places the history of Judith after the captivity of Babylon, is founded principally on the authority of the Greek version, which is certainly, as we have already said, very ancient, and it may pass for an original, there being nothing more ancient and authentic; for it is dubious, whether St. Jerom's Chaldee were the original text of this work. A ter all, what seems demonstrative for the opinion, which places this after the return from the Babylonish captivity, is the import of the Greek, chap. iv. 2. In this opinion almost all the ancients, and many of the moderns, have concurred. Eusebius places it in the reign of Cambyses, Seneclaus in that of Xerxes, Sulpitius Severus in that of Ocnus; others under Antiochus Epiphanes, and in the time of the Maccabees.

Dr. Prideaux supposes, that the Nebuchodonosor of the book of Judith is Sardanapalus, king of Babylon, who commenced his reign in the 31st year of Manasseh, and that Arphaxad

phaxad is Deioeces, king of Media; and that the destruction of Holofernes and his army at Bethulia took place in the 44th year of Manasseh, B.C. 655. He further supposes, on the authority of St. Jerom, that this book was originally written in the Chaldee language, and translated by Jerom into the Latin tongue, which is the translation that is now extant in the vulgar Latin edition of the Bible. The English translation, which we at present have among the apocryphal writings in our Bible, as well as the Syriac, was made from the Greek.

Whether the book of Judith be authentic and canonical is a point that has been very much disputed. The Jews read it in St. Jerom's time; St. Cæment hath cited it in epist. 1. ad Corinth., as well as the apologetic constitutions, Clemens Alexandrinus, Origen, Tertullian, St. Ambrose, and St. Jerom. Jerom says, in his preface to the book of Judith, that the council of Nice received it among the canonical books, though no canon was made to approve it. St. Athanasius, or the author of the Synopsis, gives a summary account of it. St. Austin, and the whole African church, received it. Pope Innocent I., and pope Gelasius, acknowledged it. The council of Trent hath also confirmed this book. The Romanists of course, having received this book into the canon of divine writ, hold the history recorded in it to be true. On the other hand, it is the opinion of Grotius, that it is wholly a parabolical fiction, written in the time of Antiochus Epiphaneus, when he came into Judæa to raise a persecution against the Jewish church; and that the design of it was, to confirm the Jews under that persecution, in their hopes that God would send them a deliverance: accordingly "by Judith is meant Judæa; by Bethulia the temple or house of God; and by the sword which went out from thence, the prayers of the faints; that Nebuchodonosor doth there denote the devil, and the kingdom of Assyria, the devil's kingdom, pride; that by Holofernes is there meant the instrument or agent of the devil in that persecution, Antiochus Epiphaneus, who made himself master of Judæa, that fair widow, so called, because destitute of relief; that Eliakim signifies God, who would arise in her defence, and at length cut off that instrument of the devil who would have corrupted her." Many learned writers among the Protestants, though they do not adopt the peculiar fancy of this great man, agree with him in the general, that this book is rather a parabolical than a real history, designed for the instruction and comfort of the Jews under that figure, and not to give them a narrative of any thing that was really done; and their reason is, that they think it utterly inconsistent with all times, where it hath been endeavoured to be placed, either before or after the captivity of the Jews. Dr. Prideaux thinks that by putting it in the time of Manasseh he removes all the objections which are alleged to prove its inconsistency with the times after the captivity, which he thinks are unanswerable.

After examining a variety of objections relating to this book and its history, Dr. Prideaux concludes, "that if any one will still contend, that it is only a religious romance, and not a true history; that, according to the intention of the author, the scene of it was put under the reign of Xerxes, when Joakim, the son of Josiah, was high-priest, and the civil government of Judæa, as well as the ecclesiastical, was in the hands of that officer: and that the inconsistency of so many particulars in that book, with the state and transactions of those times, was only from the ignorance of the author in the history of the said times, and his awkwardness in placing the scene of his history in them; I

say, if any will insist on all this, notwithstanding what is above said, I shall not enter into any controversy with him about it: only thus much I must insist on, that if it be a true history (which I am inclined most to think, though I will not be positive in it), it can fall no where else but in the time where I have laid it."

The author of the book of Judith is unknown. St. Jerom seems to think that it was written by Judith herself; others imagine, that the high-priest Joachim or Eliakim, mentioned in this book, was the author: but all this is mere conjecture. Those who believe that the history of Judith happened in the time of Cambyses, and after the captivity of Babylon, suppose that Joshua, the son of Josedek, then high-priest, wrote it. The author, whoever he was, does not appear to have been contemporary with the transactions. He says, that Achior's family was still in his time subsisting in Israel, Judith, xiv. 6. and that the festival instituted in memory of Judith's victory was still celebrated, Judith, xvi. 31. Dupin on the Canon. Prideaux's Conn. v. 1. Calmet.

JUDOIGNE, in *Geography*. See *JODIGNE*.

JUDOMA, a river of Russia, in the government of Irkutsk, which joins the Maïa, N. lat. 58 50. E. long. 134° 14'.

JUDOOK, a town of Bengal; 18 miles N of Dacca.

JUDOSA BAY, a bay of Louisiana, which lies in the N.W. corner of the gulf of Mexico; connected by a chain of islands towards the S.W. with St. Bernard's bay.

JUEFRAS, a town of Africa, in the kingdom of Barra.

JVEL RIVER, in Bedfordshire, is navigable from Tempsford to the town of Biggleswade: it does not appear, that any steps have yet been taken for extending this navigation up to Shefford, agreeably to the act for that purpose, which passed in the 30th year of Geo. II.: the private interests of the merchants of Biggleswade seem a more effectual bar to the completion of this object, than the want of money, which has been so often insisted on.

JVELCHESTER and LANGFORD CANAL, is the parliamentary name of an inland navigation in Somersetshire, about seven miles long, from the Parret river, near Langport, to the town of Ilchester, made in pursuance of the act obtained in the year 1795. See CANAL.

JVENACK, a town of the duchy of Mecklenburg; 30 miles S.E. of Roßock.

JVERAGH. See KERRY.

JVERSKOI, a town of Russia, in the government of Novgorod; 80 miles S.E. of Novgorod.

JVES, SIMON, in *Biography*, was a lay vicar of St. Paul's cathedral, till driven thence by the republicans; when he became a singing-master, and a teacher of music in private families.

During the reign of Charles I., Ives stood high as a composer, as we are told in the MS. account of the masque intitled "The Triumphs of Peace," written by Shirley, a dramatist of the second class, which was acted at Whitehall in 1633, and the whole expense of the procession defrayed by the gentlemen of the four inns of court, as a testimony of duty and loyalty on his majesty's return from Scotland, after terminating the discontents of that kingdom.

A very circumstantial account of this masque by the lord commissioner Whitelocke, in his own hand-writing, has been preserved. It was the property of the late Dr. Morton of the British Museum. In this narrative, the commissioner, who was the principal manager of the exhibition, says: "I made choice of Mr. Simon Ives, an honest and able musician,

man, of excellent skill in his art, and of Mr. Lawes, to compose the airs, lessons, and songs for the masque, and to be masters of all the musicke under me."

The compositions of Simon Ives are not devoid of merit; some of his rounds and catches, published in Hilton's collection, still live; "Come honest friends and jovial boys," &c.

In *Playford's Musical Companion*, and among the "Ayres and Dialogues" published in his time, there are several songs set by Ives, who died in 1662, in the parish of Christchurch, London.

IVES, St., in *Geography*, is a populous borough, market and sea-port town, in the hundred of Penwith and county of Cornwall, England. It is situated near the north-east angle of a fine bay, which is bounded by bold rocks of black killas. The church is a low, but spacious building, having a nave and two aisles: from its situation near the shore, it is frequently covered, at high tides and tempests, with the spray of the sea. The chief articles exported from this town are date and pilchards. The latter are in most seasons taken in the bay in great abundance; and at the time of large draughts, it is usual for all the inhabitants to contribute their assistance: the shops are then deserted; and if it should be Sunday, even the church is likewise abandoned. This port, as well as most others on the north coast, is greatly incommoded by the shoals of sand driven in by the north-west winds; and the town, as appears from Leland, has also suffered from the same cause. In the reign of queen Mary, St. Ives was governed by a portreeve and burgesses; but was not incorporated till the sixteenth year of Charles I., who confirmed some former privileges, vested the future government of the town in a mayor, recorder, twelve capital and twenty-four inferior burgesses, and granted the inhabitants four annual fairs, two weekly markets, Wednesday and Saturday, and also endowed a grammar school. Two members are returned to parliament from this borough: the right of election is possessed by the corporation, and all the inhabitants paying foot and lot; the number of voters being about 280. St. Ives is distant from London 275 miles: the number of houses was estimated, under the population act of 1800, as 540, inhabited by 2714 persons. Beauties of England and Wales, vol. ii. Polwhele's History, &c. of Cornwall.

IVES, St., a market town and parish in the hundred of Hurlingham, Huntingdonshire, England, is situated on the banks of the river Ouse. It was called, in the Saxon times, Slepe, and is mentioned by that appellation in the Domesday book: but it afterwards obtained the name of St. Ives from Ivo, a Persian archbishop, who is reported to have travelled through England, preaching the gospel, about the year 600. On the spot where the remains of this saint were reported to have been found, abbot Ednoth built a church; and soon afterwards, anno 1017, a priory was erected by earl Adelmur, who brought thither some Benedictine monks from the abbey of Ramsey. After the dissolution of monasteries, the site of this priory was granted, 36 Henry VIII., to sir Thomas Audley. The priory, barn, and dove-house, are yet standing, but do not exhibit any thing worthy of notice. The parish church is a neat edifice; its spire has been twice blown down. The other places for religious worship in this town are, two meetings for Baptists, one for Quakers, and one for Presbyterians: the latter had its rise at the period of the civil wars of the seventeenth century, when the ejected minister of St. Ives was supported by the inhabitants in opposition to the reigning powers. Great part of the town was destroyed by a fire on the 30th of April 1689: it began in a malt-house at the end of White-hart-lane; and laid in ashes the dwellings and property of upwards of

hundred families. The lower part of the town, from its proximity to the river Ouse, has been frequently overflowed. Over the river is a stone bridge, with four pointed, and two semicircular arches. The charter for the market was granted by king Edward I. about the year 1290: it is held on Mondays, and is one of the largest in the kingdom for cattle, sheep, pigs, and poultry; being considered as second only to that of Smithfield in London. Here are also two well frequented fairs, held annually, at Michaelmas and Whitfuntide: the former sprung from an annual meeting appointed in 1022, to be held on the feast of St. Michael; the latter was granted by a charter of Henry I., dated in 1110, and was privileged to continue from "Whit-Monday till the Monday following, and all that day." Several breweries and malt-kilns are established in the town: the inns and public-houses are numerous. Many charitable donations are recorded on two tablets in the church, but the gifts are not large. St. Ives is 60 miles distant from London: the population, as returned under the act of 1801, amounted to 2099, inhabiting 478 houses. In the pits in the neighbourhood of this town, the cornua ammonis, belemnites, and other fossils, are occasionally found. Beauties of England and Wales, vol. vii.

IVETEAX, NICHOLAS VAUQUELIN, in *Biography*, celebrated as a French poet, was born at Frefnaye, near Falaise, about the year 1559. His father, Vauquelin de la Frefnaye, was eminent for his poetry, and had the office of lieutenant-general of the bailiwick of Caen, which he readily made over to his son, but he was ill adapted to the duties of the situation, and after another change or two he was appointed preceptor to the duke of Vendome, natural son of Henry IV. He was next engaged in the same business with regard to the dauphin, afterwards Louis XIII, but not giving satisfaction, he was discharged with a pension and two abbacies. These, on account of some irregularities, he was obliged to resign, and then retired to a good house in the Faubourg St. Germain, where he adopted an epicurean life: after this he retired to a country seat in the diocese of Meaux, where he died, in 1649, at the age of ninety. The works by which he is known are "Institution d'un Prince," a poem written with force and solidity, and containing excellent lessons of morality: and "Stanzas, Sonnets, and other Poems." Morcri.

JUFFERS, among *Carpenters*, a term used for pieces of wood about four or five inches square, and of several lengths.

JUFOSTA, in *Geography*, a town of Arabia, in the province of Oman; 160 miles E.S.E. of El-Catif.

JUG, an earthen pot or pitcher to hold drink; also a term used in many parts for a common, palture, or meadow.

JUGANG, in *Geography*, a town of Thibet; 30 miles E.N.E. of Zungna.

JUGDALLIK, a town of Candahar, on the Kameh; 35 miles E.S.E. of Cabul.

JUGDEES, a town of Hindoostan, in Oude; 31 miles N.E. of Allahabad.

JUGDISPOUR, a town of Hindoostan, in Bahar; 15 miles S.W. of Arrah. N. lat. 25 27'. E. long. 83° 35'.—Also, a town of Hindoostan, in Bahar; 8 miles S. of Bettiah. N. lat. 26 39'. E. long. 84 51'.—Also, a town of Hindoostan, in Oude; 44 miles N. of Manickpour.—Also, a town of Hindoostan, in Oude; 46 miles W.S.W. of Kairabad.

JUGERUM, a Roman measure, the double of the actua quadratus. It was a square of 120 Roman feet. The jagerum was divided into 12 uncia, and the uncia into 24 scrupula.

160000. Its proportion to the English acre is as 10,000 to 16,097.

JUGHOGPA, in *Geography*, a town of Bengal; 27 miles E. of Rangamutty.

JUGK, a town of Prussia, in the province of Natangen; 10 miles N.W. of Lick.

JUGLANS, in *Botany*, so called by the Roman writers, on account of the excellence of the nut. It is contracted from *Jovis glans*, the acorn or mast of Jove.—Walnut-tree, Linn. Gen. 496. Schreb. 645. Willd. Sp. Pl. v. 4. 455. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 360. Juss. 375. Lamarck. Dict. v. 4. 500. Illustr. t. 781. Gærtner. t. 89. (Nux; Tournef. t. 346.) Class and order, *Monocotyledon Polypetala*. Nat. Ord. *Amentaceae*, Linn. *Terebinthaceae*, Juss.

Gen. Ch. Male, *Cal.* Perianth elliptical, flat, divided into six, depressed, concave, obtuse segments. *Cor.* none. *Stam.* Filaments from eighteen to twenty-four, very short; anthers oval.—Female, *Cal.* Perianth of one leaf, bell-shaped, four-cleft, erect, very short, single-flowered. *Cor.* of one petal, four-cleft, erect, acute, a little longer than the calyx. *Pist.* Germen inferior, oval, large; style very short; stigmas two, reflexed, jagged at the extremity. *Peric.* Drupa dry, oval, large, of one cell. *Seed.* Nut large, roundish, reticulated with furrows; kernel four-lobed, variously furrowed.

Eff. Ch. Male, Calyx depressed, six-lobed. Corolla none. Stamens about twenty. Female, Calyx four-cleft, superior. Corolla four-cleft. Styles two. Drupa with a furrowed lobed kernel.

1. *J. regia*. Common Walnut-tree.—Linn. Sp. Pl. 1415. Mill. Illustr. t. 81.—Leaflets about nine, oval, smooth, slightly serrated, equal. Fruit globose.—A native of Persia, and also of the northern parts of China. It flowers in the spring, and bears fruit in autumn. A large and handsome tree, with strong spreading boughs. *Leaves* pinnate, extremely fragrant; the end leaflet standing on a foot-stalk. *Male-flowers* in a close, pendulous spike. *Females* scattered, frequently two or three together.—*Fruit* an ovate, smooth nut, containing a white, delicious, oily kernel, whose surface is rugged, and covered with a tough, yellowish skin.—The walnut-tree is universally known and admired for the splendour of its foliage, the delicacy of its fruit, and the utility of its wood.—There are many varieties of the species in question, well known to cultivators. It was formerly more propagated in Britain than at present, for its wood, which was in very great esteem, till the introduction of mahogany somewhat superseded its use, but is still in great request for furniture in various parts of the continent; with us it is valued chiefly for gun-blocks, the demand for which, of late years, has caused great devastation among our walnut-trees, a circumstance worthy the attention of persons who make planting an object either of pleasure or profit. The unripe fruit is frequently converted into a pickle or preserve.

2. *J. alba*. The Hickory, or White Walnut-tree.—Linn. Sp. Pl. 1415.—Leaflets seven, oblong-lanceolate, pointed, serrated, pubescent underneath; the odd one sessile. Fruit nearly quadrangular, smooth.—Native of North America.—*Leaves* composed of two or three pairs of oblong leaflets, terminated by an odd one, which is sessile. *Fruit* shaped somewhat like a common walnut, but the shell is not furrowed, does not split asunder, and is of a lighter colour.—Cateby describes this as a very large tree, with a trunk two or three feet in diameter, the leaves differing from the last not only in being serrated, but narrower, and more pointed. The shell is so very hard that it cannot easily be broken.

The kernel is sweet and well-tasted, affording a wholesome and pleasant oil.

3. *J. nigra*. Black Walnut-tree.—Linn. Sp. Pl. 1415. Jacq. Ic. Rar. t. 191.—Leaflets about fifteen, oblong-lanceolate, serrated. Fruit globular, roughish, dotted.—Found from Pennsylvania to Florida. It flowers in April and May. This is also a large tree. *Leaves* composed of six or seven pairs of leaflets, which are acute and serrated, emitting a strong aromatic flavour. Outer cover of the nuts rough; these are rounder than the common walnut. *Shell* hard and thick; kernel very sweet. The wood is the most valuable of all walnut-trees, being very finely veined, and capable of receiving a high degree of polish. There were large trees of the Black Walnut in Chelsea garden in 1759, which had produced abundance of fruit for upwards of forty years.

There are several other species of *Juglans*, chiefly, if not entirely, natives of America, all remarkable for the excellence of their wood. Willdenow enumerates eleven—professor Martyn eight.

Of these *J. cinerea*, the Ash-coloured Walnut, Jacq. Ic. Rar. t. 192. and *J. baccata*, the pulpy-coated walnut, figured in Sloane's Jamaica, t. 157. f. 1, are the only remaining Linnæan ones. Of the genus of the latter we presume there must be considerable doubt.

JUGLANS, in *Gardening*, comprises plants of the deciduous, hardy tree kind, of which the species mostly cultivated are, the common walnut-tree (*J. regia*); the white walnut-tree (*J. alba*); and the black walnut-tree (*J. nigra*).

It is remarked of the first sort by Martyn, that, as "they all vary again when raised from the seed, and that as nuts from the same tree will produce different fruit; persons who plant the walnut for its fruit, should make choice of the trees in the nurseries, when they have their fruit upon them."

The principal varieties are, the oval walnut, the round walnut, the large walnut, the small-fruited walnut, the double walnut, the early walnut, the late walnut, the tender-shelled walnut, and the hard thick-shelled walnut.

Method of Culture.—It may be observed that all the sorts are capable of being increased by planting the seed or nuts, which in the first species should be of the best varieties when intended as fruit-trees, which, after they are become perfectly ripe, and have been preserved in dry sand till about the end of February, should be set either in slight drills, five or six inches apart in the rows, and a foot distant, or by the dibble, at the same distance, putting them into the depth of two or three inches, the ground having been previously well dug over. When the plants have had two years' growth in the seed-bed, they should be removed into nursery rows, shortening the top roots, but preserving the tops entire, putting them at the distance of two feet and a half from row to row, and a foot and a half in the rows; they should remain in this situation till they have attained five or six feet in height, training them with single stems; after which they may be removed into the situations where they are to grow.

When the trees are intended for timber, it is a good practice to plant them out at once where they are to grow, as they thrive faster, and form better trees.

But in raising the walnut for fruit, Mr. Boucher recommends flat-stones, tile-slurds, or slates, to be buried eight inches deep, under the nuts when they are set: the distance to be six inches, and the depth two inches. After two seasons, they should be removed early in autumn, and planted fourteen or sixteen inches asunder, on the same kind of bottom,

tom, or any hard rubbish, to prevent them from striking downwards, and to induce them to spread their roots on the surface. At the end of two or three years this should be repeated again, making the bedding at the depth of fifteen or sixteen inches, and planting them two feet asunder; here let them remain three or four years, when they will be fit to remove for the last time. The soil for fruit-trees should be dry and sound, with a sandy, gravelly, or chalky bottom. The trees managed in this way will have higher flavoured fruit, ripen earlier, and bear a plentiful crop twenty years sooner than in the usual method. The best manure for them is ashes, spread the beginning of winter, the land having been first ploughed or dug over.

And as plants raised from the nuts of the same tree bear fruit of very different qualities, he advises the sowing one of the best sorts on the common walnut-tree; and by which method the planter is secure of his sort, and will have fruit in one-third of the time that he would obtain it from the nut. This method can, however, be practicable only in few situations. The length of time in which the walnut bears well from the nut, is about twenty years.

The nuts of the two other sorts are procured from America by the nurserymen.

Plants of the first sort are cultivated for ornament, as well as the nut or fruit which they afford. The fruit is used in two different stages of its growth; as, when green, to pickle; and when ripe, to eat the kernel. For the first purpose, the young green walnut, when about half or near three parts grown, before the outer coat and internal shell become hard, is most excellent; for which they are generally ready in July or the following month, and should be gathered by hand, choosing such as are free from specks as possible.

The fruit is discovered to be fully ripe by the outer husk easily separating from the nut, or by the husks sometimes opening, and the nuts dropping out; it is usually about the latter end of September, which, in trees of considerable growth, is commonly beaten down with long poles; for, as the walnuts grow mostly at the extremity of the branches, it would, in very large spreading trees, be troublesome and tedious work to gather them by hand. As soon as gathered, they should be laid in heaps a few days to heat and sweat, to cause their outer husks, which closely adhere, to separate from the shell of the nuts; then be cleared from the rubbish, and deposited in a dry room for use, covering them over close with dry straw, a foot thick, where they will keep three or four months. They are always ready sale at market, in large towns, where, at their first coming in, they are brought with their husks on, and sold by the sack, or bushel, but afterwards cleaned, and sold both by the measure and the thousand.

Plantations of these trees are therefore profitable, in their annual crops of fruit, while growing, and in their timber, when felled or cut down.

These, as well as the other sorts, may many of them be admitted into clumps or plantations, in large pleasure-grounds, for variety. After one or two years, the other sorts are nearly as hardy as the first; but till that time should be protected against frosts in the winter season.

JUGLANS Regia, Common walnut-tree, in the *Materia Medica*. The unripe fruit has an astringent bitterish taste, and has been long used as a pickle. This is the part directed for medicinal use by the London college, on account of its antiseptic virtues. Its effect in destroying worms seems to be confirmed by the testimony of several authors; and in proof of its possessing this vermifuge power, we are told that water, in which the green shells of walnuts have been ma-

cerated, on being poured in a garden, was found to drive all the earth-worms together as far as the water extended; and that the worms, by being immerged in a strong infusion of these shells, were immediately seized with spasms, and died in two minutes afterwards. An extract of the green fruit is the most convenient preparation, as it may be kept for a sufficient length of time, and made agreeable to the stomach of the patient by mixing it with cinnamon-water. This fruit, in its immature state, is also found to be laxative, and of use in apthous affections and sore throats. The Wirtemberg Pharmac. directs a rob for the above purposes to be prepared of its juice. The kernel of the walnut is similar in qualities to that of the almond and hazel nut, and affords an oil, which amounts to half the weight of the kernel. This oil is said not to freeze by cold, and to answer the medical purposes of the oil of almonds. Vinegar, in which walnuts have been pickled, has been found to be a very useful gargle. *Woody. Med. Bot.*

JUGLERS. See *PROVENÇAL Ports*.

JUGON, in *Geography*, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of Dinan; 10 miles W. of Dinan. The place contains 428, and the canton 9911 inhabitants, on a territory of 147½ kilometres, in 8 communes.

JUGRAT, a town of Hindostan, in the circle of Chandernagore; 15 miles N. of Chandernagore.

JUGULAR, among *Anatomists*, is applied to certain veins of the neck, which terminate in the subclavians. See *VEIN*.

JUGULAR Vein, how to puncture in bleeding. See *VENESECTIO*.

JUGULAR is also applied to certain glands in the neck, in the spaces between the muscles. See *GLANDS*.

JUGULARES, in the *Linnean System*, is the name of an order or division of fish, the general character of which is, that they have ventral fins before the pectoral fins, and ossiculated bronchiae. This order comprehends six genera, viz. *callionymus*, *uranoscopus*, *trachinus*, *gadus*, *blennius*, and *kartus*; which see respectively.

JUGURTHA, in *Biography, king of Numidia, was the natural son of Masinissa, one of the three sons of Masinissa, who, after the death of that prince, possessed the kingdom jointly. Micipia, the survivor, and who inherited his father's kingdom, educated his nephew Jugurtha with his two sons Adherbal and Hiempsal; but as he was of an aspiring disposition, he sent him with a body of troops to the assistance of Scipio, who was besieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquillity of his children. His hopes were frustrated, and Jugurtha returned with great glory, having also acquired the friendship of his general Scipio Africanus. Micipia appointed him successor to his kingdom with his two sons, but the kindness of the father proved fatal to the children. Jugurtha caused Hiempsal to be assassinated, and stripped Adherbal of his possessions, and obliged him to fly to Rome for safety. The Roman people listened to the well-grounded complaints of Adherbal, but Jugurtha's influence prevailed among the senators; and the suppliant monarch, forsaken in his distress, perished by the hands of the enemy, and with every circumstance of cruelty. These atrocities excited such a flame at Rome, that the senate, in effect, declared war against Jugurtha. Cæcilius Metellus was sent against him, and by his firmness and success, the Numidian was forced to seek support from his savage neighbours. A variety of actions ensued, in which the Roman arms were mostly successful, though Jugurtha, skillfully pursuing the Numidian mode of warfare, did not cease to harass his enemies, and*

oppose obstacles to their attempts. Marius and Sylla succeeded Metellus, and fought with equal success; at length they persuaded Boechus, a Mauritania king, who was in alliance with Jugurtha, and his near relation, to enter into negotiations of peace. By tempting offers he agreed to betray Jugurtha, and put him into the hands of his enemies; he was accordingly delivered up to Sylla, after a war of five years. Sylla carried him in chains to Cirthea, whence he was sent to Rome in the year 106 B.C. and the joy testified on beholding him there in the condition of a captive, was a proof of the dread which he had inspired as an enemy. He was exposed to the view of the Roman people, and dragged in chains with his sons to adorn the triumph of Marius, after which he was insulted by the populace, and remanded to his dungeon, where he was either strangled or suffered to perish with hunger. He left two sons, who spent their days in captivity; and his dominions were divided between Boechus, the remaining heirs of Massinissa, and the Roman republic. *Sallust. Bell. Jugur. Universal History.*

JUHOO, in *Geography*, one of the mouths of the Indus; 10 miles W. of the Ritchel.

IVICA, IRTÇA, *Ebusus*, the largest of the *Pityuse* islands. See *PITYUSE*.

This island is about 15½ leagues from the island of Majorca, which lies to the N.E. It is commonly said to be seven leagues long, and about 4½ broad in certain places, and 22 leagues in circumference. It is high, and covered with mountains, whose verdant declivities present an agreeable and picturesque prospect from the sea. The soil is adapted to every kind of culture. This isle is divided into five parts, or quartones, *viz.* the plain of the city, St. Eulalia, Balanzar, Pormany, and the Salines. The *Plain* of the town occupies a space of about 1½ league, and contains 200 houses, separated into little hamlets, the population of which is estimated at about 900 inhabitants. The canton presents on all sides well cultivated gardens and vineyards. The city furnishes a sort of militia, consisting of about 1120 men, for the safety of the district. The district of *St. Eulalia* has a territory of about four leagues in extent, bordering on those of Balanzar and Ivica, and lies to the N.E. of the latter. The number of houses is about 700, dispersed, without forming towns, villages, or hamlets. They are inhabited by 4000 persons, distributed in two parishes. A river, bearing the name of the Saint, flows at the foot of the mountain, where the spire of the church of St. Eulalia rises. The other parish is called St. John's. This district furnishes a contingent of 700 men for the security of the island. The territory of the district of *Balanzar* extends over about three leagues, and joins those of Ivica, St. Eulalia, and Pormany. The houses are reckoned at about 400, and the inhabitants may amount to 2200. The parish church is dedicated to St. Michael. The contingent for the safeguard of the island consists of 300 men. On the coast is situated the creek of Balanzar, near a mile in length. At the end is the little port of San Michela, which can only admit small vessels. This port is at the mouth of two rivulets, the sources of which are upwards of a league in the interior. The district of *Pormany* has a territory four leagues in length, bounded by Balanzar, Salinas, and Ivica. The soil presents a fertile plain, on which are about 450 houses, containing at least 2000 inhabitants, and furnishing a contingent of 350 men. The principal church is consecrated to St. Antony, and its steeples, or turret, commands the port, and is guarded by two pieces of cannon, and some artillery men. The other church is dedicated to St. Joseph. The district of *Salinas*, or las Salinas, takes its name from the salt found there, and is bounded by the districts of Pormany and

Ivica. It is two leagues in extent; the houses are reckoned at 150, and the population at 900 persons. The contingent consists of a company of 200 men. On a beautiful plain in this canton is situated the church of St. George. Port St. Antony, or Porto-magno, or Pormany, lies on the opposite coast. Ivica, though its mouth is difficult of entrance, is sufficiently spacious to accommodate a squadron; but in the winter season it is only fit for small vessels. The islanders of Ivica have criminal as well as civil laws peculiar to themselves. This island belongs to the Spaniards.

IVICA, the capital town of the above described island; which has a good port, situated to the S.E. below a small hill, under the cannon of a fortress constructed in the time of Charles V. Some ancient authors ascribe the foundation of this city to the Phœnicians, 663 years B.C. It was called *Pityusa*, because it is covered with pines and firs. Others attribute it to the Carthaginians, 70 years after Carthage was founded, alleging that the name *Ebusus* in the Punic language signifies arid. The Romans had it in their possession; it was afterwards occupied by the Moors; but the Africans were expelled by John, prince of Aragon, archbishop of Tarragona; and it has since remained under the spiritual jurisdiction of this city. The town, which is situated on a mountain, is honoured with the title of a bishopric, and it is also the seat of government. It has a cathedral, as many manereries as parishes, one hospital, several churches, and some barracks. The town is well fortified, and has two entrances, *viz.* the New Gate, and the Principal. The suburbs, commanded by the cannon of the town, contain one church, called St. Elmo, well filled with sailors. The port, though spoiled by the mud, is large enough to contain a squadron; it is the largest, most convenient, and best sheltered in the island. The N.E. wind is the only one from which it is not protected. The English took possession of this port in 1706; but the Spaniards have again obtained it. The governor has an assessor, and some other persons, who assist him in taking cognizance of all civil, criminal, and military matters, from whom the appeal lies to the captain-general of Majorca. Including the inhabitants of the suburb, the population is estimated at 800 families, comprehending 3600 persons. N. lat. 38° 58'. E. long. 1° 22'.

JUICE, a liquid substance, which makes part of the composition of plants; being diffused among all the solid parts, and serving for their nutriment and growth.

The juice, or sap, is that to plants, which blood is to animals.

There are juices of divers kinds, *aqueous, vinous, oleaginous, gummosus, resinous, and bituminous*; and of all tastes and colours.

JUICE, *Spanish*. See *LICHTORIE*.

JUICE is also applied to several, and even to all, the fluids, or humours, in an animal body.

JUICE is also applied to the vapours and humidities included in the earth.

JUICES, *Concrete*, in *Mineralogy*, a name given by many authors, to such substances found in the bowels of the earth, as have once been in a state of fluidity, and are capable of being rendered fluid again by art, by means of heat, moisture, or common agents.

Others apply the word *concrete* to all those substances which may be separated from fluids by chemical operations, whether they are afterwards soluble in them again or not; such are the particles of spar, separated from water by a slow distillation, and remaining at the bottom of the vessel.

The concrete juices of the earth are supposed to be the principal

principal things which give the virtue to mineral waters; for those which receive no concretion, and are only mingled with the waters in their passage through that part of the earth where they are evaporated, on the water's being exposed to the air, though they may give a briskness to it, while entire in it, yet are not to be supposed to give the principal virtues. These fluid and volatile juices all fly off in the analysis of the waters, but the concrete juices are more permanent, and leave certain sediments which render them visible and palpable, after the distillation of the waters with which they are mixed. When these happen to be simple, and of the same species with those known in a solid state, it is easy to deduce the virtues of the waters from them, and to know what must be the effect of such fluids as carry spar, sulphur, vitriol, or other well-known substances, into the blood; but it seldom happens that these things are thus contained simple and entire in the waters, they are often blended variously with one another, and often not the whole of the known body is contained, but the principles that constitute some part of it, such as the acid of vitriol without its metalline part, the basis of sea-salt without its acid, and so of the rest.

Salts and earths are evidently the most sensible and the most common matters which are mixed with water, and it is from them in general that the medicinal springs take up their virtues. There is scarcely any earth that does not contain some sort of mineral salt, capable of being washed out by water, though it be generally in imperceptible quantities; but where the earths are richer in these salts, the waters not only take them up, but carry also with them the several finer particles of the earth itself, in which they are bedded, and rising up at some small distance from the place, they make medicinal springs, of virtues answerable to the peculiar species of the salt that was lodged there. We are always able to separate, by analysis, the salts and the earths of the mineral waters; but when we have done this, we are not arrived at the end of the task, for they are often such mixed substances, that we can neither know them perfectly as they are, nor separate them.

The four most known and frequent of those concrete juices which are called salts, are alum, nitre, vitriol, and culinary salt; but the examination of the waters of different medicinal springs shews us, that there are in the earth others very different from these, and that perhaps in great numbers. There is in Asia a native alkali salt, or natrum, and in all the mineral waters we celebrate, there is a peculiar salt separable by evaporation, which is more nearly allied to this than to any of the other four, to one or other of which it has been the custom to reduce all salts; and yet different even from this in some respects. Besides this, those juices of the saline kind, whose disposition to concretion is not yet finished, and whose state is, as it were, but in embryo, or the first stage of being, are not to be known, when separated from the waters to which they may have perhaps given virtues greater than the concrete, in what we call its more perfect state, might have given: nay, even those that are more formed, and are already concreted, or in a state capable of concretion, have not simple and homogeneous substances in each of the species. The salt that is called culinary salt, is observed to have two different portions mixed together; the one is condensed and crystallized by cold and in moisture, after the evaporation of a part of the water wherein this salt hath been dissolved; and the other will not be crystallized nor condensed, but by a total evaporation of the water. The portion of this salt that is crystallized by cold and in moisture, is the most sulphureous, and by its sulphureity it will mix itself with the sulphureous salt of

calcined tartar dissolved in a moist air, or in common water, without turbidness, and without coagulation; but that portion of this common salt which is not condensed but by the total evaporation of the water which had dissolved it, hath an acidity which instantly coagulates the salt of tartar dissolved, and all other salts in the same state which are sulphureous and nitrous. It is evident, that while this salt is in its embryo state, the one or the other alone of these two very different substances of which it is contained, may be mixed with the waters of a spring, and communicate virtues different from those which the whole body of the salt would have done. This salt also being procured by evaporation of the water, or by any other analysis of it, could not be known or referred to the common salts, and much less if in the earth, as may very easily happen, it should be united with some one of the constituent parts of some other salt, in the same dissolved or unfashioned state.

The vitriol which in a moist air yields an efflorescence upon sulphureous marcaffites, has likewise a juicy portion, condensable only by a total evaporation of its aqueous humidity; this is of a very acrimonious taste, of an unctuous substance, and easily runs to water in a moist air. This juicy portion of vitriol is very different from that which shoots and condenses in the fluid liquor, by means of the cold. These crystals are pure vitriol acid, austere, and on being mixed with the sulphureous and nitrous salts, a great quantity of earthy matter precipitates out of them; but the other portion will mix itself with these salts in solution, without turbidness or emotion, not having, like the former, that acidity upon which the sulphureous or nitrous salts can act; which is exactly contrary to what happens to common salt, of which the first portion is the most sulphureous, and the latter portion the most acid. Nitre is also, like the rest, composed of two different saline portions, the one more sulphureous, which crystallizes with the cold, and in moisture, and the other, which remains dissolved after all the crystals are obtained, and which cannot be obtained in a dry form, but by the evaporation of all the humidity. This is less sulphureous than the other part obtained in crystals, and has some acidity which the other has not.

The first embryos of mineral salts are nothing else but vapours or juices not concreted, but totally volatile or vaporable; of these some may be condensed, and in part fixed by the action of fire, or disengaged from their matrices, and made capable of concretion by means of the air, as is observed in certain nitrous, aluminous, and vitriolic salts. The sulphureous part, which is formed in the lime, made of certain hard stones burnt in the fire, which is generally allowed to be a species of nitre, has certainly its seminal being in these crude stones, and in that state of its being, is very different from that which we find after it has passed the fire, which, from cold and coagulative, changes into caustic and resolute. This cold and coagulative quality of this stony salt, in its first state, manifests itself sufficiently in the waters of certain rock springs, which are very limpid and cold, and breed cold and scirrhusous tumours under the throats of those people who ordinarily drink them, as in the Alps, &c. See BRONCHOPHY.

The seminal matter of this salt then is wholly altered in its nature by fire, and is rendered sulphureous and caustic as nitre. Fire is able to exalt and alter the state of being of this salt, but it is no more able to produce it in these doses than in the shells of oysters, &c. of which also a lime is made, which yields a salt not more sulphureous than this. De Clos, Observ. sur les Eaux Mner.

The second being of alum and vitriol must, in the same manner, separate those substances out of which those salts

are extracted by water, after they have been calcined by fire, or exposed to a slower calcination in the open air. They are not found in these stones before these processes, yet it is sufficiently evident that the fire and air could not produce them, but could only exalt them there.

All these varieties to which the several mineral salts are liable in the different stages, and in which they may be absorbed together, and united by water under the earth, do not only render the judging of the mineral waters, which partake of them by analysis very uncertain, but even, in many cases, perplex and confound us, by the very means by which we hope to understand them.

JULES, Mineral. Many countries afford these, and give marks by them of treasures that might be turned to great account, were the proper manner of assaying them known, which is by first properly reducing them to a dry substance, so as to come at the solid matter they contain. With a view to the discovery of metallic veins, the erection of salt-works, vitriol-works, alum-works, borax-works, and the like, the curious on this subject may find many excellent hints for farther discoveries in the cloze of Agricola's work, "De Re Metallica" and the view is farther carried on by Boyle, Becher, Stahl, and Homberg. The Royal Academy of Paris have also given some hints that may be of use, in their Memoirs; and some practical things are recorded in the Philosophical Transactions. We have accounts in the Philosophical Transactions of white and thick fluids like cream, found in mines at very great depths, and containing mineral particles. The bottoms of our coal-pits sometimes afford this liquor in very large quantities. And some of the iron mines in Shropshire, particularly that called the White mine near Hales in that county, affords a great quantity of this sort of juice. It is thick as cream, white, and of a sweetish taste, but with a vitriolic twang behind it. This is contained in the nodules of iron-stone, which are here a sort of eulydri, very large, composed of thick crusts, and some of them holding near a hoghead of this sort of liquor. Phil. Trans. N^o 100. See EULYDRIOS.

JULLAC, in Geography, a town of France, in the department of the Correze, and chief place of a canton, in the district of Brives; 19 miles W. of Tules. The place contains 2015, and the canton 9462 inhabitants, on a territory of 125 kilometres, in 10 communes.

IVINGHOE, is a market town and parish in the hundred of Cotflow, and county of Buckingham, England. It is situated on the declivity of a chalk hill, near the ancient Ikeneld-street, 35 miles distant from London, and consists of two streets, containing, at the time of the late population report of 1800, 78 houses, and 452 inhabitants. In the church, which is a handsome structure, is an altar-tomb, said to be that of a brother of king Stephen. A market was granted to this town in the year 1318: it is now held on Saturday; but it is so small, that it may almost be said to be discontinued. Here are two annual fairs. The parish of Ivinghoe is very extensive, being fourteen miles in length, and containing several hamlets. In one of these, St. Margaret's, which is about five miles distant from the town, are the remains of the monastery of Murelley, founded by Henry de Blois, bishop of Winchester, in the reign of Henry I. for nuns of the Benedictine order. At the dissolution the site was granted to sir John Dance: it has been lately sold by Mr. Catherall, in whose family it has been during several generations, to Mr. Mercer. The building was, in 1802, almost entire: the parlour and hall, which are of Toterhoe stone, appear to be of the age of Henry VII. Lyons's Magna Britannia, vol. 1.

IVIRA, in Botany, a Caribbean name for a species of

Sterculia, called by Aublet *Veira frurient*, Pl. Guian. v. 2. 604 t. 279. See STERULIA.

JUJUBE. See ZIZIPHUS and RHAMNUS.

JUJUI, in Geography, a river of South America, which rises W.N.W. of Omaguaca, which gives it name; but afterwards, being joined by several small rivers at St. Salvador, it is called Jujui. On the borders of the province of Chaco, it unites with the Vermejo in S. lat. 24° 50'. Its whole course is S.E. nearly 300 miles.

JUJUMORA, a town of Hindoostan, in the circar of Sumbalpour; 20 miles S.S.E. of Sumbalpour.

JUKAN, a town of Hindoostan, in Guzerat; 20 miles N. of Nonnagar.

JUKUM, a town of the duchy of Courland; 32 miles E.S.E. of Goldingen.

JULE, in the Music of the Ancients, Athenæus, lib. xiv. a song for woollen manufacturers; but afterwards the same author says it is the name of one of the songs or hymns in honour of Ceres, and it was, in fact, a hymn sung by the Greeks, and after them by the Romans, in the time of harvest, in honour of Ceres and Bacchus, in order to render those deities propitious.

The word is derived from *Julæ*, or *Julæ*, a *flow*. This hymn was sometimes called *demitriak*, or *demitriak*, that is, the Iule of Ceres.

JULEP, or JULAP, Julapium, in Pharmacy, and derived, according to Menage, from the Arabic *gialp*, or rather from the Greek *ζυλάριον*; Olearius derives it from *gulap*, a Persian word, signifying *rose-water*; is an easy, agreeable, extemporaneous potion prescribed to sick persons; usually composed of common water, or simple distilled water, with one-third or one-fourth its quantity of distilled spirituous water, and sweetened with sugar, or proper syrups. This is sharpened with vegetable or mineral acids, or impregnated with other medicines. Juleps are sometimes used as the ordinary drink in certain diseases, but more usually as a vehicle for other forms of medicines; serving chiefly to dilute, to correct the peccant humours, restore the declining force of the heart, and promote sleep.

In dispensatories, we have several different juleps; the principal of which are, the camphor julep, *julepina a camphora*. See CAMPHOR.

The *cardial* julep, which is made by mixing four ounces of simple cinnamon-water, two ounces of Jamaica pepper-water, volatile aromatic spirit, and compound spirit of lavender, of each two drams, and an ounce of syrup of orange-peel; and is given in the dose of two spoonfuls, three or four times a day, in disorders accompanied with great weakness and depression of spirits.

The *expectorating* julep is formed by mixing four ounces of the emulsion of gum ammoniac with two ounces of the syrup of squills. Two table-spoonfuls of this julep may be taken every three or four hours in coughs, asthma, and obstructions of the breast.

Musk julep is made, by rubbing half a dram of musk, and half an ounce of sugar together, and adding gradually two ounces of simple cinnamon-water, and as much of peppermint-water, and also two drams of the volatile aromatic spirit. Two table-spoonfuls of this julep may be taken every two or three hours, in a low state of nervous fevers, hiccapping, convulsions, and other spasmodic affections.

The *saline* julep is prepared by dissolving two drams of salt of tartar in three ounces of fresh lemon-juice, strained; when the effervescence is over, add of mint-water, and common water, each two ounces, and of simple syrup one ounce. This julep removes sickness at the stomach, relieves vomiting,

promotes perspiration, and may be of service in fevers, especially of the inflammatory kind.

The *vomiting* julep is made, by dissolving four grains of emetic tartar in eight ounces of water, and adding to it half an ounce of the syrup of clove-flowers. This julep may be given, in the beginning of fevers, in the dose of one table-spoonful every quarter of an hour till it operates.

JULEP, *Mezbitic*. See *PYRMONT Water*.

JULETA, in *Geography*, a town of Sweden, in Sudermania; 35 miles N.W. of Nyköping.

JULFAR, or **DSJULFAR**, a town of Arabia, in the province of Oman, situated on a bay of the Persian gulf; 100 miles N.W. of Oman. N. lat. 26° 3'. E. long. 57°.

JULGANOO, a town of Hindoostan, in the Candeeih; 46 miles E. of Burlhampour.

JULGONG, a town of Hindoostan, in the circar of Auringabad; 15 miles S.W. of Auringabad.

JULI, or **CATRIS**, *Petrified*, in *Natural History*. Small fossil bodies are found in the chalk-pits, near the bottom of the chalk series in Cherry-Hinton, in Cambridgeshire, which Mr. Parkinson has described in the 1st volume of his *Organic Remains*, p. 456, and considers them as the iuli of the larch, or some other tree; Dr. Parfons having considered them as parts of the roots of some plant, both of which opinions we consider as very far from probable. Dr. Woodward, from observing the great accumulation of iuli, chives, or chaff of the buds of trees and plants, in the peat marshes of our low fen lands, in his edition to the 2d part of his *Natural History of the Earth*, p. 125, considers the same as an evidence that the Mosaic deluge happened in the spring season, as related: not considering that the floods of every spring and summer still bring down such floating bodies in the rivers, and deposit them on their banks and shores in the level parts of their course.

JULIA DOMNA, in *Biography*, second wife of the emperor Severus, was a woman of great accomplishments, a native of Emesa, in Syria, and daughter to Bassianus, priest of the sun. In early life she applied herself to the study of geometry and philosophy, and became as celebrated for her mental as her personal charms. She came to Rome, where her learning recommended her to all the literati of the city. At twenty years of age she married Severus, who, twenty years after this matrimonial connection, was invested with the imperial purple. Her accomplishments made very little impression upon the heart and character of her husband, who, after a time, became so jealous of her, that she thought it right, probably from a consciousness of guilt, and from a desire of safety, to withdraw from all public affairs, and occupy her time wholly in the study of letters. She was fully sensible of literary merit, and invited to her court men distinguished for literary reputation, and it was at her desire that Philostratus wrote the life of Apollonius Tyaneus. Her influence, after the decease of the emperor, was for a time productive of tranquillity and union between her sons Caracalla and Geta. She opposed the plan of dividing the empire, but her attempts were unsuccessful, and so far from being able to effect a fraternal union, she was obliged to be the witness of the murder of her favourite son Geta, stabbed in her own arms by the order of Caracalla. It is said she herself was wounded in endeavouring to ward off the fatal blow. She soon recovered from her grief, by the flattering attention paid to her by Caracalla, and by his placing her name along with his own in letters to the senate and people. Her influence could not prevent him from practising those follies and enormities which led to his ruin, and his death plunged her into the deepest affliction. Recovering from her grief, she hoped to share the government

with Macrinus, the successor of her son, and being disappointed in this she retired from court, and died in 217. It is generally admitted that she starved herself to death, but whether from the dread of Macrinus, or to free herself from the pains of a cancer, has not been ascertained. She had experienced all the vicissitudes of fortune: from an humble station she had been raised to greatness, only to taste the superior bitterness of an exalted rank. Gibbon. *Univer. Hist.*

JULIA, in *Ichthyology*, a name given by Salvan and Gaza, to the *iolus* of the Greek, called *julia* by the Latin writers in general, and by the Italians, *danzellina*. It is a species of the *Labrus*, according to Artedi, and is distinguished by that author from the other fish of that kind, by the name of the variegated labrus of a palm long, and having two large teeth in the upper jaw. See *LABRUS Julia*.

JULIAN, FLAVIUS CLAUDIUS JULIANUS, in *Biography*, Roman emperor, the son of Julius Constantine, brother of Constantine the Great, was born at Constantinople in the year 331, and was six years of age at the time of the massacre of the collateral branches of the Flavian family, after the death of Constantine, from which only himself and his elder brother Gallus were saved. The young princes were extremely well educated; and being brought up in the Christian religion, were baptized, and admitted to some inferior ecclesiastical offices. Julian publicly read the Scriptures in the church of Nicomedia. Gallus was invested with the imperial purple as Cæsar, in the twenty-fifth year of his age; and though he behaved with fraternal affection to Julian, his general conduct was tyrannical and disgusting, and soon brought him to his end. (See *GALLUS*.) From the time that his brother was made Cæsar, Julian was freed from every restraint, and put in possession of ample patrimony. He had imbibed strong prepossessions in favour of the doctrines of Paganism, which were followed by the lessons of some philosophers of the Platonic school. From Maximus he received a secret initiation into the mysteries of the science of theurgy. From his abandoning the principles in which he had been educated, he has obtained the title of "The Apostate." At the fatal catastrophe of his brother Gallus, Julian partook of this disgrace, and was kept some time at the court of Milan, an object of suspicion. At length he was allowed to retire to Athens, where he was confirmed in all his notions; so that there probably did not exist in the Roman empire a more ardent votary for Paganism than he. About the year 355, he was recalled from his studious retreat to court; was declared Cæsar, and married Helena, the emperor's sister. He was now employed in military enterprise, and in a short time made several expeditions, in which he humbled the pride of many kings, and recovered 20,000 captives. The rising reputation of Julian was regarded with envy and jealousy by the emperor, who, to prevent him from becoming dangerous, deprived him of the principal part of his army. By this, Julian was reduced to great distress; he was, however, determined to submit. He accordingly made his soldiers a speech from the tribunal, exhorting them to loyalty and obedience; and gave the officers a farewell entertainment. Their reluctance to quit a commander, to whom they were so much attached, was augmented by this interview; and in the night, the soldiers encompassed the palace, and saluted Julian as the emperor. The prince strenuously rejected the proffered honour; and by securing the doors, endeavoured to exclude his persons from their tumultuary attachment. Till the third hour of the day he remained inflexible to their prayers, their reproaches, and menaces; when being informed, that if he wished to live, he must consent to reign, he complied with

their wills. He immediately addressed, in his own name, and that of the army, a letter to Constantius, acquainting him with the event, and soliciting the confirmation of the dignity of Augustus, but still acknowledging his supremacy as head of the empire, and offering to remain contented with the administration of the western provinces of Gaul, Spain, and Britain. Constantius received his communication like an offended sovereign, refused to admit his assumed title, and commended him to return to his duty, with the rank which he formerly possessed. Julian now held him at defiance, and dispersed manifestoes justifying his conduct; of which one of the most characteristic still extant was an epistle to the senate and people of Athens, whom, as a philosopher, a scholar, and a worshipper of the gods of Greece, he seems to have regarded with peculiar respect. In his progress he was stopped by the resistance of Aquileia, held by the troops of Constantius; and the approach of that emperor, with his veteran legions, prepared a bloody conflict, which was happily prevented by the sudden death of Constantius on the confines of Cilicia. Julian, now in the thirty-second year of his age, entered Constantinople amidst universal acclamations, and was acknowledged the sole sovereign of the Roman empire. His elevation to supreme power made no alteration in his character: he was a philosopher on the throne, as far as that title is merited by strict temperance, disregard of idle pomp, and trifling amusements; the diligent employment of his time in active occupations, or the pursuit of mental improvement, and constant study to fulfil the duties of his station. The ruling passion of Julian was to restore the heathen religion in all its ancient splendour; and to this, in various instances, he sacrificed both policy and justice. He wrote an elaborate work against the truth of Christianity, of which some fragments only have come to modern times. An edict of general toleration was his first measure, which produced the re-opening of all the heathen temples, and the return of Christian sectaries, who had been banished by the late emperor. He endeavoured to render Paganism more respectable in the eyes of the public, by certain regulations for securing the morals of the priesthood. He invited to his court all the eminent philosophers, and men of learning of that persuasion; and he encouraged profelytes, by tokens of imperial favour. The restoration of the ancient temple of Jerusalem attracted the ambitious mind of the emperor, who flattered himself that the completion of the undertaking would be at least a specious argument against the faith of prophecy, and the truth of revelation. To accomplish it, he employed one of his ablest generals, and ordered the governor of Palestine to lend his most strenuous support in restoring the work of Solomon to its pristine beauty. But neither the power of an emperor, the resources of an empire, nor the enthusiasm of a whole people, could effect the purpose. A commencement was made of this work; but the builders were interrupted by extraordinary irruptions of fire, which obliged them to abandon their undertaking. Though restrained either by prudence or temper from the violence of persecution, Julian systematically pursued measures calculated to degrade and depress the Christians. He treated them with the language of sarcastic contempt, deprived them of the management of charitable contributions, and levelled all the honours of sacerdotal rank. He forbade all Christians from acting as teachers of grammar and rhetoric, or the liberal arts; thus compelling their youth to remain uneducated, or to receive, with the rudiments of learning, impressions subversive of their faith. He excluded them from posts of trust and honour; and condemned them to make ample amends for the destruction of Pagan temples in the preceding reigns, and restitution

of lands and revenues, which had been converted to the use of their own religion. The love of military glory was another passion by which Julian was actuated; and the field which he thought most worthy of its indulgence was the Persian empire, long the rival and formidable foe of the Roman. When he crossed the Tigris, he burned his ships, that his soldiers might proceed with firmness and resolution. He defeated the Persians drawn up to oppose him, and pushed on to the gates of the capital. Misled by treacherous guides, he was presently reduced to a scarcity of provisions; and he found that the only means of safety for his army consisted in retreat. In the mean time, the whole force of the Persian empire was assembled, and clouds of light troops harassed the Romans on every side, while the main body of the Persian host advanced in formidable array. Julian performed every duty of a soldier and a general, partook in every fatigue and hardship, and was present wherever danger was most urgent. The attacks of the enemy were several times repelled: at length Julian was mortally wounded, fell senseless from his horse, and was conveyed from the field in a state which announced approaching death. Sensible of his situation, he pronounced a farewell speech to the surrounding officers, and directed the disposal of his private property; after which, he entered into a metaphysical discussion with regard to the nature of the soul. Exhausted by these efforts, he called for a draught of cold water; and as soon as he had swallowed it, calmly expired, on June 26th, 363. The character of no eminent person has been more differently represented by friends and enemies. Of his writings, which are composed in the purity of the Greek language, one of the most curious is entitled "The Cæsars," which, in the form of a fable, freely discusses the characters of the several emperors, his predecessors. He gives the decided preference to Marcus Antoninus, whom he made his model in his religious and philosophical quality, although in temper he was a very different man. The learned Spanheim gave an elaborate edition of his works in Greek and Latin, in folio, 1696. Julian's partiality for every thing Grecian had infused into his mind a love of liberty, and a sense of the natural equality of mankind; and he rejected with abhorrence the haughty title of "Lord," which the Romans had introduced in addressing the master of the empire. He also imitated the habit of the emperors, in paying respect to the consular dignity, and obedience to the laws of the state. He frequently sat upon the bench as judge, and administered justice with great impartiality between the rich and the poor. He possessed fine ideas of legislation; and it is to the credit of his character, that, of the laws enacted during his short reign, fifty-four have been received into the codes of Theodosius and Justinian. Univer. Hist. Gibbon's Rom. Hist. vol. iii. and iv.

The most ancient proof of an instrument, resembling a modern organ, blown by bellows, and played with keys, very different from the hydraulicon, which is of much higher antiquity, is a Greek epigram in the Anthologia, attributed to the emperor Julian, who flourished about 364. We shall here give a literal translation of this epigram, which, though it contain no very beautiful or poetical images, will answer the historical purpose of ascertaining the existence of an instrument in the fourth century, which, in many particulars, resembled a modern organ.

We shall insert the original here, for the satisfaction of the learned reader, from the Anthol. lib. i. cap. 86. 8.

Ἀλλήτοις ἔρω δοκίμας φρεσὶν ἵνα ἀπ' ἄλλης
Χαλιχίης τόχῃ μάλιστ' ἀπολαύσασθαι ἄξιόν
Ἄγχι, εὐ' ἀντήσαν ἴψ' ἡμετέραις δοκίμασι,
Αἰὲν ἔσο τανύτης πρῶτον σπ' ἡλικίας ἡμετέρας.

Ἦρθε Νύκτας καλὴν ἔπι ζῆλον ἄνθρωπον.
 Κρατὶ τῆ ἀντὶ ἀντὶ τῆς ἑξῆς δὲ ἀπὸ τῆς ἑξῆς
 Πρατὶ ἀμὲν τὸν καὶ τὸν συμφραδὸν τὸν καὶ τὸν
 Οὐδ' ἀπαρὸν σαρτῶντι, ἀποδοκίμου ἀνθρώπου.

"I see seeds of a new species, the growth of another and a brazen foil; such as are not agitated by our winds, but by a blast that rushes from a leathern cavern beneath their roots; while a *rebuff* mortal. (*ἀνθρώπος*, a tall sturdy fellow, alluding to the force necessary to beat down that kind of clumsy *caillon* keys of this rude instrument of new invention) running with swift fingers over the concordant keys, (the rulers of the pipes, *αὐλῶν*; literally *λύγες*), makes them, as they smoothly dance, emit melodious sounds."
 Nothing material is omitted in the version of this epigram, or rather enigma, upon the organ, though not a very ingenious one; for the word *αὐλῶν*, the pipes, discovers the whole mystery.

JULIAN Calendar, Epochs, and Period. See the subalternatives.

JULIAN Law. See PAPIAN POPÆAN law.

JULIAN Year. The Julian is the old account of the year, used among us in England till 1752. It is so called from its founder Julius Cæsar; and by that name is distinguished from the new, or Gregorian account, used in most parts of Europe. See YEAR.

JULIANS, in Botany. See Dame's VIOLET.

JULIEN, SAINT, des Mençhiers, in Biography. M. Millet, in his History of the Troubadours, tells us, that William IX. count of Poitou, in one of his poems, after relating a particular adventure with a common woman in very free terms, and reflecting upon his *bonnes fortunes*, or favour with the ladies, thanks God and St. Julien for his success. "It was then," says M. Millet, "customary, such was the superstition of the times, for libertines to invoke heaven for success in their most profligate undertakings; and St. Julien was the particular saint and protector to whom they addressed themselves upon such occasions;" as, in higher antiquity, Mercury was the patron divinity of thieves.

This saint, in order to expiate an involuntary crime, is said to have made a vow that he would receive into his house all passers who should be in want of a habitation, by which he obtained the title of the "Hospitable Saint," and was afterwards addressed as the patron of travellers, to whom prayers were made for a good lodging. "L'Oraison de St. Julien, et l'Hôtel de St. Julien," were afterwards used by the French in pleasantries, much in the same sense as with us, *dining with duke Humphrey*. But in the tales written in old French so early as the twelfth century, the allusion was more licentious. Boccace (Gorn. II. nov. 2.) speaks of the "Paternòtro di San Giulino," and makes Rinaldo, after a successful adventure with a female, return thanks to God and St. Julien: "Per la qual cosa Rinaldo Iddio, et San Giuliano ringraziando, montò a Cavallo." La Fontaine, who has translated this tale, calls it "L'Oraison de St. Julien."

JULIEN, St., in Geography, a town of France, in the department of the Jura, and chief place of a canton, in the district of Lons-le-Saulneur; 18 miles S. of Lons-le-Saulneur. The place contains 806, and the canton 7098 inhabitants, on a territory of 120 kilometres, in 29 communes.—Also, a town of France, in the department of the Côte d'Or: nine miles N.N.E. of Dijon.—Also, a town of France, in the department of the Lemau, and chief place of a canton, in the district of Geneva; five miles S.W. of Geneva. The place contains 750, and the canton 11,071 inhabitants, on a territory of 197½ kilometres, in 24 communes.—Also, a town

of France, in the department of the Rhône and Loire; 10 miles E. S. E. of St. Etienne.

JULIEN'S, St., Bay, a large bay, containing a port, on the coast of Patagonia. S. lat. 49° 8'. W. long. 67° 43' 30".

JULIEN en Champanie, St., a town of France, in the department of the Higher Alps; six miles N. of Gap.

JULIEN de Clappeuil, St., a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Le Puy; seven miles E. of Le Puy. The place contains 2151, and the canton 7448 inhabitants, on a territory of 152 kilometres, in 7 communes.

JULIEN l'Ais, St., a town of France, in the department of the Vienne, and chief place of a canton, in the district of Poitiers; six miles E. of Poitiers. The place contains 281, and the canton 4907 inhabitants, on a territory of 207½ kilometres, in 13 communes.

JULIEN de Montagnier, St., a town of France, in the department of the Var; nine miles N.W. of Barjols.

JULIEN de Fouventes, St., a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Chateaubriant; seven miles S.E. of Chateaubriant. The place contains 1401, and the canton 5676 inhabitants, on a territory of 212½ kilometres, in 5 communes.

JULIEN du Sault, St., a town of France, in the department of the Yonne; six miles N.W. of Joigny.

JULIERS, Duchy of, lately a country of Germany, but now annexed to France, and forming a part of the department of the Roer. This duchy was formerly bounded on the N. by the duchy of Gueldres, on the E. by the electorate of Cologne and the Rhine, on the S. by the territories of Blankenheim and Schleiden, and on the W. by the bishopric of Liege, the duchy of Gueldres, and the Muse. The soil is fertile, producing corn in abundance, and yielding good meadow and pasture land; it furnishes a good breed of cattle and of horses. Wood is plentiful, and linen is manufactured. Near Eichweiler stone-coal is found. In this duchy are 162 towns, and about 11 free boroughs. See ROER.

JULIERS, a town of France, in the department of the Roer, and chief place of a canton, in the district of Cologne, situated on the Ruhr. It is said to have received its name from the Romans. The town is small but strong, and has a regular citadel. It has a church and a convent, and without the walls are a Calvinist and a Lutheran church. The place contains 2126, and the canton 12,630 inhabitants, in 28 communes. This town surrendered at discretion to the French troops in October 1794, after a severe battle between the Austrians and French. N. lat. 50° 54'. E. long. 6° 18'.

JULIFUNDA, a town of Africa, in the country of Dentila; 10 miles W. of Baniferle.

JULIO, a mountain of the Grisons, N. of the Upper Engadine; eight miles S.W. of Zulf.

JULIUS, in Ichthyology, the name of a small fish, a species of the labrus, caught principally about Genoa, and sold in the markets, being a very delicately tasted fish. Its usual size is about the length, and a little more than the breadth of a finger. The males of this species are very beautifully painted. Their backs are green, and their heads have variegations of yellow and red. Its sides have very broad serrated lines of a fine gold yellow, and its back fin has several large spots of blue and red. They are fond of human blood, and will seize upon the legs of people who walk naked into the water. See LABRUS *Julis*.

JULIUS I. in Biography, pope, was a Roman by birth,
 at 2

and succeeded to the papal see on the death of Mark, in the year 337. At this period the celebrated Athanasius lived in a state of exile at Treves, but in the following year he was permitted to return to Alexandria by the emperors Constantine, Constantius, and Constans. This circumstance excited the alarm of the Arian party, who, at a council assembled at Antioch, got Athanasius deposed, and Gregory, bishop of Alexandria, appointed in his stead. But in the Roman council, Athanasius was pronounced innocent of the crimes alleged against him, and was admitted by Julius to his communion, as an orthodox pillar of the church. The orthodox party confirmed the acts of the council of Rome, and, in the height of their zeal, they introduced for the first time, and authorized the practice of appealing to the pope, in contested ecclesiastical concerns, of which the successors of Julius availed themselves in establishing the enormous spiritual tyranny, which, by degrees, they erected in the church. Julius died in 352, having sat upon the pontifical throne somewhat more than fifteen years. Two of the letters of this pope are extant, one addressed to the Oriental bishops, and the other to the people of Alexandria in favour of Athanasius.

JULIUS II. pope, formerly known by the name of "Julian della Rovere," nephew of pope Sixtus IV., was born in the year 1443. He is said to have been of very mean extraction, and to have followed for some time the occupation of a waterman; he was preferred by his uncle Sixtus to the see of Carpentras, and raised to the purple in the year 1471. By the same pope he was raised successively to other valuable bishoprics, and upon the breaking out of an insurrection in Umbria, his uncle gave him the command of the papal troops, which was an employment perfectly adapted to his genius. He put an end to the rebellion which gave him vast influence and power at Rome. In 1480 he took an active part in the elevation of Innocent VIII. to the papacy, and while that pontiff lived he was in high favour at the papal court; but during the popedom of his successor Alexander VI., thinking his life in danger, he retired into France, and attended king Charles in his expedition against Naples. In 1503 he was himself elected pope, in the stead of Pius III. who had held the sacred office only twenty-six days. He took the name of Julius II., and, being possessed of a bold and martial spirit, determined to extend the temporal empire of the church by the force of arms. The emperor Maximilian, with the kings of France and Aragon, endeavoured to depose him, but he frustrated their designs, and in the year 1508 the famous league of Cambray against the republic of Venice was concluded between the pope, the emperor, the king of France, and the king of Spain, which threatened the entire ruin of that state. Before Julius signed this league, his unwillingness to increase the power of either the emperor, or the French king in Italy, induced him privately to communicate the terms of it to the Venetian ambassador, at the same time offering not to confirm it, provided that the republic restored to him the cities of Rimini and Faenza. This proposal was most unwisely rejected by the Venetian senate, and Julius confirmed the league. The Venetians were wholly unable to withstand such powerful enemies, and being reduced to the greatest extremities, they were obliged to submit. The pope absolved them from the effects of the sentence of excommunication issued against them, and without hesitation granted leave to all the subjects of the church to serve under their banners. He now formed the design of driving the French out of Italy, and with this view he laid siege to Mirandola, which he entered in triumph in 1511, but fortune turning against him, he was driven to Rome. In the course of his journey he received the unwelcome intelli-

gence, that an order for the assembling of a general council at Pisa was poited up at Modena, Bologna, and other cities in Italy, and that himself was summoned to appear at it in person. To counteract their proceedings, of which he had reason to entertain apprehensions, the pope summoned a general council to meet the following year at Rome, pretending, by that measure, to have superseded the council convoked at Pisa. An end, however, was not put to the sessions of this council before a decree had been passed declaring pope Julius II. a disturber of the public peace, a fower of discord among the people of God, a rebel to the church, a public incendiary, a blood-thirsty tyrant, and as such suspended from all spiritual and temporal administration of the church, and forbidding the faithful thenceforth to acknowledge or obey him. In revenge, Julius excommunicated the king of France, laid his kingdom under an interdict, and absolved his subjects from their oath of allegiance. In May 1512 the council met at Rome, in opposition to that of Pisa, but during the fifth session, the pope was seized with an illness which proved fatal to him in Feb. 1513, at the age of seventy, and after a pontificate of between nine and ten years. Julius was a person of great abilities, courage, and resolution, but arrogant and of insatiable ambition; possessing the most extravagant passion for war and bloodshed; so that it was said of him, if he wanted the qualities of a good bishop, he had at least those of a conquering prince. He has been accused of every crime, but his faults have been probably much exaggerated. He was much less chargeable with nepotism than many preceding popes; for of the twenty-seven cardinals created by him, four only were in any degree related to him, and these were men of unblemished characters. He was an encourager of the arts of painting, sculpture, and architecture, and began the erection of the magnificent church of St. Peter.

JULIUS III. pope, formerly known by the name of John-Maria del Monte, was a person of mean extraction, and born in Rome about the year 1488. His uncle Anthony del Monte was made a cardinal by pope Julius II., and thus had the means of raising his family from obscurity. Under his patronage John-Maria was educated for the church, and distinguished himself by his proficiency in literature and jurisprudence. By his uncle's influence he obtained an archbishopric, and afterwards filled various posts under the holy see. In 1536 he was created a cardinal by pope Paul III. who afterwards employed him on different legations. He acquitted himself so well in these employments, that he obtained the character of a person of vast application and uncommon abilities, and he recommended himself so powerfully to his holiness, that in the year 1545 he appointed him his principal legate in the council of Trent, and confided to him his most secret intentions. In February 1550 he was elected to the popedom, and took the name of pope Julius III. out of respect to the memory of the pontiff, who, by raising his uncle to the cardinalship, had laid the foundation of his good fortune. One of his first acts gave great offence to every decent person; he conferred a cardinal's hat, with ample ecclesiastical revenues, upon a youth of sixteen, born of obscure parents, and known by the name of Ape, from his having been entrusted with the care of an animal of that species, in the cardinal del Monte's family. Such an indecent promotion was regarded by the cardinals as a gross affront offered to their body, but when they reproached him for introducing such an unworthy member into the sacred college, who had neither learning nor virtue, nor merit of any kind: he asked them "what virtue or merit they had found in him, that could induce them to place him in the papal

papal chair?" The subsequent conduct of Julius corresponded with this shameful behaviour at the commencement of his pontificate. He gave himself up to the unrestrained indulgence of his desires, and spent his whole time, and the revenues of the church in amusements, dissipation, and licentiousness of every kind. He died in 1555, having held the papal see about five years. Moreri. Bower. Bayle.

JULKADDER, in *Geography*, a town of Hindoostan, in Bengal; 27 miles S. of Islamabad.

JULKANPOUR, a town of Hindoostan, in Guzerat; 50 miles N.W. of Amedabad.

JULLOMA, a town of Peru, in the diocese of La Paz; 50 miles S.W. of La Paz.

JULSIO, a town of Sweden, in Westmanland; 52 miles N.W. of Stroemthelm.

JULTOWKOW, a town of Poland, in the palatinate of Braclaw; 5 1/2 miles W.N.W. of Braclaw.

IULUS, in *Antiquity*. See **IULE**.

IULUS, in *Botany*, an old name for the *amentum*, or catkin, of Linnaeus; but the word being now appropriated to a genus of insects, is laid aside by botanists.

IULUS, in *Entomology*, a genus of aptera, with the lip crenated and emarginate; feelers two, and filiform; body long, semi-cylindrical, and consisting of numerous transverse segments; legs numerous, being two on each side of every segment of the body. This is the definition of the genus, according to the Gmelinian system. Fabricius, to whom we are indebted for our knowledge of several new species, distinguishes it merely by the lip and antennae; the first of which, he observes, is crenated and emarginate; and the latter moniliform; in addition to these peculiarities, the structure of the body, legs, &c. constitute a secondary character. The species are chiefly ascertained by the number of the legs.

Species.

OVATUS. Legs each side twenty. Linn. *Oniscus*, Gronov.

Inhabits the seas of Europe.

COMPLANATUS. Legs each side thirty; body flattish; tail pointed. Fabr. *Iulus complanatus*, Linn., Degeer, &c. *Scotopendra Iulacea*, Scop. *Iulus scotopendricus*, Pod. Muf.

Native of Europe. Linnaeus describes the antennae of this insect as being clavated, which is the case, though slightly.

DEPRESSUS. Legs each side thirty; body flattish; tail rounded and entire. Fabr.

An Indian species of very large size, the head of which is brown, and the segments rough, grey, and prominent, each side. Lund.

STIGMA. Legs thirty each side; body black, with a white dot each side on every alternate segment. Fabr.

Found at Tranquebar by Dr. Koenig. Its size is twice that of *Iulus complanatus*; the antennae and legs are black; tail pointed and white.

TRIDENTATUS. Legs each side thirty-six; tail armed with three teeth. Fabr.

An American species, in the cabinet of Drury. The eighteen segments of the body grey, and each marked with a ferruginous dorsal dot; legs with two denticles at the base.

VARIUS. Legs seventy-eight each side; segments of the body black at the base, and white at the tip. Fabr.

A species of moderate size, which inhabits Italy. The head is black, with a white band in the middle; segments whitish, and having a fine or thin ferruginous margin; legs black.

CRASSUS. Legs each side eighty. Linn.
Native of Asia. Pale, with a line of minute black dots each side; tail acute.

TERRESTRIS. Legs each side one hundred. Linn. *Iulus fufiatus*, Degeer.

Inhabits Europe. Don. Br. Inf.

CARPENX. Legs each side ninety-four; head and legs red; tail with a red line. Fabr.

Native of Tranquebar.

INDUS. Legs each side one hundred and fifteen. Linn. Inhabits India.

SABULOSUS. Legs each side one hundred and twenty. Linn. *Iulus globosus*, &c. Ray.

Found on the nut in Europe.

FUSCUS. Legs each side one hundred and twenty-four. Linn.

An inhabitant of India.

MAXIMUS. Legs each side one hundred and thirty-four. Linn.

A large species found in South America.

IULUS, in *Ichthyology*, a species of *Cyprinus*; which see.

JULY, in *Chronology*, the seventh month of the year, during which the sun enters the sign **LEO**. The word is derived from the Latin *Julius*, the surname of C. Caesar the dictator, who was born in it. Mark Antony first gave this month the name **JULY**, which was before called *Quintilis*, as being the fifth month of the year, in the old Roman calendar established by Romulus, which began in the month of March. For the same reason, August was called *Sevillus*; and September, October, November, and December, still retain the name of their first rank.

“Quae sequitur, numero turba notata suo.”

On the third day of this month the dog days are commonly supposed to begin, and to end on the eleventh day of August. See **CANICULAR DAYS**.

JULY Flowers, or *Gilliflowers*, in *Botany*. See **PINK**.

JULY Flower, *Clove*. See **DIANTHUS** and **PINK**.

JULY Queen's Flower. See **DAME'S VIOLET**.

JULY Stick Flower. See **STOCK**, &c.

JUMANAH, in *Geography*, a river of Bengal, which runs into the bay, N. lat. 21° 34'. E. long. 88° 38'.

JUMANDAR, a town of Asiatic Turkey, in Natolia; 24 miles E.S.E. of Dagnida.

JUMBO, a town of Africa, in the kingdom of Kaffon; 5 miles N.W. of Kooniakary.

JUMBOOAH, a town of Hindoostan, in Guzerat; 5 miles S. of Broderah.

JUMCUNDY, a town of Hindoostan, in Visapour; 11 miles W. of Galzala.

JUMDAY, a town of Bengal; 30 miles S. of Bogli-pour.

JUMEAUX, a town of France, in the department of Puy-de-Dôme, and chief place of a canton, in the district of Issoire. The place contains 1106, and the canton 7525 inhabitants, on a territory of 122 kilometres, in 10 communes.

JUMETTAS, or *YUMETTAS Keys*, a range of rocks or islets among the Bahamas, extending from the S.W. coast of the island of Yuma. N. lat. 22° 42'. W. long. 76°.

JUMGERBAD, a town of Hindoostan; 30 miles W. of Benares.

JUMHAMURKA, a town of Hindoostan, in the Carnatic; 25 miles N.N.W. of Ongola.

JUMHILA, a town of Spain, in the province of Murcia; 22 miles S.W. of Murcia. The town is small, but contains about 8000 inhabitants. It is situated at the entrance of a

large and magnificent valley, at the foot of the mountain on which its old cattle stands. The streets are straight, long, and large, but unpaved; the houses are clean, though not splendid. It has an hospital under the title of the Holy Ghost, a convent of Franciscan monks, and two parish churches.

JUMILLAC, LE GRAND, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Nontron; 9 miles N. of Exideuil. The place contains 2424, and the canton 8056 inhabitants, on a territory of 215 kilometres, in 7 communes.

JUMMANEAH, a town of Hindoostan, in Candeish; 10 miles N.E. of Poplood.

JUMNEEDY, a town of Bengal; 24 miles S. of Ghidore.

JUMMOO, JUMBO, or *Jumbhu*, a town of Hindoostan, and capital of a district in Lahore, to which it gives name. It is distant 42 cosses from Bissfooly, and 50 about N. by E. from Lahore. It is situated on the side of a hill, near the river Rauvee, and divided into Upper and Lower Towns. This place is a mart of considerable consequence. Various circumstances concurred to divert the trade of Cachemire or Cashmere to Jummo, and thus to render it a place of extensive commercial resort, where persons of all descriptions, under the protection and encouragement of its chief, experienced in their persons and property full security. The commodities, constituting the trade of Jummo and Cashmere, are transported by men, usually Cachemirians, whose burdens are heavy, two of them making the load of a mule, and the hire is fixed at the rate of four rupees for each carrier. The shawls, when exported from Cachemire, are packed in an oblong bale, containing a certain weight or quantity, which, in the language of the country, is termed a "bidding," enclosed in an ox's or buffalo's hide, and carried by the Cachemirian as a Scotchman carries his pack.

In 1790, the period of Runzeid Deve's death, Jummo sustained a grievous loss; for one of his sons seized the government, put to death one of his brothers, who was intended by the father for his successor, and imprisoned another. The Seiks embraced this opportunity of invading Jumbo, from which they had before exacted a moderate tribute. The most valuable division of the Jumbo districts lay in the plain country, and formed a part of the Panjab. These were laid waste by the Seiks, under a pretence of giving assistance to the fugitive chief, who recurred to them for protection. N. lat. 33°. E. long. 74 5'.

JUMMUCANDY, a town of Bengal, 20 miles S.W. of Moorhedabad. N. lat. 23 56'. E. long. 88° 13'.

JUMNAH, a river of Hindoostan, which rises in Thibet, and passing by Delhi, runs into the Ganges at Allahabad.

JUMNEE, a town of Bengal; 20 miles W. of Noony.

JUMOTTO, a town of Japan, in the island of Ximo; 12 miles S.E. of Naugafaki.

JUMP, in *Mining*, is one among the very numerous appellations, which the dislocations of the strata have received from the practical miners of different districts. See our article **FAULT**.

JUMPER is the name for a long iron tool, with a steed chisel-like point, which they use in quarries and mines, for drilling, or boring shot-holes in rocks, which require to be blasted with gunpowder. Drill, noger, and gad, are other terms for this tool.

JUMUNDERAD, in *Geography*, a town of Sweden, in the province of Angermanland; 24 miles N. of Hernofand.

JUNAGUR, or **CHUNAGUR**, a city and fortress of Hin-

doostan, in Guzerat; 170 miles S.W. of Amedabad. N. lat. 24° 50'. E. long. 69 54'.

JUNASKA, one of the Fox islands, in the Pacific ocean. N. lat. 53 26'. E. long. 180 14'.

JUNAT, a town of Bengal; 13 miles N.E. of Rogo-natpur.

JUNCAGO, in *Botany*, Tourn. Inft. t. 142, fo called from its resemblance to a *juncus*, or rush. See **TRIGLOCHIN**, Arrow-headed grass.

JUNCAL, in *Geography*, a sea-port of South America, in the country of Chili, situated on the coast of the Pacific ocean; 50 miles N. of Copiapo.

JUNCALAS, a town of France, in the department of the Upper Pyrenees, and chief place of a canton, in the district of Argeles; 12 miles S. of Tarbes. The place contains 400, and the canton 4572 inhabitants, on a territory of 102½ kilometres, in 18 communes.

JUNCAW, a town of Hindoostan, in the circar of Mohurhunge; 25 miles N. of Harriourpur.

JUNCLEE, in *Botany*, Brown Prod. Nov. Holl. v. 1. 257. See below.

JUNCI, the 13th natural order of plants in Jussieu's system, or the third of his third class. It is named from one of its principal, or leading genera, *Juncus*, the Rush, properly so called.

Jussieu's third class comprehends monocotyledonous plants whose stamens are inserted into the calyx or corolla. His definition of the present order is as follows.

Calyx (which, in some of the genera, we should, with Linnæus, term *corolla*) inferior, in six deep segments, (rather of six leaves,) either equal or unequal, the three alternate ones, in the latter case, being larger, and petal-like, or it is glumaceous, and akin to the husks of grasses. *Stamens* definite (except in *Sagittaria* and perhaps *Alisma*), mostly six, rarely three or nine, inserted into the lower part of the calyx. *Germen* superior, in some simple, with a single style; the stigma simple or divided; capsule of three cells and three valves; with many seeds, inserted into the partitions originating from the centre of each valve. In others the germens, still superior, are three or six, rarely indefinite, sometimes united at their base; styles and stigmas equal to them in number, as well as the capsules, which are single-celled, either distinct or united, either single-seeded and often not burbling, or many-seeded, separating into two valves at their inner edge, the margins of the valves, (or the partitions) bearing the seeds. Corculum (perhaps of all) in the fear of a horny albumen. Plants herbaceous. The radical leaves, as well as those on the lower part of the stem, alternate and sheathing; the upper and floral leaves often assuming the form of a spathe, and sessile. Flowers furnished with spathe.

The sections are four.

1. *Germen* solitary. Capsule of three cells. Calyx glumaceous.—This comprises five genera, all Linnæan, *Eriocaulon*, *Rostk*, *Xyris*, *Aphyllanthes*, and *Juncus*, the last only properly answering to the character.

2. *Germen* solitary. Capsule of three cells. Calyx half petal-like.—Here are six genera, *Mnagium* of Schreber (which is *Rapatea* of Aublet), *Syena* of Schreber (Aublet's *Mayaca*), *Pollia* of Thunberg, *Callisia*, *Commelina*, and *Tradescantia* of Linnæus.

3. *Germens* several. Capsules as many, single-celled. Flower-stalks radical, umbellate or whorled, the umbels and whorls encompassed with a three-leaved involucre. Plants aquatic.—The genera are *Butomus*, *Damafronium*, *Alisma*, and *Sagittaria*.

4. *Germens* several (mostly three). Capsules as many, single-celled, sometimes united at their base. Flowers panicled

eled or spiked.—Here we find *Neritis* of Schreber (*Cambomba* of Aublet), *Scheuchzeria*, *Triglochin*, *Nartibeicum* (*Tofieldia* of Hudson and Smith), *Helonias*, *Melanthera*, *Verrucrum*, and *Colchicum*.

This, nearly analogous to the *Tripetaloides* of Linnæus, is perhaps, on the whole, one of the least correct of Jussieu's orders. The order of *Juncea*, extracted from it by *Decandolle* and *Brown*, is much better defined, in consequence of the expulsion of *Raffia* and its allies on the one hand, and *Commelina*, &c. on the other, with the removal of other genera to their proper places.

Juncus Lapidis, in *Natural History*, the name given by authors to a species of fossil coral, of the tubularia kind, and composed of a congeries of small tubules, which are usually round and striated within.

JUNCKER, GOTTLÖB JOHN, in *Biography*, a learned physician, was born on the 3d of June, 1680, at Londeroff, near Giessen, in Hesse. He pursued his medical studies at Marburg and Erfurt, and afterwards took the degree of M.D. at Halle, in the year 1718. He became subsequently a distinguished professor in this university, and attained a high reputation as physician to the public hospital. He died at Halle, on the 25th of October, 1759. His works, which are chiefly compilations, have been much esteemed, and are still occasionally referred to, especially as they contain the best and most compendious view of the doctrines of Stahl, which he espoused and taught. They are as follows: 1. "Conspectus Medicinæ Theoretico-practicæ, Tabulis 137 primarios morbos, methodo Stahliana tractandos, exhibens," Halle, 1718, 4to.;—2. "Conspectus Chirurgiæ, &c." *ibid.* 1721, 4to.;—3. "Conspectus Formularum Medicarum, &c." *ibid.* 1723, 4to.;—4. "Conspectus Therapiæ generalis, &c. Tabulis 20 methodo Stahlianâ scriptis," *ibid.* 1725, 4to.;—5. "Conspectus Chemiæ Theoretico-practicæ in formâ Tabularum Representatus, &c. Tomus primus." *ibid.* 1730, 4to. This is an elementary work on chemistry, according to the principles of Becher and Stahl.—6. "Conspectus Physiologiæ," *ibid.* 1735, 4to.;—and 7. "Conspectus Pathologiæ," *ibid.* 1736, 4to. Juncker likewise published many academical theses on medical, chirological, and philosophical subjects. Eloy. Dict. Hist.—Gen. Biog.

JUNCO, in *Geography*, a river of Africa, which crosses the Grain Coast, and runs into the Atlantic; 90 miles E.S.E. of Cape Monte.

JUNCO, in *Ornithology*, the reed sparrow. See *EMBERIZA Schoeniculus*.

JUNCO is also used by Bellonius for a bird, seeming, by his description, the same with what we call the linn. See *TRINGA Cinctus*.

JUNCTIN, FRANCIS, in *Biography*, a mathematician of Florence, who flourished in the sixteenth century, and was for a time a Carmelite, but quitted his order, and going to France, abjured the Roman Catholic religion. He became a corrector of the press, and afterwards a manufacturer of paper, and a banker, by which avocations he gained a large fortune. He died about the year 1580. He was author of some arithmetical works, commentaries on the sphere of Sacroboscus, on the Reformation of the Calendar, and on the age of the Loves of Petrarch.

JUNCTIONS. Among the Hindoos, junctions or meetings of many things are deemed holy and mysterious; more especially the junctions of rivers. The junction of the day with night, the forenoon with the afternoon, &c. are duly revered, by strict observers, with appropriate prayers and ceremonies; but the junction of rivers, above all, are very mysteriously contemplated. An act performed there, be it ever so good, is rendered vastly more so by this holy loca-

lity. Widows who burn themselves with their husbands' corpse, always do it, where practicable, at the junction of two rivers: this horrid sacrifice is called *Sati*, which see. As well as this species of meritorious suicide the Hindoos recognize some others, and if performed at the confluence of rivers the merit of the act is greatly enhanced.

"One of the holiest spots of the Ganga (or Ganges) is where it joins the Yamuna (Jumna) below Delhi. A third sacred river, the Saraswati, is supposed to join them further eastwardly, whence the junction is called *Triveni*, or the three plaited locks. Pilgrims here begin the ceremonies afterwards completed at Gaya. The confluence of rivers is a spot peculiarly dear to Hindoos; and this, more especially of the Ganga and Yamuna, is highly esteemed, that a person dying there is confident of immediate beatitude, without risk of farther transmigration. Suicide is not only pardonable, but in some cases meritorious with Hindoos. Cutting one's throat at the above holy junction, is, in reference to its immediate result, an instance of the latter. (See *STICIDE*.) Widows who become *Jati*, or *parsi*, by burning themselves with the bodies of their deceased husbands, which is generally done at the *fangam*, or confluence of rivers, perform an act of meritorious suicide. And all acts in themselves good, are rendered vastly better if done on such a spot." Moor's Hindoo Pantheon.

JUNCTURE, any joint, or closing, of two bodies. See *JOINT*.

JUNCTURE, in *Oratory*, is a part of composition, particularly recommended by Quintilian, and denotes such an attention to the nature of the vowels, consonants, and syllables in the connection of words, with regard to their sound, as will render the pronunciation most easy and pleasant; and best promote the harmony of the sentence. Thus the coalition of two vowels, occasioning an hollow and obscure sound, and likewise of some consonants rendering it harsh and rough, should be avoided; nor should the same syllable be repeated at the beginning and end of words, because the sound becomes hereby harsh and unpleasant. The following verse in Virgil's *Æneid* is an example of juncture:

"Arma Virumque cano, Troja qui prius ab oris."

JUNCULAM, in *Geography*, a town of the island of Java, on the S.W. coast; 55 miles S.S.W. of Batavia. S. lat. 6 40'. E. long. 105° 15'.

JUNCUS, in *Botany*, an old Latin word, a *jungendo*, say the etymologists, from the use of the plants which bear this name in joining or birding things together. The Rush.—Linn. Gen. 173. Schreb. 230. Willd. Sp. Pl. v. 2. 204. Mart. Mill. Dict. v. 2. Sin. Fl. Brit. 374. Brown. Prodr. Nov. Holl. v. 1. 258. Juss. 44. Tournef. t. 127. Lamarek Dict. v. 3. 263. Illustr. t. 250. Gærtner. t. 15. Clafs and order, *Hæxandria Monogynia*. Nat. Ord. *Tripetalaceæ*, Linn. *Juncus*, Juff.

Gen. Ch. Cal. Perianth of six oblong, pointed, permanent leaves, inferior. Cor none. Stam. Filaments six, (in *J. conglomeratus* only three), capillary, very short; anthers oblong, erect, the length of the perianth. Pist. Germen superior, pointed, triangular; style short, thread-shaped; stigma three, long, thread-shaped, downy, inflexed. Peric. Capsule: invelted with the calyx, triangular, of three more or less completely divided cells, with three valves, the partitions from their centre. Seeds various in number, rarely solitary, roundish.

Ess. Ch. Calyx of six leaves, permanent. Corolla none. Capsule superior, of three valves, with one or three cells. Seeds several. Stigmas three.

The extensive and very natural genus of *Juncus* is commodiously enough divided into two sections; the first containing such as have leafless stems, the second those with leafy ones. Of the former Willdenow reckons fifteen species, of the latter twenty-five. This author has judiciously enriched his stock by adopting those indubitable, chiefly alpine, species, which Scheuchzer, Haller, Allioni and other alpine botanists had well defined, but which Linnaeus had, rather incautiously, huddled together under his *pilosus* and *compilivris*. His Syst. Veg. ed. 14, contains only twenty-two in all. Lamarck has thirty-two. The *pallescens* of the latter, omitted by Willdenow, is very distinct, though near *articulatus*, found at Buenos Ayres. Its flowers are much fewer together than in *nodosus*, to which Lamarck suspected it might belong. Mr. Brown has added nine New Holland species, previously nondescript, to the catalogue, and we believe America affords several more.

Eight British species are found in the first section, fifteen in the second. Of the former may serve as examples,

J. acutus, Engl. Bot. t. 1614, a large and rigid spinous-pointed plant, found on some of our sandy sea-coasts, but rarely.

J. maritimus, t. 1725, much more common, and found not only in clean sand, but in muddy salt-marshes also, confounded with the former by Linnaeus, from which it differs in its more slender form, glaucous colour, and oblong capsules.

J. conglomeratus, t. 835, which is triandrous, and *effusus*, t. 836, are both extremely common in moist places, as is *squarrosus*, t. 933, on the most dry and barren sandy heaths.

The second section, with leafy stems, is much more various and remarkable. In the beginning of it we find a tribe whose leaves are internally cellular, with transverse partitions, so as to feel, and even to look, jointed. These are scarcely yet well understood, especially the American ones, to which the Linnaean *nodosus* belongs. Those of British growth have lately been elucidated by the Rev. H. Davies in Tr. of Linn. Soc. v. 10. See Engl. Bot. t. 238, now called *acutiflorus*, t. 2143, *lampocarpus*, and t. 2144, *obtusiflorus*, all confounded by Linnaeus under his *articulatus*.—A more slender tribe succeed. *J. bulbosus*, t. 934, very improperly so called, from a bulbous-rooted species, *J. uliginosus*, t. 801, whose synonym was once referred to it. *J. bufonius*, t. 802, with a very compound slender stem, is common in watery places, and rather extraordinary in its genus for having only an annual root. *J. gracilis*, t. 2174, a new Scottish species, resembles it in general aspect, but is not so much branched, nor so leafy.

J. biglumis, t. 898, *triglumis*, t. 899, and *caulescens*, t. 900, are three rare and curious mountain kinds, the first in particular, a Lapland plant, extremely uncommon in Britain, and scarcely well known by some of our best botanists. It may however always be distinguished from two-flowered specimens of *triglumis*, by the flowers being placed one above another, not in the same plane.

The genus finishes with another very distinct tribe, whose copious broad leaves, and more or less panicle numerous flowers, with a shining brown, yellow, or brilliant white calyx, give their leading characters. Of these are the common *J. pilosus*, Engl. Bot. t. 736; the more rare *J. Forsteri*, t. 1293; the great *sylvaticus*, t. 737 (Willdenow's *maximus*); the beautiful *luteus* of Allioni, Villars Dauph. t. 6, common on the alps of Switzerland, Savoy, &c.; the elegant *niveus* found on the mountains of Italy, Switzerland, and some parts of Germany; and our common *compilivris*, Engl. Bot. t. 672.

JUNDGEH, in *Geography*, a town of Asiatic Turkey, in the province of Natolia; 16 miles W. of Kintaja.

JUNDOO, a town of Bengal; 5 miles S. of Ghidore.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive a *Junone*. Ovid, in the sixth of his *Faisti*, makes the goddess's say,

"Junius a nostro nomine nomen habet."

Others rather derive it a *junioribus*, this being for young people, as the month of May was for old ones.

"Junius est juvenum, qui fuit ante senum."

In this month is the summer solstice.

JUNERE, or JENCAGHER, in *Geography*, a town of Hindoostan, in the country of Baglana; 122 miles W.S.W. of Auringabad. N lat. 19° 11'. E. long. 73° 59'.

JUNES, EL, a town of Morocco; 15 miles N.E. of Azamor.

JUNGDRAWBERG, a town of Prussia, in the palatinate of Cohn; 20 miles S. of Dantzic.

JUNGERBAD, a town of Hindoostan; 35 miles W. of Benares.

JUNGERMANNIA, in *Botany*, a cryptogamic genus of plants, very numerous in species, as well as distinct in character, named by Ruppini and Micheli, who have been followed by all botanists since, in honour of Lewis Jungermann, Professor of Botany at Altdorf, and afterwards at Gießen, in the early part of the seventeenth century. He wrote catalogues of the wild plants found near those towns, as well a near Leipzig, his native place, and Frankfurt on the Maine. Haller says he left a fine *hortsus ficus* of two thousand plants, which is still preserved at Altdorf. Of him it may justly be said, that the genus in question has preserved his name, rather than his merits, from oblivion; for those to whom it is familiar, commonly rather wonder than take any pains to inquire, who Jungermann was. Linn. Gen. 564. Schreb. 764. Mart. Mill. Dict. v. 2. Mich. Gen. 6. t. 5. Hedw. Theor. 83. t. 22, 23. Schmidel. Monogr. ann. 1760. cum tab. Juss. 8. Lamarck Dict. v. 3. 278. Illustr. t. 875. (Lichenastrum; Dill. Muic. 479. t. 60—74.) Clafs and order, *Cryptogamia Algæ*, Linn. C. *Hepatica*, Schreb. Nat. Ord. *Algæ*, Linn. *Hepatica*, Juss.

Gen. Ch. Male, *Cal.* and *Cor.* none. *Stam.* Anthers aggregate, of an indeterminate number, in powdery heads, which are either stalked, sessile, or immersed in the substance of the frond.

Female on the same (rarely on a separate) plant. *Cal.* Perianth erect, tubular, truncate, variously crenate or jagged. *Cor.* Veil membranous, sessile, smaller than the perianth, somewhat globose, closed on all sides, crowned with the style, at length bursting at the top. *Pist.* Germen oblong, sessile, enclosed in the veil; style solitary, cylindrical, terminating the veil; stigma abrupt, tubular. *Peric.* Capsule elevated on a long, fleshy, very tender, pale, simple, cylindrical stalk, globose, of one cell, at length bursting into four equal, permanent valves, spreading in the form of a cross. *Seeds* very numerous, globular, adhering by spiral elastic fibres to the base, summit, disk or margin of the valves.

Obs. Several germens are often found in one perianth, though only one of them comes to perfection, the others withering at the base or sides of its veil.

Eff. Ch. Male, Anthers aggregate, in powdery heads. Female, Capsule of four valves, on a stalk rising from a tubular calyx. Seeds attached to elastic filaments.

Nothing can be more elegant than the general habit of this genus, which is, in a manner, intermediate between the true *Mosses*, or *Musci*, and the other *Hepatica* and *Algae*. It is throughout highly vascular or cellular, exhibiting the appearance of fine internal reticulation, as in *Hookeria* and some other mosses; but the texture is commonly more tender and succulent than in that family. Some species emit an aromatic fragrance, like that of red cedar wood, very perceptible and delightful in groves, or the shady walks of gardens. The capsule is essentially different from that of the true mosses, its having no *operculum* or lid; but the singular character of the fl: being terminating the veil, or corolla, is proper to both. Great ambiguity occurs in the botanical descriptions of the various species, from Linnaeus having termed the whole plant a frond, though he often inadvertently calls its segments leaves, *folia*, and speaks of the *stem*, as if the plant were a real *herba*, as in the *Musci*. On this subject the writer of the present article has long been at a loss to form a decided opinion, and in the descriptions of many *Jungermannia* in *English Botany*, has given into the practice of Schreber and others, who use the terms leaves and stipulas, for what, according to the original Linnaean principle, are segments of the frond, leaflets, or scales. On mature deliberation, however, it seems best to keep rigidly to this last-mentioned principle. The stalks, and the leaflets, or segments of the fronds, will always be found homogeneous and inseparable. The apparent leaves are never thrown off like the real leaves of other plants, but are of one substance with the part that bears them. The *Jungermannia auriculata*, which constitute the last section of the genus, as *epiphylla*, Hedw. Theor. t. 21—23; *pinguis*, Engl. Bot. t. 185; *multifida*, t. 186, &c. have to all intents and purposes real fronds, not stems and leaves; and it would be offering great violence to nature to suppose some species of a genus to be frondose and others herbaceous. Some German writers indeed cut this gordian knot, by abolishing the term frond altogether; but against such a measure we must put in our decided protest. (See FROD.) Little difficulty will arise from calling the segments leaflets instead of leaves, and what have been termed stipulas, may, by the analogy of ferns, be safely named scales, *squamae*. In Engl. Bot. v. 31. p. 2231, we have fuddled the propriety of terming the larger half of the leaflet, (in those species usually known by the appellation of auricled,) in Latin *lobus*, and the smaller one, or auricle, *lobulus*. This will be found very commodious in constructing neat specific characters. In English leaflet and *side-lobe* will be equivalent to those terms.

On all these particulars, and others, we have had frequent consultation with our able friend Mr. W. J. Hooker, whose attention to this genus has been very deep and minute, and who has undertaken to illustrate the British species in particular, with excellent figures and descriptions.

Our native species amount to above 65, though Hudson has but 30. The foreign ones are very numerous, but the greater part remain undescribed, except what professor Swartz has given in his *Prodromus*. Mr. Archibald Menzies collected, at the Cape of Good Hope, Staten Land, the west coast of North America, and especially at Dusky bay, in New Zealand, a profusion of new and magnificent species, of which he has favoured us with specimens, but he reserves to himself their description, which is anxiously expected by his friends. It is presumed that 150 *Jungermannia* might easily be reckoned up. Linnaeus's Syst. Veg. ed. 14, has but 33 in all, but his herbarium contains many more. Dillenius was the first who laboured with much success to explain the species of this genus, though Michx. also bestowed no small pains upon them, but his figures are, in this

instance, not very expressive. Schmidel, in his *Icones*, has illustrated a few species to amply and accurately as to leave nothing to be wished. It is but justice to Mr. Sowerby to say, that the plates he has given of *Jungermannia*, in Engl. Bot. are as characteristic as most botanical figures of any kind.

A natural distribution of the species is still wanting. Linnaeus divides them into five sections.

1. *Fronds pinnate; leaflets turned to one side*. Of this the common *J. alpinoides*, Engl. Bot. t. 1788, and *bidentata*, t. 666, are examples.

2. *Fronds pinnate; leaflets with auricles, or stipulas (rather scales), beneath*.

See *J. nemarosa*, t. 607, which has auricles (side-lobes) and *reptans*, t. 608, which has scales.

3. *Fronds imbricated*.

Under this head are arranged *tamariscifolia*, t. 1086, *ciliaris*, t. 2241, and some other very fine species.

4. *Stems imbricated on all sides, the leaflets flattened*.

To this belong *concinata*, t. 2220, and *trichophylla*, t. 2252. *J. rupestris* and *alpina* are properly established as a genus of real *Musci* by Ehrhart, under the name of *Andreea*, *Andreea* of Fl. Brit. 1178. Engl. Bot. t. 1277, 1278, and 2162, and Hooker in Tr. of Linn. Soc. v. 10 381.

5. *Without a stem, the fronds being simple*.

To this, as we have already said, belong *epiphylla*, *pinguis*, and *multifida*.

The intelligent reader will easily perceive the insufficiency and inaccuracy of these subdivisions, and the necessity of better. The difficulty lies in finding technical characters to mark natural sections. It is easy enough to arrange any natural objects by such characters artificially, without regard to their real affinities. S.

JUNGEVSKOI, in *Geography*, a town of Russia, in the government of Tobolsk; 56 miles S. of Kemikoi.

JUNGFRAU (probably from the Celtic *Jun-fra*, i. e. a place from which water descends), a mountain in the canton of Bern, in Switzerland, which, according to professor Tralles's trigonometrical survey, rises 12,852 feet above the level of the sea, and affords a spectacle, the sublime beauty of which is scarcely equalled by any other object of nature in the Alps. The middle part of this stupendous mass is more generally known by the above name; the coniform rock towards the right hand (when viewed from the Pletich mountain) is called the *Munk*, and the summit, covered by eternal snows, is called the *Jungfrau-born*. The valley of Lauterbrunn, at the foot of this mountain, is too confined to allow the eye to seize the whole grandeur of the object before it; but from the neighbouring Pletich mountain it may be seen to the greatest advantage, together with the vast groups of other craggy mountains and glaciers with which it is connected.

We read in an article from Bern, in the *Moniteur* of 25th Aug. 1811, that, in the beginning of that month, two Swiss gentlemen have succeeded in ascending the summit of this stupendous mountain, an undertaking which, hitherto, has been deemed impracticable. After having spent three days and four nights on the snow and ice, and made some fruitless attempts, they have seen their endeavours crowned on the 3d of August, when they reached the summit, where they fixed a black flag. They intend publishing an account of this remarkable journey.

JUNGERUN, STOR, a small island, about six miles in circuit, on the W. side of the gulf of Bothnia; it is high and rocky, and dangerous to navigators. N. lat. 61° 10'. E. long. 17° 10'.

JUNGERM, *Lill*, another small island on the W. side of the gulf of Bothnia. N. lat. 61° 16'. E. long. 17° 9'.

JUNGHERAH, a small island in the river Ganget, on which is a feminary of Hindoo medicants; 12 miles from Boglipour.

JUNGIA, in *Botany*, so named by the younger Linnæus, in memory of Joachim Jungius, a learned German botanist of the 17th century. (See JUNCIUS.) Linn. Suppl. 58. Schreb. 589. Willd. Sp. Pl. v. 3. 2391. Mart. Mill. Dict. v. 2. Juff. 175.—Clafs and order, *Syngenesia Polygamia-fregregata*. Nat. Ord. *Compositæ capitata*, Linn. *Cinacrociphalæ anomale*, Juff.

Gen. Ch. Cal. Common perianth of many, somewhat spreading, linear, obtuse, channelled leaves, containing three or four flowers: partial longer, many-flowered, of many, nearly equal, oblong, channelled, obtuse, erect leaves. Cor. compound, of uniform, hermaphrodite, equal florets: partial of one petal, funnel-shaped; the tube dilated upwards; limb of two lips; the outer longest, revolute, linear, toothed at the extremity; inner deeply divided into two small, erect, acute segments. Stam. Filaments five, very short, inserted into the tube of each floret; anthers united into a cylinder.

Pist. Germen inferior, linear, angular; style thread-shaped; stigmas two, revolute, obtuse. Peric. none, except the unaltered calyx. Seeds solitary, angular. Down long, sessile, feathery. Recept. clothed with scales, resembling the leaves of the calyx.

Eff. Ch. Receptacle chaffy. Common perianth containing three flowers. Florets tubular, two-lipped; the outer lip ligulate; inner deeply divided.

1. *J. ferruginea*. Linn. Suppl. 390. Gathered by Mutis, or some of his pupils, in New Granada. A tree or shrub, whose branches are round, clothed with soft down, of a rusty hue, at least in the dried specimen. Leaves alternate, remote, stalked, flat, rounded, bluntly five-lobed; heart-shaped at the base; hairy on both sides; lighter coloured beneath. The only leaf we have seen is two inches in diameter, but there is reason to think the lower ones may be much larger. Footstalks downy and rusty. Panicle terminal, large, repeated & branched with downy stalks. Flowers in roundish clustered heads. Florets purple, encompassed with the long white down of the seed.

This plant is known in Europe by the single specimen in the Linnæan herbarium only, nor has any figure of it appeared.

JUNGILE, in *Geography*, a town of Hindoostan, in Benares; 20 miles S. of Bidizgur.

JUNGIPOUR, a town of Hindoostan, in Bengal, where the East India Company have a factory for raw silk; 20 miles N. of Moorshedabad.

JUNGIUS, JOACHIM, in *Biography*, an eminent mathematician, physician, and botanist, the son of a schoolmaster at Lubec, in Germany, was born on the 21st of October 1587. His mother was daughter to a clergyman of the cathedral church at Lubec. Jungius having unfortunately been deprived of his father very early in life (for he was stabbed one evening upon his return home from a convivial party), and being left with a slender patrimony, was obliged to depend almost entirely upon his own exertions for whatever knowledge and information he was anxious to acquire, the narrowness of his circumstances not enabling him to pass through the usual routine of a learned and philosophical education. Notwithstanding this obstacle, we are informed that, in his youth, he became a very subtle logician, and ingenious disputant. By a close attention to such studies he prepared his mind for that clearness of investigation and accuracy of judgment, which were so eminently conspicuous

in the works which he published at a more advanced period of his life. Selecting the study of medicine as a profession, he travelled, at the age of 30, over a great part of Italy, and visited many of the principal places in Germany. His great object in travelling was to become acquainted with some of the most distinguished physicians of that time, from whose company and conversation he hoped to derive much amusement and instruction. He had previously graduated at the university of Gießen A. D. 1607, at which time he was ranked first among his competitors in the list of honours, and he remained there a few years in the capacity of mathematical tutor. In 1624 he married Catharine, the daughter of Valentine Haffeman, a respectable citizen of Rostock, in Lower Germany, by whom he had no issue. She died in 1638, from which period he remained a widower. He had been chosen professor of physic at Helmstadt in 1625, which had led him to remove from Rostock; but, on account of the Danish war, he was obliged, soon after his appointment, to fly to Brunfwick, where he resided for a short time, and practised as a physician. However, he soon returned to Helmstadt, till, in 1629, he was appointed rector of the school at Hamburg.

Jungius seems to have eminently distinguished himself in the several studies of theology, medicine, mathematics, metaphysics, and botany, upon all which pursuits his opinions and observations are handed down to us in his writings, though the most famous part of his work, entitled "Doxoscopia: Physicæ Minores," is upon the last mentioned subject, botany. This book was first printed at Hamburg, in 4to. A. D. 1602, and again, in 1679, under the care of Martin Fogel, with this additional title, "Præcipuarum opiuminum physicarum." A copy of the former edition of this work is in the Linnæan library, having been presented to Linnæus by his pupil, professor P. D. Giseke, of Hamburg. The botanical part of it, included in the third section of the second part, occupies about 100 pages. Here are to be found many judicious and acute rules for making distinct species of plants, as well as some curious remarks upon genera. Professor Jungius was also the first author who contended that trees cannot with propriety be separated from other plants with respect to their classification, though the honour of having first started this idea is often bestowed upon Rivinus, for till this time trees had been regarded as a superior kind of productions in the vegetable kingdom. Jungius preferred the discriminative marks afforded by the herbage in general, viz. the leaves, stalks, and flower-cups of plants to those which are taken from colour, taste, or smell. He was a great critic in botanical nomenclature; and constructed a variety of terms which agree with those of Linnæus. Many species of plants were judiciously separated and determined by him, which had before been entirely misplaced or confusedly arranged. He moreover detected the seed of certain plants which, till his time, were supposed to have been destitute of seed, especially in the genus *Salsia*. His remarks upon botanical discrimination have been of considerable advantage to succeeding botanists, and many of his definitions are repeatedly made use of by our immortal countryman, Ray. What further test of his abilities is requisite? It has been said, with a view to detract from the fame of Linnæus, that the works of our author furnished him with many hints which he never acknowledged; but this is scarcely possible, for though their ideas accord in many points, yet there is reason to believe that Linnæus never saw the writings of Jungius till long after his own were published.

Much credit is due to the subject of our memoir for having been the first who projected and raised a literary society in Germany,

Germany, though this institution did not share a better fate than the one which had just before been found in this country (and which appears to have served for its model) by Hugh Latimer, Thomas Linacre, and others, for the purpose of diffusing and illustrating Aristotle's philosophy. They both flourished but for a short period, though the Hænetic or Erenetic society, as it was called, established by professor Jungius, was on a far more comprehensive plan than the other, and may indeed be considered as having, in some measure, embraced the same views with which the Royal Society was afterwards instituted in Great Britain. The fame of Jungius was originally diffused through this country by his noble pupil, the honourable Charles Cavendish, who appears to have studied under him at Hamburg. This gentleman was brother to the earl of Newcastle, who had the care of Charles I. when a youth.

After a long life, spent in the acquirement and diffusion of general philosophical knowledge, and having always manifested a strong attachment to the Lutheran church, professor Jungius departed this life on the 23d of September 1657, at the age of 70 years, and was buried in the church of St. John at Hamburg, where a handsome tablet was inscribed to his memory by his friend and pupil, Michael Kirften. The following is a list of his works, as given by Martin Fogel, who edited the second edition of his "Doxo- scopiæ."

Logica Hamburgensis. Hamb. 1638, in 8vo.

Geometria Empirica. Rostock. femel et Hamb. bis, in 4to.

Doxosopiciæ Physicæ Minores, sine Isagoge Physica Doxosopiciæ. Hamb. 1662, in 4to.

Kurzer Bericht von der Didactica oder Lehrkunst Wolfgangi Raticchi, durch Christoph. Helvicum und Joach. Jungium. Gießen, 1614, in 4to.

Disputationes de naturali Dei cognitione: de potentia activâ: de loco Aristotelis, lib. 3. de celo, t. 66: de figuris locum replentibus: de relationibus: de notionibus secundis: de demonstratione tritermina: de definitionibus, &c.

Haller's Bibl. Bot. Witten. Memoria Philosophorum, Frankfurt, 1679.

JUNGKEN, JOHN HELERIC, a physician, was born at Kalern, in Hesse, in December 1648, and was distinguished by his abilities during his early studies. He pursued his medical education at Marburg and at Heidelberg, and took the degree of doctor at the latter university in 1671. After this period, he spent many years in travelling in pursuit of knowledge, and finally settled at Frankfort on the Maine in 1689, and was appointed physician to the public hospital there in 1693. He obtained a high reputation and a most extensive practice, in the course of which, however, he published several works. He died, greatly regretted, on the 5th of January, 1726. His writings are now seldom referred to, and it will be unnecessary here to detail the long titles of them. They treated of every branch of the profession, but chiefly on chemistry and pharmacy; and his pathology was founded on the mathematical doctrines, especially those of Descartes. Eloy. Dict. Hist.

JUNGLEBARRY, in *Geography*, a town of Bengal; 50 miles N. of Dacca.

JUNGNAU, a town of Germany, and capital of a lordship belonging to the princes of Furstenberg; 14 miles W. of Buchau.

JUNGS HOUND, or *Head*, a cape of Denmark, on the E. coast of the island of Zealand. N. lat. 53° 7'. E. long. 12° 11'.

JUNIATTA, a town of America, in Pennsylvania, 5 miles W.N.W. of Huntingdon.—Also, a river of Pennsylv.

vania, which rises from two springs in the Alleghany mountains, and runs into the Susquehanna, 15 miles N.W. of Harrisburg.

JUNIEU, ST., a town of France, in the department of the Upper Vienne, and chief place of a canton, in the district of Rochechouart; 15 miles W. of Limoges. The place contains 6046, and the canton 123,519 inhabitants, on a territory of 170 kilometres, in seven communes. N. lat. 45° 53'. E. long. 9° 5'.

JUNJOW, a town of Poland, in the palatinate of Bracław; 52 miles N. of Bracław.

JUNIPA, in *Botany*, the name of a tree of the Caribbee islands, and some other places, the fruit of which is said to yield a juice as clear as water, yet yields a fine violet-coloured dye, and being rubbed twice on the same place, makes it black. This tincture, it is said, cannot be got out by soap, or any other method of cleansing, but after nine or ten days disappears of itself. It is said also, by the same authors, that hogs and parrots, feeding on this fruit, have their flesh and their fat all tinged throughout of a violet colour.

JUNIPERUS, an ancient Latin name, of whose meaning or derivation no account is given. Juniper. Linn. Gen. 531. Schreb. 705. Sm Fl. Brit. 1085. Mart. Mill. Dict. v. 2. Art. Hort. Kew. v. 3. 413. Tournef. t. 361. Juss. 413. Lamarck. Illustr. t. 829. Gærtner. t. 91. — Class and order, *Diacia Monadelphica*. Nat. Ord. *Conifera* Linn. and Juss.

Gen. Ch. Male, Catkin conical, consisting of a common receptacle, bearing three rows of three flowers each, with a terminal one; the base of each flower is a broad, short, incumbent scale fixed by a stalk to the common receptacle. *Cor.* none. *Stam.* Filaments (in the terminal flower) three, awl-shaped, united below into one body (in the lateral flowers scarcely perceptible); anthers three, distinct in the terminal flower, but in the lateral ones attached to the base of each scale. *Female.* *Cal.* the scales of a catkin, fewer, imbricated, the upper ones at length fleshy and permanent. *Cor.* none. *Pist.* Germens three, imbedded in the uppermost scales; styles three, simple; stigmas simple. *Peric.* Berry fleshy, roundish, marked in the lower part with three, opposite, obsolete tubercles, the points of the coarctated scales, and at the top umbilicated with three teeth. *Seeds.* Nuts three, oblong, convex on one side, angular on the other; abounding with cells of turpentine on the outside.

Eff. Ch. Male, Calyx-scales of a catkin. Corolla none. Stamens three.—Female, Calyx-scales of a catkin, fewer, at length pulpy, united into a berry with three seeds.

J. communis. Common Juniper. Linn. Sp. Pl. 1470. Engl. Bot. t. 1100. Woodw. Med. Bot. t. 95.—Leaves three together, spreading, tipped with a spine, and longer than the ripe fruit.—A native of open, hilly places on a calcareous soil, flowering in May, though by no means a common plant in Britain.—This *shrub* is generally of humble growth, much branched, rigid, smooth, evergreen. *Juice* of the whole plant a kind of turpentine. *Wood* hard and durable. *Leaves* opposite, acrosc, channelled, sharp-pointed, glaucous above. *Cotkins* diceous, axillary. *Berry* globose, dark-purple, covered with a glaucous dew, sweetish and aromatic.—The alpine variety β is more humble in its growth, and more depressed, having broader leaves and rather oblong berries.—The bark of juniper is frequently converted into ropes, and it is well known that spirits, when impregnated with the essential oil of its berries, become Juniper water, or Gin.—Linnaeus observes, in his *Flora Laponica*, n. 376, that the Laplanders drink infusions of the Juniper-berries, as we do tea and coffee, and that the

Sweden:

JUNIPERUS.

Swedes prepare a beverage from them in great estimation for its diuretic and antiscorbutic qualities.—There is reason to presume that the Swedish variety of this shrub, which is much taller and more arborefcant than our's, may be a distinct species.

Linnaeus enumerates nine species of this genus, and professor Martyn eleven, the most remarkable of which are the following.—*J. Oxycedrus*, the brown-berried Juniper, a native of Spain, the south of France, and the Levant.—The wood of this species is supposed to have been the famous cedar of the ancients, celebrated for its durability, of which some of their first statues were made, before the use of marble in this branch of art was known.—*J. virginiana*, a native of North America, the West India islands, and Japan.—The wood of this tree is celebrated for its very powerful fragrance, and for resisting the attacks of insects, being the well-known red cedar, used for lead pencils, and formerly in great request for waincotting, and cabinet-work. Large trees of it are not uncommon in the older gardens and shrubberies of this country.—*J. bermudiana* is also a hardy tree with us. It is suspected that more species than one have been confounded under this or the last.—*J. fabiana*, the common Savin, a native of the south of Europe, is sufficiently well known, and is a popular medicine in some female complaints, being also supposed to be powerfully capable of procuring abortion. It is commonly of humble growth, but sometimes forms a handsome dark evergreen bush three or four feet high. In Greece it is said to become a tree like a cypress, with a trunk a foot in diameter. Botanists are by no means correctly versed in the species of this genus, or the varieties to which they are subject.—*J. Lycia*, is with difficulty distinguished from the last; its shoots are however somewhat thicker, and its leaflets more acute and less clustered. It is a native of the south of France and the Levant.—The gum-resin *Olibanum*, of a strong smell, and bitterish pungent taste, is extracted from the Lycian cedar, and is supposed to have been used by the ancients in their sacrifices, being still employed in Catholic countries in their religious ceremonies, as incense.

JUNIPERUS, in *Gardening*, comprehends plants of the evergreen tree and shrub kinds, of which the species generally cultivated are, the common juniper (*J. communis*); the brown-berried juniper (*J. oxycedrus*); the Spanish juniper (*J. thusifera*); the Barbadoes juniper (*J. barbadensis*); the Bermudas juniper (*J. bermudiana*); the favin (*J. fabiana*); the Virginian juniper, or red cedar (*J. virginiana*); the Phœnician juniper, or cedar (*J. phœnicea*); and the Lycian juniper, or cedar (*J. Lycia*).

The sixth species has a variety with variegated leaves.

And the seventh species affords the Swedish or tree juniper, which rises to a very considerable height. Also the alpine or mountain juniper, which has the leaves broader and thicker, and the berries of a rather oval shape.

Method of Culture.—All these plants, except the fifth sort, may be increased either by seeds, layers, or cuttings; the latter methods are proper for the favin kinds.

The seeds or berries should be sown in beds of light earth, in the early autumn or spring, but the former is the better in light soils, in a warm sheltered situation, in the open ground, being well raked in. The beds should be kept perfectly clear from weeds, and the young plants be occasionally watered during the summer season. When the plants have had two years growth in these beds, and are become strong, they should be removed into nursery rows at two feet apart, and a foot or eighteen inches distant in the rows. They should remain in these situations till of proper growth to be planted out where they are to remain.

The layers of the young branches should be laid down at either of the above seasons, and, when well rooted, taken off, and planted in the nursery, in the same manner as the seedling plants.

The cuttings should be made from the young branches, and be planted in a shady border, in the latter end of summer, watering them occasionally till they have taken good root; when they may be taken up with earth about their roots, and be managed in the same manner as by the other methods.

The plants raised in these last ways seldom grow so upright, or to so large a size, as in the seed method.

The common upright and striped favins may likewise be increased by planting slips of the young branches; for the last sort the most variegated being made use of, in the latter end of summer, or in the autumn, in a shaded border, due water being given. When the plants are come up, they must be managed as the other forts.

The fifth sort must be sown in pots or tubs, at the same seasons as the other sorts, being placed in a frame to have the protection of glasses when the weather is froly and severe. As the seeds are long in coming up, the mould in the pots, &c. must remain undisturbed till they appear, being shaded from the sun, and slightly watered occasionally. The young plants should be kept quite free from weeds, and be duly watered till they have attained sufficient growth to be removed into separate small pots, filled with light earth, which is generally when from one to two years old. In removing them, they should have ball of earth preserved about their roots, and be watered, and placed in a warm situation. The best season for this is in the early spring; but it is of great advantage to plunge the pots in a mild hot-bed. They must be protected in the winter, either in frames, or under a warm fence; the pots being plunged in the earth. When they have been removed into different larger pots, till of sufficient large growth, they may be planted out where they are to grow, which should be in a warm situation. It is proper to shelter them the first two winters during severe frosts, by mats, or other similar coverings.

The proper periods for removing all the different sorts into the open ground are in the early autumn or spring months.

These plants all succeed in the open ground, and grow in any common soil and situation, with other hardy plants of the tree kind; though they are the most prosperous in a light sandy soil, where the aspect is sheltered.

In placing these kinds of plants in the clumps and shrubbery plantations, attention should be had to arrange them according to their degrees of growth, so as to exhibit a regular gradation of height; placing the low growing sorts, as the common juniper and favin kinds, towards the fronts, and the other larger growing forts more backward, in assemblage with other ornamental shrubs and trees of the evergreen tribe; and some may be placed as single standards, on open spaces of short grass, in the pleasure ground quarters. Some of the large growing forts may also be introduced into the forest-tree plantations, as they have a fine effect, and afford excellent timber for many uses, more particularly the Virginia cedar, which arrives at a considerable size, especially when the under branches are trimmed off occasionally while young.

JUNIPERUS, in the *Materia Medica*. The tops and fruit or berries of the shrub juniperus, which is common on heaths in different parts of Europe, are much used in medicine; but the latter are preferred.

These berries, which are first green, and when ripe of a dark

JUNIPERUS.

Dark purple colour, ripen in the autumn. They are chiefly brought to us from Holland and Italy; and should be chosen fresh, not much shrivelled, and free from mouldiness. Their smell is moderately strong, but not disagreeable. Their taste is warm, pungent, and sweetish, which, after they have been long chewed, or previously well bruised, is followed by a considerable degree of bitterness. The sweetness of these berries appears to reside in the juice, or soft pulpy part; the bitterness in the seeds; and the aromatic flavour in oily vessels, spread throughout the substance, both of the pulp and of the seeds, and distinguishable even by the eye. The fresh berries yield, on expression, a rich, sweet, honey-like, aromatic juice; and if the seeds are thoroughly broken, the juice proves tart and bitter.

Juniper berries give out nearly all their virtue, both to water and rectified spirit, tinging the former of a brownish-yellow, and the latter of a bright orange colour. Distilled with water, they yield a yellowish essential oil, very subtle and pungent, resembling the berries in smell, and in quantity, when the berries have been sufficiently bruised, about one ounce from forty. This oil is a very stimulating diuretic; the decoction inspissated to the consistence of a rob or extract, has a pleasant, balsamic, sweet taste, with a greater or less degree of bitterness. A part of the flavour of the berries arises also in distillations with rectified spirit: the inspissated tincture consists of two distinct substances; one oily and sweet; the other tenacious, resinous, and aromatic. The extract may be used with advantage in cases where the more stimulating preparations would be improper; as in catarrhs, debilities of the stomach and intestines, and difficulties of the urinary excretions, in persons of an advanced age. Among the aromatics that have been tried in composition with juniper berries, sweet fennel seeds, and carraway seeds, seem the best adapted to improve their flavour. A cordial water is prepared in the shops, by drawing off a gallon of proof-spirit from a pound of the berries, and an ounce and a half of each of the seeds. To this water may be usefully super-added, a proper quantity of the rob. Lewis.

The berries are chiefly used for their diuretic effects; and they are also considered to be stomachic, carminative, and diaphoretic. We have several testimonies in favour of the efficacy of juniper berries in many hydropical affections by physicians of great authority; but authors do not seem to be perfectly agreed which preparation of the juniper is most efficacious; many preferring the rob or inspissated decoction; but Dr. Cullen observes, that this is an inert medicine, alleging that to the essential oil, which is much the same as that of turpentine, only of a more agreeable odour, he thinks all the virtues ascribed to the different parts of juniper are to be referred. Hoffman, on the contrary, strongly recommends the rob, and declares it to be of great use in debility of the stomach and intestines; and he found it to be particularly serviceable to such old people as are subject to these disorders, or labour under a difficulty with regard to the urinary excretion; whence it appears, that the berries retain medicinal powers, though deprived of the medicinal effects of the essential oil. Van Swieten prescribed the following formula: R. Rob. bac. junip. ℥ii; dilue in aqua junip. ℥ii; add. spirit. bacc. junip. ℥ii; quandoque spiritus nitri dulcis ℥ss ad siccum sedandum additur. Of this mixture one or two ounces were given every three hours. But juniper being now seldom or ever relied upon for the cure of dropsies, and only used in aid of more powerful remedies, it is justly observed by Duncan (New Ed. Disp.) that "perhaps one of the best forms under which the berries can be used is that of a simple infusion. This by itself, or

with the addition of a little gin, is a very useful drink for hydropic patients." Medical writers have also spoken of the utility of juniper in nephritic cases, uterine obstructions, scorbutic affections, and some cutaneous diseases; and in the two last-mentioned complaints, the wood and tops of the plant are said to have been employed with greater advantage than the berries. Our Pharmacopœias direct the essential oil and a spirituous distillation of the juniper berries to be kept in the shops: the former, in doses of two or three drops, is found to be an active and stimulating medicine; the latter contains this oil, and that of some other aromatic seeds united to the spirit, and therefore differs not considerably from the genuine geneva imported from Holland; but there is great reason to believe, that the gin usually sold here is frequently nothing but the frumentaceous spirit, imbrued with turpentine, or other materials to give it a flavour. Woodv. Med. Bot.

Etmuller had a high opinion of juniper berries. The rob made of the expressed juice of the green berries has been called by many, the *theriaca Germanorum*; so much are they esteemed by that nation for their alexipharmic qualities.

The wood of juniper, it is said, will last a hundred years without corrupting; the chemists add, that a coal of juniper, covered with ashes of the same kind, will keep on fire an entire year.

From this juniper, the gum sandaracha is obtained: it exudes through the crevices of the bark, or the perforations made by insects.

The bark of the *Juniperus Lycia* yields the officinal gummy resinous substance, called *Olibanum*. See *FRAXINUS*: and *OLIBANUM*.

The *Juniperus Sabina*, or common favin, is a native of the south of Europe and the Levant: it has been long cultivated in our gardens; and from producing male and female flowers on separate plants, it was formerly distinguished into the barren and berry-bearing favin. The leaves and tops of favin have a moderately strong smell, somewhat disagreeable, and a hot, bitterish, acrid taste: they give out part of their active matter to watery liquors, and the whole to rectified spirit. Distilled with water, they yield a large quantity of essential oil. From thirty-two ounces Hoffman obtained five ounces of this oil, in which the whole virtue of the plant seems to reside. Decoctions of the leaves, inspissated to the consistence of an extract, retain a considerable share of their pungency and warmth along with their bitterness, and have some degree of smell, not resembling that of the plant itself. On inspissation of the spirituous tincture, there remains an extract, consisting of two distinct substances, of which one is yellow, unctuous or oily, bitterish, and very pungent; the other black, resinous, tenacious, less pungent, and subsulphureous. Lewis's Mat. Med.

Savin is a powerful and active medicine, and has been long reputed the most efficacious in the *Materia Medica*, for producing a determination to the uterus, and thereby proving emmenagogue: it heats and stimulates the whole system very considerably, and is said to promote the fluid secretions. Its force in overcoming interior obstructions is so great, that it is said to have been employed, and too successfully, for purposes the most infamous and unnatural. It has, however, sometimes failed as an emmenagogue, which has, in some measure, been ascribed to the smallness of the dose given by physicians. Dr. Hume (see *Clinical Exper.*) seems to have had very great success with this medicine; for in five cases of amenorrhœa, which occurred at the Royal Infirmary at Edinburgh, four were cured by the sabina, administered in powder from a scruple to a dram

twice a day. He says it is well suited to the debile, but improper in plethoric habits; and he therefore orders repeated bleedings before its exhibition. Externally favin is recommended as an escharotic to foul ulcers, syphilitic warts, &c. Woodv. Med. Bot.

JUNISEN, in *Geography*, a town of Sweden, in the lapmark of Kemi; 64 miles N.N.E. of Kemi.

JUNIVILLE, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Retlic. The place contains 984, and the canton 5775 inhabitants, on a territory of 215 kilometres, in 13 communes.

JUNIUS, FRANCIS, in *Biography*, a learned French Protestant divine, descended from a noble family, was born at Bourges in the year 1545. At the age of thirteen, he had made an extraordinary proficiency in learning; and being intended for public life, he began the study of the civil law, and after prosecuting it for some years, he was sent to Lyons, to join the train of the ambassador from the king of France to Constantinople. He unfortunately arrived too late, and accordingly remained in that city to attend the public lectures of the college. Here, by his avidity in pursuing knowledge, he recommended himself to the principal, which was of great service to him in his studies. In this city he became acquainted with a person deeply tinctured with sceptical notions, and became himself an atheist. On his return to Bourges, his father engaged him in a course of reading, particularly of the New Testament, which insensibly reclaimed him from those principles which he had imbibed at Lyons; and from this period he attached himself to studies connected with sacred literature and piety. In 1565 he was appointed minister of the Walloon church at Antwerp, where his labours were eminently useful in spreading the reformed religion, on account of which his father had been murdered a short time before by the bigotted Catholics. Junius soon became obnoxious to the Inquisition, which had been lately introduced into the Low Countries; and many attempts were made by the emissaries of that tribunal to get possession of his person, which timely information enabled him to elude. In 1568 he was made chaplain to the prince of Orange, whom he accompanied during the unfortunate expedition to the Netherlands; and upon his return, he resumed his ministerial functions at Schoon, to which he had been before appointed by the elector palatine Frederic III. He was, after this, noticed by Henry IV. of France, and employed upon some public missions; which being accomplished, he accepted the divinity professorship at Leyden, the duties of which he performed with ability and great reputation for the space of ten years. He died of the plague in 1602, in the 57th year of his age. He was author of numerous works, theological, controversial, and philological, of which the following may be mentioned:

“Commentaries,” on the first three chapters of Genesis, the prophecies of Ezekiel, Daniel, and Jonah; “Sacred Parallels,” and “Notes,” upon the book of Revelation; “A Translation out of Hebrew into Latin of the whole Old Testament;” “Hebrew Lexicon;” “Grammar of the Hebrew Tongue;” “Notes on Cicero’s Epistles to Atticus.”

JUNIUS, FRANCIS, son of the former, was born at Heidelberg in 1589, and was educated at Leyden. He was first intended for the military profession, but circumstances induced him to change his purpose, and he devoted himself entirely to letters. As a literary man, his first occupation was in collecting and publishing some of his father’s works. In 1620 he came to England, and resided in the family of Thomas earl of Arundel, as librarian, during the space of

thirty years. Being, it is said, void of all ambition, and indifferent to the usual objects of worldly pursuit, he made study the whole business of his life. His frequent visits to the Bodleian and other libraries led him to obtain an intimate knowledge of books written in the Anglo-Saxon dialect. Convinced that in this he could discover the etymologies of all the tongues of northern Europe, he applied to it, and to the other dialects connected with it, with the greatest assiduity. His final conclusion was, that the Gothic was the mother of all the languages of the Teutonic stem. In hopes of hearing the ancient Saxon spoken in its ancient purity, he went and resided in Friesland for two years. On his return through Holland, he met with the MS. of the four evangelists in silver Gothic letters, known by the name of the silver MS. This he set about explaining, and published it with a glossary, furnishing a version of the same in the Anglo-Saxon, with notes by Dr. Marshall. He returned to England in 1674, and died at Windfor in 1677, at the age of eighty-eight. He bequeathed all his MSS. and collections to the public library at Oxford. His works are “De Pictura Veterum;” “Observationes in Willeromi Francicum Paraphras in Cantici Canticoorum.” But his great labour was a “Glossarium Gothicum,” in five languages, comprised in nine volumes. An “Etymologicum Anglicanum” was published from his papers, by the Rev. Edward Lye, in 1743. Bayle. Wood Ath. Ox.

JUNUS, in *Geography*, a military township of America, in Onondaga county, New York, at the N. end of Cayuga lake.

JUNUS Creek, a northern branch of the Little Kanaway, which interlocks with the western waters of Monongahela river. See KANAWAY.

JUNK, a river of Guinea, which runs into the Atlantic, N. lat. 6° 5'. W. long. 10° 5'.

JUNK, in *Sea Language*, a name given to any remnants or pieces of old cable, which is usually cut into small portions, for the purpose of making points, matts, caissets, fennit, &c.

JUNKS, large flat-bottomed vessels, from 100 to 500 tons burden, used by the Chinese. They have three masts, and a short bowsprit placed on the starboard bow. The masts are supported by two or three shrouds, which at times are all carried on the windward side. On the fore and main mast is hoisted a sort of lug-sail, made of cane or bamboo. These sails are confined by iron travellers, that encircle the mast, and fixed to bamboos at several divisions on the sail. The sail is kept to the wind by two ropes, fastened to wood stirrups, fixed to the foot of the sail, and lead to the mast-head. The lee part of the sail is hauled aft, by a rope that branches into short legs, that are made fast to each fold of the sail. On the mizen-mast is a gaff-sail, made of coarse cotton; a top-sail made of the same is carried on the main-mast; also a jib and sprit-sail, that are set on the bowsprit. Similar to these junks are the Japanese barks, which are 80 or 90 feet long on one deck, but have only one mast, that carries a square sail, and forward one or two jibs made of cotton. They only use fails when the wind is large.

JUNKER, CHRISTIAN, in *Biography*, was born at Dresden in 1688. He studied at Leipzig, was made first rector and librarian at Eisenach, and historiographer to the prince of Saxony. In 1711 he was elected a member of the Royal Academy of Sciences at Berlin, and in 1713, director of the gymnasium at Altenburg. He died in the following year through grief from the loss of his wife, whose death preceded his own but five days. Of his literary talents he gave sufficient proof by the many works which he published, and particularly by his “Geography of the Middle

Middle Ages," in quarto. This work, which was published at Jena in 1712, is divided into two parts, and the whole concluded with a very useful index of all the countries, towns, villages, forests, rivers, and mountains known in the middle ages. His other principal works are, "Vita D. Mart. Lutheri et successum Evangelicæ Reformationis," &c.; "Vita Jobi Ludolphi, accedunt Epist. aliquot clariss. virorum, nec non Specimen Lingue Hottentotice;" "Principles of the Ecclesiastical History of the Old and New Testament;" and "Lineæ primæ Eruditionis universæ Historiæ Philosophicæ." Gen. Biog.

JUNKOWADA, in *Geography*, a town of Africa, in the kingdom of Yari; 22 miles W. of Pifania.

JUNKSEILON, or **JUNK CEYLON**, an island in the East Indian sea, on the E. side of the bay of Bengal, belonging to Siam, and governed by a viceroy from that court. It derives its name, according to captain Forreft, from a corruption of "Ojong Sylan," signifying, in the Malay language, point or promontory of Sylan, the S. point projecting a little way into the sea. It stretches nearly N. and S. about 50 or 60 miles long, and is about 15 miles broad; its centre is situated in S. N. lat. separated from the continent of Malacca by an isthmus of sand, about a mile long and half a mile broad; which isthmus is covered only at high water, and shuts up in the N. part an excellent harbour, called "Popra," with good anchorage round it, generally on a muddy bottom. The hills of this island are of moderate height; and instead of rivers, it has creeks, running into the sea, through flat marshes of mangrove trees from pleasant brooks in the interior parts. The vessels used by the inhabitants consist of a few praws, about the size of Indiamen's long boats, and small canoes, in which they fail up the creeks to the cultivated plains in the middle of the island, abounding with rice fields. Besides Popra, there is another capacious harbour on the S. W. part of the island. The place where ships generally anchor is in a good road, well sheltered behind a small island, joined at low water to the main land. In this island are 17 towns or villages, and the number of inhabitants is estimated at about 12,000. They have many elephants procured from Mergui, but no horses; they have bullocks and buffaloes for labour; wild hogs and deer; a few tame goats; no sheep; domestic dogs and cats. They have some of the common poultry. The climate is agreeable, without extreme heat; the rain comes on gently in July, and continues, but not without frequent intermissions, till November, when fine weather succeeds, with very cool N. E. winds at night, favourable to the cultivation of vegetables. The opium, formerly sold on this island in great abundance, was brought in English ships from Bengal, and purchased by those who used Malay and Buggefs praws; they sold it by retail to the natives for tin, and exchanged it with the Bengal vessels for opium, which they carried chiefly to Celebes and other Malay islands. The mixed cargo of the Malays was generally a chequered cloth, called Buggefs cambays, made on the island of Celebes, painted cloths and painted handkerchiefs of Java, generally made from Hindoostan long cloth, Java gongs, brass pots, and other utensils of brass made in that island; China and Java tobacco; various porcelain; blue and white unbleached cloth called "kangan," and white and blue called "compow," brought from China by the junks that resort to Siam, Macassar, Sooloo, Batavia, and other places. But the course of trade is much altered of late: opium being forbidden to the natives, the importation of it is prohibited, and a heavy duty is laid on the exportation of tin by orders from Siam; so that the trade has much declined. Hindoostan piece goods, and some European articles, such as iron,

steel, lead, sutlery, and broad cloth, being almost the only imports. The trade of this island is considerable in ivory and tin. The exportation of tin is annually estimated at 500 tons. N. lat. 8°. E. long. 98 20'.

The Birmanis, wishing to extend the entire dominion of the western coast, as far as the territories of the Malay prince of Queedah, made an attempt, in 1785, to get possession of this island. By so doing, they would have been able to monopolize the commerce of the peninsula, and prevent the Siamese from communication with India by any other channel except the gulf of Siam. Besides, the island was desirable on account of its mild climate and luxuriant soil. Having fitted out a powerful armament of 11 ships and 8000 men, they attacked the fort, which is situated on the E. side of the island, and succeeded, notwithstanding a spirited resistance on the part of the Siamese governor, who afterwards withdrew from the fort into the interior of the island. The triumph of the Birmanis was of short duration: the Siamese governor rallied his forces, and drove the Birmanis from their shipping with great loss. Apprehensive of greater disasters they returned to Mergui, whence the fleet sailed for Rangoon, and the troops marched to Martaban. In the year 1786, the Birmanis renewed their attack, and blocked up the harbour of Junkseylon; but in the event they were completely routed by a powerful army of the king of Siam. Symes's Embassy to Ava, vol. i. See SIAM.

JUNO, in the *Heathen Mythology*, a goddess; the daughter of Saturn and Rhea, the sister and wife of Jupiter: she is otherwise called Lucina. According to Hesiod, she was the mother of Hebe, Venus, Lucina, and Vulcan.

Juno, as well as Jupiter, had a great variety of characters among the ancients, but the favourite one of them all, among the Romans, was that of the Juno Matrona, dressed like the Roman matrons in a long robe which covered her from head to foot. The figures of the Roman empresses were often formed under this character of Juno. Such is the statue of Sabina, at the Villa Mattei in Rome. This Juno was called indifferently, Juno Matrona and Juno Romana. The Juno Regina, and Juno Moneta, are always represented on the ancient gems and medals, in a very fine and magnificent dress, with the instruments of coinage, and under the latter appellation she had a temple at Rome. We may observe, that Virgil, *Æn. i. v. 17.* and *Æn. ii. v. 614.* speaks of Juno, not according to the appearance she used to make among the Romans, but according to the representations of her in other countries. In one place, where he describes her arms and military chariot, he speaks of the Carthaginian Juno; and in the other he has given her an angry and warlike figure, which belongs to the Juno Argiva, or some particular Juno of the Greeks. However, the Juno Sospita, among the Romans, appears on several medals in a war chariot, and with a spear in her hand. She was called Sospita, because she watched over the salubrity of the air, the temperature of which is the cause of diseases. Under this name she had three temples, one at Lanuvium, and two at Rome; and Cicero informs us, that the consuls, before they entered upon their office, were obliged to offer a sacrifice to her. Another name of Juno was the "Queen," or "Regina," under which appellation she had a statue at Veii, that was transported to the Aventine mount, under the dictatorship of Camillus, where it was consecrated by the ladies of the city. This statue was held in such reverence, that none but her priest could touch it. There was also a mild Juno, as well as a mild Jupiter, among the Romans; under which character, her face appeared more gentle and good-humoured than usual: but the most obvious and striking character of

Juno, which we derive from the writings of Homer and Virgil, is that of an imperious and haughty wife. These poets oftener represent her scolding at Jupiter, than caressing him. Nevertheless, she was anciently considered as the great patroness of marriage and a wedded life. Under this character she had the name of *Juga* and *Pronuba*, (Virgil, *Æn.* 4.) and had an altar in the street called *Jugara*. When the pious over women in childhood, and was confounded with Diana, she obtained the name of *Lucina*, and was represented as a matron, holding a cup in her right hand, and a spear in her left, with this inscription, "Junoni Lucinae." Sometimes she was represented sitting on a chair, holding in her left hand a child in swaddling clothes, and in the right a flower resembling a lily; and also a whip and a scepter, the whip signifying a happy delivery. Juno, under the character of presiding over the air, is represented in a light car, drawn by peacocks, and attended by the *Auræ*, or nymphs of the air.

Of all the divinities of the Pagan world, there was not one whose worship was more solemn and more general than that of Juno. It was not confined to Europe alone, but found its way into Asia, especially into Syria; and also into Egypt, and other parts of Africa. Greece and Italy abounded with temples, chapels, or altars dedicated to this goddess, and in some places of distinction she had several of these. Among the more celebrated towns, there were three that paid a more particular worship to Juno than others, *viz.* Argos, Samos, and Carthage. The priestesses of Juno of Argos were highly respected in Greece; and their priesthood served to distinguish the principal eras of the Grecian history. Among the birds, the hawk was appropriated to her, and above all the peacock, which last was frequently an appendage to her statues. According to *Ælian* (*De Animal.*), the Egyptians consecrated to her the vulture. Dittray and the poppy were the plants which the Greeks offered to her, when they took her for Juno *Lucina*. Among the animals, the ewe-lamb was peculiarly consecrated to her, and was the most common victim offered to her in sacrifice. It was usual, however, to offer to her a sow on the first day of each month. We may infer the high veneration which was paid to Juno, especially by the women, from this circumstance, that their guardian deities were called "Junones," as those of the men were denominated "Genii." Apuleius sums up the honours that were paid to Juno in a comprehensive manner, by informing us that she was worshipped as the "Queen of the Goddesses." See *JUPITER*, *infra*.

JENO the Assyrian was called *Astarte*, which see.

JENO, in *Astronomy*, the name given to one of the new planets by M. Harding the astronomer, who discovered it at Lilienthal, in Germany, the 1st September 1804. Two of these singular bodies, *Ceres* and *Pallas*, had before been discovered by Piazzi and others, and the great difficulty with which they are formed after they have been enveloped in the sun's rays, suggested the task to Mr. Harding, of constructing a species of zodiac, to enable astronomers to find these two small planets. In this zodiac he placed not only all the stars in the catalogues, but also all the small stars which he himself could observe and place in the probable tract of the planets. It was in executing this laborious undertaking, that he perceived a small star which he thought had not been in the same place a short time before. Three days afterwards it had evidently changed its place, and advanced towards the east two degrees. A series of observations soon convinced him that he had discovered a third planet of the same class as *Ceres* and *Pallas*.

Its orbit has been calculated by Mr. Gauss and Mr. Burckhardt, as follows:

	Secberg, 1st Jan. 1805.	Mr. Gauss.	Mr. Burckhardt.
Longitude	1° 12' 32" 36"	1° 12' 17" 31"	
Aphelion	7 23 11 39	7 22 49 0	
Node	5 21 4 16	5 21 6 0	
Inclination	13 3 38	13 5 0	
Diurnal motion	815" 9595		
Annual motion	2 23 43 45.2		
Eccentricity	0 254236	0 25096	
Semi-axis Maj.	2 06445	2 657	

The mean diameter of this planet, as seen from the earth, is, according to Schroeter, $3''$. 57, but he differs in his opinion on this subject from Dr. Herschel, who estimates it much smaller, and astronomers are at present unable to decide to which theory they should incline.

Under the article *PLANETS* we shall again resume the subject of these newly discovered bodies, and attempt to shew the strong arguments that may be urged to prove that they are all fragments of a large planet which once circulated between Mars and Jupiter.

JUNOH, in *Geography*, a town of Hindoostan, in Bahar; 35 miles N. E. of Nagpou.

JUNONES. See *GENIUS*.

JUNONIA, the name given at Rome to a festival instituted by the Greeks in honour of Juno, and by them called *Heraea*; which see.

JUNQUERA, LA, in *Geography*, a small town of Spain, in the province of Catalonia, situated at the entrance of a plain, which, as Strabo says, was fertile in flax and spart, or sea-rub, whence it acquired the name of "Campus Juncarius," and the town that of "Juncaria." This town was established by a colony of Massians, and was formerly considerable; but is now much reduced. It has a parish church, but little trade. The environs abound with cork trees; 30 miles N. of Gerona.

JUNTA, called also *Junto*, and *Junta*, a council, or company, of several persons, meeting for the dispatch of any business.

The term is particularly used in the Spanish and Portuguese affairs. On the death of Charles II. king of Spain, the kingdom was governed, during the absence of Philip V. by a junta.

In Portugal they have three considerable juntas: the junta of *commerce*, that of the *three estates*, and that of *tobacco*. The first was established by king John IV.; this is a council of marine. The same king also assembled the estates of his kingdom, to create the tribunal of the junta of the three estates. King Peter II. created the junta of tobacco in 1675; it consists of a president and six counsellors.

IVOIRE, in *Geography*, a town of France, in the department of the Lemau; 13 miles N. N. E. of Geneva.

IVORY, (*Ebur*.) the tusks or large conical teeth in the upper jaw of the elephant. This name is also sometimes improperly given to the teeth of the sea-corn (Monodon monoceros), the morse (Trichechus rosmarus), and those of the Hippopotamus (see these articles).

The elephants' tusks from Africa are in general preferred by the dealers in this article; they generally run considerably larger, but it is a common opinion, that the ivory from Ceylon is less liable to turn yellow when exposed to the action of the atmosphere, whence it is sold at a higher price than the other. By far the greatest part of this merchandize is brought from Africa; and a part of Guinea, which has furnished the greatest quantity of it, has obtained the name of the Ivory Coast: the tract of coast from Cape Palmas, to Apollonia or Trespunta, is more particularly

Early known by this appellation. But the principal market for some time past appears to have been at the east coast of Africa, where the ivory is supposed to be found of superior quality; indeed the English merchants at Surat pay a greater price for the tusks furnished by this part of the coast than for such as are brought from any other part of Africa.

The best tusks are those that are least curved, without spots, and most solid towards the base. Some writers on this subject pretend that such elephants as inhabit swampy places, generally produce blue, spongy, and knotty tusks, in every respect inferior to those of elephants living in hilly countries or on dry plains. The Ethiopian elephants' tusks, according to Paul Lucas, are furnished with larger cavities, and are therefore less esteemed.

In commerce, unwrought ivory passes under the appellation of *marfil*, or *morfil*, a word which Frisch derives from the Spanish, but is probably of Moorish or Indian origin. Tusks under a certain weight (some say 14, others 20 pounds) are called *Crocodils* by the African merchants; a word which appears to be the same with *Ejfarballi*, or *Ejfarboille* of the French, and *Scaravellio* of the Spaniards and Portuguese.

Elephants' teeth constitute a very important article of commerce. Labat computed the quantity of ivory annually imported into France at his time, by the Senegal company, to be 500 quintals, or 50,000 pounds. In 1784 the number of tusks imported into Nantes was 744, besides 360 pounds weight; and into Havre de Grace, in the same year, 435 tusks and 1805 pounds, and into Bourdeaux 5999 pounds. In the following year 3027 pounds and 471 tusks were imported into Nantes; in 1787, 16,184 pounds and 395 teeth; and into Havre de Grace 3784 pounds.

In an account which the house of commons ordered to be given in, of the quantities of the principal articles in the nature of raw materials, imported and used in the manufactures of Great Britain for twelve years preceding the year 1799, we find the following respecting the importation of elephants' teeth; *viz.*

1788	1,387 cwt.
1789	2,145
1790	1,476
1791	3,735
1792	1,484
1793	1,412
1794	2,203
1795	1,647
1796	1,167
1797	1,969
1798	889

and in an account, likewise delivered to the house of commons, of the quantity of the same articles, on an annual medium of four periods of five years, each commencing the 5th of January 1772, the following related to the article under consideration; *viz.* Five years preceding

5th January 1776	690 cwt.
1787	1,339
1792	2,650
1797	1,291

The component parts of ivory being the same as those of bones (*viz.* phosphate of lime combined with a gelatinous substance), and differing only with regard to texture, hardness, and whiteness, the preparations it undergoes in the arts are equally applicable to the bones of animals. The whiteness which ivory acquires depends chiefly on the degree

of dryness it has acquired. When yellow, its gelatinous matter is altered by the air, and appears to be combined with the oxygen of the atmosphere. Oxygenated muriatic acid will restore it to its original whiteness. Those employed in working ivory, distinguish the *white* and the *green*. The former is known by the whitish or lemon coloured rind of the tusks, the other by the brown and blackish. The green ivory (so called from a greenish or faint olive colour pervading its substance) is preferred, it being of a closer texture, and known soon to exchange its green hue for the most beautiful white, which is less liable to turn yellow. This green ivory is, however, more brittle than the other.

Heat cannot be made use of for making ivory pliant, though it is rendered softer by being exposed to that agent. It is divided by the saw; sometimes (for delicate work) under water, in order to prevent its being heated or rent in the operation. It is polished with pumice and tripoli. Ivory has been said to become soft by being placed in mallard; but that end is attained with greater certainty by steeping it in some diluted mineral acid. Both ivory and common bones become also soft by being immersed in an alkaline lye made of soda and quick lime.

By burning this substance in closed vessels, and afterwards levigating it with water on a porphyry slab, we procure what is called *black ivory*, much used for painting and other purposes that require a very intense velvet-like black colour.

The following observations, relative to the nature of the tusks of elephants, are extracted from Cuvier's excellent memoir "On living and fossil Elephants," in the *Annales du Muséum*, and translated in the *Philosophical Magazine*, vols. xxvii. xxviii. and xxix. to which, especially as our article ELEPHANT was written previous to the publication of that elaborate memoir, we refer our readers for a more complete natural history of that remarkable animal.

Cuvier, in examining the varieties of tusks, and the differences remarked in this respect among elephants, observes, that their texture exhibits no important difference. It always presents, upon its transverse section, those streaks which proceed like an arc of a circle from the centre to the circumference, and form, in growing, curvilinear lozenges which occupy the whole disk, and which are more or less broad, and more or less perceptible to the eye. This character, common to all elephant ivory, and depending immediately on the pores of their pulpy nucleus, is not to be found in the tusks of any other animal. It is to be seen in all fossil tusks, and it refutes the opinion of Leibnitz, adopted by some other writers, and even by Linnæus, that the mammoth horns might have belonged to the *Trichoceros rosmarus*. The tusks of these animals, however, seem wholly composed of small round accumulated grains.

The size of tusks varies according to the species, sexes, and varieties; and as they are growing all their lives, age, more than any thing else, influences their dimensions. The African elephant, as far as we are able to ascertain, has very large tusks in both sexes. The African female, 17 years old, the skeleton of which is in the museum of Paris, has larger tusks than any male or female Indian elephant of the same size that we are acquainted with. It is from Africa we receive the most ivory, and the greater number of tusks; and they are also harder and whiter than any others. But our limited knowledge is confined to the elephants of the western coasts, and to those of the south of Africa. We are ignorant if those of the eastern shores resemble them in every thing, and if there be any varieties in the interior. We know from Pennant, however, that the coast of Mal-

fambique furnishes tusks ten feet long, being the largest ever known. In the Indian species there are more varieties of tusks, which Mr. Corfe has developed with more care than any other writer (see Phil. Transf. 1799, and art. ELEPHAS;) but all these varieties have nothing constant, and are mixed indifferently with each other. In Bengal, the tusks weigh little more than 72 pounds, and they do not exceed 50 in the province of Tipperah, which produces the best elephants. There are tusks in London, however, probably

from Pegu, which weigh 150 pounds. It is, in fact, from Pegu and Cochinchina that the largest elephants and tusks of the Indian species come. The coast of Malabar furnishes no tusks, according to Pennant, more than four feet long.

Cuvier has drawn up the following table of the length, diameter, and weight of the largest tusks taken from other authors, or actually inspected by himself: the tusks from Africa are not distinguished here from those of India.

Authors who have quoted the Facts.	Their Authorities and Details upon the Origin of the Tusks.	Length following the Curvature.	Diameter at the thick End.	Weight.	
Hartenfels Elephantographia, P. 47, 48.	{ Tusk from Sumatra, according to Louis Vartoman, } quoted by Jonifon	—	—	163 0	
	{ Tusk mentioned by J. C. Scaliger, "de Reb. Ind." } Tusk from the Cab. of Septal, quoted by Herzog	—	—	162 0

				126 0	
				from 60 to 120 0	

As the tusks, M. Cuvier adds, grow during the life of the animal, and the body does not, the size of an elephant cannot be concluded from its tusks, even by establishing the proportion between individuals of one same variety, and the same sex; as, on the other hand, the tusks rot or break at their points, according to the greater or less use the animal makes of them, and they are sharpened, more or less abruptly, into a point, we cannot conclude their length from the diameter at their base. Finally, their weight cannot be concluded from their dimensions (Messerichmidt in the Phil. Transf.), because their cavity at the base may be more or less filled. The degree of curvature of the tusks of elephants

varies almost as much as their size. In various cabinets there are several tusks to be seen with curvatures more or less strange, and in particular some are spiral. Camper saw several of them in the British Museum, and Grew represents one which is turned round several times; and Cuvier knows, from M. Fabroni, that there is one of that description in the Florence cabinet also. They are frequently seen in the form of an Italic S, &c.

A green dye may be given to ivory, by steeping it in aquafortis, tinged with copper or verdigris, or in two parts of verdigris and one of ful ammoniac, ground well together, with strong white-wine vinegar poured on them; and by converting

converting the aqua-fortis into aqua regia, by dissolving a fourth part of its weight of sal ammoniac in it, ivory may be stained of a fine purple colour.

Ivory, bone, horn, and other solid parts of animals, may be stained black, in the same manner as wood. These substances may be stained yellow, by boiling them first in a solution of one pound of alum, in two quarts of water; and then, having prepared a tincture of the French berries, by boiling half a pound of the berries, pounded, in a gallon of water, putting them into this tincture, after it has boiled about an hour, and letting them remain there half an hour. Turmeric root may be used instead of the berries; but in this case the ivory, &c. must be dipped in alum water after it is taken out of the tincture. Ivory, &c. may be stained blue, by first staining it green, and then dipping it in a solution of pearl ashes made strong, and boiling hot: or it may be otherwise boiled in the tincture of indigo, prepared by the dyers; and afterwards in a solution of tartar, made by dissolving three ounces of white tartar, or cream of tartar, in a quart of water. For other processes and colours, see *DYEING of Bones*, &c. *Colouring and Staining of Bones*, and *TORTOISE Shell*.

Ivory may be prepared as a ground for miniature painting, by cleansing the ivory leaves or tables, and rubbing them over with the juice of garlic. This is said to be more essential for taking off the greasiness, which prevents the colours from fixing on the ground, than soap or gall. Ivory has the same medical virtues with hartshorn; its shavings too, like those of hartshorn, boil into a jelly with water, and have the same restorative quality. See *HARTSHORN*.

Ivory Black. See *Ivory BLACK*.

IVORY, Fossil, in *Natural History*. It is not uncommon in the most modern alluvial soils, like the vallies in the basin of Paris, mentioned by Cuvier and Brogniart, and the soil in which the docks adjoining the Thames were excavated, to find the bones, teeth, and tusks of elephants; and this fossil ivory is not, in some instances, much altered, though in general it has lost its consistence in a great measure, and readily scales off in concentric rings, and in others is impregnated with metallic substances, so as to imitate, if not form the Turquoise stones, the Callais of Pliny, &c. as Dr. Woodward has shewn in his Letters on the Method of Fossils, p. 15. It may, however, be doubted, we believe, whether fossil ivory has ever been found imbedded in the strata, or the parts of any dry-land animals, numerous as their remains are in the last alluvial covering of some districts. The abundance of elephants' teeth found buried in different parts of the world, and many of those parts such as no elephant is ever known to have lived in, have given amazement to naturalists.

The long tusks, which are what we call ivory, are the only teeth the vulgar are acquainted in this creature; yet even these, in their fossil state, have often been mistaken for horns, or other animal parts. The grinders of this animal are so enormously large, and of so singular a shape, that it requires some knowledge in natural history to discover them at sight, and many have mistaken them, when imperfect, for parts of a petrified shell-fish of the nautilus kind, their root being hollowed all along, and armed with an indented ridge on each side, in the manner of the back parts of some shells of that and of the Cornu ammonis kind.

We are not to wonder that the teeth of elephants are found more frequently than any other bones of the animal, since their use in the creature required that they should be harder than any other bone, and that hardness has preserved them in places where the other bones have perished. The

different state in which these teeth are found, is wholly owing to the different juices abounding in the earth in the place where they were deposited, some of those juices being of power to preserve, others to destroy them; some eating them insensibly away, some as it were calcining them by slow degrees, and others rendering them greatly more hard and durable than before. Mem. Acad. Par. 1727.

Count Marigli, and some other writers, have thought it an easy solution of the question of the teeth and bones of elephants being found in countries where elephants are not naturally found, that we owe them to the Romans, who, bringing them over for their use in war, buried them wherever they happened to die. But sir Hans Sloane expresses himself very justly against this opinion: he observes, that of the remains of elephants found in Europe, nothing is so common as the ivory tusks. Now, as he well observes, the Romans held ivory in the highest esteem, and it sold among them at a great price; wherefore, had they been the buriers of the elephants, they would certainly have taken away the ivory tusks first. It is certain, therefore, that accident, and not design, hath buried these bones, and that accident can have been no other than some prodigious inundation. Woodward is desirous of making the universal deluge to have done all this, but that seems not necessary to be supposed in every case. Sir Hans Sloane gives an enumeration of the most curious of these pieces of fossil ivory, which his own cabinet contained, and of some others of the most remarkable, mentioned by authors; from which we may form a very distinct idea, both of the nature of the bodies themselves, and of the places where they are usually met with. See *Philos. Transf. N^o 403. p. 458*.

The power of subterranean calcinations to render things of this kind brittle, is remarked by the same author from Moreton's History of Northamptonshire, in the instance of a fossil tusk of an elephant, which was in the whole at least six feet long, and had preserved its natural whiteness, though rendered so brittle as to fall into several pieces in the digging. This was dug up near Little Bowden, in Northamptonshire; and the strata of the place where it lay were as follows: 1. Vegetable mould, 14 inches. 2. Loam, a foot and a half. 3. Large pebbles, with a small mixture of earth among them, two feet and a half. 4. Blue clay; in the upper part of this last stratum the tooth was found.

Sir Hans mentions another elephant's tusk very entire and found, found in Siberia. The like are common in Siberia and many parts of Russia, and are so little injured, that they are used as ivory, and are supposed to be the teeth of a vast animal called the *mammoth*, which they think lives under ground. *Phil. Transf. N^o 468*. See farther on this subject, *BONES, Fossil, ELEPHANTS' Bones, and TEETH, Fossil*.

IVORY Coast, in *Geography*, a name given to a country of Africa, situated on the coast of the Atlantic, between Cape Apollonia to the E. and Cape Palmas to the W. The principal towns and villages are Grona, or Grua, Great Tabo, Little Tabo, Grand Drewin, Batrou, Lahø, Apollonia, and Valo. These lie at the mouths of rivers, whence they derive their names. The interior of the country is little known, as the natives do not allow the Europeans to establish settlements, or even to trade among them, except very cautiously, by means of the coast negroes. The chief commodities are gold, ivory, and slaves. The inhabitants are reckoned savage, and in a high degree jealous and suspicious; insomuch that in their traffick with the Europeans, they are artful and imposing, and so easily incensed and alarmed, that they will precipitate themselves into the sea from the European ships, and swim to their canoes.

The whole coast, if we except a few capes, from Cape Palmas to Cape Apollonia, is so low and straight, that it furnishes no distinct land-marks besides the heights and mountains round Drevin. The landing is every where dangerous, on account of the swelling waves and high furs; and the negroes, who are acquainted with this sea, are the only people that can combat with the fury of its winds, tides, and waves, in their little canoes. From Cape Palmas to Cape Apollonia, these canoes are employed in loading and unloading our ships, that dread coming near the shore. Every country within the limits of the Ivory Coast is fruitful in rice, peas, beans, gooseberries, citrons, oranges, and cocoa-nuts, besides sugarcane. Upon the whole, the Ivory Coast is reckoned one of the finest divisions of Guinea: the mountains and valleys, filled with villages, which are surrounded with lofty palms and cocoa-trees, present a delightful prospect. The soil of the high land is a reddish earth, which, with the perpetual verdure of the trees, forms an agreeable mixture of colours. Cotton and indigo are the spontaneous growth of the provinces of Great Drevin and St. Andrew, which are the richest of the whole. Palm wine and oil are plentiful; together with a species of fruit, growing on a sort of palm-tree, which the natives call *tombo*, or *bourbon*. This the negroes eat with great pleasure, drinking at the same time a wine, drawn from the same tree, mixed with water. All sorts of tame animals, sheep, cows, goats, and hogs, are so numerous, that they are sold almost for nothing. The coast affords great variety and abundance of fish. As to the people, they are rather above the common stature, clean-limbed and well proportioned; but their features on the first glance are hideous; yet when the first impression is removed, Villault and Der Marchais concur in representing them as the most rational, civilized, and polished people in all Guinea. This account, however, is restricted to the natives of the Quauca coast, that is, from the river Drevin to cape Apollonia; for as to the others, all authors describe them as the most barbarous, cruel, and savage of all nations. Drunkenness is a crime of so odious a nature among the most civilized, that the laws have prohibited it under the severest penalties, and on pain of death. Their diet is coarse and indelicate. Their teeth are sharp, as they are in the constant habit of pointing them, and in general they are crooked and irregular. Long nails and a quantity of hair are deemed very ornamental. They are much addicted to the chewing of betel, with the juice of which they moisten the neck and chin, under a notion, that it gives a fine varnish and beautiful lustre to the skin. Round the small of the leg they wear large and heavy rings of iron, to which are appended bells, with the tinkling sound of which they are most delighted; and the multitude of these, as they imagine, constitute their dignity and grandeur. The common people only wear a piece of cloth round the waist, from a regard to decency; but persons more opulent cover themselves with a sort of cloak or surplice, with long sleeves, which they wrap round the shoulders, and hang down below the knee; and by their sides they wear lancers or short swords. Some of the women, who do not part with their hair to the men, adorn it with little plates of pure gold; and they are fond of costly trinkets. Their dress is a cloth, which falls over the fore-part of their bodies, the hinder parts being left naked; and indeed there are hardly any people on the whole coast of Guinea so primitive and simple in this particular, as the natives of the Ivory Coast, and particularly of Quauca. Their form of salutation they have in common with all negroes; that of laying hold of the fingers, making them crack, and repeating the word "quaqua" several times in a low voice. It is a constant rule among them, that the son follows the profession of the father, what-

ever it may be. In the mechanic arts they are singularly expert; a common door-lock is reckoned a great curiosity; a watch excites still higher admiration; and making paper speak, as they express it, is a perfect miracle. Their religion, like that of the people on the Gold Coast, is wholly founded in ignorance and superstition. They entertain great reverence for their princes and priests; and they are fully persuaded, that magic and foreery are powers inseparable from majesty and priesthood. The natives of Quauca cultivate several branches of trade with assiduity; and crowd on board any ships that approach their coast with all the produce of their country, gold, ivory, provision, and slaves. The European factors are much amused with observing canoes filled with men crowding round them, whilst every mouth utters the same sound, *quaqua, quaqua*, which seems to be a word by which they express welcome. The negroes of Quauca, however, are timorous and jealous in their intercourse and traffic with Europeans. The usual trade carried on in this part of the coast consists of cotton cloths, ivory, gold, and slaves. The maritime negroes act as brokers to the inland negroes, sell their stuffs for them, and receive so much *per cent.* by way of commission. The Quauca negroes manufacture a kind of plant, resembling hemp, into a strong cloth, to which they give beautiful colours, and pleasing flowers and designs that indicate them to be no bad artists in their way. They have also a considerable trade in salt with their inland neighbours, to whom they sell it at a very high price, on account of the distance and expence of carriage. All the countries behind Quauca furnish large store of elephant's teeth, the most beautiful ivory in the world. This is constantly bought up as soon as it is brought to the coast by the English, Dutch, French, and sometimes by the Danes and Portuguese. Villault infers from the quantity of pure gold which the women wear for ornament, that the inland country has mines that furnish virgin native gold. The European commodities which the negroes accept most readily in exchange for their own, are such as are held in estimation in other parts of Guinea; with this difference, that here the bracelets and rings for the legs, either of copper or iron, must be of an intolerable weight.

Although the Ivory Coast be divided into a variety of petty states or kingdoms, yet they have scarcely any separate interests; for among themselves war seldom happens, and of consequence, the slave trade here has borne but a small proportion to that traffic on the Gold and Slave Coasts.

Authors have observed, that the exomphalus, hernia umbilicalis, or preternatural tumour of the abdomen at the navel from a rupture, is a disorder extremely common on the Ivory Coast; though they are unable to account for its prevalence. Other deformities are as rare as this is common. Mod. An. Hist. vol. xiv.

JUPARITUBACA, a river of Brazil, which runs into the Atlantic, S. lat. 11° 10'.

JUPITER, a river of the island of Anticosti, which runs into the river St. Lawrence, N. lat. 49 25. W. long. 63 42.

JUPITER, or JOVE, in the *Heathen Mythology*, the sovereign god of the heathens; the son of Saturn and Rhea; born in the island of Crete, at the same birth with Juno; he married Juno, expelled his father out of his kingdom, and divided the kingdom of the world with his brethren. Under several shapes he is said to have played many wanton pranks; so that, according to poetic fiction, he filled heaven with his natural children.

The philosophers, as we learn from Cicero's discourses on the nature of the gods, took Jupiter only for the more purified air, or the ether, and Juno, his wife, for the grosser

air that surrounds our earth. Those who regarded him as an animated god, or one of those men, who, for their illustrious actions or useful inventions, were raised to divine honours, after having considered him as the sovereign of gods and men, or as an almighty god, who, by the mere movement of one of his eye-brows, made Olympus tremble, degraded him afterwards by ascribing to him the most unworthy actions and the most enormous crimes; he is, according to them, guilty of incest and adultery, an ungrateful son, a faithless husband, choleric, passionate, and revengeful. Whence, we may naturally inquire, did the Greeks and Romans, renowned for their genius and philosophy, derive such ideas of their supreme divinity? They were the poets, it is said, who gave such a representation of their Jupiter; but they must have borrowed it from the prevalent theology of the times. However, the history of this god is perplexed by the number and variety of persons, to whom the name has been applied. We may observe, that the history of Jupiter, who was best known, is that of him, who had been king of Crete, and this history is filled up with the adventures of all the rest. The ancients are not agreed with respect to the number of those, to whom the appellation of Jupiter was applied. Diodorus Siculus reckons only two; one, who was the prince of the Atlantide, and the other, supposed to be his nephew, who became much more famous, and was king of Crete, the limits of whose empire extended to the extremities of Europe and Africa. Cicero admits three; two from Arcadia, one the son of Æther, and father of Proserpine and Bacchus, and the other, the son of Cælus, and father of Minerva, who is said to have invented war, and to have presided over it; and a third, the son of Saturn, born in Crete, where, says Cicero, his tomb is still to be seen. The most ancient of these, who bore the name of Jupiter, is said to have been Jupiter Ammon of the Lybians. (See AMMON.) Jupiter Serapis, worshipped also in Egypt, is very ancient. (See SERAPIS.) Jupiter Belus claims high antiquity; he is said to have had a temple at Babylon, and was, according to Herodotus, the Jupiter of the Assyrians. (See BELUS.) Jupiter of Thebes has been supposed by some to have been Ammon, and by others Osiris. (See OSTRIS.) The Scythians, the Ethiopians, and several other nations, had their respective Jupiter. Indeed, it is impossible to give a complete list of all who bore that name, since, according to Varro and Eusebius, they amounted to 300. Besides, all the gallantries that are ascribed to Jupiter of Crete, and which, according to the poets, lasted 400 years, cannot belong to one and the same person. Jupiter of Crete, having banished his father Saturn, and overthrown the Titans and Giants, determined to make his subjects happy. According to Hesiod, he was seven times married, and the last of his wives was Juno. His true name is said to have been "Jov," signifying young, to which was afterwards added the appellation of "Pater," father, whence was derived Joupater and Jupiter. Others derive Jupiter from Juvax, or Juvans Pater. The Greeks call this god Ζεύς. The designation of father was intended to point out his superiority over the other gods, which was also expressed by the epithets "Optimus Maximus." Jupiter, having become master of a vast empire, married his sister, named by the Latins Juno, and by the Greeks Hera; and as he found it difficult to govern dominions of so wide an extent, he distributed them into different provinces. Accordingly we learn from Diodorus Siculus, that Atlas governed the frontiers of Africa. The ancients also inform us, that Pluto was appointed governor of the western parts of the empire of the Titans, of the Gabil, and Spain; which government was afterwards transferred, upon Pluto's death, to Mercury, who, having seized

himself, became the great deity of the Colchians. Others referred to himself the whole empire of Asia, Greece, Thrace, and that part of Africa, whose ancestors had sprung from the mountains who visit the rivers, to Crete. He tolls Jupiter for his private, public, and military virtues, and for other civil and military virtues; and from such a variety of his work are now left, the various traditions, which are taken the accounts they give of his life and reign. Oppressed with old age, after many adventures, he is said to have been ascribed to other places, who, though he died in Crete, where his tomb was found long since, near Gnoffus, one of the principal cities of the island, was thus epitaphed, "Here lies Zæus who was called Jupiter." We lived to 120 year, having reigned 62 years from the death of the Titans and the death of Saturn. Some reckon his reign to have begun 1842 years B.C., and to have terminated at his death 1780 years B.C. After his death his dominions were divided into several petty kingdoms; of which we have no account. The poets embellish the ancient traditions, probably in part true, and in part false, with a great variety of fabulous circumstances, which best suited the age and country in which they lived, and the purposes for which they wrote; and it would be endless to give a minute detail of the various fables which their luxuriant fancy created. Perhaps, in the better and more approved mythology, Jupiter might represent the supreme god, who governed at once heaven, earth, and hell. (See PAULANUS in CORINTH. c. 24.) The various names by which this deified Jupiter, who was the great divinity of the Pagan world, and who was universally worshipped from Egypt to the centre of Spain, was distinguished, were derived from the places where he was worshipped, or from some circumstances that gave rise to the temples, chapels and altars that were consecrated to him; but it is needless to recount them. Many of them occur in the sequel of this article, and make separate heads in the Cyclopædia. Of all the gods of Paganism, whether they were derived from the elements of nature, or from some eminent persons, who were raised to this rank, the Jupiter seems to have been pre-eminent, and of course his worship was the most solemn, and attended with the greatest variety of ceremonies. The most common victims offered to this god were the she-goat, the sheep, and the white bull, whose horns they took care to gild. In several cases they had no victim, but made him an offering of flour, salt, and incense, especially at Rome; at Athens, they sacrificed an ox; and when he represented Jupiter the avenger, the sacrifice of atonement presented to him was a she-goat. He had a temple at Rome, under that name, near the Capitol, where he was represented with arrows in his hand, to denote that he was ready to execute vengeance upon crimes. Among the trees, the oak and the olive were consecrated to him. None worshipped him more religiously, if we may believe Cicero, than the Roman Ladies; "A Matrona Romanis castissima est," says the author. (De Nat. Deor. l. i.) Jupiter's three oracles, that of Dodona, that of Trophonius, and that which he had in Libya, were famous. (See ORACLE.)

As mankind are directed by an internal instinct or mind, the universe also is governed by an over-riding intelligence; which, as the cause and preserver of all animal being, was called Ζεύς Ζῴων. See GOD.

The heathens in general believed that there was but one supreme God; but when they considered the great being as influencing the affairs of the world, they gave him as many different names; and hence proceeded from a variety of nominal gods. When he thundered or lightened, they called him Jupiter; when he calmed the sea, Neptune; when he guided their counsel, Minerva; and when he gave them

Strength in battle, Mars. In process of time they used different representations of this Jupiter, &c and considered them, vulgarly at least, as so many different persons. They afterwards regarded each of them in different views: *e. g.* the Jupiter that showered down blessings, was called the *Kind Jupiter*: and when punishing, the *Terrible Jupiter*. There was also one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans: nay, there was scarcely a town or hamlet perhaps, in Italy, that had not a Jupiter of its own; and the Jupiter of Terracina or Jupiter *Æneas*, represented in medals as young and beardless, with rays round his head, more resembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almost every where: at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome, the greatest Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the best and greatest Jupiter, "*Jupiter optimus maximus*." The figure of this Jupiter was represented in his chief temple on the Capitoline hill, as sitting on a turule chair, with the fulmen or thunder, or rather lightning, in one hand, and a sceptre in the other. This fulmen in the figures of the old artists was always adapted to the character under which they were to represent Jupiter. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of flames wreathed close together, held down in his hand. When punishing, he holds up the same figure, with two transverse darts of lightning, sometimes with wings added to each side of it, to denote its swiftness: this was called by the poets, the three-forked bolt of Jove: and when he was going to do some exemplary execution, they put in his hand a handful of flames, all let loose in their utmost fury; and sometimes filled both his hands with flames. The superiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavoured to express in his countenance: particular attention was paid to the head of hair, the eye-brows, and the beard. There are several heads of the mild Jupiter on ancient seals, where his face has a mixture of dignity and ease in it, admirably described by Virgil, *Æn. i. v. 256*. The statues of the Terrible Jupiter were generally of black marble, as those of the former were of white: the one sitting with an air of tranquillity; the other standing, more or less disturbed. The face of the one is pacific and serene; of the other angry or clouded. On the heads of the one the hair is regular and composed; in the other, it is so discomposed, that it falls half-way down the forehead. The face of the Jupiter *Torans* resembles that of the Terrible Jupiter: he is represented on gems and medals as holding up the triple bolt in his right hand, and standing in a chariot, which seems to be whirled on impetuously by four horses. Thus he is also described by the poets. *Ovid. Deian. Herc. v. 28. Horace, lib. i. od. 34. v. 8.* Jupiter, as the intelligence, presiding over a single planet, is represented only in a chariot and pair: on all other occasions, if represented in a chariot, he is always drawn by four horses. Jupiter is well known as the chief ruler of the air, whose particular province was to direct the rains, the thunders, and the lightnings. As the dispenser of rain, he was called Jupiter *Pluvius*; under which character he is exhibited seated in the clouds, holding up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand on the earth; whilst the fulmen is held down in his left. The wings that are given to him

relate to his character of presiding over the air: his hair and beard in the Antonine pillar are all spread down by the rain, which descends in a sheet from him, and falls for the refreshment of the Romans; whilst their enemies are represented as struck with the lightnings, and lying dead at their feet. Spence's *Polymetis*, p. 46. 182, and 217, &c.

JUPITER, in *Astronomy*, the largest of the planets of the solar system; his diameter being 11 times greater than that of the earth, or 89,170 English miles. Its revolution on its axis is performed in 9 hours, 55 minutes, and 37 seconds. This planet moves from west to east in a period of 11 years, 318 days, 14 hours, 27 minutes, 10.7 seconds. Its synodical revolution is about 399 days. Before its opposition with the sun, and at about 115° from it, its motion becomes retrograde, and its velocity continually augments till the moment of opposition, after which it diminishes, and when at about 115° from the sun, its motion changes from retrograde to direct. The duration of this retrograde motion is about 121 days, and the arc of retrogradation about 10 degrees: and it may be observed as a general rule with the superior planets, that the farther they are from the sun, the less is their arc of retrogradation; but the longer time is taken in describing it, for were the distance of planets indefinitely great, the arc of retrogradation would be extremely small, and its retrograde motion would last half a year, resembling the effect of parallax of a fixed star, if ever this should be rendered sensible to our instruments.

Jupiter is, next to Venus, the most brilliant of the planets, and sometimes even surpasses it in brightness. Its apparent diameter is greater at the oppositions, and is then equal to nearly 48"; its mean equatorial diameter is estimated at 38.8". Its figure is an oblate spheroid, the proportion of its equatorial to its polar axis being about 14 to 13. La Place from theory deduces this proportion to be 1,000,000 to 9,286,922, a result obtained from computing the effect of the equatorial regions of the planet in disturbing the nodes of the satellites. Almost every person is sufficiently acquainted with the telescopic appearance of Jupiter, to know that its surface is remarkable for being always covered with a number of belts or stripes of various shades. These appearances differ much at different times, and even at the same time in telescopes of different powers. Usually these belts seem to be of an uniform tint; but in very favourable weather, they sometimes appear to consist of a number of curved lines, like the strokes of an engraving. *Figs. 143, 144, 145, 146. Plate XVI.* *Astronomy*, represent four views of this planet, as given by Dr. Herschel and Mr. Schroeter.

These belts were first observed at Naples by Zuppi and Bartoli, two Jesuits; and about the year 1666, they were observed by Campani, with refracting telescopes of his own construction, and not much inferior in distinctness to those of the present day; the great modern improvement in refracting telescopes, consisting rather in the reduction of their size than in the increase of their magnifying power.

Jupiter is accompanied by four satellites, which were discovered by Galileo, the 8th of January 1610. He at first took them for telescopic fixed stars; but continued observation soon convinced him that they really accompanied the planet. The relative situation of these small bodies changes at every instant: they oscillate on each side the planet, and it is by the extent of these oscillations that the rank of these satellites is determined; that being called the first satellite, whose oscillation is the least. They are sometimes seen to pass over the disc of the planet, and project a shadow in the form of a well-defined black spot, which then describes a chord of this disc.

Jupiter and his satellites, therefore, are opaque bodies, enlightened

JUPITER.

enlightened by the sun; and when the latter interpose between the sun and Jupiter, they produce real solar eclipses, precisely similar to those which the moon occasions on the earth.

This phenomenon leads to the explanation of another which the satellites present. They are often observed to disappear, though at some distance from the disc of the planet: the third and fourth re-appear sometimes on the same side of the disc.

The shadow which Jupiter projects behind it, (relatively to the sun,) is the only cause that can explain these disappearances, which are perfectly similar to eclipses of the moon.

The circumstances which accompany them leave no doubt of the reality of this cause. The satellites are always observed to disappear on the side of the disc opposite to the sun, and consequently on the same side to which the conical shadow is projected. They are eclipsed nearest the disc, when the planet is nearest to its opposition.

Finally, the duration of these eclipses answers to the time which should elapse while they traverse the shadow of Jupiter.

Thus it appears that these satellites move from west to east, in returning orbits round the planet. Observations of their eclipses are the most exact means of determining their motions. Their mean sidereal and synodical revolutions, as seen from the centre of Jupiter, are very accurately determined by comparing eclipses at long intervals from each other, and observed near the opposition of the planet. It is thus discovered that the motion of the satellites of Jupiter is nearly circular and uniform, because this hypothesis corresponds very nearly with those eclipses which happen when we see this planet in the same position relatively to the sun. Therefore, the positions of the satellites at every instant, as seen from the centre of Jupiter, may be determined. From hence results a simple and sufficiently exact method of comparing with each other the distances of Jupiter and of the sun from the earth:—a method which the ancient astronomers did not possess. For the parallax of Jupiter is insensible even to the precision of modern observations, when it is nearest to us. They only judged of its distance by the time of its revolution; as they estimated those planets to be the farthest from us, whose period of revolution was the longest.

Let us suppose that the total duration of an eclipse of the third satellite has been observed. At the middle of the eclipse, the satellite, seen from the centre of Jupiter, is nearly in opposition to the sun. Its sidereal position, observed from this centre, (which may easily be deduced from

its mean motion, is, therefore, the same as that of the centre of Jupiter seen from the centre of the sun.

Direct observation, or the known motion of the sun, gives the position of the earth as seen from its centre. Thus, supposing a triangle to be formed by the right lines which join the centres of the sun, the earth, and Jupiter, we have given in this triangle the angle at the sun, observation will give that at the earth, and we shall obtain the rectilinear distance from Jupiter to the earth and to the sun, at the instant of the middle of the eclipse, in parts of the distance from the sun to the earth.

It is found by these means that Jupiter is at least five times farther from us than the sun, when its apparent diameter is $38''.3$. The diameter of the earth, at the same distance, would not subtend an angle of $3'''.5$; the volume of Jupiter is, therefore, at least a thousand times greater than that of the earth.

The apparent diameters of these satellites being insensible, their magnitude cannot be exactly measured. An attempt has been made to appreciate it, by the time they take to penetrate the shadow of the planet. But there is a great discordance in the observations that have been made to ascertain this circumstance. This arises from the various powers of telescopes, the different degrees of perfection in the sight of the observer, the state of the atmosphere, the altitude of the satellites above the horizon, their apparent distance from Jupiter, and the change of the hemisphere presented to us. The comparative brightness is independent of the four first causes, which only alter their proportional light, and ought, therefore, to afford information concerning the rotatory motion of these bodies. Dr. Herschel, who is occupied in this delicate investigation, has observed that they surpass each other alternately in brilliance:—a circumstance which enables us to judge of the *maximum* and *minimum* of their light. The relation of this *maximum* and *minimum* to their mutual positions has persuaded him, that they turn upon their own axis, like the moon in a period equal to the duration of their revolution round Jupiter: a result which Maraldi had already deduced with regard to the fourth satellite, from the returns of the same spot observed on its disc in its passage over the planet.

The great distance of the celestial bodies weakens the phenomena which their surfaces present, till they are reduced to slight variations of light, which escape the first view, and are only rendered sensible by a long course of observations. But information derived from this source ought to be received with the greatest caution; considering how much we may be misled, on such occasions, by the effect of imagination.

JUPITER.

Explanation of the Tables of Jupiter.

The first Table contains the epochs of the mean longitude of the aphelion and node of Jupiter; together with the Arguments of the equations expressed by dividing the circle into 10,000 equal parts for Arguments II, III, IV, V; and into 1000 equal parts for Arguments VI, VII, VIII, IX. Table II contains the mean motions of the fame for years. Table III contains the mean motions for months; that is, for the beginning of each month reckoned from the beginning of the year. Table IV contains the mean motions for days. Table V contains the mean motions for hours and minutes. Table VI contains the great equation of Jupiter for every 10 years. Table VII contains the equation of Jupiter's orbit for the year 1750, with the secular variation. Table VIII contains the equation of the orbit corresponding to Argument II. Table IX contains the equation answering to Argument III. Table X contains the equation answering to Argument IV. Table XI contains the equation answering to Argument V. Table XII contains the equation answering to Argument VI. Table XIII contains the equation answering to Argument VII. Table XIV contains the equation answering to Argument VIII. Table XV contains the equation answering to Argument IX. Table XVI contains the equation answering to Argument VII. — Argument VIII. Table XVII contains the equation answering to Argument VII, + Argument VIII. Table XVIII contains the radius vector of the orbit of Jupiter for 1750, with the secular variation; the mean distance of the earth from the sun being unity. Table XIX contains the equation of the radius vector answering to Argument II. Table XX contains the equation answering to Argument IV. Table XXI contains the equation answering to Argument V. Table XXII contains the heliocentric latitude of Jupiter for the year 1750, with the secular variation. Table XXIII contains the reduction to the ecliptic; with the log. cosine of the heliocentric latitude.

All the above mentioned equations of the motion of Jupiter, the equations of the orbit excepted, arise from the attraction of Saturn, and depend upon the relative situation of Jupiter and Saturn. The theory of these equations was given by M. de la Place in the Memoirs of 1785, from the theory of gravity, and they were computed by M. de Lambert.

Let a express the number of years from 1750, S the mean longitude of Saturn, J the mean longitude of Jupiter; then the great equation of Jupiter is,

$$= (20^{\circ} 49'' .5 - a \times 0^{\circ} .042733) \times \sin. (5S - 2I + 5^{\circ} 34' 8'' - a \times 58^{\circ} .88).$$

The great equation of Saturn arising from the attraction of Jupiter, is also found to be (Mem. 1785),

$$= (48^{\circ} 44'' - a \times 0^{\circ} .1) \times \sin. (5S - 2I + 5^{\circ} 34' 8'' - a \times 58^{\circ} .88).$$

The period of these two equations is 918.76 years. By way of distinction, these are called the *great* equations of Jupiter and Saturn; these two equations of Jupiter and Saturn are very nearly in the ratio of 3 to 7. Now it is manifest, that when $5S - 2I - a \times 58^{\circ} .88 = 360$, the equation must then begin again, and therefore this will determine the period; now $5S - 2I - a \times 58^{\circ} .88$ increases 1410°.6 in a common year; therefore $\frac{360}{1410.6} = 918.76$ years, the period in which these equations return again the same.

These equations show the reason, why the present mean

motions of Jupiter and Saturn differ from the true mean motions, as the latter cannot be determined but by taking in the above period. We have the apparent mean motion of Saturn, in a common year, by adding to its mean annual motion, the quantity by which the great equation varies in that time, and this quantity is very nearly $= (48^{\circ} 44'' - a \times 0^{\circ} .1) \times \sin. 23^{\circ} 31' \times \cos. (5S - 2I + 5^{\circ} 34' 8'' - a \times 58^{\circ} .88)$; and the apparent mean motion of Jupiter is this quantity with a contrary sign, diminished in the ratio of 7 to 3, and added to his mean annual motion.

Now the fluxion of the cosine of any quantity $= \sin. \times \text{flux. arc}$, therefore when $\cos. =$ a maximum, $\sin. \times \text{flux. arc} = 0$, or the sine of the arc $= 0$, or the arc $= 0$; therefore when the above quantity $=$ a maximum, $5S - 2I + 5^{\circ} 34' 8'' - a \times 58^{\circ} .88 = 0$, which happened in the year 1750. At that time, the apparent annual motion of Saturn was less than the true, by 20°.1, and that of Jupiter greater by 8°.6; since that time their apparent mean motions have been approaching to their true mean motions, and in 1785, their apparent and true mean motions were equal. These results shew, why, in comparing the modern with the ancient observations, the mean motion of Saturn appears to be retarded, and that of Jupiter accelerated; and that from a comparison of the modern observations, the mean motion of Saturn appears to be accelerated, and that of Jupiter to be retarded.

Now if H be the heliocentric mean longitude of Jupiter; b that of Saturn, corrected by the above equations respectively, computed from the equinox of the year 1750; the other equations of the motion of Jupiter from the action of Saturn, are,

$$\begin{aligned} & - 1^{\circ} 22' .7 \sin. (H - b) + 3' 24'' .3 \sin. 2(H - b) + 17'' \sin. 3(H - b) + 3 .9 \sin. 4(H - b) \\ & + 2' 18'' .4 \sin. (H - 2b - 13^{\circ} 33' 7'' + a \times 13^{\circ} .7) \\ & + 1^{\circ} 27' .4 \sin. (2H - 3b - 61^{\circ} 59' 48'' + a \times 21 .9) \\ & + 2^{\circ} 47' .0 \sin. (3H - 5b + 55^{\circ} 19' 21'' + a \times 43 .0) \\ & - 16 .0 \sin. (3H - 4b - 62^{\circ} 51' 19'') \\ & + 12 .8 \sin. (3H - 2b - 8^{\circ} 30' 15'') \\ & - 13 .0 \sin. (3b - H - 58^{\circ} 31' 0'') \\ & + 11 .6 \sin. (b + 45^{\circ} 4') \\ & + 10 .0 \sin. (4H - 5b + 45^{\circ} 16' 32'') \\ & - 5 .4 \sin. (2H - b + 16^{\circ} 12' 27'') \end{aligned}$$

Now the sum of the maxima of all these equations, is $11^{\circ} 56' .3$; and in the Tables computed for these equations, each equation is increased by its maximum, in order to render all the equations additive; this quantity, therefore, must always be subtracted from the sum of the equations taken from the Tables.

To find the heliocentric Latitude and Longitude of Jupiter.

From Table I. of the epochs, take out the epochs of the mean longitude of the aphelion and node, with the Arguments II, III, IV, V, VI, VII, VIII, IX, and place them in an horizontal line. But if the given year be not found in that Table, take the nearest year preceding the given year as an epoch, and take out as before; under which, from Table II, place the mean motion in longitude, of the aphelion and node, with the Arguments, answering to the number of years elapsed since the epoch to the given year.

Under these, write down (Table III.) the mean motions of the same, for the given month.

Under these, write down (Table IV.) the mean motions of the same, for the given day of the month.

Under these, write down (Table V.) the mean motions of the same, for the given hours and minutes. The arguments for hours and minutes are so small that they are here

JUPITER.

mitted; the mean motions for seconds are also omitted for the same reason. In our computations, therefore, we take to the nearest minute.

Under these, write down the great inequality (Table VI.) in the first column, with the corresponding arguments.

Add together the numbers in the several columns, rejecting 12 S, or any multiple thereof, if they occur; and in the arguments, rejecting 10,000 for Arguments II, III, IV, V, and 1000 for Arguments VI, VII, VIII, IX, or any multiples thereof, and you get, for the given time, the mean longitude corrected for the great equation, the aphelion, the node, and the arguments corrected for the great equation.

From the longitude corrected for the great equation, as already found, subtract the longitude of the aphelion, and you have Arg. I, Arg. VII. — Arg. VIII. gives Arg. X.; Arg. VI. + Arg. VIII. gives Arg. XI.

With Argument I. making proportion for the minutes and seconds, take out the equation of Jupiter's orbit in Table VII., together with the secular variation, with their proper signs, except the time be *before* 1750, in which case, the secular variation is to be taken out with a contrary sign; then say, 100 : the years from 1750 to the given time :: the secular variation above found : the secular variation required. With Argument II. take out the equation in Table VIII., making proportion in this, and in the following equations, for the intermediate numbers of the arguments. With Argument III. take out the equation in Table IX. With Argument IV. take out the equation in Table X. With Argument V. take out the equation in Table XI.

With Argument VI. take out the equation in Table XII. With Argument VII. take out the equation in Table XIII. With Argument VIII. take out the equation in Table XIV. With Argument IX. take out the equation in Table XV. With Argument X. take out the equation in Table XVI. With Argument XI. take out the equation in Table XVII. Take the sum of all these equations (regard being had to the signs of the first equation and the secular variation, the signs of the others being all positive), and from it subtract $11' 56''.3$, and you have the value of these eleven equations; and this applied, with its proper sign, to the longitude already found as corrected by the great equation, gives the longitude of Jupiter in his orbit.

From the longitude thus found, subtract the longitude of the node, and you get Argument XII.

With Argument XII. enter Table XXIII. and take out the reduction to the ecliptic with its proper sign, making proportion for the minutes and seconds of the argument; and this applied to the longitude of Jupiter in his orbit, gives his true heliocentric longitude on the ecliptic, reckoned from the mean equinox.

With the Argument XII. enter Table XXII.; take out the latitude with its secular variation, making proportion for the minutes and seconds of the argument; and apply the secular variation, according to its sign, to the latitude, and you have the true heliocentric latitude of Jupiter.

With the mean anomaly of Jupiter, enter Table XVIII. and take out the radius vector, and correct it by the following Tables, and you have the true distance of Jupiter from the sun; the earth's distance being unity.

JUPITER.

Example.—To find the true heliocentric Latitude and Longitude of Jupiter, on July 11, 1780, at 5^h 49' mean Time at Greenwich.

Argument I. and the secular variation being negative, they are added to 11' 56".3 to get the negative parts; but if the two first taken together had been positive, they would have been put above Argument II. amongst the positive equations, and then all the positive equations might have been added up, and 11' 56".3 subtracted from the sum.

This is the true heliocentric longitude on the ecliptic, from the mean equinox; and if we want it from the true equinox, we must apply to it the equation of the equinoxes.

In this operation, the first five lines are taken out immediately from the Tables. The great equation is thus found: for the beginning of 1780 it is 20' 46", as found immediately in the Table. The great equation for a very distant period is thus found: the variation is expressed by $-a \times 0.042733 \times \sin. (5S - 2I + 5^{\circ} 34' 8'' - a \times 58''.88)$; if we take $a = 459.3S$, which is half a period, $a \times 0.042733 = 19.6$, which is additive before 1750; this then is the greatest variation of the equation, taking $5S -$

$2I + 5^{\circ} 34' 8'' - a \times 58''.88 = 90^{\circ}$, so that its sine may = 1, a maximum; that is, it is the variation answering to the present greatest equation 20' 49".5, for this is the greatest equation when $a = 0$, or for 1750, and therefore will be very nearly so for the present time. Now suppose we wanted to know the equation for May 16, in the year 133, or in the year 133.37; then we multiply a half period by such a number, that the product added to 133 may produce some year in our Table VI., and then we find the equation for that year; multiply therefore 450.38 by 4, and add it to 133, and it gives 1970, corresponding to which, the equation is 6' 40".2; now the variation of the greatest equation is 19".6 for half a period, and therefore it is $4 \times 19".6 =$

1
78".4

JUPITER.

78^o 4 for 4 half periods; hence, the greatest equation 20' 49".5 : 6'.40".2 :: 78^o.4 : 26', which (as the time is before 1750) added to 6'.40".2, gives 7'.01".2, the equation for May 16, 133. This, however, is only an approximation. We calculate for half periods, because then all the arguments return again the same. Now from that time to the given time, that is, July 11, 5, the interval is 0.53 of a year; and for 10 years, the increase of the equation is 1^o.7; hence, 10 : 0.53 :: 1^o.7 : 0^o.09, the variation in 0.53 of a year; which added to 20' 46", gives 20' 46".09, or 20' 46".1, taking it to the nearest tenth of a second, the great equation. The arguments of the great equation are taken from the year 1780, they not having sensibly altered from that time to the given time. The sums of all the columns give the longitude corrected by the great equation, the aphelion, the node, and the arguments, for the given time. The Arguments I, X, XI, are immediately found according to the rule. The equation to Argument I. is thus found; the Argument is 20' 7' 58". Now in Table VII. the equation answering to 20 is - 1' 46' 59", and the variation for 60' is 5' 9"; hence, 60' : 7' 58" :: 5' 9" : 41", which (as the equation is increasing) added to - 1' 46' 59", gives - 1' 7' 40", the equation required. And to find the secular variation, that variation is - 16^o.98 for 20, and it changes 0^o.82 for 60'; hence, 60' : 7' 58" :: 0^o.82 : 0^o 11, which (as the variation increases) added to - 16^o.98, gives - 17^o.09, the secular variation corresponding to the given argument. Now this secular variation is reckoned from 1750, and from thence to July 11, 1780, there has elapsed 30.53 years; hence, 100 : 30.53 :: - 17^o.09 : - 5^o 2, the secular variation for 30.53 years. With 9080 take the equation from Table VIII. Now the equation is 1' 30".6 for the Argument 9000, and it changes 3".7 for 100; hence, 100 : 80 :: 3".7 : 3", which (as the equation is increasing) added to 1' 30".6, gives 1' 33".6, the equation required. By proceeding thus to Argument XI. we get all these equations. And by taking the difference of the positive and negative parts, we obtain 1' 48' 57".8, the value of these 11 equations, which applied, with the proper sign, to 7^o 0' 57' 53".9, gives 6^o 29' 8' 56".1, the longitude of Jupiter in his orbit. Now for the reduction of this to the ecliptic, we have Argument XII. = 3^o 20' 56' 24"; and the reduction in Table XXIV. is + 17".5 for 3^o 20'; and it changes 0".7 for 60'; hence, 60' : 56' 24" :: 0".7 : 0".7, taking it to the nearest tenth of a second; and this (as the reduction increases) added to + 17".5, gives + 18".2, the reduction, which applied to 6^o 29' 8' 56".1, gives 6^o 29' 9' 14".3, the true heliocentric longitude of Jupiter in his orbit, from the mean equinox. With Argument XII. enter Table XXIII. and the latitude for 3^o 20' is 1' 46' 16" N., and the variation is 29" for 60'; hence, 60' : 56' 24" :: 29" : 27", which (as the equation is diminishing) subtracted from 1' 46' 16" N., gives 1' 13' 49" N., the latitude uncorrected for the secular variation. Now for 3^o 20' 56' 24", the secular variation is - 20".5, as we may take it the same as for 3^o 21'; and the time from 1750 being 30.53 years, we have, 100 : 30.53 :: - 20".5 : - 6", the secular variation for 30.53 years, and thus applied to 1^o 13' 49" N., gives 1^o 13' 43" N., the true heliocentric latitude of Jupiter.

Given the heliocentric latitude and longitude of Jupiter; to find the geocentric latitude and longitude, and his distance from the sun and earth.

Example.—To find the geocentric latitude and longitude of

Jupiter, and his distance from the earth, on July 11, 1780, at 5^h 49^m mean time.

JUPITER, among *Alchemists*, signifies the philosopher's gold. The gentlemen of this profession apply every thing to their art, which the mythologists mention of the god Jupiter, pretending that the ancient fables are to be understood in a figurative sense: for instance, Jupiter is the master of the gods; and gold, say they, is the most precious of metals. Mercury is the ambassador of Jupiter; and this shews with how much ease Mercury infinuates into every thing. Jupiter holds the thunderbolt as his sceptre; which evidently points out the external sulphur used in projection. Jupiter has the heavens for his ordinary habitation; this

shows him volatile, dry, and hot. The debauches of Jupiter, who fought for pleasure in the low, but prolific and fruitful earth, discover, say they, its fecundity, and that gold might be made, were but the way of preparing it discovered. In a word, Jupiter is the son of Saturn, which shows some resemblance between the qualities of gold and lead.

JUPITER, in *Chemistry*, denotes tin.

JUPITER'S *Beard*, *Barba Jovis*, in *Botany*, the name given to a species of orchis.

JUPITER'S *Beard*, *American*, is a species of *Amorpha*.

JUPITER'S *Legion*, is a species of *Salvia* or sage.

JUPITER *Fulminans* and *Fulgurator*. See FULMINANT.

JUPITER, *Plamer of*. See FLAMES.

JUPUBA, in *Ornithology*. See ORIOLUS *Hemorrhous*.

JUPUBA, the Brazilian name of a bird of the woodpecker kind, more commonly known by the name *Japu*. See ORIOLUS *Perseus*.

JUQUER, in *Botany*. This plant is found in Brazil, and is of a poisonous nature; but if we may credit Piso, its root is its antidote.

JURA, in *Geography*, one of the eleven departments of the eastern region of France, composed of the bailliages of Dôle and Aval, in 45° 40' N lat., between Saône and Switzerland. It is bounded on the N. by the department of the Upper Saône, on the E. by the department of the Doubs, and the canton of Berne in Switzerland, on the S. by the department of the Aisne, and on the W. by the departments of the Saône and Loire, and Côte d'Or. The capital is Lons le Saulnier. This department contains 5273½ kilometres, or about 256 square leagues, in four districts, 32 cantons, and 728 communes; and 283,865 inhabitants. The districts or circles are Dôle, including 63,581 inhabitants; Poligny, 69,378; Lons-le-Saulnier, 107,478; and St. Claude, 49,285. Its contributions amount to 2,005,226 francs, and its expenses to 225,873 fr. 58 cents. The plains in this department produce grain, wine, fruits, and pastures; the hills yield little grain, but abound in pastures and extensive forests. It has mines of copper, lead, iron, salt, coal, with quarries of marble, stone, &c.

JURA, one of the Hebrides, or western islands of Scotland, is situated opposite to the district of Knapdale, in Argyle shire, to which county it is politically annexed. Its extent upwards of thirty miles in length, and, on an average, seven in breadth. Of all the western isles, Jura is the most rugged, being chiefly composed of mountains of vast rocks, apparently piled on each other in the utmost disorder, without a possibility of cultivation. The four principal of these mountains are termed the Paps-of-Jura; which form a ridge from south to north, nearly through the middle of the island. These are conspicuous at a great distance, and terminate the western prospect from the continent; from their situation and height, they are frequently enveloped in clouds and darkness. Of these four, the southern is called Beinn-Achaolais, "the mountain of the found," from its proximity to the found of Illa; the next, which is the highest, Beinn-an-oir, "the mountain of gold;" the third, Beinn-sheunta, "the consecrated mountain;" and the northern Corra-blaen, "the steep mountain." Pennant reports that he ascended Beinn-an-oir with great difficulty, and describes it as being composed of large floves, covered with mosses near the base; but all above were bare and unconnected with each other. "The whole," he says, "seems a *cainn*, the work of the sons of Saturn." The grandeur of the prospect from the summit, however, compensated him for the fatigue of the ascent. Jura itself afforded a stupendous scene of rock, varied with innumerable small lakes, and calculated to

raise sublime emotions in the mind of the spectator. From the west side of the hill ran a narrow strip of rock, called *the slide of the old bog*, and terminating in the sea. To the south appeared Illa, extended like a map; and beyond it, the north of Ireland; to the west, Gigha and Cara, Cantyre and Arran, and the Firth of Clyde, bounded by Arra-shire; an amazing tract of mountains to the north-east, as far as Ben-lomond; Skarba finished the northern view; and over the western ocean were scattered Colonsay and Oranay, Mull, Iona, and the neighbouring group of islands; and still further, the long extent of Tirey and Coljuy apparent. Sir Joseph Banks and his friends, in their journey to Scotland, ascended Beinn-sheunta, and found it to be 2359 feet above the level of the sea; but Beinn-an-oir exceeds that in height by 61 feet. The west side of the island is not fit for cultivation, being so wild and rugged, and so intersected by torrents rushing from the mountains, that no person chooses to make his abode in it. All the inhabitants, therefore, live on the east side; where, on the margin of the sea, the coast is pretty level; but at a small distance from the shore there is a gradual ascent. The only corn cultivated here is oats and barley; potatoes and flax are also produced: the only manure is the sea-weed, which is cast on shore. Artificial grasses are unknown; and lime cannot be procured by the poor husbandmen. On the east coast of the island are two good harbours; that to the south called *the Small Isles*; the other *the Lowlandman's Bay*; there are also some anchoring places on the western coast. The mountains of Jura abound with several kinds of red deer; and they are also frequented by plenty of grouse and black game. Mr. Pennant mentions his having "some obscure account" of a woman, a native of this island, which, though less praiseworthy, bears some resemblance to the *Furia infernalis* of Linnaeus. There are several barrows and castles in the island; and on the coast, near the harbour of small isles, are the remains of a very considerable encampment. The stones of which the mountains are formed, are of white or red quartz granite; some of which are brecciated, or filled with crystalline kernels of an amethystine colour. There is great abundance of iron, and a vein of the black oxyd of manganese. The climate of Jura, though necessarily of a very moist character, is considered to be very healthy, and favourable to longevity. When visited by Mr. Pennant in 1772, it contained only about 750 inhabitants; but in 1793 the number was 1385. The parish is supposed to be the largest in Great Britain; and the duty the most troublesome and dangerous; it comprises Jura, Colonsay, Oranay, Skarba, and several little isles, divided by narrow and hazardous sounds; forming an extent of sixty miles; the whole of which is supplied by only one miller and an assistant. Pennant's *Voyage to the Hebrides*.

JURA *Sound*, on the western coast of Argyleshire in Scotland, is a very wide channel, except at its northern end, which separates Illa, Jura, Luning, Skarba, and some smaller islands, from the main land of Scotland. The found of Jura connects with Illa found, Tarbat weit loch, Knield loch, Achafilly loch, Crinan loch, and the Crinan canal, Graigrells loch, &c. Gnis, Cara, Taxa, Avacharin, Borfill, Mackermores, Craigedive, Rukeel, Murda, and other small islands, are situated in this spacious found.

JURA, (*Geograph. Lat.*; *Jura*, Strabo; *Jousag*, i. e. the domain of God or Jupiter, in Celtic), a chain of mountains, descending, like a stupendous bulwark, the N.W. side of Switzerland. The Jura runs S.S.W. to N.N.E. to the Vouache in Savoy to the canton of Schaffhausen, nearly parallel with the high chain of the Alps; its width towards N.W. being from about 25 to 45 miles. Its highest ridge

to the Alps. Ascending from the plains of Switzerland, like the sides of a steep roof, to the height of from two to three thousand feet, (which elevation it preserves nearly for the whole of its length), it describes an undulated line, here and there diversified by rising hills, which appear from 600 to 1000 feet higher than the rest of the chain; and it is seen gradually to decrease in height towards Burgundy. The most elevated parts of the Jura (according to Meffis. Tralles and Prætor) are, the Dole, 5082 feet above the level of the sea; the Mont Tendre, 5170; and the Reculet (the summit of the Thory) 5196 feet.

The Jura not attaining the height of the line of snow, is every spring deprived of its snowy covering; nor are glaciers ever seen on it, and it is only in some deep grottos, such as those behind Nyon, and between the Travers and Bevine valleys, that pillars and slabs of ice are found throughout the year. The pasture-meadows of the Jura are much drier than those of the High Alps; there are, however, in some of its parts (for instance in the canton of Basle) full as beautiful and fertile alpine meadows as there are in the central chains: indeed the same alpine plants are found there which in those districts are seen at the elevation of as much as 500 feet above the level of the sea. The brown bear still inhabits the western declivity of the Jura, and is remembered to have several times made a descent into the Pays de Vaux.

The whole Jura consists of compact lime-stone, the stratification of which affects various inclinations. Marble, gypsum, petrifications, and iron-ores, are frequently met with almost in every part of it; the finest and rarest petrifications are found in the department of the Jura, near Orgelet, in a mountain called Perouse. Along the whole of the E. side of the Jura a stratum of iron-stone clay may be followed, which contains the iron-ore called bean-ore, and is wrought in different places. Here and there strata of brown-coral and sources of asphaltum are seen in the valleys of the Jura; they owe their origin to forests swallowed up by those terrible earthquakes, to which the Jura has been subject in past ages. As geologically remarkable may likewise be mentioned the numberless blocks of granite and gneiss, dispersed all along the east side of the Jura, in some parts even to the height of 2400 feet. For a more detailed account, see Dr. Ebel's *Bau der Erde in dem Alpen gebirge*, 1805.

JURATAM—*Assisa cadit in juratam.* See ASSISA.

JURATI. See JURATS.

JURÁTIS, *Non ponendo in.* See NON PONENDO.

JURATORES, DISTINGUAS. See DISTINGUAS.

JURATS, JURATI, magistrates in the nature of aldermen, for the government of several corporations.

Thus we meet with the mayor and jurats of Maidstone, Rye, Winchester, &c.—So also Jersey has a Bailiff and twelve jurats, or sworn assistants, to govern the island.

JURBERG, in *Geography*, a town of Samogitia; 20 miles S.S.W. of Roshene.

JURBO, a river of South America, which runs into the gulf of Darien. N. lat. 8° 15'. W. long. 76° 44'.

JURBY POINT, a cape on the N.W. part of the Isle of Man, five miles W. of Ramfay. N. lat. 54° 23'. W. long. 4° 28'.

JURE, DE. See DE FACTO and POSSESSION.

JURE DICTO. See RIGHT to the CROWN and TITLES.

JURE, Quo. See QUO JURE.

JUREA, or JUREA, in *Geography*, a town of France, in the department of the Dora, late a city of Piedmont; originally a Roman colony, established there during the sixth consulship of Marius, and the first of Valerius Flaccus; called *Eperedia*. It is situated partly on a plain, and partly

on the declivity of a hill; the number of inhabitants is about 6000; it was the see of a bishop, suffragan of the archbishop of Turin, and the cathedral is said to have been anciently a temple of Apollo. It has a castle joining to the town, and two towers. Besides the cathedral, it has three other parish churches, and several religious houses: 20 miles N. of Turin. N. lat. 45° 24'. E. long. 7° 44'.

JUREV POVOLSKOI, a town of Russia, in the government of Koftrom, on the Volga; 73 miles E.S.E. of Koftrom. N. lat. 57° 10'. E. long. 43° 24'.

JUREVSKA, a town of Russia, in the government of Olonetz; 42 miles N.E. of Olgkoi.

JURGIANY, a town of Lithuania, in the palatinate of Troki; 28 miles S. of Birza.

JURGISTAN, a town of Persia, in the province of Farsistan; 105 miles N. of Schiras.

JURIAGUR, a town of Bengal; 30 miles S.W. of Ragonatpour. N. lat. 23° 45'. E. long. 86° 35'.

JURIDICI DIES. See DIES.

JURIEU, PETER, in *Biography*, a celebrated Protestant divine, was born at Mer, a small town four leagues from Blois, in the year 1637. He received part of his education in Holland, but completed his studies in England under his uncle, Peter du Moulin. He was admitted to holy orders in the English episcopal church; but on the death of his father he returned to succeed him at Mer, and submitted to be re-ordained by Presbyters according to the Geneva form. Jurieu, though he differed in many respects from the reformed, set himself up as a rigorous defender of orthodoxy. Either his opinions, or the violence of his temper, obliged him to quit the church at Mer, and another also at Virey, and proved the cause of many mortifications which he met with at Sedan, to which he afterwards went. In 1682, through the influence of his friend Bayle, he obtained the professorship of divinity at Rotterdam, and in connection with this he was appointed minister of the Walloon church in the same city. In 1685, Jurieu published "Prejuges legitimes contre le Papisme," in two volumes; which was followed, in the year 1686, by a work intitled "The Accomplishment of the Prophecies, or the approaching Deliverance of the Church;" a work in which it is proved that "Popery is the kingdom of Antichrist; that this kingdom is not far from its ruin, and that this ruin is very soon to begin; that the present perfection cannot continue more than three years and a half." With the expectation which the title of this book expresses he published "Pastoral Letters," to prepare the minds of the reformed in France for the great revolution. The event soon falsified his predictions; and he acknowledged he had mistaken the time, but firmly believed that God had raised up king William to execute his great design of humbling the persecutor in France, and of bringing about a speedy deliverance of the reformed. After this he embroiled himself in a controversy with his friend Bayle, whom he used extremely ill, as he did many other persons who were the objects of his dislike, and who objected to the extravagance of his opinions. He also offended his best friends by the irascibility of his temper in charging M. Saurin and other eminent persons with heterodoxy. He died at Rotterdam in 1713. His principal works are "The History of Calvinism and Popery;" "On the Unity of the Church;" "An Abridgement of the History of the Council of Trent;" "History of the Opinions and Religious Ceremonies of the Jews;" "Sermons," &c. Life of Bayle, Moreri.

JURIEWICZE, in *Geography*, a town of Lithuania, in the palatinate of Minsk; 40 miles E. of Minsk.

JURIEWO,

JURIEWO, a town of Lithuania, in the palatinate of Minsk; 20 miles E. N. E. of Minsk.

JURILGUNGE, a town of Bengal, in Chittigong; 35 miles N. N. W. of Islamabad.

JURIN, JAMES, in *Biography*, a physician of the mathematical fact, was, during several years, an active member and secretary of the Royal Society of London, and, at the time of his death, in 1750, was president of the College of Physicians. He distinguished himself by a series of ingenious essays, to the number of seventeen, which were published in the Philosophical Transactions in the years 1718, 1719, &c.; and afterwards printed collectively, in 1732, under the title of "Physico-Mathematical Dissertations," in which mathematical science was applied with considerable acuteness to physiological subjects. These papers involved him in several philosophical controversies; first with Keil, in consequence of his calculations in regard to the force of the contractions of the heart, against which also Senac published some objections, which he answered. Jurin computed the contractile force of the heart to be equal to fifteen pounds four ounces; that of the right ventricle being equal to six pounds three ounces, and that of the left to nine pounds one ounce. To Smith's System of Optics, published in 1738, Jurin added "An Essay upon distinct and indistinct Vision," in which he made subtle calculations of the changes necessary to be made in the figure of the eye to accommodate it to the different distances of objects. This paper was commented on by Robins, to whom Jurin wrote a reply. He had likewise controversies with Michellotti respecting the force of running water, and with the philosophers of the school of Leibnitz on living forces. He communicated to the Royal Society some experiments made with a view to determine the specific gravity of the human blood, and he contributed much to the improvement of their meteorological observations. He was a warm partisan and an active defender of the practice of inoculation; and in several publications, giving an account of its success from 1723 to 1727, established its utility upon the true foundation of a comparison between the respective mortality of the casual and the inoculated small-pox. He did not, however, foresee, that this practice, although preserving the lives of those who had recourse to it, yet contributed to increase the mortality in general, in consequence of keeping up an artificial epidemic, as it were, by a constant multiplication of the contagion. His papers in the Philosophical Transactions, are to be found in vols. ix. to lxvi. inclusive. Eloy. Dict. Hist. Gen. Biog.

JURINGI, in *Geography*, a town of Japan, in the island of Nippon; 40 miles W. N. W. of Jedo.

JURIS UTRUM, in *Law*, a writ called the parson's writ of right (Booth, 221.), which lies for the parson of a church, or parsonage, at common law, and for a vicar by stat. 14 Ed. III. c. 17. whose predecessor hath alienated the lands and tenements thereof, by which they may recover lands and tenements belonging to the church, or of which they were disseised; or which were recovered against them by verdict, confession, or default, without praying in aid of the patron and ordinary; or on which any person has intruded since the predecessor's death. (F. N. B. 48, 49.) But since the restraining statute of 13 Eliz. c. 10 whereby the alienation of the predecessor, or a recovery suffered by him of the lands of the church, is declared to be absolutely void, this remedy is of little use, unless where the parson himself has been desorced for more than twenty years (Booth 221.); for the successor, at any competent time after his accession to the benefice, may enter, or bring an ejectment.

JURISCONSULTUS, or *JURISCONSULTUS*, *Utriusque*,

among the Romans, was a person learned in the law; a master of the Roman jurisprudence; who was consulted on the interpretation of the laws and customs, and the difficult points in law-suits.

The fifteen books of the Digest were compiled wholly from the answers, or reports, of the ancient jurisconsults. Trebonianus, in destroying the two thousand volumes from whence the Code and Digest were taken, has deprived the public of many things, which would have given them light into the office of the ancient jurisconsult.

We should scarce have known any thing beyond their bare names, had not Pomponius, who lived in the second century, taken care to preserve some circumstances of their office.

The Roman jurisconsults seem to have been the same with our chamber counsellors, who arrived at the honor of being consulted, through age and experience, but never pleaded at the bar. Their pleading advocates or lawyers were but bare jurisconsults.

In the times of the commonwealth, the *advocati* had by much the more honourable employment, as being in the ready way to attain to the highest preferments. They then despised the jurisconsults, calling them in derision *formularii* and *legulii*, as having invented certain forms and monofyllables, in order to give their answers the greater appearance of gravity and mystery. But in process of time they became so much esteemed, that they were called *prudentes* and *sejunctores*, and the emperors appointed the judges to follow their advice. Augustus at length advanced them to be public officers of the empire; so that they were no longer confined to the petty counsels of private persons.

Bern. Rutilius has written the lives of the most famous jurisconsults, who have lived within these two thousand years.

JURISDICTION, a power, or authority, which a man has to do justice in cases of complaints made before him. There are two kinds of jurisdiction; the one *ecclesiastical*, the other *secular*.

Secular, belongs to the king, and his justices, or delegates.

The courts and judges at Westminster have jurisdictional over England, and are not restrained to any county or place; but all other courts are confined to their parts: for jurisdictions, which if they exceed, whatever they do is erroneous. There are three sorts of inferior jurisdictions; the first is *tenere placita*, to hold pleas, and the plaintiff may sue either there or in the king's courts. Another is the continuance of pleas, where a right is invested in the lord of the franchise to hold pleas; and he is the only person that can take advantage of it, by claiming his franchise. The third sort is an exempt jurisdiction, as where the king grants to some city, that the inhabitants should be sued within their city, and not elsewhere; though there is no jurisdiction that can withhold a *certiorari* to the superior courts. Among the various beneficial regulations of Edward I. he defined the limits of the several temporal courts of the highest jurisdiction, those of the king's bench, common pleas, and exchequer, so as they might not interfere with each other's proper business: to do which they must now have recourse to a fiction, very necessary and useful to the present enlarged state of property. He also settled the boundaries of the inferior courts in counties, hundreds, and manors; confining them to causes of no great amount, according to their primitive institution. See JUSTICE, and COURT.

Ecclesiastical jurisdiction belongs to bishops and their deputies. See BISHOP, and OFFICIAL.

Bishops, &c. have two kinds of jurisdiction; the one *in*

ternal, which is exercised over the conscience in things purely spiritual; and this they are supposed to hold immediately of God.

The other is *contentious*, which is a privilege some princes have given them in terminating disputes between ecclesiastics and laymen. (See *CONTENTIOUS*.) Edward I. gave a mortal wound to the encroachments of the pope and his clergy, by limiting and establishing the bounds of ecclesiastical jurisdiction; and by obliging the ordinary, to whom all the goods of intellects at that time belonged, to discharge the debts of the deceased.

JURISDICTION, *Enforcement of*, an injury, cognizable by the courts of the common law, which consists in calling one "comam non iudice," to answer in a court that has no legal cognizance of the cause. For this injury the common law has provided a remedy by the writ of prohibition. See *PROHIBITION*.

JURISDICTION, *Plea to the*, is where an indictment is taken before a court that hath no cognizance of the offence; as if a man be indicted for a rape at the sheriff's tourn, or for treason at the quarter sessions; in these, or similar cases, he may except to the jurisdiction of the court, without answering at all to the crime alleged. 2 Hal. P. C. 236. See *DEATHLY PLEAS*.

JURISPRUDENCE, the science of what is just and unjust, or of the laws, rights, customs, statutes, &c. necessary for the doing of justice.

Civil jurisprudence is that of the Roman law; *canonical* that of the canon law; and *feudal*, that of fees.

JURJURA, in *Geography*, a mountain of Africa, the highest in Barbary, anciently called the "Mors feratrus." It is, says Shaw (in his Travels) at least eight leagues long; and if we except a pool of good water, bordered round with ar-bile ground, that lies near the middle of it, the whole, from one end to another, is a continued range of naked rocks and precipices. In the winter season the ridge of this mountain is covered with snow: and it is remarkable, that whilst the inhabitants of one side of it maintain an hereditary implacable animosity against those of the other, yet, by consent, this border of snow puts a full stop to all hostilities during that season; which, like those of the cranes and penguins, as related by the poet, are renewed with fresh vigour in the spring:

Νίχια δ' αρα τανυ κκυλι βιδα προειρητο.

Il. v. v. 7.

This mountain lies between Dellys (Ruscium) and Bou-jehaj (Saldis).

JURKONE, a town of Hindoostan, in the circar of Kitchwara; 15 miles S. of Bushwar.

JURMO, a small island in the Baltic, between the island of Aland and the coast of Finland. N. lat. 60 33. E. long. 20 52.

JURO, or *Devil's Island*, a small island in the Grecian Archipelago. N. lat. 39 33. E. long. 24 15.

JUROCO, a town of Brazil, in the province of Minas Geraes; 110 miles S.W. of Villa Rica.

JUROR, *JURATOR*, in a *Legal Sense*, is one of those twenty-four, or twelve men, who are sworn to deliver truth upon such evidence as shall be given them touching any matter in question.

The punishment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very severe. See *ATTAINT*.

The practice, heretofore in use, of fining, imprisoning, or otherwise punishing jurors, merely at the discretion of the court, for finding their verdict contrary to the direction of

the judge, was arbitrary, unconstitutional, and illegal, and was treated as such by Sir Thomas Smith, more than 200 years ago; who accounted "such doings to be very violent, tyrannical, and contrary to the liberty and custom of the realm of England." For, as Sir Matthew Hale well observes (2 Hal. P. C. 313.), it would be a most unhappy case for the judge himself, if the prisoner's fate depended upon his directions: unhappy also for the prisoner; for if the judge's opinion must rule the verdict, the trial by jury would be useless. Yet in many instances, where, contrary to evidence, the jury have found the prisoner guilty, their verdict hath mercifully been set aside, and a new trial granted by the court of King's bench; for in such case, as it hath been said, it cannot be set right by attaint. But there hath yet been no instance of granting a new trial where the prisoner was acquitted upon the first. 2 Hawk. P. C. 442. Blackit. Com. b. iv.

Com. b. iv.

JURONS, *Challenge to the*. See *CHALLENGE*.

JUROUDA, in *Geography*, a town of Hindoostan, in the circar of Chardaree; 15 miles S.E. of Seronge.

JUROZEL, a town of Russian Lithuania; 80 miles S.E. of Minsk.

JUR'ZHEREMONSKOI, a town of Russia, in the government of Tobolsk, on the Oby; 68 miles S.W. of Tomsk.

JURVA, a town of Sweden, in the government of Wafsa; 32 miles N.N.E. of Chrialiantad.

JURUCUA, in *Zoology*, the Brazilian name of a species of tortoise. This has feet almost in shape of wings, the fore ones about six inches long, the hinder ones considerably shorter; its tail is short, and of a conic figure; its eyes large and black; its mouth has no teeth, but resembles the beak of a bird. It frequently grows to four feet long, and about three in width; its ribs are fastened to the shell, and are eight on each side; the middle ones of these are the longest, the fore and hinder ones being the shorter. The flesh and eggs of this species are very delicately tasted; they lay their eggs in holes on the sea-shore, covering them over with sand, and leaving them for the sun to hatch them. There are usually a great many very odd figures, like geometrical lines, running in various directions on the shell; the whole ground of the shell is usually black and very glossy, adorned with yellow variegations; but this is no certain character of the species, the varieties in the colouring of these shells being very great. See *TESTUDO Mydas*.

JURUNCAPEBA, in *Ichthyology*, the name of a fish, of the *turdus* or wrasse kind, caught about the shores of the Brasils, and called also *aitaiara*. It is usually about five or six inches long, about a third part of its length in breadth; its mouth is extremely large and wide, and of a somewhat triangular figure.

It is caught among the rocks, and is a very delicate fish for the table.

JURUNGE, in *Geography*, a town of Hindoostan, in Bahar, on the Bogmutty; 13 miles W. of Durburgah.

JURURA, in *Zoology*, the name of a species of tortoise, common in the Brasils. It is a small kind, seldom exceeding ten fingers in breadth, and eight or nine in length, and of an elliptic figure; its under shell is about nine fingers long, and four and a half broad, and is flat; it can at pleasure hide its whole body in the shell, or thrust out its neck to three fingers' breadth distance; the head is thick and long, the nose elevated and pointed; the mouth is large, and the eyes black; it has four long claws on its feet; its tail is short and pointed; and its skin is rough and scaly. The upper shell is brown, the lower yellow; its eggs are

white and round, and about half the size of a hen's egg, and are very well talled.

JURY, in *Common Law*, signifies twenty-four, or twelve men, sworn to inquire of a matter of fact, and declare the truth, upon such evidence as shall be delivered them touching the matter in question.

The mode of trial by jury, called also the trial "per pais," or "by the country," is very ancient, and seems to have been coeval with the civil government of this nation. Some authors have endeavoured to trace the original of juries up as high as the Britons themselves, the first inhabitants of our island; it is certain, however, that they were in use among the earliest Saxon colonies, their institution being ascribed by bishop Nicholson to Woden himself, their great legislator and captain. Sir John Spelman has represented Alfred as the author of trials by juries; but his proof has not been thought to be decisive. Dr. Pettingal, who has found the use and practice of juries amongst the ancient Greeks and Romans, and who thinks that the rite of the English jury may be deduced from them, has supported his opinion with much ingenuity and learning.

Traces of this mode of trial in Germany have been thought to be visible in the *100 co-accusers*, mentioned by Tacitus, as chosen out of the Ingenni, which the lord of a territory had when he sat in judgment. This number, says Mr. Carte, prevailed undoubtedly among the Saxons, as it did likewise in all the northern nations, till succeeding times gave occasion to some alterations. Thus, among the Danes, the number of these assessors was restrained to twelve in the time of Redner Ladebrog; and the same number is still kept up in Sweden. When it was first thus reduced in England does not appear from any passage in our old historians. Nevertheless, Mr. Carte infers, that this was the established number in Alfred's time, from his hanging Cadwine for sentencing a man to that kind of death, without the assent of all the twelve jurors, upon whom he had put himself to be tried; and from the laws which he gave to Gothum. According to the same historian, it is very probable that Alfred was the author of extending to *civil* causes the trial by jury, which had been, perhaps, used before only in *criminal* cases. Sir William Blackstone contends, that this is a mode of trial which has prevailed time out of mind in this nation. Accordingly he says, traces of juries may be found in the laws of all those nations which adopted the feudal system, as in Germany, France, and Italy, and in England we find actual mention of them so early as the laws of king Ethelred, and even then not as a new invention. The truth, Sir William says, seems to be, that this tribunal was universally established among all the northern nations; and is interwoven in their very constitution, that the earliest accords of one, give us also some traces of the other. On the other hand, there are not wanting considerable names, who refer the introduction of juries into England to a much later period. Dr. Hickeys, who finds the original of this institution in Scandinavia, asserts, that it was not known to the Saxons, and that it did not take place in our own country till after the Norman conquest. Mr. Barrington and Dr. Henry, in deference, as it should principally seem, to Dr. Hickeys's profound knowledge in Saxon learning, have given their sanction to these sentiments; but it clearly appears that they have done so without sufficient reason. The establishment and use of this mode of trial in our island, though for a time greatly impaired and shaken by the introduction of the Norman trial by battle, were so highly esteemed and valued by the people, that no conquest, no change of government, could ever prevail to abolish it. In "Magna Carta" it is more

than once insisted on, as the principal bulwark of our liberties. (See *JUDICIUM parium*.) And it has been ever esteemed, in all countries capable of appreciating its importance and utility, a privilege of the highest and most beneficial nature.

Trials by jury in civil causes are of two kinds; extraordinary and ordinary. The first species of extraordinary trial by jury is that of the grand assize. See *ASSIZES*.

Another species of extraordinary juries, is the jury to try an *Attainr*; which see.

With regard to the ordinary trial by jury in civil cases, when an issue is joined, the court awards a writ of *venire facias*, which is accordingly issued to the sheriff. Thus the cause stands for a trial at the bar of the court itself, provided it be of consequence; but all trifling suits are ended in the court baron, hundred, or county courts. However, when the usage began to bring actions of any trifling value in the courts of Westminster-hall, it was found very inconvenient to compel the parties, witnesses, and jurors, to come from the remotest parts of the country to try a trivial action at Westminster; and, therefore, the legislature referred matters in issue to the justices of assize. Accordingly it was enacted by 13 Edw. I. cap. 30. that a clause of *nisi prius* should be inserted in all the writs of *venire facias*, by virtue of which the sheriff returned his jurors to the court of the justices of assize, which was sure to be held in the vacation before Easter and Michaelmas terms, and there the trial was had. But this method was inconvenient, and therefore was altered by 42 Edw. III. cap. 11. which statute enacted, that no inquests, except of assize and gaol delivery, should be taken by writ of *nisi prius*, till after the sheriff had returned the names of the jurors to the court above. It is now the course to make the sheriff's *venire* returnable on the last return of the same term wherein issue is joined, viz. Hilary or Trinity terms, which are called *issuable* terms; and he returns the names of the jurors in a panel, *i. e.* little pane, or oblong piece of parchment, annexed to the writ. This jury is not summoned, and therefore not appearing at the day, must unavoidably make default: for which reason a compulsive process is now awarded against the jurors, called in the common pleas a writ of *habeas corpora juratorum*, and in the king's bench a *distingas*. The entry, therefore, on the roll or record is, "that the jury is respited, through default of the jurors, till the first day of the next term, then to appear at Westminster; unless before that time, viz. on Wednesday the fourth of March, the justices of our lord the king appointed to take assizes in that county shall have come to the place assigned for holding the assizes, &c." And as the judges are sure to come and open the circuit commissions on the day mentioned in the writ, the sheriff returns and summons this jury to appear at the assizes, and there the trial is had before the justices of assize and *nisi prius*; among whom are usually two of the judges of the courts at Westminster, the whole kingdom being divided into six circuits for this purpose. If the sheriff be not an indifferent person, or if he be a party in the suit, or be related either by blood or affinity to either of the parties, the *venire* shall be directed, not to him, but to the coroners; and if any exception lies against them, to two clerks of the court, or to two persons of the county named by the court and sworn, and called *elisors*, or electors, who shall indifferently name the jury, and their return is final. In order farther to remove all suspicion of partiality, it is provided by the statutes 4 Edw. III. cap. 2. 8 Ric. II. cap. 2. and 23 Hen. VIII. cap. 24. that no judge of assize should hold pleas in any county where he was born or inhabits. See 12 Geo. II. c. 27. and *JUSTICES of Oyer, &c.*

When the general day of trials is fixed, the plaintiff, or his attorney, must bring down the record to the assizes, and enter it with the proper officer, in order to its being called in course. If it be not so entered, it cannot be tried; therefore it is in the plaintiff's breach to delay any trial by not carrying down the record, unless the defendant undertakes to bring on the trial by giving proper notice to the plaintiff. This proceeding is called the trial by *proviso*. However, this practice hath begun to be disused, since the statute 14 Geo. II. cap. 17, which enacts, that if, after issue joined, the cause is not carried down to be tried according to the course of the court, the plaintiff shall be deemed to be non-suited, and judgment shall be given as in case of a non-suit. In case the plaintiff intends to try the cause, he is bound to give the defendant (if he lives within forty miles of London) eight days notice of trial; and if he lives at a greater distance, fourteen days notice; and if he changes his mind, and does not countermand the notice six days before the trial, he shall be liable to pay costs to the defendant for not proceeding to trial, by the last-mentioned statute. The defendant, however, or plaintiff, may, upon good cause shewn to the court above, as upon absence or sickness of a material witness, obtain leave upon motion to defer the trial of the cause till the next assizes. But when the cause is called on regularly in court, the record is conveyed to the judge, while the jury is called and sworn. To this end the sheriff returns his compulsive process, the writ of *habeas corpus*, or *ex officio*, with the panel of jurors annexed, to the judge's officer in court. The jurors contained in the panel are either special or common jurors. See *Special Jury*.

A common jury is one returned by the sheriff, according to the directions of the statute 3 Geo. II. cap. 25, which appoints that the sheriff or officer shall not return a separate panel for every separate cause, as formerly; but one and the same panel for every cause to be tried at the same assizes, containing not less than forty-eight, nor more than seventy-two jurors: and that their names, being written on tickets, shall be put into a box or glass: and when each cause is called, twelve of these persons, whose names shall be first drawn out of the box, shall be sworn upon the jury, unless absent, challenged, or excused; or unless a previous view of the lands or tenements, or other matters in question, shall have been thought necessary by the court (stat. 4 Ann. c. 16.); in which case six or more of the jurors returned, to be agreed on by the parties, or named by a judge, or other proper officer of the court, shall be appointed to take such a view, and then such of the jury as have appeared upon the view, shall be sworn on the inquest, previous to any other jurors.

Lists of the jurors qualified according to the acts 4 & 5 W. & M. cap. 24. 7 & 8 W. III. c. 32. and 3 & 4 Ann. cap. 18. are now to be made from the rates of each parish. The justices at Midsummer sessions are to issue warrants to the high constables who require the petty constables to prepare such lists; and if the high constables neglect to issue their precepts for this purpose, they shall forfeit 10*l*. These lists are to be fixed on the doors of churches, &c. twenty days before Michaelmas, that public notice may be given of persons omitted who are qualified, and of persons inserted, who ought to be omitted. (3 Geo. II. cap. 25.) And if any persons are inserted wrongfully, or omitted for the sake of reward, &c. the petty constable incurs a forfeiture of 20*l*. The lists shall be delivered by the petty constables, at Michaelmas sessions, in open court; or when they are subscribed by them, and attested on oath, and also signed by the justice, they shall be delivered by the petty constables to the high constables, who shall deliver them,

upon oath, in open court. The constable failing to make such return shall forfeit 5*l*. Persons not qualified may be discharged by the justices at the sessions. These lists shall be then fairly entered in a book by the clerk of the peace, on forfeiture of 20*l*. and duplicates of them shall, during the sessions, or within ten days after, be delivered by him to the sheriff, who shall cause the names, with their additions, &c. to be entered in a book of his own; and if the sheriff shall return any person whose name is not in the duplicates, he is liable to a fine not exceeding 10*l*. nor less than 40*l*. (3 Geo. II. cap. 25.) Every summons of jurors shall be made by the sheriff, his officer, or lawful deputy, six days before the session, at least, in Wales eight days before; and in the counties palatine fourteen days before; and the penalty of neglect, or of excusing any person for favour or reward, is 20*l*. by 7 & 8 W. cap. 32. or a fine of 10*l*. or under, imposed by the judge of assize. (3 Geo. II. cap. 25.) No person shall be summoned, who has served within one year before in the county of Rutland, or two years before in any other county, not being a county of a city or town, and except the counties of York and Middlesex, under a fine not exceeding 5*l*. Every person who has served, shall have a certificate gratis, testifying his attendance. (3 Geo. II. cap. 25.) In the county of York, jurors shall not be returned above once in four years; and the sheriff neglecting his duty shall forfeit 100*l*. and for not discharging a juror, who has served within four years, and giving notice to the party summoned, six days before the assizes or sessions, shall forfeit 20*l*. to the party with full costs. (7 & 8 W. cap. 31. 3 & 4 Ann. cap. 18. and 10 Ann. cap. 14.) In the county of Middlesex, no person shall be returnable to serve as a juror, at any sessions of *nisi prius*, who hath been returned in the two terms or vacations next before, on pain of the sheriff being fined by the judge 5*l*. or under. (4 Geo. II. cap. 7.) And by 7 & 8 W. cap. 32. the inhabitants of the city and liberty of Westminster shall be exempted from serving on any jury at the sessions for Middlesex, by reason of their attendance at the courts of Westminster. By the common law, jurors returned, and not appearing, shall lose and forfeit the issues returned upon them. And if a jurymen be called, and, being present, refuse to appear; or, having appeared, withdraw before he be sworn, the court may fine him at their discretion. (35 Hen. VIII. cap. 6.) And by 29 Geo. II. cap. 19. a juror not appearing and serving in any court of record within the city of London, or in any other city or town corporate, liberty or franchise, after being openly called three times, &c. shall, without reasonable excuse, be fined not more than 40*l*. nor less than 20*l*. And by 3 Geo. II. cap. 25. in causes of *nisi prius*, every person whose name shall be drawn, and who shall not appear without reasonable excuse, shall forfeit not exceeding 5*l*. nor less than 40*l*. If a juror take a bribe of either party, he shall forfeit ten times as much as he hath taken. (5 Edw. III. cap. 10. 34 Edw. III. cap. 8. 38 Edw. III. stat. 1. cap. 12.) If a man assault or threaten a juror for giving a verdict against him, he is punishable by fine or imprisonment; and if he strike him in the court, in the presence of a judge of assize, he shall lose his hand and his goods, and profits of his lands during life, and suffer perpetual imprisonment.

The jury is to be chosen of the same class or rank with the parties, and by the policy of the ancient law, the jury was to come *de vicineto*, from the neighbourhood of the vill or place where the cause of action was laid in the declaration, and for want of this, the array might be challenged for defect of hundredors. However, this practice was entirely abolished by 4 & 5 Ann. cap. 16. upon all civil actions,

actions, except upon penal statutes; and upon those also by the 24 Geo. II. cap. 18. the jury being now only to come, *de corpore comitatus*, from the body of the county at large, and not *de vicinis*, or from the particular neighbourhood. It is also enacted by 28 Edw. III. cap. 13. enforced by 8 Hen. VI. cap. 20. that where either party is an alien born, the jury shall be one half aliens, and the other denizens, if required, for the more impartial trial. But where both parties are aliens, the whole jury are directed to be denizens, by 21 Hen. VI. cap. 4. For other grounds of challenge and qualification of jurors, see CHALLENGE. Jurors in London and Westminster must not only be housekeepers, but have lands or goods worth one hundred pounds; and they may be examined on oath as to that point. (3 Geo. II. cap. 25.) All cities, boroughs, and corporate towns, are excepted out of the act that settles the qualifications of jurors for county assizes or sessions; and triers of felons in corporations may be men worth 40*l.* in goods, though they have no freehold. Jurors in the town shall have 20*l.* a-year freehold, or 26*l.* 8*d.* copyhold. Any person whatsoever is capable of being put upon the jury in a court, and upon the coroner's jury. The qualifications of jurors, with regard to estate, depend upon a variety of statutes. But by the last statute 3 Geo. II. c. 25. any lease-holder for the term of 500 years absolute, or for any term determinable upon life or lives, of the clear yearly value of 20*l. per annum*, over and above the rent reserved, is qualified to serve on juries. By the common law every grand-jurymen ought to be a freeman (1 Hawk. 255); and a freeholder (2 H. H. 155) But in Yorkshire, they ought to have 8*l.* a-year, freehold or copyhold. (7 & 8 W. c. 32.) Persons excused from serving on juries are those that are sick and decrepit; those not commorant in the county, and men above seventy years old, by 13 Edw. I. c. 38. and by 7 & 8 Will. III. c. 32. infants under twenty-one. This exemption is also extended, by divers statutes, customs, and charters, to physicians, and other medical persons, counsel, attorneys, officers of the courts, and the like; all of whom, if impelled, must shew their special exemptions. Dissenting teachers, qualified under the toleration acts, are exempted, and also quakers. Clergymen are also usually excused; but if they are seized of land and tenements, they are strictly liable to be impelled in respect of their lay fees, unless they be in the service of the king, or of some bishop.

If, by means of challenges or other cause, a sufficient number of unexceptionable jurors doth not appear at the trial, either party may pray a tales. When the legal number of twelve is obtained, they are then separately sworn, well and truly to try the issue between the parties, and a true verdict to give, according to the evidence; and hence they are denominated the *jury, jurata*, and jurors, *sc. juratores*. Pleadings are then opened to them by counsel on that side which holds the affirmative of the question in issue; the nature of the case, and the evidence intended to be produced are next laid before them by counsel also on the same side; and when their evidence is gone through, the advocate on the other side opens the adverse case, and supports it by evidence; and then the party which began is heard by way of reply. See EVIDENCE.

As to such evidence as the jury may have in their own consciences, by their private knowledge of facts, it was an ancient doctrine, that this had as much right to sway their judgment as the written or parol evidence which is delivered in court; and, therefore, it hath been often held, that though no proofs be produced on either side, yet the jury might bring in a verdict. But this doctrine was gradually exploded, when attaints began to be disused, and new trials

introduced in their stead. And if a juror knows any thing of the matter in issue, he may be sworn as a witness, and give his evidence publicly in court. When the evidence on both sides is gone through, the judge, in the presence of the parties, the counsel, and all others, sums up the whole to the jury; who, unless the case be very clear, withdraw from the bar to consider of their verdict; and, in order to avoid intemperance and causeless delay, they are to be kept without meat, drink, fire, or candle, unless by permission of the judge, till they are all unanimously agreed. And if they eat or drink, or have any catables about them, without consent of the court, and before verdict, it is finable; and if they do so at his charge for whom they afterwards find, it will set aside the verdict. Also, if they speak with either of the parties or their agents, after they are gone from the bar, or if they receive any fresh evidence in private, or if, to prevent disputes, they call lots for whom they shall find, any of these circumstances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or imprisoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. When they are all unanimously agreed, the jury return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himself, attorney, or counsel, in order to answer the amercement, to which by the old law he is liable, in case he fails in his suit, as a punishment for his false claim; a form which is still continued, though the amercement is disused; and if the plaintiff does not appear, no verdict can be given, but the plaintiff is said to be *non-juit*. But in case the plaintiff appears, the jury by their foreman deliver in their verdict. When the jury have delivered in their verdict, and it is recorded in court, they are then discharged. Such is the process of trial by jury in civil cases; a trial which, besides the other vast advantages which attend it, is as expeditious and cheap, as it is convenient, equitable, and certain. On these accounts, says judge Blackstone, "the trial by jury ever has been, and I trust ever will be, looked upon as the glory of the English law." It is "the most transcendent privilege which any subject can enjoy, or wish for, that he cannot be affected either in his property, his liberty, or his person, but by the unanimous consent of 12 of his neighbours and equals. A constitution, that I may venture to affirm, has, under Providence, secured the just liberties of this nation for a long succession of ages, and therefore a celebrated French writer (Montesquieu), who concludes, that because Rome, Sparta, and Carthage, have lost their liberties, therefore those of England must in time perish, should have recollected, that Rome, Sparta, and Carthage, at the time when their liberties were lost, were strangers to the trial by jury." This trial by jury, which is the grand bulwark of our liberties, as Englishmen, is secured to us by the great charter, 3 Hen. III. c. 19. "The antiquity and excellence of this trial, for the settling of civil property, have been already briefly stated. But if it has by great advantage in regulating civil property, how much more that advantage be heightened, when it is applied to criminal cases! "In times of difficulty and danger," says Blackstone, "has well observed, "more is to be apprehended from the violence and partiality of judges appointed by the crown, in suits between the king and the subject, than in disputes between one individual and another, to settle the metes and boundaries of private property. Our law has therefore wisely placed this strong and twofold barrier, of a presentment and a trial by jury, between the liberties of the people, and the prerogative of the crown."—"The founders of the English

English law have with excellent foresight contrived, that no man should be called to answer to the king for any capital crime, unless upon the preparatory accusation of 12 or more of his fellow-subjects, the grand jury; and that the truth of every accusation, whether preferred in the shape of indictment, information, or appeal, should afterwards be confirmed by the unanimous suffrage of 12 of his equals and neighbours, indifferently chosen, and superior to all suspicion. So that the liberties of England cannot but subsist, so long as this *paladium* remains sacred and inviolate: not only from all open attacks. (which none will be so hardy as to make), but also from all secret machinations, which may sap and undermine it; by introducing new and arbitrary methods of trial, by justices of the peace, commissioners of the revenue, and courts of conscience. And however convenient these may appear at first, (as, doubtless, all arbitrary powers, well executed, are the most convenient,) yet let it be again remembered, that delays, and little inconveniences in the forms of justice, are the price that all free nations must pay for their liberty in more substantial matters; that these inroads upon this sacred bulwark of the nation are fundamentally opposite to the spirit of our constitution; and that, though begun in trifles, the precedent may gradually increase and spread, to the utter disuse of juries in questions of the most momentous concern."

In criminal cases, it is provided by the equity and lenity of the English laws, that no man should be called to answer for any capital crime, unless, as we have already stated, upon the preparatory accusation of twelve or more of his fellow-subjects, called the *grand jury*. This jury considers all bills of indictment against criminals preferred to the court, which they either approve or find, by writing upon them *habeat verum*, or disallow, by indorsing *ignoremus*, and generally consists of gentlemen that are freeholders of superior quality to those who form the *petit jury*, who try the prisoners indicted by the other jury, and convict them by verdict.

When a prisoner, on his arraignment, has pleaded not guilty, and for his trial hath put himself upon the country, which country the jury are, the sheriff of the county must return a panel of jurors that are freeholders, without just exception, and of the *visne*, or neighbourhood, *i. e.* of the county where the fact is committed. If the proceedings are before the court of king's bench, there is a time allowed, between the arraignment and the trial, for a jury to be impelled by a writ of *venire facias* to the sheriff, as in civil causes; and the trial in case of a misdemeanour, is had at *nisi prius*, unless it be of such consequence as to merit a trial at bar; which is always invariably had, when the prisoner is tried for any capital offence. But, before commissioners of *oyer and terminer*, and gaol delivery, the sheriff, by virtue of a general precept, directed to him beforehand, returns to the court a panel of forty-eight jurors, to try all felons that may be called upon their trial at that session; and, therefore, it is usual to try all felons immediately, or soon after their arraignment. But persons indicted of smaller misdemeanours, usually give security to the court to appear, for trial at the next assizes or session. See **INDICTMENT**.

When the trial is called on, the jurors are to be sworn, as they appear to the number of twelve, unless they are challenged by the party. (See **CHALLENGE**, & *supra*) *Tales* may be awarded as in civil causes, till the number of twelve is sworn, "well and truly to try, and true deliverance make, between our sovereign lord the king, and the prisoner whom they have in charge; and a true verdict to give, according to the evidence." When the jury is sworn, if it be a cause of any consequence, the indictment is usually opened, and the evidence stated by the counsel for the crown,

or prosecution. But it is a settled rule at common law (inconsistent, indeed, with the humane treatment of prisoners by the English laws, but palliated by the declaration of law, that the judge shall be counsel for the prisoner, *i. e.* shall see that the proceedings against him are legal and strictly regular) that no counsel shall be allowed a prisoner upon his trial, upon the general issue, in any capital crime, unless some point of law should arise proper to be debated. (2 Hawk. P. C. 400.) However, the judges never scruple to allow a prisoner counsel to stand by him at the bar, and instruct him what questions to ask, or even to ask questions for him, with respect to matters of fact; for as to matters of law, arising on the trial, they are entitled to the assistance of counsel. When the evidence on both sides is closed, the jury cannot be discharged, (unless in cases of evident necessity,) till they have given in their verdict; but are to consider of it and deliver it in, with the same forms as upon civil causes; only that they cannot, in a criminal case, give a *privy verdict*. (2 Hal. P. C. 300. 2 Hawk. P. C. 439.) But an open verdict may be either general, guilty or not guilty; or special, setting forth all the circumstances of the case, and praying the judgment of the court, whether, for instance, on the facts stated, it be murder, manslaughter, or no crime at all. (See **VERDICT** and **JURORS**.) If the jury find the prisoner not guilty, he is then for ever discharged of the accusation, except he be appealed of felony within the time limited by law. (See **APPEAL**.) And upon such his acquittal, or discharge for want of prosecution, he shall be immediately set at large, without payment of any fee to the gaoler. (Stat. 14 Geo. III. c. 20.) But if they find him guilty, he is said to be *convicted* of the crime whereof he stands indicted. On a conviction for any felony, in general, the reasonable expences of prosecution are, by stat. 25 Geo. II. cap. 36 and 18 Geo. III. c. 19. to be allowed to the prosecutor out of the county flock, if he petitions the judge for that purpose; and if he be poor, a compensation for his trouble and loss of time; and by 27 Geo. II. cap. 3. explained by stat. 18 Geo. III. c. 19. poor persons bound over to give evidence are likewise entitled to be paid their charges, as well without conviction as with it. Moreover, on a conviction of larceny in particular, the prosecutor shall have restitution of his goods, by 21 Hen. VIII. cap. 11. which enacts, that if any person be convicted of larceny by the evidence of the party robbed, he shall have full restitution of his money, goods, and chattels; or the value of them out of the offender's goods, if he has any, by a writ to be granted by the justices; and this writ shall reach the stolen goods, though the property of them is transferred to another by sale in open market. (1 Hal. P. C. 543.) Without such writ of restitution, the party may peaceably retake his goods wheresoever he finds them. And if the felon be convicted and pardoned, or allowed his clergy, the party robbed may bring his action of trover against him for his goods, and recover a satisfaction in damages. Such are the proceedings and consequences of a trial by jury in criminal cases. See **Blackk. Comm.** book iii. iv.

JURY, Special. Where it is conceived that an indifferent impartial jury will not be returned between party and party by the sheriff, the court upon motion will order the sheriff to attend the secondary of the king's bench, with his book of freeholders of the county; and the secondary, in the presence of the attornies on both sides, is to strike a jury. And when a cause of consequence is to be tried at the bar, the court of king's bench, on motion and affidavit made, will make a rule for the secondary to name forty-eight freeholders; and each party is to strike out twelve, one at a time, the plaintiff, or his attorney, beginning first; and

from the remainder the jury for the trial are to be drawn. This is called a *special jury*.

By the stat. 3 Geo. II. cap. 25. either party is entitled upon motion to have a special jury struck upon the trial of any issue, as well as the assizes at bar; he paying the extraordinary expence, unless the judge's writ certify, in pursuance of the stat. 24 Geo. II. cap. 18. that the cause required such special jury. And no person serving on a special jury shall be allowed more than the sum which the judge shall think reasonable, not exceeding one guinea, except in cases where a view is directed. When any special jury shall be ordered by rule of the court of Westminster, in any cause arising in any city, &c. the jury is to be taken out of lists, or books of persons qualified, which shall be produced by the sheriffs, &c. before the proper officer. The fame indulgence is granted both to merchants and foreigners; for where two merchants are plaintiff and defendant, a jury of merchants may be returned to try the issue between them; and if either of the parties in the suit be an alien, the jury, at the desire of the party, is to be composed of half foreigners and half English.

JURIES, Clerk of the. See CLERK.

JURY of Matrons. See MATRONS.

JURY-MAST, an appellation given by seamen to a temporary or occasional mast, pitched up of yards, or other pieces of timber, and set up in the room of a true mast, which has been lost in a fight, or by a storm.

JURZEC, in *Geography*, a town of Lithuania, in the palatinate of Minsk; 20 miles N. of Rohaczow.

JUS, and **JURA**. See LAW, RIGHT, &c.

Jus accrescendi, in *Law*, is the right of survivorship between joint-tenants.

Jus ad rem, is an inchoate and imperfect right, such as a parson promoted to a living acquires by nomination and institution; in contradistinction to the *jus in re*, or complete and full right, by corporal possession.

Jus Anglorum, denotes the law and customs of the West Saxons, in the time of the heptarchy, by which the people were for a long time governed, and which were preferred before all others.

Jus coronæ, *rights of the crown*, is part of the law of England, which differs in many things from the general law concerning the subject. Coke on Litt.

The king may purchase lands to him and his heirs, but he is seized thereof in *jure coronæ*; and all the lands and possessions, whereof the king is thus seized, shall follow the crown in descents, &c. See PREROGATIVE.

Jus curialitatis Anglie. See COURTESY.

Jus duplicatum. See RIGHT.

Jus fiduciarium, in the *Roman Law*, a right in trust for which there was a remedy in conscience.

Jus gentium, is the law by which kingdoms, and society in general, are governed.

Jus gladii is mentioned in our Latin authors, and the Norman laws, where it signifies a supreme jurisdiction. Camden. And hence it is, that at the creation of an earl, he is said to be *gladio fuscinus*, to signify that he had a jurisdiction over the county of which he was made earl. See PLEAS of the Sword.

Jus imaginum was the foundation of civil nobility among the Romans, and denoted having the image of one's ancestor at least, who had borne some curule office.

Jus legitimum, in the *Roman Law*, a legal right which was remedied by the ordinary court of law.

Jus patronatus, is a commission granted by the bishop to some persons to enquire who is the rightful patron of a church. If two patrons present their clerks, the bishop shall deter-

mine who shall be admitted by right of patronage, &c. A commission of enquiry by six clergymen and six laymen, living near the church; who are to enquire in articles and jury, whether the church is void? who presented last? who is the rightful patron? &c. But if coparceners severally present their clerks, the bishop is not obliged to *investire jus patronatus*, because they present under the title; and are not in like case, where two patrons present under several titles. The awarding a *jus patronatus* is not of necessity, but at the pleasure of the ordinary, for the better information who hath the right of patronage; for if he will at last prefer take notice of the right, he may do at the clerk of either of the patrons, without a *jus patronatus*.

Jus precarium, in the *Roman Law*, a right in courtship, for which the remedy was only by intreaty or request.

Jus quale. See QUALITY, jus.

Jus togæ. See TOGA.

JUSKPOUR, in *Geography*, a circle of Hindoostan, in the country of Orissa, bounded on the N. by Sargowah, on the E. by a part of Bahar, on the S. by the circles of Gangpou and Ruttanpou, and on the W. by Ruttanpou. The capital is Odeypour.

JUSOFIE, a town of Arabia, in the province of Hedjaz, on the S. coast of the Persian gulf. N. lat. 25 34'. E. long. 50 30'.

JUSQUIAMUS, in *Botany*, a name used by some authors for the hyoscyamus, or henbane.

JUSSAUHA, in *Geography*, a town of Hindoostan, in Moultan; 14 miles W. of Toulomba.

JUSSEY, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Vesoul, situated on the Aمانة; 15 miles N.W. of Vesoul. The place contains 3033, and the canton 14,776 inhabitants, on a territory of 227: kilometres, in 22 communes. N. lat. 47 40'. E. long 5 59'.

JUSSIEA, in *Botany*, so named by Linnæus, (who, as it appears by his *Tour in Lapland*, v. 1. 284, had at first destined for this purpose the plant he afterwards called *Sibbaldia*;) in honour of the two illustrious brothers Antony and Bernard de Jussieu. The former was professor of botany at Paris, and wrote numerous papers in the Memoirs of the academy, being also the editor of the work of Barrelier. He was born at Lyons in 1686, and died at Paris, where he practised medicine, in 1758, aged 72. His brother Bernard, a first rate botanist, who, as Haller observes, was deterred by excess of modesty from giving his ideas to the world, was one of the first who laboured at a natural system of arrangement. His nephew, the present A. L. de Jussieu, has given us a plan of his method, according to which the garden of Trianon was arranged in 1759, and which in fact laid the foundation of his own celebrated work, published in 1789. Bernard de Jussieu was demonstrator of botany at the Jardin du Roi, and died in 1777, aged 79. A third brother, Joseph, travelled to South America as a surgeon, and sent home dried specimens of many curious plants.—Linn. Gen. 215. Schreb. 202. Willd. Sp. Pl. v. 2. 574. Mart. Mill. Dict. v. 2. Art. Hort. Kew. v. 2. 65. Juss. 319. Lamarck Illustr. t. 285. Gært. t. 31.—Clas and order, *Decandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagraceæ*, Juss.

Gen. Ch. Cal. Perianth superior, in five, (for times but five.) ovate, acute, permanent segments. Cor. of five, (for times but four,) roundish, spreading, fleshy, equal petals. Stam. Filamentous, (sometimes eight) very short, thread-shaped; anthers roundish. Pist. Germen oblong, prismatic, inferior; style thread-shaped; stigma capitate, flat, marked with five streaks. Peric. Capsule oblong, 4 N.

gular, of four or five cells, bursting at the angles, crowned with the calyx. Seeds numerous, small, smooth, and polished, disposed in rows upon the angles of the central column, which are opposite to the partitions, the latter originating from the centre of each valve. See GÆRTNER.

Eff. Ch. Calyx superior, of four or five leaves. Petals four or five, equal. Capsule of four or five cells, oblong, bursting at the angles; partitions from the middle of the valves. Seeds numerous, minute.

Obf. Gærtner asserts the difference between this genus and *Cnethera* to be merely factitious and imaginary. In our opinion the permanent, leafy, equal calyx, destitute of a tube, and the smooth, round, not angular nor spongy, seeds, are sufficient to mark *Justicea*, not to mention the undivided ligula, which in this tribe is perhaps of no great moment.—As to its place in the Linnæan system we are less decided, and think Lamarck most correct in removing it to *Ocandria*.

The greater number of the species are natives of the warmer parts of America; a few are found in the East Indies, or in Guinea. Linnæus defines it in his *Species Plantarum*; Willdenow has twice.

1. *J. repens*, Linn. Sp. Pl. 555. (Nir-carambu; Rheede Hort. Mal. v. 2. 99 t. 51.)—Stem creeping. Leaves obovate, obtuse. Flowers five-cleft. Calyx-leaves lanceolate.—This is truly an East Indian species, growing in watery places, and throwing out from its procumbent branched stems, large tufted fibrous perennial roots. The herbage is smooth. Leaves alternate, stalked, obovate, entire, veiny, obtuse, often emarginate, an inch or more in length. Flowers on solitary, simple, axillary stalks, shorter than the leaves, but the ripe fruit and stalk together are about as long as each leaf. Segments of the calyx five, lanceolate, narrow, acute, entire. Petals five, rounded, whitish, with orange-coloured veins.—*J. adscendens*, Linn. Mant. 69, appears to be the very same plant, described from a specimen, whereas *J. repens* was originally taken up from books.

2. *J. inclinata*, Linn. Suppl. 235. (*J. erecta*; Amoen. Acad. v. 8. 256.)—Stem ascending. Leaves obovate, obtuse. Flowers four-cleft. Calyx-leaves elliptical, broad.—Sent from Surinam by Dalberg, being a part of the collection preserved in spirits, which King Gullavus III. gave Linnæus. The latter at first mistook this species for a totally different one, *erecta*. It is more akin to *repens*, but larger, and the above specific character sufficiently marks it. The very broad calyx-leaves are remarkable.

3. *J. peruviana*, Linn. Sp. Pl. 555. (*Onagra laurifolia*, flore amplo pentapetalo; Feuille. Peruv. 716. t. 9, not 11.)—Stem erect. Leaves elliptical-narrow, acute, roughish. Flowers four or five-cleft. Calyx leaves ovate, pointed, toothed.—Gathered by Feuillée about the sides of rivers in the plain of Lima. He reports that the natives highly esteem the brewed leaves, as a cooling application to distal tumours. Mutis sent Linnæus a specimen from Mexico, which answers precisely to Feuillée's plant, except the flowers being four-cleft, and in which we find no ribs. The rounded calyx is our's remarkable. The petals are large and yellow. Leaves roughish with short, rigid, scattered hairs; their under side pale.

4. *J. hirta*, Willd. n. 6. (*Cnethera hirta*; Linn. Sp. Pl. 491. *Onagra frutescens* et *hirtata*, neri folio, flore magno luteo; Pam. Ic. 167. t. 174. f. 2.)—Stem erect, hairy. Leaves elliptic-lanceolate, acute; hairy beneath. Flowers four-cleft. Calyx-leaves ovate, pointed, entire.—Known to us only by Pliner's figure, who gathered it in some part of South America. If that figure be exact, the entire calyx, and more hairy herbage, distinguish it from the

last. Willdenow has properly followed Swartz and Vahl in removing it from *Cnethera*.

5. *J. pubescens*, Linn. Sp. Pl. 555. Loeffl. It. 282. n. 205.—Stem upright, hairy. Leaves oblong. Flowers five or six-cleft. Calyx-leaves lanceolate, pointed, hairy beneath.—Gathered by Loeffling in South America. We have an unnamed specimen which answers well enough to the short accounts of this species given by authors. Of the synonym of Sloane we do not presume to judge with certainty, but it appears to belong to *J. peruviana*. The stem of our plant is erect, clothed with loose, spreading, white hairs, as are also the leaves more or less, the long slender *germen*, and backs of the calyx-leaves. The latter are six in every flower we have examined, lanceolate, taper-pointed, wavy, scarcely crenate, very smooth above. Petals six, white or yellowish. Leaves linear-lanceolate, near two inches long, on short hairy stalks.

6. *J. fulfuricola*, Linn. Sp. Pl. 555. (Cattu-carambu; Rheede Hort. Mal. v. 2. 97. t. 50.)—Stem erect, much branched. Leaves lanceolate, downy. Flowers four-cleft. Calyx-leaves ovate, downy beneath.—Native of the East Indies, flowering during the rainy season. The whole plant, two or three feet high, is usually clothed with dense soft pubescence, though occasionally nearly smooth. Leaves numerous, lanceolate, almost sessile, about two inches long. Fruit nearly as long. The ovate four-leaved calyx, downy, not hairy, beneath, essentially distinguishes it from the last. Linnæus adopted this species from books; and though he had specimens, never rightly determined them.

7. *J. obtusivalvis*, Swartz. Obf. 142. (*Cnethera octovalvis*; Jacq. Amer. 102. t. 70. Linn. Sp. Pl. 4. 2. *Onagra foliis pericariae angustioribus, flore magno luteo*; Plum. Ic. 168. t. 175. f. 1.)—Stem erect. Leaves lanceolate, downy. Flowers four-cleft. Calyx-leaves ovate. Capsule of eight valves. Native of wet places in the West Indies. This seems to be the plant incorrectly figured by Merian, Inf. Surin. t. 39. There is great difficulty in distinguishing it specifically from the last, as we have seen no specimen, but we have no doubt of their being different. The present is said to be an annual plant. The petals are yellow, and inversely heart-shaped.

8. *J. erecta*, Linn. Sp. Pl. 556. Swartz. Obf. 173. (*Onagra foliis pericariae amplioribus, areo flore luteo*; Plum. Ic. 168. t. 175. f. 2. Carambu; Rheede Hort. Mal. v. 2. 95. t. 49.)—Stem erect. Leaves lanceolate, smooth. Flowers four-cleft, sessile. Calyx-leaves lanceolate.—Native of marshy places in both Indies. The root is said to be annual. Whole plant smooth or nearly so. Leaves two or three inches long, stalked, lanceolate, pointed. Flowers small, yellow, axillary, sessile. Calyx-leaves slightly downy and three-ribbed beneath. Fruit obovate, not an inch long, the membranous sides, between the ribs, becoming toruli to let out the seed.

9. *J. americana*, Swartz. Ind. Occ. v. 2. 745.—Nearly erect, smooth. Leaves lanceolate, broad, tapering at each end. Flowers four-cleft, nearly sessile.—In low ground in the fourth part of Jamaica, but rare. Swartz. This differs from the last in the singularly taper-pointed leaves, and in the stem being decumbent at its base.—The calyx-leaves, moreover, are described as somewhat ovate.

10. *J. tenuis*, Plum. Ind. 103. t. 24. f. 2.—Erect, smooth. Leaves lanceolate, opposite. Flowers five-cleft, nearly sessile.—Native of Java. A small plant much branched. Leaves according to Burmann opposite, an inch long. The Carambayaya of Maregrave, 50. f. 1, which he quotes, is more like *J. obtusivalvis*.

11. *J. linearis*, Willd. n. 3.—Leaves linear, sessile, rigid.

c. 7, 8.), "Justitia conjuncta est beneficentia;" Beneficence is connected with justice. And again, "Injustitia duo genera," &c. There are two kinds of injustice, one of those who do an injury to others; another with which they are chargeable, who neglect to vindicate and defend the injured, when it is in their power. To the same purpose Cicero says (7, 2, 1. i. c. 5.), "A man may be unjust not only by doing, but neglecting to do something." These philosophical writers seem evidently to have thought, that the duties of humanity are parasitic of justice properly so called. Simple justice we have already defined, agreeable to the accurate definition of it in the civil law. "Justitia est constant et perpetua voluntas jus suum cuique tribuendi;" Justice is a constant and prevailing will, or disposition, to render to every one his due.

Justice does not derive its being from fear, as is affirmed by Mr. Hobbes, who supposes mankind in their natural state to have a licence uncircumscribed by any other bounds, besides their own natural force. This licence they are induced to exchange for a more limited right in society, to prevent that war of every one with every one, which would be the consequence of every one's insisting upon his natural rights. "According to this hypothesis," as Dr. Cudworth well observes (Intellect. System), "justice and civil government are plainly things not good in themselves, nor desirable (being a hindrance to liberty, and nothing but shackles and fetters, but by accident only, as necessary evils. They are lesser evils submitted to purely for the sake of avoiding a greater. Hence it inevitably follows, that all men must be as they are, unwillingly just, or not with a full and perfect, but mixed will only." The true principles of justice are such as these: It is reasonable that his will, who is the common father of mankind, should be the measure of their behaviour one towards another. It can never be thought a thing pleasing to God, who has originally the same affection for one as for another, that one man, by fraud or violence, should usurp dominion over another, or any way molest or hinder him. Besides, this would introduce confusion into his works, the glory of which is their order and harmony. "If it be the disposition of mankind," says Cicero (De Offic. l. iii. § 5.), "that every one for his own advantage should oppress and rob his neighbour, it is necessary that society, which is the most natural state of mankind, be entirely dissolved. Just as in the human body, the whole must be weakened and destroyed, if every member could have this persuasion, and act upon it; that it should flourish by drawing to itself the strength and nourishment of the member nearest to it." Thus from that original and universal society to which all mankind belong, necessarily flow obligations to mutual justice; and Mr. Hobbes's state of war appears to contradict the very first view of human nature. But besides this general society, particular civil societies have, by the direction of nature, been erected in several parts of the world. The Affection of nature has formed his rational creatures with a desire and inclination to combine into bodies politic. This inclination, therefore, which makes men seek society, not for the sake of benefiting themselves by it; to satisfy their passions more than to defend themselves from violence. When societies are formed, though justice be necessary to maintain them, and hence we infer the will of the great governor of the world; yet in the nature of things, the obligation to justice is antecedent to any society whatsoever. From the formation of society with which God hath made man, we infer his will to be, that justice should be cultivated, which is necessary to the support of society; but civil society is not the original of justice. Another prin-

ciple of justice is, that the good of the whole is to be preferred before the good of any one part. Is it good, pleasing to a most benevolent creator, and consequently deserving the approbation and concurrence of every rational agent, that this or that man should be happy? It is much better that a greater number, and best of all that all should be so. But how can all men be made happy, without a constant regard to the rules of justice. Bishop Cumberland (De Legibus Nature, cap. ii. § 23.) not only resolves justice, with the several duties annexed to it, into this principle, but even the right of self-preservation. Farther, it is altogether reasonable, that we should, or should not do to another, what we would, or would not that he should do unto us. Every man is agreed to think every other man unjust, who deprives him of any good thing which he lawfully enjoys. We should therefore consider, that others may reasonably expect of us, whatever we may reasonably demand from them. Moreover, all men have their rights and properties. He that is born to least, is born with a right to life, liberty, and safety. If there be right, there must be justice: these mutually suppose one another. Again, whatever is enjoyed or possessed by a moral agent, independently of another, may be used, enjoyed, and encouraged, without being subject to the control of that other; provided that the possessor has not alienated or forfeited his right; and that he uses it not to the prejudice of any other person. Upon this principle is founded the natural equality of mankind, that is, an equality of right. This equality subsists in all the essentials of being and happiness, under all the changes of condition to which every man is liable. Let a man's condition be what it will, high or low, rich or poor, a prince or a subject, as he has an equal right to what he lawfully possesses, with that which any other man can have; so there are certain possessions, the right of which he cannot transfer to another; of which number are life, limbs, and liberty, both civil and religious: in all which respects, therefore, the meanest person, while innocent, is equal to the greatest among men. Mr. Hobbes indeed (De Cive, l. i. c. 1. § 3.) proves the equality of mankind from the equal power they have of doing mischief. M. Barbeyrac observes, that this equality may be called an equality purely physical; whereas it is a moral equality, or an equality of right, that must be laid as the foundation of justice. Puffendorf deduces this equality of mankind from the sameness of nature; which seems to make it, as well as that of Mr. Hobbes, a physical equality. Of Mr. Godwin's sentiments concerning the subject under present discussion, we shall probably have occasion to give some account under the articles POLITICS, SOCIETY, and VIRTUE.

Having briefly stated the great principles of justice, we shall now proceed to the division of it. According to Aristotle, justice is *universal* or *particular*. *Universal* justice consists in the observance of the laws, which extend to all the actions of mankind capable of good or evil, and thus comprehends all the virtues. Hence arose the common saying, "Ἐστὶ δὲ δικαιοσύνη κοινὴ καὶ ἀρετὴ ἅη," that is, all virtue is included in righteousness. *Particular* justice respects the rights of other men, and consists in the observance of equality, or in challenging no more than our own; and in giving to others what is theirs. Particular, or simple justice is either *distributive* or *commutative*. *Distributive* justice is concerned in the distribution of honour, money, or whatever else is to be divided among the members of a society, for in all these there is room for equality or inequality; and therefore to distribute as we ought is a part of justice. In other words, it is concerned in matters of government, and of beneficence; and is either remuneratory, or punitive: it observes

observes an equality in the rewards and punishments, according to each man's condition and merit; for as actions are either good or evil, for the good, rewards must be assigned; and for the evil, punishments; and here in a geometrical proportion is observed. Commutative justice superintends the management and disposal of such things as enter into compacts and contracts; or it is conversant in matters of commerce, and in the execution of contracts or covenants, of things, and other duties which are contractual in nature, without any regard to person and condition. To which we may add *Lex talionis*, that which makes in the state, or morally, by whose power and justice the offences of commutative and distributive justice are justly apprehended, or punished; as in the case of a man that has taken from him; and the like.

Dr. More distinguishes Justice into three kinds, and *politically*; the first considers all mankind as one body; the second regards them as divided into several states; the third relations of husband and wife, parent and child, master and servant; and the third comprehends that which is called public justice, and is divided into certain duties, either as magistrates or people.

The province of justice, by the civil law, are these, two. "Positive justice, wherein men have a certain definite right; the other is the liberty of man to live, and to render to each his law." The two last proceeding to strict justice, and they may accordingly term in a distinction of justice into *negative* and *positive*. Negative justice denotes every man's right to exemption from injurious actions; and positive justice comprehends the performance of all those actions, which by contract, or any other way, are due to him. Some distinguish between "injunctive" and "injuria." Injunctive is opposed to justice in general, whether negative or positive; an injury to negative justice alone. A person may be injured in his mind or soul, his body, his name, his relations, and his estate. (See INJURY.) Positive justice is the rendering to all their dues; and things may be due by a natural or an acquired right. (See RIGHT and PROPERTY.) On the subject of this article, see Grove's System of Moral Philosophy, vol. ii. and the authors to whom he refers.

JUSTICE, *Hand of*. See HAND.

JUSTICE, *Officers of*. See OFFICERS.

JUSTICE, *Poetical*. See POETICAL.

JUSTITIAM, *Temperamentum al.* See TEMPERAMENTUM.

JUSTICE, *Judicialis*, is likewise an officer appointed by the king or commonwealth, to do right by way of judgment.

He is called *justice*, not *judge*; anciently *justitia*, not *justitarius*, because he has his authority by deputation, as a legate to the king, and not *jure magistratus*; so that he cannot dispute any other man his seat, the justice of the forest only excepted.

Of these justices we have various kind in England; viz.

JUSTICE of the King's Bench, Chief, is the capital justice of Great Britain, and is a lord by his office. His business is chiefly to hear and determine all pleas of the crown; that is, such as concern offences against the crown, dignity, and peace of the king; as treason, robbery, &c.

This officer was formerly not only chief justice, but also chief baron of the exchequer, and master of the court of wards. He usually sits in the king's palace, and there executes that office, formerly performed *per curiam palatii*; he determined that part of all the disputes happening between the barons and other great men.

He had the prerogative of being vicegerent of the king-

dom, when ever the king went beyond sea; and was usually chosen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed into *capitaneus Anglie justitiarius*, to *capitaneus justitiarius et placitorum coram rege*, or *capitaneus justitiarius hanc regis*. See COURT of King's Bench.

JUSTICE of the Common Pleas, Chief, he who, with his Justices, hears and determines all causes at the common law, that is to say, all civil causes, between common persons, as well personal as real; and he is also a lord by his office. See COURT of Common Pleas.

JUSTICE of the Forest, is a lord by his office, who has power and authority to determine offences committed in the king's forests, &c. which are not to be determined by any other court, or justice.

Of these there are two; whereof one has jurisdiction over all the forests on this side Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never belowed but in some person of great distinction. The court there sits this justice sits, is called the *justice seat of the forest*, and once every three years, of which 4 days' not exceed to be given, for hearing and determining all trespasses within the forest, and all claims of franchise, liberty, and privileges, and all pleas and causes whatsoever therein arising. (Plac. 291.) This court may fine and imprison for offence within the forest (4 Inst. 313.), it being a court of record; and therefore a writ of error lies from hence to the court of king's bench. The last court of justice for any note was that held in the reign of Charles I. before the earl of Holland. After the Restoration another was held, for form sake, before the earl of Oxford; but since the Revolution in 1688, the forest laws have fallen into total disuse, to the great advantage of the subject.

This is the only justice who may appoint a deputy: he is also called *justice in eye of the forest*.

JUSTICES of Assize, were justices who went, by special commission, to be sent into this or that county, to take assizes, for the sake of the subjects.

For whereas these assizes pass always by jury, so many men might not, without great damage and charge, be brought up to London; and therefore justices, for this purpose, by commissions particularly authorized, were sent down to them.

These continue to pass the circuit, by two and two, twice every year, through all England, except the four northern counties, where they go only once, dispatching their several business by special commissions; for they have one commission to be assizes, another to deliver goals, and another of over and terminer. In London and Middlesex a court of general goal delivery is held eight times in the year.

All the justices of peace of any county who are the assizes are lords, are bound by law to attend assizes, or otherwise liable to be taken, to return recognizances, &c. and to assist the justices in such matters as by which their knowledge and jurisdiction, and in which some of them have been probably concerned, by way of private execution. See A. and M. 127.

JUSTICES in Law, *Magistratus, or curiales*, were those who were usually sent with commission into divers counties, to hear and determine all causes as well *per curiam palatii* of the crown; and that was the state of the Assize, who must also have been heard by the courts of Westminster if the cause were not tried by the county court.

According to some, these justices were set once in seven years;

years; but others will have them to have been sent oftener. Camden says, they were instituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were somewhat like our justices of assize at this day; though for authority, and manner of proceeding, very different.

JUSTICES of Gaol-delivery, those commissioned to hear and determine causes appertaining to such as, for any offence, are cast into prison.

Justices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, trespass, &c. and to order execution or reprieve; and they have power to discharge such prisoners as upon their trials shall be acquitted; also all such against whom on proclamation made, no evidence appears to indict; which justices of oyer and terminer, &c. may not do. (2 Hawk. 24, 25.) But these justices have nothing to do with any person, not in the custody of the prison, except in some special cases; as if some of the accomplices to a felony may be in such prison, and some of them out of it, the justices may receive an appeal against those who are out of the prison as well as those who are in it; which appeal after the trial of such prisoners, shall be removed into B. R. and process issue from them against the rest. But if those out of prison be omitted in the appeal, they can never be put into any other; because there can be but one appeal for one felony.

In this way the gaols are cleared, and all offenders tried, punished, or delivered, twice in every year.

Their commission is now turned over to the justices of assize. See **GAOL-delivery**.

JUSTICES of Nisi Prius, are now the same with justices of assize. It is a common adjournment of a cause in the common pleas, to put it off to such a day. *Nisi prius julitarius venerint ad eas partes ad capiendas assisas*: from which clause of adjournment they are called *justices of nisi prius*, as well as *justices of assize*, on account of the writ and actions they have to deal in. See **NISI Prius**, and **JURY**.

JUSTICES of Oyer and Terminer, were justices deputed on some special occasions to hear and determine particular causes.

The commission of oyer and terminer is directed to certain persons, upon any insurrection, heinous demeanour, or trespass committed, who must first enquire, by means of the grand jury or inquest, before they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commission of oyer and terminer, or in that of gaol-delivery, within the county where he was born or inhabitant; but it was thought proper by 12 Geo. II. cap. 27, to allow any man to be a justice of oyer and terminer and general gaol-delivery, within any county of England.

Justices of the Peace, are persons of interest and credit, appointed by the king's commission to keep the peace of the county where they live.

Of these, some, for special respects, are made of the quorum, to as no business of importance may be dispatched without the presence, or assent, of them, or one of them. Nor is the practice to always appoint all of them to that duty, naming them all over again in the quorum clause except perhaps only some considerable person for the sake of property; and to execution is now allowable, for not appearing in the form of the warrants, &c. that the justices who attend them is of the quorum. Whenever any justice intends to act under this commission, he sues out a writ of "dedimus potestatem" from the clerk of the

crown in chancery, empowering certain persons therein named, to administer the usual oaths to him; which done he is at liberty to act. Every justice of peace hath a separate power, and his office is to call before him, examine, issue warrants for apprehending, and commit to prison, all thieves, murderers, wandring rogues; those that hold conspiracies, riots, and almost all delinquents which may occasion the breach of the peace, and quit of the subject; to commit to prison such as cannot find bail, and to see them brought forth in due time to trial; and bind over the prosecutors to the assizes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over prosecutors, they shall be fined. A justice may commit a person that doth a felony in his own view, without warrant; but if on the information of another, he must make a warrant under hand and seal for that purpose. If a complaint and oath be made before a justice of goods stolen, and the informer, suspecting that they are in a particular house, shew the cause of his suspicion, the justice may grant a warrant to the constable, &c. to search in the place suspected, to seize the goods and person in whose custody they are found, and bring them before him or some other justice. The search on these warrants ought to be in the day-time, and doors may be broke open by constables to take the goods. Justices of peace may make and persuade an agreement in petty quarrels and breaches of the peace, where the king is not entitled to a fine, though they may not compound offences, or take money for making agreements. A justice hath a discretionary power of binding to the good behaviour, and may require a recognizance, with a great penalty, of one, for his keeping of the peace, where the party bound is a dangerous person, and likely to break the peace, and do much mischief; and for default of sureties, he may be committed to gaol. But a man giving security for keeping the peace in the king's bench or chancery, may have a *superseades* to the justices in the country not to take security; and also by giving surety of the peace to any other justice. If one make an assault upon a justice of peace, he may apprehend the offender and commit him to gaol till he finds sureties for the peace; and a justice may record a forcible entry on his own possession; in other cases he cannot judge in his own cause. Contempts against justices are punishable by indictment and fine at the sessions. Justices shall not be regularly punished for any thing done by them in sessions as judges; and if a justice be tried for any thing done in his office, he may plead the general issue, and give the special matter in evidence; and if a verdict is given for him, or the plaintiff be non-suited, he shall have double costs; and such action shall only be laid in the county where the offence was committed. (7 Jac. cap. 5. 21 Jac. cap. 12.) But if they are guilty of any misdemeanour in office, information lies against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a justice, for any wilful or malicious injury, are entitled to double costs. By 24 Geo. II. cap. 44. no writ shall be sued out against any justice of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the suing out of the same, containing the cause of action, &c. within which month he may tender amends; and if the tender be found sufficient, he shall have a verdict, &c. Nor shall any action be brought against a justice for any thing done in the execution of his office, unless commenced within six months after the act committed.

A justice is to exercise his authority only within the county where he is appointed by his commission, not in any city

city which is a county of itself, or town corporate, having their proper justices, &c but in other towns and liberties he may. The power and office of justices terminate in six months after the demise of the crown (1 Ann. cap. 8.), by an express writ of discharge under the great seal, by writ of *superfedas*, by a new commission, by the accession of the office of sheriff or coroner.

If the same justice, whose office ceases on the demise of the crown, be put in commission by the successor, he shall not be obliged to sue out a new *dedimus*, or to swear to his qualification afresh (stat. 1 Geo. III. c. 13.); nor, by reason of his new commission, to take the oaths more than once in the same reign. In case of a *superfedas*, the power of the justices may be revived again by another writ, called a *procedendo*. Formerly it was thought, that if a man was named in any commission of the peace, and had afterwards a new dignity conferred upon him, that this determined his office; as he no longer answered the description of the commission; but now it is provided (stat. 1 Edw. VI. c. 7.), that, notwithstanding a new title of dignity, the justice on whom it is conferred, shall still continue a justice. For a further account of the duty of justices, see QUARTER SESSIONS.

The original of justices of the peace is referred to the fourth year of Edward III. They were first called *eschevours*, or *wardens of the peace*, elected by the county, upon a writ directed to the sheriff; but the power of appointing them was transferred by statutes from the people to the king; and under this appellation appointed by 1 Edw. III. cap. 16. Afterwards the statute of 34 Edw. III. cap. 1. gave them the power of trying felonies, and then they acquired the appellation of justices. They are appointed by the king's special commission under the great seal, the form of which was settled by all the judges, A.D. 1590; this appoints them all, jointly and severally, to keep the peace, and any two or more of them to inquire and determine felonies, and other misdemeanors; and the king may appoint as many as he shall think fit in every county in England and Wales, though they are generally made at the discretion of the lord chancellor, by the king's leave. At first the number of justices was not above two or three in a county. 18 Edw. III. cap. 2.) Then it was provided by 34 Edw. III. cap. 1. that one lord, and three or four of the most worthy men in the county, with some learned in the law, should be made justices in every county. The number, which gradually increased through the ambition of private persons, was afterwards restrained first to six, and then to eight, in every county, by 12 Ric. II. cap. 10. and 14 Ric. II. cap. 11. But their number has greatly increased since their first institution. As to their qualifications, the statutes just cited direct them to be of the best reputation and most worthy men in the county; and the stat. 12 Ric. II. cap. 7. orders them to be of the most sufficient in knowledge, equities, and good men of the law; and by 2 Hen. V. stat. 1. cap. 4. and stat. 2. cap. 1. they must be resident in their several counties. And by 15 Hen. VI. cap. 11. no justice was to be put in commission, if he had not lands to the value of 20*l.* per annum. It is now enacted by 5 Geo. II. cap. 11. that every justice, with some exceptions, shall have 100*l.* per annum, clear of all deductions; or which he must make do by 15 Geo. II. cap. 20. And if he acts without such qualification, he shall forfeit 100*l.* It is also provided by 5 Geo. II. cap. 10. no praedial attorney, solicitor, or proctor, shall be capable of acting as a justice of the peace.

Justices of peace within burghs, are justices of the peace who have the same authority in burghs, or other corporate towns, as the others have in counties; and the powers are the same; only that, where there are ale and beer, wood

and stables, &c. Justices of cities and corporations are not within the qualification a3, 5 Geo. II. cap. 18.

Justice of the Forest. See JUSTICE OF THE FOREST.

JUSTICIA, in Botany, is named by Houston, in compliment to his contemporary James Justice, esq. F. R. S. a clerk of session, said by Miller to have been a great lover and encourager of gardening and botany. He published, in 1764, an 8vo. volume, called the British Gardener's Director, but, if we are not mistaken, he derives more honour from this fine and extensive garden, than his works upon it.—Linn. Gen. 12. Schreb. 17. Willd. Sp. Pl. v. 1. 79. Mart. Mill. Dict. v. 2. 1194. R. L. t. 1. Vahl. ELEM. v. 1. 108. Ait. Hort. Kew. ed. 2. v. 1. 35. Brown. Prodr. Nov. Holl. v. 1. 475. Juss. t. 4. Lamarck. Illustr. t. 12. Gaertn. t. 54. (Adhucula; Tourm. Juss. t. 79. Diandra; Linn. Gen. 13. Schreb. 17. Mart. Mill. D. t. v. 2. Juss. 104. Gaertn. t. 51.—Class and order, *Diandra Monogyna*. Nat. Ord. *Perforata*, Linn. *Acanthis*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, in five deep, acute, erect, equal, narrow segments. Corolla of one petal, ringent; tube swollen; limb in two very unequal lips, the upper oblong, notched, the lower in five divisions. Stam. Filaments two, swollen, the lower fixed in the upper lip; anthers erect, of two cells, which are sometimes more or less distant or unequal. Pist. Germen superior, turbinate; style thread-shaped, as long as the filaments and parallel to them; stigma simple. Peric. Capsule oblong, obtuse, contracted at the base, of two cells and two elastic valves, the partition contrary to, and fixed in the middle of, each valve. Seeds two in each cell, reniform, each subtended by a fibrous prolix.

Ess. Ch. Calyx in five deep equal segments. Corolla ringent; its lower lip three cleft. Capsule of two elastic valves and two cells; partition from the centre of each valve. Seeds two in each cell, subtended by fibres.

The 14th edition of Syst. Veg. contains but 30 species of *Justicia*, and seven of *Diandra*, which latter genus, differing only in having the two lobes of its anthers a little distant from each other, is now, by the agreement of all botanists, united to the former. Vahl, in his *Enumeris*, has 148, including Andrew's *Just.* v. 2. 405. Andr. Rep. t. 312; but excluding five species separated by Vahl as a genus by themselves, called *F. anrica*. Mr. Brown, who has paid more critical attention to this tribe than any other, with whom we are acquainted, has separated from *J. grandifolia* his own *Hymenis* (see that article); as well as his *Andromeda*; keeping distinct also the Linnæan *Dracopis*, characterized by having a filiform style, nearly equal to the corolla, which appears a very distinct character. He finds, that the remaining supposed *Justicia* ought to be further divided, by multiplication of the anthers, taken from their number, into six capsules, and five monospermic.

We are well assured that the generic characters above given will not apply to the plant to which the name is referred to this genus by Linnæus, and his followers, especially what is called the Lion or Marigold of the country. It is here pointed out, the calyx has but four segments, instead of five, the lobes of the petals, according to Mr. Brown, is not exactly white or carmine. Vahl, however, thought he included *Diandra*, but not *Justicia*. There is the *Justicia*, and of Vahl, which are detected with a double calyx, clearly belong to *Hymenocallis puberula*, Linn. cap. pl. 84. Vahl. n. 20. Jacq. Ic. Rar. t. 102. with *J. indica*, Vahl. n. 21. and *Justicia*, Jacq. Hort. Schober. t. 1. p. 1. 152. Mr. Brown writes into a new genus *Apocynis*, defined in 1790 by unequal calyx, in five deep segments, and four unequal lobes.

the anthers of one cell each. These are very handsome flowers, with dense spikes of long scarlet flowers; all natives of South Am. ric.

Examples of what are at present considered as *Justicia* are

J. coriaria. Aublet, Guian. v. 1. 10. t. 3. Sm. Ic. Pl. t. 1. S. Curt. Mag. t. 432.—Spikes terminal. Leaves and bracts elliptical, acute. Upper lip of the corolla lanceolate, reflexed.—Native of Cayenne. A tall shrub, which flowers in our islands in winter, but not unless it be of a considerable size. The leaves are a span long. Flowers of a rich scarlet, even more splendid than those of the *Aphelandra*: just named, which at first sight they greatly resemble. See also those of *J. lucida* above-mentioned. See Curt. Mag. t. 1014.

J. nitida. Jacq. Amer. 5. Vahl. Enum. n. 45. Andr. Repof. t. 570.—Clusters terminal, somewhat branched. Flowers whited. Calyx smooth. Leaves stalked, lanceolate, somewhat elliptical, pointed at each end.—Native of the West Indies. The leaves are smooth and shining. Flowers white, the under lip dotted with pink.

J. nifolia. Linn. Sp. Pl. 23. Curt. Mag. t. 325.—Leaves elliptical, entire. Flower-stalks axillary, forked. Upper lip of the corolla linear, very narrow.—Found in the East Indies. It thrives in our isles, flowering almost all the year through. The flowers are conspicuous for their whiteness, and for the great breadth of the lower lip, whose base is dotted with crimson, while the upper is extremely narrow.

J. furcata. Jacq. Hort. Schoenbr. v. 1. 2. t. 3. Vahl. Enum. n. 89. (J. peruviana; Cavan. Ic. v. 1. 17. t. 28. Curt. Mag. t. 430.)—Downy. Axillary flowers sessile and rarely solitary; terminal ones ternate. Leaves ovate, or somewhat lanceolate.—Native of Peru, from whence it was brought to Spain, and from thence by the marchions of Brito to England. It increases plentifully by seed in the isles, and is a shrubby plant, with copious not inelegant purple flowers, whose palate is speckled with white.

J. Adiantum. Linn. Sp. Pl. 20. Curt. Mag. t. 861.—Spikes opposite, axillary, stalked. Bracts ovate, acute, ribbed. Corolla somewhat closed.—Native of Ceylon, an old green-house plant in Europe, and Tournefort's original species. It is commonly called the Makbar nut, a name not very appropriate. The shrub is handsome and umbrageous, with large ovate leaves. The flowers are white, their palate veined with purple, which is much concealed by their closed or drooping form. They are but rarely produced in England.

J. crotolaria. Linn. Suppl. 85. Venten. Malmais. t. 51.—Leaves sessile, lanceolate. Stalks axillary, solitary, one or two-flowered. Corolla somewhat closed.—Native of the Cape of Good Hope. It is kept in the green-house at Kew, flowering in autumn. This is a rigid shrub, with small crowded, harsh leaves. The flowers, not very unlike the last in form, are white with a reddish tinge about the palate, and grow, solitary or in pairs, on axillary stalks, longer than the leaves.

JUSTICIA, in Gardening, comprizes plants of the shrubby and herbaceous kinds, of which the species mostly cultivated are, chickweed-leaved *justicia* (*J. hexangularis*); the four-nail Vera Cruz *justicia* (*J. scorpioides*); the long-spiked *justicia* (*J. ecbolium*); the Makbar nut (*J. adiantum*); and the snap-tree (*J. hyssopifolia*).

Method of Culture.—These plants may be increased, some of them by seeds, and the others by layers and cuttings; but the latter modes are mostly practised, as the seeds are obtained with difficulty.

Where the seeds are capable of being procured, they may be sown in small pots filled with light fresh earth, in the early spring, being plunged in a hot-bed of bark, watering the mould of the pots moderately, when it becomes dry. As they often remain long before the plants appear, the pots should not be disturbed, but be kept in the hot-bed. When the plants appear, fresh air should be admitted in mild weather, and slight waterings given; and when they have attained a few inches in growth, they should be removed into separate pots filled with best earth, re-plunging them in the hot-bed, watering and shading them till they have taken fresh root; air being then freely admitted, and as the season grows warm, due waterings being given. As they advance in growth, they should be placed in larger pots, taking care not to overpot them, keeping them constantly in the hot-bed.

The layers should be laid down in the early spring, in pots filled with light earth, a little water being given at the time.

The cuttings may be made from the young shoots, and planted in pots filled with the same sort of earth, in the later spring or summer months, giving them a little water, and plunging them in the hot-bed of bark in the stove, due shade being given.

When the plants have become perfectly rooted, they may be taken off, or removed into separate pots, keeping them constantly in the stove or green-house, according as they are more or less hardy. The two first sorts are the most hardy; the others succeeding best in the hot-house or stove.

The two first afford ornament and variety among the other potted plants of the less tender sorts, and the other among those of the stove kinds.

JUSTICIAR, in our *Old Laws*, an officer instituted by William the Conqueror, as the chief officer of state, and who principally determined all pleas civil and criminal. He was called in Latin *capitalis justiciarius totius Anglie*. See **JUSTICE**.

JUSTICIARI, in *Church History*, an appellation given to heretics who boast much of perfect righteousness, and despise others; such were the Pharisees among the Jews, and the Novatians and Donatists among the Christians.

JUSTICIARIUS, **MAGISTER**, a judge in the kingdom of Naples, who has supreme jurisdiction in all cases of treason, and pleas of the crown, and finally determines all appeals. He has four assessors.

JUSTICIARY COURT, in Scotland. The court of *justiciary* has supreme jurisdiction in all criminal causes. It came in place of that of *justice-eyre*, or *justice-general*, which was lost in the person of the earl of Argyle, who transacted for it with king Charles I. and was made *justice-general* of all the islands; which raising great debates between him and some hereditary sheriffs there, the jurisdiction was taken away in 1672, and this court of *justiciary* erected instead of it, consisting of a *justice-general*, alterable at the king's pleasure; a *justice-clerk* and five other judges, who are likewise lords of the session.

This court commonly sits on Mondays, and has an ordinary clerk, who has his commission from the *justice-clerk*. They have four ordinary macers and a doomsier appointed by the lords of session.

The form of process is this; the clerk raises a libel or indictment, by a bill passed by any of the lords of that court, at the instance of the pursuer against the defender or criminal, who is committed to prison immediately after citation. When the party, witnesses, and great assize, jury of forty-

five men, are cited, the day of appearance being come, fifteen of the great affize are chosen to be the affize upon the panel, or prisoner at the bar. The affize sits with the judges to hear the libel read, witnesses examined, and the debates on both sides, which is written verbatim in the adjournal books. The king's advocate pleads for the pursuer, being the king's cause, and other advocates for the panel. The debates being closed, the judges find the libel or indictment either *not relevant*; in which case they desert the diet, and assize or absolve the party accused; or else they find the libel *relevant*; in which case the affize or jury of fifteen is removed into a close room, none being allowed to be present with them; where they choose their own chancellor and clerk, and consider the libel, depositions, and debates, and bring in their verdict of the panel sealed, guilty or not guilty. If not guilty, the lords absolve; if guilty they condemn, and order the sentence of condemnation to be pronounced against the criminal by the mouth of the doomsday. It has been strenuously maintained by some, and as strenuously controverted by others, that an appeal lies from this court to the house of lords. The lords of judicatory likewise go circuits twice a year, *viz.* in May and October, into the country, which is divided into three circuits, the fourth, west, and north, where assizes are held, and criminals tried, as mentioned above.

JUSTICES, in Law, a writ directed to the sheriff in some special cases, by virtue of which he may hold plea of debt in his county-court for a large sum; whereas otherwise, by his ordinary power, he is limited to sums under forty shillings. The freeholders of the county are the royal judges in this court, and the sheriff is the ministerial officer.

JUSTIFIABLE HOMICIDE. See **HOMICIDE.**

JUSTIFICATION, in Law, a special plea in bar, which signifies a maintaining or showing a sufficient reason in court, why the defendant did what he is called to answer. Pleas in justification must set forth some special matter; thus, on being sued for a trespass, a person may justify it by proving that the land is his own freehold; that he entered a house in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a distress; in an assault, that he did it out of necessity; and, in an action of slander, that the plaintiff is really as bad a man as the defendant said he was.

JUSTIFICATION, or Justifying, among Letter Founders. See **Letter FOUNDER.**

Among **Printers**, it denotes the proper adjustment of the lines and pages.

JUSTIFICATION, in Theology, that act of grace which renders a man just or righteous in the sight of God, and places him in a state of salvation.

The Romanists and reformed are extremely divided about the doctrine of justification; the latter contending for justification by faith alone, and the former by good works.

In the 11th article of the church of England it is declared that "We are accounted righteous before God, only for the merit of our Lord and Saviour Jesus Christ, by faith, &c." By the faith, which in several passages of scripture is said to justify and save, says a commentator on the thirty-nine articles (see *Elem. of Christian Theology*, by the lord bishop of Lincoln) we are to understand that lively "faith which worketh by love;" which purifieth the heart, and which keepeth the commandments of God: But though by these acts of obedience we demonstrate that we truly and firmly believe the divine authority of Christ and his doctrines, yet this faith is not so meritorious in its own nature as to entitle us to the reward of eternal life: it justifies us only by being the

condition upon which it has pleased our Almighty Father to offer us salvation. Our justification is not to be attributed to the inherent efficacy of faith, but to the mercy of God, and merits of Christ, from which that efficacy is derived. On the contrary, the Papists assert, that men's inherent righteousness is the meritorious cause of their justification, and that good works "ad vitam æternam consequendam verè promerent." (*Cave. Trid. de B. n. Op. c. 12.*) Some other divines maintain, that as, on the one hand, our sins were imputed to Christ, so on the other, we are justified by the imputation of Christ's righteousness to us; *i. e.* we, though guilty, on complying with the gospel, are finally treated by God as righteous persons (*i. e.* as if we had never offended him at all, or had ourselves satisfied the demands of his law for such offences), out of regard to what Christ has done or suffered, whereas we should not otherwise have been so treated. Others again, who disapprove both the term imputation and the sentiment which it implies, represent faith in Christ and the gospel as the principle or spring of those virtues or of that character which renders men fit objects of mercy, and of those promises of pardon, favour, and eternal life, which flow originally from the grace of God, and which are communicated to mankind by the mediation of Jesus Christ. For the manner in which the doctrines of St. Paul and of St. James, with regard to justification, are rendered consistent with each other, see the article **Faith**. Dr. Whitby represents faith as consisting merely in an assent to the gospel as true; and says, that upon declaring that assent, a man was justified from all past sins, without good works; but that good works were necessary in order to continue in a justified state. A notion much resembling this has been advanced and largely illustrated by Dr. Taylor, in his "Key to the Apostolical Writings," prefixed to his Commentary on the epistle to the Romans, and included in a "Collection of Tracts," published by Dr. Watson, bishop of Landaff, for the use of students in the universities, and the younger clergy. (See **Faith**.) This learned divine endeavours to establish a "double justification," or salvation, for which, he thinks, we have the clearest scriptural evidence. The *first*, or fundamental justification, relates to the heathen state of us gentile Christians, and consists in the remission of sins, and in our being admitted, upon our faith, into the kingdom and covenant of God; when, with regard to our gentile state, we were obnoxious to wrath, and deserving of condemnation. This is of "free grace, without works." For how wicked forever any Heathen had been, or now has been, upon profession of faith in Christ, his former wickedness neither was, nor is, any bar to his advancement into the kingdom of God, nor to an interest in its privileges and blessings. Nay further, our present common salvation, or justification, is so of grace, and reaches so far, that in case any professed Christian has lived disagreeably to the rules of the gospel; yet, upon his repentance and return to God, his interest in the divine grace and the pardon of sin stands good, notwithstanding his former evil life. This our author calls the "first justification," or salvation, by which we are involved in all the present privileges of the gospel; and in reference to which we are said in scripture to be *electèd, adoptèd, saved, justified, washed, sanctified, born again, born of God*, &c. The *second* justification, however, does not terminate in itself, but is in order to another, which we may call "*final* justification," or salvation. This relates to, and supposes, our Christian state; and consists in our being actually qualified for, and being put in possession of, eternal life, after we have duly improved our *first* justification, or our Christian privileges, by patient continuance in well-doing, to the end, under all trials and temptation. By *work*, says our author, excluded

excluded by St. Paul from justification or salvation, he doth not mean any *ceremonial works*, or *ritual observances* of the Mosaic constitution (see Titus, iii. 5.); but all acts of obedience properly *moral*. Moreover, by *works*, or *works of love*, excluded from justification, the apostle doth not always mean only sinless, perfect obedience. The *works* excluded from justification are any kind of obedience, perfect or imperfect, which may be supposed a reason for God's bestowing the privileges and honours of the gospel upon the heathen world. Those privileges and honours were bestowed out of pure mercy and goodness, without regard to the foregoing good or bad works of the heathen world. The *works*, which are excluded from justification, refer to the prior state of Christians, and to their *first* justification; when they were taken into the church or kingdom of God, and had their *past sins* forgiven them. This *first* justification was not of works, it was of mere grace, according to the counsel and purpose of God's own will, without regard to what the Heathen had been before his conversion. But after conversion, when a man is become a Christian, and with regard to *final* justification, works are expressly required. Nevertheless, works of righteousness are so insisted upon in our Christian state, now that we are taken into the kingdom of God, that if any Christian should neglect the performance of them, there is still room, in *this life*, for repentance. For our Lord and his apostles not only called men to repentance, in order to their *first* justification; but the apostles, and our lord after his ascension, exhort wicked Christians, such as were members of the gospel church, to repentance, in order to their *final* justification. 2 Cor. xii. 21. Rev. ii. 5, 16. iii. 3, 19.

JUSTIFYING BAIL, in *Law*. See BAIL *above*.

JUSTIFYING GRACE. See GRACE.

JUSTIN I., in *Biography*, emperor of the East, a native of Dacia, was born about the year 450, and was brought up to the mean occupation of keeping of cattle. Possessing a strength and stature which he thought were likely to recommend him, he left the business of a pastoral life, and obtained a place among the guards of the emperor Leo. He rose by degrees in the service, till at length, in 518, he possessed, at the death of Anastasius, the important office of praefect-praetorio; and by the application of timely bribes, he stepped on to the vacant throne, and apparently with the unanimous consent of the military, the clergy, and the people. The eunuch Amantius, who would gladly have raised one of his own friends to the high office, was for a real or pretended conspiracy, with some of his associates, punished with exile or death. The Gothic chief Vitalian, who had revolted against Anastasius, and remained at the head of a powerful army, was decoyed into the palace, and assassinated at a royal banquet. Justin, to whom the epithet of *elder* is given, to distinguish him from another emperor of the same name and family, was sixty-eight years of age when he was invested with the imperial purple; and though without any advantages of education, he was preserved from exposing his incapacity, by his good sense in following the direction of able statesmen, whom he had the discernment to select, and the wisdom to confide in. At this time, says the historian, the world beheld two contemporary monarchs, Theodoric and himself, who were even destitute of the knowledge of the alphabet; but the commanding genius of the Goth rendered him respectable amidst all his ignorance; and Justin, conscious of his deficiencies, relied on the diligence of his quillor Proclus, and the talents of his nephew Justinian, whom the emperor had brought from the solitudes of Dacia, and educated as his future heir. The chief events of this reign were the persecution of the Arians, advances

towards a reconciliation with the Roman see, and the commencement of a war with the king of Persia. He allocated Justinian as his colleague in the empire in 527, and soon after died, in the ninth year of his reign. An earthquake, which almost ruined Antioch and several other cities in the East, was a calamity which greatly affected the emperor. He is said to have laid aside the imperial robes, clothed himself in sackcloth, and passed several days in fasting and prayer, to avoid the divine judgments. His piety was not surpassed by his humanity; and he displayed much benevolence in relieving those who had suffered by and survived the terrible disaster. Gibbon. Univer. Hist.

JUSTIN II., emperor of the East, nephew and successor of Justinian, ascended the throne in 565. The choice of the senate and people was sanctified by the benediction of the patriarch, who placed the diadem on his head, which was the first time the ceremony had been performed by a priest. As his predecessor had given great offence by abolishing the office of consul, the new emperor restored it in his own person, almost as soon as he came to the throne. On this occasion, he distributed large sums of money among the people, and immediately discharged the debts, and corrected the abuses of his late uncle. The popularity acquired by this commencement of Justin's reign was soon forfeited by instances of cruelty and avarice, which were imputed to the instigation of the empress Sophia. He caused his relation Justin, who had a military command on the banks of the Danube, to be strangled; and he put to death some of his senators, from a suspicion of their being disaffected. He made war against Persia; but being defeated at the head of a numerous army, he was obliged to sue for peace. Soon after this, Justin was seized with a disorder, which affected his intellects, and rendered him incapable of government. By the advice of his empress, he raised to the rank of Caesar, in the year 574, a Thracian named Tiberius, who had obtained, by his abilities, the office of post-captain of the guards. The ceremony of his elevation was performed in the portico of the palace, in the presence of the patriarch and the senate. On this occasion Justin made a long speech, which his flatterers imputed to divine inspiration, in which he recommended his successor to love his people as himself; to cultivate the affections, and maintain the discipline of the army; to protect the fortunes of the rich, and to relieve the necessities of the poor; and he concluded with a prayer, that the God of heaven and earth would infuse into his heart to do whatever he himself had neglected or forgotten. The four last years of his life were spent in retirement; and his choice was justified by the filial reverence and gratitude of Tiberius. Justin died October 5th, 578.

JUSTIN, a Latin historian, is supposed to have flourished in the second century, under Antoninus Pius. His history, which is used in our schools as an elegant compendium for young people, is an abridgement of that of Trogus Pompeius, in forty-four books, which has been long lost. The narration of Justin is clear, his reflections are sensible, though obvious, and his style is sometimes eloquent. The history comprehends what relates to the Assyrian, Persian, Grecian, Macedonian, and Roman empires. The best editions are those by Gronovius, Hearn, and Barboiu. The Delphin edition is much in use.

JUSTIN, *s.*, in *Geography*, a town of France, in the department of the Landes; 27 miles W. of Condom.

JUSTINGEN, a town and capital of a lordship, purchased in 1751 by the duke of Wirtemberg; 16 miles N.N.E. of Luechau.

JUSTINIAN I., in *Biography*, emperor of the East,

was born of an obscure race in Dacia, whence, as we have seen in the article JUSTIN I., he was brought, and educated with a view of succeeding to the empire. Justinian was, during the life of his uncle, made partner in the imperial throne; and upon the death of Justin, became its sole possessor, being at that period, A.D. 527, in the forty-fifth year of his age. Immediately upon his elevation, he solemnly espoused Theodora, an actress, who in early youth had followed a course of prostitution, and who gained so complete an ascendancy over the mind of the emperor, as to be associated with him on the throne. He began his reign by a violent persecution of heretics and sectaries, and he regarded himself as a great theologian. His reign was, however, remarkable for many important transactions, military and civil; as he carried his arms with success against his enemies, for which he was chiefly indebted to Belisarius his great general, who also preserved him from a formidable conspiracy. (See the article BELISARIUS.) The legislative labours of Justinian are what have conferred the chief celebrity on his name. The reformation of the Roman jurisprudence occupied the attention of the emperor from his first possession of the supreme power. The person to whom he principally confided this arduous task was Tribonian, an eminent lawyer of various and extensive attainments. By his cares, and those of nine persons associated with him, the new code of Justinian was completed in the year 529. This publication was followed in 534 by that of the *Pandects* or *Digest*, a compilation of the decisions and opinions of former civilians; and of the Institutes, an elementary treatise of the Roman law for the use of students. A new edition of the Code, in 534, made a considerable addition to the emperor's own laws; and his Edicts and Novels complete the vast edifice of jurisprudence, reared by the legislative spirit which distinguished his reign. Another remarkable trait in this emperor's character was his passion for building. His piety was displayed in numerous churches, and other buildings dedicated to religion, of which the celebrated church of Sancta Sophia at Constantinople, now subsisting as the principal mosque of the Turkish empire, attests the magnificence of his designs. Bridges, aqueducts, high-roads, and hospitals, were among his works of public utility, by which every province of the empire was benefited. His works of peace were frequently interrupted by wars, which agitated the empire during almost the whole of this reign; but in 558, a peace upon honourable terms put an end to the long contests between the Roman and Persian empires. The rejoicings on this event were disturbed by a dreadful earthquake, which overthrew many lately edifices, with a great loss of lives. Justinian, broken down with cares and old age, died in November 565, in the thirty-ninth year of his reign, and the eighty-third of his age. Among other distinguished events of this reign, the introduction of the silk-worm into the Greek empire, by means of two Persian monks, who went as missionaries to China, ought not to be omitted. The increasing jealousies, and the heavy burdens which Justinian imposed upon his subjects, had, some time before his death, destroyed all attachment to his person; and he who, in many respects, deserved the title of the last Roman emperor, left the stage unlamented and unhonoured. Gibbon. Univer. Hist.

JUSTINIAN II., emperor of the East, succeeded his father Constantine Pogonatus in 685, being then only sixteen years of age. He was naturally of a violent temper; and his love of war induced him to break a treaty which he had made with the Saracens, and renew hostilities against them. He recovered several provinces from his enemies, and made an extravagant peace with them; but his exactions, cruelties,

and declensions, tarnished the glory of his arms, and he was deemed himself an object of hatred to all. He gained victory of destroying all the inhabitants of Constantinople; but Leontius, a celebrated commander, at the request of the natives of his country. He was succeeded by another emperor, and seized him and his minister, whom Justinian's law was spared, but he was deemed to be punished, as it to suffer the imputation of having been killed. He was named by the Greeks as "Rhinotmetus." In 740, by the assistance of the Bulgarians, he raised his party, whom he revereed himself upon his enemies. The chief enemies were Leotheus and Tiberius, who had themselves killed the throne during the interval of Leontius's reign. These were dragged in triumph through the city, and they placed in chains beneath his throne, whom he held in the neck, with a foot upon each of their necks, while the rebellious people shouted, "Thou dost trample on the slip and basilisk." They were then led to execution. So many persons were, on this occasion, the victims of his fury, that it is said whole provinces were almost depopulated by the multitude of his executions. Justinian died by the hands of assassins in 711; and such was the hatred which he had every where inspired, that his young son Tiberius, whom his grandmother had placed in a sacristy, was dragged from the altar, and murdered before her eyes. Thus the race of Heraclius was extinguished, after a reign of one hundred years. Univer. Hist. Gibbon.

JUSTIZA, a magistrat of Arragon, whose office bore some resemblance to that of the ephori in ancient Sparta. He acted as the guardian of the people, and the controller of the prince. His person was sacred, and his jurisdiction unbounded. He was the supreme interpreter of the laws. Not only inferior judges, but the kings themselves, were bound to consult him in every doubtful case, and to receive his responses with implicit deference. An appeal lay to him from the royal judges, as well as from those appointed by the barons within their respective territories. Even when no appeal was made to him, he could interpose by his own authority, prohibit the ordinary judge to proceed, take immediate cognizance of the cause himself, and remove the party accused to the "Manifestation," or prison of the state, to which no person had access but by his permission. His power was exerted with no less vigour and effect in superintending the administration of government, than in regulating the course of justice. It was his prerogative to inspect the conduct of the king, to review all the royal proclamations and patents, and to declare whether or not they were agreeable to the law, and fit to be executed. He, by his sole authority, could exclude any of the king's ministers from the conduct of affairs, and call them to answer for their mal-administration. The justiza himself was accountable only to the Cortes for the execution of his high office. By a law enacted in the Cortes, A.D. 1442, it was ordained that the justiza should continue in office during life, and should not be removed from it, unless by the authority of the Cortes. This officer was appointed by the king; but to prevent his becoming a dependent and tool of the crown, instead of the guardian of the people, it was determined that he should retain his office during life. He was selected from persons of the second class, or caballeros, answering nearly to gentlemen or commoners in Great Britain, and not from the rich-hombres or noblemen, that he might check the domineering and oppressive spirit of the nobles, as well as set bounds to the power of the monarch; and that he himself might be accountable for the manner in which he executed his trust, and liable to rigorous punishment; whereas the rich-hombres were not subject to capital punish-

ment. For contracting his power, seventeen persons were chosen by lot in each meeting of the Cortes; and these formed a tribunal, called the court of inquisition into the office of justitia. This court met at three stated times in the year; and to this court the justitia and his deputies were responsible for their conduct. The members of the court passed sentence by ballot; and they might punish by degradation, confiscation of goods, or even with death. The law which erected this court, and regulated the forms of its procedure, was enacted A.D. 1461. Robertson's *Hist.* of Charles V., vol. 1.

JUSINESS, the exactness or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and sentiments. The justness of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject.

Justness of language consists in using proper and well chosen terms; in not saying either too much, or too little.

M. De Merc, who has written on justness of mind, distinguishes two kinds of justness; the one arising from taste and genius; the other from good sense, or right reason. There are no certain rules to be laid down for the former, viz. to shew the beauty and exactness in the turn, or choice of a thought; the latter consists in the just relation which things have to one another.

JUTE, in *Manufactures*, is a remarkably strong vegetable fibre, the produce of the East Indies, which Dr. Wiliam Roxburgh has fully described, and its uses, in the *Transactions of the Society of Arts*, vol. xxii. p. 372.

JUFERBOCK, in *Geography*, a town of Germany, in the principality of Querfurt, with two faubourgs, situated on the Angerbach; 16 miles N. E. of Wittenburg. N. lat. 52°. E. long. 13 2'.

JUTES, in *Antient History*, a tribe of the Getz, the conquerors of so many countries, inhabited the extremity of the Cimbric Chersonesus, which from them is still called *Jutland*; which see.

JUTHIA, **ODIA**, or *Siam*, in *Geography*, a town of Asia, capital of the kingdom of Siam, and residence of the king, situated on a large island in the river Menan, at the distance of some leagues from the sea. The royal palace is large and beautiful, and the pagodas are numerous. The Dutch have a factory here, and many merchants from different countries come to trade. In 1766, this town was taken by the Birmans. N. lat 14 18'. E. long. 100 52'.

JUTLAND, a peninsula of Europe, in the kingdom of Denmark, formerly called "Cimbria;" and the "Chersonesus Cimbricus;" bounded on the E. by the Scaggerak, the Little Belt, and the Baltic; on the S. by the duchy of Holstein, and on the W. and N. by the Northern sea; about 200 miles long, and 95 broad. It is generally divided into North Jutland, more especially called *Jutland*, and South Jutland, more generally called the "duchy of Sleswick;" which see.

JUTLAND, or *North Jutland*, is bounded on all sides by the sea, except towards the south, where its boundary is the duchy of Sleswick; it is about 150 miles long, and from 60 to 80 broad. Of all the territories belonging to Denmark, it is the largest and yields the greatest revenue. The middle part consists of heaths and moors, intermixed with few spots of arable land; but these afford good pasture for oxen, sheep, and goats. The other parts, of greater extent, are very fertile, and yield a great quantity of grain, which is annually exported to Sweden, Norway, and Holland. The inhabitants derive all considerable sums from their oxen, horses, and hogs. Hence Jutland is commonly called "the land of bacon and rye bread." This country

is also plentifully supplied with all kinds of fresh water and sea fish. On the east side it has fine woods of oak, beech, fir, &c. but on the west side the inhabitants are obliged to use heath and turf for fuel. Jutland abounds with game. The air is keen and cold, especially towards the North sea. The inhabitants are vigorous, robust, and resolute; and seem to have gained a greater degree of freedom than the other inhabitants of Denmark. Many of the Jutlanders have freeholds, for which they pay a small acknowledgment to the lord of the manor and the public taxes. The Danish language is spoken in Jutland with a particular accent, and with less purity than in the other provinces. The only place in which the exercise of any religion, besides Lutheranism, is tolerated, is Fredericia. North Jutland is composed of four dioceses, or governments; each of which has its bishop and general-governor; and they derive their names from those of their chief cities, viz. Aalborg, Wiborg, Arrhuus, and Ripen. The population of these four dioceses is stated by Mr. Coxe at 358,136 persons. Jutland supplies triply and fuller's earth, besides some alum and vitriol.

JUTRAM, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 16 miles N.W. of Amood.

JUTTARA, a town of Hindoostan, in the circar of Cicacole; 10 miles N. of Viligapatam.

JUTTY HEAD. See *JETTY Head*.

JUTWAR, in *Geography*, a small circar of Hindoostan, in Guzerat, on the left bank of the Puddar, a little above the gulf of Cutch; about 25 miles long, and 16 broad.

JUVANTIA, in *Medicine*, literally signifying *aiding* things, and generally contrasted with *ledentia*, or *hurtful* things, is a term applicable to every agent or circumstance which contributes to alleviate a disease, as the word *ledentia* signifies every thing which can increase the symptoms of a disorder, or prevent its progress towards amendment; but the terms are principally used to denote those things, which possess a minor degree of influence on the animal economy, and cannot be classed among the actual remedies or causes of disease. Whence the common precept of medical writers, to attend to the *juvantia* and *ledentia*, at the same time that the active remedies for any disease are employed.

JUVELSKOI, in *Geography*, a town of Russia, in the government of Tobolsk. N. lat. 63° 40'. E. long. 61 14'.

JUVENAL, **DECIVS JUNIVS JUVENALIS**, in *Biography*, a celebrated Roman poet, who was born at Aquinum, in Italy. He came early to Rome, and passed much of his life in the pursuits of the bar, after which he applied himself to write satires, sixteen of which are still extant, and very highly prized. They stand pre-eminent in the class of those which employ warm serious invective, and make vice rather than folly their object. He wrote with acrimony against all his adversaries: he is far more correct than his contemporaries, which has been attributed to his judgment and experience, being far advanced in life when he wrote his satires. He appears to have been a lover of virtue, though his language and descriptions are sometimes very gross; many of his maxims of morality are delivered with great force and dignity; as a poet he has more animation than taste. He has with reason been called the last of the Roman poets, for after him poetry decayed, and nothing more claims attention as a perfect poetical composition. The best editions of this poet are those by Casaubon, of Hawkey, and of Grævius cum notis variorum. The Delphin edition is much used, as are the Aldine and Glasgow editions.

JUVENALIA, or **JUVENALES ludi**, games, exercises of body, and combats, instituted by Nero the first time his beard was shaved.

They were celebrated in private houses, and even the women had a share in them; probably they were the same with what were otherwise called *Nerianina*.

JUVENCUS, **CAIUS VERTIUS AQUILINUS**, in *Biography*, one of the earliest Christian poets, was a priest of a noble family in Spain, and flourished in the fourth century. He wrote a poem on the life of Christ, taken from the gospel of St. Matthew. It was composed about the year 329. It has been frequently reprinted, and may be found in Mattaire's "Corpus Poetarum;" and in the "Bibliothèque des Peres." Gen. Bio.

JUVENEC, in *Geography*, a town of Poland, in the palatinate of Wilna; 20 miles E. of Lid.

JUVENTAS, in *Mythology*, the goddess who presided over youth among the Romans. This goddess was long honoured in the Capitol, where Servius Tullius erected her statue. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proserpine. The Greeks called the goddess of youth Hebe; but it has been generally supposed that this was not the same with the Roman Juventas.

JUVIGNY, in *Geography*, a town of France, in the department of the Channel, and chief place of a canton, in the district of Mortain; four miles N. W. of Mortain. The place contains 632, and the canton 5603 inhabitants, on a territory of 100 kilometres, in nine communes. Also, a town of France, in the department of the Marne; nine miles N.W. of Chalons-sur-Marne.—Also, a town of France, in the department of the Orne, and chief place of a canton, in the district of Domfront. The place contains 1945, and the canton 11,126 inhabitants, on a territory of 207½ kilometres, in 12 communes.

IVY, in *Botany*, &c. (See **HEDERA**.) The ivy is a small well-known creeping or climbing kind of plant. From its property of spreading rapidly over a surface, it has been recommended as proper for protecting the faces of earthen dikes, and other similar fences, as by this means they are preserved from mouldering down and being destroyed.

IVY, in the *Materia Medica*. The leaves of ivy are seldom used inwardly, but outwardly they are applied to issues, to keep them cool, and free from inflammation, as also to scabs, sores, and scald heads. Mr. Boyle, in his use of Experimental Philosophy, commends a large dose of the full ripe berries as a remedy against the plague; and it is said, that in the London plague, the powder of them was given in vinegar, or white wine, with success; and they have been recommended in small doses, as alexipharmic and sudorific. Schroder says, they purge upward and downward. The gum of ivy is somewhat caustic, and commended to take away spots and freckles out of the face. This resinous juice, exuding from the stalks of ivy, has been recommended as corroborant and resolvent, in cachexies and uterine obstructions; but has been rarely used, except as an ingredient in plasters; nor does it appear to possess any virtues which common resin has not in an equal degree.

IVY, *resin* is brought from Persia, and some other of the hot countries, where alone it is to be found in any considerable quantity. Mr. Ray, indeed, mentions some of it having been found on ivies in Worcestershire, and other authors in other parts of Europe; but these are only singular instances of what may happen, our shops being obliged to be supplied from the East.

The ancient Greeks were acquainted with this resin, which they called *lachryma hederae*, as some also do to this day. It is said to be emollient and detergent, and to make

a noble balsam for fresh wounds; but is never used by us with these intentions. The Persians esteem it much as an astringent.

IVY, *Ground*, in *Botany* and the *Materia Medica*. See **GLECHOMA**.

IVY, *tree of America*. See **KALMIA**.

IVY, *Petrifid*. See **PETREFACTUM**.

IVY, *Virginian*. See **MOONSHED**.

JUNON, **WILLIAM**, in *Biography*, was born at Chichester, but received his education at Merchant Taylors' school, London, from whence he was removed to St. John's college, Oxford, of which he was made a fellow in 1598, and in 1621, he was elected president. In 1627, he was promoted to the deanery of Worcester, and in 1635, appointed clerk of the closet to the king, and in the following year he obtained, through the interest of archbishop Laud, the bishopric of London; and shortly after he was appointed lord high treasurer. This last promotion gave general offence. His birth and character were deemed too obscure for a man raised to one of the highest offices of the crown; nevertheless, his conduct in that station was irreplicable. In the rebellion he suffered the loss, not only of his ecclesiastical revenues, but of a great part of his temporal estate. In 1648, he attended the king upon the scaffold, after which he was taken into custody with a view of forcing him to reveal any secrets with which his majesty had entrusted him; but his prudence, integrity, and honour, were superior to every art exercised upon him. At the restoration he was made archbishop of Canterbury. He died in 1663, at the age of 81, and was buried in St. John's college-chapel, Oxford. He was a person of great integrity, mildness, and humanity, and endowed with an excellent understanding. Wood. Hume.

JUXTAPOSITION, is used by philosophers to denote that species of growth, which is performed by the apposition of new matter to the surface, or outside, of old.

In which sense, it stands opposed to intussusception; where the growth of a body is performed by the reception of a juice within it, diffused through its canals. See **NUTRITION**.

JUZCUR, in *Geography*, a town of Africa, in the kingdom of Fez, on the coast of the Mediterranean; 15 miles W. of Mez-mba.

JUZENNECOURT, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Chaumont; six miles N.W. of Chaumont. The place contains 245, and the canton 6435 inhabitants, on a territory of 272½ kilometres, in 24 communes.

IWAMI, or **SEKISU**, a province of Japan.

IWANCZOWICZA, a town of Lithuania, in the palatinate of Novogrodek; 52 miles S.S.W. of Novogrodek.

IWANGROD, a town of Poland, in the palatinate of Bra-law; 60 miles E.S.E. of Bra-law.

IWATA, a town of Japan, in the island of Niphon; 100 miles W. of Jedo.

IWETPOUR, a town of Bengal; 15 miles E. of Goragot.

IWIE, a town of Lithuania, in the palatinate of Wilna; 24 miles E. of Lid.

IWNICA, a town of Poland, in the palatinate of Kiev; 60 miles W.S.W. of Kiev.

IXIA, in *Botany*, *lex*, the Greek name of the Mistletoe, or *Lycium album*. It does not appear why Linnaeus adopted it for the present genus.—Linn. Gen. 26. Schreb. 35. Willd. Sp. Pl. v. 1. 195. Vahl. Enum. v. 2. 49. Thunb. Diff. n. 8. Att. Hort. Kew. ed. 2. v. 1. 86. Ker. in Ann. of Bot. v. 1. 226. Curt. Mag. p. 1013. Mart. Mill. Dict.

v. 2. Juss. 58. Lamarck. Illustr. t. 31.—Class and order, *Triandria Monogynia*. Nat. Ord. *Ensatæ*, Linn. *Iridæ*, Juss.

Gen. Cl. *Cal.* Spatha inferior, shorter than the corolla, of two oblong permanent valves; the outermost enfolding the inner one. *Cor.* of one petal, superior; tube thread-shaped, slender, erect, scarcely dilated upwards; limb regular, divided to its very base into six, nearly equal, spreading, flatish segments. *Stam.* Filaments three, inserted into the mouth of the tube, decurrent, much shorter than the limb; anthers oblong, somewhat curved. *Pist.* Germen roundish, somewhat triangular; style thread-shaped, erect; stigmas three, linear, recurved, spreading. *Peric.* Capsule roundish-ovate, membranous, tumid, of three cells and three valves. *Seeds* numerous, globose.

Eff. Ch. Spatha of two valves. Corolla with a slender tube, and regular limb. Stigmas three, narrow, recurved. Capsule ovate, somewhat globose. Seeds globose.

An extensive genus of bulbous Cape plants in Linnæus, Willdenow, and Vahl, from which Mr. Ker has, generally we think very happily, separated several genera, all agreeing with it in the regular corolla, by which they are all in common distinguished from *Gladiolus* (see that article); but differing from it, as well as among themselves, in other particulars. See *ARISTEA*, *GEISSORRHIZA*, and *HESPERANTHA*.—As we have given a view of all the certain species of *Gladiolus*, we deem it necessary to do the same by *Ixia*, of which Mr. Ker reckons up 15 species. In its old state the genus stands in Willdenow with 47 species, and in Vahl with 56, besides six reckoned by the latter doubtful, adopted from Burmann.

Section 1. *Limb less spreading, tube shorter, spatha larger, as well as more thin and membranous, than in the rest.*

1. *I. pendula*. Thunb. Diff. n. 16. Linn. Suppl. 91.—Flowers somewhat bell-shaped, pendulous. Branches of the panicle capillary, drooping. Spatha longer than the tube.—Gathered at the Cape of Good Hope, in watery places, in November, by Thunberg, who describes it as the tallest and most ornamental of its genus, with large, pendulous, flesh-coloured flowers, the segments of which, in his specimen given to Linnæus, are above an inch long, while the tube is not half so much. We know no figure of this species, nor is it in the gardens.

2. *I. capillaris*. Thunb. n. 12. t. 2. f. 2. Linn. Suppl. 92. Ker in Curt. Mag. t. 57.—Flowers somewhat bell-shaped. Spatha equal to the tube. Leaves linear.—Native, like all the rest, of the Cape of Good Hope, flowering in our green-houses chiefly in the spring. Mr. Ker quotes under this *I. lancea*, Jacq. Ic. Rar. t. 281. If this be right, it varies in the breadth of its leaves, as well as in having sometimes only one flower on a stalk, sometimes several. They are of a pale rose or flesh colour. The bulb is curiously reticulated.

3. *I. aulica*. Ait. Hort. Kew. ed. 1. v. 1. 57. ed. 2. v. 1. 86. (*I. capillaris* ?; Ker in Curt. Mag. t. 1013.)—Flowers nearly falver-shaped. crowded. Spatha half as long as the tube. Leaves oblong, many-ribbed.—Sent by Mr. Masson to Kew garden in 1774. Mr. Ker esteems it a variety of the preceding, but the characters we have given seem to distinguish it. The flowers are much more expanded, and larger, of a full rose-colour, and the leaves very much broader.

Section 2. *Tube slender, considerably longer than the spatha; limb evidently spreading.*

4. *I. ariflata*. Thunb. Diff. n. 15. Ker in Curt. Mag. t. 589.—Spike somewhat level-topped. Spatha about one-fourth the length of the tube, sharply toothed. Limb falver-shaped. Stamens nearly equal to the style.—The leaves

are broad and sword-shaped, with many ribs, and a cartilaginous though narrow edge. *Stem* round, sometimes branched. *Flowers* numerous, somewhat corymbose, rose-coloured with a white orifice, inodorous, their limb quite flat. The spatha has much of the character of Mr. Ker's genus *Sparaxis*. This species requires a constant supply of water, especially when about flowering.

5. *I. patens*. Ait. Hort. Kew. ed. 1. v. 1. 59. ed. 2. v. 1. 86. Ker in Curt. Mag. t. 522. Redout. Liliac. t. 140. (*I. filiformis*; Venten. Jard. de Cels, t. 48. Redout. Liliac. t. 30. *I. ariflata*; Schneev. Ic. t. 329.)—Spike cylindrical. Tube very slender; limb widely spreading, somewhat reflexed. Filaments erect and close together.—The leaves of this very handsome species are sword-shaped. *Stem* slender, erect and rigid. *Flowers* more or less numerous, in a cylindrical spike, rarely branched, their colour a vivid crimson or carmine, sometimes varying to a lighter vermilion hue. The segments of the limb are often much reflexed, and they vary in length, but are usually elliptical, and each near an inch long. The eye, or orifice of the tube, is often green bordered with white.

6. *I. flexuosa*. Linn. Sp. Pl. 51. Ker in Curt. Mag. t. 624. (*I. polytachya*; Redout. Liliac. t. 126. *I. capitata*, var. *stellata*; Andr. Repof. t. 232.)—*I. flexuosa*; Curt. Mag. t. 127.—*Stem* branched, racemose. Tube slender, slightly dilated upward; limb somewhat contracted, its segments elliptical, concave, spreading. Filaments close together.—The leaves are linear, grassy. *Stem* slender, not quite erect, branched for the most part, each branch bearing a shortish cluster of pale rose-coloured, mostly striped, fragrant flowers, half the size of the last, their orifice mostly yellow, their segments not expanded into a falver-shape, each of them moreover being concave. Sometimes the flowers are of a pale or dull violet-colour.

7. *I. conica*. Salis. Hort. 36. Ker in Curt. Mag. t. 539. Redout. Liliac. t. 138. (*I. capitata*, var. *fl. aurantia*; Andr. Repof. t. 50. *I. fusco-citrina*; Redout. Liliac. t. 86.)—*Stem* simple. Cluster dense. Limb spreading, twice as long as the tube. Style longer than the filaments.—The leaves are linear and grassy. *Flowers* in a thyrsus, or dense cluster, as large as those of *I. patens*, but less expanded, of a rich orange, sometimes a lemon-colour, with a brown and yellow eye, inodorous. The style continues undivided above the base of the anthers.—This is one of the most splendid of the genus.

8. *I. monadelphæ*. Ait. Hort. Kew. ed. 2. v. 1. 87. Ker in Curt. Mag. t. 607. (*I. colummaris*, var. *fl. aurantia*; Andr. Repof. t. 203, 211, 213, 250. *Galaxie ixiflora*; Redout. Liliac. t. 41.)—Cluster corymbose. Flowers falver-shaped. Filaments united into a tube. Remarkable for its perfectly monadelphous stamens. The leaves are sword-shaped. *Flowers* scentless, rather large, not numerous, in a short corymbose cluster; their tube about equal in length to the limb, which is flat, usually light blue or purple, rarely yellow, always distinguished by a broad brownish, or greenish, central stain, or eye.

9. *I. columellaris*. Ait. Hort. Kew. ed. 2. v. 1. 88. Ker in Curt. Mag. t. 577. (*I. colummaris*, var. *fl. angustifolia*; Andr. Repof. t. 392.) Cluster corymbose. Flowers nearly falver-shaped. Filaments united at their base.—Differs from the last in the stamens being united at their base only, the flowers located like woodruff or new hay, not quite so horizontally expanded, opening in the morning and closing at noon, and produced in August instead of the spring. Their colour is purplish, the eye richly variegated with broad circles of black and red. The leaves are grassy.

10. *I. muricata*. Thunb. Diff. n. 19. Linn. Syst. Veg. ed. 14. 85. Mart. 320. Ker in Curt. Mag. t. 549. 789. 1285. Andr. Repof. t. 196. 236. Redout. Liliac. t. 137. Jacq. Hort. Schoenbr. v. 1. 9. t. 19—23. Schneev. Ic. t. 6. 25. (I. cajutata; Andr. Repof. t. 23. 159. I. spicata, var. viridini-gra; Andr. Repof. t. 29.)—Flowers nearly falser-flap-d; tube capillary; limb flained at the base. Stigmas separate as low as the tube.—This common and ornamental species, figures of which are needlessly multiplied by author, is known by the broad dark stain in the centre of the *stigma*, while it differs from the two last in having distinct filaments. The colour of the *corolla* sports in every shade of crimson, pale purple, orange, yellow, even to white; though, as Mr. Ker observes, some other species may possibly be confounded under Jacquin's numerous varieties. The most remarkable variety is the green, in t. 23. of that author, Curt. Mag. t. 549. Andr. t. 29. Schneev. t. 6. The leaves are linear-forward-shaped. *Spike* or *cluster* oblong, various in length, simple and almost always solitary. *Flowers* about as large as those of our 5th and 7th species, their tube very slender, shorter than the limb, which is a little concave. *Style* enclosed in the tube; *Rigmas* projecting.

11. *I. cresta*. Thunb. Diff. n. 18. Ker in Curt. Mag. t. 623. 1173. Jacq. Hort. Schoenbr. v. 1. 9. t. 18. (I. polytachya; Linn. Sp. Pl. 51. Andr. Repof. t. 155. I. dubia; Redout. Liliac. t. 62. Venten. Choix. t. 10.)—*Corolla* widely spreading; tube capillary; limb pale at the base. Stigmas separate as low as the tube.—The stem sometimes bears many spikes. The flowers are smaller than in the last, white or yellow, without any broad dark stain. They come late in the summer, and are inodorous. It is very difficult to find a good specific character between plants so variable, and yet so much alike.

Section 3. *Style extended above the anthers. Bulb somewhat tuberous and deformed.*

12. *I. crateroides*. Ker in Curt. Mag. t. 594. Ait. Hort. Kew. ed. 2. v. 1. 89. (I. speciosa; Andr. Repof. t. 186.)—Corymb of two or three flowers. Limb of the corolla hemispherical; tube very short. Style longer than the filaments.—Found at the Cape by Mr. Nevin. The flowers rarely so many as three on a stem, are large, concave, of a rich crimson within, paler externally. Their style is so long as to extend nearly to the end of the anthers before the *Rigmas* branch off.

Section 4. *Anthers short. Stigmas cloven.*

13. *I. retusa*. Salis. Hort. 35. Ait. Hort. Kew. ed. 2. v. 1. 89. (I. polytachya; Jacq. Ic. Rar. t. 275. Ker in Curt. Mag. t. 629. Andr. Repof. t. 128.)—Tube of the flower twice as long as the spatula; segments of the limb elliptic-oblong. Stigmas cloven and gaping.—This, being often branched, has been taken for the *polytachya* of Linnaeus, a name now had aside, as causing only confusion. That we have retained is indeed not unexceptionable, the segments of the corolla not being always abrupt. It is a tall slender species. Flowers small, rose-coloured, smelling like hly of the valley.

14. *I. feillearis*. Linn. Sp. Pl. 52. Ker in Curt. Mag. t. 542. Redout. Liliac. t. 127. (I. pentandra; Linn. Suppl. 92. Thunb. Diff. n. 22. I. reflexa; Andr. Repof. t. 14.)—Spatha as long as the tube. Segments of the limb spatulate, concave. Stigmas funnel shaped. Anthers deflexed.—That this is the real *I. feillearis* of Linnaeus, not unaptly compared by him to *Saila amocna*, appears from his herbarium; though Thunberg induced Linnaeus the younger to call it *pentandra*, because the filaments are sometimes four or five, and led him to adopt his own *feillearis*, Diff. n. 14.—

It differs from *retusa* in the above characters, and has not four. The leaves are broad, with many ribs. Flowers rose-coloured, in a long spike.

15. *I. crispata*. Linn. Suppl. 91. Thunb. Diff. n. 8. t. 2. f. 3. Ker in Curt. Mag. t. 590. Leaves strongly undulated. Stigmas funnel-shaped, deflexed.—A beautiful little species, on account of its curiously waved and crisped leaves. The flowers are rose-coloured, inodorous; their segments obovate and concave.—Thunberg says they vary at the Cape to blue or white.

IXIA, in *Gardening*, contains plants of the herbaceous, bilious, and tuberous-rooted perennial kinds; of which the species principally cultivated are, the crocus-leaved ixia (I. bulbocodium); the Chinese ixia (I. chinensis); the rose-coloured ixia (I. rosea); the bulb-bearing ixia (I. bulbifera); the bearded ixia (I. arillata); the bending-stalked ixia (I. flexuosa); the many-spiked ixia (I. polytachya); the spotted ixia (I. maculata); and the crocus-flowered ixia (I. crocata).

The first of these species varies with white and yellow flowers; with purplish and yellow flowers; with blue and white flowers; with white flowers; and with variegated flowers.

The third sort also varies with the three inner segments of the corolla yellow, and the three outer green; with the three inner white yellow, and the three outer greenish; with the three inner blue white, and the three outer greenish; with the three inner white, and the three outer green; with corollas wholly yellow, or wholly blue, or rose-coloured, with a yellow base; and in the size of the flowers.

The fourth sort likewise varies with the corolla purple, red and white, yellow; with the scape very short and simple, higher and branched, and bulbiferous.

The fifth species varies with the segments of the borders of the corolla of a deep and elegant purple violet colour within, three of them of the same colour on the outside, but the three others alternately of a pale dirty violet; one of these, with two on the side of it, has a double band in the throat, meeting at one end; and, according to Mr. Salisbury, with whitish corollas, having a purple star, violet-coloured and yellow. Also in the figures of Miller, with the corolla of a beautiful purple on the outside, but white within, and the stem terminated by two or three flowers; with the stalk terminated by two large flowers; the outside of a violet colour, edged with white, and the inside pale blue; and with one flower, and the corolla of a most beautiful purple colour, both within and without.

The seventh kind varies with the corollas yellow and violet, of one colour.

And the ninth sort varies with a short, simple, five-flowered scape, and a dark spot above the windowed, or hyaline one; with a lofty, many-spiked, many-flowered scape; and with bright red flowers.

Method of Culture.—These plants may be increased by seeds or offsets from the roots.

The seeds of such sorts as can be procured should be sown in pots filled with light earth in the spring, plunging them in a mild hot-bed. When the plants have attained some growth, they should be removed into separate pots of the same earth, being placed under the protection of a frame till they have taken root. They should be placed during the winter in a hot-bed frame. They may afterwards be removed into warm borders, being protected from frosts in the winter, and a few retained in pots under the frame, or in a dry stove.

But they are three or four years in flowering when raised from seeds.

The common way is, therefore, to increase them by planting off-sets from the roots, which are afforded in great plenty; the proper season for this is in the early spring, before the shooting of the root, when the roots should be removed, and the off-sets taken from them and planted out.

The old roots should not be removed oftener than every three years.

As soon as the stems and leaves decay to the roots in the borders in autumn, they should be covered over with tan a few inches thick, to protect them from frost, and the depredations of mice.

The hardy sorts serve to adorn the borders in the open ground, and the other tender sorts among other potted green-house plants that require protection in winter.

IXIA, in *Surgery*, a dilated vein; a varix.

IXO, in *Geography*, a town of Japan, in the island of Nippon; 65 miles E.N.E. of Meaco.

IXORA, in *Botany*, so named from *Isora*, a Malabar idol, to whom its flowers are offered by the Indians in their solemn festivals. Linn. Gen. 54 Schreb. 70. Willd. Sp. Pl. v. 1. 609. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 244. Juff. 203. Lamarck Dict. v. 3. 343. Illustr. t. 66. Gartn. t. 25, and t. 95 — Class and order, *Tetrandra Monogynia*. Nat. Ord. *Stellate*, Linn. *Rubiaceae*, Juff.

Gen. Ch. Cal. Perianth superior, four-cleft, very small, erect, permanent. Cor. of one petal, funnel shaped; tube cylindrical, slender, very long; limb four-cleft, flat; segments various in shape. Stam. Filaments long, rising above the mouth of the corolla, very short, incurved; anthers oblong. Pist. Germen inferior, roundish, style thread-shaped, the length of the tube; stigma cloven. Peric. Berry roundish, two-celled. Seeds solitary, convex on one side, angulated on the other.

Obf. Gærtner has remarked that the partition of the fruit is perforated just above the centre, and that the seeds are never more than two in each berry, though the Hortus Malabaricus describes three or four. Sufficient characters are wanting to distinguish this genus from *Pavetta*.

Efl. Ch. Calyx four-toothed, superior. Corolla of one petal; tube long, thread-shaped; limb four-cleft, widely spreading. Stamens rising above the mouth. Stigma cloven. Berry of two cells. Seeds solitary.

The species of this fine Indian genus have not been in general clearly understood. We shall attempt an explanation of them, with an account of some hitherto entirely non-descript.

1. *I. coccinea*. Linn. Sp. Pl. ed. 1. 110. Lamarck Dict. v. 3. 342. (Schreft); Rhede Hort. Mal. v. 2. 17. t. 13. Jalmium flore tetrapetalo, Isora Linnæi; Burm. Zeyl. 125. t. 57.) — Leaves elliptic-obovate, somewhat heart-shaped at the base, not longer than the corymb. Segments of the corolla ovate, acute, flat. Style but little extended beyond the tube. Native of sandy and stony places on the coast of Malabar, bearing flowers and fruit all the year. A shrub the height of a man, with round, smooth, greyish, leafy branches. Leaves opposite, nearly sessile, two inches or more in length, about one broad, more or less obovate, or somewhat elliptical, obtuse, entire, smooth, often pointed; their base for the most part heart-shaped, but varying in breadth; their upper side polished. *Stipulas* embracing the stem in pairs, within the leaves, and alternate with them, awl-shaped, longer than the footstalks, broad and triangular at their base. *Corymb* terminal, repeatedly forked, dense, of

from ten to thirty inodorous flowers; the stalks smooth and shining, red, as well as the calyx, whose segments are ovate or triangular, their points a little spreading. Tube of the corolla an inch and half long, very slender; segments of the limb each about half an inch long, horizontally spreading, ovate or elliptical, pointed. The hue of the limb, according to Rhede, is a flesh-colour, deeper on the inside, at length turning yellow and paler; the tube of a coral red. *Stamens* very small and red, with yellow anthers, bursting longitudinally at their inner side into two cells. Style very little extended beyond the tube, with a thick red stigma, of two elliptical lobes, cohering in the dried specimen. *Berries* the size of a small currant, reddish-brown, shining, sweet and eatable.—We have never met with this species in any garden.

2. *I. flammula*. Salisb. Hort. 62. (*I. chinensis*; Lamarck Dict. v. 3. 344. 1. *coccinea*; Curt. Mag. t. 169. Schneev. Ic. t. 1. Ait. Hort. Kew. ed. 2. v. 1. 244. *Flamma sylvorum peregrina*; Rumph. Amb. v. 4. 107. t. 47.) — Leaves elliptic-lanceolate, bluntish, stalked; narrow at the base. Segments of the corolla orbicular, obtuse, rather convex. Style extended to half the length of the limb.—Native of Java, according to Rumphius; as well as of China, from whence we have a specimen. It is not rare in our houses, where the splendour of its flame-coloured flowers causes it to be much admired. Lamarck has well distinguished it from the above, and Mr. Salisbury long ago made the same remark. The leaves are five or six inches long, contracted at each end, standing on short, thick footstalks. *Corymb* almost globose, composed of 100 flowers, or more, whose tube is but half, or two-thirds, the length of the former, but rather less slender; the segments of the limb broad and round, very obtuse, each not $\frac{1}{3}$ of an inch long. *Stamens* spreading. Style rather longer than in the foregoing, with red spreading lobes of the stigma, but these cohere after drying.

3. *I. longifolia*. (*Flamma sylvorum*; Rumph. Amb. v. 4. 105. t. 46.) — Leaves ovato-lanceolate, taper-pointed. Segments of the corolla elliptical, sharpish, reflexed.—Native of moist islands in the East Indies, according to Rumphius. We have a specimen from the late Mr. Christopher Smith, gathered in Honimoa. Those who attend to Rumphius's description and figure of his *Flamma sylvorum*, and consider that all his figures are diminished, will be aware that his plant can belong to neither of the foregoing species, for which it has been quoted indifferently. Our specimen exactly answers to his account, and is undoubtedly a new species. The leaves are seven or eight inches long, and two or three broad, ovate at the base, tapering at the end to a very fine point. *Footstalks* half an inch long, channelled. *Stipulas* much shorter than in either of the former. *Corymbs* from the bosoms of the top upper leaves, as well as terminal, much branched from their very bottom, repeatedly forked, consisting of innumerable flowers, whose tube is as long and slender as in the first species, and of a light red; but the segments of the limb rather smaller, elliptical, not ovate, spreading widely, and more or less reflexed. The *stamens* are very short. Style but little prominent. Rumphius says the flowers are of a vermilion hue on their inside, which becomes a blood colour as they grow old, whence arises their brilliant fiery aspect, the origin of the name. The berries turn first purple and finally black.

4. *I. incarnata*. Roxb. MSS.—Leaves elliptical, sessile. Segments of the corolla roundish, obtuse, somewhat reflexed. *Corymb* above half as long as the leaves.—Native of the East Indies. Our specimen was communicated by lord viscount Valentia, who received it from Dr. Roxburgh with the above name. The leaves are two inches long, and one

Broad, nearly or quite sessile, elliptical, slightly pointed. *Stipulæ* with a very broad short base, and short slender point. *Corymb* about two-thirds the length of the leaves, dense, level-topped, many-flowered. *Tube* of the flowers above an inch long, very slender; *limb* small, its segments shaped much like *I. flammæ*, but rather less. *Style* projecting above half their length. By the name we presume the flowers are flesh-coloured. In a dried state their tube looks reddish, the limb pale.

5. *I. arborescens*. Roxb. MSS. (*I. Pavetta*; Andr. Repôt. t. 78).—Leaves elliptic-oblong, on short stalks. Segments of the corolla linear, obtuse, reflexed, one-third the length of the tube. *Corymb* dense, half as long as the leaves.—Native of the East Indies. It flowered in the dowager lady de Clifford's stove in the autumn of 1799, as Mr. Andrews mentions, but his name is altogether founded in error. The leaves are three or four inches long, and above one broad, coriaceous, widely spreading, on short thick stalks; their base slightly heart-shaped. *Flowers* innumerable, dirty-white, small, fragrant, in very dense corymbs, whose stalks are a little downy; their tube is scarcely half an inch long, segments of the limb one-third as much, linear-oblong, recurved or reflexed, as are also the anthers. The *style* projects in some degree; the *stigma* is large and green, cloven, but not spreading.

6. *I. barbata*. Roxb. MSS.—Leaves elliptic-oblong, pointed, stalked. Segments of the corolla obovate, obtuse, reflexed, densely bearded at their base. *Corymb* spreading, equal to the leaves.—Brought by lord viscount Valentia from the East Indies. The leaves are five or six inches long, two or more in breadth, with blunt points. *Footstalks* half an inch long. *Corymbs* three at the end of the branch, equal, many-flowered, loose and spreading, about as long as the leaves, and very broad. *Tube* of the flowers an inch and a quarter in length, slender at the base, but rather swelling upwards; *limb* reflexed, its segment $\frac{1}{4}$ th of an inch long, obovate, obtuse, twisted in the bud, revolute when dry, densely bearded at their base only, about the orifice of the tube, with longish white hairs. The colour of the flowers seems to be reddish.

7. *I. undulata*. Roxb. MSS.—Leaves ovate, pointed, stalked. Segments of the corolla oblong, reflexed, smooth, half as long as the tube. *Corymbs* numerous, dense, panicled.—For this also we are obliged to lord Valentia, who received it, with the two last, from Dr. Roxburgh. The leaves, about four or five inches long, are of a broad ovate figure, tapering to a point; their edges wavy. *Footstalks* above half an inch long. *Panicles* terminal, longer than the leaves, repeatedly forked, spreading, each branch terminating in a dense many-flowered corymb. The *tube* is about half an inch long, not very slender, reddish; *limb* and *filaments* half that length, reflexed. *Style* projecting to the extent of the limb.

8. *I. lasiflora*.—Leaves elliptic-oblong. Segments of the corolla spreading, convex, bearded on their upper surface. *Panicle* corymboid, lax, widely spreading, longer than the leaves. Gathered at Sierra Leone, by Dr. Adam Afzelius, to whom we are obliged for a specimen, and the publication of whose rich discoveries is much to be desired, though he himself has hitherto been unable to attain that object. We wish to secure his fame, not to encroach upon it. The leaves of this species are two or three inches long, and rather above an inch wide, all somewhat pointed; the uppermost rounded at the base, and quite sessile; the rest tapering down into a winged foot-stalk. *Stipulæ* with short points. *Panicles* terminal, solitary, stalked, nearly twice as long as the leaves, many-flowered, repeatedly branched and

divaricated, slender and lax. *Calyx* tubular, with very short rounded teeth. *Tube* of the corolla an inch long, very slender, slightly swelling upwards; segments of the limb one-third as long, obovate with a small recurved point, their edges reflexed, their disk hairy half way along the middle from the base. *Stamens* very short. *Style* projecting almost the length of the limb, with long, nearly linear, filigams. We have no account of the colour of the flowers. In the dried specimen they are dark brown, with a purplish tinge.

9. *I. parviflora*. Vahl. Symb. v. 3. 11. t. 52. Ait. Hort. Kew. ed. 2. v. 1. 214.—Leaves nearly sessile, lanceolate-oblong. *Corymbs* dense, panicled. Segments of the corolla elliptical, reflexed, one-fourth the length of the tube.—Native of the East Indies. We have a specimen sent by Koenig to Linnaeus; which was never described, but we have no doubt of its being Vahl's plant. The leaves in our's are two or three inches long, or more, lanceolate inclining to obovate, coriaceous, reticulated with veins. *Footstalks* thick and very short. *Stipulæ* broad and short, with a rigid straight point. *Panicle* rather longer than the leaves, erect, straight, branched from the bottom; the branches downy, each bearing a dense corymb of red flowers, whose tube is about half an inch long, not very slender, and whose limb is scarcely one-fourth that length, its segments elliptical, and smooth.

10. *I. alba*. Linn. Sp. Pl. ed. 1. 244. (Bem-fchetti; Rheede Hort. Mal. v. 2. 10. t. 14).—Leaves elliptic-lanceolate, pointed, stalked. *Panicle* corymboid, stalked, of few flowers. Segments of the corolla ovato-lanceolate, acute, about half as long as the tube.—Native of the East Indies. This species stands on the authority of the *Hortus Malabaricus*, whence Linnaeus adopted it, for there is no specimen in his herbarium, and the synonym of Plukenet, t. 109. f. 2, surely belongs to our first species of all. Miller is said in Hort. Kew. to have cultivated *I. alba* before 1768, but we have never been able to satisfy ourselves concerning this species in any garden. A specimen in fruit from professor David Van Royen, of what he had from Thunberg under this name, agrees tolerably with Rheede's figure, though the fruit being globose, or rather depressed, not elliptical, is an exception, neither is our said fruit didymous, like Gärtner's t. 95. Rheede contrasts his plants with the true *I. coccinea*, his Schetti, t. 13, justly saying that the leaves are rather longer, more pointed at the end, and contracted at the base. The flowers are white or yellowish, with a reddish tube. *Stamens* longish and slender. *Style* prominent. *Fruit* more oblong than round, pale green or yellowish.

11. *I. americana*. Linn. Am. Acad. v. 5. 393; excluding the synonym of Plumier. Sp. Pl. ed. 2. 160; excluding the syn. of Browne. (Petefia, N° 1; Brown. Jam. 143. t. 2. f. 3).—Leaves elliptical, pointed at each end, on long downy footstalks. *Panicles* axillary, downy; their branches cymose.—Gathered by Dr. P. Browne near the waterfall in Mammee river in Jamaica. His own specimen is before us, shewing how much Linnaeus has confused the history of this plant, by a misquotation of synonyms that belong to *Cestrea occidentalis*, hence leading Lamarck to suppose these two very distinct shrubs might be one and the same. We are not however by any means of opinion that the present is a real *Isora*, but till its fruit be better known, the question cannot be decided. Dr. Swartz appears not to have touched upon it. The leaves grow by threes, on stalks about an inch and half long, half their own length. The flowers are very small, short, thick, and downy, truly cymose, at the ends of long forked panicles.

12. *I. multiflora*. Swartz. Ind. Occ. v. 1. 240. Willd.

n. 6.—“Leaves lanceolate-ovate, clustered. Flowers in small aggregate, single-flowered, very short. Berries with one seed.”—Native of Jamaica. A still more doubtful *Ixora* than the last, or rather a *Strobil* of a distinct genus. Dr. Wright, to whom we are obliged for a specimen, observes that “the *filaments* are in the bottom of the *corolla*; the *berry* white, small, sweet, with a little compressed seed.”—The small box-like *bracts*, and dense tufts of *flowers* from lateral buds, are quite foreign to this genus, as is the swelling tube of the *corolla*.

I. fasciculata, Sw. Prodr. 30, is now by that author himself removed to *Gleichenia*, Fl. Ind. Occ. v. 1. 238.

How far the *Parveta* of authors, or any of the species ranged under it, may be referable to *Ixora*, we are not at present competent to determine, but we are well assured that their generic characters require investigation. S.

IXORA, in *Gardening*, comprehends plants of the shrubby, flowering, exotic kinds, of which the species mostly cultivated are, the scarlet *ixora* (*I. coccinea*); and the white *ixora* (*I. alba*).

Method of Culture.—These plants may be increased by seeds, when they can be procured from the countries where they grow naturally, as they do not perfect them in this climate. They should be sown in small pots as soon as they arrive, and be plunged into a hot-bed when they arrive in the autumn or winter seasons, the pots being plunged in the tan-bed in the stove; but when they come in the spring, it is best to plunge them in a tan-bed under frames. The seeds sometimes come up in about six weeks, if they are quite fresh; otherwise they lie in the ground four or five months, or longer. The earth should therefore not be thrown out of the pots till there are no hopes of their growing. When the plants come up, and are fit to remove, they should be each planted in a separate small pot, filled with light earth, being preserved in the green-house or stove.

They may also be increased by cuttings, which should be planted during the summer months, in small pots, and plunged into a moderate hot-bed, covering them close either with bell or hand glasses, to exclude the external air, shading them from the sun in the heat of the day, until they have put out good roots, when they should be parted, and each put into a separate pot, treating them as the seedling plants. Mr. Curtis thinks it probable, that these plants are less tender than is supposed.

They afford variety among other stove or green-house plants.

IXWORTH, in *Geography*, a town of England, in the county of Suffolk, with a weekly market on Friday; 73 miles N.E. of London.

IYAR, in *Chronology*, the second month of the ecclesiastical Jewish year, answering to part of our April and May.

JYENAGUR, or **JOINAGUR**, called also *Jyepour* and *Jainpur*, in *Geography*, a circar or province of Hindoostan, situated S. of the Mewat. The capital of this circar is Jaepour or Jainagur; 70 miles E.N.E. of Agimere. N. lat. 26° 58'. E. long. 26° 9'. The raja of Jaepour, called Jessing, has erected two observatories, one in his newly built capital of Jaepour, which is about a league from Umbeer, or Ambeer, the ancient capital, the other in one of the suburbs of Delhi. At the former observatory father Claud

Boudier, at the raja's request, made some observations in 1732; and probably, by the assistance of the same raja, at Agra and Delhi.

JYEPOUR, a town of Hindoostan, in the circar of Cattaek; 16 miles N.E. of Cattaek.

JYTEPOUR, a town of Hindoostan, in Bundelcund; 18 miles N.E. of Chatterpouir.

JYVASKYLA, a town of Sweden, in the government of West Wafä; 120 miles S.E. of Wafä.

IZENDICK, a town of France, in the department of the Scheldt, and chief place of a canton, in the district of L'Ecluse. The place contains 1127, and the canton 5001 inhabitants, on a territory of 112½ kilometres, in five communes.

IZER, a town of Africa, in the western part of the country of Berdoa.

IZIGINSK, a town of Russia, in the government of Irkutsk, on the river Izigin, about 15 miles from its mouth. It is defended by an enclosure of palisades, and wooden bastions, erected in piles at the four angles. These bastions are provided with cannon, and a variety of military stores. The governor's house is defended by a constant guard. The houses are constructed of wood, low, and having a regular front. The number of inhabitants is about 5 or 600, who are either merchants, or in the service of government. The commerce consists of furs, and the skins of rein deer. N. lat. 63° 10'. E. long. 159° 14'.

IZIUK, a town of Russia, in the government of Tobolsk, on the Irtysh; 240 miles E.S.E. of Tobolsk.

IZIUM, a town of Russia, in the government of Charkov, on the river Donetz; 64 miles S.E. of Charkov.

IZQUITENANGO, a town of Mexico, in the province of Chiapa.

IZTICHUILOTLI, in *Natural History*, the American name of a stone found in New Spain, and some other places; it is very hard, of a beautiful black, and takes a fine polish. The Americans are very fond of it as a gem, and wear it by way of ornament.

De Laet mentions an American stone in his possession, which was cut by the Indians into a flat oval plate, and was of a beautiful black, but with two round spots of a silvery white. He supposes this to have been the uterine lapis, and probably it was either that stone, or of the species here mentioned.

IZTICPASO-QUERZALIZTLI, the name given by the natives of some parts of America, to a stone famous for its virtues in curing colic, and many other diseases, externally applied. It is of a beautiful green colour, and is by Ximenes supposed a coarse species of emerald; but is more properly a very fine kind of lapis nephriticus, of a pale green colour, very hard, and more pellucid than the other species of that stone, but yet always shewing that greasy look on being polished, which characterizes all the nephritic stones. It is usually found in large masses, and the Indians cut it into flat pieces, which they apply to the navel in the colic, and in other diseases to the part affected, and suppose it has great power in promoting a discharge of the noxious humours.

IZTLI, the American name of a species of stone, of which the natives made their weapons of war, &c. before they knew the use of iron. It is called by De Laet and other authors, lapis novacularum.

K.

K

K, A double consonant, and the tenth letter of the alphabet.

This consonant has the found of hard *c*, and is used before *e* and *i*, where, according to the English analogy, *c* would be soft; as in the words *kept*, *king*; at the end of words it is not much used, except after *e*, and chiefly in monosyllables, as *clock*, *back*, &c. It is now properly omitted in many other words, as *music*, *public*, &c. It is also used between a vowel and the silent *t* final, as *clock*, *break*, &c. It likewise ends a word after a diphthong, as *look*, *break*, &c. In the present pronunciation, *k* is silent before *n*, as *knee*, *knell*. It is never doubled; but *c* is used before it, to shorten the vowel by a double consonant, as *kick*, *pick*.

K is borrowed from the Greek *kappa*, and was but little used among the Latins. Prician looked on it as a superfluous letter, and says it was never to be used except in words borrowed from the Greek. Dauiques, after Sallus, observes, that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word *kalende*, where it sometimes stands in lieu of a *c*. Carthage, however, is frequently spelt on medals with a **K**: SALVIS AVG. ET CAES. FEL. KART. and sometimes the letter **K** alone stood for *Carthage*.—M. Berger has observed, that a capital **K**, on the reverse of the medals of the emperors of Constantinople, signified KONSTANTINUS; and on the Greek medals he will have it to signify ΚΟΙΝΗ ΣΥΡΙΑ, Cœlefyria.

Quintilian tells us, that in his time some people had a mistaken notion, that wherever the letter *c* and *a* occurred at the beginning of a word, *k* ought to be used instead of the *c*. See **C**.

Lipius observes, that **K** was a stigma, anciently marked on the foreheads of criminals with a red-hot iron.

The letter **K** has various significations in old charters and diplomas; for instance **KR**. stood for *chorus*, **K.R.C.** for *cara civitas*, **KRM**. for *carmen*. **KR. AM. N.** *carus amicus noster*. **KS. chaos**. **K.T.** *capite tonsus*, &c.

The French never use the letter *k*, excepting in a few terms of art, and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in *k* complaining, that he has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the North.

K is also a numeral letter, signifying 250, according to the verse;

“**K** quoque ducentos et quinquaginta tenebit.”

When it had a stroke at top, \bar{K} , it stood for 250,000.

K, on the French coinage, denotes money coined at Bourdeaux.

The letter **K** is the initial of no musical term; and as most of the musical technica are derived from the Italian, in

which language **K** has no admission, the Greek *kappa*, and the hard *c* being supplied by *che*, this letter will chiefly occur in German words, and proper names.

KAABA. See **CAABA**.

KAABE, in *Geography*, a town of Arabia Felix, in the province of Yemen; 12 miles N. of Taas.

KAALING, in *Ornithology*, the name of a species of starling, common in China, and not infrequent in the Philippine islands. It is black; but its eyes, legs, and beak are yellow. It is easily kept tame, and may be taught both to sing and talk. It eats rice and insects in its wild state; but when kept in a cage, will feed very heartily on bread, and all kinds of fruit.

KAARTA, in *Geography, a considerable state of Africa, bounded on the N. by Ludamar, on the E. by Bambarra, on the S. by Fooladoo and Manding, and on the W. by Kaffon and Fooladoo; about 200 miles long and 80 broad. Its capital was formerly a large and populous town, called Kemmoo; which has been since destroyed. The sovereign of Kaarta received Mr. Park with great kindness; and major Houghton was the only European whom he had ever before seen. The language of the country seemed to Mr. Park to be formed of a mixture of the Mandingo and Serawoolli; but the Mandingo was generally understood. N. lat. 13° 10' to 15°. W. long. 5° 10' to 8° 20'.*

KAAT'S KILL, or **CATSKILL**, a small, but thriving place in America, in Green county, and state of New York, on a creek of the same name, W. of Hudson's river; 5 miles S. of Hudson city, and 125 N. of New York. In its vicinity are Kaat's Kill mountains, which are the first part of a chain of mountains, called the Alleghany, or Appalachian mountains. The township of this name contains 2460 inhabitants.

KAAU-BOERHAAVE, **ABRAHAM**, in *Biography*. See **BOERHAAVE**, **ABRAHAM KAAU**.

KAAWI, in *Geography*, a town of Sweden, in the government of Kuopio; 22 miles E.N.E. of Kuopio.

KAB, in the *Jewish Antiquity*. See **CAB**.

KABALA, in *Geography*, a town of Persia, in the province of Schirvan; 36 miles S.S.W. of Seamachie.

KABANI, in the *Oriental Office*, a person who supplies the place of what we call the notary public. All obligations that are valid are drawn by him; and he is likewise the public weigh-master, and every thing of consequence ought to be weighed before him.

KABANSKOI, in *Geography*, a town of Russia, in the government of Irkutsk; 28 miles W.N.W. of Verchnei-Udinsk.

KABARDA, a town of Russia, in the government of Caucasus; 32 miles E. of Eksterinograd.

KABASSI, a town of European Turkey, in the province of Albania; 24 miles N. of A. ibo.

KABASSON, in *Zoology*. See *DASYPUS Umicinifur*.

KABBA, in *Geography*, a town of Africa, in the kingdom of Bambarra, seated on the Niger; 10 miles N.E. of Sezo. It is situated, says Mr. Park, in the midst of a beautiful and highly cultivated country, bearing a considerable resemblance to the central part of England, and abounding with the "shea" tree, the fruit of which produces the ficatoulon, or tree-butter. The tree very much resembles the American oak, and the root, from the kernel of which the butter is prepared, by boiling it in water, has somewhat the appearance of a Spanish olive. The butter produced by it, besides the advantage of its keeping without salt, is, in Mr. Park's opinion, whiter, firmer, and of a richer flavour than the best butter he ever tasted made from cow's milk. The growth and preparation of this commodity seem to be among the first objects of African industry, in this and the neighbouring states, and it constitutes a main article of their inland commerce.

KABBADE, or CABADE, the name of a military habit of the modern Greeks, which they wear under another garment.

KABBALA. See CARBALA.

KABBOS, in *Ichthyology*, the name of an East Indian fish of the Mustela kind. It grows to about two feet long, has no scales, but feels smooth and soft like the eel, and is of a brown colour; the nose or snout much paler than the rest, and spotted with black. The head is obtuse, and the eyes placed very near the extremity of it.

KABERAN, in *Geography*, a town of Persia, in the province of Khorasan; 45 miles E. of Meshid.

KABESQU, or CAESQU, is the name of a piece of money, equal in value to five deniers and a maille of French, coined and current only in Persia.

KABESTERA, in *Geography*, a district of Africa, on the Gold Coast.

KABIKI, a town of Japan, in the island of Niphon; 25 miles S.W. of Nigata.

KABIN, KHABIN, *Kelin*, or *Kubin*, a temporary kind of marriage, in use among the Mahometans.

The kabin is contracted before the cadi, in whose presence the man espouses the woman for a certain time, upon condition that if he quits her at the end of that term, she shall be allowed a certain sum of money.

Some authors say that the kabin is only permitted among the Persians, and in the sect of Ali; but others maintain that it is practised among the Turks.

KABIS, CHABIS, or *Gabbis*, in *Geography*, a town of Persia, in the province of Kerman. N. lat. 31°. E. long. 57° 50'.

KABOJA, a town of Japan, in the island of Niphon; 90 miles W. of Meaco.

KABRA, a town of Africa, in the kingdom of Tombuctoo, on the N. side of the Niger; 8 miles S.E. of Tombuctoo.

KABREND, a town of Persia, in Faristan; 38 leagues S. of Schiras.

KABROANG, one of the Silibabo islands, in the East Indian sea, about 18 miles in circuit. N. lat. 3° 50'. E. long. 126° 30'.

KABRUA, a town of European Turkey, in Bulgaria; 16 miles S. of Ternova.

KACHAN, a town of Persia, in the province of Irac; 35 leagues N. of Ispahan.

KACHAO, a town of Africa, in the kingdom of Kambou, on the river San Domingo, about 50 miles from its mouth; surrounded with a rampart and palisades, and defended by artillery and a Portuguese garrison. It has a

parish church, and a convent of Capuchins. N. lat. 12° 6'. W. long. 16°.

KACHIRA, a district of the government of Tula, in Russia, on the Occa.

KACHTAN, a district or territory of Arabia, in the province of Yemen. It is of small extent, and lies among the mountains, about three days' journey northward from Nedsjeran. It is governed by a scheyk.

KACIAZYN, a town of Lithuania, in the palatinate of Wilna; 36 miles N.E. of Wilna.

KACOVA, a town of Transylvania; 12 miles S. of Colofvar.

KACUNDY, a town of Africa, in the country of the Foulahs, seated on the E. side of the river Nunez; not far from its opening into the Atlantic.

KADAN, or CAADAN, a town of Bohemia, in the circle of Saatz; 12 miles W. of Saatz. N. lat. 50° 20'. E. long. 13° 16'.

KADAR, a town of Mingrelia; 16 miles N.N.E. of Anergchia.

KADANAKU, in *Gardening*, the name of a plant. See ALOE.

KADARI, or KADARITES. See CADARI.

KADELY, a town of Bengal; 8 miles N.W. of Ramgur.

KADEN, in *Geography*, a town of Russian Lithuania, in Polesia; 14 miles S. of Brzesc.

KADEN-KAN, a town of Asiatic Turkey, in Carmania; 28 miles W. of Cogni.

KADER, an island at the N.W. extremity of the Persian gulf, formed between the streams of the Euphrates and the Tigris.

KADESIA, a town in the Arabian Irak; 80 miles S.W. of Bagdad.

KADIJANG, a town on the W. coast of the island of Celebes. S. lat. 6° 28'. E. long. 119° 50'.

KADIEI, or KADYI, a town and district of Russia, in the government of Koltroma; 68 miles E.N.E. of Koltroma.

KADITTE, a town of Prussia, in the circle of Natanagen; 23 miles S. of Brandenburg.

KADNIKOV, a town and district of Russia, in the government of Vologda; 10 miles N.N.E. of Vologda.

KADOM, a town and district of Russia, in the government of Tambov, or Tambof, on the river Mokcha; 108 miles N.N.E. of Tambov.

KADRAGUTA, a town of Hindooftan, in the circle of Singboom; 40 miles S.E. of Doefa.

KADROS, a town of Asiatic Turkey, in Natolia; 28 miles E. of Amafiéh.

KADSINDA, a town of Japan, in the island of Niphon; 30 miles S.W. of Nambu.

KADZURIM, a town of Hindooftan, in Bahar; 12 miles N.E. of Rotafgur.

KÆADAS, *καεαδας*; among the Lacedæmonians, a punishment for throwing their criminals into. It was of the same nature with the Athenian barathron, or orygm.

KÆKURIAGHAKA, in *Botany*, a name used by some authors for the tree which affords the gum elemi of the shops.

KÆMPFER, ENGELBERT, in *Biography*, a celebrated German physician and naturalist, was born, in the year 1651, at Lippe, in Westphalia. It appears that he was educated in Sweden, where, for some years, he cultivated with zeal and success the several studies of physic, natural philosophy, and natural history. His great desire for travelling made him seize with avidity an opportunity of accompanying the Swedish ambassador Fabricius to Persia; whom he attended in the

the capacity of secretary. He departed from Stockholm in 1683; spent a short time at Moscow, and then proceeded to Ispahan, where he remained two years. His ardour in the pursuit of knowledge had so much increased during this period, that instead of returning with Fabricius, he obtained the appointment of chief surgeon to the Dutch East India company, in which capacity he had the full enjoyment of his wishes, for he penetrated as far as the kingdoms of Siam and Japan. The geography of these parts had been but very imperfectly known, till Kæmpfer's genius and industry supplied the deficiency, and the world is indebted to him, for having first given a correct idea of the situation of different places, which had before been inaccessible to strangers. On his return to Europe in 1694, he graduated at Leyden, and settled in his own country. Here he did not remain idle, but was constantly employed in the composition of several works, and in the practice of physic. He was appointed physician to his sovereign, and terminated a useful life in the year 1716, aged 65. His inaugural dissertation, published at Leyden in 1694, is intitled "De casu observationum exoticarum." Of this a copy is preserved in Dr. Smith's library, but we have never met with any other. The subjects on which it treats are, 1, the *Agnus Scythicus*, or Borometz; 2, the bitterness of the Caspian sea; 3, of the native *Mumis*, or bitumen, of Persia; 4, of the Torpedo, or electrical fish of the Persian gulf; 5, of the drug called dragon's blood, produced by the fruit of a palm: 6, of the *Dracunculus* of the Persians, a sort of worm proceeding from a tumour in the skin; 7, on the *Andram*, or endemic hydrocele of the Malabars; 8, on the *Perical*, or ulcer of the feet among the same people; 9, on the cure of the colic amongst the Japanese by puncture with a needle; 10, on the *Moxa*, or actual cautery, of the same people and the Chinese. These subjects are, as Haller observes, all of them probably treated more fully in the great work of our author, published at Lemgow in 1712, entitled "Amoenitates Exoticæ;" and is often quoted by Linnæus for its botany, as well as other authors for its authentic details, relating to the history and manners of Persia, and other parts of the East. His history of Japan is well known by the English translation in folio, and is extremely valued for its accuracy and fidelity. Kæmpfer was skilled in the use of the pencil, as the plates of his works testify. Some botanical drawings of his, made in Japan, are preserved in the British Museum. Of these Sir Joseph Banks, in 1791, liberally presented the learned world with 59 folio engravings at his own expense. Many of the plants are still undetermined by systematic botanists. Hall. Bibl. Bot. Kæmpf. Opera.

KÆMPFERIA, in Botany, named by Linnæus in commemoration of KÆMPFER, (see that article,) was selected for that purpose with the more propriety, because of the excellent original account and figure given of the plant by this writer, in his valuable *Amoenitates Exoticæ*, 901.—Linn. Gen. 4. Schreb. 5. Willd. Sp. Pl. v. 1. 15. Mart. Mill. Dict. v. 3. Roscoe Tr. of Linn. Soc. v. 8. 350. t. 20. f. 10. Dryand. in Ait. Hort. Kew. ed. 2. v. 1. 7. Juff. 64. Lamarek Illust. t. 1.—Class and order, *Menandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. Roscoe. *Canna*, Juff.

Gen. Ch. *Cal.* Perianth superior, of one leaf, tubular, sheathing, membranous, splitting on one side. *Cor.* of one petal; tube about as long as the calyx, cylindrical, erect; outer limb in three equal, spreading, linear, acute, involute segments; inner two-lipped, the upper lip of two oblong lobes, lower of one or two broader, rounded, spreading ones. *Stam.* Filament one, erect, oblong, flat, much shorter than the limb, extending much above the anther,

and terminating in two spreading equal lobes; anther attached by its back to the middle of the filament, of two oblong, nearly marginal, rather distant lobes, meeting round the style, curling at their outer edge. *Pist.* Germen inferior, small, roundish; style thread-shaped, embraced by the anther; stigma cup-shaped, concave, fringed, projecting a little beyond the anther. *Peric.* Capsule roundish, somewhat triangular, of three cells and three valves. *Seeds* several.

Eff. Ch. Anther two-lobed. Filament extending above the anther, two-lobed at the top. Outer limb of the corolla in three equal, linear, acute lobes; inner two-lipped.

1. *K. Galanga*. Galangale. Linn. Sp. Pl. 3. Hort. Cliff. 2. t. 3. Redout. Liliac. t. 144. Sims in Curt. Mag. t. 850. (Wahom; Kæmpf. Amoen. Exot. 901. t. 902).—Upper segments of the inner limb of the corolla obtuse, slightly three-lobed; lower ones deeply separated, undulated. Leaves depressed, broad-ovate, pale beneath.—Native of the East Indies. Kæmpfer met with it in Japan in a cultivated state only. With us it is rare; kept in the stove, and flowering in July. The root is perennial, tuberous, throwing out elliptical stalked knobs, like the Peony. These are fleshy and white within, with a grateful and pungent aromatic flavour, which remains long after they are dried. They are still used in the East for their stomatic and tonic properties, but are laid aside in European practice. *Siam* none. *Leaves* several, sheathing, spreading in a depressed position, three or four inches long, and nearly as broad, many-ribbed; dark-green, and smooth above; paler, glaucous and downy beneath. *Flowers* several, radical, sessile, in the centre of the leaves, white, with two purple spots at the base of the lower or front lobes of the inner limb. We cannot help remarking the superiority of Linnæus's fine engraved plate over any coloured one that has met our notice.

2. *K. rotunda*. Round-rooted Kæmpferia. Linn. Sp. Pl. 3. Sims in Curt. Mag. t. 920. Woods. Med. Bot. t. 133. (K. longa; Jacq. Hort. Schoenbr. v. 3. 37. t. 317. Redout. Liliac. t. 49. Malan-kua; Rheede Hort. Mal. v. 11. 17. t. 6).—Upper segments of the inner limb of the corolla acute, entire; lower ones deeply separated, obovate. Leaves erect, elliptic-oblong, acute, coloured beneath.—Native of the East Indies. Mr. Miller is said to have cultivated it in 1768, but the plants, now not unfrequent in the stoves of this country, all probably originated from what Sir George Yonge introduced in 1791. The knobs of the roots, rather less oblong than those of the former, are pungent and aromatic. The leaves grow upright, and are a foot long, remarkable for the fine purple colour of their under side. The flowers appear early in the spring, before the leaves, with a few sheathing green bractæ that grow likewise from the root. They are sweet-scented, white, except the lower lip, which is of a light purple, prettily variegated.

3. *K. angustifolia*. Narrow-leaved Kæmpferia. Roscoe Tr. of Linn. Soc. v. 8. 351.—Upper segments of the inner limb of the corolla linear, obtuse; lower one emarginate. Leaves lanceolate, pale beneath.—Native of the East Indies, from whence it was introduced into the Kew garden in 1797 by Sir Joseph Banks. It flowers in the stove, about March or April. Mr. Roscoe examined it in the botanic garden at Liverpool, and all our knowledge of this species is comprized in the above definition.

4. *K. ovata*. Ovate Kæmpferia. Roscoe, *ibid.* (Manjankua; Rheede Hort. Mal. v. 11. 19. t. 10).—Lower segment of the inner limb of the corolla lanceolate, undivided. Leaves ovate.—All our knowledge of this plant is derived from the Hortus Malabaricus, from whence Mr. Roscoe adapted

adopted it, there being no doubt of the genus. It is there said to be perennial, flowering in April and May. The root is a globose tuber, an inch in diameter, yellow internally, with concentric red and orange lines; of a very strong taste and smell, resembling ginger and saffron. Leaves a foot long, elliptical, pointed, tapering down into sheathing footstalks, of a pleasant scent and bitterish taste. Flowers six or seven from the centre among the leaves, short-lived, white with a tinge of red, their tube much longer than the limb. Rheede's figure displays the generic character sufficiently well, and shows the lip, or lower segment of the inner limb to be undivided, ovate, acute, and wavy. Seeds rarely perfected. The *Curcuma rotunda* of Linnæus seems chiefly to depend on this synonym of Rheede. His herbarium throws no light upon the matter.

KEMPERIA Rotunda, in the *Materia Medica*. See ZEDOARY.

KAEN, in *Geography*, a town of Africa, and capital of a kingdom, on the banks of the river Gambia. N. lat. 13°.

KAFAR TUTHA, a town of Asiatic Turkey, in the province of Diarbekir; 32 miles S.W. of Nisibin.

KAFER, a town of Persia, in the province of Farsistan; 40 miles S. of Schiras.

KAFFABA, a town of Africa, and capital of a kingdom of the same name, in Soudan. N. lat. 11° 45'. W. long. 0° 12'.

KAFFERS, or rather KOUSSIS, a tribe of people who inhabit those parts of Africa that lie to the north and east of the colony of the Cape of Good Hope. Mr. Barrow has not been able to ascertain how far the belt of country extends in width across the southern part of Africa, that is inhabited by the Kaffers; but the points on each coast to which they do not extend are sufficiently determined. To the southward of the Portuguese settlement of Rio de la Goa, the natives are Kaffers, but appear to be a degenerated race. They are, however, free; nor has Portuguese avarice yet dared to attempt to make them slaves. This is not the case to the northward. At Mozambique and Sofala, the black people are all negroes; not indeed the natives of the sea-coast, but such as are brought down from the interior as articles of trade. From Mozambique, they have now a direct communication across the continent with their settlements of Congo, Loango, and Benguela, on the west coast, as appears from the information of a Portuguese slave merchant, between which negro merchants are established in different parts of the country. In the line of this route there are therefore no Kaffers. It further appears that another powerful tribe of the same nation, called "Baroloos," inhabit the country under the southern tropic, nor are they the sail to the northward. According to the account given of this people, they are of a kind and friendly disposition; their town is so extensive, that if a person set out in a morning from one extremity and travelled to the other, he would not be able to return before the following day; and contains many thousand inhabitants; the people are very ingenious in carving of wood, and have furnaces for smelting both copper and iron. They are very rich in cattle, and their gardens and lands are better cultivated, and their dwellings much superior to those of *Leetakoo*, which see. The "Damaras" also, who possess the art of smelting copper from the ore, are inhabitants of the tropic; and they are complete Kaffers, differing in no respect from those on the eastern coast. Mr. Barrow, therefore, supposes, that a line drawn from the 24th parallel of latitude on the E. coast to the 20th on the W., may nearly mark the boundary between the Kaffers and the Negroes.

An open and manly deportment, says Mr. Barrow, free

from suspicion, fear, or embarrassment, seems to characterize the Kaffer chiefs. Though extremely good-humoured, benevolent, and hospitable, they are neither so pliant nor so passive as the Hottentot. Those of the poorer class sometimes seek for service among the boors, and engage themselves for so many moons in consideration of so many head of cattle; but they never suffer themselves to be duped out of their hire like the easy Hottentots. They are for the most part tall, upright, and well-made men; and in their stature and strength they exhibit satisfactory evidence that animal food is by no means necessary to promote the growth of the human species, or to add strength of fibre to the muscular parts of the body. Milk in a curdled state is the principal food of the Kaffers. To this they sometimes add a few graminaceous roots, berries of various kinds, the seeds of the "Strelitzia Regina," and the pith of a large palm, to which botanists have given the name of Zamia. They rarely kill any of their cattle, unless upon particular occasions. They possess no other domestic animals to yield them food. In the whole Kaffer country they have neither sheep nor goats, pigs nor poultry. They cultivate no kind of grain nor vegetables on this side of the Great Fish river, and very little on the other side; but the Kaffer tribes more to the westward, are very considerable horticulturists. The commissioners, sent out by the British government in the year 1804, to endeavour to procure a supply of draught oxen, found extensive fields of a species of *Holcus* near the city *Leetakoo*, the capital of a tribe of Kaffers, called "Boothoona," situated at the distance of 16 days' journey beyond the Orange river, in the direction of north-east from the Cape. The women here, as well as among the eastern Kaffers, and indeed in all nations just emerged from a savage state, went through all the hard labour and drudgery that were required for the support of the family. They not only performed the task of breaking up the ground with a kind of hoe made of iron, and afterwards planted it; but they constructed their habitations, and collected the materials that were necessary. They reaped the grain, cleared it from the husk, and laid it up in the granaries, which, with other earthen pots and wooden vessels, were the work of their hands. The men prepare the skins and hides which serve for shoes, and make them up into cloaks for themselves, their wives and children. They attend also the cattle, milk the cows, and hunt the antelopes and other game, with a weapon called the *Hassagai*, which is used also in battle.

Mr. Barrow is of opinion, that the Kaffers were not the aborigines of the southern angle of Africa; but that they might, perhaps, derive their origin from some of those wandering tribes of Arabs known by the name of *Bedouins*. Their pastoral habits and manners, their kind and friendly reception of strangers, their tent-shaped houses, the remains of Islamism discoverable in one of its strongest features, the circumcision of male children, universally practised among the Kaffer hordes, seem to indicate their Arabic origin and their affinity to the Bedouin tribes. Their countenance also is Arabic; the colour only differs, which in some tribes varies from deep bronze to jet black, but the latter is most generally the prevailing colour. Nor is it likely that they owe this colour to their connection with those blacks that are usually called negroes, as they have no resemblance, in any part of the body, to the peculiar conformation of this race of human beings. To the Ethiopians or Abyssinians they have a much closer resemblance. Barrow's Travels in Southern Africa. See CAFFRARIA and DELAGGA *Bay*, under which latter article the reader is requested to substitute Kaffers for Kuffers, a typographical error.

KAFR ERRAZI, a town of Egypt, on the left bank of the Nile; 18 miles S. of Cairo.

KAFR el Ryk, a town of Egypt, on the left bank of the Nile; 3 miles N.E. of Atheli.

KAGA, a town of Japan, on the N. W. coast of Niphon. N. lat. 57 15'. E. long. 137 40'.

KAGAN, a town of Russia, between Altrachan and the Caspian sea; 10 miles S. of Altrachan.

KAGEROD, a town of Sweden, in the province of Skone; 12 miles S.E. of Helsingborg.

KAGNAS, a small island in the gulf of Bothnia. N. lat. 64 48'. E. long. 21 7'.

KAGZEVAN, a town of Asiatic Turkey, in the government of Erzerum. N. lat. 39 35'. E. long. 43 20'.

KAHEDE, a town of Africa, on the N. side of the Senegal. N. lat. 16 8'. W. long. 11 47'.

KAHEM, or **CAHEM**, a town of Asiatic Turkey, on the Euphrates; 50 miles W.S.W. of Ana.

KAHGON, a town of Bengal; 20 miles S. of Moorshedabad.

KAHIASSCE, in the Turkish court, an officer of state, answering to our master of the ceremonies.

KAHIRIA, in *Botany*, Forsk. *Ægypt*. Arab. 153. See *ETHULIA conyzoides*.

KAHL, in *Geography*, a town of Germany, on a river of the same name, near the Maine; 4 miles S. of Hanau.

KAHLA, a town of Saxony, in the principality of Altenburg, on the Saal; 36 miles W. of Altenburg. N. lat. 50 48'. E. long. 11 27'.

KAHOKIA, a post-town of America, and chief town of St. Clair county, in the Indiana territory, containing 719 inhabitants.

KAHONE, a town of Africa, in the kingdom of Burfali. N. lat. 13 56'. W. long. 16 8'.

KAHUN, a town of Persia, in the province of Ker-man; 36 miles S. W. of Sirgjan.

KAHUNSILYA, or **KAONSALIA**, in *Hindoo History*, was the wife of Dabaratha, to whom she bore Rama, distinguished by the epithet of Chandra, (meaning Lunarian,) from other heroes of the same name. See **RAMA**.

KAI, in *Geography*, a town of Russia, in the government of Viatka, on the Kama; 124 miles N.E. of Viatka.

KAJAAGA, or **GALLAM**, as the French call it, a small negro kingdom of Africa, which occupies the extremity of the navigable course of the Senegal, terminated in this place by the cataract of F'low. This country is bounded on the N. by the Senegal, on the S.E. by Bambouk, and on the W. by Bondou and Foota Torra. The residence of the king is at Maana, within a short distance of the ruins of Fort St. Joseph, where the French had formerly a small factory. The air and climate are, according to Mr. Park, more pure and salubrious than at any of the settlements towards the coast; the face of the country is agreeably interperfed with hills and vallies, and the windings of the Senegal, which descends from the rocky hills of the interior, render the scenery on its banks picturesque and beautiful. The natives are called Sera-Woollies, and seem to be pure negroes, without any Moorish admixture, and are naturally of a mild and docile disposition. With regard to their colour, which is a jet black, they are not to be

distinguished from the Jaloffs. They are much addicted to trade, and formerly carried on a considerable commerce with the French in gold and slaves: they are reckoned tolerably fair and just in their dealings, though Mr. Park'loit among them about one-half of his goods and apparel: they are much devoted to the acquisition of wealth, and they derive considerable profit from the sale of salt and cotton cloth in distant countries. Their language abounds much in gutturals, and is less harmonious than that of the Foulahs; it is, however, well worth acquiring by those who have occasion to travel through this part of the African continent; as it is very generally understood in the kingdoms of Kallon, Kaarta, Ludamar, and the northern parts of Bambarra. In all these countries the Sera-Woollies are the chief traders.

KAIDA, in *Botany*, Rheede Hort. Mal. v. 2. t. 1.—S. See **PANDANUS**.

KAIDERM, in *Geography*, a town of Persia, in Segeistan; 50 miles W. of Zarang.—Also, a town of Persia, in the province of Khorasan; 15 miles E. of Turfraz.

KAI-FONG, or **CAI-FONG**, a city of the first rank in China, the capital of Ho-nan, situated at the distance of two leagues from the river Hoang-ho. As the river is higher than the city, it is subject to inundations, for the prevention of which, strong dykes have been raised which extend more than 30 leagues. On occasion of a siege in 1642, by an army consisting of 100,000 rebels, the commander of the troops sent to relieve it determined to drown the enemy by breaking down the large dyke of Hoang-ho; the stratagem succeeded, the city was overflowed, and 300,000 inhabitants perished. It has been rebuilt since this calamitous event, but in a style far inferior to that of its former magnificence. Its jurisdiction comprehends four cities of the second class and 30 of the third.

KAIGOL, a town of Persia, in the province of Khorasan; 225 miles N. of Herat.

KAIGUEZ, a town of Asiatic Turkey, on the S. coast of Natolia; 18 miles S. of Mogla. N. lat. 36 50'. E. long. 28 10'.

KAIGUM, a town of Hindoostan, in the circle of Aurungabad; 30 miles S.W. of Aurungabad.

KAIIHA, a town of Sweden, in the province of Tavastland; 60 miles N.N.E. of Jamfio.

KAJIPET, a town of Hindoostan, in the circle of Cuddapa, on the Pennar; 20 miles S.E. of Cuddapa.

KALAFUETUEVSKOI, a town of Russia, in the government of Irkutsk, on the Argun; 160 miles S.S.E. of Nerzhinsk.

KALIASA. Hindoo mythologists have assigned different places of resort or habitation to their different deities: that of Siva is Kailasa, sometimes written Calasa, which is described as one of the three peaks of the wonderful mountain, Meru. (See **MERU**.) Here the gods, with their comforts, animated with music, dancing, and ambrosia, called by the Hindoos *amrita* (see **KURNAVATARA**), pass their hours in banquets and happy dalliance, reminding us strongly of the tales of our own classics; and appearing indeed to be the same stories under different names. This similarity occurs in every page of Moor's Hindoo Pantheon, although the author in that work professes to avoid the discussion of such similitudes. (See **KALYA**.) The following instance, from page 47, will further illustrate this and the present article. "The comparison between Siva and Jove runs parallel in many instances. In the capacity of avenger and destroyer Jove overthrew the Titans and giants whom Typhon, Briareus, &c. led against the god of Olympus, to whom an eagle brought lightning and thunderbolts during the warfare.

In a similar contest between Siva and the Daityas, or children of Diti, who frequently rebelled against heaven, Brahma is said to have presented the god of destruction with fiery shafts. As the Olympian Jupiter fixed his court and held his councils on a lofty and brilliant mountain, so the appropriated seat of Mahadeva, whom the Saivas consider as the chief of the deities, is mount Kailasa, every splinter of whose rocks is an incalculable gem." Kailasa is therefore the Olympus of Siva or Mahadeva. See SIVA.

KAIMACHAN, among the Turks. See CAMACHAN.

KAIMENI, in *Geography*, a small island in the Grecian Archipelago. N. lat. $36^{\circ} 57'$. E. long. $23^{\circ} 26'$.

KAIMO, a town of Africa, in Bambaarra, seated on the Niger. N. lat. $13^{\circ} 56'$. W. long. $3^{\circ} 46'$.

KAIMOW, a town of Hindoostan, in Bundelcund; 12 miles N. of Chatterpouir.

KAIN, a town of Persia, in Cohestan; 60 miles S.S.W. of Herat.

KAINER, a town of Persian Armenia; 24 miles S.E. of Erivan.

KAINGERSKOI, a small island in the North Pacific ocean, near the east coast of Kamtschatka, belonging to Russia. N. lat. $53^{\circ} 40'$. E. long. 160.

KAINSK, a town of Russia, in the government of Tobolsk, on the Om. N. lat. $56^{\circ} 55'$. E. long. $77^{\circ} 54'$.

KAIRA, a town of Hindoostan, in Guzerat; 10 miles S.S.W. of Mahmoodabad.

KAIRABAD, a town of Hindoostan, and capital of a circar in Oude, to which it gives name. The circar is bounded on the N. by Thibet, on the E. by Bahraitch, on the S. by Lucknow, and on the W. by Rohilcund; and is about 80 miles long and from 50 to 76 broad. The town is 86 miles N.W. from Fyzabad. N. lat. $27^{\circ} 30'$. E. long. $81^{\circ} 5'$.

KAISARIEH, anciently *Mazaca* and *Cesarea of Cappadocia*, a town of Asiatic Turkey, in the province of Caramania, the capital of a Sangiakat, situated at the foot of a mountain, always covered with snow, about five or six miles in circumference; surrounded with walls and defended by a castle. This town is well peopled, and in each of the 150 districts to which it is divided, it has a mosque or chapel. The Greeks have two churches, one of which is a Metropolitan, and the Armenians have three. The article which constitutes its principal trade is Morocco leather; 250 miles E.S.E. of Constantinople. N. lat. $38^{\circ} 20'$. E. long. $35^{\circ} 48'$.

KAISENI, a town of Bucharia, on the Ardgis; 23 miles N.W. of Bucharst.

KAISERBERG, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Colmar. The place contains 2428, and the canton 13,606 inhabitants, on a territory of 125 kilometres, in 23 communes; 15 miles N.W. of Colmar.

KAISERSBERG, a town of the duchy of Stiria, having a castle on a hill; 5 miles S.W. of Leoben.

KAISERSECH, a town of France, in the department of the Rhine and Moselle, and chief place of a canton, in the district of Coblenz; 12 miles W. of Coblenz. N. lat. $50^{\circ} 18'$. E. long. $7^{\circ} 2'$. The place contains 435, and the canton 2413 inhabitants, in 16 communes.

KAISERSLAUTERN, a town of France, and principal place of a district, in the department of Mont Tonnerre; 24 miles N.W. of Landau. N. lat. $49^{\circ} 27'$. E. long. $7^{\circ} 47'$. This town was ceded to France by the elector of Bavaria in 1802. The place contains 2363, and the canton 8640 inhabitants, in 21 communes.

KAL-TONG-GI, a town of the island of Borneo; 60 miles S.S.E. of Negara.

KAJUC, a town of Afa, in the country of Kharafin; 23 miles N.W. of Samarang.

KAKA-PAKSHI-DHARA, a name of Rama; in Hindoo history, and of other warriors, who had a habit of shaving their heads, leaving only the hair projecting over their ears, which was fancied to resemble the wings of a crow. The name means *heaving-crow-wings*.

KAKA-TODDALI, in *Botany*, Rheede Hort. Mal. v. 5. St. t. 41, is *Paulinia africa* of Linnaeus, distinguished as a new genus by Jusseu, under the uncouth name of *Toddalia*, and by Schreber under that of *Cranzia*. There having been another genus already given to professor Crantz; Dr. Smith has called that of which we are speaking *Scopolia*, Plant. Ic. under t. 34. See SCOPOLIA.

KAKATOES, in *Ornithology*. See PSITTACUS.

KAKBERG, in *Geography*, a town of Prussia, in the Frisk Nering; 18 miles E.N.E. of Vogelfang.

KAKEGAVA, a town of Japan, in the island of Nippon; 95 miles S.W. of Jedo.

KAKELIK, in *Ornithology*, a species of *Tetrao*; which see.

KAKHET, or KAKHETTY, in *Geography*, the eastern part of the principality of Georgia, comprehending a part of the ancient Iberia, about 180 miles long and 90 broad. This state, as well as Karduelia, borders northwards on the Kabarda, eastwards on Daghestan, southwards on the Persian Armenia, and westwards on Immeritia. This state and Karduelia are under the sole sovereignty of a prince of the Kakhethian dynasty. The residence is Tefis. The air is salubrious, but the country is thinly inhabited. The town Kaket, in this province, is situated near mount Caucasus; 45 miles N.N.E. of Tefis. See GEORGIA.

KAKI, a town of Japan, in the island of Nippon; 70 miles N. of Meaco.

KAKILAN, a town of Persia, in the province of Segeitan; 65 miles N. of Boft.

KAKILE, in *Botany*, Broter. Lufit. v. 1. 498. See CAKILE, and BUNIAS, sp. 12.

KAKKABBAN, in *Geography*, an island in the East Indian sea, being one of the group called "Meritaba"; 40 miles from the E. coast of Borneo. N. lat. $2^{\circ} 8'$. E. long. $116^{\circ} 50'$.

KAKKAWATA, one of the Friendly islands.

KAKOPIT, in *Ornithology*. See CERCITHA *Amboinensis*.

KAKOULI, in *Geography*, a town of Turkish Armenia; 23 miles E. of Baibourdi.

KAKURI, a town of Japan, in the island of Nippon; 85 miles N.E. of Meaco.

KAL, or KALA, in *Hindoo Mythology*, a name of Siva in his character of the *Destroyer*, in which he agrees with Saturn or Time, and is called also Maha-kala, *naba* being an epithet equivalent to *great*. Kali, or Maha-kali, is a name of his consort Parvati, in one of her avenging or terrific characters, as she appears in several of the plates of Moor's Hindoo Pantheon, wherein one of Kal is described as "Eternity, at the period of Maha-pra-laya, or grand consummation of all things. In the original he, like his name, is *black*; he holds the roll of fate, and a scymitar to execute its destructive decrees. He devours man, his own offspring, towns, cities, "the great globe itself and all that it in herits"—the univereal. The great personified powers of the Almighty, Brahma, Vishna, and Siva, "alike await the inevitable doom;" they also "fall into the jaws of non-existence." Kala will then, like Saturn, destroy himself, and nothing will remain but Brahm; the eternal one," p. 30. See KALI, KALPA, and MAHA-KALA.

KALAAAT-EL-NEGUER, in *Geography*, a town of Asiatic Turkey, in the province of Diarbekir; 25 miles S. of Bir.

KALADGIK, a town of Asiatic Turkey, in Natolia; 8 miles S.E. of Kiangari.

KAL-AGNI-RUDRA, in *Hindoo Mythology*, a name of Siva, or rather three of his names combined. Kal is his name as Time, Agni as Fire, Rudra as Fate. See **KAL**, **SIVA**, and **RUDRA**.

KALANSHEE, in *Geography*, a town of Africa, in the country of Gonaah.

KALANTEKA, in *Hindoo Mythology*, is a name given to Yama, the judge of departed souls. (See **YAMA**.) It means the destroyer of Kal, or of Time, and is a personification of great boldness. See **KAL**.

KALATOE, in *Geography*, an island in the East Indian sea, about 30 miles in circuit. S. lat. $7^{\circ} 18'$. E. long. $122^{\circ} 15'$.

KALATU SERID, a town of Persia, in Farfistan; 10 miles N. of Neubendjan.

KALBA, a town of Persia, in the province of Mazanderan; 60 miles E. of Fehrad.

KALBRA, or **KELBRA**, a town of Germany, in the principality of Schwarzburg-Rudolstadt, on the Helm; 27 miles N. of Erfurt. N. lat. $51^{\circ} 28'$. E. long. $11^{\circ} 4'$.

KALCKREUTH, a town of Germany, in the territory of Nuremberg; 7 miles N. of Nuremberg.

KALCOBO, a small island in the East Indian sea. S. lat. $5^{\circ} 20'$. E. long. $117^{\circ} 39'$.

KALDEKIRCHEN, a town of France, in the department of the Roer; 8 miles N.N.E. of Ruremond.

KALDI, **GEORGE**, in *Biography*, a native of Hungary, was born in Timaw about the year 1572, and from his connections he might probably have attained to considerable preferment in the church, but he preferred enrolling himself in the society of the Jesuits. He was received into the order at Rome, and returning to his own country, he was banished into Transylvania, with the other members of the society, during the commotions which, at that time, agitated the kingdom. After this he discharged the duty of theological professor in the university of Olmutz, and filled some other important posts in different places. His last retreat was to a college which he built at Presburg, where he died, in the year 1634, at the age of sixty-two. He was regarded as one of the most eloquent preachers in Hungary. He published a volume of sermons at Presburg in 1631, but he is chiefly celebrated, as an author, for having undertaken and completed a translation of the bible from the Vulgate into the Hungarian tongue, which was printed at Vienna, in 1626.

KALDUROSAN, in *Geography*, a town of Wallachia; 10 miles N.N.E. of Buchareit.

KALE, **WILLIAM**, in *Biography*, a painter of still life. In the catalogue of the gallery of the Louvre, at Paris, he is called *Kalf*, and there are two exquisite works of his, uniting the merits of Rembrandt and Teniers. He was born at Amsterdam in 1635, and was a disciple of Hendrick Pot, a portrait and historical painter; of whom he learned the practice of the art, but from whom he varied in the application of it; and applied his talents, which were very considerable, in a close imitation of objects in still life; which he composed with great beauty and effect. He possessed an eye informed with the power of Rembrandt's arrangements and contrast of light and shade, and a hand, that managed the pencil with the neatness and correctness of Teniers: his pictures are therefore as agreeable perhaps as

it is possible for the art to exhibit; when the kind of subjects which he chose are represented. He died in 1693.

KALE, in *Botany*, &c. See **BORCOLE**, **BRASSICA**, and **CRAMBE**.

KALE, in *Agriculture*, the common name of a plant of the brassica kind, which is occasionally cultivated in the field for the use of live flock. There are several varieties of it in cultivation, which are all very hardy in their nature, rise to a considerable height in the stems, and afford a large proportion of green food per acre. They are an excellent sheep feed in the early spring months, as March and April, throwing out fresh sprouts as the old ones become removed. The bite of sheep is not by any means injurious to them; and they are capable of being fed off without harding, which is a very considerable advantage in most situations. See **BORCOLE** and **BRASSICA**.

KALE, in *Gardening*, the common name of a hardy tall growing plant of the cabbage kind; of which there are several varieties cultivated in gardens for winter and spring use, but the curled sorts are probably the best for the table. They are capable of being had recourse to for a considerable length of time, as they throw out sprouts in great abundance, and are ready in these severe parts of the winter season when but few other greens can be procured, especially in the more northern parts of the island. See **BRASSICA** and **BORCOLE**.

KALENBERG, in *Geography*, a general name given to a ridge of Aultrian mountains, extending from near the source of the river Save, towards the Danube, about 9 British miles on the west of Vienna, where it is called Leopoldsborg; and supported by Bulching to be the ancient Cetus. This ridge of Kalenberg was the western boundary of Germany till about the year 1040, when it was removed E. to the river Leitha.

KALENDAR. See **CALENDAR**.

KALENDERI, in *Hindoo Mythology*, a daughter of Surya, or the Sun; spoken of also as a water nymph. She is one of the eight wives of *Krishna*, which see.

KALENDS. See **CALENDS**.

KALF, in *Geography, a town of Sweden, in West Gothland; 45 miles S. E. of Gotheborg.*

KALFSKAR, a small island on the east side of the gulf of Bothnia. N. lat. $63^{\circ} 34'$. E. long. $20^{\circ} 53'$.

KALFVEN, a small island on the west side of the gulf of Bothnia. N. lat. $61^{\circ} 3'$. E. long. $17^{\circ} 7'$.

KALGAGICHA, a town of Russia, in the government of Archangel; 40 miles S.S.W. of Oneg.

KALGAPOL, a town of Hindoostan, in Dowlatabad, on the Beemah; 12 miles S.W. of Naldourouk.

KALGUEV, an island in the Frozen sea, about 140 miles in circuit; 240 miles N.N.E. of Archangel. N. lat. $68^{\circ} 20'$ to $69^{\circ} 18'$. E. long. $45^{\circ} 30'$ to $47^{\circ} 30'$.

KALHAT, **CALHAT**, or *Calphat*, a town of Arabia, in the province of Oman, at the mouth of a river of the same name, which runs into the Arabian gulf; 80 miles S.E. of Maskat. N. lat. $23^{\circ} 10'$. E. long. $58^{\circ} 25'$.

KALHAT, *Cape*, or *Ras Kalbat*, a cape on the E. coast of Arabia. N. lat. $23^{\circ} 18'$. E. long. $58^{\circ} 30'$.

KALI, in *Agriculture*, the common name of a plant of the sea kind, which affords a saline matter by incineration, which, in many sorts of soil, is employed with great advantage as a manure, in combination with other substances. See **QUERCUS MARINA**, and **SEA-WEED**.

KALI, in *Botany*, Tournef. Inst. 247. t. 128, an Arabic name. (See **SALSOOLA**.) The same appellation has been given to various succulent alkalescent plants.

KALI, in *Chemistry*. See **CARBONAT** of *Potash*, and **ALKALI**.

KALI, in the *Matrīa Medica*. See **SALSOLA** and **SODA**, and also **ALKALINE**.

KALI, in *Hindu Mythology*, a name and form of the goddess Parvati, consort of Siva, in his character of *Kal or Time*, which see. Under this name and form she is of a terrific appearance, and is thus described in Moor's *Hindoo Pantheon*, p. 151. "Maha-kali, or the Great Kali, black and dreadful, is encompassed by symbols of destruction: two of her hands seem employed in the work of death; of the other two, one appears pointing downwards, alluding to the universal havoc which surrounds her, while the other, pointing upwards, seems to promise the resurrection of nature by a new creation. She is represented without a crescent (the artificial measure of time), because it is unnecessary to her character as the hieroglyphic of eternity; but the belief of the Hindoos in successive destructions and renovations of the universe (see **KALPA**), accounts for her wearing a *mund mala*, or necklace of skulls, as emblems of those revolutions." In that work are many plates of this deity under various names, including Bhadra-kali, as well as Maha-kali. Kali is the Hindoo name of the Nile, in the vicinity of which the scene of some of the Puranas is laid; and they relate, indeed, that the river itself is but a transformation of Kali, which, in Sanscrit and other Indian languages, means *black*; as does Nila, another of her names, or rather *dark blue*: the following also are names of this multi-form deity, and have a like meaning: Aita, Shyama, or Shyamala, Mekara, Anjanabha, Krishna. (Ibid. p. 157.) Other plates in the same work, representing the goddess, are thus described: "Plate 27. is taken from a brass cast deposited by the author in the museum at the India-house: it is eighteen inches high, including the pedestal, which is about a foot in diameter, six inches deep and hollow, as if intended to be fixed on something; and I was told such images are occasionally fastened on the top of the *rat'ba*, a carriage dragged about the streets on certain festivals. Kali is said to assume this form to frighten sinners into repentance and virtue: her attitude seems a chacing one, assumed to cause immediate terror; her limbs bend; her hands are open, fingers lengthened into points, stretched out; a serpent forms her girdle; she is naked, except a scanty cloth, called *pirca*, round her middle; her belly is empty, thin, and shrivelled; her breasts pendent, with long disgusting nipples; a serpent convolves round her neck, and, twining on her bosom, projects its head to support her protruded, long, rough tongue: her chin is peaked; immense teeth and tusks are fixed in her lips and gums; her nostrils and goggle eyes are distended and bloated; snakes form appropriate rings for her many ears, being knotted in the pendent lobes, with their heads raised, and their hoods expanded; her hair is stiffened out, forming a frightful glory round her head, diverging to meet a wider glory that rises from a flower on each side, forming a support to the figure. The cast is of brass; and, however disgusting to the eye, is far from being devoid of merit: our engraving is taken from an exact portrait, and exhibits considerable expression." P. 159.

"Plate 28. is from a very fine bronze image, about a foot high, cast, I was informed, in the Carnatic. It was presented to me by a Brahman, and is, I think, on the whole, the most elegant and best finished figure in my possession. She is, in this form, called Bhadra-kali, Maha-kali, and by other names; also, being eight-handed, Ahtabuja. Two of her hands are empty, pointing upward and downward, in the position before noticed; one of her right hands holds something, not unlike a caduceus, which, in the cast, it resembles more nearly than in the plate; its corresponding left hand the *Paura* (see **PATRA**) or cup: the

next right and left hands, a singular crooked sword, and a shield with an embossed flower or fruit: the superior right hand has an agricultural implement, called *masa*; in the left the cord *pas*, or *paśa* (see **PASHA**), to catch or strangle sinners with. Her line person is full dressed, with a profusion of ornaments; between her full breasts a five-headed serpent appears itself; she has a necklace of human heads; her earrings are elephants; and a row of snakes' heads peep over her coronet. Her forehead is marked either with Siva's third eye (see **VRUPAKSHA**), or her own hieroglyphic; and her open mouth shows her teeth and tusks, giving her a fierce and threatening aspect." P. 160.

KALININA, in *Geography*, a town of Russia, in the government of Tobolsk, on the Tunguska. N. lat. 60° 56'. E. long. 106° 26'.

KALIPH. See **CALIPH**.

KALISCH, or **KALITZ**, in *Geography*, a city in the duchy of Warsaw, late the capital of a palatinate of the same name in Great Poland, or Western Prussia, situated on the Protna, and surrounded with walls, towers, and moorings. This palatinate was also called the "palatinate of Gnesen," from the city of that name; 57 miles N.E. of Breslau. N. lat. 51° 50'. E. long. 18°. See **GNESEN**.

KALITVA, a TOWN and district of Russia, in the government of Voronez, situated on the rivulet Kalitva; which falls into the Don; 60 miles S.E. of Voronez.

KALITVENSKAIA, a town of Russia, in the country of the Cossacks, seated on the Donetz.

KALIYA, or **KALANAGA**, in *Hindu Mythology*, a serpent slain by Krishna, who, being the Sun, corresponds in this, and many other instances, with Apollo, the slayer of Python, both of whom, according to Clemens, were adored at Delphi; and in like manner both Krishna and Kaliya find adorers in India, where, in honour of Krishna's triumph, games and sports are annually held, as the Pythic games were at stated times in Greece. Like the Pythonic serpent in the temples of Apollo, Kaliya-naga enjoys also his apotheosis in those dedicated to Krishna; nor, says major Moor, in his *Hindoo Pantheon*, whence we have taken this article, "are arguments wanting toward identifying Serpenterius on our sphere with his formidable foe, and the theatre of the conflict, the river Yamuna, or Jumna, with the via lactea. So the variety of demons sent to annoy Krishna, are, perhaps, the allegorical monsters of the sky, attempting in vain to obstruct his apparent progress through the heavens, where other constellations are fabled as so many beautiful nymphs ready to receive him, and have given rise to allegories of his incontinency." (See **KRISHNA**.) Other names of this mighty mythological serpent are, *Naga*, *Sesha*, and *Vasoky*, which see.

KALIYANA-RAYA, a name of Vishnu among the Hindoos, of whom there is, under this name, a statue at Barra, on the banks of the Euphrates, which is said to be carefully concealed from the sight of the Mahometans.

KALKA, or **KALKA-PIRA**, in *Geography*, a river of Chinese Tartary, which, though one of the smallest, gives name to the *Kalkas*. It rises in a famous mountain, called Suelki, or Siolki, which name may be applied to the ridge that separates the Kalkas from Chinese Daouria, and which is 130 miles W. distant from Teitecar. This river empties itself into the lake Coulan.

KALKALLY, a town of Hindoostan, in Dowlatabad; 20 miles E. of Nandur.

KALKAS, a tribe of Tartars, consisting formerly of more than six hundred thousand families, which inhabit the country that lies N. of the Mogul Tartars. Their country,

which stretches as far as the kingdom of the "Eleuthes," is near 500 leagues in extent from east to west. In this region was anciently situated, towards the 45th degree of N. latitude, the city of "Karakan;" the seat of the empire of Tichinghis-kan, and of that of his successors. The Kalkas live in tents along the banks of the rivers which water their country; of which the principal, though they take their name from Kalka-pira, are the Kerlon, Toula, Touy, and Salangué. The banks of these rivers are well inhabited, and they flow through extensive plains, which are covered with rich pastures; their waters are very wholesome, and abound with excellent fish, especially trout. The vast desert, called "Cobi," (which see,) occupies almost the whole northern part of the country of the Kalkas. The war which the king of the "Eleuthes" (see KALMUKS) carried on in 1688 against the Kalkas almost destroyed the whole nation. To avoid the pursuit of a superior enemy, they supplicated the assistance of the Chinese arms, and offered to submit to the empire. Kang-hi undertook their defence, conquered the king of the Eleuthes, and kept the Kalka Tartars under his dominion, after having conferred upon their princes different titles of honour.

KALKATA-GARGAR, a country of Chinese Tartary, which contains one class of Mongul Tartars. N. lat. 41° 50'. E. long. 110 35'.

KALKE, one of the Prince's islands, in the sea of Marmora; anciently called "Chalcitis," on account of its mines of copper, which have been long neglected. On this island are three large Greek monasteries.

KALKI, in *Hindoo Mythology*, is the name given to an expected *avatara*, or manifestation of the god Vishnu. (See **VISHNU**.) The incarnations of this deity are numerous; but ten of them are of more importance than the others, and are, for distinction, called the ten incarnations, *das-avatara*. Of these nine are past; in the tenth, or Kalki, Vishnu is to appear mounted on a white horse, with a drawn scymitar, blazing like a comet, to end the kali-yug, that is, the present, or iron age, preparatory to a renovation of the world with an era of purity, or satya-yug. (See **YUG**.) In pictures, this avatara is represented by a man leading a white-winged horse. It is also called kalenki and aswah; likewise said to mean a horse; but as kal is time, and in several dialects means both yesterday and to-morrow; or, more extensively, the past and future, it is furnished by the author of the *Hindoo Pantheon*, p. 188. that the name of kalki, applied to this ender and renovator of ages, may have some allusion to that idea, rather than be confined to the form in which he is to be manifested. See **KAL** and **KALMA**.

KALKISSEE, in *Geography*, a town of the island of Ceylon; 19 miles S. of Colombo.

KALKOON, or **TURKEY ISLANDS**, a cluster of small islands in the East Indian sea. N. lat. 6 15'. E. long. 115 45'.

KALLA, a town of Sweden, in Jamtland; 42 miles N.W. of Olofsund.

KALLA, a small island on the east side of the gulf of Bothnia. N. lat. 64 20'. E. long. 23 26'.

KALLATMA, a town of Egypt; 15 miles N. of Co-Tair.

KALLERY, a town of Sweden, in the province of Smoland; 28 miles S.S.W. of Jonkioping.

KALLODRA, a town of Hindoostan, in Guzerat; 16 miles N. of Surat.

KALLSKYR, a small island in the N. part of the gulf of Bothnia. N. lat. 65 43'. E. long. 23 36'—Also, a small island on the E. side of the Gulf of Bothnia. N. lat. 63 55'. E. long. 22 44'—Yet another small island on the same

side of the gulf. N. lat. 63° 50'. E. long. 22° 33'.—Also, another small island on the same side of the gulf. N. lat. 63 26'. E. long. 21° 28'.

KALLVIKEN, a small island in the N. part of the gulf of Bothnia. N. lat. 64 18'. E. long. 21 7'.

KALM, PETER, in *Biography*, a very celebrated naturalist, and pupil of **Linnaeus**, the account of whose travels, from having been translated into English, is well known in this country. He was a native of Finland, and was born in the year 1715. Having imbibed a taste for the study of natural history, it appears that he purified his inclination with much zeal and industry. His first researches were rewarded by the discovery of many new plants in Sweden, of which he gave some account to the botanical world between the years 1742 and 1746. He was particularly anxious to explore the virtues of plants, both with respect to their uses in medicine, and in the useful arts, so that planting and agriculture occupied some portion of his attention. His reputation as a naturalist caused him to be appointed professor at Abo, and in October 1747, he set out upon his travels, sailing from Gottensburg for America; but on account of a violent hurricane was obliged to take shelter in a port of Norway, whence he could not depart till the ensuing February, when he proceeded immediately for London. From hence he went to North America, as we learn from his book; and having spent two or three years in exploring whatever was worthy of observation in that country, he returned to his professorship at Abo in 1751. The expenses of this undertaking appear to have exceeded what was allowed him by the Academy of Sciences, so that our author was obliged to live rather penuriously upon his return. Yet we are informed that he found means to cultivate, in a small garden of his own, several hundred plants, for the use of the university, as there was no public botanical garden at Abo. "His discoveries in botany were materially enriched the *Species Plantarum* of his great master, and the *Linnaean Herbarium*; abundantly with specimens brought home by him, distinguished by the letter K." Haller enumerates a long list of tracts published by Kalm, and his inaugural dissertation appeared in the *Annalibus Academiæ* of **Linnaeus**. He was originally intended for the ecclesiastical profession, but was drawn aside from this pursuit by attending the lectures of **Linnaeus** on natural history, given in the university of Upsal. Indeed, it was through the recommendation of **Linnaeus** that professor Kalm was fixed upon to undertake the voyage to North America. He afterwards made, at his own expense, a very extensive tour into Russia, the history of which never appeared in print, but which is supposed to have furnished considerable matter for the work of a Swedish writer, who published a book of travels in that kingdom. Kalm was a member of the Royal Swedish Academy of Sciences, and departed this life in the year 1779, aged 64. His collection of dried plants, made in his various journeys, and doubtless valuable for the purposes of botanical information, is said to remain in the hands of his family in a state of neglect. Hall. Bibl. Bot. Aikin. Gen. Biogr.

KALMIA, in *Botany*, a genus named by **Linnaeus** in honour of his friend and pupil Peter Kalm, D.D. professor of Economy at the university of Abo. (See **KALM**.) *Linna. Gen.* 217. *Schreb.* 293. *Willd.* Sp. Pl. v. 2. 6co. *Mart. Mill. Dict.* v. 3. *Ant. Hort. Kew.* v. 2. 64. *Jurt.* 158. *Lamarck Dict.* v. 3. 345. *Illustr.* t. 353. *Gartn.* v. 6. 3.—Class and order, *Decandria Monogynia*. *Nat. Ord.* *Bicornes*, *Linna. Rhododendro*, *Juss.*

Gen. Ch. Cal. Perianth inferior, small, permanent, divided into five, subovate, acute, rounded lobes. Cor. of the petals, slender or furnished; tube cylindrical, longer than

the calyx; limb with a flat disk, the margin upright, five-cleft half way down; ten little horn-like cells projecting outwardly from the corolla, and surrounding it where the border is upright. *Stam.* Filaments ten, awl-shaped, slightly spreading, a little shorter than the corolla, at whose base they are inserted; anthers with two pores. *Pist.* Germen superior, roundish, furrowed, style thread-shaped, longer than the corolla, declining; stigma obtuse. *Peric.* Capsule somewhat globose, depressed, five-celled and five-valved. *Seeds* numerous.

Eff. Ch. Calyx in five deep segments. Corolla cup-shaped, with ten prominent veins. Anthers with two pores. Capsule with five cells.

1. *K. latifolia*. Broad-leaved Kalmia. Linn. Sp. Pl. 560. Curt. Mag. t. 175. Sm. Inf. of Georgia, t. 37.—“Leaves ovate-elliptical, ternate and scattered. Corymbs terminal.”—Professor Kalm relates that he found this species in various parts of North America, and especially in the province of Pennsylvania, on the sides of hills, and occasionally in woods, which were enlivened by its foliage when most other trees had lost their verdure. It was covered with a profusion of beautiful blossoms in the month of May.—*Stem* 10 or 12 feet high, branched. *Leaves* rigid, bright green above, pale beneath, on short footstalks. *Flowers* in a round bunch, sitting very close to the branch, of a pale bluish colour, variegated beautifully with crimson.

2. *K. angustifolia*. Narrow-leaved Kalmia. Linn. Sp. Pl. 561. Curt. Mag. t. 331.—“Leaves lanceolate. Corymbs lateral.”—A native soil of North America, flowering from May to July.—*Stem* from three to six feet high, divided into small woody branches, covered with a dark grey bark. *Leaves* of a shining green colour above, paler beneath, obtuse, on short footstalks, placed without order, varying in breadth. *Flowers* in loose, lateral bunches, of a bright red colour when they first open, but afterwards fading to a bluish or peach-colour.—There are two varieties of this species mentioned in the *Hortus Kewensis*, one with red, the other with pale flowers.

3. *K. glauca*. Glaucous Kalmia. Willd. n. 3. Curt. Mag. t. 177. Ait. Hort. Kew. v. 2. 64. t. 8.—“Leaves opposite, oblong, smoothish, glaucous underneath, revolute at the margin. Corymbs terminal. The little branches two-edged.”—Discovered by Sir Joseph Banks at Newfoundland, and introduced into this country in 1767. It flowers in April and May.—This *shrub* is about two feet in height. *Stems* branched, round, reddish-brown. *Leaves* embracing the stem, each furnished with a broad, longitudinal, yellowish rib. *Flowers* on very long stalks, about five or six in a bunch, of a beautiful pink or rose-colour.—It much resembles *latifolia* in habit, but is considerably smaller, and of more humble growth.

4. *K. hirsuta*. Hairy Kalmia. Willd. n. 4. Curt. Mag. t. 138.—“Leaves opposite and alternate, elliptical, hairy. Flower-stalks axillary, single flowered.”—A native of South Carolina, in a swampy soil. It flowers in the autumn.—*Stem* upright, slender, about three feet in height, branched. *Leaves* small, bright-green, numerous. *Flowers* purplish, axillary, each growing on a single stalk, though inaccurately described by Curtis and Martyn as being racemose. The general appearance of this species is somewhat similar to that of *Andromeda Deborahii*.

This whole genus is remarkable for its elegant flowers and foliage. It thrives well in a boggy soil, and is a general favourite in all gardens.

KALMIA, in *Gardening*, comprehends plants of the hardy evergreen shrubby kinds; of which the species mostly cultivated are, the broad-leaved kalmia (*K. latifolia*); the nar-

row-leaved kalmia (*K. angustifolia*); the glaucous kalmia (*K. glauca*); and the hairy kalmia (*K. hirsuta*). The value of the first fort, which is an elegant shrubby plant, is much lessened by its noxious properties.

In the second kind, there are varieties, with pale and deep red flowers, differing in their habit; the latter, the most humble of the two, not only produces the most brilliant flowers, but in greater abundance. This is said to be poisonous to sheep and cattle in its native situation, America.

Method of Culture.—These different plants are capable of being increased by seeds, layers, and suckers from the roots. But the first fort is most commonly raised from the seeds, which are procured from America, and sown in pots or boxes filled with light sandy mould, in the spring season, and plunged in an easterly border, or in beds of light mould, in the same aspect. However, when placed in a gentle hot-bed they succeed much better. They must, notwithstanding, be insured to the full air of the atmosphere during the summer season, having shelter in the winter from frost. As soon as the plants have had two years growth, they may be removed into separate pots, in order to be continued two years longer or more; when they may be planted out where they are to remain, in warm situations in the open ground.

The second species is mostly increased by layers, which should be made from the young shoots, and laid down in the early autumn. In a year or two, when they are become well rooted, they may be taken off, and planted separately in pots filled with bog earth, or in a warm border formed of the same sort of soil. This is a more hardy kind than the former.

The third kind is mostly increased in the same manner as the first, and demands a similar method of treatment.

The fourth is capable of being raised from layers, but the plants are preserved with difficulty in this climate.

Almost all the plants are likewise capable of being increased by suckers; which should be taken off, and planted out in the spring, in nursery rows, for two or three years, after which they may be removed to the places where they are to grow.

In the more hardy forts, these plants afford ornament and variety, when properly placed in the fronts of clumps and shrubby borders; and in those which are tender, in mixture with other potted, green-house, and other similar plants.

KALMOUA, in *Geography*, a town of Prussia, in the circle of Natangen; 12 miles S.S.E. of Marggrabowa.

KALMUCKS, OEOLETS, or *Eleuthes*, a tribe of Tartars, who affirm their home to have been between the Kokonor or Blue lake, and Thibet. Long before Tchingis-khan, according to the old reports of these people, the greatest and mightiest part of the Oelets made a military expedition westward as far as the Lesser Asia, and there lost themselves among the mountains of Caucasus; but the rest, who had staid behind in Great Tartary, received from their Tartarian neighbours, the name Khaimak (the separated). In fact they call themselves also Khalnik, though Oelets is always their peculiar denomination, which word likewise denotes a separated, disjoined, or distinct nation. The Oelets divide themselves, at least since the destruction of the Mongolian monarchy, into four main shoots, who denominate themselves Khofchet, Derbet, Soongarr, and T'orgot; and from the time of their separation from the Mongoles or Monguls, they have been uniformly subjected to various princely families. The major part of the “Kolchot” Kalmucks are said to have remained in and about Thibet and on the Kokonor, and after the downfall of the Soongarian power they have been under the protection of the Chinese. The smaller

smaller part of this flock had long before withdrawn to the banks of the Irtysh, and at length fell under the dominion of the Soongarian horde, with which it took part in the wars against China, and was also dispersed at the same time with the Soongarians. Those under the Chinese sovereignty, the still united horde of the Khofchotes, are estimated at 50,000 heads. They are reported to have had their name, which implies warrior or hero, from the courage they displayed under Tschingis; and from this circumstance, as well as their deriving their princely race in uninterrupted succession from the brother of the great Tschingis, they maintain a superiority of rank above the other Kalmuck herds. The number of Khofchotes subject to Russia is but small. In the year 1675 there came 1500, and in 1759 an additional 300 families to the shores of the Volga, where they settled and voluntarily submitted to the Russian sovereignty. The "Soongares," at the separation of the Mongolian monarchy, formed but one flock with the Derbetans, who afterwards parted, under two discordant branches of their princely family. This horde, in the 17th and beginning of the 18th century, reduced to their subjection a great part of the other Kalmuck races, particularly the Khofchot, Derbet, and Kho-it, and waged bloody wars with the Mongoles as well as with the Chinese empire itself, but which ended in their total subjugation and dispersion. Previously to this unhappy period, they, together with the Derbets, reckoned upwards of 50,000 fighting men, and were deemed the bravest, richest, and most powerful horde. They resided formerly about the Balkhash lake and its rivers Tschuy and Ily; and their most flourishing period was between the years 1696 and 1746. The towns of the eastern Bucharia and the Great Kirghise horde were about this time tributary to them. Many of the Soongarians dispersed themselves in the interior parts of Asia and quite into the Ubeck towns; some thousands of them fled into Siberia; and most of them accommodated themselves to the Chinese sovereignty, and, from their own statements, it appears, that scarcely 20,000 families of them and the Derbetan nation are now remaining. The number of the Soongares, who at that time (1758) took refuge in Russia, amounted to about 20,000 heads; they were united with the Volgaic Kalmucks, but for the most part returned with them again in the year 1770 into the Soongarey. The "Derbetans," who at first had their pasturages in the region of the Koko-noor, removed thence, on account of the Mongolian disturbances, towards the Irtysh, and, on that occasion, split into two parties. One of them united with the Soongares, in whose fortunes and final dissolution it was involved; and the other proceeded westward with the Torgots towards the Yaik (now Ural) as far as the Volga and the Don, where it completely settled. In 1723 they removed to the parts beyond the Don; and afterwards joined the Torgots on the Volga. The "Torgots" seem to have formed themselves into a particular horde much later than the other Kalmuck branches. Removing from the restless Soongares, they marched westward to the Steppes on the Volga, and there settled, receiving from the Russians the appellation of the Volgaic Kalmucks. In the year 1761 the Russian government came to an agreement with this rich and powerful horde, which restricted the authority of the khan to narrower bounds, and excited such discontents, that they returned in great numbers in 1770 and 1771, over the ice of the river Ural, across the Kirghilian Steppe, into the Soongarey. The whole amount of the Kalmucks that remained in Russia was estimated, some few years ago, at ~~more~~ what more than 20,000 tents. These are the remains of all the four herds; but the Khofchotes, the Soongares, and Torgots, who re-

mained and are distributed among the Derbet, have besides several petty princes, a khan presiding over them. They wander, with their flocks and herds, in the steppes between the Don and the Volga, from the line of Tartary as far as Caucasus; and between the Volga and the river Ural, from the Irghis quite to the Caspian; that is, in the governments of Saratof and Astrachan, and in the seats of the Cossacks of the Don. In addition to this there is still a numerous colony of "baptized Kalmucks." Towards the close of the 17th century, many, among the distinguished and noble, professed themselves of the Christian faith. In the year 1737 the government established them in a fruitful region about the rivers Samara, Sok, and Tok (in the present government of Simbirsk and in the Orenburg district of the government of Ufa), and granted them also the city of Stavropol, which is now a chief town of the government of Simbirsk. The increase of this colony was so considerable, that in the year 1771 they could reckon nearly 14,000 heads, whereas in 1754 they were only 8695. There is yet subsisting in the government of Ufa a small colony of "Mohammedan Kalmucks," which originated from individual proselytes made by the Kirghises and adopted by that body.

The Chinese empire has been lately extended in Tartary by the celebrated conquest of the kingdom of the Eleuthes, made in 1759 by the arms of the emperor "Kien-Long," who had been 46 years on the throne of China. The whole nation of the Eleuthes, known in Europe and Russia by the name of Kalmucks, may be divided (says Grofier) into three branches, which have all proceeded from the same stem. The most westerly (now the most numerous and powerful) occupy the country contained between the Caspian sea, Mufcovy, Samarcand, and Cashgar, and which extends towards the east as far as a vast chain of mountains, supposed to be a continuation of Caucasus. Every year during winter these Tartars encamp on the shore of the Caspian sea, near Astrachan, where they carry on a great trade. The second division of the Eleuthes inhabit to the east, from the chain of mountains now mentioned, as far as another chain of lofty mountains, the most considerable of which are called "Altai," in which are the sources of the Obi and Irtysh. The country which these people inhabit is very extensive; since it borders on the north with Mufcovy, and on the south with the territories of the Ubeck Tartars; these are the people whom Kien-Long has constrained to submit to the Chinese government. The third branch of the Eleuthes inhabit to the west of China; they are the Tartars of Kokonor, who have been for a long time subjects of the empire. They are separated from the province of Chen-E by lofty mountains. They take their name from a lake in that country, called in their language "Kokonor," and which is one of the largest in Tartary. They are subject to eight princes, who are independent of each other, and who are all of the race of the khan of the Eleuthes Tartars. These people derive their principal riches from the gold which is found mixed with the sand of their rivers, and above all with that of "Altangkol," or the Golden river. The gold-dust which it furnishes is the principal revenue of the princes of Kokonor, who employ their vassals during summer in collecting it. One of the principal articles of the trade of Kokonor is a kind of napped woollen stuff, called "pou-lou;" it is manufactured by these Tartars, who have the art of dyeing it in different colours; long dresses are made of it in the country, and it is generally used at Pe-king for covering seats. The famous Houg-ho, or the Yellow river, has its source in this corner of Tartary.

The Kalmucks of Asiatic Russia are divided into three ranks 3

ranks; the nobility, whom they call white bones; the common people, who are bondmen, and denominated black bones; and the clergy, descending from both, who are free. In like manner, the noble ladies are called white flesh; and the common women black flesh; but pedigrees are only reckoned by the bones. The power of the "Taidha," or chief prince, consists solely in the number and opulence of his subjects; territory being of no estimation in so wide a region. These subjects form an "Oluis," divided into "Imaks," from 150 to 300 families; each Imak being commanded by a "Saissan," or noble. If there be a great khan, or emperor, the princes are only guided by him in affairs of general importance. The tribute is about a tenth part of the cattle, and other property; but on the first summons every man must appear on horseback before the prince, who dismisses those who are unfit for the fatigues of war. The weapons are bows, lances, and sabres, and sometimes fire-arms; and the rich warriors are clothed in mail of interwoven rings, like that used in Europe till the 15th century. But they cannot oppose regular armies, and are apt even to disorder that of their allies. Tooke's View of the Russian Empire, vol. i. Grozier's China, v. l. i.

KALMUNZ, a town of Bavaria, in the principality of Neuburg, at the conflux of the Vils and the Nab; 12 miles N.N.W. of Ratibon.

KALNICK, a town of Russian Poland, in the palatinate of Braclaw; 16 miles E.N.E. of Braclaw.

KALO, a town of Hungary, fortified with a moat and bastions; 21 miles S.E. of Tokay.

KALOMBA, a town on the N. coast of the island Cum-bava. S. lat. 8° 9'. E. long. 118°.

KALOUKE, a town on the W. coast of the island Celebes. S. lat. 2° 11'. E. long. 119 15'.

KALPA, in *Hindoo Chronology*, an imaginary period, at the end of which all things are absorbed in the Deity; it seems to mean a creation or formation. "The Hindoos say that it has been revealed, that from the beginning to the end of things, when the whole creation will be annihilated and absorbed into the Supreme Being, there will be five great kalpas, or periods. We are now in the middle of the fourth kalpa, fifty years of Brahma being elapsed, and of the remainder the first kalpa is begun. These five great kalpas include five hundred years of Brahma, at the end of which nothing will remain but Brahm, or the Self-existing. Every kalpa, except the first, is preceded by a renovation of the world, and a general flood. These five kalpas have five deities, who rule by turns; and from whom the kalpas are denominated. These five deities are Devi (or Parvati), Surya or the Sun, Ganca, Vishnu, and Iwara or Siva. Brahma has no particular kalpa: he is intimate to them all. Each deity, in his own period, is called Kalsa-rupi, meaning with the countenance of Kal, or Time; or Chronus, as western mythologists would say; they having several ruling deities of that name. We are now under the reign of the fourth, Chronus, or in the kalpa of Vishnu; who to create, thought on Brahma to preserve; he fosters the whole creation in his own character, and he will ultimately destroy it through the intervention of Rudra, or Siva. It is declared in the Puranas, that all animals and plants are the linga or phallus of the presiding Kalsa-rupi deity, and that at the end of his own kalpa, he is deprived of his ling by his successor, who attracts the whole creation to himself, to swallow it up, or devour it, according to western mythologists; and at the end of his kalpa he disgorges the whole creation. Such is the origin of Chronus devouring his own offspring; of Jupiter disgorging it, through a potion administered to him by Metis, and of Chronus castrating his own father."

Moor's Hindoo Pantheon. (See KAL.) We shall extract no farther on this abrupt point of Hindoo metaphysics, in the consideration of which great difficulties are necessarily interposed.

KALPA-DRUMA, the name given by Hindoo fabulists to a tree, situated in the garden of Indra, called Nandana, which, as well as others, yield all that is desired of it. See INDRA.

KALSCHARPOVI, in *Geography*, a town of Russia, in the government of Ufa; 28 miles S.E. of Burgurudlansk.

KALSOE, one of the Faroer islands.

KALTENBERG, a town of Bohemia, in the circle of Koniggratz; 20 miles N.W. of Gitchin.

KALTENBRUNN, a town of the duchy of Courland; 24 miles E. of Seelburg.—Also, a town of Bavaria, in the principality of Sulzbach; 12 miles N.E. of Sulzbach.

KALTENSTEIN, a town of the bishopric of Passau; 10 miles N. of Passau.

KALTHOF, a town of Prussia, in the province of Smaled, near Konigsberg.

KALUA, a town of Prussia, in Pomerelia; 8 miles E. of Marienburg.

KALUADA, a town of the Arabian Irak, on the Tigris; 10 miles S.E. of Bagdad.

KALUBBLUB, a small island in the East Indian sea, near the S.W. coast of Mindanao. N. lat. 6° 46'. E. long. 121° 32'.

KALUGA, a city of Russia, and capital of a government, called "Kalatskoe," or "government of Kaluga," situated on the Occa; a place of considerable trade, and one of the most populous between Cherson and Moscow. N. lat. 54° 28'. E. long. 36 2'.

KALVOLVA, a town of Sweden, in the province of Tavastland; 12 miles N.W. of Tavasthus.

KALUOT, a small island on the E. side of the gulf of Bothnia. N. lat. 63° 21'. E. long. 21° 39'.

KALUTSKOE, or *Government of Kaluga*, a government of Russia, bounded on the N. by that of Moscow, E. by those of Moscow and Tula, S. by Orlovskoe, and W. by Smolenskoe, about 140 miles long, and from 30 to 90 broad, divided into 12 districts. See KALUGA.

KAMA. See KAMMA.

KAMA, a small island in the N. sea, near the coast of Lapland; 10 miles N. of Suroe.

KAMA, in *Hindoo Mythology*, is the god of love. "The Hindoo god," says Mr. Jones, "appears evidently the same with the Grecian Eros, and the Roman Cupid; but the Indian description of his person and arms, his family, attendants, and attributes, has new and peculiar beauties. According to the mythology of Hindoostan, he was the son of Maya, or the general attracting power, (see MAYA), and married to Reii, or Affection; and his bosom friend is *Va-fanta*, or Spring. (See these articles.) He is represented as a beautiful youth, sometimes conversing with his mother and consort in the midst of his gardens and temples, sometimes riding by moonlight on a parrot, or *lari*, and attended by dancing girls or nymphs, the former of whom bear his colours, which are a *filo* on a *red* ground. His favourite place of resort is a tract of country round Agra, and principally the plains of Matra; where Krishna also and the nine Gopas (see KRISHNA), who are clearly the Apollo and Muses of the Greek, usually spend the night, in music and dancing. His bow is sugar-cane or flowers, with a string formed of bees, and his five arrows, each pointed with an Indian blossom of a heating quality, are equally new and beautiful. He has more than twenty names: that of Kam, or Kama,

signifies desire, a fensh which it also bears in Sanskrit and modern Persian." Kamdeo is a more popular way of expressing his name. He is also called *Makara-ketu* alluding to the fish in his banner, which is said to be the name of the horned shark; Makara is also the zodiacal sign Capricorn. Kandarpa, meaning *love*, is another of his names; and Puspā-danva, or with a *bow of flowers*. Mara is another. Ananga means the incorporeal, derived from a very popular fable of Kama having been reduced to a mental existence by Siva; thus related in the Ramayana, h. i. sect. 22. "Kandarpa, the wily one, wounding S'hanu, the lord of the gods, while, with uplifted arm, he was engaged in sacred duties, met the defeat of his crime: from the eye of the great Rudra—all his members, being scorched with fire, fell from his body: he was thence called Ananga (void) and the place where it happened Kama's desire." His name of Smara, the ideal, may refer to his mother Maya, meaning illusion. Madana, Madama, and Makadanta, major Moor, from whose Hindoo Pantheon this article is taken, deems derived from a root signifying *jaunesce* and *intoxicate*, or pleasurable merriment, but not approaching to drunkenness. Kama is said to have been the son of Krishna and Rukmini, that is, incarnated in a son of theirs, and then named Pradyumna, the adventures of whose son Anurudha with the beautiful Usha are the subject of a pretty tale, and a very interesting drama.

The banner of Kama, a fish on a red ground, and his *walan*, or vehicle, the parrot, or *lari*, have doubtless their allusions; the former possibly, as major M. conceives, to the stimulating nature of that species of food stirring the blood to aid Kamdeo's ends; and perhaps the enlanguined colouring, and extreme beauty of the *lari*, and, like the fish (and the dove of western mythologists) its supposed *aphrodisiac* tendency as food, may have had a share in guiding a selection of attributes for the ardent deity. The soft affection and fabled constancy of the dove may have weighed with the Greeks; although constancy may not, perhaps, in strictness, be a characteristic of love.

Sir William Jones has addressed a spirited hymn to this deity. The following stanza describes Vasanta preparing the bow and shafts for his mischievous friend. The flowers with which the five arrows are tipped are of a heating inflaming quality, denoting that it is through the senses that love's shafts are felt.

"He bends the luscious cane, and twists the string
With bees; how sweet! but ah! how keen their sting!
He with five flow'rets tips thy ruthless darts,
Which through five senses pierce enraptured hearts:
Strong Champa, rich in odorous gold;
Warm Amer, nurs'd in heavenly mould;
Dry Nakefer, in silver smiling;
Hot Katicum our sense beguiling;
And last, to kindle fierce the scorching flame,
Lovehaft, which gods bring! • Bela name."

The Champa or Chumpa, or more correctly Champaka, is a polyandrian polygynian flower, the melleha of European butanists; it is of two sorts, white and yellow; finally, and in its foliage like an expanded rose-bud. Gardeners make and expose for sale, chaplets and long strings of the blossom, which louse women, on the supposition that its fragrance excites favourable sensations in the votaries of Kama, decorate their hair with, and wear round their necks: its fragrance is, however, so potent, that nerves unaccustomed to it can scarcely bear it within doors. Another flower, called *myrica*, is of the same description, and may, perhaps, be one of those classically named in the hymn. The odour of the Champa

is so strong, that bees are said not to extract honey from it; a circumstance that could not escape the keen eye of the Hindu poets, and they accordingly imagine the champa to be sadly mortified at the neglect. They have, however, consoled it by dedicating it to Krishna, the black deity; as they, contrary to the notion of some European naturalists, consider the union of yellow and black as peculiarly beautiful. The champa is farther consoled by the preference it has obtained in bedecking the glossy locks of black-haired damsel, as just noticed; and in the following stanza, literally translated from the Sanskrit:

"That thou art not honoured by the ill-disposed bee, why, O Champa! dost thou so heavily lament. The locks of lotus-eyed damsels, resembling the fresh dark clouds adorning the sky; let these embellish thee."

The Amer, mentioned in the extract from the hymn, is also called *amra*, and *amla*, and is said by some to be the mango flower. Dry Nakefer is a handsome flower with white and yellow petals. The Bela is a beautiful species of jasmine.

Among a refined people, advantageously situated in a low latitude, we naturally expect to find love, in all its vast variety of relations, no inconsiderable proportion of their occupation and amusement. Books and tales on amatory topics are very abundant in India, and in common conversations are constantly occurring to Kama and his excitations. The ode, translated from the Sanskrit, with which we shall conclude this article, is a popular canticle on a festival held at the full moon of the month Chaitra, in honour of Kamadeva, attended by music, bathing, and festive jollity. It must be recollected that Kama was incarnated as a son of Krishna, who being Vishnu is called by one of his names, Madhava, in the second stanza. The three first stanzas consist chiefly of compound words forming names of Kama, for instance, Puspā-danva, with a flowery-bow; Makaraketa, fish-bannered, &c.

1. "Hail, god of the flowery bow! Hail, warrior, with a fish on thy banner! Hail, powerful divinity, who causest the firmness of the sage to forsake him, and subdueth the guardian deities of the eight regions!

2. "O Kandarpa! thou son of Madhava. O Mara! thou foe of Sambara. Glory be to thee who lovest the goddesses Reti: who springest from the heart.

3. "Glory be to Madana; to Kama; to him who is formed as the god of gods; to him, by whom Brahma, Vishnu, Siva, Indra, are filled with emotions of rapture!

4. "May all my mental cares be removed! all my corporal sufferings terminate! May the object of my soul be attained, and my felicity continue for ever." Hin. Pan. P. 451.

KAMA-DHENU, } names of *Surabhi*; which see.
KAMA-DHOK, }

KAMAK, in *Geography*, a town of Turkish Armenia, on the Euphrates; 10 miles S.S.W. of Arzingen.

KAMAKURA, a town of the island of Nippon, in the gulf or Jedo. N. lat. 35 10'. E. long. 139° 40'.—Also, an island of Japan, near the S. coast of Nippon, about three miles in circuit, having its coasts so precipitous, that a crane is used to raise the freight from the boats. This is used as a state prison.

KAMAL, or KAMALA, the Sanskrit name of the lotus, a plant esteemed by the Hindoos, as well as by the ancient Egyptians, as very sacred and mysterious. See LOTUS, or NYMPHEA, or whatever word under which Egyptian superstition, connected with the lotus, may be noticed. We shall give a short article under LOTUS. An extensive class of Hindoo philosophers, being Nep-

tunists,

tunifs, look on this aquatic plant with profound reverence; being more especially the symbol of humidity; and Vishnu being a personification of water, his worshippers deem it his emblem also. It is farther the name of his consort Lakshmi, who, in her character of Venus, generally holds in her hand the lotus, the emblem also of beauty, and denoting her aquatic origin. (See LAKSHMI, and LOTUS.) There is no end of mystical symbolism connected with allusions to the lotus among Hindoo mythologists. Of these many occur in Moor's Hindoo Pantheon. See the index under Kamal and Lotus. Many engravings are likewise there given of this subject in various combinations.

KAMALADAN, in *Geography*, a bay on the S. coast of the island of Mindanao. N. lat. 7° 21'. E. long. 121°.

KAMALAVA, a town of Persia, in Chulistan; 25 miles W. of Tostar.

KAMALA-YONI, in *Hindoo Mythology*, a name of Brahma, derived, it would appear, from the symbols of Lakshmi and Devi, or Parvati, the consorts respectively of Vishnu and Siva. The kamal is the lotus, an emblem of female beauty, and a name of Lakshmi; and the Yoni, the *pudenda muliebria*, most mysteriously contemplated by the votaries of Devi, as the mystical matrix of nature, and as her symbol. It does not, however, clearly appear why these terms or things should be conjointly applied to Brahma, the deities creative power. On the subjects of this article see KAMAL, LAKSHMI, LOTUS, LINGA, and YONI. In this work, which are amply discussed in the Hindoo Pantheon.

KAMALIA, in *Geography*, a town of Africa, in Manding, the inhabitants of which are partly Pagans and partly Mahometans. Mr. Park, in his return home, was taken ill of a fever in this town. This severe and dangerous sickness was owing to excess of fatigue, to vicissitudes of weather, and to the various hardships which he encountered, being sometimes plunged to the neck in rivers and swamps, and sometimes lost in woods and deserts, without shelter, clothing, or food. In this distressed condition, and whilst he was waiting for a caravan with which he might pursue his journey towards the Gambia, he was hospitably entertained by a worthy negro, whose name was Karfa Taura, who not only undertook, for the value of one slave, to be paid on his safe arrival at the Gambia, not only to conduct him safe to Pisania, but to accommodate him in his house until the time of the caravan's departure. During the long interval of six months, not a murmur escaped the lips of Karfa, or of any of his wives, at the trouble and expence which their inmate, who was confined more than a month to his mat (his only bed), brought upon them. To the kind attention, the tender sollicitude, the cheerful assiduity, and unwearied hospitality of these poor pagans, Mr. Park declared that he was indebted, not only for his safe return to Great Britain, but also for the preservation of his life; and he gratefully acknowledges, that he made his friend Karfa but an inadequate return (though the best in his power), by presenting him, on their arrival at the Gambia, with double the sum which he had originally promised. Kamalia is distant about 40 geographical miles S. W. of Sibidooloo, and lies nearly midway between the Joliba and Senegal rivers. N. lat. 12° 46'. W. long. 6° 25'.—Also, a town of Africa, in the kingdom of Dambarra, on the Niger; 18 miles S.W. of Sero.

KAMAN, a town of Asiatic Turkey, in Caramania; 17 miles N. W. of Kaisariéh.—Also, an island in the Red Sea. N. lat. 27° 35'.—Also, a town of Walachia; 16 miles S. W. of Rufci.—Also, the name given by Tavernier to the *Corbans*, or *Commus*, of others, which is the

frontier town of the Carnatic, towards Golconda, near the source of the river Gondegama, or Gandlecomma.

KAMAN, in *Natural History*, a name given by many authors to a stone found about the burning mountains, and at some times used to engrave seals on. It is described as a white stone, variegated with several colours.

KAMARIS, in *Geography*, a town of Asiatic Turkey, in Natolia; 22 miles W. of Artaki.

KAMBALA, mountains of Thibet, between lake Jamdoo and the Sampoo river.

KAMBAMBA. See CAMBAMBA.

KAMBELE, a town of Persia, in the province of Mecran, on the sea-coast; 127 miles S. of Kidge.

KAMBERG, a town of Bohemia, in the circle of Kaarizim; 12 miles S. of Benefchov.

KAMCHADALS. See KAMSTCHATKA.

KAMEH, a province of Candahar, lying W. of Cabul, N. of Cabul river, nearly opposite to Jalalabad.—Also, a river of Asia, called *Cabul*; which see. It is formed of various streams that issue from the northern mountains, and join in the district of Kameh, whence the confluent river receives its name, and which it communicates to the Cabul river during the remainder of its course.

KAMEINOI, a town of Russia, in the government of Pskov; 12 miles S. E. of Opogka.

KAMEL, GEORGE JOSEPH, in *Biography*, a jesuit missionary, who lived at the end of the 17th century, and sent various plants from the Philippine islands to the botanists of Europe. See CAMELLIA.

KAMELEY, in *Geography*, a town of Africa, in Senaar; 60 miles S. of Gerra.

KAMEN, a town of the duchy of Warfaw; 12 miles S. E. of Gnesna.

KAMENI. See KAMMENI.

KAMENITZ, a town of Bohemia, in the circle of Bechin; 24 miles E. of Bechin. N. lat. 49° 21'. E. long. 14° 56'.—Also, a town of Moravia, in the circle of Iglau; 13 miles E. of Iglau.

KAMENIZ, a town of Bohemia, in the circle of Chrudim; 10 miles S. of Chrudim.

KAMENKA, a town of Russia, in the government of Tobolsk; 120 miles E. of Eniseik.

KAMENOI, a town of Russia, in the government of Ochotsk, at the northern part of the Penzinskaia gulf, containing about 400 inhabitants; 16 miles S. of Oklaask.

KAMENSKAIA, a town of Russian Tartary, in the country of the Cossacks, on the Denetz; 122 miles N. of Azof.

KAMENSKOI, a town of Russia, in the government of Archangel; 124 miles S. E. of Kola.—Also, a town of Russia, in the province of Ekaterinburg, on the Het; 40 miles S. E. of Ekaterinburg.

KAMERAN, an island in the Red sea, near the coast of Arabia, governed by a Dola, subordinate to the Dola of Lohela: the soil is fertile, and it has a good harbour, which affords refreshment to vessels that touch at it in their voyage from the Indies to Jidda. N. lat. 15° 6'. E. long. 42° 25'.

KAMERINA, a town of Arabia, in the province of Yemen; 48 miles S. of Sa.de.

KAMERINA, a town of Poland, in the palatinate of Kiev; 12 miles S. E. of Czurkafy.

KAMERITZ, a town of Bohemia, in the circle of Bechin; 16 miles N. of Filtriz.

KAM-HI, in *Biography*, emperor of China, was the grandson of a Tartar prince, who conquered that country in 1644, and ascended the throne in 1661. He had a great attachment

attachment to the arts and sciences of the Europeans, and liberally patronized the missionaries. He was a good geographer, and directed the construction of many maps and charts, yet so vain was he of the country over which he governed, that he would never suffer a map of the world to be laid before him unless China was represented therein as the centre. He died at the age of 71, in the year 1722.

KAMI, in *Cegegraphia*, a town of Japan, in the island of Niphon; 20 miles E.N.E. of Jedo.

KAMIABA, a town of Africa, in Manding. N. lat. 12 32'. W. long. 6° 15'.

KAMIAMACONDA, a town of Africa, in the country of Jenarrow. N. lat. 12 48'.

KAMIEN, a town of Poland, in the palatinate of Volhynia; 34 miles N. of Luchow.—Also, a town of Lithuania, in the palatinate of Wilna; 64 miles E. of Lida.

KAMIENEC, a town of Lithuania, in the palatinate of Brzeic; 16 miles N.N.E. of Brzeic.

KAMIENTSCHIK, a town of the duchy of Warsaw; 36 miles E.N.E. of Warfaw.

KAMISHELER, a town of Circassia, on the coast of the Black sea; eight miles E.S.E. of Mamak.

KAMINIEC, a town of Ruffian Poland, and capital of the palatinate of Podolia, having a castle built on a rock, and one of the best fortified places in Poland. Below it runs the river Smetricz, which falls into the Dniester. It has a Popish and Armentan bishop resident in the city; and here are also held a court of justice and provincial diet. The episcopal see was founded in 1375. Its college formerly belonged to the Jesuits. The whole province is sometimes called "Kaminiec;" 120 miles W. of Bracław. N. lat. 48 53'. E. long. 26 45'.

KAMIONKA, a town of Poland, in Volhynia; 48 miles N.N.E. of Zytomiers.

KAMIR, a town of Persia, in the province of Laristan; 60 miles E.S.E. of Lar.

KAMISCHIN, a town of Russia, in the government of Saratof, on the Volga; 80 miles S. of Saratof.

KAMITNICZA, a town of Poland, in the palatinate of Bracław, near the Dniester; 54 miles S. of Bracław.

KAMITSKI, a town of Japan, in the island of Ximo; 28 miles E.S.E. of Kokara.

KAMMA, a river of Russia, which is the largest of all those that unite their streams with the Volga. It rises in the government of Perme, from the western projections of the Ural chain, waters a small part of the government of Viatka, flows through a large tract of the government of Perme, forms the border between the governments of Viatka and Ufa, and at Laisheva, 60 versts below Kazan, falls into the Volga; having terminated a course of 1000 versts. By the Tartars it is called "Tsholman-Idel." For the transport of salt and iron, it is one of the most important rivers of the empire. This is chiefly effected by the Tchoufoviaya and the Belaiya, two rivers of considerable magnitude, flowing into it on the left. Beside these, the Kamma takes up a great number of other rivers, such as, on the left, the Kolva, the Yaiva, the Kovsa, and the Ik; on the right, the Obva, the Okhau, and the Umyak. The Kamma, above the mouth of the Belaiya (which is of a whitish water), has a blackish wholesome water. It is mostly attended by a ridge of mountains, consisting of sand, gypsum, and marble, with forests of firs and oaks. It is tolerably well stored with fish; and they are reckoned better tasted than those of the Volga.

KAMMAGOJAH, a town of Africa, in the country of Quoja.

KAMMAH, a town of Asia, and capital of a district

in the kingdom of Birmah, on the Irawaddy; which carries on a large trade in teak timber, conveyed from hence to Rangoon; 15 miles N. of Prome.

KAMMENI, GREAT and LITTLE, two islands of the Grecian Archipelago, so called on account of the nature of the calcined substances of which they are formed; the name denoting "burnt;" whence they have obtained the appellation of *Burnt islands*. The first of these rose above the sea in a surprising manner, whilst the water boiled up, and on account of its origin, which bordered upon a prodigy, and which occasioned it to be considered by the ancients to be the god of hell, it was denominated "Him." In the year 1743, during subterraneous commotions and convulsions, and various other terrifying phenomena, another island suddenly appeared above the surface of the waters. In order to distinguish it from the former, which is the larger, the Greeks have called it "Mikri Kammeni," or the Little Burnt island. These islands are within about three miles W. of Santorin. N. lat. 36 30'. E. long. 25 24'. The Great Kammeni, which is the more ancient, is covered with a thin stratum of dull, which allows a few herbs to grow upon it. The Little Kammeni, in which are visible five craters, by which the volcano vomited forth the substances that compose it, is naked and barren. At the beginning of the last century a new islet appeared between the Great and Little Kammeni, about a league from Santorin. Its formation, accompanied with shocks of earthquakes, which were felt at Santorin, was gradual; and various circumstances attended it, which are minutely described by Sonnini in his "Travels in Greece and Turkey."

KAMNIG, a town of Silesia, in the principality of Neisse; 8 miles N.N.E. of Patzschkau.

KAMNITZ, or CHEMNITZ, a town of Bohemia, in the circle of Leutneritz; the principal article of trade is the manufacture of stockings; 20 miles S.E. of Dresden. N. lat. 50° 47'. E. long. 14 52'.

KAMO, a town of Japan, on the south coast of the island of Jedo.

KAMOEER, a small island in the East Indian sea. S. lat. 6° 30'. E. long. 132° 5'.

KAMOURASKAS, a town of Canada, on the right bank of the St. Lawrence. N. lat. 47 33'. W. long. 69° 40'.

KAMRAJE. See CASHMERE.

KAMSCHEVSKA, a town of Russia, in the province of Ekaterinburg, on the Ict; 52 miles S.E. of Ekaterinburg.

KAMSCHLOV, a town of Russia, in the province of Ekaterinburg; 56 miles E. of Ekaterinburg.

KAMSIN, hot southerly winds of Egypt, where they are known under the general name of "winds of fifty days." (See EGYPT.) These winds have been mentioned by travellers under the denomination of "poisonous" winds, or, more correctly, "hot winds of the desert." By the Arabs of the desert they are called "Semoun," or poison; and by the Turks "Shamyela," or wind of Syria, from which is formed the "Siamk" wind. The heat of these winds is sometimes so excessive, that it may be compared to the heat of a large oven at the moment of drawing out the bread. When they begin to blow, the atmosphere assumes an alarming aspect. The sky, which at other times is clear in this climate, becomes dark and heavy; the sun loses its splendour, and appears of a violet colour. The air is grey and thick, and filled with an extremely subtle dust, which is universally penetrating. This wind increases gradually in heat, in proportion to its continuance; and its effects are felt by all animated beings. The lungs are contracted and become

painful. Respiration is short and difficult, the skin becomes parched and dry, and the body is consumed by an internal heat. Large draughts of water afford no relief, nor can any thing restore perspiration. Marble, iron, water, though the sun no longer appears, are hot. The streets are deserted, and the dead silence of night prevails every where. The inhabitants of towns and villages shut themselves up in their houses, and those of the desert in their tents, or in pits dug in the earth, waiting the termination of this destructive heat. It usually lasts three days, but if it exceeds that time, it becomes insupportable. The danger is most imminent when it blows in squalls, for then the heat is so much increased, as to cause sudden death by suffocation. This wind is peculiarly fatal to persons of a plethoric habit, and to those that are exhausted by fatigue. The corpse manifests signs of that putrid fermentation, which takes place in animal bodies when the humours become stagnant. These accidents are to be avoided by stopping the nose and mouth with handkerchiefs; and the cuculis bury their noses in the sand, and keep them there till the squall is over. Another quality of this wind is its extreme aridity; which is such, that water sprinkled on the floor is evaporated in a few minutes: it withers and strips all the plants, and exhales too suddenly the emanations from animal bodies, and produces that feverish heat which results from suppressed perspiration.

These hot winds are not peculiar to Egypt, they blow likewise in Syria; more frequently, however, near the sea, and in the desert, than in the mountains. M. Niebuhr met with them in Arabia, at Bombay, and in the Diarbekir: they are also known in Persia, and in the east of Africa, and even in Spain, and though their direction may vary, their effects are similar. In Egypt, the most violent proceed from the S.S.W.; at Mecca, from the E.; at Surat, from the N.; at Bassora, from the N.W.; from the W. at Bagdad; and in Syria from the S.E. They always proceed, says Volney, from desert continents; and he adds, it is natural that the air which covers the immense plains of Lydia and Arabia, meeting there with neither rivulets nor lakes, nor forests, but scorched by the rays of a burning sun, increased in intensity by the reflection of the sand, should acquire a prodigious degree of heat and aridity; hence he infers that these qualities are owing to the heat of the sun upon the sands. Volney's Travels in Egypt, &c. vol. i.

KAMTSCHATKA, a river of Russia, in the peninsula of that name. See below.

KAMTSCHATKA, a peninsula of Russia, in the government of Irkutsk, deriving its name from the river Kamtschatka, which is supposed to have been so called from some brave warrior named Kamfata. It is bounded on the N. by the province of Ochotsk, on the E. and S. by the Northern Pacific ocean, and on the W. by the sea of Ochotsk, and the Penhinkoe gulf. On the southern promontory, the Kurily islands are included in it, and towards the west it is connected with North America by the Aleutian islands. This country consists of a chain of mountains, forming one train with the very mountainous and rocky islands of Kurily and Japan, and these again seem to be connected with the mountains that reach from Tibet through China. All these countries and islands seem to have arisen by subterraneous fires, which still continue to act much more lately than Siberia. The peninsula of Kamtschatka, according to the account given of it by captain King, who visited it in October 1776, lies on the eastern coast of Asia, running nearly N. and S. from 52 to 61 N. lat.; the longitude of its southern extremity being 156 45' E. The isthmus which joins it to the continent on the N. lies between the gulf of Oulotok, and the gulf of Penhink. Its southern extremity is cape Lopatka, a

word signifying the blade-bone of a man, and so called from its supposed resemblance to it. The shape of the whole peninsula is not unlike that of a shoe, widening from the toe, that is cape Lopatka, towards the middle, and again narrowing towards the heel, the neck of land above-mentioned connecting it with the continent. Its greatest breadth is from the mouth of the river Tigil to that of Kamtscha ka, and is computed to be 236 miles, from whence it narrows very gradually towards each extremity. It is bounded on the N. by the country of the Koriaks, from which it is separated, according to the Russian geographers, by Oulotokoi-nofs, which is the southern boundary of the Koriaks country. A chain of high mountains stretches through the whole length of the country from N. to S.; dividing it nearly into two equal parts, from which a great number of rivers take their rise, and empty themselves, on each side, into the Pacific ocean, and the sea of Ochotsk. There are three rivers of much greater magnitude than the rest; the "Bolchoireka," or great river, the "Kamtschatka," and the "Awatka." The first discharges itself into the sea of Ochotsk, and is navigable for the Russian gallies, upwards of five leagues from its mouth, or within nine miles of Bolcheretk, a town situated at the conflux of the Goltsofska and the Biltrai, which here lose themselves in the Bolchoireka. The Biltrai, which is no inconsiderable river, has its source in the same mountain with the Kamtschatka, and, by taking a direct contrary course, affords the Kamtschadales the means of transporting their goods by water, in small canoes, almost across the whole peninsula. The river Kamtschatka, after pursuing a course of nearly 300 miles from S. to N., winds round to the eastward, in which direction it empties itself into the ocean, a little to the southward of Kamtschatkoi-nofs. Near the mouth of the Kamtschatka, to the N.W. lies the great lake, called Nerpitsh, from "nerpi," a Kamtschadale word, signifying a seal, with which this lake abounds. About 20 miles up the river, reckoning from the mouth of the lake, is a fort called Nihnei Kamtschatka Oitrog, where the Russians have built an hospital and barracks, and which is said to have become the principal mart in this country. The river Awatka rises from the mountains situated between the Bolchoireka and the Biltrai, and running, from N.W. to S.E., a course of 100 miles, falls into the bay of Awatka. The Tigil is likewise a river of considerable size, rising amidst some very high mountains, which lie under the same parallel with Kamtschatkoi-nofs, and running in an even course from S.E. to N.W. falls into the sea of Ochotsk. The soil of this peninsula is extremely barren, and seems to be incapable of profitable cultivation, either in the way of pasture, or in any other mode.

The face of the country, in general, is thinly covered with stunted trees, having a bottom of moss, mixed with low weak heath, and bears a more striking resemblance to Newfoundland than to any other part of the world which Capt. King had ever seen. He was informed, however, by major Behm, the late governor, that many parts of the peninsula, particularly the banks of the river Kamtschatka and the Biltrai, produce grass of great height and strength, which they cut twice in the summer; and that the hay is of a succulent quality, and particularly well adapted to the fattening of cattle. From other accounts it appears that there is no part of the country equal in fertility to that which borders on the river Kamtschatka; and that to the N. and S. it is much inferior both in point of soil and climate. Repeated experiments have been made in the culture of oats, barley, and rye, in different quarters near this river, which have generally succeeded; and it is not doubted, that wheat, in many parts, particularly near the source of the Biltrai

and Kamtschatka, would grow as well as in the generality of countries situated in the same latitude. The fertility of this part of the country may probably be owing to its being the widest interval of the peninsula, and consequently most remote, on each side, from the sea; whereas the moiling fogs and drizzling weather, which prevail almost perpetually along the coast, must necessarily render the parts adjacent very unfit for all the purposes of agriculture. The severity of the climate, we may naturally conclude, must correspond to the sterility of the soil, of which it is probably the cause. The first time, says Capt. King, we saw this country, was in the beginning of May 1779, when the whole face of it was covered with snow, from six to eight feet deep. On the 8th of May, at noon, the thermometer stood at 32; and the snow lay so deep on the ground, that all attempts to cut wood were fruitless. On the 12th the thaw began to advance gradually; and in the beginning of June, the snow was generally melted from the lowlands. On the fifteenth of this month, the thermometer had never risen higher than 58°, nor the barometer than 30.4. The S. E. wind was the most prevalent. On the 24th of August, the foliage of the trees and all sorts of vegetation seemed to be in the highest state of perfection. During this month and September, the weather was very changeable, but in no respect severe. The winds veered towards the west. The greatest height of the thermometer was 65; the lowest 40. The barometer's greatest height 30; its lowest 29.3. So that, upon the whole, during this month, an equal and moderate degree of temperature prevailed. But at the beginning of October, the tops of the hills were again covered with new-fallen snow, the wind continuing westerly. In computing the seasons, the spring should not be taken into the account. The interval from the middle of June to the middle of September may properly be said to constitute the summer. October may be considered as an autumnal month; and from thence, to the middle of June, it is perfect winter. It is said that the climate, in the country adjoining to the river Kamtschatka, is not less serene and temperate than in many parts of Siberia that are under the same latitude. This variation, says Capt. King, is probably owing to the same causes, to which the superior fertility of the soil in those parts has been attributed.

The ingenious Mr. Kirwan, in his "Climate of the Temperature of different Latitudes," states the distance of Kamtschatka from the Atlantic to be such, that its temperature is not in any respect influenced by it, but rather by that of the North Pacific, to which it adjoins. Accordingly the northern parts of this peninsula enjoy the most moderate weather, being chiefly influenced by the North sea, the temperature of which, even in winter, is milder than that of the sea below the straits that separate Asia from America. Speaking of the temperature of the North Pacific ocean, the same judicious author observes, that this part of it is contracted in latitude 66 to the narrow space of 40 miles; and in latitude 52, it occupies the space of only 30 in breadth from east to west, that is, about 1300 miles; whereas the Atlantic in latitude 52 is about 1700 miles in breadth, and is no where contracted to a less space than 500 miles. To which we may add, that the coasts of Asia on one side, and those of America on the other, are bordered with high mountains, covered with snow for a great part of the year; and numerous high islands lie scattered between both continents. From these circumstances we have sufficient reason for concluding *a priori*, that this sea should be much colder than that portion of the Atlantic contained between the same parallels: for, during the winter, the mountains that line the coasts are covered to a much greater degree than the flat

coasts of the Atlantic; and the sea, where it is narrow, is entirely frozen: in summer, heaps of ice, being long scattered from the sun by the winds, are carried down to lower latitudes, and the snow remains long unmelted on the mountains; so that Mr. Kirwan is inclined to think, that the annual temperature of it is at least 4 degrees below that of the standard in correspondingitudes. But further observations are necessary for determining with precision the mean temperature of any of these parts. But it is not in the fertility of the ground alone that the Kamtschadales find the unfavourable temperature of their climate; the uncertainty of the summer season sometimes prevents their laying up a sufficient stock of dried fish for their winter's provision, and the multitude of the air cattle worms to breed in them, which not infrequently destroy the greatest part. The inhabitants of this country are very seldom troubled with storms of thunder and lightning; and never but in a slight degree. The general severity of the winter, as well as the dreadful hurricanes of wind and snow which that season brings along with it, cannot be questioned, from the subterraneous habitations to which the natives are under a necessity of retreating for warmth and security. Major Behm, informed captain King and his companions, that the cold and inclemency of the winter of 1779 were such, that, for several weeks, all intercourse between the inhabitants was entirely obstructed, every one being afraid to stir even from one house to another, for fear of being frost-bitten. The extraordinary rigour of climate in so low a latitude may be accounted for, from its being situated to the east of an immense uncultivated tract of country, and from the prevalence of the westerly winds, blowing over so extensive and cold a continent. The extraordinary violence and impetuosity of the winds are attributed to the subterraneous fires, the sulphureous exhalations, and the general volcanic disposition of the country. This peninsula abounds in volcanoes, of which only three have been, for some time past, subject to eruptions. One of these is situated in the neighbourhood of Awatka. The volcano of Tolbatlack is situated on a neck of land between the river of Kamtschatka and Tolbatlack. The mountain, from the summit of which the eruptions proceed, is of a considerable height, and terminates in pointed rocks. The third volcano is on the top of the mountain of Kamtschatka, which is mentioned as the highest in the peninsula. A thick smoke never ceases to ascend from its summit, and it has frequent eruptions of the most violent and dreadful kind; some of which were much talked of when captain King visited the island, and seemed to be fresh in the memories of the Kamtschadales. This country contains numerous springs of hot water, and extraordinary pits or wells, at the bottom of which the water seems to boil as in a cauldron with prodigious impetuosity, accompanied with a dreadful noise, and discharging a thick vapour.

Near the village Milkova a merchant of Irkutsk, in 1760, discovered iron ore, and erected smelting houses on the spot. Silver ore, though not very rich, is also said to have been found in Kamtschatka. Of the trees which fell under the notice of captain King and his associates, the principal were the birch, the poplar, the alder, (with the bark of which they flain their leather,) many species of the willow, and two sorts of dwarfish pines or cedars, of one of which they made their essence for beer, and it was found excellent for the purpose. The birch tree was the most common; and of this there were three sorts, two of which are fit for timber, and the third, which is of a dwarfish kind, is applied to a variety of uses. The liquor, distilled by it upon being tapped, is drunk without any previous preparation; and the bark is converted into staves for domestic purposes; and of

the wood they make their sledges and canoes. Besides the trees above mentioned, there are the larch, and also fir, the service-tree, and two species of the white-thorn. Of the shrub kind, as junipers, the mountain-ash, rose-trees, and raspberry bushes, the country produces great abundance; together with a variety of berries, which are collected at the proper season, and preserved by boiling them into a thick jam, without sugar. These are used as sauce to their dried and salt fish; and are eaten by themselves, in puddings, and various other ways; and decoctions are also made of them for their ordinary liquor. The country furnishes many wholesome vegetables in a wild state, such as wild celery, angelica, chervil, garlic, and onions; and upon some spots of ground in the valleys there are excellent turnips and turnip-radishes. They have also more recently cultivated potatoes. Major Belin exerted himself very laudably in endeavouring to promote agriculture and grazing, and not altogether without effect; and his successor, Mr. Assessor Reinkin, continued these endeavours, inasmuch that, in 1782, from 68½ pood of winter-rye 34½ sheaves, and from 594 pood of barley 24,840 sheaves, were reaped. Oats, wheat, and buck-wheat, were much injured by the early frosts; but hemp succeeds very well. There are two plants in this country that deserve particular notice, on account of the extensive use to which they are applied: one, called by the natives "Sarana," is the *Lilium Kamtschatense flore atro rubente*, of which Steller enumerates five different species. The roots are collected in the beginning of August, dried in the sun, and laid up for use. When roasted in embers, it supplies the place of bread; and baked in the oven and pounded, it becomes an excellent substitute for flour and meal of every sort, and in this state is mixed in all their soups, and most of their other dishes. It is esteemed very nourishing. The roots of this plant are also applied to similar purposes at Oonalaska. The other plant is called the "Sweet grass," the *Heracleum Sibericum foliis pinnatis*, &c. Hort. Upfal. 65. This plant was formerly a principal ingredient in the cookery of most of the Kamtschadale dishes; but since the Russians have obtained possession of the country, it is entirely appropriated to the purposes of distillation. The liquor obtained from it is of the strength of brandy, and is called by the natives "raka." Two pood (72 pounds) of the plant yield generally one vedro (25 pints) of raka. There are several other plants, which we cannot enumerate. It is said, that the Kamtschadales (before their acquaintance with fire-arms) poisoned their spears and arrows with the juice of the root of the "zgate" (*anemonoides et ranunculoides*); and that wounds inflicted by them are equally destructive to land and marine animals. The Tschutski are reported to use the same drug for this purpose at present. Of the straw of the "triticum radice perenni spiculis binis lanuginosis," which grows abundantly along the coast, they make a strong matting, which they use not only for their floors, but for sacks, bed-clothes, curtains, and a variety of other domestic purposes. Of the plant called "bolotnaia," growing in the marshes, and resembling cyperoides, which is carded like wool, with a comb made of the bones of the sea-swallow, they make various garments, which they use instead of linen and woolen cloths. The nettle supplies the place of hemp and flax, and serves in the manufacture of their fishing-nets.

The animals of this peninsula are the common fox, the float or ermine, the zibelline or sable, the isatis or arctic fox, the varying hare, the mountain rat or carleus marmot, the weasel, the glutton or wolverene, the argali or wild sheep, rein-deer, bears, wolves, and dogs. The dogs are very numerous; and they are very useful in drawing the sledges,

which are the common vehicles of the country. The coast and bays of this country are frequented by almost every sort of northern sea-fowl; the rivers are stored with numerous flocks of wild ducks of various species. In the woods are eagles of a very large size; and of the hawk, falcon, and bulldog kind, there are great numbers. This country likewise affords wood-cocks, snipes, and two sorts of grouse, or moor-grouse. Swans are also very plentiful, and generally, in their entertainments, make a part of their repast. The sea-coast furnishes no amphibious animals, except seals, which swarm in the bay of Awatka, where they pursue the salmon, that are collected there in shoals in order to ascend the rivers. They are also found in most of the lakes, which communicate with the sea. The sea otters resemble those of Nootka found; but since the Russians have opened a trade for their skins to China, where they are sold at a price above that of any other kind of fur, they have been hunted almost entirely out of the country. Those of the Kurile islands are of a superior quality to those of Kamtschatka, or the American coast. Fish may be considered as the staple article of food, with which providence hath supplied the inhabitants of this peninsula. Whales are frequently seen, both in the sea of Ochotsk, and on the side of the eastern ocean, and when caught, are converted to various uses. Of the skin they make the soles of their shoes, and strops and thongs for various other purposes. The flesh they eat, and the fat is stored up, both for kitchen use and for their lamps. The whippers are used for sewing together the seams of their canoes, and for making nets; and with the under jaw-bones their sledges are fixed. They work the bones into knives; the intestines are cleaned, and blown like bladders, for containing their oil and grease; and of the nerves and veins, they make excellent snares. Flat-fish, trout, and herrings are abundant; the season for the latter begins in May, and they do not remain long on the coast; they are fine and large. They have also cod of a large size; but their principal dependence is on salmon, which they lay up in store for their winter provisions. The season of fishing, for this species, lasts from the middle of May till the end of June.

The present inhabitants of Kamtschatka are of three sorts; the natives, or Kamtschadales; the Russians and Cossacks; and a mixture of those two by marriage. The true Kamtschadales, are, according to Steller, a people of very great antiquity, and have for many ages inhabited this peninsula; and he says, that they are originally descended from the Mungalians, and not either from the Tungusian Tartars, as some, or the Japanese, as others have imagined. Many words, he says, in their language have terminations similar to those of the Mungalian Chincfe, and the same principle of inflexion or derivation obtains in both languages. They are, in general, under-sized, as are the Mungalians; their complexion, like theirs, is swarthy; they have black hair, little beard, the face broad, the nose short and flat, the eyes small and sunk, the eye-brows thin, the belly pendant, the legs small; all which are peculiarities that are to be found among the Mungalians. As the result of the whole he infers, that they fled for safety to this peninsula, from the rapid advances of the eastern conquerors; as the Laplanders, Samoeds, &c. were compelled to retreat to the extremities of the north by the Europeans. The Russians, having extended their conquests, and established ports and colonies along that immense extent of coast of the Frozen sea, from the Jenesei to the Anadyr, appointed commissaries for the purpose of exploring and subjecting the countries still farther eastward. They soon became acquainted with the wandering Koriaks inhabiting the N. and N.E. coast of the sea of Ochotsk, and without difficulty

made them tributary. These being the immediate neighbours of the Kamtschadales, and likewise in the habit of bartering with them, a knowledge of Kamtschkatka followed of course. The honour of the first discovery is ascribed to Feodot Alexieff, a merchant, who is said to have sailed from the river Koyma, round the peninsula of the Tschutski, in company with seven other vessels, about the year 1648. Being separated from the rest by a storm, near the Tschukotkoi-nofs, he was driven upon the coast of Kamtschkatka, where he wintered; and in the summer following coasted round the promontory of Looatka, into the sea of Ochotzk, and entered the mouth of the Tigil; but he and his companions were cut off by the Koriaks, in endeavouring to pass by land from thence to the Anadirik. But as these discoverers did not live to report what they had done, Volodimir Ataloff, a Cossack, is reputed the first discoverer of Kamtschkatka. This person, under the quality of commissary, penetrated, in 1709, with about 60 Russian soldiers, and the same number of Cossacks, into the heart of the peninsula, gained the Tigil, and levying a tribute of furs, proceeded to cross over to the river Kamtschkatka, on which he built the higher Kamtschkatka Oitrog, called Verchnei, where he left a garrison of Cossacks, and returned to Jakutsk in 1700, with an immense quantity of rare and valuable tributary furs. Upon his arrival at Moscow, he was appointed commander of the fort of Jakutsk, with farther orders to repair again to Kamtschkatka. But as he advanced towards the Anadirik, he fell in with a bark on the river Tunguska, laden with Chinese merchandize, which he pillaged; but in consequence of a remonstrance from the sufferers to the Russian court, he was seized at Jakutsk, and thrown into prison. During the disgrace and trial of Ataloff, several successive commissaries were sent into Kamtschkatka; but at length Ataloff was reinstated in his command, and appointed to conduct a second expedition into Kamtschkatka; however, in this service he was guilty of oppression and cruelty, which occasioned a mutiny among the Cossacks, and they succeeded in getting him displaced, and seized upon his effects. Accustomed to plunder, they were reduced to military discipline and subjection with great difficulty. The history of this country, from that period till the grand revolt of the Kamtschadales in 1731, presents one unvaried detail of massacres, revolts, and savage sanguinary encounters between small parties, from one end of the peninsula to another. When peace was established, the country remained tranquil till the year 1740, when a few Russians lost their lives in a tumult; and except an insurrection which occurred at Bolcheretsk in 1770, there has been no disturbance since.

After the rebellion of 1731 was quelled, the country recovered itself, and became more populous than ever; when, in the year 1767, the small-pox, brought by a soldier from Ochotzk, threatened the total extinction of its inhabitants. It has been computed that near 20,000 died of this disorder in Kamtschkatka, the Kureki country, and the Kurile islands. The inhabitants of whole villages were swept away, and their habitations left desolate. In the diminished state of the natives, with fresh supplies of Russians and Cossacks perpetually pouring into the country, and intermixing with them by marriage, it is probable, that in less than half a century there will be very few of them left. According to major Behm's account, there were not, in 1779, more than 3000 who paid tribute, the Kurile islands included. Capt. King understood that in the year above-mentioned, there were in the five forts of Nichnei, Verchnei, Tigil, Bolcheretsk, and St. Peter and St. Paul, about 400 Russians and Cossacks, and near the same number at Lugsa, which,

though to the N. of the peninsula, was then under the command of Kamtschkatka; to these may be added the Russian traders and emigrants, whose number is not very considerable.

The Russian government, established over this country, though military, is in a high degree mild and equitable. The natives are permitted to choose their own magistrates among themselves, in the way and with the same powers to which they had ever been accustomed. One of these, under the title of "Toion," presides over each "oitrog," who refers merely cases of difficulty, or crimes of peculiar malignity, to the decision of the governor of Kamtschkatka. The Toion has likewise the appointment of a civil officer, called a corporal, who assists him in the execution of his office, and in his absence acts as his deputy. By an edict of the late empress, no crime whatever can be punished with death; but it is said, that, in cases of murder, the punishment of the "knout" is administered with such severity, that the offender generally dies under it. The only tribute exacted, as an acknowledgment of the Russian dominion, consists, in some districts, of a fox's skin, in others of a sable's, and in the Kurile isles of a sea-otter's. The tributes are collected by the Toions in their several districts. The Russians, it is said, have taken great pains in converting the Kamtschadales to Christianity, and they have so far succeeded, that there remain few idolaters among them. The religion taught and professed is, of course, that of the Greek church. Schools are likewise established in many of the oitrogs, where the children of both the natives and the Cossacks are gratuitously instructed in the Russian language.

The commerce of this country, as far as concerns the exports, is entirely confined to furs, and carried on principally by a company of merchants, instituted by the late empress. Besides these, there are many inferior traders (particularly of the Cossacks) scattered through the country. The principal merchants, during their stay in the country, reside at Bolcheretsk, or the Nichnei oitrog, in which two places the trade almost wholly centres. The articles of importation are principally European, but not restricted to Russian manufactures; many are English and Dutch; several likewise come from Siberia, Bucharia, the Kalmucks, and China. They consist of coarse woollen and linen clothes, yarn stockings, bonnets, and gloves; thin Persian silks; cottons, and pieces of nankeen, silk and cotton handkerchiefs; brass coppers and pans, iron shovels, files, guns, powder, and shot; hardware, such as hatchets, bills, knives, scissors, needles, looking-glasses; flour, sugar; tanned hides, boots, &c. It has been observed, that these articles in general are sold for treble the price they might have been purchased for in England; and though the merchants have so large a profit upon these imported goods, they have a still larger upon the furs at Kuchta, upon the frontiers of China, which is the great market for them. The best sea-otter skins sell generally in Kamtschkatka for about 30 roubles a piece; at Kiachta the Chinese merchant buys them at double that price, and sells them again at Peking at a considerable advance, where a profitable trade is made with some of them to Japan. All furs exported from Kamtschkatka across the sea of Ochotzk, pay a duty of 10 per cent. and sables a duty of 12; and all sorts of merchandize imported from Ochotzk pay half a rouble for every pood (35 pounds English). The duty on exports and imports is paid at Ochotzk; and the tribute, which amounted, in 1779, to 10,000 roubles annually, is collected at Bolcheretsk. Six vessels, from 40 to 50 tons burthen, were employed by the late empress between Ochotzk and Bolcheretsk; five for the transportation of stores and provisions from the former to the latter place, and one

as a packet boat for conveying dispatches. B-fides there, there are about 14 vessels employed by the merchants in the fur trade, among the islands to the eastward. The most considerable and valuable part of the fur trade is carried on with the islands that lie between Kamtschatka and America.

The houses in Kamtschatka are of three sorts, *viz.* *jourts*, *balagans*, and *log-houfes*, called there *ifbas*. The first are their winter, and the second their summer habitations; the third are altogether of Russian introduction, and inhabited only by the better and wealthier sort. A town of Kamtschatka is called an "ostrog," and consists of several of the three sorts of houses above-mentioned; but the balagans are the most numerous. St. Peter and St. Paul consists of seven log-houfes, 19 balagans, and three jourts. Paratounca is of about the same size. Karatchin and Natchekin contain fewer log-houfes, but full as many jourts and balagans as the former. The outermost garment of the men is of the shape of a carter's frock. Those worn in summer are of nankeen; in winter they are made of skins, most commonly of the deer or dog, tanned on one side, the hair being left on the other, which is worn innermost. Under this is a close jacket of nankeen, or other cotton stuff; and beneath that a shirt of thin Persian silk, of a blue, red, or yellow colour. The remaining part of their dress consists of a pair of tight trowsers, or long breeches, of leather, reaching down to the calf of the leg; of a pair of dog or deer-skin boots, with the hair innermost; and of a fur cap, with two flaps, which are generally tied up close to the head, but in bad weather are let to fall round the shoulders. On ceremonious occasions the Toions wear a fur dress. The dress of the women consists of a full loose robe of white nankeen, gathered close round the neck, and fastened with a collar of coloured silk. Over this they wear a short jacket without sleeves, made of differently coloured nankeens, and petticoats of a slight Chinese silk. Their shifts, which have sleeves down to the wrists, are also of silk; and coloured silk handkerchiefs are bound round their heads, concealing entirely the hair of the married women, whilst those who are unmarried, bring the handkerchief under the hair, and suffer it to flow loose behind.

The Kamtschadales amuse themselves with singing and dancing. Their dancing they seem to have learned from the bears, which is intended to represent the awkward and clumsy gestures of this animal. The body was always bowed and the hams bent, whilst the arms were used in imitating the tricks and attitudes of that animal. Cook's Third Voyage, vol. iii. Took's Russian Empire, vol. i. Cox's Russian Discoveries.

KAMTSCHATKOEI Noss, the southern cape of Kamtschatka. N. lat. 55° 3'. E. long. 163° 20'.

KAMTSCHATSKOI, Nivinci or Lovaci, a town or ostrog of Russia, on the E. side of the peninsula of Kamtschatka, about 20 miles from the river Kamtschatka; containing two churches and about 150 houses, and having a citadel with magazines, an arsenal, guard-house, and barracks. It is the seat of two tribunals, one for matters of government, and another for those of commerce; 142 miles E. S. E. of Ochotk. N. lat. 56° 40'. E. long. 160° 14'.

KAMTSCHATKOEI, Verelnci or Uppur, a town or ostrog of Russia, in the peninsula of Kamtschatka, governed by a sergeant, and containing about 600 houses; 60 miles N. N. E. of Belcheretkoi. N. lat. 93° 50'. E. long. 157° 39'.

KAN, a river of Russia, which runs into the Enilien, near Belchutsko, in the government of Kolivan.—Also, a river of China, which rises in the S. part of Kiang-si, and runs into the lake Po-yang; 20 miles N. of Tchang.

KAN, or *Khon*. See **KHAN**.

KANA, in *Geography*, a town of Arabia, in the province of Hedjaz; 40 miles E. S. E. of Hajar.

KANAAP, a town of Hindoostan, in Bahar; 47 miles S. S. W. of Patna.

KANADEL, a town of Russia, in the government of Simbirsk; 72 miles S. S. W. of Simbirsk.

KANAGA, one of the Andreanofskie islands, between Kamtschatka and America, which has a high smoking mountain.

KANAHOODY, a town of Persia, in the province of Cohistan; 100 miles W. S. W. of Nifabur.

KANAKI, a small island in the gulf of Engia, near the W. coast of Coluri.

KANAMBADDY, a town of Hindoostan, in Mysore; 8 miles W. of Seringapatam.

KANAN, a town of Africa, in the kingdom of Cayor, near the Atlantic. N. lat. 16° 40'. W. long. 15° 55'.

KANANIKOLSKOI, a town of Russia, in the government of Upha; 52 miles S. W. of Sterlitamatk.

KANAR, a large lake, formed by an expansion of the river Dewah, in the country of Kemaoun.

KAN-AREDMERD, a town of Persia, in Faristan; 90 miles S. of Schiras.

KANARNA, a town of European Turkey, in Bulgaria; 22 miles N. E. of Varna.

KANARY, a small island in the East Indian sea, surrounded by a number of islets, called by this name. S. lat. 1° 44'. E. long. 129° 54'.

KANAS, or **KANGAS**, a town of Turkish Armenia; 60 miles S. E. of Erzerum.

KANASIER, is a name given in America to baskets of rushes or cane, in which they put the tobacco which they send into Europe; hence arises the name of kanasier tobacco, the best of which comes from Makaribou.

KANAZAVA, in *Geography, a town of Japan, in the island of Niphon; 130 miles N. E. of Meaco.*

KANCABA, a town of Africa, in the kingdom of Mandingo, seated on the Niger, a mart for slaves; 16 miles S. E. of Kamalia.

KANDA, a town of Africa, in the kingdom of Congo; 30 miles N. E. of St. Salvador.—Also, a town of Japan, in the island of Xicoco; 16 miles S. E. of Ovuti.

KANDABAGA, mountains that form part of the boundary between Russia and Chinese Tartary, a part of the great chain W. of the river Oka. See **SAYANE MOUNTAINS**.

KANDABIL, a town of Persia in the province of Mucran, 285 miles S. of Candahar. N. lat. 28° 28'. E. long. 67° 20'.

KANDAL, a town on the N. coast of the island of Java. S. lat. 6° 48'. E. long. 110° 18'.—Also, a town of Abyssinia, near the coast of the Red sea. S. lat. 14° 30'. E. long. 41° 15'.

KANDALAKS, a town of Russia, in the government of Archangel, on the N. coast of the White sea; 140 miles S. S. E. of Vola.

KANDARPA, a name of Kama, the Hindoo god of love. See **KAMA**.

KANDEGHERI, in *Geography*, a town of Hindoostan, in the Carnatic, formerly the capital of a kingdom, called *Nandya*, and the residence of a Hindoo king, whose dominions extended over Tanjore and Madura. In 1640, a descendant of the reigning prince permitted the English to form a settlement at Madras. It is distant 70 miles N. W. from Madras. N. lat. 13° 40'. E. long. 79° 24'.

KANDEI-RAO, or **KANDOVA**, in *Hindoo Mythology*, an

an avatara or incarnation of Siva; his consort, Parvati, having been also incarnated, under the name of Malfara, to accompany her lord in this manifestation, which is said by some to have occurred in the Carnatic, for the purpose of destroying a giant named Manimal. A magnificent temple is dedicated to the worship of Siva, in this incarnation, at Jejury. It is described under that article; and by some it is said the incarnation happened there. The incarnated pair are generally represented together on horseback, with a dog, he being four armed. Images and pictures of them are very common in the Mahabata country, where Kandeih Rao is a popular deity, and is very extensively propitiated. Several engravings of the subject of this article are given in Moor's Hindoo Pantheon.

KANDEK, in *Geography*, a town of Asiatic Turkey, in the province of Notolia; 48 miles E. of Ifmid.

KANDEL, in *Botany*. See *RHIZOPHORA*.

KANDERI, in *Geography*, a town of Asiatic Turkey, in Notolia; 24 miles N.E. of Ifmid.

KANKING, a town of the Arabian Irak; 23 miles N.N.E. of Shehrban.

KANEM, a city of Africa, in the way from Fezzan to the capital of Bornou. The inhabitants of the adjacent country are composed of Mussulmen and Pagans, and are employed in breeding cattle, and raising innumerable horses for the service of the king; 125 miles N. of Bornou. N. lat. 32°. E. long. 21° 45'.—Also, the name given by the geographer Edrisi to the kingdom of *Bornou*; which see.

KANG, or *Chinese Stove*, is a kind of stove that is heated by means of a furnace, which casts all its heat into it. The furnace is adapted to the fire of the stove which it is intended to heat; and it may be placed either in a room that is used, or an adjoining room, or on the outside of the house. The heat of this furnace, impelled by the outward air, rushes through a slit into a tube or conductor; and passing through this into another pipe or channel at right angles to it, lying under the middle of the floor of the stove, spreads through the stove by vent-holes in this last pipe, and is communicated to the bricks which form the pavement of the stove, and from them through the whole room. The smoke is carried off by funnels at both ends of the stoves. See a drawing and description of this kind of stove in Phil. Transf. vol. lxi. p. i. art. 7.

Any kind of fuel is used in the heating furnaces, but sea-coal is generally used; it is observed, that in order to draw off the noisome vapours of the air constantly heated by the coal fire, the Chinese always keep bowls of water in the rooms, and occasionally renew them; and the emperor's apartments in the palace are decorated with flower-pots, and little orange-trees, &c. which, as the Chinese philosophers allege, is the best way of sweetening the air, and absorbing the fiery particles dispersed in it.

KANGA, in *Geography*, a sea-port of Africa, in the kingdom of Loango, situated in a sandy bay of the Atlantic, where vessels may ride at anchor within mulket-shot of the shore, in 6 or 5 fathoms water.

KANGAANPAA, a town of Sweden, in the government of the; 27 miles N.E. of Biersborg.

KANGANI, a town of Hindoostan, in Mysore; 25 miles W of Tademeri.

KANGASAK, a town of West Greenland. N. lat. 62°. W. long. 48°.

KANGASALA, a town of Sweden, in the province of Tavastland; 30 mil. N.N.W. of Tavasthus.

KANGASNEFMS, a town of Sweden, in the province of Tavastland; 85 miles N.E. of Tavasthus.

KANG-CHIAN, a town of Corea; 16 miles S.W. of Kang-tcheou.

KANGEE, a town of Africa, in the kingdom of Kaffou; 33 miles S.E. of Kooniakary.

KANGELANG, an island in the East Indian sea, about 25 miles from east to west, indented on the south coast with two or three considerable bays. S. lat. 6° 37'. E. long. 115° 44'.

KANGIS, a town of Sweden, in West Bothria; 80 miles N. of Teinea.

KANG-TCHLOU, a town of Corea, in Kinchen; 170 miles S.E. of Pekang. N. lat. 35° 40'. E. long. 128° 49'.

KANG-TCHOU, a city of China, of the first rank, in the province of Kiang-ni; situated on a river of the same name. Its river, port, riches, and population, serve to attract strangers. Near the walls of the city is a very long bridge, composed of 130 boats, joined together by strong iron chains. The custom-house is upon this bridge, where a receiver constantly resides, to visit all barks, and examine if they have paid the necessary duties. Two or three moveable boats are so placed, that by their means the bridge can be opened or shut, to give or stop a passage; and no barks are suffered to pass that have not been examined. In the territory belonging to this city, a great number of those valuable trees grow, from which varnish distils. Its district is extensive, and contains twelve cities of the third class. N. lat. 25° 32'. E. long. 114° 30'.

KANG-TCHIN, a town of Corea; 48 miles S.S.W. of Koang-tcheou.

KANGUROO, in *Zoology*, an animal on the coast of New Holland, which, when full grown, is as big as a sheep, and in form resembling the jerboa. The head, neck, and shoulder, are very small in proportion to the other parts of the body; the tail is nearly as long as the body, thick near the rump, and tapering towards the end; the fore-legs of one of them measured only eight inches in length, and the hind-legs twenty-two; the progress is by successive leaps or hops of a great length, in an erect posture; the fore-legs are kept bent close to the breast, and seem to be of use only for digging. The skin is covered with a short fur, of a dark moult or grey colour, excepting the head and ears, which bear a slight resemblance to those of a hare. Hawke's-worth's Voyages, &c. vol. iii. p. 174.

KANHAWA, in *Geography*, a large mountainous county of America, on the western line of Virginia, having the Ohio river on the north-west, and Kentucky on the west. The population consists of 3008 free inhabitants, and 250 slaves. About seven miles from the mouth of Elk river, in this county, is a burning spring, sufficiently capacious to hold forty gallons. A bituminous vapour constantly issues from it; and on presenting a torch within sixteen or twenty inches of its mouth, a column of flame ascends to the height of three or four feet, and about eighteen inches in diameter, which burns sometimes for ten minutes, and at other times continues three days.

KANHAWAY GREAT, a river of Virginia, the head waters of which are in the western part of North Carolina, in the moist easterly ridge of the Alleghany or Appalachian mountains, and south of the thirty-sixth degree of latitude. These head branches encircle those of the Holston, from which they are separated by the iron mountain, through which it passes ten miles above the lead mines. About sixty miles from Little river it receives Green Brar river. About forty miles below the mouth of Green Brar river in Virginia, in the Kanhaway, is a remarkable cataract,

the water falling over a rock that traverses the bed of the river about fifty feet perpendicularly. The obstacles to the navigation of this river are the Great Falls, ninety miles above its mouth; and from these falls to the mouth of Green Briar is a distance of 100 miles. Its mouth, where it falls into the Ohio, in the north-west part of Virginia, (N. lat. 38° 55'. W. long. 82° 15') is 280 yards wide.

KANAWAY, *Little*, a small navigable river of Virginia, 150 yards wide at its mouth in the Ohio, (N. lat. 39° 6'. W. long. 81° 53') and navigable only ten miles.

KANJA, YANSHIA, or *Tanja*, a town of Persian Armenia, on a small river which runs into the Kur; 150 miles E.N.E. of Erivan.

KANJEE, a town of Hindoostan, in Berar; 20 miles N. of Notalagong.

KANIKA, a town of Africa, in the kingdom of Bambarra, seated on the Niger; 100 miles S.W. of Sego.

KANIOW, a town of Russian Poland, in the palatinate of Kiev, on the Dnieper; 56 miles E. of Bielaeckiew.

KANISS, a town of Africa, in Nubia, on the west side of the Nile; 25 miles E. of Dongala.

KANITZ, a town of Moravia, in the circle of Brunn; 10 miles S.W. of Brunn. N. lat. 49° 4'. E. long. 16° 21'.

KANKANAN, a town of Hindoostan, in Lahore; 12 miles S.E. of Lahore.

KANKARU, a town of Africa, in Mandingo. N. lat. 12° 20'. W. long. 5° 45'.

KANKERARA, a town of Hindoostan, in the circle of Kottah; 32 miles W. of Kottah.

KANKY-LABY, a town of Africa, in the country of Foota. N. lat. 10° 55'. W. long. 16° 5'.

KANNAKA, a town of Hindoostan, in the country of Kattaek, at the mouth of the river Brannee; 15 miles N.W. of Point Palmiras.

KANCOONGAN POINT, a cape on the east coast of Borneo. N. lat. 1° 3'. E. long. 119°.

KANNEAH, a town of Hindoostan, in the circle of Sumbul; 15 miles N. of Nidjebabad.

KANNYA, a town of Hindoostan, in Rohilcund; 35 miles S. of Berilly.

KANOOERAH, a town of Hindoostan, in Coondwanah; 75 miles N.N.E. of Nagpou.

KANOON, a town and fortrefs of Hindoostan, in the country of Mewat; 70 miles S.W. of Dellii. N. lat. 28° 3'. E. long. 76° 30'.

KANOUNG, *LITTLE*, or *KANOUNGLEY*, a town of the Birman empire, on the Irrawaddy, in the vicinity of which are plantations of various fruit trees, and fields well fenced and regularly laid down; with every aspect of industry and plenty.

KANOUNG, *Great*, or *Kanounge*, a long town, situated like the preceding, with a good quay, and well constructed wooden flairs, consisting of 100 steps, descending to the water's edge. The population in the neighbourhood of this and the forementioned town is considerable.

KANOWLY, a town of Hindoostan, in the country of Vifapour; 22 miles E.S.E. of Poonah.

KANSA, in *Hindoo History*, the uncle of Krishna, whom, as his predestined destroyer, Kanfa made many vain attempts to put to death. After several fruitless efforts, Kanfa ordered all male infants to be slain; in a manner that reminds us of the cruelty of Herod on a similar occasion. See KRISHNA.

KANSAKI, in *Geography*, a town of Japan, in the island of Nippon; 28 miles S.W. of Meaco.—Also, a

town of Japan, in the island of Ximo; 15 miles S.W. of Ikna.

KANSEZ, a river of Louisiana, which runs into the Missouri, N. lat. 38° 45'. W. long. 95° 35'.

KANSEZ, *Little*, a river of Louisiana, which runs into the Missouri, N. lat. 38° 17'. W. long. 04° 53'.

KANSEZ, a town of Louisiana, seated on the river Kanse; 240 miles W. of Genevieve. N. lat. 38° 5'. W. long. 95° 54'.

KANSKOI, a town of Russia, in the government of Kolivan, on the Kan, in which is carried on a considerable trade in furs; 140 miles E. of Kraf-noiark.

KANSON, an island in the Red sea, about twenty miles long, and from two to five broad. N. lat. 16° 44'. E. long. 42° 40'.

KANSZILI, a town of European Turkey, in Bessarabia; 28 miles S. of Bender.

KANT, in *Biography*. See KANTISM.

KANTAMATI, a name of Radlia, the wife or mistress of Krishna. See RADHA.

KANTERA, EL, in *Geography*, a town of Africa, in the kingdom of Tunis; 14 miles N. of Tunis.

KANTISM, or philosophy of Emanuel Kant, in the *History of Literature*, is the denomination of a system of metaphysical science, invented and propagated with great avidity on the continent, towards the close of the eighteenth century. It is now, even in its birth-place, much neglected; and will probably, in another half century, fall into utter oblivion. The celebrity, however, to which it attained, requires that a pretty full account should be given of it, in a work devoted to the illustration of the principles espoused and vindicated by men endowed with superior talents and ardent tempers. We shall, accordingly, first give a biographical sketch of the philosopher, and then endeavour to unravel and develop the secrets of his system.

Emanuel Kant was born April 22d, 1724, in the suburbs of Konigsberg, in Prussia. His father, John George Kant, was a faller, born at Memel, but originally descended from a Scotch family, who spelt their name with a C; but the philosopher, the subject of this article, in early life, converted the C into a K, as being more conformable to German orthography. Emanuel, the second of six children, was indebted to his father for an example of the strictest integrity, and the greatest industry; but he had neither time nor talent to be his instructor. From his mother, a woman of sound sense and ardent piety, he imbibed sentiments of warm and animated devotion, which left, to the latest periods of his life, the strongest and most reverential impressions of her memory on his mind. He received his first instructions in reading and writing at the charity school in his parish; but soon gave such indications of ability and inclination to learn, as induced his uncle, a wealthy shoe-maker, to defray the expence of his further education and studies. From school he proceeded to the college of Fridericianum. This was in the year 1740; and his first teacher was Martin Kautzen, to whom Kant was strongly attached, and who devoted himself with no less zeal to the instruction of his pupil, and contributed very greatly to the unfolding of his talents. His favourite study at the university was that of mathematics, and the branches of natural philosophy connected with them. On the completion of his studies, he accepted a situation as tutor in a clergyman's family. In this, and in two other similar situations, he was not able to satisfy his mind that he did his duty so well as he ought: he was, according to his own account, too much occupied with acquiring knowledge to be able to communicate the rudiments

ments of it to others. "I always," said he, "valued the business of instructing of young people; but I could never level myself to their infant capacities." Having acted in the capacity of a tutor for nine years, he returned to Königsberg, and maintained himself by private instruction, that he might be ready to embrace the first opportunity that offered of being introduced to a higher sphere of action in the university. In 1746, at the age of twenty-two, he began his literary career with a small work, intitled, "Thoughts on the Estimation of the Animal Powers, with Strictures on the Proofs advanced by Leibnitz and other Mathematicians on this Point; to which are annexed, various Reflections on the Powers of Bodies in general." In 1754, he published "An Examination of the Prize Question of the Berlin Society,—Whether the Earth, in turning round its Axis, by which the Succession of Day and Night was produced, had undergone any Change since its Origin? What could be the Causes of it; and how we could be assured of it?" This work acquired him great reputation as a philosopher, and paved the way to his long-desired promotion to a degree in the university. In the year 1755, he was chosen master of arts, and entered immediately upon the task of lecturing, which he performed to his own satisfaction, and the enthusiastic approbation of a very crowded audience. During the space of fifteen years, which he continued in this office, he published a variety of tracts on the abstruse branches of science. Among these may be mentioned, 1. "An universal Natural History and Theory of the Heavens, or an Essay on the Constitution and mechanical Structure of the whole Globe, according to the Newtonian System." On this subject his biographer says, "that the justness of Kant's theory was, thirty years afterwards, evinced by the practical investigation of Herschel." 2. "Principiorum primorum Cognitionis Metaphysicæ nova Dilucidatio." 3. In 1758, he gave the world "New Principles of Motion and Rest, and the Results connected with them in the Fundamentals of Natural Philosophy." This work excited very much notice, and was afterwards inserted more at large in his later writings. 4. In 1759, he published "Considerations on Optimism." And, 5. In 1763, "The only possible Grounds for a Demonstration of the Deity." In the last mentioned work, the author wished to shew that without presupposing the independent existence of ourselves, or that of other spirits, something is possible; and on that proof alone rests the grounds by which to demonstrate the existence of a Deity. This piece contributed very much to establish his literary character. The first traces of that metaphysical system, which has given such celebrity to the name of Kant, are to be found in his inaugural dissertation, "De Mundi sensibilis atque intelligibilis Forma et Principiis," which was written in the year 1770, when he was appointed to a professorial chair in the university of Königsberg. He had, previously to this, had offers of preferment, which he declined. His reputation and literary character had been long known to the Prussian monarch, who had made him repeated offers of a professorship in the universities of Jena, Erlangen, Mitau, and Halle; and also to have invested him with the character of privy councillor. He declined all these honours, from an attachment to his native place. He wished to labour and to be useful on the spot where he had received his physical and mental existence; and it was not till March 1770 that the metaphysical department at Königsberg became vacant, which was immediately bestowed upon him. The situation required his whole attention to metaphysical subjects, and his succeeding publications were almost entirely of this nature. He pursued this study with the most unmitigated ardour, and entered

into all the depths of metaphysical subtlety, in order to unfold the rational powers of man, and deduce from thence his moral duties. It was not till the year 1781, that the full development of the principles of his system appeared in his "Review of pure Reason." The German title of this work is "Critik der reinen Vernunft;" and the system it contains is commonly known under the name of the "Critical Philosophy." This celebrated work, on which we shall shortly enlarge, was nearly six years published before its importance was at all understood; and it is perhaps one of the most striking instances of the reverses of literary fortune, that the bookseller was about to destroy the copies for waste paper, when a sudden demand required and exhausted rapidly three new editions. The doctrine was soon presented, under innumerable forms, by a multitude of commentators; among the earliest and most distinguished of whom were Reibold, the son-in-law of Wieland, and the mathematician Schultz. For a considerable time the system of Kant had, in almost every philosopher of Germany, either an avowed partisan or determined antagonist. In his "Criticism of pure Reason," he maintained that the doctrine of materialism was limited by external objects; and that any pretended perception of things in themselves, and independent of a sensual representation, was utterly impossible. This publication, which subjected him to much misrepresentation, occasioned a second part in 1783, intitled, "Prolegomena for future Metaphysics, which are to be considered as a Science." In this he illustrated his former doctrine, and entirely abstracted from the definition of metaphysics any thing supernatural. In 1786, he was appointed rector of the university, an office to which he was called a second time in 1788; and in a few months after, he was advanced to be senior of the philosophical faculty. About the year 1798, he took leave of the public as an author, and soon after gave up all his official situations; and, in consequence of increasing infirmities, he retired into an almost perfect solitude, having been a writer sixty years, and having written more than sixty works. During the last ten years of his life, his corporeal and mental decay was strikingly and painfully visible to his friends: but in nothing did the decay of nature discover itself so clearly as in his perfect loss of memory. An intimate friend, who had been a beloved scholar also, and who had for many years enjoyed the pleasure of his society, entered his room a few months before his decease, and with the freedom of a friend, going up to him, embraced him with a sort of filial reverence. Kant, however, declared that he had not the pleasure of knowing him. He used every means in his power to bring the idea of him before him in his mind; but it was all in vain: "the sun at his genius was set; the vapour which overspread the horizon of his soul, darkened every object past and present." He died on the 12th of February 1804. The character of M. Kant called for universal respect and admiration; and during his life he received from the learned throughout Germany, and from others in distant countries, marks of esteem bordering upon adoration. His principles were made the subject of universal investigation, and obtained him a multitude of zealous adherents. In the universities of Jena, Halle, Göttingen, Erlangen, &c. lectures were delivered on his system; and books were written by his advocates, to illustrate and defend his doctrines. Professors were even sent, at the request and expense of princes and crowned heads, to learn more minutely, by a personal conference with him, what had not been sufficiently elucidated in his books. His lectures were constantly crowded by young persons; and, not infrequently, persons far advanced in years and knowledge came to sit in his disciples. R

the fact of the German Gamaliel. Truth was the object of his search, and liberality was the result. He wished to establish all human knowledge on the firm basis of reason; and rejected all principles as visionary, which did not admit of a fundamental explanation. He conceived, however, of religion as an inherent quality of the soul, which parted after some higher object than this transitory existence. It demanded no proof from without: it flowed of itself from within ourselves. Hence he was accused by some of mysticism, and by others of infidelity: but it seems certain from the testimony of his best friends, and from the whole tenor of his works, that he was a firm believer in the existence of a great First Cause, in a future state of rewards and punishments, and in Christianity. In his political opinions, he held that all men were originally born free; but, though a citizen of the world, he was, at the same time, a friend to peace and good order, and deprecated every violent effort which was made to acquire that freedom to which all men are by nature entitled; and in his own private conduct, he always testified due respect and submission to established authorities. By one of his biographers, M. Charles Villers, Kant is represented as having never withdrawn, in a life of eighty years, from his native city; contenting himself, in the true simplicity of a sage, with the occupations of study, and the society of a few favoured friends. It is not merely as a metaphysician that he claims to be considered; for there is scarcely a science which he has not endeavoured to illustrate. He is a mathematician, an astronomer, a chemist; in natural history, in physics, in physiology, in history, in languages, and literature, and the arts; in all the details of geography, as they relate to the exact situation of the parts of the globe, their inhabitants, and productions, every thing is familiar to him. The prominent feature in Kant's intellectual character was the accuracy with which he analysed the most complex ideas. Nothing escaped the scrutiny of his intellectual eye. Whatever was barely perceivable to others in the moral and physical world, became manifest to him. He discovered, therefore, very easily the congruities of other men's sentiments, and traced with perfect precision their errors to their true source. He had likewise the faculty of unfolding the most abstruse principles, and digesting single and individual sentiments into a systematic order. Herein consisted the originality of his mind. He viewed the world through the medium of his own happy temper, and found every thing around him agreeable and alluring. He is said to have united in the happiest degree two qualities so rarely combined in one person, - the greatest acuteness of reasoning, with the polish of a gentleman. He possessed the enviable talent of making every thing interlocking upon which he spoke, and of being able to speak upon every subject. Such was professor Kant. We shall now touch upon his theory as a metaphysician.

Besides employing a vast number of words of his own invention, chiefly derived from the Greek language, Kant uses expressions, which have long been familiar to metaphysicians, in a sense different from that in which they are generally received; and hence a large portion of time is requisite to enable the most sagacious mind to ascertain with precision the import of his phraseology. He divides all our knowledge into that which is "a priori," and that which is "a posteriori." Knowledge "a priori" is conferred upon us by our nature; and knowledge "a posteriori" is derived from our sensations, or from experience; and it is, in this system, denominated "empyric." Kant does not, as this division would seem to imply, intend to revive the doctrine of innate ideas. He considers all knowledge as acquired; he maintains that experience is the productrix of all know-

ledge, and that without it we could not have had a single idea. Our ideas "a priori," he says, are produced *with* experience, but not *by* it, or do not proceed from it. They exist in, and are forms of the mind. They are distinguished from other ideas by two marks, which are easily discerned: they are universal and necessary; they admit of no exception, and their converse is impossible. Ideas which we derive from experience have no such characters. We can imagine that what we have seen, or felt, or heard once, we may see, or feel, or hear again; but we do not perceive any impossibility in its being otherwise. Thus, if I see a building on fire, I am certain of this individual fact; but it affords no general knowledge. But if I take twice two small balls, and learn to call twice two four, I shall immediately be convinced that any two bodies whatever, when added to any other two bodies, will constantly make the sum of bodies four. Experience affords the opportunity of acquiring this knowledge; but it has not given it: for how could experience prove that this truth should never vary? Experience must be limited, and cannot teach what is universal and necessary. It is not experience which discovers to us, that we shall always have the surface of a whole pyramid, by multiplying its base by the third part of its height; or, that two parallel lines extended "in infinitum" shall never meet.

All mathematical truths, according to Kant, are "a priori;" thus, that a straight line is the shortest of all possible lines between two given points; that the three angles in any plane triangle are always equal to two right angles, are propositions which are true "a priori." Pure knowledge "a priori," is that which is without any mixture of experience. Two and two make four, is a truth of which the knowledge is "a priori;" but it is not *pure* knowledge, because the truth is particular. The ideas of substance, and of cause and effect, are "a priori;" and when they are separated from the objects to which they refer, they form, according to this system, "void ideas." It is our knowledge "a priori," that is, the knowledge which precedes experience, as to its origin, which renders experience possible. Our faculty of knowledge has an effect on our ideas of sensation, analogous to that of a vessel which gives its own form to the liquor with which it is filled. Thus, in all knowledge "a posteriori," there is something "a priori," derived from our faculty of knowledge. All the operations of our minds, all the impressions which our senses receive and retain, are brought into effect by the conditions, the forms, which exist in us by the pure ideas "a priori," which alone render all our other knowledge certain. Time and space are the two essential forms of the mind: the first, for impressions received by the internal sense; the second, for those received by our external senses. It is by means of the form *space*, that we are enabled, "a priori," to attribute to external objects impenetrability, divisibility, &c.; and it is by means of the form *time*, that we attribute to any thing duration, succession, &c. Arithmetic is derived from the internal sense, and geometry from that of our external. Our understanding collects the ideas received by the impressions made on our organs of sense, confers on those ideas unity by a particular energy "a priori," and thereby forms the representation of each object. Thus a person is successively struck with the impressions of all the parts which form a particular garden. His understanding unites these impressions, or the ideas resulting from them; and in the unity produced by the act, it acquires the idea of the whole garden. If the objects which produce the impressions, afford also the matter of the ideas, then the ideas are "empyric;" but if the objects only unfold the forms of the thought, the ideas are "a priori."

Judgments are divided into two species; *analytic* and *synthetic*. An *analytic* judgment is that in which the attribute is the mere development of the subject, and is found by the simple analysis of the perception,—as, a triangle has three sides. A *synthetic* judgment is that in which the attribute is connected with the subject by a cause or basis taken from the faculty of knowledge, which renders this connection necessary,—as, iron is heavy; wood is combustible; the three angles of a plane triangle are equal to two right angles.

The forms of the understanding are, in this system, quantity, quality, relation, modality. *Quantity* is distinguished into general, particular, and individual; *quality*, into affirmation, negation, infinite; *relation*, into categoric, hypothetical, and disjunctive; and *modality*, into problematic, certain, and necessary. M. Kant adds likewise to the properties of the four principal forms of the understanding a table of categories, or fundamental ideas, “a priori.”

Pure reason is the faculty of tracing our knowledge “a priori,” to subject it to principles, to trace it from its necessary conditions, till it be entirely without condition, and in complete unity. The great work of Kant is divided into several parts, under the titles, “Of *Æsthetic* transcendental;” “Of transcendental Logic;” “Of the pure Ideas of the Understanding;” “Of the transcendental Judgment;” “Of the Paralogism of pure Reason,” &c. We cannot, from the nature of our work, discuss all the parts of the system; but may observe, that the author contends that we know objects only by the manner in which they affect us; and as the impressions which they make upon us are only certain apparitions or phenomena, it is impossible for us to know what an object is in itself. Hence the system of Kant has been compared with that of Berkeley, which maintains that sensations are only appearances, and that there is no truth, only in our reason. But Kant does not go to this length. According to his theory, the understanding, when it considers the apparitions or phenomena, acknowledges the existence of the objects themselves, inasmuch as they serve for the bases of those apparitions; though we know nothing of their reality, and though we can have no certainty but in experience.

Truth, according to our author, consists in the agreement of our notions with the objects, in such a manner as that all men are obliged to form the same judgment: belief consists in holding a thing to be true, in consequence of a persuasion which is entirely personal, and has not its basis in an object submitted to experience. There is a belief of doctrine; as, that “there are inhabitants in the planets,” which is not the same as moral belief; because in moral belief there is something necessary. The ordinary mode of teaching the existence of God belongs to the belief of doctrine; and it is the same with regard to the immortality of the soul: nevertheless, the author was a firm believer in the existence of God, and a future state; because, said he, “this persuasion renders immovable my moral principles,—principles which I cannot reject, without rendering myself contemptible in my own eyes. I wish for happiness, but I do not wish for it without morality; and as it depends on nature, I cannot wish it with this condition, except by believing that nature depends on a Being who causes this connection between morality and Happiness. This supposition is founded on the want or necessity of my reason, and not on my duty. We have, however,” says Kant, “no certainty in our knowledge of God; because certainty cannot exist, except when it is founded on an object of experience. The philosopher acknowledges that pure reason is too weak to prove the existence of a being beyond the reach of our senses.

The necessity of believing in God is, therefore, only subjective, although necessary and general for all those beings who conform to their duty. The proofs of natural theology, taken from the order and beauty of the universe, are proofs only in appearance. They resolve themselves into a bias of our reason to suppose an infinite Intelligence, the author of all that is possible; but from this bias it does not follow that there really is such an author. To say, that whatever exists must have a cause, is a maxim “a priori;” but it is a maxim applicable only to experience: for we know not how to subject to the laws of our perceptions that which is absolutely independent of them. It is impossible to know that God exists; but we can comprehend how it is possible to act morally on the supposition of the existence of an intelligent Creator,—an existence which practical reason forces theoretical reason to adopt. This proof not only persuades, but even acts on the conviction, in proportion as the motives of our actions are conformable to the law of morality. Religion ought to be the means of virtue, and not its object. Man has not in himself the idea of religion, as he has that of virtue. The latter has its principle in the mind; it exists in itself, and not as the means of happiness; and it may be taught without the idea of God, for the pure law of morality is “a priori.” He who does good by inclination, does not act morally. There are compassionate minds, which feel an internal pleasure in communicating joy around them, and who thus enjoy the satisfaction of others; but their actions, however just, however good, have no moral merit, and may be compared to other inclinations;—to that of honour, for example, which, while it meets with that which is just and useful, is worthy of praise and encouragement, but not of any high degree of esteem. According to Kant, we ought not even to do good, either for the pleasure which we feel in doing it, or in order to be happy, or to render others happy; for any one of these motives would be *empiric*, and injure the purity of our morals. We ought to act after the maxims derived “a priori,” from the faculty of knowledge, which carry with them the idea of necessity, and are independent of all experience; after the maxims which, if it be to be wished, could be erected into *general laws* for all beings endowed with reason.

Such seem to be the leading principles of the philosophy of Kant. It is not our business to enter into a critical examination of them; but the reader will find this very ably done in the first volume of the Edinburgh Review, said to have been written by Mr. now Dr. James Mackintosh.

Kant, there is no doubt, was very sincere in all the opinions which he maintained. He was a most decided enemy to falsehood of every kind. He never could endure to hear an untruth even in jest; and in his own language, he was scrupulous to avoid every thing that could convey a false idea of himself. Nothing could draw him into a temporary renunciation or qualification of his sentiments; but wherever a free declaration of his opinions was not found agreeable, he was careful never to appear. He wished, in all his actions, to show himself to the world simply as he was, unvarnished by any false art whatever; and he even condemned the attempt to conceal one's merit under a forbidding appearance. He had a high sense of his own dignity, as an individual in the scale of existence; and he had no less respect for every man, as an independent and thinking being, and evinced these sentiments by a respectful deportment towards all. For merit under every form, and in every person, whether of his own or contrary sentiments, he testified the most unequivocal esteem.

After the death of Mr. Kant, a beautiful medal was executed by M. Abraham or Berlin, as a memorial of his great talents.

talents. On one side is a striking likeness of the philosopher, with the inscription "Immanuel Kant nat. 1724." On the reverse, the artist has attempted to express the fervices which Kant has rendered to speculative philosophy, by assigning limits to its empire, and to shew, at the same time, the madness of attempting to pass those limits. This he has represented by a Minerva seated, and holding an owl in her right hand, which she prevents from flying, with the inscription, "Alius volentem arcuit." Monthly Magazine, 1805. Edinburgh Review, vol. i. Supp. to Encyc. Brit.

KANTO, in *Geography*, a town of Japan, in the island of Nippon; 140 miles W. of Meaco.

KANTOR, a country of Africa, on the south side of the Gambia, with a capital of the same name.

KANTREFF, or KANTREV. See CANTRED.

KANTURK, in *Geography*, a market and post-town of the county of Cork, province of Munster, Ireland, situated on the river Dalua; 125 miles S.W. from Dublin, and 4 miles S.E. from Newmarket.

KANWARRAH, a town of Hindoostan, in the circuit of Gurrul; 30 miles S. of Mahur.

KAO, one of the Friendly Islands, in the South Pacific ocean, called also Aghao or Oghao, and Kaybay. S. lat. 19. 12'. E. long. 184° 58'.

KAO-CHAN, a small island in the Chinese sea, and the most westerly of those called Mi-atai; 18 miles N.W. of Teng-tcheou.

KAOLIN, the name of one of the two substances which are the ingredients of china-ware. The other, which is called *petunse*, is easily vitrifiable, and this kaolin is scarce at all so; whence the fire composes from a mixture of them both a semi-vitrification, which is china-ware. See PORCELAIN.

The kaolin, used in the composition of porcelain, requires less labour than the *petunse*. There are large mines of it, in the bosoms of certain mountains, the exterior strata of which consist of a kind of red earth. These mines are very deep, and the kaolin is found in small lumps, that are formed into bricks, after having undergone the same process with the *petunse*; which see. Father d'Entrecolles thinks that the earth called terre de Malte, or St. Paul's earth, has much affinity to the kaolin, although it has not those small shining particles which are interspersed in the latter.

M. Reaumur had an opportunity of examining this substance, not in its native state, but only in form of small bricks, made out of the paste of the powder of the native kaolin and water. He found it of a white colour, and sprinkled all over with fine glittering particles; but these he did not judge to be fragments of a different substance mixed among the mass, as are the small flakes of talc in our clays and sands; but that the whole mass was composed of some stone reduced to powder, and made into a paste with water, and that these larger spangles were only coarser particles of the powder; the examination of which he promised himself would discover what the stone was of which they were formed. And this was the more worthy of a diligent inquiry, since the *petunse* might easily be supplied by many of our own earths and sands; nothing being required of that but a substance easily running into a white glass. But the difficulty of vitrifying this other ingredient renders it a thing much more difficult to be supplied by one of the same nature among ourselves. The comparison of these, with other mineral substances, soon proved that they were of the nature of talc; or, in other words, that kaolin was talc powdered, and made up into a paste with water. And to be assured whether the whole mass was talc powdered, or

any thing else with a mixture of talc, he separated the particles of the kaolin by water, and found the small ones wholly the same with the larger; and that the larger, when reduced to powder alone, made with water a paste wholly the same with the kaolin. It is well known, that the fragments of talc have a great resemblance to the pearly part of some shell fishes; and hence unquestionably has arisen the opinion of porcelain being made of sea shells; ignorant persons having seen the talc of kaolin, and taken it for a shelly matter. Talc has not yet been successfully used in any of our European manufactures of porcelain; but it is easy to see, from many unanswerable reasons, that since China porcelain is made of a mixture of vitrifiable and unvitriifiable matter, nothing is so likely to succeed with us in the place of the last of these as talc.

1. We know no substance in the fossil world so difficult to reduce to glass as talc, which, if put into the strongest of our fires, in a crucible, is not to be vitrified, nor even calcined.
2. We know no substance which keeps so much brightness after having passed the fire as talc, or that is of so pure a white; whence we may also learn that it is not to be put to use alone, that the china-ware owes its whiteness, but that the kaolin is instrumental to the giving it that colour.
3. Talc is transparent, nay, and in some degree keeps its transparency after the action of the most violent fire. If we are to make porcelain of a vitrifiable and unvitriifiable matter mixed together, yet it is necessary that the unvitriifiable one should retain its transparency, otherwise it would obscure the mass; and talc is therefore the only known substance qualified for this purpose. Persons who have been at the china works, say, that the porcelain is made of equal quantities of *petunse* and kaolin, and it is therefore a just and exact semi-vitrification.
4. Talc is well known to have a great flexibility or toughness, and as it is found to preserve this even after it has passed the fire; it is very probable, that it is owing to this property of the kaolin that the china-ware is so much less brittle than glass. Mem. Acad. Par. 1727.

It has been before observed, that we may easily, in Europe, be provided with different substances, which will, in our porcelain manufactures, supply the place of the *petunse* of China, and talc appears equally qualified to serve instead of the kaolin. For this purpose we may use the common Muscovy talc, or singlass, used by our miniature-painters to cover their pictures instead of glass, and, by the curious, to preserve objects for the microscope; or perhaps the Venetian talc of the druggists would succeed even better; at least the process is so rational, as to be extremely well worth trying.

But this kaolin is more probably an argillaceous earth, from its forming with water a mass tenacious enough to be made into the leaves into which it is brought over. M. Bomare says, that by analysing some Chinese kaolin, he found it was a compound earth, consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a mealy appearance; of sparkling particles of mica, and of small gravel or particles of quartz crystals. He says, that he has found a similar earth upon a stratum of granite, and conjectured that it may be decomposed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See CLAY, HOACH, and PORCELAIN Earth.

KAO-TCHEOU, in *Geography*, a city of China, of the first rank, in the province of Quang-ton, situated in a delightful and fertile country, on a river, about 36 miles from the sea. The tide ebbs and flows as far as this town, and serves for bringing up to it the Chinese barks. It has in

is distant one city of the second class, and five cities of the third. On one side this district is surrounded by the sea, and on the other by mountains; and it abounds with peacocks, and several sorts of birds of prey. In the vicinity of the town is a kind of stone, resembling marble, and resembling, naturally, rivers, mountains, trees, and landscapes; this stone is cut into slabs, and formed into tables and other curious pieces of furniture. Crabs are also found on the coasts, similar to those of Europe; but when they are taken out of the water, they become petrified, without any change of their natural figure. The Chinese physicians use them as a remedy against fevers. N. lat. 21° 40'. E. long. 110° 4'.

KAO-TCHUEN, a town of Corea; 104 miles N.E. of King-ki-tao.

KAPAR, a town of Prussia, in the circle of Smaland, 10 miles W. of Königsberg.

KAPAW, a town of the island of Borneo, near the E. coast; 100 miles E.S.E. of Nagara.

KAPĪ, a term in the eastern countries for *gate*.

Thus the chief gate of the palace of the emperor of Persia is called *alla kapi*, the Gate of God. Hence also, the officer who has the command of the grand seignior's palace gates, is called *capichi bachi*.

KAPĪLA, in *Biography*, a very eminent literary character among the Hindoos, and founder of one of their philosophical schools, having many tenets in common with the theories introduced to Europe by Pythagoras, especially that of the unlawfulness of slaying animals to eat, under pretence of a sacrifice; as seemed to have been very extensively practised in India. This benevolent doctrine became so approved, that the grateful Hindoos have deified Kapila; affirming that he was an incarnation of the god Vishnu, under the name of Vafudeva, as Kapila is called in their sacred romances, the Puranas. His theory is named Sankya, which seems a modification of that called Mimansa, which corresponds with the Platonic. These points are slightly touched on in Moor's Hindoo Pantheon, and the same writer, in a posterior work, (*Hindoo Infanticide*), says that "Kapila expounded to the Hindoos the same tenet (the immortality of things) modified, to give it the attraction of variety and novelty. He, as Epicurus did after him, tricked out his theory in so meretricious a stile, as to have provoked, from more sober reasoners, the opprobrium of atheism." See **MIMANSA** and **SANKYA**.

KAPLANIK, in *Geography*, a town of European Turkey, in Macedonia; 60 miles N.E. of Akrida.

KAPLITZ, a town of Bohemia, in the circle of Bechin; 9 miles S.E. of Crumau.

KAPOS, a town of Hungary.—Also, a river which runs into the Danube, six miles from Mohacs.

KAPOSVAR, a town and castle of Hungary, formerly very strong, but now much reduced; 12 miles W. of Altenburg. N. lat. 46° 30'. E. long. 17° 51'.

KAPPAS, a tribe of Illinois Indians, in Louisiana, formerly very numerous. Their country has good pasture.—Also, a town of Louisiana, on the Mississippi; 130 miles S.S.W. of New Madrid. N. lat. 34° 30'. W. long. 91°.

KAPPAS Old Fort, situated in Louisiana, at the mouth of the river St. Francis, and built by the French, principally for a magazine of stores and provisions during their wars with the Chickasaws, by whom their Illinois envoys were attacked and destroyed.

KAPRIAN, a town of European Turkey, in Moldavia; 60 miles E. of Jassi.

KAPSBERGER, **JOHANNES HIERONIMUS**, in *Biography*, a German of noble birth, celebrated by Kircher (*Musurgia*), and by many others, was not more famed for the

number and variety of his compositions, than for his exquisite skill in performing upon almost every species of instrument; but more particularly on the theorbo lute, which seems to have been a new invention in the 17th century. The author's name has not been recorded; but it is said to have been of Neapolitan construction. The difference between the common lute and theorbo, was in the latter having two necks, and thence called in Latin *Cithara biceps*.

Kapfberger, who assisted Kircher in compiling many parts of his *Musurgia*, is highly praised by that laborious, but often credulous and visionary author; but, according to Bapt. Doni, Kapfberger was loquacious and presumptuous. The truth is, that the practical musician and the dilettante theorist were rivals in the favour of cardinal Barberini, afterwards Urban VIII., a lover and patron of music. Both the disputants were reformers, but with different views: Doni, a credulous believer in the miraculous powers of the music of the ancients, without understanding the modern; and Kapfberger, an innovator, who wished to have the compositions of Palestrina banished the church, in order to make way for his own. The feuds of musicians and their partisans are seldom worth recording; as it often happens that they are unable to explain to the public the cause of their difference.

KAPSDORF, in *Geography*, a town of Hungary; 26 miles N.N.W. of Callovia.

KAPTEBERO, an island in the gulf of Bothnia, near the E. coast, about eight miles long and two broad; 2 miles W. of Wafa.

KAPTSCHAK, a large and well compacted state, which Banty, the kinsman of the great Tchingis or Zingiskhan, founded, about the year 1240, fell, in the year 1441, into four khanates, viz. Kazan, Altrachan, Kaptschak, and the Krim. The first of these were, somewhat more than 100 years afterwards, conquered by the Russians; but the fourth of these states preserved its independency above 230 years longer. At present, however they altogether form a part of the Russian empire. The kharate of Kaptschak, which, from the time of its separation in 1411, has had its principal seat in the plain, which is now called the Altrachan-Steppe, fell first. So long ago as the year 1506, it lost its last khan, and was divided among the sovereigns of Kazan, Altrachan, and the Krim, on which at length it came to Russia by the conquest of the two former states. These repeated subjugations had reduced the Kaptschak Tartars to an insignificant residue, which, now removed from its ancient homestead, dwells among Baskchiks and Kirghutes, though still retaining its appellation, and the memory of its origin. **Tooke**.

KAR, a town of Persia, in the province of Irak; 156 miles N. of Ispahan.

KARA, a river of Russia, which runs into the Kaskoi sea, at Kankoi.—Also, a town of Hindoostan, in Guzerat; 60 miles S.W. of Gogo.—Also, a town of Hindoostan, in Berar; 8 miles N. of Chanda.

KARA-AGATZ, a town of European Turkey, in Romania; 6 miles S. of Adrianople.

KARA-BAGAN, a town of Asiatic Turkey, in Natioha; 24 miles S. of Milets.

KAR-PAGH, or the *Black Garden*, a mountainous province of the principality of Georgia, south of the river Arax.

KARABAS, a mountain of Grand Buclaria; 70 miles N.W. of Samarcand.—Also, a town of Persia, in the province of Irak; 70 miles S.S.W. of Hamadan.

KARABASAR, a town of Russia, in the government of Tauris; 35 miles N.E. of Barafsey.

KARABAZARI, a town of Asiatic Turkey, in Natolia; 20 miles W. of Kiangari.

KARABE. See CARABE.

KARABE-SHEH, in *Geography*, a town of Persia, in the province of Mazanderan, on the coast of the Caspian sea; 60 miles E. of Fehrabad.

KARA-BIGNAR, a town of Asiatic Turkey, in Carmania; 20 miles S. of Akferai.

KARABIOW, a town of Poland, in Podolia; 12 miles N. of Kaminnic.

KARABOZA, a town of Asiatic Turkey, in Natolia; 24 miles W. of Artaki.

KARABOGAS, a bay on the E. side of the Caspian sea, 40 miles long and 25 broad, the water of which is very bitter. N. lat. 41 45'. E. long. 54 44'.

KARABOULAKI, a town of Georgia, in the province of Carduel; 45 miles S. of Gori.

KARABUNAR, a town of Asiatic Turkey, in Carmania; 40 miles E. of Cogni.

KARAC, a town of Arabia Petraea, on the river Safia; 90 miles S. of Jerufalem. N. lat. 30 44'. E. long. 35 45'.

KARACAL, or CARACALLA, a town of Walachia; 60 miles S.W. of Buchareit.

KARACUZ, a town of Persian Armenia; 22 miles E. S. E. of Erivan.

KARADERA, a town of Asiatic Turkey, in Diarbekir; 10 miles S. S. E. of Merdin.

KARADJEHLAR, a town of Asiatic Turkey, in Natolia; 36 miles S. W. of Caitamena.

KARADJUK, a town of Natolia; 20 miles S. E. of Dognizlu.

KARADRO, a town of Asiatic Turkey, in Carmania; 50 miles W. S. W. of Selefke.

KARADSHELAR, a town of Natolia; 40 miles N. of Angura.

KARAEVIAN, a town of Russia, in the government of Perm; 64 miles S. S. W. of Ekaterinograd.

KARAGANSKOI, CAPE, a cape on the E. coast of the Caspian sea. N. lat. 44 20'.

KARAGINSKOI, an island in the N. Pacific ocean, near the N. E. coast of Kamtschatka, about 80 miles in circumference. N. lat. 59 5'. E. long. 162 14'.

KARAGODE, a town of the island of Ceylon; 86 miles S. of Candy.

KARAGOL, a town of Grand Bucharia, seated on a lake; 24 miles S. W. of Duclaria.

KARAH, a town of Arabia, in the province of Nedsjed; 300 miles E. of Mecca.

KARAHUUM, a town of Dungal; 13 miles N. W. of Torce.

KARAHISSAR, a town of Asiatic Turkey, in Carmania; 38 miles S. of Yurcup. See АРНОМ, &c.

KARA-HOTUN, a town of Tartary, in the country of the Monguls; 120 miles N. W. of Peking. N. lat. 41 16'. E. long. 121 53'.

KARAJIN, a town of Poland, in the palatinate of Braclaw, near the Bog; 50 miles S. E. of Braclaw.

KARAI8, a town of Sweden, in the province of Savolax; 35 miles N. N. W. of Nyflot.

KARAITES. See CARAITES.

KARAKAJI, in *Geography*, a town of Georgia, in the province of Kaketi; 80 miles S. E. of Teflia.

KARAKAKOOA BAY, a bay on the W. side of the island of Owhyhee, one of the Sandwich islands, situated in a district called Akoma. It is about a mile in depth, and bounded by two low points of land, at the distance of half

a league, and bearing S. S. E. and N. N. W. from each other. On the N. point, which is flat and barren, stands the village of Kowrowa; and in the bottom of the bay, near a grove of tall cocoa-nut trees, there is another village of a more considerable size, called Kakooa; between them runs a high rocky cliff, inaccessible from the sea-shore. On the S. side, the coast, for about a mile inland, has a rugged appearance; beyond which the country rises with a gradual ascent, and is overpread with cultivated inflores, and groves of cocoa-nut-trees, where the habitations of the natives are scattered in great numbers. The shore, all round the bay, is covered with a black coral rock, which makes the landing very dangerous in rough weather, except at the village of Kakooa, where is a fine sandy beach, with a "morai," or burying-place, at one extremity, and a small well of fresh water at the other. This bay, appearing to Capt. Cook a proper place to refit the ships, and lay in a fresh supply of water and provisions, he caused them to move on the N. side, about $\frac{1}{4}$ of a mile from the shore, Kowrowa bearing N. W. This was in January 1779. The natives came from the shore in astonishing numbers, and expressed their joy by singing and shouting, and exhibiting a variety of wild and extravagant gestures. Capt. Cook was received by the chiefs of the island with a respect, approaching to adoration; and the natives, though they manifested a propensity to pilfering, treated him and his companions with a great degree of hospitality. On the 4th of February, the ships unmoored and failed out of the bay, being followed on their departure by a great number of canoes. It was the design of Capt. Cook to finish the survey of this island before he visited the other islands, in hopes of finding a road better sheltered than the bay which was now left. But the weather becoming equally and tempestuous, it was found necessary to return to this bay; where the natives manifested a very different disposition from that which they had discovered on the first visit. They now appeared hostile, and adverse to every exercise of hospitality. Several circumstances occurred, which served to widen the breach between the islanders and Capt. Cook; and it was found necessary to recur to the use of arms. For subsequent particulars, and an account of the unfortunate death of the commander, see his biographical article.

KARAKALPAKS, a tribe of Tartars settled in Russia, who called themselves Kara-Kiptchaks, and inhabit the districts on the Syr Darya, a considerable river springing from the lake Aral. They divide themselves, according to their position, into the upper and the nether horde. Previous to the origin of the Kazanian khanate (see KAZAN), they removed to the Volga; where, pressed by the Nogays, they marched like the Chivines, not as other nations did to the west, but back towards the east, into their present seats. About the year 1742 the nether horde, then consisting of 30,000 kibitkas, implored the Russian protection; but the Kirghises, against whom they were desirous of securing themselves, took such sanguinary vengeance, that the greater part of them was exterminated, and those who remained were obliged to return to the upper horde. As they seldom have the courage to flee from the Kirghisan captivity, their number in Russia is very small. Tooke's Russ. Emp. vol. i.

KARAKAN, a town of Kurdistan; 10 miles S. W. of Betlis.

KARAKECHIS, a town of Persian Armenia; 48 miles N. E. of Erivan.

KARAKERMAN, a town of European Turkey, in Bulgaria; 36 miles S. S. E. of Ismail. N. lat. 44 45'. E. long. 29 58'.

KARAKITA, a small island in the East Indian sea, belonging

loging to the king of Ternate. N. lat. 3° 6'. E. long. 125° 24'.

KARAKUM, or the *Black Sea*, the name of a great desert, which forms the northern boundary of Khorasan and modern Persia.

KARAKURODY, a town of Persia, in the province of Schirvan; 20 miles S. of Scamachie.

KARALANSKA, a town of Russia, in the government of Irkutsk, on the Tungulka; 72 miles N.W. of Ilimsk.

KARALEJANGO, a town of Africa, in Kaarta. N. lat. 14° 20'. W. long. 6° 20'.

KARALUKALA, a town of Turkish Armenia, in the government of Erzerum; 30 miles E. of Erzerum.

KARAMAN, a town of European Turkey, in Bulgaria; 35 miles E.S.E. of Nicopoli.

KARAMEISCHEVO, a town of Russia, in the government of Tver; 72 miles N. of Tver.

KARAMIT, a town of Natolia; 30 miles E.S.E. of Mæri.

KARAMUSAH, a town of Natolia, on a bay of the sea of Marmora; 36 miles N.N.E. of Bursa.

KARAN, a town of Africa, in Benin, in which is a manufacture of fine cloth.

KARANKALLA, a town of Africa, in Kaarta; 10 miles W. of Kemmo.

KARANSEBES, a town of Hungary, on the Temis; 38 miles E.S.E. of Temiswar.

KARASBAG, a town of Persian Armenia; 174 miles E.S.E. of Erivan.

KARASM, or **CHARASM**, a country of Asia, bounded on the N. by Turkestan, on the E. by Grand Bucharia, on the S. by Khorasan, and on the W. by the Caspian sea; about 320 miles from N. to S. and about as much from E. to W. The country is in general fertile, and is divided among several Tartarian princes, one of whom takes the title of khan, assuming pre-eminence over the rest. The capital is Urkonje, which is the usual residence of the khan in winter; but in summer he usually encamps on the sides of the river Amol; his camp being called Khiva. He is said to be able to raise forty or fifty thousand horsemen. This country was formerly full of cities, towns, and castles, strong and populous; it was then a province of the Persian and Arabian empires; but it was probably most flourishing, when it subsisted as an independent kingdom, under the family of the Kharasmi khans, who by conquest annexed to it the whole of Iran, or Persia at large, and Turan, or the countries N. of the Gihon or Amu, thus forming a great empire, of which Urkonje was the capital. At present its cities are few, and much reduced by the devastating power of the Uibecks, who have introduced poverty and distress wherever they have settled.

KARASU, a town of Asiatic Turkey, in Caramania; 100 miles S.E. of Yorcup.—Also, a river of Persia, called *Karansu*, which rises in the N.W. part of the province of Irak, and runs into the Tigris, near Bassora, anciently called *Euleus* and *Chodspes*.—Also, a river of Asiatic Turkey, called *Koremoz*, which rises near Kaifarich in Caramania, and runs into the Euphrates near Ilija.

KARAT, a town of Arabia, in the province of Oman; 190 miles S.W. of Mascat.

KARAT. See **CARAT**.

KARATA, by some called *caraguata naca*, a kind of aloe growing in America; whose leaves, when boiled, are made into a thread, of good use for making cloth, fishing nets, &c. Its roots or leaves, thrown into the water, stupify the fishes to that degree, that they are easily taken with the

hard; its stalk, when dried and burnt, serves for tinder; and when briskly rubbed on a harder wood, it takes fire, and consumes itself.

KARATAS, in *Botany*, Plum. Gen. 10. t. 33, the Welt Indian name of a fine plant referred by Linnæus to *Bromela*; see that article, sp. 2.

KARATCHIN, in *Geography*, a Russian otrog, in the peninsula of Kamtschatka; fifty miles from Bolchertskoi. It is pleasantly situated by the side of the river Awatka, and consists of three log-houses, three courts, or houses made under ground, and nineteen balagans, or summer habitations. The inhabitants are a singularly hospitable people.

KARATOPE, a town of Hami, in Chinese Tartary; 30 miles W. of Hami.

KARAT-SIRIM, a town of Kurdistan; 40 miles S.E. of Kerkuk.

KARATUIN, a town of Persia, in the province of Irak; 40 miles N.E. of Neiuwend.

KARAUINOI, a town of Russia, in the government of Kolivan, on the Genifei; 60 miles S. of Krafnioarsk.

KARAVUN, a town of Hindoostan, in Doobab; 40 miles W. of Pattary.

KARBENING, a town of Sweden, in Westmannland; 30 miles N. of Stromsholm.

KARBY, a town of Sweden, in West Bothnia; 20 miles N. of Lulea.

KARCARA, a town of Persia, in Segestan; 70 miles N.W. of Zareng.

KARCOJA, a town of Persia, in Segestan; 21 miles N.W. of Zareng.

KARCZOW, a town of the duchy of Warlaw; 16 miles S.W. of Czerk.

KARDAMA, in *Hindoo Mythology, a being sometimes said to have been an *avatara* or incarnation of the god Siva, and to have been produced by Brahma's shadow; sometimes he is said to be one of the Rishis.*

KARDANAH, in *Geography*. See **BELUS**.

KARDGHA, the name of a short sword held in the hand of Hindoo deities of avenging character; the sacrificial weapon.

KARDUH, in *Geography*, a town of Persia, in the province of Kerman; 56 miles N. of Maftih.

KAREDJUK, a town of Asiatic Turkey, in Natolia; 20 miles S.W. of Dognizlu.

KAREK, a town of Persia, in Segestan; 30 miles S. of Fuheng.

KAREK, a town of Persia, in the province of Laristan; 42 miles S. of Lar.

KAREK, or **GARAK**, an island situated on the E. coast of the Persian gulf, between Abu Schehr and Bender Rigk, containing only a single village; but appearing, from its aqueducts cut in the rocks, to have been formerly more populous in proportion to its extent, which is about five leagues in circumference. The Dutch, who once had a settlement here, made the island famous, by carrying on a great trade from hence to Bassora, under the direction of baron Kriphaufen. But Mir Mahenna, prince of Bender Rigk, having made an unsuccessful attempt upon the island, at length concluded a peace with the Dutch governor, who was the second in succession to Kriphaufen, and the Dutch trade for some time met with no interruption. At a subsequent period Mir Mahenna made a descent upon Karek, and besieged the town. The Arab, having outwitted Van Houting, the Dutch governor, entered the fort with a small retinue, in order to settle terms of accommodation; and having made the Dutch garrison prisoners, sent them to Bata-

via. This event happened in the end of December 1765. Vessels failing to Balfora generally touch at this island for a pilot. N. lat. 29° 15'. E. long. 50° 26'.

KAREMPI, CAPE, *Karempitapan*, or *Cape Pisello*, a cape on the coast of Natolia, in the Black sea. N. lat. 42° 50'. E. long. 33° 10'.

KARENDAR, a town of Persia, in the province of Khorasan; 210 miles N. of Herat.

KAREPOS, a town of Russia, in the government of Archangel; 60 miles N.E. of Archangel.

KAREVON, a town of Persia, in Farfistan; 35 miles N.E. of Pasa.

KAREZIN, a town of Persia, in Farfistan; 60 miles S.E. of Bender Rigg.

KARFE, a kind of cinnamon.

KARGALDZIN, in *Geography*, a lake of Russian Tartary, 60 miles in circuit; 340 miles S. of Orenburg.

KARGAPOL, a town of Russia, on the N. side of the lake Latcha. N. lat. 61° 30'. E. long. 38° 50'.

KARGHERD, a town of Persia, in the province of Khorasan; 16 miles N.W. of Fuheng.

KARGHERON, a town of Persia, in the province of Gilan; 60 miles N.N.W. of Reshd.

KARGHI, a town of Asiatic Turkey, in Natolia; 27 miles N.E. of Kiangari.

KARGINIGI, a town of Russia, in the government of Olonetz; 32 miles W. of Vitegra.

KARGO, a province of Africa, in the kingdom of Lbango, famous for its mines of excellent copper.

KARADEH, a town of Natolia, in the gulf of Smyrna; 28 miles W. of Smyrna.

KARAJA, a town of Sweden, in the government of Abo; 23 miles N. of Abo.

KARIATAIN, a town of Arabia, in the province of Nedsjed, anciently Kirjathjearim; 300 miles E. of Medina.

KARIMATEIN, a town of the desert of Syria; 60 miles S. W. of Palmyra.

KARIBAZARI, a town of Natolia; 18 miles W. of Kiangari.

KARIKAL, or **CARICAL**, a town of Hindoostan, on the coast of the kingdom of Tanjore, situated on one of the branches of the Cauvery; ceded by the king of Tanjore to the French. It contains five mosques, 14 pagodas, and about 500 inhabitants. It was taken by the English in 1760, and retaken in 1779; six miles S. of Tranquebar.

KARINAIS, a town of Sweden, in the government of Abo; 20 miles N.E. of Abo.

KARINKULA, a town of Africa, in Bambouk. N. lat. 13° 36'. W. long. 9° 50'.

KARIS, a town of Sweden, in the province of Nyland; 10 miles N.N.E. of Eknas.

KARISTOJO, a town of Sweden, in Nyland; 16 miles N.N.E. of Eknas.

KARK, a town of the Arabian Irak, on the Tigris; 80 miles N.N.W. of Bagdad.

KARKA, a town of Asiatic Turkey, in the government of Sivas; 30 miles S. of Tocat.

KARKARLANG, a small island in the Pacific ocean, belonging to a cluster called Meages. N. lat. 4° 45'. E. long. 126° 59'.

KARKI, an island in the Mediterranean; six miles W. of Rhodes. N. lat. 37° 25'. E. long. 27° 19'.

KARKOLA, a town of Sweden, in Tavastland; 27 miles E. of Tavasthus.

KARKRONY, a building where the royal manufactures of Persia are carried on.

Here are made their tapestries, cloth of gold, silk, wool, and brocades, velvets, taffeties, coats of mail, fabrics, bows, arrows, and other arms. There are also in it painters in miniature, goldsmiths, lapidaries, &c.

KARKU, in *Geography*, a town of Sweden, in North Finland; 35 miles S.E. of Biornborg.

KARLANDA, a town of Sweden, in Warmeland; 42 miles W.N.W. of Carlstadt.

KARLE, a Saxon word, used in our laws, sometimes simply for a *man*, and sometimes for a *servant* or *lessee*.

Hence the Saxons call a seaman a *byskarle*, and a domestic servant a *byskarle*.

KARLE Hemp, a term used by our country people for the latter green hemp.

KARLEBY, GAMLA, in *Geography*, a seaport town of Sweden, in East Bothnia, with a good harbour. It trades principally in hemp, salt, and ship building; 60 miles S.W. of Cajana. N. lat. 63° 50'. E. long. 23° 1'.

KARLEBY, NY, a town of Sweden, in East Bothnia, seated on the river Lappoock, about five miles from the sea, built in 1620 by Guttavus Adolphus; 70 miles S.W. of Cajana. N. lat. 63° 32'. E. long. 22° 26'.

KARLUTZKA, a town of Russia, in the government of Irkutsk; eight miles E. of Niznei Udinsk.

KARLY, a village situated on the road between Bombay and Poona, having in its vicinity a lofty hill, in which are some excavations that have not, until within these few years, come under the notice of Europeans. The hill is named Ekvera, and is two or three miles to the N.E. of Karly, but the excavations are generally called by the name of the village. The late Mr. Wales, a very respectable artist, was the first European who explored this magnificent cavern-temple, of which he made several accurate sketches, and copied several inscriptions. The sketches have not been published, nor have, we believe, the inscriptions been hitherto explained. Lord Valentia has more recently visited Karly, and in his "Travels" describes the cave, of which a beautiful view and a ground plan are given; and Mr. Salt, who accompanied his lordship, has, in his elegant series of oriental views, given two of this beautiful temple. Major Moor, who has also frequently visited it, has given a plate of some of its sculptures in his Hindoo Pantheon. There are many apartments scooped out of the rock in an elevated situation, having flat tops, as usual in most of the Indian excavations; but the grand apartment of Ekvera is arched, and of a most striking and magnificent description. "Its size, and the peculiarity of its form," says Lord Valentia, "struck me with the greatest astonishment. It consists of a vestibule of an oblong square shape, divided from the temple itself, which is arched and supported by pillars. The length of the whole is one hundred and twenty-six feet, the breadth forty-six feet. No figures of any deities are to be found within the pagoda, but the walls of the vestibule are covered with carvings, in alto-relievo, of elephants, of human figures of both sexes, and of Budha, who is represented in some places as sitting cross-legged, in others he is erect, and in all attended by figures in the act of adoration; and in one place, two figures standing on the lotus are fanning him, while others hold a rich crown over his head. I think, therefore, that it is beyond dispute, that the whole was dedicated to Budha." Travels, vol. ii. p. 163. (See BOODIR.)

The farther end of the cave is round, the sides straight; a row of pillars, ten feet from the sides, support kneeling elephants, on which are seated human figures, all beautifully sculptured. From a cornice, running the whole length of the temple over the heads of the figures, spring ribs of wood forming an arch, and touching in its whole concavity the

roof which they seem to support. This is a singularity not known to exist elsewhere. The wooden ribs are not more than three feet apart, and about two in depth, and nine inches thick, and have something the appearance of a ship's bottom, inverted. They run parallel to each other, forming a fine arch, from side to side of the apartment. The pillars are sixteen in number on each side, with a space between equal to the diameter of their ball, viz. about four feet. The pedestals are square, the shafts polygonal. Seven plainer columns continue the line at the end: on them rests an architrave, whence an arch springs inwards, forming a roof over the altar, as it may be called, which in the Hindoo Pantheon is said to "consist of a vault hemisphere of stone, resting on a round pedestal of greater diameter, and having its convexity surmounted by a sort of canopy or umbrella of peculiar construction. The principal arched temple of Kenera is exactly on the same plan of that here described, and the altar is alike in both. That at Ellora, described by Sir Charles Malet, in vol. vi. of the Asiatic Researches, is also exactly similar in respect to ground plan, but the principal object is different, being Budha himself, with the semi-globe on the round pedestal behind him. In neither of these three arched caves will, I think, be found any sculptures referring to the gods of the Brahmans; and these three are the only caves that I ever saw or heard of constructed with an arched roof. And I presume to hazard an opinion that they are of modern origin, relatively with other excavations at Ellora and on Elephanta, containing, with and without Budha, many of the deities now worshipped by the Brahmans.

"What I would hence infer is, that in the older sculptures we find Budha mixed with the other Hindoo gods; Elephanta and the flat-roofed Pantheistic temples at Ellora, I reckon among the oldest. In sculptures more modern, Budha, as a deity, is often seen exclusively portrayed; the arched caves of Ellora, Karly, and Kenera, I judge to be of later date; and as to form and proportion, of more refined and elegant construction. May we not be allowed, from these premises, to deduce a farther confirmation of the idea that the Budha incarnation of Vishnu, and the sectarian deity of that name, exclusively worshipped by so many different nations under so many different forms and designations, are one and the same person? and that such exclusive worship, and its accompanying ceremonies and privations, is a heresy or reformation, or whatever it may be termed, of the more ancient Brahminical religion? Among European as well as Indian enquirers, this opinion will find the most numerous, but, like other majorities, not the most zealous supporters.

"Sir Charles Malet's plate of Ellora gives exactly a representation of the temples of Karly and Kenera as far as regard ground plan and general design; and they must certainly have originated in the same person, as one has been taken from the other. The capitals of the interior pillars, from which the arched roofs spring, are different: at Ellora they appear to be men in the act of adoration; at Karly the entablatures are elegantly formed of figures of men and women seated on kneeling elephants, whose probosci, joining at the angles, form, in graceful curves, the volutes of the capitals." P. 245.

In Mr. Daniel's publications of oriental scenery, unrivalled in elegance by any production of the British press, are a series of views of Ellora, finished from the sketches of Mr. Wales. To these we refer such as desire a faithful picture of these truly wonderful excavations, of which some account occurs in an earlier volume, under the article ELLORA. See also ELEPHANTA, (in which article we will here not

trace an error in the ancient and native name of this glorious and interesting island, which is Ghari-puri, or Gharipouri, and not, as misprinted, Gari-pouli,) and KENERA for some farther particulars of the cavern-temples of India.

KARM, an island in the North sea, about 12 miles long, and two wide, near the coast of Norway. N. lat. 59 17 E. long. 5 34'.

KARMALĀ, in *Hindoo Mythology*, a servant or minister of Yama, the judge of departed spirits. See YAMA.

KARMEĪS, in *Geography*, a town of Kurdistan; 12 miles E. of Mosul.

KARMATIANS, an Eastern sect which bore an inveterate malice against the Mahometans, and began to raise disturbances in the year of the Hegira 78. It is said to have originated with a poor person, called Karmata, who came from Chusistan, in Persia, to the villages near Cyle, and there feigned great strictness and sanctity; alleging that God had enjoined him to pray fifty times a day, and pretending to invite people to the obedience of a certain person of the family of Mahomet. This course he pursued till he had formed a great party, out of which he chose twelve as his apostles, to govern the rest, and to propagate his doctrines. But as his doctrines promoted idleness, particularly among the husbandmen and peasants, he was seized by the governor of the province, imprisoned, and menaced with death. But this menace having been overheard by a girl, who was one of the governor's domestics, she took the key of the dungeon from under her master's pillow while he was asleep, released the prisoner, and returned the key to the place where he had found it. On the following morning, when the fact was known, his adherents announced that God had taken him into heaven. He afterwards appeared in another province, declaring to his followers, that it was not in the power of any one to hurt him: at length, however, his resolution failed him, and he retired into Syria, and was not heard of any more. His sect continued, and it was pretended that he was a true prophet, and that he had left them a new law, which changed the ceremonies and form of prayer used by the Moslems, having introduced a new fast, having allowed them to drink wine, and having dispensed with the obligation of several precepts of the Koran. The precepts of this sacred book they interpreted allegorically. From the year above-mentioned, the Karmatians, under several leaders, gave almost continual disturbance to the Caliphs and their Mahometan subjects for several years, committing great outrages in Chaldea, Arabia, Syria, and Mesopotamia; and at length establishing a considerable principality, which attained its height of eminence and power in the reign of Abu Dhiher, famous for the capture of Mecca, and the indignities offered by him to its temple; but it soon after declined and came to nothing. The Ismaelians of Asia resembled the Karmatians, if they were not a branch of them. These Ismaelians, in 483, possessed themselves of Al Jebel, in the Persian Irak, under the conduct of Hasan Sabah; and this prince, with his descendants, enjoyed the same for 171 years, till the whole race of them was destroyed by Holagu the Tartar. D'Hérbelot. Sale's Koran.

KARMIN, in *Geography*, a town of Persia, in Segistan; 25 miles N.E. of Zareng.

KARMOE, a small island in the North sea, near the coast of Norway. N. lat. 59 10.

KARMSUND, a strait in the North sea, between the island of Carman and the coast of Norway.

KARMUK, a town of Kurdistan, on the side of the lake Van; 22 miles N.N.E. of Balis.

KARNAC. See CARNAK.

KARNE, a town of Africa, in the kingdom of Bornou.

KARNICAR, a town of Grand Bucharia; 20 miles N. E. of Termed.

KARNKOWSKI, STANISLAUS, in *Biography*, celebrated as a Polish writer and statesman, was born in 1525. He was educated for the church, and obtained a bishopric about the year 1563, and upon the death of Sigismund Augustus, king of Poland, in 1572, he promoted the election of Henry of Valois, and, on his reception, made an eloquent harangue to him in the name of the states. After the abdication of this prince, Karnkowski nominated Anne, the sister of the late Sigismund, queen of Poland, and crowned her husband, Stephen Batori, upon the refusal of the primate to perform this office. After this he placed the crown on the head of Sigismund III. prince of Sweden, who was acknowledged by the kingdom. He had already succeeded to the primacy, and, in 1590, he joined a party who were in opposition to the great chancellor, Zamoisley, and convoked an extraordinary assembly at Kiow, in which he endeavoured to cancel the ordinances of the last diet. This step rendering him unpopular, he was obliged to seek a reconciliation with the chancellor. He died in 1603, at the age of seventy-eight, and was interred in the Jesuits' college at Kalish, which he had founded. As an instructor of youth he did much to reform the systems of education: but as an author he is known by "Historia Interregni Polonici," being a relation of the affairs of the interregnum succeeding the abdication of Henry of Valois: "De Jure Provinciarum, Terrarum, Civitatumque Prussie;" "Epiſtole Illuſtrium Virorum, lib. iii." This collection of letters is very rare, and is said to contain many important particulars relative to the history of Poland, from 1564 to 1577.

KARNOWL, in *Geography*, a town of Hindoostan, in Bahar; 38 miles N. N. W. of Hajypour. N. lat. 26° 17'. E. long. 85° 11'.

KAROLI, JASPER, in *Biography*, a Hungarian divine, who flourished towards the close of the sixteenth century, was held in high estimation for his talents as a philosopher, theologian, and philologist, and much admired as a preacher. His memory is greatly revered on account of his having translated the bible from the original Hebrew into his native language. This work was published at Hanover, in 4to., in the year 1608, and another impression of it was given to the public from the press at Frankfort, in Sw., by Albert Molnar. The work has been reprinted very frequently, in different countries, and is still held in high estimation.

KAROLOU-KALA, in *Geography*, a town of Turkish Armenia; 42 miles E. of Erzerum.

KAROP, a town of Russia, in the government of Novgorod Sieverſkoi; 28 miles S. of Novgorod Sieverſkoi.

KAROS, an island in the Grecian Archipelago, six miles in circumference; 6 miles S. E. of Naxia. N. lat. 36° 53'. E. long. 25° 30'.

KAROTTA, a small island in the Pacific ocean, belonging to the cluster called Mizanges. N. lat. 5°. E. long. 126° 50'.

KAROUJI, a town of European Turkey, in Beſſarabia; 68 miles S. W. of Bender.

KARPILAX, a town of Sweden, in Tavastland; 14 miles N. E. of Jamio.

KARPILOWKA, a town of Poland, in the palatinate of Kiev; 8 miles N. N. W. of Kiev.

KARRIARPOUR, a town of the circar of Gohud; 16 miles N. of Gohud.

KARRIETEN, a town of Arabia, in Yemen; 20 miles S. S. E. of Chamir.

KARROO, a Hotentot name given, in the colony of the Cape of Good Hope, to vast plains, which are inter-

posed between the great chains of mountains. Out of their impenetrable surfaces of clay, glistening with small crystals of quartz, and condemned to perpetual drought and aridity, not a blade of grass, and scarcely a verdant twig, occurs to break the barren uniformity. The hills, by which these surfaces are sometimes broken, are chiefly composed of fragments of blue slate, or masses of felspar, and argillaceous ironstone; and the surfaces of these are equally denuded of plants as those of the plains. Yet, Mr. Barrow observes, that wherever the Karroo plains are tinged with iron, and water can be brought upon them, the soil is found to be extremely productive. Barrow's Africa, vol. ii. p. 32.

KARS, a town of Asiatic Turkey, in Aladulia; 25 miles N. N. E. of Adana.—Also, a town of Persia, in the province of Kerman; 20 miles N. of Sirjian. This is the extreme town on the frontiers of Persia, and though an inconsiderable place, is tolerably fortified.

KARSABOO, a town of Africa, in Bambarra. N. lat. 13° 10'. W. long. 5° 35'.

KARSAMAKI, a town of Sweden, in the government of Uleå; 65 miles S. of Uleå.

KARSEK, an island near the west coast of East Greenland. N. lat. 60° 35'. W. long. 45° 20'.

KARSHAGNI, a fiery expiation among the Hindoos, of which the following account is taken from Moor's Hindoo Pantheon. "Cow-dung is a great purifier on several occasions. It is related in the Agni-purana, that a most wicked person, named Chanyaka, had exceeded every known possibility of salvation. At the court of Indra were assembled gods and holy men; and as they were discoursing on such enormities, Indra, in answer to a pointed question, said that nothing certainly could expiate them except the karshagni. It happened that a crow, named, from her friendly disposition, Mitra-kaka, was present; and she immediately flew and imparted the welcome news to the despairing sinner, who immediately performed the karshagni, and went to heaven. This expiation consists in the victim covering his whole body with a thick coat of cow-dung, which, when dry, is set on fire, and consumes both sin and sinner. Until revealed by the crow, this potent expiation was unknown; and it has since been occasionally resorted to, particularly by the famous Sankara-Charya. The friendly crow was punished for her indiscretion; and forbidden, and all her tribe, ascension to heaven, and was doomed on earth to live on carrion." P. 143. See SANKARA-CHARYA.

KARSKOI, in *Geography*, a settlement of Russia, in the government of Archangel, at the mouth of the Kara; 600 miles E. N. E. of Archangel. N. lat. 68° 35'. E. long. 64° 14'.

KARSKOI Sea, that part of the Frozen ocean which lies between the continent of Russia and Nova Zembla, extending from N. lat. 70° to 75°, and from E. long. 61° to 68°.

KARSKOI Gulf, is a large bay of the Frozen ocean, lying to the south of the Karikoi sea. N. lat. 68° to 70°. E. long. 62° to 69°.

KARSTORP, a town of Sweden, in the province of Smaland; 48 miles S. E. of Jonkioping.

KARSTULA, a town of Sweden, in the government of Wafsa; 85 miles E. of Wafsa.

KARSUN, a town of Russia, in the government of Simbirsk; 60 miles W. S. W. of Simbirsk.

KARSURUSK, a town of East Greenland. N. lat. 61° 10'. W. long. 45°.

KARSYTSIÄK, a town of East Greenland. N. lat. 60° 10'. W. long. 43°.

KARTAL, a town of Asiatic Turkey, in Natolia, on the coast of the sea of Marmora; 40 miles W. of Iffmid.

KARTAN,

KARTAN, or **MARTAN**, four small islands in the Arabian sea, at the entrance of the gulf of Curia Muria, bounding it on the S.W. N. lat. 17° 30'. E. long. 54° 55'.

KARTASCHEN, a town of Russia, in the government of Tobolsk, on the Irtysh; 48 miles S. of Tara.

KARTBIRT, a town of Asiatic Turkey, in Diarbekir; 48 miles W.N.W. of Diarbekir.

KARTERON, a town of Syria, on the Euphrates; 10 miles S. of Ofara.

KARTES, a town of Africa, in the country of Whidat; 12 miles E. of Sabi.

KARTIKYA, in *Hindoo Mythology*, the offspring of Siva, whose seed falling through the hands of Agni, the god of fire, into the Ganges, has given rise to other names allusive to his birth, of a very extravagant nature if taken literally, but which are most likely astronomical allegories; he is hence called Agni-bhuva, and Ganga-putra. Kumara, Srimana, and Skanda are others of his names. He arose, say the Puranic legends, on the banks of the Ganges, as bright as the sun, and beautiful as the moon; and it happened that six daughters of as many rajas going to bathe, saw the boy; and each calling him her son, and offering the breast, the child assumed six mouths, and received nurture from all, whence he was called *Sehti-matriya*, that is, having six mothers. Other legends relate, that on the birth of the child he was delivered to the Pleiads to be nursed. The Hindoos reckon but six bright stars in that constellation, which is named *Kritika*. These six offering their breasts, "the six-headed was nurtured, and named Kartikya, the descendant of the Kritikas." See *KRITIKA*.

He is, however, generally esteemed the second son of Siva and Parvati, the god of war, and commander of the celestial armies, and Sir William Jones, who spells his name Carticeya, deems him to be clearly the Orus of Egypt and the Mars of Italy; and was convinced that the name Skanda, by which he is called in the Puranas, has some connection with the old Sekander of Persia, whom the poets ridiculously confound with the Macedonian. He is usually represented with six heads and six arms, and sometimes mounted on a peacock. Several places of him are given in Moor's Hindoo Pantheon; where, and in *As. Res.* vol. 1, and Maurice's *As. Hist.* are many particulars of this warlike deity, from Puranic legends and other authorities. His *fakti*, or consort, is always called *Kaumari*, after his name of Kumara.

KARTUNSAI, in *Geography*, a small island in the gulf of Finland. N. lat. 60° 30'. E. long. 27°.

KARTUSH, a town of Turkish Armenia, in the government of Cars; 52 miles N.E. of Ardanoudji.

KARTUTA, a town of Sweden, in the government of Kuopio; 20 miles W. of Kuopio.

KARVIA, a town of Sweden; in the government of Abo; 47 miles N.N.E. of Bjorneborg.

KARUN, a town of Persia, in the province of Chufistan; 70 miles S. of Sufter.

KARUNA, a town of Sweden, in the government of Abo; 13 miles S.S.E. of Abo.

KARUP, a town of Denmark, in North Jutland; 14 miles N.W. of Aalborg.—Also, a town of Sweden, in the province of Holland; 15 miles S. of Halmstadt.

KARZALA, a town of Russia, in the government of Saratov, on the Choper; 85 miles N.W. of Saratov.

KAS, or **GESS**, called also *Kpen* and *Quefche*, a low fertile island in the gulf of Persia, separated from the continent of Persia by a good channel about 12 miles broad. N. lat. 26° 34'. E. long. 54° 4'.

KAS, *El*, or *Kas Kofaron*, a mountainous cape of Egypt, on the coast of the Mediterranean; 3 miles N. of Catich. N. lat. 30° 58'. E. long. 33° 22'.

KASABI, a town of Syria, on the Euphrates; 25 miles E. of El Der.

KASAKURA, a town of Japan, in the island of Ximo; 22 miles E.S.E. of Taifero.

KASAN. See *KAZAN*.

KASBAITE, or *GASBAITE*, a town of Algiers, anciently called *Satafa*; 50 miles S.W. of Conitantina.

KASCHAN. See *CASHAN*.

KASHGAR. See *CASHGAR*.

KASCHIL, a town of Africa, in the Kingdom of Benguela.

KASCHIN, a town of Russia, in the government of Tver; 60 miles N.E. of Tver.

KASCHIRA, a town of Russia, in the government of Tula; 56 miles N. of Tula.

KASCHKARANTZI, a town of Russia, in the government of Archangel, on the White sea; 140 miles N.W. of Archangel.

KASHAKLU, a town of Asiatic Turkey, in Caramania; 55 miles S.W. of Cogni.

KASHAN. See *CASHAN*.

KASHEKA, in the historic legends of the *Hindoos*, is the father of a very renowned ascetic and sage named *Tijivara*; which see.

KASHMIR, in *Geography*. See *CASHMIRE*.

KASI, or **KASSI**, sometimes written *Kasbi*; a Sanscrit name of the revered city of Benares; the latter popular name being probably a corruption of its classical appellation *Vara-nari*, so called from two rivers that form a junction of waters and name near its fete. See *BENARES*.

KASI, a term in the East, applied to the fourth pontiff of Persia, who is also the second lieutenant civil, and judges of temporal as well as spiritual affairs.

He has two deputies, who determine matters of less consequence; particularly quarrels arising in coffee-houses, which make a great part of their business.

KASILAX, in *Geography*, a town of Sweden, in the province of Savolax; 29 miles E. of Nyllot.

KASIMOV, a town of Russia, in the government of Riazan, on the Oka, formerly the residence of a Tartar prince; 76 miles E.N.E. of Riazan.

KASKAREL MELIK, a town of the Arabian Irak; 36 miles N. of Bagdad.

KASKASKIAS, a post-town of America, and the chief of Randolph county, on the S.W. bank of a river of the same name, 12 miles from the mouth of the river; containing about 150 houses, many of which are well built with stone; and 467 inhabitants, of whom 47 are slaves.—Also, an Indian nation near the river of this name in the Indiana territory. In 1774 they could furnish 250 warriors. These miles northerly of Kaskaskias is a village of Illinois Indians, of the Kaskaskias tribe, containing, in 1774, about 210 persons and 60 warriors. They were formerly brave and warlike, but are now degenerated and debauched. In August 1834, governor Hamilton concluded a treaty with the Kaskaskias Indians, by which they ceded to the United States in full right the immense tract of country extending from the mouth of the Illinois river to the mouth of the Ohio; from thence to the mouth of the Saline creek, below the Wabash; thence bounded by the highlands, dividing the waters which run into the Wabash from those which run into the Saline creek; thence by the highlands dividing the waters which run into the Wabash from those which run into the Mississippi, until it reaches the river Kaskaskias; thence, by the high-

lands, which divide the waters that fall into the Kaskaskia river from those which fall into the river Illinois, and from thence in a direct course to the mouth of the Illinois again; supposed to contain from 10 to 12 millions of acres. The whole was ceded in consideration of the annual addition of 50 dollars to a like sum, which by the treaty of Greenville, the Kaskaskia tribe receives every year from the United States, together with the reservation of 1580 acres near the village of Kaskaskia, for cultivation and domestic purposes: Morfe.—Alto, a river of the north-west territory, which is navigable for boats 130 miles. Its course is S.S.W., and near its mouth it turns to the S.E. and falls into the Mississippi river, 84 miles from the Illinois. It runs through a rich country, abounding in extensive natural meadows, and numberless herds of buffaloes, deer, &c. Along the east side of the river lie high grounds, the banks being composed of lime-stone and free-stone, and from 100 to 130 feet high, divided in many places by deep cavities, through which many small rivulets pass before they fall into the Mississippi. The sides of these hills fronting the river are in many places perpendicular, and appear like solid pieces of masonry, of various colours, figures, and sizes. Morfe.

KASKASKUNK, a town of the Delawares, between Great Beaver creek and Alleghany river, in Pennsylvania; 40 miles N. of Pittsburg.

KASKEIRA, a town of Persia, in the province of Irak; 25 miles N. of Sava.

KASKINOMPA, a small river which runs W. into the Mississippi from Tennessee, in N. lat. 36° 28'. On the north side of its mouth is an iron mine.

KASKIS, a town of Sweden, in Tavastland; 30 miles E. of Tavasthus.

KASKO, a small island in the gulf of Bothnia, near the coast of Finland. N. lat. 63° 16'. E. long. 90° 10'.

KASKOYAR, a small island in the gulf of Bothnia. N. lat. 63° 16'. E. long. 90° 10'.

KASNICH, a town of Persia, in the province of Khorasan; 12 miles S. of Zauzan.

KASR, a town of Egypt; 6 miles N.N.W. of Ashmounein.

KASR Ahmed, a town of Tripoli, on the coast; 100 miles E. of Tripoli. N. lat. 32° 4'. E. long. 15° 20'.

KASR Kiofira, a town of Egypt, built on the ruins of the ancient Nicopolis, on the coast of the Mediterranean; 10 miles N.E. of Alexandria.

KASSAN, a town of Africa, in the kingdom of Yari, on the N. side of the Gambia; 36 miles N.W. of Pifania.

KASSAR, an island of the Baltic, to the southward of Dago, with a chapel, about 11 versts long and between four and seven versts broad.

KASSERAMANGALUM, a town of Hindoostan, in Buramaul; 17 miles S. of Coveripuram.

KASGUR, a town of Hindoostan, in the Doobah; 24 miles N.W. of Pattariy.

KASSINA, or **CAHINA**, a kingdom of Africa, situated N. of the river Niger, between Bornou and Tombuctoo. The two empires of Bornou and Kaffina extend northwards towards Nubia, and comprehend a very considerable space. In both these empires, the sovereigns are Mahometans; but their subjects are said more generally to adhere to the ancient worship; that is to say, the lower orders are, almost universally, Negroes. Kaffina, till of late, was esteemed the first in power; but though a thousand villages and towns are still included in its vast domains, this empire is now considered much inferior to Bornou. The circumstances of soil and climate, and those also which constitute political character, are nearly the same in both; their prevailing winds are the

fame; their rains, which are periodical in each, though much more profuse in Bornou, begin at the same season; the same grains are cultivated; the same fruits (generally speaking), are produced; and except that no camels are bred to the westward of the city of Kaffina, the capital of the empire, the same animals are reared. In both, the complexion of the inhabitants is black; their mode of building too is similar, and their manners, though in some respects more civilized in Bornou, have a general resemblance. Each of the two empires is formed by the subjection of different tribes or nations to the dominion of one ruling people. The nature of the government, and the laws which regulate its succession, are the same in both. In both, the ruling people are Mahometans; in both, the dependant nations are composed of converts to the Mussulman faith, and of adherents to the ancient worship; and though at present their languages are different, the conquerors in both had probably the same original. The word Soudan, expressing the land of the Blacks, is by the Arabian geographers applied to the Nigritia of European geographers; but some Africans restrict it to the empire of Kaffina, which is N. of the Niger, and others extend it to the Negro states on the S. of the river; and wishing to express the transcendent power and extended rule of the emperor of Kaffina, they call him, with extravagant compliment, the sultan of all Soudan. His real sovereignty is bounded on the N. by the mountains of Eyre, and by one of those districts of the great Sahara, that furnish no means of useful property or available dominion; on the S. by the Niger; and on the E. by the kingdom of Zampbare, and the empire of Bornou. Its western limit is not ascertained. There are some circumstances of difference, which, notwithstanding the general resemblance between Bornou and Kaffina, discriminate between them. The rains are less violent in the latter than in the former. Kaffina exclusively furnishes the Bishmal, a species of Indian corn, that differs from the gamphily in the blended colours of red and white which distinguish its grain. Its monkeys and parrots (animals seldom seen in Bornou) are numerous, and of various species. The meridian of its capital is considered as a western limit, in that parallel of latitude, to the vegetation of grapes and breeds of camels; for between Kaffina and the Atlantic few camels are bred, and no grapes will grow. The manners of the common people are less courteous in Kaffina than in Bornou; and their games are less expressive of reflection; for their favourite play consists in tossing up four small sticks, and counting those that cross each other, as so many points of the number that constitutes the game. But the circumstances of chief discrimination between the two empires, are those of language, currency, and certain articles of commerce. Many words occur in one language which are not found in the other. The currency of Kaffina, like that of the Negro states S. of the Niger, is composed of those shells called cowries. Of these shells, 2500 are estimated as equal in value to a miktal of Fezzan, which is worth about 75 piastres of Tripoli, or 10*l.* sterling. Among the few circumstances which characterize the trade of Kaffina, as distinguished from that of Bornou, the most remarkable is, that the merchants of the former kingdom are the sole carriers to other nations, of a scarce and most valuable commodity, which is only to be obtained from the inhabitants of the latter. For though the fat of Bornou supplies the consumption of Kaffina, and of the Negro kingdoms to the south, yet its owners have abandoned to the commercial activity of the merchants of Agadez the whole of that profitable trade. The lakes, on the dreary shores of which this scarce article of African luxury is found, are separated from Agadez by a march of 45 days, and are encompassed on all

fides by the fands of the vast desert of Bilma, where the ardent heat of a flaming sky is returned with double fierceness by the surface of the burning soil. A thousand camels, bred and maintained for the purpose, are said to compose the caravans which annually explore, in the savage wilderness, the long line of this adventurous journey. Perilous however, and full of hardships as their labour is, the merchants find an ample recompence in the profits of their commerce; for while the wretched villagers who inhabit the neighbourhood of the lakes, and collect the salt that congeals upon the shores, are contented to receive, or obliged to accept a scanty price, the value which the merchants obtain in the various markets of Caffna, Tombuctoo, and of the countries S. of the Niger, is suited to the high estimation in which the article is held. The people of Agadez are equally anxious to avail themselves of the productions of their own country. Accordingly, being well apprised of the superior quality of the fenna, which grows upon these mountains, they demand and receive from the merchants of Fezzan a proportionable price. From Tripoli this fenna is conveyed to Turkey, Leghorn, and Marseilles. Of the other articles of sale which the extensive empire of Kaffina affords, the principal are gold dust, slaves, cotton cloths, which are the general manufacture of Caffna, Bornou, and the Negro states S. of the Niger, goat-skins of the red and yellow dyes, ox and buffalo hides, and civet; and in return for these, the inhabitants of Kaffina receive cowries, horses, and mares, red woollen caps, check linens, light coarse woollen cloths, baize, barakans or albaiks, small Turkey carpets, plain Mesurata carpets, silk, wrought and unwrought, tiffines and broades, fabre blades, Dutch knives, scissors, coral, beads, small looking-glasses, tichies, or a paité prepared in Fezzan, from dates and the meal of Indian corn, and which, whenever they travel, is in great request among the people of Fezzan; and Gooroo nuts, which are brought from the Negro states on the S. of the Niger, and which impart a pleasant bitter to any liquid in which they are infused.

The Fezzaners, equally connected by their commerce with Caffna and Bornou, dispatch to the former as well as to the latter, and always at the same season, an annual caravan. From Mourzouk, their capital, which they leave at the close of October, they take their course to the S.W. and proceed to the province of Hiatts, the most barren, and the worst inhabited district of their country. From Hiatts they cross the low mountains of Eyre, which separate the kingdom of Fezzan from the empire of Caffna, and next arrive at the town of Ganatt, where they repose for two days. From thence, by a march of 10 days, during six of which they are exposed to the scorching heats of a thirly desert, they pass on to the town of Assouda. On leaving Assouda, they traverse a delightful country, fruitful, and populous; and while the exhilarating sight of Indian corn, and of frequent herds of cattle accompanies and cheers their passage, the eighth day introduces them to the large and populous city of Agadez, the capital of an extensive province. Distinguished as the most commercial of all the towns of Caffna, and, like Assouda and Ganatt, inhabited by Mahometans alone, Agadez naturally attracts the peculiar attention of the merchants of Fezzan. Many proceed no farther; but the greatest part, committing to their agents the care of the slaves, cotton, and fenna, which they purchase in the course of a 10 days' residence, continue their journey to the south. In this manner, if the camels are completely loaded, 47 days, exclusive of those which are allotted to refreshment and necessary rest, are employed in travelling from Mourzouk to Agadez. At the end of three days more, amidst fields that are enriched with the luxuriant growth of Indian

corn, and pastures that are covered with multitudes of cows; and with flocks of sheep and goats, the traveller reaches the small town of Begzam; from which, through a country of hardmen, whose dwellings are in tents of hides; and the second day conducts him to the town of Tesomah. There, as he surveys the stony, uninhabited, desolate hills that form the cheerless prospect before him, he calls a regretful eye on those verdant scenes that surrounded him the day before. Employed for two days in the passage of these dreary heights, he descends on the third to a deep and scorching sand, from which he emerges at the approach of the fifth evening, and entering a beautiful country, as pleasingly diversified with the natural beauties of hills and vales and woods, as with the rich rewards of the husbandman's and the shepherd's toil, he arrives in seven days more at the city of Caffna, the capital of the empire of which it bears the name, and the usual residence of its powerful sultan.

The river Niger traverses the empire of Caffna with such rapidity, that no vessel can ascend its stream; and such is the want of skill, and such the absence of commercial inducements among the inhabitants of its borders, that even *with* the current, neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds a passage for himself and his goods; but even there, though the ferry-men, by the indulgence of the sultan of Caffna, are exempted from all taxes, the boat which conveys the merchandise is nothing more than an ill-constructed raft; for the planks are fastened to the timbers with ropes, and the staves are clofed, both within and without, by a plaster of tough clay. The depth of the river, at the place of passage, which is more than 100 miles to the south of the city of Caffna, is estimated at 23 or 24 feet English. (Proceedings of the African Association.) The city of Caffna, or Kaffina, is distant 650 miles W.S.W. from Bornou, and 690 miles E.S.E. from Tombuctoo. N. lat. 16° 30'. E. long. 11° 34'.

KASSON, a strong hilly country of Africa, of small extent, bounded on the N. by the Moors of Jaffoa, on the E. and S.E. by Kaarta, on the S. by the Senegal, and on the W. by Kajaaga; about 50 miles from N. to S., and nearly the same from E. to W. N. lat. 14° to 15°. W. long. 8° to 9°.

KASSUTO, an African wooden instrument, composed of a hollow piece of wood, about an ell long, covered with a plate cut into a kind of scale, upon which the negroes beat with a stick. See *Musiq. of the Negroes*.

KAST, in *Geography*, a town of Persia, in Segestan; 40 miles S.W. of Yrokhaige.

KASTANOVITZ, a town of Croatia, situated on an island in the river Unna; 50 miles S.E. of Carlstadt.

KASTHOLM, a town of Sweden, on the S.E. coast of the island of Aland.

KASTRICAUR, CAPE, a cape on the N.E. coast of the Company's island, in the North Pacific ocean. N. lat. 46° 30'. E. long. 151° 40'.

KASTRIEL, in *Zoology*. See **KESTREL**.

KASYA, in *Hindoo Mythological History*, was the Guru, or spiritual preceptor of Krishna, of whose wife the following legend occurs in the Padma Purana, and in the Sri Bhagavat among the strange miracles recorded of this incarnate deity. She complained to Krishna that the ocean had swallowed up her children on the coast of Gurjura, or Guzerat, and supplicated their restoration. Krishna, proceeding to the coast, was assured by Varuna, the regent of the ocean, that not he, but the sea-monster, Sankasura, had stolen the children. Krishna fought, and after a violent contest, slew the demon, and tore him from his shell, named Panchajanya, which

which he bore away in memorial of his victory, and fled afterwards in battle by way of trumpet. (See SANKASERA.) Not finding the children in the dominions of Varuna, he descended to the infernal city, Yama-puri, and founding his tremendous flank, or shell, (see SHANK.) struck such terror into Yama, that he ran forth to make his prostrations, and restored the children of Kafya, with whom Krishna returned to their delighted mother.

KASYAPA, an important character, who, in different theogonies, assumes different lines of parentage and character. In the Siva-purana he is made the great-grandson of Brahma. Marichi and Bhrigu being his immediate ancestors; and he is there feigned to have married thirteen of Dakha's sixty daughters, an astronomical allegory that has not yet been explained; but alluding, we apprehend, to a cycle of sixty years in all among the Hindoos. Sir William Jones suspected, and Mr. Wilford has proved the whole fable of Kafyapa to be astronomical, and the fame with the Cassiopeia of the Greeks. Kafyapa, in some points, corresponds in character with Uranus; Marichi, the offspring of Brahma, being a personification of Light. Surya, or the Sun, is sometimes found mentioned as the sun or offspring of Kafyapa, and sometimes he is included in the list of the seven Rishis; in other relations he is the husband of Diti, and the parent of Indra, Aruna, Garuda, and many of the minor deities. In Vishnu's avatara of Vamana, or the dwarf, he became incarnate in the person of Kafyapa's son, by Aditi; and the Nakshatras, or lunar mansions, (see NAKSHATRA) are, in the Initiates of Menu, attributed to "Kafyapa, the first production of Brahma's head."

KATABA, in *Geography*, a town of Arabia, in the province of Yemen, situated in a fertile country, near a river that runs into the sea at Aden, governed by a dola, and defended by a citadel; 75 miles N. of Aden. N. lat. 13° 54'. E. long. 44° 39'.

KATAL, a town of Asiatic Turkey, in the government of Sivas; 18 miles S. of Sivas.

KATAPANG, a small island in the East Indian sea, near the N. coast of Java. S. lat. 7° 39'. E. long. 113° 22'.

KATAREN, a town of Arabia, in the province of Yemen; 60 miles S. of Saade.

KATENIA, a town of Bengal; 80 miles N. of Dacca.

KATEREVI, a town of the principality of Georgia; 18 miles W.S.W. of Teflis.

KATERINENSCHSTAT, a town of Russia, in the government of Saratov, on the Volga; 32 miles N.E. of Saratov.

KATHITPACAMUNCK, an Indian village in America, on the N. side of Wabash river, at the mouth of Ripacano creek, and about 20 miles above the Lower Weau towns. In 1791, before its destruction by generals Scott and Wilkinson, it contained 120 houses, the best of which belonged to the French traders. N. lat. 40° 20'. W. long. 87° 2'.

KATIF, a town of Arabia, in the province of Lachfa, of some magnitude, situated upon the coast, at the distance of about five German miles from the isle of Bahrein. The inhabitants earn their subsistence by the pearl fishery; the season for fishing is in the hotter months of the year, when the air is deemed to be very insalubrious.

KATIMBEVOLE, a town of the island of Ceylon; 36 miles S. of Candy.

KATIMTUMU, a town of Russia, in the government of Irkutsk, on the Lena; 60 miles E. of Ockmink.

KATIRLI, a town of Natolia; 28 miles N. of Burfa.

KATISTI, a town of Natolia, on the coast of the sea of Marmora; 36 miles S. of Constantinople.

KATKIN. See CATKIN.

KATMANDU, or **CATMANDU**, in *Geography*, the capital of Nepal or Nepal, in a province of the same name; called also Jingbu by the people of Thibet. It is placed by Rennell 105 geographical miles nearly N. from Maissy, that is, in latitude 28° 6'. It is 536 British miles from Lassa, or in horizontal distance 346 geographical miles. According to Giuseppe, it contains about 18,000 houses, probably yielding a population of 70 or 80 thousand. (See NEPAUL.) According to colonel Kirkpatrick's account it is seated on the eastern bank of the Bihmutty, along which it runs for a mile, with a breadth not exceeding half a mile. The most striking objects which it presents to the eye are its wooden temples, which are scattered over its environs, and particularly along the sides of a quadrangular tank or reservoir. The colonel says, "there are nearly as many temples as houses, and as many idols as inhabitants." The number of idols, according to his statement, amounts to 2733. Besides these wooden temples, Katmandu contains several others on a large scale, constructed of brick, with two or three sloping roofs, diminishing as they ascend, and terminating in pinnacles, which, as well as some of the superior roofs, are splendidly gilt, and produce a very picturesque and agreeable effect. The houses are of brick and tile, with pitched roofs towards the street, frequently surrounded by wooden balconies, of open carved-work, and of a singular fashion. They are of two, three, or four stories, and generally of a mean appearance. The streets are narrow and filthy. Katmandu, with its dependent towns and villages, according to Kirkpatrick, may contain about 22,000 houses; but the town itself, if ten people be allowed to each house, which he thinks to be a low computation, does not contain more than 50,000 persons. The next most considerable towns of Nepal are Patn, Bhetgong, and *Khirtipore*. Asiatic Ref. vol. ii. p. 307.

KATNA, a town of Sweden, in Sudermanland; 30 miles S.W. of Stockholm.

KATNEBLOW, a town of Poland, in the palatinate of Kiev; 36 miles S. of Bialacerkiew.

KATNIA-STANITZ, a town of Russia, in the government of Irkutsk; 64 miles N.E. of Vitimkoi.

KATOEENE, a town of the island of Ceylon; 64 miles S. of Candy.

KATOU-CARVA, in *Botany*, the name by which some authors have called the tree, whose leaves are the tamalapatra, or Indian leaf of the shops. See MALTHATHUM.

KATOVINDEL, the name given by the authors of the HORTUS Malabaricus, to a genus of plants, called by some *elate*, and by Linnæus *phenix*.

KATOUN-SERAI, in *Geography*, a town of Asiatic Turkey, in Caramania; 12 miles S. of Cogni.

KATSCHER, a town of Moravia, in the circle of Pre-rau, with a lordship in Silesia, to which it once belonged; 12 miles W. of Ratibor. N. lat. 49° 59'. E. long. 17° 52'.

KATTA, a town of Bootan; 15 miles S. of Biffnee.—Also, a town of Persia, in Farsistan; 30 miles W.S.W. of Yeزد.

KATTAH, a town of Arabia, in the province of Hedjaz; 160 miles E.S.E. of Madian.

KATTAYANI, in *Hindoo Mythology*, a name of Parvati, consort of Siva.

KATTRON, in *Geography*. See GATRON.

KATUADI, a town of the Arabian Irak; 12 miles S. of Bagdad.

KATUNSKAIA, a town of Russia, in the government of Kolivan; 12 miles S. of Biük.

KATZA, a town of Germany, in the county of Henneberg; seven miles W.N.W. of Memmigen.

KATZEMAUGE, in *Mineralogy*. See *Cat's Eye*.

KAOU, in *Geography*, a town of Africa, in the kingdom of Loango.

KAUADI, an island of Egypt, in lake Berelos; 13 miles N. of Faoué.

KAVARNA, a town of European Turkey, in Bulgaria, in the gulf of Varna; 22 miles N.E. of Varna. N. lat. 43° 21'. E. long. 28° 17'.

KAUBUL, a town of European Turkey, in Bessarabia; 34 miles W. of Akerman.

KAUDER, a town of Hindoostan, in Lahore; 40 miles S.S.W. of Lahore.

KAUDER, a town of Arabia, in the province of Hedjaz; 60 miles N.W. of Mecca.

KAVERZINA, a town of Russia, in the government of Tobolsk, on the Tchiuna; 20 miles E.S.E. of Eniseïsk.

KAUFFHEUREN, a town of Germany, situated on the Wutach, and till the year 1802, when it was given to the elector of Bavaria, imperial. The burghers are partly Lutherans, and partly Roman Catholics; but its magistracy consists of eight Lutherans and four Roman Catholics. In the town-court and great council are also two Roman Catholic members, but the rest are all Lutherans; 62 miles E.N.E. of Constance. N. lat. 47° 42'. E. long. 10° 35'.

KAUFFMAN, MARY ANGELICA, in *Biography*, a lady who possessed the talents and taste of a painter in a degree very unusual among her sex. She was a native of Coire, the capital of the Grisons, and born in 1740. Her father was an artist, who, perceiving the extraordinary capacity of his daughter, and how worthy it was of the best cultivation, conducted her, at the age of fourteen, to Milan, and afterwards to Rome; where her talents and accomplishments soon acquired her the most distinguished attention. It was the happy lot of lady Wentworth, the wife of the British resident at Venice, to be the instrument of conveying Angelica to England in the year 1764. Here she was received in a very flattering manner; her works eagerly sought for; and her company solicited by the learned, the great, and the polite. She was honoured with royal attentions, and was esteemed and courted by artists. She was very industrious, and painted the lighter scenes of poetry with a grace and taste entirely her own; and happily formed to meet that of an engraver whose labours highly contributed to the growth and perpetuity of her fame. Bartolozzi was the man, who, enjoying at the same time youth, health, and ingenuity, almost entirely devoted his talents between Angelica and Cipriani. The three were endowed with congenial feelings in arts; which, if not of the highest class, were certainly entitled to rank among the most agreeable.

After some years residence here, she was unhappily deceived by a footman of a German count, who, coming to England, personated his master, contrived to be presented at court, and persuaded Angelica to marry him. The cheat was soon discovered, and the rascal had not the humanity to endeavour to sooth her disappointment by kindness, but treated her very ill. At last, however, by a payment made to him of 300*l.*, he was induced to return to Germany, and promised never to molest her any more. He kept his engagement; and the lady not hearing of him for seven years, and concluding him dead, then married an Italian painter of the name of Zucchi, and having spent seventeen years in England, returned with him to her native country, and thence to Rome; where her house became the resort of genius and

taste; all artists and cognoscenti taking pleasure in being admitted to her conversations; while amateurs endowed with rank and wealth were happy in finding employment for her agreeable talents, and in the possession of her works. She lived to the age of 67, and then fell by a gradual decay, under that power which pays regard alike to the great, the learned, the virtuous, and the profligate. She died in 1807, universally regretted, and was honoured by splendid public obsequies.

The talents of Angelica were of a pleasing rather than of a splendid kind. She excelled most, as was most justly to be expected, in the representation of female characters. Her figures of men want form and energy, and their faces and characters are all of the same mould. Grace, ease, and suavity of expression, generally mark her women; and to single figures, such as "Calypto watching the Departure of Ulysses," or "Penelope weeping over his Bow," she imparted the true interest of the story.

KAUGA, in *Geography*, a town of Africa, in a kingdom of the same name, S. of Bornou, traversed by the Niger. The town is situated on a lake, called by Ptolemy "Nubia Palus," in which some have supposed that the Niger loses itself; 22½ miles S.S.E. of Bornou. N. lat. 16° 10'. E. long. 24° 40'.

KAUGASNIEMI, a town of Sweden, in the province of Savolax; 35 miles N. of Chrifina.

KAUHAJOKI, a town of Sweden, in the government of Wafa; 24 miles E.N.E. of Chrifinedladt.

KAUHAVA, a town of Sweden, in the government of Wafa; 37 miles E. of Wafa.

KAUHAUT, in *Biography*, an excellent performer on the lute, and perhaps the last eminent musician who highly cultivated that instrument. Signor Colini was the last good performer on the lute in England. We believe that Kaudaut was a German; but he is enumerated by M. Laborde among French composers; he was in the service of the prince of Conti, and composed between 1760 and 1764 several comic operas for the Theatre Italien at Paris. But in 1772 we found him at Vienna, in high reputation as a lutenist.

KAUI, in *Geography*, a town of Persia, in the province of Adirbeitzan; 48 miles N.W. of Tabris.

KAUKEBAN, a small unfortified town of Arabia, in Yemen, but situated on the summit of an almost inaccessible mountain. A causeway has been formed, by which loaded camels can now advance up to the city; 18 miles W. of Sana. The country bearing this name is surrounded almost on all sides by the dominion of the Imam of Sana; only, on one side, it meets the territory of the confederated Scheichs of Hachid-u-bekil. The reigning family are descendants from Mahomet, by Hadi, Imam of Saade. Although they have lost the title of Imam, they still retain sovereign authority over a considerable territory.

KAUKENEN, a town of Prussian Lithuania, on the Kauke, which runs into the Curisch Haff; 12 miles W.N.W. of Tilsit.

KAUMARI, in *Hindoo Mythology*, is the fakti or consort of Kumara, or Kartikya, and is represented riding on a peacock, with a lance in her hand. See *KARTIKYA* and *SAKTI*.

KAUMBOLI, in *Geography*, a town of Hindoostan, in the circar of Ellore; 12 miles S.S.W. of Ellore.

KAUNITZ, WENZEL ANTONY, in *Biography*, prince of the holy Roman empire, count of Rietborg, knight of the golden fleece, &c. was born at Vienna in 1711. Being a younger child of a large family he was brought up to the church; but on the death of his elder brothers he quitted the

The ecclesiastical profession to enter into the service of the state, in which his ancestors had made a considerable figure. He laid the foundation of his studies at Vienna, and in 1737, was made a counsellor of state, and, two years after, imperial commissioner at the diet of Ratibon. In the year 1742, he was appointed minister plenipotentiary to the court of Sardinia, which had entered into a new alliance with Austria. A treaty was brought to a conclusion by Kaunitz, which induced the court to confer on him offices of more importance. In 1744, he went to Brussels, to undertake the chief management of public affairs, which, at that time, required a man of talents, as the king of France had already declared war, and the Netherlands were the first part of the emperor's dominions exposed to the attack of the French army. In February 1745, he was appointed minister plenipotentiary, and in 1748, he took a part in the signing of the preliminaries of peace at Aix-la-Chapelle. On this occasion he acquired, by his great talents for negotiation, and the noble conduct which he displayed, the respect of all the ministers then present. When peace was concluded, the empress Mary Theresia conferred upon him the order of the Golden Fleece, and appointed him envoy to Paris. During his residence in that city, he laid the foundation of an alliance between France and Austria, which took place some time after. On the resignation of count Ulfheld, as chancellor of state, Kaunitz was appointed his successor, and recalled from Paris about the end of the year 1752, but at the same time was ordered to return to Brussels, to bring to an end the negotiations in regard to the barriers, which had been carried on a whole year without success. When he had completed this object he returned to Vienna in 1753, and entered upon the official duties of the chancellorship of the state, in addition to those belonging to the supreme dictatorship of the affairs of the Netherlands and of Lombardy, with the rank of minister of state, which he retained till his death. In 1764, he was raised to the dignity of prince of the empire, with descent to his heirs male. He concluded the treaty of alliance between France and Austria in 1766, which put an end to that hostility which had prevailed for several centuries between the two countries. After this he had the sole management of all foreign affairs, and enjoyed the unlimited confidence of the empress Mary Theresia, and afterwards of Joseph II., Leopold II., and Francis II. He died in June 1794, in the 84th year of his age, leaving behind him a very high reputation. Gen. Bio.

KAUNITZ, in *Geography*, a town of Moravia, in the circle of Brun; eight miles S.W. of Brun.—Also, a town of Moravia, in the circle of Znaym; 11 miles N.N.W. of Znaym.

KAUNPOUR, a town of Hindoostan, in Moultan; 15 miles N.E. of Moultan.

KAUNUDON, a town of Hindoostan, in Lahore; 20 miles E.N.E. of Callanore.

KAVO, one of the smaller Molucca islands, five miles S. of Machan. N. lat. 0° 5'. E. long. 127° 24'.

KAUOS, a town of Grand Bucharja; 65 miles N. of Samarcand.

KAUR, a town of Persia, in the province of Irak; six miles E. of Natons.

KAURABANG, a town of Candahar; 80 miles S.W. of Cabul.

KAURESTAN, a town of Persia, in Laristan; 65 miles E.S.E. of Lar.

KAURYSOUL, a body of soldiers who form the part of the five corps of the king of Persia's guards.

They are in number two thousand, and are all horse, com-

manded by the constable, and in his absence by the captain of the watch. They keep watch in the night around the palace, serve to keep off the crowd when the sopher goes on horseback, keep silence at the audience of ambassadors, seize the khans and other officers when disgraced, and cut off their heads when the sopher commands it.

KAURZIM, in *Geography*, a town of Bohemia, and capital of a circle of the same name, on a river which runs into the Elbe; the circle supplies Prague and other places with timber; 24 miles E.S.E. of Prague. N. lat. 49° 56'. E. long. 15° 5'.

KAUSZAN, a town of Beffarabia, inhabited by Budziack Tartars; 12 miles S.S.E. of Bender.

KAUTEE, a town of Bengal; 14 miles E. of Toree.

KAUVERI, or **KAVERI**, in *Hindoo Mythology*, the faksi or consort of Kuvera, the deformed god of riches. The river in Mysore, in which is the island of Sri-rangapatana, or Seringapatam, usually written Cavery, is named after this goddess. See **KUVERA**, and **CAVERI**.

KAWAH, in *Geography*, a town of Hindoostan; in the circle of Ellichpour; 20 miles E. of Omrautz.

KAWAR, or **KUAR**, a country of Africa, lying to the northward of Kuku and Bornou, and extending eastward to Al Wehat. It is bounded on the N. by that extensive desert which separates Egypt from Fezzan, and which is the proper desert of Libya; on the E. by Egypt, and on the W. by the desert of Bilmal.

KAWOMURAH, a town of Japan, in the island of Nippon; 100 miles N.W. of Meaco.

KAWTAAH, a town of Hindoostan, in the circle of Singboon; 45 miles E. of Doefa.

KAWUCK, or **KHWICK**, the furthest, or most eastern, of the passes leading through Hindoo-Kho into the province of Cabul.

KAWUTZA, a town of Sweden, in the government of Abo; 25 miles S.E. of Biorneborg.

KAXHERTA, a town of Sweden, in the government of Abo, on an island in the gulf of Finland; five miles S. of Abo.

KAY, **KEY**, or **Quay**, a wharf or place by the water-side, in a sea-port, for the loading and unloading of merchandise.

The verb *cajare*, in old writers, according to Scaliger, signifies to keep in or restrain; and hence came our term *kay*; the ground where keys are made being bound in with planks and posts.

The lawful keys and wharfs for the lading or landing of goods, belonging to the port of London are the following: viz. Chelker's Key, Brewer's Key, Galley Key, Wool Dock, Custom-house Key, Bear Key, Porter's Key, Sab's Key, Wiggan's Key, Young's Key, Ralph's Key, Dice Key, Smart's Key, Somer's Key, Hammond's Key, Lyon's Key, Botolph Wharf, Graunt's Key, Cock's Key, and Fresh Wharf; besides Billingsgate, for landing fish and fruit; and Bridgehouse in Southwark, for corn and other provisions; but for no other goods or merchandize. Deal-boards, masts, and timber, may be landed at any place between Limehouse and Westminster; the owner first paying or compounding for the customs, and declaring at what place he will land them.

KAYA, in *Geography*, a town of Cacongo. S. lat. 5° 20'. E. long. 12° 10'.

KAYADERE, a town of Asiatic Turkey, near the W. coast of Natioia; five miles E.N.E. of Vouria.

KAYAGE, the money, or toll, paid for loading or unloading wares at keys.

KAYANG, in *Geography*, a river of the island of Celebes, which

which runs into Boni bay. S. lat. 4° 59'. E. long. 120° 40'.

KAYCOON POINT, a cape on the W. coast of the island of Celebes. S. lat. 3° 22'. E. long. 129° 50'.

KAYDANOW, a town of Lithuania, in the palatinate of Minsk; 16 miles S.S.W. of Minsk.

KAYE, a town of Africa, in the kingdom of Loango; 10 miles N.W. of Loango.

KAYE'S ISLAND, an island in the N. Pacific ocean, near the W. coast of North America, discovered by Capt. Cook in his third voyage, May 1778, and thus named in honour of Dr. Kaye, late dean of Lincoln. It is 11 or 12 leagues in length, in the direction of N.E. and S.W.; but its breadth is not above a league, or a league and a half, in any part of it. The S.W. point, which lies in lat. 59° 49', and long. 216° 58', is a naked rock, considerably elevated above the land within it. Towards the sea, the island terminates in bare sloping cliffs, with a beach, a few paces wide, of large pebble stones, intermixed here and there with a brownish clayey sand. Parts of the shore are interrupted by small valleys and gullies; in each of which a torrent rushes down with violence, which is furnished by the melted snow. These valleys are filled with pine-trees, extending from the entrance to about the middle part of the island. This island is covered with a broad girdle of wood, spread upon its side, included between the top of the cliffy shore, and the higher parts in the centre. The trees are of diminutive size. About the wood were observed a crow, and white headed and white breasted eagles; and fowls of various kinds were seen upon the water and near the shore. No animals were seen except a fox; nor were perceived any signs of inhabitants ever having been upon the island. Cooke's Third Voyage, vol. ii.

KAYEE, a town of Africa, in Kajaaga, or the Senegal. N. lat. 14° 30'. W. long. 9° 35'.

KAYKIYA, in *Hindoo Mythological History*, is one of the three wives of Dafaratha, the father of Rama-chandra. About the period of the birth of the latter hero, Kaykiya, or Kahikeya, produced Lucins, his half brother, to assist him in the wars of Lanka or Ceylon, as detailed at great length in *Ramayana*, which see.

KAYMEN, in *Geography*, a town of Prussia, in the province of Samland; 12 miles E.N.E. of Konigsberg.

KAYMOURA, a town of Africa, in Bondou; 15 miles S.S.W. of Fatteconda.

KAYNS, a race of mountaineers in the Birman empire, perfectly distinct from the Carianers, and speaking a language differing radically both from theirs and that of the Birmans. They were originally inhabitants of the Arracan mountains, whom the Birmans, since their conquest of that kingdom, have prevailed on, partly by force, and partly by mild treatment, to abandon their native hills, and settle on the plain. There are several small societies of these people established near the foot of the mountains further north. The Carianers are not to be found higher up than the city of Prane.

KAYOO, a town of Africa, in Bambarra, on the Niger. N. lat. 13°. W. long. 4° 59'.

KAYOR, or **CAYOR**, a kingdom of Africa, near the sea-coast, between the rivers Gambia and Senegal.

KAYSERSWERT, a town of Germany, on the E. side of the Rhine, once fortified, but now without walls; for a long time annexed to the bishopric of Cologne, but in the year 1762, returned to the elector palatine; 24 miles N. of Juiyu. N. lat. 51° 16'. E. long. 6° 37'.

KAYUWAH, a town of Pegu, on the left bank of the Ava; 15 miles S. of Prome.

= Vol. XIX.

* **KAYZEVAN**, a town of Turkish Armenia; 69 miles S.W. of Erivan.

KAZAKOVKA, a town of Russia, in the government of Irkutsk; 12 miles W. of Nerchinsk.

KAZAN, a city of Russia, and capital of a government of the same name, situated on the Volga. In the Turkish and Tartarian languages, *kazan* signified a cauldron large enough to contain victuals for many persons; and hence the name has been given by the Crim and Badziak Murtes to the families of their subjects or vassals, reckoning about 10 men to a *kazan*. This city consists of a strong fort, built with stone; the wooden town, as it is called; and several adjoining slobodes, or suburbs; and among them is one inhabited by Tartars, in which are four methods. There are also several churches built with stone, and 11 convents in and near the town. The governor of the fort has the command of the garrisons and regiments; the garrison of the city consists of three regiments, for which a good hospital is provided. *Kazan* is also an archbishop's see. Here are also a manufacture of cloth, and a school, in which are taught the Russian and Latin languages, the principles of the Christian religion, and the elements of philology, in order to qualify preachers for the conversion of the nations to which they belong. This city was totally destroyed by fire in the years 1749 and 1752. *Kazan* was once the capital of a principal part of Tartary, and the seat of government, where the royal family resided. The Russians first made themselves masters of this important place on the 3d of October 1552; 400 miles E. of Moscow. N. lat. 55° 45'. E. long. 49° 3'.

This khanate (see *KAPTSCHAK*) subsisted as a peculiar state till the year above-mentioned, 1552, when it was conquered by czar Ivan II., and incorporated for ever with the Russian empire. The city of *Kazan* had been built in the year 1257 by a son of Bantuy, nephew of Tschingis-khan; and this khanate asserted its independency about the same time (1441) when the Crim disjoined itself from *Kaptschak*. The present *Kazan* Tartars are but a feeble remnant of what they were, partly consisting of those who remained in their old seats, and partly such as settled as fugitives, in other districts of Russia. They principally dwell at present in the governments of *Kazan*, *Simbirsk*, *Riefan*, *Viatka*, *Perme* and *Ufa* (particularly in the *Orenburg* district of that government); their number is upon the whole considerable, but in no degree proportionate to the idea we form of their ancient population, from historical accounts; for, as far as we are able to conclude from particular statements, they cannot amount to much above 100,000. These Tartars form the root of the native of Russia; being not only unmingled, but also of a superior civilization to most of the remaining branches of their brethren. *Tooke*.

KAZANOW, a town of Poland, in the palatinate of Sandomirz; 40 miles N.N.W. of Sandomirz.

KAZANSKAIA, a town of Russia, in the country of the Cossacks, on the Don; 100 miles S.S.E. of Veronetz.

KAZANSKOE, or *Government of KAZAN*, a government of Russia, bounded on the N. and N.E. by *Viatka*, on the E. by *Uphimkoe*, on the S. by *Simbirskoe*, and on the W. by *Niznei-Gorodkoe*; about 100 miles in length, and from 100 to 110 broad; the capital is *Kazan*.

KAZARON, a town of Persia, in the province of Farsistan; 55 miles W.S.W. of Schiras. N. lat. 29° 44'. E. long. 51° 28'.

KAZIKIRAN, a town of Persia, in the province of Adirbetan; 45 miles S.E. of Urmia.

KAZIMIERS. See *CASHMIR*.

KEA, a town of Africa, in the kingdom of Bambarra; 65 miles N.E. of Sego.

KEADUE, a post-town of the county of Roscommon, province of Connaught, Ireland; 85 miles from Dublin.

KEADY, a market and post-town of the county of Armagh, province of Ulster, Ireland, situated on the river Callan, along the banks of which, from Armagh to this place, are many considerable bleach greens, the linen manufacture being carried on here very extensively. Keady is 59 miles N. from Dublin; and six S. from Armagh.

KEAJA, or KIAHIA, is the name of the lieutenant of the chief officers of the Porte, or the superintendent of their particular court.

KEALE, small fragments resembling chips or broken pieces of stone of various kinds; some of lime-stone, others of free-stone, and others of rag-stone, found mixed among the earth, of the upper stratum in many parts of this kingdom, and giving that soil the name of kealy; hence, some of these pieces of keale are thin and flat like bits of slate.

KEALY SOIL, in *Agriculture*, is used by the husbandmen for a sort of land, plentifully strewed with keale or kals.

KEANPAN HEAD, in *Geography*, a cape on the E. coast of the island of Lewis, forming the N.E. point of the peninsula of Aird. N. lat. 58° 15'. W. long. 6° 5'.

KEANGON, a town of Grand Buclaria; 75 miles N.W. of Anderab.

KEARAH, a town of Hindooostan, in Bahar; 30 miles S.S.W. of Patna.

KEATE, GEORGE, in *Biography*, an entertaining and miscellaneous writer, was born at Trowbridge, in Wiltshire, in the year 1720. Having been educated at Kingdon, he repaired to Geneva, where he resided some years, and contracted an intimacy with Voltaire. He made the tour of Europe, and returning to his native country, entered himself as student in the Inner Temple, and was in due time called to the bar, and sometimes attended the courts in Westminster Hall, though he did not practise, either on account of his want of encouragement, or for want of a degree of application sufficient to make himself master of his profession. His first literary performance was entitled, "Ancient and Modern Rome," a poem written at Rome in the year 1755. It was published in 1760, and was very well received by the public: he next produced "A short Account of the Ancient History, present Government, and Laws of the Republic of Geneva." In 1768 or 69, he published "Ferney," an epistle to Voltaire, in which he introduced a fine eulogium on Shakespeare, which procured for him the compliment, from the mayor and burgeses of Stratford, of a itandish mounted with silver, made out of the mulberry-tree planted by that illustrious bard. In 1779, he published "Sketches from Nature, taken and coloured in a Journey to Margate," in two vols. 12mo. This, though an avowed imitation of Sterne's "Sentimental Journey," contains for many just strictures on life and manners, enlivened by strokes of genuine humour and delicacy of sentiment, as to have been extremely popular, and it was thought that Sterne never had so happy an imitator as Keate. In 1781, he collected his poetical works, and published them in two volumes, which he dedicated to Dr. Heberden. The last, and his best production, and that which did most credit to his genius and liberality, was the "Account of the Pelew Islands," which he drew up and published in 1788. This work is written with great elegance, and compiled with much care: it had a considerable sale, but the author drew it up from the most distant motives, and received no advantage from it whatever. He died in the year 1797, leaving

behind him several other publications besides those already noticed. Gentleman's and Monthly Magazines.

KEATING, GREGORY, an Irish historian, was a native of Tipperary, and flourished in the earlier part of the seventeenth century. He was educated with a view to the duties of the Roman Catholic church, and having received at a foreign university the degree of doctor of divinity, he returned to his native country, and became a celebrated preacher. Being well versed in the ancient Irish language, he collected the remains of the early history and antiquities of the island, and formed them into a regular narrative. This work he finished about the time of the accession of Charles I. to the throne: it commences from the first planting of Ireland, after the deluge, and goes on to the 17th year of king Henry II., giving an account of the lives and reigns of one hundred and seventy-four kings of the Milesian race. From the above circumstances, our readers will readily suppose that this work is little better than fiction. Indeed the advocates of the author allege in his defence, that he has given his extraordinary relations merely as fables, and not as true history. It remained in MS. in the original language, till it was translated into English by Demot O'Connor, and published in London in 1723. A new edition was published in 1738, with plates of the arms of the principal Irish families. Keating died about the middle of the seventeenth century.

KEBAN, in *Geography*, a town of Asiatic Turkey, in the province of Diarbekir; 70 miles N. of Diarbekir.

KEBER, the name of a sect among the Persians, who, in general, are rich merchants. See GABRES.

KEBET, in *Geography*, a small island in the East Indian sea. S. lat. 7° 10'. E. long. 130° 40'.

KEBLA, or KEBLAH, called also *Kebles*, *Kiblah*, and *Allikla*, among the Mussulmen, denotes that point, or quarter, to which they turn themselves when they say their prayers.

Mahomet, at first, durst not propose any other kebla to his followers but the temple of Jerusalem, which was the kebla of the Jews and Christians. In the course of time, however, being willing to bring them off from any communication in matters of religion, with the Jews and Christians, he appointed them, in the Koran, to turn themselves, at prayer, towards the temple of Mecca: from which time they called those two temples the *keblatan*, or two keblas.

Ricaut adds, that it is not the temple of Mecca, properly speaking, that the Turks call kebla, but rather the large square tower in the middle of the amphitheatre of that temple.

The kebla of the Jews was the temple at Jerusalem; that of the Sabians, the meridian; and that of the Magians, the rising fun. To this the prophet Ezekiel refers chap. viii. 16.

KEBLA is also used for an altar; or rather a *niche*, as Ricaut calls it, which the Mahometans have in all their mosques, and which is placed very exactly on that side towards the temple of Mecca.

Hence also kebla comes to be used, metaphorically, for the object, or end proposed, in doing any thing.

Thus, the kebla of kings, is their crown and authority; that of men of business, is money; that of gluttons, good cheer. &c.

KEBLA-NOMA, or KELEPH-NOMA, a name which the Turks and Persians give to a little pocket-compass, which they always carry with them, in order to place themselves the more exactly when they go to prayers.

KEBLE, JOSEPH, in *Biography*, son of Richard Keble, esq. a lawyer of reputation at Ipswich, was born in London

In 1632, and studied at Jesus and All-Souls colleges in Oxford. He was admitted a barrister at Gray's Inn, and attended with the utmost assiduity at the king's bench for fifty years, though it is believed he never had a cause put into his hands; or was called to make a motion. He died suddenly in 1710, as he was stepping into a coach at Holborn-gate, being in his 78th year. His publications were numerous, and chiefly on legal subjects. He published, however, an essay on "Human Nature;" and another on "Human Actions." At his death, it is said, his manuscripts amounted to one hundred folios, and more than fifty quartos, all in his own hand-writing. Biog. Brit.

KEBLE'S *Island*, in *Geography*, an island in the Mergui Archipelago, about five miles long, and $1\frac{1}{2}$ broad. N. lat. $8^{\circ} 59'$.

KEBUCK HEAD, a cape on the E. coast of the island of Lewis. N. lat. $58^{\circ} 2'$. W. long $6^{\circ} 19'$.

KECKERMAN, BARTHOLOMEW, in *Biography*, a Prussian divine, was born at Dantzie in the year 1571: here he received the elements of a learned education, and at the age of eighteen he was sent to the university of Wittemberg, and studied philosophy and divinity two years. From this seminary he went to the university of Leipzig, where he spent some time, and then removed to Heidelberg. At this place he took his degrees, and at length became a tutor in several branches of knowledge. The fame which he acquired, as professor of Hebrew, induced the senate of Dantzie, in the year 1597, to invite him to become co-rector of the celebrated academical institution in that city, an office which he thought proper to decline. Four years afterwards the invitation was renewed, and he accepted it. The professorship to which he devoted his talents was that of philosophy, and he proposed to lead students to its inmost recesses by a more compendious method than had been before adopted. According to his plan, they were to complete their course of studies in three years. In the execution of his method he drew up a great number of treatises on almost all subjects that could claim the attention of the young; but by studying, writing, and teaching, he ruined his health, and fell a sacrifice to his industry in the thirty-eighth year of his age. His works have been published in two volumes, folio.

KECKLE, on *Board a Ship*. When the cables gall in the hawse, or the bolt-ropes do so against the ship's quarter, the seamen wind some small ropes about them; and this is called *keckling*.

KEDAS, in *Geography*, a town of Bengal; 15 miles S.E. of Midnapour.—Also, a town of Syria, on the river Jermuk, anciently called *Gadara*; 56 miles N. of Jerusalem.

KEDE', or QUADE, a town of Africa, in the country of the Fonlahs; 40 miles W. of Kayor.

KEDE-FARAH, a town of Asiatic Turkey, in the government of Sivas, on the Kizilirmack; 30 miles W. of Samfoun.

KEDGE, or KINGE. See GERBOSIA and MACRAN.

KEDGER, or KEDGE-ANCHOR, in a *Ship*. See ANCHOR.

KEDGING, a sea-term used when a vessel is brought up or down a narrow river by the wind, though the tide be contrary to it.

To do this, the seamen set their fore-sail, foretop-sail, and mizen-sail, and let her drive with the tide, that they may flat her about. If she come too near the shore, they have a little anchor ready, called the *kedger*, or *kedge-anchor*, with a hawser fastened to it from the ship; and this they drop in the midst of the current, by which means they wind her head about; and this done, take up the anchor again.

KEDGOORA, in *Geography*, a town of Hindoostan, in Bundeelcund; 30 miles N.N.E. of Callingar.

KEDGREE, a town of Hindoostan; $3\frac{1}{2}$ miles N.E. of Benares.

KEDHAM, a town of Upper Guinea, situated on the river Scherbro; 200 miles from its mouth.

KEDOUS, a town of Asiatic Turkey, in Natoria; 32 miles W. of Kintajon.

KEDRELEON, CEDRELAION, in the *Materia Medica of the Ancients*, an oil taken from the *pix cedri*, or pitch of the cedar-tree.

KEDRON, in *Geography*. See CEDRON.

KEEBLE, JOHN, in *Biography*, an eminent organist and harpsichord-master, who, in 1737, on Rosingrave being superseceded at St. George's, Hanover-square, on account of the derangement of his intellects, was appointed officiating organist of that church, upon half the salary, during the life of his predecessor. See ROSINGRAVE.

Mr. Keeble was the first performer on the organ at the opening of Kanelagh, and at the subscription concert established by Hickford in his room in Brewer's-street. (See HICKFORD.) He had likewise, to the end of his life, the best range of teaching of any master in London; and was so full of pupils of rank and fashion, in the immediate vicinity of his own residence, in Prince's-street, Hanover-square, that he declined the attendance of any others.

This able and experienced master, besides his practical abilities, had a passion for theoretical studies, and spent his leisure hours, during many years, in the investigation of the music of the ancients, and the *Harmonica*, which see. He was supposed to die worth 30,000*l.* in 1780.

KEEFA, in *Geography*, a town of Africa, in Algiers; six miles N.E. of Tipa.

KEEL, in *Botany*. See CARINA.

KEEL, the lowest piece of timber in a ship, placed in the bottom of her hull; one end thereof being let into the stern-post, and the other into the stem.

If we compare the carcass of a ship to the skeleton of the human body, the keel may be considered as the back-bone, and the timbers as the ribs. It, therefore, supports and unites the whole fabric, since the stem and sternpost, which are elevated on its ends, are, in some measure, a continuation of the keel, and serve to connect and inclose the extremities of the sides by transoms; as the keel forms and unites the bottom by timbers. The keel is generally composed of several thick pieces, placed lengthways, which, after being scarfed together, are bolted and clinched upon the upper side. When these pieces cannot be procured long enough to afford a sufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the *false keel*.

When a ship has a deep keel, she is said to have a *rank keel*; and this serves to keep her from rolling.

KEEL is also a name given to a low flat-bottomed vessel, used in the river Tyne, to bring the coals down from Newcastle, and the adjacent parts, in order to load the colliers for transportation.

KEEL, upon an *even*, in *Sea Language*, denotes the position of a ship when her keel is parallel to the plane of the horizon, so that she is generally deep in the water at both ends.

KEEL-haling, or *Keel-raking*, is a punishment inflicted at sea, in the Dutch navy, on very great offenders, who are drawn underneath the very keel of the ship. See DUCKING.

KEEL-ropes, a hair rope running between the keelson and the keel of a ship, to clear the lumber-holes when they are choaked up with ballast, &c.

KEELAGE, KILLAGIUM, a privilege to demand money for the bottoms of ships resting in a port or harbour.

KEELERS, in the *Sea Language*, small tubs to hold fluff to grave a ship's bottom.

KEELING, a name used in some English writers for the common cod-fish. See **ASELLINE**.

KEELSON is a keel without side similar to that without, upon the floor timbers exactly over the keel of the same dimensions, but always oak, keeping their butts or scarfs clear of each other: thus the bottom of the ship becomes firmly united by bolts driven through every floor timber, from the upper side of the keelson to the under side of the keel.

KEEMA-KEDAN, in *Geography*, a cluster of small islands in the East Indian sea, near the W. coast of the island of Leyta. N. lat. 10° 30'. E. long. 124° 36'.

KEEMO, in *Natural History*, a large shell of the cockle-kind; probably, says Mariden (Hist. of Sumatra, p. 9.) the largest in the world. It is found in the bay of Tappanooly, in Sumatra, chiefly, and likewise in other parts of the East. These shells are taken in deep water, by thrusting a long bamboo between the valves as they lie open, and by the immediate closure which follows they are made fast. The largest, says Mr. Mariden, which I have seen, was about three to four feet over. The shell is perfectly white, and is worked up like ivory by the natives.

KEENDUEM, in *Geography*, a river which rises in Thibet, and runs into the Irrawaddy, 40 miles below Ava. This great river comes from the N.W. and divides the country of Caffay from that of Ava. It is navigable, as far as the Birman territory extends, for vessels of burthen. The entrance of the Keendum is about a mile wide.

KEENE, EDMUND, in *Biography*, an English prelate, was born at Lynn, in Norfolk, of which place his father was alderman. He was educated at Caius college, Cambridge, and, in 1749, obtained the rectory of Stanhope, in the bishopric of Durham. In 1750, he was chosen master of St. Peter's college, and in a short time after he served the office of vice-chancellor, in which he promoted the regulations for improving the discipline of the university. In 1752, he was made bishop of Chester, where he continued eighteen years, when he was translated to Ely. He died in the year 1781. He had a brother who was several years ambassador at the court of Madrid. Gen. Biog. Dict.

KEENE, in *Geography*, a post-town of America, in New Hampshire, and one of the most flourishing in Cheshire county; incorporated in 1753, and containing, in 1800, 1645 inhabitants. It is 86 miles N.W. from Boston.

KEENEBALOV, or **ST. PETER'S MOUNT**, a large mountain in the N. part of the island of Borneo, near which are a people called Oran, Idaen, and Maroots, who offer human sacrifices to their deity. It is said that they are acquainted with a subtle poison, in which they dip their small darts, and thus cause a wound which produces instant death.

KEEP, To, in *Sea Language*, is a term used on various occasions: as

To keep the land aboard, is, to keep within sight of land as much as possible. See **HOLD**.

To keep the luff, is to continue close to the wind, or to fail with a course inclined to the direction of the wind as much as possible, without deviating to leeward. This is also called *keeping the wind*. See **CLOSE-BAULD** and **LOOP**.

To keep off, is to fail off, or keep at a distance from the shore. See **OFFING**.

KEEP, or **Dungeon**, the strong tower of an ancient castle, commonly placed on a high natural or artificial mount, into which the garrison retired when the castle itself was taken. The lake or cellar of such keep was generally used to confine prisoners in.

KEEPER of the Forest, otherwise called *chief warden of the forest*, is an officer who has the principal government of all things belonging to a royal forest, and the check of all the other officers.

The lord chief justice in eyre of the forest, when he thinks fit to hold his justice seat, sends out his general summons to the keeper forty days before, to warn all under-officers to appear before him, at a day assigned in the summons. See **JUSTICE of the forest**.

KEEPER of the Great-feal, is a lord by his office, and is styled *lord keeper of the great-feal*. He is one of the king's privy-council, through whose hands pass all charters, commissions, and grants of the king under the great-feal; without which feal, all such instruments, by law, are of no force: for the king is, in the interpretation of the law, a corporation, and passes nothing firmly but under the feal feal; which is, as the public faith of the kingdom, in the highest esteem and reputation.

The lord keeper has the same place, authority, pre-eminence, jurisdiction, execution of laws, and all other customs, commodities, and advantages, as the lord chancellor of England has for the time being. Both these officers cannot properly subsist at the same time, since the statute of 5 Eliz. The lord chancellor, or lord keeper, is superior in point of precedence to every temporal lord.

KEEPER of the Privy-feal, is a lord by his office; through whose hands pass all charters signed by the king, before they come to the great feal, and some things which do not pass the great-feal at all. He is of the king's privy council, and was anciently called *clerk of the privy-feal*; yet reckoned in the number of the great officers of the realm. 12 Ric. II. c. 11. 27 Hen. VIII. c. 11.

KEEPER, Boat, in *Sea Language, one of the rowers, who remains as a sentinel in his turn, to take care of any boat and her contents, either when she lies by the shore, or along-side of the ship; or when she is towed a-stern of her.*

KEEPER, The, in *Geography*, a high mountain in the county of Tipperary, province of Munster, Ireland, which forms a conspicuous object to a great extent of country. It is seven miles S.S.W. from Nenagh.

KEEPING, in *Painting, is a technical term, which signifies the peculiar management of those parts of the art, colouring and chiaro-scuro, which produces the proper degree of relief in objects admitted into a composition; according to their relative positions in the imagined scene, and the degree of importance the artist attaches to them.*

When he has chosen his subject, and arranged his figures, forms, and colours, his next talk will be, to give each object its local situation, and to bring those forward in the picture which he intends should be most impressive on the beholder; or at least, so to manage the surrounding ones, that those which are principal in the subject and composition, should not fail of their effect. This may be effected either by shade or colour: either by throwing a shadow across the inferior objects, or tinging them with a colour less bright than that given to the others; and even, in very skilful hands, it may be done by the very reverse mode of practice to either of the above: but that is extremely difficult, and requires the knowledge and the hand of a great master in the art to execute it.

As the objects recede in the ground-plane of the picture, the hue of the atmosphere intermixing with their proper, or local colour, as it is termed, (though improperly so,) will assist in their keeping; i. e. will cause them to appear at their just distance from the front figures. Therefore there is less art required here, than in separating and rounding figures situated nearly in the same plane, and combining to-

gether in masses, wherein the great difficulty of keeping lies.

It will be seen by what has been said, that keeping is but another word for *effect* in its more confined sense, as it relates to the individual objects of a picture; it is, however, a component part of *effect* in its general and most extensive meaning; of which it forms the basis in conjunction with arrangement of forms and colours; which latter includes, in the painter's eye, lights and shades. See *EFFECT*, in *Painting*.

On keeping, relief entirely depends; for if the lights, shadows, and half-tints be not kept in their exact relative proportions of depths, no rotundity can be effected; and without due opposition of light, shade and colours, no apparent separation of objects can take place.

Whatever kind of effect is intended, keeping must be called into action; since each object must have its own apparent, proper, and local projection; and no less its relative strength in regard to the general impression which the subject is calculated to produce.

So much has been said that applies to this article under the word *Effect*, that we forbear to enlarge further upon it, than just to state, that the Flemish school may be most advantageously studied with regard to it, in what relates to history, portraiture, and still life; and in landscape, we would add to Ruysdale and Hobbima, the more valuable name of Claude, as the painter who has produced the most exquisite productions in art for the quality we are now discussing.

KEEPTHEIA, in *Botany*, the name by which some authors call the trees, on the branches of which the gum lacca of the shops is usually found.

KEERA, in *Geography*, a town of Hindoostan, in Boglind; 12 miles E. of Kewah.

KEERETPOUR, a town of Hindoostan, in the circar of Sumbul; 10 miles S.S.W. of Nidjabad.

KEERPOU, a town of Hindoostan, in Bengal; 33 miles S.S.W. of Burdwan. N. lat. 22° 45'. E. long. 87° 35'.

KEERYSHUR, a town of Hindoostan, in the Carnatic; 22 miles S.S.W. of Bomrauzepollan.

KEESERA, a town of Hindoostan, in the circar of Condapilly; 16 miles N.W. of Condapilly.

KEEVE, in *Rural Economy*, a provincial term used to signify a vat in which beer is worked or fermented.

KEEVE is also a vessel used in dressing tin-ores. See *TIN*.

KEFF, or KEFTS, in *Geography*, a town of Africa, in the kingdom of Tunis, reckoned the third for riches and strength in the country: anciently called "Sicca," or "Sicca Veneria." In the 18th century the citadel was blown up, and afterwards rebuilt with additional strength and beauty. In levelling an adjacent mount on this occasion an entire statue of Venus was dug up, which was instantly broken to pieces by the Moors. At the same time was dug up an equestrian statue, dedicated to Marcus Antoninus Rufus, which suffered the same fate. Keff, as its name imports, is situated upon the declivity of a hill, with a plentiful source of water near the centre of it; 70 miles W.S.W. of Tunis. N. lat. 36° 15'. E. long. 9° 3'.

KEFFEKIL, in *Mineralogy*, a stone of a white or yellow colour, soapy feel, and moderate hardness, which increases in the fire. It is the substance of which the large Turkey pipes are made. It is found in Krim Tartary, in Canada, in Flanders, and in other places. The Tartars use it instead of soap, and it is so used in Austrian Flanders. Wiegler found it to consist of equal parts of magnetia and flex, whence it seems to operate as a fuller's earth. See *MEERSCHAUM*.

KEFFING, in *Geography*, a small island in the East Indian sea, near the S.E. coast of the island of Ceram. S. lat. 3° 28'. E. long. 131° 11'.

KEFIL, a village of the Arabian Irak, famous for the tomb of the prophet Ezekiel, annually visited by a multitude of Jews; 14 miles S. of Helleh.

KEFKEBEHI, a town of Natolia; 20 miles N.E. of Eskishehr.

KEFKEN, a small island in the Black sea, near the coast of Natolia. N. lat. 41° 6'. E. long. 36° 46'.

KEFREEN, a town of Syria, on a large plain to which it gives name, distinguished for the number of pigeons that are bred there; 15 miles from Aleppo.

KEFT, or KEFTU. See *CORTOS*.

KEHEEP, a town of Hindoostan, in Lahore; 45 miles S. of Attock.

KEHEMEND, a town of Persia, in the province of Faristan; 35 miles N. of Eilakar.

KEHL, a fortress in the duchy of Baden. At the peace of Ryfwick in 1697, this fort was ceded to the emperor and empress, and declared an imperial fortress. In the war between France and Austria, it was often taken and retaken; 2 miles E. of Strauburg. Kehl was united to the French empire by a decree of the Conservatory Senate in January 1808, and made a part of the department of the Lower Rhine.

KEHOA, a town of Asia, in Tonquin, near the coast. N. lat. 19° 12'. E. long. 105° 21'.

KEHRICZ, a town of Persia, in Khorasan; 70 miles N. of Herat.

KEIA-REGIAN, a town of Persia, in Irak; 60 miles W.N.W. of Hamadan.

KEIFLINGE, a town of Sweden, in the province of Schonen; 6 miles N.E. of Lund.

KEI-GAM, a town of Corea; 30 miles S.E. of Coufou.

KEIGHLEY, a town of England, in the county of York, situated on a navigable canal, and having a market on Wednesday. In 1801, the population consisted of 5745 persons, of whom 3456 were employed in trade and manufacture; 12 miles N. of Halifax, and 209 N.N.W. of London.

KEIKEM, in the *Materia Medica*, a name given by the Arabian writers to a gum used in their time for making of varnish.

Gum lacca is generally said to be the substance meant by it, but Avicenna seems to express by it every thing that was used as varnish. Thus he sometimes means by it the gum-fandarach, and sometimes amber. The gum cancamum of the Greeks is also certainly often meant by it; but this is scarce to be mentioned as an application of the word, it being almost as general a term as itself, and standing with many of the old authors for bandarach, gum lac, and amber, as well as for the gum properly expressed by it. In short, all the gums used in making varnish, are in general called by the names of any one of them, and thus vernix, bandarachi, cancamum, and lacca, are made synonymous words, and either stands for each of the things signified by all the words.

KEIKIS, in *Geography*, a town of Sweden, in the government of Abo; 48 miles N. of Biorneborg.

KEILAH. See *CEILA*.

KEILL, JOHN, in *Biography*, a celebrated mathematician and philosopher, was born at Edinburgh in the year 1671; here also he received his early education, and at the university pursued his maturer studies, and took his degree of M.A. He was particularly attached to Dr. Gregory,

who taught the mathematics, and read a course of lectures on the Newtonian philosophy. Under him and by his aid he was enabled to make himself master of the "Principia," which he regarded as the ground-work of his future studies. In the year 1694, Mr. Keill went with his tutor to Oxford, entered himself of Baliol college, and read lectures himself in his own chambers upon natural and experimental philosophy, by which he acquired considerable reputation. As an author, he first appeared with an "Examination of Dr. Burnet's Theory of the Earth," which led to a more extended controversy on the subject; in this he displayed very commanding talents, and ably refuted the ingenious theories of Dr. Burnet and Mr. Whiston. He readily admitted that though the work, the errors of which he undertook to expose, was full of mistakes in philosophy, yet none ever abounded with more beautiful scenes and surprising images of nature. In 1700, he succeeded Dr. Millington, who was appointed physician in ordinary to the king, as Siedleian professor of natural philosophy, and read lectures in the public schools. He now removed to Christ-church college, and, in 1702, he published his treatise, intitled "Introductio ad veram Physicam," containing the substance of several lectures on the new philosophy. This work met with a favourable reception in his own and in foreign countries, and was considered as a good introduction to the Principia. In 1736, a new edition of it was printed in London at the wish of M. Maupertuis, who subjoined to it a new hypothesis of his own concerning the ring of the planet Saturn. In 1708, Mr. Keill was elected a member of the Royal Society, of which he proved himself a very useful member, and enriched the Transactions of the Society with many valuable papers. In the following year he made a voyage to New England, as treasurer of the Palatines who were sent by government into that country, and soon after his return, in the following year, he was chosen Savilian professor of astronomy. Mr. Keill next engaged in the controversy respecting Sir Isaac Newton's claim to the invention of fluxions: several letters passed on the subject between M. Leibnitz and our author, till at length a special committee of the Royal Society was appointed to examine the merits of the case, which committee concluded their report with declaring, that they reckoned Sir I. Newton the first inventor of the method in question, and that they were also of opinion that Mr. Keill, in asserting the same, had been no ways injurious to M. Leibnitz. The particulars of these proceedings may be found in a work to which we have, in this Cyclopaedia, already more than once referred, viz. the "Commercium Epistolicum" of Mr. Collins. The dispute was carried on for some years in the "Acta Eruditorum," and the "Journal Litteraire." It was generally admitted that Mr. Keill conducted himself in these contests with a great degree of firmness and spirit, and that he satisfactorily repelled the attacks upon the reputation of our illustrious countryman. In 1711, he published a paper in the Philosophical Transactions, "On the Rarity of Matter, &c." in which he points out various phenomena which cannot be explained upon the supposition of a plenum. About this time queen Anne was pleased to appoint him to the office of decypherer to her majesty, in which he continued till the year 1716. In 1713, the university of Oxford conferred upon him the diploma of doctor of medicine, and two years afterwards he published an edition of Euclid, to which he added two tracts on Trigonometry and the Nature of Logarithms. In the year 1718, Dr. Keill published at Oxford his "Introductio ad veram Astronomiam," which was afterwards translated by himself into English, at the request of the dukes of Chandos, under the title of "An Introduction to the true Astronomy," &c. The author did not long

survive this work. He died of a fever in the summer of 1727, being only in the 50th year of his age.

KEILL, JAMES, an eminent physician, was born in Scotland on the 27th of March 1673. Having received the early part of his education in his native country, he went abroad with the view of completing it in the schools of celebrity on the continent; and obtained such a degree of knowledge as distinguished him soon after his return to England. He had early applied to dissections, and pursued the study of anatomy, under Duverney, at Paris; whence he was enabled to give anatomical lectures, with great reputation, in both the English universities. He was honoured with the degree of M.D. by the university of Cambridge. In 1703 he settled at Northampton, and began the practice of his profession, in which he attained considerable fame and success. In 1706 he published a paper in the Philosophical Transactions, N^o 306, containing "an account of the death and dissection of John Bayles, of that town, reputed to have been 130 years old." The circumstances which he detailed very much resembled those that were observed by the celebrated Harvey in the dissection of old Parr. Dr. Keill, like his brother John, was well skilled in mathematical learning, which he applied to the explanation of the laws of the animal economy. His first publication was a compendium of anatomy, for the use of the pupils who attended his lectures, and was entitled, "The Anatomy of the Human Body abridged," 12mo. Lond. 1698, and was taken chiefly from Cowper; it went through many editions. In the year 1718, he gave the world a proof of his mathematical skill, in "An Account of Animal Secretion, the Quantity of Blood in the Human Body, and Muscular Motion," Lond. 8vo. This work was reprinted in 1717, with the addition of an essay, "concerning the Force of the Heart in driving the Blood through the whole Body;" and under the title of "Essays on several Parts of the Animal Economy." He likewise published the same treatise in Latin, with the addition of a "Medicina Statica Britannica." The essay concerning the force of the heart drew him into a controversy with Dr. Jurin, which was carried on in several papers, printed in the Philosophical Transactions of the Royal Society, of which Dr. Keill had been elected a member; and was continued to the time of the death of the latter, which took place at Northampton, on the 16th of July 1619, in the vigour of his age. He had for some time laboured under a very painful disorder, viz. a cancer in the roof of his mouth, to which he had applied the cautery with his own hands, in order, if possible, to procure some relief, but in vain. Eloy. Dict. Hist. Hutchinson. Biog. Med.

KEILLESAY, in *Geography*, one of the smaller Western islands of Scotland; 3 miles N.E. of Barray island. N. lat. 57° 2'. W. long. 7° 23'.

KEIM-HO-TUN, a town of Chinese Tartary, in the government of Kirin. N. lat. 42° 45'. E. long. 129° 24'.

KEIRAN, in the *Oriental Learning*, the Persian and Arabic name for the planet Saturn, according to Salmassius. See CHIRUS.

KEIRLEBERUS, JONAS GREGOR, in *Biography*, born at Würtemberg, was at once a philosopher, poet, and musician. In 1691, he composed for the birth-day of the emperor Joseph I. a Latin poem, which he set to music in a perpetual canon of 16 vocal parts, and 76 violin accompaniments, in a different melody; a piece of pedantry much admired by professors and deep dilettanti at the latter end of the 17th century. He afterwards composed another perpetual canon in eight parts, four viol da gambas, two court-tenors, and two tenors, with several other various and complicated

complicated contrivances, as mystical, and as much respected at the time as the oracles delivered by the Pythia.

KEIS BAY, or *Sinclair's Bay*, in *Geography*, a bay on the E. coast of Scotland, in the county of Caithness. N. lat. 58° 28'. W. long. 2° 58'.

KEISER, REINHARD, in *Biography*, a German composer of the first class, for invention, ingenuity of accompaniments, and number of his works. This admirable musician was born in 1673, at Weissenfels in Saxony, and, very early in his professional career, appointed maestro di cappella to the duke of Mecklenburg. Though his first attempt at dramatic music was a pastoral, called "Ifimesa," for Wolfenbützel, which he set in his 20th year, the year following he composed his opera of "Baillius," which was performed in the theatre at Hamburg with very great applause; and he continued writing for that stage till the year 1730.

He was educated at Leipzig, where he was entered of that university. He began to study music in that city, but was chiefly his own master, forming himself upon the Italian school, by studying the best productions of that country. His second opera for Hamburg, "Adonis," established him in the favour of that city for the rest of his life. According to Mattheson, whatever words he set on the subject of love, his music was peculiarly excellent. His operas, in Hamburg alone, amounted to 118. But besides his dramatic productions, he composed *dizertimenti, serenats, and cantatas* innumerable. Indeed, this matter was as sure of fancy and originality whenever he put pen to paper, as Haydn in his time. In a manuscript collection of near seventy cantatas by the greatest composers of his time, both of Italy and Germany, in which there are twelve by Keiser, in opening the book by chance, in any part of it where his cantatas are inserted, it is instantly known to be his music, at the first glance; so new are the passages, and so different the arrangement of the notes from that of his companions in this collection, amounting to near thirty of the first order. For grace and facility we do not recommend him: indeed, these excellencies were little known or sought during his time; but for modulation, ingenuity, and new ideas, he had scarcely his equal.

In a conversation with the elegant and judicious Haffe at Vienna in 1772, he assured us that, according to his conceptions, Keiser was one of the greatest musicians the world ever saw. His compositions, he said, were more voluminous than those of Alessandro Scarlatti; and his melodies, though then 70 years old, were still, he thought, modern and graceful. Adding, that this had been always his opinion; and he was not likely to be prejudiced in his favour, as Keiser was not his relation, his master, or even his acquaintance; but having lately looked at some of his works, he was astonished to see so much more elegance, clearness, and pleasing melody than are to be found in the productions of most modern masters, even now. "He composed, indeed, chiefly for Hamburg," Signor Haffe observed, "and, in general, to the German language, not being very well versed in that of Italy; so that he often blundered in setting Italian words; but he had always merit of other kinds, to compensate for this defect."

At this time all our own knowledge of this composer was traditional, as we were then totally unacquainted with his works; but we can now speak from demonstration, and our own examination of his works of various kind, which manifest all the vigour of a fertile invention, and correctness of study and experience.

KEISER'S River, in *Geography*, a river of Africa, at

the Cape of Good Hope, which descends from Table mountain.

KEISKAMMA, a river of Africa, which runs into the Indian sea. S. lat. 32° 4'.

KEITH, JAMES, in *Biography*, a distinguished general, younger son of George Keith, earl marshal of Scotland, by a daughter of Drummond, duke of Perth, was born in 1696, and educated at the college of Aberdeen. He was an adherent to the Stuart family, and engaged in their defence in the year 1715; but on the defeat of his party he was glad to escape to France, where he applied to all the branches of knowledge useful in the military profession. He was admitted a member of the Academy of Sciences on account of his great proficiency in mathematics. He travelled through many countries in Europe, served 10 years in the Irish brigades in Spain, and afterwards entered into the Russian service, in which he was raised to the rank of brigadier-general. In the war between the Russians and the Turks he gave the most signal displays of courage and heroism, and was himself the first to mount the breach at the capture of Otechakof. He had a share in the war in Finland, between the Swedes and Russians, and was instrumental in placing the princess Elizabeth on the throne of Russia. At the peace of Abo in 1743, he was sent ambassador to the court of Stockholm, and on his return to Peterburgh he was honoured with the marshal's staff; but as the emoluments of this office were insufficient for his support, he accepted an invitation from Frederick king of Prussia, by whom he was honoured with considerable appointments, and with his own personal friendship. In the war of 1756 he entered Saxony in the quality of field marshal; and in 1758 he was killed, at the surprize of the camp of Hochkirchen, by count Daun. He was reckoned a very able general, and was highly estimable in his private character. The king of Prussia honoured his memory with a fine monument at Potzdam.

KEITH, in *Geography*, a parish in the county of Banff, Scotland, contains four hamlets or villages: 1st, the old town of Keith; 2d, the new town of Keith; 3d, the new town of New-Mill; and, 4th, the old town of New-Mill. The old town is nearly deserted by the inhabitants in consequence of the superior advantages of the new town. This was commenced in the year 1750, by the earl of Findlater, upon a barren moor, which was let in lots of 30 feet by 70. Here several manufacturers established themselves, and the place gradually increased in houses and population. In 1791 there were 1075 of the latter; and in 1800 the whole parish contained 749 houses, and 3284 inhabitants. These are comprised within an area of about six miles in length, by six in breadth. Flax dressing, spinning, and weaving, are the chief branches of manufacture; a tannery, distillery, and bleaching field, are included within the parish. The parish-church of Keith has been long noted for its able masters. Near old Keith, the river Isla, falling over some high rocks, forms a fine cascade, called the "Linn of Keith." James Ferguson, justly celebrated for his astronomical and philosophical writings, was a native of this parish. Within the precincts of the parish are some druidical remains. Sinclair's Statistical Account, vol. v. article written by the Rev. Alexander Hunsbury.

KEFU, a town of Japan, in the island of Ximo; 15 miles N. N. W. of Naka.

KEIO. See *FERR-OL*.

KEKO, in *Geography*, a town of Hungary, with a castle; 15 miles S. E. of Korpona.

KELA, or QUILLA, a town of Africa, on the Slave coast, in the canton of Koto.

KELAIA, a town of Arabia, in the province of Hedjas; 50 miles E.S.E. of Calaat el Moilah.

KELANG, or KILANG, a small island in the East Indian sea, near the W. coast of the island of Ceram. S. lat. 3 8'. E. long. 128°.

KELAR, a town of Persia, in Irak; 70 miles E.S.E. of Casbin.

KELAT, a town of Persia, in the province of Khorasan, at the edge of a mountain surrounded by rocks; it was taken by Timur Bec in 1382; 12 miles E. from Abivard.

KELES, a town of Asiatic Turkey, in Natolia; 28 miles E.N.E. of Ephesus.

KELHEIM, a town of Bavaria, situated on an island formed at the conflux of the Altmuhl and Danube; 46 miles N.N.E. of Munich. N. lat. 48 52'. E. long. 11° 52'.

KELIUB, or KALJUB, a town of Egypt, on the Kalit's Abu Meneggi, the capital of a district; 6 miles N. of Cairo.

KELL, in *Rural Economy*, a web, or kind of bag, in which insects are bred.

KELLAH, in *Geography*, a town of Abyssinia; 75 miles E. of Axum.

KELLER, JOHN BALTHASAR, in *Biography*, a celebrated artist, was born at Zurich in 1638. Having learnt the art of a goldsmith, in which he displayed great ingenuity, he went to Paris by the invitation of his brother, who held the posts of canon-founder, and commissary of artillery to the king of France. While in the French service he cast a great many cannon, together with several statues for the gardens of Versailles; but that by which he is chiefly celebrated is the grand equestrian statue of Lewis XIV. executed after the model of Girardon. He was made inspector of the foundery at the arsenal, and died at Paris in the year 1702. Gen. Biog.

KELLER, GODFREY, a native of Germany, who settled in England about the beginning of the last century, and had much practice as a harpichord master. In 1711, he published, at Amsterdam, six sonatas, engraved on copper-plates; of which the three first were for two violins, a tenor, a trumpet or hautbois, and a bass; the three last for two flutes, two hautbois or violins, and a basso continuo. These the author dedicated to queen Anne. After this he and Finger published sonatas, jointly, in five parts.

As a composer, Keller was soon forgotten; but he was remembered a considerable time as the author of a posthumous treatise on *thorough-bass*, which he had finished, but did not live to publish. It was, however, printed, a short time after, by Cullen at the Buck, between the Temple gates and Fleet-street, with the following ample title: "A complete Method for the attaining to play a Thorough-Bass upon either Organ, Harpichord, or Theorbo-Lute; by the late famous Mr. Godfrey Keller, with Variety of proper Lessons and Fugues, explaining the several Rules throughout the whole Work; and a Scale for tuning the Harpichord or Spinnet, all taken from his own Copies, which he did design to print."

This treatise, though meagre, was the best our country could boast, till Lampe, in 1737, published his "Plain and Compendious Method of teaching Thorough-Bass, after a most rational Manner, with proper Rules for practice; the Examples and Lessons curiously engraved on Copper-plates." Of this work we shall speak hereafter. See LAMPE.

KELLERAMPT, in *Geography*, a bailiwick of Switzerland; in the canton of Zurich, of which Bremgarten is the principal place.

KELLEY, EDWARD, in *Biography*, the associate of Mr. Dee (to whose article the reader is referred), in his incantations, was born at Worcester in the year 1555. He was educated in grammar learning in his native city, and at the age of seventeen he was sent to the university of Oxford. According to Anthony Wood he left Oxford very abruptly, and in his peregrinations behaved so ill, and committed so many foul matters, that at Lancaster he was for some offence deprived of his ears. After this he became acquainted with Mr. Dee, and, as we have seen, they set out for the continent. For some time Kelley lived in a very expensive style, supported, probably, by the contributions which he levied on the credulous, till he was ordered into confinement by the emperor Rodolph. He obtained his release, and conciliated the favour of the prince, who conferred on him the honour of knighthood. Fresh discoveries of his knavery occasioned a second imprisonment, and in attempting to escape from the place of his confinement, he met with an accident which put an end to his life in the year 1595. He was author of several works, of which "A Poem on Chemistry," and another on "The Philosopher's Stone," were inserted in Athmole's "Theatrum Chymicum Britannicum." He published at Hamburgh, in 1676, a treatise, "De Lapide Philosophorum;" he was author, likewise, of "A True and faithful Relation of what passed, for many Years, between Dr. John Dee and some Spirits, &c." Several of his MSS. are still preserved in the Athmolean Museum, at Oxford. Wood's Athen.

KELLEY, HUGH, a dramatic writer, was a native of Ireland, and bred a stay-maker, which profession he quitted when he came to London, and became writer to an attorney. He afterwards obtained a livelihood by his pen, and was author of the following pieces: "Falsè Deliciæ;" "A Word for the Wife;" "The School for Wives;" "The Romance of an Hour." These, as their titles denote, are all comedies. He was author also of "Clementina," a tragedy; "Thepsis," a poem; "Memoirs of a Magdalen;" "The Babbler;" and a collection of Essays. He died in the year 1777.

KELLI, in *Geography*, a town and fortress of Hindoostan, in the country of Tanjore; 27 miles S. of Tanjore. N. lat. 10° 20'. E. long. 79° 7'.

KELLINORE, a town of Hindoostan, in the Carnatic; 10 miles N. of Pondichery.

KELLS, a market and post-town of the county of Meath, province of Leinster, Ireland. It was in former times a city of note, and on the arrival of the English was walled and fortified with towers: a castle was built in 1178, and there were several religious houses. It was also a borough town, which, before the Union, sent two burgesses to parliament. Kells is 32 miles N.W. from Dublin on the river Blackwater, and nearly eight from Navan.

KELLY, EARL OF, in *Biography*, an illustrious dilettante musician, in whom were united application, genius, and a powerful hand on the violin. This nobleman went through all the gradations of study necessary to form a profound contrapuntist. When he quitted Great Britain to make the tour of Germany, according to Pinto, he could scarcely tune his violin; but stopping at Manheim, he heard the best instrumental music in Europe, and shut himself up with the elder Stamitz, whose originality and fire set his young pupil in a blaze, and so congenial were the taste and disposition of the scholar and the master, that they seemed the growth of the same soil. The same energy and enthusiasm

enthusiasm which had lifted Stamitz above his fellows of the Mannheim school, stimulated the young earl to study composition, and practise the violin with such serious application, that, on his return to England, there was no part of theoretical or practical music in which he was not equally versed with the greatest professors of his time. Indeed, he had a strength of hand on the violin, and a genius for composition, with which few professors are gifted. His ear was so correct, and his perception so acute, that in the middle of a turbulent and tumultuous movement of a symphony in twelve or fourteen parts, if any instrument failed either in time or tune, though playing a different and difficult part himself, he instantly prompted the erroneous performer with his voice, by singing his part without abandoning his own.

KELLYSBURG, in *Geography*, a township of America, in Chittenden county, Vermont, at the head of the north branch of La Moille river.

KELMEE, a town of Hindoostan, in the Baglana country, on the coast; 16 miles N. of Baliceen.

KELMEBEK, a town of Natalia; 28 miles E. of Pergamo.

KELMO, a town of Sweden, in East Gotland; 23 miles N. of Linköping.

KELNAR, a town of Carmania, near the coast of the Mediterranean; 12 miles W. of Selchek.

KELNER, in *Biography*, a German musician, who came into England early in the last century, and performed on the double-bass in the theatres and concerts of the time. Having attached himself to Dr. Pepusch, his venerable countryman, it was found, at the doctor's decease, that the most curious books and MSS. of his valuable library at the Charter-house, were bequeathed to Kelner and Travers, another of the doctor's constant attendants, who both dying soon after their bequest was known, that, and the remainder of the most curious and inestimable musical library perhaps in Europe, were sold piece-meal, disposed of and embezzled, in a manner difficult to describe or understand. See **PEPUSCH**, and **MUSICAL LIBRARY**.

KELP, in *Agriculture* a term applied to the mineral alkali in its more impure state; the kelp of commerce contains the ashes of the plant that affords it, and is found to be a good manure. See **CARBONAT of SODA**.

KELSAL'S ISLAND, in *Geography*, a small island in the Mergui Archipelago, separated from the S.E. extremity of the island of St. Sufanna, by Alderley's straits. N. lat. 10 27'.

KELSO, a town in the county of Roxburgh, Scotland, is built on a spot where the rivers Tevid and Tweed unite their streams, and is nearly surrounded with eminences covered with trees. Hence the scenery is particularly picturesque and pleasing. The houses are arranged round a large square, and on the sides of six streets, which diverge from the square in nearly a regular and uniform manner. The town house, with shops and some of the principal dwellings, are in the square. In the town are the parish-church and an episcopal chapel, which are described as handsome structures. Among the public buildings are a dispensary, a public subscription library, and a modern bridge over the Tweed, erected in the place of a former one, swept away by a flood in 1798. A church was founded here in 1138; and a monastery was transferred from Selkirk to this place by David I., who "conferred on the monks this village, with its lands and waters, free from all exaction." David II. granted to the abbot a free-market here. "The town of Kelso shared the fate of the abbey during the hostile conflicts between the kindred nations in being often plundered and sometimes fired." In the years 1522, 1542, and 1544,

it was greatly damaged from the border warriors. The town was almost destroyed in 1686 by an accidental fire, and about the middle of the last century, it sustained great damage from the same cause.

David II. constituted the town of Kelso, with the barony of Bolden, and other lands, a free regality. This was converted, in 1607, into a lordship in favour of Robert Kerr, earl of Roxburgh. The duke of Roxburgh is proprietor of the lands here. The principal trade of Kelso is the manufacture of woollen cloth, and dressing of sheep and lambs' skins, of which it is supposed that from 700,000 to 800,000 are annually exported. Great numbers of boots and shoes are annually made here. This place is much resorted to by gentlemen who attend the "Caledonian hunt," and by others on account of the races. The abbey buildings of Kelso have been very extensive and grand. At present its ruined church presents many interesting fragments of Norman architecture. Mr. Pennant remarks, that the "environs of Kelso are very fine, and the inhabitants have much reason to boast of their prospects." In the vicinity of the town are several feats of the nobility and gentry: "Fieurs," "the magnificent feat" of the duke of Roxburgh; Springwood-park, the residence of sir George Douglas, bart.; Softlaw-tower, Mr. Proctor's; Rose-bank, captain Scott's; Pinnacle-hill, Mr. Davidson's; Wooden, Mr. Walker's; &c. In 1809, Kelso contained 527 houses, and 4196 inhabitants. Chalmers's Caledonia, vol. ii. Sinclair's Statistical Account, vol. x p 576. Pennant's Tour to Scotland.

KELTAN, a town of Thibet; 40 miles E. N. E. of Lassa.

KELTANPUSUACLIAN, a town of Thibet; 52 miles W. of Szigatche.

KELTSCH, a town of Moravia, in the circle of Prerau; 14 miles E. of Prerau.

KELVAN, a town of Persia, in Farsilan; 18 miles E. N. E. of Schiras.

KELVEH, a town of Persia, in the province of Mecran, on the Nehen; 280 miles S. E. of Zareng. N. lat. 28 50'. E. long 65 48'.

KELVIN, a river of Ireland, in the county of Londonderry, which runs into the Roe, about 4½ miles S. from Newtown Limavaddy.

KELVIO, a town of Sweden, in the province of Ulea; nine miles E. N. E. of Ganda Karleby.

KELWAY, JOSEPH, in *Biography*, the best extemporaneous performer on the organ, and next best harpsichord player among the natives of our own country, during the middle of the last century. He had been, early in his life, apprenticed to a dancing-master at Bath: but having attempted the harpsichord, and received a few lessons from old Chilcot, he had made such a progress on that instrument, that Geminiani, happening to hear him, discovered a hand and disposition so promising, that he not only encouraged him to study music as a profession, but gave him instructions. And his style of playing ever after more resembled the compositions of Geminiani than those of Handel, which all other organists fervently copied. The broken phrases and rhapsodical flights of Geminiani often seem more like voluntary playing than regular composition. Stanley's voluntaries were so smooth and well-phrased, that they seemed pieces played by memory; but Kelway's extempore playing, in the style of Geminiani, never had the air of studied pieces.

In removing from Bath to London, Kelway was soon noticed, and elected organist of St. Michael's, Cornhill, where he did not long remain; for on the death of Weldon, he resigned the organ at St. Michael's church to Mr., after-

wards Dr., Boyce; and was elected organist of the king's parish church, St. Martin's-in-the-Fields, where, of a Sunday afternoon, it was the custom, not only for young organists, but the principal professors, to crowd under the organ-loft to hear his voluntaries; in which there was an original and matterly wildness, which long supported his character as a great player, in a style totally different from other organists; bold, rapid, and fanciful.

With his harpsichord playing we were unacquainted; but we have often been assured, that he constantly kept in high practice, Scarlatti's best and most difficult lessons, which he executed in a manner peculiarly neat and delicate. As to composition, it is to be lamented that he did not exercise his pen and fancy more early in life, or that he ever attempted it at all; for on the arrival of Bach, and appointment at court as chamber-musician to the queen, to whom he dedicated his first publication in this country, Mr. Kelway thought it necessary, as music-master to her majesty, to publish a book of harpsichord lessons, which are, perhaps, the most crude, awkward, and unpleasant pieces of the kind that have ever been engraved. There is a manifest want of facility and experience, which proves, that though he was old in practical music, he was young in its theory and in composition.

Handel, who used to go frequently to St. Martin's church to hear him play, always, when indisposed, requested Kelway to play the organ for him in his oratorios.

This admirable performer, the most brilliant we ever heard, in point of fancy and finger, lived to a great age, but, unhappily, during the last years of his life, his intellects were somewhat deranged. He died in 1782, and was succeeded at St. Martin's church by Dr. Benjamin Cook, organist of Westminster Abbey.

KEMAS, in *Geography*, a town on the E. coast of the island of Celebes. N. lat. 1° 8'. E. long. 125° 2'.

KEMA, in *Natural History*, a name given by Leo Africanus, and other writers of the African history, to a sort of subterranean production of the vegetable kind, greatly esteemed as a delicious food. The Arabian writers on medicine have often mentioned it, and that under names sufficiently resembling the modern African appellation, such as *camabé*, *canab*, *kenab*, and *camba*. They are not the roots of any plant, but a fine kind of subterraneous mushroom, or truffle, white on the outside, and which lie generally pretty deep in the earth.

KEMAON, in *Geography*, a small state, which, with others, forms a tract of country separated from Hindoostan by lofty mountains, and situated to the N. of Oude and Rohilcond.

KEMAR, a town of Asiatic Turkey, in Natolia; eight miles S. of Sinop.

KEMBELLA, a town of Sweden, in the government of Uppsala; five miles S. of Ula.

KEMBERG, a town of Saxony; six miles S. of Wittenberg.

KEMER, a town of Asiatic Turkey, in the government of Trabizond; 12 miles E.N.E. of Ruzch.

KEMGUR, a town of Hindoostan, in Bahar; 27 miles N.N.E. of Durbunga.

KEMI, a town of Russia, in the government of Olonetz, at the mouth of the river Kem, on the W. of the White sea. N. lat. 64° 55'. E. long. 28° 38'.—Also, a sea-port town of Sweden, in East Bothnia, situated on the right bank of the river Kemi, which runs into the gulf of Bothnia, about three miles from its mouth; 10 miles E. of Tornæa. N. lat. 66° 49'. E. long. 24° 27'.

KEMIJAN, a town of Hindoostan, in Bahar; 31 miles S.S.W. of Patna.

KEMITRASK, a town of Sweden, in East Bothnia, at the N. extremity of a considerable lake formed in the river Kemi; 90 miles N.E. of Kemi. N. lat. 66° 42'. E. long. 27° 14'.

KEMLIK, or GHIO, a town of Asiatic Turkey, on the bay of the sea of Marmora; 20 miles W. of Iznik.

KEMMOO, a town of Africa, the metropolis of Kaarta; formerly large and populous, but destroyed since it was visited by Mr. Park. N. lat. 14° 20'. W. long. 7° 46'.

KEMNAT, a town of Bavaria; 26 miles N. of Augsburg. N. lat. 49° 53'. E. long. 11° 55'.

KEMNITZ, a town of Silesia, in the principality of Jauer, on a river of the same name, which runs into the Bober; six miles W. of Hirschberg.

KEMPACH, a town of Tyrol; six miles N.W. of Schwaz.

KEMPEN, a town of France, in the department of the Roer, and chief place of a canton, in the district of Crevelt; 15 miles N.E. of Ruremond. The place contains 2870, and the canton 12,820 inhabitants, in 12 communes. It formerly contained a college and three convents, with some linen manufactures.—Also, a town of the duchy of Wariauw; 27 miles S. of Siradia.

KEMPFERA, in *Botany*, so named by Houttaun, in honour of Dr. Engelbert Kempfer, or rather *Kempfer*, the celebrated traveller and naturalist. See VERBENA, and *KEMPEER*.

KEMPIS, THOMAS, in *Biography*, was born in the year 1380, at a village in the diocese of Cologne, whence he derived his surname. The circumstances of his parents were such as led them to seek for him an education on a charitable foundation. At this place he was distinguished for his talents, piety, and attachment to a contemplative life. He entered the monastery of Mount St. Agnes, received the habit in 1406, and was ordained priest in 1423. He occasionally filled very important posts of his order, though it was much against his will that he engaged at all in the active duties of life. He died in 1471, at the advanced age of ninety-two. His works are chiefly devotional, and written in an animated style. The most complete edition of them is in three volumes, octavo, published at Antwerp in 1600, and in 1615. Many of them have been translated into a variety of languages, particularly that entitled "De Imitatione Christi," which is to be found in almost every known tongue in the world. The best English version is that by Dr. George Stanhope, which was printed in 1696, and has been several times reprinted. The learned are not agreed as to the real author of this celebrated work, though given to Thomas à Kempis by general consent, many have offered reasons why he cannot be the writer. The question was warmly agitated for sixty years, and gave rise to many curious discussions, an account of which is given by Dupin.

KEMPSVILLE, in *Geography*, a post-town of America, in Prince Ann county, Virginia; 243 miles from Washington.

KEMPTEN, a town of Bavaria, on the river Iler, lately Imperial. The burghers and magistracy profess Lutheranism, and in the town are a handsome parish church and a grammar school. In 1501, this town and its abbey were given to the elector of Bavaria; 30 miles S. of Augsburg. N. lat. 47° 43'. E. long. 10° 17'.—Also, a princely abbey, founded, or at least repaired and enriched, by Hildegard, wife of Charlemagne, in the 8th century. To this abbey belonged some towns and villages.

KEMSER, a town of Bengal; 15 miles S.S.E. of Currukpour.

KEMSKOI, a town of Russia, in the government of Tobolsk. N. lat. 57 25'. E. long. 92'.

KEN. THOMAS, in *Biography*, an English prelate, was born at Berkhamstead, in Hertfordshire, in the year 1637. He received his classical education at Winchester school, was elected scholar, and removed in due time to New-College, Oxford, of which he was chosen fellow. After taking his degrees he entered into holy orders, and became chaplain to lord Maynard, comptroller of the household to king Charles II. In 1666, he was chosen fellow of Winchester college, and in a short time afterwards was appointed domestic chaplain to Dr. Morley, bishop of Winchester, from whom he received a presentation to the rectory of Brixton, in the Isle of Wight, and afterwards, in 1669, to a prebend in the church of Winchester. About the year 1673, the same friend and patron gave him the rectory of Woodhey, in Hampshire, which, however, he soon resigned, conceiving that he ought to be satisfied with the emoluments which he had previously possessed. In 1675, he went, in company with his nephew, Mr. Isaac Walton, to Rome, and on his return he used to say he was grateful for the effect produced by the journey, inasmuch as he was more strongly confirmed in his belief of the excellence of the reformed religion, by witnessing the absurdities of the superstitious practices abroad. In 1679, he took his degree of doctor of divinity, and being appointed chaplain to the prince of Orange, he went to Holland. He discharged the duties of his office with so much prudence and zeal, as to secure the esteem and confidence of his royal mistress, but he incurred the temporary displeasure of her consort, afterwards William III. of England, by obliging one of his favourites to fulfil his engagement to a young lady of the prince's train, whom he had seduced under a promise of marriage. On his arrival in England he was appointed chaplain to lord Dartmouth, who received a commission to demolish the fortifications of Tangiers, and on his return from this expedition, he was immediately advanced to be chaplain to the king, by an express order from his majesty, who hoped thereby to render him subservient to his measures, and to the laxity of his morals. When the court removed to Winchester, the sovereign desired Dr. Ken to admit into his prebendal house Eleanor Gwyn, one of the king's mistresses, but he positively refused to submit to an arrangement which might appear to give countenance to vice; and Charles, so far from being offended with this decisive proof of religious intrepidity, took an early opportunity of raising him to the episcopal bench, by presenting him with the see of Bath and Wells. Within a few days of this appointment the king was attacked by his last illness, during which the bishop attended him in the most sedulous manner, endeavouring, though, it is said, ineffectually, to awaken the king's conscience to a sense of sorrow for his past profligate life. Nevertheless the bishop did not hesitate to pronounce absolution over his majesty without receiving any declaration of repentance, for which he has been deservedly censured; though it is to be feared, that almost all death-bed repentances, being the effect of dread of the future, can avail the supposed penitents very little with regard to a future state. The bishop was exemplary in performing the duties of his station, and was incessantly devising means for relieving the poor, and instructing the ignorant. With this view he built the first workhouse at Wells, which he ordered the monks for numbers that have been erected since his time; and he established many schools in all the great towns of his diocese. To these, and many other similar objects, Dr. Ken devoted the principal part of the

income of his see. He was a warm friend to the doctrine of passive obedience and non-resistance, and on that account was at first well received by James II., but when that prince endeavoured to introduce popery as the established religion of the country, he found it expedient to act upon more constitutional grounds, and to oppose the measures of the court with spirit and zeal. He was one of the seven bishops sent to the Tower for resisting that monarch's dispensing power, and for petitioning in behalf of their own and the people's rights. The bishop and his brethren, though charged with high treason, were honourably acquitted, to the inexpressible joy of every friend to the country. At the Revolution he refused to transfer his allegiance to the new sovereigns, and, declining to take the oaths required of him, was deprived of his bishopric. He now lived a life of retirement, but considered himself still as bishop in right, though not in fact, conceiving that no human power could separate him from the relationship which he bore to his diocese. Upon the death of his first successor, Dr. Kiddier, he urged Dr. Hooper, who had been nominated to the vacant bishopric, to accept it, and ever afterwards signed himself "late bishop of Bath and Wells." From this time the queen settled on him a pension of 200*l.* per ann. which he enjoyed so long as he lived. He died, as he was on a journey to Bath, in March 1710-11, in the 74th year of his age. He had been in the habit of traveling many years with his sword in his portmanteau, which he always put on when attacked by illness: of this he gave notice the day before his death, in order to prevent his body from being draped. His works, which are all of a theological and practical turn, were collected, in 1721, in four volumes octavo. *Biog. Brit.*

KEN, in *Geography*, a town of Hindoostan, in the province of Behker; 20 miles N. of Behker.—Also, a small low island in the Persian gulf, in which are a few houses. N. lat. 27 54'. E. long. 50 76'.

KENAMOW, a town of Hindoostan, in Oude; 30 miles S.S.E. of Canpour.

KENAPOOSSAN, a small island in the East Indian sea, in the Sooloo Archipelago. N. lat. 5 12'. E. long. 120 23'.

KENAREI-HAVAZ, a town of Hindoostan, in Moul-tan; 20 miles E. of Batuir.

KENAWAS, a town of Hindoostan, in the circar of Kitchwarah; 17 miles W. of Sheergur.

KENCHESTER. See **ARICONUM** and **HEREFORD**.

KENDAL, or **KENDALE**, a market town and parish in the ward of Kendal, and county of Westmoreland, England, is built in a pleasant valley on the western banks of the river Kent, over which there are three bridges. The town consists of one principal street running north and south, with several smaller ones branching off at right angles. Kendal has long been famed for its manufacture of cottons. In the year 1800, Houlfman states that the town contained 12 manufactories engaged in this business, and that about 12 000 pieces of cotton were made weekly, each of which contained about 24 pounds of wool. The business was then increasing. Eight houses were also engaged in the linen manufactures, and "several other manufactures of less consequence are carried on. There are likewise a considerable number of persons employed in working and polishing marble, which, in the beauty and variety of its colours, is thought by many to be superior even to that imported from Greece and Italy. Mr. Wakefield manufactures large quantities of gunpowder at his mills a little below the town." The public buildings of Kendal are the church, a large and commodious workhouse, and a bridewell. Near the church is a handsome house called Abbot-hall, the property of sir Alan Chambers, one

of the judges of the court of common pleas. To the east of the town are the remains of a castle, which is supposed to have been built by the first barons of Kendal. It was formerly a place of considerable extent and strength; but its towers and walls are much mutilated and reduced. Parts of two square and two round towers, however, still remain, as well as great part of the wall round the outer baillium. Another object of antiquity is an artificial mound, called by the inhabitants Castle-law-hill. In the town are chapel for Quakers, Methodists, Presbyterians, and Roman Catholics. The chief manufacturers and tradesmen of the town are united into twelve companies, each of which has a hall: viz. Mercers, Tanners, Glovers, Sheermen, Cordwainers, Tailors, Pewterers, &c. Kendal is 22 miles from Lancaster, and 260 N. of London. In the year 1800 it contained 1424 houses, and 6892 inhabitants. Nicholson and Burn's History of Westmoreland, &c. two vols. 4to; and Houfeman's "Descriptive Tour through various Northern Counties," &c. 8vo. 1800.

KENDER, a town of Hindoostan, in Schaurunpour; 10 miles N. of Schaurunpour.—Also, a town of Kurdistan; 28 miles S.W. of Bethis.

KENDRICK'S ISLAND, an island which forms the W. side of Nootka Sound, into which there is an entrance from the W. by Maffachuffet's Sound, along the northern side of the island.

KENDUSKEAG, a river of America, which runs into the Penobscot at the town of Bangor, about two miles below the head of the tide; where is a thriving village of handsome houses, and a place of the greatest trade in the river.

KENDY, a town of Bengal; 50 miles N.N.E. of Ramgur. N. lat. 24 16'. E. long. 85 6'.

KENE'. See CENY' and GHNSA.

KENEF, a town of Persia, in the province of Khorasan; 45 miles N. of Herat.

KENERA, or KENEREE, a mountain on the island of Salfette, near Bombay, celebrated for the number and extent of its excavations. Its principal cavern is arched, in the style of that described under the article KARLY; and was evidently, from its stile of sculpture, a temple of the god Budha, or Boodhi. (See BOODHI.) On each side of the vestibule are standing figures of the god, in easy attitudes, of tolerable proportions, and well sculptured in alto-relievo, fourteen feet high. This cave and three figures are elegantly represented in Daniel's fine series of oriental scenery. See KARLY.

KENFIG, or CYNFIG, a parish of Glamorganshire, South Wales, is noticed in this work, chiefly to correct the errors of other topographical writings; in most of which it is described as a town. Mr. Donovan, in his "Descriptive Excursions through South Wales," describes it as a poor, small village, inhabited mostly by sailors and smugglers, and represents these as being particularly rude and insulting to strangers. A cluster of mean cottages, grouped together, with a church on a ridge of rising ground, constitute this village. In this parish is Kenfig-pool, a lake of fresh water, which "is embosomed in a depression of an irregular form, in the midst of sands that have been apparently drifted upon this spot from the contiguous coast, and though lying within a very short distance of the sea at flood tide, invariably retains its freshness pure and untainted by the maricative properties of the former. The circumference of this pool is estimated at a mile and three quarters. The depth is great in some places. Indeed it has the reputation of being, in many parts, unfathomable." It is traditionally said, that a town formerly occupied this spot, and that it was swallowed

up by an earthquake. At a short distance from this lake, on an eminence, are some ruins, called Kenfig-castle, which was only a small fortress. In 1800, this parish contained 156 houses, and 655 inhabitants.

KENGHEVAR, a town of Persia, on a river which runs into the Karasu; 240 miles N. of Ispahan. N. lat. 34 20'. E. long. 47 10'.

KENJAR, a town of Hindoostan, in Bahar; 30 miles S.W. of Patna.

KENILWORTH, a market town and parish in the hundred of Knightlow and county of Warwick, England, is famed in the annals of the kingdom for its ancient castle, "which," says Dugdale, "was the glory of all these parts, and for many respects may be ranked, in a third place at the least, with the most stately castles of England." This fortress was built by Geoffry de Clinton in the time of Henry I. He was chamberlain and treasurer to that monarch. By subsequent kings and occupiers it was greatly enlarged and strengthened at different times; and in the various civil and domestic wars of England, it was frequently the object of contention with different monarchs and nobles. To detail such particulars would be foreign to the nature of this work; but the reader may find much curious and interesting information relating to the fame, in Dugdale's "Antiquities of Warwickshire." What remains of the building's flew that the whole was an immense and spacious pile: consisting of an outer wall with baillium towers, a tilt-yard, with towers at each end; and several buildings within the baillium, or bafecourt. The area within the walls consists of seven acres. There were four gatehouses, and the walls were from ten to fifteen feet in thickness. At a short distance from the castle was a priory for Black canons. Of the buildings, parts of the gateway and chapel remain. Near these is the parish church, the western door-way of which is a curious specimen of ancient architecture. In the town are two meeting-houses, or chapels. Kenilworth is five miles from Warwick, and five from Coventry. In 1800, the town contained 418 houses, and 1968 inhabitants. Dugdale's Antiquities of Warwickshire.

KENKRI, a town of European Turkey, in Livadia; 40 miles W. of Athens.

KENKS, in the *Sea Phrase*, are doublings in a cable or rope, when it is handed in or out, so that it does not run smooth, or when any rope makes turns, and does not run smooth and clever in the block, they say it makes kenks.

KENMARE TOWN, called *Naden*, in *Geography*, a post-town of the county of Kerry, province of Munster, Ireland. It is situated at the north-east extremity of an extensive river or bay on the Atlantic ocean. Kenmare is 155 miles S.W. from Dublin, and 12 miles S. from Killarney.

KENMARE RIVER, a river or arm of the Atlantic ocean, on the coast of Ireland, which extends about 20 miles in length, and about three in breadth, situated at the south-west side of the county of Kerry. It affords a safe and capacious harbour, but little frequented. The mouth is situated in N. lat. 51 40'. W. long. 9 57'

KENNEBECK, a river of America, which, next to Penobscot, is the finest in Maine. Three miles from the mouth, the waters of the river are divided by Swan island, seven miles in length; on both sides of which they are navigable: at the distance of 38 miles from the sea is the island Nahunkage, signifying the land where eels are taken. Within three miles of this island, a small river, issuing from ponds in the town of Wintthrop, runs into the Kennebeck, and it is known by the Indian name Cobblecoteage, denoting the place where furgeons are taken. Six miles higher is the head of the navigable waters, which is a

balon four miles from the sea, and commodious for the anchorage of vessels. Where the navigation terminates stands Fort Western, erected in 1752. From this fort to Taconnet Fall is a distance of 18 miles. On the eastern side of the river near the fall is Fort Halifax, erected in 1754, situated on the point of land where the Sabattacook makes an addition of one-third to the size of the Kennebeck. Thirty miles above Halifax fort Sandy river flows into the Kennebeck; and about 40 miles higher, the Kennebeck takes a S.W. course; and 50 miles from Halifax fort it receives the eastern branch. The main branch of the Kennebeck, in its course through the wilderness, forms several carrying places or portages. At about 100 miles distance from the mouth of the eastern branch, the source of the main or western branch extends to a great distance along the side of the Chaudiere, which carries the waters from the highlands into the St. Lawrence. The eastern branch issues from a body of waters which lie N., about 20 miles from the confluence of the two branches. These waters are called Moose pond, or lake. The sides of the lake are very crooked, so that it forms an irregular figure, containing three times as much water as Lake George. To the N. and W. of the lake are high mountains, from which waters run by many channels to the St. Lawrence. The Kennebeck affords great quantities of lumber, and is inhabited, at different seasons, by several species of valuable fish; particularly salmon and sturgeon, shad, and alewives. This river forms the nearest sea-port for the people on the upper part of the river Connecticut. From the Upper Cohos, or Coos, on the latter river, to the tide water in Kennebeck, is a distance of 90 measured miles.—Kennebeck is also a county in the district of Maine, and the first inland county erected in this district. It was separated from the maritime county of Lincoln, by which it is bounded on the S., by Hancock county on the E., by Cumberland on the W., and by the Highlands on the N. It was incorporated in February 1799, and derives its name from the river, which, passing through it, divides it nearly in equal parts. It is about 40 miles wide and upwards of 100 miles long. The soil is better and more easily cultivated than that on the sea-coast. It contains 24,402 inhabitants.

KENNEBUNK, a river of Maine, having at its mouth a good harbour, whence great quantities of lumber are shipped. This river divides the townships of Wells and Arundel. After running a short course, it discharges itself into the sea between Capes Porpoise and Neddick.—Kennebunk is also the Indian name of the place, since called Wells, in Maine, about 33 miles below Portsmouth, in New Hampshire; in which is a post-office.

KENNEDY'S CREEK, a river of Kentucky, which runs into the Ohio, N. lat. 58 30'. W. long. 83 36'.

KENNEL, a term used indifferently for a puddle, a water-course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves.

Among sportsmen, a fox is said to *kenel*, when he lies close in his hole.

On a presumption that a kennel for hounds is to be erected, its site is thus described by Somerville:

“ Upon some little eminence erect,
And fronting to the ruddy dawn; its courts
On either hand wide opening to receive
The sun's all cheering beams, when mild he shines
And gilds the mountain tops.”

However, this selection of a high situation is incompatible with a running brook; and as these two advantages cannot be united, water is to be preferred, with the aspect to

the morning sun as much attended to as possible. The number of its inmates will regulate the size of the kennel, and the architecture should be neat without being uselessly expensive. The most magnificent is the duke of Richmond's, at Goodwood, which cost 19,000*l.* and is sufficiently extensive for two packs of hounds. The building comprises five kennels; two 36 by 15; three 30 by 15; and two feeding rooms 20 by 15 feet, with floves for warming the air when too cold. The huntsman and whipper-in have each a parlour, kitchen, and sleeping room. The kennel should be near the house, that it may be duly inspected; as cleanliness is no less essential than food. There should be room for two kennels under the same roof, for the convenience of keeping both clean, and for removing the hounds from one to the other, when they are washed. Besides, a second kennel will afford opportunity for drafting the hounds that are intended for hunting the next morning. Hounds will soon learn to answer to their names, and in drafting them, they may be easily counted into the hunting kennel. When the feeder first enters the kennel in the morning, he should let the hounds into the outer court; and the lodging room should be then thoroughly cleaned, the windows and doors opened, the litter well shaken, and the kennel be made sweet, before the hounds are again shut into it. The lodging room should be bricked, and sloped on both sides to the centre, and a gutter should be provided for carrying off the water, so that the floor, when washed, may be soon dried. It should be recollected, that nothing is more hurtful to hounds than damp, or more refreshing than warmth, after hard work. The kennel should have three doors, two in front and one behind; the latter having a lattice window in it with a wooden shutter, which is to be always kept closed, except in summer, when it should be left open during the whole of the day. The large centre window should have a folding shutter, which at night, according to the weather, may be wholly or partially closed, and thus the warmth of the kennel may be regulated according to circumstances, and as it may be judged necessary. The two great lodging rooms are exactly similar, and having a court belonging to each, are distinct kennels, situated at the opposite ends of the building; in the centre are the boiling house and feeding yard; a lesser kennel, either for hounds that are drafted off, or those that are sick and lame, or for any other necessary purpose, is on each side; at the back of which, as it is but half the depth of the two larger kennels, are places for coals, &c. for the use of the kennel. There is also a small building in the rear for hot bitches. The inner court floors should be bricked or flagged, and sloped towards the centre, like those of the lodging rooms; and water brought in by a leaden pipe, should run through the channel in the middle. In the centre of each court is a well, large enough to dip a bucket to clean the kennel; to keep these from wanting repair, they should be faced with stone; to that of the feeding-yard a wooden cover should be fixed. The benches, which must be open to let the urine through, should have hinges and hooks in the wall, that they may fold up when the kennel is washed; they should be made as low as possible, that when a hound is tired, he may have no difficulty in jumping up, and at no time be able to creep under. A large brick court in front, having a grass court adjoining, and a brook running through the middle of it, completes the kennel. This court should be planted round, and also have lime and horse-chestnut trees near the centre for shade; some pots bound round with straw rubbed with galbanum, may be placed to prevent the hounds urining against the trees. The brook may be used as a cold bath for hounds lamed in the stile, and strained. A high pale should inclose the whole, which, to the height

of four feet, should be close, the other open two inches wide. At the back of the kennel should be a thatched house, fenced up at the sides, to contain at least a load of straw; a pit for receiving the dung, and a gallows for the flesh. If a piece of ground adjoining the kennel can be inclosed for such dog-houses as may be brought alive, it will be very serviceable, as the disorders of condemned horses are not always to be discovered, and may be dangerous to others; the hounds may also be brought into this field to employ themselves after feeding; and the draft for the next day's hunting can here be more accurately made than when they are confined in the kennel. Stoves are used in some kennels; but a good feeder, and the mop properly applied, render them needless. Should ticks at any time be troublesome, the walls of the kennel should be well washed; and if they are not thus destroyed, the walls should be white-washed. When the hunting season is over, one kennel will suffice; the other, with the adjoining grass-yard, may be allotted to the young hounds. If there be convenience, the dogs should be kept separate from the bitches during the summer months. When hounds are very riotous, the feeder may sleep in a cot in the adjoining kennel, and if they be well chastised at the first quarrel, his voice will be sufficient afterwards. A feeder in Oxfordshire pulls a bell, the meaning of which he has taught the hounds to understand; and it silences them immediately, without his having the trouble to leave his bed. The farther removed a kennel is from a road or pathway, the quieter will it be. The interior regulations of a kennel comprehend the feeder, the sorts of food, and the mode of preparing and adapting it to the appetites of the hounds. A good feeder, young, active, industrious, and good-tempered, is essential. The exquisite sense of smelling peculiar to the hound, being that on which the sport principally depends, should be carefully preserved; and nothing so much contributes to this purpose as cleanliness. It is, therefore, of the greatest importance that the kennel should be kept clean and sweet. The heartiest and best food for hounds is oatmeal; which should be preserved in bins or sugar hogsheads; for the older the meal is the better. The boiler should be of cast iron; and in size proportioned to the number of hounds in kennel. The flesh should be thoroughly boiled, and taken out of the broth with the strainer, before the oatmeal is put into it. After about three quarters of an hour's boiling, the liquor may be taken off and left to cool, which will soon become a strong jelly, and for hunting hounds it cannot be too compact. Five or six pecks of good old oatmeal will thicken a boiler of broth, sufficient for two feeds for 20 couple of hounds. The meat should never be given to the hounds too hot. The feeding troughs should be wide at bottom and have wooden covers; nor should they be made too long, as they are less convenient for being moved. After all, great attention to the time and mode of feeding will be required on the part of the kennel husbandman. He should be accustomed to call each hound by name, when he is fed; when a hound is called, he should approach the huntsman, and when he is touched with a stick, he should follow any where. By thus using hounds to their names, they will learn obedience. The day before hunting the hounds should be fed at eight in the morning, and three in the afternoon. Those that are to hunt the next day should be drafted into the feeding-yard, when about three buckets of thick mixed oatmeal is prepared for them; and the tender and bad feeders should have a handful of boiled flesh given to them afterwards. If hounds be low in condition, and have far to go to cover, they may all have a little thin lap agin in the evening; but this should never be given, if you hunt early. Hounds should be sharp set before hunting, as in this state they run

the better. During the hunting season, hounds should have one pound of sulphur given them in their meat, and when the season is over, half a pound of antimony should be added to the sulphur and well mixed with the meat. Greens boiled in their meat, once a week, are likewise proper. A horse killed and given to hounds whilst warm, after a very hard day, is an excellent meal; but they should not hunt till the third day after it. The bones broken are good for poor hounds; sheep-trotters are very sweet food; and bullocks' paunches may also be of service, in the scarcity of horse-flesh. Immediately when hounds return from hunting, they should be fed; and if they have had a severe day, some hours after they should be fed again. By turning them out from the lodging-house to be fed, they will be refreshed, and stretch their limbs; and besides the litter being shaken up, and the kennel cleaned out, they settle themselves better on the benches afterwards. At all times after being fed, the hounds should be turned into the grass-court to empty themselves; as this practice will not a little contribute to the cleanliness of the kennel. Hounds should be shut up warm at night after hunting. Daniel's Rural Sports, vol. i. See HOUNDS and HUNTING.

KENNERLY, in *Geography*, a small island near the coast of Malabar, surrounded with a wall and towers. N. lat. 18 42.

KENNET, a river of England, which rises near a village of the same name in Wiltshire, passes by Marlborough, Hungerford, and Newbury, whence it is made navigable to the Thames, which it joins a little below Reading. See CANAL.

KENNET, a township of America, in Chester county, Pennsylvania.

KENNETT II., in *Biography*, king of Scotland, succeeded his father Alpin in 823. He made war upon the Picts, and subdued their dominions in the north, which he divided among his soldiers. He translated the stone chair to Seone, where his successors were crowned, till it was removed by Edward I. He died in the year 854.

KENNETT III., son of Malcolm, subdued the Britons of Strathelynd, and was equally successful against the Danes, who had invaded his dominions, but attempting to alter the succession of his crown in favour of his family, he was assassinated in 994.

KENNETS, in our *Old Writers*, a sort of coarse Welsh cloth, mentioned in the stat. 33 Hen. VIII. c. 3.

KENNETS, in a *Ship*, are small pieces of timber, nailed to the inside of the ship, into which the tacks and sheets are belayed (as they call it), *i. e.* fastened.

KENNETT, WHITE, in *Biography*, a learned English prelate, son of the R. W. Basil Kennett, rector of Dinchurch, in Kent, was born at Dover in the year 1660. He received the early part of his education in the country, and made such progress in classical learning, that upon his being removed to Westminster, he was admitted into the upper school. Immediately after his admission he fell sick of the small pox, which obliged him to wait another year before he could be received into the school. During this period he undertook the office of tutor to a gentleman's son in the neighbourhood. He entered himself at Oxford in 1678, and went through the studies and exercises of the place with great reputation. While he was an under-graduate, he was introduced to the acquaintance of Anthony Wood, and employed by him in collecting epitaphs, and other notices of eminent men, who had been members of Oxford. Mr. Kennett was particularly attached to the several branches of polite literature, connected with antiquities and history. But his career as an author commenced in the publication of a political tract while he was under-graduate, entitled "A Letter from a Student at Oxford

Oxford to a Friend in the Country concerning the approaching Parliament in Vindication of his Majesty, the Church of England, and the University." It was written in defence of court measures, and supported principles which he renounced in his maturer years. The Whig party in parliament were so much offended with it, that enquiries were made after the author, in order to get him punished, but the sudden dissolution of parliament preserved him from the effects of their resentment. Mr. Kennett took his degree of B.A. in 1682, and in the following year he published an English translation of Erasmus's "Moris Encomium;" entitled "Wit against Wisdom, or a Paegyric upon Folly." He entered into holy orders about the year 1684, and in the following year he was presented to the vicarage of Amerden, in Oxford, by Sir William Glymme, to whom he dedicated "An Address of Thanks to a good Prince, presented in the Panegyric of Pliny upon Trajan, the best of Roman Emperors." Mr. Kennett distinguished himself by preaching against Popery, though he did not engage in the famous Popish controversy. While he was out on a shooting party, he received a dangerous wound on his head, which obliged him to undergo the operation of trepanning: he, however, soon recovered, and was chosen lecturer at St. Martin's, Oxford: he was likewise chosen tutor, and vice-principal at Edmund Hall, where he lived in terms of friendship with the principal Dr. John Mills, who was at this time employed in preparing for the press his celebrated edition of the New Testament. In 1693, he obtained the rectory of Shotelbrook, in Derkshire, and, in 1695, he commenced D.D., and in the following year was presented to the living of St. Boltolph, Aldgate, having been already appointed arch-deacon of Lincoln. In 1701 he engaged in a controversy on the rights of the convocation against Dr. Atterbury. In 1705, upon the advancement of Dr. Wake to the see of Lincoln, Dr. Kennett was appointed to preach his consecration sermon; which was published at the desire of the archbishops and bishops, and was greatly admired by lord chief justice Holt, who declared that it contained more to the purpose of the legal and Christian constitution of the church of England than any volume of discourses. In 1707 he was made dean of Peterborough, but he was growing very unpopular on account of his Whig principles and his opposition to Dr. Sacheverell: nevertheless, in the same year, he was allowed to exchange his living in Aldgate for the rectory of St. Mary Abchurch, in order that he might have more leisure for study and retirement. The zeal which dean Kennett displayed in opposition to the claims of the high church clergy, and the sentiment of moderation which he discovered towards the Dissenters, as well as his attachment to the Protestant succession, and the interests of civil liberty, rendered him very obnoxious to the Tories, who took every method in their power to expose him, one of which was devised by Dr. Wilton, rector of Whitechapel, who was afterwards deprived of his living as a nonjuror. This clergyman presenting a new altar-piece, representing the Last Supper, to his church, caused the figure intended for Judas Iscariot to be drawn as a likeness of the dean of Peterborough, with a black patch on his head, similar to one which Dr. Kennett wore on the wound which he had formerly received. It was soon known for whom the caricature was intended, and people came in crowds to see it. But by all moderate people of both parties, it was regarded as an insolent and profane prostitution of what was intended for the most sacred uses, and the bishop of London, without any interference on the part of the dean, ordered it to be taken down. After the accession of king George I., and when a rebellion was breaking out in Scotland, he preached with the utmost boldness in defence of the present settlement of the government of the

house of Hanover: he used to say, he was ready to live or die in defence of the glorious principles of the Revolution, and that he would go out to fight, when he could no longer preach in defence of them. He warmly opposed the proceedings in the convocation against Dr. Hoadly, bishop of Bangor, on whose side he was deeply engaged in the dangerous controversy. His zeal in the cause of civil and religious liberty was, in the year 1718, rewarded by the bishopric of Peterborough, which he enjoyed ten years. He died in 1728, in the sixty-ninth year of his age. His principal works are, 1. "The Life of William Somner," which was prefixed to Mr. Brone's edition of the famous antiquary's "Treatise of the Roman Ports and Ports in Kent." 2. A collection of English historians, under the title of "The Compleat History of England," in three vols. folio, the last of which was written by himself. 3. "Historical Account of Appropriations." Bishop Kennett sustains a considerable rank in the episcopal order for learning and abilities. He was deeply read in English history and antiquities, though he was by no means deficient in that kind of knowledge which was the more immediate business of his profession. He was anxious to discharge the duties of his ministerial functions with credit to himself, and advantage to those who were the immediate subjects of his pastoral care; nor did the high rank to which he attained lead him to neglect the duties of a parish-priest. He was accessible and communicative, a true friend, as well as an admirable pattern to his clergy; and those of them who distinguished themselves either by their learning, or by a zealous discharge of their parochial duties, were sure of his respect and encouragement.

KENNETT, BASIL, younger brother of the above, was born at Polling, in Kent, in 1674, and educated at Corpus Christi college, Oxford. In 1690, he published "Romæ Antiquæ Notitia, or the Antiquities of Rome," a work that for a century was generally used in our classical schools. In the following year he gave to the public "The Lives and Characters of the Ancient Greek Poets;" and he was about the same time elected a fellow of his college, and entered into orders. He was author likewise of "An Exposition of the Apostles' Creed, according to Bishop Pearson," and "An Essay towards a Paraphrase on the Psalms in Verse, with a Paraphrase on the third Chapter of Revelations." In 1706, he was appointed chaplain to the English factory at Leghorn; in this office he conducted himself with so much prudence and propriety that he acquired universal esteem, even from the Catholics, who had used every effort to prevent his officiating in that capacity. In 1714, he returned to England, and commenced D.D., but died in a few months afterwards. A volume of his sermons, prepared for the press during his life, was published in the year 1715. Biog. Brit.

KENNICOTT, BENJAMIN, a learned English divine, and oriental scholar, was born at Totness, in Devonshire, in the year 1718. His father was master of a charity-school in that place, and the son succeeded to the employment at a very early age. While in this situation his talents were discovered, and a subscription entered into, in order to procure him the advantages of an academical education. He accordingly was entered of Wadham college, Oxford, where he soon distinguished himself in that department of study in which he afterwards became so eminent. He commenced his career as an author while he was an under-graduate, by publishing two dissertations; the first "On the Tree of Life in Paradise, with some Observations on the Fall of Man;" the second "On the Oblation of Cain and Abel." This work procured the author the extraordinary honour of having the degree of B.A. conferred on him by the university a year before

before the statutable period; and likewise was the means of obtaining for him a fellowship of Exeter college. When he was of a sufficient standing, he took the degree of M.A. and about the same period he was admitted to holy orders. In the year 1753, he laid the foundation of his great work, by publishing "The State of the Hebrew Text of the Old Testament considered; a Dissertation in two Parts, &c." The design of this publication was to overthrow the strange notion which had long prevailed among divines concerning what is called the integrity of the Hebrew text; viz. that the copies of it had been preserved absolutely pure and uncorrupt. This notion had been thrown out and vindicated by Capellus, but though his arguments were supported by the authority of the Samaritan Pentateuch, that of parallel passages, and the ancient versions, yet as he had no opportunity of consulting MSS. he could never prove his point. This talk was referred for Mr. Kennicott. His dissertation proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally supposed to agree with each other, and with the printed Hebrew text, yet contained numerous and important various readings, and that from these considerable authority was derived in support of the ancient versions. This work was examined with great severity, both at home and abroad: many excellent and learned Christians imagined that it was opening wide a door to infidelity, and that the cause of their holy religion would be much injured by it; but by the generality of learned and candid biblical scholars, both natives and foreigners, its value was fully appreciated, and they were led to form high expectations of the author's future labours in the service of sacred criticism. Mr. Kennicott spent the next three or four years principally in searching out and examining Hebrew MSS. In 1759, he was presented to the vicarage of Culham, in Oxfordshire, and in the following year he published his "State of the printed Hebrew Text of the Old Testament considered." In this volume he vindicated the authority and antiquity of the Samaritan copy of the Pentateuch;—proved that the present Chaldee paraphrase has not been taken from MSS. so very ancient as has been generally supposed, and that it has been, in some cases willfully, altered in conformity to the Hebrew text, where that text itself had been corrupted;—appealed to the sentiments of the Jews themselves on the subject of the Hebrew text, and gave a history of it from the close of the Hebrew canon, down to the invention of printing, and presented an account of all the Hebrew MSS. then known, with a collation of eleven Samaritan MSS., and a particular catalogue of 110 Hebrew MSS. in Oxford, Cambridge, and the British Museum. Mr. Kennicott now published proposals for collating all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring as many collations of foreign MSS. of note, as the time and money he should receive would permit. In this undertaking he was supported with the most liberal subscriptions from persons of all parties, and of the very highest ranks in society, and he bent his whole powers to complete the very arduous undertaking. While he was proceeding in the work he was appointed keeper of the Radcliffe library; admitted to the degree of doctor of divinity; presented to a living in Cornwall, and rewarded by a canonry of Christ-church, Oxford. In the year 1776, Dr. Kennicott published the first volume of his Hebrew bible, and in the year 1780 the second volume, which completed the design, made its appearance. To the whole was prefixed a general dissertation, giving a full history of the nature of the design, and of the benefits likely to result from it. The various readings which are inserted in it are the result of a collation of six hundred

MSS. Such a work, and so important to the best interests of mankind, reflects very high honour on the country in which it was first patronized and carried into execution. Within two years of his death, Dr. Kennicott resigned his living in Cornwall, from conscientious motives, on account of his not having a prospect of ever again being able to visit his parish. No one, however, capable of appreciating the doctor's labours, can doubt that they might properly have entitled him to retain this preferment; and his conduct, so signally disinterested, deserves to be recorded and celebrated. He died at Oxford on the 18th of September 1783, at the age of sixty-five. At the time of his death he was employed in preparing for the press "Remarks on select Passages in the Old Testament," which were published as a posthumous work, accompanied by eight sermons, partly critical and partly practical. In private life, Dr. Kennicott sustained the character of a liberal, worthy, and friendly man: in company he appeared unaffected, good tempered, and cheerful. *Encyc. Brit. Monthly Review, and New Ann. Register.* For a particular account of Dr. Kennicott's laudable undertaking, see the article *Hebrew BIBLES*.

KENNINGTON, in *Geography*, an extensive and populous hamlet, annexed to the parish of Lambeth, Surry, England. The manor formerly belonged to the duchy of Cornwall, and was provided with a palace, which was occasionally occupied by Edward the Black prince, and Henries IV., VI., and VII. On a common or open piece of ground the convicted felons of Surry were formerly executed: around this spot several rows of houses and streets have been recently built: and Kennington may now be considered as constituting a part of the British metropolis. Lysons's *Environ. of London*.

KENNIS, in *Biography*, a performer on the violin, with an uncommon power of execution. See *LOUVAIN* and *CARILLONS*.

KENNOMICK, GREAT, in *Geography*, a navigable river of America, in the N.W. territory, which empties itself into the S. end of the lake Michigan, N. lat. 42 14' W. long. 86 52'. The waters of this river communicate, by a portage of 30 yards, with Little Kennomick, a short river which runs north-easterly into this lake.

KENPOU, a river of Thibet, which runs into the Sampo, in the kingdom of Ava.

KENRICK, WILLIAM, in *Biography*, the son of a citizen of London, was brought up to a mechanical employment, which he soon abandoned, and devoted himself to the cultivation of letters, by which he supported himself during the remainder of life. He was some time a student at Leyden, and, upon his return to England, he appeared as a poet, in "Epistles Philosophical and Moral." He wrote an avowed defence of infidelity while in prison for debt, and with a declaration, that he was less ambitious of the character of a poet than of a philosopher. He was for a considerable time a writer in the *Monthly Review*, but having a disagreement with Mr. Griffin he began a new review of his own. He published, in a few days after the appearance of Dr. Johnson's edition of Shakspeare, a review of it, "in which the ignorance or inattention of that editor is exposed, and the poet defended from the persecution of his commentator, 1765." In the year 1766, he produced a comedy, entitled "Falstaff's Wedding," at first intended to have been given to the public as an original play of Shakspeare, retrieved from obscurity; and it was admitted to be a tolerably good imitation of the great master of drama. Mr. Kenrick was continually involved in disputes, many of which were not creditable to his character. He translated the *Emilius and Eloiſa* of Rousseau, and Millot's *Elements of the History of England*.

England. He was likewise the author of several dramatic performances, and other miscellanous pieces. He was, in 1774, the editor of "The Poetical Works of Mr. Robert Lloyd," in two vols. 8vo. He died in the month of June 1777. *Esq.* B. 71.

KENSINGTON, in *Geography*, a pleasant and populous village in the hamlet of Oldulton, England, is about one mile and a half W. of Hyde-park Corner, and consisted, in 1803, of 1433 houses, which were occupied by 8556 inhabitants. This place is chiefly noted for its royal palace, which was first appropriated to the crown by king William III. who built a house here; but that and the gardens have been much altered and improved by succeeding monarchs. The gardens are of considerable extent, and are laid out in gravel walks, plantations, &c. This is a favourite place of resort and exercise for the inhabitants of London, particularly during the fine weather in summer. They are nearly four miles in circumference, and are separated, on the eastern side, from Hyde-park by a low wall. Through these gardens flows a small stream, which is made to flow east within the inclosure, and another much larger, called the Serpentine river, in Hyde-park. The palace is a fine irregular edifice, built at various periods, without harmony of design or beauty of architecture. Its five rooms consist of a suite of 12 apartments, which contain several valuable and curious paintings by artists of eminence. The names of some of these are published in *Walpole's Environs of London*; and more fully in "The Ambulator," 12mo. 1810. Besides several elegant villas in this parish, is a fine ancient mansion called Holland House, the seat and property of lord Holland, for a view and account of which, see *Architectural Antiquities of Great Britain*, vol. ii.

KENSINGTON, a township of America, in Rockingham county, New Hampshire, about six miles S. of Exeter, and eight N. of Newbury port. It was incorporated in 1737, and contains 776 inhabitants.

KENT, a maritime county of England, forms the south-eastern extremity of this island, and is bounded on the west by Surry, on the north by the German ocean and the river Thames, which separates it from Essex, on the east by the Downs and the Straits of Dover, and on the south by Suffex, and part of the same Straits. The medium length of the district, thus encompassed, from east to west, is 66 miles, and its breadth about 26, whilst the circumference is nearly 174 miles. Its area, according to *Boys's Agricultural View*, is about 832,000 acres.

Kent is primarily divided into five large districts, called *Leats*, viz. Sutton at Home, Aylesford, Scray, Shipway, and St. Augustin. These are subdivided into bailiwicks, hundreds, and liberties. The whole county contains fourteen bailiwicks, sixty-three hundreds, fifteen franchises or liberties, the two cities of Canterbury and Rochester, and thirty-four market towns, though in some of these the market is discontinued. The number of houses, according to the returns under the population act of 1800, amounted to 52,998; that of inhabitants to 307,624; of whom 151,374 were males, and 156,250 females. For local purposes, the county is nearly equally divided into East and West Kent, the former contains the laths of Sutton at Home, Aylesford, and the southern part of Scray; the latter the northern part of the laith of Scray, and those of Shipway and St. Augustin. In each of these great districts, a court of session is held four times every year; twice originally and twice by adjournment; those for the eastern division at Canterbury, for the western at Maidstone. The justices, though appointed for the whole county, generally confine their attention to that district in which they reside. The county

town is Maidstone, where the assizes are held, and the knights of the shire are elected. Elect returns eighty members to parliament; viz. tw. for the county, and two each for Canterbury, Rochester, Maidstone, Quomborough, Dover, Sandwich, Romney, and Hythe. The four last are reckoned among the County Ports. The ecclesiastical jurisdiction is divided between the archbishopric of Canterbury and the bishopric of Rochester; the former having, of them deaneries, 64 and 281 parishes; the latter four deaneries, containing 132 parishes.

Ancient History.—This district is peculiarly interesting to the antiquary, not only from the numerous vestiges of castles, abbeys, and old churches still remaining, but from its proximity to the continent. Many authors conjecture that it formerly joined the main land, by means of an isthmus; and adduce plausible arguments in support of such hypothesis. Strabo, Caesar, Ptolemy, and some other ancient writers, call this district Cantium; which word the Saxons altered to Cant-guar-Cantid. In the Domesday Survey it is written Cheeth. All the transactions relating to Caesar's invasion of Britain occurred in this county; for on this coast he made two descents, the 1st, fifty-five years before the birth of Christ, and the 2d, in the following year. At this time Kent was governed by four British kings; who collected not only their own subjects, but a vast concourse of armed men from the neighbouring states, to oppose and repel the invading Romans. Their efforts and bravery were unavailing, and the foreign warriors ultimately compelled the Britons to pay an annual tribute. In the year A.D. 43, a third descent was made on this coast by Anlus Plautius, who, being afterwards joined by Claudius, effected a conquest over the Britons. Kent was now included in that division of Britain called Britannia-Prima; and was governed by Roman laws and Roman officers. Several permanent stations and temporary encampments were established in this county; and military roads were formed. Among the latter was the Watling street, which extended from Dover, Dubris, to London, Londinium. On its course were the other Roman stations of Durovernum, at Canterbury, Durolevum, Durobrivis, at Rochester, Vagniacæ, and Novionagus. Two other vicinal roads, at least, were formed in this county; one from Durovernum to Regulbium, or Reculter, and the other from the first place to Rutupium, or Richborough. Another road, called Stone-way, extended from Canterbury to Linne, the Roman Portus Lemans.

The first descent of our Saxon ancestors was made in this county, A.D. 449, when Hengist and Horsa, with about 1500 men, landed at Ebsfleet, in the Isle of Thanet. After some battles with the Picts and Scots, Hengist was invested with the sovereignty of Kent; but willing to engross the whole island, he was involved in a war with the Britons, and several battles were fought within this county and on its confines. The Saxons, however, prevailed, and Kent continued a distinct kingdom for many reigns. In this county Christianity was first established in Britain. See *St. AUGUSTIN*, and *Turner's History of the Anglo-Saxons*, 2 vols. 4to.

The present flourishing condition of Kent has partly originated from the peculiar custom by which the descent of landed property is here regulated, and which is comprehended under the term *gavel-kind*. The customs are of very remote date, and prevailed throughout England till the Norman conquest. It is evident that at that period the eldest son did not inherit to the exclusion of his brethren; the right of sole succession, in preference to the divisible practice of inheritance, was then introduced by the Conqueror, as a specimen of the arbitrary dominion he intended to establish. The men of Kent successfully resisted the encroachment, and retained their ancient customs: while the other parts of the

nation were gradually brought to acquiesce in the claim of primogeniture.

The law of gavel-kind comprehends the joint inheritance of all the sons to the estate of the father; and should the father survive his sons, the inheritance devolves to his grandsons, or to his daughters. The partibility of this custom is not restrained to the direct line of consanguinity; for all brothers may jointly inherit the estate of a deceased brother; and, agreeably to the same rule, nephews and nieces, by the right of representation, are, in their degrees, intitled to the same division of property. So predominant is gavel-kind in Kent, that all lands are presumed to be subject to that usage, till the contrary is proved; and formerly, such lands only were exempted from it, as were holden by knight's service. See GAVEL-KIND.

The general aspect of Kent is very beautiful; arising from the inequality of the surface, the diversity of the scenery, and the variety in the verdure. "The whole county," Mr. Haught observes, "excepting the marshes and the Weald, is a general cluster of small hills; two chains of which, higher than the rest, run through the middle of Kent, from west to east, in general at about eight miles distance from each other, (though at some places much less), and extending from Surrey to the sea." These are called the Upper and Lower Hills, and are mostly covered with coppice and woodlands. The northern range, and, indeed the whole north side of the county, is composed principally of chalk and flints, as well as a large tract on the eastern coast: the southern range is chiefly of iron-stone and rag stone: to the westward, clay and gravel prevail on the eminences.

Mr. Boys, in the Agricultural Survey of this county, has divided it into eight districts, according to the nature of the soil and produce: these respectively comprehend the Isle of Thanet; the upland farms of East Kent; the rich flat lands in the vicinity of Faverham, Sandwich, and Deal; the hop-grounds, &c. of Canterbury and Maidstone; the Isle of Sheppey; the upland farms of West Kent; the Weald of Kent; and Romney Marsh. The Isle of Thanet forms the north-eastern angle of Kent, from the main land of which it is separated by the river Stour and the water called the N-thergong; its length is about nine miles, and its breadth about five. This district is in a very high state of cultivation, and of very remarkable fertility; its soil, though originally a light mould on a chalky bottom, having been greatly improved by the inexhaustible store of manure supplied by the sea. The whole soil contains about 3500 acres of excellent marsh land, and 23,000 acres of arable; those of the latter, which border on the marshes, are the most productive; though even the uplands are rendered extremely fertile by the excellent modes of cultivation. The general routine of crops on the lighter soils is fallow, barley, clover, and wheat; but a crop of peas is occasionally introduced instead of the fallow; and sometimes beans in the place of the clover. Where the round-till course is pursued in the rich sandy loam lands, the general routine is beans, wheat, and barley. Canary-seeds are likewise grown here in great quantities, as well as radish, spinach, miltard, cabbage, and other esculent plants for the London markets. The marsh lands are principally applied to the fattening of sheep and cattle. The upland farms of East Kent may be described as including an open and dry tract of land, lying between the city of Canterbury, and the towns of Dover and Deal; and another tract, inclosed with woods and coppice, extending from Dover, by Elcham and Ashford, to Rochester, in length; and from the Isle of Sheppey to Lenham, &c. in breadth. The former tract includes a great variety of soils, scarcely those of any two farms being similar. Stiff clays are principally met with on the tops of

the highest hills about Dover; flinty tracts occur in the valleys in the same neighbourhood, and about Stockbury near Maidstone. The woodlands in East Kent are dispersed chiefly between the great road from Rochester to Dover, and the chalk hill that runs from Folkestone, by Charing to Detling. These furnish the adjacent country with fire-wood, and the dock-yards with timber for ship-building; but the most material part of their produce, is the immense quantity of hop-poles cut out for the neighboring plantations. The wood is generally cut at from ten to fourteen years growth, and its value is estimated by the quantity of hop-poles produced. The rich flat lands in the vicinity of Faverham, Sandwich, and Deal, lie nearly on a level, are extremely fertile, and excellently managed under a general system. They are almost entirely arable; the soils are a rich sandy loam, intermixed with sand, and a stiff wet clay. In the vicinity of Sandwich are many orchards, which in some years produce large quantities of good apples, the greater part of which is conveyed by the coal vessels to Sunderland and Newcastle. The hop-grounds, extending from Maidstone and Canterbury to Sandwich, are very productive, and under a good system of management; though the soils are different, as well as the kind of hops cultivated. The plantations have of late years been greatly increased, particularly in those parts contiguous to Maidstone, Faverham, and Canterbury; the plantations called the City Grounds, extend through a circuit of two miles and a half round Canterbury, and are estimated to include from 2500 to 3000 acres. The hops grown here, and in the grounds running hence to Sandwich, are very rich in quality, and in much request for their great strength; if well managed, they are also of a good colour. These grounds are found most productive, which have a deep rich loamy surface, with a sub-soil of deep loamy brick earth; and this kind of land forms the principal part of the plantations of East Kent; though there are some good grounds where the surface is very flinty. The produce is subject to great fluctuation; in some years amounting to fourteen or fifteen hundred weight per acre; in others not exceeding two hundred. In drying hops, a small quantity of brimstone is sometimes used, in order to suffocate the insects, and occasion a more speedy evaporation of the superfluous moisture: by the use of the sulphur, the hops are thought also to be improved in colour. In the plantations of Maidstone, and its vicinity, very great crops of hops are grown; but they are inferior in quality to those of Canterbury and East Kent. The soil is what is locally termed stone flatter; that is, where there is a mixture of small pieces of stone and sand: the sub-soil is called Kentish rag, and burns into good lime. The hop plantations afford employment to great numbers of the poorer classes, not only of this, but of other counties; and the motley groups that assemble to assist in hop-picking are truly amusing. Hops are generally regarded as having been introduced into this country about the time of Henry VI.; and in the year 1428, they were petitioned against as *wicked weed*. This, however, can only refer to the use of them, for they are found wild in almost every part of Britain. They came into more general use in the reigns of Henry VIII. and Elizabeth. Nearly one-fourth of the whole produce of the hop-duty in England, is paid from the plantations of East Kent. Besides the hop-grounds, the neighbourhood of Maidstone is celebrated for apples, cherries, and filberts; many small fields, of from one to fifteen acres, being planted with different species of these kinds of fruit; it is also a common practice to plant hops, apples, cherries, and filberts, all together. The apples intended for cyder, are generally gathered towards the end of October, and after being laid in heaps to ripen, under cover, are manufactured for use.

In plentiful years the cyder fruit falls for fourteen-pence per bushel. The apples appropriated for domestic uses are sold to the fruiterers, who send them to London by the hoys, or to the north of England by the coal vessels. The cherries, which are of the white and black heart, Hertfordshire-black, red, and Flemish or Kentish kinds, are usually sold to higglers, who retail them on the sea-coast by the sieve or basket, containing forty-eight pounds each; or else they are sent by water to London, and consigned to the fruit-factors. The filberts are mostly disposed of in the same manner. The Isle of Sheppey is separated from the rest of Kent by an arm of the sea, called the Swale, which is navigable for vessels of 250 tons burthen. Its length is about eleven miles, and its breadth eight; four-fifths of it consisting of marsh and pasture lands; the remainder is arable. The prevailing soil is a deep, strong, stiff clay, through which the plough can hardly be forced. The upland farms of West Kent include a great variety of soils, and are cultivated under various systems of husbandry. This district is more inclosed than the eastern part, and produces greater quantities of timber and underwood, particularly on the upper or westernmost side. The waste and common lands of this district form an extent of many thousand acres. The turnpike roads are mostly in good condition; but the cross roads of West Kent are frequently impassable for carriages. The Weald of Kent is a considerable and remarkable tract, stretching along the south side of the county, from Romney Marsh, to Surry; on the north it is bounded by the range of hills which enter the county near Well-street, and extends, in nearly a due westerly direction, to Sutton and Egerton, and thence south-eastward to Hythe; on the south it stretches to the confines of Sussex, and includes the Isle of Oxney. This district was in ancient times an immense wood or forest; wholly destitute of inhabitants, excepting swine and deer. By degrees, however, it became peopled, and is now every where interperfed with towns and villages; though it still contains some extensive and flourishing woodlands. Its present name is Saxon, and signifies a woody country; but the Britons called it *Cott Andred*, the great chafe or forest. The whole was a demesne of the Saxon kings; and there are still certain privileges annexed to the possession of the lands, which induce the proprietors to contend for being within its limits. "It is said," Mr. Hasted observes, "that within the Weald, the proof of woodlands having ever paid tythe, lies on the parson, to enable him to take tythe of it, contrary to the usual custom in other places, where the proof of exemption lies on the owner; nor are the lands in it subject to the statute of woods; nor has the lord waste within the Weald; the timber growing thereon belongs to the tenant. This latter custom of excluding the lord from the waste, is called *land-pegage*." The Weald, when viewed from the adjoining hills, which command the whole extent, exhibits a most delightful landscape, interperfed with small eminences, highly cultivated, and animated by farm-houses, seats, and villages, promiscuously scattered among towering oaks and other trees. Romney Marsh is an extensive level tract of rich marsh land lying on the southern coast, and comprehending, in itself, about 23,925 acres; but when described, as it frequently is, in connection with Walland Marsh, which adjoins it on the south-west, and Denge Marsh, which connects with the latter on the south-east, it includes about 43,326 acres; Walland Marsh containing 16,439, and Denge Marsh 2912. The whole level, however, is yet more extensive; for Guildford Marsh, which adjoins Walland Marsh on the west, comprehends 3265 acres; most of this latter tract is in Sussex. The beautiful appearance of these levels in the summer season, when the entire surface is clothed with luxuriant ver-

ture, and covered with numerous flocks of sheep and droves of cattle, cannot fail to excite considerable interest in every observer. The Marsh is defended against the violence of the sea by an immense bank of earth, of great strength, called Dimchurch-Wall, which extends above three miles in length. This wall is the sole barrier that prevents the sea from overflowing the whole extent of the level; and as it is for the general safety, so "is it supported," says Hasted, "as well as the three grand sluices through it, which are for the general drainage of the marshes, by scots levied over the whole of it; but the interior drainage, which is portioned out into a number of divisions, called watermgs, is provided with sewers, and maintained at the expence of the respective land-holders, by a scot raised separately on each" in proportion to their own watering. In that portion of the Marshes within this county, are comprehended the two corporate towns of New Romney and Lydd, and sixteen other parishes. The inclosures are principally formed by ditches and a rail fence. The soil of these spacious levels has been almost wholly deposited by the sea, and consists principally of a fine, soft, rich, loam and clay, with a greater or less proportion of sea-sand intermixed. The sub-soil consists of alternate layers of sand and clay, with sea-beach occasionally intervening. In many places throughout the Marsh, at the depth of three or four feet, have been frequently dug up oak leaves, acorns, &c. together with large trees lying in different directions; some across each other; some appearing with the roots to them, as if overturned by a storm, or other convulsion of nature; and others as if cut down with an axe or sharp instrument; and the colour being as black, and the wood as hard, as ebony. These marshes are almost entirely appropriated to the grazing and fattening of sheep and cattle, but chiefly to the former, which are bred and fed here in immense quantities; their number, perhaps, exceeding that of any other district in the kingdom. Romney Marsh has generally been considered as unhealthy; and probably this opinion has operated to keep it thinly peopled. Of late, however, its fanative qualities have been greatly improved; a change attributed to the attention that has been given to keep the ditches free from stagnant and putrid water. The extent and rental of farms in Kent are uncommonly various, as must be evident when the peculiar customs of the county are considered in connection with the diversities of the soils and surface. The number of freeholds in the county is stated, by Mr. Hasted, at about 9000; independent of the large estates of the churches of Canterbury and Rochester, and of various corporate bodies. The copyhold and customary tenants are very few. The general distribution of the freeholds, and their close intermixture with each other, occasion a very frequent intercourse between the gentry and the yeomen, and thus generate that equality of sentiment so favourable to the interests of individual right.

The manufactures carried on in Kent are various, though not particularly extensive. The clothing trade, which once gave employment to great numbers of its inhabitants, is now nearly forgotten in the county. At Canterbury, muslins, broadened silks, and stockings, are made; at Deptford and Whitstable are large copperas works; at Stoner, in the Isle of Thanet, and likewise in the Isle of Grain, salt is manufactured; at Ofspringe is an extensive manufactory for gunpowder, erected by government; and there is also another near Dartford; in the Weald, bordering on Sussex, are various iron furnaces; and at Dartford and Crayford are mills for the manufacturing of iron; at the latter place also, are extensive works for the printing of calicoes, and spacious grounds for the bleaching of lins; at Seven Oaks are large silk mills; and at Boxley, near Maidstone, is the most exten-

tenfive and curious manufacture of paper, perhaps, in Europe; paper is also made in the vicinity of Dartford, and some other places. The various dock-yards at Deptford, Woolwich, Chatham, &c. provide employment for numerous artificers in all the different branches of naval affairs; ship-building is also carried on at other places on the sea-coast.

The religious houses, or monastic establishments, in Kent, were formerly very numerous, and their net annual income, at the periods of their dissolution, amounted to 9000*l*. Among them were two abbeys, three priories, and five nunneries, of the Benedictine order; one priory of the Cistercian; one abbey of the Cistercian; of secular canons, five colleges; of regular canons, four abbeys and five priories, one of which was Premonstratensian; of friars, there was one priory and one nunnery of Dominicans; two priories of Franciscans, one priory of Trinitarians, three priories of Carmelites, and four alien priories: there were also two commanderies of knights hospitallers of St. John of Jerusalem; and fifteen hospitals; besides various hermitages, chantries, and free chapels.

The number of castles that have been erected in Kent is very considerable; and many of them yet remain, in different degrees, almost perfect. Of these, the immense fortrefs of Dover is the principal; and this is now garrisoned with a strong force, as are also several others on the sea-coast; but most of the castles in the interior of the county are dismantled and mouldering into ruins.

The principal rivers that intersect or bound this county are the Thames, the Medway, the Greater and Lesser Stoures, the Rother, the Darent, the Cray, and the Ravenbourne. The Thames, the Tamisis of Cæsar, which has a very important influence on the trade and commerce of this county, will be fully described in its place. (See THAMES.) The Medway, which is more peculiarly a Kentish river, was called *Vaga* by the Britons, a name descriptive of its very sinuous course and mazy wanderings. The Saxons changed this appellation to *Medweg* and *Medwege*, of which the present name is a corruption. This river has four principal sources, of which only one is in this county; two being in Suffex, and the other in Surry. That branch which enters Kent from Surry, rises in Blechingley parish, and having been joined by several rills, flows on to Eaton bridge, Hever castle, and Penshurst, near which it receives one of the branches that rise in Suffex, and proceeds to Tunbridge. A little above this town the river separates into several channels, one of which is navigable and is again joined by the other division about two miles below Tunbridge. At Yalding it receives the united waters of the other two principal branches, and flows in a winding direction to Maidstone, and gradually augmenting in depth and breadth, pursues its picturesque course to Rochester, where the scenery is peculiarly beautiful. Proceeding hence towards Sheerness, it passes Chatham, Upnor Castle, and Gillingham Fort, and flows onward to the Thames, which it enters between the Isle of Grain and Sheppey, having first united its waters to those of the Swale. The Medway, with its numerous tributary streams, is calculated to overpread a surface of nearly thirty square miles in the very midst of Kent. The tide flows almost as high as Maidstone; but at Rochester bridge it is exceedingly strong and rapid; and below that, all the way to Sheerness, a distance of about twenty miles, the bed of the river is so deep, and the reaches so convenient, that many of the largest line of battle ships are moored here, when out of commission, as in a wet dock, and ride as safely as in any harbour in Great Britain. The Medway was first made navigable to Tunbridge about the middle of the last century, under the provisions of an act of parliament passed in the year 1740; though an act had been procured for the pur-

pose in the reign of Charles II. The Greater Stoure has two principal branches, both of which rise in this county; the first at Well-treet near Lenham; the other among the hills between Liminge and Poffling. These streams unite near Ashford; whence the Stoure proceeds to Canterbury, through which it flows in a divided stream, and again unites a little below that city. The Lesser Stoure rises in the vicinity of Liminge, and directing its course northward, has its waters increased by several small rills, and sometimes by a temporary water called the Nailbourn, which, after continued rains or sudden thaws, issues from several springs and forms a strong current. The Rother, formerly called the Lincene, rises at Gravel-hill, in the parish of Rotherfield, in Suffex, and flowing eastward becomes the boundary of this county below Sandhurst and Newenden. The Darent rises on the borders of this county and Suffex, near Wefferham, whence flowing to the north-east, it passes on to Riverhead, where it turns to the north, and flows in that direction to South Darent. The Cray, and the Ravenbourne, are only small streams; the former has its source at Newell, in Oppington parish, the latter rises on Keiton Downs, near an ancient Roman encampment. Hailed's History and Antiquities of Kent, 12 vols. 8vo. Beauties of England and Wales, vol. vii. 1807.

KENT, a county of America, in Maryland, on the east shore of Chesapeake bay, bounded E. by Newcalle, and part of Kent county, Delaware, and W. by Chesapeake bay; about 32 miles long, and 13 broad; containing 11,771 inhabitants, including 4,474 slaves. Its chief town is Chestertown.

KENT County, in Upper Canada, extends northward to the boundary line of Hudson's bay, including the whole territory to the westward and southward of that line, to the utmost extent of the country known by the name of Canada.

—Also, a county of Rhode island, lying S. of Providence county, on the W. side of Narraganset bay; 20 miles long and 10 broad; divided into four townships, and containing 8,487 inhabitants.—Also, the middle one of the three counties of Delaware; 40 miles from N. to S. and 26 from E. to W.; containing 10,544 inhabitants, including 1,485 slaves. The lands in this county are esteemed the richest in the state. It is well watered by several small streams that empty themselves into the Delaware. The chief town is Dover.—Also, an island in Queen Ann's county, Maryland, and the largest in Chesapeake bay; 12 miles from N. to S. and six broad. It has a post-office.—Also, a township in Litchfield county, Connecticut, bordering on the state of New York, and 6 or 10 miles W. of Litchfield; containing 1607 inhabitants.

KENTAISSE, a ridge of mountains of Thibet, between the heads of the Ganges and the Sanpoo rivers. N. lat. 30° 40'. E. long. 80° 49'.

KENTHI, a town of Poland, in the palatinate of Cracow; 30 miles S.W. of Cracow.

KENTSIAN, a mountain of Thibet; 3 miles E. of Sarangpou.

KENTUCKY, a crooked river of America, which rises in the state of the same name, and after a general N.W. course of 200 miles, falls into the Ohio, N. lat. 38° 35'. W. long. 85° 30'. It is sometimes called "Cattawa." Its source is in the Laurel mountains, and it interlocks with Licking river. Its mouth, which is 250 yards wide, is 77 miles above the Rapids, and 626 below Pittsburg. The river is navigable 130 miles, though its current is rapid, the banks being high and rocky. It is said that black-lead mines have been found on the head waters of this river. Little Kentucky river is 25 yards wide, and 3 miles W. of Kentucky river.

KENTUCKY, one of the United States of America, bounded

K E N T U C K Y.

bounded N.W. by the river Ohio, W. by Cumberland river, S by Tennessee flate, E. by Sandy river, and a line drawn due S. from its source, til it strikes the northern boundary of Tennessee. It lies between 36° 30' and 39° 30' N. lat., and between 81° and 89° W. long., is about 250 miles long, and 200 broad; and contains 50,000 square miles. It was well known to the Indian traders many years before its settlement; a map of it was made from their description in 1752; and it was farther explored in 1754 and 1769. But it was first settled by Col. Daniel Boone in 1773; erected into an independent flate by act of Congress, in December 1790; and received into the Union in June 1792. Kentucky, which was originally divided into two counties, Lincoln and Jefferson, has been since subdivided into 42, as in the following table.

In January 1799, the legislature passed an act, apportioning representation, and distributing the flate into senatorial districts. This act provides, that the house of representatives shall be composed of 62 members, elected from the several counties, according to the ratio of one for every 500 qualified electors, and that the senatorial branch of the legislature shall consist of 24 members.

The whole extent of the north-western side of Kentucky is washed by the river Ohio; the principal branches of which, that serve to water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, Tennessee, and Cumberland rivers. These again branch out into rivulets and streams, which, pursuing different directions, serve to fertilize the whole country. In the dry season, however, many of them disappear, and the inhabitants are distressed for want of water. At the bottoms of these water-courses, the lime-stone rock, which is common in this country, appears of a grayish colour; but where it is exposed to the air, in its natural flate, it appears like brown free-stone. On the banks of these streams the flone has the appearance of fine marble, being of the same texture, and found in great plenty. In this country there are five noted salt-springs or licks, which supply abundance of salt for use and exportation. The whole country lies upon a bed of lime-stone, generally about six feet below the surface, except in the vallies, where the soil is much thinner. A tract, about 20 miles wide, along the banks of the Ohio, is hilly, broken land, interspersed with many fertile spots. The rest of the country is agreeably uneven, formed of gentle ascents and descents. The vallies are commonly narrow, and the soil thin and inferior in quality; and that along the ascending ground is frequently not much better; though it is sufficiently deep for vegetation, as the size of the trees indicates. The soil is either black, or tinged with a brighter or deeper vermilion, or is of the colour of dark ashes. In many places there are appearances of potter's clay, and of coal in abundance. Although this country is generally hilly or mountainous, and in many parts barren, it has various plains and slips of land fit for pasture and the rearing of cattle; and a project has been accomplished of cutting a road through the most mountainous part from Kentucky, to pass by the sweet springs in Virginia, and thence to Winchester, by which a saving is made of 200 miles in distance from the one to the other. This country is well timbered. Of trees of the natural growth of the country we may reckon the elm, the beech, the ash, the juniper, the sugar, the coffee, the papaw, the hackberry, and the cucumber. The two last are soft wood, and bear a fruit of the size and shape of the cucumber. The coffee tree resembles the black oak, and bears a pod, that incloses a seed, of which is prepared a liquor not unlike coffee. Beside these there is the honey-locust, the black mulberry, and wild cherry, of a large size. The buck-eye, an exclusively soft wood, is the horse chestnut of Europe. The magnolia bears a beautiful blossom of a rich and exquisite fragrance. Such are the variety and beauty of the flowering shrubs and plants, which grow spontaneously in this country, that in the proper season the wildness appears in blossom. The accounts that have been given of the fertility of the soil in this country have, in some instances, exceeded belief, and probably have been exaggerated. However, it is allowed that some parts of Kentucky, particularly the high grounds, are remarkably good. The lands of the first rate, it is said, are too rich for wheat, and will produce 50 or 60, and in some instances, 100 bushels of good corn per acre. In common, the land will yield 30 bushels of wheat or rye per acre. Early, oats, flax, hemp, and vegetables of all kinds, common in this climate, yield an abundant increase. Cotton is seldom, and with difficulty brought

brought to perfection. Irish potatoes thrive well; but sweet potatoes are raised with difficulty. A species of rye was found by the first settlers growing wild in Kentucky, and on the lands near the Ohio. It had a bearded ear like the cultivated rye, the beard somewhat longer, and the grain less. The staple commodities in this state are wheat and tobacco; but as the circumstances of distance from a market, and the difficulty of navigating the Mississippi, render them unprofitable to the cultivators, they are turning their attention to the raising of hemp, for which the soil is well adapted. The rivers abound with fish of various sorts; and as swamps are rare in Kentucky, the reptiles which they produce, such as snakes and frogs, &c. are not numerous. The honey-bee may be called a domestic insect, as it is said not to be found but in civilized countries. Accordingly, it is a common saying among the Indians, when they see a swarm of bees in the woods, "Well, brothers, it is time for us to decamp, for the white people are coming." The quadrupeds, except the buffalo, are the same as in Virginia and the Carolinas. The climate, if we except a few places in the vicinity of ponds and low grounds, is healthy and delightful. Their inhabitants do not experience the extremes of heat and cold. In 1798 the greatest heat was 89 Fahrenheit. The weather in winter is fluctuating. Snow seldom falls deep or lies long. The winter begins about Christmas, and is never longer than three months, commonly two, and is so mild that cattle can subsist without fodder. Fahrenheit's thermometer seldom falls below 35 in winter, nor rises above 80 in summer. The approach of the seasons is gradual; the summer continuing till the middle of October, the autumn or mild weather till Christmas, and the spring appears to produce effect in March, and by the middle of April, the foliage of the forests is completely expanded. Kentucky has various minerals. A valuable lead mine has been discovered between Cumberland and Green rivers. Marble, chalk, gypsum, and ochres are found in different places. The country affords also iron, copper, sulphur, nitre, coppers, alum, &c. From the caves on Green river earth is collected for salt-petre; and many of the inhabitants manufacture their own gun-powder. Iron-works are established. Paper-mills, oil-mills, fulling-mills, saw-mills, and a great number of valuable grist-mills, are erected. Several valuable tanneries have been established in different parts of the country. Attempts are made, on a large scale, for the culture of vineyards, and the introduction of the cotton manufacture. The salt-works are more than sufficient for the supply of all the inhabitants, at a low price. Considerable quantities of sugar are made from the sugar trees. The amount of exports from this state, in 1801, was 626,673 dollars. Malt liquor, spirits distilled from corn and rye, and the juice of the sugar-tree, mixed with water, constitute the ordinary beverage of the country. No preference is given to any one religious denomination in this country. The Presbyterians, Baptists, and Methodists, are the most numerous. Among the natural curiosities of the country may be reckoned the banks of Kentucky and Dick's river. Here may be observed 3 or 400 feet of solid perpendicular rocks, in some parts of the lime-stone kind, or in others of fine white marble, curiously chequered with strata of astonishing regularity; so that the rivers appear like deep artificial canals. Their high rocky banks are covered with red cedar groves. Caves have also been discovered in this country, several miles in length, under a fine lime-stone rock, supported by curious arches and pillars. Springs that emit sulphureous matter have been found in several parts of the country. Near Lexington are found curious sepulchres, full of human bones.

By the constitution of this state, formed and adopted in

1792, the powers of government are divided into three distinct departments; legislative, executive, and judiciary. The legislative is vested in a general assembly, consisting of a senate and house of representatives (see the beginning of this article); the supreme executive in a governor; the judiciary in the supreme court of appeals, and such inferior courts as the legislature may establish. The representatives are chosen annually by the people; the senators and governor are chosen for four years by electors appointed for that purpose; the judges are appointed during good behaviour, by the governor, with the advice of the senate. The declaration of rights asserts the civil equality of all; their right to alter the government at any time; liberty of conscience; freedom of elections and of the press; trial by jury; the subordination of the military to the civil power; the rights of criminals to be heard in their own defence; the right of the people to petition for redress of grievances, to bear arms, and to emigrate from the state. It prohibits unreasonable searches and seizures; excessive bail; confinement of debtors, unless there be presumption of fraud; suspension of habeas corpus writ, unless in rebellion or invasion; ex post facto laws; attainder by the legislature; standing armies; titles of nobility, and hereditary distinctions. The legislature of Virginia, while Kentucky belonged to that state, made provision for a college in it, and endowed it with very considerable landed funds. There has been since established a college at Lexington, called "Transylvania," regularly organized and well endowed, having a fund of 14,000 acres of land. The officers of the university are a president and two professors, in the literary departments; three medical professors, in the school of medicine; and a professor of law; a divinity professorship has been also contemplated. The library, supplied chiefly by liberal gentlemen in England, amounts to near 3000 volumes; and the philosophical apparatus is gradually enlarging. In Lexington there is also a circulating library of about 1000 volumes. Schools, in several towns, are liberally encouraged and supported. The distance from Philadelphia to Kentucky by land is from 7 to 800 miles; from Baltimore nearly 700; nearly 600 from Alexandria; and upwards of 500 from Richmond. Morfe.

KENTZINGEN, a town of Germany, in the Brisgau, about a mile from the east side of the Rhine; 13 miles N.W. of Friburg.

KENYON, LLOYD, in *Biography*, was born at Greddington, in Flintshire, in the year 1733. He was educated at Ruthin school in Denbighshire, after which he was articled to Mr. Tomlinson, an attorney at Nantwich, in Cheshire. When he had completed his clerkship, he entered himself a member of the society of Lincoln's Inn, and was called to the bar in 1761. He now began to practise as a conveyancer, and soon obtained a high reputation as a sound lawyer, which was the means of introducing him to notice in the chancery court. Still, however, he made no figure at the bar, till the trial of lord George Gordon, in 1780, gave him an opportunity for a full display of his talents; and from this moment he was looked up to with respect by his brethren at the bar. In 1782, he was made attorney general, and chief justice of Chelter; and, much about the same time, he was returned to parliament for Hindon in Wiltshire. In 1784, he was appointed to the office of master of the Rolls; and on the resignation of the earl of Mansfield in 1788, he was, by the zealous recommendation of lord Thurlow, raised to the office of chief justice of the king's bench, and ennobled with the title of baron Kenyon. He died at Bath in April 1802, leaving two sons, George the present lord, and the honourable Thomas Kenyon, Gent. Mag.

KEOGANG, in *Geography*, the most westerly of the branches or mouths of the river Ava, in Pegu, which runs into the sea near Cape Negrais.

KEOWE, or **KEOWEE**, the name given in America to the Savannah river, above its conflux with the Tugulo, the west main branch.—Also, the ancient name of the populous town and territory of the Cherokee Indians, on the river of that name. The soil is fertile, and the adjacent heights might, with little expence, be rendered almost impregnable. The fruitful vale of Keowe is seven or eight miles in extent, terminated by a high ridge of hills, and opening again to an extent of ten or twelve miles down to Sinica, and in breadth one or two miles. This was once a thickly inhabited settlement, well cultivated and planted. To the feeble remains of the once potent Cherokees it now exhibits a different spectacle.

KEOZEE, a town of Birmah, on the Irawaddy; 15 miles N.E. of Pagahm. This town is ornamented with several neat temples.

KEPELDEE, a town of Hindoostan, in the country of the Nays; 30 miles E. of Tellicherry.

KEPHER KENNA, a village of Palestine, said to be the ancient "Cana," where our Saviour changed the water into wine.

KEPLER, JOHN, in *Biography*, a celebrated astronomer and mathematician, born at Wicl, in the duchy of Wirtemberg, December 27th, 1571, was son of Henry Kepler, an officer in the army, who had served his country with distinction, but who, by misfortunes, was reduced to low and narrow circumstances. He gave his son the best education in his power, though the youth was subject to many difficulties, by being sent to different places, and by being put under different masters. His genius and avidity for knowledge animated him to surmount every obstacle, and to make a very rapid proficiency. He was sent to Tubingen to pursue his academic studies, and was admitted to the degree of bachelor in 1588, and to that of master of philosophy in 1591. He applied himself to mathematics and theology, and undertook the duties of the ministry for a short time. But his inclination being decidedly in favour of mathematics, he resolved to devote his whole time and strength to the science; and so high was his reputation, that in the year 1594 he was invited to Gratz, in Stiria, to fill the mathematical chair in the university of that city. In the year 1596, he married a lady of a noble family; and in two years from this period he was driven from Gratz by persecution, on account of his religious principles; though he was soon recalled by the states of Stiria; but not thinking himself safe, he accepted a pressing invitation from Tycho Brahe to settle in Bohemia, and removed thither with his family and books in the year 1600. Upon a close intimacy, Kepler was dissatisfied with the conduct of Tycho, and complained of his unwillingness as well to promote his interest, as to communicate to him all his discoveries and improvements. Tycho, however, died in 1601; but previously to this, he introduced him to the acquaintance of the emperor Rodolph, who gave him a favourable reception, and appointed him his mathematician. This title of mathematician to his imperial majesty Kepler possessed during the remainder of his life, not only under the reign of Rodolph, but under his successors, Matthias and Ferdinand. Upon the death of Tycho, the emperor Rodolph ordered him to complete the tables begun by that great man, which were to be called the "Rodolphine Tables." These, notwithstanding the vigour with which he applied himself to them, were, owing to unexpected difficulties, not completed and published till the year 1627. Having completed that work, he

obtained the emperor's leave to go and reside at Sagan, in Silesia, where he full red much inconvenience from not having his pension regularly paid him. This circumstance obliged him to take a journey to Ratibon in 1630, to solicit for the arrears due. Here he died in November, at the age of 59 years. The account of the labours and discoveries of this great man has been given by Mr. Maclaurin, in his work on the "Discoveries of Sir Isaac Newton," and from that we shall extract the following sketch. "To Kepler," says he, "we owe the discovery of the true figure of the orbits, and the proportions of the motions of the solar system. This astronomer had a particular passion for finding analogies and harmonies in nature, after the manner of the Pythagoreans and Platonists. Three things, he tells us, he anxiously sought after from his early youth:—Why the planets were six in number? Why the dimensions of their orbits were such as Copernicus had described from observations? And, what was the analogy or law of their revolutions? He sought for the reasons of the first two of these in the properties of numbers and plane figures, without success. But at length reflecting that while the plane regular figures may be infinite in number, the regular solids are only five, he imagined that certain mysteries in nature might correspond with this limitation inherent in the essences of things; he therefore endeavoured to find some relation between the dimensions of those solids and the intervals of the planetary spheres; and imagining that a cube inscribed in the sphere of Saturn would touch by its six planes the sphere of Jupiter, and that the other four regular solids in like manner fitted the intervals that are between the spheres of the other planets; he became persuaded that this was the true reason why the primary planets were precisely six in number, and that the author of the world had determined their distances from the sun, the centre of the system, from a regard to this analogy. Being thus, as he imagined, possessed of the grand secret of the Pythagoreans, and pleased with the discovery, he published it in 1596, under the title of "Mysterium Cosmographicum." He sent a copy of this book to Tycho Brahe, who did not approve of the speculations contained in it, but wrote to Kepler, urging him first to lay a solid foundation in observations; and then, by ascending from them, to strive to come at the causes of things; and to this advice we are indebted for the more solid discoveries of Kepler. This great man, soon after the death of Tycho, found that astronomers had erred from the first rise of the science, in ascribing always circular orbits and uniform motions to the planets; and he discovered that each of them moves in an ellipse, which has one of its foci in the centre of the sun; that the motion of each is really unequal, and varies in such a manner, that "a ray supposed to be always drawn from the planet to the sun describes equal areas in equal times." It was some years later before he discovered the analogy that there is between the distances of the several planets from the sun, and the periods in which they complete their revolutions. He has, however, left it upon record, that on the 15th of May, 1618, he found that "the squares of the periodic times are always in the same proportion as the cubes of the mean distances from the sun." When Kepler saw, according to better observations, that his disposition of the five regular solids among the planetary spheres was not agreeable to the intervals between their orbits, he endeavoured to discover other schemes of harmony. For this purpose, he compared the motions of the same planet at its greatest and least distances, and of the different planets in their different orbits, as they would appear viewed from the sun; and here he fancied that he had found a similitude to the divisions of the octave in music.

Of these notions, which are wholly unfounded in nature, he was so fond, that hearing of the discovery of the four fatellites of Jupiter by Galileo, he owns that his first reflections were from a concern how he could save his favourite scheme, which was threatened by this addition to the number of the planets. The same attachment led him into a wrong judgment concerning the sphere of the fixed stars; for being obliged, by his doctrine, to allow a vast superiority to the sun in the universe, he restrains the fixed stars within very narrow limits; nor did he consider them as fans placed in the centres of their several systems, having planets revolving round them. Kepler's great sagacity, and continued meditations on the planetary motions, suggested to him some views of the true principles from which these motions flow. He speaks of gravity as of a power that was mutual between bodies; and says, that the earth and moon tend towards each other, and would meet in a point, so many times nearer to the earth than to the moon, as the earth is greater than the moon, if their motions did not hinder it. He adds also, that the tides arise from the gravity of the waters towards the moon. But not having notions sufficiently just of the laws of motion, he was unable to make the best use of these ideas; nor did he steadily adhere to them, for in his "Epitome of Astronomy," published many years after, he proposes a physical account of the planetary motions derived from different principles. Kepler was author of several pieces besides those already mentioned, of which the following may be noticed: "Prodromus Dissertationis Cosmographarum;" "De Stella nova in Pede Serpentarii;" "Astronomia nova, seu Physica Cœlestis, Tradita Commentariis de Motibus Stellæ Martis ex Observationibus Tychoonis Braheii;" "De Cometis libri tres."

This great geometriean and astronomer, in his "Harmonices Mundi," published at Lintz, in Austria, in 1619, and dedicated to our James I., speaks on the subject of music like a man who had not only thought of it as a science subservient to the laws of calculation, but in the language of one who had studied it practically as an elegant art, and been truly sensible of its powers. And though the eloquent astronomical historian Bailly says, in a sweeping decision, that "Kepler, from his veneration for Pythagoras and Plato, has plunged into musical ratios, and blended them with the movements, distances, and eccentricities, of the planets, in his visionary analogies; they contain not one single true ratio or resemblance: in a crowd of ideas there is not one single truth." This severe censure of M. Bailly must be confined to the proportions and analogies between musical intervals and the distances of the heavenly bodies: as the ratios of Kepler are accurate, as far as concerns music.

Neither Maclaurin nor Dr. Hutton have expressed themselves so harshly on his fancied similitudes to the divisions of the octave in music; which they indeed call the dreams of this ingenious man, as the harmony of the spheres had been of Pythagoras and Plato long before.

This great mathematician and precursor of sir Isaac Newton was so far from allowing to the ancients, much as he respected them, such harmony as is practised by the moderns, that he says, though Plato, in his "Republic," speaks as if something like it were in use, he supposes if they ever had any accompaniment to their melodies by way of base, it must have been such a one as is produced by the drone of a bagpipe. This is perhaps being as unjust to the ancients, as those are to the moderns, who will not allow them to have made any progress in music, because they are unable, by their compositions and performance, to cure deafness, tame wild beasts, or build to winds.

KEPLER'S *Laws*, is a term used by astronomers to denote certain analogies between the distances of the planetary bodies from the sun, and their times of periodic revolution; as also between the rate of motion in any revolving body, whether primary or secondary, and its distance from the central body about which it revolves. The latter of these, which is generally called Kepler's first law, being that which he first discovered, is commonly expressed as follows.

1. Equal areas are described in equal times; that is, if a line be supposed to join the central and revolving body, this line always passes over, or describes equal areas in equal times, whether the planet be in its aphelion, perihelion, or in any other part of its orbit.

2. The squares of the times of revolution of the planetary bodies are as the cubes of their respective distances from the sun.

These laws were first discovered by Kepler, the celebrated astronomer, whose name they bear;—a name which will be perpetuated as long as the science of astronomy itself is known, and the sublimity of its laws have charms to captivate the minds of philosophers. The discovery of these analogies forms a most important epoch in the history of astronomy, as they may be considered as having paved the way to that sublime and universal system of attraction, the discovery of which has immortalized the name of Newton; for Kepler having deduced them from the comparison of actual observations, and therefore independent of any theory, they formed a very useful criterion for the corroboration of any particular hypothesis, as well as an important datum in the investigation of new theories.

In order to form a proper estimate of the value of these improvements, and the difficulty their author had to encounter in establishing them, we must look to the state of astronomy at that period. Copernicus had just revived the Pythagorean system, and Kepler was one of its ablest advocates: but still it was held as a sacred principle, that the motions of all the planetary bodies were performed in uniform circular orbits; to reconcile which to actual appearances, many ingenious contrivances were made use of, and which, it must be allowed, represented the planetary motion with considerable exactness.

The angular motion of each of the planets consists of two parts: one part increasing uniformly with the time; and another which is periodical, and acquires all degrees of magnitude within a certain limit, in the several parts of the orbit. Now every such motion was accounted for with a tolerable degree of accuracy, by the ancient contrivances of epicycles and deferents. Accordingly the ancient systems represented, with considerable exactness, those observed places of the planets that depended only on the real angular motions; as at the oppositions. But they failed when applied to the other positions of the planets, and to the latitudes, where the apparent places depend not only on the angular motions, but likewise on the relative distances. It was here that all the ancient systems were alike defective; and it was by a strict comparison of observation with theory, that Kepler at last found himself obliged to depart from that principle of uniform circular motion, which had been so scrupulously adhered to by all his predecessors.

The situation of the heavenly bodies, in respect to one another, depends upon their real angular motions, and their relative distances. But when a planet is in opposition, the apparent places, as seen from the earth and sun, are coincident, and its position is effected only by the angular motions; and, therefore, observations in opposition, being the simplest and the least liable to inaccuracy, are of great use

KEPLER'S LAWS.

in astronomy. But in observing oppositions, a practice had been introduced, that in part defeated the purpose for which such observations had been preferred to all others. A planet was reckoned to be in opposition, when its place in the heavens was removed 180° in longitude, not from the real place of the sun, but from his mean place. It is evident, therefore, that by this practice the observer was not situated in the same line with the sun and the planet, at the computed time of opposition; and, therefore, the apparent place of the planet was not entirely divested of the second inequality, excepting in the rare case when the true place of the sun coincided with his mean place. To this practice Kepler objected, and conceived the design of determining the orbit of Mars from real, instead of apparent oppositions; and he entertained the most sanguine expectations of completely reforming the theory of the planets, by his projected innovation. Kepler's intended substitution of real for mean oppositions led him to examine the practice of astronomers in another important point. It very seldom happens that a planet is found in the plane of the ecliptic, in which the motion of the sun is performed; and in order to ascertain the place of the planet in its orbit at the time of observation, a reduction from the ecliptic to the plane of the orbit becomes necessary: and in examining the ancient methods of reduction, Kepler found them to be erroneous and inconsistent; and his investigation ultimately established this important conclusion, "that the orbits of the planets are invariable planes, intersecting each other in lines passing through the sun's centre." This was a most important improvement, and of greater consequence in simplifying the science of astronomy than any that had been introduced in all the preceding ages; and his successful and decisive establishment of its truth may be justly ranked among his greatest discoveries.

Kepler having overcome all the difficulties that opposed his projected innovation, at length completed a theory of Mars, derived solely from apparent oppositions; and its accuracy was unquestionable in representing the oppositions; but it totally failed when applied to the latitudes, and to the longitudes out of opposition. Disappointed in the high expectation he had formed of his new theory, he yet drew from its failure an important inference, the first step to emancipation from the ancient prejudice of uniform circular motion. For as the theory involved only two suppositions, *viz.* that the orbit of Mars was a circle, and that the motion of the planet was uniform about a fixed point in the line of apices, he justly concluded that one at least of these two suppositions was false. He now prepared for further researches; but, first of all, judged it necessary to examine the circumstance that affected the theory of the earth's annual motion: for as the latitudes of the planets, and the longitudes out of opposition, (the phenomena which had hitherto rendered his attempts abortive,) depended on the distances of the earth from the sun, it was requisite to be assured that no errors crept in from this quarter.

Nor was Kepler without suspicions of inaccuracy in the terrestrial orbit. He had early remarked it as an anomaly, that an equant was assigned to all the planets, the Earth or Sun excepted; and although the authority of all astronomers was against him, he even then presumed to doubt of the justness of the exception. Resuming the examination of this point on the present occasion, he established, by multiplied and undeniable proof, that the eccentricity was bisected in the orbit of the Earth or Sun, as well as in the orbits of the other planets. Kepler, in turning his attention to the solar theory, had also a farther improvement in view, *viz.* a method for deriving the equa-

tions of the planetary orbits from a less arbitrary and precarious principle than that of the equant, or a centre of uniform angular motion. He had remarked, that it is a general fact in the solar system, that the velocity of a planet diminishes as it recedes from the Sun, and increases as it approaches that luminary; and he concluded, that these two quantities, the velocity of a planet, and its distance from the Sun, must be related according to some law, which, if discovered, would enable astronomers to calculate the rate of a planet's motion for all points of its orbit, and, of course, to determine the equation, or correction due to the mean motion in every such point. This was undoubtedly the conclusion of a man of genius and originality; for though we are now familiar with the notion, that whenever the variations of one quantity depend on those of another, the one of the quantities may be expressed by some functions of the other; yet, in the days of Kepler, it must have required no small effort of generalization to perceive this truth, and the important consequences which result from it. Great difficulties, however, stood in the way of the investigation; and Kepler had to struggle, not only with his own precipitancy, which frequently led him into error, but with the imperfections of the geometry of that age, which were great in all matters connected with the quadrature of curves.

His ingenuity and perseverance, however, at last prevailed. He found that the times of describing small arcs of the Earth's orbit, are as the distances from the Sun; that therefore the times of describing any arcs whatever, must be as the sums of those distances; and having satisfied himself, from geometrical considerations, that the sum of the distances may be expounded (at least nearly) by the area contained between the arc and the radii drawn from its extremity to the centre, he inferred that the times of describing any arcs whatever, are proportional to these areas, or which is the same, *That equal areas are described in equal times.* In consequence of this improvement, Kepler began to speculate on the nature of the force which produced so curious an adjustment; but the honour of this discovery was reserved for the genius of the immortal Newton. When he again resumed the consideration of the orbit of Mars, he soon saw reason to conclude that this body described its orbit under the guidance of the same law that he had just found to hold on the Earth; *viz.* that the areas described by a line drawn from the planet to the Sun, are every where proportional to the time of description.

The attempt, however, of computing the equation of Mars's motion on this principle, was attended with much difficulty, on account of the great eccentricity of the orbit, but still more from that prejudice in favour of the old doctrine of circular orbits, which has been already mentioned. In his new method of computing the equations, Kepler supposed the orbit to be accurate; but the results, from the combination of the two principles, were such as could not be reconciled with the places of Mars, observed by Tycho Brahe. In this dilemma, finding that he must give up one of the principles which he had adopted in his calculation, he first proposed to sacrifice his own theory to the authority of the old system; thus giving one of the most memorable examples which has ever occurred, of the influence of candour and prejudice at the same moment. He soon found, however, that this sacrifice would not answer his purpose, and that, in order to make the calculus agree with observations, it was the old hypothesis, and not the new one, that must be abandoned.

Thus the idol was overthrown by which Kepler had been so long deceived, and the emancipation of astronomy was

achieved; but many difficulties were yet to be overcome, before the empire of truth could be firmly established.

It was proved, that the orbit of Mars was not circular, but its real form was yet undiscovered. The hypothesis which first presented itself was, that this orbit is an oval or ellipse, coinciding with the supposed circular orbit at the two apides, but falling very much within it in the middle between them; and Kepler having assigned the proportions of the longer and shorter axes of the curve, according to views that he thought found, but which proved to be extremely fallacious, proceeded to describe the ellipse, to obtain its quadrature, to cut its area in any given proportion, and to derive from thence the equations of the mean motion; all which was accompanied with such labour as nothing but his fortitude and perseverance would have been able to overcome. He compared the distances of Mars, thus computed for no less than forty different areas of anomaly, with the same as deduced from observation, and had the mortification to find, that they did by no means agree, but that the real places of the planet fell as far with it the new oval, as within the old circular orbit. After trying many different means of correcting these errors with incredible labour, and always subjecting each hypothesis to the severest test, he found, at length, that an ellipse, with the sun in one of its foci, and its greater axis equal to the mean distance of Mars, represented the whole motion of the planet with wonderful exactness. *The planets, therefore, describe ellipses, having the sun in their common focus; and this is the second great discovery which delighted the mind, and has immortalized the name of Kepler.*

His third discovery was that of a law of no less importance than either, the description of equal areas, or the elliptic orbits of the planets; but it was made more easily than them, and without the same elaborate deductions. His strong propensity to trace out laws and discover analogies in nature, set him eagerly at work to find out what relation subsists between the distances of the planets from the sun, and the times of their revolutions round him. The data here lay in a much smaller compass, and were much less various than in the two former researches; and Kepler, after making some fanciful comparisons between the distances of the planets, and the regular solids in geometry, and also between the same and the divisions of the monochord, thought at last of comparing the different powers of these quantities with one another, from which comparison, though not without some abortive attempts, this truth at last emerged, *that the squares of the periodic times of the planets, are as the cubes of their mean distances from the sun.* He expressed, in strong terms, the delight and astonishment he felt on the discovery of this simple and beautiful analogy. He has carefully marked the day on which the discovery was made, (8th May, 1618), "and few," says a writer on this subject, "are the days in the history of the world that deserve so well to be remembered."

After the happy idea of comparing the powers of the distances and times, the step to the final result was extremely simple and easy; though it does not appear that Kepler employed any particular method for this purpose, but had recourse to various trials before the real law was discovered.

Suppose, for instance, D , d , and δ , to represent the distances of any three planets, and T , t , τ , the three corresponding times of periodic revolution; then, in order to ascertain whether any law subsists between these two series of quantities, let us assume the following proportions: *viz.*

$$D^n : d^n :: T^m : t^m$$

$$D^n : \delta^n :: T^m : \tau^m$$

where m and n may represent any numbers whatever, either integral or fractional. Then

$$m \log. D + n \log. t = m \log. d + n \log. T$$

$$m \log. D + n \log. \tau = m \log. \delta + n \log. T$$

$$m (\log. D - \log. d) = n (\log. T - \log. t)$$

$$m (\log. D - \log. \delta) = n (\log. T - \log. \tau)$$

$$\therefore m \log. \frac{D}{d} = n \log. \frac{T}{t}$$

$$m \log. \frac{D}{\delta} = n \log. \frac{T}{\tau}$$

Whence again,

$$\log. \frac{D}{d} \times \log. \frac{T}{\tau} = \log. \frac{D}{\delta} \times \log. \frac{T}{t}$$

which equality must necessarily obtain if any law subsist, and it is remarkable that it should be totally independent of the law itself. Therefore, it was only necessary to submit the above equality to examination, in order to be assured of the existence or non-existence of any analogy; and having thus ascertained that some law must have place, the law itself is readily discovered from any of the above equations. Thus

the equation $m \log. \frac{D}{d} = n \log. \frac{T}{t}$ gives immediately

$$\frac{n}{m} = \frac{\log. \frac{D}{d}}{\log. \frac{T}{t}}$$

which fraction being reduced to the lowest

terms will furnish the particular values of m and n . As these formulæ are applicable to any two series of quantities, between which any law of this kind is suspected to obtain, they are not altogether unworthy of attention. We have thus given a slight sketch of the discoveries of this celebrated astronomer, which had the limits of our article admitted of it, might have been extended to a much greater length; in the present instance, however, we can only refer the reader who wishes for more complete information on this interesting subject, to Dr. Small's "Account of the Astronomical Discoveries of Kepler."

KEPLER'S PROBLEM. See PROBLEM.

KEPPEL, AUGUSTUS, in *Biography*, a celebrated English admiral, the second son of William, earl of Albemarle, was born April 23, 1725. He entered the sea-service while he was young, accompanied commodore Anson round the world, and by the zeal which he manifested in his profession, was raised to the first honours which it had to bestow. The most important occurrence in his life took place in 1778, when he had the command of the channel fleet, to which he had been appointed at the personal and urgent solicitation of the king, and which he readily accepted, though he could not help observing, that "his forty years services were not marked by any favour from the crown, except that of its confidence in the time of danger." On the 12th of July he fell in with the French fleet, under count d'Orvilliers, off Ushant: an engagement ensued, which, though partial, was very warm while it lasted. It was necessary to take a short time to repair the damages; which being done, the admiral made proper signals for the van and rear division to take their respective stations. This order was obeyed with great alacrity by sir Robert Harland of the van, but admiral sir Hugh Palliser of the rear took no notice of the signal, and refused to join his commander, till night prevented a renewal of the battle. The French, taking advantage of the darkness, escaped to their own coast. Admiral Keppel, willing to ex-

cuse Sir Hugh Palliser, at least to screen him from public reprobation, wrote home such a letter as seemed even to imply great inpropriety of behaviour in the commander himself. The conduct, however, of the rear-admiral was attacked in the public papers: he demanded of his commander a formal disavowal of the charges brought against him, which Keppel indignantly refused. He immediately exhibited articles of accusation against the commander-in-chief, for misconduct and neglect of duty, although he had a second time failed with him, and had never uttered a syllable to his prejudice. The lords of the admiralty, to the amusement of the nation, instantly fixed a day for the trial of admiral Keppel: he was most honourably acquitted, and received the thanks of both houses of parliament for his services. Palliser was next tried, and escaped with a censure only, but the resentment of the public was so great, that he was obliged to resign several offices which he held under government, and to vacate his seat in parliament. The acquittal of Keppel was celebrated with the most magnificent illuminations, and other marks of rejoicing which had never been known at that time in this country, and the houses of Lord Sandwich, first lord of the admiralty, and Sir Hugh Palliser, were with difficulty saved from destruction; the windows and much of the furniture being demolished by the fury of the populace. In 1783, admiral Keppel was raised to a peerage, with the titles of viscount Keppel, baron Eldon: he was afterwards, at two different periods, appointed first lord of the admiralty. He died Oct. 3d, 1786, unmarried, and of course his titles became extinct. He was a thorough seaman, and a man of great integrity and humanity. *Genl. Mag.*

KEPPEL'S BAY, in *Geography*, a bay of the South Pacific ocean, on the N.E. coast of New Holland. S. lat. 23° 28'. E. long. 150° 33'.

KEPPEL'S ISLAND, or *Traitor's Island*, an island in the South Pacific ocean. S. lat. 15° 53'. W. long. 172° 33' to 175° 13'.—Also, a small island on the N. side of the most westerly of the Falkland islands, in the S. Atlantic ocean. S. lat. 51° 24'. W. long. 60° 15'.—Also, one of those called queen Charlotte's islands, in the S. Pacific ocean. S. lat. 10° 15'. W. long. 134° 56'.

KEPPEL'S ISLANDS, a group of islands near Keppel's bay, on the N.E. coast of New Holland, discovered by captain Cook in the year 1770. Near these islands the water, which was too shallow for fish, abounded with crabs, which were of two sorts, and both such as had not been seen before: one of them was adorned with the finest blue that can be imagined, in every respect equal to the ultramarine, with which all his claws and every joint were deeply tinged; the under part of it was white, and so exquisitely polished, that in colour and brightness it resembles the white of old China; the other was also marked with the ultramarine upon his joints and toes, but somewhat more sparingly, and his back was marked with three brown spots, which had a singular appearance. S. lat. 25° 8'. W. long. 209° 1'. *Hawkesworth's Voyages of Cook, &c. vol. iii.*

KEPSE, a town of Syria, on the coast of the Mediterranean, and on the N. side of the mouth of the Orontes, about a mile from the sea; situated, as it is supposed, on the site of the ancient *Selenia*, which see.

KEPTA, a town of Bostan; 24 miles S. of Taffafudon.

KERAMIANS, a heretical sect of Mahometans, the followers of Mohammed Ebn Kerâm, called also Mojalessians, or Corporealists, who not only admitted a resemblance between God and created beings, but declared God to be corporeal. They were led to this notion by the literal acceptation of those passages in the Koran, which figuratively attribute

corporeal actions to God, and of the word of Mahomet, when he said, that God created man in *his own image*, and that himself had *felt the fingers of God*, which he laid on his back, to be *add.*

KERAMO, in *Geography*, a town of Asiatic Turkey, in Natolia; 24 miles S.S.E. of Millets.

KERANA, a long fort of trumpet; somewhat in form of a speaking-trumpet, used by the Persians.

To the sound of this, they add a confused noise of haut-boys, timbrels, drums, and other instruments, every evening at sunset, and two hours after midnight.

KERATI, in *Geography*, a town of Asiatic Turkey, in Caramania; 26 miles N.W. of Heisuburi.

KERATIA, a town of European Turkey, in Livadia; 24 miles S.S.E. of Athens.

KERATOPHYTUM, in *Natural History*, a species of *Gargonia*; which see.

KERAUN, in *Geography*, a town of Hindoostan, in Lahore; 15 miles W.N.W. of Gujrat.

KERBEH, a town of Natolia; 44 miles N.E. of Ikind.

KERBOOZA, a town of Hindoostan, in Lahore; 32 miles S.E. of Atteck.

KERCAL, a town of Africa, in Fez, on the coast of the Mediterranean; 45 miles E.S.E. of Tetuan.

KERCH, or **KERTSCH**, a fortified town of Russia, in the province of Tauris, on the channel between the Black sea and the sea of Azoph. It was founded by a colony of Greeks from Miletus, and afterwards subdued by the kings of Bosphorus. In the year of Rome 689, it was taken by Mithridates, king of Pontus, who, in consequence of the rebellion of his son Pharnaces, was besieged in the castle, and at his own request put to death by an officer of the Gauls, who had forced the walls; 100 miles E.S.E. of Perekop. N. lat. 45° 16'. E. long. 36° 14'.

KERCHA, a town of Persia, in Chûfistan; 30 miles N.W. of Sulter.

KERCKRING, THEODORE, in *Biography*, a celebrated physician, was a native of Amsterdam. He had attained the age of eighteen, when he began the study of the Latin language, under the tuition of Francis Van Ende, and soon afterwards applied himself to medicine with so much zeal and success, that he obtained a high reputation, both in the practice of the profession, and by his anatomical and chemical discoveries. He continued the exercise of his art at Amsterdam for several years, and married the daughter of his preceptor, before mentioned; after which he settled at Hamburg in the year 1678, where, after having for a long time held the appointment of resident from the grand duke of Tuscany, he died in November, 1693. Anatomy was the favourite subject of his researches, and he formed an anatomical museum, which was long an object of admiration, and the resort of the curious, who visited that city. His principal writings were likewise upon anatomical subjects; they are as follows: 1. "Spicilegium Anatomicum, continens Observationum Anatomicarum rariorum Commentum unum, necnon Osteogenia Fetuum, in quâ, quid cuique officulo singulari accedat mensuris, quidque debeat & in eo per varia immutetur tempora, accuratissimè oculis subjicitur." *Andl. 1670, 1673.* 2. "Anthropogenia ichnographia, sive, conformatio Partus ab ovo usque ad effluatantis principia, in Supplementum Osteogenia Fetuum." (*Ibid. 1671.*) In this work the development of the fetus, at different periods of its age, is traced with great attention and minuteness. 3. "Commentarius in Curam Trismus, phalem Antimonij Bas. Valentini." (*Ibid. 1671.*) This is chiefly a translation of Basl' Valentine's work, from the

German to the Latin. A posthumous collection of his anatomical writings was published at Leyden in 1717, with the title of "Opera omnia Anatomica" Eloy. Dict.

KERCOLANG, in *Geography*, an island in the East Indian sea, about 80 miles in circumference, inhabited by Malays. N. lat. of the north extremity 4° 28'. E. long. 126° 30'.

KERDA, a town of Sweden, in the province of Smaland; 38 miles W.N.W. of Wexio.

KERDECAN, a town of Persia, in the province of Kerman; 22 miles N.W. of Sirgian.

KERDISTAN, a town of Persia, in Chusistan; 90 miles E.S.E. of Suter.

KERDIZ, a town of Candahar, in Cabulistan; 70 miles E. of Ghizni.

KEREDGE, a town of Persia, in Irak; 15 miles S.W. of Sava.

KERELO, a town of Transylvania, on the Maros; 20 miles W.N.W. of Schefburg.

KEREMPIBURUN, called *Cape Crampe*, a cape on the N. coast of Natoha, on a neck of land which projects into the Black sea. N. lat. 42° 45'. E. long. 33° 10'.

KEREN, a town of Persia, in Irak; 45 miles W. of Kermansha.

KERESBANJA, a town of Transylvania; 44 miles S.S.W. of Colofvar. N. lat. 46° 16'. E. long. 22° 25'.

KERESOUN, a town of Turkish Armenia, at the mouth of a river of the same name, which runs into the Black sea, anciently a city of Pontus, called *Cerafus*; which see.

KERESZTUR, a town of Transylvania; 36 miles N. of Schefburg.

KERET, a town of Russia, in the government of Archangel, on the White sea; 145 miles S. of Kola.

KERETSKOI, a town of Russia, in the government of Archangel, on the White sea; 32 miles N. of Archangel.

KERF is the notch or slit that is made by the saw between two pieces of wood, when they are sawing asunder.

KERFE-KARUMFEL, in the *Materia Medica*, a name given by Avicenna, and others, to the wood of the clove-tree, as the wood of the cinnamon-tree was called *kerfe darfini*; and many others in the same manner.

KERGONG, in *Geography*, a town of Hindoostan, in Candahar; 45 miles S. of Indore.

KERGUELEN'S LAND, otherwise called the *Island of Desolation*, an island in the Southern Indian ocean, first discovered in 1772, and afterwards visited, in 1773, by M. de Kerguelen, who, in his second voyage, discovered some other small islands in its vicinity. Kerguelen has, since the death of captain Cook, published the journal of his proceedings in these two successive voyages, and has annexed to his narrative a chart of the coasts of this land, as far as he had explored them in both voyages. M. de Pagès, much about the same time, favoured the public with another account of the second voyage, in some respects fuller than Kerguelen's own, on board of whose ship he was then an officer. Captain Cook fell in with these islands in December 1776; and of the first he says, that it is an island of considerable height, and about three leagues in circuit. To this island Kerguelen had given the name of "Croy," or "Crouy;" and the view of it in his chart exactly corresponds with Cook's account of its being of considerable height. Cook observed another island of the same magnitude, one league to the eastward, which Kerguelen had called "Isle Rolland," after the name of his own ship, and of which he has given a view in his chart. Between these two islands Cook observed some smaller ones in the direction of S.E. In the direction S. by E. ½ E. from

the E. end of the first island, a third high island was seen. This appears to have been Kerguelen's "Isle de Clugny," as marked on his chart. Another island in the N.E. direction was a high round rock, named by captain Cook "Bligh's Cap," which he justly concluded to be the same which M. de Kerguelen called the "Isle de Rendezvous," though Cook says "I know nothing that can rendezvous at it but fowls of the air; for it is certainly inaccessible to every other animal." Bligh's Cap was ascertained to be in S. lat. 48° 29'. E. long. 68° 40'. The French and English navigators agree very nearly with respect to the latitude of this island; but they differ as to its longitude.

The pilot at Tenerife made it only 64° 57' E. from Paris, which is about 67° 16' E. from London; or 1° 24' more westerly than captain Cook's observations fix it. M. de Pagès says it is 66° 47' E. from Paris, that is, 69° 6' E. from London, or 26 miles more easterly than it is placed by captain Cook. Kerguelen himself only says, that it is about 68° E. long. The northern point of this land captain Cook erroneously concluded to be the "Cape Louis" of the first discoverers; whereas, by an inspection of Kerguelen's chart, this northern point described by Cook, is the same with that to which the French have given the name of "Cape François." The whole extent of coast lying between Cape Louis and Cape François, of which the French saw very little during their first visit in 1772, and which may be called the N.W. side of this land, they had it in their power to trace the position of in 1773; and they have assigned names to some of its bays, rivers, and promontories upon their chart. On the 25th of December (Christmas day), captain Cook anchored in the harbour from this circumstance denominated "Christmas Harbour," which see. On the 27th many of the ship's crew went on shore, and made excursions, in different directions, into the country, which they found barren and desolate in the highest degree. They brought with them a quart bottle, which was found fastened with wire to a projecting rock on the N. side of the harbour. This bottle contained a piece of parchment, with the following inscription: "Ludovico XV. Galliarum rege, et D. de Boynes regi a secretis ad res maritimas annis 1772 et 1773." Captain Cook, as a memorial of having been in this harbour, caused to be written on the other side of the parchment this inscription: "Naves Resolution et Discovery de Rege Magnæ Britanniæ, Decembris 1776." This parchment was put again into a bottle with a silver two-penny piece of 1772; and the bottle, having been covered with a leaden cap, was placed on a pile of stones erected for the purpose, upon a little eminence on the N. shore of the harbour, near the place where it was first found. The Christmas harbour of captain Cook is the same with the "Baie de l'Oiseau" of the French, and Cape François, and not Cape St. Louis, is the northern point of this land; and the account of the S. point of the harbour given by M. de Pagès and captain Cook remarkably agree. The land on both sides of the inlet is high, and it runs in W., and W.N.W. about two miles. Its breadth is 1½ mile, for more than half its length; above which it is only half a mile. The depth of water is 45 fathoms at the entrance, and varies, in proceeding farther inward, from thirty to five and four fathoms. The shores are steep, and the bottom is every where a fine dark sand, except near the shore, where are beds of sea-weed. The head of the harbour lies open only to two points of the compass; and even these are covered by islands in the offing, so that no sea can fall in to hurt a ship. It is high water here at the full and change days, about 10 o'clock; and the tide rises and falls about four feet. Captain Cook explored this island, and other islands adjacent

to it, with a view of extending Kerguelen's discovery. After having anchored in another harbour, called "Port Pallifer," and situated in S. lat. $49^{\circ} 3'$. E. long. $69^{\circ} 37'$, and finding no encouragement to continue his researches, captain Cook put to sea. The French discoverers, with some reason, imagined Cape François to be the projecting point of a southern continent. "The English have since proved that no such continent exists; and that the land in question is an island of no great extent, which, from its sterility," says captain Cook, "I should, with great propriety, call the "Island of Defolation," but that I would not rob M. de Kerguelen of the honour of its bearing his name." Kerguelen now concurs with captain Cook as to its being an island: but he apprehends, that it is about 200 leagues in circuit; and he says, that he was acquainted with about 80 leagues of its coast. After all, it cannot but be remarked, that Kerguelen was peculiarly unfortunate, in having done so little to complete what he had begun. He discovered, indeed, a new land, but, in two expeditions to it, he could not once bring his ships to an anchor upon any part of its coasts. Captain Cook had either fewer difficulties with which to struggle, or was more successful in surmounting them. From the account of Mr. Anderson, surgeon to captain Cook, who lost no opportunity of searching the country in every direction, we make the following extract.

"Perhaps no place, hitherto discovered in either hemisphere, under the same parallel of latitude, affords so scanty a field for the naturalist as this barren spot. The verdure, which appears when at a little distance from the shore, would flatter one with the expectation of meeting with some herbage; but in this we were much deceived. For on landing, we saw that this lively colour was occasioned only by one small plant, not much unlike some sorts of faxifrage, which grows in large spreading tufts to a considerable way up the hills. It forms a surface of a pretty large texture, and grows on a kind of rotten turf, into which one sinks a foot or two at every step. This turf, dried, might, in cases of necessity, serve for fuel, and is the only thing we met with here that could possibly be applied to this use. There is another plant, plentifully enough feathered about the boggy declivities, which grows to near the height of two feet, and not much unlike a small cabbage, when it has shot into seeds. The leaves about the root are numerous, large, and rounded; narrower at the base, and ending in a small point. Those on the stalks are much smaller, oblong, and pointed. The stalks, which are often three or four, all rise separately from the root, and run into long cylindrical heads, composed of small flowers. It has not only the appearance, but the watery acid taste of the antiscorbutic plants, and yet differs materially from the whole tribe; so that we looked upon it as a production entirely peculiar to the place. We ate it frequently raw, and found it almost like the New Zealand feurvy-grafs. But it seemed to acquire a rank flavour by being boiled." In our gardens it might, by cultivation, so far improve as to be an excellent pot-herb. Two other small plants were found near the brooks and boggy places, which were eaten as salad; the one almost like garden cresses, and very fiery; and the other very mild. This last, though but small, is in itself a curiosity; having not only male and female, but what the botanists call androgynous plants. A coarse grass, which we cut down for the cattle, grows pretty plentifully in a few small spots about the sides of the harbour, with a smaller sort, which is rarer: and upon the flat ground, a sort of goose-grafs, and another small plant much like it. In short, the whole catalogue of plants does not exceed sixteen or eighteen, including some sorts of moss,

and a beautiful species of lichen, which grows upon the rocks higher up than the rest of the vegetable production. Nor is there even the least appearance of a shrub in the whole country. "Nature has been rather more bountiful in furnishing it with animals; though, strictly speaking, they are not inhabitants of the place, being all of the marine kind; and, in general, only using the land for breeding, and for a resting-place. The most considerable are seals, or (as we used to call them) sea-bears; being that sort called the urine seal. These come ashore to rest or breed; but they were not very numerous; which is not to be wondered at, as it is known, that these animals rather frequent out-rocks, and little islands lying off coasts, than bays or inlets. They were, at this time, shedding their hair, and so tame, that we killed what number we chose. No other quadruped, either of the sea or of the land kind, was seen; but a great number of birds, viz. ducks, petrels, albatrosses, flags, gulls, and sea-swallows." Penguin forms by far the greatest number of birds here, and are of three sorts. The flags of this place are of two sorts; the lesser cormorant or water-crow, and another which is black above with a white belly; the same that is found in New Zealand, Terra del Fuego, and the island of Georgia. Another sort of white bird, flocks of which flew about the bay, is very singular; having the base of the bill covered with horny crust. It is larger than a pigeon, with the bill black and the feet white, made like those of a curlew. Some of the people put it in competition with the duck, as food. The teine was hauled once, but we found only a few fish about the size of a small haddock." "The only shell-fish are a few limpets and mussels, and, among the fishes, a few small flat-fish and sazanomies were found.

"The hills are of a moderate height; yet many of their tops were covered with snow at this time, though answering to our June. Some of them have large quantities of stone irregularly heaped together at their foot, or on their sides. The sides of others, which form steep cliffs towards the sea, are rent from the top downward, and seem ready to fall off, having stones of a considerable size lying in the fissures. Some were of opinion, that frost might be the cause of these fissures, which I shall not dispute; but how others of the appearances could be effected, but by earthquakes, or some such severe shocks, I cannot say." "It appears that rain must be almost constant here, not only from the marks of large torrents having rushed down, but from the disposition of the country, which, even on the hills, is almost an entire bog or swamp, the ground sinking at every step. The rocks, or foundations of the hills, are composed chiefly of a dark blue, and very hard stone, intermixed with small particles of glimmer or quartz." "Another brownish brittle stone forms here some considerable rocks; and one which is blacker, and found in detached pieces, incloses bits of coarse quartz. A red, a dull yellow, and a purplish sand-stone are also found in small pieces; and pretty large lumps of semi-transparent quartz, disposed irregularly in polyedral pyramidal crystals of long shining fibres. Some small pieces of the common sort are met with in the brooks, made round by attrition; but none hard enough to resist a file. Nor were any of the other stones acted on by aquafortis, or attracted by the magnet. Nothing, that had the least appearance of an ore or metal, was seen." S. lat. $49^{\circ} 20'$. E. long. $69^{\circ} 30'$. Cook's Third Voyage, vol. 1.

KERI-CHETIB, are various readings in the Hebrew bible: *keri* signifies that which is read; and *chetib* that which is written. (See CHETIB and KERI.) It is generally said by the Jewish writers, that these corrections were introduced by Ezra; but it is most probable that they had their original

original from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Masoretes. Those kerî-chetib, which are in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption, that the others are of late date. These words amount to about a thousand; and Dr. Kennicott, in his "Dissertatio Generalis," remarks, that all of them, excepting fourteen, have been found in the text of manuscripts.

KERJE, or EL KERDSJE, in *Geography*, a district of the province of Neged, or Nedsjed, in Arabia, lying on the S.W. part of this province, and of course on the frontiers of Yemen, extending along the east of Hedjaz, or Hejaz, a considerable way to the N. In this district is the city of Imam, famous even before the days of Mahomet, for being the native city of Mozeilama, who set himself up as a prophet. This province also comprises other towns, among which is Salernia, on the confines of Yemen.

KERIGAR, a town of Hindoostan, in the foubah of Oude; 80 miles N. of Lucknow. N. lat. 28° 12'. E. long. 81° 25'.

KERIKERD, a town of Persia, in Chufistan, taken by Timur Bec in 1393; 15 miles N. of Sufer.

KERIMGUNGE, a town of Hindoostan, in Bahar; 24 miles S.E. of Hajypour.

KERION, a town of Thibet, 24 miles N.W. of Scrang-pour. N. lat. 32° 35'. E. long. 83°.

KERISONGAR, a lake of America, in the district of Maine, which sends its waters to Penobscot river.

KERIST, a town of Persia, in Faristan; 106 miles S.E. of Schiras.

KERKA, a town of Persia, in Chufistan; 45 miles W. of Toltar.

KERKELAN, a town of Asiatic Turkey, in the government of Sivas; 30 miles S.W. of Amalich.

KERKENI, a small island near the E. coast of Tunis. N. lat. 34° 50'. E. long. 11° 12'.

KERKER, a town of Asiatic Turkey, in Aladulia, on the Euphrates; 30 miles S. of Malatia.

KERKHA, a town of Persia, in Chufistan, on the Karai; 15 miles N. of Sufer.

KERKHERDERE, JOHN GERARD, in *Biography*, a learned professor of the university of Louvain, was born in the neighbourhood of Maelricht, about the year 1678. He pursued his academical studies at Louvain, and distinguished himself during several years for his accurate and comprehensive knowledge of history and the belles-lettres. In 1708, he was appointed historiographer to the emperor Joseph I, and died in the year 1738. He was author of many works in general history and theology, of which the principal are entitled "De Monarchia Romæ Paganæ secundum Concordiam inter S. S. Prophetas Danielelem et Joannem, &c.;" and "Prodromus Danielicus sive novi Conatus historici, critici, in celeberrimas difficultates Historiæ veteris Testamenti." These pieces are distinguished by profound erudition and great critical acumen, and are said to throw much light on many obscure passages in the scriptures relating to history, chronology, and geography. He published a Latin grammar, and a number of Latin poems.

KERKIL, or GHERGIL, in *Geography*, a town of Kurdistan; 35 miles S.E. of Amadich.

KERKISIA, or KERKISIEH, a town of Asiatic Turkey, in the province of Diarbekir, now decayed; eight miles N. of Rabba. N. lat. 35° 18'. E. long. 40° 10'.

KERKONI, a town of Georgia; 25 miles S.W. of Tedis.

KERKUK, a town of Kurdistan, the capital of a government, and residence of a pacha; surrounded with walls and defended by a castle; 150 miles N. of Bagdad. N. lat. 35° 50'. E. long. 43° 42'.

KERKWYCK, a town of Holland, in the department of Guelderland; 2 miles S. Bommel.

KERL, JOHN GASPAR, in *Biography*, a native of Saxony, but having acquired in early youth great reputation as an organ player, he was called to Vienna by the archduke Leopold, and appointed organist at his court; and manifesting signs of extraordinary genius for composition, he was placed under Giovanni Valentini, maestro di cappella at the Imperial court, and afterwards sent to Rome to study under Carissimi. Upon his return to Germany, great offers were made to him from the elector palatine, if he would enter into his service; but he declined them, and preferred settling at Munich, where he became maestro di cappella to the elector of Bavaria, Ferdinando Maria. His principal work as a composer was his "Modulatio organica super Magistris Octo Tonis Ecclesiasticis Responsens," engraved and published at Munich, in 1684. Kerl was esteemed one of the most able and skilful organists of his time. In a competition with some Italian musicians at the court of the elector of Bavaria, he is said by Walther to have composed a piece for the organ of wonderful contrivance, which none but himself could execute.

KERLE, JACOB DE, canon of the cathedral of Cambrai, from Ypres, was a very voluminous composer, contemporary with Galpar. He published "Peeces specialis succelli," in 1560; "Cafmen Italica musicis modulis ornata," 1570; "Cantiones sacras, 5 & 6 vocum," 1571; in 4to. Venice, 1573, two, four, and five-part motetti, four and five-part masses, and a Te Deum.

KERLEH, in *Geography*, a circar of Hindoostan, in Berar. N.W. of Goondwana, and S.E. of Hindia and Bopaltol.

KERMAN, anciently *Caramania*, a province of Persia, bounded on the N. by Segestan, on the E. by Mekran, on the S. by the Persian gulf, and on the W. by Faristan and Laristan. The northern part is barren and almost desert, without rivers or brooks, and the air unhealthy; towards the S. the air is more pure, and the land fertile. This province contains a city of the same name (see SIRGIAN); but some authors represent Yezd as the capital. (See YEZD.) The Guebres in this province are numerous; and are chiefly employed in manufactures of silks and silk. Here are some mines of copper, lead, and iron. The great desert of Kerman joins with the Great Saline desert, by the Nauben Dejam, and extends about 350 miles. The Saline desert extends from the vicinity of Kom to that of the sea of Zurra, in a line from E. to W. of about 400 British miles; the breadth from N. to S. being about 250. These two extensive deserts may be considered as stretching N.W. and S.E. for a space of about 700 miles, by a medial breadth of about 200 (without including in the length other 200 miles of the desert of Mekran), thus intersecting the wide empire of Persia into two nearly equal portions. This vast extent is impregnated with nitre and other salts, which taint the neighbouring lakes and rivers.

KERMAN. See SIRGIAN.

KERMANA, a town of Hindoostan, in Oude; 40 miles E. of Bahraitel.

KEMANSHER, a town of Persia, in the province of Kerman; 130 miles S.E. of Sirgian. N. lat. 28° 20'. E. long. 58° 50'.

KERMANTSCHUK, a town of Circassia, near which

the Mogul Tartars were surpris'd by the Russians in 1783, and defeated with great loss.

KERMANIN, a town of Persia, in the province of Ker- man; 160 miles S. E. of Sirghan.

KERMES, a kind of little animal, found in great plenty in many parts of Asia and the S. of Europe, on an evergreen of the oak kind, and forming excrescences, or *nidules*, of considerable use, both in physic and dyeing. That which was brought from Galatia and Armenia was formerly preferred; but at present it is chiefly gathered in Languedoc, Spain, and Portugal.

The kermes, called also *fourlet grain*, and by the Greeks *coccus baphica*, by the Latins *vermiculus*, by the French sometimes *vermilon*, or *grain de gale*, or *vermeil*, is about the size of a juniper-berry, round, smooth, and glossy; of a beautiful red colour, and full of a mucilaginous juice, of the same dye; it is found adhering to the bark on the stem and branches of a peculiar sort of scarlet oak. See *Coccus Illicis*.

Kermes has been supposed to derive its name from an Arabic word, signifying a little worm, *vermiculus*, whence it has been called *vermilon*. Atruc deduces the name from two Celtic words, one of which signifies an oak, the other an acorn.

This insect hangs to the tree from which it is gathered by means of a cottony down, which, according to M. Chaptal, has many characteristics of the caoutchouc, being insoluble in alcohol, melting at the heat of boiling water, and burning with a flame on the coals. In Languedoc, about the middle of May, when this insect has attained to its proper size, and when in colour and shape it resembles a small fly, the harvest commences, and the peasants begin to gather it. This harvest continues till about the middle of June, or later, if the great heats be retarded, or no violent rains fall; for one heavy storm of rain puts an end to the gathering for that year. The persons employ'd in this business are women, who set out early in the morning, with a lantern and a glazed earthen pot, so as to pick off the kermes from the branches before day, which is the most favourable time for this business. A single person may gather from one to two pounds a day. At the commencement of the harvest, the kermes weighs more, but fetches a less price than at the end, when it is drier and lighter.

According as the winter has been more or less mild, the harvest of kermes is the more or less plentiful; and the people always preface themselves a fine season, when the spring has been free from frosts and fogs. It is observed, that the lowest and oldest shrubs are always the fullest of this insect; and the kermes produced on those trees, which are in the neighbourhood of the sea, is always larger and finer than from the inland places.

It is no uncommon thing to have two harvests of kermes in a year. Those of the latter season are smaller and less valuable than those of the first, and are found not on the branches, but on the leaves of the shrub; which is just analogous to the custom of the gall-insects of all other kinds; all which, about this age, leave the branches to feed on the leaves, where their yet tender trunks can find an easier entrance.

From this analogy between the kermes, and other insects of the same class, it should seem worth while to try, whether some of those may not possess the same virtues in medicine, at least, if not in the arts. It is certain that the common oak produces a red-gall insect of the very shape of the kermes, and of the colour of the paler ones. Reaumur. See the article *Coccus*.

The kermes is of a vinous smell, a bitter, rough, and pun-

gent taste; and its pulp, or juice, is pregnant with numerous minute ova.

The animal retains these ova under her belly, till they hatch into a very numerous offspring.

Hence, when the kermes is dried, there comes out of it an infinite number of little insects, and flies, so small, that they are scarcely visible; and so much, that the whole inward substance seems converted into them. This shell is nothing but the body of the mother, distended by the growth of the eggs. To prevent this inconvenience, they usually steep the kermes in vinegar before it be dry; and thus prevent the exclusion of the ova, and kill such animals as are already hatched. It is afterwards dried on linen cloths. This operation gives it a colour like that of red wine. They draw the juice, or pulp, from the kermes by pounding it in a mortar, and then straining it through a sieve: of this they make a syrup, by adding a sufficient quantity of sugar. Sometimes they dry the pulp separate from the husk; which pulp, thus dried, they call *passel of kermes*. If the living insect be bruised, it gives out a red colour.

The kermes was formerly of great use in physic: esteemed to be cardiac, delicate, and astringent; to fortify the stomach, and prevent abortion. Of this was made that celebrated confection called *alhermes*.

The refringent and corroborant confection that was sold in the shops, was prepared by dissolving, in the heat of a water-bath, six ounces of fine sugar, in six ounces, by measure, of damask rose-water; then adding three ounces of the juice of kermes, warmed and strained; and after the whole had grown cold, mixing half a scruple of oil of cinnamon. This confection was taken, from a scruple to a dram, or more, either by itself, or in juleps, with which it mingles uniformly, without injuring their transparency.

The dried grains of kermes, if they have not been too long kept, give out, both to water and to rectified spirit, the same deep red colour, and nearly the same kind of smell and taste with those of the expressed juice. The inspissated extracts are considerably bitter, astringent, and of a kind of mild balsamic pungency.

It is, however, of greater use in dyeing scarlet; for which use, the manner of preparing it is as follows: the kermes being taken when ripe, they spread it on linen; and at first, while it abounds most in moisture, turn it twice or thrice a day, to prevent its heating, till such time as there appears a red powder among it: this they separate, by passing it through a sieve, and then again spread abroad the grain on the linen, till they perceive the same redness of powder, when they repeat the sifting: thus they proceed, while they discover any red powder on the surface of the grain, which is still passing through the sieve, till it yield no more.

In the beginning, when the small red grains are found to move, as they will always do, they are sprinkled over with strong vinegar, and rubbed between the hands. Were not this precaution taken, out of every grain would be formed little insects, which would be of no use in dyeing.

The grain being quite emptied of its pulp, or red powder, by the process above-mentioned, is washed in wine, and then exposed to the sun; after this, it is put up into the husks, formed into balls; and along with it the proportion of red dust that it had afforded.

According to M. Martigli's experiments, made at Montpellier, the kermes has the effect of galls, when mixed with vitriol; and makes a good ink: mixed with oil of tartar, or lime-water, its colour turns from a *vermilon* to a crimson colour. In a decoction of turnish flowers, it retains its proper colour. They have not been able to get any fixed essential salt from it; but a volatile salt it yields in

abundance; which, in M. Marsigli's opinion, would have a better effect in medicine, if taken in a liquid, than when enclosed in conferves and confections, which hinder its action.

Woolen cloth, prepared with alum and tartar, acquires, on being boiled with dry kermes berries, a durable deep red colour, called *scarlet in grain*, from the kermes having been formerly supposed to be the grain or seed of the tree; and *Venice scarlet*, from the greatest quantities having been dyed there. This colour wants the lustre and fire of the cochineal scarlet now in vogue, but in return is far more permanent, nor subject to be stained by dirt, or acid liquors; and when spotted with grease, may be cleaned again without injury to the colour.

Mr. Hellot observes, that the figured cloths to be seen in the old tapestries of Brussels, and the other manufactures of Flanders, which have scarcely lost any thing of their liveliness in standing for two hundred years, were all dyed with this ingredient; that, nevertheless, kermes is at present entirely in disuse among the European dyers, though said to be commonly employed in the Levant, and exported thither from Marseilles in considerable quantities: that when the kermes scarlet (now called an ox-blood colour) is wanted for tapestries, &c. our dyers endeavour to imitate it with cochineal; that as the colour is difficultly hit with cochineal alone, they generally add a portion of Brazil wood; and that the dyes thus produced, though at first more vivid than they ought to be, often lose their lustre before a year is at an end, and turn white and grey in an extraordinary manner: that kermes might again be introduced to very good advantage, as its colour is of the most durable kind, and as sundry shades are obtainable from it with less trouble and expence than from other drugs.

The same author has given a great number of experiments upon kermes, with different salts and metallic solutions. The principal of these are as follow:

On adding to the decoction of kermes a small quantity of solution of tin, the dark colour of the liquor is immediately brightened, and prepared woolen dyed therein, inclines more to the orange than with the kermes alone. With this improvement of the colour, it receives the imperfections, though not all the beauty of the cochineal scarlet; all alkaline substances staining the cloth, that is, destroying the effect of the acid solution.

Kermes, with cream of tartar, and as much of the solution of tin as is employed for the cochineal scarlet (without any alum) dyed unprepared cloth of an extremely vivid cinnamon colour. On dipping the cloth in a solution of alum, a part of the red re-appeared, but was not beautiful.

With cream of tartar, solution of tin, and alum in larger quantity than the tartar, this drug gives purplish colours, which vary according to the proportions of the ingredients.

If vitriolated tartar be substituted to the alum and tartar; and if after the kermes has been boiled in a solution of a small quantity of this salt, the stuff be boiled in this mixture for about an hour, the dye proves a beautiful kind of grey, in which the red is little perceived.

Glauber's salt, employed along with kermes, entirely destroys its redness, and gives an earthy grey colour. This dye is very perishable, on account of the particular nature of the saline substance, by means of which the tinging particles are applied; for Glauber's salt dissolves easily in cold water, and falls into a powder in the sun's heat. This obtains equally in all dyes; those drugs which afford most durable colours with tartar and vitriolated tartar, give

very perishable ones with the more dissoluble and calcinable salts.

Green and blue vitriol, substituted separately to alum, but taken in conjunction with cream of tartar, destroy likewise, or conceal the red colour of kermes, which in these two experiments has the same effect with galls, for it precipitates the iron of the green vitriol which tinges the cloth of a bright grey, and the copper of the blue, which gives a kind of olive dye. It likewise gave an olive dye with solution of copper made in aqua fortis; a certain mark, that it possesses, like galls, an affracting precipitating quality. It is probably the atringency of kermes that renders its dye so durable; for all the barks, woods, roots, and other substances that are affracting, yield permanent colours.

White vitriol, employed with crystals of tartar, changes the red colour of kermes into a violet. A tincture of bismuth itself made leisurely in four times its weight of spirit of nitre, diluted with an equal quantity of water, gave also a violet dye upon white cloth. All acids convert it to a cinnamon colour, which inclines more or less to red, according as the acids are weak, and their quantity small. Alkalies render its colour dull and dry. See Neumann's Chemistry, by Lewis, p. 508, &c.

To dye spun worsted with kermes, it is first boiled half an hour in water with bran; then two hours, in a fresh bath, with one-fifth of Roman alum, and one-tenth of tartar, to which four water is commonly added: after which it is taken out, tied up in a linen bag, and carried to a cool place, where it is left some days to obtain a full colour. As much kermes as equals three-fourths, or even the whole of the weight of the wool, is put into a warm bath, and the wool is put in at the first boiling. As cloth is more dense than wool, either spun or in the fleece, it requires one-fourth less of the salts in the boiling, and of kermes in the bath. Less proportions of kermes will produce lighter and paler colours. If a succession of shades be wanted, we must, as usual, begin with the deepest. Hellot directs a small handful of cot or refuse wool to be thrown into the boiler in which the kermes is, and to let it boil a moment before the wool to be dyed is put in. This will absorb a kind of black dregs, and the wool afterwards dipped will take a better colour. Before the wool that is just dyed is taken to the river, it may be dipped in a bath of water a little warm, in which a small quantity of soap has been dissolved. In this way the colour will acquire more brightness, though it will be rendered a little rosy, that is, will have a crimson cast. The colour imparted by kermes to wool, has much less bloom than the scarlet made with cochineal; whence the latter has been generally preferred, since the art of heightening its colour by means of solution of tin has been known. Berthollet.

Kermes Mineral, or, in modern language, the hydro-sulphuret of antimony. The kermes mineral was a preparation of Glauber, which the king of France bought of M. de la Ligerie, and made public in 1720. That receipt was in the following form: take a pound of Hungarian antimony, broken into thin pieces, according to the direction of its spicula; four ounces of nitre, fixed by charcoal; and a pint of rain water; boil them two hours; then filter the warm liquor, and when it cools, the kermes precipitates. The same antimony undergoes the same operations with the remaining liquor, to which three ounces of fixed nitre, and a pint of water are added. In a third boiling, two ounces of nitre, and a pint of water are to be added to the former lixivium. The kermes thus obtained is about a dram, and is well edulcorated by washing it with water, and burning spirit of wine on it; then it is dried for use.

Mr. Geoffroy shews, by many experiments, that the kermes is the reguline part of the antimony, joined to a fort of hepar sulphuris. He teaches us a much easier way of preparing this medicine, thus: Mix intimately the fine powder of two parts of antimony, and one of any fixed alkaline salt; melt these metals in a crucible; then having powdered them while hot, boil them two hours in a large quantity of water; after this, pass the liquor through paper, receiving it into a vessel, in which there is hot water, the kermes separates when it cools. The grosser parts, which do not pass through the paper, are to be boiled again, and filtrated as before; and the operation is to be repeated a third time, by which six or seven drams of kermes may be got out of every ounce of antimony. He says, he has seen effects like to those of mild kermes from antimony, reduced to such a fine powder, that none of the shining spicula are to be seen; and that the magistery of antimony, made by pouring spirit of nitre, or aqua regia, on the powder of antimony, and then educerating the mafs with water, has the same effects as kermes. Mem. de l'Acad. des Sciences, 1734, 1735. For the modern method of preparing it, see ANTIMONY.

Half a grain, or a grain of this powder, given every three or four hours, produces no violent effects; but by increasing the dose, it may be made to vomit, purge, and sweat.

When seven or eight grains are taken at once, it chiefly acts upon the primæ viæ, generally as an emetic and purgative. A dose of three or four grains is seldom emetic, and more frequently purgative. When taken in these quantities as an evacuant, a little of it passes also into the viæ secundæ & tertix. When it is administered in smaller doses, it passes almost entirely into the lacteal blood and lymphatic vessels. In these it occasions such spasms and oscillations as it does in the primæ viæ; so that it increases all secretions and excretions, but particularly those of urine, sweat, and expectoration; according to the dose, the nature of the disease, and the disposition of the patient. It produces singularly good effects in those diseases of the breast which proceed from fullness and obstruction. It may be administered in any vehicle, or incorporated in a bolus, with other suitable remedies. But it should never be joined with acids, when it is designed to act as kermes.

Some commend this medicine as the most universal relolvent and deobstruent; assuring us, that it almost infallibly cures pleuritis, peripneumonia, allmas, catarrhs, agriæ, small-pox, and many other diseases. Others are as positive, that it heats and thickens the blood, thereby increasing obstructions, and is particularly harmful in all inflammatory diseases.

This preparation was famous in France, and known by the name of *poudre des Chætes* &c. because a Carthusian monk, who got it from M. de la Ligerie, first brought it into vogue. See Hist. de l'Acad. des Sciences 1727, and the Mémoires for the same year, where it is said that Glauber was look'd upon as the first inventor of this remedy. Its effects, like those of many other antimonial preparations, are very various, which is frequently owing, as Mr. Geoffroy observes, to the different manner and care in making it. He adds that the more the kermes consists of a reguline earth revivified, the more it proves emetic. He also shews how to make a cumbræ with the kermes and mercury, and to prepare the vitriolic acid from the kermes. See Mem. de l'Acad. des Sciences, 1734. This preparation of antimony is now distal d; and in its room the phlogistic has adopted the "Sulphur antimonii præcipitatum vel auratum;" for the method of preparing and administering which, see ANTIMONY.

KERMISE, in *Geography*, a town of Arabia, in the province of Nedjed; 65 miles S.S.E. of Jassama.

KERN, or **KERN**, a term in the ancient Irish militia, signifying a *foot-soldier*.

Camden tells us, the arms of Ireland consisted of cavalry, called *galloglass*; and infantry, lightly armed, called *kerns*. The kerns bore swords and darts; to the last were broad cords, by which they could recover them after they had been launched out.

KERN, in the *English Salt-works*, a word used to signify the crystallizing, or floating of salt in the brine, which faintly evaporated in the boiler pan.

This word is also used by the farmers for the first coming of the bay-salt, made by the sun's heat in the Isles of Man, &c. See SALT.

KERN-STONE, in *Natural History*, a name given by the common people of many parts of England, to a peculiar sort of stone, which is found on the sides of hills in many countries, where the hills are rocky. Pyran sands afford a great number of stones of this kind; and the manner of their formation is thus: the rocks in the sides of the hills are continually covered over with the loose sand, which the winds stir up, and the sparry matter continually oozing out of the pores of these stones, with the wet, cements the grain of sand together. When one crust is thus formed, another is soon added, and so on till the whole mafs is of a considerable thickness; and the spar still serving as a general cement, the whole is held together, though but in a loose way, yet so as to resemble a sort of stone. The little grains of sand are still visible in all parts of this stone, and are what induced the people to call it kern-stone, as they call these *kerns*, or *kernels*. This account of the origin of the stone is easily proved, by putting a small piece of it into aquafortis, for this dissolves the spar, or cement, and the sand is left loose.

KERNES, in our *Laws*, signify idle persons, or vagabonds.

KERNING, in *Letter-Foundry*. See *Letter-Foundry*.

KERONA, in *Geography*, a town of Hindoostan, in the circle of Gohud; 15 miles N. of Dattcah.

KEROWLY, a town of Hindoostan, in the country of Agra; 74 miles S.W. of Agra. N. lat. 26° 27'. E. long. 77° 28'.

KERPEN, a town of France, in the department of the Roer, and chief place of a canton, in the district of Cologne; 10 miles E.S.E. of Juliers. N. lat. 50° 25'. E. long. 6° 41'. The place contains 1575, and the canton 10,419 inhabitants, in 37 communes.

KERRAH, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 65 miles S.S.W. of Gogo.

KERRERA, one of the smaller western islands of Scotland, near the coast of Argyre, where, in 1249, Alexander II. died, when he was endeavouring to visit the island out of the possession of the Norwegians; 12 miles S. of Lismore. N. lat. 56° 23'. W. long. 5° 52'.

KERRI, a town of the Arabian Irak, at the conflux of the Tigris and Euphrates; 52 miles N.W. of Balorah.

KERROO, a town of Hindoostan, in Villipour; 12 miles N.W. of Baddammy.

KERRY, a county of the province of Munster, Ireland, situated on the south-western coast of the island. It is bounded on the north by the river Shannon, which divides it from the county of Clare; on the east by the counties of Limerick and Cork; on the south-east by the latter county, and on the south-west and well by the Atlantic ocean. Its form is very irregular in consequence of two great projects of rivers of blood, comprising the barony of Iveagh and Cotcaghmore.

Corcaiguiny. It extends from north to south $53\frac{1}{2}$ ($67\frac{1}{2}$ English) miles, and in the broadest part from east to west 41 (52 English) miles; and contains 1012 square miles, or $647,650$ Irish acres, equal to $1,046,487$ English acres. It thus appears to be the fifth county of Ireland in point of extent, though after Galway its population is the thinnest, and it is one of the most backward in point of culture. The number of houses, at the time Dr. Beaufort wrote, was, by return to the house of commons, $19,395$, which at $5\frac{1}{2}$ to a house, would be $107,000$. This, however, falls much short of the present population. The number of parishes is 83 , all in the diocese of Ardferd and Aghadoe, but by unions they are reduced to 40 benefices, in which are 20 churches and only three glebe houses. Indeed, in this county the number of Roman Catholics is greater, in proportion to that of Protestants, than in almost any other. The number of members which represent this county in the Imperial parliament is three, two knights of the shire, and one member for the borough of Tralee. "It is not surprising," says Dr. Beaufort, "that this county should be thinly inhabited; barren mountains, and almost inaccessible rocks, render a large portion of it unfit for habitation and incapable of culture. Even the northern baronies, in which there is much good land, with few mountains, are far from level; and the cheerful aspect of cultivated fields and fine pastures, is frequently interrupted by bleak and stony hills; while tracts of bog intersect the narrow plain that extends from Cattleman harbour to the borders of the county of Cork, between the Mang and the Fleck. Grazing is more attended to than tillage, and this part of Kerry supplies many fat beasts of good size, and great numbers of store cattle; but the native breed of the country is extremely small, yet remarkably good for the pail, resembling the Alderney cow both in size and character; butter is consequently a considerable article among the exports of Kerry. The barony of Corcaiguiny forms a peninsula between the bays of Dingle and Tralee, and terminates at Dunmore Head, the most western point of Ireland and of Europe. It is full of mountains, but the high promontory of St. Brandon is eminent above the rest, and the mountain of Cahircource stands across the isthmus. Among the rough and high hills in the barony of Iveragh, and the southern part of Dunkerron, some pleasant valleys and improveable grounds are interperced; and in the island of Valentia, there are more inhabitants and a better culture than could be expected in so remote a spot. Glanerought is entirely covered with exceeding high and rugged hills, and separated from the county of Cork by an immense and almost impassable ridge of rocky mountains; over which there is but one pass, and that very difficult, called the Fielt's Leap; but the loftiest mountains in this county stand in a huge assemblage on the west and south of Killarney, half encompassing the lower, and entirely surrounding the upper lake. Of these, Mangerton is generally esteemed the highest, being 2500 feet above the sea, but it is doubted whether the craggy summits of Macgillcuddy's rocks do not surpass it in altitude. In this desolate tract, there are large herds of red deer, and abundance of game." To this account of Dr. Beaufort's, published almost 20 years ago, there is very little to be added. The state of agriculture is still very low, though a few gentlemen have turned their attention to the improvement of it. The barony of Iveragh, in particular, is in a very rude state. It should be noticed that the horses of Iveragh are much esteemed; they are a small but an excellent breed, climbing over the most rugged rocks, and both ascending and descending the steepest precipices with great facility and safety. They are strong and durable, easily supported, and not ill-shaped; so hard

as to stand abroad all winter, and will browse upon heath, furze, and other shrubs; and they have an easy, ambling gait. The principal lake is Lough Lane, generally called the lake of Killarney, for an account of which, see KILLARNEY. Many fine rivers water this county. The Cashing, which is formed by the union of the Feele and the Gale, is navigable for eight or ten miles. The Lane flows out of the lake of Killarney, which receives the Fleck. The Roughy pours its impetuous current into Kenmare river. The Mang, which is navigable to Cattleman, was the northern boundary of the ancient counts palatine of Desmond, and falls into Cattleman harbour, at the bottom of the great bay of Dingle, which can only admit vessels of moderate burden. Ventry bay, the roads of Dingle and Valentia, and Ballynakellig's bay, are small but commodious harbours. Kenmare river is a secure and capacious haven. The principal towns are Tralee, where the assizes are held, Killarney, Milltown, and Dingle, for which see the respective articles under those names. This county has several marble and slate quarries, and is not destitute of coal mines, but the abundance and cheapness of turf render them useless. The mines of copper, lead, &c. near Killarney will be noted under that head; iron was formerly obtained in great quantity, till the scarcity of timber put a stop to the works. The cider of Kerry, which is made of the cockage apple, is highly prized, and brings a great price; yet orchards are not very numerous, and that valuable fruit, with another excellent apple, the Kerry pippin, are little propagated, and difficult to be procured. The original possessors of this county were the O'Connors, O'Sullivan's, and, above all, the McCarthys, who were kings of Munster. The English families of Fitzmaurice and Fitzgerald early obtained settlements in it, and the head of the latter, who was created earl of Desmond, had the part of the county south of the Mang erected into a county palatine. The power of this family became very great, and the earls were often in opposition to the English government. In queen Elizabeth's time an act of attainder was passed, and all the possessions of the house of Desmond were divided amongst English settlers. From these some of the principal Protestant families are descended. Beaufort's Memoir of a Map of Ireland, Smith's History of Kerry.

KERRY Head, a cape of Ireland, in the county of Kerry, at the south extremity of the mouth of the river Shannon. Near this, very fine quartz crystals, both white, and amethyst are found, and for some time the latter were in great request. A set of ear-rings, a necklace, and other jewels composed of these amethysts, were presented to queen Caroline. This cape is in N. lat. $52^{\circ} 24'$. W. long. $9^{\circ} 47'$. This cape is sometimes called Ballyleigh Head. Smith. Beaufort.

KERRY Point, or, according to M'Kenzie, Kenry, a cape of the county of Down, Ireland. N. lat. $54^{\circ} 22'$. W. long. $5^{\circ} 22'$.

KERS, a town of Tyrol, on the river Inn; 12 miles N.E. of Landeck.

KERSCHAN, a town of Istria; 16 miles N.N.E. of Pedena.

KERSEY, JOHN, in *Biography*, an able mathematician and philologist, who flourished towards the close of the seventeenth, and beginning of the eighteenth centuries, and is chiefly known in the scientific world by his "Elements of Algebra," in two vols. folio, which is an ample and complete work, containing a full explanation of the problems of Diophantus: he was author likewise of "Dictionarium Anglo-Britannicum, or General English Dictionary."

KENSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KERSHAW, in *Geography*, a district of South Carolina, on Wateree river, which separates it from Richland district; 35 miles long, and 30 broad, containing 7340 inhabitants, of whom 2530 are slaves.

KERUA, a town of Persia, in the province of Kerman; 90 miles S.W. of Sirjan.

KERVIKER, a town of Natolia; 28 miles S.W. of Aphion-kara-hissar.

KERUN, a lake of Egypt, in a district forming a kind of excrescence to the west, about 30 miles long, and six broad; which has no appearance of being artificial.

KERYE, a town of Hindoostan, in Baghana; 25 miles W. of Naffuck.

KESALAX, a town of Sweden, in the government of Kuopio; 84 miles S.S.E. of Kuopio.

KESAVA, in *Mythology, a name of the Hindoo deity Vishnu; and of his principal avatars or incarnation of Krishna, and is said to refer to the beauty of his hair. The name is also written Kefavi, and sometimes pronounced Keflu. Budha, or Vishnu in that avatars, is also sometimes addressed as Kesava.*

KESAW, in *Geography*, a town of Hindoostan, in Bahar; 48 miles S.S.W. of Patna.

KESBAH, a town of Bengal; 23 miles S.S.E. of Moorshedabad.

KESCHIM, or **KESER**, a sea-port town of Arabia, in the province of Hadramaut, and the residence of a sovereign prince. Its inhabitants are said to be highly civilized, and to receive all strangers hospitably. The English sometimes visit this harbour. The cheick of Keschim is sometimes called king of Fartak; and his dominions comprehend a considerable number of cities, among which is that of Fartak. Besides his possessions on the continent, the cheick of Keschim is likewise head of the island of Soccatra, famous for its aloes. N. lat. 15 20'. E. long. 50 2'.

KESELBAUDEN, a town of Bohemia, in the circle of Koniggratz; 18 miles N.N.E. of Gitschin.

KESELDORF, a town of Bohemia, in the circle of Koniggratz; 10 miles E. of Gitschin.

KESH, **كش**, or **كش**, a town of Grand Bucharia, and capital of a district, of which Timur Bee was governor in 1360. This town was famous on account of its university for the study of sciences and law. It was the ordinary summer residence of Timur, and declared by him to be the second seat of his empire: he encompassed it with walls, and built a new palace in 1379. It was also called "Chaber-Sebz," or the green city, from the verdure of the gardens and meadows celebrated for rare and beautiful plants; and also "Coubbet Ehlmi Veladeh," which signifies the dome of science and virtue; 30 miles S. of Samarcand. N. lat. 39° 10'. E. long. 64 15'.

KESHAM, a town of Grand Bucharia; 70 miles W.S.W. of Badakshan.

KESHIK-DAG. See **OLYMPUS**.

KESHO, **Кешо**, or **Kachon**, a city of Asia, capital of the kingdom of Tonquin and the royal residence, is situated upon the navigable river Songkoy, or San Koy, about 40 leagues from the sea, and about 21 N. lat. With regard to size it may be compared with the most celebrated cities of Asia, and may at least equal that of Paris. On the 11 and 15th days of every moon are held great markets, which attract most of the inhabitants of the surrounding towns and villages to a considerable distance. The crowd is there so immense, that, though the streets be very wide, it becomes difficult to advance 100 paces in half an hour. Yet great order prevails, each merchandise and village having distinct streets for the

exposure of their articles. The streets are paved with brick, except some parts which are left for the passage of horses, elephants, and the king's carriages. Two-thirds of the houses are of wood, others of brick, among which are the factories of foreign merchants, distinguished amidst a multitude of huts constructed of bamboos and clay. The palaces of the Mulladarins, and the public buildings, which occupy large spaces of ground, are chiefly built with wood in a neat and solid manner, and decorated with sculptures and paintings. The roofs consist of tiles of different colours. The common houses are composed of a roof placed on wooden columns, commonly covered with straw, reeds, or large leaves of trees, which, accidents excepted, will last 30 or 40 years. These houses have no ceilings or stories, but are divided by partitions, on a ground floor; and the numerous windows are covered with gauze, or fine muslin, glass being almost unknown. This construction being very liable to take fire, the police only permits it to be lighted during certain hours of the day. The trade is very considerable; and the great river is crowded with barks and boats, conveying the merchandize of the provinces to the capital. Each boat pays about two-pence for the right of anchorage, and this small tax forms a considerable revenue. The royal palace occupies a considerable space in the finest quarter of the city, situated amidst groves, gardens, and canals, and difficult of access. The women and eunuchs never quit its precincts. Before a recent revolution, the triple walls of the ancient city and palace, the courts paved with marble, and other features of grandeur, displayed one of the most beautiful and vast edifices of Asia; for the circumference of the palace and gardens is said to have been from six to seven French miles. At present the capital is only defended by a quick hedge of bamboos. In the neighbourhood is quartered a body of soldiery; the arsenal and other magazines of ammunition being on the banks of the river. On the other side is the Chinese town, established by precaution; nor are other strangers allowed to enter the city without a special permission.

Abbé Richard cited in Pinkerton's *Geography*, vol. ii.

KESI, in *Hindoo Mythology*, a monster slain by Vishnu, or Krishna.

KESIRMAK, in *Geography*, a town of Poland, in the palatinate of Braclaw, near the Dnieister; 72 miles S. of Braclaw.

KESITAH. This word is to be met with in Genesis, and in Job; and is translated in the Septuagint and Vulgate, sheep or lambs. But the Rabbins and modern interpreters are generally of opinion, that Kesitah signifies rather a piece of money. Bochart and Eusebinus are of opinion the Septuagint meant *mina*, and not lambs; in Greek *λεπτα μνοα*, *λεπτα μνοα*, instead of *προβατα οφιαρα*. Now a mina was worth sixty Hebrew shekels, and consequently six pounds sixteen shillings and ten-pence halfpenny sterling; or nine pounds English, supposing, as Dr. Prideaux does, that a shekel is worth three shillings. M. de Pelletier of Rouen is of opinion, that Kesitah was a Persian coin, stamped on one side with an archer, (*Kesitah*, or *Keseth*, in Hebrew signifying a bow) and on the other with a lamb; that this was a gold coin known in the East by the name of a Daric, and was in value about twelve livres and ten-pence French money. A Daric is a piece of gold, worth, as Dr. Prideaux says, five and twenty shillings English. Several learned men, without mentioning the value of the Kesitah, say it was a silver coin, the impression whereof was a sheep; for which reason the Septuagint and Vulgate translate it by this name. Calmet is of opinion, that Kesitah was a purse of gold, or silver. In the East they reckon at present by purses: a purse in Persia consisting of 50 toman, which make 2518 penny

pieces of French money. The word *kifla* in Chaldee signifies a measure, or vessel. And Euthathius says that *kifla* is a Persian measure. Jonathan and the Targum of Jerusalem translate *Kefitah*, a pearl. Gen. xxxiii. 19. Job, xlii. 11. See his Connect. P. I. p. 101. See Calmet Comment. upon Gen. xxxiii. 19. Gen. xxv. 12. Job, xlii. 2, &c. and Dict. Bibl.

KESKER, or KURAB, in *Geography*, a town of Persia, in the province of Gilan, on the coast of the Caspian sea; 25 miles N.W. of Rehd.

KESOCOTTY, a town of Thibet; 40 miles S. of Gangotri.

KESON, a town of Hindoostan, in Lahore; 25 miles E.N.E. Jullindar.

KESSELDORF, a town of Saxony, in the margravate of Meissen; seven miles W. of Dresden.

KESTEN, a town of Syria; 25 miles W. of Aleppo.

KESTENUS, a town of Asiatic Turkey, in Natolia; 20 miles S. of Amasieh.

KESTREL, the English name of a hawk, called also the *flannel* and the *windhover*, and by authors the *tinnunculus* and *ceneris*. It builds with us in hollow oaks, and feeds on partridges and other birds.

KESWICK, in *Geography, a market town in the ward of Alderdale, in the county of Cumberland, England, is situated near the lower end of Derwentwater, on the eastern side of the extensive and beautiful vale of Keswick. The town consists of one long street: the houses are of stone, and were returned under the late population act at 290; the number of inhabitants 1350. A cotton factory has lately been established here; coarse woollen goods, carpets, blankets, kerseys, and some linens are also manufactured in the town and its vicinity. The chief trade is derived from the influx of travellers visiting the lakes; by whom Keswick, from its central situation, is much frequented; the number in one season, the summer of 1793, amounting to 1540. A weekly market is held on Saturdays; and a fair for cattle every fortnight from May to October. In this town two museums, collected by private persons, are open for public inspection; they contain specimens of almost every variety of the mineralogical substances of Cumberland, with many kinds of fossils, plants, antiques, and other curiosities. Keswick is distant from London 291 miles.*

About two miles to the south of the town, on an eminence called *Castle Rigge*, is a Druidical arrangement of stones, some standing upright, some fallen, and others leaning obliquely: the whole number is fifty; of which forty are disposed in an oval form, thirty paces by thirty-two in diameter; the other ten compose a recess or long square within the area on the east side, in conjunction with the stones of the oval; this is seven paces in length, and three in width. One stone is more than seven feet high, others exceed five feet; but the greater number are smaller. *Wells's Guide to the Lakes*. *Houfeman's Tour*. *Hutchinson's History*, &c. of Cumberland. *Beauties of England*, vol. iii.

KET, WILLIAM, in *Biography*, a tanner of Norfolk, who, in the reign of Edward VI. instigated a revolt against the government. The populace were at first excited by the complaints against inclosures, but finding their numbers increase, and already amounting to 20,000 strong, they grew insolent, and proceeded to more exorbitant pretensions. They demanded the suppression of the gentry; the placing of new commissioners about the king, and the re-establishment of the Popish religion. Ket assumed the government over them, and exercised his chief authority with the utmost arrogance. Having taken possession of Monksfield-hill, near Norwich, he

erected his tribunal under the branches of an old spreading oak, thence denominated the Oak of Reformation, and summoning the gentry to appear before him, he gave such decrees as might be expected from his character and situation. At length the earl of Warwick was sent against the rebels, and put them to flight. Two thousand fell, either in the action, or pursuit: Ket was taken and hanged at Norwich castle: nine of his followers suffered the like punishment on as many boughs of the Oak of Reformation, and the insurrection was thus entirely suppressed in 1549. *Hume*.

KETAH, in *Geography*, a town of Hindoostan, in Allahabad; 11 miles N. of Jounpou.

KETALEAH, a town of Hindoostan, in Bahar; 74 miles S.S.W. of Patna. N. lat. 24° 38'. E. long. 84° 36'.

KETCH, in the *Marine*, is a vessel with two masts. The masts are placed and rigged with sails, as the main and mizen-masts of a ship. Upon the bowsprit, and between that and the main-mast, they have stay-fails, and a very large jib. Formerly bomb-vessels and yachts were thus rigged, as ketches, but of late years as ships. At present only a few coasting vessels are rigged ketch fashion.

KETCHAR-TCHOU, in *Geography*, a town of Thibet; 10 miles S. of Giti.

KETCHENG-TASE TARTARS, a tribe of Tartars who inhabit the territory of Chinese Tartary, that lies on both the banks of the river Saghalien-Oula, and extends as far as the eastern sea. Their country, which is almost 150 leagues in length, contains only small villages, most of which are situated on the banks of the river. The language of these Tartars is different from that of the Manchews, and is distinguished by the name of "Fiatta." It is probably the same which is spoken by the other more northerly Tartars, who live beyond the mouth of the river Saghalien.

The Tartars of Ketcheng-tase do not shave their heads, as other people of the empire. They wear their hair tied in a knot with a ribbon, or enclosed in a bag behind. They appear to be less clownish than the Yupi-tase Tartars. They employ much of their time in hunting fables, and are obliged to pay a certain number of their skins in tribute.

KETCHICTEN, or **KESICTEN**, a country of Chinese Tartary, divided into two standars. N. lat. 43°. E. long. 117° 38'.

KETEMBER, a small island in the East Indian sea. S. lat. 6° 12'. E. long. 132° 53'.

KETEMBEH, a town of Natolia; 27 miles E. of Pergamo.

KETMIA, in *Botany*, the Syrian appellation of the shrub commonly called *Althæa frater*, *Hibiscus sriacus* of Linnæus. *Tournefort*, in his *Institutions*, 99, t. 26, adopts it for the whole genus of *Hibiscus*; see that article. Some species of *Bombax* and *Hermannia* have also occasionally been called by this name.

KETOI, in *Geography*, the name of the Kurile or Kurilskoi islands, in the N. Pacific ocean. This island is 30 versts in length, and about 10 in breadth. On it are seen high mountains, with their white rocky walls and summits: at the foot of these, and in the vallies, are forests of birch, alder, the forbus sylvæstris aucuparia, and several species of pines. The island nourishes white, black-bellied, and red foxes. The sea animal is great plentiful. It is uninhabited. N. lat. 48° 45'. E. long. 153° 38'.

KETRAN, **KITRAN**, or **Alkeiran**, a name given by some of the Arabian authors to the oil of cedar, called by the Greeks *cedria*. We have of later times formed the word *cedrum* upon this, and it has since been applied to the zophia of the ancients, a compound made of pitch and

and wax melted together, and used for covering the bottom of ships.

KETSIO, in *Geography*, a town of Sweden, in the province of Smaland; 40 miles N.W. of Wexio.

KETSKOI, a town of Russia, in the government of Tobolsk, seated on the river Ket, which runs into the Oby at Narim; 64 miles S.E. of Narim.

KETSKEMET, a town of Hungary; 92 miles E. of Camifeha.

KETERING is a populous market-town, situated on an easy ascent, in the hundred of Huxloe, Northamptonshire, England. In the time of the Saxons, it was called Cytrinog and Katringes: the lordship was granted by king Edwy, in the year 976, to his servant Ellfric. The church, which comprises a nave, north and south aisles, and a chancel, has a handsome tower and spire at the west end. The tower consists of three stories, in each of which are large windows, or window frames, of several compartments; the angles are flanked with double buttresses; under the embattled parapet runs an ornamented fascia, and at each corner is raised a small hexangular embattled turret; the whole surmounted by a handsome hexagonal crocketed spire, with three windows, diminishing in their size upwards, on the alternate sides. The following quaint prophetic promise is inscribed in this church: "Who so redis mi name shal have Godys blessing and our lady; and my wyfis doo fey the fame." Excepting the church, Kettering has nothing to attract or interest the antiquary. Near the middle of the town is a spacious area, surrounded by some private houses and shops of respectable appearance. Here are a feoffee-house, and a well endowed free-school; also an almshouse for six poor widows, and two dissenting meetings. By the returns made to parliament in 1801, the number of houses appears to be 641; of inhabitants, 3314; of which number 1770 were reported as employed in various trades and manufactures, and 221 in agriculture. The chief manufactures are those of lace-working, wool-combing, and the spinning and weaving of tammies and lalings. Kettering is 16 miles distant from Northampton, and 7 from London; has a well supplied weekly market on Fridays, and four annual fairs.

Kettering was the birth-place of Dr. John Gill, a dissenting minister of distinguished eminence, through the greater part of the last century. He was one of those self-taught sons of genius, who, by overcoming what are too often considered obstacles, have excelled in literature, although the world by the variety and extent of their acquisitions. See GILL, JOHN.

In the vicinity of this town, to the westward, in a road called Staunch Lane, are found what are denominated *kit-cats*, a kind of pulviced stones, apparently vitrifications. These, when pulverized, are considered singularly efficacious as a hyptic, and are consequently much esteemed. They are frequently discovered near the surface of the ground, but more usually in the calcareous strata, dug for making brick. In a spot named Stony-dale, between Kettering and Welby woods, in quarrying for stones, were found uras, bones, coins, and other antiquities. Bridge's History of Northamptonshire. Description of England, vol. xi.

KETTLE FALLS, a cataract on the river Utawa, in Canada; 90 miles W. of Montreal.

KETTLE RIVER, a river of Canada, which runs into Lake Erie, N. lat. 43°. W. long. 82° 51'. See GAZETTEER.

KETTLE, in the *Language of War*, a tray or funnel, used to a battery of mortars, by which it is sunk under ground.

KETTLE-Drum. See DRUM.

The kettle-drum, with trumpets, is the most essential band of any; each regiment of horse formerly had a pair.

The kettle-drummer rides always at the head of the squadron, and his post is on the right when the squadron is drawn up.

The kettle-drum, belonging to the royal regiment of artillery, is mounted on a superb wheeled carriage, gilt and ornamented, and drawn by four white horses, elegantly caparisoned, with a feat for the drum-major personal.

KETTLEWELL, JOHN, in *Biography*, was born at North-Allerton, in the county of York, in the year 1653. Here he received the elements of a liberal education, and in 1670 was entered a servitor at St Edmund Hall, in the university of Oxford. Having taken the degree of B.A., he was chosen a fellow of Lincolns-college, and became eminent as a tutor in that society. He took the degree of M.A. in 1677, entered holy orders, and became celebrated for his useful and instructive mode of preaching, and also for his great theological knowledge. In the year 1681, he published "Measures of Christian Obedience, &c. for the Promotion of the Piety and Peace of troubled Consciences;" which procured the author a high degree of reputation as a practical and controversial writer. It was dedicated to Dr. Compton, bishop of London, but when that prelate took an active part in the measures that terminated in the abdication of James II. Mr. Kettlewell ordered the dedication to be erased from all the copies of the work which were unfolded, and directed it to be omitted in future editions. The work itself induced the countess of Bedford to appoint him one of her domestic chaplains, and it procured for him the patronage of lord Digby, who, in 1782, presented him with the living of Coldhill, in Warwickshire. On this living he continued to discharge the duties of the pastoral office, with esteem and respect, till the year 1795, when he was deprived for refusing to take the oath of supremacy to king William and queen Mary. After his deprivation he resided to London, where he chiefly associated with gentlemen, who entertained similar sentiments with those which he himself avowed. In conjunction with Mr. Robert Nelson he concerted "a model of a fund of charity for the needy suffering, that is, the nonjuring clergy." He died of a consumption in 1695, when in the 42d year of his age. "He was," says his friend, "learned without a pride, vigilant and judicious without cunning; he served at the altar without either covetousness or ambition; he was devout without affectation; sincerely religious without moroseness; courteous and affable without flattery, or mean compliance; just without rigour; charitable without vanity, and heartily zealous for the interest of religion without faction." His works, which are numerous, were published in 1718, in two vols. folio. Ping. Brit.

KETU, in *Hindoo Mythology*, is the remnant of the descending node, or the dragon's tail. The following legend on this subject is from Moor's Hindoo Pantheon, p. 282. "Rahu was the son of Karyaka and Diti (see KARYAKA), according to some authorities; but other authorities say he was (perhaps the Sphinx) as his natural mother. He had seven arms; his lower parts ended in a tail, like that of a dragon, and his aspect was grim and gloomy, like the *deities* of the chaos, whence he had also the name of Tamaha. He was the avenger of all mischief among the Deities, or evil spirits, and his chief delight was to low upon an hour of the Devasas, or beneficent deities. When the gods had procured the Amrita, or elixir of immortality, he drank from the ocean (see KURMA-VARAHA), he divided several shares of them, and received a portion of it; but the Suras and Devasas, discovering the fraud, withheld his head and tail, so

his arms from the rest of his monstrous body. That part of the nectareous fluid, that he had time to swallow, secured his immortality; his trunk and dragon-like tail fell on the mountains of Malaya, where Mini, or Brahma, carefully preserved them by the name of Ketu; and, as if a complete body had been formed from them, like a dismembered polype, he is said to have adopted Ketu as his own child. The head, with two arms, fell on the sands of Barbara, where Pithemas was then walking with his wife Sinhika; they carried the Daitya to their palace, and adopted him as their son. This extravagant tale is no doubt astronomical; Rahu and Ketu being the *nodes*, or what astrologers call the head and tail of the dragon. It is added, that they appeared Vishnu, and obtained re-admission to the firmament, but were no longer visible from the earth, their enlightened sides being turned from it; that Rahu frives, during eclipses, to wreak vengeance on the Sun and Moon who detected him; and that Ketu often appears as a comet, a whirlwind, a fiery meteor, or water-spout, or a column of sand. Fifty-six comets are said, in a book called Chintamani, to have sprung from Ketu; and Rahu had a numerous progeny of Grahas, or crocodiles." A plate of the Hindoo zodiac includes Rahu and Ketu, the latter appearing merely as a head of a black colour, handsomely ornamented, and resting against a pillow. In a plate of the Indian zodiac, published by Sir W. Jones in the second volume of the Asiatic Researches, Ketu is mounted on a frog; the meaning of which, if it have any, has not been explained. See RAHU.

KETVER, in *Geography*, a town of Grand Bucharia, on a mountain, taken by Timur Bec in 1598; 100 miles S. of Badakhian.

KETZIN, a town of Brandenburg, in the Middle Mark; 8 miles N.W. of Potsdam.

KETZLDORF, a town of Bohemia, in the circle of Chrudim; 12 miles S.E. of Leutimfelh.

KEVALCOTTY, a town of Thibet; 18 miles N.W. of Sirinagur.

KEVEL of Buffon, in *Zoology*. *Antelope Kevella* of Linnæus, *Aby* of Kæmpfer, and *flat-horned antelope* of Pennant, has large horns, which are flattened, and bent in form of a lyre; the fur is yellowish, with pale streaks, and a dark coloured band runs along each side. This animal inhabits Barbary, Senegal, and Persia. It is about the size of a small roe; lives in large flocks, and, like most species of the genus, is reckoned very delicate food, though it has a musky odour when alive. In both sexes the horns are furrowed with prominent rings, usually from 14 to 18, except the ends, which are smooth: they are bent in the same manner with those of the antelope doesas, and in general the two animals resemble each other very much, except that the horns of this species are flattened, and have a greater number of rings.

KEVELS, or **CHIEVELS**, in a *Ship*, are two pieces of timber nailed to the inside of a ship, from whence the upper ends branch outward into arms or horns, serving to belay the great ropes, by which the bottoms of the mainsail and foresail are extended.

KEUKZER, in *Geography*, a town of Persia, in Farsistan; 40 miles S. of Jezdkait.

KEULA, a town of Germany, in the county of Schwartzburg; 11 miles N. of Mullaufen.

KEURA, in *Botany*. Fork. *Ægypt*. Arab. 172. Thunb. Nov. Gen. 35. See KAIDA and PANDANUS.

KEURBOOM RIVER, in *Geography*, a river on the S. coast of the colony of the Cape of Good Hope, which, like the Knyfia, runs up into the midst of tall forests, and might be navigated by boats to a considerable distance;

but its mouth, in Plettenberg's bay, is completely sanded up by the almost perpetual rolling swell of the sea, from the fourth-eastward upon the sandy beach.

KEURN, a town of Sweden, in the government of Wafä; 96 miles S.E. of Wafä.

KEVROI, a town of Russia, in the government of Archangel; 100 miles S.E. of Archangel.

KEUSCHBERG, or **KIADÉ**, a town of Saxony, remarkable for a victory obtained by Henry the Fowler over the Huns, in 933; 6 miles S.E. of Merseburg.

KEW, a village and parish in the hundred of Kingfishon, and county of Surry, England, is pleasantly seated on the southern banks of the river Thames, at the distance of 6½ miles westward of London. In the year 1800 it contained 85 houses, and 424 inhabitants. Previous to the year 1769, this place was only a hamlet to Kingfishon, but in that year an act of parliament was obtained to unite this and Peterfisham in one vicarage. The neighbouring inhabitants then subscribed to build a chapel on a piece of land given by Queen Anne. In this is a tablet to the memory of Jeremiah Meyer, a celebrated miniature painter; and in the adjoining cemetery repose the remains of Thomas Gainsborough, an artist of distinguished merit. (See GAINSBOROUGH.) Over the Thames, at this place, is a handsome stone bridge of seven arches, built from a design by Paine. It was opened in 1789, and is private property; to defray the expences of which a toll is exacted from all persons, carriages, horses, &c. passing over it. In this village is one of the royal palaces, which is held on lease. It is a small house, in a bad style of architecture, and in a flat, confined situation; yet, from its contiguity to the fine and interesting gardens of Kew, has continued a royal residence for many years. His present majesty, George III. has commenced a new palace upon a larger scale; but the works have been long suspended, and it is not improbable that both these structures may be utterly deserted by the next monarch. It is built from designs of James Wyatt, esq. The gardens of Kew are the pride and ornament of the place. They are comprised in 120 acres of land, and are planted with almost every species of exotic tree, shrub, and plant that can be preserved alive in this country. Sir William Chambers published a particular account of these gardens, and of the various ornamental buildings within them; but since Sir William's decease many additions and improvements have been made to the exotic garden. The late Mr. Aiton, gardener, gave some account of the rare plants, &c. cultivated here, in a work, entitled "Hortus Kewensis." The following are the names and dates of the different buildings erected by Sir William Chambers within these gardens; The Orangery, or Greenhouse, built in 1761, is 145 feet long, 30 feet wide, and 25 feet high. In the same year, and near the same building, was erected "The Temple of the Sun," partly resembling one of the temples of Balbec. In the Flower Garden is an "Aviary," and near it a "Menagerie," with a pavilion designed in imitation of a Chinese opening. Contiguous to this stands "The Temple of Bellona," built in 1760, of the prostyle kind, with portico tetrastyle Doric. In a solitary walk, near the lake, is "The Temple of the God Pan," of the monoprotus kind, of the Doric order, built in 1758. On an eminence stands "The Temple of Eolus," of similar figure with the preceding. Not far from this, at the head of the lake, is a Chinese octagon, of two stories, called "The House of Confucius," built from designs by Goupy. Passing hence through a winding shady walk, the stranger is next conducted to a Corinthian colonnade, called "The Theatre of Augustus," built in 1760. "The

Temple

Temple of Victory" is the next object, executed in 1759, in commemoration of a victory obtained by prince Ferdinand of Brunswick, in that year. The Allhandia is imitative of a morefque building; and the great Pagoda is built in imitation of the Chinese TAA. The bafe is a regular octagon of 49 feet in diameter, and the elevation is compofed of 10 primas, or 10 ftories, and is 163 feet in height. The other buildings are called the Mofque, the Gallery of Antiques, the Temple of Arethufa, and the Ruin. The Gardens at Kew are opened every Monday during the fummer. Lyfons's Environs of London.

KEWAN, a town of Hindooftan, in the circuit of Kitchwara; 10 miles W. of Sheergur.

KEWEH, a town of Natolia, on the Sakaria; 24 miles E. of Ifnik.

KEXHOLM, a town of Ruffia, in the government of Viborg, built on two iflands at the mouth of a river, on the fide of lake Ladoga. The houfes are conftituted of wood, but the town is well fortified, and defended by a citadel; 40 miles E.N.E. of Viborg. N. lat. 61°. E. long. 29° 50'.

KEXLEBODA, a town of Sweden, in the province of Smaland; 36 miles S.S.W. of Wexio.

KEY, GREAT, a small ifland in the Eaft Indian fea, about 50 miles long, and from 5 to 12 broad. S. lat. 52°. E. long. 133° 28'.

KEY, LITTLE, an ifland in the Eaft Indian fea, about 60 miles in circumference. S. lat. 52°. E. long. 133° 12'.

KEY, a little iron inftrument for the opening of locks.

L. Molinus has a treatife of keys, "De Clavibus Veterum," printed at Uptal. He derives the Latin name *clavis* from the Greek *κλειω*, *clawdo*, *I fhut*; or from the adverb *clavi*, *privately*; and adds that the ufe of keys is yet unknown in fome parts of Sweden.

The invention of keys is owing to one Theodor of Samos, according to Pliny and Polydore Virgil; but this muft be a miftake, the ufe of keys having been known before the fidge of Troy; mention even feems to be made of them in the nineteenth chapter of Genefis.

Molinus is of opinion, that keys, at firft, only ferved for the untying certain knots, wherewith they anciently fecured their doors; but the Laconic keys, he maintains, were nearly akin in ufe to our own: they confifted of three fingle teeth, and made the figure of an E; of which form there are ftill fome to be feen in the cabinets of the curious.

There was alfo another key, called *the key of Solomon*, made in the manner of a male fcrew, which had its correfponding female in a bolt affixed to the door.

KEY is hence become a general name for feveral things ferving to fhut up or clofe others.

KEY, or *Key-ftone*, of an Arch, or Vault, is the laft ftone placed atop thereof; which, being wider and fuller at the top than the bottom, wedges as it were, and binds in all the reft.

The key is different in the different orders; in the Tufcan and Doric, it is a plain ftone, only projecting; in the Ionic, it is cut, and waved fomewhat after the manner of confoles; in the Corinthian and Composite, it is a confole enriched with fculpture, foliage, &c.

M. Belidor makes the thicknefs of the arch-ftones of a bridge, one twenty-fourth part of the width of the arch; but Mr. Gantier, another experienced engineer, makes their length, in an arch twenty-four feet wide, two feet; in arches, forty-five, fixty, twenty-five, ninety wide, three, four, five, fix feet, refpectively: and it is obferved by Mr. Muller, that the thicknefs allowed by Belidor is not fuffi-

cient to prevent the weight of the arches from crufhing the key-ftones to pieces by their preffure againft one another. Muller's Praët. Fortif. p. 253.

The name key-ftones, or arch-ftones, is fometimes alfo given to all the ftones which form the fweep of an arch, or vault, anfwering to what the French more diftinctly call *vousfoirs*.

KEY is alfo ufed for the ecclefiaftical jurifdiction; particularly for the power of excommunicating, and abfolving. The Romanifts fay, the pope has the power of the key, and can open and fhut paradife as he pleafes; grounding their opinion on that expreffion of Jefus Chrift, "I will give thee the keys of the kingdom of heaven."

In St. Gregory we read, that it was the cuftom heretofore, for the popes to fend a golden key to princes, wherewith they always enfolded a little of the flings of St. Peter's chains, kept with great devotion at Rome; and that thefe keys were worn in the bofom, as being fuppofed to contain fome wonderful virtues.

KEY, in *Mufic*, is a certain fundamental found, or tone, to which the whole piece, be it concerto, fonata, cantata, &c. is accommodated; and with which it ufually begins, but always ends.

To get an idea of the ufe of the key, it may be obferved, that as in an oration there is a fubject, *viz.* fome principal perfon or thing, to which the difcourfe is referred, and which is always to be kept in view, that nothing unnatural and foreign to the fubject may be brought in; fo in every regular piece of mufic, there is one note, *viz.* the key, which regulates all the reft. The piece begins and ends in this; and this is, as it were, the mufical fubject, to which a regard muft be had in all the other founds of the piece. Again, as in an oration there are feveral diftinct articles, which refer to different fubjects, yet fo as they have a vifible connection with the principal fubject, which regulates and influences the whole; fo in mufic there may be various fubaltern fubjects, that is, various keys, to which the different parts of the piece may belong; but then, they muft be all under the influence of the firft and principal key, and have a fenfible connection with it.

To give a more diftinct notion of the key, we muft obferve, that the octave contains in it the whole principles of mufic, both with refpect to confonance or harmony, and difcord or melody; and if either feale be continued to a double octave, there will, in that cafe, be feven different orders of the degrees of an octave, proceeding from the feven different letters, with which the terms of the feale are marked. Any given found, therefore, *i. e.* a found of any determinate pitch or tune, may be made the key of the piece, by applying it to the feven natural founds arifing from the divifion of an octave, and repeating the octave above or below, at pleafure. The given found is applied as the principal note or key of the piece, by making frequent clofes or cadences upon it; and, in the progress of the melody, no other but thofe feven natural founds can be admitted, while the piece continues in that key, every other found being foreign to the fundamental, or key.

For inftance, fuppofe a fong begun in any found, and carried on upwards, or downwards, by degrees and harmonical diftances, fo as never to touch any founds, but what are referable to that firft found as a fundamental, *i. e.* are the true founds of the natural feale proceeding from the fundamental; and let the melody be fo conducted through thofe natural founds, as to clofe and terminate in the fundamental, or any of its octaves above or below; that found is called the key of the melody, becaufe it governs all the reft, limiting them fo far, as that they muft be to it, in the rela-

tion to the seven essential sounds of an octave; and when any other sound is brought in, it is called *going out of the key*.

From which way of speaking, *viz.* a song's continuing in, or going out of the key, it may be observed, that the whole octave, with its natural sounds, come under the idea of a key; though the fundamental or principal sound is, in a peculiar sense, called the key.

In which last sense of the word key, (*viz.* where it is applied to one fundamental sound,) another sense is said to be out of the key, when it has not the relation to that fundamental of any of the natural sounds belonging to the consecutive division of the octave.

Here too it must be added, with respect to the two different divisions of the octave, that a sound may belong to the same key, *i. e.* it may have a just musical relation to the same fundamental in one kind of division, and be out of the key with respect to another.

Now a piece of music may be carried through several keys; *i. e.* it may be given in one key, and be led out of that into another, by introducing some sound foreign to the first, and so on to another; but a regular piece must not only return to the first key, but those other keys too, must have a particular connection with the first. It may be added, that those other keys must be some of the natural sounds of the principal key, though not any of them at pleasure.

As to the distinctions of keys, we have already observed, that to constitute any given note or sound, a key, or fundamental sound, it must have the seven essential or natural notes added to it; out of which, or their octaves, all the notes of the piece must be taken, while it keeps within the key, *i. e.* within the government of that fundamental. It is evident, therefore, there are but two different species of keys, which arise according as we join the greater or less third, these being always accompanied with the sixth or seventh of the same species; the third *G*, for instance, with the sixth or seventh *G*, and the third *F* with the sixth and seventh *F*.

This distinction is expressed under the names of *sharp* key, which is that with the third *G*, &c. and the *flat* key, which is that with the third *F*, &c.: whence it is plain, that how many different closes forever there be in a piece, there can be but two keys, if we consider the essential difference of keys; every key being either flat or sharp, and every sharp key being the same, as to melody, as well as every flat one.

It must be observed, however, that in common practice the keys are said to be different, when nothing is considered but the different tone, or pitch of the sound, in which the different closes are made. In this sense, the same piece is said to be in different keys, according as it is begun in different sounds, or degrees of tune.

To prevent any confusion which might arise from using the same word in different senses, Mr. Malcolin proposes the word *mode* to be substituted instead of the word key, in the former sense; that is, where it expresses the melodious constitution of the octave, as it consists of seven essential and natural sounds, besides the fundamental; and in regard thereto two species of it, he proposes, that that with a third *G* be called the *greater mode*; and that with a third *F*, the *lesser mode*; appropriating the word key to those sounds of the piece in which the cadence is made; all of which may be called *different keys*, in respect of their different degrees of tune.

To distinguish then accurately between a *mode* and a key, he gives us this definition; *viz.* an octave, with all its natural and essential degrees, is a *mode*, with respect to the constitution, or manner of dividing it; but with respect to

its place in the scale of music, *i. e.* the degree or pitch of tune, it is a key; though that name is peculiarly applied to the fundamental.

Whence it follows that the same *mode* may be with different keys; *i. e.* an octave of sounds may be raised in the same order, and kind of degrees, which makes the same *mode*, and yet be begun higher or lower; *i. e.* be taken at different degrees of tune, with respect to the whole, which makes different keys; and *viz. contra*, that the same key may be with different *modes*, *i. e.* the extremes of two octaves may be in the same degree of tune, yet the division of them be different.

Keys also imply those little levers in the fore-part of an organ, harpsichord, or piano-forte, by means of which wind is given to the pipes, and the jacks or hammers strike the strings of the instrument.

In large organs there are generally three sets of keys; one for the great or full organ, one for the choir organ, and one for the swell and echoes. The long keys used to be black, and the short, or flats and sharps, white; but a contrary practice took place about the beginning of the last century.

KEYS, in *Sea Language*, a name given to certain rocks lying near the surface of the water, particularly in the West Indies.

KEY, a dry piece of tapering oak, driven into scarfs to fit them close.

KEY, in a *Naval Sense*. See *KAY*.

KEY, in *Polygraphy*, and *Steganography*, denotes the alphabet of a cipher; which is a secret known only to the person who writes the letter, and him who deciphers it. See *ALPHABET* and *CIPHER*.

Some ciphers have a single key, where the same characters are used throughout; in other ciphers, the characters are varied, and the key is doubled.

KEYS, a denomination given to the seeds of the ash.

KEY-Lough, in *Geography*, a lake of Ireland, in the northern part of the county of Roscommon, near the town of Boyle. The river Boyle flows through this lake, which is a beautiful piece of water, interspersed with several islands, some of them well wooded, and others highly cultivated. It is sometimes called Kington lough.

KEYNSHAM, a market town and parish in the hundred of Keynsham, and county of Somerset, England, is five miles east of Bristol, and seven west of Bath, on the great public road between those cities. In the year 1800, the town consisted of 286 houses, and contained 1591 inhabitants. Here was formerly a considerable woollen manufactory, but at present the staple trade of the town is malting. An abbey was founded here, in 1170, by William earl of Gloucester; and at the dissolution was granted to Thomas Bridges, some of whose descendants still have an interest in the lands annexed to it. The sub-stratum of the county is an immense rock; in which are imbedded vast numbers of the cornu-ammonis, or snake stones. Many of these are very large, and by the common people are believed to have originated from some miraculous power. The church is a large building. Here are a weekly market, and two annual fairs. Colleson's History, &c. of Somersetshire. 3 vols. 4to.

KEYSLER, JOHN GEORGE, in *Biography*, a celebrated traveller, was born at Thurnau, in the county of Giech, in the year 1683. He received a good education, and manifested, at an early period, a strong attachment to the sciences. At a proper time, and having laid in a good stock of elementary knowledge, he was entered at the university of Halle, where he studied jurisprudence, without neglecting the

the other branches of academical instruction. When he had finished his studies, he was invited to superintend the education of Charles Maximilian, and Christian Charles, counts of Giech-Buchan, with whom he repaired to Halle in 1717, and then accompanied them on their travels in foreign countries. In his journey he met with the celebrated Roiland, who recommended to his attention the immense field of German antiquities, as yet almost untouched; he accordingly caught at the idea, and formed the resolution of undertaking something systematic on the antiquities of Germany, and the origin of its inhabitants. He went through the principal towns in Germany and the Low Countries, collecting, as they occurred, materials for his intended work. In consequence of the great reputation which he acquired in his first tour, M. Bernstorff, minister of his Britannic majesty in Hanover, an enlightened statesman, engaged him as a travelling tutor to his sons. After remaining two years in Hanover, he obtained permission, in 1718, to visit England for his own improvement. At London and Oxford he met with a kind reception, but nothing, probably, pleased him more, than the honour of being elected a member of the Royal Society. He wrote some tracts at this period, one containing several curious observations on Stonehenge, and a dissertation on the consecrated mistletoe of the Druids; and on his return to Hanover in 1720, he published his immortal work, entitled "Antiquitates selectæ Septentrionales et Celtaicæ," in which the author is exceedingly happy in solving a great number of difficulties never before sufficiently explained. In 1727, Keyser's pupils, who continued under his care more than ten years, accompanied him to Tubingen, and, in 1729, they began their travels, which comprised the whole of Germany, Switzerland, Italy, Hungary, France, England, and Holland. On their return ample provision was made for the tutor, and they entrusted him, at the same time, with a valuable library, their collection of medals and natural curiosities, and even gave him the chief management of their domestic concerns. M. Keyser, in the course of his travels, had made a valuable collection of books, antiques, &c. to which he added, by purchase, that of M. Eckard, and to prevent the whole from being dispersed, he destined it after his death to be added to that of M. Bernstorff. He was of an open and communicative disposition, and ready to assist in their literary labours, all those who stood in need of his advice. He rendered M. Eckard great service when about to publish his German Antiquities, after the model of the "Theaurus Antiquitatum Græcarum et Romanarum," by Grevius and Gronovius. This work was never printed. In 1728, when M. Jark reprinted the work of Schedius, on the German deities, Keyser not only corrected it, but furnished him with considerable additions, and subjoined an ingenious dissertation "De cultu Solis." He died suddenly, in June 1743, at Stentenbourg, an estate he was owing to M. Bernstorff. His travels were translated into the English language from the second edition in German, and published in four vols. 4to. Gen. Biog.

KEYSERSFÜL, in *Geography*, a town of Switzerland, in the county of Baden, on the river Rhine, with a wooden bridge to Schaffhausen; 9 miles N.N.E. of Baden. N. lat. 47° 37'. E. long. 8 15.

KEY-SIMA, an island of Japan, between Corea and the W. coast of Nippon.

KEY-WALE-LA, an island in the East Indian sea, about 45 miles in circumference. S. lat. 5 36'. E. long. 138.

KEYWAWA, a small island near Charleston harbour, South Carolina.

KEYZER'S BAY, a bay on the S. coast of the island of Sumatra. N. lat. 5 40'. E. long. 104 38'.

KEZEMSKA, a town of Russia, in the government of Irkutsk, on the Angara; 40 miles S.W. of Ilimsk.

KEZEREH, a town of Natolia; 40 miles E. of Castamena.

KEZIL, a river of Persia, which runs into the Caspian sea, near Rofhd.

KEZIL, *Khefil*, or *Khezil*, a river of Asia, which rises in the mountains of Bucharia, N.E. of Samarcand, and formerly ran into the Caspian sea; but the Russians, in 1719, endeavouring to trace the stream, were put to death by the Tartars, who turned the current of the river into lake Aral, by uniting it with the Gihon; but this change of the course of the Gihon has been disputed. See OXUS. See also KHARASM.

KEZIL-AGZAB, a town of Persia, in the province of Ghilan; 20 miles N. of Lenkeran.

KEZIL-KAJA, a town of Natolia; 25 miles S. of Izbarteh.

KEZIN, a town of Poland, in Volhynia; 10 miles W. of Krzeminec.

KEZMA, a town of Russia, in the government of Irkutsk, on the Tunguska; 160 miles N.N.W. of Ilimsk.

KEZUC, a town of Persian Armenia; 4 miles S. of Erivan.

KHABUR, a river of Asiatic Turkey, which rises 20 miles E. of Harran, and runs into the Euphrates at Kerkiia.—Also, a river of Kurdistan, which passes by Betlis and runs into the Tigris; 15 miles S.E. of Gezara.

KHADARAH, EL, or CHADRA, a town of Algiers, in the province of Tremecen, seated on an eminence near the river Shelliff. Dr. Shaw concludes from its ruins, which are about three miles in circumference, that it was once a large place. According to Ptolemy, its ancient name was "Zuechabbari," and according to Pliny "Succabar" and "Colonia Augusta." Eastward are the remains of a stone bridge, probably the only one ever built over the Shelliff, though travellers are much inconvenienced, in the winter season, by waiting a whole month before they can ford it; 55 miles S.S.W. of Algiers.

KHALEKAN, EBN, in *Biography*, a celebrated biographer of illustrious Mussulmen, particularly of such as were distinguished by their proficiency in the sciences, was born in the year 608, and died in 661 of the Hegira. His work is entitled "Vasaf Alaiian," or "The Deaths of illustrious Men," and was undertaken by him at the city of Cairo, in Egypt, under the reign of Bibars, a sultan of the Mameluke dynasty. Being appointed by that prince cadi of Damascus in the year 659, the duties of his new employment so far interrupted his studies, that he was not able to finish his work before the year 672.

KHAMI, in *Geography* See HAMI.

KHAMIES BERG, a cluster of mountains belonging to the colony of the Cape of Good Hope, situated in the middle of the country, that was formerly inhabited by the Namaqua Hottentot, at the distance of five days' journey N.W. from the *Hantam*, (which see,) over a dry sandy desert almost destitute of water. This cluster of mountains being the best, and indeed almost the only habitable part in the Namaqua country, has been taken possession of by the wandering peasantry, who, to the advantage of a good grazing country, had the additional inducement of settling there, from the easy means of increasing their flock of sheep from the herds of the native Hottentots, who, however, are now so reduced and scattered among the Dutch farms, as scarcely to be considered a distinct tribe of people. The

copper mountains commence where the Khames-berg ends, the whole surface of which is said to be covered with malachite, or the carbonate of copper, and cupreous pyrites. But the ores of these mountains, though abundant and rich, are of no great value on account of the total want of every kind of fuel to smelt them, as well as of their very great distance from the Cape, and from there being neither bay nor river, where they could be put on board of coasting vessels. In the Khames-berg is also found, in large blocks, that beautiful species of stone, to which mineralogists have given the name of Prehnite.

KHAMIR. See CHAMIR.

KHAN, or **KAN,** the name of an officer in Persia, answering to that of *governor* in Europe. There are khans of provinces, countries, and cities, who have different additions to distinguish them. In the language of the north of Asia, this title expresses the full extent of the regal dignity.

KHANAKA, a town of Kharafm, on the Gihor; 250 miles S.W. of Samarcand.

KHANGA, EL, a town of Egypt, formerly enriched by the caravans which passed from Cairo to Syria, and containing about 1000 inhabitants; 12 miles N. E. of Cairo.

KHANUDUM, a large lake of Persia, in the province of Adirbetzan, 60 miles long and 30 broad; called also the lake of Urmia; 30 miles S.W. of Tabris.

KHARA, a malignant being, according to Indian legends, who commanded a legion of 14,000 demons, like himself, in the wars of Lanka, as Homerically described in the Rama-yana. He espoused the cause of Ravana, and was with his followers destroyed by Rama.

KHARASM. CHARASM, or *Kharizm*, in *Geography*, a country of Asia, bordered on the N. by Turkellan, on the E. by Great Bucharia, on the S. by Chorasan, or Korafan, and on the W. by the Caspian sea; extending from the Gihon, or Amu to this sea, and terminating N. and S. in wide deserts. Its chief town is Khiva. This country is about 350 miles in length and breadth, and in the time of Zingis, was a powerful kingdom, including at that time Korafan, and a part of Great Bucharia. D'Anville supposes, that this country was the Chorasmia of antiquity, and he supposes Korafan to have been the seat of the Parthians. In the 10th century, Ebn Haukal calls this country Khwarezm, and says that the river Gihon flows into the lake of Khwarezm, while he terms the Caspian the sea of Khozr. We have reason to believe, that the deserts, probably occasioned by the decomposition of hills of sand-stone, have increased in Kharafm; and these encroachments may be estimated from the historians of Zingis and Timur. At present this state is almost restricted to the district of *Khiva* (which see), the circuit of which may be performed on horseback in three days; but there are five walled cities or rather towns within half a day's journey of each other. The inhabitants are Turcomans and Usbeks, besides the Sarts, which perhaps is another name for the Tadjiks. The khan is absolute and altogether independent of any other power, except the Mulla Bashi, or high priest, by whom he is controlled. The Kiev'nki Tartars differ very little from the Kirgeese or *Karghises* (which see), but surpass them in cunning and treachery. Their manners are the same, only that the Kirgeese live in tents, whilst the others inhabit cities and villages. Their only trade is with Bokhara and Persia, whether they carry cattle, furs, and hides, all which they have from the Kirgeese and Turcoman Tartars, who are often very troublesome neighbours to them. The place itself produces little more than cotton, lamb-furs of a very

mean quality, and a small quantity of raw silk, some of which they manufacture. Hanway, cited by Pinkerton. (See *KITVA*.) The history of Kharafm has been well illustrated by its king, or khan, Abulghazi, in his general history of the Tartars, written about the year 1660. See his biographical article.

KHAREJITES, the first heretical sect among the Mahometans, which revolted from Ali in the 37th year of the Hegira; and hence their name, which signifies "revolters," or "rebels." This sect commenced with 12,000 men, who abandoned Ali and his cause, after having fought under him at the battle of Seifein, taking offence at his submitting the decision of his right to the caliphate, which Moawiyah disputed with him, to arbitration, though they themselves had first obliged him to do it. They were also called Mohakkemites, or Judicarians; because the reason which they gave for their revolt was, that Ali had referred a matter concerning the religion of God to the judgment of men, whereas the judgment, in such case, belonged only to God. The heresy of the Kharejites consisted in two particulars; viz. 1. That they affirmed a man might be promoted to the dignity of Imam, or prince, though he was not of the tribe of Koreih, nor even a freeman, provided he was a just and pious person, and endowed with the other requisite qualifications, and also held, that the Imam, if he turned aside from the truth, might be deposed or put to death, and that there was no absolute necessity for any Imam at all in the world. 2. That they charged Ali with sin, for having left an affair to the judgment of men, which ought to have been determined by God alone; and went so far as to declare him guilty of infidelity, and to curse him, on that account. In the following year, viz. the 38th of the Hegira, all the Kharejites, who persisted in their rebellion, to the number of 4000, were cut to pieces by Ali. Nine of them are said to have escaped, two into Amu, two into Kerman, two into Segestan, two into Mesopotamia, and one to Tel Mawrun; and to have propagated their heresy in those places, the same remaining there to this day. The principal sects of the Kharejites, besides the Mohakkemites already mentioned, are six; which, differing in other respects, agree in absolutely rejecting Othman and Ali, preferring the doing of this to the greatest obedience, and allowing marriages to be imparted on no other terms; that they account those who are guilty of grievous sins to be infidels; and that they hold it necessary to resist the Imam when he transgresses the law. Sale's Koran, Intro.

KHATANGA, in *Geography*, a river of Russia, that has its source in a lake in the government of Tobolsk, about 68 N. lat. and 110 long; and in 120 long. rushes into a large bay of the Frozen ocean, called Khatankain Guba. This river pursues the greatest part of its course through a low and very marshy country; and the most considerable rivers which add to its waters are the Kheta and the Potigan.

KHATOUN-SERA, a town of Asiatic Turkey, in Caramania; 12 miles S. of Cogni.

KHAUAR, or **CREVER,** a town of Persia, in the province of Irak, seated on a mountain, which terminates the province of Irak towards Mazanderan, and gives name to a pass, called the Strait of Khauar; 200 miles N. of Ispahan.

KHAUASH, a town of Persia, in Segestan; 18 miles N. of Zareng.

KHAULAN, a small district of Arabia, in the province of Yemen; a few leagues S.E. of Sana. It is governed by an independent sheick, the representative of a very ancient family; who ordinarily resides at Beit Rodje, a small town in his own dominions. Several places which once be-

longed to the prince of Khautan have been gradually annexed to the dominions of the Imaan.—Also, a small district of Arabia, lying among the mountains westward from Saade, upon the road from Sana to Mecca, four days journey from Hah, the extreme city upon that side of the fierrier's territory. It has an independent scheidick.

KHAZARES, the name of a bold and powerful Turkish tribe, which first occupied the isthmus of Caucasus between the Caspian and the sea of Azof. In the seventh century they began to be famous, and till towards the middle of the ninth century their state was increasing and flourishing. About that time the empire of the Khazares extended from the Volga and the Caspian, across the Caucasian isthmus, the peninsula of the Crimea, and what is now the south of Russia, as far as to Moldavia and Walachia; and several Slavonian tribes, particularly the Polianes about Kief and on the Dnieper, the Severans, on the rivers Desna, Sem, and Sula, the Viatitches on the Oka, and the Radimitches on the Socha, were tributary to them. But after the year 862, three nations effected their downfall; *viz.* the Russians, the Petchenegrans, and the Uzes. The Varagian or Russian leaders, Oskold and Dir, ravished from them the dominion over the Polianes; Oleg, in 884, reduced the Severans and the Radimitches to his authority. His successor, in 904, conquered the territory of the Viatitches and the nine Khazarian countries on the isthmus of Caucasus. The Khazares lost the residue of their dominion about 1016, to the combined forces of the Russians and Romans of the east. The nation, indeed, continued for some time longer, but they were submissive and tributary to the Russians. Tooke's Russ. Emp. vol. 1.

KHAZINE, the grand seignior's treasury. See **TREASURY**, and **ESCHEQUEUR**.

Here are kept registers of receipts, accounts of provinces, in drawers, marked with the years, and the places' names: here is also kept part of the emperor's wardrobe.

Every day of the divan this treasury is opened, either to take out, or put something in; and the principal officers, who have the charge of it, are all to assist at this opening. The *tehaouch-bachi*, in their presence, first breaks the wax with which the key-hole had been sealed up, and carrying it to the grand vizir, that minister first kisses it, and then draws out of his bosom the grand seignior's gold seal. In the mean time he looks narrowly after the officer, who, when he has done his business in the treasury, locks and seals up the place; and returns the seal to the vizir with the same ceremony as before.

Besides this, there are other apartments for the money, where the officers are never allowed to enter with any clothes that have pockets in them.

KHEIR, in *Geography*, a town of Hindoostan, in the country of Visapour; 18 miles N. of Poonah.

KHEIVAN, a town of Arabia, in a district of the same name, in the extensive country of Hachid-u-Bekil, is remarkable for having been the seat, first of the Hanjare monarchs, and afterwards of the Imams. Ruins of a very ancient palace are still to be seen there.

KHEMLASA, a large walled town of Hindoostan, adjoining to which is a fort, built upon a hill. It belongs to the district of Sagur, which is distant about 17 cofs to the south eastward.

KHIEBAR, or **KEIBAR**. See **HEDJAS**.

KHIEVA, or **KHIVA**, a district of KHARASM, situated on a rising ground, W. of the river Gihon, and having three gates, and a very thick, strong wall of earth, much

higher than the houses, with turrets at small distances, and a broad deep ditch full of water. It occupies a considerable space, and commands a pleasant prospect of the adjacent plains, which the industry of the natives has rendered very fertile; but the houses are low, mostly built with mud, the roofs flat, and covered with earth. The city of Urglitz, which was formerly the capital of Kharasm, is now in ruins, with only a mosque remaining. The most southern town in the dominions of Khiva is Az-rub, or Hazarasp, which adjoins to the great desert, called *Kerakum*, which the Khiva is said to stand at the distance of 17 days from the Caspian sea, and from Orenburg 33, computing the day's journey at 40 versts; equal, by Hanway's account, to 17 British miles; so that the distance of Khiva from the Caspian would be 459 British miles, while our maps scarcely allow 300. In 1739, the khan of Khiva assembled an army of 20,000 men, to oppose Nadir; but the city surrendered at discretion. According to the information of Pallas, the people of Khiva bring to Orenburg considerable quantities of raw cotton. But the coasts of the Caspian are held by some remains of Turcomans in the north, and by Uzbeks in the south. A more considerable trade is maintained with *Mangyblak*, which see. As the merchants of Khiva brought gold and gems to Astrachan, probably from the two Bucharias, an idea was suggested to Peter the Great, that these precious products were found in Kharasm, in consequence of which he attempted a settlement. But the Russians, to the number of 3000, advancing under the command of a Circassian prince, called Beckawitz, towards Khiva, were all cut off by the Uzbeks. Upon this occasion, as it has been said, these Tartars changed the course of the Khefel or Keviz, which formerly fell into the Caspian; but as this river is on the E. of the Gihon, it is clear that it could not pass that river to join the Caspian; and in the 10th century the Gihon is known to have flowed into the Aral. It is not improbable that, before the deserts encroached on Kharasm, one or two rivers might have run to the Caspian from the east; or perhaps these fables may have arisen from one or two small branches of the Amu having joined that sea. Pinkerton. Khiva is 263 miles N.W. of Samarcand. N. lat. 41° 30'. E. long. 58° 25'.

KHILLI, a cape on the N.E. coast of the island of Negropont. N. lat. 38° 36'. E. long. 24° 4'.

KHILLIS, a town of Syria, governed by an Aga; which, some years ago, was created into a pachalic, to restrain the Arabs; but the pacha being defeated, it was again put under an Aga. It is situated at the foot of Mount Taurus, and is a celebrated market for cotton; 25 miles N.N.W. of Aleppo.

KHIRTPOOR, a town of Nepaul, the reduction of which cost the conqueror so much trouble, that in resentment of the resistance made by the inhabitants, he cut off all the men's noses. Col. Kirkpatrick, at the distance of 23 years, was reminded of this act of barbarity, by observing that a great proportion of the people appointed to transport his baggage across the hills were deprived of their noses. To perpetuate this exploit, the sovereign ordered the name of the place to be changed to *Nakkatapoor*, which signifies "the town of men without noses."

KHONDEMIR, in *Biography*, a celebrated Persian historian, who obtained the patronage of the emir Ali Shir, a lover and protector of men of letters, whom he inspired with a passion for his own favourite principal, and with the desire of forming a collection of the principal writers in this class of science. The great object which Khondemir had in view, was to facilitate the study of history by drawing it up in a

more methodical manner, than had been done by other writers, and the result of his labours was a judicious compendium of oriental history from the creation of the world to the year 875 of the Hegira, under the title of "Khelafat Alaḥkar ḥi Veian Aḥual Alakhiar," that is, "A faithful and correct Summary of what is valuable and interesting in the most authentic and genuine Histories."

KHORASAN, KORASAN, Chorafan, or Corafan, in *Geography*, a province of Persia, situated in the N.E., and bound'd on the N. by Kharafin, on the E. by Bucharia and Candahar, on the N.E. by the river Gihon or Oxus, on the S. by the lake of Zurrak, or Durrah, and Segeltan, and on the W. by the province of Mazanderan and the Caspian sea. This province comprehends the ancient countries of Margiana N. and Ariana S. Its length is estimated at 450 miles, and its breadth at 420. This country was comprehended within the dominions of Timur Bee, who conquered it in 1396, and granted it to his son Mirza Charoc, together with Mazanderan and Segeltan. Its capital is Herat.

KHORFAKAN, a sea-port of Arabia, in the province of Oman, situated in the bottom of a bay of the Arabian gulf, which is only open to the east. On the S.E. side is a harbour for boats. The town is now in a reduced state, consisting mostly of fishermen's huts, with few houses of stone. N. lat. 25° 15'. E. long. 56° 14'.

KHORREABAD, or CURREMABAD, a town of Persia, in the province of Irak, situated on a river which runs into the Karafu; 200 miles W.N.W. of Ispahan. N. lat. 34° 35'. E. long. 48° 5'.

KHOSCIAH, a town of Arabia, in the province of Hedjas; 26 miles S.W. of Medina.

KHOUD, a town of Hindooistan, in Orissa; 35 miles S. of Koanjoor.

KHUNTIJANT, a town of Hindooistan, in Guzerat; 20 miles N. of Surat.

KIA, a town on the E. coast of the island of Gilolo.

KIAB, a town of Persia, in the province of Chlusitan, on the Karafu; 120 miles N. of Bassora. N. lat. 32° 30'. E. long. 47° 40'.—Also, an Arabian tribe, called also by the Persians "Ḥsjeb," who inhabit the furthest point upon the side of the Persian gulf. The territory of this tribe extends from the desert of Arabia to the country of the Hindian, and northward to the principality of Havifa. It is watered by several rivers, large and small. It abounds in dates, rice, grain, and pasture. Its principal cities are Damel, lying within Persia, Hafar, and Ghoban, the feat of a scheick, near one of the mouths of the Euphrates.

KIA-KING, a city of the first rank in China, in the province of Tche-kiang. This city is large and populous, and carries on a good trade; its suburbs are extensive, and over the canals and ditches are several bridges, and these is not a house in the town, in which silk-worms are not bred. Canals are cut through all parts of the town; and its streets are ornamented with beautiful piazzas, which shelter passengers from the sun and rain. There are many triumphal arches within and without the city, and 15 marble towers on the sides of the canal that lies to the west of the city, by which all the barks pass. Seven cities of the third class are dependant upon it. N. lat. 36° 50'. E. long. 120° 14'.

KIAKILUMA, one of the small Japanese islands. N. lat. 20° 50'. E. long. 132° 12'.

KIAKTA, or KIACHTA, a town of Russia, in the government of Irkutsk, situated on a small river which runs into the Selinga: one of the places open, between the courts of Peking and Peterburg, to private trade between the subjects of both nations; the other is Tzuruchatu, or Zu-

ruchaitu, on the Argunia; according to a treaty, settled at Kiakta, in 1728. In 1762, the empress abolished the imperial monopoly, and laid the fur trade open; since which time, no caravans have been sent to Peking, and Kiakta is become the centre of the Russian and Chinese commerce; 60 miles S. of Selengiak. (Coxe's Russian Discoveries, p. 220.) Kiakta contains about 150 houses, inhabited solely by merchants and commissaries. Opposite to it, about 120 yards distant, lies the Chinese village of Maimatsehin, containing about 200 houses. Kiakta is reckoned the third trading city in Russia, and stands 498 versts S. of Irkutsk, and 1532 from Peking, on a small stream of the same name. The following goods are exported free of duty; viz. all sorts of paper, Russian cloth (except the common cloth used by peasants), and spirits distilled from fruits. Goods imported, which are duty free, are raw and dyed wools, glass-coral, false pearls, white lead, fans, sewing needles, printed cottons, ginger, confectionary, rice, toys, musical and other instruments, porcelain, earthen ware, lacquered and enamelled goods, furniture, and ornamental articles. The exportation of arms, warlike stores, powder and lead, specie, gold and silver in ingots, stallions and mares, hides, beaver-hair, pot-ash, resin, and hemp-yarn, is prohibited; as is also the importation of salt, spirits, poison, and copper coin. Since the year 1754, the merchants of European Russia, who traded with Kiakta, were allowed, on account of the dilance, to pay the duties there by giving drafts. An order in 1794, extended this privilege to the Siberian merchants likewise, under the following conditions; the drafts must be given on Irkutsk, Tobolsk, Moscow, or Peterburgh, and made payable there. Nine months' payment was allowed, but 10 per cent. per annum were claimed by the crown for this allowance. The drafts must be drawn according to a particular form, and guaranteed. The most important articles of trade are peltry, partly imported to Peterburgh from North America, particularly Canada, Russian manufactures, viz. hides, leather, coarse cloth, Russian leather, Muscovian woollens and silks, linen, metal and glass wares, and iron-glass; provisions, viz. sheep and cattle, salt meat, &c. and tallow and glue, foreign manufactures, particularly fine cloths. The principal articles imported, are fine silver in stamped bars; raw and wrought silk; raw and manufactured wool; tea; rhubarb, porcelain, tobacco, provisions and preserved fruits. The manner of conducting the commerce of Kiakta is as follows. Barter is the grand medium. The Chinese come to the Russian warehouses, where the samples are laid out, previously to make their assortments. Bargains are often struck on the spot, but generally the Chinese go to the merchants' houses to settle their business. At first the Russians state what Chinese goods they will take in exchange; then the price is accurately fixed by both parties; and when they are agreed, they return to the warehouse, where the Chinese puts his seal on the bales, and sometimes on the whole stock. Then the Russian goes to the Chinese, examines the goods which he is to receive in exchange, and if they answer the contract the barter is concluded. For the conveyance of this merchandise the Chinese mostly use camels, but sometimes two-wheeled carts. When the caravans cross the desert in winter, they carry with them tents made of felt; but in summer they have balagans, made of reeds, which fold up and are put into a case. When the balagans are fixed, and covered with sail-cloth, two persons can sleep in one of them very commodiously. All the Chinese who trade to Kiakta understand the Mogul language, which is also spoken by the Russian merchants.

The state of the trade at Kiakta, from 1793 to 1797, was as follows :

Imports - -	2,546,825 roubles
Exports - -	2,543,785
Total - -	5,090,610

Zuruchaita, another mart of the Russian and Chinese trade, though much inferior to Kiakta, is seated on the river Argun, and lies 1326 versts east of Irkutsk. When the Mogul troops are quartered on the frontiers during the summer, this place carries on a trifling bartering trade in articles of primary necessity, which are not worth the detail, as the trade is sunk almost to nothing. From 1793, to 1797, the imports and exports amounted only to 724 roubles; whereas from 1773, to 1777, they amounted to 2985 roubles.

KIALEK, a town of Persia, in Adirbeizan; 50 miles N.W. of Urmia.

KIAM, a town of Egypt, on the right bank of the Nile; 20 miles S. of Girgê.

KIANGARI, a town of Natolia, and chief place of a fangiacte, defended by a castle on a rock; 256 miles E.S.E. of Constantinople. N. lat. 39° 54'. E. long. 34° 17'.

KIANG-NAN, a province of China, reckoned to be the most fertile, commercial, and opulent in the whole empire. It is bounded on the W. by the provinces of Honan and Hou-quang; on the S. by Tche-kiang and Kiang-ni; on the E. by the gulf of Nan-king; the rest borders on the province of Chan-tong. The emperors long kept their courts in this province; but they have since made choice of Peking, because it is nearer to Tartary. This province is of vast extent, and contains 14 cities of the first class, and 93 of the second and third. These cities are very populous, and places of trade. Large barks can go to them from all places, because the whole country is intersected by lakes, rivers, and canals, which have a communication with the great river Yang-tse-kiang, or Kian-kou, which runs through the middle of the province. Silk stuffs, lacquer-ware, ink, paper, and, in general, every thing that comes from Nan-king, as well as from the other cities of the province, are much more esteemed, and fetch a higher price, than those brought from the neighbouring provinces. In the village of Chang-hai alone, and the villages dependent upon it, there are reckoned to be more than 200,000 weavers, of common cotton cloths. The manufacture of these affords employment to the greater number of the women. In several places on the sea-coast there are found many salt pits, from which salt is distributed over the whole empire. Upon the whole, this province is so abundant and so opulent, that it brings every year into the king's treasury about 32,000,000 taels, a tael being equal to an ounce of silver, worth, in China, about six shillings sterling; exclusive of the duties upon exports and imports. The inhabitants, who, according to the estimate of Sir George Staunton, amount to 32 millions, are ingenious and docile; and hence many of them become eminent in literature, and rise by their abilities to offices of importance. This province is divided into two parts, each of which has a distinct governor. The governor of the eastern part resides at Sou-tcheou, that of the western at Nan-king, which is the capital of the province. Grosier.

KIANG-NING. See NAN-KING.

KIAN-FE, or TCHANG-FE, a town of Thibet, near a river which runs into the Sanpoo. It is represented as a fine city with a fortress, and a convent, so extensive, as to

have the appearance of another city; 25 miles S.W. of Laffa. N. lat. 29° 58'. E. long. 90° 4'

KIAN-KU, KIAM, *Kiang*, or *Yang-tse-kiang*, one of the two great rivers of China, (the other being *Hoan-ho*, or *Hoang*, which see,) rises in the vicinity of the sources of the Hoan-ho; but according to the received accounts and maps about 200 miles further to the west, and winds nearly as far to the south as the Hoan-ho does to the north. After washing the walls of Nan-king, it enters the sea about 100 miles to the south of the Hoan-ho. The Kian-ku is known by various names through its long progress; and near its source is called by the Eluts Porticho or Petchou; the course is about equal to that of the former, these two rivers being considered as the longest on the face of the globe; they certainly equal, if they do not exceed, the famous river of the Amazons in South America, and the majestic course of the Ganges does not extend half the length. In the late embassy of Lord Macartney, the length of the Kian-ku is estimated at about 2200 miles; and it is observed, that these two Chinese rivers, taking their sources from the same mountains, and passing almost close to each other, in a particular spot, afterwards separate from each other to the distance of 15 of latitude, or about 1050 British miles; and finally discharge themselves into the same sea, comprehending a tract of land of about 1000 miles in length, which they greatly contribute to fertilize. To these great rivers many important streams are tributary. Pinkerton.

KIANG-SI, a province of China, bounded on the N. by that of Kiang-nan, on the W. by Hou-quang, on the S. by Quang-tong, and on the E. by Fo-kien and Tche-kiang. The country is very fertile, but it is so populous, that it can scarcely supply the wants of its inhabitants. The mountains of this province are covered with medicinal plants and trees, and contain in their bowels mines of gold, silver, lead, iron, and tin. The rice of this country is delicate, and several barks are loaded with it every year for the court. The porcelain, made principally at King-te-ehing in this province, is the finest and most valuable of the empire; and the wine made from this rice is reckoned delicious by the Chinese. The river Kan-kiang divides the whole province into two parts; and it contains 13 cities of the first class, and 78 of the second and third. The capital is Nan-tchang. The population of the province, according to Sir George Staunton's statement, is 19,000,000.

KIAO-KE, a town of Corea; 72 miles W. of King-ki-tao.

KIAO-TAO, a small island of China, in the Hoan-ho, or Yellow river, near the coast of Corea. N. lat. 38° 13'. E. long. 124° 25'.

KIARE, a town of Persia, in the province of Irak; 30 miles S.W. of Casbin.

KIA-TCHUEN, a town of Corea; 27 miles S.S.W. of Sing-tcheou.

KIA-TING, a city of China, of the second class, in the province of Se-tchuen, on the river Yang; great quantity of milk is collected in the environs of this city. N. lat. 29° 29'. E. long. 103° 30'.

KIAUTEN, a town of Prussian Lithuania, situated in a mountainous country, with an iron foundery, and a large manufacture of paper.

KIAYA-BEY, an officer in the Ottoman empire, who is the lieutenant of the visir, and momentarily discharges his functions when the latter happens to die. All affairs pass through his hands before they arrive at the visir, and all orders emanating from the Porte receive their execution through the impulse of the kiaya-bey. He is appointed by the grand signior, on the presentation of the visir. He

is generally involved in the disgrace of his principal, and if he do not lose his head as frequently as the other, his fortune always, in that case, runs the greatest risk. Although he has no military rank, it may be said that he occupies the second administrative place in the empire, considering the importance and multiplicity of his functions. If the sultan be dissatisfied with his services, he receives, on quitting his office, the dignity of simple vizir, or pacha with three tails. It seldom happens that he is given only the two tails when he is sent to govern a province. See *BEY*.

KIBBIE, in *Geography*, a town of Africa, in Bornou; 150 miles S.E. of Bornou. N. lat. 18° 23'. E. long. 24° 10'.
KIBES. See *CHILBLAIN*.

KIBITKA, a travelling carriage in Russia, which is a small cart capable of containing two persons abreast, while the driver fits on the farther extremity close to the horses' tails. It is about five feet in length, and the hinder half is covered with a semi-circular tilt, open in front like the top of a cradle, made of laths, interwoven and covered with birch or beech-bark. There is not a piece of iron in the whole machine. It has no springs, and is fastened by means of wooden pins, ropes, and flicks to the body of the carriage. The Russians, when they travel in these kibitkas, place a feather-bed in the bottom, admirably calculated to break the intolerable jolts and concussions occasioned by the uneven timber roads. With this precaution, a kibitka, though inferior in splendour, equals in comfort the most commodious vehicle. The traveller stretches himself at length upon the feather-bed; and, if inclined, may doze away the journey in perfect tranquillity.

KIBOLA, in *Geography*, a town of Mingrelia; 25 miles S.E. of Anaghia.

KICKAPOO, a town of America, in the Western territory. N. lat. 40° 20'. W. long. 87° 10'.

KICKAPOUS, an Indian nation, whose different tribes inhabit near the entrance of lake Superior, where, some years ago, they had 400 warriors; some reside at lake Michigan, and between that and the Mississippi, near the Outtagamies, &c.; and another tribe near the Piankeshaws, and on the Wabash and its branches. The Kickapou and Kaskaskias, two Indian nations lately hostile, ceded lands to the United States at the treaty of Greenville, Aug. 3, 1795. See *KASKASKIAS*.

KICKEMNIT, a river of America, being the north-western arm of Mount Hope bay; about two miles long, and half a mile broad. North-west of it lies the town of Warren, in the state of Rhode island.

KICKER, in *Agriculture*, a term applied to such horses as have the habit of kicking: this should be particularly guarded against in the rearing and managing of young horses, especially those intended for team labour.

KICKER against the Spurs, in the *Manege*. See *RANINGUE*.

KICKTOOL, in *Geography*, a town of East Greenland. N. lat. 61° 15'. W. long. 45° 5'.

KICYDANI, a town of Lithuania, in the palatinate of Wilna; 48 miles N.W. of Troki.

KID, a small island near the western coast of Ireland, a little N. of Broadhaven; 3 miles S.W. of Brow Head.

KID, a name applied to the young of the goat kind. See *GOAT*.

KID, in *Rural Economy*, a small faggot of under, or brushwood.

KID ARNAUT, in *Geography*, a town of Thibet; 100 miles N. of Siringur. N. lat. 32° 4'. E. long. 79° 12'.

KIDDER, **RICHARD**, in *Biography*, a learned English prelate, of whose early life no account has come down to

us. In the year 1649, he was sent to Emanuel college, Cambridge, where he took his degrees. Two years afterwards, he was incorporated at the university of Oxford. He was presented by his college to the vicarage of Stanground, in Huntingdonshire, from which he was ejected for non-conformity, under the Bartholomew Act, in 1662. Either the fear of suffering, or some other motive, soon brought him back to the bosom of the church, and he was, in 1664, presented by the earl of Essex to the rectory of Raine. Here he continued about ten years, esteemed by his connections, and in high reputation for learning, particularly for his extensive and deep knowledge of the oriental languages. In 1674, he became rector in the metropolis, and, in 1681, he obtained a prebendary in the cathedral church of Norwich, which was succeeded by his nomination to the deanery of Peterborough in the year 1689. About this period he took his degree of D. D. and in 1691 he was consecrated bishop of Bath and Wells. In 1693, he preached the lecture founded by Mr. Boyle, and afterwards inserted his sermons on that occasion in his "Demonstration of the Messiah," of which work they constitute the first three chapters in the second part. The bishop continued his labours as an author till he was unhappily killed in his bed, together with his lady, by the fall of a stack of chimnies in his palace at Wells, during the great storm in the night of Nov. 26th, 1703. He was esteemed one of the best divines in his time. His largest work, next to that already mentioned, was "A Commentary on the Five Books of Moses, with a Dissertation concerning the Author or Writer of those Books, &c." in 2 vols. 8vo. Bishop Kidder was author of "The Life of Dr. Anthony Horneck," 1698; "Critical Remarks upon some difficult Passages of Scripture in a Letter to Sir Peter King," 1719, a posthumous publication; several practical treatises; tracts on the Popish controversy, &c. *Biog. Brit.*

KIDDERMINSTER, in *Domesday Book* written *Chideminstre*, in *Geography*, a market town and parish in the hundred of Halfshire, and county of Worcester, England, is seated on the river Stour, at the distance of 13 miles of Worcester, and 126 N.W. of London. In the year 1800, the town contained 1695 houses, and 8336 inhabitants, the majority of whom were dependant on, or connected with, the manufactures of the place. In the time of king Henry VIII. Kidderminster was noted for its manufactures, first of broad cloths, afterwards of woolsies, and subsequently of bombazines, crapes, and poplins. But early in the last century the carpet business was introduced here, and has been continued, with increasing success, up to the present time. In the year 1772, the town and its suburbs contained no less than 250 looms, and since that time a larger number has been employed. At first, the carpets made here were of the Scotch and flat species; but soon the cut carpets were invented, and this kind has since continued to be the distinguished class of Kidderminster. By sundry charters from Henry II, Richard II, Henry VI, and Henry VIII., the inhabitants are granted an exemption from toll, pontage, and murage throughout the whole kingdom; all these privileges are also confirmed by a charter from queen Elizabeth. In this town the lord of the manor, or his deputy, occasionally holds a court-leet, principally for the prevention of encroachments and public nuisances; here is also a court of request for recovery of debts under forty shillings. No county-judge has a right to exercise any judicial authority in this town, which is governed by a recorder and bailiff; the latter is annually elected by his brother aldermen, twelve in number, with the concurrence of twenty-five common-council-men, who collectively are enabled by charter 12 Charles I.

to make bye-laws for the government of the body-corporate and the trade of the town. It formerly sent members to parliament. A market is held on Thursdays for all sorts of grain; but this article is now chiefly disposed of by sample: here are four annual fairs. The church, a large structure of great antiquity, is capable of containing more than two thousand persons. In the choir are several ancient monuments belonging to the Bonvies and Cooks; also a cross-legged effigy of the late Mr Thomas Aeton. The tower is a strong and lofty pile. The grammar-school, to which all the inhabitants have the privilege of sending their children free of expence, is at the east end of the choir of the church: the preceptors, once defined in the charter as the high, the other as the low matter, are elected by certain freeholders, to which the consent of the bishop is always necessary: their annual stipend, upwards of 150*l.*, arises from buildings and lands with which the school is endowed. The town-hall, which is principally constructed of brick, is roomy and elegant: a portion of the lower part is used as a prison, but to the credit of the town, it is very rarely occupied; on what is called the ground-floor are erected stalls for the butchers; and, above is the council-chamber for transacting the business of the corporation. Kidderminster, by the late inland navigation, has communication, by the junction of the Severn canal, with the rivers Mersey, Dec, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above five hundred miles. The river Stour rises in the celebrated groves of the Leafowes, near Hales Owen, distant from hence about twelve miles, and after forming a large reservoir at a village called Cradley, proceeds through Stourbridge, Kivver, and Wolverley, and enters Kidderminster on the north side, tracing nearly its whole length, and thereby dividing it into two unequal parts. Over this little river, whose length is not more than twenty miles, part of which was once navigable, are now erected a great number of forges, flitting-mills, corn-mills, and other works of considerable utility: 2. and to the fitness of its waters to the purpose of dyeing is attributed, in a considerable degree, the unequalled lustre of the colours of the yarn used in the several branches of the weaving manufactory here, which, on this account, is justly esteemed an inexhaustible source of wealth to the inhabitants. The Staffordshire and Worcesterhire canal, completed in the year 1774, at the expence of 105,000*l.*, crosses the Stour within one hundred yards from Kidderminster market-place. In this town are three respectable reading societies for cultivating the taste of the wealthier inhabitants; and the instruction of the poor is not forgotten; for, exclusive of several Sunday schools, no less than eight charity schools are established. Here are also twelve almshouses, and other charitable endowments. At Round-hill, in this town, is a chalybeate spring of great medicinal virtues; and in the vicinity are several others, of which that at Sandburn is the strongest. British Directory, vol. iii. The name of Baxter was long held in veneration in this town. See his article.

KIDDERS, those that badge or carry corn, dead victuals, or other merchandise, up and down to sell: every person being a common badger, kiddr, lader, or carrier, &c. says the stat. 5 Eliz. cap. 12. And they are called kiddiers, 13 Eliz. cap. 25.

KIDDLE, or **KIDEL**, *Kidellus*, a dam or weir in a river, with a narrow cut in it, for the laying of pots, or other engines to catch fish.

The word is ancient; for in Magna Charta, cap. 24. we read, "omnes kidelli dependunt per Thamefiam & Medweyam & per totam Angliam, nisi per coleram maris." And by king John's charter, power was granted to the city

of London, "de kidellis amovendis per Thamefiam & Medweyam." A survey was ordered to be made of the weirs, mills, flanks, and kiddles, in the great rivers of England, (1 Hen. IV.) Fishermen of late corruptly call these dams *kettles*; and they are much used in Wales, and on the sea-coasts of Kent.

KIDDOW, in *Ornithology*, the most common English name of the *Merula*, a web-footed bird, common on our shores, and called in different places the mill-motor, gullen, and the sea-lark and trout. See *CORVYPER LARVA*.

KIDELD, in *Agriculture*, a term provincially applied to the pods of beans.

KIDELIA, in *Geography*, a town of Russia, in the government of Viborg, on the N. coast of lake Ladoga; 48 miles N.N.E. of Kestholm.

KIDDEROW, in *Rural Economy*, a term that signifies a place for keeping a sucking-calf in.

KIDES, in *Geography*, a town of Sweden, in the government of Klupio; 83 miles S.E. of Klupio.

KIDGE, a fortified town of Persia, in the province of Mekran. N. lat. 26° 30'. E. long. 61° 10'.

KIDNAPPERS, **CAPE**, a cape on the E. coast of New Zealand, discovered in 1769, and thus named by captain Cook, from an attempt made by the inhabitants to carry a boy from the Endeavour. It is remarkable for two white rocks like hay-stacks, and high white cliffs on each side. S. lat. 39° 43'. W. long. 182° 24'.

KIDNAPPING, in *Law*, is the offence of a forcible abduction or stealing away of a man, woman, or child, from their own country, and sending them into another. This offence was capital by the Jewish law. (Exod. xxi. 16.) So likewise in the civil law, the offence of spiriting away and stealing men and children, which was called "plagium," and the offenders "plagiarii," was punished with death. (Ff. 48. 151.) This is unquestionably a heinous crime, as it robs the king of his subjects, banishes a man from his country, and may in its consequences be productive of the most cruel and disagreeable hardships; and, therefore, the common law of England has punished it with fine, imprisonment, and pillory. (Raym. 474. 2 Show. 221. Skin 47. Comb. 10.) Also, if a matter of a ship shall, during his being abroad, force any person ashore, or wilfully leave him behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment. 11 & 12 W. III. c. 7.

KIDNEY, in *Anatomy*, a glandular body, situated in the abdomen, and secreting the urine.

The urinary apparatus consists of two secretory organs (the right and left kidneys), by which the urinary fluid is separated from the blood; of two membranous tubes (the ureters) by which this fluid is conveyed into a large musculo-membranous reservoir (the urinary bladder); and of a canal (the urethra) by which this reservoir is evacuated at various intervals. The latter conveys the seminal fluid also in the male subject, and is there described in the article **GENERATION**. The different arrangement and conformation of the female generative organs occasion the urethra to assume a very different form; it is here entirely unconnected with the generative functions, and we shall therefore describe it in the present article with the bladder.

The essential parts of the urinary apparatus correspond nearly to those of the biliary organs; but there are some remarkable differences. The liver is always a single organ. There are almost constantly two kidneys. The proportions of the secretory organ and the reservoir are inverted in the two cases: the liver is too large as to exceed probably all the other glands in the body put together: the gall-bladder

KIDNEY.

is comparatively small: in the other case, the capacity of the reservoir considerably exceeds the size of the glandular organs. A part only of the bile passes into the gall-bladder, the remainder flowing directly into the duodenum: and this secretion seems not to be very active in the intervals of the digestive process. The kidneys, on the contrary, are always active, and the whole of the fluid which they separate passes into the urinary bladder.

Two small bodies, placed near the kidneys, and called the renal capsules, receive their vessels for the most part from the renal: we shall therefore unite their description with that of the kidneys.

The kidneys are placed deeply in the lumbar regions, at the sides of the vertebral column. They are usually two, a right and a left; but the number is exposed to occasional unimportant variations. Sometimes the two are united by their upper or lower extremities, so as to form a crescent, with the concavity upwards or downwards, something like the figure of a horse-shoe, from which the gland, in these cases, is sometimes named: or, there may be an unusually large one on either side, with two ureters, and a deficiency of the opposite gland: or, a small supernumerary kidney on the front of the vertebral column. Other deviations from the accustomed structure have been registered by anatomists; but all these varieties are unimportant in physiology.

They are surrounded by a large quantity of fat, of a peculiar structure and properties. This substance is contained in a loose and easily lacerable cellular texture, which connects it to the kidney; it forms a complete case, isolating these organs from the surrounding parts. Its quantity varies remarkably in different subjects, being so abundant as to hide the organs where the individual is very fat, and very sparing in the opposite state. This fat is remarkable for growing hard when it is cold, particularly in the ruminating herbivorous animals, where it is distinguished by the name of suet.

On account of the different bulk of the liver and spleen, the two organs, which are placed immediately above the kidneys, the latter are somewhat differently situated on the two sides of the body, the right being rather lower than the left: the difference in this respect may amount to an inch, but it is not constant. They both lie deeply buried behind the abdominal viscera; the right having above it the renal capsule and the liver, and in front the colon and caecum, the duodenum, and the other small intestine; the left being covered by the spleen and pancreas, stomach, colon, and small intestine.

The figure is jolly compared to that of the kidney bean, with the concavity placed inwards. It is elongated from above downwards, convex in the greatest part of its circumference, and rather broadest at its upper end. The size varies considerably, from four ounces in the adult to five, six, or even a pound: often one is considerably larger than the other.

In order to describe more exactly the external form and the relations of the kidney, we divide it into two surfaces and a circumference. The anterior surface is slightly convex; sometimes completely covered by the peritoneum, with the interfection of a stratum of variable thickness of fat and loose cellular substance; and sometimes in more or less immediate contact with the corresponding part of the colon: for in some subjects the membrane simply passes in front of the intestine, and binds it to the kidney, while in others there is a more or less loose fold, called the lumbar mesocolon. From the right kidney the peritoneum rises to the liver above, and even to the diaphragm; below, it passes

to the colon and duodenum; on the left side it goes to the colon and spleen. Cellular substance, containing more or less fat, always connects the front surface of the kidney to the membrane; so that the gland is behind the cavity formed by that membrane, and would not be enumerated among the abdominal viscera, if that epithet were confined to the parts contained within the cavity of the membrane.

The posterior surface is nearly plane, and rests on a thick layer of fat, which separates it from the lower part of the diaphragm, from the anterior layer of the aponeurosis of the transversus, where it covers the quadratus lumborum, and from the psoas magnus.

Thus, there is placed behind the kidney the thick mass of soft parts, which extends from the pelvis to the chest, protecting the organ from all external injury, and rendering it nearly inaccessible to the knife of the surgeon. It is also supported behind by the two or three last ribs. In its longitudinal direction it corresponds nearly to the two last dorsal, and the two neighbouring lumbar vertebrae.

The circumference of the kidney presents a thick and rounded extremity above, covered by the concave basis of the renal capsule; a thinner and more elongated end below, approaching more or less nearly to the crista of the ilium: a convex, thick, and rounded edge, turned outwards, and corresponding to the muscular parietes of the abdomen and the diaphragm; a deep excavation on the inside, called the notch of the kidney. This notch has thick and rounded edges, and contains some fat. The divisions of the renal artery occupy the upper and front part, those of the vein are placed behind: the pelvis occupies the deepest portion, and the commencement of the ureter is seen below.

The consistence of the kidney is remarkably firm, exceeding, in this respect, all other glandular organs. Its colour is reddish, with a tinge of brown; but the intensity varies according to the quantity of blood contained in the vessels: When an animal has died of hemorrhage, it is quite pale. The structure of the organ comprehends a peculiar glandular tissue, arteries, veins, lymphatics, nerves, excretory tubes, and a peculiar membrane.

The proper tissue of the kidney is remarkable for its firmness. It will be best understood by carrying a section through the kidney, so as to divide it into an anterior and a posterior half. We shall then be able to distinguish very clearly two substances; an exterior, which is called the *cortical or arterial*, and an interior, named the *tubular or uriferous*. All kidneys are not equally well suited for this examination: in some, without any alteration from disease, the two substances are confused together. The contrast of the two component parts is seen particularly clearly after minute injection.

The section of the kidney presents to us also, disposed in a still more deeply seated stratum than the tubular part, a series of small bodies, called *papilla* or *manilla*, which are merely the apices of the small cones formed by the tubular substance. Many anatomists describe these as a third substance, under the name of the *mamillary*. Lastly, we observe the infundibula or calyces, and the pelvis, besides the orifices of divided vessels scattered here and there.

The cortical substance is so named because it covers the exterior surface of the organ: it is about two lines in thickness. Its colour is a palish red, inclining to yellow: its consistence is less firm than that of the tubular, and is about the same with that of the liver, so that it may be torn easily. It is smooth externally, and closely connected to the proper membrane of the kidney. Internally it is continuous with the tubular substance, and it forms prolongations

tions which fill the intervals of the different portions of the tubular matter. These septa have been called the fleshy columns of the kidney; they grow thinner as they approach the pelvis, round which there is always found some adipous substance. Their number depends upon that of the papillae. The renal arteries are distributed almost entirely to the cortical substance; injections thrown into these vessels penetrate it most easily, and colour it throughout; hence it has been concluded to be of a nature entirely vascular. Some anatomists have admitted the existence of very small glands in this substance, connected to the blood-vessels as grapes are to their stalks; these are technically named acini. On tearing the cortical substance, small granulations are observed on the torn surface, and minute granular bodies are seen in great abundance throughout this part of the kidney, where it has been minutely injected. These are considered as the glands in question, while some contend that they are only convoluted blood-vessels. For an account of the controversy on this matter, see GLAND. The minuteness of the objects does not allow us to arrive at any satisfactory conclusion concerning their minute structure.

The tubular or uriferous, called also the striated substance, is lighter in its colour, more dense and solid than the cortical. Injections do not penetrate it, but leave it in general quite colourless. It is composed of a vast number of small tubes (tubuli uriferi) united into conical fasciculi of unequal size. The rounded bases of these fasciculi are turned towards the exterior of the kidney, and present diverging striæ, which are lost in the cortical substance: their apices are directed towards the notch. These fasciculi are every where surrounded by the cortical substance, except at their apices, which are embraced by the infundibula. Each of these points forms a conical papilla, pierced by numerous small apertures, which are the openings of the tubes just mentioned.

The papillae, therefore, are simply the points of the cones which constitute the tubular substance; their number varies from five to eighteen. Generally there is a single papilla for each cone; sometimes two cones are united by one papilla, which is then larger; two papillae are very seldom found on one cone. Their form and length are very various; they may be short and rounded, or long and pointed. They are of a tolerably bright red colour, but sometimes rather pale, while the rest of the tubular substance is redder, or even of a violet hue at the bases of the cones. Their surface is smooth, soft to the touch, and probably covered by a fine membrane. The orifices of the uriferous tubes are seen on it, and as these are much less numerous than the base of the tubular substance, probably several of the fine tubes unite together before they terminate. Compression of the kidney causes the urine to transude at these pores; and the urine may be expressed in like manner, when the papillae have been divided by a section perpendicular to the course of the tubes.

From the preceding description of the two substances which compose the kidney, it appears, that the cortical performs the secretion, and that the tubular, exclusively concerned with this function, has the office of transmitting the secreted fluid. This it differs from all other glands of which the component substance is identical throughout.

That the arteries of the kidney be entirely distributed in the cortical matter is evident from anatomical dissections; the vessels made in which they are connected to the uriferous tubes, being always or being surrounded. The arteries seem to be continued towards the cones, where they are bound to the cortical matter, and anastomose often with the vessels from the upper vena cava, which are then

seen running in straight lines, and converging toward the papillae. Ruyfch and others found that water, quicksilver, fact, wax, and air, thrown into the renal arteries, would come out at the pores of the papillae, which is a strong argument for the existence of continuous tubes. A further proof of the same circumstance has been drawn from the passage of arterial blood in many instances by the urinary passages.

The basis of each papilla is embraced by a small membranous tube, into the cavity of which the apex projects. These calyces, or infundibula, are surrounded externally by some fat, and are less numerous than the papillae, because two or three of the latter are sometimes provided with a single tube. They are collected ordinarily into three trunks, which come respectively from the upper, middle, and lower parts of the kidney. These three trunks open at the notch into the pelvis; sometimes a greater number of branches opens into this membranous bag. The pelvis is placed at the deepest part of the notch, behind and between the divisions of the renal artery and vein. It is most capacious in its middle, narrower at the two ends, and continued below into the ureter. The openings of the trunks formed by the union of the calyces, and of the ureter, are directed by its inner surface. These are simple openings without any valvular apparatus. Sometimes there are two pelvises to a single kidney.

The pelvis and calyces are composed of a firm, white, and opaque membrane, connected by a loose cellular texture to the surrounding organs, and having a smooth mucous surface internally, continuous with that of the ureter, and with the covering of the papillae. Its structure is dense, and not very vascular; of its properties and action we know nothing. Bichat and Boyer distinguish three strata in this membrane; an exterior, derived from the capsule of the kidney; a middle, or proper membrane, continued at the bases of the papillae into the substance of the organ; and an internal, or mucous coat.

The arteries and veins of this gland will be described in the articles concerning these vessels; we have only to point out a few circumstances here concerning them. The renal arteries arise nearly at right angles, and pass through a short course before they arrive at their destination. Their diameter is very considerable in proportion to the volume of the organ. It is shown by fine calculations, the results of which cannot be received with very implicit confidence, that one-fourth or one-third of the blood of the abdominal aorta goes to these glands; consequently, a very large proportion of the whole mass. Hence the whole of the blood will have passed through the kidneys in a few pulsations of the heart. They are covered and accompanied by several veins; both vessels divide near the kidneys into several branches, which enter the notch and penetrate into the organ, accompanied by nerves and lymphatics. All these parts are surrounded by a soft cellular tissue, continuous apparently with that contained in the notch. The urinary membrane of the kidney extends to their infundibula. The large branches occupy the intervals of the papillae, and follow a winding course round the cones; the smaller ramifications form arches in the cortical substance, from the convexity of which numerous ramifications are distributed to the substance. They do not terminate above the papillae of the cortical and tubular parts in convoluted tubes. The veins have a disposition similar to that of the arteries.

The lymphatic vessels, distinguished into deep and superficial, communicate frequently. They take the course of the blood-vessels, pass out at the same points to the Lymphatic glands.

KIDNEY.

The nerves, derived from the ganglia of the great sympathetic, constitute the renal plexus, of which the branches surround the blood-vessels, particularly the artery, and penetrate with it into the kidney. The kidneys seem to be hardly sensible in the natural state: but disease, as, for example, inflammation, develops their sensibility in a very high degree.

The external surface of the kidney is closely invested by a pericapsular membrane, sometimes called the capsule, which adheres by means of short and very fine threads, but can be separated without much difficulty. It enters the notch, and is connected there to the calyces and blood-vessels. It is very dense and firm, semi-transparent, rather thicker than the peritoneum, and not divisible into laminae. Immersion in boiling water makes it curl up and become thicker.

The ureter is the tube designed to convey the urine from the kidney, commencing from the inner and lower part of the pelvis of the kidney by a wide opening, sometimes called infundibulum, and continued thence in a descending course to the inferior surface of the bladder, where it is not more than an inch distant from its fellow of the opposite side. Its ordinary size is about equal to that of a quill, except towards the lower extremity, where it is slightly contracted; but it varies in this respect in different subjects, and even in different parts in the same subject. Commonly there is one to each kidney, but sometimes it is double.

From its origin it goes obliquely inwards and downwards as far as the front of the sacro-iliac symphysis, where it is separated from the opposite one by the breadth of the basis of the sacrum. In this part of its course the peritoneum and the spermatic vessels lie in front: the psoas muscle, which it crosses at a very acute angle, is behind it. Lower down it crosses the common iliac artery and vein. The right tubules parallel to the outer side of the inferior vena cava. Several small blood-vessels are distributed on it. At the base of the sacrum it passes forwards, downwards, and inwards through a large quantity of adipous substance, and advances towards the under surface of the bladder. Here it crosses the vas deferens, and is placed a little above and externally to the vesicula seminalis, at which point it penetrates the bladder. It runs obliquely between the coats of that organ, passing for about an inch from without inwards and from behind forwards, between the muscular and mucous coverings, and then opening into the cavity by a very narrow orifice placed at the posterior angle of the triangular space near the neck of the bladder.

The course of these tubes is the same in the female; they present no peculiarities worthy of notice in the pelvis of this sex.

As the ureter is a continuation of the pelvis, we naturally expect to discover in it the same organization as in that bag. Anatomists describe three coats; an exterior, thin, transparent, and of a cellular nature; a middle, which is thicker, and gives to the part its colour and consistence; and an internal mucous covering, continuous with those of the pelvis of the kidney and bladder, and habitually moistened, like them, with a mucous fluid capable of defending it from the action of the urine. These strata are, however, so closely connected, that it is almost impossible to exhibit them distinct. The blood-vessels are derived from the renal, the spermatic, the aorta and vena cava inferior, and the iliacs.

The ureters, as well as the pelvis and calyces of the kidney, are very extensible; their ordinary functions probably require the exercise of such a property, as they must be subject to various conditions of plenitude and emptiness. But disease elucidates this point most clearly: when the

natural passage of the urine is obstructed by a stone, or when it is disturbed by difficulties in the evacuation through the urethra, the ureters are often enlarged very considerably, even in some cases almost to the size of a small intestine, and the pelvis, with its dependencies, undergoes an analogous dilatation.

These parts do not seem to possess animal sensibility in their natural state; but that property is manifested in them to the highest degree, by the passage of a stone, which causes perhaps torture as exquisite as any disease of any organ in the body.

Their function of conveying the secreted urine from the kidney to the bladder, requires the exercise of tonic powers: the idea of this fluid finding its way by the force of gravity, is not only repugnant to the laws of the animal economy, but is irreconcilable with obvious phenomena. The adhesion of the sides of the tube, where it penetrates the coats of the bladder, presents an obstacle, which can be overcome only by the exertion of some force; and this obstacle is vastly increased in the distended state of the bladder, during which the fluid is constantly finding its way into the receptacle. The only power in this case, by which the requisite end can be obtained, is a contraction of the canal.

Development of the Kidney.—In the fetus all parts of the urinary apparatus are remarkable for their considerable advancement; and some are distinguished by considerable peculiarities of conformation and structure. The kidneys are very large, surrounded at first by a soft and reddish cellular tissue, but covered, before the end of utero-gestation, by a small quantity of granulated fat: this is most abundant behind, so that the peritoneum is almost immediately in contact with them in front. The external surface is tuberculated at this time: anatomists have sometimes described the organ, as if the cones of tubular substance were imperfectly connected together as yet, so that each kidney might be regarded as an assemblage of smaller kidneys. This representation is not correct; no traces of such distinction are visible in the interior; and the tubercles of the outside, which correspond to the bases of the cones, seem to depend on the cortical matter being not completely developed. Some animals, as those mammalia which either live in or frequent the water, have kidneys composed of small kidneys connected by cellular substance. There is in these cases a large number of cones, each surrounded by a stratum of cortical matter, and furnished with a calyx of its own; and these separate pieces are only united by cellular substance. We may conceive the human kidney to be formed in this way, except that the separate portions are blended into one mass: and the distinction is only external even in the fetus. A structure of a description quite opposite prevails in many other animals, particularly in all the ferae of Linnæus. The kidney in them consists of a single portion of tubular substance, with one papilla and calyx, and a single stratum of cortical matter.

While the kidney retains this tuberculated exterior, the proportion of cortical matter is smaller than in the perfect gland; but the distinction between it and the tubular is well marked: the papillæ exhibit a very lively red colour. The gland at this time has considerable firmness, particularly if compared to the liver or spleen. The capsule is very perfectly formed, and separates easily. The calyces, pelvis, and ureter are remarkable for their considerable progress: the latter, in particular, is nearly half as large as in the adult, in a fetus of seven or eight months. Its size may be more accurately estimated if it be compared to the vas deferens, which is like a slender nervous thread, recognizable only by its whiteness.

No considerable change has taken place at the time of birth: although the kidneys are still tuberculated, their figure is more precisely determined, and the difference of the two constituent parts is strongly marked. There is nothing remarkable about the pelvis or ureter. In the subsequent years fat is collected more abundantly about the kidneys: these organs, by acquiring a thicker covering of cortical matter, lose their unequal surface, and gradually assume the form which characterizes them in the adult. The external membrane becomes more dense, and more closely connected to the surface. The other parts experience no further change except that they partake of the general growth. In old age the kidneys become soft and flaccid; and the surrounding fat is diminished in quantity. The external membrane presents occasionally points of a cartilaginous consistence.

Physiology of the Kidneys.—The minute ramifications of the renal arteries, which compose so great a portion of the cortical substance of the kidneys, separate from the blood the urinary fluid, which is conveyed along the tubuli uriniferi, and deposited by their orifices in the calyces of the kidney. It then goes through the pelvis and ureter, and thus arrives at the bladder. The secretion goes on constantly, and the transmissibility into the bladder is equally constant: for there is a continual efflux, when a catheter is placed permanently in the bladder, as also in those examples of malformation, where the ureters open on the surface of the body. Ligatures placed on the ureters, or obstructions of those canals by other causes, as, for example, by stones, demonstrate this course of the urine; the tubes are distended between the kidney and the obstacle, and empty below.

That the urine is formed in the cortical substance of the kidney, is the amount of our knowledge concerning this part of the subject; the mode, in which the secretion takes place, is entirely unknown. This is the problem of secretion, towards the solution of which we have approached no nearer than the above general fact since physiology has been cultivated. In the present instance, indeed, it is not yet agreed whether the uriferous tubes be continuous with the capillary arterial canals, or whether some organ be interposed between them. Hence all attempts to explain the peculiar nature of the urine from the structure of the parts in which it is formed, and to shew how the properties of this fluid agree with the size, direction, curvatures, &c. of the canals, in which the secretion takes place, must be founded on grounds completely chimerical, although these reveries are sanctioned by the respectable authority of Haller. (Element. Physiol. lib. 26. sect. 4. § 5.) Another unaccountable error is committed by the same physiologist in his observations on this subject. He asserts that the urine is formed in the blood, and separated only by the action of the kidney; and defends the opinion by stating that this fluid goes off by perspiration, or by the stomach and intestines, when its ordinary passage is obstructed. This notion is completely irreconcilable with the present state of our knowledge concerning the chemical constitution of the blood and the urine; and the alleged facts, by which it is supported, are, to say the least, of a suspicious nature.

We may establish, in the second place, this fact; that the kidneys are the only organs in the body capable of forming urine, and that the ureters are the only passages by which fluids can be conveyed into the bladder. Yet both of these points are contrary to the opinions of some physiologists. When the evacuation of the urine from the body is stopped, some suppose that it is separated by other organs. "It appears," says Haller (Element. Physiol. lib. 26. sect. 4.

§ 12.), "that the fraction of the circulation, and the heat of the fluids produce in the blood acrid particles, tending to an alkaline nature, of which the more volatile are dissipated by insensible perspiration, while others, too large for the pores of the skin, can be separated by the kidneys only. For, in all cases of ichthyuria, where these particles are not separated by the urine, either symptoms of acrimony take place in the whole body, or these matters are thrown off by other organs. Thus the sweat and perspiration have an urinous odour: or there is an urinous oedema of the whole body, or urine deposited in the cellular substance, with violent and fatal fever. In other instances urine has been discharged by the salivary organs; by the ears or nostrils, mixed with blood; by the mammae; by vomiting, or stool; or it has become mixed with the fluid of the abdomen, or it has been deposited in the brain, causing cephalalgia, blindness, delirium, stupor, convulsions and apoplexy. When secreted into the stomach, it causes hiccup and vomiting. Lastly, the concretion of earthy substances in the blood, caused by ichthyuria, may produce sandy matter in the sweat." That a fluid, possessing such very peculiar properties as the urine does, consisting of such numerous and complicated elements, and separated usually in a very intricate glandular structure, should be formed also in almost every other kind of organic apparatus in the body; that it should be separated by the exhalants of the cellular substance, and of the skin, by those of mucous and serous surfaces, by the vessels of the brain, as well as by glandular organs, is a position so completely at variance with all that we understand of the composition and actions of the animal frame, that we could not receive it without very unexceptionable evidence. The whole quotation exhibits credulity rather than the deliberate caution necessary for establishing so singular a fact, and the subjoined authorities are not at all calculated to remove our scruples. Perhaps an urinous odour has been sometimes observed in the perspiration; although we believe that even this has not been hitherto proved by very convincing evidence. Must we immediately conclude that the cutaneous exhalants have formed urine? When the biliary passages are obstructed, and various fluids are tinged with bile, we explain the phenomena by the absorption of that fluid from its natural receptacles. Will not the same explanation suffice for the cases, if there are any sufficiently proved, of urinous properties in the other secretions and exhalations of the body?

That there is some more direct passage from the alimentary canal to the bladder, than through the absorbents, the general circulation, and the kidneys, is an opinion that has been partially entertained even from the most ancient times. The very rapid manner in which the urinary secretion is augmented by copious draughts of fluids, and the communication, within a very short time, of particular properties to the urine, by certain substances taken into the stomach, are the circumstances on which this opinion has been grounded. Anatomical investigation has hitherto detected no such passage; no dissector has met with any tube that could possibly serve the purpose of forming such a communication: while the experiment of tying the ureters corroborates this negative fact, by teaching us that no urine gains admission into the bladder, when these tubes are obstructed. "Cæterum," says Haller, (Element. Physiol. lib. 26. sect. 4. § 4.) "taught us long ago, that when the ureters are cut or divided in the living body, the urinary bladder is found empty, and that the animal evacuates no urine. This experiment has uniformly exhibited the same result in the hands of several very practised and dextrous experimenters; and Rast lately repeated it on a dog, and found the kidneys swollen and full of

water, the papillæ dilated, the ureters enlarged above the ligature, and empty below, the bladder not containing a single drop of urine." The phenomena of disease confirm the conclusions to which these trials lead: obstructions of the ureters, and suppression of the action of the kidneys, entirely stop the urinary discharge, whatever quantity of fluid the patient may drink.

The assertion of the existence of a short communication between the stomach or bowels and the bladder, against the evidence of anatomy and experiments, is founded on an assumption which we consider to be highly questionable. We are so far from allowing that the absorbents and blood-vessels are inadequate to the explanation of the phenomena, that we believe the very reverse to be true. We believe that the great absorbing surface afforded by the alimentary canal, together with the infinite number of absorbing vessels, and the diameter of the thoracic duct, fully account for the conveyance of fluids into the blood; and that the large size of the renal arteries, which must circulate the whole mass of blood through the kidneys several times in the course of a minute, with the great number of the uriniferous tubes, very satisfactorily explain the secretion of urine in any quantity of which we have examples. If these passages, which are obvious to our senses, and large enough to allow a considerable quantity of fluid to pass through them, cannot transmit the urine with sufficient celerity, how shall we expect that a greater quantity can pass through canals, which must be beyond all comparison smaller, since no dissector even conjectures that he has ever seen them? There is another and still more fatal objection to these opinions: the fluids voided in these cases are urine, of a very aqueous kind indeed, but still urine;—still that peculiar animal fluid, which is secreted only by a kidney. Now, if there be a direct passage from the stomach to the bladder, we ought to void, according to the nature of our drink, tea, wine, punch, cyder, &c. We must suppose, therefore, the existence of an unknown kidney to convert these different fluids into urine, as well as of an unknown passage to convey them to the bladder. The existence in the urine of particular properties, derived from certain articles of food, will prove nothing in this case, until we have been convinced that they cannot have been imported by the medium of the general circulation. Exposure of the body to the vapour of turpentine will affect the urine, without its introduction into the stomach. (See the experiments under the article *INTOXICATION*.) What are the secret passages by which this is conveyed, in such a case?

The urine is regarded as a fluid entirely excrementitious; a dissolving of materials, which are either useless in the animal economy, or which, if retained, would be actually prejudicial. The fluids which we drink dilute the solid food, reduce it to that state in which it constitutes the chyle, and are absorbed with it. Probably a considerable portion is taken up immediately from the alimentary canal, without undergoing the previous change into chyle; since copious drinks often augment the urinary discharge much sooner than the formation of chyle could be effected. The superfluous fluid, thus introduced into the blood, is separated by the kidneys, and very speedily separated, when large quantities are drunk: hence the chief component part of the urine is water. The organs of the body are constantly undergoing change in their composition: they receive fresh particles from the blood, while the absorbing system removes the old ones; so that there is a perpetual movement over the whole body of combination and decomposition. Again, a similar change is incessantly carried on in the animal fluids. The lymph of the cellular texture and the

serum of the circumscribed cavities are at all times in this kind of circulatory motion. These old materials are conveyed into the blood by the absorbents, and separated from it in the kidneys, in order to be thrown out of the body. They separate it under the peculiar form denominated by the French chemists *urée*; which matter exceeds in amount by many times all the other saline substances dissolved in the urine, and belows on that fluid its colour, odour,—in a word, all its peculiar characters. We shall anticipate, from this view of the matter, what the researches of modern chemistry have most clearly proved, that the component ingredients of urine are very numerous: it exceeds, in this respect, all the other animal fluids. A particular account of its sensible characters and chemical composition will be found under the article *URINE*; and that of the concretions occasionally formed in the urinary passages under *STONE*.

No secretion exhibits such signal variations as this: the term urine, therefore, is applied to fluids differing in almost every circumstance from each other. The nature and proportion of its ingredients are not alike in the same individual, at the different periods of life. Peculiar characters distinguish it in the fetus, the boy, the adult, and the old subject: they differ in the same day, according as a person is exposed to heat or cold, as he is inactive or uses much bodily exertion, according to the nature and quantity of the food and drink, and the length of time after meals at which it is voided; the state of health, particularly of the stomach, and other digestive organs, and the passions of the mind, have also considerable influence.

The kidneys and bladder of the fetus contain a very small portion of fluid, which can hardly be deemed urine: it is almost entirely aqueous, rather viscid and turbid, and has no smell or taste. In the first years of life, the colour is not deep; the acrid and odorous properties are but slightly marked. As the motion of composition prevails, in almost all the organs, over that of decomposition, the quantity of urea is small. The earthy phosphates, particularly that of lime, are not present, or in very minute quantities. While ossification is incomplete, this substance is required for the development of the bony system. In the adult, where the growth of the body is complete, the residue of nutrition is more abundant: all the properties of the urine are more strong. It contains salts, earthy phosphates, phosphoric acid, urea, and uric acid, according to the description in the articles already referred to. The salts and the animal substance increase in the old subject; the phosphate of lime is very abundant.

The modifications produced in the urine by heat and cold, which include also the effects of exercise, and the influence of the seasons, are not the result of any direct action on the kidneys, but arise from the operations of these causes on the cutaneous functions. The relations between the urine and the external and internal exhalations are peculiar to this secretion. In proportion as we perspire more abundantly, the urinary evacuation is diminished; and the same circumstance is observed in considerable dropsies. From this character, which belongs exclusively to the function of the kidneys, naturally arise the frequent variations in the quantity of the urine; while the other secretions are nearly always in uniform proportions. Exposure of the surface to cold, or inactivity, is attended not only with an increased quantity of urine, but with alterations of its other properties: it is pale, not acrid, nor strong in its smell. Warmth, with free perspiration, or strong exercise, diminishes the quantity, and renders it more highly coloured, acrimonious, and odorous. Slighter changes of an analogous nature may be remarked in winter and summer. (See *INTOXICATIONS*.) When the

quantity of urine is so remarkably augmented in diabetes, the skin is parched and dry.

The quantity of food, and more particularly of drink, influences very greatly that of the urine; and several physiologists represent the two as nearly equal. The effect of aqueous drinks, however, will be considerably modified by the state of the cutaneous discharge. If the individual be warm and florid, a great part of such drinks is dissipated by the skin; in a weaker state of the body, combined with external cold, it is disposed of by the kidneys. The labourers in harvest will often drink some gallons of liquor, while prosecuting their hard work under a hot sun, without any increased urinary discharge; the perspiration, however, is uncommonly copious, and its evaporation has a most favourable effect in keeping the body cool. The liquors which increase the urine most remarkably are those of an aqueous kind, such as water, vegetable infusions, weak beer, cyder, &c. taken cold. Stimulating drinks, such as the stronger wines and spirits, and warm fluids, excite the system in general, and are more likely to be disposed of by the skin. The quantity of urine, ascertained by actual experiment, has varied considerably. The accounts of Hartman, Robinson, De Gomer, Keil, Rye, Home, Saucorius, and Linnæus, give us the following numbers of ounces in twenty-four hours; 28, 31, 34, 38, 40, 44, 50½, 64: the average of the whole will be 39 ounces.

The qualities of the urine are affected, in many instances, in a very obvious way by the nature of the food. As this secretion provides for the removal from the body of the residual and excrementitious part of our aliment, we cannot doubt that it must be very essentially influenced by the properties of the food. Remarkably, beet root, madder, and other substances affect its colour. Forcroy mentions a man, who conceived that he voided blood, but was perfectly free from pain, and all symptoms of urinary affection. He had eaten a large quantity of beet root for several days; and on leaving this off, the urine recovered its healthy appearance. (Syll. des Comptes, Chim. t. 10. p. 170.) Garlic and onions affect its smell; oil of turpentine gives it an odour resembling that of Volæx; and asparagus imparts to it a remarkable taste. Several other vegetables, such as fennel, carrots, parsnips, &c. produce also very sensible effects on its smell. A very striking instance of change in its properties, produced by an alteration in the food, is afforded in the treatment of the diabetes mellitus by animal diet. See DIABETES.

The alteration of the urine by the food is more particularly evinced in individuals, whose digestive organs are not strong; hence the state of the urine is an important symptom in such cases.

Two or three kinds of urine are distinguished, according to the interval between the re-uptake and the time of voiding the fluid. The first, discharged within a very short time after drinking, is called urine of the drink (*urina potus*), or crabs urine. It is often evacuated so soon after drinking, and has so little of the distinguishing characters of urine, that it has given rise to the notion already mentioned of a short communication between the stomach and bladder. It appears almost like a mere water, and has neither the smell, colour, nor weight of urine; it must be regarded as an extremely diluted form of the fluid, in which the water is diffused in a very large proportion of water. The urine of digestion or concoction (*urina chyli*) is that evacuated two or three hours after a meal. Its colour and other urinous properties are more strongly marked than in the preceding; but it is not yet perfect urine. It is affected by the nature of the food. The urine of the blood (*urina sanguinis*) is

voided seven or eight hours after eating, or in the morning after a night's sleep. It is highly coloured and acrid, has a strong taste and smell, not that imparted by any particular food, but the peculiar urinous odour. The circumstances of digestion and the nature of the food either do not affect this, or affect it in a much less degree. It contains a large proportion of salt and acids. Its characters, in short, are those described as belonging to urine; and it is always collected for the purpose of experiments on the chemical constitution of this fluid.

The passions have an influence on the nature of the fluid; fear, sorrow, and, in general, the emotions which act violently on the frame, often cause an abundant flow of colourless and odorous urine, which seems to consist almost entirely of water.

But the effects of the causes which we have just considered, are very slight in comparison with the changes produced by disease. The alteration in this case goes deeper, and the variations are more numerous and characteristic. Since the earliest ages of medicine, physicians have drawn indications from this source concerning the nature, progress, and termination of diseases; and empirics have not overlooked so favourable an opportunity of laying a tax on public credulity. Careful analyses of the various morbid urines are still among those desiderata, which promise very interesting results to the physiologist and pathologist. A few facts only have been collected on this subject. The sediment of the urine, at the termination of acute diseases, has been found to consist chiefly of uric acid. The colourless fluid voided in nervous disorders, in hysteric paroxysms, &c. is little more than mere water. Phosphoric acid and phosphate of lime are not found in the urine during the paroxysm of gout; but the latter returns towards its cessation, and is even more abundant than in the healthy state. In these affections, in which the bones become softened, the urine has a large proportion of phosphate of lime; the earth absorbed from the bones is evacuated by the kidneys. During re-ossification, this earthy salt is not found in the urine. For the remarkable qualities of this fluid in *diabetes*, see that article. The secretions of the mucous membranes, over which the urine passes, may variously modify its properties; and diseases of these parts may occasion the admixture of blood, pus, mucus, &c.

The last circumstance we have to mention concerning the urinary secretion, distinguishes it from all others; *viz.* that the secreted fluid is concerned in no other function, but is entirely expelled from the body, after traversing the urinary passages. In other instances the secreted fluids serve some office; the tears lubricate the surface of the eye; the secretion of the saliva in assimilation is very important; the bile and pancreatic juice concur in digestion. Hence the alterations in the quantity or quality of the urine are followed by serious consequences; while the changes of the urine, particularly in quantity, are hardly observed.

The *renal capsula* (capsule suprarenalis, or adrenalis, renes luce-turati) are two small bodies, a right and a left, placed above the upper extremities of the kidneys, which they cover to a certain extent, and behind the peritoneum. They are sometimes double on one or both sides. Their size varies much according to the age of the subject; in the first months of fetal existence they are at least as large as the kidneys, and they continue to grow until the 3d year after birth; but at this growth it is much to be regretted that of the kidneys, the proportionate sizes of the two organs are soon entirely changed, and become such as we find them in the adult. When they have acquired their greatest magnitude, they sometimes preserve it in the adult; or they are gradually

KIDNEY.

gradually diminished, and at last disappear almost entirely. Their figure does not much resemble any known object; it is somewhat triangular, and bent from above downwards. We may distinguish in them an anterior and a posterior surface, a superior and an inferior margin, an internal and an external extremity.

The anterior, which is also the broadest surface, presents a little above its middle, a transverse groove, which receives the chief capsular vein; this corresponds, on the right side, to the inferior vena cava and the duodenum; on the left, to the spleen and pancreas. The posterior surface is in contact with the semi-lunar ganglion and the diaphragm. The inferior edge, which from its breadth has been described as a surface, is excavated obliquely from before backwards, and from above downwards, and embraces the superior end of the kidney. The superior margin, thin and convex, is rather inclined inwards, corresponding to the liver on the right, and to the spleen on the left side. In the extremities there is nothing remarkable: the inner is rounded and rather lower than the outer, which is more pointed. The whole exterior is unequal, with an appearance of small lobes, and adheres to the neighbouring parts by numerous vessels, by nerves and by a loose adipous substance, continuous with that which surrounds the kidneys. This substance in most cases nearly resembles the capsules themselves in colour, so that they may be easily overlooked in a superficial examination.

A kind of triangular cavity occupies the middle of the capsule, with an oblong eminence, caused by the course of a vein projecting into it below; the sides of this hollow often appear united by a kind of downy matter. It contains a fluid of a reddish colour in the fœtus, yellow in young subjects, and brown in the adult. Its consistence and quantity are variable; and it is coagulable by alcohol. It has been asserted that this cavity may be inflated by the capsular vein; but Haller could not succeed in attempting this in the human subject, although he accomplished it in animals. Some deny the existence of a cavity, and others have asserted that it is a vein. Haller saw it clearly sixteen times in the human subject: it was not observable in three instances.

The colour is a brownish-yellow, and deepest in the interior: it has more of red in the fœtus and in children. The form at that time is more rounded, the volume more considerable, and the fluid more abundant. Their consistence is moderately firm; more so on the outside than in the internal portion, in the adult than in the child. They are composed of lobes divisible into lobules, which may again be reduced into smaller portions. The surrounding cellular substance enters the organ and joins together these portions. In this respect the structure of the renal capsules resembles that of the conglomerate glands; but no excretory duct has been discovered in them.

Their arteries are numerous, and divided into superior, which come from the lower diaphragmatic, middle from the aorta or cœliac artery, and inferior, which arise from the renal. They anastomose frequently, and seem to run on the surfaces without entering the substance of the organs. The veins are less complicated. There is always a large one on each side, produced from the inferior vena cava on the right, and from the renal vein on the left side. It enters the groove of the anterior surface, and after running through it, passes into the neighbouring adipous substance, and to the lower part of the diaphragm. The branches enter the substance of the capsules, but probably do not open into the cavities, as some have supposed.

Lymphatic vessels arise from all points of these organs, and several join those of the kidney. On the right side they go to some lymphatic glands placed round the vena

cava, below the liver; or they are united with the absorbents of the liver, and proceed with them to the thoracic duct. On the left side they enter glands placed in front of the left crus of the diaphragm.

The nerves of the renal capsules come from the cœliac ganglia and from the renal plexuses.

Physiology of the renal Capsules.—The use of these bodies is entirely unknown: the physiologist or pathologist has not hitherto noticed one fact that can throw the smallest light on their office, or that can prove them to possess any connection with any function of the animal economy. "From an attentive consideration of all circumstances," says Haller (*Elem. Physiolog. lib. xxvi. sect. 4. § 14.*) "I can venture to affirm nothing further of these capsules, than that they secrete a fluid, which is more necessary to the life of the fœtus than to that of the adult. I can draw nothing from comparative anatomy, except the probable conjecture, that they are made for important purposes, as they are found in so many animals. They are large, and have a large cavity in the carnivorous, as the tiger, and in some herbivorous animals. But in other herbivora they are small, and the cavity is small in the voracious shark."

The urinary bladder, or muscular and membranous reservoir for the urine, is placed at the middle and anterior part of the pelvis, behind the bones of the pubes; before the rectum in man and the uterus in woman; below the small intestine, above the lower part of the rectum, the vasa deferentia and vesiculæ feminales in man, and the vagina in woman. This is the natural situation of the bladder in the adult, but age and various circumstances produce changes in this respect, which it is important to observe. In the fœtus the bladder is situated almost entirely out of the pelvis, and reaches nearly to the navel, in the midst of the cellular substance, which occupies the lower and front part of the abdomen, externally to the peritoneum. Hence it follows, that at this age its anterior surface is covered by the peritoneum only at the upper part, and that in the rest of its extent it corresponds immediately to the ossa pubis and the recti and transversi abdominis. It may accordingly be opened above the pubes, even in its empty state, without wounding the peritoneum. This peculiarity of position arises from the bladder being greatly developed in proportion to the neighbouring organs, and especially from its being very elongated, while the pelvis is small and very shallow: the upper aperture moreover is very oblique, and the rectum, distended by a large quantity of meconium, particularly towards the latter periods of pregnancy, almost entirely fills the pelvis. As the cavity of the latter is developed, the bladder sinks in it, and retires from the umbilicus. At three years of age it is said to rise hardly more than three fingers' breadth above the pubes, and at twelve this is reduced to about half an inch: at eighteen it is said to be completely hidden behind the bone. Haller, however, observes, that he has seen the length of this viscus remaining even to the time of puberty, so that it still projected considerably above the pelvis. In the adult, where the pelvis is deep, and the bladder shorter, not exceeding the bulk of an egg in its undistended state, it never rises above the pubes when empty; and even at other times is generally below the upper edge of the bone. But when it contains a large quantity of urine, it ascends and forms in the hypogastric region a very discernible tumour, which rises and increases gradually, in proportion as the quantity of contained fluid becomes greater. It may reach in these cases beyond the umbilicus. It is contained in the abdomen in the latter months of pregnancy. Perhaps it may be inclined rather more backwards in the supine position of the body. It has sometimes been contained

contained in an inguinal or vaginal hernia. Its situation is not always perfectly straight, but sometimes, as Celsus has observed, rather inclined to the left. It is retained in its situation by cellular substance, which furrounds it on all sides, and by other means, which will be described presently.

The capacity of the organ differs according to the age, sex, and diseases. It is much greater, in proportion to the size of the body, in children than in adults: it diminishes afterwards as it sinks in the pelvis. It is larger in persons who have the habit of retaining the urine for a long time, than in others; and on this account it may be larger in some females. In cases of retention of urine it sometimes is so enlarged as to hold several pints: and it is diminished in a corresponding degree in other affections, as when it is irritated by the constant presence of a stone, or by any other cause. We can hardly assign any particular capacity as the natural one, there is so much variety in different individuals: a healthy person may void, at one time, from half a pint or less to two pints.

The figure of the bladder, in an adult male, is nearly that of an oval, rather flattened from before backwards, with the large extremity placed downwards and a little backwards, and the smaller in the contrary direction. In females, and particularly in those who have had many children, it is not so high, but broader in the transverse direction. It is very elongated, and nearly cylindrical, in the fœtus, at which time its extremity, formed by the urachus, approaches the navel: its length is three times its breadth, and its transverse diameter is nearly equal to the antero-posterior. At no long period after birth these dimensions change, the bladder becomes more rounded, and assumes a somewhat pyriform figure; and, as the child grows, the figure approaches more and more to the oval. Several anatomists distinguish in the bladder a superior portion, which they call the fundus; a middle part, or body of the bladder; and an inferior division, comprehending the lower surfaces and the neck. We shall divide the organ into two surfaces, an external and an internal.

The external surface may be naturally divided into six regions: *viz.* an anterior, a posterior, a superior, an inferior, and two lateral, or right and left.

The anterior, which is slightly inclined forwards, is bounded above by the urachus, and below by the neck of the bladder. At its lower part are seen two small fibrous fasciculi, called anterior ligaments of the bladder. They have a horizontal direction, and are attached to the back of the symphysis pubis in front, to the superior portion of the neck of the bladder, and to the prostate behind. This region then corresponds to the flattened posterior surface of the ossa pubis and their symphysis, to which it is connected by a loose cellular substance. When the organ is empty, or moderately filled, it does not ascend above the bone; but in the distended state it rises out of the pelvis, and corresponds immediately, without the interposition of the peritoneum, to the abdominal muscles. Hence, at this time it may be perforated by a trocar, or opened for the extraction of a stone, without exposing the patient to an effusion of urine in the abdominal cavity.

The posterior surface, slightly inclined upwards, is convex, smooth, entirely covered by peritoneum, contiguous to the rectum in the male, and to the uterus in the female subject, and to the inferior convolutions of the small intestine in both sexes.

The lateral regions, which are broader below than above, are covered by peritoneum in their posterior part only: in front they are connected to the Edes of the cavity of the

pelvis by a large quantity of cellular tissue. The umbilical arteries, and the vasa deferentia, pass along them.

The superior region is commonly called the fundus of the bladder; it corresponds to the convolutions of the small intestine, and affords attachment to the superior ligament of the bladder. The latter is composed of the urachus and of the two umbilical arteries, each of which is here included in a small fish-form portion of peritoneum. The urachus, occupying the middle of the ligament, appears in the adult under the form of a whitish fibrous cord, extended from the fundus of the bladder, on the external surface of the peritoneum, to the umbilicus, where it is confounded with the aponeuroses of the transverse muscles. It is about as thick as a small quill at the bladder, but it grows gradually smaller towards the navel. It possesses no interior cavity, and seems capable of no other use than that of fixing the bladder in its situation. Instead of being solid and ligamentous, it is said sometimes to form a true canal, by means of which the urine escapes at the navel: this unusual appearance, which we have never seen, is said to arise from obstriction at the neck of the bladder, and to cease as soon as the urine flows through the urethra.

The elongated figure and great elevation of the bladder in the fœtus, make the urachus very short; it then forms a canal, beginning from the upper part of the bladder: thence it ascends to the umbilicus, becoming at the same time contracted. Lastly, it enters this ring with the umbilical arteries, and is continued into the cord: according to Haller, it may be filled with mercury for an inch, or an inch and a half. Further on, it is said to be divided into several filaments, which are lost on the arteries: but Mr. Cruikshank states that it is continued, in the form of a very slender thread, throughout the cord. In quadrupeds it is manifestly hollow, and passes through the cord to a membranous bag called the allantois, in which it ends. Its diameter is variable: in general it is not more than one-third of a line in breadth, and it opens into the bladder by an orifice, which is so small and difficultly found, that many good anatomists have altogether denied its existence. Sometimes it is considerably larger in this situation. Haller says that he has expressed from it a drop of gelatinous lymph, and others speak of urine as contained in it. Its consistence is firm; it seems to be formed by a prolongation of the internal coat of the bladder, inclosed by long and hard fibres continued from the muscular coat. It is closed, and becomes solid and ligamentous some time before birth: its cavity is obliterated, like that of the umbilical vessels, and it can no longer be dilated, or receive urine. Sometimes, however, it remains open: Haller introduced a hog's bristle into it in the adult, and he mentions gravel being contained in it in another instance. In 1787, says Boyer, I dissected the bladder of a man thirty-six years old, whose urachus formed a canal an inch and a half long, and contained twelve urinary calculi of the size of millet seeds. I ascertained that the containing tube was not a facculus or elongation of the internal coat through the muscular tunic. These examples of a hollow in the urachus of the adult are very rare.

As the existence of a canal in this part is sometimes denied, we subjoin the following express testimony of Haller on the subject. "Doubts have been entertained whether the urachus be hollow, since we often find that nothing passes into it, when the bladder is distended with air or mercury; and several good anatomists have found no canal. But the repeated investigations of this matter by myself, and by one of my pupils, have plainly shewn that a foramen leading into the urachus exists at the top of the bladder in the human fœtus. When the surrounding cellular substance

has been removed, and the fold, which is sometimes formed between it and the bladder, is destroyed, air, quicksilver, or a brittle oil enter easily: I have also squeezed out a drop of gelatinous fluid, and others have found urine in the cavity. It may be demonstrated as far as the umbilicus.' *Elem. Physiol. lib. xxv. sect. 2.*

The two umbilical arteries, which are constantly obliterated in the adult, form merely ligamentary cords of a cylindrical figure, placed at the sides of the urachus, and adhere to it with tolerable firmness to the peritoneum.

The fibrous proceſſes of the peritoneum are necessarily and mechanically produced by the reflexions of that membrane on the three ligamentary cords juſt deſcribed: they riſe from the membrane from the ſides of the cavity, and make it project into the abdomen in the form of three ſmall elongated folds, of which the middle furrounds the urachus, and the two lateral ones the umbilical arteries. They are broader below than above, and more ſtrongly marked in the fetus than in the adult. They are united and blended at the navel, but ſeparate as they deſcend; the middle, which is vertical, and correſponds to the linea alba, terminating on the fundus of the bladder, the lateral ones, which diverge, on the ſides of the organ.

The lower region, which is alſo called the baſis of the bladder, is rather more extenſive from ſide to ſide than from before backwards. It is ſubdivided into an anterior and a poſterior portion: the former, rather more elevated than the latter, is narrow, ſhaped like a funnel, and called the neck of the bladder. It is embraced by the proſtate, and correſponds to the poſterior and inferior part of the ſymphysis pubis. The poſterior part is large and expanded: it is bounded behind by the kind of cul-de-ſac which the peritoneum forms as it is reflected from the back of the bladder to the rectum. This part covers, in man, the veſiculae feminales and vafa deferentia, which are united to it by cellular tiſſue, cloſe in front near the proſtate, and looſer behind: in the triangular interval, ſeparating the vafa deferentia, the ſurface of the bladder is in contact with the rectum, and connected to it by a looſe abundant cellular ſubſtance, containing fat and interperſed with numerous blood-veſſels, particularly veins. In the female this part of the bladder correſponds to the front of the vagina. The ſides of this lower portion of the bladder are covered in both ſexes, by the levatores ani, and correſpond to the intervals between the anus and the tuberoſities of the ſclia.

The internal ſurface is poliſhed and covered by an abundant mucous ſecretion. It preſents a great number of wrinkles, more or leſs ſtrongly marked, taking various directions, and formed by the internal membrane. Theſe are very apparent when the bladder is empty and contracted, but are eſcaped almoſt entirely when it is dilated. They ariſe from the unequal contraction of the muſcular and mucous tunics, of which the latter poſſeſſes a much leſs degree of contractility than the former. In ſome ſubjects there are few, becauſe theſe wrinkles, elongated promnences, reſembling in many points the muſcular columns of the right ventricle of the heart. Theſe are formed by the fibres of the muſcular tunica, diſpoſed in large ſtateuli, and elevating the mucous membrane ſo as to project towards the bladder. Correſponding depreſſions are ſit between theſe columns, which have given riſe to a particular name in French (veſſies a colonnes), diſtinguiſhing the bladders with this appearance. Beſide theſe depreſſions, there are ſometimes cells or pouches of various ſizes and number opening into the cavity. Stones may be contained in ſuch cells, and are then called encyſted.

The anterior, poſterior, and lateral regions of the internal

ſurface of the bladder, preſent nothing beſides what we have juſt particularized. In the ſuperior region there is a ſmall pore in the ſetus, often ſcarcely viſible, and conſulting the commencement of the urachus, which we have already ſpoken of. The inferior region offers to our view, in ſucceſſion from before backwards: 1ſt, the neck of the bladder; 2dly, the triangular ſpace; 3dly, the inferior part of the ureters; and, 4thly, the inferior ſurface or bottom of the bladder.

The neck of the bladder, or oriſice of the urethra, is a tolerably large circular opening with thick ſide, contracted a little to form the urethra properly ſo called. It occupies the moſt depending part of the bladder in the fetus, becauſe the bottom of the organ (baſfond in French) is not developed at that time. In the adult, the neck of the bladder is rather higher than the inferior ſurface; ſo that there is a ſlight declivity from the former to the latter, directed from before backwards and from above downwards. The circular figure of the opening in the neck of the bladder is ordinarily interrupted by a ſleſhy tubercle, ariſing from its lower portion, and called by Lieutaud, who firſt deſcribed it, *luette veſicale*, or *uvula veſicale*. Its ſize varies, inſomuch that it is often ſcarcely viſible. It is ſubject to enlargement, particularly in old perſons, and then it forms an oblong tumour, rounded at its upper margin, and, by its ſituation, rendering the expulſion of the urine difficult. However, we ſometimes find it ſwollen in the dead body when the bladder has not been diſtended. It ſeems to be chiefly formed by the internal membrane of the bladder, and to be merely the termination of the anterior angle of the triangular ſpace. It is deſcribed by Mr. Home, in a paper contained in the *Philophical Tranſactions*, as a third lobe of the proſtate gland. (See the deſcription of that gland in the article *GENERATION*.) In the natural ſtate, the neck of the bladder is cloſed, except during micturition; and is only opened for the evacuation of the urine. It is ſurrounded externally by the proſtate gland. (See *GENERATION*.) The opening is larger in the female; where, if it depended on the proſtate, we ſhould not expect to find a *luette veſicale*: yet Lieutaud aſcribes it equally to that ſex.

The trigonum veſicæ (*trigone veſicale* in French) is a triangular portion, bounded by three openings, which mark its three angles. Theſe apertures are diſtant from each other about an inch, or an inch and a half, and are, in front, the opening of the urethra already deſcribed, which forms the apex of the triangle; behind and laterally, the openings of the two ureters. The ſurface is a little inclined backwards, and juſt prominent enough to allow of the fact being obſerved. It is much leſs wrinkled than other parts of the bladder, and may alſo be diſtinguiſhed by its colour, which is not the ſame in all ſubjects, but conſtantly different from that of the reſt of the organ, and generally whiter. The anterior angle, or apex, which is contoured with the *luette veſicale*, is nearly three or four times its thickneſs; it grows thinner towards the baſis. Its thickneſs and colour, and the ſtrong adheſion of the internal membrane, lead us to ſuppoſe that its organization is peculiar. It preſerves nearly the ſame extent in the contracted bladder, and is then more prominent. It is more extenſive in the female than in the male bladder.

The openings of the ureters, occupying the two poſterior angles of the triangular ſpace, are narrow, elongated, and directed obliquely forwards and inwards. Their diameter is much ſmaller than that of the ureters, and they often appear to be covered by ſmall folds of the internal membrane, which it is neceſſary to elevate with a probe in order to ſee them clearly. The introduction of the probe ſhews us the obliquity of the canals, and the extent of their courſe between

tween the two coats of the bladder, a point which we have already mentioned in speaking of the ureters.

The bottom of the bladder is a large hollow situated behind the triangular space, and below the level of the neck: it is, in fact, the most depending part of the organ.

The sides of the bladder become thicker in proportion as the organ contracts, and they are rendered thinner when it is dilated. They consist of a serous, a muscular, and a mucous coat.

The first of these invests only the posterior region, and a small portion of the lateral regions. In the fetus it covers also a small part of the front and upper portion of the organ. Its external surface is perfectly smooth, and moistened by a serous secretion. The internal surface is connected to the muscular covering, by cellular substance, in such a way as to admit with tolerable facility of separation by dissection. This covering is furnished by the peritoneum, which passes from the front of the abdominal cavity, that is, from the recti muscles or the ossa pubis, to the fundus of the bladder, then descends over the posterior to the inferior surface of the organ. Here it quits the bladder, and passes to the front of the rectum in men, to the anterior surface of the uterus in women. As it goes from one to the other of these organs, it forms on the sides the two folds improperly called posterior ligaments of the bladder, and in the middle a cul-de-sac, which is the lowest portion of the peritoneal cavity in the male subject. This part may become distended with the fluid of ascites; and, as the cul-de-sac just mentioned extends to within two or three inches of the anus in many subjects, the paracentesis of the abdomen might be performed, in the male subject, from the rectum; indeed this has been actually done in one instance. The cul-de-sac formed in the female, by the reflexion of the peritoneum from the vagina to the rectum, would allow a similar operation, in that sex, from the posterior part of the lower surface of the vagina.

Where this serous covering does not exist, the bladder is covered by a layer of cellular tissue, the thickness and appearance of which are not every where uniform. At the anterior region, behind the pubes, and on the lateral regions, it is very loose and abundant, and usually contains more or less fat. At the inferior surface it is less copious, but still loose, and containing little or no fat; a considerable number of vessels, particularly veins, is seen here. It is dense and whitish about the vesiculae feminales and prostaticae.

The muscular coat surrounds the bladder at all points; corresponding, by its external surface, to the serous tunic, and to the cellular substance; by its internal surface, to the outside of the mucous coat. It is composed of a thin stratum of pale fibres, disposed in fasciculi of various sizes, crossing each other in all directions, so as to form a very close network, of which the interstices present every variety of size and figure. Ordinarily the mucous coat is completely covered by this muscular tunic; but sometimes there are small spaces without any muscular covering. Through such spaces the mucous membrane may be protruded, so as to form the cells already mentioned, communicating with the cavity of the bladder.

An attentive examination of the muscular fibres shows us, that some have a longitudinal, others a nearly circular direction; that several are oblique, and that the rest compose an inextricable network. The longitudinal fibres, forming the exterior stratum, are directed from the neck to the fundus of the bladder. The anterior ones arise from the prostate and its covering, and sometimes from the posterior and inferior part of the pubes, and the front ligaments of the bladder; in the female, from the point of union of the

bladder with the urethra; they ascend over the front of the organ to its upper part, and afford to the urachus the external covering already mentioned. The posterior fibres form more numerous and larger fasciculi than the anterior; they pass from the urachus, over the posterior and inferior surfaces, to the prostate in man, and to the junction of the bladder and vagina in woman. Both these portions send off fibres laterally, which cover the lateral regions, decussate with each other, and with those of the more deeply-seated strata. As all these fibres have their fixed points in the prostate and neck of the bladder, they will draw the other parts of the organ, which are all more or less moveable, to the neck, and consequently press the urine against the orifice of the urethra.

The oblique fibres are less distinct and more deeply-seated than the longitudinal; and are so blended with the others that it is almost impossible to observe any order in their distribution. Some have a transverse direction, and embrace the bladder almost in a circular manner: the more deeply-seated they are, the more they approach to this course; yet several longitudinal fasciculi may be seen in the interior of the organ. The contraction of these fibres diminishes the capacity of the organ in all its diameters, and tends to bring its sides in all directions towards their common centre. The urine, thus forced on all sides, will escape in the direction where there is the least resistance; that is, the neck of the bladder, against which it is moreover forced by the contraction of the longitudinal fibres.

From its office of expelling the urine, the muscular coat of the bladder is frequently described as a muscle, under the name of detrusor urinae. It will be readily understood, from the account which we have just given of its action, that the bladder is brought into a flattened state, and lies wholly just behind the pubes, when this covering has contracted. The fixed point of the organ is behind those bones; the prostate and neck cannot move, and all the other parts are drawn towards them. In this state the organ is flattened before and behind, and has a triangular outline; the fundus forms the apex, the inferior surface the basis, and the lateral regions the two sides of the triangle.

In a distended bladder, the muscular coat is thickest at the inferior surface and at the basis; in other situations it is often remarkably thinner. This difference arises from the circumstance, that the coats do not yield equally to distention in all directions; for, when we divide a contracted bladder, the thickness is nearly uniform throughout.

The description of the muscular fibres about the neck of the bladder is stated very differently by different writers. Some admit, and others deny the existence of a sphincter vesicae, or circular muscle surrounding the opening, and closing it by its contraction. The fibres in this situation are pale, and mixed with several veins and cellular texture; they are certainly completely continuous on all sides with the rest of the muscular coat. It is observed by Haller, that a sphincter was assigned to the bladder, in the first instance, from the supposed necessity of such a structure to account for the functions, rather than from actual dissection; hence Vesalius places it in front of the prostate. Santorini could find no circular fibres surrounding the mouth of the urethra. Others reject altogether the notion of a sphincter; and Winslow refers the descriptions of such a part to fasciculi arising from the pubes. Haller gives the following description from his own dissections. In men there are transverse and even arched fibres above, intricately connected together, and lying on the neck of the bladder, on the prostate, and on the longitudinal fibres arising from the pubes. Others of an arched form, with the concavity towards the bladder, lie

under these. In women he found fibres at the anterior part decussating at considerable angles, so as to form a kind of circle; in other instances they were more transverse. The inferior fibres are transverse, continuous with the circular stratum of the bladder, and covered by the prolate. The effect of the contraction of these fibres, however slender and obscure they may be, must be that of contracting the opening about which they are placed.

The modern French anatomists will not allow the fibrous substance about the neck of the bladder to be of a muscular nature. "When the neck of the bladder," says Boyer, "is attentively dissected, we find under the external cellular stratum, and between that and the mucous membrane, only a whitish, thick, firm, and fibrous substance, continuous with the muscular coat, the fibres of which very manifestly end in it. There is no sphincter, since we see no distinct muscle, and the fibres of the neck are moreover continued with those of the general muscular coat. But the structure, which we have just described, communicates to the neck of the bladder a resisting power, which, although not produced by the action of any particular muscle, is still superior to the contractile tendency of the bladder." *Traité complet. d'Anat. t. 4. p. 490.*

The muscular coat of the bladder is proportionally thicker in the fœtus and child, than in the adult. The irritability of the organ, and the force exerted in expelling its contents, seem to be greater in the early years of life.

The name of nervous coat has been given to a whitish stratum, placed between the muscular and mucous coats. The structure of this is completely cellular; it is looser towards the former, and more close towards the latter of the tunics. It is very extensible, and recovers itself after distention, forming, in conjunction with the mucous membrane, the folds which we have described in the inner surface of the organ. It contributes considerably to the solidity of the sides of the bladder.

The internal or mucous coat lines the whole interior. It is continuous on one side, with the linings of the ureters; and on the other, with that of the urethra. To its external surface adheres the cellular stratum just described. Internally it is perfectly smooth, having no visible villi, nor any other inequalities except the rugæ which arise from contraction of the muscular coat. Its surface is constantly covered by a mucous fluid, destined, in the opinion of physiologists, to protect it from the irritating qualities of the urine. This secretion must be perpetually removed by the urine and perpetually renewed. It is expelled in that fluid, and becomes sensible by chemical analysis. When any cause of irritation affects the bladder, as for example, when a calculus is contained in it, this mucus is voided in very large quantities, to the amount of some ounces at each time of making water: in such cases it often subsides and concretes into a tolerably firm jelly.

The sources of this secretion cannot be easily demonstrated; although, as Haller observes, the glands of the bladder are mentioned as familiarly as if they were visible on superficial inspection. Is the mucus poured out by the exhalants of the internal membrane, or secreted in a glandular apparatus? Sometimes, but rarely, says Haller, have I seen simple follicles on the external surface of the mucous coat, chiefly near the neck of the bladder; some round, like those of the cheeks, equal in size to millet seeds, and in clusters in the female, others smaller. At other times I saw no follicles, but mere pores." *Element. Physiol. lib. 26. sect. 2.*

The mucous membrane is thin and whitish, particularly towards the neck of the bladder; in other parts it has a somewhat red tint. We do not know much of its organiza-

tion or properties. It is continuous, through the urethra, with the epidermis, and seems to resemble that part in being occasionally detached in shreds, and renewed.

A whitish eminence is continued from the ureter on each side towards the mouth of the urethra, and sometimes seems connected to the verumontanum. It is a firm substance, connected to the mucous membrane, and it forms the trigonum vesicæ already described. According to Haller and Morgagni, these rifings are not constant.

The arteries of the bladder are derived chiefly from the umbilical; some small ones come from other branches of the internal iliac. The epigastric sends twigs towards the fundus. They anastomose together, and form an elegant network between the muscular and mucous coats, extending also into the latter. The veins, following the divisions of the arteries, terminate on each side in the obturator and internal iliac veins. They ramify chiefly on the lateral and inferior regions of the organ, where they form, together with those of the rectum, a considerable plexus.

The lymphatics arise from all points of the internal surface, and generally follow the blood-vessels. They go through small glands in the course of the umbilical arteries, and end in the hypogastric plexus.

The nerves come from the sacral and from the great sympathetic.

The urethra of the male has been described in the article GENERATION; we must insert in this place an account of that canal in the female. It is about an inch or a little more in length, but much larger and more susceptible of dilatation than in man. Its shortness and large diameter enable it to transmit stones of a considerable size; consequently, the operation of lithotomy is much less frequently performed on females than on males; and the former suffer, on the whole, much less from calculous complaints. It has been enlarged by sponge tents sufficiently to admit the finger and thumb. Its direction is nearly horizontal from the neck of the bladder, at which it begins, under the pubes and clitoris to the pudenda; but it describes a very slight curve, of which the concavity is turned upwards, and the convexity downwards. It corresponds above to the corpus cavernosum of the clitoris, adhering to it by a loose cellular substance.

Below it is very closely connected to the vagina, particularly in front, and forms a longitudinal projection, which is sufficiently conspicuous on the front of the canal. The anterior extremity is situated rather lower than the posterior, and terminates by an opening, called the meatus urinarius, at the lower part of the triangular space included between the nymphæ, and just on the front edge of the entrance into the vagina. This aperture, which is sometimes as large as the urethra, which it terminates, sometimes smaller, is irregularly rounded, and has a thick prominent margin, exhibiting the excretory ducts of certain mucous glands situated in the neighbourhood. In pregnancy, particularly towards the latter months, the meatus urinarius is rather drawn inward, and not to be discovered without difficulty.

The structure of the canal is analogous to that of the male urethra. Externally it is covered by a thick layer of cellular and vascular matter, the nature of which has not been clearly ascertained, bearing considerable resemblance on a section to the vascular texture round the male urethra. This is not confined by any proper covering, as in the male, but is connected by loose cellular substance to the surrounding parts. At the front, the urethra and vagina are nearly consolidated into one substance, and are covered by a common layer of convoluted veins, called the plexus retiformis. The internal surface of the urethra is lined by a thin mucous membrane, continuous at one end with that of the bladder,

and at the other with the lining of the pudenda. It is marked by five or six longitudinal lines, in the intervals of which mucous lacunæ open in rows. There may be from four to seven orifices in each of the grooves, leading to canals, which are continued obliquely into the spongy texture of the urethra, and capable of receiving bristles. On the tumid edge of the meatus urinarius two very large sinuses open, capable of admitting the end of a probe. The structure of these organs resembles entirely that of the lacunæ in the male urethra. The mucous fluid secreted by them defends the surface of the urethra from the irritation of the urine; it seems also to be poured out more particularly in coition, or under the influence of strong desires.

Besides the difference of length and size in the urethra of the two sexes, arising out of the additional function belonging to this canal in the male, of conveying the fecundating fluid into the vagina, the want of prostate in the female is another remarkable distinction. There is no foundation whatever for the opinion of De Graaf concerning the female prostate.

Functions of the Urinary Bladder.—The urine secreted, as we have already observed, incessantly by the kidneys, is transmitted, without interruption, through the ureters into the bladder, retained there for a certain length of time, and then expelled by an operation under the controul of the will. The bladder, in its empty state, occupies a very small space, is concealed entirely within the pelvis, and has its relations to the surrounding organs reduced within a small extent. Its contracted coats are thick, but all of them are not equally concerned in producing this state of the organ. The ferrous coat, and the cellular layer, have nothing to do with it; and the mucous membrane, incapable of a quick and considerable contraction, forms the numerous wrinkles of the internal surface, which may be seen both in living animals, and in the dead subject. The continued contraction of the muscular covering produces the state in which the empty bladder is found; and if its coats at this time are thicker than those of the stomach and intestines; it is because the muscular fibres are stronger and more abundant. At this time there is, properly speaking, no cavity of the bladder. The urine, deposited drop by drop, dilates the organ insensibly, and makes it contract new relations to the surrounding parts. Although this distention takes place in every direction, except towards the front, it is most sensible in the long diameter, or from below upwards. Its basis presses on the rectum in man, and the vagina in woman; but the natural limits which the connections of these parts offer, prevent it from extending much downwards. In the opposite direction there is no obstacle to prevent its enlargement; it rises freely above the pubes, the muscular coat is distended, the wrinkles of the mucous membrane are effaced, and the whole organ is consequently rendered thinner.

The peculiar conformation of the ureters, at their entrance into the bladder, accounts for the urine not returning along these canals to the kidney. When the bladder is distended with urine or air, the ureters are compressed between the mucous and muscular coats, in that portion which is included between these coverings; and the obstacle becomes more complete, in proportion as the distention of the bladder is increased. This mechanism does not depend on any vital properties; you may throw air or any fluid into the dead bladder, through the urethra, but not a drop will gain admission into the ureters; force the injection, and the bladder will burst. Hence, when the urethra is impervious during life, and the bladder is distended far beyond its usual dimensions, the ureters are continually adding to the collection, stretching the organ so as to produce most severe pains, and

ultimately causing rupture. If the muscular covering be dissected away, fluids escape immediately.

Thus, we have no difficulty in explaining why no urine passes in a retrograde course into the ureters; but the cause, which prevents it from entering the urethra, is not equally obvious. Although this be the natural course, the urinary fluid does not pass constantly through the urethra, as it does through the ureters: it is retained for a considerable time, both in man and in quadrupeds, and never escapes spontaneously, in either instance, in the healthy state. After a certain delay, a sense of inconvenience and pain produces a voluntary muscular exertion, by which it is expelled. As there is an uninterrupted flow of urine into the bladder, why does it not constantly escape? The voluntary act, by which we suddenly interrupt the stream in micturition, or resist an urgent desire to void the urine, is manifestly the contraction of the accelerator, which closes the bulb of the urethra, and consequently intercepts the communication between the bladder and the front of the canal. But we inquire the cause which acts perpetually, not only independently of the will, but when we are not attending, even when we are asleep, in preventing the urine from flowing guttatin through the urethra, as it arrives from the ureters. It is the more interesting to discover this cause, since there seems to be in the bladder a natural tendency to contraction, in virtue of its irritable powers. Hence, where a direct opening is made into its cavity, when the resisting power of the neck is destroyed by paralysis, or when an open catheter is left in the urethra, the urine escapes constantly as it is secreted, and no accumulation takes place in the bladder. The effect cannot be produced by a sphincter, obedient to the action of the will, because it takes place in an infant unconscious of the usages of society and the laws of decorum, and in an animal which has never been trained to cleanliness. Both expel the urine at intervals, and in obedience to a stimulus, which seems to be the natural motive of the act. Moreover, the evacuation is so far from being spontaneous, that it requires a considerable effort.

Physiologists have commonly referred the closing of the urethra to the sphincter vesicæ muscle, and have considered it analogous, in every respect, to the sphincter ani. But this is unsatisfactory, when the very existence of the part, as a muscle, is questioned. To the action of this, which he acknowledges to be inadequate to the effect, Haller joins the relative position of the bladder and urethra. He observes, that the inferior portion of the receptacle descends below the level of the urethra, and may consequently be dilated without the urine running off through that opening; and that a greater portion of the bladder is so placed when the organ is distended. Hence, he adds, the bladder may be distended, in some degree, in the dead subject, before its contents will escape by the urethra. The French anatomists seem to be of opinion that there is some peculiar contractile and resisting power in the neck of the bladder: this is termed in the *Anatomic Descriptive* of Bichat, "le ressort ou la résistance organique du col;" t. v. p. 157. Boyer speaks of the "habitual contraction of the fibres surrounding the neck of the bladder, and the elastic force of the neck and prostate." *Traité complet d'Anat. t. iv. p. 493.*

We do not pretend to explain clearly the exact mode in which this business is effected. We see no sphincter muscle adequate to the purpose, and the circumstance noticed by Haller will not at all account for the retention of the urine until the fundus of the bladder has ascended far into the abdomen. We must be contented to recognize the existence, without knowing the nature of a powerful contractile

property in the neck of the bladder, retaining the urine, in ordinary circumstances, until the sense of inconvenience induces us to make the requisite voluntary exertion for its evacuation, and, in paralysis of the muscular coat, and other states of disease, holding it until the bladder, enormously distended, sphacelates and bursts. The advantages of this arrangement, in enabling us to retain the urinary secretion, until it has accumulated in considerable quantity, and in securing us from the fetor, excoriation, and other annoyances, which a constant involuntary flow of urine produces, are too obvious to need a more particular detail.

Does the retention of the urine in the bladder produce any alteration in its qualities? Physiologists generally believe that the water is partly absorbed. The urine voided at different times possesses, as we have already remarked, very different properties: if, after emptying the bladder, we make water again in a short time, it is almost colourless and inodorous; allow a long time to elapse, and it will be high coloured, acrid, and have a strong smell. The latter properties particularly characterize what is voided after a night's sleep. These circumstances are most easily explained by the agency of the lymphatics. The admixture of secretions from the surface of the bladder is another important source of modifications in the urine, particularly when the organ is irritated or diseased.

The increase in the quantity of urine accumulated in the bladder produces an unpleasant feeling, which soon amounts to pain, and ends, if the cause continues, in the most excruciating agonies. Many circumstances influence the length of time, during which the urine is retained, and the quantity that may be accumulated before the desire to expel it is felt. The qualities of the fluid, as being more or less irritating, and the quantity secreted in a given time, produce considerable differences: a much larger quantity can be retained, when introduced gradually, than when secreted very fast. Habit has considerable influence; and hence women, from the usages of society, can generally support a greater distention than men. The bladder itself, without any disease, varies in its retentive power in the same individual, according to his state of health: the effect of age is also very perceptible; the irritable bladder of the child empties itself very frequently; in advanced age the contrary is observed. But the effects of disease are more obvious and important; in paralysis, distention produces no feeling, and the natural stimulus to evacuation does not take place. When the organ is affected by any irritating cause, as the presence of a stone, it will hardly bear a few drops of fluid.

The evacuation of the bladder is the joint effect of two powers; viz. the action of the respiratory muscles, and that of the muscular coat of the organ. By the first we overcome the resistance of the neck of the bladder; and the operation is finished by the second. We begin, as in all similar efforts, by a deep inspiration; then, retaining this air in the chest, we exert also the abdominal muscles. The perpendicular position of the body subjects the bladder, in the most favourable way, to the downward pressure of the diaphragm: the business is accomplished more difficultly in the recumbent posture. The effort is always greater in proportion to the distention of the bladder: when the quantity of urine is small, the exertion may be slight; but inspiration in all cases precedes micturition. A few drops, or a very slender stream, come through the urethra first, proving that the orifice of the bladder is very completely closed in the healthy state. It then comes in a larger and larger current, and with increasing force; being propelled further in young than in old subjects. When it flows in a full stream, we remit the effort with which the operation began,

and continue respiration in the ordinary manner: the process is completed by the powers of the bladder, which force out its contents in a continuous stream. We may still increase the impetus by renewing the effort; or we may project a portion of the fluid more forcibly by the assistance of the accelerator urine muscle. Perhaps the contraction of the bladder is the most important circumstance in the operation: for, when that is paralyzed, we put the respiratory powers in action without effect. Distention of the organ very much weakens its expulsive power; so that, when we have retained the urine beyond the proper time, we exert the abdominal muscles and diaphragm very violently for a considerable time without effect.

Towards the end of micturition, the urine again flows guttatum, as at the beginning; and the last portions are thrown into the urethra with so feeble an effort, that they must be expelled from that tube by the accelerator urine.

KIDNEYS, *Inflammation of*. See NEPHRITIS.

KIDNEYS, *Calculus in*. See NEPHRATIA.

KIDNEYS of Birds and Fishes. See Anatomy of BIRDS, and FISH.

KIDNEY-bean, in Gardening, a common name which is often applied to a particular sort of bean. See PHASEOLUS.

KIDNEY-bean Tree. the common name of a particular kind of tree. See GLYCINE.

KIDNEY-witch, the common name of a peculiar sort of vetch. See ANTHYLLIS.

KIDONIA, or CIDONIA, in Geography, a province of Crete, or Candia, which has retained the name of the ancient city of the Cretans, produces oil, grain, cotton, flax, silk, honey, wax, some fruits, and a tolerably large quantity of cheese: its territory is in general extremely fertile. The nearest mountains which lie to the south, being more temperate and more cool than the territory of Canea, yield a great many fruits; but little wine, much oil, and some wheat and barley are produced in this province. See CANDIA.

KIDWELLY, or CIDWELLY, a market town and parish of Caermarthenshire, South Wales, is seated on the banks of the river Gwandraeth, over which is a bridge, connecting two portions of the town called the new and old town. In the year 1800, the parish contained 333 houses and 1388 inhabitants. Kidwelly has been for many ages a town of considerable traffic. "Its harbours were so well frequented as to render it the rival to Caermarthen; the fisheries of this port were considerable; its coal trade great, and it had besides a flourishing internal business in the clothing line. But the condition of the place has been for years on the decline. By virtue of its charter, the affairs of the town are regulated by a mayor, who is chosen annually. About the middle of the sixteenth century, Leland speaks of Caermarthen having increased in consequence of the decay of Kidwelly harbour, the entrance of which became suddenly intercepted by a dangerous sand-bank, driven up by the sea, that prevented vessels of large burden from sailing up the river as before. It is worthy of remark, that this bar of sand, after lying so long in the situation above-mentioned, as to almost ruin the Kidwelly port, separated, a few years back, of its own accord, in the middle, and now affords a sufficient depth of water for the vessels commonly employed in the trade of this part of the country to come up the river. The old town, in the time of Leland, was nearly desolated, but the walls surrounding it appears, from his words, to have been entire, for he tells us, this part was "prettily walled," and that he saw "three gates ther." The old town is at present inconceivable." The castle, at one extremity of it, stands proudly elevated on an artificial mount, on the side of the marshes. It is allowed to be the most perfect building

of the kind in Wales, and, according to Mr. Donovan, "is certainly a magnificent remain of ancient military architecture. There is an air of solemn majesty in its appearance, that betrays a noble origin." In the same author's "Descriptive Excursions," is a print of this castle, and a long note on the history of the building controverts the assertions of Camden, Buck, and Grose, who affirm that "Kidwelly castle was built soon after the conquest by Maurice de Londres, one of the Norman knights, who conquered Glamorganshire." Instead of this, Mr. Donovan says it was built in 1189, by Rhys, Prince of Wales. Since that time it has undergone various alterations and enlargements. The present remains are carefully preserved from "every species of wanton depredation." The ground plan is nearly quadrangular, with four round towers at the angles; and smaller towers in the walls. At the west end is the chief entrance, between two other round towers. Several of the apartments are nearly perfect. The prospects from the summit "are uncommonly fine."

Near the church, in the new town, was a priory, or cell of Black monks. Donovan's "Descriptive Excursions through South Wales," 2 vols. 8vo. 1805.

KIE, or KIEH, a town of Persia, in the province of Mekran; 100 miles N.N.E. of Kidge. N. lat. 27° 40'. E. long. 60° 8.

KIEKERNES, a town of Prussia, in the province of Jamlund, situated on an island in the Rufs; 19 miles N.W. of Tilit.

KIEL, a town of Sweden, in the lapmark of Afele; 55 miles S.S.E. of Afele.

KIEL, a town of the duchy of Holstein, situated at the bottom of a bay or gulf in the Baltic, and forming a convenient harbour. It contains 800 houses, three churches, an university founded in the year 1650 by Christian Albert, duke of Holstein-Gottorp, and considerably enlarged by the late king. It contains 24 professors, and when Mr. Cox visited it about 300 students. It has also a college established in 1768. The prosperity of this place very much depends upon an annual resort to it of the nobility and persons of wealth in Holstein and Sleswick, for the transfer and disposal of their monies; this pecuniary intercourse usually lasted eight days, at which time was held a considerable fair, which commenced by the ringing of a bell on Twelfth-day, and terminated in the same manner on the eve of the Purification. It was formerly one of the Hanse towns, and the staple for all goods exported from or imported to Denmark. The district of Kiel is that portion of the duchy of Holstein, which descended to the line of Holstein-Gottorp, and belonged to Peter III. as part of his hereditary dominions. In 1773, the empress of Russia ceded it to the king of Denmark, in exchange for the counties of Oldenburgh and Delmehorst, which she gave to the prince bishop of Lubec. This exchange was favourable to Denmark, as it possessed the whole duchy of Holstein. For an account of the canal of Kiel, see CANAL.

KIEL, Lake of, a lake of Norway, in the province of Christiansand; 16 miles N. of Christiansand.

KIELEE, or KIALTZE, a town of Austrian Poland, in the palatinate of Sandomirz, the see of a bishop; 24 miles E. of Malagoez.

KIELO, a town of Persia, in the province of Irak; 35 miles N.E. of Sultania.

KIEMI. See KEMI.

KIEN, a town on the E. coast of the island of Ceram, one of the Malacca islands.

KIENG-HIEVER, a town of Persia, in the province of Irak; 39 miles S.S.W. of Hamadan.

KIEN-NING, a city of China, of the first class, in the province of Fo-kien. To its district belong eight cities of the third class. It is situated on the river Minho, which renders it a place of considerable trade. At the time of the conquest of China by the Tartars, this city sustained two sieges, and refused to submit to the power of the conqueror; but some time after it was taken, and all the inhabitants were put to the sword. It was afterwards re-established by the Tartars, who destroyed it. N. lat. 27° 5'. E. long. 117° 2'.

KIEN-TCHANG, a city of China, of the first class, in the province of Kiang-si, situated on the frontiers of the province of Fo-kien. It has five cities under its jurisdiction. In the adjacent country, which is fertile, the common rice is used in making wine, and a reddish sort is used by the richer people for food. N. lat. 27° 35'. E. long. 118° 20'.

KIEOU-CARPOU, a town of Corea; 500 miles E.N.E. of Peking.

KIEOU-KIANG, a town of China, of the first class, in the province of Kiang-si, situated on the S. side of the river Yang-tse-kiang, or Kian-ku; it has five cities under its jurisdiction. This city is the rendezvous of all the barks which pass and repass from the other cities of this province, and the provinces of Kiang-nan and Hou-quant. Although it is 300 miles distant from the sea, salmon, dolphins, and sturgeon are taken in its river; which ebbs and flows every new and full moon. N. lat. 29° 53'. E. long. 115° 41'.

KIERADY, a town of Hindoostan, in Benares; 15 miles E.S.E. of Chunar.

KIERALI, a town of Turkish Armenia, on the coast of the Black sea, at the mouth of a river of the same name; 30 miles S.W. of Trebisond.

KIERE, a town of Persia, in the province of Irak; 20 miles S.E. of Casbin.

KIERNOW, a town of Russian Lithuania; 25 miles N.W. of Wilna.

KIERTEMINDE, a sea-port town of Denmark, in the island of Funen, on the side of a large bay. The merchants of Odenfee have warehouses in this town; eight miles E.N.E. of Odenfee. N. lat. 55° 22'. E. long. 10° 40'.

KIESELSCHIEFER, in *Mineralogy*, a species of stone, which, according to Werner, comprehends the two following subspecies, viz. the *Siliceous schist* of Kirwan, and the *basanite* of the same author. The principal colour of the former is ash-grey, bluish or greenish-grey, with occasional spots or stripes of red, and is often crossed by veins of quartz. It occurs in mass, forming whole beds, or in smooth rounded pieces. Internally it is dull, rarely somewhat glimmering. Its fracture in the great is imperfectly flaty, and in the small intermediate between splintery and uneven, inclining sometimes to flat conchoidal. Its fragments are sharp-edged, indeterminate. It is opaque, occasionally somewhat translucent on the edges. It is hard, but not difficult to break, and is moderately heavy. Before the blow-pipe it becomes white and friable. It is found among transition mountains, in thick beds, in Bohemia, Saxony, Switzerland, the south of Scotland, and Siberia, &c. Wiedenmann supposes that this substance is argillite, containing a larger proportion than usual of silice. It is one of the numerous rock masses called by the Germans *Hornschiefer*. The second subspecies is the *basanite* of Kirwan, the Lydian stone, or touch-stone. Its colour is greyish, passing into bluish-black. It occurs in mass and in rounded fragments, generally penetrated by veins of quartz. Internally it is glimmering. Its fracture is even, approaching to conchoidal, and sometimes to splintery; in mass it is generally

nerally flaty. Its fragments are indeterminate and sharp-edged, often trapezoidal. It is opaque, moderately hard, and easily frangible. Sp. grav. 2.4 to 2.8. It is found in similar situations with the preceding. It is used, on account of its hardness and colour, as a touch-stone to ascertain the comparative purity of the various kinds of gold and silver alloys. (See TOUCHSTONE.) Humboldt ascribes its black colour to a portion of carbon. See SCHISTUS.

KIEV, KIEF, *Kief*, or *Kiew*, in *Geography*, a government of Russia, bounded on the N. and N.E. by the government of Tchernigof, on the S.E. by the government of Ekaterinoflav, on the S.W. and N.W. by Poland; about 148 miles long and 60 broad; situated for the most part on the left side of the Dnieper. Being part of the Ukraine, or Little Russia, it was once a duchy belonging to the great dukes, and Kiev was their principal residence. This country was conquered by the Tartars, and came again into the possession of the great dukes; but was afterwards over-ran and possessed by the Cossacks, under the protection of Poland. In 1654, the natives, discontented with John Calimir, king of Poland, submitted to Russia, and have ever since continued subject to that empire. The vast privileges enjoyed by the natives have been gradually abolished, and they are now reduced to the same grade as the other provinces of the Russian empire. The country is a continued plain, very fertile, and producing abundance of grain and pasture, honey, flax, tobacco, &c. Its capital is Kiev or Kiouf.

KIEV, *Kief*, or *Kiof*, the capital of the above government, and of the district belonging to it, is situated on the *Dnieper*, which see. It consists of three small towns, *viz.* the castle of Petshersky, with its suburbs; the old city of Kiev; and the town of Podol, which lies below the latter. All these are partly inclosed by a common fortification, and communicate by a large entrenchment, carried on as the inequality of mountains would allow. The first mentioned castle stands on an eminence facing the south; and, besides barracks for the garrison, magazines, officers' houses, and some churches, includes a rich and lately monastery, founded in the eleventh century, and called "Petshersky," because the monks formerly lived in a "petthera," like a cavern, on the mountain where the convent now stands. In its subterranean vaults, which resemble a labyrinth, and consist of cells, chapels, &c. are found great numbers of undecayed bodies, supposed to be the remains of saints and martyrs. The old city of Kiev stands on an eminence facing the north, and is fortified, according to the mountainous nature of the country, with horn-works, &c. Here stands the cathedral. Podol lies below old Kiev, in the plain on the banks of the Dnieper, and besides the university, churches, and convents, entirely consists of shops and tradesmen's houses. This city is the see of a Greek archbishop; 420 miles E. of Cracow. N. lat. 50° 32'. E. long. 30° 56'.

KIEUSK, a town of Natolia; 40 miles N.N.W. of Mogla.

KIEZVENSКОЕ, a town of Russia, in the government of Perm; 80 miles N. of Perm.

KIFANTAN, a town of Boontan; 64 miles N. of Dinagepaur.

KIFFER, an island in the East Indian sea, about 20 miles in circumference, near the north coast of the island of Timor. S. lat. 8° 0'. E. long. 126° 20'.

KIFTELAK, a town of Hungary; 18 miles N.W. of Zegedin.

KIGELGA, one of the *Fox-islands*, which see. N. lat. 54°. E. long. 194° 28'.

KIGGELARIA, in *Botany*, was named by Linnæus in honour of Francis Kiggelar, a Dutchman, who imported many new and rare plants into Europe from America, and who published the *Hortus Beaumontianus* in 1690, and observations on *Commelin's Hortus Amstelodamensis* in 1697—Linn. Gen. 528. Schreb. 697. Mart. Mil. Dict. v. 3. Ait. Hort. Kew. v. 3. 409. Juss. 387. Lamarck. Dict. v. 3. 365. Illustr. t. 821. Gærtn. t. 44.—Class and order, *Diocia Decandria*. Nat. Ord. *Columnifera*, Linn. *Euphorbia*, Juss.

Gen. Ch. Male. Cal. Prianth of one leaf, concave, divided into five lanceolate, concave segments. Cor. Petals five, lanceolate, concave, a little longer than the calyx, and forming with it a sort of cup; nectary of five small, obtusely three-lobed, depressed, coloured glands, the middle lobe larger; each gland attached to the claw of a petal. Stam. Filaments ten, very small; anthers oblong, shorter than the calyx, opening at the tips by two perforations.—Female. Cal. and Cor. as in the male. Pist. Germen superior, roundish; styles five, simple; stigmas obtuse, slightly cloven. Peric. Capsule leathery, globose, rough, of one cell, and five valves. Seeds numerous, about eight, roundish, afterwards angulated, each covered with a tunic.

Eff. Ch. Male. Calyx five-cleft. Corolla of five petals; glands five, three-lobed. Anthers perforated at the tips. Female. Calyx and Corolla like the male. Styles five. Capsule of one cell, five valves, and many seeds.

1. *K. africana*. Linn. Sp. Pl. 1460. Hort. Cliff. 462. t. 29.—A native of the Cape of Good Hope. It flowers in May and June, and was cultivated, so early as 1690, in the Royal Garden at Hampton Court. This tree generally rises to the height of six or seven feet. Stems strong and woody. The bark of the branches is at first smooth and green, but afterwards purplish. Leaves on footstalks, alternate, lanceolate, serrated, spreading. On the male plant, panicles of flowers appear on branched stalks, with white petals and yellow nectaries; on the female, each flower stands on a simple stalk. Capsule rugged, and pubescent on the outside, containing a reddish or rusty-coloured pulp, in which the seeds are imbedded. The fruit has attained its full size in Chelsea Garden, but the seeds rarely come to maturity in this country.

KIGGELARIA, in *Gardening*, comprises a plant of the ever-green shrubby kind, which is the African kiggelaria, (*K. africana*.)

Method of Culture.—Plants of this sort may be increased by seeds, layers, and cuttings; but the seed method is the best, as they root but sparingly in the other two modes.

The seeds should be sown in the early autumn, in pots filled with fresh loamy earth, being plunged in a hot-bed. After they have a few inches growth, they should be removed into separate small pots, re-plunging them in the hot-bed; and when well rooted, they ought to be gradually hardened to the effects of the open air. The layers should be made from the young shoots of the same year, putting them down in the summer months.

The cuttings of the young shoots should be planted in the spring, immediately before the plants begin to shoot, in pots filled with soft loamy earth, being plunged in a very moderate hot-bed, and covered with galls to exclude the air; due shade being afforded, and but little water given after the first planting. Such plants as strike root may be removed into separate small pots of loamy earth, and be exposed to the air, in a warm sheltered situation, until the autumn, when they should be placed under the protection of the green-house, and managed in the same mode as orange trees.

These plants afford variety among other plants of the green-house kind, that are in pots.

KIGLEY, or **KIGLEV**, in *Geography*. See **KEIGHLEY**.

KIJASA, a mountain of Thibet; 25 miles S.E. of Giti.

KIKACCO, a town of Africa, in the kingdom of Congo; 30 miles S.E. of Pango.

KIKALA, a town of Sweden, in South Finland; 40 miles E.S.E. of Abo.

KIKIANY, one of the small Japanese islands. N. lat. 29 40'. E. long. 132 25'.

KIKOV, a town of Japan, in the island of Nippon; 15 miles S.E. of Iwata.

KIKUKOVI, a town of Russia, in the government of Tobolsk, on the Tchulim; 64 miles N.W. of Atchlink.

KIKUTZ, a town of Japan, in the island of Ximo; 15 miles N.N.E. of Udo.

KIL, a town of Sweden, in the province of Warmeland; 12 miles S. of Christinehamn.

KILAN, a province of the south-eastern part of Great Bucharia, deriving its name, like the other provinces of this country, from its chief city.

KILANG. See **KELANG**.

KILANOL, a town of Sweden, in West Bothnia; 105 miles N. of Tornea.

KILAR, a town of Persia, in the province of Irak; 14 miles S.E. of Taheran.

KILBARCHAN, a small town of Renfrewshire, about 4 miles N.W. from Paisley, and nearly the same distance from Renfrew. Kilbarchan is a thriving place, chiefly inhabited by the tradepeople employed in the various processes of the extensive cotton manufactures carried on through the whole of this district. There are also considerable manufactories of Scotch thread established here.

KILBEGGAN, a post-town of the county of Westmeath, Ireland, which, before the union, had the privilege of sending members to the house of commons. It is a small town, on the river Brosna, and is remarkable for two old monasteries. It is on the road from Dublin to Galway; 44 miles W. from Dublin, and 15 E. from Athlone.

KILBIRNIE, a village of Renfrewshire, near Beith, where there is a fine loch or lake of water. It is a populous, thriving, little place, engaged, like most others in that part of the country, in the manufactures of cotton goods and thread.

KILBRIDE, EAST, is a small village in Lanarkshire, about 10 miles S.E. from Glasgow. It is remarkable for some Roman antiquities, which have engaged the attention of antiquarians, who have published detailed accounts of various curiosities found and dug up in this neighbourhood. At present the great quantities of fine lime, which are worked in its neighbourhood, engage a considerably greater portion of attention, as it is found of great advantage to the whole surrounding district, both for the purposes of agriculture and building.

KILBRIDE, WEST, is a small village contiguous to the firth of Clyde, in Ayrshire.

KILBURG, a town of France, in the department of the Jorre, and chief place of a canton, in the district of Prum. The place contains 561, and the canton 4307 inhabitants, in 26 communes.

KILCH, in *Ichthyology*, a name used by some for a species of fish of the albulina kind, caught in the lakes of Germany, of a fine firm flesh and delicate flavour, and seems very little, if at all, different from the serra.

KILCOCK, in *Geography*, a post-town of the county of

Kildare, province of Leinster, Ireland, situated upon the river Blackwater. It is a small town, 14 miles W. by N. from Dublin, on the road to Mullingar.

KILCONNELL, a small post-town or village of the county of Galway, Ireland; 75 miles W. from Dublin, and almost 25 E. from Galway.

KILCULLEN, or **KILCULLEN-BRIDGE**, a post-town of the county of Kildare, province of Leinster, Ireland, situated on the river Liffey, over which it has a bridge. It is on the great thorough road from Dublin, in consequence of which its inns are much frequented. One mile and half south of it is the village of Old Killeen, where is a church, and resident clergyman. Here is a round tower, not exceeding 50 feet in height; and the shaft of a cross, of a single stone, 10 feet high. Killeen-bridge is 24 miles S.W. from Dublin. Carlisle.

KILDA, ST., or **HIRTA**, a remote island among the Hebrides, or western islands of Scotland. It is seated in the Northern ocean, at the distance of about 60 miles from Harris, and 160 miles from the nearest point of the main land of Scotland. This island is small, being only three miles in diameter from east to west, and two miles in a transverse direction: the whole circumference is about ten miles. It is nearly surrounded with a perpendicular face of rock, which rises to a considerable elevation; a small bay or landing-place is found to the south-east. Mr. Macaulay, the historian of this island, says, it "may be ranked among the greatest curiosities of the British empire. The situation of the place, the genius of the inhabitants, their manners and customs, the constitution of their little commonwealth, that amazing dexterity with which they manage the most important branches of their business, that unexampled courage with which they encounter dangers insurmountable to any other race of men, and that perhaps happy ignorance which renders them absolute strangers to those extravagant desires and endless pursuits which keep the great and active world in a constant agitation;—all these, and some other extraordinary circumstances, taken together at one view, seem highly to merit the attention of the inquisitive." The surface of the island is mostly rocky: in some places are patches of moss, and in others grass. The soil, though in many places well adapted to corn, is chiefly employed in pasture; as the inhabitants are rather averse to agricultural pursuits. In the vicinity of the village a little corn is cultivated, and the pasture is richly manured. Barley and oats are only sown: potatoes and cabbages, and some other garden plants, have recently been introduced into the island. Several springs issue from the hills, and form two small streams which run into the sea on the east and on the west. The village consists of two rows of houses, which are situated about a quarter of a mile from the bay, and contains all the inhabitants of Kilda. In the year 1764, when Macaulay published his History, the island contained only 88 persons; but he asserts that a contagious distemper (the small-pox) "swept away the greater part of the people about four-and-thirty years ago." Martin found 180 persons, when he visited the island at the time here alluded to, *i. e.* 1690. The dwellings are all low, common huts, or cottages; divided into two rooms each, and peculiarly flat in the roof. One of the apartments is appropriated to the dwelling and sleeping of the inhabitants, and the other for the cattle during winter. In these rooms they prepare the chief manure for the lands. Besides these cottages, there are several cells or storehouses in different parts of the island. These are composed wholly of stones, and are from 12 to 18 feet in length, by 7 feet in breadth and height. Fowl, eggs, and sheep are the principal objects of care and solicitude to the

the Kildeans, who entirely support themselves, and pay their rents with these. The inhabitants manifest particular skill and courage in obtaining the first: for as their places of resort for rearing their young, for roosting, &c. are recesses in the lofty cliffs on the coast, it requires particular adroitness and courage to reach such spots. A fowling party consists of four men, who are provided with a strong rope made from thongs of raw cow-hide. One end of this is fastened on the top of the cliff, whilst two men descend by means of the rope to various cliffs in the rock, where they search for eggs and young birds. Among these, the inland goose or gaunt is deemed the most valuable prize.

The laird of Macleod is proprietor of this island, and its dependants, rocks, &c. He sends his steward annually to collect the rents, which are paid in sheep, butter, cheese, and wild-fowl. Around the island are several small insulated rocks, which are often covered with wild-fowl. Floors, spars, and rock crystals are found on the north side of the island. This insulated spot was certainly visited by religious persons at a remote period. Macaulay describes a circular arrangement of upright stones, which he calls a Druidical temple; with other remnants of pagan worship and monastic rites. See his History of St. Kilda, 8vo. 1764.

KILDARE, a county in the province of Leinster, Ireland, bounded on the north by Meath, on the east by Dublin and Wicklow, on the south by Carlow, and on the west by the King's county and Queen's county. It extends from north to south 32 Irish ($40\frac{1}{2}$ English) miles, and from east to west 21 Irish ($26\frac{1}{2}$ English) miles, forming an area of 242,245 plantation acres, or 369 square miles, equal to 389,198 English or statute acres. Of these, there are 41,205 acres of bog. The number of parishes is stated by Dr. Beaufort to be 113; of which, 57 parishes belong to the see of Dublin, and 56 to that of Kildare. From unions there are, however, only 39 benefices, and 23 churches. The number of houses situated in the return used by Dr. Beaufort is 11,205, from which the inhabitants are estimated at 56,000. This is a thin population for a county to near the capital, and not at all encumbered with mountains or high hills: but besides the great proportion of bog it contains, upwards of 3000 acres are occupied by the *Curragh*; and although this beautiful plain affords pasture to an immense number of sheep, there are but a very few habitations scattered around its edges. This county is mostly flat, of fine arable soil, but much exhausted, as, from its vicinity to Dublin, it has been for centuries the county from which the capital has principally drawn its supplies of grain. "In a county where one-fifth is bog," says Mr. Rawlin in his Survey, "much water must lie on the surface: this, of course, attracts the rain from every passing cloud. It may be remarked in the summer season, that where a cloud passes over an extensive bog or river, it is arrested and drawn down. This causes the county to be subject to more moisture than any in Ireland; and this evil must continue until the kingdom be relieved by a general drainage act, which shall compel slothful occupiers and proprietors to come forward, and contribute to such extensive drainings, on a great public scale, as the legislature may in its wisdom direct, according to the benefit to be derived by each estate or property, through which such drains shall be pointed out." Since the preceding remarks were written, an act of parliament has been passed, and sums of money granted, for ascertaining the nature and extent of the various large tracts of bog in Ireland; and the reports of the engineers employed contain much valuable information. For this step, preparatory to a more effective measure, if the legislature shall be induced to proceed, the country is in-

debted, as for many other advantages, to the right honourable John Foiler, late chancellor of the Irish exchequer;—a gentleman who, though now often loaded with reproaches from a spirit of party, will in future times be numbered amongst the greatest benefactors of Ireland. The county of Kildare is full of springs and rivulets. The river Barrow forms its south-west boundary, and receives the Grees. The Liffey takes a circular course through the north-east of the county, and the river Boyne rises in the bog of Allen. The Barrow is navigable from Athy, where it meets the Grand Canal, which, from Dublin, passes through this county, crossing the Liffey on an aqueduct bridge, and soon after branches off. Near Claine is a collateral cut to the Shannon. The Royal Canal also has been carried through the northern part of the county, so that great advantage is derived to the inhabitants from the cheap conveyance of their products to market. The principal towns are Naas, the assize town, Athy, Monasteraven, and Kildare; for account of which, see the articles under the respective names. As there is no borough of sufficient extent to return a member to parliament, the county is represented by the two knights of the shire only; whilst, before the union, it had ten members. Kildare was part of the territory acquired by earl Strongbow, in right of his wife, Eva, daughter of Dermot, king of Leinster. From its neighbourhood to Dublin it was early colonized, and formed part of the English pale, when confined to four counties. There are in it the ruins of many castles and abbeys, some of which are mentioned in other parts of this work. It was also the scene of much distress during the rebellion of 1798; many battles having been fought in it, and a vast number of houses destroyed, both by the rebels, and by the military force sent to subdue them. Beaufort's Memoir. Rawlin's Statistical Account.

KILDARE, a post-town of the county of Kildare, Ireland. It is a small and ruinous place, but it retains some vestiges of having been of more importance in former times. There is a very fine round tower 130 feet high, and the ruins of two abbeys and of its cathedral. Except when there are races or encampments on the Curragh, which is very near it, it has no trade. It is 25 miles W.S.W. from Dublin.

KILDARE, a bishopric in the province of Dublin, founded about the end of the 5th century. It comprehends part of three counties, viz. Kildare, King's county, Queen's county, and contains 332,200 plantation acres, which are divided into 81 parishes. The crown is patron of 27, the bishop of 30, and different laymen of 24 parishes. In consequence of unions, however, there are but 31 benefices, and 28 churches. The bishop has no place of residence in his diocese, but being always dean of Christ-church, Dublin, resides in or near that capital. Beaufort.

KILDERKIN, a kind of liquid measure, which contains two firkins, or eighteen gallons, beer-measure, and sixteen ale-measure.

Two kilderkins make a barrel, and four an hoghead.

KILDORRERY, in *Geography*, a small post-town of the county of Cork, province of Munster, Ireland; 107 miles S.W. from Dublin.

KILDUIN, a small island in the North sea. N. lat. 69°. E. long. 34 14'.

KILDYSART, a small post-town of the county of Clare, province of Munster, Ireland, on the river Shannon; 122 miles S.W. from Dublin.

KILEF, a town of Great Bucharia, in the country of Balk, on the left side of the Gihon; 60 miles N.W. of Balk. N. lat. 37° 10'. E. long. 64° 30'.

KILFIT, a sea-port town of Nubia, on the Red sea, with

with a harbour, seven miles in circumference, safe from winds. N. lat. 21° 45'. E. long. 56° 40'.

KILGRUND, a small island on the E. side of the gulf of Bothnia. N. lat. 62° 5'. E. long. 21° 4'.

KILIA, or KILIA-NOVA, a town of European Turkey, in the province of Bessarabia, at the mouth of the Danube, near the Black sea; 20 miles E.N.E. of Ismail. N. lat. 45° 28'. E. long. 30° 12'.

KILIOS, a town of Asiatic Turkey, in Natolia, on the coast of the Black sea; 20 miles W.S.W. of Amasich.

KILKARE, a town of Hindoostan, in Marawar; 10 miles S.W. of Ramanadporam.

KILKEALE, a poll-town of Ireland, in the county of Down, and province of Ulster. It is situated on the Irish sea, under the Mourne mountains, great part of which are in the parish of Kilkeale. It is 65 miles N. by E. from Dublin.

KILKENNY, the name of a county of Ireland, in the province of Leinster. The surface of it extends from 52° 14' to 52° 52' N. lat. and from 6° 56' to 7° 37' W. long. from Greenwich. Its greatest length from N. to S. from the Slewmagy hills to the Suire is 36 Irish (45½ English) miles; and its greatest breadth from E. to W. is about 19 Irish (24 English) miles, but in the narrowest part is not above 12 miles. The area, according to Dr. Beaufort, is 300,350 Irish, equal to 482,464 English acres; but Mr. Tighe, in his valuable statistical survey, from which this article is chiefly extracted, says, that by a survey lately made for the use of the grand jury, they are stated at 518,249 Irish, which are equal to 510,882 English acres. The population, as calculated with great care from the hearth returns in 1800, is about 108,000 in 17,212 houses. Dr. Beaufort, however, in 1792, stated the houses as 17,569, though he did not make the inhabitants exceed 100,000; and he observes that the houses are much fewer than what might be expected in a county which has been generally esteemed one of the most populous in Ireland. The latter writer states the number of parishes to be 127, of which 121, united in 45 benefices, are in the diocese of Ossory, and the remaining six, forming four benefices, in that of Leighlin. The entire number of churches in the county is only 31, a very considerable proportion of the population being Roman Catholic. The position of a county strongly affects the climate. This is agreeably experienced in this county. The declivity from the northern to the southern boundary is about 500 feet, which conveys, with sufficient rapidity, the water that falls upon the surface; and the river Nore flowing through the centre, descends about 13 feet during the run of a mile. Besides this descent, which carries off the water, the surface of the county enjoys a favourable exposure to the south-east. There is little either of bog or marsh to contain stagnant water, and the greater part of the substratum is limestone, brittle schistus, or porous argillite, and only in a small part, a retentive clay. The vicinity of the ocean tends to render the climate mild, while the clouds, which are driven forward by the western and south-western winds, are not arrested here by high mountains, but passing over the low secondary hills and extended plains of this county, are attracted towards the lofty and primary ranges of rocks which rise on the north-east. From these circumstances the crops are earlier in general than in the tillage countries to the northward. The quality of the soil is in general excellent. The northern part rather bears the appearance of poverty, but by judicious management, and the prudent application of lime and lime-stone gravel, it may be rendered considerably productive in corn and grass. The

southern part is more favoured by nature; and where the hills subside into plains or valleys, fertility smiles in all its native excellence. The Nore exhibits upon its banks the most delightful prospects and the most luxuriant fields. It is not difficult to trace the nature of the different minerals in this county. Here is a termination of a chain of granite hills which take their rise in Wexlow. The stone which usually joins the granite, appearing to be imposed on it, is siliceous schistus, and lower down occurs a siliceous slate; on the surface of the lower grounds are found large boulders of quartz, sometimes pure white, sometimes streaked with red, and sometimes enclosing yellow mica. In this granite district are also found a few beds of marble and limestone gravel near the foot of Brandon hill. Many of the lower hills consist of siliceous breccia, which is composed of siliceous cement enveloping rounded pebbles of quartz, which have often a reddish tinge, and are from the size of a pea to two or three inches diameter. Such a breccia also forms many hills in the S. of Ireland, as the Galtees and other mountains in Cork and Limerick, and at least part of Magilicuddy's rocks in Kerry. This breccia, when of a fine grain, is worked for millstones. In the northern part of the county are excellent quarries for flags, especially that of Shankill. The flags raised here are sent to Dublin, Cork, and other places, where they chiefly go under the denomination of Carlow flags, being raised in the neighbourhood of that county, and mostly sent through the town of Carlow. The collieries of Castlecomer have been worked for about a century, and are yet unexhausted. The coal found in them, and in other parts of the S. of Ireland, is un-inflammable, and is called Stone coal and Kilkenny coal, and when of inferior quality, *culm*. By Mr. Kirwan's analysis it contains 97.3 per cent. of pure carbon. Mr. Tighe has given a very full account of the accompanying strata, the manner of working, the expense, &c. The late lord Warriston used to clear 6000*l.* or 7000*l.* a-year by these collieries, and sometimes more. They now belong to Lady Ormonde. The excellent qualities of the Kilkenny coal are well known in Ireland; on this account it is sent to the north and south, to Londonderry, to Belfast, to Cork, and to Waterford, as well as to Dublin. No fuel dries so fast, and this without any preparation; it is excellent for the forge, and for most works in iron; in every manufacture where steady heat is required devoid of smoke it cannot be excelled; nor does it dirty the flues where it is used. Manganese, iron ore, lead ore, and some indications of copper ore, are perceived in different parts. As long as timber lalled near Castlecomer, iron ore was smelted there; but it is now above seventy years since the forges have been used. In the limestone district of this county are many valuable marble quarries. The marble is black, though often with white marks, which appear more strong y, or increase by long exposure to the air. That which approaches nearest to black is most valued. It contains a great variety of impressions, of madrepores, of bivalve, and of turbinate shells. By analysis, a specimen of the kind most usual in chimney-pieces with marks of bivalve shells, contained 58 per cent. soluble in marine acid, and left 2 per cent. of a black powder, which appeared to be carbon, and burned without leaving any ashes. On the whole, Kilkenny marble may be considered as containing 97 per cent. pure carbonate of lime, two per cent. carbon, and 1 per cent. magnesia and iron, of which the former is in the largest proportion. This marble is a valuable article of commerce. The quantity exported, notwithstanding the disadvantage of land carriage, is about 50 tons annually; if a canal were made it would copious-

ably increase the demand, by lowering the price. There is a mill near Kilkenny, by which the marble is sawed and polished, which makes the price of chimney-pieces on the spot very reasonable. There is a chalybeate spa at Ballyspellan, near Johnstown, the medical effects of which have been often celebrated, and which is much frequented. The rivers of this county excel both in utility and beauty. The following poetical account of them by the immortal Spenser presents an accurate, concise, and clear account of the origin, termination, and qualities of the three principal ones.

“ And there the three renowned brethren were,
Which that great giant Blomius begot
Of the fair nymph Rheüsa wand'ring there,
One day as she to stunn the season hot,
Under Slewblomme in shady grove was got,
This giant found her, and by force deflowered;
Whereof conceiving she in time forth brought
These three fair sons, which being thenceforth poured
In three great rivers ran, and many countries scoured.

The first the gentle Shure, that making way
By sweet Clonmell, adorns rich Waterford;
The next the stubborn Newre, whose waters grey
By fair Kilkenny and Rosse-ponce board;
The third, the goodly Barrow, which doth hoard
Great heaps of salmon in his deep bosom:
All which long hundred, do at last accord
To join in one, ere to the sea they come,
So flowing all from one, all one at last become.”

The Suir, which divides Kilkenny from Waterford, in a winding and majestic course of about 16 miles, conveys along the southern border of this county, the trade that passes between Waterford, Carrick, and Clonmell. The Barrow skirts the eastern borders for about 20 miles, dividing it from Wexford and part of Carlow. This river is navigable to the town of Carlow, and thence communicates with the grand canal. The Newre, or Nore, more peculiarly belongs to this county, flowing nearly through its central part, in a winding course of not less than 36 miles from the neighbourhood of Durrow to its junction with the Barrow, passing by the city of Kilkenny. This last river receives many tributary streams, and is navigable for small vessels to Inistioge. It is unnecessary to enter into a minute detail of the obvious advantages of these rivers, both to the external appearance of the country and to the accommodation of the inhabitants. The natural and local advantages of this county tend to promote the interests of agriculture, which flourish in great perfection in different places, and the easy conveyance by water affords a ready market for all the productions of the soil. The roads in general are in good repair, and their situation judiciously chosen.

The county town is Kilkenny; besides, Callan, Inistioge, Thomastown, Gowran, Knocktopher, Graigne Durrow, Castlecomer, and Freshford, are entitled to the name of towns, though all of them are small ones. There are five round towers in this county, namely, at St. Canice, Tulloherin, Kilree; Fartagh, and Aghaviller. The last is the most ruinous. These are all situated close to the churches, and whatever may have been their origin, appear admirably fitted for bellries. Gramig, or Grandison castle, is one of the most considerable remains of antiquity; it is situated on the banks of the river Suir. The whole county is full of castles, having been one of the first in which the English settled. It became part of the property of earl Strongbow, from whom it descended to the Marshals, earls of

Pembroke. Isabella, one of the daughters and coheiresses of William, the last earl, conveyed it to Gilbert Clare, earl of Gloucester and Hereford. The greater part of it afterwards came into possession of the Butlers, earls and dukes of Ormond. The houses of some of the abbtees bear evident marks of decay; these, however, are outweighed by the modern structures, many of which are ornamented by the taste of the proprietors. Tighe's Kilkenny; Beauport's Memoirs; Robertson's Traveller's Guide.

KILKENNY, a city of Ireland, in the county of the same name, and province of Leinster, which, with the borough of St. Canice, forms one large town, surrounded by a district, called the county of the city of Kilkenny; it is delightfully situated on the river Nore, over which are two handsome bridges; it contains 2870 houses, and a population of nearly 16,000. There are many large and good buildings, among which, the most remarkable are the bishop's palace, the magnificent castle of the earl of Ormond, and the celebrated free school or college, where many learned men, among whom Swift, Berkeley, and Congreve are conspicuous, were educated. The inhabitants of Kilkenny have been long noted for the politeness of their manners. In this city and its environs abundance of blankets and much coarse woollen cloth are manufactured. Kilkenny was formerly represented by four members, two for the city, and two for the borough of St. Canice. At present it has only one representative. In former times parliaments were often held here, and the famous constitutions of Kilkenny, made when Lionel, duke of Clarence, was chief governor, in the reign of Edward III., long continued to be regarded as of the utmost importance to the welfare of the English colony. Kilkenny was also the seat of the Catholic council during the civil war, that succeeded the insurrection of 1641. There are but two churches in the city, but there are several Roman Catholic chapels, each of which has congregations more numerous than both the churches. Kilkenny is $57\frac{1}{2}$ miles S.W. from Dublin. N. lat. $52^{\circ} 38'$. W. long. $7^{\circ} 15'$. Beauport. Tighe.

KILKENNY, a town of America, in Grafton county, New Hampshire, incorporated in 1774, and containing 12 inhabitants.

KILKENNY Coal. See COAL, and KILKENNY, *supra*.
KILKENNY Marble, a fine black marble full of shells, and coralloid bodies, and much used in chimney-pieces, &c. See *Corallaid* MARBLE, and KILKENNY.

KILKERRAN BAY, in *Geography*, a harbour of Ireland, in the county of Galway, in that part of it called Connamara; in it there is good anchorage for vessels of any burden, but the wild state of the country prevents its being of much use. Its entrance is in N. lat. $53^{\circ} 15'$. W. long. $9^{\circ} 50'$. Beauport. McKenzie.

KILKILLA, a town of Persian Armenia; 26 miles N.W. of Kanja.

KILL, an Irish word signifying a church or cemetery, which is used as a prefix to the names of many places in Ireland. There are two or three villages of this name, one on the great southern road, about 12 miles from Dublin.

KILLACK, in *Geography*, a town of Persia, in the province of Mekran, on the coast of the Arabian sea; 60 miles W. of Tiz. N. lat. $25^{\circ} 27'$. E. long. $59^{\circ} 20'$.

KILLALL, a town of Abyssinia; 100 miles S. of Miné.

KILLALLA, a sea-port and post-town of the county of Mayo, province of Connaught, Ireland. It is situated on the western coast of a bay of that name, opening into the Atlantic ocean, and is the see of a bishop. There are
1 some

some coarse linen and woollen cloths made in it, but fishing is the chief occupation of the inhabitants. The French landed at this place on the 22d of August, 1798, and took possession of it. A very interesting narrative of their proceedings, till their departure, was published by Dr Stock, at that time bishop, who was a prisoner. Killalla is 127 miles N.W. from Dublin, and 24 nearly N. from Carrabur.

KILLALLA, a bishopric in Ireland, founded in the fifth century, which is united with Achonry, and is in the ecclesiastical province of Tuam. The united sees extend into the counties of Mayo and Sligo, the river May and the Ox mountains forming the boundary between them. They measure E. and W. 55 miles, and from N. to S. 21 miles. Large as this district is, there are only 20 benefices, each of which has a church, though only eight have glebe houses. The cathedral is small, but venerable for its antiquity; it is the only church in the parish, though a round tower at the other end of the town indicates the ancient site of another church, of which no vestige now remains. Beaufort.

KILLALOE, a bishopric in Ireland, in the ecclesiastical province of Cashel. It was founded early in the fifth century, and in 1752 was united with Killmora, which, though small in extent and value, had continued separate till after the revolution, and was then annexed for several years to the sees of Tuam and Clonsfert successively. The united sees comprehend most of the county of Clare, and part of Tipperary, with small portions of the King's and Queen's counties, Galway, and Limerick. The 138 parishes, united and condensed into 50 benefices, have only 38 churches and four glebe houses. The church of Killaloe is not large for a cathedral, but venerable for its antiquity, and in good preservation, though built above 660 years. Beaufort.

KILLALOE, a small post-town of Ireland, in the county of Clare, and province of Munster, Ireland. It is situated on the Shannon, over which it has a bridge of 19 arches. Below the bridge is a ledge of rocks which prevents the navigation of the river: here is a considerable salmon and eel fishery; but there is nothing beautiful in the town except the situation: very near the town, in the midst of a fine demesne, on the western bank of the Shannon, the bishop has a handsome residence, lately erected. Killaloe is 86½ miles S.W. by W. from Dublin, and 25 miles from Ennis.

KILLANORE, a town of Hindoostan, in the Carnatic; 9 miles N.W. of Trichinopoly.

KILLANY BAY, a bay on the E. coast of the island of Arranmore. N. lat. 53 5'. W. long. 9 36'.

KILLARD POINT, a cape of Ireland, in the county of Down, at the S. of the entrance to Strangford Lough, and six miles E. from Downpatrick. N. lat. 54 22'. W. long. 5 27'.

KILLARNEY, a market and post-town of Ireland, in the county of Kerry, and province of Munster. It is a neat and populous town, much frequented by strangers on account of the adjoining lake, the picturesque beauties of which charm every beholder. Lough Lane, or as it is more frequently called, the lake of Killarney, consists of two lakes, joined by a long narrow channel; in the lower and larger lake, the pleasing and the sublime are most happily combined; the upper lake reflects a more solemn grandeur from the stupendous crags, with which it is encircled: the several prospects in both are infinitely diversified. The best islands, the white rocks of Muckrus, the groves of arbutus, the venerable woods, the variety of waterfalls, and the impending cliffs, are separately as delightful and in-

teresting as their assemblage is infinitely grand and magnificent. Mr. Weld has published an intercelling 4to. volume descriptive of the various objects that deserve the notice of the traveller, but as these cannot well be abridged, we must pass them over in this work. In the peninsula of Muckrus, cobalt and other minerals have been found, but they are not worked. In Ross island, in the lower lake, is a valuable mine, containing copper and lead; of the former there is not only rich sulphuret, particularly the kind called purple ore, but also grey ore, which brings a high price. Killarney is the residence of the Roman Catholic bishop of Kerry, and the population is chiefly of that religion. It is 144 miles S.W. from Dublin, and 38 W. from Cork. Beaufort.

KILLAS, in *Natural History*, a name given by the people, who dig in the mines of Cornwall, to a kind of greyish-white earth, which is of great hardness, and seems to approach very much to the nature of the *ludus Helmontii* of some kinds, only that it is far what less hard than that, and has nothing of the septa or partitions that make the character of that fossil. This earth contains so great a quantity of spar, that it ferments with acids very thoroughly, though that spar being once dissolved, and the earthy part of the substance only left, it will no longer ferment with these menstrua; whence it is evident, that its terrestrial matter is not alkaline, though the spar it contains is so.

This is the certain character of what is called killas in many parts of Cornwall, where it lies in strata of two, three, or more feet thick, and often besides this is laid on each side of the vein of tin or other ore. Its texture is either lamellar or coarsely granular; the lamellar is softer and less martial than the roof schistus: its specific gravity from 2.63. to 2.666. Kirwan found 100 grains of the lamellar sort to contain about 60 of silica, 25 of argil, 9 of magnesia, and 6 of iron; the greenish sort contains more iron, and gives a greenish colour to the nitrous acid. In some other parts of England, the miners use the same word to express a kind of white, brittle, and flinty stone, somewhat like the flag-stone with which they cover houses in Northamptonshire, and many other counties.

KILLAS is also used as the name of a flaty stone of various colours, spangled all over with tale in small flakes in the place where they use it. In this sense they generally express themselves, when talking of the earth described above, by the phrase *cohitte killas*. They also sometimes call this flaky stone by the name *delvinn*.

KILLEAM, in *Geography*, a parochial village in Stirlingshire, situated on the water of Enrick, near its junction with Loch Lomond. Killeam is the birth-place of the celebrated historian and poet George Buchanan, whose history of Scotland, and Latin paraphrase of the Psalms of David, are so universally known. A handsome pillar near Killeam was lately erected as a monument to his memory. An extensive printfield is the only manufacturing establishment in this neighbourhood. The pure soft water of the Enrick is indeed extremely well fitted for all the operations of bleaching, dyeing, and printing, but the want of coal is an almost insuperable objection in point of economy to such works. The nearest are nearly twelve miles distant. In the neighbourhood is Buchanan house, the family mansion of the duke of Montrose.

KILLENAULE, a post-town of Ireland, in the county of Tipperary, and province of Munster. The country around it is very fine. In the neighbourhood coal is found, of the same kind as that in the county of Kilkenny. It is 72½ miles S.W. from Dublin.

KILLERIES' HARBOR, a bay of the Atlantic, on
5 E 2 the

the west coast of Ireland, between the counties of Mayo and Galway. A vast number of herring bailes rendezvous here in the fishing season, from all parts of Galway and Mayo. N. lat. 53° 38'. W. long. 9° 46'.

KILLESANDRA, or **KILLENHANDRA**, a post-town of Ireland, in the county of Cavan, and province of Ulster. It is 61 miles N.W. from Dublin, and 8 miles S.W. from Cavan.

KILLFENORA, a village of the county of Clare, Ireland, which is the seat of a bishopric, united to Killaloe. It is four miles N.E. from Ennilymond, which is its post-town.

KILLICRANKY, a village of Perthshire, in Scotland, near which is a famous road, cut in the side of a mountain, called "Killicranky Pass;" on one side is a lofty mountain, and on the other a precipice of 100 yards; 12 miles N. of Dunkeld.

KILLIGRAY, a small island of Scotland, between Lewis and North Uist. N. lat. 57° 43'. W. long. 7° 3'.

KILLINCHY, a post-town of Ireland, situated on Strangford Lough, in the county of Down. It is 92 miles N. by E. from Dublin.

KILLINNESS POINT, a cape of Scotland, on the coast of the county of Wigton, in Luce bay; 3 miles N. from the Mull of Galloway.

KILLING. See **HOMICIDE** and **MURDER**.

KILLINGIA, in *Botany*. See **KILLINGIA**.

KILLINGLY, in *Geography*, a town of America, in Windham county, Connecticut, situated in the north-eastern part of the state, bordering on Rhode island, and separated from Pomfret by Quinebaug river; about 18 miles E. of Windham: incorporated in 1708, and containing 2279 inhabitants.

KILLINGTON, now **SHERBURNE**, a mountainous township of America, in Rutland county, Vermont, having on the W. Medway, N.E. Barnard, S.E. Saltsb., and containing 32 inhabitants. Killington peak is the highest land in Vermont, 3554 feet above the level of the ocean.

KILLINGTRINGAN BAY, a bay of Scotland, on the W. coast of the county of Wigton. N. lat. 54° 58'. W. long. 5° 12'.

KILLINGWORTH, a post-town of America, in Middlesex county, Connecticut, situated on Long island Sound; 9 miles E. of Guilford, from which it is separated by a stream called Hammonasset, the Indian name of the township. It was settled in 1663, incorporated in 1703, and contains 2040 inhabitants.

KILLISTINOES, Indians who originally inhabited a territory N. of Lake Superior, and could furnish 250 warriors. They extend to the lake of the Hills, and N. to the Ilikims. According to Mr. Mackenzie, they were originally the same people with the Algonquins, or inhabitants of the Atlantic coast. Their manners are described by Mackenzie. See our article **KENISTENAUX**.

KILLMACDUAGH, a village of the county of Galway, which is an old episcopal see, united to Clonfert. It is 2½ miles from Gort, where is the parish church. Nothing but the walls of the cathedral remain, near which are the ruins of a monastery, and of several chapels. There, with a large round tower, of very ancient and rude masonry, denote the former consequence of this wretched village. It is 12 miles N. from Ennis.

KILLMACTHOMAS, a fair and post-town of the county of Waterford, on the road from Cappoquin and Dungarvan to Waterford. It is 83 miles S.S.W. from Dublin.

KILLMALLOCK, a post-town of Ireland, which

formerly sent members to parliament. Two centuries ago, it was one of the best built inland towns in Ireland; the walls of many large houses of stone, and excellent workmanship, remain to this day, whilst the ruins of the churches and monasteries, walls and gates, denote its former splendour, and have procured for it the name of the Balbec of Ireland. It is often mentioned in the military history of Ireland, and there is an extensive district round it called the "Liberty of Killmallock." It is now, however, little more than a village; 4 miles from Charleville, 16 S. from Limerick, and 107½ S.W. from Dublin. Beaufort, &c.

KILLMICHAEL POINT, a cape of Ireland, on the W. coast of the county of Wexford, in the Irish sea. N. lat. 52° 44'. W. long. 6° 0'.

KILLMORE, a village which gives name to a bishopric in Ireland, in the province of Armagh. The bishopric was founded in the 13th century, and in the 15th, changed its ancient name of Brevny, into Killmore. There is no cathedral, but a small parish church, 3½ miles from Cavan. It is situated in four counties, but chiefly in Cavan and Leitrim. There are 39 parishes in 30 benefices, and 36 churches.

KILLOS, a name given by the miners of Cornwall to a stone of the slate kind, found in the mines there. See **GROWN**.

KILLLOUGH, in *Geography*, a village of the county of Down, Ireland, on a bay to which it gives name, on the Irish sea. Here is a remarkable well, called St. Seordin's well, which is highly esteemed for the extraordinary brightness of its water. It is 7 miles S.E. from Clough.

KILLOW, or **CULLOW**, an English name for a black earth of a very remarkable structure, seeming of a mixed nature between the marbles, ochres, and clay; and usually containing a large quantity of the matter of the common vitriolic pyrites or ink-stone, which gives it a very sharp unpleasent taste, and makes it, when thrown on the fire, emit a slight blue flame of a sulphureous smell, and calcine to a deep red. It is common in many parts of England, Wales, and Ireland. It is lighter than any of the other clays, though that is the genus to which it most properly belongs; and it is of an uneven surface, and shattery structure.

KILLREA, in *Geography*, a post-town of Ireland, in the county of Londonderry; it is situated near the river Bann, and is 10½ miles N. from Dublin.

KILLRUSH, a post-town of Ireland, in the county of Clare, and province of Munster. It is situated upon the river Shannon, and is a place of some trade, some of the merchants of Limerick having agents residing here. It is 142 miles S.W. from Dublin.

KILLUCAN, a post-town of Ireland, in the county of Westmeath, and province of Leinster; it is 28 miles W. by N. from Dublin.

KILLWORTH, a post-town of Ireland, in the county of Cork, Munster, situated on the river Funcheon. It has gone very much to decay, on account of the neighbourhood of Fermoy; it is 108 miles S.W. from Dublin, and 18 N.E. from Cork.

KILLYBEGS, a post-town of Ireland, in the county of Donegal, which, before the Union, was represented in parliament. It is situated on a creek, on the N. side of Donegal bay, and has an extensive herring-fishery; it is 124 miles N.W. from Dublin, and 13 miles W. from Donegal.

KILLY-HOLM, one of the smaller Orkney islands; about half a mile N. of Eglisla.

KILLYLEAGH, a post-town of Ireland, in the county

of Down, and province of Ulster. It is situated on the W. coast of Strangford lough, and has a safe harbour for small vessels. Here Sir Hans Sloane, the famous naturalist, was born, in 1666; it is 80 miles N. by E. from Dublin, and 15 S. S. E. from Belfast.

KILLYTH-STALLION, in our *Old Writers*, is where lords of manors were bound by custom to provide a stallion for the use of their tenants' mares.

KILMARNOCK, in *Geography*, a very industrious, thriving, manufacturing town in Ayrshire, Scotland, 22 miles S. W. from Glasgow. Its principal articles of staple manufacture are coarse woollens and carpets, and low priced gloves, besides which a great number of weavers are employed in the cotton trade by the manufacturers of Glasgow and Paisley. Kilmarnock is situated in a very fertile part of the country, and is very plentifully supplied with

cattle from the extensive millworks of Sir William Cunningham of Cuprigton, which are in the immediate neighbourhood. Besides Sir William Cunningham, the chief landed proprietors in this neighbourhood are, the dukes of Portland, and the counts of Loudon and Moira, both of whom here possess very large estates in their own right. The immense estate of Loudon, now building, will, when finished, be one of the noblest family-seats in Britain. Kilmarnock, not being a royal borough, has no elective franchise for a member of parliament. In 1801, it contained 8270 inhabitants, of whom 6757 were employed in trade and manufactures. N. lat. 55° 40'. W. long. 4° 27'.

KILMES, a town of Russia, in the government of Viatka; 28 miles N. E. of Malmisch.—Also, a river of Russia, which runs into the Viatka; 33 miles N. E. of Malmisch.
